There is disappointment in some quarters that the Duke of Edinburgh's tour is not taking him into the far north of the islands. The supply convoy should be reaching Resolute just about the time he is in the Northwest Territories. It would have been pleasant if he could have welcomed it there, to set the crown on a new Canadian achievement. He would have visited the lands so recently named the Queen Elizabeth Islands, and he could have flown over Prince Charles Island, which was discovered only in recent years off the west coast of Baffinland. But as it is, the Duke will see far more of the Canadian North than most Canadians ever hope to see, and he will take in the newest and most dramatic projects which most clearly establish that the riches of the North are no myth. Untold quantities of minerals are waiting for the day when the world needs them badly enough to justify the new adventurers going in to get them.

The Canadian North

The mainland of Canada north of the 60th Parallel and the Arctic Islands is comprised of the Northwest Territories and the Yukon, for which the Federal Government is responsible. The Yukon Territory in the extreme north-west, bordering Alaska, consists of 207,000 square miles; and the Northwest Territories of 1,305,000 square miles. The population (1951 census) was 9,000 in the Yukon, of whom 1,500 were Indians; and 16,000 in the NWT, which included 3,800 Indians and 6,800 Eskimo. The Eskimo population is now believed to be nearly 9,000.

Mineral output from the NWT and the Yukon last year amounted to about $25 million; this was 25 per cent higher than in 1952 and 700 per cent higher than in 1946. The fur crop was worth more than $1 million; and the Great Slave Lake fishery is valued at more than $2 million annually.

Yukon has a fully elected Legislative Council; the Northwest Territories Council has four elected and four appointed members. The Commissioner of both territories is an official appointed by the Federal Government, which bears most of the costs of administration, and retains responsibility for it.

Personalities in Tunis

"THE next step lies with the Tunisians." What M. Mendès-France meant when he said this before he left Tunisia was that it is now up to the Bey and the Tunisian *élite* to form a cabinet capable of filling in the blanks in the pattern he outlined. It will be that cabinet's job to devise, with Frenchmen still at their elbow, projects for internal autonomy, including an elected assembly, and conventions whereby Frenchmen may continue to serve and live in Tunisia with confidence and in security. Tunisian nationalists of all classes are responding to the challenge thanks to their relative unity of outlook. The Bey has charged a wealthy landowner named Tahar Ben Ammar with the task of forming a ministry, and the Néo-Destour

party has agreed to occupy four seats in it; French officials are to retain the directorates of finance, public works, education and posts till the agreements finally defining home rule are signed; the cabinet will also contain five Tunisian moderates. From right to left, all see virtue in working with France now that certain inacceptable claims hitherto made by the French settlers are ruled out.

The attitude of conservative circles was always known to be favourable to co-operation with France; that of some of the firebrands who belong to the Néo-Destour was more open to question. But it was shown to be much the same when M. Bourguiba, the party leader in exile, recommended calling off terrorism in response to M. Mendès-France's gesture; perhaps an even better testimony to it is to be found in two recent news items from Cairo. Even before the latest events, the Néo-Destour was the target of attack by Egypt's Moslem Brotherhood for "sacrificing the ultimate aims of true nationalism by becoming a servant of imperialism." And, only two days before M. Mendès-France took his decision, the mouthpiece of the Néo-Destourien office in Cairo, which has been manned by exiles and was a hotbed of discontent with Paris, told a French newspaper correspondent that though the party all but despaired of bringing France to terms by any means short of violence, it still favoured a future based on the intimate relationship laid down in the protectorate treaty signed in 1881.

From Right to Left

In a word, the gap between the dissident in exile, and the stately stay-at-home who fears the all-or-nothing doctrines of the Arab League extremist, is narrow despite the wide range of backgrounds from which they come. These run from comfortable palaces belonging to the Beylical circle on the right, to needy homes of trade union members on the left; yet education has already gone some way towards bridging the gulf between them. The former have always found France an acceptable bulwark for their conservatism, yet even they have lately had glimpses of a stormier world; the Bey's eldest son, Prince Chadly, and even one of the princesses, are active supporters of the Néo-Destour. Next in the hierarchy come rich landed families such as that of the new Prime Minister; yet he, though a man of 69 and a confirmed Francophile, enjoys the confidence of Néo-Destouriens, thanks to spirited passages with the French in the past and to the fact that younger generations of his family have close ties with the party. A third important class consists of practising professional men—doctors like Dr Materi, lawyers like M. Hedi Nouira—who provide within or on the fringe of the party the practical experience that could serve as the backbone of successful government in the early stages of home rule. Next come the firebrands of the movement—men with more experience of exile than of work at home such as Habib Bourguiba himself and, in a younger generation, his lieutenant Mongi Slim, and Salah Ben Youssef, who was the mainspring of Tunisia's appeal to the United Nations. Still farther to the left are the trade unionists, many of them self-made on a French and anti-Communist model, of whom the most remarkable was Ferhat Hached, murdered in unexplained circumstances in 1952.

For a generation after the protectorate treaty, the relationship between France and Tunisia was a synonym for the relationship with the Bey, but as the years have gone by these less exalted groups of opinion have counted for more and more. What remains to be seen is whether, once autonomy is safely secured, some of them will hunger for the luxury of opposition and either advocate even more tenuous links with France or else begin to condemn their Beylical system as outdated. Some of them refer to the current changes on offer only as a "first step." Whether they find full scope for their energies once that step is taken, or whether they one day aspire to out-shout the large majority of educated Tunisians who see the advantages of the link with France, depends as much upon the behaviour of the local French residents during this transition period as on any other factor. The overriding factor is, of course, that they do not topple M. Mendès-France before he has time to give effect to his plan.

Changing Patterns of East-West Trade

THE *Economic Bulletin for Europe*, issued last week by the Economic Commission for Europe, makes the most that can be made of the modest increase in east-west trade since mid-1953. It is as optimistic as its stern statistical conscience will permit about the future, but the main conclusions that emerge from the tables and wealth of factual material give only cold comfort to those who have pinned their hopes on an expansion of trade between East and West. In 1953 exports (fob) to Eastern Europe by 18 West European countries (including Britain) amounted to only $789 million and imports (cif) from Eastern Europe to only $918 million. Furthermore, about 20 per cent of the total trade between East and West was accounted for by the special case of Finland. Although, as the *Bulletin* points out, the second half of 1953 was distinctly better than the first half, the yearly figures for 1953 were much the same as for 1952 (somewhat higher by volume, a little lower by value). It would seem premature to put much faith in the new "trend," especially as the information available shows another dip in the first quarter of 1954.

SHARE OF EASTERN EUROPE IN TOTAL EXPORTS OF SELECTED COMMODITIES

Percentages based on quantities, unless otherwise indicated.

Exporting country	Commodity and its share in country's total exports*	1952	1953	1954†
Denmark	Butter (15)	5	7	20
	Beef (7)	2	8	25
Netherlands	Butter (3)	5	34	30
Norway	Fish (excluding canned)‡ (11)	11	13	16
Iceland	Fish (77)	6	26	40
Greece	Tobacco (43)	—	4	8
Turkey	Cotton (20)	15	15	29

Sources: Commodity Trade Statistics, Statistical Papers, Series D, United Nations, and national trade statistics.
* Figures in parentheses indicate the share of the commodity in the country's total exports to all destinations in 1953.
† Most recent data available: Denmark: January-13 June; Netherlands: January-April; Norway: January-March; Iceland: January-April; Greece and Turkey: January-February.
‡ Calculated on the basis of export values.

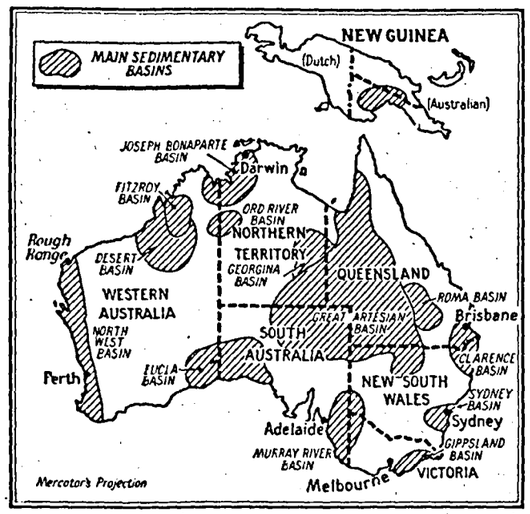
On the basis of information contained in an impressive array of bilateral trade agreements and on what the *Bulletin* calls "the moderate improvement of the climate for the expansion of east-west trade," the ECE secretariat has estimated that trade in 1954 will be "well above" the 1953 level and that exports from Eastern Europe might reasonably be expected to be about a quarter higher (by volume) than in 1953. As the *Bulletin* is the first to recognise, trade agreements are unreliable guides to the actual trade that will take place and these estimates are probably as optimistic as any that can sensibly be made.

Is it Accident or Design?

Three interesting sidelights on the changing character of east-west trade emerge from the ECE material. First, of the three largest traditional exports from Eastern Europe—coal, grain and timber—the first two appear to be heading for a fairly steady decline. Although substantial increases in timber exports, shipments of petroleum from Rumania and the Soviet Union, and the unusual Soviet gold shipments enabled the average for last year to approximate to that of the previous year, the prospect of large exports of coal and grain remains dim. Secondly, the increase in trade on the eastern side—indeed, the fluctuations in trade generally—have been almost exclusively concentrated on the USSR. As the *Bulletin* points out, "for the other East European countries, taken as a group, the picture is one of stagnation up to and including the first quarter of 1954." Is this difference in development due to accident or design?

A third, and somewhat disturbing point, that can be gleaned from the factual material presented is the evidence of the growing dependence of a number of the smaller West European countries on East European markets. Finland is the most dramatic example of a Western country which has become heavily dependent on trade with the East. Although the situation elsewhere is not comparable, patterns which will be worth watching seem to be emerging. As the table, which is taken from the *Bulletin*, shows, Eastern Europe is steadily becoming an attractive outlet for commodities of particular domestic importance to individual Western countries. It is clearly desirable to open up new markets and expand old ones in Eastern Europe, but it would be a mistake to think that in the Russian mind trade is ever really divorced from political objectives.

Australian Oil Boom



FROM A CORRESPONDENT IN SYDNEY

THE new oil boom in Australia has been capitalised thus far at more than £200 million by enthusiastic Australian investors, many of them complete strangers to the stock exchange. The boom is regarded by some observers, especially those on the inside of the oil business, as the "biggest thing" in Australia since the coming of the merino sheep; and on this belief centre the hopes and fears of those fairly numerous Australian and less numerous overseas companies which are financially committed for good or ill.

As the rate of investment rises higher and higher, prudent souls are beginning to point out that, at present prices, much of the possible future prosperity is already being paid for, especially when looked at from the income return angle. For example, it has been pointed out that on the assumption that the market would require, say, a 10 per cent return from a producing oil stock, then a dividend of 230 per cent or 11s. 6d. a share, would have to be paid by Ampol Exploration Limited, the top oil company which made the historic first strike, in order to justify its recent closing price of £5 15s. This rate of dividend would involve an annual dividend commitment of £23 million, a high figure in relation to Australia's present oil imports of £70 million-odd a year. In other words, the present oil boom is strictly a speculator's affair, some say, a speculator's paradise.

It is indeed a fact that any speculator who bought 1,000 Ampol shares just a year ago, costing £375 (including £125 in subsequent calls paid on a new issue) could have sold out on recent prices with a profit of £11,000. For the people who "work the big time," in the American idiom, this, no doubt, is very small potatoes. But to the modest investor, the man whose income is no more than £1,000 a year, it represents the full fruit of 11 years' work, and what is more, it remains entirely tax free. This kind of thing explains the public rush in the Australian oil boom, perhaps one of the most democratic operations ever seen in Australian financial history.

The spirit of optimism that pervades the market seems perennial. Investors seem quite unconcerned, for example, that Ampol's very extensive search area in Western Australia,

covering some 330,000 square miles (the area of France and Italy combined) must come up for renewal by the state government in October. What the financial effect of this reshuffle will be, with so many companies anxious for drilling rights in the Ampol area, is, at this stage, anybody's guess. On the other hand, the Ampol group has submitted its drilling programme for next year to the state government and the Minister for Mines has reported that the programme "would fully satisfy the requirements of his department." This might mean that Ampol will be allowed to hold its present massive search area, which covers some of the most geologically promising country in the entire state. Mr W. G. Walkley, Ampol's managing director, recently announced that his company would spend £2.7 million this year on drilling five exploratory and six developmental (producing)

wells. He also said that if progress matched his expectations, the company should expect to spend £20 million in the region over the next two or three years. He was careful, however, to emphasise that this was a purely personal estimate.

Prospects in New Guinea

But if Australia does in fact possess rich oil resources, estimates to this tune, however personal, raise the question of whether the country could find within its own borders all the capital required for full-scale development. Nobody holds out hope that it could. Dr H. G. Raggart, Secretary of the Department of National Development and a geologist who is regarded as a key figure in pinpointing Australia's present commercial oil-bearing region, recently declared that the "capital available in Australia would hardly be enough to find oil, let alone produce it." He pointed out that although there were good oil prospects in Australian New Guinea, the companies prospecting there had already spent £12 million without finding any oil, and he estimated the total expenditure on oil search in both Australia and New Guinea at between £20 and £25 million. But this sum seems modest indeed when compared with the £70 million-odd in foreign exchange, much of it scarce dollar exchange, that Australia spends annually on oil imports.

As to the New Guinea field, there have been periodic oil and gas showings in the lower Vailala River which encouraged exploration in Kariava, Upoia, Oroi and Hohoro areas. Drilling in these places, however, yielded no commercial results and a move was made to the present drilling site at Omati near the Turama River where at present two exploratory wells are in hand. The company (Oil Search Limited) has reported very minor impregnations of oil in various limestone strata. These signs were, however, evidently considered sufficient to suggest the presence of oil in commercial quantity and drilling continues. The market valuation on the prospective New Guinea field is £134 million. But here again a 10 per cent yield over 10 years would call for a minimum net profit of £13.4 million a year.

Where Speculators Thrive

Dr Raggart believes that New Guinea possibly offers greater prospects of oil in commercial quantities than does Australia. His opinion is reinforced by the valuable oilfields discovered by the Dutch in the Vogelkopf or Berau Peninsula in adjacent Dutch New Guinea. These fields have been in commercial operation for several years and are being steadily expanded. About seven holes have so far been drilled in Australian New Guinea to an average depth of 9,000 feet. There is, however, some comfort for the drillers in the knowledge that they can recoup exploration costs from income which remains tax free until the amount expended has been recovered. But first they must discover oil and bring the field into production.

For those Australians who have not yet taken the plunge in oil investment, a fairly dazzling array of share offerings is presented by the mushrooming oil search companies. There are no fewer than 30 massive claims pegged out across the face of this southern continent, on which government oil search permits have been granted. Scarcely a month goes by without some new oil search enterprise being rumoured or actually floated off. The launching ceremonies, represented by formal stock exchange listing at the "oil post," produce a flurry of excitement reminiscent of those not-so-distant days when the first Australian explorers set out on their daring journeys into the immensity and mystery of an unknown continent. Where the limits of that immensity extend to is no longer unknown. But where oil lies within it remains largely a mystery; and on that many speculators thrive.

Indians Share the Land

FROM OUR BOMBAY CORRESPONDENT

A PEACEFUL revolution is unfolding in India, Gandhian style; it is called Bhoodan. Acharya Vinoba Bhave, Gandhi's favourite disciple, started a voluntary gift of land movement on April 18, 1951, in the hope of defeating Communism in a land hungry countryside. The landless depend on their better-off neighbours for their livelihood. Nowhere are they in a majority, but their poverty is tinder to Communist propaganda; they rarely earn enough to get a square meal a day. Mr Bhave began his Bhoodan movement after a visit to the guerrilla-torn districts of Hyderabad where the army was meeting Communist terror with government heavy handedness. There, in some pockets where the Communists ruled, they had even distributed a few thousand acres of land to the landless and they were killing many informers and landlords. The villages were too scared to co-operate with the government. Mr Bhave was so struck by the pent up hates and fears that he decided to fight the Communists with "love."

He has announced formally that he will collect land gifts to the tune of 50 million acres—an area bigger than England and one-sixth of India's cultivable land—for its 60 million landless. The time limit he has set himself is the end of 1957. It was a proud target; people smiled at this blue-eyed Gandhian optimism. But now, after little more than three years of campaigning, Mr Bhave has received so many acres that in a number of states legislation has had to be passed to expedite the transfer of land. So far he has collected over 3,400,000 acres from over 300,000 donors; and perhaps some 80,000 acres have already been distributed to 20,000 families.

Daily Gifts to Mr Bhave

This is how it is done. Mr Bhave goes to a village, always on foot, and tells the assembled peasants of the horrors of Communist methods. All men are brothers and land, like air, belongs to everyone according to his needs. He warns the landlords that the choice for them is between Bhoodan and revolution. He tells the landless that they must cast away hate and love their benefactors. Whether it is love or fear, it works. Every day Mr Bhave gets more land with less effort. At first he was getting a couple of acres a day; two years ago 200; last year 1,000; two months ago 4,000 and today he is getting as much as 3,500 acres a day. This Bhoodan land comes from small and large holders alike: some give 10,000 acres, others 1/50th of an acre, men who only have one acre give it all and Mr Bhave takes everything from everybody because of the "moral pressure to give" that this creates. Many a rich man has taken the hint. The Raja of Ramgarh and the Maharajah of

Darbhanga between them have given 500,000 acres. The Maharajah of Darbhanga did not stop there; he also gave the monetary compensation that the government of Bihar was going to pay him for resuming his estate and stipulated that the money should be used to help settle the landless by providing them with agricultural implements.

The States Take a Hand

The states of Madras and Andhra have also been giving land on Bhoodan lines themselves. Andhra recently gave 500,000 acres to its four million landless and Madras has just given 95,000 acres. The reason for the action of the Andhra government is political; it has more Communists than any other Indian state. In an Assembly of 130 the Communists have 40 seats (as many as the Congress); there are 18 fellow travellers as well as 16 anti-Communist independent leftists. The Communists stand a fair chance of winning the next election unless something drastic is done to win over votes. Madras, too, has its Communists.

Bhoodan procedure is simple. The donor signs or affixes his thumbmark in the presence of two witnesses on a printed gift form in which the survey number of the land is entered. This form is a legal document and the land becomes automatically "Bhoodan land." After the land has been surveyed—which sometimes takes time and this delay explains the difference between the number of acres received and distributed—the village itself decides which landless family needs land most, in a joint session between the villagers, the Bhoodan workers, and the Revenue Officer who has to enter the name of the new owner in the Record of Rights. If there is not enough land to go round lots are drawn and those left out have prior claim for the next distribution. Bhoodan land is land in trust; it can neither be sold nor rented, neither mortgaged nor left fallow. If the new owner makes bad use of it it is resumed in the pool of land for distribution.

Single-Handed Mission

Bhoodan is a striking example of the advantages of private enterprise. Mr Bhave, single handed, has done more than all the State governments to get land for the landless, and he has done it without red tape. But there are snags to Bhoodan. It reduces the size of holdings which in India are already too small—an average of three wet or five dry acres for a family of five. It also gives land to men with neither capital nor education. But these inconveniences are more than balanced by the benefit of political stability. Already at the 1951 census, 60 per cent of India's rural population returned itself as landowning, even if only of a quarter of a field. Now the percentage will be increased still further. In terms of production the effects of Bhoodan are not as unfortunate as one might fear, because the agricultural extension schemes and the community projects will bring skill, seeds and credit to the villages; and a man's willingness to learn and toil is naturally greater if he has land of his own.

Bhoodan, however, rests so far upon the frail shoulders of a sickly man of 59. His lieutenant, Mr Jai Prakash Narain, the Socialist leader, may yet grow into as effective a land collector, but his pragmatic and economic appeal is bound to be less compelling than the religious and emotional appeal of Acharya Vinoba Bhave, who is in the traditions of a St Francis of Assisi or a Saint Vincent de Paul.

Headaches for Danish Socialists

FROM OUR CORRESPONDENT IN COPENHAGEN

TWO members of Denmark's Social Democrat government belong to the "million-headed Hansen family"—the Foreign Minister, Hr H. C. Hansen, who has been acting Prime Minister in Hr Hedtoft's absence abroad, and Hr Rasmus Hansen, the Defence Minister. Both have lately been troubled by a set of distinct but related problems: the breakdown of trade talks with Russia, the reduction of Denmark's terms of military service, and something very near to a major economic crisis.

The economic difficulties this summer apparently took the government by surprise. Denmark's foreign exchange reserves, which were already low at 251 million kroner in March, had dwindled by July to a mere 23 million (little over £1 million). To the charge that the country was clearly living beyond its means, Social Democrat leaders replied that rising world prices had induced farmers and industrialists to build up stocks, and that a dramatic increase in exports in the second half of 1954 could be expected. The Minister of Economics, Hr Krag, pointed out that in the first half of the year exports had earned Kr 150 million more than in the same months of 1953, but he had to admit that imports had likewise risen by Kr 295 million. Opposition spokesmen talked bluntly about a spending spree; under socialist rule, they claimed, imports of cars and non-essentials had soared, and consumption would increase still further when the effects of recent wage increases were felt. In June the bank rate, which had been lowered when Hr Hedtoft took office, was raised from 4½ to 5½ per cent. Rumours that the krone would be devalued called forth a categorial denial by the Prime Minister, who had interrupted his holiday to grapple with the problem; Hr Hedtoft also denied that new import restrictions were contemplated. But the government, forced to retrench urgently, has been seeking victims. Public building will be cut, although schools and hospitals are temporarily reprieved; purchases of American cars are to be held down by raising the dollar premium rate, and a new premium bond loan will be floated shortly.

Back from Paris and Moscow

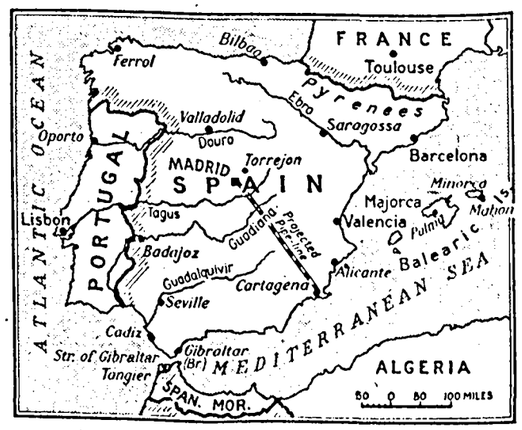
Sizeable cuts in defence spending are also on the agenda. To many Danish Social Democrats, a reduction in military service is a more welcome thought than economies on welfare services. Hr Rasmus Hansen, who has already been under fire this year owing to shortcomings in the air force and in radar defences, has had the thankless task of approaching Nato with a proposal that the national service period of 18 months should be cut to 16 months, with two subsequent months of refresher training. (Only the Communists and neutralist Radicals favour a straight cut.) On Tuesday, after the Defence Minister's return from Paris, the government decided to put forward a plan on this basis. The opposition press, however, is already accusing the government of using the question of conscription as a red herring and of sheltering behind Nato's skirts.

In the middle of these acrimonious exchanges came the Foreign Minister's announcement that the trade talks with Russia had broken down. The Danes had set high hopes on these negotiations, and a strong team headed by Hr

Krag had been in Moscow since early June. A draft agreement which would have doubled Danish-Soviet trade, and strengthened Denmark's hand in the annual tug of war with Britain over butter and bacon, came to grief when the Russians insisted that it must include the delivery of two oil tankers, which are on the western nations' embargo list. (It may be remembered that Danish-built tankers had previously been sold to Russia; but they had been ordered and partly paid for before the strategic controls came into effect.) The Russians rejected a Danish counter-proposal which offered refrigerated ships and trawlers.

The government's action in breaking off the talks once it was clear that the Russians made the whole deal dependent on embargoed items has been endorsed by the shipbuilders, whose order books are full for the next 18 to 24 months, and by the metalworkers' union, some of whose members are Communists. Full credit must be given for this sturdy decision, taken against such a threatening economic background. But, if Denmark is both to regain economic stability and play its full part in Nato, more sweeping measures may be required than the present government is prepared to take. It is possible that the Social Democrats, confronted by the uncongenial necessity of further reducing expenditure, would be happier to retire into opposition.

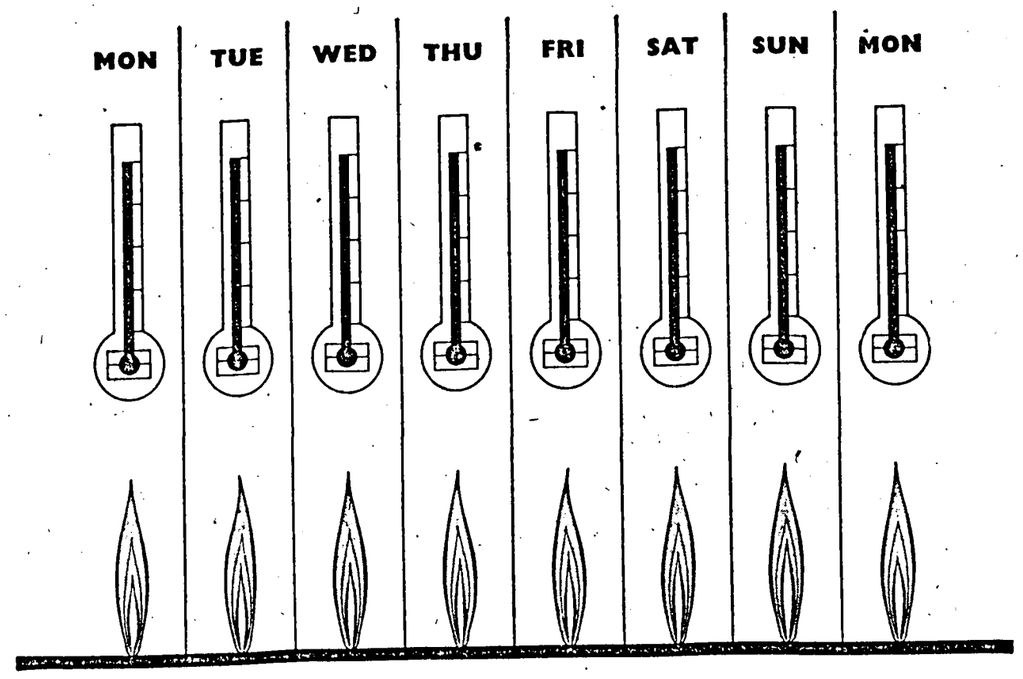
American Bases in Spain



WASHINGTON and Madrid have now concluded an agreement covering credits and contracts for offshore purchases in Spain. This should break the log-jam and get the construction of American air and naval bases under way. Up to the present, the only tangible result of the Washington-Madrid pact signed in September, 1953, has been the presence of American instructors at a jet training school near Badajoz, and the dispatch to the United States of some fifty Spanish air cadets.

Spain has been allocated $85 million in "defence support aid" and a supplementary agreement provides for the expenditure of 3.5 billion pesetas in counterpart funds. Some $19 million have been earmarked for the expansion of the naval bases at Cartagena, Cadiz and Palma de Mallorca. The American air bases are to be located at Torrejon near Madrid, et El Copero and Moron outside Seville, and at Saragossa. There are plans, moreover, to build a pipeline between Torrejon and Cartagena with its important Escombras refinery. The Pentagon hopes that a good part of the counterpart funds will be used to improve Spain's road and communication systems.

How the Dollars are Spent



A number of factors had, up to now, been delaying this whole programme. It turned out that many of the Spanish firms interested in American contracts were in no position to fulfil them. Their intention had been to issue subcontracts to German firms and the latter were asking for part-payment in American food surpluses initially intended for Spain. The new agreement is designed to prevent such arrangements. Tenders will be accepted only from *bona fide* Spanish concerns who are proposing to carry out their work with Spanish labour and under Spanish management. Bids must be backed by a bank guarantee of 30 million pesetas to ensure that contracts will be completed according to specification.

The programme of American construction and investment in Spain is being run under a complex "infrastructure" consisting of the Joint US Military Group (JUSMG) and the Military Assistance Advisory Group (MAAG). By June 30th of this year Spain had received some $140 million in direct military aid. Most of it has been devoted to the mechanisation of General Franco's army and to the purchase of heavy artillery and radar equipment. The visit to Washington of Major-General Lorgoria, Chief of Staff of the Spanish Air Force, is taken to mean that Spain is asking for jet fighters. The Pentagon, however, would prefer to see Spanish land forces built up while American units provided for Spain's security in the air and on the sea. It is becoming increasingly clear, moreover, that the major strategic result of the Washington-Madrid pact is the acquisition for the American Mediterranean fleet of relatively secure harbours. These will enjoy air cover from the bases in Spain and from the air-strips in Morocco.

But although work is about to begin at Torrejon, major problems remain unsolved. The Spanish economy is in such a weak condition that the materials and labour needed for American projects will be severely missed in other sectors. Already there have been sharp spurts in the price of construction materials followed by artificial scarcities. The release of the 3.5 billion pesetas in counterpart funds, moreover, has meant an increase in fiduciary circulation equivalent to nearly 15 per cent of the Spanish budget. All signs point to inflation and it is doubtful whether, in the long run, air bases are a net gain for a country urgently in need of schools, hospitals, roads and modern factories.

Finally, there is the delicate question of diplomatic timing. The whole Washington-Madrid arrangement has been a fine propaganda weapon in the Communist and neutralist arsenal. At a time when fears of a Washington-Bonn "line-up" are stiffening France's opposition to EDC and are increasing anti-Americanism amongst European liberals, the implementation of the alliance with General Franco will strike a sour note. Is the Pentagon's decision to push ahead with the construction of Spanish bases part of a new appraisal of "peripheral defence" plans? The whole problem will bear watching, if only because the staunchest supporters of the Washington-Madrid *entente* in the Senate also happen to be the leaders of a new brand of isolationism.

UNITHERMITY

Thermal uniformity is an important factor in assessing the true cost of your fuel. The heating value of gas is constant, predictable and guaranteed by law. It makes possible precise budgeting, reduced spoilage and better quality goods. Gas saves in other ways. Your bill shows precisely what you use. You do not have the space-and-labour problems of storage and handling because gas comes direct to the point of use, clean, flexible and easily controlled. To the time-honoured advantages of gas are now added the benefits of modern research—new methods, more efficient appliances. The Gas Industry would welcome the opportunity of bringing the latest thinking on gas to bear on your fuel problem.

Course with effect

THE first step towards best results is to consult your Area Gas Board. The services of the Boards' Industrial Gas Engineers are free and are backed by the full resources of the Gas Industry through the Gas Council's Industrial Gas Development Committee. To get things moving, you may like to have this coupon completed and sent to your Area Gas Board or to the Gas Council, 1 Grosvenor Place, London, S.W.1.

THE BUSINESS WORLD

Iranian Oil Agreement

AFTER negotiations in London and Teheran lasting eight months, the heads of an agreement have been reached between the Iranian Government, the National Iranian Oil Company (which took over the oil industry in Iran when it was nationalised), and the representatives of a consortium of eight oil companies on restoring the flow of Iranian oil, crude and refined, into the world markets. This achievement was celebrated on Thursday by an international *feu de joie*—three statements from Teheran, two from Washington (giving the blessing of the President and the Secretary of State) and two in London. There are as many angles to this agreement in escrow as there are in a polyhedron—and they vary for all the countries and all the companies that are involved in it. But every person of goodwill in the Western and Middle Eastern worlds must sigh with relief that ways appear to have been found to end the nonsense and waste that have afflicted Iran and the Anglo-Iranian Oil Company since the oil industry in Iran was nationalised three years ago. There are no triumphs in the agreement for either side. Iran admits eight members of the international oil industry to work the oilfields and refineries that it could not run itself, and has lost three years' revenues from oil. The consortium of oil companies has bargained hard, among its own members as well as with the Iranians. The Anglo-Iranian Company, dispossessed in 1951, is, to outward appearance, poorly compensated by the Iranian Government for its refineries and installations and will only have a two-fifths share in future operations—though outward appearances are indeed deceptive on both points.

The main outlines of the agreement had been accurately heralded by reports from Teheran during the last month. Two basic sets of negotiations have been concluded. The first, between the British and Iranian Governments, was concerned with compensation for Anglo-Iranian's installations. The agreed figure of £25 million, in ten instalments beginning in 1957, bears no relation to the value of the company's total assets in Iran; it is best regarded as payment for the West Iran Oilfields, and for the oil retailing system that Iran is now to own and run. Mr Eden explained in March that the other members of the consortium would buy their way into the partnership in South Iran and Anglo-Iranian will receive from them payment for the 60 per cent interest that they acquire there. The fact that Anglo-Iranian's statement on Thursday put no figure on the value of this payment will no doubt disappoint many bulls of Anglo-Iranian shares, who had supposed that the company would be receiving forthwith a sum exceeding £100 million from the other partners, and would lose no time in distributing it. What happens, after these payments are agreed, if they are made as annuities? Will AIOC (and the British tax authorities) treat them as capital or revenue? And if the former, will balancing charges become payable by the company?

That is one problem for holders of Anglo-Iranian shares at £13. They will perhaps draw greater consolation from the terms on which the consortium is intended to operate—though they should be quite clear that until the aide-memoire is spelled out in a legal agreement, formally executed by the companies participating in it, and enacted as part of the law of Iran, they will be dealing still with expectations rather than accomplished facts. The accord reached by the prospective members of the consortium* and the Iranian negotiators suggests that drafting and ratification may take two

*AIOC, 40 per cent; Royal Dutch-Shell 14 per cent; Gulf, Socony-Vacuum, Standard Oil (New Jersey), Standard Oil of California and Texas Company, 8 per cent each; Compagnie Française des petroles, 6 per cent.

months, and that large scale operations in the oilfields and at Abadan would be under way after a running-in period of three months.

In effect, the consortium has made a firm bargain for three years, starting in 1955. In those three years, given present prices and costs, the total payments for oil to the National Iranian Oil Company and the taxes payable to the Iranian Government should total £150 million—£31 million in the first year, £52 million in the second and £67 million in 1957. Since the essence of the scheme is a 50:50 division of profits between the consortium and Iran, these figures must be taken as the net revenue, after Iranian tax, that the partners expect to receive in return for buying their way into the scheme, spending perhaps £35 million on rehabilitation and meeting operating expenses. Indeed, the working-up of operations in the three years to provide minimum exports of crude oil and refined products of 68 million tons in that period should be a matter of considerable satisfaction to the Iranian side. Some 30 million tons of crude will be processed at Abadan in the three years, of which 13 million tons will pass through the refinery in the third year. This last figure is half the rate of which Abadan was capable before the refinery was closed, and while it will restore Abadan as the biggest producer of refined products in the Eastern hemisphere, it obviously takes realistic account of increases in refinery capacity in Europe, Aden (where AIOC's new refinery has come "on stream" this week, four months ahead of schedule) and in India and Australia.

The marketing of these additional supplies of Middle East oil will not perhaps present major problems to the integrated companies that are joining in the consortium. But it may be noted that co-operation between them will cease at the point of loading and that competition will then determine the selling arrangements that each company chooses to make. Weak sellers at Abadan and Bandar Mashur are not very likely; but tougher competition may be found there than at other ports along the Gulf.

*

Much importance was attached from the outset of the negotiations to forms of management for the oil industry in Iran. Two aims, not easily reconcilable, were involved—to avoid wounding Iranian susceptibilities, but to give the consortium full power of decision over all technical operations and expenditures in Iran. The solution of this problem is complicated, but it should be effective. Two new operating companies are to be formed to work in Iran; one of them will deal with exploration and production of crude oil, and the other with refining. They will be registered in Iran, and have their headquarters there, but they will be incorporated under the laws of the Netherlands. Each company will have seven directors, of whom two will be nominated by Iran, and five by the consortium. The two operating companies will be controlled by the parent (consortium) company in London, and will be assisted by a British servicing company, which will provide equipment, technical staff and engineering services.

But national aspirations are properly observed. The National Iranian Oil Company will be directly responsible for training, transport, housing and medical services, and will be recompensed for them. It will also have the right to take crude oil in lieu of cash payment, up to 12½ per cent of total exports, and sell it. It will take refined products for consumption in Iran at cost price, and distribute them. It will work the Naft-i-Shah oil field and the Kermanshah refinery to meet the balance of Iran's needs. And it will be the channel through which the production subsidiary of the consortium pays for the crude oil that it takes under the agreement.

*

This is evidence of a welcome intention of partnership on both sides. It amends past mistakes, and it should provide the foundation for popular support for the agreement within Iran. That is essential for the longer view that the agreement contemplates. Beyond three years, it is not specific about the quantities and guarantees that Iran can expect; "it would be the policy of the consortium companies to continue taking quantities of crude oil which would reasonably reflect the supply and demand trend for Middle East crude oil, assuming favourable operating and economic conditions in Iran." In other words, it holds out the expectation of a favourable annual negotiation in each year after the third, provided that all goes well in the world and in Iran itself, throughout the 25-year period of the agreement and its three possible extensions of five years each—until 1994, indeed, which is a year beyond AIOC's old concession. Iran will be paid in sterling, but will have transferable account facilities and access to dollars for its essential needs.

With such evidence of realism on both sides, it is inconceivable that there should be any change of heart, or any slip of political judgment that might imperil the agreement. Both sides have abandoned their earlier irredentism; and the merits of the agreement must now be accepted as outweighing all regrets at the events of 1951 and earlier years. Whether all speculative buyers of Anglo-Iranian ordinary stock will see the agreement in quite the same light may be more doubtful. On compensation, the company has accepted £25 million in instalments "in full and final settlement of all claims and counter-claims of the parties"; and in view of its 40 per cent interest in the consortium, it has not claimed compensation from Iran for loss of future profits. There seems to be more justification for regarding Anglo-Iranian as a company that now enters a new era of maturity and freedom from major troubles. That view would look forward logically to the next step—a more realistic capital structure and an end to the feverish speculation that has attended these many months of negotiation.

Opinions about Options

THE share option, the right to buy shares at some future date at a fixed price, has come into fashion, not as a device for raising fresh capital but as a method of rewarding heavily taxed directors and business executives. Since January the names of Lotus, Taylor Woodrow, E. S. and A. Robinson, Gray's Carpets and Textiles and Bowater Paper have been linked with such options. The fashion, imported from across the Atlantic, was first put on show in Britain by British Electric Traction at the end of 1950. Explaining the scheme to shareholders, the chairman, Mr. Harold Drayton, rounded off his comments with a quotation from the Sermon on the Mount: "for where your treasure is there will your heart be also." It was fortunate for Mr Drayton's argument that he did not begin his quotation two verses earlier at the injunction: "Lay not up for yourselves treasures upon earth, where moth and rust do corrupt and where thieves break through and steal."

The "treasure" that glittered so promisingly was the chance of a tax-free capital gain for the executive, without any need on his part to lock away his money. This chance arose because it was thought by the companies themselves, by learned counsel and, at one time, by the Commissioners of Inland Revenue that liability for income tax and surtax on the value of the options was determined by reference to the date on which the option was granted and not to the date on which the option was actually exercised. The "thieves" have now broken through. Last week the Board of Inland Revenue issued a statement that seems to turn the treasure into fool's gold. It certainly demands quotation in full:

> The attention of the Board of Inland Revenue has been drawn to recent articles and comment in the Press in which it has been stated that liability to income tax in respect of the value of options granted to employees or directors under share option schemes is determined by reference to the date when the option was granted. This was for some time the official view of the law, but the Board are advised that, as a general rule, the liability to income tax should be determined by reference to the date on which the option was exercised, and not the date when it was granted. Particular option schemes may, of course, have special features which would affect the application of this general principle.

On this general rule, if the market price of shares rises between the date on which the option is granted and that on which the recipient exercises it, the whole of the increase in value will be liable to tax as remuneration in his hands.

Why did any misconception, nursed by the Inland Revenue itself, arise on this crucial point? It is not simply because no one was sure of the law but because the law in this connection does not seem to be definitely established. Counsel in giving opinion on this point have had largely to rely on certain observations in *Weight v. Salmon*, decided in 1935 in the House of Lords. This case does not bear directly on the question of dates, for the option under discussion had been granted and exercised within a very short period of time. But in the course of his judgment, Lord Atkin remarked:

> It is to be observed that while the board [of directors] have expressed their willingness to entertain an application for these shares, nobody was bound and no right was given and no profit was received of any kind by the appellant until the application had been accepted and the shares in question had been allotted to him.

Applied to the share options recently announced the word "allotted" seems to be fatally ambiguous. It seems certain that the nice and vital point about dates will have to be settled finally either by statute or by a House of Lords judgment. It must, however, be noted that the Inland Revenue Commissioners in this instance are spinning a double-headed coin against the tax-payer's call of "tails." The Commissioners in their announcement almost openly invite the owner of an option to test their reasoning in a court of law, if he is willing to undertake lengthy and costly litigation. And if the courts decided against the Inland Revenue that misfortune could no doubt be set right in the next Finance Bill and no doubt made retrospective in its effect.

*

The intention behind the announcement was no doubt the laudable one of warning those who have been granted options (or have been hoping for them) that they would not necessarily enjoy a tax-free ride. But the method chosen to give this warning was certainly unfortunate. The authoritarian wording of the announcement (even with the saving clause of the last sentence) must have appeared to many as a flat-footed, tendentious assertion of the law. A statement pointing out that there were some legal doubts about the tax liability on options and that the Inland Revenue were inclined to a rigorous interpretation would have been warning enough, and it could have been given a little earlier than now.

Why, it may be asked, have the Inland Revenue Commissioners changed their minds? Is it that as soon as a taxpayer takes a crowbar to widen a crack in the high wall of taxation built round incomes the Inland Revenue brings in a cement mixer to stop it up? Or is it because the general drift in tax legislation (dating, perhaps, from the 1948 Finance Act and the retrospective legislation relating to the gift of shares to Sir John Black) is towards the treatment of all forms

of remuneration, whether it is commission or a share option, on exactly the same footing ?

The share option is as much a product of penal taxation as the expense allowance. Everywhere the difficulty of fully rewarding the highly paid and surtax paying executive or director for his services is recognised. But is the share option the right way of giving the reward ? The usual argument in favour is that those to whom options are granted will secure a personal stake in the business and an interest in its future prosperity, giving them a powerful incentive to diligent and enterprising work. Where an executive has been called in to set a company back on its feet after it has slipped in a bad patch there can be little doubt about the validity of this argument. The executive has then been given a personal stake in the equity which it is his job to bring back to health.

Share options have been granted in such circumstances—the one given to Mr Cyril Lord by Gray's Carpets and Textiles is an example; but they are more usually granted in a rather different setting of a flourishing and well-directed business with every prospect of development and expansion in the future. Then the chairman, basing his case on the incentive value of options, comes forward with a proposal to grant options exercisable over a number of years (often more than five) to directors or senior executives. In such a company how much genuine incentive value do these options carry ? The senior executive, like everyone else, welcomes something for nothing. For him a share option may be the means to a pleasant profit secured at no greater cost than that of obtaining temporary bank accommodation, while the shares under option are bought and sold. (This possibility disposes both of the idea that the option is valuable only to the wealthy man and of the theory that it gives the recipient a stake in the business.) The only incentive that an option may give such an executive is to take a capital profit, for he knows that the value of his option depends at least as much on the dividend policy of his directors as on his own efforts. For the director it is pertinent to ask whether an incentive is really necessary. It is a strange paradox that a director may talk quite genuinely of his devotion to his company and its prosperity, and yet be ready to argue for a new incentive so that he and his colleagues can develop their maximum efforts on the company's behalf. Is it often the case that directors fail to pull their weight because the carrot is insufficiently attractive ? The doubt about the incentive argument was perhaps illustrated when the grant of an option to Sir Eric Bowater was authorised by the directors of Bowater Paper as a "testimonial" to Sir Eric's past services.

*

In fact the share option confers on the director a special privilege which is not shared by other stockholders in the company. The principal objection to such options is not that they water the equity, for the amount of shares issued is comparatively small (though in one instance it did amount to 10 per cent of the issued capital). It is that the director given an option on equity shares in a flourishing company is given a free ride in a direction which he ought to be able to predict with far greater accuracy than any other stockholder. More than this, his own decisions on the company's policy can directly affect the value of his own option. At some stage his own personal interest is involved, as well as the interests of the company and its stockholders.

The ultimate question is whether the community considers that the services of directors and executives to industry are sufficient to justify the creation of a specially privileged class. The Commissioners of Inland Revenue now seem to have taken on themselves to answer that question. In effect, they have decided that there is no justification for the privilege. Their decision, however dubious it may be in constitutional authority, is one that stockholders and employees generally are hardly likely to fight. By making the capital profits which can accrue from share options liable for income tax and surtax, option schemes will be knocked on the head and beneficiaries put on the same footing as an investor; now, if the view of the Inland Revenue is upheld, they will have to back their faith in a company by a cash investment. Penal taxation created the share option; now, like Saturn, penal taxation has eaten its own child.

Binding Cases

Binding cases for THE ECONOMIST *can now be supplied. These cases, made by Messrs.* EASIBIND LTD., *are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding and will hold* 13 *issues of the normal edition together with the quarterly Index, or* 26 *issues of the air edition with two quarterly Indexes. The year can be stamped on the spine. The cost per case, post free throughout the world, is* 11/-. *Orders, stating requirements clearly and enclosing a remittance, should be sent,* **not** *to* THE ECONOMIST, *but to—*

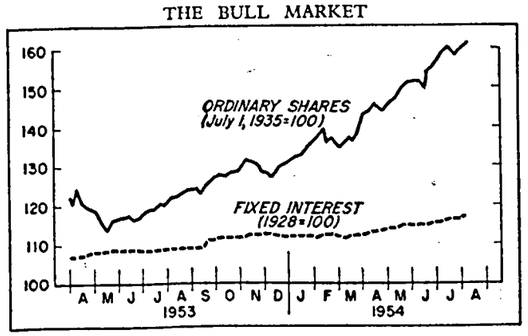
EASIBIND Ltd.
(Dept. E), 84 Newman St., London, W.1

A binding case can be sent on approval if required.

Business Notes

Holiday Peaks in the Markets

IN this year of irrepressible buoyancy in the markets all the rules of the close season have been broken. In the middle of a three-week Stock Exchange account, and on the day after August Bank Holiday when many Stock Exchange men and their clients should have been sunning themselves in warmer climes, new peaks were reached and still the markets climb strongly further. The *Financial Times* industrial ordinary share index registered an advance of 2.2 to a new high point of 162.5 in the two days following the holiday. Developing gold mines have marched in step with industrials—an unusual association—and reached a peak of 114.15, showing a rise of 3.3 over the holiday week-end. The gilt-edged market, whose broad shoulders thrust the whole structure of prices upwards, rose strongly both before and after the announcement of the very favourable gold and dollar figures for July. The fixed interest index rose 0.21 to 116.49 between Friday and Wednesday. War Loan 3½ per cent has passed well beyond 91 and the idea that the Treasury might come within sight of being able to convert it has ceased to be a mere joke. The market is strong enough to absorb a substantial gilt-edged issue in August, and both gas and electricity are knocking at the door.



It is true that the rise in the markets must by now be reaching a dangerous stage; though industrial production has been rising (it is now about 6 per cent higher than a year ago) and profits and savings have been improving, the market's advance has been going on for a long stretch and must now discount much of the improvement. But that is not yet the decisive factor: thinking men in the market and in the institutions have been aware of it for some time. Prices are not immediately affected by the doubts of a few cautious minds. The flow of funds seeking investment remains strong for there is plenty of money about. The Bank of England's note circulation provides some evidence of it. The fiduciary issue stands at the record level of £1,750 million, having been increased in four amounts aggregating £175 million since the low point of January; last year three increases amounting in all to £125 million were sufficient. The active note circulation at £1,717 million has reached a seasonal peak some £118 million higher than a year ago. But the supply of funds now seeking a home and pressing yields down and prices up has been notably expanded by the Government's two conversion operations this year. These have forced the money market and other investors interested in short-dated gilt-edged stocks to search hard for suitable investments, and to accept longer dates.

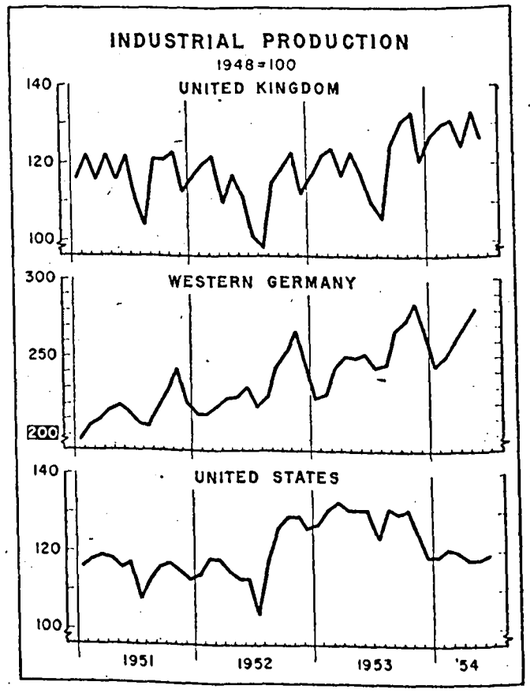
Confidence in the Boom?

MOST of the current indicators of demand and activity might suggest that in the short run the British economy has never had it so good—which is naturally enough to make more than a few people uneasy. Current economic indicators are generally at least two months out of date. Even so, no obvious signals of danger have been visible to more recent common observation; and those who question whether the economy can continue to find the resources to meet all these bounding demands may be relying upon what an American economist last year called "a visceral feeling, rather than an estimate."

Employment is brimful, with only about one per cent out of work. Wage rates in May were about five per cent higher than a year before, and earnings may well have risen slightly more than that. Spending on personal consumption in the first quarter of the year was 2½-3 per cent higher than twelve months before, with more money going on almost every



item except drink and entertainment. Since then, retail sales seem generally to have remained buoyant; last month's removal of restrictions on hire purchase may have quickened the pace of demand for durable consumer goods, though the volume of hire purchase on items such as furniture—witness the Great Universal Stores retail furniture results this week—was already rising. Yet retail prices in May were virtually unchanged from a year before; and though there had been a slight rise in wholesale prices since the beginning of the year, which may now be percolating through to prices in the shops, this rise did no more than bring the old "all items" wholesale price index to about the same level as in May, 1953.

Exports, in the first half of the year, were 8 per cent higher by volume than in the same period of 1953, about as high as they have ever been. Defence demand, to judge from some reports from engineering centres, is tapering off slightly; but such indications as can be gleaned of the pace of industrial investment—orders for machine tools, and new factory projects licensed or under construction—suggest a steady increase in this segment of industrial demand. Pressure for production, therefore, is not lacking; but for the moment, there are few indications that it is outpacing capacity and productivity, and indeed the uneasiness of some industrialists still concerns the rate at which orders are being worked off. The working pace within British industry, many observers agree, sems to have quickened somewhat over the last year, mostly perhaps through a return to relative abundance in supplies of materials and the chance to use improved equipment to the full. The index of industrial production suggests that output over the first six months of the year was 6-7 per cent higher than in 1953. What is more important is that, seasonal factors apart, there seems to have been a fresh increase above the high "plateau" of output that was reached late last autumn and was little more than held through the spring.

Lusty Competitors

EVEN this year's rising curve of industrial output, however, can hardly still anxieties about the long run—when it is viewed in perspective and in comparison. Beside the comparable indices of production in Germany and the United States, Britain's production record is creditable but not outstandingly impressive. In January, 1951, the production indices in Britain and the United States, on a 1948 base, were about equal at 116, and since then each would have touched 133 per cent of the 1948 level, Britain in November last year and May this year, and the United States in April last year. The comparison is therefore between a slower but steadier upward trend in Britain, and a rather quicker rise in the United States, broken by the recession which may or may not have begun to "saucer out." But it is only fair to add that the 1948 base upon which the chart is drawn represented for the United States a level of industrial output roughly 90 per cent higher than in 1935-39. It is difficult to find an acceptable comparison between prewar and postwar years for production in Britain, but the most favourable interpretation of the old interim index would not suggest that production in 1948 was more than 20 per cent above the 1935-38 average.

Nor does comparison with prewar levels of output greatly deflate the soaring curve of output in Western Germany. In 1948 industrial output there seems to have been just over 60 per cent of the level in 1936. With an index based on 1948 now showing a figure of 282 (for May this year),

West German output would appear to be nearly 80 per cent higher than before the war—comparing roughly with increases of perhaps 55-60 per cent in Britain and, at the peak last year, 150-160 per cent in the United States.

Buoyant Dollar Surplus

THE sterling area's gold and dollar figures for July make surprisingly pleasant reading. Despite the payment of $98½ million to seven European creditor countries as the initial lump-sum settlement of the $395 million of Britain's debt to the European Payments Union that is being funded, the gold and dollar reserves fell by only $4 million during the month. Receipts of American aid amounted to $15 million, and there was a net receipt from the EPU in respect of the June surplus of $4 million. The surplus on all other dollar accounts was thus $76 million.

This fine surplus apparently owes little to any purely financial transactions or to special sales of gold in London. It may therefore have been more firmly based than the high surpluses of the spring months, which were largely attributable to the inflow of foreign short-term capital to the London gold and foreign exchange markets, or than the December dollar balance, which was swollen by considerable sales in London of Soviet gold. One month's figures do not make a trend; but the July figures alone do suggest that

the sterling area has performed a remarkable feat. It appears to have not only retained nearly all the funds that flowed into London earlier in the year—and that were then expected to ebb away as the speculative forces worked themselves out—but also to have achieved a substantial improvement in its dollar balance on commercial transactions.

The balance with EPU also gives cause for satisfaction. This is the lean season for the sterling area's balance with

* After taking account of the payment of $181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.

† After taking account of payments totalling $99 million in mid-July direct to creditor countries in EPU in initial settlement of the U.K.'s overdraft with the Union.

‡ EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

Europe, since payments for fruit and vegetables and for tourist expenditure reach their peak. Yet in July there was a surplus of fully £9 million with EPU, to be settled 50-50 in gold and by the reduction of Britain's remaining overdraft with the Union later this month. The EPU balance in July does not include the bilateral settlements, which were made outside the mechanism of the Union direct to the creditor countries. The same procedure will be applied to the coming instalments, amounting to around $3½ million per month, to pay off the remaining $296½ million of the EPU debt that remains to be funded.

Gatt and Japan

JAPAN'S accession to the General Agreement on Tariffs and Trade, to be secured by prior tariff negotiations with other member countries, was one of the principal items on the agenda of the Gatt Intersessional Committee that met in Geneva from July 26th to August 4th. This committee of 15 nations has recommended that Japan should be allowed to enter into multilateral tariff negotiations with a view to acceding to Gatt. The recommendation will go forward to the full meeting of contracting parties that is due to open in October, and the United States, which supported the Japanese request, has already announced that it will open bilateral negotiations with Japan on February 1, 1955. The reports of the meeting at which the recommendation was made suggested that the motion had been "opposed" by the United Kingdom delegation. This definition of the United Kingdom view has, apparently, caused some resentment among the British delegation at Geneva, which has gone out of its way to issue its own official summary of its attitude. This authorised version runs as follows:

> The United Kingdom delegate said that the difficulties felt by the United Kingdom Government (and a number of other countries) about Japanese accession were well known, and on that the position of the United Kingdom Government continued to be as it was stated by the President of the Board of Trade at the eighth Gatt session. (The President on that occasion stated that the United Kingdom considered the Japanese application premature and would abstain from assuming obligations towards Japan under the agreement.) As regards tariff negotiations, if it was the general view that the Committee should recommend that arrangements should be made for tariff negotiations with a view to Japanese accession, it should be understood that the position of the United Kingdom was reserved in all respects.

If this was how the British delegate spoke, the official or journalist who summarised it in the one word "opposed" would appear to have done his work admirably.

The second important item on the agenda was the proposal to review the operation and provisions of Gatt in the light of experience gained during the six years of its application. That fundamental review will take place in October and November next at a full session of the contracting parties. It is a task that will gain enormously in importance and topicality from the fact that the revision of Gatt is closely linked with the programme of collective action for restoring convertibility and securing modifications of discriminatory restrictions on international trade.

Bargain in Tin

FRANCE'S eventual decision to join the International Tin Agreement turns out to have been the result of a nicely calculated bargain. As the price of signature, the French government obtained an assurance from the three consuming countries that also have producing interests, Britain, the Netherlands and Belgium, that they would support a French proposal to lower the maximum price in the agreement from £880 to £840 a ton. This becomes clear in a letter from the Colonial Secretary to the High Commissioner for Malaya, in which he also expresses regret that it was impossible "fully and formally" to consult the Malayan government beforehand. The time for signatures was running out, and the French vote was important, both for its own sake and because it might influence the decision of other independent consuming countries. Britain's assurance does not commit Malaya and Nigeria; the local tin-mining industries are now being asked for their views.

France may raise the matter informally when the member governments meet in London in September, or await the first meeting of the Tin Council proper; this may be held

in November if sufficient countries have by then ratified the agreement. Apart from any discussion of prices, the council will have to elect a chairman and two vice-chairmen, appoint a secretary and a manager of the buffer stock, and decide the date on which the agreement will come into force. Those countries that have not signed the agreement, such as West Germany, could then apply for accession if they wished. Instead of appointing a separate secretariat and statistical bureau, the Tin Study Group may be invited to move its staff from The Hague to London, the secretary of the Study Group becoming the secretary of the council as well. There are obvious advantages and economies in merging much of the work of these two bodies.

Modest Rise in Bank Deposits

THE latest return of the eleven London clearing banks shows some slackening in the rate of credit expansion; but it would be unwise to rely on this movement as a portent of the future trend. The return covers only the first three weeks of July; and the true movement in deposits in this period is always distorted by the great volume of cheques in transit (from branch to branch of the same bank) at the time of the end-June make-up. "Net" deposits are shown to have risen in the three weeks by £10.1 million; this compares with an increase of £129.5 million in the preceding six weeks, and with a fall of £9.7 million in deposits in the first two weeks of July, 1953—when the figures were further distorted because some banks received repayments from the proceeds of the Electricity Authority's final call of £31¼ million on its

† Ratio of assets to published deposits.

public issue. This caused the nominal total of advances to fall by £33 million, whereas this year advances are shown to have fallen by only £13.6 million.

The dominant movement behind the expansion in deposits this July has been an expansion in the banks' investment portfolios. This reached £39.2 million, the largest increase since the funding operation of October last. It is the more interesting as all but £4½ million is attributable to two banks, the National Provincial and the Westminster. Neither of these banks shared in the general increase in the banks' investment holdings in May; and until July they were in fact employing a considerably larger proportion of their funds in liquid assets than were the other banks. There is no evidence that the purchases consisted to any appreciable degree of maturing Serial Funding stock in order to take advantage of the offer of conversion into the new Exchequer Stock, 1963-64.

If the banking figures are read in conjunction with the Exchequer returns, it appears that the banks' purchases were satisfied from private rather than "departmental" holdings. The Government's net repayments to the banking system, as reflected in the fall in the banks' holdings of Treasury bills, call money and cash, amounted to £12.8 million in the three weeks. The net surplus on the Exchequer's domestic finances (after taking account of net receipts from small savings and tax reserve certificates and of finance secured from the large increase in the note circulation) amounted to around £25 million; and it seems unlikely that the sterling needed to finance the balance of payments surplus amounted to more than the remaining surplus over the apparent repayments to the banks. There was accordingly no obvious need for any large sales of gilt-edged by the "departments."

More Pig Iron

THE new "Queen Victoria" blast furnace at United Steel's Appleby-Frodingham works, which was blown in last week, is the final part of a programme that has enlarged iron-making capacity at this steelworks by about three-quarters, and marks a significant addition to the industry's total pig iron capacity. The most notable element in the steel industry's development during the last two years has been the completion of a number of new, large blast furnaces—"Queen Victoria" is of 28 ft. 6 in. hearth diameter, and is believed to be the largest in Europe—which have made possible a shift towards greater dependence upon pig iron following the high ratios of scrap that the British steelworks were able to use in the immediate postwar years.

The total pig iron capacity in Britain today exceeds 12 million tons a year, against just under 8 million tons in 1946. Of this, the basic and hematite iron capacity used mainly in steel-making makes up about 90 per cent; in 1946 the steel industry used about 6 million tons, while by 1953 this had risen to about 9¾ million tons. During the first half of this year it was consuming pig iron at the rate of about 10 million tons a year, with a scrap ratio of about 55 per cent, which compares with a ratio of 58 per cent in 1938 and of more than 60 per cent in some postwar years.

Appleby-Frodingham is one of the two major British steelworks that use home iron ores, and its development programme has been accompanied by the pioneering of improved techniques for dealing with these low-grade ores. Iron production at Appleby-Frodingham is now to be concentrated into "Queen Victoria" and the other large new furnace blown in this year, plus two blast furnaces built in 1939 that have been enlarged on re-lining to a hearth diameter of 25 feet. It is intended to operate the furnaces on 100 per cent sintered ore, which allows a very high rate of production and enables these low-grade ores to be reduced with a coke consumption comparable to furnaces working on high-grade ores. The furnaces are being operated with very high pressure blowing; though United Steel considered the use of gas turbine plant for blowing, it finally decided to use orthodox centrifugal blowers driven by steam turbines, on the ground that so many other features in the new iron-making plant were already of original design.

The Advent of Expresso

A RATHER noticeable development in the British catering business in the past year has been the appearance of small coffee houses, using Italian machines that produce what is generally called "Expresso" coffee. Since March last year, when the import of these machines was placed on open general licence, nearly 400 have arrived compared with only one or two the year before. Up to the end of last April the actual figure was 330, with a total retail value of approximately £80,000 or £90,000, and shipments since April have been averaging about 25 to 30 a month. So far some 250 or so have been sold, including a number that have been re-exported by London agents to Ireland and other parts of the sterling area. Because of the wide range of makes and models, the importers have to carry a fairly large stock.

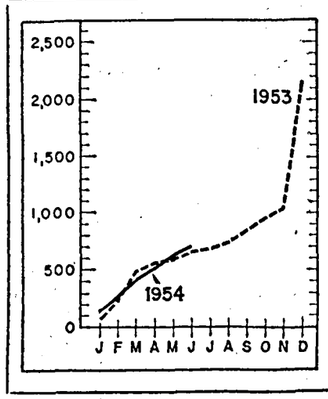
Expresso machines have been a familiar feature for a long time in Italy and other south European countries. Electrically operated, the machine makes each cup of coffee separately by forcing boiling water under steam pressure through a filter containing freshly ground coffee. The milk, too, is separately and instantaneously heated by steam for each cup of coffee. Neither the coffee nor the milk is kept boiling as in the conventional coffee urn. To the layman Expresso machines look formidable, not unlike small cinema organs in comparison with the Birmingham Gothic architecture of the traditional British urn. The largest model, which can cost up to £600 or £800, has a frightening collection of pumps, handles, and spouts. But there are smaller models on the market costing £200 or less, and one or two manufacturers make a domestic model, which operates on the same principle, has a capacity of from 12 to 24 cups, and sells at £25 to £35. Before March, 1953, a very small number of machines came into this country under special licence; the first—a Pavoni—arrived as far back as 1947. In 1949 the first Coffee House opened in London, using a Gaggia, and was so profitable that it was soon followed by one or two others. But it is only since the restrictions on the import of these machines were removed last year—another victory for OEEC—that the majority of coffee houses have opened up. A number of large department stores have also installed Expresso machines, presumably to retain the patronage of those who use the top or basement floors of stores for their "elevenses." And one machine has been put in the outpatients department of a hospital in south London for the use of patients before they meet their doctor. So far, however, no dentist has claimed to have installed one in his waiting room.

Computors Discussed

THE proceedings have just been published of a symposium on high-speed computors that was held in March at the National Physical Laboratory. The construction of these fantastic robot mathematicians is now well understood, but their applications have barely been considered. Construction and use do to some extent go hand-in-hand, a point that emerged very clearly in some of the papers. Computors for scientific research, for example, need an immense mathematical capacity for performing long sequences. The memory store that carries their instructions and details of the calculation must be big and it must work at exceptional speed if the calculation is not to be delayed. On the other hand, computors for commercial work must be able to take in and point out a large amount of data at speed, but the calculations to be done on it are less involved, so the design requirements are almost the exact reverse.

In his opening address, Professor Hartree of Cambridge pointed to the need for more information about the way the machines already existing are used, and how the work is prepared for them. The symposium itself did something to fill this gap—the papers describe a number of different British-built computors, Madam, Rascal and Mosaic among them—but the real need now is for a less technical assessment of their commercial applications. Plenty of industries are prepared to consider high-speed computing as an alternative to existing installations, if only they knew how their work could be fitted to them.

Double-talk About Roads



THE new Minister of Transport, who may have gained some experience in haggling over investment priorities in three years at the Treasury, must soon make up his mind whether to try to get road development in Britain the higher place in that queue that it so urgently deserves. In the House of Commons last week the Ministry was urged—for the fourth time in six months—to begin something much bigger than the small programme of work on the roads that the Government announced last year; once again Mr Molson was put up to fob off the critics.

All the arguments upon this issue have become somewhat worn; but continued fumbling over detail by the advocates of larger expenditure on road development does not weaken the essential strength of their central argument, and the Parliamentary Secretary seems to have been glad of the chance to escape into the now familiar discussion of financial details that the proposals for a road loan have given it. Mr Molson again made considerable and irrelevant play with the effects upon the capital market of a sudden £500 million loan—which his critics in this debate did not envisage. He conceded judiciously that the financing of road building, like other forms of capital investment "below the line," would not "be at all times necessarily improper"; but felt that it would be unwise now. But the level of realism displayed generally in this debate is perhaps best indicated by the fact that he was able to add without immediate challenge, after a homily about the fact that financial forms will not enable a nation to invest more resources than it saves, "It is entirely a matter for consideration as to where priority is to be given. I have not understood any of the speeches today to complain about this." This, of course, is where the debate should have begun: it is resources, not finance, that matter.

Test for the Sugar Agreement

THE International Sugar Agreement is now being seriously tested. In recent weeks the price of sugar on the world "free" market has sagged well below the minimum of 3.25 US cents a lb prescribed in the agreement, although export quotas have already been cut down to the minimum of 3.7 million tons. Late last week the executive committee of the International Sugar Council examined the statistical position and further methods of adjusting supply to demand. It announced that it had deferred making recommendations until more information had been obtained on (1) possible increases in demand, (2) shortfalls in export quotas, (3) the readiness of exporters to withhold any remaining surplus, (4) the readiness of importers to provide the maximum outlet for supplies. Member governments are being consulted about the action to be recommended should the council decide at its meeting in London on September 8th that further measures are required. By that time it should be possible to estimate the surplus more accurately. Some countries, principally India, may need more sugar than the council estimated, and one or two smaller exporters may be unable to meet their quotas in full. The fourth point in the committee's statement seems to imply a hope that some importers that have been using up abnormally large stocks this year might be persuaded to draw less from stock for a time, thus increasing the outlets through the free market.

The brunt of the burden of bringing supply and demand into balance may still fall on the exporting countries, particularly the largest exporter, Cuba. It would be difficult for the council to tamper with the agreement itself by attempting to reduce the basic export quotas or the minimum price; a lower minimum would in any case do little to stimulate demand. The council could take some sugar off the market by raising the level of stocks in producing countries from 10 to 15 per cent of the basic quotas, and by agreeing that any shortfall in some export quotas should not be filled by other exporters. The effect of these measures would be small, and might have to be bolstered by a further —voluntary—restriction of exports. Such action would not remedy the surplus, but it might strengthen the market for a time, in the hope that demand may increase next year. Failing such an increase, the only real remedy would be to reduce production. In the meantime Cuba might decide to reduce further its supplies for the free market by increasing the reserve stock it keeps for the American market; this, too, could only be a palliative.

Alliance Assurance Scheme

As the volume of business handled by the insurance companies has leaped forward to catch up with postwar inflation, many insurance companies have adjusted their nominal capitals to figures less obviously out of line with their current size. The latest addition to the list is the Alliance Assurance Company, a highly conservative office which is deeply entrenched in one of the steadiest classes of fire insurance. The Alliance last altered its capital in 1905. Now it tackles the complicated job again thoroughly. The company has two classes of capital—250,000 original shares of £20 each with £2 4s. per share paid up and 450,000 new shares of £1 each fully paid, making an absurdly small paid-up capital of £1 million. The two classes rank equally for dividends and assets—that is share for share and not in the ratio of the amounts paid up. But the original shares have an uncalled liability of £17 16s. per share. It is now proposed to extinguish the uncalled liability and equalise the two classes of capital, giving to the holders of the new ordinary shares an extra stake to mark the fact that the holders of the original shares are being relieved of their uncalled capital liability. At the same time the shares are being broken down to smaller units which should be more marketable than the original shares at about £34 10s. or the new shares at about £35.

Under the plan each original share will be replaced by eight fully paid £1 shares in the reconstructed capital of the company and each new share by eight and one-third £1 fully paid shares in the same class. The paid up capital will then be £5,750,000, involving the capitalisation of £4,750,000 of reserves. To provide rather more than that sum, £5,070,000 of specific reserves that have always been free for use in any department are transferred to general reserve. The largest share of these reserves, £3,850,000, comes from the additional reserves of the fire department, £720,000 from the additional reserves of the accident department and £500,000 from contingency reserve. The directors disclaim any intention of materially increasing the amount to be distributed by way of dividend. But the dividend intended does offer shareholders a small addition to last year's payment. It is proposed to pay an interim dividend of 12s. on the present capital in January and a final distribution of 1s. 6d. per share on the new capital in July next year. The equivalent on the present capital of the total distribution will thus be 24s. 3⅛d. compared with 24s. for the whole of 1953.

More Jute Goods Used

An inconspicuous feature of the boom in British production and the recovery in exports is the marked rise in the consumption of jute goods, widely used as a packaging material for industrial and farm products, in the building

WORKERS IN THE TEAM—Number 8 in a series

A SMALL MAN in charge of two huge weigh-batching plants, Taffy Evans is proud of their performance and of the team which operates them.

Taffy will tell you that the strength of concrete depends on the accurate proportioning of materials. He will show you how many tons of graded stone, sand and cement are lifted 70 feet from the stock-piles and delivered to waiting lorries, in exactly measured amounts, ready for mixing and placing—with only two men operating the electrical controls. He will tell you that a lorry can be loaded every 40 seconds, and that in one working day materials were accurately weighed out for nearly 2,000 cubic yards of concrete—sufficient to construct a mile of road 18 feet wide. He will show you how he communicates with his men and the site office by portable radio transmitter.

Taffy's pride is justified. Men and machines together are producing results impossible hitherto—not only reducing costs and saving time but also in improving quality. This is another instance of progress achieved by modern methods combined with the old team spirit.

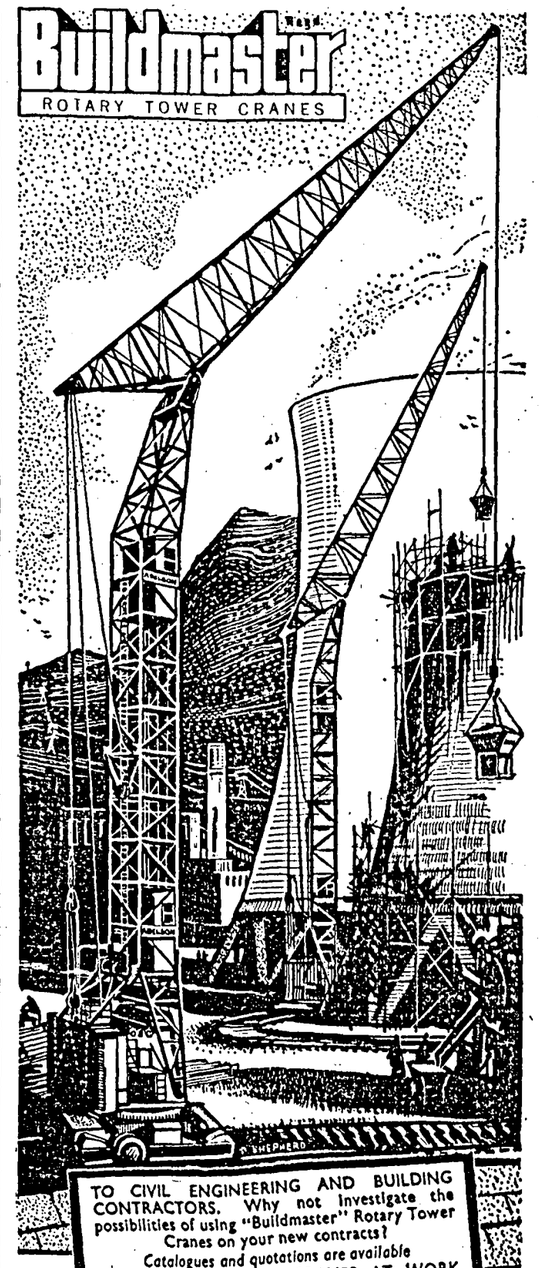
7 days quicker by Gloucester!

BRITAIN'S FASTEST DELIVERY OF BLACKHEART MALLEABLE CASTINGS



ANY other foundry needs 9 days to anneal blackheart malleable castings. But Gloucester Foundry can anneal in 48 hours! The secret is the advanced new elevator-type electric furnace at Gloucester—the only one of its kind in Britain. This means you can have delivery of the first castings within 72 hours.

Gloucester Foundry is fully mechanised for high outputs of blackheart malleable and grey iron castings. Their foundry experts will gladly advise on the design of castings to make the most of the malleable technique. Call them in early while the job is still on the board.

trades, and in the manufacture of carpets, linoleum and many other products. Production of jute goods in Dundee is at a high level, and may reach a new postwar peak this year. The shortage of labour there is now less acute, and many mills are working to the limit of present capacity. The statistical record of this activity is unfortunately sketchy, because the industry, sheltered by the skirts of the Jute Control, still maintains an old-world coyness about its production figures. The only published figures appear half-yearly in the digest of Scottish statistics, the latest being for the third quarter of 1953. Present indications are that output of jute cloth may rise by some 10,000 tons to 80,000 tons this year, and output of yarn for non-weaving uses by some 5,000 tons to 55,000 tons.

The import figures provide a more dramatic, if rough, indication of greater demand. Imports of jute cloth in the first six months of this year jumped by nearly 100 million square yards to 156 million square yards compared with the same period of last year; they were, indeed, virtually equal to the quantity imported in the whole of 1953. Imports of jute yarn, at 4,500 tons, were more than three times as large as in the same period of last year and only 100 tons short of the total figure for 1953. Sacks alone showed no increase. The expansion of imports has lately tapered off, partly because demand for agricultural uses is seasonally slack. Exports of cloth and yarn have been slightly higher this year, but exports of sacks have fallen—secondhand sacks very sharply. Even allowing for some re-stocking, a substantial part of the additional home output and imports must have gone into consumption. Helped by the recent fall in prices, jute goods appear to be regaining some of the ground lost to paper in the past. Competition from paper, however, is keen, and it is probably significant that prices of paper sacks have risen correspondingly less than prices of pulp.

SHORTER NOTES

All except one of the recommendations of the Wilson Smith committee on duty-free import licensing of machinery have been accepted by the Government, and operation of this licensing system for machinery not procurable in this country was resumed this week. The one recommendation upon which the Government has reserved its decision is the extension of duty-free licensing to plant as well as to machinery; this was one of the two significant changes recommended by the committee in the system operated between 1932 and 1952.

★

The polythene plant at ICI's Wilton centre, mentioned in the article "Experiment at Wilton" in *The Economist* last week, is owned and operated by the company's Alkali Division, not its Plastics Division.

★

The English Electric fighter "P1," designed to attain supersonic speeds in level flight, made its first flight at Boscombe Down this week. In addition to this prototype, 20 pre-production aircraft of this type have been ordered for development trials; Mr Duncan Sandys, Minister of Supply, mentioned that several other supersonic fighter types, now on order, would be flying before very long.

★

The ordinary dividend of the British Match Corporation for the year to March 31st has been left unchanged at 9 per cent. The group's gross profits at £1,466,469 are £99,438 higher than in the previous year and net profits have risen from £498,193 to £575,347.

Company Notes

CONSOLIDATED TIN SMELTERS. This company, the empire of the Patino family, smelts a large slice of the world's tin output in Liverpool and in Penang. It buys the concentrates, once they are assayed, at an agreed price from the producers, and sells the resulting metal to consumers as a principal. Being most particular never to take a view of the market, it sells its production forward as soon as it takes ore in. The consolidated balance sheet shows £2.6 million worth of stocks at March 31st, compared with £3.0 million a year earlier, but it is understood on good authority that the smelter was not in fact carrying the price risk on any of that tin, any more than it was on £3.3 million (compared with £4.8 million) of unassayed concentrates that are excluded from the balance sheet because their exact price had not been fixed.

The group smelted 5 per cent more tin last year, thanks to arrears of Bolivian shipments. It returned a consolidated trading profit of £1.4 million, against £1.1 million, and a net profit after tax of £599,865, against £466,349. That in a year of falling prices certainly supports the chairman's contention that the group does not get itself involved in market risks. But the profit does owe something to non-recurrent items; the slag contract has run out, and to mark the fact that lower earnings are expected from slag in the future, the increase in the ordinary dividend is declared as a 2½ per cent bonus, bringing the total up to 15 per cent compared with 12½ per cent. A strong liquid balance sheet has enabled the company to place £1½ million in the short loan market.

★

WILLIAM CORY AND SON. Signs of broadening trade, though in conditions much more competitive than before the 1952 recession, are to be found in the accounts of this company which distributes coal, oil and general merchandise, owns a substantial fleet including the largest single stake in the barges and tugs that ply on the Thames and has extensive wharfage facilities. The chairman, Mr F. A. Leathers, tells shareholders that trade gradually improved throughout the year ended March 31st, but that business can only be obtained in the face of the fiercest competition. On the home front the group has certainly been successful in doing so. Apparently it has been less successful in its overseas activities. The parent company's profit shows a rise of £159,000 at £1.7 million; the consolidated profit an advance of only £132,000 at £2 million because certain

of the overseas companies have contributed less to the combined total. The largest overseas investment of the group is in South Africa where the chairman describes the coal export trade as seriously cramped.

Shareholders can still feel reasonably happy at the result. Though the group trading profit is higher there is no increase in the net figure after tax which is £689,666, compared with £697,230. But there is a bigger dividend. The final payment is 12½ per cent making a total

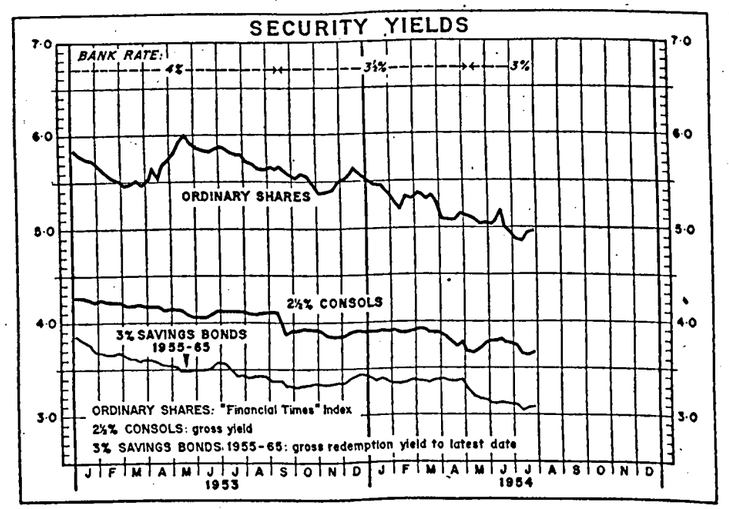
Reserves	11,750,309	9,345,902
Ordinary capital	2,850,094	5,800,188

£1 ordinary stock at 55s. 9d. yields £5 8s. per cent.

distribution of 15 per cent. A capital distribution of 100 per cent which affected the final dividend, but not the interim, in the previous year distorts comparison, but in terms of the present ordinary capital of £5.8 million the rate is up from 11½ per cent to 15 per cent. The balance sheet is strong and the policy is progressive. The chairman announces that the company has placed important new orders for ships.



★

ASSOCIATED BRITISH ENGINEERING. After the death of Mr Allen Good, a divorce was arranged between the two main companies with which he had been connected. Associated British Engineering sold the bulk of its holding (2 million 5s. ordinary shares) in the Brush Group to Thomas Tilling at the prevailing market price. The present accounts from Associated British Engineering shows that that partner has not suffered as a result of the divorce. Profits were well maintained in the year

ended March 31 ; the dividend was raised from 6 per cent to 8 per cent and the chairman, Mr Lawrence W. Robson, announces that turnover of the manufacturing subsidiaries has been held at a level above the previous year's. As a result of the sale of the Brush shares and the repayment by the Brush group of approximately £100,000 of loans (leaving £186,822 of those unsecured loans outstanding) the liquidity of the balance sheet has been much improved. Bank overdrafts at £354,493, have been reduced by £486,023. Mr Robson reports that turnover for the first four months of the current year has been higher than in the corresponding period of the previous year. But he adds a warning of increased competition, particularly from continental countries.

LONDON STOCK EXCHANGE

Next Account begins : August 11th
Next Contango Day : August 11th
Next Settlement Day : August 17th

BUSINESS in the stock market was unusually brisk after the Bank Holiday and prices, which had been firm before the market closed for the holiday, made a strong advance. The *Financial Times* ordinary share index had been carried to a new peak of 162.5 points when the market closed on Wednesday. The pace for this advance was set in the gilt-edged market. Demand in this market was concentrated upon the undated and long dated stocks. On Tuesday both War Loan (rising to 92⅛) and 3½ per cent Conversion (rising to 92) gained ¼ of a point, while many of the other long dated issues made gains of up to ½ of a point. These advances were maintained on Wednesday (both before and after the announcement of the July gold and dollar figures). War Loan put on ⅜ of a point and most of the other undated and long dated stocks made gains of ¼ of a point. There was also a good demand for Dominion and Colonial issues, particularly for the 4 per cent stocks ; the new Federation of Rhodesia and Nyasaland loan closed on Wednesday at a premium of 1⅛ on the issue price of 97½.

The advance in industrial shares covered nearly all sections of the market. The biggest rises were recorded in the stores section, where "Gussies" in a very active market closed on Wednesday at 94s. 1½d., after touching 96s. Radio and cinema shares came more into demand, with Odeon gaining 1s. 3d. to 20s. on Tuesday. Oil shares were quiet, though Anglo-Egyptian rose ⅛ to 4½. Rubber shares were steady and tea shares continued to go ahead.

The OFS issues were the most active group in the Kaffir market and Free State Geduld made a particularly strong advance. Copper shares turned a little easier after opening quite firm at the beginning of the week. In the foreign market the Peruvian stocks lost part of their earlier gains when profits were taken. Costa Rica stocks came into demand on hopes of an early debt settlement. The threat of a big strike in Western Germany made for dullness in German bonds on Wednesday.

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year: annual figures relate to October survey.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade; Belgium includes Luxemburg. (3) Average of fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended July 31st there was an "above-line" surplus (after allowing for Sinking Funds) of £12,821,000 compared with a surplus of £9,864,000 in the previous week and a surplus of £33,325,000 in the corresponding period of last year. This brought the cumulative deficit to £123,764,000 (£151,198,000 in 1953-54). Net expenditure "below-line" absorbed £5,791,000 bringing the total cumulative deficit to £268,807,000 (£320,209,000 in 1953-54).

THE MONEY MARKET

Credit conditions in Lombard Street turned tighter at the end of last week; on Thursday considerable stringency was caused by heavy tax transfers, and despite moderate special purchases made by the authorities, both directly and indirectly through the banks, the close was difficult. Further special purchases were necessary on the succeeding days. After the holiday, however, credit supplies became more plentiful; on Wednesday indeed there was a marked surplus of funds left unlent.

The market maintained its bid at £99 12s. 2d. for the fourth week in succession at last Friday's Treasury bill tender. The offer was raised to £240 million, and as total applications fell by £9 million to £414.2 million, the market secured an increase, to 39 per cent, from the abnormally low rate of allotment of 34 per cent that had obtained in the preceding two weeks.

Business in the London gold market was transacted at a new record price of 249s. 1½d. per ounce at the fixing on Friday before the weekend. Subsequently a falling off in demands reduced the price to 249s.

The Bank return shows an outflow of notes of £1.1 million. This brings the total outflow since the end of June to £69.5 million, compared with £53.5 million in the corresponding five weeks of 1953. Government securities in the banking department rose in the week by £4.5 million and bankers' deposits by £4.6 million.

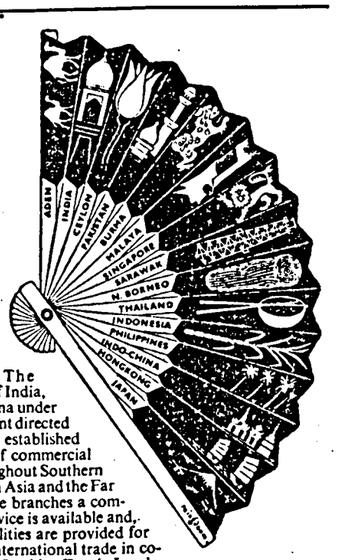
Established 1824



The Finest Service

for

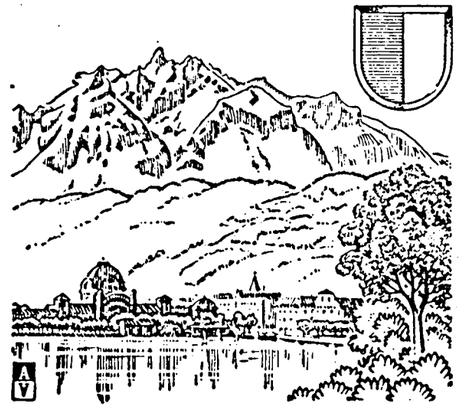
All Classes of Insurance

REPRESENTATION THROUGHOUT THE UNITED KINGDOM THE BRITISH COMMONWEALTH AND ELSEWHERE ABROAD

The Company undertakes the duties of Executor and Trustee

Spanning the East

Branches of The Chartered Bank of India, Australia and China under British management directed from London are established in most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents. In London and Singapore the Bank is prepared to act as executor or trustee.



THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2

Perhaps you didn't know that

LUCERNE

the heart of historic Switzerland, is connected by rail with the summit of mighty Mt. Pilatus (6,995 ft.).

One travels by ordinary railroad to Alpnachstad, and from there ascends, by the steepest and most daringly built electric train in the world (maximum gradient: 48%).

But everybody knows

that such enterprising railways cannot be built without full co-operation of the banking world. Should you intend visiting beautiful Lucerne, the Lucerne Branch of the Union Bank of Switzerland will be pleased to encash your Travellers' Cheques, to effect payments under your Travellers' Letters of Credit and to be of service in any other direction.

COMPANY MEETINGS

WHITBREAD AND COMPANY, LIMITED

REASONS FOR IMPROVED PROFITS

DEMAND FOR HIGHER-QUALITY BEERS

MR W. H. WHITBREAD ON THE OUTLOOK

The annual general meeting of Whitbread and Company, Limited, was held on July 30th at the Brewery, Chiswell Street, London, E.C., Mr W. H. Whitbread, Chairman and Managing Director, presiding.

The Secretary, Mr T. H. Hunt, read the notice convening the meeting and Mr S. H. Mearms, representing Messrs Whinney, Smith & Whinney, read the report of the auditors.

The following is the Chairman's statement circulated with the report and accounts for the year to December 31, 1953:

At the end of my report last year I said that in spite of difficulties and increased competition we looked forward with confidence to the future. As you may imagine, this confidence in the future was not entirely guess work as I was aware that, owing to various circumstances working in our favour, your Company was going to have a good year in 1953.

FAVOURABLE FACTORS

The management, however, are unable to claim that the good results are entirely due to their skill. Your Company has been fortunate this year in that there have been a series of factors which have favoured this year's accounts more than other years:

1. We have bought our raw materials at a more reasonable price.

2. The capital invested in new equipment throughout the business is now proving its worth.

3. The redeployment of our distribution stores at considerable capital cost has begun to show economies.

4. The general trend of public demand towards higher quality and higher priced bottled beers has favoured your Company.

5. Large sums previously provided for taxation in respect of the wartime EPT period will not now be required and have been credited in the accounts.

RESULT OF YEAR'S OPERATIONS

You will notice from the accounts that the profit of the parent company for the year, after providing for taxation, amounts to £931,532, which is an increase of £265,908 over the previous year. The consolidated accounts also show an improvement; the profit for the year after providing for taxation has, for the only time in the history of the Company, exceeded £1 million at £1,029,876, an increase of £306,014. You will also notice that the charge for taxation has increased by £377,785.

The parent company's claim for deferred repairs has now been agreed with the revenue authorities and, as a result, it has become apparent that no further payment of taxation in respect of the war period will be needed. The remaining provision of £300,059 is, therefore, no longer required and accordingly this sum appears in the profit and loss account as an exceptional credit and has been transferred to the general reserve.

ISSUED CAPITAL

For some time past, your directors have considered that there was far too large a difference between the issued nominal capital of the Company and the value of the free assets, so decided a few months ago to capitalise just over £1½ million standing to the credit of the general reserve account and distribute it in the form of ordinary shares; as a result existing shareholders received one new free share for every two held. Consequently, the issued share capital is now more in line with the amount of capital permanently employed in the business.

From the consolidated balance sheet it will be noted that the current assets amounting to £9,753,703 exceeded the current liabilities by £5,130,447; free reserves and undistributed profits amount to £5,850,630 compared with £5,048,603 for last year and exceed the issued ordinary capital of the company by over £2,750,000.

COMPARISON WITH 1949

The following comparative figures for the group between 1949, the first full year after ordinary stock of the Company became available to the public, and 1953, may be of interest:

	1949	1953
	£	£
Turnover	17,000,000	21,547,507
Gross earnings before taxation	1,380,331	2,471,853
Taxation	730,056	1,441,977
Net earnings after taxation	650,275	1,029,876
Amount available to Ordinary Stockholders after providing for Preference Dividends and Minority Interests	621,693	1,001,201
Distribution to Ordinary Stockholders	253,539	532,432
Retained in business	368,154	468,769
Non-recurring profits retained in business	93,920	333,380

CASH POSITION

During the year for various reasons the total of the parent company's cash and Government securities increased by over £420,000 to £3,114,000.

This is satisfactory, but it must be remembered that heavy liabilities for taxation and expenditure on properties will have to be met in the course of the next two or three years. We have continued to make trade investments for the purpose of expanding the sales outlets for our commodities.

DIVIDEND POLICY

You will observe that an unusual course has been taken in that the dividend is being declared on the whole of the present increased capital rather than on that existing at the end of the financial year. After such a particularly fortunate year, your directors take an especially conservative view of distribution of profits, ignoring any windfalls such as provisions not required for taxation, and after distributing a bonus to the staff and employees, are recommending a declaration of a dividend equivalent to 53 per cent of the profits earned.

BOTTLED BEER DEMAND

The policy of the Company over a great number of years has been to sell high quality bottled beers in as many outlets as possible, however small, all over the country and abroad. As the public become more selective and travel more about the country, almost all progressive traders, including over 100 brewery companies, are finding it commercially to their advantage to sell our bottled beers in their houses and off-licences. They find that, apart from the attractive profit they make on their sale, the stocking of Whitbread's Pale Ale and Mackeson's Stout tends to bring more customers into their houses and so to increase the sale of their own beers. It may well be that the increased prosperity of clubs is due in some measure to the fact that almost without exception they are able to offer the wider range of products that their members demand.

Since the end of the period covered by the accounts, an agreement has been made with Truman Hanbury Buxton & Company, Limited to sell certain of our respective bottled beers in each other's houses. In connection with this trading agreement, each Company has purchased and is now holding a small proportion of the other Company's stock. We believe that this agreement will be of mutual trading advantage.

It has always been the policy of your Company to bottle all its own beer: that means a substantial contribution to hygiene as all our bottles are washed and sterilised under our own supervision, in our own factories. In these days, with the growing public demand for cleanliness in food, it is a matter that is not without interest.

This policy of being directly responsible for the production of our beer from when it is brewed until when it is drunk, involves large capital expenditure and high costs in technical supervision. We are convinced, however, that the steadily increasing demand for our bottled beers may be attributed to the success of our efforts to produce not only a very good drink but a very clean drink.

FUTURE OF THE BREWING INDUSTRY

The future success of the brewing industry depends on the quality of service it gives to the public, on the quality of the beer it produces and on the prosperity of the public to enable them to afford to buy our heavily taxed commodities. I make no excuse in again drawing your attention to the serious and unfair competition we are up against owing to the continuance of the present high rate of Beer Duty.

Owing to the social changes in the last twenty years, our customers have many more attractions on which to spend their money. All these attractions carry considerably less purchase tax than that levied on beer. Purchase tax on beer (Beer Duty) averages over 160 per cent, while articles such as television and radio sets, electric fires, etc., bear only a 50 per cent tax. If Beer Duty could be reduced to even 100 per cent we would have a reasonably fair chance of competing with other trades.

One of the chief reasons given for increasing purchase tax was to control inflation, in other words, for the Government to spend the citizen's money instead of allowing him to spend it for himself. There is no doubt in my mind that if a Government raises money for taxation it spends it all, every penny, but there is, even nowadays, a chance that a citizen may save money if given the opportunity to do so. Purchase tax on beer to control inflation is absurd.

EXPORT

We have continued to push our export trade as it has been our traditional policy to establish a position whereby a customer can obtain our beer on demand anywhere throughout the world. Although export trade is becoming more and more difficult, we have been fortunate in meeting with a certain amount of success. In 1953 we enjoyed an all time record for export sales which has given everyone in the Company concerned with these highly competitive markets well deserved encouragement.

TRADING CONDITIONS

Times and conditions have changed during the last twenty years and especially in our industry. Many years ago a man was content to stand up in a bar with sawdust on the floor and drink large quantities of cheap strong beer. In 1954, however, a man and his wife expect to drink their beer under the most hygienic conditions and in comforable and even luxurious surroundings. We must adjust ourselves to this new state of the market and to the fact that the customer is willing to pay for the much better conditions he demands.

Today a very considerable quantity of beer is consumed in the home, a habit which has become even more popular with the spread of television. Bottled beer for home consumption, which is apt to be kept for some time before being drunk, requires particular qualities; for these again the discriminating public is prepared to pay full value. Now that an increasing amount of beer is drunk at home, every on-licensee will need to become enthusiastic about off sales, so as to maintain his turnover.

We are all glad to see the rising standard of living, and the brewer who takes note will be rewarded by the public's demand for his quality bottled beers and improved conditions of service for which they will be willing to pay a higher price.

THE BOARD

A few years ago, shortly after I had become chairman of the Company, Mr G. K. Dunning, who had suffered continual ill health as a result of a bad accident many years ago, asked whether he could be relieved of his duties as a managing director. I asked him as a personal favour if he would remain on the board to help us through the next few difficult years. This he has done in spite of bouts of ill health and we are particularly grateful to him. He has now reached the age of sixty and has requested to retire. We can congratulate ourselves on our good fortune in having had his services for so long as a managing director, especially in looking after the human side of our affairs. We wish him a long and happy retirement. We shall all here miss him very much.

THE STAFF

We are indeed fortunate in having a first rate staff and the success of the Company is largely due to their efforts and particularly the way they all co-operate together as a team. Your board realise what a pleasure it is to work with them and share their enthusiasm.

THE FUTURE

We all admit we have had a fortunate year and therefore in looking to the future we must take a cautious view. Like all other trades dependent on the weather, we are only too well aware that the weather so far this year has been deplorable; this is emphasised by the fact that the beer trade for the country for the first three months of 1954 showed a decline of nearly 8 per cent, and as I write this I cannot see that since then there has been any particularly good weather to readjust the position.

We cannot anticipate such successful results in the present trading year as we had in 1953. But, bearing in mind the extent to which our industry is susceptible to unexpected changes in political outlook and our curiously variable climate, we hope over a period of years at least to maintain our position in the industry.

The report and accounts were unanimously adopted; the proposed final dividend of 15½ per cent on the ordinary stock, less tax, making 21 per cent for the year, was approved; the retiring director, Sir Sydney Nevile, was re-elected and the remuneration of the auditors, Messrs Whinney, Smith & Whinney was fixed.

HENDERSON'S TRANSVAAL ESTATES

The forty-second annual general meeting of Henderson's Transvaal Estates, Limited, was held on August 4th in London.

Sir Joseph Ball, KBE (chairman and managing director), in the course of his speech said:

The profits, after payment of tax, amounted to £45,689 as compared with £46,704 during the previous year. The consolidated net earnings amounted to £76,051.

Current assets at £597,901 exceed current liabilities amounting to £185,974 by approximately £412,000,

This company's South African coal interests are held through its subsidiary—Tweefontein United Collieries, Limited—and shareholders will probably regard as satisfactory the fact that the accounts of the latter company for the year ended December 31, 1953, show a profit on coal of £169,500, an increase of £1,500 on the figures for the preceding year.

Coal sales, however, at 1,279,600 tons show a decrease of 37,600 tons during the same period, the decrease being due partly to transport difficulties and partly to a shortage of labour for loading. I am glad to say that this labour shortage has now been remedied, and that some improvement is also manifest in the transport situation.

White's South African Portland Cement Company, Limited: This company, in which we hold a very substantial investment, enjoyed another successful year. For the twelve months ended November 30, 1953, the total deliveries again amounted to 519,000 tons. We have every reason to be satisfied with our substantial holding in this company's shares.

The report and accounts were adopted and the dividend of 15 per cent approved.

METAL CLOSURES, LIMITED

RECORD RESULTS

The eighteenth annual general meeting of Metal Closures, Limited, was held on July 29th at West Bromwich.

Mr W. V. Esperson (the chairman) presided, and in the course of his speech, said: The group profit amounts to £227,000—the highest in the history of the company. The number of closures made and delivered and their invoiced values were also records. The increase in the group profit over last year is £33,411 or 17.24 per cent.

Our factory in South Wales is working most efficiently; it is now a comparatively low cost producer, and so far this year has shown very satisfactory profit figures.

During 1951 our capital expenditure was approximately £75,000, and during the year 1952 about £90,000—a total of £165,000: Most of this outlay was in respect of manufacturing plant and sealing machines, and our record profit for 1953 is largely due to the capital expenditure during the two previous years, coupled with, I may say, increased business due to ever-growing recognition of the excellent utilitarian qualities of our products and the energetic efforts of our sales staff.

During the year under review the post-war difficulty in obtaining an adequate supply of our principal raw material, aluminium, ceased to exist; and I believe that, at least for the next few years, it will be in plentiful supply.

For 1952, the gross profit amounted to £193,700. This, together with the profit for 1953 of £227,000 makes a total of £420,700 for the two years, but all that will be left to the shareholders, after taxation has taken its toll, is about £125,000, or just under 30 per cent. As one well-known daily newspaper pertinently remarked when commenting upon our financial figures: "How much longer can industry continue competitive and strong under such a weight of taxation?"

Early this year we entered into an agreement with the Corporation of West Bromwich to lease for a period of 99 years some building land adjacent to our West Bromwich factory; on this land we are now proceeding to erect a new factory which we anticipate will be completed early in 1955. Another matter of interest is that, in order to keep pace with the demand for our products and improve our dates for deliveries, we have this year placed orders for new manufacturing plant to the value of about £30,000, and by the end of this year we estimate we will have spent about £30,000 on new sealing machines for our customers.

We have to date orders on our books representing, comparatively, a greater volume of business than we have ever had before, and we believe that these orders represent the current requirements of our customers. A few years ago it was pretty generally believed that our domestic market had reached saturation point; this belief was due mainly, I think, to the fact that we were then dealing principally with the food industry. Fortunately, that belief has proved to be completely erroneous, and today, while we are steadily increasing the number of our food-packing customers, we are also obtaining many customers in other branches of industry—one of the most important being the wine and spirit trade—and I feel reasonably sure that our business will continue generally to expand, with, I hope, satisfactory financial results.

The report was adopted and the dividend of 40 per cent approved.

COLTHROP BOARD AND PAPER MILLS, LIMITED

RECORD PRODUCTION AND PROFITS

DISTRIBUTION RAISED TO 35 PER CENT

MR FRANK W. J. SMITH'S STATEMENT

The thirty-sixth annual general meeting of Colthrop Board and Paper Mills, Limited, was held on July 29th at the registered office of the company, Thatcham, Berks, Mr Frank W. J. Smith (chairman and managing director) presiding.

The secretary (Mr K. L. Collings) read the notice convening the meeting, and Mr W. H. Woods, of Messrs Deloitte, Plender, Griffiths and Co., the auditors, read the report of his firm.

The following is the chairman's statement which was circulated with the annual report and accounts:

In presenting the report of the directors and the accounts for the year ended May 31, 1954, I am pleased to inform you that the profit of £528,717, subject to taxation, constitutes a fresh record in the history of your company. Taxation (which includes excess profits levy of £57,000 for the final period for which the tax is payable) amounts to £338,655, leaving a net profit for the year of £190,062. There remains to be added to this amount over-provisions for tax during previous years of £69,190, so that with the balance of £41,911 brought forward from last year, and after deducting the net cost of the interim dividend of £25,733, there remains a disposable balance of £275,430.

RESERVES INCREASED

The directors propose, in view of the excellent results, to recommend an increased final dividend of 25 per cent, the net cost of which will be £64,332, to transfer the sum of £168,000 to general reserve and to add a further £3,000 to the employees' benefit fund. It will be seen from the balance sheet that the former reserve for replacements of £30,254 and the stock reserve of £32,000 have been transferred to general reserve. As it is obviously not possible to calculate the precise amount needed to cover the increased cost of replacements, it has been considered advisable to transfer the reserve for replacements to general reserve. Moreover, the stock reserve is no longer needed in view of the steadier prices of raw materials, which have shown a slight tendency to harden. The general reserve will now total £500,264.

The current assets as shown by the balance sheet have been further strengthened, having increased by £167,996 to £1,108,469 as compared with £940,473 last year, and the net surplus of current assets over current liabilities has increased by £235,268 to £635,159.

The company has, since 1945, financed entirely out of profits the capital expenditure on buildings and plant and equipment of £609,210. This sum has been spent to a large extent in replacing out-of-date preparatory plant with the result that the mill is now well equipped in this respect.

ERECTION OF NEW BOARD MILL

I am pleased to report that throughout the year our machines have been running at full capacity, a greater tonnage having been produced than ever before in the company's history. Your directors are satisfied, therefore, that a further board machine should be installed to meet the increasing demands of our associated companies, Cropper and Company, Limited, and Containers, Limited, and of our other customers. Plans are well advanced to carry out this project, estimated to cost approximately £3,150,000 over the next three years, which is the time it will take to erect the new mill. As you will see from the directors' report, until the new mill is in production short term loans have been arranged which will enable us, together with our own resources, to meet the expenditure occasioned by the erection of the new mill and machine. The borrowing powers of the directors will accordingly require to be increased and a resolution to this effect will be placed before the shareholders at the annual general meeting.

In connection with this proposed expenditure it is satisfactory to know that we should receive a substantial benefit from the investment allowance on new buildings and plant proposed in the recent budget.

Our decision to install the new machine has already received the support of many of our customers and shareholders, and I feel sure that the step we are taking is a step in the right direction. Our order books remain full and in the absence of unforeseen circumstances the results for the current year should again be satisfactory.

The figures disclosed in the accounts could not have been achieved without the wholehearted support and co-operation of my co-directors, staff and employees, and my personal thanks are due to them for their efforts during the year.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: Ladies and gentlemen,—as the report and accounts have been in your hands for the requisite time, we will, with your permission, take them as read. (Agreed.)

There are two matters concerning the future of our company to which I should like to refer. We have now received the consent of the Capital Issues Committee to the financial arrangements necessary in connection with the erection of the new mill, but a further application to the Committee will be necessary, since we are arranging for our borrowings to be placed on a permanent basis, details of which I am giving you in a moment. Our decision to erect the mill was made after the most careful consideration, and is in our view essential for the future development of the company. In fact, it is vital that we should increase our manufacturing capacity if we are to maintain the high position we hold in the industry.

ASSOCIATION WITH ALBERT E. REED & CO.

Since the publication of our report and accounts we have been approached by Albert E. Reed and Company, Limited, with a view to that company becoming associated with our company, and satisfactory terms have been arranged, as announced in the Press yesterday. These terms are subject to the approval of the necessary resolutions by our shareholders. We have agreed that our company will allot to Albert E. Reed and Company Limited, for cash, 105,000 ordinary shares of £1 each at the price of £5 5s. per share, and that Albert E. Reed and Company Limited will subscribe or procure subscriptions to an issue by the company of £1,500,000 4½ per cent unsecured loan stock.

Our associated company, Cropper and Company, Limited, will also be allotted an additional 25,000 shares at the same price as the shares to be allotted to Albert E. Reed and Company Limited.

The terms of the above agreement provide that Albert E. Reed and Company Limited give us a long term contract for the supply of a substantial quantity of board, to commence when the new mill is in production.

CONTROL AND MANAGEMENT UNCHANGED

I should like to emphasise the fact that apart from the election of two directors of the Reed Group to the board, the control and management of our company will remain unchanged. In my opinion, our association with Albert E. Reed and Company Limited cannot fail to be of the utmost benefit to our company in the future, and I and my colleagues on the board wholeheartedly welcome their association with us.

I think the statement covers most of the information that you require, but I would just mention that the taxation, amounting to £338,655, is 64 per cent of the profits, and the dividend is covered more than twice.

I now propose to pass to the resolution, after which I shall be very pleased to answer any questions you may wish to ask. I now propose: "That the report of the directors and the accounts of the company for the year ended May 31, 1954, be and they are hereby approved and adopted that a final dividend of 25 per cent, less income tax, be paid to shareholders registered at the date of this meeting; that £168,000 be transferred to general reserve; that £3,0000 be transferred to employees' benefit fund; and that £40,098, the balance of the profit and loss account, be carried forward."

Mr J. R. Henry, OBE, seconded the resolution, and it was carried unanimously.

The retiring directors (Mr Stuart W. Butters, Mr Hugh V. Dove and Mr Angus Marshall) were re-elected, and the fee of the auditors (Messrs Deloitte, Plender, Griffiths and Company) was duly fixed.

A resolution was also passed authorising the directors to borrow for the purposes of the company a sum or sums not exceeding in the aggregate the sum of £3 million, and to secure the repayment thereof in such manner and upon such terms and conditions in all respects as they shall think fit.

TRIBUTE TO DIRECTORS, STAFF AND EMPLOYEES

Mr Eric Davenport, in proposing a cordial vote of thanks to the chairman, directors, staff and employees of the company, said that in the past year there had been a record tonnage produced, record profits, and, unfortunately, a record payment to the Chancellor of the Exchequer. It was a sad business when a company had a programme in front of them as they now had, to see that tremendous sum of money being taken out of the company when it could be put to vastly better use. However, there was some relief coming in the way of cessation of EPL.

The company had brought forward a fine and imaginative programme of expansion. To propose expenditure of the order of £3½ million was a courageous thing to do, and he was very pleased, and he was sure all shareholders must have been, to see from the Press that not only had the finance been arranged, but there was coming into partnership the firm of Albert E. Reed and Company. He could not think of any better partner in the programme which the company had in mind.

Mr S. R. Greenland, in seconding the motion, endorsed the proposer's remarks in connection with the arrangements that were being made for the future prosperity of the company and paid a special tribute to the chairman. He said that his firm and his family had been associated with the company ever since its very early days and he had seen through the years the drive and energy which Mr Frank W. J. Smith had put into his task.

The motion was carried unanimously.

The chairman, in reply, said he was very pleased that his colleagues and the staff and employees had been included in the resolution, as it took all of them working together to achieve success. He saw no earthly reason why the prosperity of the company should not continue and increase.

The proceedings then terminated.

BANQUE DE PARIS ET DES PAYS BAS

(Paris)

EUROPEAN ECONOMIC SITUATION

The annual general meeting of the Banque de Paris et des Pays Bas was held on June 25th in Paris, with Monsieur Emmanuel Monick in the chair, and the following is a summary of the report presented by the board of directors:

During 1953, the world production of goods and services reached a peak level, while in the second half of the year the first signs of a recession appeared in the United States. No repercussions have yet been felt in Europe, where the year proved to be one of general progress. Dependence on the United States lessened, imports from that country dropped and reserves of foreign currency increased. Liberalisation of trade within EPU progressed during the year, and the EPU agreement itself was extended to June 30, 1955.

BELGIUM, NETHERLANDS, SWITZERLAND AND FRANCE

In 1953, Belgian trade and industry continued to prove their flexibility, the Netherlands went on improving their economic situation and business activity in Switzerland continued at a high level.

France herself continued to benefit from monetary stability during the year, with wholesale and retail prices falling slightly. Confidence, however, the mainspring of economic activity, could not be restored. Production costs remained higher than those abroad, and protective measures had to be maintained.

The bank pursued its policy of stimulating investment during the year, and was associated with the share issues and loans floated by a number of important companies.

THE ACCOUNTS

The balance sheet at December 31, 1953, totalled Frs. 88,602,667,296, as against Frs. 73,452,885,933 in the preceding year.

Net profits for the year amounted to Frs. 582,747,008, as against Frs. 508,013,137 for the previous year. It was proposed to transfer Frs. 75 million to the extraordinary reserve, and to distribute a dividend of Frs. 400 net per share.

The report and the proposals put forward by the board were adopted.

PARKLAND MANUFACTURING COMPANY

GROWING DEMAND

A WELL EQUIPPED ORGANISATION

The fifty-first annual general meeting of the Parkland Manufacturing Company Limited was held on July 30th at Bradford, Mr George F. Hanson (the chairman) presiding.

The following is an extract from his circulated statement:

A year ago I reported with regret that we had been obliged to restrict our sales to maintain reasonable delivery dates. We are still faced with a somewhat similar position because of the growing demand for our cloths, but there should be a material improvement in due course by our acquisition, at the beginning of this year, of five businesses, three of which operate up-to-date mills and plant for the manufacture of cloths similar to those we produce in our other mills.

This year we have taken advantage of an opportunity to bring the date of the accounts of another of our subsidiary companies, Smith Bulmer and Company Limited, up to February 28th, to coincide with the end of our own financial year. The result is that we have this year included in our combined profits the earnings of that company for eighteen months instead of for twelve months as in past years.

Throughout the year our mills have been very busy and our customers' requirements have continued to exceed our output. On the other hand, competition tended to become increasingly keen, resulting in narrower profit margins which, I am pleased to say, have been more than offset by our increased production.

The profits of the group, after charging all expenses, but before taxation, reached the record figure of £751,545. Taxation again absorbed more than half our profits and took £435,486. The amount remaining after taxation, £316,059, was this year augmented by £73,137 for excess provision for taxation in previous accounts, of which £50,600 arises because of the change in the accounting date of our subsidiary company, Smith Bulmer and Company Limited.

CONSOLIDATED BALANCE SHEET

Our various mills and plant have a value in this balance sheet of £966,714, compared with £630,506 a year ago. This increase of over £335,000 is due to capital expenditure on the improvement of our plant and machinery as well as to the acquisition of additional mills and plant.

The total capital reserves and revenue reserves amounted at February 28th last to £1,120,000 against £888,000 a year ago, an improvement of nearly a quarter of a million pounds. The total of these reserves is now over two and three quarter times the nominal value of the ordinary capital.

The board recommend a final dividend on the ordinary shares at the rate of 25 per cent, less income tax, and this, with the interim dividend of 7½ per cent, will maintain last year's total rate of 32½ per cent, but payable this year upon an ordinary capital increased by 50 per cent since the last balance sheet by capitalisation of reserves.

We have always pursued a policy of having the most up-to-date machinery and plant throughout all our mills and, as a result, we are well fitted to meet the keener competition now prevailing.

Over all, the price of wool has a great bearing on our future prospects, and this must never be overlooked, but apart from any risk of a sharp decline in wool values, I am confident that the efficiency of your organisation and the quality and variety of the cloths produced will enable us to show results with which you will not be disappointed.

The report was adopted.

THE AMALGAMATED DENTAL COMPANY, LIMITED

MARKED ADVANCE IN SALES

The forty-ninth annual general meeting of The Amalgamated Dental Company, Limited, was held on July 30th at 26-40 Broadwick Street, London, W., Mr Aiken Watson, QC (chairman of the company), presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts for the year ended December 31, 1953:

When I addressed you last year, your company was then experiencing at home the full impact of the restrictions on national health service imposed in 1951. For example, applications approved for dentures under the service had fallen from 2.3 million in 1951 to 1.35 million in 1952, and the fall appeared to be continuing. Severe competition in certain fields abroad, supported by hidden subsidies, was having a marked effect on our trade. In other parts of our trading territories, import restrictions were still stultifying our efforts. At that time any sudden upsurge in our trade appeared improbable and more than likely to be modest in its incidence.

Happily the last quarter of 1953 saw some diminution in the stocks earlier built up by our customers, reflecting a marked advance in our sales. The removal of some of the more onerous restrictions in the sterling area helped. Despite the handicaps referred to, our foreign markets held, and even improved. Current trading supports this trend. The improvement to which I have referred, together with a vigorous policy of economy and reorganisation still being pursued, has produced results more rapidly than at one time appeared probable.

IMPORTANCE OF RESEARCH

Perhaps in no industry where the outlet for its products is comparably restricted, does research play such an important part. Our acrylic filling material—Sevriton—remains outstanding in its field. In other allied fields our research is unremitting, and preliminary results are encouraging. On the equipment side we are not standing still. Changing techniques are demanding new approaches; work already done and in contemplation gives us confidence in the future.

On the medical side, our subsidiary, Medical and Industrial Equipment Limited, continues in the anæsthetic field to expand on the admitted merit of its products both in the United Kingdom and abroad.

Looking at the broad picture as now seen in the light of current trading, I am confident that, in the absence of any sudden collapse of present economic trends, your company is in sound shape to continue as a profitable enterprise. The continued loyalty and devotion of your managements and staffs at home and abroad are worthy of your praise and thanks, which I gladly render in your name.

The report and accounts were unanimously adopted.

ALLIED SUMATRA PLANTATIONS

The twenty-eighth annual general meeting of Allied Sumatra Plantations, Limited, was held on July 29th in London.

Mr A. L. Mathewson, OBE, chairman of the company, presided, and in the course of his speech said: After providing for depreciation, Indonesian company tax and the new Indonesian Government levy on remittances, a dividend of Rupiah 1,650,000 has been declared in favour of the holding company.

This levy on remittances, introduced after the end of the financial year with which we are dealing, provides a notable illustration of the uncertain conditions under which we have to operate in Indonesia.

In the holding company's profit and loss account the dividend of Rupiah 1,650,000, although as yet unremitted, is brought in at the current exchange rate of Rupiah 32 to £1—ie, £51,562. After providing for UK taxation the year's results do not justify more than the proposed dividend of 5 per cent.

On previous occasions I have enumerated the main factors which have hitherto ruled out the resumption of replanting on any substantial scale. Unfortunately, there has been no real clarification of any of the fundamental issues.

Since our meeting a year ago, conditions in Indonesia as they affect estate producers have unfortunately not improved. In some respects indeed they have deteriorated.

The planned process of internal subversion is made manifest in the instigation by Communist-led unions of incessant strikes, go-slow actions and demands for more and more pay and benefits for less and less work.

In support of such demands stories are put about of fabulous profits said to be earned by estate owners. A brief analysis of the 1953 results of our subsidiaries will provide just one example of the utter falsity of such propaganda; production costs (of which wages and other labour emoluments form the major part), together with Indonesian fiscal exactions of one kind and another absorbed 94 cents out of every rupiah received from the sale of the year's crops, thus leaving only 6 cents eligible for transfer from Indonesia to meet UK taxes and a distribution to stockholders, who carry all the risk. I say "eligible for transfer" advisedly, because in face of the serious state of Indonesia's foreign exchange resources it remains to be seen how applications for remittances are to be dealt with.

The vital problem which confronts responsible Indonesian leaders is how to arrest decline; how to checkmate the designs of Communist imperialism to reduce an independent and potentially highly prosperous Indonesia to the position of satellite or colony. For them it is an immediate and compelling problem; for, especially in view of developments elsewhere in Asia, subversive forces may be expected to exert their maximum efforts and influence in advance of Indonesia's first general election, now scheduled for next year.

With the future of their country so manifestly at stake it should not be too much to hope that patriotic and intelligent Indonesian leaders who are at one in viewing the Communist ideology and subversive aims as alien to the way of life their people wish to follow, may, before it is too late, decide to make common cause in meeting a critical situation by firmly applying the sound administration which is indispensable if financial stability and successful independence are to be achieved.

The report and accounts were adopted.

TEA CORPORATION LIMITED

IMPROVED RESULTS

The ordinary general meeting of the Tea Corporation Limited was held on July 30th in London, Mr E. G. Estall, chairman, presiding.

The following is an extract from his circulated statement: The year to January 31, 1954, produced a made tea crop of 1,592,244 lb from estate leaf, or some 107,000 lb more than estimated. In addition, a further 151,483 lb were manufactured from bought leaf. The average price realised for the whole crop was 43.80d. per lb, as compared with 39.29d. in 1952-53.

Whilst the proceeds of all produce harvested realised £59,539 more than in the previous year, estate costs, Ceylon export duty, freight, wharf charges and brokerage only increased by £9,104, and these figures in the main account for the pleasing results reflected in the net profit for the year of £36,734. The directors recommend a dividend of 20 per cent, less tax.

Addressing the meeting, the chairman said: The results shown by the accounts must have given great satisfaction to shareholders after two rather dismal years.

Sales to date total 507,000 lb, giving a London gross average of approximately 4s. 9d. and a Ceylon gross average of 3s. 10½d. or a combined average of 4s. 6½d. per lb. This compares with 3s. 7½d. for the whole of 1953; in other words 10½d. per lb better for the 507,000 lb sold to date, as compared with the whole of last year.

Your Board are hopeful of declaring an interim dividend in the autumn; they most certainly will if things remain as they are.

The report and accounts were adopted.

Marketing Abroad

If you are seeking new markets abroad or want to know more about your present ones, the quarterly reports by The Economist Intelligence Unit will help you. These reports give concise and up-to-date analyses of economic and business conditions and prospects in other countries, and they contain a wealth of information of value to the exporter and investor. Each report is prefaced by a summary of the main facts and conclusions, and contains a comprehensive statistical appendix supplemented by maps and diagrams.

This service of reports was started by the Unit two years ago. From the outset the demand was large and came from many parts of the world, and in response to requests from subscribers the list of countries included in the service has been extended. Fifty reports are now published every 3 months on a total of seventy territories.

THE ANNUAL SUBSCRIPTION to these reports is £10 per country or group of countries; single copies may be obtained for £3. Discounts up to 30 per cent. are available on subscriptions to reports on more than five countries.

Descriptive leaflets and a specimen copy of the reports may be obtained from:

EAST AFRICAN INSTITUTE OF SOCIAL RESEARCH, MAKERERE COLLEGE, THE UNIVERSITY COLLEGE OF EAST AFRICA

Applications are invited for Senior Research Fellowship in Statistics. Experience in demography, vital statistics and sampling methods desirable. Salary on scale £795 x £25—£995 p.a. according to qualifications and experience. F.S.S.U. Cost of living allowance 35 per cent of salary. Passages, including family, paid on appointment and termination. Family allowances £50 p.a. per child (maximum £150 p.a.). Part-furnished accommodation at rent of 10 per cent of salary. Contract 2½ years, of which 2 years spent in Africa.

Applications (six copies), naming three referees and detailing qualifications and experience, to be received by September 15th by Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained.

GENERAL MANAGER (SALES)

THE GLACIER METAL CO., LTD., invites applications for the head office appointment of a General Manager (Sales). The company manufactures a wide range of plain engine bearings and standard products, employing approximately 2,500 in factories situated in London, Manchester and Scotland. The G.M.S. will be directly responsible to the Managing Director for organising, maintaining and developing the sales activities of the company. He will be responsible for working out sales policy and for customer contact. He will need to maintain effective relationships with the general managers for manufacturing and technical development. He will have as immediate subordinates technical and export specialists, representatives responsible for large customers and a sales manager, who has subordinate to him representatives for geographical areas. He will also be responsible for advertising.

Applicants need not be qualified engineers, but must have a sufficient grasp of engineering to discuss and negotiate with top level executives in the engineering industry. Previous experience of sales management is essential, preferably in engineering. The preferred age range is 40-45, but both older and younger candidates with exceptional qualifications will be considered. Salary range is £3,000 to £4,000 according to age and experience; pension with life assurance. The successful candidate is expected to merit nomination for a directorship within one year.—All applications will be treated in confidence, and should be addressed to Mr. W. B. D. Brown, Managing Director, The Glacier Metal Co., Ltd., to reach him at the Head Office at Ealing Road, Alperton, Middlesex, not later than Monday, September 20, 1954.

THE TRADES UNION CONGRESS invites applications for the position of Assistant in its Social Insurance and Industrial Welfare Department. In addition to Social Insurance, the Department's work covers occupational health, welfare and safety. Background knowledge of the economic aspects of social legislation is desirable. Further particulars may be obtained from Sir Vincent Tewson, C.B.E., M.C., Trades Union Congress, Smith Square, London, S.W.1. Closing date for completed applications August 27, 1954.

This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

COMPANY SALES MANAGER (38) of leading international food products manufacturer seeks change of appointment. Wide knowledge and active experience of marketing, sales promotion, sales administration and management. With present company seventeen years. Well known to leading members of the grocery trade but would also consider other fields.—Box 655.

AMERICAN private organisation located on Continent requires Chief Analyst to specialise in audience research techniques concerning effectiveness of broadcasts to Iron Curtain countries. Applicant should have some knowledge of political problems of East European countries and experience in using social science research techniques; also ability to evaluate and write reports. No language requirements. Salary for appropriate person would exceed £1,000 plus furnished housing for self and family and transportation.—Full particulars including picture, should be furnished in first letter to Box 643.

CALLING Industrialists. Swindon offers spacious factory sites for industrial expansion. Excellent rail and road communications; modern essential services; healthy, attractive location. Sites available from ¼ acre upwards with ground rents from £250 p.a. per acre. Brick factories can be built from 38s. per square foot. Houses available for employees. Please send for full details to D. Murray John, O.B.E., B.A., Town Clerk, Civic Offices, Swindon, Wiltshire.

ACTUARY and also actuarial student required for a firm of Consulting Actuaries in South Africa. Very attractive prospects are offered. Full particulars as to age, marital status and experience should be sent to Box 656.

ESTABLISHED industrial concern in Glasgow with capital and premises available would consider taking an interest in or acquiring existing business with a view to expansion or to development of new products. Write 0280, Wm. Porteous & Co., Glasgow.

SENIOR FOREIGN SALES MANAGER, wide international experience commerce and industry, fluent French, German, Spanish, seeks appointment.—Please reply Box 625.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure.—Economic Research Council, 18 South St., London, W.1.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Services, you may wish to sell (*periodicals excluded*).

ECONOMIST (Hons. Oxon.), 29, seeks position Britain or abroad. Three years' experience controller work (field investigator) with U.S. Economic Mission abroad. Good knowledge of Danish.—Box 633.

Commercial, manufacturing and financial information. Enquiries invited.—Littlejohn & Co., Ltd., Caixa Postal 7352, Sao Paulo, Brazil.

AN Anglo-American concern, with world-wide connections, seeks a man of high qualifications and wide experience to study and overhaul all the administrative procedures in its manufacturing, selling and accounting divisions.

When this reorganisation is complete, which will take, possibly, 12-18 months, he will have the opportunity of filling a prominent position in the administration of the company.

He will be directly responsible to the Board but will be expected to work diplomatically with officers at all levels.

An accountancy qualification is desirable but not essential.

The position is permanent and will carry a substantial salary. Only men of the highest calibre and between the ages of 30 and 48 should apply.

Full details of education, experience, qualifications, etc., should be submitted to Box No. 7877, c/o Charles Barker & Sons, Ltd., 31 Budge Row, Cannon Street, London, E.C.4.

THE WESTERN REGIONAL PRODUCTION DEVELOPMENT BOARD, NIGERIA, invites applications for the post of CIVIL ENGINEER. Applicants must have had at least 15 years' experience and have had charge of a large constructional department and must be an A.M.I.C.E. or a B.Sc. (Civil Engineering). The duties of the post will include supervision of all the Board's civil engineering and constructional programmes such as road construction and tarring, office block, technical college, housing schemes, etc., preparation of tender forms and contract documents and so on, and general departmental administration. Experience of large scale land surveys will be an additional advantage.

The salary will be in the range of £1,850-£2,000 depending on qualifications and experience. The terms of service include free, partly furnished accommodation; contributing Provident Fund of up to 10 per cent of salary; free medical service for officer and wife; free passages or child allowance of £75 per annum each in lieu for up to two children; free first-class sea or air passages for officer and wife; facilities for purchase of motor car.

Applications should be submitted to reach The Nigeria Office, 5 Buckingham Gate, London, S.W.1, not later than August 31, 1954.

ECONOMIC RESEARCH ASSISTANT required by International Wool Secretariat. Applicants should have a First or Upper Second Honours Degree in Economics and some knowledge of Mathematics. Starting salary £475-£600, with superannuation benefits. —Apply in writing, giving references and full particulars of qualifications, experience, etc., to the Secretary, International Wool Secretariat, Dorland House, 18-20 Regent Street, London, S.W.1, marking cover "Confidential E."

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the General Certificate of Education examinations: B.Sc. Econ., LL.B., and other external London University Degrees. Civil Service, Local Government and Commercial Examinations, &c.

Also expert postal tuition for Prelim. Exams., and for the professional exams. in Accountancy Secretaryship, Law, Sales Management, &c., and many intensely practical (non-exam.) courses in commercial subjects.

More than 70,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book lending library. Moderate fees, payable by instalments.

Write today for prospectus, sent FREE on request, mentioning exam. or subjects in which interested to the Secretary.

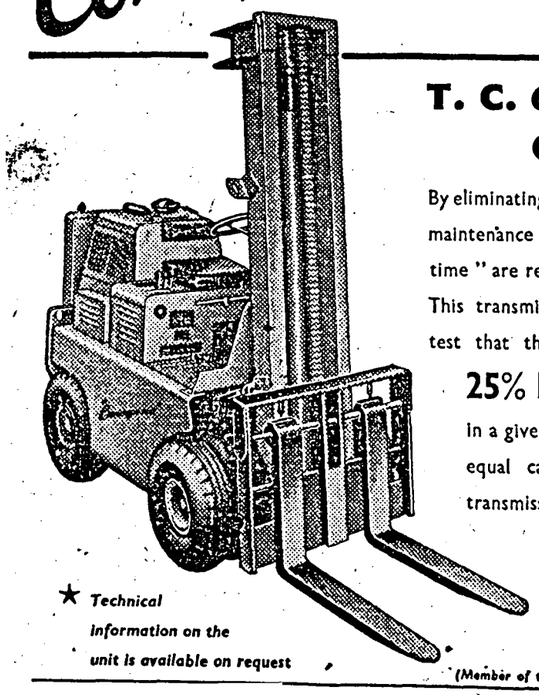
FOR DISTRICT HEATING

93.5%

Efficiency



Gustavsberg HE boilers, specially developed for installation in district heating plants, have in recent years scored a number of noted economy records under actual operating conditions. These fuel and labour saving welded steel boilers are provided with efficient separators which permit a heating plant to be sited anywhere in a residential neighborhood without risk of contamination. The boilers require little space and are available in units rated at 20 million B.T.U. and more. Detailed information available on request from our export department.

This part of the picture means shipping savings

Savings from 66¢ to $5 a ton—that's the range in savings when freight is shipped to or from the Mid-Continent *via New Orleans*. New Orleans, the Country's second port in dollar volume, offers other savings, too:

1 Direct Savings in Money—
- Lower rail, truck, and barge rates to or from entire Mid-Continent U. S.
- The Port's Foreign Trade Zone No. 2 provides all the savings of a "free port."

2 Money Savings in Time—
- Shorter inland transit time, with network of rail, air, truck and barge lines. Faster handling between inland carrier and ship.
- Ample marginal wharfage and belt railroad mean no delaying "traffic jams."
- No delays due to weather—a year-round port.

3 Money Savings in Convenience—
- Complete handling equipment for all types of cargo.
- Banking facilities in New Orleans and throughout Mid-Continent—"Bank where you buy."
- International House and International Trade Mart give unique aid to importers and exporters, domestic and foreign.
- World-wide service by almost one hundred steamship lines.

Which savings are most important to you? Write for detailed information to:

'ENGLISH ELECTRIC'

Road transport depends on tyres. And many of the processes that produce these tyres depend on equipment supplied by The ENGLISH ELECTRIC Company. Electric drive for the giant rollers that "masticate" the rubber mix... for the refrigerating plant that tests tyres in freezing conditions. Electric motors, with precise electric control, at many points. Through electricity, cheaper, stronger, safer, longer-lasting tyres.

bringing you

Tyres, in fact, are today so good that when *you* take the road you need scarcely give them a thought. But, as you drive, you will find other evidence of ENGLISH ELECTRIC achievements. This Company makes generating plant for the great power stations, transformers and switchgear to distribute the current, electrical equipment for the factories you pass. And, in many a comfortable home, the cooker, the television set, the washing machine, the refrigerator, are also made by ENGLISH ELECTRIC.

better living

No More Crises?

AT this season of the year, Britain used to become involved in economic crises. In 1954, for the third year running, it is clearly going to avoid one. It is right, therefore, that some searching questions should be asked. Is this long respite a sign that there has been some basic change in economic conditions since 1945-51, or does it merely mark a prolonged period of phenomenally good luck? Were those unnerving and apparently uncontrollable relapses into austerity characteristic only of peculiar muddles or difficulties in the early postwar years? Or should they be expected to start again soon?

It is impossible to give straight answers to these apparently straight questions. They involve judgments not only on whether the fates will be kindly, but also on whether men will be wise. But it is possible—and this seems to be a good time for such an attempt—to set down the salient facts in the simplest possible form, and let the inquirer form an opinion for himself. The object, to repeat, is to distinguish how far the misfortunes of the years of austerity were due to ordinary bad luck which may return, how far to bad management which need not occur again, and how far to the particular difficulties of a postwar period that can now be regarded as past.

The most important judgment, in hindsight, must be that the causes of the crises in 1945-51 were really very marginal—although the consequences were sometimes immense. Even in a year of so grave a balance of payments deficit as 1951 the British people overspent their total earnings by only just over 7d. in the pound. Even in so severely rationed a year as 1947 the British people ate only about 10 per cent less than they are eating now; all the paraphernalia of rationing, restrictions, queueing and red tape seems to have been kept in being to cut down the food consumption of every man, woman and child by less than 2s. a week. Even in 1947—given present consumption habits and financial policy, and if this had been the only problem to be solved—an increase of 4 or 5 per cent in total productivity could have caused the shops' shelves to bulge with manufactured consumer goods as invitingly as they do today.

Why, then, did these twopenny-halfpenny crises look so terrible at the time? There were two main reasons; and one of these—it is devoutly to be hoped—the country has now nearly left behind. Whenever shortages of essential goods cropped up in those early postwar years the Government took action that was supposed to be corrective, but in fact made the shortages look much worse than they really were. This was not only true of the stimulation of demand for imported food and scarce housing resources by lavish subsidies. It was also true of the price controls imposed on essential goods, and of the encouragement of demand for imported raw materials as a result of the deliberate cheapening of the cost of credit. In effect, the contradictory aim of Government policy in those early postwar years was to divert demand towards the goods that were in shortest supply or that Britain could least afford, and then to slap on physical controls

so that the demand could not be satisfied. It is not surprising that the authorities then looked timorously over their ramparts of rationing, allocation and import controls at a throng of unsatisfied customers, and claimed that these ramparts were essential and had from time to time to be built higher. But it will be surprising—and chuckle-headed—if Britain ever chooses to go back to quite this same system again.

The second reason for the crises in the early postwar years, however, was that the shortfall between what the public earned and what it wanted to demand, although much smaller in the so-called crucial sectors than was generally believed, nevertheless added up to a sizeable total in the round. There has been an improvement of perhaps 20 per cent in real incomes and spending since 1946-47—a substantial windfall. Three principal elements in this recovery can be picked out, and the task of the prophet is to assess how permanent each is likely to be.

*

In the first place, personal savings now seem to be running at about £1,000 million a year, compared with barely £100 million at one time just after the war; the public is now saving about 1s. 4d., whereas it was then saving only about 2½d., out of every 20s. of its earnings. It seems reasonable to hope that this recovery can be kept as something better than a transient phenomenon; low saving was a consequence partly of necessary household re-stocking and partly of unwise financial policies in the early postwar years.

The second source of recovery has been that world prices of British exports have risen more in the last two years than world prices of British imports; this is Mr Butler's uncovenanted ally, the famous favourable terms of trade. The importance of this ally can be overrated, and so therefore can the dangers of its turning traitor. Although the fortuitous improvement in 1952 and 1953 (over the very bad level in 1951) has probably served to increase Britain's real income by some 4 or 5 per cent all told, the terms of trade are no more favourable now than they were in 1946-47. With German and Japanese manufacturers back in the market—and despite the substantial recovery in the world production of the food and raw materials that Britain imports—the probability is that the future trend will be slightly less favourable. But that is not to say that the trend is likely to take us right back to 1951, when a new and immense post-Korean demand for raw materials surged suddenly against an inelastic supply, at a time when the British Government had just run its stocks down to rock-bottom. It will be very bad luck if the country has to contend with two such misfortunes again. It is true that Britain might run into another raw material crisis if the fear of impending new restrictions caused importers to hurry forward with their orders, in an attempt to beat the gun of discriminatory controls. This is a danger that a Labour government, in particular, should remember; but it is not a danger that a wise administration would be powerless to avert.

The third, and by far the biggest, factor behind Britain's recovery since the early postwar period has been that production has continued to increase at an average rate of between 2 and 3 per cent per annum; in 1953 and 1954 the rate has been rather larger. These increases would have been still more pronounced if Britain had devoted more of its income to building up its capital equipment. But, despite this insufficiency, manufacturers are now clearly installing new machinery at a slightly quicker rate than their old machinery is wearing out, and the prospect is that Britain's total productive capacity should continue to increase slightly year by year; certainly there is no reason why that capacity should slip back.

The big question here, however, is whether the level of world demand will always be sufficient to keep Britain's productive capacity working at full blast. This is the one factor that could—and probably one day will—cause a crisis that no British government could be expected to avert. Although the early postwar years are now regarded as years of intermittent agony and bad luck, they should really be regarded as years in which Britain was very fortunate that it never had to face conditions of world slump. It would be rash to assume that it will always be so fortunate in the future, or that the sterling area's experience during the very slight American recession of 1953-54 has shown that such strains can be painlessly absorbed. But, although this spectre of world recession may bring this country back to austerity some time in the future, it is not likely to be such a persistent bogey as the crises of the early postwar years; the danger of a world depression every alternate August can fortunately be ruled out.

*

The conclusion must therefore be that there have been some basic changes—not merely surface and transient improvements—since 1945-51. The system of controls in those days was more stupid, the public was more spendthrift, the terms of trade (in 1951 only) were less favourable, and production was lower than it is now. Is production ever likely to be cut back in the future, as a result of a dearth of demand? The economist must answer that it may be, but that this danger should not recur—as the old-fashioned crises did—every other year; he should add, however, that if and when such a crisis comes, it may be a very bad one indeed. Are the terms of trade likely to become less favourable? The economist must answer that they probably will, but that there is no reason why they should turn—as they did in 1951—with such devastating force that the Government is unable to bring them under control. Are the British people likely to become more spendthrift or more stupid again? The economist must answer that this is not his province. These are questions to which the parties—and the British people who elect them—must give answers of their own.

United Nations Audit

WORLD stock-holders must have read with mixed feelings the ninth annual report submitted to them by Mr Dag Hammarskjöld, Secretary-General of the United Nations. On the political front the corporation has had rather a meagre year. The great problems of Kashmir, Palestine and Korea are still on the books unsolved. The business in Guatemala is closed, but no one is very happy about the way in which it was wound up. Efforts to use the UN to promote disarmament have been futile, and behind every session lurks the problem of seating Communist China. None the less there has been visible progress towards making war less likely, but it has taken place outside the actual framework of the UN. Today, for the first time since the League of Nations showed itself impotent to defend Ethiopia, the world is more or less at peace. But both in Korea and Indo-China an armistice between great powers has been achieved by direct contact between Governments and with the active participation of the one world-power that has not been represented in the UN.

The vital diplomatic encounters have taken place not by the East River in New York but in Berlin, at Geneva and in Delhi. The problems of the balance of power in Europe and Asia are being approached through the EDC and Seato, not through the commissions of the UN. Mr Molotov has his plan for collective security in Europe, and Chou En-lai hints at a similar arrangement for Asia. And the hope for world stability is based on Nato and the creation of such regional systems as the Balkan alliance under the auspices of the United Nations, rather than on acrimonious sessions of the Security Council. Indeed, it sometimes looks as if the UN is all auspices. Who looks to the UN at present for a solution to the German problem or to preserve South East Asian security? And who believes that the UN will find a formula to control nuclear weapons? As Mr Hammarskjöld admits, a glance at his balance sheet is "a reminder of the wide gap between purpose and achievement."

This gap is less obvious in the field of economic, social and technical agencies. Here admirable work is being done. But here also there has been a diffusion of effort and means over far too many projects. The Secretary-General stresses the fact that the UN assistance programmes for under-developed areas can be vastly expanded at relatively low cost. Such programmes, moreover, demonstrate the way in which the ideals of the United Nations can coincide with those western policies best calculated to stop Communism in Asia and Africa. But if more is to be accomplished along these "international Point Four" lines, Mr Hammarskjöld must be given the power to concentrate his staff and resources. Despite his valiant efforts, an enormous mass of unread and unreadable material pours daily from the UN presses, and there exist commissions and projects which seem to come straight out of the Academy of the Laputans.

But to say that the United Nations will be doing increasingly valuable work through Ecosoc and the United Nations Children's Fund is to avoid the overriding question. Why is it that the really important diplomatic decisions are no longer being taken or even considered in the great Assembly Hall in New York? Has the basic idea of the organisation been a failure? Perhaps the greatest obstacle it faces is the fact that at several key points its structure and ideals no longer coincide with the realities of power. To take only two examples. An excellent moral and judicial case can be made for the continued exclusion of Communist China. In the words of the Secretary-General, "The attitude of the United Nations is thus not one of neutrality but one of active effort to further its most fundamental purposes." But, at the same time, nothing the UN can do will exclude the six hundred and twenty million Chinese from an ever more important and perplexing role in world affairs. The second example is provided by the intervention in Korea. No one knows what would have happened if the Soviet Union had been present in the board-room and had used its veto. The one major political action carried out by the UN took place in spite of its institutional structure rather than because of it.

The idea that the United Nations should provide a forum where the moral judgment of the world can arbitrate between right and wrong, has given place to the traditional reliance on compromises between nations armed to the teeth. Diplomacy backed by arms has ousted—or has almost ousted—debate that seeks to mobilise opinion. The parliamentary methods of the UN have been discredited because language lacks the compelling arguments which come with armed strength.

*

These facts, and the possibility of a revision of the Charter which is provided for in the agenda of the Assembly for 1955, call for a re-examination of what the UN is really supposed to accomplish. The Communists hold that the United Nations Organisation is a forum in which everyone is at liberty to speak and mimeograph his own pleadings; but in action it is to remain strictly neutral. The Russians defend this interpretation by pointing out that under present circumstances the arguments of one side automatically receive more votes than those of the other; the Communist bloc is generally outvoted. Furthermore, they suggest with some plausibility that it is absurd for Nicaragua, say, or Liberia to provide a majority against the USSR.

Americans such as General Mark Clark, on the other hand, maintain that the United Nations is a free world

club into which the Russians have somehow gained admittance. This club should support American policies and give proof of the fact that these policies benefit all decent minded people. Those who hold this position have a strong case, in that most of the ideals and principles subscribed to in the UN Charter are flagrantly violated behind the Iron Curtain. And they are also right in pointing out that UN soldiers, mostly American, were being killed in Korea by weapons provided by a UN member.

If either of these extreme positions were accepted, the UN might as well be scrapped. As President Eisenhower has reaffirmed, the United Nations should provide as wide a forum as possible for the expression of different points of view ; but equally there are standards of admission and these should imply some acknowledgment of international law and conventions. And after hearing conflicting views, the UN must be willing and able to act. That is the crucial point: "the United Nations must oppose any policy in conflict with the principles of the Charter and must support a policy in accordance with those principles, not in a spirit of partiality but as an expression of loyalty to the Charter."

Can the UN in fact take action in the face of the present realities of cold war? First, it should be admitted that neither the USSR, nor the USA, nor the United Kingdom is prepared to have its veto power abrogated. This means that no formal revisions of the Charter will overcome the dilemma posed by the ideals of the UN on the one hand and the facts of Great Power rivalry on the other. But to say this is not to say that the UN is to be merely the debating club envisaged by its Communist members.

The very fact, for instance, that embarrassing issues can be brought up and examined by the General Assembly serves as a pressure on free nations. Governments do not like to feel world opinion against them. It makes them more inclined to put their own house in order. And the hope that one day such pressures may be felt even beyond the Iron Curtain is by no means absurd. Secondly, the UN by its very nature forces the weaker and smaller nations to make up their minds on the great issues which divide the free world from the Communist empire. And this means that the UN is one of the great safeguards against the kind of isolation through slander and menace which the Communists would like to impose on the United States. It constitutes a flexible but genuine link between American and British policies and even the more neutralist nations.

One thing is clear: if the United Nations is to increase its effectiveness and take back something of what it has lost to secret diplomacy and regional negotiation, it must be ready to tackle the most awkward issues even if there is a danger of a powerful member walking out. A failure of the United Nations would be a tremendous impulse to that isolation of the United States which Communist diplomacy is trying so hard to bring about. For although Ambassador Lodge is now serving the cause of the UN, the spirit of his grandfather Senator Lodge still walks abroad, saying that this is merely another League of Nations.

A Confusion of Councils

MR MACMILLAN has promised that he will try to bring in a Bill next session to reform the structure of local government. This will not be a politically rewarding task ; the kicks that disgruntled councillors will administer (for no Bill can or should please all of them) will exceed the ha'pence of tribute that might be earned from connoisseurs of administration. But the task is important and urgent. It is important because local government is the nursery of British democracy, and operates all the main public services (except for hospitals and the post office); and its general efficiency is vital to the particular efficiency of each individual service. The task is urgent, because all parties and critics agree that the present system is anomalous and inadequate, yet no postwar minister has had the courage to tackle the subject at all. Mr Macmillan has enough political credit in hand after building so many houses to risk assuming the austere mantle of administrative statesmanship. Thereafter he can leave happily for the Foreign Office.

The Government's small majority will certainly limit the scope of what can be done in a field that is controversial and yet electorally unattractive ; for these reasons the 1922 Committee has already urged the minister to abandon the idea. Yet the fact that disputation over local government cuts right across party lines gives him a certain scope for manœuvre. Mr Macmillan cannot hope to produce an agreed Bill, nor yet one that will appeal to all his own party. He might, however, produce one that will get the approval of the majority of the House and the country, and yet achieve some changes of substance. To do this, it will be necessary to cast around for some novel and bold approach. There is no agreed remedy for the ills of local government ; but it is clear that a mere tinkering with the present system would be of little use.

Most reformers of local administration start by examining the few large authorities—the counties and county boroughs. Mr Macmillan would be wise to do the opposite. He should look first at the 309 non-county boroughs, the 572 urban districts, and the 475 rural districts. Now that the parishes have been shorn of virtually all power, it is this heterogeneous mass of over a thousand authorities—each with its own council, committees and clerk—that represents local government at its most local. As such these bodies

should have a special appeal to Conservatives. It is Little Buncombe UDC and the ancient but non-county borough of Wormbridge that still embody the old idea of self-governing communities ; and their affairs attract local interest much more readily than those of the powerful but remote county council.

Unfortunately, the minor authorities also stand today for local government at its most futile. A glance at the list of activities carried out by the average district council or non-county borough shows why. The list includes the removal and disposal of refuse and sewage, the provision of baths, wash-houses, and parks, public lighting, cleansing, water supply, housing, minor roads, the control of nuisances, the enforcement of the Shops Acts and Food and Drugs Acts. These are all very necessary services ; but politically and humanly speaking, they mostly run themselves. There is nothing on the list, except housing, to spark the interest of the ordinary citizen. The other services that concern persons and not things—such as education, clinics, and old people's welfare—have all been transferred under recent legislation to the county councils.

★

Mr Macmillan has two ways open to him to right this sorry situation. He might simply abolish the whole lot of these minor authorities. The largest boroughs and urban districts could be upgraded, after suitable amalgamation, to a status approximating to that of a county borough. The small towns and rural areas could be brought under the direct administration of the county council for all services. To make such arrangements palatable to local sentiment, divisional executives could be set up for other services (as they have been set up for education) to familiarise county councillors with local needs.

This proposal would certainly be criticised as draconian and undemocratic. In fact it would do little more than recognise the *fait accompli* of the eclipse of the smaller authorities. Administratively, the elimination of the overheads of a thousand separate authorities should in time achieve a substantial saving. Even on democratic grounds, there might well be a net gain. The public thinks instinctively of its own local authority on its doorstep, and has been slow to recognise the great powers that county councils now wield. The simplicity of a single local election should make for a more clear-headed democracy. The green light would also be given to many growing towns that now seek county borough status but are denied it because of the effect on county finances. Under the proposed arrangement, this objection would no longer be a valid one.

If this change is too far-reaching (and open to misrepresentation) for a Conservative minister to contemplate, there is only one other way open for reviving an effective democracy at the truly local level. This is to combine the minor authorities (or as many of them as possible) into units that would be strong and wealthy enough to resume some of their lost powers—particularly in the social services. This need not mean a loss of local touch or the creation of large, unwieldy units. But the condition of success is that rural and urban areas should be merged together to produce units that, without being bigger than the present average rural district, would be considerably more populous.

This proposal also will arouse a number of old shibboleths, not least in the Conservative party. It will be said that town and countryside have different wants and outlooks ; and that in any union it is the country's interests which will go to the wall. This need not be so. The standard of public services is becoming increasingly uniform throughout England, and it is the interest of the countryside to speed up this process. It is of dubious value to try to preserve a special "rural mentality." In any case the present rural district is the least satisfactory of local govern-

Essential Toil

It appears by the report of the Census Commissioners, that altogether there are 265,198 persons in Great Britain employed in working and dealing in coals. Of actual miners there are not fewer, as we have already stated, than 219,015, and of these 2,649 are females, of whom 1,295 are under 20 years of age. . . . They are liable to be tumbled out of the cage or basket in which they are hauled up or let down into the pit, to be wounded or killed by stones falling on them, and to be scorched, burnt, or smothered by fire-damp or foul air. How men are induced to submit to all the privations and dangers attendant on a collier's life for the reward of a few shillings a day, puzzles those . . . who have a reasonable horror of working 8 or 10 hours day after day in a hole several hundred yards below the earth's surface, exposed continually to the most painful accidents and the most cruel death. Yet there are candidates for the work, hands are never much wanted, and even women are engaged in the appalling labour. Though we enjoy by their toils comfortable winter fires, and are whirled along in the steam-dragged carriage or wafted over the ocean in the steam-ship, are defended by a steam navy, and clothed by steam-driven mills, and can scarcely be grateful enough for a dispensation which secures all these public advantages—and they include much of our civilisation—yet, to the dwellers in sunlight and pure atmospheric air, it is apparent that the people who engage in these toils are, as the rule, of a limited and degraded intellect, or they are compelled by some imperious necessity or habit to submit to a mode of life more appropriate to the burrowing fox or the prairie dog than human beings. What England would be without their labour, it is difficult to conceive. . . . We are never tired of extolling our poets, our philosophers and inventors, our adventurous voyagers and our great naval and military chiefs . . . but greatly as they may have raised the fame of Britain, she could not have achieved her greatest works without her coal and her colliers.

The Economist

August 12, 1854

ment units. It is a union of convenience between parishes, which usually lacks any communal life or sentiment of its own and whose boundaries are generally ill-suited to the present needs of public services. On the other hand, a market town grouped with surrounding villages may often be much more of a social and economic entity. The rural district has had its day, and there should be no mourning its passage.

★

Higher up the local government scale the ground has been well tilled with authoritative investigations. The conflict between counties on the one hand and actual or would-be county boroughs on the other is of long standing. At present mutual suspicions are poisoning the possibilities of effective co-operation. Only a settlement that can be regarded as firm and lasting will remove the poison. The best solution that is also politically feasible was sketched out in the proposals of the Local Government Boundary Commission, which Mr Bevan shrugged off four years ago as too radical for his innately conservative tastes. These proposals would amalgamate a few counties and drastically reduce the number of county boroughs ; but they would also provide much-needed balm for medium-sized towns by granting them a wide range of functions while conceding to the counties a few large-scale services.

There is, however, one clamant problem at which the Commission only nibbled. The 1951 Census revealed that 40 per cent of the population live in six great concentrations, centred on London, Birmingham, Manchester, Liverpool, Leeds and Newcastle. Since neither the medieval county nor the nineteenth-century county borough was designed to meet the needs of an agglomeration of several million persons, local government in these areas is in chaos. It needs a new design in which two principles should be borne in mind. The first is that in a densely packed concentration, where land is short, there are many services such as town planning, main roads, open spaces, fire brigades, and water supply—that can only be properly planned for the areas as a whole. This points to some type of regional authority. Secondly, since the population is tightly packed, it should be possible to delegate the administration of many services to a relatively local level. It is ridiculous that populous suburban areas like Harrow and Ilford should possess very few powers. This point could be met by creating a revised lower tier of authorities capable of handling at least most of the social services.

Some of the old panaceas for local government are now less often heard. The virtues of the small authorities are not so freely mentioned—mainly because, in their present form, they are obviously incapable of achieving much. At the other extreme, the idea of a new tier of regional councils (once the policy of the Labour party) has lost its savour—although it still has meaning if applied, in a more restricted manner, to the great urban concentrations. It is for Mr Macmillan to try to find, between these two extremes, a new cast for his present mess of authorities, using what is best in the present materials. And it is for the public, irrespective of party label, to encourage him towards the renaissance of effective and democratic local government.

Truce in Babel

THAT fashionable phrase "peaceful co-existence" has attached to it, like Dr Strabismus (whom God preserve) of Utrecht, an exhortation in brackets. It is that the free world must be vigilant, whether it is in Germany, or on the frontiers of Iran and Siam, or merely in the River Thames and around the Soviet Embassy in Canberra. The warning has behind it the authority of Sir Winston Churchill and no reasonable person will question its wisdom ; but it tends, none the less, to appear at the tail-end of politicians' periods and to be swallowed in the fall of their voices. "Vigilance" is a strenuous word—rather like fitness—which will not quickly become popular.

Political watchfulness, economic stability, military readiness, collective arrangements against possible attack, the need for all these aspects of vigilance is widely understood. What is less well known—indeed, completely ignored by many—is the battle of pens and voices that goes on day and night, in the air, across frontiers, by newspapers, leaflet and word of mouth in every language under the sun. Moscow, Peking and the satellite capitals battle unceasingly with the Voice of America and the BBC ; Communist organs of government like *Pravda* and the *People's Daily* attack in phalanx the undrilled posses of the free press. There has been nothing like it since Babel.

It is not so much a war of ideas as a contest between the organised slogans of a conspiracy on the one side and unorganised and often contradictory argument on the other. Tension may at intervals be relaxed between statesmen and foreign offices, but it is never relaxed between the champions of the broadcasting studios and the newspaper offices. The best they can achieve is a spell of studied politeness. For a few weeks Sir Winston Churchill—and even President Eisenhower—may be in Moscow's good books and M. Mendès-France in Peking's, but for the treatment of most bourgeois politicians and institutions the prescription remains "abuse as before." And for the Voice of America, and to a lesser degree for the BBC, it is "go on teaching where it hurts." Is all this a necessary part of vigilance ?

It is easy to exaggerate the importance and effectiveness of all this activity. Indeed, it is almost impossible to estimate with any accuracy the political influence of peacetime propaganda, whatever the medium that is used. What is certain is that the Russians think it necessary to devote a great deal of money and effort to jamming broadcasts from abroad, and that the Americans, British and others make a comparable effort to pierce the defences of the iron curtain. There is also evidence that broadcasts from Moscow give valuable directives to Communists working in the free world, and that broadcasts from the West help to maintain some spirit of resistance—emotional and intellectual resistance—in countries under Communist control. Who is winning the struggle and whether any victory is possible are questions seldom considered by the propagandists themselves ; for they naturally resist any suggestion that they may be wasting their time or merely cancelling one another out.

Yet, if "peaceful co-existence with vigilance" is to be taken seriously as a principle of western and Communist policy it is clear that the role to be played by psychological warfare and political propaganda needs fresh scrutiny. To take only two examples: it is not easy for British broadcasts directed at people in Eastern Europe to explain how peaceful co-existence is compatible with some of the things that have been said to them in the past from London ; just as it is not easy for any reader of the threats to "liberate" Formosa now being made from Peking to believe that the Chinese government is observing the spirit as well as the letter of the Geneva agreements. Likewise, the tone of the Voice of America, as of Radio Free Europe, sometimes make it hard to believe that Washington no longer supports a policy of "liberation," while Moscow's portrayal of what is happening in British possessions in Africa makes nonsense of its claim never to interfere in the affairs of other countries. In other words, peaceful co-existence is in principle entirely incompatible with the war of slogans and subversive suggestion.

★

Surprisingly, this matter is seldom discussed. One can recall no considered plan for banning the weapons of mass subversion. Yet the daily output of rumours, half-truths, distortions and hate-inspiring accusations by governments and their agencies is appalling. In this respect the world is already over half way to George Orwell's 1984, and on both sides of the iron curtain there must be many thousands of unhappy psychological warriors who know, if they ever stop to think, that they are being corrupted by their own daily work. The currency of news and views heard over the air or read in the newspapers is being steadily debased. Notes from Moscow have been for years so obviously drafted with an eye to their propaganda value that even the most sober draftsmen in the western foreign offices are now tempted to follow the example. Indeed, there was a time—now, one may hope, almost past—when it was impossible to distinguish in Mr Dulles's statements what was in fact American policy and what his advisers on psychological warfare had contributed.

It is, perhaps, in the more recent diplomatic practice of the Great Powers that the clue to a remedy may be found. They are rediscovering the virtue of privacy. For example, at the Geneva conference there were conversations between statesmen of which, *mirabile dictu*, no details have even now leaked out ; and there are grounds for believing that those exchanges were reasonable and well-mannered precisely because the parties to them believed that what they said would go no further. Secret diplomacy, so long in disrepute, is returning to favour. If the taste for discretion is growing, and if there is a genuine desire to relax tension, it should be possible for governments to begin thinking about a truce in word warfare, or some kind of cease-fire agreement between their political commentators.

★

Suppose, for example, that the Communist and non-Communist powers agreed to broadcast to audiences abroad nothing but news bulletins, entertainment and cultural material. Which side would gain the most ? It is not an easy question to answer. The BBC, which always claims that it does not conduct propaganda, should clearly gain. The Voice of America might win in persuasiveness what it lost in vigour. The Russians and Chinese would have to give more attention to projecting their own way of life and less to running down other people's—and who knows what effect that would have ? Some listeners beyond the iron curtain might miss the tonic of talk and argument ; but others would prefer to do without exhortation which cannot lead to active resistance. There might even be some reduction in radio programmes, so relieving the ether of an immense clutter of semi-audible talk.

There are, of course, all kinds of difficulties in the way, most of them political and psychological ; but there are few technical or administrative difficulties, save the dismissal of some highly paid impresarios. Inspection of propaganda is far easier than inspection of disarmament: newspapers can be read and broadcasts monitored, as they are already. Any breach of an agreement could be threatened with devastating retaliation by a barrage of jamming and political invective. Here, at any rate, is a problem that is worth looking into, and it would be a thousand pities if the first move towards a truce in the war of words should come from the Communists. To accept a proposal from them would be denounced by so many people as appeasement, whereas to make a proposal to them could be represented as a practical step towards making "peaceful co-existence" a reality in at least one sphere of international rivalry.

Notes of the Week

Red Carpet from Malenkov

THE Chiltern set have been as nobly entertained in Moscow as the Cliveden set once was in Berlin. Indeed, Malenkov has stolen some of Mao Tse-tung's thunder by his fêting of Mr Attlee and his fellow travellers eastward. That Malenkov should be a guest at the British Embassy and that the British delegation should be entertained in the Soviet leader's private retreat marks what can best be described as a smiling reappraisal of Soviet protocol. The Russians are doubtless aware that the party represents neither the British Government nor the House of Commons and that it is not acting as an advance guard for Sir Winston Churchill; none the less they have rolled out the red carpet with marked cordiality. Their guests cannot fail to be impressed.

There are, of course, dangers in this unofficial diplomacy. They were doubtless in Mr Hector McNeil's mind when he boldly told an American interviewer that Mr Attlee's visit was "highly irresponsible and illtimed." The good that may result in the Soviet Union itself from the spectacle of its leaders entertaining the Labour Party, whom they attack as their worst enemies, has to be balanced against the harm that will be certainly done elsewhere. People in Eastern Europe, for example, must be wondering whether they are to believe their eyes when they see on the news films in Warsaw, Prague and Budapest the smiles, the cigar smoke and Dr Summerskill's bouquet. Germans in the Federal Republic will wonder why they, too, cannot discuss co-existence and trade over the Crimean wines. More serious, every suspicion and misgiving that Sir Winston Churchill took such pains to allay when he visited Washington will revive in the minds of Americans who believe that people with conflicting interests and opposed ideals should not pretend to be friends.

★

The question that Mr Attlee has to ask himself is whether the Atlantic alliance at this precise moment can stand such strains. The future will show. Meanwhile, he could convince many sceptics that he is acting in a realistic and responsible way if he would reconsider his decision not to accompany his colleagues to Japan. There, a genuine effort is being made to imitate British institutions, to cultivate democratic habits, and to keep the past at bay. It should be just as interesting to a democratic Socialist as anything that Moscow or Peking has to show. And Mr Bevan could do serious mischief in Tokyo if left to himself.

Dr John Makes His Bow

DR OTTO JOHN could now put in a claim for the preposterous sum of DM 500,000 (over £40,000) that the Federal German government offered for information explaining his disappearance to the far side of the Potsdamer Platz. His appearance at a press conference on Wednesday, and the statement that he made there, remove much of the need for further guessing. It is now evident enough that Dr John went willingly, and that his move had been planned for some time past. Whatever part his alleged "voices" played in the past, no one can now see him as a modern male Joan of Arc. He is now a tool of the Soviet propaganda machine. The timing of his appearance was clearly planned. He could perfectly well have met the press at any time during the last 22 days, but he did not do so until the day on which the French cabinet met for its crucial discussion of the European Defence Community treaty. And his statements, with a few personal touches, were almost wholly a collection of distorted points made day-in-and-day-out by the Soviet and East German press and broadcasts. In the circumstances, the Social-Democratic party can be grateful that Dr John did not claim political sympathy with it, but with the group that advocates a neutralised Germany, linked by a new Rapallo treaty with the Soviet Union.

The sufferers from the defection of Dr John are in the first place Dr Adenauer's government and the democratic anti-Nazis, particularly those who emigrated to Britain and returned to posts in Germany. The cry of "the Reds are among us" is being heard from the press, which alleges that the confidence of the public in the security of the state is shaken. There is an unmistakable tendency to implicate the British, though Dr John himself has now stressed that his original appointment to the new Office for Protection of the Constitution was made by the Federal Government, with no objections except from the leader of the *Deutsche Partei*, most right-wing of the coalition parties.

Dr John's personal appearance will add to the ammunition that is being fired at Dr Adenauer and his government by the West German press. The Minister of the Interior, Dr Schroeder, has certainly handled the affair very ineptly. By clinging too long to the theory that Dr John had been abducted, the Minister has succeeded only in damaging his own reputation. The Communists have thus gained in an indirect way from the case, probably more than they have through the direct effect of the well-worn political propaganda against the Nazis and the EDC put out by a man who is now officially declared to have acted in a treacherous manner. If Dr John had really wanted only to combat neo-Nazis, and to promote the unification of Germany in freedom, he could have done so far more effectively by resigning and protesting in Western Germany.

Mendès-France Marches On

THE fate of the European Defence Community should be decided in less than two weeks. The long delayed battle over the ratification of the treaty setting it up is at last to be waged in the French National Assembly. Yet the timing is all that is known for the moment; hostilities will open on the 24th of this month. M. Mendès-France has not yet revealed how he will conduct the operations or by what strategy of surprise he expects to avoid a deadlock. Five days before the parliamentary debate he will be in Brussels asking the other signatories of the treaty for modifications and interpretations of the original document. Too much importance, however, should not be attached to these. If they are substantial, they will probably be rejected in Brussels; if they are not, they will not sway many deputies in the Palais Bourbon.

The shadow of the forthcoming "great debate" hangs over the National Assembly and obscures the meaning of its latest pronouncements. The two polls taken this week—granting M. Mendès-France wide powers to act by decree and allowing him to postpone the Tunisian debate—already partly reflect the hopes and apprehensions felt about the government's stand over EDC. The Christian Democrats, more confident that the premier will back ratification, voted for the first time in his favour on its economic programme, though they abstained over Tunisia. The Communists, on the other hand, withdrew their support on economic policy and threw it back into the scales over Tunisia. Both will have an opportunity to express their verdict on the North African policy of the government later this month, but since M. Mendès-France should have crossed in the meantime his "European Rubicon" the alignments and results may then be quite different.

This week's polls have shown how little the present government can afford to lose supporters; they have confirmed the frailty of the coalition spirit. As was expected, the attack on self-government for Tunisia came chiefly from the ranks of the premier's own party; his Radical "colleague," M. Martinaud-Déplat, delivered a most violent diatribe applauded by the colonialist lobby. The economic dobate revealed the right wing's mistrust of the premier, while the Socialists, curiously enough, voted for the man rather than the programme.

A Tempered Liberalism

ON the economic front M. Mendès-France has emerged with wider powers to act by decree than had been granted to any previous government of the Fourth Republic. The means rather than the ends of his proposed policy came under fire. Even among his opponents, few would quarrel with the need for wider scope for governmental action; the patient will never recover if the doctor must seek the consent of a divided Assembly for every prescription. Not many could find fault, either, with the main objective of the government: to modernise the French economy, to stop longing for the past and adapt France to twentieth century conditions. M. Mendès-France described his creed as liberalism tempered by benevolent state interference and this was intended to appease critics on both sides of the Assembly.

Criticism of the programme centred on its financial aspects. To assist in the reconversion of marginal firms and the shifts in redundant labour force—these are aims laudable in themselves and the need will become imperative when trade barriers are lifted. But where is the money to come from? The budgetary gap already amounts to about Frs. 700,000 million (or over Frs. 300,000 million if "below-line" expenditure is discounted). Strengthened by the Bank of France strictures against deficit financing, M. Reynaud, the conservative leader, accused the premier of forgetting his own precepts of financial orthodoxy and warned him against relying too much on favourable circumstances.

In reply M. Mendès-France admitted the immensity of his task and apologised for the modesty of his programme. Above all he asked for time. A government granted wide power is to be judged by its use or misuse of it. But future governmental action in this field will be largely determined by the size and kind of majority with which M. Mendès-France emerges from the battle of ratification. Thus the destiny of France is at stake in more senses than one in the forthcoming European debate.

Cows and Chop Suey

AFTER trying two years of peaceful coexistence with Labour's right wing, Mr Bevan has apparently decided to revert to cold war. He has now confirmed that he is surrendering his safe seat in the constituency section of the National Executive in order to enter an already hopeless fight with Mr Gaitskell for the treasurership. This means that in six weeks' time he is virtually certain to be off the Executive. Since he could so easily have stayed on, it must be assumed that he does not greatly mind. He is said to conceive the contest as only the first in an annual series, presumably with the party leadership as the final prize.

Certainly, his general behaviour is now falling into a clear pattern. He has resigned from the "Shadow Cabinet," he is inviting ejection from the Executive, and he has bought a farm. He has given up hope of trying to convert the right-wing majorities on the party organs and prefers to have no part in the leadership at all. His enrolment into the ranks of the squirearchy has prompted comparison with Cincinnatus, but there is a more modern parallel. Mr Bevan is suspected of seeing his Asheridge as another Chartwell.

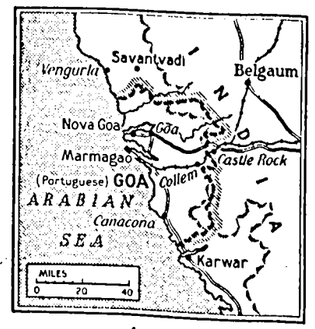
But the danger of brooding among the cowsheds, awaiting a summons to power, is that the summons may never come. Mr Bevan needs to woo Labour's rank and file with more than spleen, but he is finding it increasingly difficult to offer anything else. He has a popular issue in "German

rearmament," but it is clear that his hopes of standing on a distinctive Asiatic policy are being dashed. It was over Seato that Mr Bevan resigned from the Shadow Cabinet, but ever since then Mr Attlee has given him no cause for disagreement. And now it seems that Mr Attlee is going to be wafted back to England from his trip East on a genial tide of vodka and chop suey; the country and the Squire of Asheridge are both hoping—though for different reasons—that he will not also be in a mood to cap any Oriental extravagances that Mr Bevan makes.

Railway Trouble Again?

THE preliminary bouts in the wages struggle for 1954-55 are now in progress; and manœuvres in the next few weeks may decide whether the struggle will end with a repetition of the seven shillings a week standard for wage increases that was set up in 1953-54, or whether the employers will get away with something smaller, or even whether Britain may be about to enter its first postwar period of serious strikes. The most important current battle is again on the railways; there is to be a vital meeting between the Transport Commission and the leaders of the three railway unions this week-end.

The threat of a railway strike last Christmas was averted by an immediate wage increase, and by the promise of discussions on a new wage structure; it has been tacitly understood for some time that the result of these discussions will constitute the current year's wage increase. The unfortunate commission, however, has been faced by a demand from the National Union of Railwaymen for an increase of 10s. 6d. in minimum wages, from the engine drivers' union for an increase of about 26s. 6d. a week in their differential, and from the clerks for an improvement in their own status. The commission has tried to spread the little butter it can afford (which might amount to 4s. a week per railwayman if evenly divided) on these three separate pieces of bread; and in the result it has satisfied nobody. The country may learn this week-end how that dissatisfaction is to be expressed.



Wages Front in Flux

IN other sectors of the wages front, there is a mounting and ominous bustle. The farmworkers' representatives went to see the Minister of Labour and the new Minister of Agriculture last week, to protest against the arbitration tribunal's recent recommendation that they should not have any wage increase at all. The employers in the cotton industry have cashed in on the agricultural tribunal's call for stability, by saying that they too cannot afford to pay their workers any more; the principal union concerned has decided to report this to the Ministry of Labour, so that the matter might be referred to the Industrial Disputes Tribunal. The engineering unions have reached what they consider to be a satisfactory compromise between the proposals favoured by their skilled members (that they should demand an increase in differentials) and by their unskilled (that they should demand a substantial increase in minimum rates). They are going to ask for both.

With the cost of living still remarkably stable, employers may be justified in assuming that there is no indignant head of steam behind this year's wage demands. Some union leaders decided some months ago that their claims had already nearly struck bone, and had determined to follow a moderating policy this autumn. But now the argument of increased productivity is being brandished, and the unions are pointing out that the cries of woe that followed the acceptance of the seven-shilling standard last year have not been justified; moreover the signs of economic recovery in America and those very fortunate labour disputes in Western Germany are whittling away part of the force of the employers' pleas about a buyers' market. Above all, some workers—including the railwaymen and the cotton operatives—still feel that they have fallen behind in the race; and the personal reputation of certain union leaders with their men is at stake. It would be wrong to say that a flare up in labour relations is inevitable, but the tinder already looks much drier than it did even a few weeks ago.

Reprieve for Goa?

AT the beginning of this week a serious clash on the borders of Goa seemed inevitable. The Indian organisers of the "march on Goa," planned for August 15th, had publicly foreshadowed violent action if their first unarmed incursion into this Portuguese territory was obstructed; and the violence used during the earlier inroads into the little enclave of Daman, further north up the Bombay coast, was an ugly portent. An inglorious scuffle on the slopes of the Western Ghats was imminent; bloodshed, and the involvement of regular troops on both sides, were all too likely to follow, and only the Communists stood to gain from a train of events in which neither India nor Portugal would avoid discredit and which would create a new friction between free Asia and the West. Mr Nehru's admirably prompt, though qualified, acceptance of the Portuguese proposal to call in foreign observers opened a way out of this dark dead-end. If violence can be averted even for a short time, the two disputants—sobered, it is to be hoped, by this week's glimpse of disaster—will have a last chance of coming to terms.

Admittedly this will not be easy. On both sides, emotion is intense and genuine. To Indians, Goa is the last and intolerable vestige (now that the French are leaving Pondicherry) of what Mr Pannikkar has named the Vasco da Gama era. To Portuguese it is a relic of their heroic age and a beleaguered outpost of Christianity. Emotion, as ever, has proved a bad guide. Dr Salazar's doctrinaire refusal of all discussion, even in respect of [illegible] convenient "pockets" as Daman, smac[illegible]oons; and the Indian irredentists have turned a blind eye to the fact that the Goanese, unlike the inhabitants of the French settlements, are a distinct community with European as well as Asian traditions.

Mr Nehru's gesture on Tuesday indicated that India had been taken aback by the reaction of other nations, including "anti-colonial" Latin Americans and Asians, to the sight of the preachers of non-violence putting pressure on to a weaker power. If Delhi now undertakes the difficult task of restraining the Indian hotheads of both left and right, Dr Salazar will be foolish not to show an equally reasonable attitude. There are better methods than threats and fisticuffs for solving a dispute of this kind (for a start, a serious attempt might be made to find out the real wishes of the Goanese themselves); and Britain, as the friend and partner of both contestants, may yet be able to help them resolve their differences. But any outbreak of violence within the next few days could prove fatal to all such hopeful prospects; and the first necessity is to avert it.

Egypt, Iraq and Defence

AFTER years of a relationship that was as chilly as is compatible with common membership of the Arab League, Egypt and Iraq are to foregather this week-end. Major Salah Salem, Minister of National Guidance in Cairo, is paying a visit to Iraq's royal family and is to meet its new premier, Nuri Pasha es Said. He is still dusty from his recent rush errand to Saudi Arabia and Yemen, but this new visit is undertaken with a very different purpose—the difference having been created by the shift in Egyptian policy brought about by initialling the Suez agreement with Britain.

While that issue was still uncertain, Egypt had nothing but hard words for neighbours who failed to rate the fulfilment of Cairo's "national aspirations" as a prerequisite for all talk with the west. It therefore vilified Turkey, Pakistan and any Iraqi who expressed the view that Iraq, since it was now both wealthy and vulnerable, had better keep in with some potential great power ally. Simultaneously, Egypt cultivated Saudi Arabia and Yemen, both of which were then engaged in disputes with Britain. Now Major Salem must set about removing the suspicions that fraternisation with the Saudis always arouses in Iraq's Hashimite family breast; presumably he must also listen to Iraq's anxieties about the spread of Communism, about its undefended flank on its eastern or Iranian frontier, and about the need for adequate defence of its wealth in oil.

It is fortunate that the Iraqi statesman called on to deal with this situation is Nuri Pasha, with his wide appreciation of the world situation as a whole. He has come to power proclaiming an intention to secure revision of the Anglo-Iraqi treaty of 1932, which affords the RAF two bases in Iraq; once Egypt had secured a new arrangement, no Iraqi statesman could contemplate less. But he is likely to have some hard-headed views on the dangers of being too remote from friendly great-power bases. It is said that even people in Teheran are regretting that Iran is not on Egypt's list of countries for the sake of whose defence it would be desirable to readmit the British into the Suez base.

The Treaty of Bled

WHILE the Treaty of Bled was being negotiated it was the subject of many rumours as well as of some alarm and despondency. But now that it has been safely signed, sealed and published, it stands revealed as a workmanlike affair. It contrives to link Greece and Turkey with Jugoslavia in a firm military alliance that adequately plugs the gap in the defences of south-east Europe without making either the Jugoslavs or the Nato partners of Greece and Turkey feel that they are getting more involved in each other's affairs than they decently ought to be. If strategic requirements were all, such contrivances could be dispensed with, since Jugoslavia and Nato would no doubt find themselves willy-nilly in the same boat if the Communist armies moved westwards anywhere from Petsamo to the Caucasus. But political considerations make it unreasonable to expect Marshal Tito to jump too far or too fast into the western camp.

As it is, he is doing well out of the treaty of Bled. If Jugoslavia is directly attacked he gets automatic aid from his neighbours; in return, he promises them aid if they suffer a similar fate. But the chief deterrent to any aggression against Greece and Turkey remains their membership of Nato, and Marshal Tito, in effect, profits from this Nato shield covering his two allies—without, however, accepting any obligations to Nato in return. In the Treaty of Bled he is specifically committed only to consultation with his Greek and Turkish allies should there be aggression elsewhere in the Nato area. This helps to protect him against charges, either by his own Communists or by the Cominformists, that he has gone over to the Americans.

The treaty of Bled sets the seal on joint military planning and consultation that have been going on for nearly eighteen months. Herein lies its main strategic value. Each country can plan its military dispositions in the full knowledge of those of its partners, and can therefore dispose of its own forces to the best advantage. This is of particular importance to Turkey which, in addition to its European frontiers, has a long Asian border to defend. Where the Balkan organisation differs from Nato is in the absence of any joint staff or supreme commander—although there is to be a Balkan equivalent of the Atlantic Council. But as the main source of heavy weapons and aircraft is likely to be Britain and the United States, some standardisation of weapons and training between the three partners should be possible. Here again Marshal Tito will enjoy some of the shelter of the Nato umbrella without actually helping to hold it up.

A Maltese Ulster?

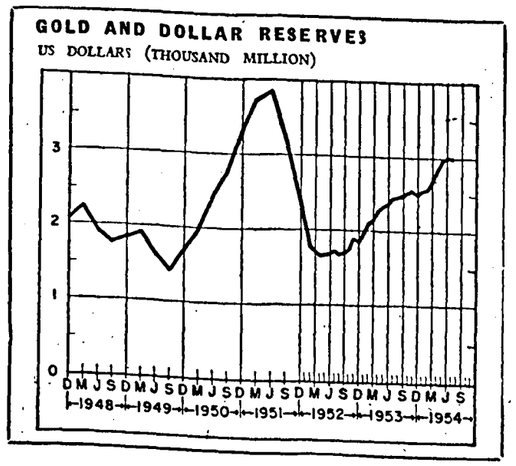
IN the last few weeks Mr Mintoff, the leader of the Maltese Labour party (the largest political party in the island, now in opposition in the Maltese Assembly), has been in Britain; and has been trying to persuade both the Colonial Office and the British Labour party to sponsor his own unconventional solution for the very real dilemma

in which the Maltese people are now placed. Malta's political problem is that its size and its importance as a fortress make it impossible for it to move much further forward towards self-government along the traditional road. Its economic problem is that it depends for its present livelihood largely on the British naval base (which for various reasons is likely to be less profitable in the future) and on generous British subventions (especially a large war damage payment, which is now running out). Mr Mintoff's proposed solution is that Malta should become a Mediterranean Ulster, with four of its own elected representatives sitting at Westminster; and he wants this to be accompanied by acceptance of a long term "economic plan" for the island.

These proposals require both straight thought and straight talk. Mr Mintoff's "economic plan"—and it is to be hoped that the British Labour party as well as the Colonial Office have told him this—is unfortunately nonsense. The main difficulty is not that he wants wage rates in government employment in Malta to be automatically raised by one quarter, to equal similar wage rates in Britain. It is that he assumes that union with Britain would open the sluice gates not only to free medical services, education and old age pensions, but also to massive investment in oil refineries, light industries and holiday traffic. In fact Mr Mintoff assumes that investment—and living standards—in Britain are determined by the state. If that were the basis on which any constitutional change was sold to the Maltese, they would quickly be disillusioned; anybody who has any kind words to say about this economic plan will merely be hastening the day when all Maltese will feel that Britain has let them down.

Mr Mintoff's parliamentary proposals are also wide open to criticism. His claim for four members at Westminster is based on the ratio between Malta's total population (300,000) and Ulster's. In fact, the real comparison should be between the total electorate in Malta (about 120,000) and the electoral quota in Northern Ireland (one member per 70,000 electors). At most, under any such plan, Malta might send two spokesmen like the two anti-partitionist MPs from Mid Ulster and Fermanagh, to glower across the House at any government at Westminster. This might not do much good; but the question to be asked, preferably at a round table conference in Malta itself and preferably also without too many horrified references to the contrary historical tradition of British government, is whether any other solution will do less harm.

A Thousand Babies



IN May and June of 1947, 1,142 babies were born in Newcastle upon Tyne. A year later 44 of them had died and 127 of them had left the city. The medical history of all but 4 of the remainder was still being observed, as it had been throughout the year, by the late Sir James Spence and his colleagues from the department of child health in the University of Durham and Newcastle's public health department.

The survey of these children is still going on. When it is completed it will provide an invaluable and, for this country, unique account of the major and minor illnesses of children, set against their family and social background. In the meantime, the observations of the first year, published* recently under the auspices of the Foundation and the Nuffield Provincial Hospitals Trust, have yielded some interesting facts. Although the survey did not record really minor ailments, it showed that only one child in five reached its first birthday without illness. Of the illnesses that were recorded, 83 per cent were infective in origin, and of these over half were respiratory infections, ranging from severe colds to whooping-cough, bronchitis and pneumonia. There were 66 accidents, most of them falls or burns and scalds; but dramatic illnesses, like meningitis and tuberculosis, were rare.

The ordinary infectious fevers—measles, chicken-pox, mumps and whooping-cough—are the birthright of most children, though in the first year of life mumps was found to be as rare as whooping-cough was unexpectedly common. It is in the after-effects of these ordinary fevers, and in the frequency and severity with which children are attacked by other infections, that the difference in a child's environment becomes apparent. Newcastle was one of the worst-housed cities of England (judged by the amount of overcrowding) at the time of the survey, and the authors attempted to relate the illnesses they found to the children's social setting. The common cold was apparently unaffected by either the social class of the parents or overcrowding. On the other hand, infants in overcrowded houses were much more likely to develop bronchitis or pneumonia than other infants. Infantile diarrhoea and vomiting were, however, associated with bad maternal care and poverty rather than with overcrowding. Infection with tuberculosis was, unexpectedly, found to be the result, not of a poor environment, but of parental ignorance.

The survey's most important conclusion was that a great deal of child illness is preventable. The authors believe that at least 15 of the 44 deaths among their thousand babies were avoidable, and they put an infant mortality rate of 23 per 1,000 live births (against this 44) as a target. Last year Newcastle's rate was 26.8, the first year that it has not been above the rate for the country as a whole. Perhaps future reports of the survey, covering the first years of the health service, will show a decline in preventable illnesses to match this big reduction in infant deaths.

Fewer Hands to Fewer Ploughs

MR HEATHCOAT-AMORY, the new Minister of Agriculture, will find mixed comfort in the results of this summer's agricultural census. On the whole the census (which was taken on June 4th) suggests that farmers have shown more foresight than the Government. Successive Ministers have called for greater self-sufficiency in feeding-stuffs. The drop of 378,000 acres in the total area of tillage shows that farmers have not heeded this plea; in the event this is perhaps just as well—the alternative, in view of falling world grain prices, would have entailed an extravagant rise in the subsidies. Farmers have, however, responded to the advice of experts by increasing the area under temporary grasses.

The presence of almost a million more pigs in England and Wales must be a source of embarrassment to the Minister. The Government asked for the pigs and paid farmers handsomely to produce them; now it finds that it has fattened rather an expensive luxury. The basic fault was in not paying enough attention to quality of production. By contrast the increase in the number of young beef cattle is welcome and could profitably be much larger.

The fact that will most disturb the new Minister is a further fall (by over 13,000 to 507,000) in the number of regular farm workers, which has now sunk just below its prewar level. Economic progress in agriculture requires a higher output per worker employed rather than a greater total of workers; but it remains true that a policy of further expansion—still officially the Government's aim—cannot be based on a steadily declining labour force. The farm workers' union, in its campaign for higher wages, can make great capital of this situation—although it seems that the lack of rural amenities is still the main factor in the new drift from the land. The Government has two seemingly irreconcilable objectives—to grow more food (which requires keeping the workers) and to grow it more cheaply (which rules out a wage increase). It is in the light of these sombre facts that the new Minister will have to determine his priorities.

China's Sorrow Still

THE Peking press has at last been compelled to admit the vast scale of the flood damage along the Yangtse and Huai rivers. No accurate and full account of the loss of life and damage to crops and property caused by these terrible floods is ever likely to emerge from the new hermit kingdom; but it is already being said that the five-year economic plan itself, now in its second year, is gravely endangered. The human tragedy is a colossal one; and, for the peoples of these great river valleys, it is all the more heartbreaking because millions of them have toiled for the past four years on the building of dams and barrages intended to end for all time the succession of catastrophes that has plagued China since its history began.

To draw a political moral from such disaster may be interpreted as a piece of heartlessness. Yet there are things that should be said, not despite, but because of the natural sympathy and concern of the socialist who

lately published which he saw

THIS is, appropriately, the first volume of what is called the "New Whitehall Series" to distinguish it from not build its vast irrigation immediate reflection brutal means, however ow obsolete "Whitehall Series" of "After all, a human being quarter of a century ago. The structing a country, he should not merely new, series is Chinese who have worked on these projects the auspices of hands have been continually goaded to great at giving, the official propagandists' promises of early rewards he reearly as 1952, the Minister of Water Conservancy was telling them that the phase of merely preventing disaster was passing into that of the beneficial use of the newly controlled water; and only a few weeks ago the peasants along the Huai were told that they could now, for the first time, live without fear of floods.

It is by such cynical falsehoods, as much as by brutal discipline, that all totalitarian regimes get back-breaking efforts out of their workers; it is by such unfounded boasts that they try to dazzle the outside world.

Bao Dai Faces the Music

THE news that Bao Dai has decided to return to Vietnam surprised even some of those who realise that the "playboy" label still persistently stuck to him should have been detached long ago. Bao Dai's previous absences from Vietnam since his return as Chief of State in 1949 have been a good deal shorter than this one. In the past few months he has gained a theoretical independence for his country, seen himself by-passed at Geneva, and received without comment the news that only half the country would be left to him, at best, after the initialling of a truce agreement to which his delegates did not subscribe. His departure to Evian "to take the waters" while the fate of Vietnam was being decided at the conference table, generally interpreted as a gesture of either cynicism or indifference, may yet turn out to have been neither.

In the circumstances, Bao Dai's decision to return is something of an act of courage; a second abdication would be a good deal easier, for a warm welcome is far from assured to him in Saigon, let alone in the villages. Ngo Dinh Diem, to whom Bao Dai is reported to have delegated full powers, seems to have made a disastrous start, as far as can be judged through the veil of a greatly tightened censorship. Francophobia is being mistaken for a policy, and the refusal of French help in evacuating anti-Communists from Tonking was an unpardonable act of folly. Even in the south, Diem appears to have been losing ground, and Nationalist propaganda has been no match for the Vietminh slogan of "Unity in six months." As for Bao Dai, he will face the unpopularity of an absentee landlord, and a defeated one at that. To counter this he brings a new promise of a detailed programme and a "healthy and honest administration." There is a twenty-fifth hour ring about all this. Yet whatever else Bao Dai may be, he is nobody's fool: he would not return to Vietnam if he did not think there was some possibility of winning the peace, or at least of salvaging something from the ruins of the war.

...os

...last week cost more
...hich brought Colonel
...caused by the smoulder-
...os irregulars, with their large
...submachine-guns, and the regular army
...uring Colonel Castillo's promenade towards
...City, the army had maintained an attitude of
...d reserve. After all, Colonel Castillo was sweeping
skies with three airplanes. But when peace was restored at San Salvador on July 2nd the army saved its face and Castillo's irregulars were theoretically incorporated into regular units.

It soon became apparent that the barefoot men from the backlands and the cadets in their polished boots would not get along. The explosion was short-lived but violent. The army won and Colonel Castillo has agreed to disband his cohorts. Nevertheless, his own position appears to have been strengthened and, with army backing, his immediate future seems assured.

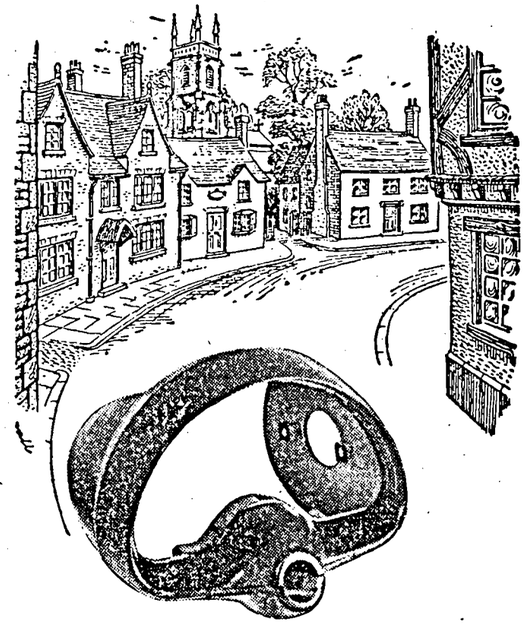
Colonel Castillo has suspended the land expropriation, begun under his predecessors, until a new Congress meets, but he has promised that land reform will be carried out. What is less clear is whether the United Fruit Company will get back the 400,000 acres confiscated by Colonel Arbenz's regime. On the whole, the company is being tactful about the past and is hoping to work with the new government. The Guatemalans know that they have become a focus of propaganda in the cold war and this undoubtedly improves their bargaining position with respect to foreign investors. But if they are to maintain this position helmets and sombreros will have to learn to work together.

Four Months' Pay Wasted

THE fourteen-week strike of electricians employed by Messrs. J. Lyons and Company provides an interesting study of the tactics of the Communist-dominated Electrical Trades Union, and of its role in industrial relations. The strike began towards the end of April, when the new supervisor appointed to the company's Greenford works was told by the shop steward that as he had not got a union card the 41 electricians employed there could not work with him. This was curious because Mr Willsher had already been a supervisor for four years elsewhere in the company's service, without either trouble or a union card; and 80 or 90 per cent of Lyons' supervisors are not members of the union. A few days later, the strike spread to Lyons' headquarters at Cadby Hall, and the ETU declared it official. The company then issued a public statement saying that it employed only members of the ETU as electricians, but made no such conditions about supervisors, whom it must be free to transfer as it thinks fit.

The strike went badly from the first. The ETU failed in its efforts to get supplies to Lyons stopped or to persuade other unions whose members were employed by the company to help with funds or sympathetic strikes. ETU members employed at other Lyons establishments voted against joining the strike, although they had to join it when they were called out by their Communist executive on June 10th. But a rebel group soon appeared among the strikers, and by early August the men started creeping back to work. The union leaders tried to stop the rot by threatening reprisals and telling them that negotiations were proceeding through the Ministry of Labour. They also announced that they could not agreed to the conditions on which the employers were prepared to meet them, one of which was that there should be no victimisation of those who had opposed the strike. This announcement came at a time when some strikers were already sick of the whole business; and on Saturday of last week the leaders bowed before the storm and called off the strike.

The story has its lessons for both sides of industry. It should discredit the Communist leadership of the ETU, and open the eyes of all workers to the way in which agitators can lead them by the nose. And it shows management the value of a prompt public statement, which in this case roused public sympathy and stiffened the resistance of those workers who were not prepared to be Communist dupes.



Towns on the Move

THE purpose of the Town Development Act of 1952 was to assist congested cities to export their surplus population to other areas—or, in Mr Macmillan's words, to enable towns to hop instead of to swell. A special issue of the journal of the Town and Country Planning Association* has recently surveyed progress under the Act to date. The most surprising achievement has been the conversion of the London County Council from its old habit of building in the green belt to a programme of long-distance dispersal.

No less than fifty towns have discussed schemes with the LCC. The most distant, Nantwich in Cheshire, was ruled out by the Ministry as too remote, but many towns more than 30 miles from the capital may shortly receive an influx of Londoners. Schemes have so far been agreed for Swindon, Bletchley and Ashford. The principle in each case is that homes should be provided only for those families that can find work locally. The scheme therefore turns on the dispersal of congested factories from London, and industrial considerations rather than pressures of local politics should guide the choice of reception towns.

If this is done, then the Act can be of mutual benefit to London and to a number of country towns whose economic life is stagnant or lopsided. Financially, the cost of developing these towns should usually be less than the alternative of constructing a great number of expensive flats on central sites. Socially, the idea is certainly preferable to a further extension of daily journeyings across the great wen of London. But, in areas such as Lancashire and Cheshire, local government rivalries apparently threaten the Act's success, and central co-ordination is badly needed. The Ministry should take a lead in bringing the local authorities together and insisting on faster progress.

PROGRESS IN ELECTRONICS

The modern fighter aircraft is a machine of great complexity. It is required to execute startling manoeuvres at supersonic speeds and at high altitudes. Apart from the skill of the pilot, its operation, its safety and even its performance depend to a very large extent upon a variety of electronic devices and apparatus.

A normal fighter is provided with radio and intercommunication equipment; with navigational aids and radar; with altimeters and other electronic instruments; and with servo-amplifiers for automatic control and regulation. In all this apparatus something like 150 radio valves of different types are employed, and they must be capable of withstanding conditions of exceptional stress and vibration.

To satisfy these abnormal requirements, Mullard have developed a range of Special Quality Valves which, besides conforming to the most exacting specifications, can be economically produced in quantity. Entirely new techniques of design and manufacture have been evolved to achieve this, and these in themselves represent a notable advance on anything yet developed on either side of the Atlantic.

The background to Special Quality Valves and other outstanding Mullard developments is a growing research organisation and continuously expanding manufacturing resources, important contributions to Britain's progress in electronics.

Letters to the Editor

Wrong Plan for Refugees?

SIR—On July 24th you referred to the presentation by the United Nations High Commissioner for Refugees of a five-year programme to help the 350,000 refugees whose economic integration in countries of asylum is still incomplete. The article, while accepting the principle of international action, suggested that a programme of this nature should be limited to the 88,000 refugees who are still in camps. There are, however, more than 2 million refugees within the High Commissioner's mandate, and the 350,000 are those for whom international assistance in emigration or economic integration is considered necessary.

Of these 350,000 refugees, 150,000 are in Austria and they comprise approximately 117,000 (of a total of 177,000) *Volksdeutsche* and 33,000 (of a total of 39,000) other refugees. The number of *Volksdeutsche* who would benefit from the plan is, therefore, approximately one-third of the total of 350,000. These refugees have been included in the High Commissioner's mandate by the General Assembly.

Your suggestion that the plan should be confined to the closure of the refugee camps does not take into account the situation of thousands of refugees in squatters' quarters and cellars, living on public assistance, casual labour or charity. The 350,000 refugees for whom the plan is designed include only 88,000 in camps. It would be no solution to exclude the out-of-camp population. The effect would be that many refugees living outside camps would become a charge on public assistance, or would be virtually compelled to return to the camps. While the proportion of refugees deserving top priority for help is greater among the camp population, the situation of the 260,000 out of camp is in individual cases often worse.

You state that in all the countries concerned, most refugees are denied economic and social rights—notably the right to work—to which they are entitled under international agreement. This is not true. The 1951 Convention relating to the status of refugees has not been violated. With regard to the legal right to engage in employment, the Convention provides most-favoured nation treatment, with complete removal of restrictive measures in respect of a refugee who has completed three years' residence, or has a spouse or a child possessing the nationality of the country of residence. The Convention has been ratified by Germany and these clauses are applicable. In Austria, while the *Volksdeutsche* have the right to work, the Austrian Government made reservations regarding the right to engage in employment. Italy, which has not ratified the Convention, also made reservations. These reservations would normally imply wide restrictions, but, in practice, only in Italy, of those countries where there are unsettled refugees, have refugees been entirely barred from the labour market.

But even when the legal obstacle is overcome, there are still economic and psychological barriers. The refugee living on charity or on the lowest scale of casual labour lacks the minimum funds necessary for starting a normal life. Whatever his skill or trade, he cannot take it up again without working clothes, tools, raw materials, a workshop, or employment, and somewhere to live if the camp is too far from his place of work. On the social side he needs friendly advice. Years of disappointment have had their effect on morale.

The High Commissioner's programme, to be operated through voluntary agencies, is intended to help the individual refugee to overcome this "dead point" by giving or lending him the minimum means with which he can start helping himself. International moneys are not intended to replace contributions from the countries of asylum, but would serve as a stimulus for national effort. The governments of the countries of asylum as well as other official and private sources would be asked to contribute handsomely to the plan. It is hoped, on the basis of previous experience, that more than twice the sum of $12 million which the UN are being asked to provide will be raised from these other sources.

Those working for refugees hope that the General Assembly's decision this coming autumn will be in favour of international action to reduce the size of the refugee problem. They fear that unless governments are prepared to make at least a small financial sacrifice, the alternative will be no action at all.—Yours faithfully,

STANLEY J. C. WRIGHT
Office of the High Commissioner for Refugees,
United Nations, Geneva

The Cypriot's Dilemma

SIR—If the article in *The Economist* of July 24th gives a correct impression of the (Greek) islanders' state of mind, it would suggest there is little hope of their accepting the offer of some degree of self-government which is shortly to be made to them.

Indeed, the problem would appear

Opinions About Options

SIR—I refer to your article of August 7th and to the "authoritarian wording" of the Revenue's pronouncement (of July 29, 1954) as to the law on the subject, viz. whether the option is taxable when granted or when exercised. The former was apparently until a year or two ago "the official view of the law," and that view would seem to accord with the decision in *Weight v. Salmon* (11 Tax Cases 174). According to the headnote the decision was that "the privilege" (i.e. the option) "granted to the respondent represented money's worth and was assessable to income tax as a profit of his office. . . ." As you rightly point out, the paragraph quoted from the speech of Lord Atkin in that case is ambiguous in its reference to "allotment," but this paragraph should be read in its context, especially the two paragraphs which immediately precede and follow at page 193 of the report.

For practical purposes the Revenue's assertion means that their new view is the law. It is intended, no doubt, *in terrorem* and will frighten off taxpayers from taking up or exercising options, on account of the risk of litigation up to the House of Lords with the further risk, as you point out, of retrospective legislation if the Revenue lose. The Conservative party in office—despite eloquent protests by leading members while in opposition—has apparently no objection to the principle of retrospective fiscal legislation even to reverse a decision of the House of Lords. Cf. Finance Act 1952, Section 72 (2), enacted to negative with retrospective effect a House of Lords decision against the Revenue. Cf. also Section 22 of the Finance Act 1926 introduced by Mr Churchill as Chancellor to negative with retrospective effect the unanimous judicial view ending in the House of

...out
...ction
...oduced
...ation to con-
...mpanies to distribute
...Part IV of the Finance
..., introduced profits tax on a
..."two-tier" basis to constrain
...ompanies not to distribute their profits. In 1948 the late Sir Stafford Cripps made a statement (commonly called "the Chancellor's Umbrella") that company surtax directions would not be made on "private" companies, but he made it clear that this concession was not to apply where there were "avoidance devices." The judges of whether or not desperate attempts to raise money in the form of capital, or on loan, to pay or provide for estate duty amount to "avoidance devices" are the assessing Special Commissioners who sit at Thames Ditton. Able and courteous as they no doubt are, the fact remains that the Chancellor's Umbrella has blossomed into the Thames Ditton Palm Tree. There is no appeal from their decisions on this point. The Chancellor's Umbrella, a conditional concession, has been allowed to become administrative law. The sanction behind it is Section 21.

I suggest that Section 21 should no longer extend to "private" trading companies, and should apply only to "private" investment companies for which already special provision is made. The continued existence of the profits tax in its present form is difficult to reconcile with the application of Section 21 to trading companies. The profits tax has ample penal provisions of its own. The whole trend of fiscal legislation over the period has changed: the new investment allowances and the "two-tier" profits tax are evidence of that. If this step were taken the Chancellor's Umbrella could be folded up and the semi-legislative and semi-judicial activities of the assessing Special Commissioners would come to an end.

This is not an attack on the Revenue officials. Those who have had occasion to meet them professionally recognise them as a devoted, skilled (and mainly underpaid) body of public servants: the principle of ministerial responsibility has been lately and gallantly re-established.—Yours faithfully,

REVENUE Q.C.

Borrowed from Stalin

SIR—We must be grateful to Mr Rothstein for his shocked correction of Mr Zavalani, which shows how right you were in asserting that the words "peaceful co-existence" have a meaning in Moscow totally different from their hopeful meaning in British Foreign Office drafts.

...Soviet Union does not impose ...al system on anyone," quotes Mr ...tein; which must be why it in...ed Finland in 1939, annexed the ...altic States in 1940, and refuses free elections in Eastern Germany in 1954. As for the rest of Eastern Europe, Stalin's letter to Tito (May 4, 1948), not being intended for publication, was frank: "The Soviet Armies created the pre-conditions needed in order to open the way of the Communist Party to power. It is a matter for regret that the Soviet Army did not and could not give this same help to the French and Italian Communist Parties."

The Moscow *Kommunist* article (April, 1954) tells us that the victory of socialism in the USSR "has opened the way for a rapid advance of all mankind to a new, higher state of development" (p. 3); describes the USSR as "the first shock brigade of world revolution" (p. 5) and boasts "the increased might of our country, the strengthening of its international authority, the organisation of an uncrushable socialist camp, the growth of the world liberation movement against capitalism, all this proves that international socialism has entered on a new stage of its development" (p. 5).

If Mr Rothstein likes to call all this "peaceful co-existence" it is clear that he is using the word in its Kremlin Russian sense, not in its Whitehall English sense. The two are poles apart, as you rightly argued on July 3rd. There is something to be said for Mr Zavalani's refusal to accept mere transliteration as a substitute for translation proper.—Yours faithfully,

D. E. MAURICE

London, S.W.13

★

SIR—Mr A. Rothstein's letter, in which he quotes a selected passage from the Moscow *Kommunist*, distorts the Soviet theory of peaceful co-existence. According to Communist ideology, peaceful co-existence is nothing but a convenient prelude to the war between Communist and non-Communist powers — considered ultimately inevitable.

This basic belief has not been superseded by the new slogan of "one world" or by the proposition that an inter-capitalist conflict will take place first. The inevitability of "frightful collisions" between the Soviet Republic and the bourgeois states, as proclaimed by Lenin in March, 1919, has remained a determining factor of Soviet foreign policy. Stalin followed this line faithfully. In 1927 he declared:

> We cannot forget the saying of Lenin to the effect that a great deal in the matter of our construction depends on whether we succeed in delaying the war with the capitalist countries, which is inevitable, but which may be delayed either until colonial revolutions come fully to a head, or finally until the capitalists fight among themselves over the division of the colonies. Therefore the maintenance of peaceful co-existence is an obligatory task for us.

This remains official Soviet policy.

It is high time to challenge the Communist Party to answer clearly this question: Do they think that Russia has abandoned Lenin's view that war between the Communist and non-Communist world is ultimately unavoidable? Yes or no?—Yours faithfully,

JUDITH LISTOWEL
LIONEL BLOCK

"Soviet Orbit," London, S.W.1

In Father's Footsteps?

SIR—The work of Dr Glass and his colleagues, which you review in *The Economist* of July 31st, is clearly a valuable and interesting study. It is, however, easy to draw misleading conclusions from it, and I am not sure that you have avoided doing so when you say of Class I, "the direct influence of a father's position on his son's career seems greater in this class than in any other." On the statistics given this may or may not be true. If, for example, in addition to the 39 per cent who manage to remain in Class I there were another 39 per cent who, while of comparable natural aptitude, failed as a result of their more comfortable home circumstances to make the effort necessary to place them in that class, we should still get the same figure of 39 per cent although the direct influence of their father's position so far from being helpful had been the reverse.

I would suggest that the main reason for the comparative success of Class I is not the father's position but his natural ability combined with that of his wife, and dependent on what I think is now the general rule, that able men tend to marry able women. This agrees with my own observations, as a Civil Servant of Administrative Grade, of the children of my colleagues and university friends and acquaintances, who in so many cases have been endowed with great inborn ability quite apart from any advantages derived from home training and conditions.

Indeed I would go so far as to say that much of the high reputation of the Public Schools for the training which the boys receive in them—although most of them undoubtedly are very good schools—is really due to the large number of able boys who are sent to them.—Yours faithfully,

HAMMOND B. JENKINS

Hadstock, Cambridge

Practical Convertibility

SIR—I should like to add to my letter of July 26th in reply to a letter in your journal of July 3rd from Mr Ernest H. Meili, who had experienced difficulties in paying for excess baggage charges at Hamburg, owing to certain currency restrictions. I am pleased to advise you that we have now received an amended licence which permits unrestricted acceptance of deutschmarks for travel purposes. In the circumstances the difficulties mentioned by Mr Meili will now disappear.—Yours faithfully,

R. L. WEIR,
Financial Controller

British European Airways

Books & Publications

Stasiology?

POLITICAL PARTIES.
By Maurice Duverger, translated by Barbara and Robert North.
Methuen. 439 pages. 30s.

CONTEMPORARY political science is a great coiner of new words. After Mr R. B. McCallum's psephology, we now get M. Duverger's stasiology, the science of political parties. Who shall deny the value of a classical education? Yet M. Duverger is not interested in the antique, nor indeed in any past but the most recent. While he stresses the importance of the origin of parties to their structure and functioning, his account of the early history of British and American parties leaves much to be desired. Indeed the value of this adequate (but not impeccable) translation of a work which has been much discussed since the French edition appeared in 1951 is precisely that it will introduce a wider circle of readers to the way these things look from a continental and more particularly from a French angle. It may incidentally be remarked that the claim that the book has been brought up to date for the English edition is not altogether justified; there is, for instance, no discussion of the electoral procedures used to beat off the Communist threat in the last French and Italian elections. A note here and there might have helped the English reader; one can see some undergraduate coming along to ask what kind of a royalist a "Valois" candidate was in 1936.

M. Duverger's useful, thought-provoking and systematic study suffers from two illusions and one limitation. The first illusion—not perhaps a major one—is that political parties will themselves see the value of such studies and give more assistance to inquiries. Why should they? Generals are interested in victory, not in the universal development of military science among friend and foe alike.

More serious is M. Duverger's illusion that there can be a general theory of political parties for which this sort of study is intended only to set out a number of hypotheses for subsequent testing. In fact, as the book itself shows, there is only a section of the whole field that lends itself to theorising and that is where the operation of parties can be reduced to mathematical terms. What M. Duverger does, and does very well, is to examine in the light of the recent political history of western and northern Europe the operation of electoral systems and their relation to the type of party system evolved by the countries concerned. To a lesser extent, the operation of parties in Parliament inside multi-party systems lends itself to analysis of the same kind, although this part of the study is heavily dominated by French experience.

But when M. Duverger tries in the first part of the book to create a typology of political parties and to examine comparatively their relation to the state and to the people, the formal nature of his approach becomes a source of great weakness. The fact is that no two countries are sufficiently alike for anyone to try to take the elements comprising the party systems out of the whole historical and social background to which they belong. And it is here that M. Duverger's limitations become manifest. His obvious familiarity with his own country and its immediate continental neighbours is simply not matched when he comes to deal with the English-speaking world. Despite references to some recent American literature on the subject, he talks of American political parties very much in terms that Bryce might have used; he discusses neither the very special background that has made the recent history of Canadian political parties so distinctive, nor the lessons about the party-state relationship that might be deduced from a study of Australia. It is useful to be reminded from the Turkish example that a one-party system may have capacities of evolution, but there is no indication that this type of problem is likely to recur in other guises in various parts of Asia. It would not be unreasonable to reply that one scholar cannot know everything and that to omit Asia and (with one exception) Latin America is still to leave oneself with a reasonable field for study. Perhaps more serious is M. Duverger's obvious unfamiliarity with the Soviet scene, which seriously distorts his picture of the Russian Communist party. It is a signal confirmation of the complete failure of the French to develop any serious study of contemporary Russia—a fact which may not be without some political as well as academic significance.

Even so, Professor Brogan is no doubt right in calling attention in his foreword to the wealth of illustration and documentation that the book does contain, if only because it may bring home to some readers the multiplicity of forms that modern democracy may take. Most examiners will agree that nothing can persuade the British undergraduate that any political institutions are superior to those of his own country; but, of course, there is always the possibility that he may be right.

Introducing Whitehall

THE HOME OFFICE.
By Sir Frank Newsam.
Allen and Unwin. 224 pages. 15s.

THIS is, appropriately, the first volume of what is called the "New Whitehall Series" to distinguish it from the now obsolete "Whitehall Series" of over a quarter of a century ago. The present, and entirely new, series is being prepared under the auspices of the Royal Institute of Public Administration, and, we are told, aims at giving, *inter alia*, "a lively account" of the responsibilities, organisation, and methods of working of the Central Government Departments.

The Home Secretary oversees a gross expenditure of £72½ million, apart from the £9½ million spent by the Prison Commissioners, who are responsible to the Home Secretary. Of the former amount, £54 million goes as Exchequer grants to local and other authorities for certain services, of which the following are the most important: the police, who account for £33½ million; child care and approved schools (£9½ million); fire services (£4½ million); and civil defence services (£3½ million). The handling of the department's relations with local and other authorities, to ensure reasonable standards of efficiency in their services, is an administrative exercise of some delicacy.

Since the author is the Permanent Under-Secretary of State himself, the account of the work of this major department of state is guaranteed to be authoritative, nicely balanced and drafted with all that skill with which civil servants customarily prepare documents for the enlightenment of their Ministers. Sir Frank Newsam regards the pattern of his department's duties as determined primarily by the prerogative powers of the maintenance of the Queen's Peace, and the Royal Prerogative of Mercy. Historically, this is correct, though today it is perhaps straining the implications of these terms a little to bring under the former head such services as those for which the children's department is responsible. The fact is that the great variety of the Home Office's functions is due to the Home Secretary's unique position as "residuary legatee" among his ministerial colleagues. He collects all the odd jobs from the protection of animals and wild birds and the regulation of London's taxicabs to marriage guidance and the relationships of the central government with Northern Ireland, the Channel Islands, and the Isle of Man.

Perhaps the adjective "admirable" is a better description of this indispensable handbook than "lively." To compress an account of all these activities and services within a little over 200 pages does not leave much elbow room for the introduction of commentary or asides. Indeed, a conscientious perusal could discover only two non-descriptive comments: the first was that even if we could rely on the effective banning of the atom bomb, the problems remaining from "conventional warfare," intensified

by modern developments, would be sufficient to occupy the time of the civil defence department; the second was the reminder that defeatist views about civil defence against orthodox bombing were sometimes expressed between 1935 and 1939 before anything had been heard of the atom bomb.

The book will save students and thesis writers (especially those abroad), journalists and perhaps politicians quite a lot of time; they will all at least get their facts right. But a critical commentary would have even more value though for obvious reasons this cannot be supplied by a working Head of a Department. It is no criticism of this excellent description of departmental functions to suggest that the New Series might be even more useful if the authors were drawn from outside the civil service and so free to comment on the form and trend of administrative functions. They could still get their facts right with departmental assistance. A copy should then be given to each incoming Home Secretary and Parliamentary Under Secretary.

Nazi Ambassador

THE RIBBENTROP MEMOIRS. Introduced by Alan Bullock.
Weidenfeld and Nicolson. 240 pages. 18s.

THIS blandly preposterous book is all very well for those who know their way about the history of Hitler's Third Reich; it can only be hoped that it will not give undue encouragement to the more childish type of surviving Nazi. From it we learn that Hitler's whole life was devoted to the service of the German people. "He believed that the future of Germany could be guaranteed only according to his precept," wrote Ribbentrop, "That he foundered was fate, so he told me."

Perhaps the least uninteresting parts of Ribbentrop's memoirs are those in which he describes the difference of his approach to Russia from that of his Führer. When German-Russian relations cooled in 1940, Ribbentrop maintains that the change in Russia's attitude was "brought about by US and British concessions" while Hitler, he says, believed that Stalin had never intended to keep faith with him. In the last period of the war Ribbentrop wished to come to terms with Moscow, while Hitler insisted upon fighting to the end; indeed, it seems that Ribbentrop's views in the matter cost him the Führer's favour.

Although his memoirs are full of absurd claims, Ribbentrop certainly made little attempt to curry favour with the victors as he compiled these papers in his prison at Nuremberg in 1946. He seemed positively eager to assume responsibility for the success of the negotiations (mostly in his house at Dahlem) in January 1933 which led to the appointment of Hitler as Chancellor. Further, he made no attempt to conceal his hostility to America. For instance, he chose to state, "Although we were perfectly well aware that, by declaring war on September 3, 1939, Britain and France had yielded to American pressure, we refused to be drawn by any of the innumerable provocations" from the United States, of which he then made a list.

Mr Bullock does well, in his introduction, to point out Ribbentrop's outrageous distortion of the facts about Hitler's treatment of Czechoslovakia; the memoirs are equally outrageous with regard to Schuschnigg and Austria. They are thus misleading without providing any psychological revelation beyond that of vanity and wishful thinking. In Mr Bullock's words, Ribbentrop "leaves only the impression of a protesting triviality unequal to the events in which he was involved."

Economic Baedeker

ECONOMIC DOCTRINE AND METHOD.
By Joseph D. Schumpeter.
Allen and Unwin. 207 pages. 15s.

IT may seem surprising that this forty-year-old classic should have had to wait until today for translation. It is hardly less surprising, at first sight, that today a translation should have been thought worth while. It is true that comprehensive histories of economic thought from Aristotle to Pareto are comparatively scarce, and that there is no reason why a survey stopping short in 1912 should not be as valuable as any other chronologically limited historical work. It is also true that no lapse of time can make the judgments of a really keen and original mind entirely uninteresting. Yet this particular work does seem a curious choice for publisher and translator. It is at once exceedingly dry and exceedingly allusive, its pages peppered with names distinguished only by a single qualifying phrase—"every inch a thinker," "a particularly outstanding member of this circle," "do not have much to offer us," "belong to the dominant school mentioned above"—and a book-title or two in brackets. Some pages read almost like the notes of a desperately conscientious examinee bent on mentioning every relevant name at least once, and indeed the conscientious examinee of any German university in 1912 must have found this book a perfect godsend. To the reader of today these "wrong ideas of dead men"—so very wrong, so very, very dead—might well appear dispensable. The Founding Fathers of the various schools, those whose thoughts, however modified and however deeply sunk into the collective unconscious of economic discipline, continue inescapably to shape the mental habit of today are one thing; Föpple and Fuoco, Beil and Baumstark, Ferguson, Grabski and Zückerkandel are quite another. It is a far cry from this economists' Baedeker to the spacious and distinguished "Ten Great Economists" of two years ago.

Yet "Economic Doctrine and Method" is much more than a guide or cram book. As an historian of ideas Professor Schumpeter displays, among others, one rare and precious quality: the ability to identify and assess the contribution of any man or school positively, as an advance on previous thinking, rather than negatively, as falling short to such and such a regrettable degree of the perfect enlightenment attained in the historian's own age. It is this quality above all that makes the date of writing of "Economic Doctrine and Method" irrelevant. It also safeguards the author—and his public—against the common errors of reading into the phraseology of earlier economists ideas which never occurred to them or, on the other hand, of imputing to them ignorance or indifference on matters which they took too thoroughly for granted to make explicit. His enormous and exasperating erudition is a live thing, a capacity to move as a native in the intellectual climate of each succeeding epoch.

The translation is frankly horrid, the translator having not only explicitly and justifiably preferred fidelity to elegance but less justifiably given up even the lesser ambition of preserving the idiomatic decencies.

America in Europe

FIRE IN THE ASHES. *Europe in Mid-Century.*
By Theodore H. White.
Cassell. 383 pages. 15s.

THIS is an American book about Europe written for perplexed American citizens. Mr White, one of the best United States journalists, has taken the trouble to write, not the expertly detailed work which was at his command, but a survey of Europe that might be profitably read in Nebraska. The style, perhaps deliberately chosen, is one of geo-political enthusiasm in which people march to the polls, dollars flow, taxes are sucked, armoured divisions are deployed near meshing-points and everything is thrusting, incubating, kinetic or in a state of imbalance. But the dynamic language in no way spoils the book; rather it gives it poetry.

The author begins his story over the Atlantic in an aeroplane approaching the coast of Europe and looks at the geography of the Continent "which is more foreign to Americans today than it has ever been in all our history." He compares the night-radiance of European cities; he remembers the quarter of a million American soldiers on the alert across Europe; he tells two excellent anecdotes illustrating the profound French weariness of great events; and we are off on the main theme — "the struggle of America and Russia for the loyalty of the hearts and the riches of the lands in all the countries of Europe."

Mr White describes the final rift with Russia in 1947, the destitution of Europe, the inauguration of the Marshall Plan—he specifies the cargoes of American ships that docked at Rouen and Le Havre one winter's day in 1950—and the semi-frustration of the American economic planners in Paris. The book's quieter centre-piece is a series of portraits, most skilfully done, of Europeans, prominent but of the second rank: the French university professor who rose in the Resistance to the position

of *Commissaire de la République* and later head of the *Sûreté Nationale*; the German young steel prodigy who ran the Ruhr for Hitler and is still running it now; the British coalminer who became the National Coal Board's chief of labour relations. Mr White gives a reasonably optimistic account of the movement towards European union, pointing out that Europe's pregnancy is likely to be longer than the eighteen months required to produce a baby elephant.

But the most interesting chapter is "America abroad," in which Mr White discusses the impact of the United States on Europe and postwar American unpopularity. He holds that America has been quite unsuccessful in explaining to foreigners the purpose and inner essence of American society. "Americans bring their techniques first, the logistics and mechanics of their system, and they leave its mothering, begetting idea to follow naturally behind."

Irish Dip

THE STRANGER IN IRELAND.
By Constantia Maxwell.
Jonathan Cape. 340 pages. 25s.

"THE Irish are fond of strangers, and it costs little to travel amongst them." It is an admirable slogan for a tourist association even if it dates from 1644. Dr Maxwell has hit on the happy idea of selecting the observations made by a succession of travellers in Ireland between the 1580s and the 1840s and of weaving them together to provide an account of events during that time.

It is not at first sight a period in which visitors would be attracted across the sea that was fatal to Lycidas. At a rough count it included five major struggles, and the intervals of peace were due more to exhaustion than to conciliation. But Dr Maxwell is concerned with the stranger rather than with the visitor; so her capacious net takes in Spenser, Essex and a (distinctly ungrateful) survivor of the Armada as well as Arthur Young, Scott and oddities such as John Dunton, "an eccentric English Bookseller"—eccentric indeed if he hoped to do much business in Dublin in the seventeenth, or any other, century.

Being a mixed bag, the book possesses no great coherence; it is admirable, however, as a dip. "The Irish of the southern and eastern coasts follow the customs of the English; those of the north, the Scotch. The others are not very polished. . . ." But the same visitor earns posthumous gratitude in Ireland by stating that "the butter, the beef and the mutton are better than in England." These foodstuffs were washed down by "excellent brandy"; a plain libel on whiskey. All writers agree on what was so great a trial to Newman in the 1850s, the underdone meat that was served to them. One hopes that that has been changed now that a later century has discovered the importance of "tourism" to the balance of payments. An Elizabethan viceroy found tobacco to be an excellent cure, but it was cheaper then.

For the rest, the country does not seem to have changed so much. We read of travelling to races at the Curragh in 1699. In the 1830s a (very dull) German thought his hosts talked too much about horses and dogs. A compatriot remarked that "Ireland is the first country for ruins"; a primacy since imperilled.

These travellers' tales (here and there one can almost hear the locals leading the visitor up the garden) are strung together with introductory essays. At times the reader may raise an eyebrow at Dr Maxwell's summaries; but such is the nature of Irish history. However, she really must not describe hurling as "a rough game like hockey." And it is surely a slip of the pen that so distinguished a historian refers to "the six counties of Ulster."

Great Liar

DANIEL DEFOE.
By Brian FitzGerald.
Secker and Warburg. 248 pages. 18s.

"HOMER more than any other," Aristotle declared, "has taught the rest of us the art of framing lies in the right way." But Aristotle might have changed his mind could he have set "Robinson Crusoe" beside the "Odyssey," for of all the great liars Daniel Defoe is certainly the most prolific and the most assured. When he applied his astonishing faculty to the business of artistic creation—which he appears to have done without much conscious knowledge of what artistic creation is—life had already given him a magnificent start. A turncoat and double-crosser long in successful practice in the political underworld, he had come to regard wary distrustfulness as the prime constituent of human nature, and had evolved an incomparable verbal technique for successfully maintained mendacity. He had founded—he could not have escaped founding—whole reaches of modern journalism. He fabricated obituaries of deceased eminent persons as by suitable hands ("written by the Lutheran minister who assisted him in his last hours, and faithfully translated out of a High Dutch manuscript") and when he scooped for "Applebee's Journal" the reminiscences of Jack Sheppard he improved the occasion by arranging that the celebrated criminal should hand the "copy" to a printer's devil attending him on the scaffold. And this prodigious deceiver was game to the end. The ruined tradesman, the detected and discredited secret agent, the associate and historian of thieves and ruffians, finally passed away while engaged in writing "The Complete English Gentleman."

But Defoe's best lie of all had been about lying. "This supplying a story by invention," he wrote, "is certainly a most scandalous crime . . . that makes a great hole in the heart, in which by degrees a habit of lying enters in." Appearing piously to accept the puritan canon, Defoe set briskly to work exploiting it in "Robinson Crusoe," "Moll Flanders" and the rest—with the consequence that this father of falsehood became too the father of the English novel. The abiding significance of Defoe lies here—lies in all that, wittingly and unwittingly, he achieved of sheer creation. On this ground, unfortunately, Mr FitzGerald is perfunctory and somewhat naïve. His interest is in Defoe's active career considered as a social document. His book will appeal to anyone who wants a lively account of the period, centred in a remarkable personality, and written in a popular style.

Shorter Notices

PRINCIPLES OF BRITISH INSURANCE.
By Harold E. Raynes.
Pitman. 189 pages. 20s.

"Principles of British Insurance" deals with its subject in a refreshingly broad way. Mr Raynes sets out in his book, which is in a sense a sequel to his "History of British Insurance," to "illustrate the universality of a principle from instances drawn from many branches and classes of insurance." Three groups of chapters deal respectively with those principles of insurance that have a purely economic basis, those that have a financial basis and those that stem from common and statute law. Insurance is seen as a process of specialisation in the economy of commerce and industry; while insurance with the market is a highly efficient means of averaging risks, it is not necessarily—as some people within the business sometimes naively maintain—always the best way of doing so.

Although the book is packed with detail, it is very readable. The reader from outside the business is given a comprehensive insight into the principles that underlie the underwriting of insurances which today bring in a global premium income of well over £1,000 million (fully half of which comes from overseas) and which—in the life assurance and annuity branch—are the main channels through which personal savings in this country nowadays reach industry. Principles and practice are, however, not always easily separated; Mr Raynes might with advantage have given the non-technical reader a somewhat greater insight into the practical application of the principles that he so clearly expounds.

Readin'...Writin'...Bankin'!

Read how bank money helps meet the demands for bigger and better schools

"HEY, you should see our new school!"

Twice-as-big classrooms, soundproofed and scientifically lighted. Broad corridors. Sparkling bright cafeteria. And a king-size gym. But who's a second-grader to thank? Good old tax-paying dad, of course, and also . . .

THE BANKS? Correct! A roomy, glittering new school can cost well up into millions — and there has to be ready money standing by.

Where Does It Come From?

Few communities have the resources to furnish the immediate funds needed to complete a new school building. The usual procedure is to spread the cost over a period of years by borrowing through the issuance of the municipality's bonds which will be paid from future taxes.

Here's how it might work in your town. Your municipality issues its bonds to cover the amount of money needed. The cash? Well, it frequently comes from banks which bid in open competition for the bonds, either for their own investment or for resale to the investing public. The result is cash on the barrelhead, at the lowest competitive interest cost to your community.

When you take this picture and enlarge it — multiplying a single grade school in a single community by thousands of elementary schools and high schools — you see that banking is as vital to American education as to American industry.

Whether bank loans or investments mean bigger and better schools or newer and better products, the important fact to remember is this:

Money is going to work, and when money goes to work, men and women do, too! This cycle provides a higher standard of living for all.

Chase National Bank is proud of the part it is playing in American progress.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Foreign Aid Yet Again

Washington, D.C.

DESPITE those members of Congress who swore that last year was positively the last time they were going to vote for "giveaways" abroad, mutual aid has survived another annual review. The formidable official front presented by the Administration overcame this determination to call a halt to programmes which not only give no tangible benefit to the American voter but also seem to bring insults and ingratitude from foreigners. After confidential sessions with leading representatives of the State Department, the Joint Chiefs of Staff, the North Atlantic Treaty Organisation and the Foreign Operations Administration, well briefed with charts, visual aids and secret information, each of the four congressional committees involved—the Foreign Relations and Appropriations Committees of the Senate and the corresponding groups in the House of Representatives—recommended in turn what was essentially the official programme. Each, of course, left on some of the details its own characteristic touch or blemish.

The Mutual Security Act of 1954 is a consolidation of eleven previous laws relating to the spending of American money abroad, and the categories of aid are somewhat redefined, so that direct comparison with previous programmes is not always possible. But certain trends are clearly visible: the total spending authority requested from Congress for the current 1955 fiscal year was smaller —$3.4 billion, compared with $4.7 billion for the 1954 year which ended on June 30th and $6 billion for 1953—and the emphasis had shifted a little further from economic to military aid and from Europe to the rest of the world, particularly Asia. Since these trends are popular with Congress, they were strongly emphasised in the presentation.

Under the new aid classifications by far the largest item, "mutual defence assistance," for which $1.5 billion was requested and $1.6 billion authorised, is straightforward military aid—the supply of arms and equipment to allied forces; most of these supplies come from the United States, but contracts are placed abroad for about twenty-five per cent of the total under the scheme for offshore procurement designed to strengthen the defence industries of allied countries. The original request from the Administration for "direct forces support" consisted largely of two items—$800 million to help pay for the war in Indo-China and $75 million as a contribution to the cost of re-equipping the British Royal Air Force with the latest jet aircraft. "Mutual defence support," for which nearly $500 million was requested and $400 million authorised, is economic aid with military strings, to help countries, like Turkey, whose economies would not otherwise be strong enough to maintain their present level of armaments. Turkey, indeed, is the brightest star in the Foreign Operations Administration's firmament; its sturdy defence effort, strengthening economy and proven willingness to adapt its laws to encourage private investment from abroad are a great comfort to FOA when called on to show concrete results for its expenditure of American money.

"Technical co-operation" is the old Point Four programme, involving the teaching of skills by American technicians to people in underdeveloped countries, while "development assistance" is the residuary legatee of economic aid without strings; its most important single item is the American subvention in support of the Indian five-year plan. Nearly $200 million has been authorised for development assistance and $133 million for technical co-operation; the remaining programmes have been allotted $123 million. About half of mutual defence support, almost a third of development assistance and about a fifth of Korean relief will take the form of American agricultural surpluses; they will be given to the governments concerned and sold for the local currency which will, in turn, be available as counterpart funds for purposes agreed upon with the United States.

★

By far the most difficult task for the spokesmen of the Administration was to explain, first of all, to members of the congressional committees why new authorisations were needed at all in view of the large sums of money on hand from previous legislation, and then, when the members seemed convinced, to coach them in the arguments they must use to convert their sceptical colleagues in the full debates on the floor. Two sums of money are involved—$7.7 billion which is obligated (that is, committed under orders and contracts already placed for future deliveries) but not yet spent, and $2.6 billion which is earmarked for particular programmes but is neither obligated nor spent.

The first of these sums represents the ordinary problem of the pipeline which affects any military programme because of the length of time it takes to build modern weapons. The second arises because only when there is a congressional authorisation can the American government undertake to supply the equipment for, say, a modernised Turkish Air Force. It might be a matter of years before the Turks would be ready for their new aircraft, and funds set aside for this purpose would remain unobligated until the

contracts had actually been signed or the planes had been released from the US Air Force and were within sixty days of being sent to Turkey.

This complex question gave rise to the most crucial debate in the Senate during the passage of the Act. Since the Administration is not planning to spend more than about $5 billion on foreign aid in the coming year it was argued that, even if not a single dollar of new money was authorised, there were enough funds in hand for at least two years' operations. The attempt of the Democratic Senator Long of Louisiana to cut the requested authorisation by $1 billion failed, but his next proposal, to cut it by half that amount, was carried by 69 votes to 13. The final figure for the authorisation, $3.1 billion, which is in effect a ceiling, was a compromise between the sums voted in the Senate and the House; the figures for the actual appropriations, which will include money to be spent this year under earlier authorisations, have still to be arrived at in a similar manner.

Otherwise the debates revolved around a few particularly controversial points in the programme. By approving, with only a slight reduction, the request for economic assistance for India, Congress endorsed the State Department's thesis that the United States needs to support non-Communist countries even if they do not acquiesce in American foreign policy, in order to prevent them from being driven into Communism by economic distress. Also, by giving the President the widest discretion in the use of the money that had been intended for the war in Indo-China—$712 million was finally authorised—Congress underwrote in advance the State Department's plan for an ambitious programme of economic aid to South East Asia which should wipe out the memory of colonialism and stiffen the people's resistance to Communist infiltration.

*

Two items that were completely wiped out by the House of Representatives were partially restored in the Senate. The House, influenced by a Senate Committee's report on the British aircraft programme, voted against the provision of $75 million to help the re-equipment of the RAF, largely on the ground that American taxpayers would thereby be indirectly subsidising British competition for the American civil aircraft industry. As a result of the Senate's efforts $35 million was put back for the RAF. Secondly, the Senate is doing something to repair a serious blunder of the House, which left the American contribution to the United Nations technical assistance fund out of its Appropriations Bill, apparently because it was worried that American money would be used to employ Communist technicians. This was all the more unfortunate as the recent Soviet decision to contribute to the fund for the first time had been hailed as a great triumph of American psychological warfare.

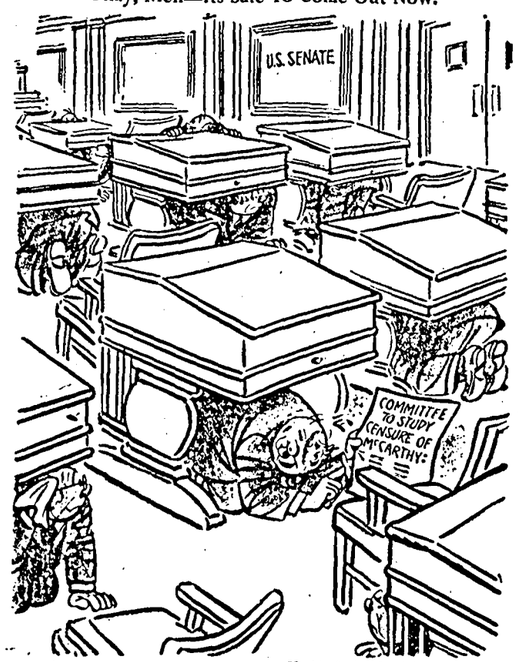
As usual Congress added to the Act a number of its own thoughts about the conduct of foreign policy by its own and other governments. It declared itself opposed to the entry of Communist China into the United Nations, and wanted a special report from the Administration if this seemed likely to happen. It was in favour of the European Defence Community, and of gradually cutting off military aid from those signatories that do not ratify the treaty; Congress was also in favour of a Pacific Pact. Mr Stassen was given notice that his Foreign Operations Administration must disappear next year because its existence provided an institutional vested interest in the continuation of foreign aid and provisions were also included for liquidating purely economic aid in two years' time. But by the end of this year's debate few members of Congress were doing more than murmuring cautiously under their breath that they hoped this was the last foreign giveaway they would have to provide.

Harvest Home

THE Senate began the week in which it expects to complete this year's legislative harvest by bringing the main load of the important farm Bill into the Administration's barn. A number of sheaves still remain to be gathered up in the agricultural field by the conferees who will have to reconcile the differences between the House and Senate Bills, but on the essential principle of farm price supports both versions agree. Next year the prices of five of the six "basic" crops—wheat, maize, cotton, rice and peanuts—will be supported at levels which may vary from 90 per cent down to 82½ per cent of parity, depending upon supply and demand. Tobacco farmers, who have kept their surpluses under control, will still be entitled to price support at a fixed 90 per cent of parity.

The President and Mr Benson, his Secretary of Agriculture, have thus reaped the reward of their steadfast refusal to be diverted by political arguments from their insistence that the present agricultural programme would sink under the weight of its own surpluses unless flexible price supports were substituted for the rigid 90 per cent of parity which Congress has maintained for so long. Mr Benson had to compromise on a floor of 82½, instead of 75, per cent of parity, but in fact wheat is the only basic crop in such over-supply that its support price might have gone below 82½ per cent in the coming crop year. What is important is that Congress, rejecting the advice of its agricultural committees, has at last given practical recognition to the principle of flexibility for farm prices.

This notable victory was achieved in the Senate, as it had been in the House, mainly by splitting the farm bloc, but on the second occasion less political pressure seems to have been required. Senators may perhaps have begun to suspect that many farmers sympathise with the President's view that an agricultural programme which benefits the whole country is the best kind of politics. Dairy farmers, however, have already, under the existing legislation, felt the effects of flexibility and they have been protesting against last spring's reduction, to 75 from 90 per cent, in the price support level for butter. They induced the House to raise the floor to 80 per cent of parity but in the Senate the President's arguments prevailed on this point too, so that the exact level of future supports for butter prices is one of the points that has to be settled in conference.



Parity is a standard for farm prices, calculated according to a complicated formula, which is designed to give the farmer a fair return for the things he sells in relation to the costs of the things he buys.

Support Prices are guaranteed by the government, either by means of loans on crops or by direct purchases, in order to prevent the prices of the more important farm commodities from falling below a certain level.

Six in Search of McCarthy

SIX conscientious Senators, three Republicans and three Democrats, have agreed to serve on the committee which is to weigh the charges laid against Senator McCarthy in support of Mr Flanders's resolution of censure. They do not include any of the distinguished names it was hoped to secure, but they command, if not enthusiasm, at least respect. This is not only because of their willingness to undertake a politically unenviable task, but for their judicial temperament—three in fact have sat on the bench—and for their concern for the good name of the Senate. Only one of the six is up for re-election and five come from southern and western states where McCarthyism is not a burning issue. What is remarkable is to find six Senators of whom it can be said that they have not prejudged the case. It is not surprising that the list is weak in striking personalities.

"Okay, Men—Its Safe To Come Out Now."

Herblock in the *Washington Post*

The committee got off to a promising start by unanimously electing Senator Watkins chairman and Senator Johnson of Colorado vice-chairman, and by firmly rebuffing Senator McCarthy's impudent efforts to join its sessions on the procedures to be adopted. A semi-judicial atmosphere will be maintained by excluding the television cameras and forbidding live radio reporting of the actual proceedings, but the public will be admitted. The rules of evidence used in federal courts will be followed. The first task will be to sift the 46 charges: there is evident a disposition to drop some, which "lack substance," and others, such as Senator McCarthy's slander of General Marshall, on the ground that they raise difficult questions of senatorial free speech.

The first cynical conclusion, that the committee had been created simply to smother an unwelcome issue, has been somewhat modified by Senator Watkins's insistence that, although hearings will not begin until August 30th, some time after the Senate finishes its legislative work the report will be in before the election. There are some doubts whether Mr Watkins will be able to keep to his time-table now that Senator McCarthy has been given the right to cross-examine witnesses. And certainly few of the Senators who took cover when Senator Flanders first levelled his resolution will relish coming back to Washington to face the Committee's fire. But the six Senators in the front line evidently do not mean to give the Senate any excuse for ducking a second time.

Economic Dynamite?

FROM A CORRESPONDENT IN WASHINGTON, DC

IT was no accident that the President termed the vast tax revision Bill, now passed by Congress, the "cornerstone" of his legislative programme. His satisfaction with the measure was a reflection, not of its impact on the budget, but of its embodiment of what can properly be termed Republican philosophy. Although in most other areas of legislative action the Republicans arrived in Washington with either no philosophy at all or a simple "ag'in the government" instinct, they knew exactly what they wanted in tax law. Their thought paralleled to a striking degree the moderate conservatism of the Committee for Economic Development, a postwar organisation of twentieth-century-minded businessmen committed to Keynesian counter-cyclical fiscal policy, but sharply anti-New Deal in their view of how the revenues should be raised.

This similarity was more than coincidence; Mr Marion Folsom, the intellectual executive from the Eastman Kodak Company who took over the job of Under Secretary of the Treasury and has worked almost exclusively on tax matters, formerly headed the CED. His labours, and those of the appropriate committees in Congress, have resulted in almost 1,000 pages of legislation and the first complete rewriting of the tax code since 1876 (when it was a simple code indeed by today's standards). This would, of course, have been a major achievement even had it not also been accompanied by a distinct about-face in much of American tax theory.

The Republicans will not presumably be emphasising the point in campaign speeches, but the items in this Bill which Mr Folsom and his chief, the Secretary of the Treasury, Mr Humphrey, most wanted—and got—relate solely to business. They discovered long ago that some relief for individuals would be required too, if only on political grounds, although they shrewdly reduced the impact upon the nation's revenues by providing this relief in the form of correction of "injustices" in the law without changing the tax rates. But their hearts were set on reform in the mysterious—to the public—area of corporate taxation.

The most controversial section of the Bill gives modest relief from "double taxation" of dividends (the phrase arises from the fact that corporate profits are taxed at the corporate level and then again at the individual level after they are distributed as dividends). This was done in the belief, for which there is considerable statistical support, that corporations in the postwar period have been doing far

too much of their financing through borrowing of various kinds (some 75 per cent of all the new money raised) instead of through sales of equities. The consequent debt "overload" is felt to act as a deterrent to new financing and hence to expansion.

Expansion, indeed, is the key word. Republican philosophy holds that the old tax structure, combined with the present inordinately high rates, was a positive deterrent to expansion of business and industry. The conviction that the root of depressions and of prosperity is in the investment sector of the economy and not the consumption sector is sharply challenged by the Democrats, who argue that productive capacity is now, if anything, too great; that more consumption is what is needed; and that therefore any income tax reduction should favour the poorer classes, who spend their money fastest.

★

The dividend relief for individuals is probably the least important of the four key provisions for stimulating expansion; some economists, notably Professor Alvin Hansen of Harvard, doubt whether this provision will ever reverse the overload of debt which prompted it. The Administration's favourite remedy is more rapid depreciation. The new law sets up a series of optional methods for writing off new plant and equipment for tax purposes, all of which give corporations the right to charge off much more than formerly in the early years of the life of the equipment.

As it will work out in most cases, a corporation will be able to deduct twice the present amount for depreciation in the first year after purchase of a new piece of equipment and two-thirds of the total in the first half of the equipment's life. Although theoretically the total tax burden remains unchanged, in fact most corporations replace a piece of equipment, or would like to, long before the tax collectors are willing to concede that its usefulness is exhausted. The high rate of write-off in the early years will undoubtedly be an inducement to buy new machinery—an inducement which a few Democrats charge will cost the staggering total of at least $19 billion in loss of revenue over the next eighteen years. It should be noted, however, that such staunch "liberals" as Senators Douglas and Sparkman voted for the provision.

Second comes loss "carryback." From now on corporations which suffer losses will be able to get refunds for taxes paid in both of the two preceding years, instead of only for one year. They will also continue to be able to "carry forward" their losses for six subsequent years. The change is designed to encourage risky ventures which are likely to lose money at first.

Third is reform in a provision originally designed by the New Dealers as a "loophole closer"—a penalty tax on closely held corporations which withhold dividend payments in order to save taxes for the owners. This penalty is felt by Mr Folsom to be a major deterrent to retention of earnings by small businesses, and a drag on their ability to expand. The new law exempts earnings up to $60,000 and beyond that puts the burden of proof of "improper" accumulation of surplus on the Treasury.

In private conversation, Administration economists have been full of examples of Company X which would build a new plant if the loss carryback provision were enacted, Company Y which would launch a purchase of new machinery worth $100 million if the depreciation provision were enacted, and so on. Their confidence may soon be put to the test. Spending on new plant and equipment in 1954 is now scheduled to fall off a shade from last year's record $28.4 billion, according to both private and government surveys; it is expected to decline even more next year. The next surveys should show whether this trend has been reversed; if it has, needless to say there will be an important fillip for the entire economy. The Republican economists are so convinced it will that they unblushingly term the tax bill "economic dynamite."

★

The thousand pages of the Bill are, of course, by no means concerned only with major changes in corporate taxation. The relief provided for individuals—ranging from the expenses of travelling salesmen to deductions for the hire of "baby sitters"—is not to be discounted. Under the unusually hazy revenue estimates accompanying the Bill, these provisions (including the dividend relief) will save an unspecified number of taxpayers some $800 million in their taxes this year. Regrettably for the Republicans, most of these millions of taxpayers will probably not appreciate their good fortune in time for it to influence their votes in November; most people have, understandably, given up trying to understand the new Bill, and their next tax returns are not due until April.

Finally, the Bill contains literally hundreds of what are being called "lawyers' changes," designed to correct anomalies in the law, to close some tax-avoidance loopholes, and generally to simplify the tax code. Some of the Administration's proposals, which would have made major changes affecting pension trusts and corporate mergers, proved too much for Congress to stomach. But even the disgruntled lawyers who will have to learn their tax law all over again concede that the bulk of the changes finally enacted were highly desirable. And on the Bill as a whole, the Republicans can congratulate themselves on having written into the law a set of conservative principles whose recognition had for many years seemed only a forlorn hope.

Independents Break Down

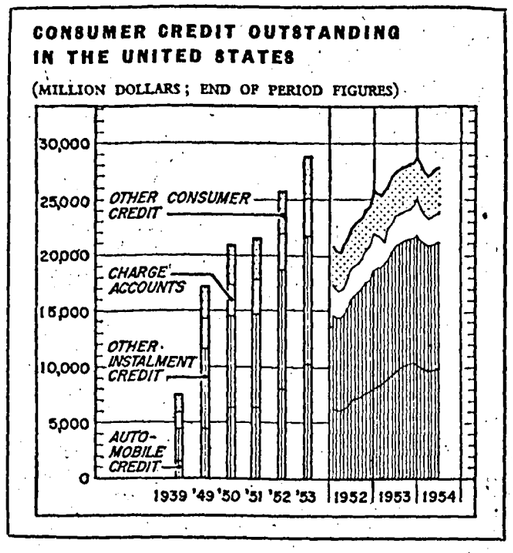
A SPOTLIGHT has been turned on the growing troubles of the small "independent" automobile manufacturers by the Studebaker Corporation's announcement that it must end its contract with its employees at its plant in South Bend, Indiana, unless they accept what amounts to a reduction of 14 per cent in their pay. Only thus can the company, which has been operating at a substantial loss this year, get back on to a competitive footing in the industry. In rejecting this proposition, which is now being reconsidered, the members of the trade union also rejected the advice of their leaders, who pointed out that wages of Studebaker employees were still on a piece work basis, which it is now proposed to abandon, and were 20 per cent above the average in the industry. The labour force has already been cut by half and the factory has been working less than half-time this year as the result of the fall in sales of Studebaker cars.

The other independent companies are almost as near a complete breakdown as is the Studebaker Corporation, without having the excuse of an unusually generous wage contract. Altogether the independents have been producing only about 3,000 of the 105,000 or so cars now being made a week, and it is mainly because of the drop in their output that the total is running about 10 per cent behind last year. Employment in the industry has fallen by about 25 per cent in the last twelve months and is expected to fall more in the next few weeks. For most manufacturers are returning to the prewar practice of an almost complete shut-down during August and September in order to retool for the production of completely new models. The particular advantage of such a policy this year is that it should give dealers time to clear their showrooms of the excessive stocks about which they have been complaining. The Chrysler Corporation is already in the process of closing down, and hopes to make a fresh start in October with particularly striking new designs.

How badly this company, technically one of the Big Three, but a very poor third nowadays, needs a fresh start is shown by the recent halving of its quarterly dividend. This came during a period when the net income of the General Motors Corporation was higher than ever before, except during the first half of 1950. This firm is producing just as many cars as at this time last year, well over 55,000 a week, and the Ford Company, with 32,000 a week, has been doing even better than last year.

Another Southern Swallow

THE handsome victory of Senator Kefauver in the Tennessee primary elections adds one more to the string of liberal successes which since May have been the striking feature of the southern primaries. In the still predominantly one-party South, the voters make their real choice at the primaries at which they pick the Democratic candidate. Senator Kefauver won by 380,000 votes to 168,000 for Representative Sutton, who regarded "internationalist" as an abusive epithet, attacked his opponent's "left-wing" tendencies, and promised to try to maintain racial segregation in the schools. Mr Ray Jenkins, of the Army versus McCarthy hearings, won the Republican nomination, but still insists he will not run.



Senator Kefauver is, of course, nationally known for his part in the Senate crime investigating committee and his unsuccessful effort to win the Democratic nomination for the Presidency in 1952; it may be unwise to read too much into his triumph. Nevertheless, the southern swallows are now numerous enough to attract attention. Even in Arkansas, the only southern state where a conservative has won, Senator McClellan was given a close shave by Mr McMath, his liberal opponent.

Victories for southern liberals, however heartening, make no summer for the Democratic politicians calculating their chances of capturing the Senate. Whether the South chooses liberals or conservatives, they bear the Democratic label. The border states, such as Kentucky, where Senator Cooper, for the Republicans, and Mr Barkley, Mr Truman's Vice-President, promise a battle royal, are a very different matter.

The high Democratic confidence of a year ago seems to be moderating; Mr Stevenson talked recently of winning a 20-40 vote majority in the House compared with the figure of 60 which used to be a common Democratic assumption, and Mr Truman has stressed the party's needs for money. The Democrats have had a series of unexpected misfortunes, such as the death of Mr Blair Moody, who was expected to give Senator Ferguson of Michigan a run for his seat. Because Mr Moody died when it was too late to enter a new contender, the Democratic standard will be carried by a little-known labour leader, Mr McNamara, who is supported by a group of dissidents; in the Democratic primaries a protest and "memorial" vote half as large as Mr McNamara's was rolled up for Mr Moody. But in addition to these individual blows, the Democrats are beginning to suspect that the farm revolt and the economic recession, which they counted on to swell the Democratic tide, are failing to materialise, and that consequently their chances of capturing the Senate, in which 22 Democratic and only 15 Republican seats are at stake, are less promising than they were.

Confident Consumers

PERSONAL incomes in June, at an annual rate of $286.4 billion, although higher than in May, were nearly $1 billion lower than in June of 1953, a record-breaking year; but for the first six months of 1954 the total was slightly above the comparable period of last year. The comforting levelling-off in unemployment, a trend which was continued in July, promises that personal incomes will also be maintained at a satisfactory rate. More important from the economic point of view, these incomes are being spent. Retail sales are now running at about the same level as in 1953, after having fallen substantially below that level in the spring; as a result business inventories were again reduced in June, although they are still high in relation to current sales.

The June rise in buying on the instalment plan, although largely explained by the seasonal increase in automobile purchases, shows that consumers have sufficient confidence in the future to be willing to add to their commitments. That they are ready to buy, if manufacturers and shopkeepers offer them things they want at prices they like, is confirmed by the latest report from the reliable Survey Research Centre at the University of Michigan. According to *Business Week*, this report shows that consumers have been reassured by the steadiness of prices and of incomes—and more of the latter are now available for spending as a result of tax reductions. Consumers are thus more optimistic and more inclined to buy than they were at the end of 1953. This feeling is confined almost entirely to the higher income groups, families with $5,000 or more a year, but this is where most of the purchases, of durable goods in particular, come from. The report therefore holds out hope of an encouraging rise in the personal consumption expenditures which are responsible for nearly two-thirds of the gross national product. They have in fact remained very steady over the past year and the explanation of the drop in GNP, from an annual rate of $371.4 billion in the second quarter of 1953 to one of $356 billion in the second quarter of this year, lies in the reductions in private investment and in government spending.

Hindsight About Coffee

New York

THE general effect of the Federal Trade Commission's long-awaited broadside, fired at the coffee trade on behalf of the coffee consumer, is more that of an indiscriminately aimed popgun. The basic conclusion of the report on why green coffee prices spiralled upward from 58 cents a pound last December to 96 cents in April is that, since in fact there was no severe shortage of coffee this year, the explanation must lie in market imperfections, trading irregularities and heavy speculation, both in Brazil, which supplies most of the coffee used in the United States, and on the New York Coffee Exchange.

In reply to the allegations outlined in detail in the FTC's 1,100-page report, the Brazilian growers disclaim any deliberate falsehood in their crop reporting and point out that the increase, from 53 to 87 cents a pound, in the level at which their government supports the price of coffee did not come until two months after the top of the market was reached. It could therefore hardly have been a cause, as the FTC argues, of the price rise in New York, and in any case, say the Brazilians, their government should not be blamed for following a well-established US precedent and protecting the growers of its most important commodity against a price decline.

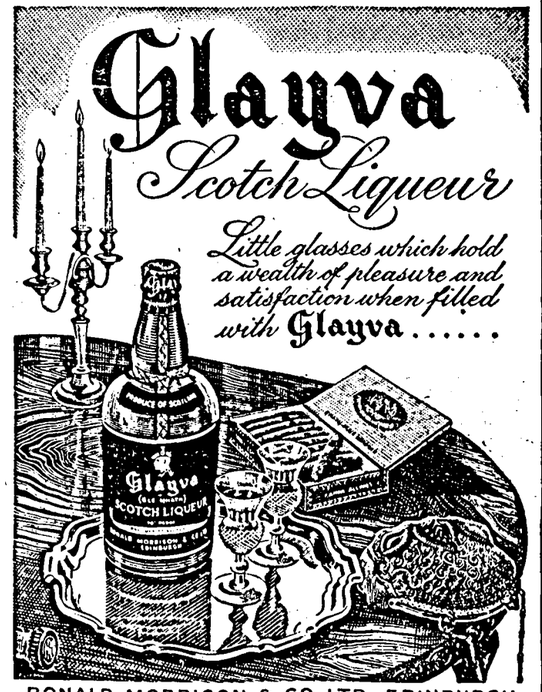
The Coffee Exchange, for its part, repudiates the suggestion that trading irregularities affected prices and disputes the FTC's contention that the "restrictive contract" used on the exchange limits futures trading to about 10 per cent of annual US coffee consumption, and thus maintains a narrow market subject to wide price fluctuations. The fundamental criticism of the FTC's report, however, is what the *Journal of Commerce* calls its "hindsight." It ignores the essential functions of a commodities futures market, which owes its existence to the inaccuracies inherent in any estimate of future supply and demand and where speculation plays an essential part. Had the market known last December what it knows now—that the first reports of the frost damage to the Brazilian coffee crop were much exaggerated—precautionary and speculative buying would not have been as heavy as it was. But to judge last year's price movements by this year's knowledge, as does the FTC, is clearly unsound.

The legislative remedies proposed by the commission are open to similar objections. The coffee futures market is certainly narrow enough to permit undesirably sharp price fluctuations, but the technical difficulties of broadening the market are very great. Similarly it is doubtful whether coffee could be effectively regulated by the Commodity Exchange Authority which has not so far had to deal with imported commodities. More money for American crop reporting services in Brazil could do no harm, but the experience of domestic crop reporting within the United States suggests that wide margins of error in initial crop estimates are unlikely to be avoided.

SHORTER NOTES

American Airlines, the country's largest airline and the world's largest passenger carrier, has been paralysed by the walkout of its 1,200 pilots. The strike was called by the Air Line Pilots Association in protest against the danger of crews being required to fly for over eight hours on the new trans-continental non-stop flights. The Civil Aeronautics Board has approved this and members of the same union are in the air for longer periods on overseas flights. The two other airlines flying across the continent non-stop schedule their flights at 7 hours 55 minutes which, according to American Airlines, is "unrealistic."

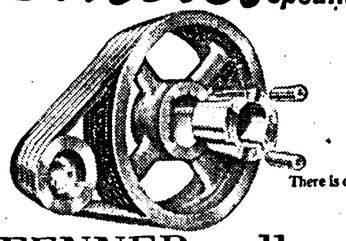
★



Congress has finally killed, for this session at least, all hope of statehood for either Hawaii or Alaska. The powerful Rules Committee of the House of Representatives rejected a proposal to let the separate Senate and House Bills—the former conferring statehood on both Alaska and Hawaii, and the latter on Hawaii alone—go to conference in an attempt to reconcile the differences between the two versions.

★

The Department of the Interior, with the support of President Eisenhower, has upheld Texas's claim to ownership of the submerged lands three leagues out from the state's coastal boundary. Since the passage of the tidelands oil Act last year, giving coastal states the title to all oil and mineral resources in the submerged lands within the states' "historic" boundaries, Texas has contended that its historic boundary extends three leagues (10.5 miles), rather than to the generally accepted three-mile limit; the federal government is now in the process of leasing underwater areas for oil drilling beyond the state boundaries. The Justice Department has not yet given its views on the Texas claim, which may also be made by Florida.



★

The Supreme Court, giving practical effect to its recent decision against racial segregation in schools, has appointed its first Negro page boy who will also be the first Negro to attend the special school for the page boys employed on Capitol Hill.

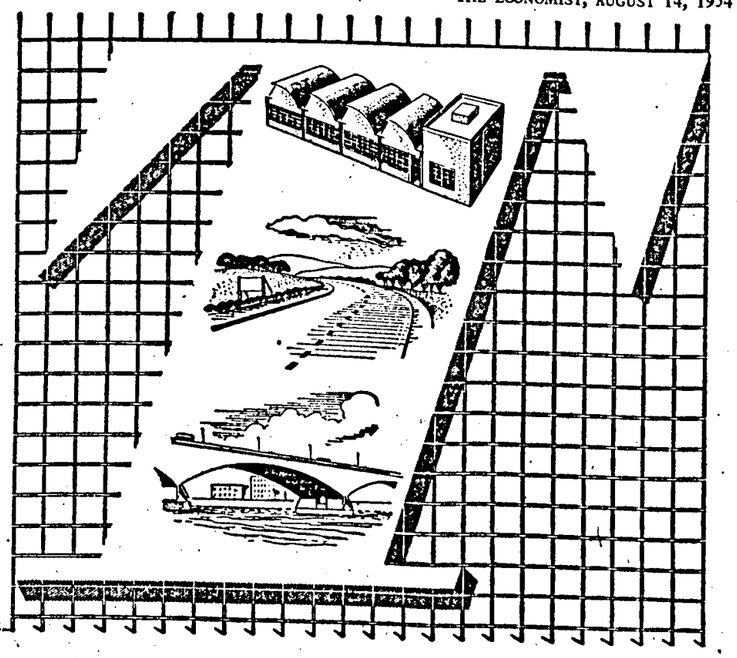
HAVE YOU DRIVEN THE SHELL MILE?



The Shell Mile is the smoothest and liveliest distance between any two milestones. It is the most enjoyable, the least tiring, the shortest-seeming mile in the world. So it's hardly surprising that a million more Shell miles are driven every day than any other kind.

The thing that makes a Shell mile such an improvement on any ordinary mile is the new Ignition Control Additive (I·C·A) in Shell. I·C·A releases your engine's full smooth power from engine deposits that hold the power in. It prevents both pre-ignition and plug failure caused by deposits. The difference it makes is a revelation.

Have you tried the two-tankful test?

It's a Wireweld World

In roads and bridges and buildings, in fact wherever concrete is used, Wireweld fabric reinforcement finds its place. Its strength and ease in handling mean lower costs—and talking of costs—the aim of Twisteel's drawing offices is economy in the structural design of Factories, Schools, Flats, etc. Finer buildings at lower cost.

Strike and Boom in Germany

THE strikes in Federal Germany have come unexpectedly. Only a week ago, economic reports were recording an almost cloudless sky. Even the business man's perennial worry about the lack of a market in which to raise risk capital and low-interest loans was showing signs of lifting. In industrial circles it was said with satisfaction that the trade unions seemed to be losing ground because the workers were fairly satisfied with the better life that they were increasingly enjoying. This complacent view was statistically based on the drop in union membership that has taken place, leaving only about one-third of the 16.5 million employed persons organised. It was also founded on the fact that Herr Freitag, the Socialist chairman of the DGB (the German Trade Union Congress) had declared that, although bigger wages would be demanded in certain branches of industry, there would not be a general movement for increases. Moreover, peace in the labour world has lasted for so long that everyone had come to feel that "Germans don't strike."

What has happened to shatter this complacency? So far, nothing very much by the standard of Britain. There has been a strike of transport and public service employees in Hamburg, after arbitration failed; and strike orders issued by the Bavarian Metalworkers' Union have been obeyed by a majority of the 200,000 members of the union—one in which there is some extreme left-wing influence. A threatened strike of metalworkers in Baden-Württemberg was settled by a compromise in which the unions accepted an increase of 6 to 8 pfennigs an hour in place of their demand for 12 pfennigs.

A sensational picture of German labour trouble is therefore hardly justified by actual events. The fact of the matter is that an unexpectedly large number of individual branches of unions with about 1½ million members have terminated wage agreements, and these moves may or may not lead to strikes. In the Ruhr improvements have been demanded for 900,000 workers, including about 180,000 of the miners. For the sake of proportion, it may be recalled that the British engineering unions which are now demanding a revision of their wages structure, or a general increase of 15 per cent, cover alone 3 million workers; and that the average wages of British workers are already considerably higher than in Federal Germany.

The executive of the DGB would certainly like to demonstrate its power to give a bigger share of the increasingly large national cake to its members, by increased wages funds and the forty-hour week. But the structure of the unions prevents them from exercising completely centralised direction. Largely owing to the good influence of the British in the early days of occupation, the Communists were frustrated in their attempts to set up a single centralised Union, controlling industrial branches, and the German DGB was formed by democratic Socialists on the pattern of the British TUC, leaving individual industrial unions to decide their own wage policy. In addition, the federal structure of the country enables unions in the various *Laender* to fix different local rates for the same industries. There is, therefore, a lack of uniformity which the Christian-Democrats would like to increase by setting up Catholic unions such as existed before Hitler smashed the whole German union organisation.

Details of the rights and wrongs of the unions' case are not easy to assess, but the main lines of evidence are in their favour. Conflicting statistics on the relation of wages and profits, and the standard of living, are being produced by the research organisations run by the DGB and the employers' association. Some basic points, however, seem incontestable. One is that the German worker has a higher real wage than before the war, but that this is chiefly due to the fact that his living accommodation is still wretched and subsidised. Only about 7 per cent of incomes, instead of double that amount, is now paid in rent by the now average west German compared with prewar days. (This is a situation which will be altered by the present government, which is planning to apply some principles of free market economy to housing.) Another uncontested fact is that productivity has greatly increased in the last year or two, owing to big investments in new plant. Yet another obvious point is that German industry is enjoying a boom. Higher dividends are being paid. Should they, in part at least, have gone on wages instead? The employers' answer is that they must pay higher dividends if a capital market is to be opened up, and they must have public investment for further expansion and modernisation. But objective economists point out that higher wages in Germany mean larger savings, and these funds would find their way back as investment to industry.

To the outside observer it seems that the chief economic adviser of the trade union headquarters, Dr Agartz, and his opponents in the employers' institute are both fighting on weak ground. Dr Agartz wants an "expansionist wage policy" because he argues that the German economy needs an injection of greater purchasing power if progress is to be continued. This is an exceedingly doubtful proposition. The best argument for an increase in wages is that it would

be socially just, and that the money would not be spent on television sets, but mostly on giving the workers a stake in house property, and in savings for a rainy day.

But there is just as little to be said for the exaggerated propagandist objections put up by the employers, and printed in the government sponsored *Diplomatische Korrespondenz.* The line taken is that wage increases would have to be added to prices and would endanger the German currency. As though this hair-raising threat were not enough, it is added that exports would be damaged and taxation reform hindered. The employers' argument —that it would be better to increase production and lower prices—would be exemplary were it not for the fact that German industrialists like to run cartels for the sole purpose of keeping prices up.

The danger of the present labour move is, indeed, in the first place political. It lies chiefly in the intransigence of many German employers, so long spoilt by years of prohibited strikes and by the willing and diligent nature of their workers. It is unfortunate, to say the least, that Dr Dehler, head of the party of "big business," the Free Democrat Party, should have just repeated a demand which roused great indignation in the DGB when he first made it—that strikes in the public services should be prohibited by law. The most serious factor is perhaps that the Bonn government is not accepted by the unions as an unbiased mediator. In the Ruhr-Rhineland, the moderate Catholic Premier, Herr Arnold, once had a coalition with the Socialists, but he has now taken the Free Democrats into his cabinet at Dr Adenauer's insistence. Dr Adenauer needs his coalition with the Free Democrats in Bonn for the purposes of his foreign policy, but the price in internal affairs may prove to be too high if the Chancellor's partners hinder a compromise with labour. The essential for west Germany is that there should be stability, and that the workers should be given a vested interest in upholding the democratic state against extremists of right and left when the present boom is over.

Hush over Cyprus

BY A SPECIAL CORRESPONDENT

AT a blow, Cyprus's new sedition law has deprived the Cypriot Greek press—from that of the Communists on the left to that of the Church on the right—of the theme that has been providing about four-fifths of its editorial matter. By branding as seditious any intention to bring about a change of sovereignty, it precludes all talk of *enosis*. It creates a terrible dilemma for editors, café orators, demagogues and even hairdressers. Seen from London, it may seem un-British; seen from the bosom of the anti-colonial bloc at UN, of course it looks a piece of typical imperialist tyranny; but in Cyprus its effect has been more mixed.

Unforeseen in its timing, and coming after so many years of British inaction and *laisser-aller,* it took everybody by surprise. It created an extraordinary hush, even in private. People were reluctant to discuss it and tended to drift off vaguely if tackled; anyone who spoke up did so in tones of sad resignation. All Greek newspapers went on strike for a week, at the end of which the first to reappear conformed to the law and confined themselves to quoting London newspapers that had criticised it. Are no Cypriot martyrs to arise? If not, and if the only choice Cypriots now see before them is either to shut up or else to emigrate, the Governor will have scored a moral victory by forcing them to show how much or how little they really mind.

Talk is the Cypriots' favourite pastime, and the question of the next months may well be whether, if deprived of the *enosis* topic, they will not have breath to spare for discussing their own politics. When the British government issued the new constitution last month, it was at once unconditionally rejected by both left and right; but it occasioned some new if timid comment in less extreme circles. No adherents of self-government openly declared their hand, but moderates were ready to discuss it and to express serious disappointment that its terms were not more liberal. The scene suggested that quite a few Cypriots were subconsciously hoping for an end to the political stalemate and for a workable scheme of self-government. But no one can prove that they exist unless they speak louder.

Since then the slamming of the door on *enosis* has certainly done more than merely hearten the Government's secret Cypriot Greek supporters. It has, of course, delighted the Cypriot Turks, who sincerely hope that even a constitution will prove unworkable, since they are sure to find themselves at the mercy of a Greek majority. They at least are genuinely appreciative of the benefits conferred by the present arrangement and by their membership of the sterling *bloc.*

The Unpolitical Right

Were discussion of self-government to come into the open, the left wing is far more likely than the right to cash in upon it as a means of increasing its influence. It has in the past shown a lively interest in a constitution, on behalf of which at least two noted Communists have paid the penalty of expulsion from the Party. The right wing, whose mainspring is the Church, has deliberately abstained from promulgating any political policy, chiefly because the Church does not regard *enosis* as a political question but as a national-religious one independent of politics, and also because it does not wish to offer any scope for the Greek talent for argument. A political policy would entail conflict of belief and opinion and lead to immediate disintegration into a dozen cabals and splinter-movements.

Through this absence of policy the Church has lost all "progressive" following; it has kept its place merely as the repository of national feeling and national religion. The Ethnarchy Council is, however, becoming increasingly conscious that its appeal to the worker and peasant is not a strong one, and is looking about for someone to lead a socialist-nationalist wing which might bring it into closer touch with the masses. A certain amount of direct pressure has been brought to bear on people, for instance, by threatening to refuse them burial in consecrated ground if they do not toe the "national" line, but this form of intimidation is not likely to achieve the desired uniformity of thought except in backward villages. For the Cypriot worker, like all industrial workers, is becoming more materially-minded and radical as he sees the bargaining-power of unions increasing and his rates of pay rising.

How strong is the left? Independent diplomatic sources have given the strength of left-wing trade unions as 16,000, and this compares favourably with figures provided by the party (AKEL) itself. The circulation of the Communist daily, *Neos Democratis,* is in the region of 9,000 whereas the ultra-Right *Ethnos* circulates to about 5,000 readers. *Eleutheria,* a middle of the road nationalist daily, has a higher circulation than either. In estimating the strength of the left, however, one should take into account a fact which AKEL has already underlined more than once: namely that the two years residence necessary to qualify for a vote is a strong factor operating against the worker who tends to move from place to place all over the island. AKEL also claims that most village *muktars* (mayors) are automatically right-wing because they are government-appointed and that they tend to cook the electoral rolls and exclude Communists. The Party membership is given as over 4,500, and it is earnestly insisted upon that no financial assistance of any kind is received from outside Cyprus. Needless to say, the Nationalists do not believe this. Nevertheless in support of this statement the Communists point out that in a recent appeal for party funds, where the target was set for £3,000, the appeal fund in a short time grew to £5,000 without any pressure being brought to bear.

While the Nationalists live in the twilight-sleep of their ethni-religious feelings the Communists have a lively argument-provoking *Pravda*-born point of view to offer Greeks who love nothing better than a political argument. The Communists have views on everything from the hydrogen bomb to village drainage, and consequently must appeal to the vocal, journalist-bred element in the industrial areas. More than this, they have a practical *mystique* to offer peasants struggling towards lumpenproletariat-hood, and the lively left-wing youth organisation AON is scoring quite a success among the young with its organised lectures on Marxism. It would not be grossly misleading to estimate Communist influence in the island as swaying somewhere near 30 per cent of the population, though how uniformly one cannot be sure.

One of the most singular things in Cyprus is the total absence of a moderate socialist party—and here perhaps the Church has made its greatest blunder. The few organised moderate elements seem completely vestigial, commanding no support; yet it is a paradox that in talking to Communists in Cyprus one is continually struck by the moderateness of their views, and cannot help feeling that most of them would be quite happy in the British Labour Party.

Mr Menzies Makes Some Changes

FROM A CORRESPONDENT IN SYDNEY

MR ATTLEE will be quoted with feeling and gratitude by future prime ministers who wish to retain the pleasure and prestige of personally handing out the political plums of cabinet membership to grateful followers. He has declared: "I am quite sure that the method of the Australian Labour party, whereby a number of members are elected (to Cabinet) by the caucus and all that is left to the Prime Minister is to fit the pieces into a jig-saw puzzle as best he may, is quite wrong." The value of this judgment is that it comes from a former prime minister who has made, in the opinion of many, an art of political modesty.

Whether the Prime Minister, Mr Menzies, quoted Mr Attlee in the recent wrangling among the victorious Australian Liberals over the membership of the new Federal Cabinet, is difficult to say. But it is quite on the cards that he did since he was faced with demands from a rather restive and ambitious back bench section which contended that it would be a good thing to allow a party caucus to elect, say, half the Cabinet, leaving the Prime Minister to appoint the rest, according to the Labour practice. For a Prime Minister who has sometimes been accused of being a "one man government," these were decidedly uncomfortable, if not dangerous, thoughts to have rumbling among the back benches. On the other hand, Mr Menzies could convincingly argue that a caucus-elected Cabinet tends to be weak (see previous Labour cabinets); and that a caucus is more inclined to look upon the beauty of the political countenance, than upon the heart of administrative ability.

It was not, therefore, altogether surprising that the only difference in Mr Menzies's new Cabinet was that four Ministers had played musical chairs—with the Prime Minister calling the tune. Mr H. L. Anthony relinquished Civil Aviation but remained Postmaster-General; Mr A. Townley took over Civil Aviation and Air, but relinquished Social Services; Mr W. McMahon, took over Social Services and relinquished Navy and Air, and Mr J. Francis, took over Navy to pair with his usual Army portfolio.

Streamlined Committees

This small reshuffle has given realism to the new defence policy of priority for Air Force expansion. Previously, with both Air and Navy under Mr McMahon, this Minister was in an impossible position in the Cabinet when the merits of boosting land-based airpower at the expense of sea-based airpower was being discussed. This source of ministerial embarrassment persists, however, in the linking of Army and Navy under Mr Francis. But since these two services are to give budgetary ground in favour of an expanded Air Force, Mr Menzies evidently thought it wiser to concentrate the slaughter in the hands of one hatchetman.

In addition to these changes, Sir Eric Harrison, Vice-President of the Executive Council, Minister for Defence Production and Deputy Leader of the parliamentary Liberal party, took over some of the administrative functions of the Prime Minister's department. This was designed to free Mr Menzies for work in the larger field of policy. The shape of policy to come, however, will be considerably determined by the new system, for Australia, of cabinet committees. These will practically replace the old and cumbersome cabinet of 20, which has sometimes been likened to the tower of Babel.

The new system will free Mr Menzies from the chairmanship of cabinet committees old style, though he will, should he so desire, attend any one of the new streamlined affairs. This means that the sixth Menzies Ministry will have its cabinet cake but will subsist mainly on committee fare. There will be questions, no doubt, as to why the British system, which was urged by newspapers favouring the government, was not adopted; by this is meant the practice of distinguishing between Ministers who were members of the Cabinet and those who attend only when the affairs of their own department are under discussion. Although the new committees will do the donkey work of government, even making their own decisions as "cabinets" in their

own fields, the system still involves the full Cabinet when a committee cannot make up its mind. Here is a fruitful field for the political tacticians and artful dodgers.

Mr Menzies' own "roving commission," where the committees are concerned, suggests that he is aware of the dangers of a multiplicity of cabinets in place of the former loquacious monster. Freed from the administrative desk, it is to be expected that the Prime Minister will maintain a constant tour of the committees, in order to keep tabs on their policy decisions and to prevent what has been criticised as "excessive compartmentalising" of authority. Certainly, to have ministers bickering across several small tables would be more confusing than across the old large one.

Two Years of the Schuman Pool

TODAY the words "Luxemburg makes progress" or "Luxemburg suffers a setback" appearing in any journal in Western Europe never makes people wonder what new development is rocking the Grand Duchy. The words are, rightly, taken to refer instead to the European Coal and Steel Community, whose headquarters occupy an impressive building in the centre of the city of Luxemburg.

Two years ago, on August 10, 1952, the High Authority of the Community took office and began to carry out the treaty for the creation of a common market for coal and steel which had been signed and ratified by France, the Federal Republic of Germany, Italy and the three Benelux countries. The essential thesis of the treaty is that national barriers should cease to exist for coal and steel and that any regulation of the market that may be required, such as fixing prices, setting quotas, or allocating products in short supply, should be done by the institutions of the Community rather than by national governments. The Community institutions are also to ensure that both governments and enterprises live up to the regime of a freely competitive, non-discriminatory market that is written into the treaty.

The drafters of the treaty and M. Monnet and his colleagues on the High Authority have, from the start, emphasised that the Coal and Steel Community is different in kind from other international organisations and is a supranational, rather than international, entity possessing powers and responsibilities which are sovereign in character although limited in scope. For some of the more visionary among them, the Community is the tangible beginning of a united Europe; for all of them it is an exciting experiment. In many ways the unique aspect of the achievement of the High Authority in the last two years has been its ability to keep its head in the clouds but its feet very squarely on the ground.

The two-year record is a good one, but it is a record of careful ground-work and sure-footedness rather than of spectacular achievement. If at times the High Authority has moved slowly, it has moved surely. It has tried to anticipate its critics and to disarm potential opposition before it could come to a head, and it has deliberately avoided any premature tests of strength.

The common market for coal was opened on February 10, 1953, for steel on May 1, 1953, and for special steels on August 1, 1954. Today, for all commodities covered by the treaty, no tariffs, or quotas, or controls through currency restrictions exist within the area. No government sets prices, or production quotas, or allocations, and prices are, at least in theory, the same to all Community purchasers regardless of nationality. The common market has led to some increase in the movement of coal within the area and a modest increase in trade in steel, although the general pattern of trade in both remains overwhelmingly traditional. Prices have softened a little but remain high. Production of coal has remained fairly stable; production of steel declined somewhat but is now recovering. The consumer has, perhaps, more freedom of choice but, except in particular areas such as Belgium where he profits from special subsidies, the effects have not yet been sufficiently pronounced to make him an articulate supporter of the Community. The producer has been more vocal, but he has not yet been hurt. The cry of "*dirigisme*" has been a persistent one heard loudest, but not only, in the Ruhr. But thus far the High Authority has been careful to give little substance to these fears.

The common market is a legal reality and much more, but it is still neither completely free from certain forms of national discrimination nor from restrictive arrangements, concealed subsidies, distorted freight rates and the like. The High Authority has probably been most open to legitimate criticism from its well-wishers for its gingerly approach to the dynamite-laden Articles 65 and 66 of the treaty, the first of which deals with cartels and other arrangements restricting competition, and the second with new concentrations (mergers, etc.) which would have effects contrary to the treaty. The High Authority has taken full advantage of the fact that no rigid timetable for action was laid down in the treaty and is exhausting the possibilities of preliminary fact finding. The test of strength with the cartels, if it comes to that, will be this autumn, but the High Authority hopes to avoid a head-on collision and to work out with the principal associations enough modifications in their existing arrangements and practices so that they can be found to conform to the treaty when the High Authority's self-imposed October deadline for decision arrives. A few minor authorisations have been issued under Article 65 and some new concentrations permitted under Article 66 but the big decisions still lie ahead.

Maze of Transport Rates

Further action on transport rates is also required before the single market will be a reality. Transport within the Community, like intra-European transport in general, is encrusted with practices of long standing based on the assumption that national discrimination is a desirable policy and that it makes sense to charge foreigners a higher rate than the local inhabitants for the same services. The task of the experts who have been told by the High Authority first to isolate the distortions and discriminations and then to recommend how to get rid of them is an unenviable one. But by the end of last year the more obvious forms of discrimination had been abolished.

Now the experts are working their way through a maze of national and international rates arising from the differing national treatment of rail and water transport, the differing rates at which the cost of carriage falls in relation to the increase in the distance carried, and the differing "spread" in charges as between countries (in France ore costs about the same to ship as coal, in Germany it costs less than half as much). Coal, steel, and iron ore loom large in terms of the total traffic carried by both rail and water and if the High Authority can succeed in "harmonising" national transport policies for these products its work should affect all transport throughout the area.

The establishment of the common market is a means to an end, not an end in itself. Article 2 of the treaty outlines the mission of the Community. Through the institution of the common market it is "to contribute to economic expansion, the development of employment and the improvement of the standard of living in the participating countries." In addition, the Community must establish conditions which will assure

> the most rational distribution of production at the highest possible level of productivity, while safeguarding the continuity of employment and avoiding the creation of fundamental and persistent disturbances in the economies of the member States.

Thus, the High Authority as well as having the essentially regulatory functions of ensuring that the single market stays a single market and becomes progressively more competitive, has a positive mandate to increase productivity and improve the standard of living.

The objective of increasing productivity is at the heart of the High Authority's investment plans. In April, 1954, negotiations for a long term, low interest bearing loan of $100 million were concluded with the US Administration. M. Monnet has made it clear that the principal economic reason for the loan is the urgent need to bring down those costs which contribute much to the relatively high steel price, and he has stressed the need for capital on reasonable terms to modernise the coal mines.

Encouraging Investors

Two weeks ago, the High Authority released a summary of the principles that would govern its actions in the field of investment and invited applications for credit. A quarter of the loan has been earmarked for miners' housing, the other three-quarters for re-equipping coal mines, for iron ore mines, for colliery power stations and for coking plants. In granting credits the High Authority will give consideration only to projects which will yield results within three years. In no case will the High Authority put up the total amount of the credit required. On the contrary, it intends that its existing, and future, financial resources should be used in such a way as to have the maximum possible impact on the European capital market. By putting up only a share of the total funds required for any project and by relying on normal financial sources for the rest, the High Authority hopes not only to make the loan go further by encouraging reluctant investors, but to bring forth money at low rates of interest since its own will be loaned at about 4 per cent, a low rate for Western Europe.

The history of the loan negotiations and the statements made by the High Authority on how it hopes to use the loan illustrate the capacity of the new institution for coupling a hard-headed businesslike approach with an acute awareness of broader issues and the ability to derive maximum political advantage from its actions. M. Monnet's interest in obtaining an American loan as his first important financial venture clearly had strong political overtones. Such a loan would be much more than funds for modernising coal mines; it would be a clear vote of confidence by the American Government in the Community.

Soviet Attacks on Religion

AN anti-religious drive has just been launched in the Soviet Union. The fighting atheists—heirs of the once powerful "Godless"—have now been recalled from the reserves and are being pushed into action. The call-up was prepared by a press campaign describing the hold religious "superstition" still has on the Soviet countryside and even on Communist party members. In the last few weeks there have been many references in the press to young Komsomols preferring the pomp of a Church wedding to the drabness of the registry office; to high party officials allowing their children to be christened; to farmers and workers leaving work to attend religious ceremonies.

The party is now mobilising for the "counter-attack." The signal was given by *Pravda* earlier this month in a leading article entitled: "Let Us Spread Scientific-Atheist Propaganda." The appeal was duly echoed throughout the Soviet press, but the struggle is apparently to be waged, at least for the time being, on the theoretical and propagandist plane. Indeed, *Pravda* skilfully, and somewhat paradoxically, argues that Article 124 of the Soviet Constitution, allowing both religious freedom and the freedom of anti-religious propaganda, is too often interpreted unilaterally; that the second right is simply neglected. Trade unions, schools and colleges, journals and publishing houses are taken to task for not doing their anti-religious duty or for carrying it out in a superficial and unattractive fashion. The order now is for more and better pamphlets and propaganda.

According to Marx's famous saying "religion is the opium for the people," but in Russia "religious superstitions" are now held responsible for a more concrete form of intoxication, namely drunkenness. Many collective farms apparently have saints as their patrons, and on their saint's days in the calendar they indulge in drunken orgies. At this very moment, when the harvest must be gathered in, it is argued that precious labour is lost in this way. The rulers must resent even more the fact that many workers, too, observe holy days and absence from work on such occasions is often tolerated by the factory authorities.

What Weapons Will Be Used?

But economic considerations, though they play a role, are not the only reason for the present campaign. The new regime honestly admits that after 37 years of Soviet rule the thirst for religion has not been eliminated in the Russian countryside, nor even in the towns. Stalin's successors deplore and possibly fear these "remnants of the past," these "survivals of an outworn mentality." But will they now be combated merely with the weapons of materialist propaganda? In the early days of the revolution, too, the Society of Godless started with a theoretical offensive, with scientific propaganda and elaborate open debates between party pundits and church dignitaries. Soon after, however, the Church was attacked as a class enemy, many priests were eliminated and most churches closed.

Indeed, a truce between the State and the Orthodox Church was only patched up in the late thirties. Stalin, embarking on a more national line, concluded that a friendly Church under proper control was a better proposition than a hounded clergy driven underground. The cease-fire was actually clinched in 1941 when the "Godless" were dis-

banded and their organ closed down. Stalin derived considerable benefits from this alliance. The backing of the Church was useful for patriotic propaganda during the war, and since then the Orthodox clergy has stuck to its part of the bargain. Patriarch Alexei of Moscow supported the Soviet case on political issues such as Korea. Finally, the relatively mild treatment of the Orthodox Church and religious toleration in general enabled Russia to gain much goodwill among western Christians and Moslems.

Do Stalin's successors consider that all this is not worth a mass? They may not want to break the truce, but they seem genuinely worried about the spread of religious feeling in the country. Their present moves must be viewed as part of a general campaign to strengthen the Communist "outlook" of the population. This is probably for them an essential precondition if the Stalinist straitjacket is to be loosened. Whether in the process they lose all the advantages of the understanding between Church and State will largely depend on the manner in which the new drive is carried out. Will it really be limited to pamphlets, lectures and other forms of propaganda?

Japan and the Bomb

FROM OUR TOKYO CORRESPONDENT

ON the ninth anniversary last week of the atomic bombing of Hiroshima, the Japanese fishermen injured after the Bikini explosion last March were allowed to receive the Press for the first time. Chushi Yamamoto, whose condition is still serious, summed up popular Japanese sentiment with the acid remark: "I trust there are people in the United States, too, who are grieving about our fate, but I regret that we have not yet heard their voice." The startled sensitivity of the Japanese over the hydrogen bomb in general and the Bikini tests in particular does indeed remain as sharp and prickly as ever. The national mood is one of vague and confused resentment, of angry self-pity, which is neither logical nor reasonable; it can best be likened to the muddled alarm of a troubled sleeper, awakened by a pistol-shot somewhere down the street. The discovery that the pistol was fired, perhaps a little carelessly, by a watchman who is technically guarding the sleeper's house has not allayed irrational resentment. Indeed, in the light of day, one suspects that the annoyed sleeper is, unconsciously maybe, gratified to have an excuse for reproaching and even criticising a watchman whose heavily benevolent protection, while a temporarily necessary evil, has become irksome.

The public reaction was immediate and widespread, with undertones of hysteria that were certainly not soothed by official pronouncements. Advertisements for "radioactive-proof" raincoats, umbrellas and soap, reports that the gentle rain from heaven was radioactive, warnings that parched mountain-climbers should not eat radioactive snow, and rumours that migratory swallows from the south were registering high geiger counts all combined to foster a feeling of panic, which recently led the public health authorities to issue assurances that it will be safe to swim at Japanese beaches this summer. This feeling has, as a matter of course, inflamed, and appeared to justify, anti-Americanism.

The official reaction is even more significant. There has been a strong, resolute and popular declaration of Japanese independence, which should not be treated lightly in the West. American experts were not allowed to help treat the unlucky fishermen from the *Lucky Dragon* who were contaminated by the radioactive dust from the Bikini explosion. A special shipload of Japanese scientists was despatched to examine the Bikini area, presumably to make sure that an atomic explosion had in fact taken place. The argument over damages for injury to the fishermen and for loss of condemned fish is certain to be prolonged and acrimonious, regardless of the fact that simultaneously the Japanese are pleading strenuously for additional dollar help.

Above all, the hydrogen bomb has had the tremendous effect of giving all shades of Japanese political and social opinion a sudden unique opportunity to unite on a Japanese attitude towards a foreign power. The conservatives can reproach the United States, the Communists can fulminate against the United States—for once, Japanese all. This is the real lesson and enduring warning of the uproar.

It must be admitted that American handling of the unfortunate emergency left much to be desired. The Ambassador, Mr Allison not only said nothing, but gave the unfortunate impression that he did not know what to say—or perhaps what Washington would allow or like him to say. Then, when the foremost American atomic authority arrived post-haste, in circumstances of such secrecy that all the wild rumours were redoubled, he was foolishly allowed to roam, with mild scientific curiosity, around Tokyo's Tsukiji fish-markets in the care only of a third secretary, and was there actually photographed taking a geiger count of a tuna carcase intended for the American market. Hence arose the monstrous theory—endorsed regrettably by the usually intelligent newspaper *Asahi*—that his visit was designed solely to ensure that fish caught in doubtful waters and intended for export to the United States were safe. The inference, openly published and still widely accepted, was that the United States was completely unconcerned with possible Japanese contamination.

Suspect American Intentions

There is no advantage in deploring, much less chiding, this spontaneous Japanese reaction. There is no point in arguing that the Japanese completely ignore Soviet possession and tests of the hydrogen bomb. (Indeed, no Japanese criticism of the Bikini tests or protests against development of the hydrogen bomb ever include a reference to the Soviet hydrogen bomb.) Atomic warfare, in Japanese popular judgment, is essentially a product of the United States. This view may be a hangover from Hiroshima and Nagasaki, but the detached observer here is forced to conclude that it is, fundamentally, a rationalisation and seeming justification of a wide and growing fear that, in some sinister fashion, the United States is inveigling Japan into a war which would otherwise pass it by.

In simple terms, the situation is that the Japanese feel that they are isolated from, but vulnerable to, international moves and counter-moves which affect them vitally, but which they cannot control, or on which they are not even informed—they feel that they are still dependent on one side in the world struggle and thereby unwillingly half-committed to that side. The fact that most of them would probably prefer to be on that side—given a choice—should help to explain their universal baffled resentment. Bikini has given them an excuse to close ranks, for the first time since the war, in confused but instinctive revolt against an inarticulate but deeply-felt consciousness of humiliation, helplessness and subservience.

NOTES FROM CANADA

(These Notes are contributed by our correspondent in Ottawa.)

Canada on the Truce Commission

CANADA had grave misgivings about accepting a place on the truce commissions for Vietnam, Laos and Cambodia, and the Government was rather careful to see that they were well known. There was never any real chance that Canada would risk upsetting the Geneva truce arrangements by refusing, but it seemed prudent to make sure that everyone (and particularly the Canadian voters) understood from the beginning that this was no picnic.

It is, in fact, one of the most difficult responsibilities that Canada has undertaken since the war. The usual patriotic bromides about "enhanced international status" seem less adequate than ever to cover the discharge of a responsibility which has no possible chance of bringing tangible reward and all-too-great a chance of bringing loud reproach. It is no consolation to be the most acceptable of the western powers in the eyes of the Communist bloc; and the private assurances of the United States Government that it welcomes Canada's participation do not remove the fear that before the whole business is over a good deal of mud will have been slung from south of the border — though not, perhaps, from the Administration itself. The truce commissions cannot work at all unless the Canadians can agree either with the Indians or with the Poles or, sometimes, it is hoped, with both. To agree with the Communist Poles about anything at all is liable to be an offence in the eyes of some American critics; and some Canadians have been wondering whether it will be considered any less an offence to agree with the Indians.

The most solid ground for hoping that the truce commissions may get through their work quietly—and this is the most anyone expects—is that it may suit the Communists to make the truce arrangements work. Ho Chi-minh and his Chinese backers may well calculate, it is thought, that in Vietnam they have a good chance, as they never had in Korea, of getting all they want by free elections. If so, a demonstration to the world that supervised and impeccable elections upheld their claims could be presented both as a sign of Asiatic solidarity through Communism, and also as a proof in both east and west that it is perfectly possible to deal with the Communists provided those difficult Americans are kept out of it.

Mr St. Laurent Sails on

THE Liberal Government of Canada is now in its nineteenth consecutive year of office, and the divided opposition forces appear as impotent as ever. One of the secrets of this longevity, though possibly only a minor one, is the ability to reverse the old saw: "Plus ça reste la même chose, plus ça change." After this summer's changes the Liberal Cabinet of twenty contains only six ministers who served in the last of Mr Mackenzie King's cabinets only five years ago. Mr King, who held office with only one short interruption from 1921 to 1930 and again from 1935 till his retirement in 1949, had the reputation of keeping his cabinet ministers "on the hop," changing them round even just for the sake of change. His successor, Mr St. Laurent, has none of this propensity. His inclination seems to be to leave his ministers alone.

This summer's triple resignation was not fomented by the Prime Minister. The three ministers concerned, who had all been known at one time as the "coming men" of the Cabinet, had each his own reasons for going, none of them stemming from disapproval of party policy or of Mr St. Laurent personally. Mr St. Laurent quietly plugged the gaps, promoted two of the new coming men, brought in two new members from Quebec (one English- and one French-speaking), and sailed serenely on. Most significant of the promotions is that of Mr Walter Harris, a Baptist lawyer from rural Ontario, to be Finance Minister. This immediately seems to put Mr Harris well in the running for the succession to Mr St. Laurent (who is 72). Long a politicians' favourite he now has a chance to capture public support, which he has so far missed by keeping out of the limelight.

* * *

Unemployment Danger Signals

ONE of the controversial questions the new Finance Minister will have to deal with is tariff policy. In the time of his predecessor, Mr D. C. Abbott, which covered all the postwar years, Canada was both busy preaching reduction of tariffs to other countries and practising what it preached. But it was a favourable time for low tariffs; Canadian industry was fully employed, with few exceptions, and was meeting the demands of a sellers' market in competition with foreign exporters.

Mr Harris on the other hand will have to face much more pressing demands for higher tariffs than ever confronted Mr Abbott. Employment has recovered satisfactorily and unemployment has declined as Canada moved into a belated summer; good markets for lumber, specially on the West Coast, have helped, but construction has helped most of all. The new system of insured mortgage lending by the banks has been a success and house-building is booming. In addition much commercial and institutional building, some of it deliberately delayed in the inflationary years, is now being undertaken.

But employment remains soft in a number of the secondary industries. The motor-car factories have choked the distribution lines in a competitive bid to sell all the cars possible; and now they are having to lay off men. The manufacturers of household appliances, with the single exception of television sets, are slack and are grumbling about import competition. The primary textile mills are the most depressed of all.

In the summer the spurt in outdoor activity keeps the unemployment total well within manageable bounds. Mr C. D. Howe, the Minister of Trade and Commerce, told an American interviewer that 200,000 unemployed out of a labour force of more than five million was getting down to the "hard core of unemployment." The summer figure is below that, but it is sure to rise again in the autumn and winter. The Government has taken the possibility of unemployment next winter seriously enough to make some limited reductions in its immigration programme. By taking some occupations off the list of acceptable immigrants, and by advancing the cut-off date by one month to the end of September, it will probably keep this year's total below the 168,000 of last year. But the reductions will still be minor; the best estimate now is that this year's admissions will come to 155,000 or more.

The Farmer and the Wheat Board

SIR NORMAN VERNON, of Allied Bakeries, Ltd., has been telling Canadians at every stop during a short Canadian tour that the price of wheat must come down. He took the opportunity to add a word of advice about the marketing of wheat. In Canada's own interest, he said, it might be a good plan to abandon the Canadian Wheat Board and return to a free market. There are Canadians who agree with him, but there could hardly be a worse time to plead the case against government marketing. Western farmers are quick to point out that on a free market Sir Norman and other grain buyers would have a much better chance of getting the price of wheat down to the level they think it should be at. As it is, Mr C. D. Howe (to whom the Wheat Board reports) has a larger say in the matter; and he gave Sir Norman no encouragement to suppose that the price would be reduced further.

The Wheat Board has fixed the initial price of wheat in the new crop year at $1.40 per bushel, on the basis of No. 1 Northern at Fort William. This is the price the farmer gets as soon as he can deliver the wheat to his local elevator. It is the same initial price as in the last two years. But if the Wheat Board realises a higher price, it distributes the remaining proceeds to the farmers later in the season. The farmers have therefore become accustomed to substantial additional payments. This year the Wheat Board will have more to distribute provided the price stays near the present level of $1.70. But if it drops to the International Wheat Agreement minimum of $1.55 the margin left will be pretty slim. Many people had expected a lower initial price this year. But it is supposed that the maintenance of the $1.40 was intended both to discourage speculation on price reductions and to represent a fair gamble on the maintenance of a price at least equal to the IWA minimum.

* * *

Talking with the Americans About the Seaway

ON August 12th three Canadian ministers met American representatives to discuss American participation in the St. Lawrence Seaway. Two days earlier the Ontario Hydro-Electric Commission and the Power Authority of New York State had ceremoniously launched the work on the power dams which will eventually give them both more than a million horsepower of electric energy. The start of the power project fulfils Canada's first condition for discussing American participation in the Seaway. The object of the negotiations is to find a basis for co-operation in carrying out the project. They seem to face two major difficulties besides a host of smaller ones. The big obstacles are the American desire for an assurance which Canada refuses to give, and Canadian desire for assurances which the Americans may be equally unable to give.

The United States would like to be assured that once the canals on the American side of the International Rapids are built, Canada will not duplicate their facilities by building a second deep canal on the Canadian side of the river. But Canada is much more likely to tell the American representatives that immediate preparations will be made for an eventual deep canal on the Canadian side. Deep dredging will be done above the power dams while it can still be done economically "in the dry" before the lands are flooded. A 27-foot lock will probably be put into the main power dam on the Canadian side, so that it will be ready to link up with an enlargement of the present 14-foot canal below the dams. The Canadian authorities feel convinced that sooner or later enough traffic will develop to support two canals, and they intend that when that time comes the second canal shall be all-Canadian.

The assurances which Canada would like from the United States relate to the conditions on which Canadian ships may have right of passage through the American canal. Equality

of treatment with American vessels is assured already. The problem is that the McCarran Act and other American legislative enactments may require interference with ships and persons in transit which Americans may be willing to impose on themselves, but Canadians are not anxious to accept from them or anybody else. In its most extreme form the Canadian request may be presented as a desire to be given Canadian treatment, rather than American treatment, on an American canal. But the grounds on which Canadians want assurances are easily understandable in the light of some of the immigration and so-called "security" processes which the United States has been enforcing.

Canada's Shakespearean Festival

FOR the second year running the little town of Stratford, Ontario, has been filled all summer with drama-lovers from all over North America. The Shakespearean Festival Foundation of Canada has been filling its 2,000-seat tent theatre since the beginning of July with *The Taming of the Shrew, Measure for Measure* and *Oedipus Rex*, none of them obvious box-office attractions even for Shakespeare lovers. How many people knew before they reached Stratford that Shakespeare was not responsible for *Oedipus Rex* has not been statistically determined.

The Stratford Festival has been most successful, perhaps largely because of its courageous unusualness, in attracting serious drama-lovers from great distances. It must also have drawn in large numbers of the curious who would never have dreamt of paying to see Shakespeare but for the acclaim given so widely to this risky venture. That both kinds of people have continued to flock to Stratford through a second season must be largely due to the brilliance of Tyrone Guthrie, who was responsible for the direction both years. He has given the *cognoscenti* productions (and, incidentally, plays) quite out of the ordinary run; and he must have been gratified at the result of his original suggestion that the stage should be built on Elizabethan lines. He has also given the unsophisticated part of his audience, who are mostly unused to living theatre of any kind, presentations sufficiently gripping to hold their loyalty against such counter-attractions as Bob Hope and Marilyn Monroe.

A letter from Brazil*

"WE were travelling up the river Jequitinhonha, in the State of Bahia, by canoe, to reach a famous *garimpo* (a camp of diamond panners), when the strap of my Rolex broke, and the watch disappeared into the flood. Search proved useless and I was obliged to continue, with a heavy heart. Two months later, I stopped for the night several miles below the point where I had lost my Rolex. That night, sitting round the fire, we began talking. Asked how things were going, an old garimpero said, 'Very badly, sir. Pedro dos Santos thought he'd found a large piece yesterday, but it was only a watch.'

"My heart stopped. I asked to see the find. Scornfully my dear Rolex was hurled at me across the fire. Pedro consented to sell it willingly, thinking that a watch that had been in the water was worth nothing, and with a broad grin at the idiocy of this foreigner he pocketed five 'milreis.' The laugh was on the other side of his face when a few minutes later I put it back on my wrist and set it going!"

This is an extract from a letter written to Rolex by a customer, Mr. Victor L. Bondi, now of Geneva. We think it speaks for itself. There are few hardships a Rolex watch cannot undergo; that delicate mechanism is so well made, so well protected by the Oyster case. This, anyway, is the true story of what happened to one Rolex Oyster.

You may say that *your* watch is never likely to be subjected to such rugged tests. All watches are subjected to tests; the hazards of day-to-day wear are slighter, but more insidious. But a watch such as this can always function perfectly, untouched by dust or dirt, water or perspiration. Isn't perfection what you ask for in a watch? Don't forget that the more junior member of the Rolex family, the Tudor, is also protected by the Oyster case.

★ Mr. Bondi's original letter can be inspected at the offices of the Rolex Watch Company, 18 rue du Marché, Geneva, Switzerland

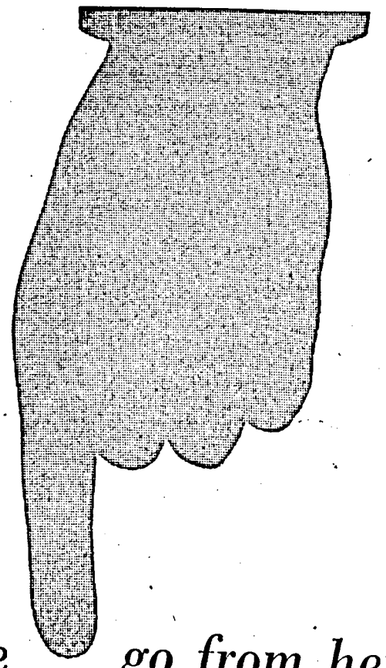
"...we were travelling up the river Jequitinhonha in the state of Bahia, by canoe, to reach a famous garimpo..."

As from now, all Rolex Oyster Perpetuals are graced by the new, slimmer Oyster case, guaranteed to withstand temperatures from 10° F to 180° F and to resist pressure to a depth of 150 feet under water.

The smooth-running, silent, self-winding "rotor" keeps Rolex Oyster Perpetuals fully wound automatically.

Delicacy and strength are combined to perfection in the Rolex Oyster. Delicacy of movement, so that its accuracy is unquestioned; strength of construction, so that no dust or damp or water can penetrate the waterproof Oyster case and harm the movement.

The Rolex Red Seal is a further proof of perfection—it is a sign that the Swiss Government have tested the chronometer and awarded it one of their coveted *Official* Timing Certificates.



THE ANATOMY OF TIME. A fascinating, illustrated book, recording man's deep preoccupation with time measurement, from the earliest recorded device to the split-second accuracy of the modern watch. For your free copy write to the Rolex Watch Co. Ltd. on personal or business stationery.

Where do we go from here?

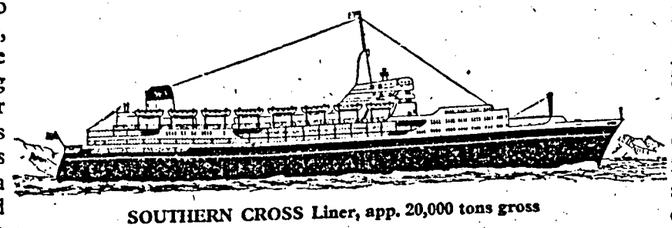
If you have a manufacturing problem to which plastics might provide a solution, the answer is:
"Go to the Product and Mould Design Service of the B.I.P. Group."
Here you will find people who know about moulding powders, about the making of moulding tools and presses and about the moulding of all kinds of products in all kinds of plastics. For the B.I.P. Group has practical experience in all branches of the industry.
Our Product and Mould Design Department exists to provide a specialist advisory service to industry and to the plastics moulding trade. Its services are available without obligation.

B.I.P. GROUP

The most comprehensive service in plastics

BEETLE UREA AND MELAMINE MOULDING POWDERS · BEETLE POLYESTER RESINS · BEETLE RESINS FOR THE PAPER, PAINT, TEXTILE, WOODWORKING AND FOUNDRY INDUSTRIES · MOULDING TOOLS AND PRESSES

BRITISH INDUSTRIAL PLASTICS LIMITED · 1 ARGYLL STREET, LONDON, W.1

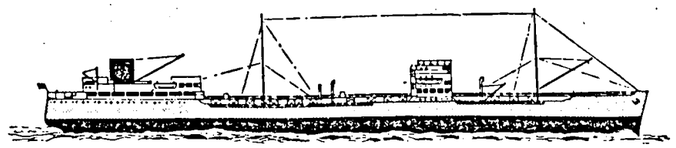


THE BUSINESS WORLD

Specialised Ships

WHEN the Queen launches the Shaw Savill liner *Southern Cross* on Tuesday, she will be sending down the slipways one of the most unusual vessels ever built by a British shipyard. A passenger liner is by definition a fairly specialised ship, designed to carry people and goods over given sea routes; but this specialisation has never been carried so far in a long-distance passenger liner as in the *Southern Cross*. This turbine steamship, of some 20,000 tons gross, unlike her predecessors, will carry no cargo of any description, apart from passengers' baggage. Her machinery will be situated aft, instead of amidships, leaving the whole of the best part of the ship entirely for use by passengers. No time will be occupied in port by loading or discharging cargo, and her speed will be sufficient to ensure four round voyages to Australia and New Zealand every year. This is undoubtedly a bold experiment, since passenger liners in this sort of trade have always relied a good deal on cargo for their revenue; but it may prove to be a useful reply to the challenge from the air on the long-distance routes, particularly if the maximum advantage of her special design can be taken by off-season cruising.

The *Southern Cross* may perhaps be taken as symbolising a significant feature of postwar shipbuilding; in contrast to the large blocks of standardised tonnage that had to be built in wartime, shipowners have been concentrating their orders for freight as well as passenger ships upon vessels of a more specialised nature. The shift of emphasis has been particularly notable in the cargo field. Such ships have been designed either for the carriage of a single type of cargo—of which the obvious example is the huge proportion of tankers on the order books—or to the requirements of a particular trade route or selection of terminal ports. Some of these tankers and specialised freighters have moreover been designed to operate between fixed terminals—bringing some of the principles of liner operation into these specialised fields of cargo. In all but a few isolated instances, the primary motive of this specialisation has been economy. With the oil companies building large fleets of tankers, the steel interests arranging for fleets of specialised ore-carriers, and even the nationalised coal and electricity industries in this country building their own coastal colliers, the question arises whether there will be much room left for the ordinary general-purpose tramp ship, whose mainstay is the carriage of bulk cargoes.

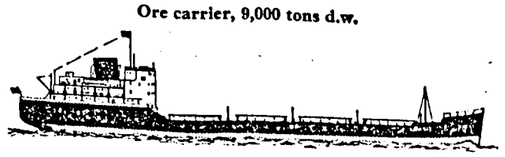


The tramp ship is essentially the unspecialised ship, deliberately designed to enable it to engage in as many remunerative trades as possible, to carry as wide a range of cargoes as possible between as wide a range of ports as possible. Tankers, which now form such a large proportion of the world merchant fleet, form the outstanding contrast to this—ships specially designed for the carriage of liquid cargo, mainly crude oil and petroleum products. The nature of this cargo requires an entirely different form of hull construction from the dry-cargo vessel

SOUTHERN CROSS Liner, app. 20,000 tons gross

and entirely different provisions for cargo-handling. So much is plain; and tankers have become so common as to be scarcely regarded as specialised ships any more. But there are degrees of specialisation; and the specialised ships themselves are breeding even more specialised types. Tankers are being built today expressly designed for the purpose of carrying specific products, such as lubricating oil, bitumen or asphalt, liquid gas and even wine. These cargoes require special equipment for their handling, and the tankers are specialised to this extent; except in the case of liquid gas tankers, they can, however,

TANKER, 31,000 tons d.w.



usually also be used for normal purposes. Liquid gas carriers, however, are specialised to the ultimate degree, since their tanks are pressure vessels; but they are proving more economical than land transport for moving liquid gas from Northern Europe to Italy, for example.

The movement of oil, like that of wine and water, is nearly always a one-way traffic—from source to consumer. Tankers, therefore, usually spend half their time in ballast, merely carrying quantities of sea water across the ocean, which is an uneconomical operation except so far as it improves stability and ensures a more efficient use of fuel. Theoretically, there is scope here for the naval architect who can design a ship which can carry a full cargo of oil homewards and an economic payload of other goods outwards; but in practice the oil exporting centres do not normally import vast quantities of bulk goods. An exception to the rule is Sweden, which can export large quantities of iron ore to regions adjacent to its sources of oil imports. To take advantage of this situation, the Swedes have devised combined oil and ore carriers, large vessels that can carry oil imports and ore exports. This combination is fortunate in two ways, not only because the trade exists, but also because the characteristics and handling requirements of oil and ore are compatible. Little or no cargo handling gear need be carried for ore, which is loaded and discharged by shore appliances; and as far as deadweight capacity is concerned, a little bit of ore goes a long way.

To make the maximum economic use of a ship it is necessary that the time spent in port loading and discharging cargo should be cut to the least possible. In this respect oil tankers have a great advantage; their cargoes can be readily discharged by means of their own powerful pumping installation with the minimum of shore handling gear, and modern tankers can discharge their cargoes at rates up to 3,000 tons an hour. With heavy and bulky cargoes such as iron ore and coal, rapid discharge can be achieved only with the aid of costly shore appliances. Quicker turnround, however, can be achieved if the specialised freighters, for example, are designed to suit the shore plant, with wide hatches, unobstructed decks and self-trimming holds. Since the war the great increase in ore imports has multiplied the number of specialised ore carriers, which have been designed to obtain the maximum utilisation from the facilities available at both loading and discharging ports.

The tendency to build specialised ships for the carriage of specific commodities has been accompanied by a tendency to build larger units at the same time. A few tankers of over 45,000 tons deadweight are already in service, with several others under construction; but even this hitherto unprecedented carrying capacity has been exceeded by the *Ore Chief*, a vessel of some 66,000 tons dw capacity recently built in Japan for an American company. Details of this ship are a closely guarded secret, but it is apparent that her range of ports must be extremely limited. Most of the ore carriers being built for British owners are much smaller vessels, of less than 10,000 tons dw, their size being restricted by terminal port limitations. There are a few ore carriers of up to 32,000 tons dw under construction in this country for American owners, however, and the completion of these large vessels will relieve the aluminium and steel companies concerned from the necessity of having to charter several general-purpose tramp ships.

Ore carrier, 9,000 tons d.w.

In view of the increasing tendency to build specialised ships for bulk cargoes—and cement and sugar in bulk are now being added to the list—coupled with the trend towards larger units, the future for the general-purpose dry-cargo tramp may appear rather dim at first sight. But there are compensating factors to be considered. In the first place the specialised ship is inflexible. Being designed to handle a particular cargo with the maximum efficiency, or to obtain maximum utilisation between limited terminal ports, it sacrifices most of its flexibility in operation. If the trade falls away the ship becomes surplus to requirements and will not find it easy to obtain economical employment, either with another kind of cargo or between different ports. In any event the very large ship is limited in its field of operation to a restricted range of ports, not only for trading but even for maintenance and repair purposes.

The highly specialised inflexible ship, therefore, depends on assured employment, and it would be unwise

for any major shipper, such as an oil or steel company, to build many more of them than would be necessary to cover its minimum expected requirements. There is a true economic advantage in having specialised ships designed either for the commodity or for the trade, provided maximum utilisation is assured. For marginal requirements, however, the major shipper must always rely on chartered ships.

This does not mean that the general-purpose tramp ship will not develop in design. What it does mean is that tramp owners will always have the opportunity of supplying marginal demands, even in trades for which specialised ships exist; and the tendency now, indeed, is for some tramp owners to provide highly specialised ships, such as tankers and ore carriers, particularly with a view to long-term employment on a charter basis. Apart from these two types, the general-purpose tramp itself is becoming more flexible, in the sense that it is being equipped with a reserve of speed, with heavy-lift derricks, and with more flexible cargo-carrying arrangements wherever possible, to increase the chances of employment in a wider variety of trades. At the same time a strict watch must be kept on economy in operation, for there is always fierce international competition in normal times for marginal employment. Despite the increase in specialised ships, a continued expansion in the volume of international seaborne trade should ensure the tramp ship a working chance of prosperity.

Business Notes

Eternity 3½'s

THREE stars have shone brightly in the market firmament this week: "eternity three and a halves" (as the market now calls the longest dated of all the redeemable gilt-edged stocks—the Funding 3½ per cent stock 1999-2004) gold shares, and Anglo-Iranian. The rise in Funding 3½ per cent marks the continuation—could it be the climax?—of the move by investors into longer-dated stocks. They have done so with growing confidence as day after day and week after week the market has risen, as the funds available for investment appeared inexhaustible and as Government policy in replacing each short-dated maturity with a somewhat longer date gave them a general signal to pluck up courage.

It happens that the Government broker now seems to have nothing left for sale to the market among the long dated issues save that Funding 3½ per cent stock and for the very reason that it is "on tap" it has been a little cheaper than its near rivals and has been bought. The climax came last Friday when the Government broker raised his price by 1/8 three times in a single day and this week, though the gilt-edged market as a whole has been merely marking time, that stock has advanced further. At 97⅞ it has gained 5/8 in a week. It is a fair assumption that it has risen not because the authorities were forcing the pace but because substantial blocks of stock have been absorbed.

No sign of a weakening in the general bullishness of markets or of the abounding confidence of investors is yet visible notwithstanding the modest easing of the gilt-edged market early this week. Nor has the industrial section yet weakened. The account drew to its close with a record volume of business. Monday's total of bargains marked—16,702—was the highest for any August day since bargains were first counted in 1942. It was roughly double the number running in August of last year. *The Financial Times* industrial index has been breaking new records too. At 164.4 on Wednesday it touched a new peak and gained 1.9 on the week. With the start of dealings for the new account on Wednesday markets began with another wave of strength. All the old speculative favourites were being bought. Great Universal Stores among others touched a new record.

Mere Mortals Wonder

YET there have also been signs that should make the cautious investor pause. As is natural in all times of good markets companies wishing to raise money and the issuing houses and brokers who advise them are pressing forward with their plans. They are coming in unusual numbers, for August is not normally an active month for issues. The strength of the market permits it and few City experts trust the market beyond the end of the year. Among the issue plans now going forward are one of £3½ million 5 per cent convertible debenture stock 1960-69 at 100½ also redeemable at £100½ in East African Power Corporation, carrying the option to convert into ordinary shares between 1955 and 1959 at prices ranging from 23s. 8d. to 26s. 1d.; an issue of £2 million 5 per cent debenture stock 1964-79 at par in Bentley Engineering; and the £2 million Ind Coope 4 per cent Debenture 1964/84 at £98.

The steadier type of investor may also reach the conclusion that there is now a ragged and unthinking side to the wave of buying that is going on. The brisk rally of the gold share market, though still concentrated on the develop-

ing mines of the Orange Free State and the far West Rand, may also be a warning of a change to come. Investors do not rush into gold shares when the industrial outlook is improving. Some of the present buying is believed to be good and some of the reasons for it may be well founded, but it is probably also true that shrewd operators are cashing their profits on industrials and taking up a position in "Kaffirs" against the time when the market goes into reverse gear.

Values for Anglo-Iranian

ANGLO-IRANIAN have this week changed hands at more than £16—they reacted a little to £15⅞ on Thursday—and Burmah and Shell have been sharing in the excitement, rising during the week from 80s. to 97s. 6d. and from 96s. 10½d. to 103s. 9d. respectively. The market's measure of the draft agreement between the consortium and Iran has undoubtedly been favourable, and it has been concentrating, quite logically, on Anglo-Iranian's expectations of earnings under the scheme—looking inevitably, but it hopes not indefensibly, far ahead.

The jumping off point is the estimate of revenue that the agreement should provide for Iran—£31 million in the first full year rising to £67 million for the third. These sums consist of payments to the National Iranian Oil Company for crude oil, together with Iranian taxes; the latter will rank for double-taxation relief. It is likely that satisfactory arrangements have been made with the Iranian authorities about the allowances for depreciation on the installations in Iran. Given the 50:50 principle that governs the agreement, and the fact that Anglo-Iranian will have a two-fifths share in the consortium, the inference that the market draws is that £25 million may accrue to Anglo-Iranian from the consortium in the third year, with the prospect of additional profits from marketing.

How this sum would be further modified by British income tax is far from clear; it would not be "net" in the hands of Anglo-Iranian, presumably, unless the corresponding Iranian tax (which cannot be identified within the joint sum of £67 million) reached the equivalent of the British standard rate. This makes the expected £25 million rather difficult to relate directly to the £20 million of ordinary stock, or to last year's net earnings of £22½ million. But evidently if all goes well, there will be a large addition to effective earnings.

A doubling of earnings with more than a doubling of the dividend may eventually justify the present level of Anglo-Iranian, with their exiguous yield of 2½ per cent. The fulfilment of these conditions lies some years ahead. And capital factors are evidently still exerting considerable influence on the price—the £25 million of compensation in ten instalments and the still undisclosed arrangements whereby the other members buy into the consortium, with the glittering hopes of over £200 million to be paid over the years. And there are some who still think that the £50 million set aside to special contingencies in 1950 is somehow freely distributable, though it has in fact been absorbed in the business. These are tempting incalculables. Perhaps the market has been wise to loosen rein a little this week, for the next move in explanation clearly lies with the company.

Five Dozen Viscounts

THE sudden decision of Capital Airlines to take up the option that it held on 37 Viscount airliners more than six months earlier than expected, and at the same time to take out an option on a further 20, will oblige the manufacturers, Vickers-Armstrongs, to reconsider their carefully-laid production plans. Orders of this size are not unusual in the United States, but they are unheard of in Britain. Although Vickers has signed orders for 143 aircraft, and if current negotiations are taken into account the total would be nearer 200, its biggest customer to date has been British European Airways with 38, ordered over the course of several years, followed by Trans-Canadian Airlines with 15 and Air France with 12. A single order for 60 aircraft worth $67 million—for there is little doubt that Capital will take up its new option—could tie up Vickers' production capacity for a matter of years, a consideration that Capital has no doubt borne in mind.

This year, the factory at Hurn will turn out 25 Viscounts. It has a capacity for 100 a year, two a week, which is as high a rate of output for a civil airliner as any company here or in America has contemplated. Vickers had planned to build up gradually to this rate of production as the order book required, offering delivery to all comers in a period of 18 months to 2 years. By stepping up production now as rapidly as possible, Vickers expect to deliver all the first 40 aircraft to Capital by mid-1956, when production should reach 90 aircraft during the year and be running to full capacity before its end. To give as good delivery to other airlines that sign orders in the future, the company may have to put down new Viscount lines elsewhere. This is a serious decision to take, for tooling costs several millions of pounds, and while the Viscount still has no competitor in sight the appearance on the market of, say, an American airliner re-fitted with British turbo-prop engines, might make an appreciable dent in sales.

One of the most interesting aspects of the sale has been the parallel negotiations that have gone on between the British Air Registration Board and the American Civil Aeronautics Administration about the acceptance in America of the Viscount's British Certificate of Airworthiness. American teams have twice come over to examine the aircraft and the ARB's documents on its airworthiness trials. There are important differences in the practices of the two licensing authorities; the British ARB bears the heavy responsibility of being the first to grant airworthiness certificates for gas turbine airliners, the Americans are naturally apprehensive about a power plant of which they have no experience. It has been necessary to demonstrate, step by step, by such drastic measures as special fire trials with Viscount engines, that the ARB requirements are reasonable. Some points still remain to be settled, but there is a good chance that final agreement will be reached within a week. The CAA has been subject to considerable pressure from American interests that are against the sale of British aircraft in the United States, but, as Capital has discovered, there is an unexpected amount of goodwill in other quarters.

Importing Coal

BETWEEN this time last year and the beginning of the coal winter, the coal industry managed to increase distributed stocks of coal by about 3 million tons, nearly a million of the increase being a mere transfer of coal from opencast stocks into consumers' bunkers and cellars. This autumn the industry needs to do more, having so far done less. The aim always mentioned in speeches is a level of 20 million tons in consumers' stocks by the end of October. Last year, in fact, these stocks reached 18¾ million tons, which it was agreed to consider satisfactory, and they did, in fact, prove adequate. This year, coal consumption in Britain is running about 3¼ per cent higher than last year; on the other hand, statistics of coal distribution have been revised to leave out about 12 per cent of industrial consumption. The industry's own undistributed stocks at collieries and opencast sites are 1,700,000 tons less than at this time last year, and can hardly afford much assistance. Weather was good at the beginning of last winter, and this year it has so far been worse than in 1953. Many such considerations affect estimates of a "safe" level of coal stocks for this winter; from outside, it may be guessed that to begin the winter with less than 19½ million tons in stock would be cutting it fine.

It is clear that the British coal industry cannot produce enough to increase these stocks by over four million tons by the end of October; with consumption sharply up, it will do well to be able to put as much into stock this autumn as it did last year. "Safety" in stocks, therefore, might mean the import of nearly two million tons of coal to augment distributed stocks for the winter, unless exports are to be restricted; which implies that imports will have to rise well above the level of some 80,000 tons a week at the end of July. This, of course, is far more than a matter of balancing supplies of large coals; fortunately, the surplus of coal on the Continent and in the United States may keep it a slightly less costly process for the National Coal Board than in recent years. In June the landed value of imported coals was about £6 5s. a ton, according to the Trade and Navigation Accounts in 1952 it was costing more than £8 a ton. The combination of low prices and low freight rates has continued to make American coal competitive with that from the Continent (mainly Belgium), though fixtures for September-October delivery from the United States have recently been made at rather higher rates and any considerable increases in the import programme could push freights up further.

Walsall Comes to Market

THE first local authority to borrow by public issue since the Public Works Loans Board brought its charge for long-term money down to 3¾ per cent, is another socialist borough—Walsall. Walsall came to market this week with an issue of £2 million 3½ per cent stock 1973/6 at £99. From the market point of view it was a bagatelle even though it is the biggest loan that this small borough (population 114,900) has in the market. The price and the yield of £3 11s. 4d. per cent gross to redemption at the latest date were quite keen, but because it was small it went comfortably. Lists closed in five minutes on Wednesday morning and dealing started on Thursday at a small premium applicants for up to £1,000 receiving full allotment and larger applicants about 40 per cent of their requirements.

But from the point of view of the borough the choice between borrowing through the market and borrowing from the Public Works Loans Board must have been difficult. Had the borough gone to the Treasury it would have had to pay 3¾ per cent plus an application fee of 4s. per £100. What it has had to pay through the market is unfortunately not certain for prospectuses of the trustee class do not give as much information about expenses of issue as do industrial prospectuses. Underwriting is believed to have been one per cent, the invariable rate for trustee issues involving new money. The rest—the allotment commission printing and advertising, broker's fee, and bank fee can only be surmised. It would be in line with general experience if the net sum to be received by the borough was the equivalent of £97¼ per cent, implying an average cost to the borrower of £3 13s. 8d. per cent if the loan is redeemed on the latest date. To that must be added the sum of 2s. per annum to compound stamp duties in the future making the total cost to the borough of £3 15s. 8d. per cent per annum plus the initial stamp duty charge of 5s. per cent.

It does not seem likely that the local authority has gained anything in terms of total cost of the debt service by its decision to use the market. What it has gained is greater latitude in use of the money. Repayments will not be tied to particular projects, nor the length of the borrowing to that of particular works sanctions. The borough is obliged

to make annual provision for the repayment of its debt as a whole but it is not obliged to make any redemption of this loan before the due date. That is an important advantage which the market still holds in meeting local authority needs with minimum immediate burden on the rates. It may happen that the rigidities of borrowing from the Public Works Loans Board will be lessened within the next few weeks as a result of the discussions now about to begin between the Government and the local authorities. These discussions follow upon the Government's undertaking of June 4th to discuss with the local authorities the types of project for which a loan might be raised for a shorter period than that of the relevant departmental sanctions. But it will be surprising if market borrowing loses all its advantages.

IMF and Convertibility

THERE is more than a hint of impending triumph and justification in the International Monetary Fund's latest annual report on exchange restrictions. The year 1952 marked the end of the transitional period during which members of the IMF were allowed to stray freely from the strict code of convertible conduct; since then those countries that still retained restrictions on payments for current international transactions have been required to consult with the Fund as to their further retention. The latest report, covering the second year of consultation, records that during this period "a considerable number of major trading countries regarded as possible both relaxation of restrictions and progress towards convertibility" and is prepared to predict that "during the third series of consultations further progress in this direction may be expected." As to the relaxations of restrictions during the past year, the Report makes the point that during the period world economic conditions were generally auspicious, that prices of internationally traded commodities fluctuated less than at any time since the end of World War II, that the gold and dollar reserves of non-dollar countries increased in the aggregate by about $2,500 million. Thanks to this altered climate of opinion and circumstance certain basic restrictions that had been maintained since the war were relaxed. The United Kingdom gains special commendation for the simplification of the regulations involved in the wide extension of the sterling transferable account system.

The prospect for further removal of restrictions, the report points out, is necessarily influenced by the views formulated by the several countries about economic conditions in the United States. But there is encouragement in the fact that the non-dollar world has so far reacted little to the reduction in US production and income. And there is an unashamedly cheerful conclusion that "the conditions for convertibility and expansion of multilateral trade have been more progressively and actively prepared during the past year than at any time since the Fund was established." Perhaps the most useful section of the report is its description, country by country, of the origins, essential features and administration of exchange control, with a detailed account of recent changes.

Hire Purchase Jump

THE figures of hire purchase transactions, sketchy though they are, do give further evidence that the volume of this business was already straining at the leash when the Board of Trade regulations were withdrawn. It was only in the middle of July that the regulations ended. Yet the figures for that month from HP Information disclose a sharp advance. These figures give a useful guide to a comparatively small sector of the field of hire purchase business; they cover motors, motor-cycles and certain types of machinery, but they exclude furniture, pedal-cycles and radio and television sales. The

NUMBER OF HP CONTRACTS

		July, 1953	June, 1954	July, 1954
Cars	New	2,428	3,973	4,536
	Used	17,387	22,911	25,728
Commercial Vehicles	New	1,191	1,834	2,032
	Used	2,526	2,696	3,183
Motor-Cycles and Side-cars	New	4,223	4,674	5,188
	Used	11,901	12,175	13,550
Tractors	New	395	414	442
	Used	414	312	326
Farm Equipment	New	619	553	568
	Used	nil	157	193
Aircraft and Engines	New	nil	nil	nil
	Used	2	nil	2
Caravans	New	832	920	839
	Used	202	419	643
Industrial Machinery	New	450	400	421
	Used	123	132	79

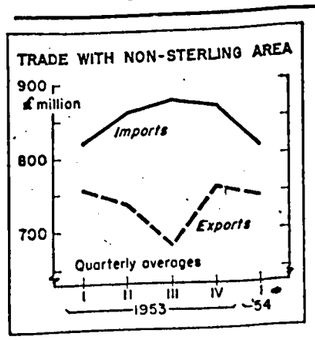
July figure shows a peak number of 55,857 contracts entered into during the month compared with the previous record of 51,808 in May. The figures summarised in the accompanying table point to remarkable rises in the hire purchase of motor vehicles, both new and second-hand, and a rising tendency in most of the other sectors covered. The significant exception is industrial machinery—in which a growth of hire purchase trading would surely have been generally welcome.

The Gnat Flies

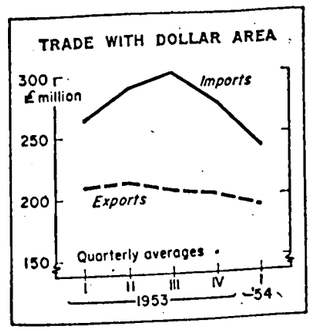
THE first flight this week of an uncommonly small fighter, the Folland Gnat, opens a fresh phase in the controversy that has surrounded this aircraft since its early design days. It is a high-speed fighter that should, when its scheduled engine is delivered next year, be able to reach supersonic speeds in level flight. Because it is smaller, lighter, and structurally simpler than the massive standard jet fighter there is reason to believe that it could be built in a simple workshop, in one-fifth the time, and at a cost of £25,000 as compared to £70,000 for a machine like the Swift or Hunter. It is, therefore, peculiarly suitable for any role that demands aircraft in quantity—and ground attack duties is, from the British side, the most pressing of these.

In Western Europe, a light fighter of this kind is looked on as an economic necessity for any form of air defence. The other Nato members cannot afford, as Britain can, to equip with an adequate number of aircraft of the Swift and Hunter type, not to mention the even more costly supersonic fighters, such as the English Electric P.1 that flew last week. The Air Ministry has turned down the Gnat on the grounds that it has already ordered as many of the more elaborate fighters as its budget will stand even though the RAF is noticeably weak in ground attack. Nato headquarters, on the other hand have shown some anxiety to see an aircraft of this type developed. So while the aircraft continues to be built as a private venture—and this also applies to the engine being designed for it by the Bristol Aeroplane Company—there have been discussions about the provision of the direct financial support witheld by the British Ministry of Supply from a dollar fund voted by Congress to finance the development of special weapons in Europe. Since Folland plans to build and flight test at least six aircraft from its own funds, Nato headquarters are not now likely to feel under the same obligation to reach a quick decision that they would have been if there was any danger that the project might be dropped for want of official financial support.

Money for Houses



INTERIM statements now coming through from a few of the big building societies show that the societies did a roaring business in the first half of this year. With interest rates falling and making 2½ per cent net a more and more attractive proposition to investors, they could hardly have failed to draw the money in. With houses rattling up and the Minister pressing for freer loans and smaller down payments from houseowners, they could hardly have failed to lend it out again.

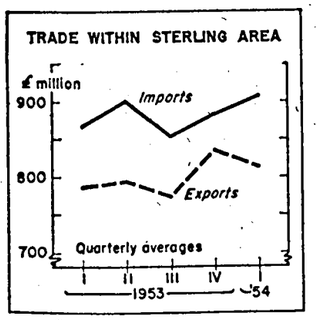


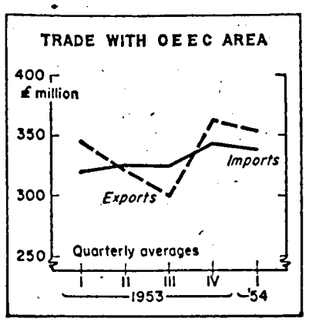
One of the current announcements comes from the Woolwich Equitable Society. On Tuesday it announced that its total assets "now exceed £100 million." That is certainly a sharp advance from the figure of £86 million in the September 30th balance sheet and even from the interim figure of £89.2 million on December 31st. The society deserves congratulations. The Woolwich announcement claims that it is "the third British building society to record this achievement." The Halifax and the Abbey National passed the £100 million mark years ago, but the Woolwich has just beaten the Co-operative Permanent whose total assets were £95.7 million at the end of June, £97.8 million at the end of July and may reach £100 million next month.

The Halifax half-yearly statement at July 31st shows that in the half-year the society's total assets grew by £11.6 million to £225.9 million. Soon there may be competition in the £200 million class, too. No doubt the Halifax society like to know how far outside that class the Abbey National now is, if indeed it still is outside. Assets last December were over £181 million and rising fast. During the six months the Halifax advanced on mortgage £22.4 million compared with £16.6 million in the first half of the previous year. It drew in from investors £26.2 million compared with £22.4 million in the first half of the previous year.

BEA's Renfrew Thistle

THE future of the aircraft maintenance base at Renfrew presents British European Airways with a prickly problem whose barbs are growing sharper with time. In its early days shortly after the war, the corporation serviced





Sterling Area Trade

The Board of Trade has almost succeeded in reducing the story of how the sterling area survived the American recession to the dimensions of a strip cartoon. Its latest summary of sterling area trade traces the switch from dollar to non-dollar countries and the growth of trade within the sterling area itself. The fall in the sterling area's exports to the dollar area was less sharp than the fall in its imports from that area. The fall in exports to dollar countries was more than offset by increased exports to the OEEC area, thanks to rising industrial activity in Western Europe. Imports from the OEEC area rose too, but less sharply than exports. There was little change in trade with other non-sterling countries.

The net result was that by the first quarter of 1954, the sterling area's visible trade deficit with the non-sterling world was no larger than in the same period of last year. It was not, however, roses, roses all the way. The value of world exports in the first quarter was 7 per cent higher than in the first quarter of 1953, but exports from the sterling area were only slightly higher. Britain's exports kept pace with the world trend, but exports from the overseas sterling area lost ground, being more affected than other areas by the fall in some commodity prices.

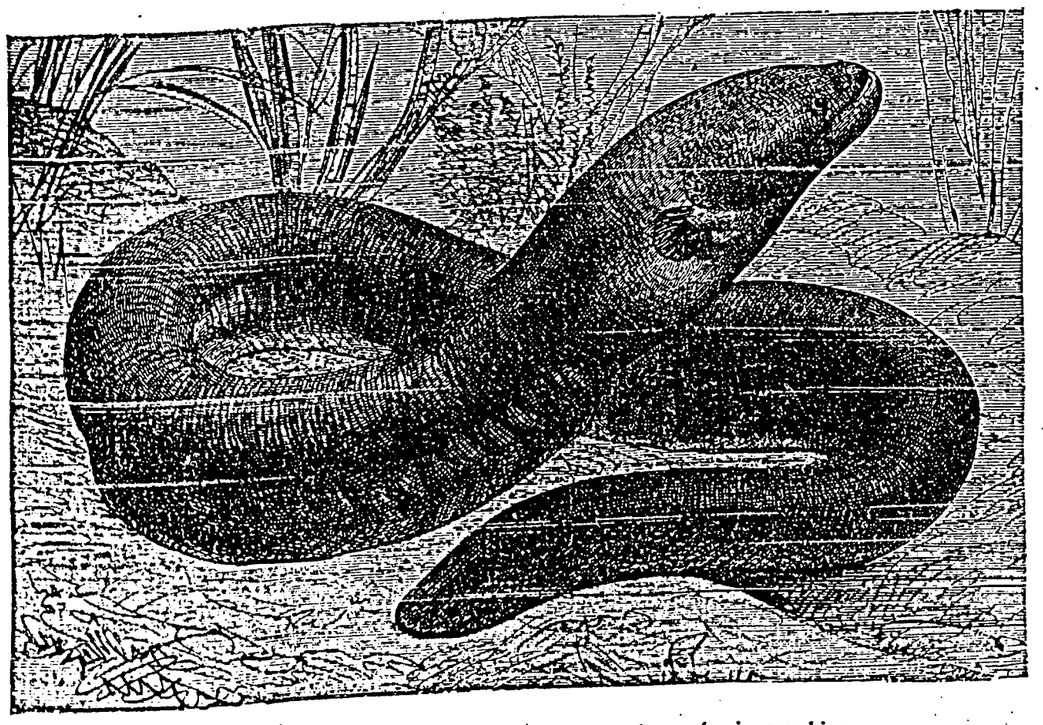
the aircraft used on its domestic routes at Renfrew and those operating to the continent at Croydon, and subsequently at Northolt. The weakness of this arrangement became apparent when the corporation started to use the same type of aircraft on both services. By this time, the base at Renfrew was well established, and even when BEA was able to move into palatial new maintenance hangars at London Airport that could easily accommodate its entire fleet, local union pressure in Scotland prevented the Renfrew-based aircraft from being moved south. Today, therefore, the new Viscounts and Ambassadors are serviced in London, and the older Vikings and Dakotas in Scotland.

Renfrew employs about 800 engineers, and in October, when the Vikings are withdrawn from service, the work available for them is likely to be reduced by half. The only aircraft still based at Renfrew after that will be 46 Dakotas whose numbers are dwindling as age takes its toll. The local unions are aware that the logical course for BEA would be to close down the base and move the Dakotas to London. The cost to BEA of keeping Renfrew in existence after October will be an additional £15,000 a year, a sum that it can ill afford; and the corporation has already offered to move down to London as many engineers and their families as choose to go, with, presumably, some assurance of a place to live in when they arrive.

There is not much doubt that the closing of Renfrew would create hardship, and local opposition has been building up to such a point that the corporation recently issued a statement making it plain no final decision to close the base had been taken. But it also made it clear that BEA was not going to move any new aircraft to Renfrew and that the retirement of the Dakotas would simply mean that it shut down later rather than sooner. The Renfrew dispute, in the unions' view, has now become a matter for the Minister; and the corporation itself has asked for a Ministerial ruling on whether "wider national issues should prevail over what would otherwise be a normal commercial decision." If union opposition successfully prevents BEA from closing the base, the corporation will have fresh reason to complain that its steadily recurring deficit is the direct outcome of instructions to undertake uneconomic ventures—most of them in the interests of Scotland—and some justification for asking for a special grant to cover these expenses.

Cable Depreciation Policy

CABLE AND WIRELESS—the nationalised communications company—has increased its dividend. The Government takes out 4 per cent for the year ended March 31st, thus restoring the rate to the level at which it stood before the cut to 3 per cent in 1952. Ample profits are there to justify the increase, the consolidated net profit having risen by £286,632 to £2,064,438, and the dividend cost is modest —only £660,000. What is significant in the field of nationalised industry is the progressive attitude which Cable and Wireless pursues on the matter of depreciation.



Unlike other nationalised concerns this company already makes provision for the increased cost of renewals in addition to normal depreciation. The sums allocated to this purpose are once again increased. Renewals in excess of normal depreciation this year cost £334,942 compared with £209,603 and are charged before arriving at the net profit. They are based on current replacement costs plus a provision for deficiency in total reserve. The report contains a hint that the company intends to go further along the progressive road. In the long run the reserves will go a comparatively small way towards financing renewals at the current costs of cable. Future revenue will have to finance the increased cost to a greater extent than hitherto. Is this a forerunner of a change of heart among the nationalised industries? If Cable and Wireless can provide true replacement instead of conventional depreciation, why not the Post Office itself?

British Banking Overseas

A PARTNERSHIP arrangement between two of the "Big Five" banks that has endured for nearly forty years is to come to an end in a few months time. On January 1st the National Provincial Bank will withdraw from Lloyds and National Provincial Foreign Bank Ltd., which it has owned jointly with Lloyds since 1917, and its half share in the capital of £1,200,000 will be acquired by Lloyds. The Foreign Bank will thereafter be operated by Lloyds as a wholly-owned subsidiary, and it is officially stated that its policy will remain unchanged. No reason has been given for this agreement to part—beyond the tantalisingly vague statement that both banks felt that there are advantages to be derived from sole ownership—but the decision of the National Provincial Bank to utilise the services of the Foreign Bank in the capacity of overseas correspondent is evidence that the parting will be a friendly one. Since the Foreign Bank is a private company, no details of its profits are published, but it is understood that it has been enjoying profitable working. It has ten branches, in France, Belgium, Switzerland and Monaco.

As this geographical range indicates, the change relates to only a modest part of the overseas business of the banks concerned; outside the centres in which the Foreign Bank operates, this business has naturally always been conducted through the correspondent system that provides the channels for the bulk of the external transactions of the clearing banks and their customers. It is, however, an interesting change, because there have always been two schools of thought about the merits of direct representation overseas. For many years, the agency system was the only system employed by the English deposit banks, and the Foreign Bank was in fact the first experiment in direct representation. It grew from the acquisition by Lloyds Bank, in 1911, of the Paris business of Armstrong and Company. Soon afterwards the Westminster Bank also ventured into Paris, the National Provincial later joined Lloyds, and Barclays set up its own organisation in the early twenties (and later went much further afield through its Dominion, Colonial and Overseas subsidiary). The Midland Bank then became the one major exponent of the other school of thought. It has always contended that, since the agency system must handle a big part of the business in any case, it is unwise to establish offices abroad that would compete with the correspondent banks in certain centres and might therefore lead them to give less than whole-hearted co-operation in agency work

How much electricity in an eel's tail?

IN OUR SEVENTY-FIVE YEARS of electrical experience, that is something we have never been asked to measure, which, when we come to think of it, is a little surprising. For every day we are called upon to supply equipment for measuring, generating or utilising electrical energy. And the many users of our products have found that there is a certain additional quality about them which is beyond all measure. That's what we were hinting at when we referred to seventy-five years. Like the eel, we've got a lot of electricity behind us.

When it comes to electrical equipment . . . you've got to hand it to

Crompton Parkinson LIMITED — ELECTRICAL EQUIPMENT

NOTE: Curiously enough, the electric eel (Gymnotus Electricus) is actually a fish. It gives a greater shock than any of the other fishes endowed with electric power. Its electric organs are situated on the back of the tail and along the base and sides of the anal fin. They are capable of giving shocks sufficient to kill other fish and small mammals.

There's room for you in this picture

She's proud of that husband of hers. He's come a long way fast and the indications are that he's going much further. Already they've bought many of the things that were little more than dreams when they married eight short years ago and they've wonderful plans for the future, too. Are they planning to buy *your* products? There's room for you in the picture, you know.

With its vigorous, realistic approach, the Daily Mirror appeals particularly to young families like these. In fact, the majority of the 4,600,000 who buy it every day belong to this all important younger generation. For, with long buying years ahead of them and an ambition to possess better and lovelier things, they've got a great influence on your future prosperity.

With the biggest daily sale on earth the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. And—Daily Mirror readers are young readers. *Your customers today—next month—next year.*

in other centres. The argument is plausible; but, on the other hand, there is no reason to suppose that direct representation has not served the other clearing banks well. Agency arrangements, after all, are reciprocal.

No Relief for Tea Prices

No relief from the present high level of tea prices can be expected for some time. Bad weather in North India for the second successive year has put paid to that: indeed, prices may well rise further. At the end of July this season's crop in North India, the largest producing area, totalled 190 million lb, no better than at the same time last year and 20 million lb less than at the end of July, 1952. Tea blenders in Britain were hoping for a real improvement last month. July and August are normally the two bumper months, by which time half the North Indian crop should be harvested. Even if the weather now improves, the total crop can hardly be appreciably larger than last year's.

Higher output in Ceylon, where the crop is already 20 million lb ahead of last season, appears to be fully absorbed by the steady growth in world consumption, and stocks in Britain and some other countries are lower than usual at this time of the year. The average price of clean common tea at the London auctions this week rose slightly to 4s. 7½d. a lb. Low grown and medium Ceylon teas were 1d. to 1½d. a lb dearer, and certain high grown teas 2d. to 3d. a lb dearer. The rise was partly due to better quality, but also to the news from India, which also strengthened the Colombo market. A further rise of about 4d. a lb in retail prices in Britain now seems unavoidable.

Mixing the Beers

THE postwar path of the brewing industry has been strewn with empty beer bottles—not with empty barrels. To tread this path with success the brewers have had to ensure that some of these bottles bore their labels and were, if possible, sold in an area wider than that served by their own chain of public houses. Since the draught beer trade has proved impossible to expand, amalgamations to effect economies in production and sometimes to reduce competition, together with mutual agreements between brewers to sell each other's bottled beers, have become the order of the day. That has been the brewers' answer to the change in social habits, to the television set, to heavy taxation and to the rise in both working and capital costs.

The wetness of the summer, bringing with it poor consumption figures, seems to have given a stimulus to these moves in self-defence. Barclay Perkins and Courage, two of the London breweries, have just announced that they are discussing reciprocal arrangements to sell certain of their products in each other's public houses—arrangements which might cover mineral waters as well as bottled beers. Whitbread recently came to a similar agreement with Truman Hanbury Buxton and flanked it with a small interlocking holding of each other's shares. Sometimes amalgamations have taken the place of agreements. Joshua Tetley, the Yorkshire brewers, have taken over Duncan Gilmour and in the south Brickwood has taken over the Portsmouth and Brighton United Breweries. This merger has made costly schemes to extend the United brewery unnecessary and plans for integrating production are under consideration. In an allied trade, Seager Evans, the distillers, is exchanging information with J. and W. Nicholson, distillers and wine and spirit merchants, with a view to "possible association in the future."

All these moves point to keen competition; there can be little doubt that the market in bottled beers is becoming more crowded with sellers. Simultaneously there is another move on foot, designed to lure drinkers back to the public house by the promise of hygienic and comfortable—almost luxurious—surroundings. That was one of the solutions propounded by Mr W. H. Whitbread at the annual general meeting of Whitbread. It received practical confirmation when Ind Coope and Allsopp, the owners of the largest chain of public houses in this country, announced a £2 million debenture issue. The issue, the first new money that the company has raised since the war in the capital market, is being sponsored by Baring Brothers and will be spent on a modernisation and reconstruction programme. The directors believe that the greater part of the capital projects can be financed out of the company's own internal resources, but they seem anxious to take advantage of the easing of building restrictions to step up the pace.

SHORTER NOTES

The directors of British-American Tobacco have announced a second tax free interim dividend of 5d. on each 10s. ordinary stock unit, or 4⅛ per cent. This compares with the second interim of 4d. per unit, or 3⅓ per cent, in 1952-53 and follows the first interim dividend for the current year of 4⅛ per cent. When that payment was made the directors stated that the increase was designed to even out the year's distributions.

★

Cotton spinners and weavers have rejected a claim for a 10 per cent increase in the wages of some 300,000 workers. The unions intend to notify the Ministry of Labour of the dispute, with the object of taking it before the Industrial Tribunal.

★

The new standard copper contract has been approved by the London Metal Exchange and will be introduced on October 4th. It requires all copper to be delivered ex-warehouse, instead of ex-ship or ex-smelter.

★

The Iranian rial has been appreciated for commercial transactions. The effective exchange rate has been changed from 93 to 82 rials to the dollar and from 253 to 229.6 rials to the pound. This marks a rise in the dollar-sterling cross rate from $2.72 to $2.80. The official rate for the rial, which was last applied to the transfers of the Anglo-Iranian Oil Company, remains at 90 to the pound. The rate that will be applied to the transactions of the oil consortium is not yet known.

Company Notes

WHITWORTH AND MITCHELL. Though Whitworth and Mitchell makes and processes its own fabrics, the heart of its business both at home and abroad is merchant converting — that is, the merchanting of cloths manufactured and finished to the company's specifications and designs by other firms. Its stocks are vulnerable to shifts in prices and shrinkage of demand. When the recession hit Lancashire, Whitworth and Mitchell was forced in two successive stages to write its stocks down by £435,000, a process which turned its trading profits into losses. Any recovery from such a blow is bound to be slow and it was not until the latest financial year (to June 30th last) that the company set back along the road to prosperity.

In this year the company earned a profit before tax of £128,322. After tax a net profit of £71,822 was returned, in contrast to a loss in 1952-53 of £31,230 and in 1951-52 (when most of the losses on stocks were brought in) a loss of £108,833. This profit has enabled the directors to pay a full year's dividend on the 6 per cent preference stock for the period to December 31st last, leaving the preference dividend still six months in arrears. These arrears will have to be made good before the directors can declare a dividend on the ordinary stock; the last dividend the equity shareholders received was an interim of 2½ per cent paid in 1951-52. The £1 ordinary stock units are now quoted at 17s. 6d., while over the year so far the price has ranged between the "high" of 23s. and the "low" of 15s. 6d.

FURNESS WITHY. The reports of other big shipping lines earlier this year pointed inevitably to a decline in the profits of Furness Withy when that company made its report. Its preliminary statement for the year to April 30th does indeed reveal a sharp fall in earnings. Profits before tax have dropped from about £3½ million to about £2½ million, the unavoidable result of lower freight rates and rising costs. Taxation has naturally also fallen—from £1,370,124 to £970,145—but net profits are down from £1,869,877 to £1,285,182. That the ordinary dividend should be left unchanged at 12 per cent in these circumstances was as inevitable as was the fall in profits. Investors certainly had not expected anything better and after the announcement the £1 ordinary stock units lost only 3d. to 34s. 3d., to offer a still well covered yield of 6.9 per cent—well in the centre of the bracket of yields offered by shipping shares.

For Furness Withy, like the other shipping companies, the decline in profits has come at a time when the company was completing the modernisation of its fleet; a year ago the chairman pointed out that the estimated cost of new tonnage contracted for was nearly £12½ million, compared with £6.3 million in 1951-52 (the year of booming profits in the shipping industry). Now Furness Withy, like P. & O. and Clan Lines, has taken an interest in air freighting. This year it acquired a substantial, though not controlling, interest in Airwork, the independent and privately owned air transport undertaking.

LONDON STOCK EXCHANGE

Next Account begins: August 25th
Next Contango Day: August 25th
Next Settlement Day: August 17th

THE stock market was very active both at the end of the old account and the beginning of the new. Interest switched to Kaffirs but industrial equities remained firm and by the close on Wednesday (the *Times* ordinary share index had been pushed up to a new peak of 164.4. In the gilt-edged market prices slipped back on Monday (with old Consols dipping ⅜ to 68⅛); these falls were due more to a slackening in demand than to any offerings of stock. Prices soon began to edge up again and long dated stocks on Wednesday more or less wiped out the earlier losses; but on Thursday further small losses were reported. Little interest was taken in foreign bonds; Japanese issues turned dull on Mr Dulles's statement. Greek bonds were marked up ½ of a point on the news that the debt settlement negotiations would begin in Paris next month.

Though some profits were taken in the industrial market, the falls reported in some issues were counter-balanced by the gains made in the store, engineering, paper, motor, brewery and radio issues. Bowater climbed to 64s. 6d. after the news about the mills in the United States. Tobacco shares were also firm and after the announcement of the interim dividend "Bats" gained 2s. to 43s. 3d. When the market opened on Thursday prices still remained firm and Vickers put on 3s. to 39s. on the Viscount order and Hudson's Bay gained 6s. to 133s. on the news of an increase in production by the company's oil interests. The oil market was very active indeed and Anglo-Iranian shot up at one time to 16⅜, though on the close on Thursday the price had slipped back to 15⅞. Other oil shares followed Anglo-Iranian.

Turnover in the Kaffir market increased sharply. The developing mines in the OFS attracted most interest (with President Brand and F. S. Geduld prominent). But the producers and the finance houses also shared in the advance. But losses in Kaffirs were reported on Thursday.

[1] Petroleum production in Canada in 1938 includes natural gasoline. 1938 figure of electricity production in Australia was for 12 months ended 30th; figures for New Zealand represent about 87 per cent of total generation. [2] Copper and tin refer to metal production. [3] General trade ...ing re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports ...). Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and ...tralia and Pakistan 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank: only figures ...tralia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. ...sia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ended June 30th. [a] Average for ...rter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended August 7th there was an "above-line" surplus (after allowing for Sinking Funds) of £26,392,000 compared with a surplus of £12,821,000 in the previous week and a surplus of £29,174,000 in the corresponding period of last year. This reduced the cumulative deficit to £97,373,000 (£122,024,000 in 1953-54). Net expenditure "below-line" absorbed £12,657,000 bringing the total cumulative deficit to £255,073,000 (£300,442,000 in 1953-54).

THE MONEY MARKET

CREDIT conditions became stringent in Lombard Street on Saturday last, after a week in which credit supplies had been plentiful and even in surplus. The authorities made small purchases of bills, mainly indirectly through the banks, but funds still remained in keen demand. On the first three days of this week the stringency remained, and was again only partially relieved by special purchases, made on a moderate scale and again mainly through the banks. Throughout the week the banks bought only few bills, mainly October maturities at 1⅛ per cent.

At last Friday's Treasury bill tender the market maintained its bid at £99 12s. 2d. per cent for the fifth week in succession. The offer remained at £240 million, but total applications fell by £16.6 million, so that the market's allotment rose from 39 to 46 per cent. At yesterday's tender the offer was raised to £250 million.

Business in the London gold market was inactive in the week covered by the Bank return, and the price at the fixing fell from 248s. 11½d. per fine ounce on Thursday of last week to 248s. 10d. on Wednesday last.

The Bank return shows the first post-holiday influx of notes, of £21.4 million. Government securities in the banking department fell by £39.8 million, but £8.5 million of this was merely the counterpart of a fall in the Treasury special account. Bankers' deposits fell by £2.9 million.

COMPANY MEETINGS

W. H. SMITH AND SON (HOLDINGS), LIMITED

ANOTHER SUCCESSFUL YEAR'S TRADING

THE HON DAVID J. SMITH'S REVIEW OF PROGRESS

The fifth annual general meeting of W. H. Smith and Son (Holdings), Limited, was held on August 6th at the Registered Office of the Company, Strand House, Portugal Street, London, W.C.2.

The Hon David John Smith (the chairman) presided, and the following is his statement, which was circulated with the report and accounts:

I am pleased to be able to report to you that the group has enjoyed another successful year's trading. Sales on both the wholesale and retail sides of the business showed a satisfactory increase. However, additional costs, mainly in salaries, wages and transportation, very largely absorbed the increase in the gross profit.

WHOLESALE TRADE

We now have 41 main wholesale houses and 33 sub houses and depots. They cover most of England and Wales, with the exception of South and South-East England, and constitute a valuable part of the business. As a group they play an important role in the daily task of distributing newspapers, periodicals and magazines, besides doing a large trade in books, stationery, toys and fancy goods. We are grateful to our trade customers for their continued and growing support. We hope this year to start on the rebuilding of Birmingham and Hull Wholesale Houses, the one badly damaged and the other destroyed during the war. Plans are in hand to rehouse our wholesale businesses at Plymouth and Coventry, both of which were destroyed by enemy action and have since carried on in temporary premises.

RETAIL SHOPS

We added two new businesses to our number during the year by the acquisition of shops in Horsham and Barry Docks. Our Canterbury shop moved back in May into new premises built on the site of the old shop destroyed by enemy action. We have rebuilt or rehoused almost all of our properties damaged or destroyed during the war, with the exception of our Coventry and Preston shops. The reconstruction of these is now taking place.

The programme for refitting and modernisation of shops continues each year and examples of the progress we have been making new fronts and fittings in Sloane Square and Oxford Street.

BOOKSTALLS

The negotiations with the London Transport Executive were concluded during the year, resulting in a renewal of the contract on satisfactory terms for a period of 21 years. This contract concerns the bookstalls on the underground system of London.

Our bookstalls can be found not only on railway stations but also at the principal airports in London and the provinces and at some well-known London hotels and terminals.

OVERSEAS BUSINESS

During last year we sent a representative on an extended tour of the Middle and Far East, primarily to visit our trade customers, and were very pleased with the reception he received and with the new business which resulted.

This past year has seen the first step in the physical expansion of our Canadian business since 1950 when our first retail shop was opened in Toronto. We have now agreed to purchase the bookshop business of Burtons, Limited, and, as a result, will, by the end of this present financial year, have a shop in each of the thriving cities of Montreal and Ottawa. We take over control of the Ottawa shop in September and of the Montreal shop next March, and for the time being shall retain the Burton name for these two businesses.

The amalgamation of these two businesses with that already under our control in Toronto will result in a substantial stake in Canada and should materially improve in the future the operating results of your Canadian subsidiary, which to date, although making good progress for an entirely new business, has not yet shown a profit.

HAMBLEDEN ESTATES

The balance sheet reflects certain changes in the group's financial structure as during the year this was simplified by the liquidation of Hambleden Estates, Limited, the subsidiary company which held the greater part of the group's freehold and leasehold properties. The original reasons for the existence of this company and for the segregation in it of the group's properties had ceased to exist and your directors feel satisfied that with its disappearance, the transfer of its freehold and leasehold properties to W. H. Smith and Son, Limited, and the replacement of its preference shares and debenture stocks by preference shares and debenture stock of your company, any future financing of the group will be much more flexible.

ACCOUNTS

The accounts of the group this year are presented in a different form from previous years, in that the figures of W. H. Smith and Son (Holdings), Limited, have been included in the consolidated balance sheet and profit and loss account with those of W. H. Smith and Son, Limited, and its subsidiary companies. The figures of the previous year have been adjusted so as to be shown on a comparable basis. The most important of these adjustments relates to the item described as "premiums at which shares in subsidiary companies are held and goodwill, patents and trade marks, at cost less amounts written off." This item, which was shown in the consolidated accounts of W. H. Smith and Son, Limited, and its subsidiary companies at March 28, 1953, at £140,104, has had to be adjusted as at that date to £2,372,024. Taking into account the net addition to the total during the year reflecting the acquisition of new businesses and the amounts written off, it now stands at £2,379,763. Apart from the valuable asset which this figure represents, the valuation of most of our freehold and leasehold properties which we undertook during the year shows that this amount was more than covered by the estimated increase in the value of the properties over the figures at which they stand in the balance sheet.

The profit shown in the consolidated profit and loss account, namely, £1,811,629, before charging taxation, shows an increase of £19,054. The charge for taxation, after taking into account £40,000 provisions for previous periods no longer required, amounts to £1,036,122. The excess profits levy relates to the final accounting period ended December 31, 1953.

After charging taxation, the consolidated net profit for the year is £775,507, of which a total of £442,500 has been transferred to revenue reserves and £16,070 has been added to the balance of profit carried forward. The total net dividends on the preference and ordinary shares of W. H. Smith and Son (Holdings), Limited, amount to £316,937.

In the balance sheet of W. H. Smith and Son (Holdings), Limited, the loan to W. H. Smith and Son, Limited, should be regarded as a permanent investment. The preference shares of Hambleden Estates, Limited, have since been repaid and in next year's balance sheet will disappear and be replaced by an addition of a like sum of £687,500 to the loan to W. H. Smith and Son, Limited.

With regard to the consolidated balance sheet reference should be made to the movements in the reserves which are explained in the notes on the accounts on page 10.

Properties, plant, motor vehicles, fittings, fixtures, etc., have increased during the year by £162,336 after deducting depreciation charges and sales. The gross capital expenditure during the year under these headings amounted to £375,976. The surplus of current assets over current liabilities increased during the year by £479,968.

THE DIVIDEND

We have been a public company for nearly five years, during which time we have paid a dividend at the rate anticipated in the prospectus issued in September, 1949, i.e. 12 per cent. We feel now that we are justified, this year, in paying an additional 2 per cent, making 14 per cent in all for the year.

DIRECTORS

Your board are very sorry to lose Lord Harcourt who has resigned on becoming United Kingdom Financial Adviser in Washington.

In his place, we have been fortunate enough to obtain the services of Mr John Phillimore, a director of Baring Brothers and Company, Limited.

STAFF

The distribution of newspapers in this country is a complicated and highly organised undertaking. It is worth recording here that at all seasons and in all weathers members of the staff are working all through the night and the early morning to make sure that our customers shall be able to read their newspapers before the day's work starts for them. Among the most important of the unrecorded assets is the loyal and efficient work of the staff. To them all I wish to express our appreciation.

PROSPECTS

For each of the past five years the group as a whole has enjoyed an increase in sales. Public demand, the rise in selling prices and physical expansion are important factors contributing to that result. While we look forward to further progress it will come from a more competitive retail world as a result of the end of all rationing, and may therefore well be of smaller proportions.

If our trade continues at its present level the group should enjoy another satisfactory year.

The report and accounts were adopted.

JOHN THOMPSON LIMITED

(Steam Power Plant and General Engineers)

INCREASED OUTPUT

MR EDWARD W. THOMPSON'S REVIEW

The nineteenth ordinary general meeting of John Thompson Limited was held on August 11th at Ettingshall, Wolverhampton, Mr Edward W. Thompson, MA, JP (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The net profits for the year 1953 after paying £769,940 for taxation and providing £232,441 for depreciation are £413,168. This figure is the highest in the long history of your company and compares with £381,158 for 1952. The gross trading profits of the group are £1,472,760 comparing with £1,343,729 for 1952. The reason for the comparatively small increase in the net profit is, of course, due to the fact that taxation has again increased over the previous year by over £59,000, whilst we considered it necessary to increase the depreciation provision by over £35,000.

The total output invoiced over the whole group for the year amounted to £14,421,005 compared with £12,901,320 for 1952. It is interesting to note that the corresponding figure for 1936, when the public company was formed, was £1,708,000.

The total assets include no less than £5,337,050, representing stock-in-trade and work-in-progress (less progress payments which compares with £4,787,055 for the previous year). The total net assets after deducting appropriate liabilities were £5,308,532 compared with £4,833,003 at the end of 1952.

Your directors are recommending that the same final dividend of 12½ per cent be again paid on the issued ordinary capital.

NEW CAPITAL

In my report last year I explained how our liquid cash resources had been reduced. With the expansion of our business the figure for stock-in-trade and work-in-progress continues to rise, and during six years the increase is over £4 million to the present total of £5,337,050.

Heavy taxation and essential capital expenditure also add to the difficulties of maintaining liquid cash. Coupled with this problem two opportunities have arisen of acquiring other interests which your board believe will be to the advantage of your company. These are, firstly, the purchase of the whole of BVC Industrial Constructions Limited, and, secondly, the purchase of a controlling interest in E. Leonard & Sons Limited of London, Ontario, Canada.

Your board felt it was prudent in present circumstances to raise additional capital this year, both to cover these purchases and also to augment the working capital of the John Thompson group of companies generally. It has been decided to issue 1,146,599 new ordinary shares of 5s. each at a price of 15s. per share; these shares to be offered to existing ordinary stockholders of the company in the proportion of one new share for every complete three Stock Units of 5s. each held at the close of business on June 22, 1954. In addition your board propose to increase the nominal capital of the company by £1 million (which includes the new shares now to be issued) in order to make full provision for future additions and alterations in the ordinary capital structure of your company as these may become necessary and desirable.

I would like to make some comment on the general question of "profits" on which there has been so much misleading propaganda, adverse criticism and misguided thought. To survive at all, a company must make profits, and they are the only true indication of its efficiency. The National Revenue is the first and greatest beneficiary from all gross profits, and the country would be in a very sad position if there were a serious decline in the profits of industry generally, as taxes on industrial profits provide approximately 40 per cent of the total National Revenue from direct taxation. I think industry as a whole, with very few exceptions, is endeavouring to increase its efficiency so as to maintain and increase its profits—this certainly is the case with your own company—therefore if increased profits do result they should be welcomed, not criticised.

FUTURE PROSPECTS

It is unwise to make anything other than a cautious forecast. All I propose to say is that the output of our group of companies for the first three months of the year showed an increase of 13½ per cent over that for the corresponding period last year, and at the present time this rate of production is being maintained.

During a period in 1953 we noticed a slight falling off in orders, but this has since righted itself; and while our orders on hand uninvoiced are not quite as large as at this time last year, they still stand at over 36½ million pounds in spite of the increased output during 1953 and onwards.

Our various group companies are very active, and as a result of the large expenditure on improving plant and production methods they are in a strong position to meet competition.

While our direct exports during 1953 showed a very slight reduction of 1½ per cent compared with 1952, this was largely due to the increasing demands for local manufacture of sub-contracts for our main overseas contracts. It may be interesting to point out the dependence of this company on overseas trade; taking our direct exports, plus indirect exports and plus the trade of our overseas companies, the total figure represents nearly 50 per cent of our total output of 14½ million pounds.

The report was adopted.

EDGAR ALLEN & CO., LIMITED

MR W. H. HIGGINBOTHAM'S REVIEW

The fifty-fifth annual general meeting of Edgar Allen & Co., Limited, was held on August 12th at Sheffield.

Mr W. H. Higginbotham, FSAA, FSS, chairman, in the course of his speech, said:

The results of the company's trading during the year ended April 3rd last, suffer—like those of the preceding year—by comparison with the remarkable records of turnover and profits set up in the year 1951-52; but closer investigation of the accounts, and of their background of trading conditions, discloses some encouraging features, and leads to the conclusion that in view of all the circumstances the results are not unsatisfactory.

DIVERSITY OF ACTIVITIES

The company's business is very diversified; it falls roughly into three groups: (a) steels, tools and magnets; (b) steel castings and (c) engineering and trackwork. This diversity (as we know from long experience) has its advantages; it brings us into contact with a wide range of industrial activities, at home and abroad, and thereby ensures us to a large extent against the effects of local or sectional trade depression. But this insurance is by no means a complete indemnity against the effects of a reduction in the activity, or in the ratio of profit to turnover, of any group or department; and it is quite possible for the profits arising from successful trading operations in one sector to be offset, in greater or less degree, by decline in the contribution made by another.

It is apparent that although in group (a) turnover—and, given suitable conditions, profits also—may be expanded much more rapidly, there are correspondingly greater risks of fluctuation in volume and value of turnover, and of losses on realisation of stocks in the event of prices falling.

Although in the steel castings trade as a whole there is a falling off in orders, and productive capacity has overtaken demand, we have secured our share of the business available. Our engineering department has had a record turnover this year; it still has very substantial contracts in progress, and other valuable business in view; but foreign competition (apparently subsidised) is exceptionally keen in the export field (as we have good reason to know), and profit margins tend to be lower. The trackwork department is also very active; its sales of axle-box liners are still expanding, and have extended further into overseas markets.

THE FUTURE

To forecast the future is never usually unwise. There is still a satisfied demand for our types of be met; there is also far more petition, and the recurrence of increases in wages is discouragir books, though lower in some s year ago, are still good; and a of orders is reduced, deliveries a On the showing of the current it seems reasonable to expect re as favourable in 1954-55 as u. before you now show.

Although we are grateful to the C. of the Exchequer for his concessions this with respect to allowance of tax on expenditure on machinery and plant, and for the cessation of the politically inspired exc profits levy, they are in themselves a re nition that taxation of the profits of in still remains at a dangerously high lev must be reduced in the national inter

THE INDEPENDENT TELEVISION AUTHORITY

The Independent Television Authority invites applications for the post of DIRECTOR GENERAL.—Applications should be addressed to the Chairman, c/o Postmaster General, G.P.O. Headquarters, London, E.C.1.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)

Applications are invited for appointment in October, 1954, or as soon thereafter as possible, to Assistant Lectureships in Economic History with special reference to England since 1750. In the case of one post, ability to assist in the teaching of the Economic History of the U.S.A. would be a qualification. Salary scale £500 x £50—£600 per annum with superannuation benefits and family allowances. In assessing the starting salary, due consideration will be given to age and experience.

Applications, with the names of three referees, should be forwarded not later than September 6, 1954, to the Secretary, London School of Economics, Houghton Street, Aldwych, W.C.2, from whom further particulars may be obtained.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the following Fellowships:—

(i) One Leverhulme Post-Graduate Fellowship in the Faculty of Arts, tenable for one year at a value of £500, renewable for a second year at a value of £550.

(ii) Three University Fellowships in Arts, tenable for one year at a value of £350, renewable for a further year.

Applications, stating age, whether National Service requirements have been fulfilled, details of qualifications and experience, research work in progress and completed, and an outline of the proposed field of research, together with the names of two referees, should be received not later than September 1, 1954, by the undersigned, from whom further particulars may be obtained.

STANLEY DUMBELL, Registrar.

GENERAL MANAGER (SALES)

THE GLACIER METAL CO., LTD., invites applications for the head office appointment of a General Manager (Sales). The company manufactures a wide range of plain engine bearings and standard products, employing approximately 2,500 in factories situated in London, Manchester and Scotland. The G.M.S. will be directly responsible to the Managing Director for organising, maintaining and developing the sales activities of the company. He will be responsible for working out sales policy and for customer contact. He will need to maintain effective relationships with the general managers for manufacturing and technical development. He will have as immediate subordinates technical and export specialists, representatives responsible for large customers and a sales manager, who has subordinate to him representatives for geographical areas. He will also be responsible for advertising.

Applicants need not be qualified engineers, but must have a sufficient grasp of engineering industry. Previous experience of sales executives in the engineering industry, preferably in engineering. The preferred management is essential, preferably in engineering. The preferred age range is 40-45, but both older and younger candidates with exceptional qualifications will be considered. Salary range is £3,000 to £4,000 according to age and experience; pension with life assurance. The successful candidate is expected to merit nomination for a directorship within one year.—All applications will be treated in confidence, and should be addressed to Mr. W. B. D. Brown, Managing Director, The Glacier Metal Co., Ltd., to reach him at the Head Office at Ealing Road, Alperton, Middlesex, not later than Monday, September 20, 1954.

THE UNITED STEEL COMPANIES, LIMITED invite applications from mathematical statisticians for a post as Assistant in the Mathematics Section of the Research and Development Department. The candidate should possess a good honours degree in statistics or mathematics and should have an interest in the application of statistical techniques to industrial problems. Research or industrial experience desirable but not essential. Salary will depend on qualifications and experience.

Apply, Assistant Director of Research, The United Steel Companies, Ltd., Swinden Laboratories, Moorgate, Rotherham.

ACCOUNTANT. A qualified accountant is required in our Financial Accounts Department. Age 25 to 30 years. This position should offer good opportunities for a young accountant who is keen to make a career in industry. Selected applicant is offered excellent staff conditions, including contributory superannuation scheme, in an ideally situated factory. Application, giving full details of age, experience and salary required, and quoting reference CC/4622/3, should be addressed to the Personnel Manager, Ferodo Limited, Chapel-en-le-Frith, Via Stockport.

A MEMO TO THE MANAGING DIRECTOR. More business and better business awaits your executives if they have the use of a 1954 self-drive car. Lowest possible rates. Contract hire by arrangement. Free third party, fire and theft insurance. No maintenance costs. Ask your secretary to write for our new brochure which gives full details.—Autohall, Dept. 2-A, 302-306, King Street, London, W.6. Tel.: RIVerside 2881.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

TRANSLATION Service for Science and Industry, conscientious, speedy specialist translators.—20 Derby Road, Watford. Garston 3019.

SENIOR FOREIGN SALES MANAGER, wide international experience commerce and industry, fluent French, German, Spanish, seeks appointment.—Please reply Box 625.

FOR SALE, Keesings Archives, bound, 1950-54. Best offer.—Box 661.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)

Applications are invited for appointment in October, 1954, to an Assistant Lectureship in Economic History, with special reference to the economic history of the ancient world. Salary scale, £500 x £50—£600 per annum, with superannuation benefits and family allowances. In assessing the starting salary, due consideration will be given to age and experience.

Applications, with the names of three referees, should be received not later than September 6, 1954, by the Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, from whom further particulars may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Assistant Grade II (salary £450-£550 p.a.) in the Research Section of the Faculty of Economic and Social Studies. The appointment is for research into the process of innovation in industry, and applications will be considered from graduates in Economics, Political Science, History or Sociology. Applications should be sent not later than September 15, 1954, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

BRAZIL

Commercial, manufacturing and financial information. Enquiries invited.—Littlejohn & Co., Ltd., Caixa Postal 7352, Sao Paulo, Brazil.

INDUSTRIAL AND COMMERCIAL FINANCE CORPORATION LIMITED require a first-class Executive to take charge of the Corporation's Industrial Investigation Department, comprising engineers and other technicians, accountants, market investigators and other specialists. The Department has three main functions: the investigation of the businesses of new applicants; routine liaison with existing customers; and the provision of special assistance and advice to customers. Applicants for this post, which will command a substantial salary, should have first-class experience in industrial consultancy. Communications should be addressed to The Chairman, at 7 Drapers' Gardens, London, E.C.2, marked "Personal." All communications will be treated in complete confidence.

MARKETING RESEARCH: A vacancy exists in the Slough Office of Aspro Limited for an Assistant to Marketing Research Officer. Minimum age 21 years. Degree in Statistics or Social Psychology or with some experience in Market Research. Please apply, giving full details of previous experience, to Personnel Officer, Aspro Limited, Slough, Bucks.

PROGRESSIVE GROUP manufacturing precision instruments and electrical and optical equipment, selling both to industrial and domestic consumers, seeks a man with a technical and commercial background to lead a small marketing development department. The work involves product studies, market research at trade level and sales forecasting, commercial intelligence and interpretation of sales statistics.—Write, stating age, experience and salary required, to Box 658.

JUNIOR MARKETING EXECUTIVE required by large London West End Advertising Agency. At least two years' Market Research experience and some knowledge of economics and statistical methods.—Box 657.

BRITISH ELECTRICITY AUTHORITY require STATISTICAL ASSISTANT in the Commercial Department at Headquarters, London. Candidates should have a University Degree in Mathematics or Economics, with Statistics as specials subject. Some practical experience in Electricity Supply Industry would be an advantage. The duties will be to assist in applying statistical methods especially sampling, regression analysis, etc., to electricity supply problems.

Salary, within N.J.C. Grade 4, £635-£698 p.a. inclusive of London allowance, according to qualifications, experience. Applications, stating age, qualifications, experience and present position and salary, to D. Moffat, Director of Establishments, Winsley Street, London, W.1, to be received by August 23, 1954. Please quote Ref. ECT/503.

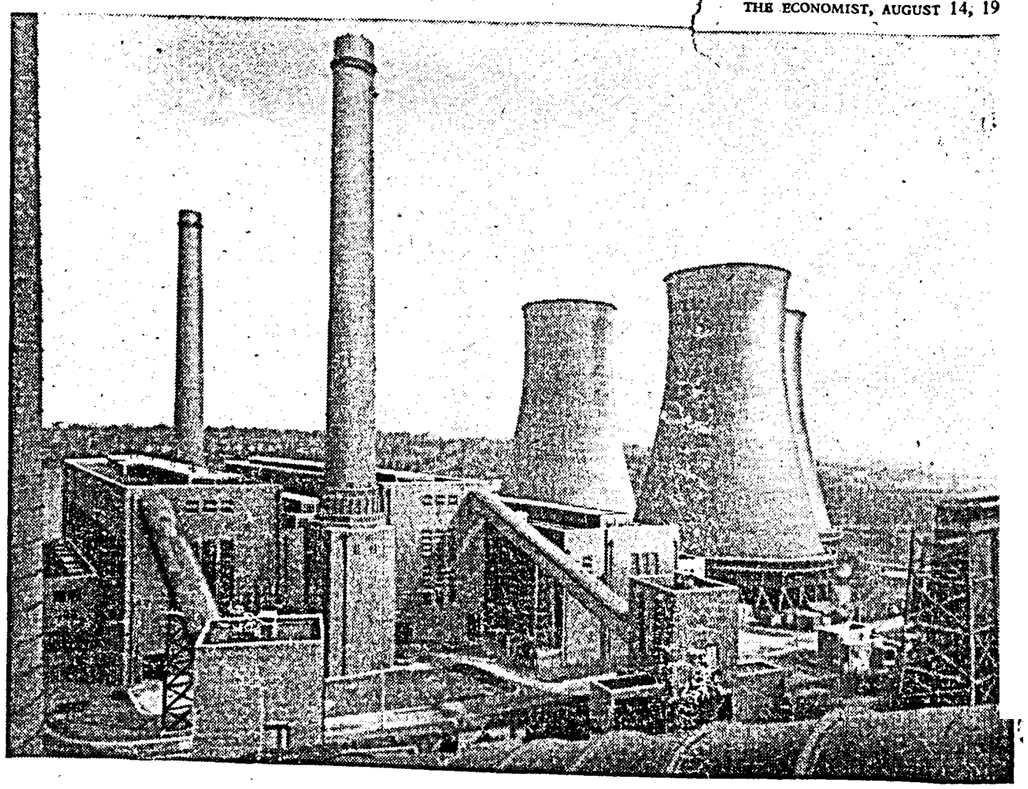
THE WESTERN REGIONAL PRODUCTION DEVELOPMENT BOARD, NIGERIA, invites applications for the post of CIVIL ENGINEER. Applicants must have had at least 15 years' experience and have had charge of a large constructional department and must be an A.M.I.C.E. or a B.Sc. (Civil Engineering). The duties of the post will include supervision of all the Board's civil engineering and constructional programmes such as road construction and tarring, office block, technical college, housing schemes, etc., preparation of tender forms and contract documents and so on, and general departmental administration. Experience of large scale land surveys will be an additional advantage.

The salary will be in the range of £1,850-£2,000 depending on qualifications and experience. The terms of service include free, partly furnished accommodation; contributing Provident Fund of up to 10 per cent of salary; free medical service for officer and wife; free passages or child allowance of £75 per annum each in lieu for up to two children; free first-class sea or air passages for officer and wife; facilities for purchase of motor car.

Applications should be submitted to reach The Nigeria Office, 5 Buckingham Gate, London, S.W.1, not later than August 31, 1954.

STUDY AT HOME

B.Sc. ECON.



This London University degree, open to all, is a valuable qualification for statistical, research, educational and welfare work. It is necessary only to pass three examinations. Wolsey Hall (founded in 1894) can prepare you for these at home. Reasonable fees, instalments. 952 B.Sc. Econ. (Final) Successes, 1925-53. Prospectus from C. D. Parker, M.A., LL.D. Coal handling at Birmingham

This new power station, the Nechells " B " Station, near Birmingham, recently began operation. Mitchells supplied the two coal-handling plants—one for each line of boilers. This plant can be seen in the forefront of the picture—the two square buildings are the wagon tippler hoists, which empty the incoming full wagon-loads of coal. Running from each of these tippler hoists can be seen the inclined belt conveyors which carry the coal up to the boiler plant.

Similar equipment has been supplied by Mitchells to other large power stations in the Birmingham area—and in most of the other important industrial centres of Great Britain. Other Mitchell activities include wagon-marshalling equipment, boiler plant, power station buildings and cooling towers.

THOUGHTS ON THERMAL INSULATION No. 2

It doesn't appear in the Profit and Loss Account

CORRECT US if we're wrong. You can turn up last year's sales analysis figures in a twinkling, seconds suffice to pull the September production levels from your desk drawer. Absenteeism in the machine shop, overtime in the finishing department, tantalising graphs about increased productivity in the handling section—they're all no more than a bell-push away. Even fuel bills—a nice solid item rising steadily over the years. We'd like to pause here, because this is a neglected item worth a glance or two.

Did you know that thermal insulation could help you trap some of the fugitive heat (for which you pay) which leaves your plant without doing its job properly? Much of it could be profitably put to work by the application of sound thermal insulation principles. Lack of thermal insulation is costing the country something like 5 million tons of coal every year.

How do you go about making a fuel bill saving and helping to reduce this waste of coal? First of all you need someone who can rate your fuel/heat efficiencies. Next you need to be certain that any thermal insulation is carried out using only proved materials. You can solve these problems by calling in NEWALLS who will be pleased to give you the benefit of their long experience as contractors and manufacturers of their well-known 85% MAGNESIA, NICOSIL, NEWTEMPHEIT and ASBESTOS products, and who offer free consultation and preliminary investigation to any firm interested in fuel saving by better thermal insulation.

Have a look at your fuel bills, then ask your Plant Engineer to drop us a line.

Issued in the interests of a better understanding of thermal insulation in industry by

with finger-tip microphone control!

DICTATION QUICK AS THOUGHT!

1 PRESS TO RECORD

2 PRESS TO START OR STOP

3 PRESS TO RECAP

This remarkable new microphone puts all controls at your fingertips. Three simple movements control all dictation, correction and listening back.

Here is a revolutionary development in dictating machine design.

You can sit, stand, walk about—and still dictate. Or have the microphone right at your elbow and dictate whenever you feel like it. There is no need ever to touch the Tape-Riter during dictation; the microphone switches give you complete control, complete freedom to concentrate.

With the new Tape-Riter you can save up to 40% of the time you spend on paper-work; increase your secretary's output by up to 60%. These are facts you can hardly afford to ignore.

MORE EFFICIENCY-PLUS FEATURES

Here is a steel window that keeps its rustless finish

The Crittall mark on the steel windows of any new building means that you can be sure of two things. First, that the quality of design and metal craftsmanship is as good as modern knowledge and long experience can make it. Second, that the tough, galvanized surface will keep its rustless finish. For every steel window bearing the 'Crittall' label has been *positively rustproofed* and, with the very smallest outlay for sensible maintenance, will give you lasting service.

Fried fish and mothballs?

Recently many people, including the National Federation of Fish Friers, have been slanging our old friend the potato. It has been variously accused of tasting mouldy, musty and 'like eating mothballs'!

The official word for this unfortunate deterioration in flavour is 'taint'—the result of treating potato fields with chemicals to control Wireworm.

Shell scientists have the complete answer to this one!
Aldrin, the new soil insecticide developed by Shell, not only controls Wireworm as effectively as any chemical previously known, but does so without even the remotest possibility of tainting—
even when the potatoes are planted immediately after treatment.

Many farmers have used aldrin this year with outstanding success and there will be plenty for the next potato season.
Its use will give certain protection against Wireworm and bring back to our tables the finely flavoured potatoes we have always enjoyed.

Needless Scarecrow

THE Labour party has run into a strange and baffling dilemma in the formation of its economic policy. It is a dilemma that only the party's economists have recognised as yet; but the others will have to turn round to face it soon. They would be wise to do so now, for it is important to them that next month's conference at Scarborough should not commit the party to any new shibboleths that will prove to be awkward when it comes to putting them into practice.

The root of the problem is that the party's thinkers now admit that public "confidence" is, after all, an important factor in preserving prosperity. If the trading community—not merely the tycoons of Big Business but the rank-and-file of the trading and purchasing public—thinks that business is going to be good or that sterling is going to be strong, then business probably will be good and sterling probably will be strong. Certainly the obverse of the same statement is true—unless there is widespread business confidence there cannot be any prosperity. In other words, prosperity cannot be planned by the back room boys. What has forced this admission—the plainest statement of it was in a recent article by Dr Thomas Balogh, the Bevanites' *éminence grise*—is the course of events in the last two years, which defies explanation by any other thesis. By rights, the United States ought now to be in a deep depression; the fact that it is not can be explained only by the persistent refusal of the American public to accept the diagnosis. Similarly, the inflow of foreign capital to Britain's gold reserve or the re-birth of private savings cannot be explained in planners' terms but only as phenomena of an improved public psychology.

These demonstrations are clearly going to have a deep effect on the whole trend of economic thought. They may well force a reaction against the mechanistic model-building, the equation-hawking, of recent years. Economics may even become a human study once again. But for the moment the political implications are even more interesting. For candour compels the Labour party to admit that it is not very good at creating business confidence. It spends so much of its time making grimaces at capitalists and business administrators of all kinds that they tend to get nervous when it is in office. This scarecrow effect could be much more serious in Labour's next period of office than in its last one, because the crows will find it much easier to take wing. Labour came to power in 1945 at a time when the great majority of Britain's imports were bought on government account, and when the allocation, rationing and exchange controls that had been built up during the war gave it draconian powers to prevent a run on the exchanges and on scarce supplies of imported goods; even when it left office more than 50 per cent of Britain's imports were still being bought by government departments, and the rest of the economy was little more than half-free. But today all the great commodity imports have been returned to private hands, the rationing and allocation structures have been torn down, and exchange

controls are much looser than they were three years ago. There is therefore a haunting fear in the Labour party that in the first few days after its next return to power there might be a rush to buy imported goods and to send capital out of the country, that millions of pounds might slide out of the country down the merchants' and bankers' ramp. The Tory election cry that a return to Labour rule would mean a return to economic crisis would seem to be confirmed.

The Labour intellectuals who have thought their dilemma through to this point have so far attempted only one answer. This answer—Mr Strachey set it down in a much-quoted article in the *New Statesman* six months ago—is that the party must be ready to restore the most stringent controls within a few hours of returning to office. Mr Strachey himself made it clear that he did not like this prospect; and other members of his party have made it even clearer that they did not like his brandishing it in a scared electorate's face. But—and this is the next stage in Labour's dilemma—both Mr Strachey and his critics have missed the main point. The real trouble about a policy of dashing from freedom is not that it would be uneconomic and unpopular (although it undoubtedly would be). The real trouble is that it would be impossible to implement.

★

It would be impossible because so much would have to be done so quickly in such unpropitious circumstances. The principal lesson that Labour ex-Ministers should have learned from their own experiences in 1945-51 is surely that hasty or half-measures never work. Hasty new restrictions on private imports have little (or else a long-delayed) effect on expenditure of foreign exchange, although a cut in overseas purchases by Government departments can sometimes be implemented more quickly. Hasty schemes of internal allocation and rationing never work, although order can sometimes be created out of chaos if very full information is collected about the pattern of demand and if private distributors and trade associations can be persuaded to co-operate with their warders. The so-called controlled economy of 1945-51 was an economy that limped along because it had been built up in the very different conditions of wartime and stood ready to the Labour ministers' hands when they came into office. They were also helped by the fact that the Ministries held a strong bargaining position as sole purchasers of many important raw materials, and because private industry, in the immediate aftermath of war, was willing to co-operate or at least ready to be cajoled.

There can be some argument about whether this complex system could ever be re-established in peacetime, in the teeth of the suspicion that co-operation was being demanded—and the cajolement exerted—for party instead of national ends. But there can be no argument at all that it could be re-established quickly. With the worst will in the world, Labour could not hope to close down the commodity markets, re-discover and re-instate the committees and civil servants who used to run the allocation schemes, turn public libraries back into food offices, call together the trade associations to discuss how a noose of new allocation controls could be tied round their necks, and slam down the hatches at the exchange control department at the Bank of England—all in the trice that it takes the international trading community to say "flee from sterling." And if Labour tried to do even one half of these things, the cry "flee from sterling" would reverberate insistently and speedily.

It is probable, indeed, that there are only two measures that a Labour Government could take if it was faced by a crisis of confidence as soon as it returned to power. One would be to depreciate the exchange rate, thus causing an increase in the internal price of food; the other would be to raise Bank rate to a crisis level, possibly creating unemployment thereby. If Labour insists on proclaiming itself as the party that will soak the rich and bring back the controls, it will find itself landed with dear food and dear money.

This is the dilemma. There is only one way out of it, and that is to avoid having a crisis of confidence in the first place. But that would require the party to set about reassuring the business community and wooing its confidence. It would involve Labour speakers, from both wings of the party, in declaring that, while they remained socialists, they would do nothing doctrinaire or vindictive or ill-considered. And in its present mood the party is wholly unprepared to preach anything of the sort. So there arises the peculiar phenomenon of a party clinging to an attitude which it admits may well provoke an economic crisis, which in turn may well be fatal to the party.

★

What is the explanation of such strange suicidal tendencies? Partly it is the old habit of proclaiming the slogans of the class war, without really meaning them. Partly it is the fruit of the compost heap of sheer malicious envy that some Labour leaders have built up in recent years—again perhaps without fully meaning it. But mainly it is because of a simple piece of intellectual confusion. The one objective that the Labour party can never abandon, that it never should abandon, is that of raising the standard of living of the poor. And it has persuaded itself in recent years into the belief that the only way to do that is to take wealth away from the prosperous and give it to "the workers." Raising the standard of living and reducing the inequality of wealth are spoken of in Labour circles as if they were inseparable and identical. And since the objective of abolishing poverty cannot be abandoned, neither can that of being beastly to the possessors, managers and creators of wealth, however many crises may be induced in the process.

But, of course, there is no identity at all between the two. Indeed, there is a strong contradiction between them. Save in the quite peculiar circumstances of wartime, any attempt to make a large and rapid transfer of a slice of the national income from one class to another would be almost certain to reduce the total national income. Save again, in the peculiar circumstances of wartime, the periods and countries in which the standard of living of the workers has risen most rapidly have been the periods and countries in which the profits of enterprise have also been rising most rapidly. There is no need for a Labour dilemma at all; for the choice is not between social progress with a crisis and social stagnation without it, it is a choice between another bout of levelling down with a crisis and rising prosperity with social reconciliation.

Is it too much to hope that the new-found admission of the importance of confidence should lead the Labour thinkers to a realisation of this simple truth? The changes that would be needed to forsake the role of scarecrow are much more changes of posture than of specific policy. The domestic policy outlined in "Challenge to Britain"—or at any rate those parts of it that Labour would actually try to implement—are not very inspiring; but they are also not very frightening. They are merely being made to appear so by intermittent cries of envy, and calls for more controls, and yelped assurances that this mixture is something very different (and very much nastier for the rich) than the successful policy that the Tories have been lucky enough to pursue. It is not at all clear why Labour should insist that it is opposed to that part of Tory rule that has worked, instead of to those parts that have limped. It is not at all clear why the party should so obstinately misunderstand the criticisms that are made of it and lump all its critics together as enemies of the poor; what many of them complain about is not that Labour wants to do too much for the poor but that its methods condemn it to doing too little. Why cannot Labour lift its eyes to see the opportunity for a policy of national expansion that lies before it? More people than the party tacticians dream of are waiting anxiously—and a little desperately—today for a progressive party instead of a scarecrow, and for the re-emergence of a generous, idealist and dynamic Left.

Nothing but the Treaty?

THERE is a certain air of effrontery about the mission that takes the French Prime Minister to Brussels this weekend. He is asking the governments of Belgium, Holland, Italy, Luxemburg and the Federal German Republic to revise the treaty for a European defence community on which they, or their predecessors, agreed over two years ago. He proposes some sixty objections and amendments of the kind that their spokesmen have wrestled with and overcome in their own countries and parliaments, without even being able to give any hard and fast assurance that these changes will satisfy his own cabinet or the National Assembly. To men like Dr Adenauer and M. Spaak, who have stood for many months waiting to plunge into European integration at the deep end, it is exasperating to be invited at this late hour to do no more than step down timidly into the shallow end. And the prospect of having again to spend weeks in persuading parliaments to approve is frankly intolerable.

Fortunately for French prestige, M. Mendès-France cannot himself be blamed for his nation's hesitations. Indeed, he can claim that he is trying to bring them to an end by what seems to him the only possible methods. It can also be pleaded on his behalf that if he is not allowed to present a modified EDC to the National Assembly then no other statesman will be found to present the treaty in its present form. It can even be threatened that the failure of M. Mendès-France would mean the end of EDC, so frustrating not only the rearmament of Germany but also the promised restoration of its sovereignty. As the nucleus and indispensable base of the Atlantic alliance's defence system in Europe, France is in a position—with assistance from Moscow—to cause the United States and Britain the gravest embarrassment if a determined Prime Minister tried to "go it alone."

On the face of it, therefore, there is a case for listening patiently to what M. Mendès-France has to say and for calculating carefully what he can and cannot do. He has acquired a prestige among his countrymen that no other French sponsor of EDC has enjoyed since M. Schuman withdrew from politics. He is offering to do what no predecessor of his has dared to do—to stage a debate on the treaty in parliament on August 28th. He has launched his country on new paths in Indo-China and North Africa which offer fresh hope for the future. He has the power to inject some fresh vigour into the French economy. Is this man of promise then to have hung around his neck the millstone of the EDC treaty, the whole treaty, and nothing but the treaty? Is this to be the reward of courage?

That is how a loyal and reasonable Frenchman might argue in his Prime Minister's favour; but it is an argument in favour of a man at the expense of a policy. And as such it must be countered with the reminder that it is just as important to safeguard the prestige and influence of Dr Adenauer. He, after all, long ago persuaded his parliament to ratify and his countrymen to vote for a European policy that accepts important limits on German sovereignty. It is around this policy that he has rallied moderate German opinion. If it has to be seriously modified and again submitted to parliament in Bonn, there must be a reappraisal of German policy by a discredited Chancellor; and it must be

made in the sultry atmosphere of recrimination and suspicion that has been created by the defection of Dr John and by an intense and widespread anti-German campaign in British and European newspapers. It would be unwise of M. Mendès-France to create a situation in which the United States and Britain would have to choose between Dr Adenauer and himself.

★

Why is this so? Why should the French Prime Minister's attitude to EDC inspire less confidence in Washington and London than that of the German Chancellor? It is because M. Mendès-France has to struggle against the feeling of mistrust and disappointment created among allies by his predecessors. How many concessions have been made to French views in the drafting of the EDC treaty, how many guarantees have been given by Britain and the United States, in the belief that these would make ratification possible by an early date? Again, the treaty and the Bonn conventions to which it is linked go far in discrimination against Germany, because this was admitted as necessary to calm French fears. It may be said that the Germans, in view of their past record, ought to give special assurances and accept special restrictions. Well and good; but there is a limit to what a Chancellor can persuade a German parliament to accept, and even that is not accepted unless something valuable is promised in return. That something has been nothing less than equality of status with France and other nations in a freely negotiated integration of Western Europe, of which the European Defence Community, with its supra-national authority, was to be an essential part. It is a fundamental revision of this idea that M. Mendès-France is now said to be proposing.

To criticise his amendments in detail is unfair, for he claims that they have been inadequately reported in the press. But three things are quite clear from what has gone before and from what is now happening within his cabinet. First, France is asking for a long delay in establishing the real authority of the defence community over member governments. Secondly, it wants to insert escape clauses for any French or German government that may wish later to change its mind about European integration, like a woman who accepts betrothal without promising marriage. Thirdly, it is suggesting further safeguards, which amount to further discrimination, against Germany.

M. Mendès-France may sincerely believe, though he cannot promise, that such changes would just win a majority for the Treaty next week-end in the National Assembly; and it is possible that they represent a maximum rather than a minimum demand. But even this maximum may be insufficient to win the Gaullist support he needs. It is difficult, therefore, to see why the Germans at Brussels should be tempted to consider the kind of modifications that the French Prime Minister seems to have in mind; and it is not easy to see what there is in them to attract the Benelux ministers and the Italians.

The probability is, therefore, that France will meet strong opposition at Brussels. The other governments are tired of delay, irritated by the suspicion—right or wrong—that M. Mendès-France is listening to advisers whose real aim is to get Soviet agreement to the unification and neutralisation of Germany, if only the EDC can be held up or abandoned. On the other hand France's partners may find it harder than they now realise to resist the blunt and bustling methods of its new Prime Minister. He has promised, if the treaty is modified, to demand a vote of confidence in the debate that begins at the end of next week, to stand or fall with it—and he believes he will stand. Those who reject his proposals, therefore, expose themselves to the charge that they are prepared to kill the policy of European integration rather than tamper with the authority and balance of the defence community.

★

For good Europeans the choice is appallingly difficult, and it may well be determined by their judgment of the strength and sincerity of the man who presents it. But they will seek the advice of the Americans and the British. What should that advice be? Some attempt at compromise with M. Mendès-France should be possible, but it must not endanger three essential points in western policy. The first of these points is that further delay in a decision about EDC is unacceptable; and that means that any changes must be such that the treaty need not be submitted again to national parliaments that have approved it. The second is that, in the attempt to gain France, no risk must be run of losing Western Germany. The third is that the scope and authority of the defence community should be sufficient to make unnecessary in Germany the creation of a powerful defence ministry and general staff.

BUSINESS ABROAD

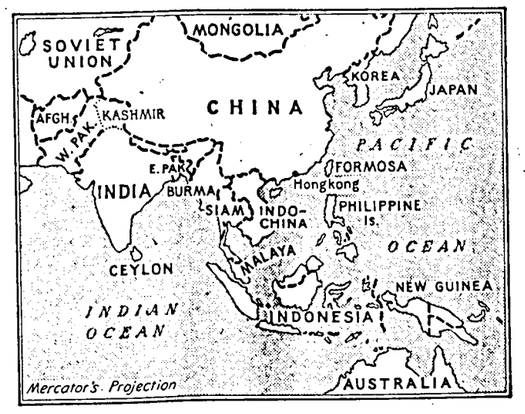
Shield for Free Asia



THERE may have been moments when Mr Attlee and his colleagues, treading the red carpets in Peking, have felt that the talks about a defence pact in south-east Asia to be held at Baguio on September 5th will be unwise, even unnecessary. And there are many others, in this country as well as in Asia, who would go further and assert that attempts to create a defence organisation around the southern frontiers of China will do more harm than good. Like the Indians, they will argue that it would prevent a genuine political settlement and would provoke retaliation. (Communists, like Nazis, react violently to encirclement.) The doubters are right in so far as it is certain that China will resist the formation of Seato as vigorously as the Soviet Union has resisted the formation and existence of Nato. None the less the need for a long-term plan to meet Communist pressure in South East Asia is clear beyond doubt. Western policy in that area must take account of military realities as well as of political imponderables.

That is not to say the imponderables are anything but important. Indeed, in some circumstances they could be decisive. No area can be successfully protected if the major countries to be defended refuse to take part in the defence plan, or actively oppose association with the would-be defenders. Most statesmen in free Asia have to think carefully before they interest themselves too closely in American and British military plans; to be too friendly with the West can be a serious liability in political life. For example, the fact that a meeting-place in the Philippines has been chosen for the Seato conference will cause suspicion among many Asians, because it is regarded as the seat of a government that is a puppet of the United States. And they will also notice that only three Asian nations—Pakistan, the Philippines and Siam—are joining Australia, Britain, France, New Zealand and the United States in the talks. The task of this first meeting will therefore be as much to persuade opinion in free Asia of good intentions as to deter the Communists from bad ones.

Similar suspicions have to be allayed in the West. The foundations of this conference had to be laid on the shifting sands of Anglo-American disagreement over Indo-China, and account has to be taken of the fact that Britain opposed the holding of any conference on defence until the Geneva negotiations had been pressed home. If there is to be a treaty it will have to be clearly defensive in character, and if there is to be a treaty organisation it must be competent to work on more than military and security problems. There is reason to think that this is understood in Washington, and that the absentee Asian Governments will be interested in the economic aspect of Seato.

Although Mr Eden has leant over almost too far in his effort to get all five Colombo powers—India, Pakistan, Burma, Indonesia, and Ceylon—to attend the conference, only Pakistan has agreed to do so, and then only on condition that attendance implies no promise of final commitment. Refusal from the other four was expected, but the effort to interest them was worth making, not only because the value of any treaty organisation would have been immeasurably enhanced by the adherence of all the powers in the region, but because their refusal strengthens the hands of the rest in their determination to go ahead.

Agreement will still not be easy, either on the places to be left out of any defence plans or on those to be included. It is reported that, under the tentative draft proposals already drawn up, neither Formosa nor Hong Kong is to be included; and no one has even suggested that Japan should take part. Yet, apart from Siam, no territories are clearer potential targets of Communist expansion. Only this week, Chou En-lai has shocked his admirers by letting out a snarl of rage at Formosa's independence; the winning of Japan is the

logical long-term goal of Russian Far Eastern policy; and Hong Kong has been a cause of anxiety ever since the Communists came to power in Peking nearly five years ago. Such contentious though critical places will no doubt have to be left out. But, if so, it must be understood that, Seato or no Seato, they would not be allowed to go to the Communists by default.

One of the strongest arguments used against any form of defence organisation for South East Asia has been that anyone left out would automatically become a sitting target for attack; any pact must therefore include everyone and, since that seemed impossible, it seemed best to have none at all. Now the case for making a start has been strengthened by the Western powers' lamentable show of division and indecision over Indo-China. There nothing was all right on the night, even though there had been months to rehearse. If a similar

situation is not one day to develop, say, in Siam, there must be precise advance planning.

The next problem is how to define aggression. No Communist army has ever crossed the frontiers of Malaya or Burma, or even of Indo-China, and it is unlikely that open aggression would now be conducted against a country like Siam, which has already put itself virtually under American protection. The favourite Communist weapon is internal subversion, and nowhere has this been more skilfully used than in South-East Asia. But how is it to be countered without the Seato powers themselves being made to look guilty of aggression if they interfere? And how could a Communist seizure of power be dealt with in a vital non-member state—in Indonesia, for instance?

Thirdly, it is already certain that the steps to be taken within Seato both to back any military guarantee and to stimulate political and economic resistance to Communist interference cannot be anything like as definite or detailed as they are in Nato. The forces simply do not exist to provide a network of international and inter-service commands like those that exist in Europe. And a burden-sharing exercise would be nothing but a mockery. At the same time, it will be essential to have some kind of permanent body responsible for intelligence and planning and capable of rapid expansion if Seato is to have any real substance to it.

Lastly, there is the general problem of wrapping up all these points in a treaty which would make a real contribution to the divergent needs of the area as a whole. It must be a tight military agreement without alienating the neutralist Colombo powers; the door must not be slammed against their eventual association with the treaty. It must be a constructive political and economic document which will help governments in their fight against local Communists. And it must commit the non-Asian governments to specific action, without alienating public support in countries with moods as diverse as those in Britain and America, Australia and Pakistan.

The creation of Seato closely affects the basic strategic interests of this country, notably in Malaya. It used to be the British who most wanted a formal guarantee for South East Asia, and the Americans who hung back. Today the roles are reversed. But while the British are right to point out the practical drawbacks and political risks of what is being undertaken, the need remains what it has always been. The Korean war might have been avoided if the aggressor had known for certain that he would be met by force. This is, perhaps, the last opportunity to prepare such a warning for south-east Asia with the support of the United States.

Urban Rides—III

New Ventures at Bristol

BY A SPECIAL CORRESPONDENT

SEVENTY years ago Bristol Corporation stretched out to grasp land and create an outport for the city at the mouth of the Avon. It seemed then that this was the only way that Bristol could survive into the twentieth century—a century which, it was becoming apparent, would have little to do for ships small enough to navigate the narrow and winding Avon up to Bristol. For Bristol's greatness as a city has always depended on its greatness as a port. Indeed, it was second only to London until far into the eighteenth century.

And even today the things that spring to mind most readily at the mention of Bristol—chocolates, cigarettes, bananas, wine—are associated with the import trade. Bristol has always been an importing centre, with special connections with the Americas; but since it has had virtually no industrial hinterland until very recent years, its export trade has been negligible. Most Englishmen have conventional ideas about industrial cities, and have never regarded Bristol as one. But while it has always been far more industrialised than most people have given it credit for, its manufacturers—like those of London—have been varied, mainly concerned with consumer goods, and until recently most of them were connected with the port. The making of chocolates, now carried on just outside the city; of tobacco; of leather and boots and shoes, requiring imported hides; of paper and card, using imported wood pulp—all these draw their raw materials today very largely from abroad, through the quays at Bristol or the docks at Avonmouth. With these characteristics, they have been on the whole stable industries, and Bristol did not experience extreme unemployment in the thirties; but on the whole, too, they have not expanded to provide more employment for Bristol people.

During the last twenty years there has been a dramatic change in this pattern. The change has been associated largely with the settlement on Bristol's outskirts, just before the First World War, of what turned out to be one of the most successful of British aircraft constructors. Like the rest of the industry, this firm expanded out of all recognition during the rearmament of the late thirties, and especially during the war. In the latter part of this period engineering firms sprang up in the city to make components or to do sub-contracting work for it. Employment in connection with aircraft in the Bristol area rose from 4,000 in 1923 and 17,000 in 1939 to a wartime peak of 30,000. This was a staggering figure in a city with an occupied population of under 200,000—even allowing for the fact that some of the aircraft employees came from outside.

Commentators during and immediately after the war were gloomy about Bristol's postwar prospects on this account. Its waggon had been hitched to a star which had been shown, by experience after 1918, to be potentially a falling star of the greatest velocity. Once military demand closed down, Bristol's aircraft industry would sink back, if it was lucky, to the level of the 1920s. What would happen to the thousands of engineers who, immediately before and during the war, had moved into the city and settled down there?

★

But the gloomy prognostications were soon upset. And upset not merely by the revival of the military demand, which would simply have postponed their realisation. Bristol is less concerned with military demand than are most aircraft producers. It has concentrated, in the postwar period, on civil aircraft; on a successful line of freighter planes; on the development of a big turbo-prop airliner, the "Britannia," which is now going into large-scale production; and on the development of the helicopter for commercial use—not to mention pre-fab houses and schools of aluminium, originally a wartime hedge against postwar slump, but retained as a permanent line. The result is that the factories that ring Bristol have remained fully occupied; and far from unemployment arising in the industry, great difficulty has arisen recently in attracting sufficient skilled labour to the area for the extended "Britannia" programme.

It remains true that, to the extent that Bristol has become a "one-industry" town, it is more vulnerable than it was twenty years ago—in the sense that a heavy decline in this one industry would, by itself, create an intolerably high level of unemployment in Bristol. And, to the extent that Bristol has created as its chief industry a producer of capital goods, it has become, like the shipbuilding towns of the Tyne, Wear and Tees in the past, liable to take rather more than its share of the burden of cyclical downswings, instead of, as in the past, bearing rather less. But it is not, as were the aircraft firms of the twenties, almost entirely at the mercy of arbitrary changes in government policy on arms production.

This single development has inevitably stimulated the general engineering industry of the city, which is now of respectable size, producing such varied commodities as lorries and the slot machines that are now again in demand for English railway stations. But beyond this immediate neighbourhood, in the foothills of the Cotswolds, in Gloucester and Bath, in the country towns of Wiltshire and Somerset, engineering factories of all sizes have appeared in some numbers during the last thirty years. The south-west of England has been an important beneficiary of the spread of engineering industry outside the old industrial areas, which was made possible by the appearance of electricity as a source of power and by the dilution of engineering skills. And the seriousness with which Bristol's role as the regional centre of all this new industry is viewed can be seen from the fact that Bristol University's largest postwar project is a new School of Engineering, which will cost a million pounds and will be one of the finest in the country.

With all its old and new industry, Bristol has not the air of an industrial city. From the Cabot Tower the eye is drawn first to the city docks immediately below, to the river from which John Cabot sailed to the discovery of North America four and a half centuries ago. Beyond, on the heights of Bedlington, and away to the east where the city spreads itself unchecked by the Avon Gorge, industry—even the new coal-pits being sunk at Downend—is lost in the rows of little houses; it is not advertised by the columns of factory chimneys, or blast furnaces. This is, in part, because some of the largest factories are situated beyond the city boundaries in green fields. Much, too, of the small-scale industry that has long been established in the heart of the city is now moving to the outskirts. Heavy bombing necessitated very large-scale rebuilding in the central districts, and this, if it has proceeded slowly, has been used to change the character of the centre. Trading estates, created in the outer suburbs, have been occupied in the main by firms which had been using temporary premises in the central area, or which were being evicted from it by reconstruction schemes. An important new cluster of industries is developing round Avonmouth—chemicals and non-ferrous metal refining, which need close proximity to a port. Thus central Bristol, if it is surrounded by industry, is surrounded at a distance.

★

But this is not the whole story. Bristol really is less industrialised than, say, Coventry or Middlesbrough, in the sense that a substantially smaller proportion of its population is engaged in manufacturing industry. It is a regional centre. This is in an age that has seen a proliferation of Government services requiring regional sub-offices, of the branch organisations of great firms, of regional boards of all kinds. Bristol, like other towns in similar situations, has benefited greatly from being the natural seat of their offices. It has thus received accretions of middle-class population requiring middle-class housing and services, and has found new occupation for the great houses of Berkeley Square and Whiteladies Road. It is, too, though to a lesser extent than before the wartime bombing, the shopping and service centre of a wide area.

Bristol, then, has found in the age of electricity, aircraft and the welfare state a place of importance which it seemed in the days of steam-power and *laisser faire* to be in some danger of losing. But it is a new and different kind of place. Will Bristolians change too? Many observers profess to find this city characterised by a somewhat conservative and puritanical atmosphere, founded on the conscious superiority of ancient riches. How will this atmosphere survive as Bristol turns its back on the Merchant Venturers and looks towards the new technology?

Notes of the Week

With Molotov in the Wings

In barely a week the curtain should be raised in Paris on the momentous debate about EDC, but utter confusion still reigns behind the scenes of the Palais Bourbon. The actors are perplexed and nobody knows what text of the treaty will finally be presented. M. Mendès-France, who has directed with such skill on previous occasions, now faces a much stiffer test. His amendments to the text have angered the partisans of the EDC treaty without, at least for the moment, appeasing its critics.

This hostility, however, is more obvious among the opponents of the treaty than in the "European" ranks. The Christian Democrats (MRP) and their allies on this issue are apparently resigned to compromise and prefer a truncated treaty to no treaty at all. The Gaullists, on the other hand, and the left-wing critics seem in no mood for compromise. They have already warned M. Mendès-France that in backing EDC he is putting himself in the hands of his political enemies, who will not hesitate to drop him by the wayside at the first opportunity. That the Communists would not cease their opposition because of textual alterations could easily be foreseen. Nor are the changes in the treaty's "supranational" character likely to sway the 45 or so Socialist "rebels" who are really against any form of German rearmament. The modifications were clearly calculated to attract the Gaullists and in this they have not succeeded up to now.

Thus suspense will prevail until the very last moment and much will depend on external factors. Even if M. Mendès-France carries the day in Brussels, the outcome in Paris will not be certain. M. Moch has been quick to point out that five parliamentary commissions in turn have voted against the treaty. On the other hand, the prestige and powers of persuasion of M. Mendès-France should not be underestimated. If he comes back from Brussels with empty hands, he may refuse to make ratification a question of confidence, or he may be abandoned by the opponents of the treaty who still sit in his cabinet. There are also those in the Assembly who greatly hope, or fear, that Mr Molotov may transform the whole picture by proposing or hinting at Soviet concessions in Germany.

Banquo's Ghost in Peking

When Mr Attlee and his party reached Peking they found the Chinese determined not to be outdone by the Russians in the lavishness of their hospitality and the fervour of their polite speeches. But one wonders whether any Banquo's ghost appeared to mar the British guests' enjoyment of the exotic delicacies provided for them at the banquet in the Hall of Magnanimity. Presumably they must have known that only a few days earlier Chou En-lai, in a report to the People's Government Council, had called for "determined action on the liberation of Taiwan", and that recent speeches by Chinese military leaders and resolutions by local bodies make it clear that this is to be forcible liberation by military invasion.

Did they wonder how this squared with Chou En-lai's assertion that "international co-operation and the maintenance of world peace has been steadfastly upheld by China"? Or with the famous five principles, including peaceful co-existence, non-aggression and respect for other countries' territorial integrity and sovereignty, that are now playing such an important part in Chinese propaganda? They may have remembered that these principles first appeared in a Sino-Indian treaty in which Delhi virtually accepted China's annexation of Tibet.

But if the British delegates were perplexed by the Chinese Premier's conflicting utterances, they must have been even more bothered—if they read it—by a widely circulated editorial in a Chinese newspaper which managed to imply that the British Socialists sympathised with Peking's policy towards Formosa:

> To liberate Taiwan is the desire of the Chinese people. Members of the (British Socialist) delegation can naturally understand this desire of the Chinese people through personal contact. . . We believe they share our view that, to restore normal trade, it is necessary to oppose the "blockade and embargo" policy and Chiang Kai-shek's piratical acts under US auspices and to strive for the realisation of peaceful co-existence.

This is only one example of the way in which Mr Attlee's journey to Moscow and Peking is being used to make trouble between the western allies. The general tenor of the Communist comment is that the visit is an important and determined demonstration by "a considerable section of the British community that the British attitude to People's China is different from that of the USA".

Full Circle on the Railways

After "serious thought" whether it should call an immediate strike, the engine drivers' union decided on Tuesday that it preferred to pass its dispute with the Transport Commission through the remaining stages of the railways' negotiating machinery. The National Union of Railwaymen, meeting on the following day, protested that this would merely shift negotiations that have already reached deadlock at a high level into channels that would lead to another deadlock at a lower level. It has asked for an immediate meeting with Sir Brian Robertson, to impress on him the "critical developments" that may follow if a settlement is not achieved. The difference between these approaches seems to be that the NUR's proposal might bring the railway crisis to a head in September; the engine drivers' proposal might bring it to a head one or two months later.

The engine drivers and other skilled workers clearly have cause for complaint. The 6 per cent increase in wages that was granted to all railway workers earlier this year was originally meant to satisfy in full the claims of the unskilled and lowest paid men; subsequent negotiations should have dealt solely with the problem of the wages structure, which means mainly with an increase in differentials for skilled grades. Under pressure from the NUR, however, the Transport Commission has felt compelled to offer an extra 2s. 6d. a week to the lowest paid workers; and this has left it with only an extra 4s. 6d. a week to offer to top-grade engine drivers, who had been asking for an extra 26s. 6d. The NUR itself recognises that the commission has no more money left in the kitty. Apart from a vague desire to raise freight rates, its most positive—and most dangerous—proposal is that the government should step in with a subsidy to give the skilled workers more.

The individual union leaders are in a difficult position; and they are acting with all the moderation that they can muster. But their difficulties arise directly from their own immoderation in the recent past. The authorities should now hurry forward with the emergency measures that will be needed to face—they should not be deterred by cries that these may also be interpreted as measures that will be needed to break—the grave possibility of an autumn or winter railway strike.

Meat in a Muddle

The moderate rise in the price of meat since decontrol is not due to the fact that the markets have been set free, but to the fact that long-term contracts and the dictates of agricultural policy are still keeping them half-enslaved. Last week the president of the National Federation of Meat Traders, representing some 2,700 butchers, made a strong protest about higher prices for imported meat. Prices have fallen from the heights they reached immediately after decontrol, but they are on the average perhaps 3d. or 4d. a lb. higher than they were in the days of restriction. Mr Pascoe particularly mentioned offal as having risen sharply in price, and he asked who was getting the benefit of these higher prices. It was not, he said, the retailer.

The profiteer is also not the Ministry of Food, although it remains almost the sole importer of meat. Its contracts for Australian beef and veal and for all types of New Zealand meat do not end until September 30th, and it will continue as the sole importer of Argentine meat until it has taken delivery of the quantities that ought to have been (but, as usual with Argentina, were not) sent by June 30th. But the Ministry has not raised its average prices; it has merely widened their range. Higher prices are mainly due to the higher profits exacted by the prewar importers—wholesalers who do not yet do much importing but to whom the Ministry releases its stocks.

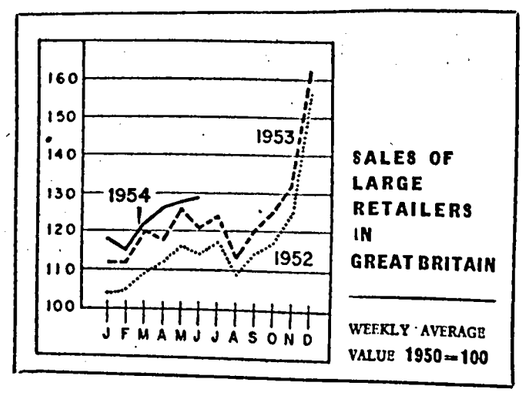
In one sense, however, the Ministry must take the blame. The middleman's higher profit is made possible by scarcity, and scarcity has been created by the niggardliness of the recent fortnightly releases of imported meat. The Ministry clearly does not want to depress the market for home-killed meat—which is already rather flat—just when supplies are approaching their peak; for this would involve heavy deficiency payments to farmers. And supply and demand are extraordinarily difficult to judge accurately, for housewives, unused to decontrol, buy in an unpredictable way. But the Ministry's efforts to save the taxpayer money now may cost him more later. It broke its usual secrecy in June to announce that existing stocks plus expected arrivals under the bulk contracts amounted to 400,000 tons. Some of this meat has been in store for months and a small part is already unfit to eat. Towards the end of the year, when the new season's meat will be coming in from New Zealand, the Government may find it very difficult to dispose of its meat fast enough—unless it cuts its prices sharply or is willing to see its stocks turn rancid. Now that freedom has returned the legacy of long-term contracts is harder than ever to reconcile with agricultural policy. It is also harder than ever to reconcile either those contracts or that policy with common sense.

Keeping Out the Bacon

The same problem—that deficiency payments can be kept down only if imports under bulk contracts are sold at a price that does not undercut the British farmer—is preventing the Ministry from bringing home all the bacon that a free market would provide. Danish bacon comprises about 40 per cent of Britain's total supplies. Imported at 237s a hundredweight, it yields the Government a profit of 50s a hundredweight on the restricted home market; while the British producer is paid about 400s, and thus involves the Government in a heavy loss. In the negotiations that are being resumed as *The Economist* goes to press, the Danes are asking for an increase of 10 per cent on this year's price—the maximum increase provided by the terms of the contract. They also ask that Britain should take more of their bacon—for it is clear that the housewife would buy more if she had the chance; they ask that next year's total should be some 250,000 tons, compared with 230,000 tons this year.

Britain, however, already has at present prices an embarrassing surplus of bacon. Home supplies have been swollen by recent imports of rather fat bacon under the contract with Eire (which is due, like the contract with Holland, to end in 1956); and already the Fatstock Marketing Corporation has had to announce a cut of 15 per cent in the acceptance of pigs for the bacon factories. The British negotiators are therefore unwilling to take more than 225,000 tons next year, or to pay more than a small increase in price. Their attitude is inescapable given Britain's agricultural policy. But it should be made quite clear that the principal function of this long-term contract is no longer to secure ample supplies at the lowest price. Its function is precisely the opposite: to keep out the

Danish bacon that the housewife would prefer to buy, but at the same time to avoid the stigma of resorting to import quotas, which would be a breach of an agreement dating back to 1933 and reaffirmed in Gatt.



The Ministry of Food also makes a profit on Danish butter, which is bought at 345s a hundredweight and will, after this week's price reduction of 20s, be sold at 370s a hundredweight. So far the Danes show no sign of following New Zealand's example and terminating their butter contract (which should end in 1955) in response to the price cut of 3¾ per cent which Britain has proposed. It will be inconvenient if this contract survives. The Ministry wants to get out of the import business wherever it can—and British butter production is small and so therefore is the cost of protection.

Relief Across the Curtain

THE Communists have had a gratifying if surprising change of heart about accepting relief supplies from the United States. Just over a year ago the East Germans brusquely turned down an American offer to help alleviate their food shortages. This month, East Germany, Hungary and Czechoslovakia have all accepted the offer made by President Eisenhower on July 29th to send surplus foodstuffs to victims of the Danube floods on both sides of the iron curtain.

The East Germans were the first to take advantage of the offer. Their acceptance, conveyed by Herr Grotewohl and not by Mr Pushkin, the Soviet High Commissioner, was widely assumed to be designed to inveigle Washington into relations with a government that it refuses to recognise. But Mr Conant, the American High Commissioner, was quite equal to the situation. He blandly ignored Herr Grotewohl and continued his correspondence with Mr Pushkin, to whom he suggested that detailed arrangements about the transfer of the supplies should be left to the Red Cross. The East Germans took this lying down; Herr Grotewohl faded from the scene, and last Monday representatives of the German and of the International Red Cross met in Berlin and decided to follow normal Red Cross procedure in administering the aid.

Presumably the East German leaders really wanted some extra food supplies; or, at any rate, they did not want to face the popular disapproval that would greet a rejection of aid that is, after all, meeting the consequences of a

natural disaster and not filling the breaches caused by the Communists' own mistakes and muddles. The Czechs and the Hungarians were evidently in the same position, although they took much longer to make up their minds to it; the Czech acceptance was only received this week, but it has been accompanied by a remarkably handsome acknowledgment in *Rude Pravo* of the American people's sympathy. The exact consequences of the flood disaster in all three countries are unknown, but they were plainly considerable; and in many areas the floods must have spoiled, or at least seriously damaged, a fairly promising harvest. This is a serious matter for Communist regimes that have at last come to realise that they must improve supplies of food and consumer goods.

Anticlimax in Goa

ANTICLIMAX was written large over last Sunday's "march on Goa." At the point on the Goan frontier where a major incursion had been expected the demonstrators found themselves outnumbered by journalists and photographers, who had assembled to watch their essay in non-violent liberation. Elsewhere the efforts of the exponents of *Satyagraha* appear to have been equally pathetic and equally futile. Two days earlier, about 6,000 of the people of Goa had made a solemn pilgrimage to the tomb of St. Francis Xavier in Old Goa to beg him to intercede for them and save them from disturbances; they must have felt that the saint had listened to their prayers.

If both the Portuguese and the Indian governments had not behaved with good sense and restraint last Sunday, the Goan frontier might easily have been the scene of tragedy. The Portuguese authorities withdrew their armed forces to a discreet distance, leaving police armed only with truncheons to deal with the invaders. Likewise, Mr Nehru, although unable to refrain from a distinctly inflammatory speech, took firm action to prevent any Indians from crossing into Goa in support of the "Goan National Congress." Since then he has opposed a fresh attempt by over a thousand members of the Praja Socialist Party to enter the Portuguese settlement of Damao north of Bombay. It is to Mr Nehru's credit that he has persisted in a policy of moderation that is not popular with many Indians; it has, moreover, had the consequence of demonstrating how frail is the enthusiasm of the Goans living in India for the liberation of their country.

It now remains to be seen whether the Indians and the Portuguese can use the present breathing-space to work out a settlement of their quarrel. The collapse of the liberation movement and the passivity of the Goans has, one might think, reduced the whole affair to what Mr Nehru himself recently called it—a storm in a tea-cup. But the Indians do not see it that way. They are as determined as ever to remove the last vestiges of colonial rule from the Indian sub-continent. The Portuguese, for their part, remain equally determined not to be removed; they maintain that Goa, in any case, is not a colonial territory. These irreconcilable views are the cause of the two governments' present sparring over the Portuguese proposal to call in foreign observers. The Portuguese intended that these should confine themselves to the situation along the frontier, but the Indians seem to regard them as a means of bringing about the discussions on the territory's status that Lisbon refuses to consider. Neither side yet seems ready to concede that the decision might be left to the people of Goa itself.

Uphill Prospect in Iran

LAST Thursday was a national holiday in Iran, because it is exactly a year since army and people dealt Dr Mossadegh his *coup de grace*, summoned the Shah back from a calculated flight, and installed General Zahedi in power. Since then the chief change in the face of the country is the restoration of complete internal security. The Shah's smiling tour in Azerbaijan this summer is a symbol of the fact that travel is once again safe and easy. Another major change that affects the whole country is the official switch from fancy broadcasts, coloured to suit Dr Mossadegh's whims, to sober tales of Iran's actual position in world affairs. The third major act has been the initialling of the oil agreement; but this remains at the paper stage until, when the lawyers finish their drafting job, it goes before the Majlis for approval. The agreement must be approved or rejected as it stands. There can be no monkeying with a text that was achieved only as the result of the utmost effort to strike a balance between Iran's need to offer bait, if the foreign investor were to return at all, and its well-known antipathy to foreigners.

What will Parliament say? The elections to it in the spring were conducted with the inevitable amount of pressure from the men in the saddle, and both Senate and Majlis are full of friends and supporters of the regime. But there are disquieting little signs that some Iranians are already at their national pastime of picking holes in the men in power whenever their achievement is less than the optimum. General Zahedi, for instance, referred in a recent speech to "elements who want to see me supplanted"; and ears applied to the ground can detect the rustle of people taking out reinsurance policies by being nice to his adversaries. The curse of Iran has for years been a lack of continuity at the centre; whether this can now be preserved and the oil agreement brought to fruition depends, more than on any other single factor, upon the example set by the Shah.

If the agreement is ratified, there lies ahead a long slow plod uphill of a kind that is unattractive to the nimble Iranian. At present, the budget is out of balance; the cost of living, which may drop this summer thanks to a good harvest, had risen by 10 per cent in the early part of this year; provincial administration has sunk to a new low under the strain of Mossadegh's years of failure to pay salaries; and past methods of allocating earnings from oil to capital projects need overhaul. Ratification of the oil agreement will be only a first step towards rehabilitating an enormous, diverse and difficult country.

Colourless Call

THE Home Office has decided to launch an intensive recruiting campaign for the civil defence services next month. The small supply of ammunition allowed it by the Treasury will nearly all be fired off in a matter of weeks; most of its expenditure on newspaper advertising

will be concentrated into a single fortnight. The plan is that the country should be flooded with national publicity in the last fortnight of September; that equally intensive local campaigns should be conducted in the first fortnight of October; and that door-to-door canvassers should have the rest of the winter and the spring to reap a harvest of recruits.

Intensive publicity for a short period may be a better way of using limited resources than a continuous but insignificant dribble, but there must be some doubt whether this is the best moment to put the theory to the test. Most people more responsible than the proposed freemen of Coventry recognise the continuing, even growing, need for civil defence in the hydrogen bomb age, but remain unconvinced that civil defence in this country is in any way up-to-date. The posters being issued for the new campaign will not dispel these doubts; no one imagines that recruiting would be stimulated by pictures of piles of radio-active corpses, but it scarcely seems necessary to go to the other extreme and depict searchlights that could easily be probing for Zeppelins.

All civil defence tactics and techniques are now being reviewed in the light of the data provided by the hydrogen bomb tests, and it may be reasonable that these studies should not yet be finished. But by the time the Home Office is ready to show that it can deal with hydrogen bombs it will apparently have no money left for publicity, at least for the current year. Nor can there be much confidence in its ability to make effective propagandist use of its new look. The weakness in civil defence is less one of industry than of leadership and imagination. The Home Office has still not acted on the Mabane Committee's urgent suggestion that a chief of staff should be appointed, able to give national leadership. The service clubs must be knee deep in picturesque war heroes, free and able to take on this job. Recruiting campaigns will never go well so long as people feel they are volunteering to join a vacuum.

A Ministry for Consumers?

THE group of Co-operative MPs has just published a memorandum with one of the best opening paragraphs, but not with one of the best conclusions, that has come out of the Labour Party for a long time. The memorandum starts:

> A combination of mistakes, omissions and misrepresentations contributed to the defeat of the Labour Government in 1951. If one overriding factor has to be picked out, it was Labour's failure to give full consideration to the interests of the people as consumers.

It goes on to propose the establishment of a Minister of Consumers' Welfare. This department would take over such harmless functions as the control of weights and measures, the distribution of welfare foods, and the supervision of the Council of Industrial Design. The Minister would also—and these are the functions that are supposed to raise his status from that of a minor bureaucrat to a major economic force—be responsible for Government policy arising out of the reports of the Monopolies' Commission; receive an annual report from all trade associations that seek to enforce minimum prices; interfere with

the management by other Government departments of import and price controls (so long as these controls remain in existence); and act as a sorting house for complaints issued by revised Consumers' Councils. "In the field of agricultural marketing," the Co-operative MPs believe that "the responsibilities of producers' marketing boards should end at the point of sale from farms and that new arrangements should be made to bring order and efficiency into distributive sales to consumers."

These proposals are based partly on an accurate diagnosis of a real administrative weakness, but mainly on a complete misunderstanding of both economic and political democracy. There are fifty million consumers in this country; and they are meant to be represented not by a single department but by the entire Government. It is quite true that post-war Governments have often failed in this duty; it is quite true that any conscientious Minister of Consumers' Welfare would have resigned from both the Labour and Conservative administrations every other week. But if he did do this he might not be a very effective force; if he did not do this he would become merely a minor snooper in the field of distribution, leaving the real sinners in producers' monopolies and (especially) in other Government departments untouched. The consumers' welfare will best be protected by oiling the wheels of competition and the price mechanism, not by throwing in new bureaucratic spanners to be broken up.

Strike with a Silver Lining

It is not often that an unofficial strike in Britain can be described as almost heartening; but there was a silver lining to the stoppage at Hull docks this week. The background to the strike is simple. Twelve dockers from Cardiff were recently brought to the port to help with a rush of work that has arisen there. They immediately said that the methods of unloading grain at Hull were "prehistoric"; they were not going to do with their bare hands work that is performed in other ports entirely by machinery. Last year visiting dockers from Salford had voiced the same indignant criticism; and the men of Hull — their pride stung to the quick — promptly and unanimously followed their visitors out on strike.

The strike has many undesirable features. Some of its leaders may be professional malcontents. The men are in breach of their agreement. They have put themselves badly in the wrong by refusing to unload even perishable food, and by making interim demands that would slow the turn-round of all grain ships in Hull. But their main demand (which, admittedly, involves technical difficulties) is for the installation of some very expensive machinery, which would allow one man to do the work now done by four, and which would cut wage payments per grain ship unloaded by more than three quarters. This is, therefore, one of the first occasions in history in which British dockers have struck in favour of labour-saving methods. In the past, they have often struck against them. The occasion should not be allowed to pass without remarking that this new fashion in dockers' strikes seems very much better than the old.

Europe and the Recession

Although President Eisenhower has now announced officially that the American recession is over, Europe's economic ministers will not breathe easily until they have answered two questions to their satisfaction. The first is why the recession of 1948-49 caused so much more international havoc than the recession of 1953-54, although the percentage fall in American production was roughly the same in both periods. The second is whether the "halt" in the decline will be succeeded by an upswing in economic activity, or whether the "levelling out" will continue. The answer to the second will be much more important than the answer to the first.

The answer to the first is a compound of technical factors which have not yet been fully analysed, such as the remarkable stability of prices in 1953, the fact that 1949 was marked by speculative capital movements and 1953 was not, and the heavier concentration of the recent decline on a few sectors of the economy. But the largest single reason for the difference would seem to be the obvious one, that it is easier for a fat man to lose ten pounds than for a thin man to do the same. Exports to the United States in 1953 were substantially larger than in 1949, and imports from the United States formed a much smaller proportion of Europe's total import bill in 1953 than in the earlier year. The dollar gap is still there, hidden beneath the foreign assistance, but it has shrunk appreciably.

The United States has sneezed without the rest of the world catching influenza and the experience should help the bogey of an American recession to shrink to its proper size. But it would be a mistake to go to the other extreme and to assume that Western Europe can now afford a policy which ignores the basic economic interdependence of the free world. A continued improvement in the economic health of Western Europe will depend considerably on the answer to the second question. For if the American economy does not resume its expansion, not only will markets fail to develop, but the domestic pressures to restrict existing markets will continue to increase.

Bullets in Brazil

Brazil has enjoyed far greater political stability than most of its Latin American neighbours, but last week it showed a glaring contrast between industrial evolution and political backwardness. At Belo Horizonte, President Vargas inaugurated new steel mills which represent an investment of $22 million. These mills will be the greatest producer of seamless steel tubing on the Latin American continent. But, at the same moment, President Vargas's administration is threatened by one of those combinations of bungled violence and military unrest which characterise Latin American politics.

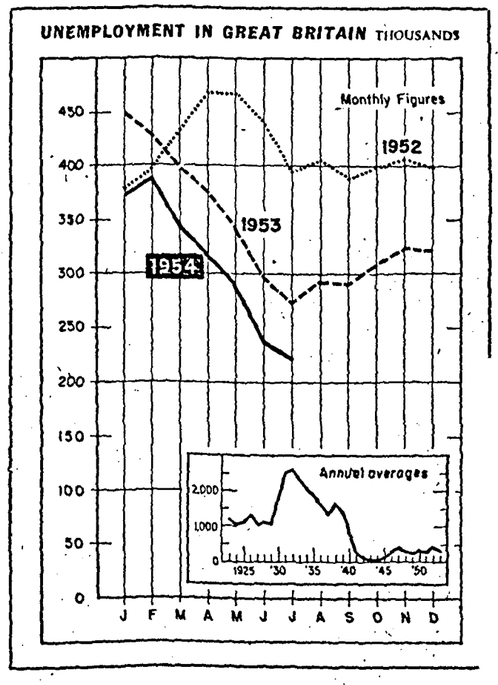
Responsibility for the attempted assassination of Carlos Lacerda, a journalist violently hostile to the Vargas regime, is being brought straight to the President's door. His son and his bodyguard seem more or less directly involved in the shooting. The whole affair is a tangle of allegations, denials and protestations of innocence from Catete Palace. Although Lacerda escaped with a slight wound, an Air-Force major with him was killed. That is the crucial point, for it has brought the military into the picture.

So far they have done little but group their forces and await the results of the inquiry into the shooting. The Minister of War and the head of the Air Force appear to hold the reins. An attempt at a more vigorous military intervention in the Bahia region has been checked. It is clear that the military have not yet decided whether to try to force President Vargas to resign. He is a cunning statesman and has weathered similar crises before. The longer the generals deliberate, the more certain it is that Vargas will divide their loyalties.

It is a pity that Brazil, with its infinite potential in natural resources, and with its central position in Latin America, should be at the mercy of politics through assassination.

Finding the Nurses

Little has been heard recently about a shortage of nurses, except for the continuing difficulties of the mental hospitals. Thanks to measures taken during and immediately after the war, the number of nurses and midwives employed in England and Wales has risen steadily and is now about 50 per cent higher than in the 1930s. In its latest report, however, King Edward's Hospital Fund for London points out that this state of comparative plenty is not going to continue. It depends on the supply of student nurses being maintained, but the number entering the training schools is falling year by year and in 1953 was 5,109 fewer than in 1949. In mental and mental deficiency hospitals, the problem is much more serious. They have only 4,530 student nurses between them (compared with about 45,000 in other hospitals), although they account for about 40 per cent of all hospital beds. The ratio of trained nurses to patients in mental hospitals and institutions is already only one to 12.5, compared with one to 5.4 in general hospitals; the combined effect of fewer student nurses and an ever-increasing number of mental hospital patients means that the ratio will soon fall farther.



The hospitals generally have taken two steps to keep up the numbers of their nursing staff. Many of them, to bridge the so-called gap between the school-leaving age of 15 and the age—18—when girls can begin their nursing training, have started nursing cadet schemes. These provide a combination of further education and hospital duties unconnected with the wards. They are, or should be, organised according to a code laid down by the Ministry of Health; but a recent circular from the Ministry states that in some hospitals, where there is a shortage of nurses, the code is ignored; young girls are being employed on full nursing duties, even to the extent of being left in sole charge of wards. Neither the Ministry nor King Edward's Fund is in favour of a wholesale adoption of these cadet schemes, especially by the mental hospitals.

The other means of obtaining enough nurses is through the employment of enrolled assistant nurses, a recognised grade of nursing that requires a shorter and easier training and is particularly useful in the care of the chronic sick. The King's Fund points out that recruitment to the mental hospitals might be helped if such a grade, with a definite training and qualification, existed in mental nursing. The fact remains that the hospital service as a whole is probably reaching a peak in its supply of full-time nurses. It will shortly have to consider seriously how to make a more economic use of those it has got. As a start, could not the patients' flowers be left in the wards at night?

Two Voices from Africa

The voice of statesmanship in Kenya seems to have passed, at least temporarily, from Mr Blundell to Mr Patel. Mr Blundell is preoccupied with defending the attitude of himself and his supporters to the Lyttelton constitution against the virulent attacks being made on him by his diehard European opponents. Last week, Mr Patel, Indian Minister without Portfolio in the new Government and leader of the Asian group in Kenya's legislative council, defined his policy for the achievement of a multiracial state. He reminded his Indian audience that a common voters' roll and common schools could not be achieved, or all racial discrimination removed, overnight. He asked for a greater understanding by each race of the other races' viewpoint, and for

faith and courage to treat this country as a laboratory

experiment to bring about unity at the apex with diversity at the base.

More specifically, he proposed, as a first step towards a common voters' roll, that about 10 members of the legislative council should be elected on a non-racial electoral roll—along with continued separate racial representation. These members would provide a force designed to put forward policies for the interests of the country as a whole.

In Northern Rhodesia, Mr Moffat, European representative of African interests in the territory's legislative council, has also recently affirmed in that assembly his attitude towards a multi-racial state. Speaking in support of what have since been named, and published as, the "Moffat Resolutions," he looked forward to the gradual replacement of racial representation in the legislature by a common franchise. Taken by themselves three of his resolutions are as unexceptionable—and as meaningless—as the term partnership that Mr Moffat denounced as so woolly that it had become distrusted by the Africans. It was the words that Mr Moffat used in support of his resolutions that are important. In effect he told his fellow Europeans that they have to decide, and quickly, between strict *apartheid*, which he believed preferable to dishonest partnership, and full co-operation between the races; there can be no halfway house.

The last of the Moffat resolutions is unequivocal. It states that

> every lawful inhabitant of Northern Rhodesia has the right to progress according to his character, qualifications, training, ability and industry, without distinction of race, colour or creed.

This, Mr Moffat declared, was the most important part of his resolutions. Just how important it is can be illustrated by the refusal of the European workers in the copper mines to allow the Africans to progress in industry. The European trade union should therefore note that this resolution, together with the others, was adopted wholeheartedly, with only one dissentient, by Northern Rhodesia's legislative council.

Heavy Weather

It is reported that trade customers now have to wait three months to take delivery of umbrellas. It is nice to know that someone has done well out of the rain. From other industries come reports of depressingly heavy weather. The building trade has probably suffered more than any—the operatives through reduced pay packets and the employers through having to pay the "guaranteed week" wage to men who could not work. Manufacturers are burdened with stocks of summer dresses and of unwanted sandals. The canning industry has seen its soft fruit pounded by the rain, and estimates its losses in millions. The strawberry crop was only two-thirds of the normal. The absence of thirst has reduced beer consumption as a whole, but it has sold well in seaside pubs where damp holidaymakers sought consolation and shelter; sales of soft drinks through the shops have been about half their total in a normal summer. Ice cream sales are also down, although they have to some extent been buoyed up by cinema audiences, which have been exceptionally good this summer. Dance halls also have done well.

Seaside resorts that offer such indoor amusements have naturally suffered less than small resorts and beauty spots like the Lake District. But even the large resorts have seen some of their attractions squelched. Blackpool, for example, is £19,000 down on last year's receipts from open air amusements, while Brighton is £13,000 and Southend is £10,000 down. The hotels, however, have had a fairly good year, and so have holiday camps, for people book well in advance and have a pathetic faith that bad weather cannot last.

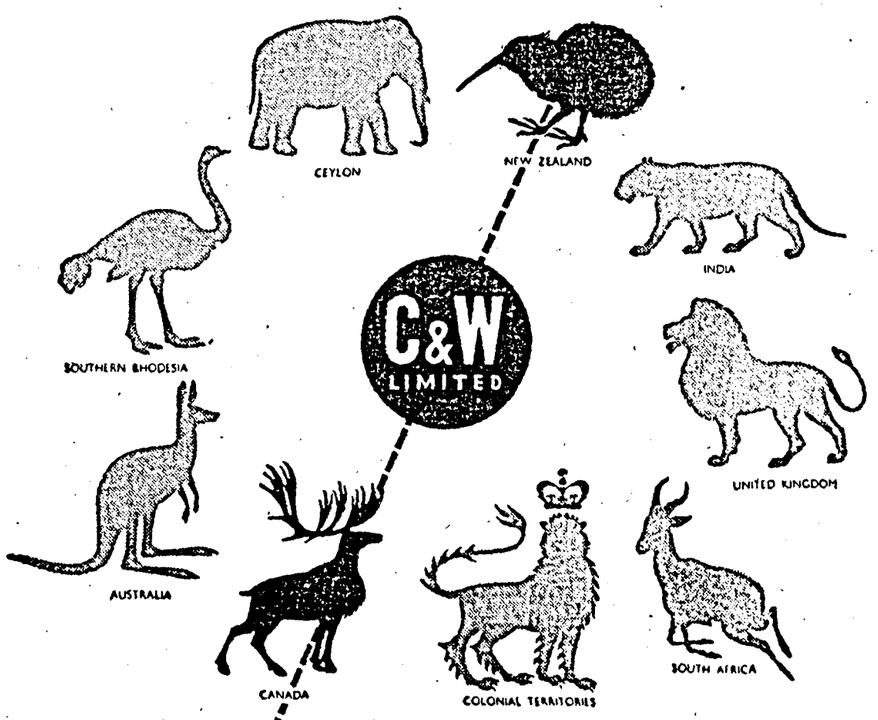
The Meteorological Office celebrated August Bank Holiday with a communiqué that contained one of the great truths of the year: "A contributory factor to the unpleasantness of the summer . . . has been the pronounced deficiency of sunshine." This month, at least so far, is rather less sunless than July. Up to August 16th London had 81.6 hours sunshine, compared with an average of 183 hours for the full month during the last thirty years.

The Dangers of Negotiation

The first campaign is scarcely more than half over, and already Russia has been baffled, defeated and repelled. She has been obliged to exchange the attitude of aggression for that of self-defence. From being resolved to appropriate her neighbour's territory, she is reduced to tremble for her own. . . . The insolent language of the Autocrat, who was resolved to have his way in defiance of all Europe . . . has been moderated into the complaining phrases—not yet quite apologetic or deferential—of a man who would fain make out that he had been misunderstood and ill-used. . . . It is clear that the Czar has been worsted, and that he admits it; and it is believed that he is inclined to come to terms. Already writers and diplomatists are discussing what these terms should be. This is the crisis of affairs that we have always looked forward to with the greatest anxiety. The dangers of hostilities seem about to be exchanged for the far more serious dangers of negotiation. Our readers will remember that, though we have never dreaded the arms of Russia, we have always expressed the greatest fear of her diplomacy. We know the characteristic weakness of the British nation—aggravated as it now is by our settled love of peace. . . . We know that our real danger is not in being beaten in a campaign, but of being overreached in a treaty; . . . not of conducting the war ill, but of throwing away all the advantages of victory by too great a desire for peace and too great magnanimity towards a fallen foe. . . . We shall be as thankful as anyone for the restoration of peace on a permanent and solid basis. Our only object in the preceding remarks has been to warn our countrymen against acceding to terms which, however plausible, are yet proverbially fallacious; and which will leave the embers of discord still slumbering and ready to burst out whenever circumstances shall render it the interest of the great aggressor again to fan them into a flame. Do not let us cobble or slur over our work. Do not let us have to do it over again at some future and less convenient period. Do not let us have spent ten millions for a hollow and unreal victory.

The Economist
August 19, 1854

This is not a detective story about a wire that led by some devious route to the discovery of a burglar. In the Philips history these various objects are very closely related.



More than forty years ago Philips engineers found that available diamond dies—through which wire is drawn during manufacture—did not produce wire fine enough to meet their rigid specifications. Therefore, as so often in the Philips story, they took on the job themselves—they started to make their own diamond dies. What is more, in mastering this intricate craft they also paved the way to other products, such as chisels, milling cutters and drills for fine mechanical work, of which diamonds are an essential component.

In the history of Philips there are many instances such as this, in which initiative in one sphere has also led to achievement in another. For this reason, Philips service to industry, already so comprehensive, is for ever expanding.

When the Kiwi cables to the Caribou

Between the land of the Kiwi and the land of the Caribou urgent messages must travel speedily and safely. Cabinet decisions, business quotations, Press despatches, family news—they are all part of the daily interchange of opinion and information between New Zealand and Canada. In New Zealand these messages are sent and received by the New Zealand Post Office; in Canada by the Canadian Overseas Telecommunications Commission. Between New Zealand and Canada they travel for 6,000 miles on the bed of the Pacific Ocean along cables owned and maintained by Cable & Wireless Ltd. Cable & Wireless Ltd. is a trading organisation; but it stands at the centre of Commonwealth communications. It owns the Commonwealth's 150,000 mile submarine cable network and operates the wireless relay stations on most of the Commonwealth's trunk wireless routes. From 62 telegraph stations within the Commonwealth and 70 in foreign countries, Cable & Wireless Ltd. operates the overseas telegraph service of most of the Colonial territories and the cable services of foreign countries in which concessions are held. Linking the Commonwealth is a vital part of the business of Cable & Wireless Ltd.—part of Britain's business.

How these services are carried out is explained in a 40-page illustrated booklet "World Wide Communication", which gives many interesting details about the Company's equipment, operations and administration. A copy will be sent to you without charge if you will write, mentioning this paper, to: The Public Relations Officer, Cable & Wireless Ltd., Electra House, Victoria Embankment, London, W.C.2.

Letters to the Editor

Borrowed from Stalin

SIR—Just back from a holiday abroad, I find that Mr Rothstein has answered my letter commenting upon an article which appeared in the April issue of the Soviet journal *Communist*. I must admit that I had overlooked the short paragraph on peaceful coexistence, which was squeezed between a denunciation of American war preparations and a boastful comparison of economic progress in the USSR and Great Britain between 1929 and 1951.

In the context of that long article dealing almost exclusively with the coming downfall of capitalism and the inevitable triumph of Socialism of the Soviet type, the Russian conception appears like coexistence with a moribund. The Communists claim to be the legitimate inheritors of the capitalist estate and they do not miss any chance to give it a few kicks in order to hasten its final disintegration. Mr D. E. Maurice, in his letter published in your issue of August 14th, has rightly mentioned some of the most striking instances of Soviet tactics to bring the Communists to power or to keep them there. To those may be added the more subtle procedure of camouflaging MGB agents as members of diplomatic missions entrusted with the task of recruiting local fifth columnists to work underhand for Russia, while the Communist parties serve Soviet policy by their open propaganda and other activities.

Mr Rothstein must be thankful that the freedom of expression prevailing in this country has given him the possibility to stand for the USSR against what must have looked to him as an unfair interpretation of its policies. It would certainly be a great help to the policy of peaceful coexistence if Mr Rothstein could send to the Editor of the journal *Communist* a letter based on his personal observations in this country so as to correct some of the sweeping assertions contained in the article he quotes in his letter. He could explain to him that it is not true to say, at least as far as Great Britain is concerned, that: "Capitalism is unable to provide people with work, bread, homes and clothes; that it cannot guarantee their security and that it deprives them of access to all cultural achievements." He could also point out the inaccuracy of the statement to the effect that "Production in all branches of industry in the capitalist countries of Europe is stationary or even diminishing." Mr Rothstein could find the necessary facts in your issue of August 14th, which shows that in Great Britain production has continued to increase at an average rate of between 2 and 3 per cent per annum and that in 1953 and 1954 the rate has been rather larger.—Yours faithfully,

T. ZAVALANI

London, W.11

Truce in Babel

SIR—Your call for a truce in the war of words will, I am sure, find many supporters. But would it help matters?

One very effective weapon is so often forgotten—the radio switch. The ether may well be cluttered up with accusations and counter accusations, but the only people really affected by them are the script-writers, commentators, those who choose to listen, those who have to listen and those relatively few unfortunates who do not possess superheterodyne nets.

Your suggestion of a truce on this matter between "the Communist and non-Communist powers" refers only to the BBC and the Voice of America on our side. But equally important are the privately run Radio Free Europe, Radio Liberation and Radio Free Asia: do you propose that they should be muzzled and put under censorship? What would the Communists do about their own supposedly independent stations like "Free Japan," "Free Greece" and the new "Voice of National Independence and Peace"?

Approaches to end the war of words have been made from our side before now, with no success. What we should like to see as a first step by the Communists is an end to their jamming not only of programmes intended for their own peoples, but also of those for their neighbours, like Finland, the Middle East and Iran. We should like to see the unrestricted sale of Western non-Communist papers and books in Iron Curtain countries once more, instead of their restriction to specialised libraries. We should like to see the Western embassies being allowed to re-open their information and cultural centres. These are the acts by which the Communists could make a welcome first move. But who is to judge when "news bulletins, entertainment and cultural material" become that distasteful thing, "propaganda"?—Yours faithfully,

JOHN CLEWS

London, W.C.1

The Egyptian Market

SIR—In a letter to *The Economist* from the British Chamber of Commerce in Egypt, Mr E. A. H. Goodwin says that "Egypt's removal of all restrictions on sterling imports reopens to British firms one of the easiest, safest and most profitable markets available." (July 31st.)

Mr Goodwin has evidently been more fortunate (or possibly better advised) in his choice of a line of business than the majority of us who are engaged in the representation of British firms and the sale of British goods in Egypt, which is notoriously a "price-market" where the last millieme (¼d.) counts, whether it be in the sale of a packet of peanuts or hand tools or heavy machinery.

For this very reason Egypt is a most difficult market for British quality goods, and the British manufacturer and his local agent have often to cut their prices to the bone in order to secure business in the face of the severe competition from continental (and now also Japanese) manufacturers. I understand that a good market in Egypt used to exist for quality British cotton and woollen piece goods, the importation of which into Egypt during the past two years has, however, been prohibited on account of Egypt's shortage of free sterling exchange. But although the Egyptian market has recently been opened again to British cotton and woollen piece goods, the market will seemingly now be only a very limited one on account of:—

(*a*) The eclipse of the "Pacha" class of customers.

(*b*) The very high customs duty imposed on such goods to protect local industries.

(*c*) The premium which has to be paid for sterling under the "Import Entitlement Account" system which at present adds some 6-7 per cent to the c.i.f. value of not only cotton and woollen piece goods but also to a very large range of other British goods which may now be imported into Egypt.

It is for these reasons that the British manufacturer looks to the British Government (the Board of Trade and the Export Credits Guarantee Department) for every possible measure of help and assistance in selling his goods in this by-no-means-so-easy market.

As regards risks, Egypt is no safer or more risky than other markets. The "safety" of any market depends primarily upon the selection of good customers, and in this respect the foreign manufacturer has to rely in a large measure upon the advice and guidance of his local representative or agent.—Yours faithfully,

Cairo W. D. LONG

Her Majesty's Oversea Service

SIR—With reference to your article of June 26th, I wonder if you realise how many men from the Commonwealth, as opposed to men from Britain, are already members of this service.

Among my own friends and acquaintances in Nigera I can think of geologists from South Africa, Canada and Australia, agricultural officers from Canada and the West Indies, and members of the Legal Department from the West Indies, Mauritius, Sierra Leone and the Gold Coast.—Yours faithfully,

Enugu, Nigeria JOHN HARRISON

Books & Publications

Disenchantment

BETRAYAL OF AN IDEAL.
By G. A. Tokaev.
Harvill Press. 314 pages. 21s.

THE Ideal is the picture, formed in the warm heart of a young Caucasian mountaineer, of the Bolshevik Revolution as the dawn of personal liberty, opportunity for the poor but intelligent, and freedom for national minorities. The Betrayal is the way Stalin misunderstood and feared all such spontaneous enthusiasms, using them for his own purposes when they were naïve and pliable; and suppressing them with rough insolence whenever they insisted on acting as the conscience of the regime they were otherwise prepared to serve loyally.

The indictment has often been made, but never more convincingly than in this personal account of a student who graduated over the years from tractor driving in his village to distinction as an expert on rockets and jet aircraft. His story is all the more compelling in that disillusion has not brought cynicism with it; he can still say that it was bliss in that dawn to be alive:

> Indeed to this day I feel that my status as "first-class tractorist," pioneer in introducing mechanisation to farming in my own countryside, was my most precious attainment. . . . To have been one of the founders of practical mechanisation I regard as a glorious honour.

Grateful as he was for his opportunities, he had at the same time a strong sense of his own powers and brought from his native mountains a fastidious integrity that not merely despised, but scorned to use the prudent hypocrisies of public life in Moscow. He said what he thought, imagining that sincerity and ability were all he needed. When he heard a funny story about Stalin he retailed it; and (since this happened soon after Kirov's assassination) found himself publicly tried at a party court as a Bukharinite, howled down by the colleagues who had previously joined in the laughter, and expelled from the party.

For long he bore a charmed life; and at such crises his own disarming personality moved some older and saner revolutionary to recognise the genuine zeal beneath the obviously exasperating lack of tact. Such men, themselves already Gullivers bound by the reddest and most lilliputian of red tape, were yet still able in the thirties to save by their exertions men of revolutionary temperament from being destroyed by Stalin's counter-revolution.

He scraped back into favour more than once, but each time the margin of survival was narrower, and the last involved a beating-up that almost proved fatal. A second volume, dealing with his career as an aviation expert, will presumably give the immediate reasons for his defection from Soviet society; but it is evident from the story he tells here that there could have been no final choice for such a man but death or self-imposed exile.

Mr Tokaev's experience is no doubt that of many of the more talented of his generation. What is less clear is how far his responses are equally typical. His abilities, enthusiasm and capacity for devotion are well above the average. But so are his individualism (he calls himself a "revolutionary democratic liberal" and he ought to add "nationalist" as well), his scorn of compromise and his disconcerting innocence of temperament.

Courage and frankness like his are probably not widespread, and it would perhaps be too hopeful to think of Soviet technicians as so many million Tokaevs, uttering their twentieth century version of *laissez-nous faire* to a big brotherly government; which is in effect exactly what he did. Even so, his account of the thirties does suggest that he and his like are the visible part of a much larger iceberg of opposition to Stalin and his system, and that the gestures of concession shown to the new managerial class in the last year and a half are intended to serve as a political gulf stream, liquidating it by less brutal and socially dangerous means than those employed by the Man of Steel.

Incredible City

FABULOUS CHICAGO.
By Emmett Dedmon.
Hamish Hamilton. 380 pages. 25s.

MOST aspects of Chicago are fabulous, but none beggars belief more than the plain description of the speed with which it grew into one of the world's great cities. The answer given by the ill-starred Samuel Insull to an inquirer about his ancestry was this: "My family tree is so short. All that I know is that my family were good Presbyterians." It was an answer that might have been given by most of the men and the women who built up this Arabian Nights capital of the Middle West.

So much happened so quickly that, almost against his will, Mr Dedmon's opulent panorama has the effect of "hustled history." Those readers who have been brought up to know best the Chicago of the "melting pot," of "Big Bill" Thompson, of Al Capone and the St. Valentine's Day Massacre will find much profitable new light on the city in these knowledgeable pages. The author makes the point that the pioneer Chicago stock sprang mainly from Puritan Anglo-Saxons, who migrated from the Eastern States. They were dour, thrifty, fanatically hardworking, with a sharp eye to the main chance, but that explains no more than half the miracle.

For example, at the Art Institute, a supercilious visitor inquired how Chicagoans could afford to buy so many Renoirs. "We did not buy them," replied Mr Chauncey McCormick, the Institute's President. "We inherited them from our grandmothers." What ancestresses! And what an inheritance! Mr Dedmon is happy in the extraordinary diversity of his odd century or so of social history, and he tells such stories as that of the Great Fire of 1871 with picturesque gusto. The book is illustrated by a wealth of admirable pictures.

The Founding Fathers

MARXISM AND ANARCHISM, 1850-1890.
By G. D. H. Cole.
Macmillan. 493 pages. 30s.

IN this, the second volume of his "History of Socialist Thought," Professor Cole really hits his stride. The first volume, "The Forerunners," was a good deal more than a curtain-raiser to the main enterprise; it was an exceedingly solid work of historical scholarship. It dealt, however, with a very mixed bag of freaks, whose ideas for the most part provided neither mutual support nor fruitful controversy; and it suffered accordingly from a certain lack both of cohesion and of intrinsic interest. In "Marxism and Anarchism" the great debate is in full swing, the great guiding ideas are taking definitive shape; and moreover Mr Cole does much more, in this second volume, to relate the Socialist thought which constitutes his main theme to the development of political ideas and events in general. There are still oddities galore, very minor prophets, ephemeral pamphleteers, marginal agitators and petty sects, whose controversies and mutual denunciations demand, one might think, either the pen of a Gibbon or the mercy of oblivion. But the lasting polarities are established, the oddities fall into place as allies, enemies or bickering camp followers; Socialism, from a vague descriptive term denoting a nebulous common factor in several disparate systems of thought, becomes unmistakably and formidably a movement.

The scholarship, comprehensiveness and nicety of historical judgment that Mr Cole brings to his task are probably beyond the assessment of any reviewer except Mr Cole himself. On this subject, he is the authority. Other historians are equipped to produce monographs and sectional studies; here, formidably based on a mountain of authorities, is an encyclopaedia. Mr Cole retains in this *magnum opus*, however, all the qualities that make him so outstanding a popular writer: clarity of exposition (particularly well exemplified in his account and evaluation of Marx and Engels); simplicity of style; the deft use of an occasional unbuttoned phrase (how delightful, for instance, to find Bakunin described as "a bit of an ass as well as a volcanic force"); the power of organising large masses of material into manageable and memorable shapes. It would be going too far to call "Marxism and Anarchism" a book for the general reader; but few works equally erudite can offer to the serious student, or to the seeker for particular references, so pleasurable and stimulating a task.

Le Roi Jean

SO FULL A GLORY
By Major-General Sir Guy Salisbury-Jones.
Weidenfeld & Nicolson. 300 pages. 21s.

WITH a foreword by the late Viscount Norwich, this is a biography of Marshal de Lattre de Tassigny. Its title is taken from *King Henry V*, and reads in full:

> But I will rise there with so full a glory,
> That I will dazzle all the eyes of France.

When de Lattre died in January, 1952, and his coffin was borne through the streets of Paris, many Frenchmen suddenly realised, almost for the first time, how dazzling indeed was the figure that had departed from the military scene. There was universal approbation for the President's action in promoting him posthumously as the first Marshal of France for a quarter of a century. By one of the odd quirks of history Jean de Lattre de Tassigny was born in the same village in La Vendée, Mouilleron-en-Pareds, that produced Clemenceau. And it is a measure of his stature that, in a different field and very different circumstances, the example and leadership of de Lattre's sixty-three hectic years already bear comparison with those of his fellow villager.

From first to last de Lattre was essentially a soldier, though he finished by being a statesman as well. A cavalry troop commander in 1914, in 1940 he was in command of the 14th Infantry Division, one of the very few which, at Rethel on the Aisne, broke the plans of the German advance. Henceforward, however, the French army could not escape politics, and, ironically enough, General de Lattre was put in command of the area that included Vichy itself. But, as it was often to do later, his spirited attitude soon began to make enemies, and he was shifted farther south. There followed an abortive attempt to resist the German march into unoccupied France in 1942, his trial at Riom, imprisonment, escape, flight to England, service under General Eisenhower in North Africa, and historic return to Southern France as commander of the First French Army. At the end, *le roi Jean*—a nickname earned as much by his downright efficiency as by his flamboyant love of *panache*—signed for France on the German surrender document in Berlin. Later, he became Commander-in-Chief of the Land Forces of Western Europe and finally High Commissioner in Indo-China.

General Salisbury-Jones is by no means the first to write a biography of France's most prominent soldier of the second world war; but he is the first to do so in English, and he has brought to his task the authority of a former Military Attaché in Paris. His book is a major contribution to a better understanding of the travail through which France has been passing. It is also a testimony to the fact that not every Frenchman has lost those traditional qualities that once made his country great.

Ungrateful Inheritors

FAMILY INHERITANCE. *A life of Eva Hubback.*
By Diana Hopkinson.
Staples. 196 pages. 10s. 6d.

IS it character or convention that causes eminent women to miss eminence? Had Eva Hubback been a man her achievements would have brought her honours and fame. Any man with her abilities and record of successful public service would have been bedizened with ribbons and chains of office and made chairman of innumerable public bodies. Was it Mrs Hubback's own natural unwillingness to publicise herself, as distinct from the causes she so vigorously pursued, or an excessive diffusion of her energies over too many causes that lost her public recognition? Or is society still far more preponderantly male than is generally recognised?

A great part of Eva Hubback's life was spent in securing legal equality for women. She herself had a combination of intellectual ability, astounding vitality and an enthusiasm for bettering the conditions of mankind which few men or women of her generation could rival. She was a redoubtable fighter, much feared in the lobbies of the House of Commons and in the government departments she sought to convert; a successful principal of Morley College; a member of the London County Council for three years; and chairman of many committees concerned with education and the welfare of women and children. Yet she died almost unknown to the public at large. Why?

This book, by Mrs. Hubback's daughter, does not attempt to give the answer. Indeed the picture it paints of her public life is singularly colourless. It fails to convey convincingly that facet of the woman who finally killed herself by overwork for innumerable causes. The book does, however, give an interesting and true picture of her as a private person: the rebellious daughter, of a public-spirited Jewish family, a Cambridge undergraduate, a mother of three children and a wise and generous counsellor and friend to people of every generation. Though Eva Hubback could be masterful and ruthless in pursuit of her "causes," she had a fund of wisdom and kindliness which gave her a matriarchal position among her friends and friends' children. Her advice was constantly sought and freely given. This generosity of spirit gave an immense richness to her life even though at the core of it there was loneliness and, one suspects, regret that no one was concerned to reward her labours and successes by giving her greater responsibilities. She was far too great a person to pine at such neglect; but that neglect has obscured the debt that generations of women owe to her efforts to secure for them political and legal equality, family allowances and other benefits now accepted as a matter of course.

Headlong Rush

WHY DICTATORS?
By George W. F. Hallgarten.
The Macmillan Company of New York
392 pages. 38s. 6d.

ONE supposes that the market for books about our oppressors, past, present and to come, is more or less illimitable; and if Dr Hallgarten had done no more than add to the number of volumes on Caesar, Napoleon, Hitler or Stalin, there would be no more to be said. But Dr Hallgarten, whose subtitle for his book is "The Causes and Forms of Tyrannical Rule since 600 BC," makes no such limited claim upon our attention. His purpose is to apply to the subject the sociological methods of Max Weber, whose "influence on American science," he ominously assures us, "is steadily increasing." As presented at the beginning these methods are more than simple tools of analysis:

> By applying Weber's methods, we shall prove that there were typical situations —both economic and social—in which certain kinds of dictatorships arose, and were, indeed, bound to do so whenever the basic situation repeated itself. Seen from this angle, the emergence of the individual strong men will lose some of its miraculous luster and will appear natural and understandable. Standard sociological types of dictatorship, if properly devised, not only explain the cases of tyrannical rule in the past, but also illustrate the nature of present and even of future regimes of this kind, just as the rules of astronomy apply to yet unknown and unseen stars.

And so we are taken on a headlong rush through history and around the world as the successive regimes are classified as "classical dictatorships," "ultra-revolutionary dictatorships," "counter and pseudo-revolutionary dictatorships" and "dictatorships in the present world." How good a guide Dr Hallgarten is, only a reviewer with his own seeming claim to omniscience could indicate. But what Dr Hallgarten has to say about Oliver Cromwell gives one no confidence in what he says about Venezuela; his rather detailed account of the Soviet regime in all its aspects seems to miss the point so often that one hopes he is better informed about the Anabaptists of Münster. At any rate, it would seem that his own courage fails him at times. About three-quarters of the way through, William of Ockham

is dragged in to remind us that Weber's "types" do not claim real existence; almost at the end of the book Dr Hallgarten suddenly admits that "sociology, as little as any other science, can pretend to look into the future." Where is astronomy now?

What does it all come to, then, but a series of comparisons of more or less value for the understanding of this or that aspect of dictatorial rule? Does it really help one to understand the Medici or other Renaissance tyrants to be told that their rule bears some resemblance to that of Pilsudski? Is there any similarity other than a superficial one between the foreigners who enlisted to fight for the Spanish colonies against the mother country in the days of Bolivar and the Soviet-recruited International Brigade of the Spanish Civil War? Does sociology help one to grasp the essentials of the French Revolution when one reads sentences like this: "the Dumouriez affair was the signal for the downfall of the entire French capitalist class known as La Gironde and for the turbulent and strife torn regime of the radical masses, commonly called La Terreur"? Dionysius I of Syracuse (405 to 367 BC), "unlike the Fascists," we are told, "was a more or less progressive type." So, no doubt, is the good Dr Hallgarten.

Guide to the Fourth Republic

POLITICS IN POSTWAR FRANCE.
By Philip Williams.
Longmans. 514 pages. 35s.

IT is easier to jeer at the antics put on the French political stage than to analyse and explain the poor quality of the performance. Mr Williams has chosen the more difficult course and produced an excellent study of the working of the French political system since the war. Indeed, if anything, he seems at moments over-optimistic and too indulgent in his criticisms; he may have been carried away in certain passages by the French motto that *tout comprendre c'est tout pardonner.* Thanks to the author's understanding, however, the book is a most valuable guide through the complicated web of political parties and the constitutional labyrinth.

The journey begins with a bird's eye view, a brief survey of the Fourth Republic from the days of the "three-party system" to the Laniel government of a few months ago. This is followed by a well-documented analysis of the party rainbow from one extreme to the other. The multitude of colours and shades is shown not as the cause of French governmental instability but as the effect, the reflection of real political variety in the country. The constitutional problem is set against this background, thus showing that the weaknesses of the system cannot be cured by a stroke of a pen.

This is not a book for people seeking oversimplified diagnoses and magic prescriptions. The cleavages are too deep-rooted to be eliminated overnight. There is the traditional *incivisme*—the mistrust of the state (strengthened by the Vichy interlude)—and its companion—the belief in the ultimate right of insurrection. Nor is governmental instability a new phenomenon. Coalitions were as insecure under the Third Republic; but the political patching up is now more difficult with a powerful Communist party.

There is certainly room for an economic and social study of the French ills, but Mr Williams's scope was limited to its political symptoms. Within its terms of reference this is a most valuable book. The narrative is clear and lucid; the argument is always backed by pertinent, sometimes illuminating, illustrations. Both the layman and the specialist will find a wealth of up-to-date information and an antidote to the fashionable superficial utterances on France. The Mendès-France experiment has revived interest in French politics and this book should help its readers to weigh more soberly the chances of a French recovery.

Foreigner in China

CHINA TRADER.
By A. H. Rasmussen.
Constable. 246 pages. 18s.

THE years between the Boxer Rising in 1900 and the mastery of the country by the Kuomintang (Chiang Kai-shek's party) in 1927 were the best that the white man ever had in China. In those years the foreigner (if he was not a missionary he was usually a trader of one sort or another) was feared and respected and, minor discomforts notwithstanding, he could enjoy all that the country had to offer while, at the same time, conducting a highly remunerative business.

This book tells one man's story of those years. It is told in a simple but straightforward narrative, which not only draws a picture of day-to-day life in the Foreign Settlement at one of the smaller outports, but also delineates the types—Chinese and foreign—to be found in those small islands set in the human sea that is China. The reader is also left with a good comprehension of the character of the ordinary Chinese—that curious mixture of charm, courtesy, shrewdness, selfishness, inhumanity and cruelty—and of the deplorable methods of the old-time officials.

Mr Rasmussen had more than the normal share of live adventure, thanks mainly to an indomitable urge to find out for himself where and why his cargoes "en route" from the interior were held up during times of disturbance. His travels on these errands carried him among and through the "Warlord" armies during their struggles for power in 1920-27, and his accounts of some of the pitiful scenes he witnessed will convey to the intelligent reader some inkling why the ordinary Chinese peasant and worker today find the Communist Government, which at least takes some care of its own soldiers and of "the people," so much better than anything he has known before.

This book will certainly have a place in the literature of the hundred years of foreign privilege in China—the century of the Merchant Adventurer. It will also induce nostalgia in many an old China hand by the names it recalls—Dr Balean, Mr (now Sir Allan) Mossop, George Soderbom, and many others known throughout the English-speaking communities in China before 1941.

Shorter Notices

WORLD POPULATION AND PRODUCTION.
By W. S. Woytinsky and E. S. Woytinsky.
The Twentieth Century Fund, New York.
1268 pages. $12.00.

The authors of this work set themselves the task of presenting an economic picture of the entire globe. This volume, overwhelmingly impressive in its size and comprehensiveness, is to be followed by a second on world trade. The research that has gone into the study was financed by the Rockefeller Foundation and the Twentieth Century Fund.

Here is a tremendous array of facts about the peoples of the world: their numbers, religions, languages, health, the communities in which they live, and the natural and man-made resources at their disposal. Nearly 500 statistical tables support the text, many of these ranging over a long period. It is no reflection on the skill of the compilers that the inadequacy of statistics for international comparisons is revealed time and time again. Concepts such as the standards and levels of living in different countries do not lend themselves to straightforward measurement. Nevertheless, the authors have made effective use of what is available and there is the added interest that they have projected forward their extensive study of the past. Somewhat cautious in their crystal-gazing, they are reasonably optimistic. They see the rapid growth in the world population approaching its end and do not subscribe to the Malthusian outlook on the food situation provided adequate economic aid is given to the underdeveloped countries; but they give a warning that a shortage of oil may develop before the end of this century. Among manufacturing industries, they see the brightest outlook for chemicals. The scope of this study is so vast, however, that in spite of the size of this volume, some of the inevitable generalisations seem rather superficial. But as a reference book it is a valuable assembly of facts.

WORK CAPACITY

THE PRIME REQUIREMENT in developing new types of transport aircraft is to provide greater work capacity at lower cost per ton-mile. The formula for this increased earning power is the carrying of larger payloads at high speeds over longer non-stop distances, and flying as many hours out of the 24 as possible. Speed is, perhaps, the element that attracts most attention in all forms of transport, and speed is, of course, a function of power. Turboprop engines being built in Britain develop horsepowers considerably more than can be obtained from the piston engines which power all large, long-haul airliners at present in use.

Modern intercontinental airliners with their spares cost about a million pounds each, or roughly twice the price of the last generation of airliners. Their capital cost is usually depreciated over about six years, although their useful life is at least twice and nearer three times this period. The higher annual depreciation costs incurred would increase rather than lower the present operating cost unless the aircraft were capable of greatly increased work capacity. Each of the turboprop Britannias that Bristol is building can offer a yearly work capacity of about 11.5 million ton-miles—assuming each does 3,000 hours flying a year at an average net speed (take-off to touch down) of 320 mph and carries 12 tons on each flight. In terms of passenger carriage—the measure being 10 passengers to the ton—this is equivalent to 115-million passenger-miles. In 1953 Pan American Airways made available 3,200-million passenger-miles, which corresponds to the potential annual output of 27 Britannias, compared with that airline's fleet of 105 main line aircraft in service last year. In practice, of course, paper plans and estimates do not work out so ideally as this, and a greater margin of fleet capacity is required. But the arithmetic serves to show how the advanced capabilities of these new aircraft will enable lower costs to shippers and the travelling public to be achieved.

This enhanced work capacity, therefore, is the product of three factors: more speed due to greater power, longer range due to fuel economy combined with speed, and many more seats. To offer one of these without the other two is not enough. For instance, an annual average speed of 400 mph allied to a capacity of 5 tons, makes possible at the same 3,000 hours yearly utilisation, a work capacity of only 6-million ton-miles per aircraft by contrast with the Britannia's 320 mph, 12-ton capacity and 11.5 million ton-miles a year. And if the range of new aircraft is limited because of high fuel consumption, the annual average speed is reduced by the need for more fuelling stops—to say nothing of the higher fuel bills. Moreover, as payload is always subject to the weight of fuel that must be carried for a given distance, very high speeds at high consumptions can be less rewarding than somewhat lower speed combined with more miles per gallon.

World competition for long range, heavy airliners has been taking the form of marginal advances in the designs of four or five manufacturers. Every few years range, payload and speed figures of the individual designs have been inched higher. The Britannia has been evolved not only to provide all-round gains in these respects over existing piston-engined types, but to start life with a basis for continued improvement during the next 10 to 15 years as a normal process of development. The broadening new science of harnessing gas turbines to high-speed propellers offers powers, air-speeds and fuel consumptions that will steadily push the piston-engine farther into the background.

309.P

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The Morning After Geneva

Washington, D.C.

WASHINGTON is a sadder, and a soberer, city today than it was in the period of what the *New Yorker* magazine called "thrashing indecisiveness" before the Indo-Chinese truce was signed. There are signs that it is also a wiser city. Looking back over the last months it is easy now to understand why the United States provided such a spectacle of vociferous inaction but few people gave much thought to the reasons at the time.

There were three possible courses of action open to the makers of American policy when it suddenly dawned on them that their confidence in the Navarre plan had been misplaced and that the French could not win in Indo-China without help. One was to help the French to hold the position on the field; another was to help the French to save what they could at the conference table; the third was to remain as aloof as possible and deplore whatever settlement was made without doing much to improve it. The choice of the third course was inevitable for an Administration which had come to office on the programme offered by the Republican party in 1952.

It would have been of no use to intervene on behalf of the French without sufficient forces and, although for a time nobody bothered to listen to him, General Ridgway was quietly taking every opportunity to point out what sufficient forces would mean—probably seven divisions. When Admiral Radford was advocating so passionately the bombing from American carriers of China as well as Indo-China there is no evidence that he counted, or, at least, was concerned about, the consequences of his proposed action. But a government accepting his ideas and translating them into policy would have had to count the cost.

The government, however, whatever the knowledge, experience and views of the President and the Secretary of State as individuals, represented the party which had undertaken to stop the fighting in Korea (and had succeeded in doing so) and had promised to reduce the military establishment (and had begun, even if more slowly than public pronouncements suggested, to make the reductions). The fact that it had also preached a policy of liberation of the Soviet satellites somewhat obscured the reality of its more basic policies but liberation was, after all, an ideal, something more distant and less distinct than intervention, which would have entailed the abandonment of election promises.

There is no need to wonder, therefore, why no policy in favour of intervention in the Indo-Chinese war was ever adopted and there is as little need to guess why the United States could not play its full part in the negotiations at Geneva for a settlement. The Republicans had made much political capital out of accusing the Democrats of "losing China" and they could hardly play an active part in "losing Indo-China."

★

There seems to be no doubt that the President, and every sign that Mr Dulles, soon absorbed the lessons of the worst diplomatic disaster in recent American history. But the congressional leaders appeared to be totally unaware of what had been happening and only shouted the louder at Communist China and those who had been indiscreet enough to recognise its government. It took Dr Syngman Rhee to bring them to their senses. Dr Rhee, with a deceptive display of naïveté, took Congress at its word and developed its arguments to their logical conclusion of renewing the war in Korea. Congress was not amused, but President Eisenhower may well have felt inclined to offer his heartfelt thanks. Since then he has been visibly more relaxed on the kind of subject that only lately stirred up trouble in Congress.

The week after Dr Rhee spoke, President Eisenhower said that the distinguished citizens meeting as the American Assembly were only being realistic when they deplored a rigid policy of permanent opposition under all circumstances to the seating of the Communist Chinese regime in the United Nations, and expressed their belief that

> the United Nations should, in principle, be an organisation of universal membership [and that] the question of what government should represent China in the United Nations is not, technically, a question of membership, but of proper representation of a country already a member.

This is a very different approach from the anguished threats to use the veto which have been the stock comment on the situation up to now.

A week later the President disagreed firmly and completely with General Mark Clark's suggestion that the United States should sever diplomatic relations with Russia and reorganise the United Nations without the Communists. Those were by no means the views of his Administration, he said, and he was quite certain that the world must retain a forum, established by agreement among all the major nations, in which to discuss their differences. And he went on to express, with some fervour, his opposition on moral, political, military and all other grounds to talk of a preventive war.

After eighteen months which have provided some sharp lessons the Administration has clearly begun to learn that it is harder to operate a policy than to proclaim a programme and that, in the area of geopolitics, the statement of a reasonable proposition does not ensure that anyone else accepts it. In his speech to the American Society of Newspaper Editors on April 16th last year, for instance, President Eisenhower made the eminently reasonable statement that a Korean truce should mean an end to the direct and indirect attacks upon the security of Indo-China and Malaya because "any armistice in Korea that merely released aggressive armies to attack elsewhere would be a fraud." When the armistice came it was, in fact, according to the President's own specifications, a fraud, but one which the United States had encouraged. America was talking so much about coming military reductions that the Chinese felt they could move their armies south without danger.

However, little of the reduction that was given so much publicity has yet taken place—the United States is probably stronger today than it was when the policy of military retrenchment was announced—and most of it has already been quietly abandoned. When Mr John Hannah, the Assistant Secretary of Defence, held a press conference three weeks ago to discuss a new military manpower plan all the attention was directed to the programme for making qualified young men undergo a period of training and for building an effective reserve. But Mr Hannah also referred to the fact that, a year from now, the regular forces would be stabilised at a total of just over three million men. This, he pointed out, was 230,000 more than had been planned a year ago and the increase, which would chiefly benefit the Army and the Marine Corps, had been approved because "we require more strength in the Far East."

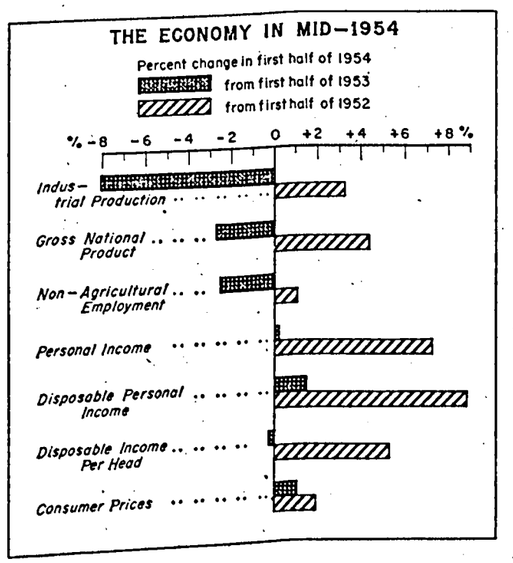
At the same time, therefore, that the United States has stopped wielding the big stick in a threatening manner abroad it has also decided to stop whittling it away at home. It was a Republican President, Theodore Roosevelt, after all, who advised his country to speak softly but to carry a big stick and the advice was never more disregarded than during the first seven months of this year. President Eisenhower, who never followed his Secretary of State down the corridors of "massive retaliation," has now set a different tone.

Making Capital Out of Communists

THE anti-Communist legislation with which the Republicans hoped to wind up the congressional session this week has got sadly out of hand with the overwhelming votes in both chambers to make membership in the Communist party a crime. The President, the Attorney-General, and the Federal Bureau of Investigation are all on record as opposing any legislation to outlaw the party. Moreover, the proposal was sprung on the Senate, without any warning or hearings, by liberal Democrats who made no secret of their satisfaction in finding a politically effective reply to the Republicans who were foolish enough to accuse the Roosevelt and Truman Administrations of "twenty years of treason." But the Republicans were determined to share in the political capital that was being made on the eve of the elections, and once it was clear that Senator Humphrey's motion would pass, only one Senator—Mr Kefauver, a Democrat—refused to vote for it.

If the Humphrey amendment, which provides gaol sentences and heavy fines for membership in the party or those who in any way have co-operated with it, survives the meeting of Senate and House conferees on the measure, the President can hardly avoid vetoing the whole Bill, even though it contains provisions penalising Communist-infiltrated trade unions which he wants. The Humphrey amendment would make nonsense of anti-Communist legislation already on the books: the Smith Act, under which 81 Communist leaders have already been convicted, and the Internal Security Act of 1950. The Communist party and its front organisations could not be required to register themselves with the government if this amounted to self-incrimination, and the question of whether the Bill infringed constitutional liberties would occupy the courts for years.

The President may yet be spared the embarrassment of vetoing the most dramatic anti-Communist legislation passed by Congress, though only at the cost of accepting a hasty and ill-considered Bill. The House has voted only to direct its conferees to add the Humphrey amendment to its own measure, and they may prove more anxious to help the President than to carry out their instructions. The House version would outlaw the Communist party, not its members, and strip it of such rights as those of running political candidates and suing in the courts. Some sincere liberals think this would be preferable to the proliferation of legislation aimed at subversives, but capable of being used to restrict the liberties of all. Congress has acted in a way, however, that suggests it is less concerned with constitutional liberties or the practical effects, at home and abroad, of driving the tiny Communist party underground, than with scoring a master, if bi-partisan, electoral stroke.



Burying the Recession

THE end of the decline in business which began last July has been officially announced by the President in a three-page document which is required reading and quotation for all Republican candidates in the congressional elections. The statement is not to be confused with the mid-year economic report which used to be issued by the Council of Economic Advisers, but has been abolished by the present Administration. It is a political document drawn up by the White House to prove that prosperity is no monopoly of the Democrats and to spike their big gun, the charge of Republican recession.

This charge was already losing some of its effectiveness in the face of the evidence that the Federal Reserve Board's index of industrial production was levelling off; for the last three months it has stood at 124 of the seasonal average for 1947 to 1949. The President was quite justified in pointing out, moreover, that although industrial production in the first six months of this year was running 8 per cent below the level in the first half of 1953, other and broader economic indicators, such as the gross national product, show much smaller declines, and the personal income figures show actual, though small, increases over the totals in 1953,

the most prosperous year on record. Even more satisfactory conclusions can be reached by making comparisons with the first half of 1952, which sets not quite so high a standard.

No one will quarrel with the President's attempt to set the over-advertised recession in perspective, although it is a pity that the only authoritative recent summary of economic conditions should try so hard to prove that the "performance of the economy thus far during this Administration has been better than during any earlier time." The

Democrats will certainly take exception to the effort to take credit for the boom in early 1953, which they consider a Democratic legacy that was dissipated by an ill-timed monetary policy. And no comparison of selected indicators over the past two years, however comforting, can conceal the embarrassing fact that, although unemployment has diminished slightly, it is still, at 5.1 per cent of the labour force, higher than it has been since 1949-50, the year of the Democratic recession before the Korean war. Unless business responds wholeheartedly to the inducements the Republicans have given it to expand, the cry of "economic stagnation" raised by the American Federation of Labour last week will be hard to silence.

Atoms for All

BY returning the compromise version of the Atomic Energy Bill to the House and Senate conferees for reconsideration, the Senate showed that it had not forgotten the lesson taught by the Democrats who prolonged the original debate on the Bill for two weeks. For their aim was to point up the danger that atomic energy might be developed for peaceful purposes in a way that would benefit private business interests rather than the American people as a whole. The filibusterers succeeded in modifying the Senate version of the Bill, but the first compromise reached in conference leaned unsatisfactorily far toward the House's side on the two key points—the licensing of patents and the distribution of electric power obtained from nuclear reactors.

The second compromise Bill, which has now gone to the President for signature, provides for the compulsory sharing, for a fee and for five years, of atomic patents taken out by private concerns. This is what the Administration itself had originally requested, but Representative Cole, the chairman of the Joint Congressional Committee on Atomic Energy, persuaded the House that such licensing would stifle private initiative and was probably unconstitutional in any case. The argument for compulsory licensing is that without it an unfair competitive advantage would be given to those large firms which have been managing atomic energy installations on behalf of the government and have therefore until now been the only private undertakings in this field. What the Democrats fear is that the present government monopoly of atomic development might be replaced by private monopolies which would restrict the application of nuclear research.

The final version of the Bill also provides, without qualification, for government agencies and other public groups to have first claim on electricity generated from atomic reactors. This is the "preference clause" which long ago became an established principle (although the present Administration is accused of undermining it) in connection with the distribution of power from another national resource, publicly-owned hydro-electric projects. This clause is held to be an essential check which holds down the cost of electricity to ultimate consumers.

Attention has been concentrated on these sections of the Bill because of their bearing on domestic political issues, but it is the other parts which are of international interest. The President is now permitted to give limited information on atomic weapons to allied countries. More important in the long run, he is also allowed to enter into "agreements for co-operation" with friendly countries and with international agencies on beneficial civilian uses of atomic energy; in particular other countries can be helped to build their own nuclear power plants.

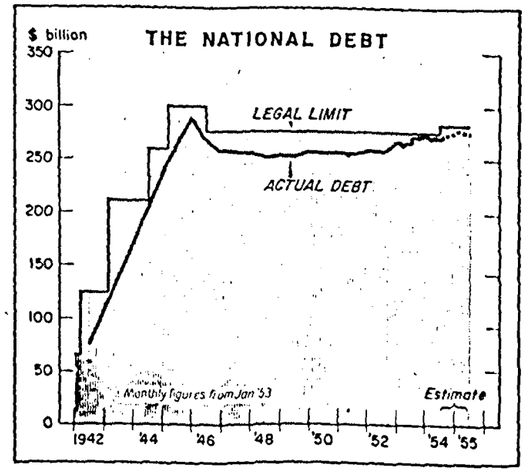
Good Will or Bad?

ANY chance that the enemy assets seized by the United States during the last war would be returned to their original, mainly German, owners by this Congress was killed when President Eisenhower wrote to Dr Adenauer, denying that he supported any of the legislation proposed at present. These assets, now valued at about $500 million, were taken over by international arrangement after the war, instead of reparations, for the compensation of Americans who had suffered at the hands of the enemy. The President made it clear that, provided a satisfactory arrangement could be made for Americans whose claims had not yet been fully met, he would agree to some form of restitution for individual Germans of modest means; in fact the German government is already pledged to compensate such people although it has not done so.

But by implying that he did not favour the return of corporate assets the President took the steam out of the well-financed drive which pushed the Dirksen Bill through

the Senate Judiciary Committee last month. For it is presumed that the money for the lobbying came from those German industrial interests, particularly the chemical companies, which were the original owners of the major portion of these assets. There can be little doubt that the President's view would be widely shared if it was generally realised that the heirs of the notorious German cartels would be the chief beneficiaries were the assets to be restored and that the most important are probably the patents against which so much popular resentment was once felt.

The American chemical companies are, of course, well aware of this and they oppose any change in the present position, not only because they would have to pay royalties on patents which the government has allowed them to use free, but also because they fear that this additional capital would make their German competitors quite irresistible. Furthermore, under the Dirksen Bill, the former German owners would be paid the full present value of the assets, which have frequently appreciated substantially.



All these points were put forward by the Department of Justice, now responsible for the assets, as practical arguments against the Bill which it also opposed on the principle that international agreements should not be repudiated. The Department of State based its support of the Bill—this open disagreement between government departments demonstrates the confusion there still is about this problem—on the argument that to retain the German assets in peacetime was a violation of the sacred principle of private property rights and would also set a bad example to other countries in which Americans had financial interests. Finally, said Mr Dulles, Germany was now an ally of the United States and to return these assets would be an investment in good will. It does not seem to have occurred to the State Department that such a move might undermine the good will of other allies of the United States, for example, the British who liquidated their American investments during the war with no hope of restitution.

Debt's Repeat Performance

SENATOR BYRD specialises in forced budget balancing, whichever party is in control of the United States government, but as a Democrat he can hardly be sorry that it is a Republican Secretary of the Treasury whom he has been keeping on the brink of bankruptcy for a year—and who will probably be appealing to the Senator for rescue again next July. When last summer the Secretary, Mr Humphrey, asked Congress to raise the legal limit of the national debt to $290 billion, it was Mr Byrd who saw to it that the Senate ignored the request. He argued that the existing limit of $275 billion was high enough, provided that Mr Humphrey exercised the strictest economy and kept less cash than usual in the till.

The Treasury unwillingly managed to prove the Senator right, although it only avoided bumping its head last autumn by undignified and uneconomic stratagems. As a result, however, when Mr. Humphrey renewed his request this summer, tactfully deciding that he now needed only an extra $10 billion, half of it for one year only, instead of $15 billion, Mr Byrd rewarded him by recommending a rise of $6 billion in the debt limit. This has been accepted by both the Treasury and Congress.

This increase is just enough for the present, although it means the government will be inconveniently short of ready money in January. But the rise is only temporary, until the end of the current fiscal year in June, 1955, which means that the whole time-wasting performance will have to be repeated next year, unless the Administration manages to curtail its spending much more sharply than now seems likely. The difficulty arises partly because the annual budget is still showing a deficit, but mainly because the

greater part of the tax revenue is collected during the first six months of the calendar year; in the autumn and early winter the government's outgoings inevitably exceed its income and funds have to be borrowed to cover expenses. There will eventually be some improvement under the new Tax Bill, for it will spread corporate tax payments more evenly over the year.

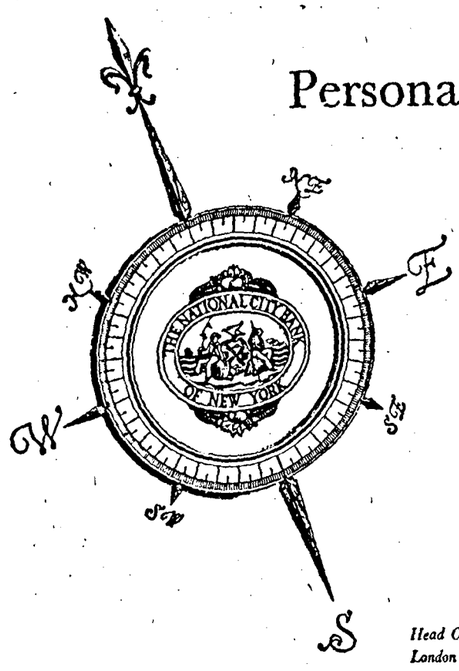
Crossed Party Lines

FROM A SPECIAL CORRESPONDENT

BRITISH voters would be surprised, to put it gently, were they to find Labour candidates for Parliament pleading for votes on the ground that they had supported Sir Winston Churchill more consistently than their Conservative opponents. Yet many a Democrat standing for office this autumn in the United States will be found following the example of Representative Charles Howell, the party's candidate for the Senate in New Jersey, whose campaign literature asserts that "Congressman Howell has a better record of support in Congress for President Eisenhower than does his opponent, ex-Congressman Case."

With an eye on the Gallup public opinion polls, and free in this off-year election from the necessity of supporting their own presidential candidate, the Democrats will handle Mr Eisenhower much as the Whigs used to deal with the young George III in the days of his popularity: by saying he's a fine fellow, and all the blunders of his Administration are the fault of his bad advisers and false friends. In some states, where they face Republicans of the Taft or

McCarthyite persuasion, this strategy may work, even though most Americans probably retain a certain natural, if not entirely rational, inclination to reject the idea that what a Republican President needs most is more Democrats in Congress. But in New Jersey, the Republican standard-bearer is Mr Clifford Case, an attractive, youngish man and a devoted champion of the Eisenhower forces.



Democratic hopes in New Jersey rest on other factors. During the years of Democratic supremacy in Washington, New Jersey remained Republican for the most part, although it made an exception for President Roosevelt himself. The state Democratic party was then dominated by the unsavoury Hudson County machine of Mr Frank Hague, long the boss of Jersey City. All that Republicans had to do was to point with righteous horror at Mr Hague and his cohorts. But now the power of Mr Hague is broken, he himself is reduced to an uneasy retirement spent dodging subpœnas, and the Democrats of New Jersey are led by an extraordinarily personable and energetic young man named Mr Robert Meyner, who is Governor of the state. What is more, Mr Meyner was elected because by 1953 the shoe had passed to the other foot and the Republicans were under the shadow of suspected "crime and corruption." Their gubernatorial candidate was linked with a labour racketeer named Mr Joey Fay, a prominent resident in Sing Sing prison.

This year the Democrats will have the added assistance of the revelation, just after his death, that Harold G. Hoffman, a former Republican Governor and member of Congress, had embezzled $300,000 to pay for his expensive life in Washington. Mr Case's own integrity is beyond question, but he is likely to suffer. Governor Meyner has scheduled an investigation, involving many Republican state officials, of the Hoffman scandal. It will not help the Republicans to have these hearings going on throughout the campaign.

Mr Case's other difficulties arise because many long-time members of his own party organisation suspect him of lacking enthusiasm for party regularity. The incumbent Senator Hendrickson was induced to accept a federal judgeship to leave the way clear for the more impressive candidacy of Mr Case. But Mr Case, it is felt, is too sympathetic toward Mr Eisenhower's tendency, in distributing New Jersey patronage, to overlook the organisation stalwarts. The latter feel that they were winning elections before Mr Eisenhower emerged as a Republican at all, and refuse to admit that it was their actions, when they were in power, which placed New Jersey Republicanism under a cloud.

The most recent addition of fuel to this fire was Mr Case's uniquely forthright and detailed statement against Senator McCarthy, issued a few weeks ago, and viewed by angry party regulars as a kind of treason against Republican unity. Mr Case's demands for action against Mr McCarthy go beyond anything that Mr Howell has said, which may indicate a hope of embarrassing the Democrats, whose ranks include the strongest liberal opponents of McCarthyism. But, in the old Hudson County stronghold of Irish and Polish Catholics, they also include its warmest admirers. If Mr Howell is embarrassed he conceals it well, while such arch Republican newspapers as the *Newark Star-Ledger* are severely critical of Mr Case's tactics. President Eisenhower himself has had to come to the defence of Mr Case from his right-wing critics.

The problem of Democrats who are also McCarthyites is not peculiar to New Jersey. In Massachusetts it is far more acute. The traditional division in Massachusetts politics is between the Irish Catholics, centred in Boston,

Personal service the world around

THE NATIONAL CITY BANK of New York maintains a world-wide network of 57 overseas branches and of correspondents in every commercially important city throughout the free world.

Businessmen who consult The National City Bank are thus assured of individual and personal service the world around. Their particular interests can be assisted and furthered by up-to-the-minute reports from the experienced group who man this extensive banking chain.

The London officers of The National City Bank are always happy to advise on all aspects of world trade and banking and are, as well, especially trained to deal with enquiries regarding the dollar area. A visit to any branch of The National City Bank of New York will help solve your problems.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK

London Offices:—City: 117 OLD BROAD STREET, E.C.2 *West End:* 11 WATERLOO PLACE, S.W.1

who have dominated the Democratic party, and the Protestant Yankee elements in the Republican party, which is led by blue blooded "proper Bostonians" but relies on the rural areas and smaller towns for mass support. Ethnic and religious considerations have outweighed national issues of policy, and this continues although the more prolific Italians are forcing the Irish Democrats to share their power, and although the Republicans are trying to broaden their support by including Jewish or other minority names among their candidates. The contest for the Senate seat this year is between Mr Foster Furcolo, who enjoys the priceless blend of Irish and Italian ancestry that spells magic to Democrats, and the incumbent, Senator Leverett Saltonstall, whose name and whose long, aristocratic countenance are perfect incarnations of Yankeedom.

Mr Furcolo, a moderate Trumanite member of Congress for two terms, has shown his fear of being too closely identified with the more uncompromising Fair Dealers and anti-McCarthyites by fighting shy of the Americans for Democratic Action, the *bête noire* in Massachusetts as elsewhere of Senator McCarthy's friends. Senator Saltonstall also has shown marked unwillingness to attack his colleague from Wisconsin. As chairman of the Senate Armed Services Committee, he carefully side-stepped any suggestion that his committee might be the proper place to investigate the clash between Senator McCarthy and the Army. In an interview last January, the most that Mr Saltonstall would say was that he did not "approve of all of Senator McCarthy's methods," to which he hastened to add that

> Mr McCarthy has been helpful in stimulating action in the government and in keeping us keyed up to the dangers subversives present to our life as free men.

Both New Jersey and Massachusetts are faced by economic problems more serious than those of most states. The decline of the textiles industry, the worries over the future of shipyards, the general flight of industry to the South have affected both states, although they are more serious in Massachusetts. Democrats think that this will help them, since they can offer more hope of active government assistance than can Republican defenders of strict *laisser-faire*. In New Jersey, however, it is difficult to detect much differences between Mr Howell and Mr Case on these "bread and butter issues"; if Mr Howell has the edge, it is because the Democrats generally stand for government intervention and the Republicans generally do not. In Massachusetts, the demarcation is clearer, for Mr Saltonstall's defence of the state's economy has not been very marked or very successful.

Both states serve to show how much the fortunes of Mr Eisenhower this November depend on regional, or even local, and personal matters, rather than on national divisions between Republican and Democrat. They also underline the extreme difficulty of dealing effectively with the problem of McCarthyism by the electoral process. McCarthyism is often described as "a cancer in the body politic." Most politicians feel that to attack it by direct surgery would be to risk injury to organs which, from their point of view, are vital—the Hudson County votes in New Jersey, the Boston vote in Massachusetts. Mr Case is an exception to this rule of timidity. A victory for him would be very damaging to the myth of Senator McCarthy's electoral omnipotence, but even if he is defeated, it may be the ghost of the unfortunate Governor Hoffman and his $300,000 in tarnished money, rather than Senator McCarthy, who is responsible.

Hotel Empire

New York.

BY its purchase of a controlling interest in Hotels Statler Co., Inc., the Hilton Hotels Corporation becomes the largest chain of first class hotels under a single ownership in the world. To the eighteen Hilton hotels, which include the Waldorf-Astoria and the Plaza in New York City and the Palmer House and Conrad Hilton (the nation's largest hotel) in Chicago, is now added the tightly knit standardised chain of eight Statler hotels (with two more under construction)—a combined total of 26 hotels providing 30,000 rooms. The Sheraton Corporation of America, the second biggest chain of hotels in the United States, with as many hotels as the combined Hilton-Statler chain, but some 10,000 fewer rooms, has also purchased two more large hotels within the last month, and was in the market for the Statler properties.

In the face of a declining rate of hotel room occupancy, rising costs of construction, maintenance, labour and food, and falling returns on investments in the hotel industry since the postwar boom, the fierce competition to acquire more hotel properties needs explanation. In the first place, it is the small town hotels for transient guests that have been the chief sufferers, not the large and luxurious city hotels, which are hardly affected by the "motels," the popular and convenient roadside accommodation for passing motorists. The three—now two—large chains all had a flourishing year in 1953.

Secondly, the advantages to be gained by the acquisition of more hotels, and their consolidation into a larger chain are of a wide variety. Debt laden properties can be refinanced on cheaper terms and taxes can often be saved by consolidating and "juggling" a larger number of properties. In the Statler case, however, the gains to which most attention is being given are the savings in operating costs, derived by combining facilities and eliminating duplication between two or more hotels in the same city, and by larger scale purchasing. It has been estimated that the savings—in such costs as laundry, food, advertising and administrative overheads—that would accrue simply from the joint management of the Statler and New Yorker, both now Hilton hotels, in New York, might reach $700,000 a year. Perhaps the most important feature of all, however, is prestige — the acquisition of the best, or at least the biggest. In particular the impetus given to the highly profitable convention business by the common ownership of the biggest and best hotels in town is especially important. The two most profitable hotels in the Hilton chain, for example, draw a third of their revenues from gatherings of trade associations and other organisations.

SHORTER NOTE

Last week the employees at the Studebaker Corporation's Indiana automobile plant voted by an eight to one majority to accept the end of the incentive wage system, with a resulting 14 per cent cut in their pay packets. They had rejected this earlier but the threatened shut-down of the plant made them change their minds. Another development which may contribute to a solution of the company's financial difficulties is the vote of the Studebaker Corporation's and the Packard Company's shareholders in favour of a merger.

The World Overseas

Across the Sea from China

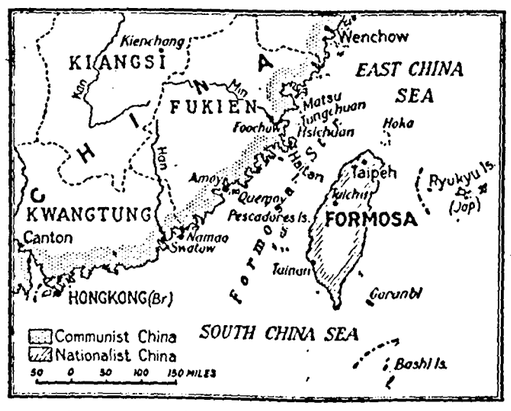
BY A CORRESPONDENT

PRESIDENT EISENHOWER has now responded to the declarations of Chinese Communist intention to "liberate" Formosa by stating that any invasion of the island will have to get past the United States Seventh Fleet, since the orders to protect the island given to the navy by the Truman Administration at the beginning of the Korean war are still in force. Thus the two powers confront each other, each committed officially to courses of action which, if both are carried out, mean war. The question is naturally asked, therefore, whether Peking is bluffing and what is the nature of the "determined action" which it is proposed to take.

Even without the American naval protection, an invasion of Formosa from the mainland would be a hazardous undertaking if one assumes that the Nationalist forces would offer a resolute resistance. The Communists probably have enough shipping—mostly junks—to transport a substantial army across the intervening hundred miles of sea, but they would need a decisive command of both sea and the air to cover the expedition against interception by Nationalist naval and air forces and to keep it supplied after it had been put ashore. There is so far no certainty that the Communists have sufficient naval or air superiority to provide the necessary cover.

The greater part of the scanty Chinese navy stayed with the Nationalists after the end of the civil war, and new Communist naval units have not hitherto put in an appearance. On the other hand, there have been reports of Soviet-aided naval construction at Dairen, and the Soviet Union might at any time reverse the previous balance of naval strength by transferring some relatively powerful units to its Chinese ally.

The end of the Korean war and the armistice in Indo-China must have freed a large part of the Communist air force, which can now be concentrated on the Fukien coast and could be used to cover landings on the island, to soften up the defence by bombing and to drop paratroops. Even so, it would be difficult to make certain of victory; and a defeat, which would probably involve the loss of most of the expeditionary force, would be a severe blow to the prestige of the Peking regime. When to these risks is added the task of overcoming the American Seventh Fleet, which is provided with a powerful carrier-based air arm and can be reinforced by land-based air-power from Okinawa, the prospects of an attack are not such as to attract any military planner in his right mind.



It may be, however, that the Communists are not thinking in terms of hard fighting, but hope by a mixture of menaces and inducements to disrupt the Nationalist resistance from within and present the world with a *fait accompli* through internal subversion. In view of the past record of Nationalist deflections, this must always be reckoned a possibility. On the other hand, those who followed Chiang Kai-shek to Formosa were precisely those who refused to surrender or pass over to the Communist side in 1949, and there is no evidence of conditions in Formosa today similar to those prevailing on the mainland during the civil war. The one thing, however, that might produce defeatism and disaffection in the Nationalist ranks would be a loss of confidence in American support. For if the Taipeh regime were left to fight alone against the whole power of Peking aided by Soviet armaments, its cause would be recognised as hopeless, and the more prudent Nationalist leaders would be concerned either to "work their passage home" with the Communists or to get away from the island before the end came. Any wavering in Washington would, therefore, almost automatically bring about a Nationalist collapse. But as long as the United States stands firmly on its declared policy of not allowing Formosa to fall under Communist control there is no reason for the Nationalists to despair of their capacity to hold the island indefinitely.

To get Formosa—unless the Peking leaders really contemplate an all-out war against the United States—is only possible for the Communists if they can somehow induce or compel the American Government to "uncover" it. There are signs that they hope to do this by isolating America diplomatically to such an extent that a reversal of American policy will be brought about. The United States is clearly in a weak position internationally on this issue. The American protection for the island was given unilaterally; it has never had either the support of Britain or any kind of endorsement from the United Nations. Today, not only is Britain, having recognised the Communist regime as the *de jure* government of China, legally precluded in any case from joining in a guarantee to Formosa, but British opinion is almost entirely sympathetic to Peking's case on this question. Indeed, there is no issue on which America might be involved in a war crisis with less moral or political support from London.

It seems likely, too, that Russia, or some other state of the Soviet bloc, is meant to bring up the question of Formosa at the forthcoming Assembly of the United

Nations. If the Chinese Communists can make enough show of fighting without going far enough to provide the Americans with a pretext for "massive retaliation"—which they could do by attacking, not Formosa itself, but the Nationalist outposts on Quemoy and other small islands close to the mainland—the situation can be represented as a threat to peace on which the United Nations must take action. America would be accused of armed intervention in China's internal affairs and thus of aggression against China. The position of non-Communist states which have recognised Communist China would then be a highly embarrassing one. Moscow and Peking may well calculate that either the United States would have to climb down—in which case the Communists would get the island—or the Western powers would be thrown into complete disarray, with perhaps fatal results for the Anglo-American alliance.

There are three possible solutions for the problem of Formosa. The first is to abandon it to Communist conquest. Britain has always been ready to do this, but it is unlikely that America can now be persuaded to do so. There are good strategic reasons for keeping the island in friendly hands, and no one has suggested an alternative refuge for Chiang and his followers. The second course, which has been canvassed in some quarters, is to make the island a ward of the United Nations. For various reasons

this cannot be regarded as a practical proposition; even if it were voted by the Assembly, it is difficult to see how Formosa could be administered by an authority on which Communist and neutralist states would have to be represented, and the violent antipathy of the Nationalists themselves to any such device would render it unworkable.

The third possibility is to recognise Formosa as a sovereign state on the grounds that it is effectively controlled by a government which repudiates the authority of Peking and cannot be dislodged except by the defeat of the United States in war, just as the People's Republic, which was helped to power by Russia and was protected by the Russian alliance during its intervention in Korea, cannot be overthrown except by the defeat of Russia. The British official doctrine is the "realist" one that recognition does not imply approval, but merely acceptance in international relations of an effective and apparently stable rule over a particular territory. It would be well for Britain to be consistent in its realism, for what is sauce for the Peking goose is sauce also for the Formosan gander.

M. Mendès-France's Economic Task

SPECIAL powers are normally requested by a government to deal with an emergency situation. In the economic field they are usually requested in order to relieve the treasury or to combat a balance of payments crisis. But as a speaker remarked during the debate over special powers for M. Mendès-France, the French treasury can cope with its immediate needs, prices are stable, production is picking up and the balance of current payments has actually shown a surplus in the first half of this year. This statement, however, was rhetorical. The speaker went on to say that, in spite of a considerable improvement, France's economic balance is still precariously maintained by favourable circumstances and American aid.

During the debate nobody seriously queried France's imperative need for structural changes and rapid expansion if it wants to put away the American prop and face the storms of the competitive world. M. Mendès-France has been entrusted with the task of preparing the convalescence without waiting for a crisis. The overall improvement, the increased confidence in the franc should help him in the urgent and tremendous task of adapting the French economy to the competitive conditions of the twentieth century.

The survey of last year's developments now published by the Bank of France, as well as figures of more recent progress, show both the extent of the recovery and the weakness of the present position. Last year price stability was obtained at the cost of industrial stagnation. In fact, both wholesale and retail prices went down slightly, though the level of retail prices was reduced only in the second half of the year (wholesale prices had been falling since February, 1952). Gross national product rose by a fraction to Fr. 13,800 milliard (about £13,800 million). The rise, however, was due entirely to a bumper crop, since industrial production actually fell by three per cent over the year. The use of the national product also changed: the share of consumption was increased and that of investment, particularly private, was reduced. There was a small rise in the purchasing power of the wage earners, but much less than demanded by the unions.

Dangers of a Budgetary Gap

Deficit on current payments fell from $659 million in 1952 to $220 million. Indeed, in the second half of the year France had a surplus of $56 million. The improvement affected all areas, with the notable exception of sterling; it was most marked in relation to the dollar area. The Bank of France goes on to issue a warning about deficit financing at home. Budgetery revenue covered about 75 per cent of the expenditure, leaving a gap of Fr. 652 milliard. In spite of American counterpart funds the government had to borrow Frs. 240 milliard from the Bank because the loans floated brought in less than in the previous year. The report recalls the dangers for the national economy of a budgetary gap and maintains that its coincidence with economic stagnation and price stability should not obscure the inflationary threat.

Further progress was made in the first half of this year when stability was no longer accompanied by stagnation.

Another bumper crop is expected, while industrial production has already picked up; it was six per cent higher in the first six months of this year than in the corresponding period of 1953. Prospects are bright for the steel, engineering and chemical industries, though not for textiles and coal. According to M. Faure, the finance minister, the average wage-rates have risen by 5 per cent between last November and April. Excluding direct aid, but including American expenditure on infrastructure, off-shore purchases and American troops in France, the balance of payments has been slightly favourable up to now.

All these are healthy signs, but there is a gloomy side to this picture. Over the last half-century France has lagged far behind in the European economic race. It is officially admitted that nearly one million workers earn less than £20 per month. The unions are clamouring for higher wages and will not be patient for very long. The budgetary deficit is estimated at Frs. 700 milliard this year and is likely to be much higher next. In spite of recent stability most French prices are substantially above the world levels. Last year, even with its record harvest, France was still importing more agricultural products than it shipped abroad.

Operating With Anaesthetics

In the first seven months of the current year the total French foreign trade deficit amounted to Frs. 120 milliard compared with Frs. 142 milliard in the same period of 1953. Yet, as M. Mendès-France pointed out, even this small closing of the gap would have been impossible without trade relaxations by France's partners, and if France does not proceed now with liberalisation it must expect retaliation. Finally, there remains the problem of American aid which is likely to be cut with the end of the war in Indo-China. M. Faure distinguishes between American expenditure (infrastructure, off-shore purchases, troops—altogether about $420 million in 1953) and direct aid ($350 million) and argues that a cut in the latter need not jeopardise the French position. Since it would be coupled, however, with freer trade and larger imports for an expanding economy, the claim seems somewhat overoptimistic.

The new programme must be viewed against this background. M. Mendès-France received a mandate to prepare the overhaul of the country's economy, to cut costs and prices, while fostering production. An operation seems inevitable if the French economy is to survive the shocks of competition. The Assembly decided to grant wide powers to its surgeon and his team so that it is performed under the best possible conditions and not without anaesthetics.

The word "decree powers" evokes the image of the gendarme, the ghost of dictatorship. Yet, it is really a problem of delegated legislation. True, the French Constitution declares that "The National Assembly alone has the right to legislate. It cannot delegate this right." It was soon realised, however, that an omnipotent but deeply divided Assembly prevents the government from fulfilling its function, and so the old compromise was revived of granting the government the power to act by decrees which must subsequently be ratified by parliament.

M. Mendès-France is not the first to be given such powers, though the scope is now greater than in the case of his predecessors. He can issue decrees relating to economic expansion; costs of production; purchasing power; foreign trade; and the Overseas Territories. The sub-headings cover such important problems as investment, subsidies, the fiscal system, distribution, etc. Indeed, the framework is so vast and so vague that in principle the government could do almost anything. But there are limitations. The decree powers are not valid beyond the end of next March. Though they become operative as soon as they are published in the *Journal Officiel*, the decrees become law only after ratification by parliament, to which they must be submitted before the end of next May. Finally, the powers end with the fall of the government and its economic policy can easily be transformed into a question of confidence.

Still, as long as it is assured of parliamentary backing, the government can wield its weapons with vigour. The present team has repeatedly asserted that it does not want to use coercion. In fact, it does not need to be a gendarme; it may simply refuse to be a nurse. By lowering trade barriers, cutting subsidies and reducing privileges the government could launch a competitive wave that would threaten to submerge marginal enterprises. These will then run to the state for assistance, and the protector can obviously select and impose conditions.

Thus, the projected "reconversion fund" looks like being the principal weapon in the official arsenal. This also shows the chief brake on official action—lack of money. Not many francs can be spared now for the fund, while it is specified that decree powers cannot be used to alter next year's budget. The decrees are destined merely to smooth the running of the machine, to prepare the ground for the real drive. In the budgetary proposals the government should show its hand more openly. It has also promised to face the Assembly with its long-term plans, including a crucial programme for the reduction of unproductive expenditure. The doctor has been given a free hand to get started on the preparatory stages of the cure; but the nature of the treatment cannot be judged before he has signed any prescriptions. M. Mendès-France must now be praying that the EDC affair will not knock the pen out of his hands.

Russia's New Granary

AFTER months of gloomy reports from the agricultural front Moscow now claims its first successes in the battle for grain. According to a communiqué published this week by the central committee, the drive for land reclamation is running ahead of schedule. Originally it was intended to bring 13 million hectares of virgin soil under cultivation by next year's sowing in Kazakhstan and Siberia. It is now claimed that this area has already been ploughed and that two million more hectares will soon be added. Furthermore, it is now planned to conquer another 13 million hectares in 1956, and it is asserted that altogether some 50 million hectares of virgin and waste land could be reclaimed in the next few years.

The figures are staggering, but they seem to indicate that what began as an emergency operation is now being transformed into a long-term plan. These distant and inhospitable lands are to become the Soviet Union's new granary. This is why praise is mixed with warnings and exhortations. Building and transport are lagging behind and, though 90,000 tractors (in 15 hp units) have already been sent to these areas, progress in many places is hindered by

lack of equipment. 150,000 people have been induced up to now to face the pioneering conditions, but a new wave of eastward migration is being prepared. Even according to the original plans, reclaimed land was to contribute about 20 million tons of grain by next year. It now appears that the Kremlin hopes to get some 40 million tons from this source by 1956, or nearly one-third of the present total output.

The results are still to be seen and the real test will come in the next two years. In the current one planners cannot expect much relief from reclaimed land, while nature seems once again to have been unfavourable to the new regime. Little is known about the crop prospects throughout the country, but it has been admitted that winter was long in leaving and sowing had to be delayed by as much as a month in many regions. Weather conditions subsequently improved, though heavy rain, particularly in Northern Caucasus, may have damaged crops. Anyhow, a bumper harvest, which could help to overcome the agricultural crisis, seems unlikely. In the circumstances, the success of Nikita Khrushchev's drive to conquer new land becomes even more important.

A Smaller Greek Army

FROM A CORRESPONDENT IN ATHENS

NOW that the Greek government is preparing its budget for 1954-55, it is being forced to make up its mind what to do about the pressing problem of its defence expenditure. To keep the military credits at roughly last year's level as some people suggest, is no solution, not even when the recently agreed reduction of the armed forces by 30,000 men has been carried out. For this reduction will be more than compensated by three new factors; the rise in internal prices after the devaluation of the drachma; the new expenses arising out of contributions to the Nato infrastructure programme as well as from new deliveries of military equipment; and finally, the need to find money to compensate those whose land has been expropriated for the bases granted to the United States under the agreement of last October.

It is not, therefore, surprising that the reduction in the size of the armed forces is not felt to provide any real easing of the government's financial problems. What is surprising, on the contrary, is that the Papagos government should have taken so long to face the realities of the situation and that it should not have taken steps — for instance when negotiating the bases agreement with the Americans last year—to consult its allies about its difficulties and the proper means of overcoming them.

The policy of arming "to the limit of the possible" has by now been largely discredited. It could hardly be otherwise in a country which, well before any in Europe, was making a military effort that absorbed, according to the Nato formula, more than 35 per cent of its budgetary revenues and 7 per cent of its national income. These figures, moreover, give only a partial picture of the weight of military expenditure, since they do not include a whole series of other closely-related expenses, connected with the police, war pensions, the victims of the Communist guerillas, and other special burdens.

Greece cannot go on with its present military effort without a serious reduction in the modest reconstruction plan that the government is now battling against wind and weather to carry out. Any reduction in the investment plan for the present year would mean abandoning all hope of putting the Greek economy back on a stable footing in the immediate future and would be deeply resented by public opinion as an unjust sacrifice.

Many people are consequently coming round to the military doctrine put forward by Lord Montgomery when he visited Athens in 1952—the idea of a covering shield strong enough to ward off any surprise attack, buttressed by a trained reserve that could be rapidly mobilised on a local basis. At the time this idea was received coldly, especially in military circles; but now it is at the back of a great many people's minds.

Two difficulties, however, seem to make it particularly difficult to put Lord Montgomery's ideas into practice in Greece. The first is to find enough troops to form the covering shield. This would not be strong enough if, according to the proposals attributed to the Greek government, the total number of troops is reduced to 75,000, of which about 50,000 would be needed to man the support and auxiliary services. The second difficulty arises out of the geographical nature and the size of the northern part of Greece. The mountain ranges running from north-west to south-west create difficulties of command and supply for large military units; while the extent of the whole mountain area, running as it does right up to the Turkish border, makes it difficult to reduce the number of troops beyond a certain point. This is more than a local defence headache for the Greeks; it involves the whole problem of co-ordinating Greek, Turkish and Jugoslav defence plans, and especially of the defence of the Straits. This, however, will be easier to solve now that the Treaty of Bled has been signed.

Glut on the Labour Market

The Greek government must also bear in mind that the disbanding of a large number of young men would make the country's labour problems even worse. There are in any case 80,000 newcomers entering the labour market each year. Sixty per cent of the agricultural population is employed during only 100 to 170 days each year, while in the towns unemployment is a constant burden on the public funds, making necessary increased taxation, which in its turn raises the already high production costs still further. The government is now attempting, although timidly, to deal with this labour problem; a sudden influx of 50,000 to 75,000 young men on the labour market might seriously jeopardise its plans.

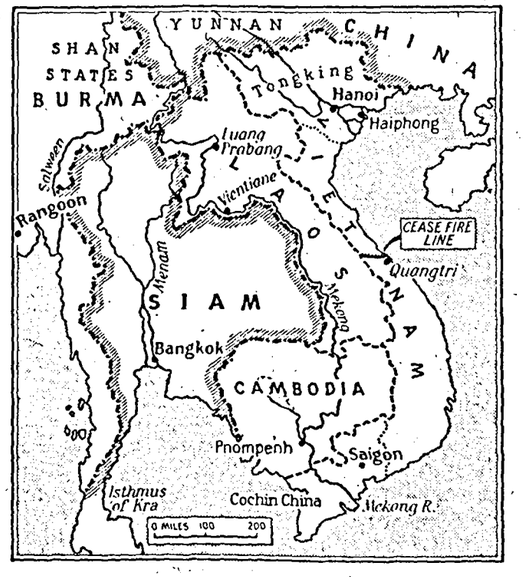
The problem is clearly very complicated and it is hardly fair to reproach the government for hesitating before it makes up its mind what to do. It would be possible to make a few economies in the present disposition of the armed forces; but a real alleviation of the problem is only possible if Greece's allies are willing to lighten the load of its defence budget by themselves paying for some of the infrastructure programme and for the purchase and maintenance of some of the Greek army's equipment. In a country such as Greece where it is money not manpower that hampers the defence effort, there should not be any insurmountable difficulties in such a solution. In any case it would clearly be dangerous to let the Greek people get the impression that the plans of Nato, which they now warmly support, are destroying their right to a decent livelihood.

Mythical States in Indo-China

BY A CORRESPONDENT

IN the sprawling, untidy kind of war that has beset Indo-China, it is easier to order a cease-fire than to enforce it. Where disciplined regular forces confront each other, the difficulty is relatively slight: it is the irregulars that are likely to give trouble. As last week's White Paper on the truce agreements recalled, fighting was supposed to end in Cambodia and Laos on August 7th and 6th respectively. There are no reports to suggest that shots have been fired in anger in either country since those dates, but the real test—the disarming of the irregulars—is still to come. In Cambodia, the "Khmer" resistance forces are to be demobilised on the spot within thirty days of the cease-fire date. In Laos, the agreement provides for the regrouping and demobilising of the "Pathet Lao" forces, but maintains a discreet vagueness about the deadline in view of the character and history of the mythical states of "Khmer" and "Pathet Lao." It will be surprising if the demobilisation does not run into trouble in both states.

Few people outside Indo-China, and not very many inside, had heard of Khmer and Pathet Lao until Pham Van Dong, Molotov and Chou En-lai produced them like rabbits out of a top hat in the early days of the Geneva conference. Each is a Communist creation, an alien growth foisted by Vietnamese outsiders upon relatively weak anti-French movements in Cambodia and Laos. In their present form, they are somewhat less "nationalist" in character than the Viet Minh, which can at least claim to be Vietnamese through and through, in spite of outside material aid. In the case of Cambodia it has long been a paradox of the country's political life that so many of its leading figures should be partly Vietnamese in descent: a paradox made the more striking by the traditional hostility the easy-going Cambodians are said to feel towards their aggressive and energetic Vietnamese neighbours.



Paradox Personified

Son Ngoc Thanh, Cambodia's *âme damnée* and without exception the best-known living Cambodian, is the paradox personified. Of mixed Vietnamese, Chinese and Cambodian origin, his very name is Annamite; yet he is the most prominent leader of the Khmer Issarak ("Khmer Freedom") movement. In 1936 he was editing an anti-French paper and in 1942 he obtained Japanese backing for a plot to overthrow the French administration. The plot failed and he was condemned to death, but by this time he was safe in Tokyo. His hour came in March, 1945, when he returned to Pnom Penh in a Japanese aircraft and wearing a Japanese Army uniform.

His triumph was as short-lived as the success of the Japanese *coup de force* in Indo-China. He was Prime Minister for about six weeks, until General Leclerc's forces arrested him on September 15th. His supporters melted into the bush and formed roving bands with a vague nationalist programme: they called themselves the Khmer Issaraks. As for Son Ngoc Thanh, he was condemned to 20 years' forced labour for "threatening the external security of the State." But the "forced labour" was in fact a tolerant house arrest at Nice; and late in 1951, in a quixotic gesture of conciliation to Cambodian nationalism, the French released him. On October 29th he returned in triumph to Pnom Penh. But six months later he left Pnom Penh and joined his followers in the bush; and he has been there ever since.

Whatever the nationalist pretensions of the Khmer Issaraks, they soon degenerated into mere banditry. A more serious factor, however, has been their infiltration by the Viet Minh, who were not slow to recognise the trouble-making possibilities of these wandering anti-French gangs. Son Ngoc Thanh's group has been operating in north-western Cambodia, and has been relatively, though not entirely, free from Viet Minh infiltration. In the south, however, a relative of his, Son Ngoc Minh, built up a "Khmer Issarak" movement with Viet Minh help during Thanh's exile. It was Son Ngoc Minh, not Son Ngoc Thanh, who was named at Geneva as the prime minister of the Khmer "state."

Of the original Khmer Issaraks, very few are still in open rebellion. The patent success of King Norodom Sihanouk in winning independence from the French brought more than 6,000 of the original rebels back from the bush in late

1953 and early 1954. Only a few hundred apparent irreconcilables under Son Ngoc Thanh himself remained in a nationalist movement whose cause had been won by other means than terrorism. In addition, there were approximately the same number taking their orders from Son Ngoc Minh, together with some 8,000 Vietnamese Communists. How many of these will peacefully hand over their arms within thirty days remains to be seen.

The story of "resistance" in Laos is closely parallel to that in Cambodia. Here again, the Japanese *coup* of March, 1945, provided the ideal conditions for rebellion. Four princes of the royal house were concerned in the movement: Pethsarat, Khammao, Souvanna Phouma and Souvannouvong. The movement itself was called Lao-Issarak, a further parallel with Cambodia. In Laos also the Issaraks obtained Viet Minh aid, and a Communist-sponsored government was set up under Prince Pethsarat,

at Vientiane, the administrative capital of Laos. When the French reoccupied Laos, Pethsarat and his government fled to Siam. In the years that followed Laos remained, comparatively, an oasis of peace, disturbed only occasionally by Viet Minh guerrillas.

It might, indeed, have remained like this if the Viet Minh regular army had not invaded the country in April, 1953. It is now clear that the main purpose of this attack, apart from its "headline" value in terms of victory over the Franco-Laotian forces, was to set up a Laotian "resistance" government. In the event, the Viet Minh captured the province of Sam Neua, and Souvannouvong, the only one of the four rebellious princes who had not given up the struggle, was proclaimed prime minister of the state of "Pathet Lao" in the "liberated" area. Of the other princes, Khammao and Souvanna Phouma had returned under an amnesty and Pethsarat had retired to private life.

It is doubtful whether Souvannouvong's "government" in the sparsely populated hill and jungle country has ever consisted of anything more that Viet Minh cells in the villages. There are no reliable estimates of the military strength of his movement, apart from Viet Minh support. Its political strength has been boosted by his association with the "Free Thai" movement in the Thai autonomous regions in the Chinese province of Yunnan. Like another exiled politician, the Siamese, Pridi Phanomyong, who was recently brought forward by the Chinese in Peking, Souvannouvong is a leader of the movement for a "Greater Thai Federation," which would embrace Pathet Lao, the Thai areas of Yunnan, Siam and the Shan part of Burma. It seems doubtful whether this dream of grandeur will keep many of his followers by his side now that fighting has officially ceased in Laos.

Australia Looks to its Defence

FROM OUR MELBOURNE CORRESPONDENT

IN committing Australia to support the proposed South East Asian Treaty Organisation (Seato), the Prime Minister, Mr Menzies, has pledged his country to accept for the first time in its history military commitments in advance of the actual threat of war. The Commonwealth Government clearly realises that participation in the proposed regional defence organisation would be meaningless unless it were supported by firm military commitments.

The Australian Government believes that the setting up of Seato is the only effective way of meeting an overt and direct act of territorial aggression from Chinese Communist forces. The future shape of Seato has not yet been decided nor has it been agreed where the "thus far and no farther" line shall be. But Mr Menzies sees it as an even chance that before long Australia may have to face the possibility of the Communist frontier lying not on the 17th parallel, but on the southern shores of Indo-China, within a few hundred miles of the Kra Isthmus.

This possibility does not make inevitable a direct act of aggression in South East Asia such as would bring the mechanism of the collective organisation into operation. What is much more likely in the foreseeable future is that the Communists will intensify their infiltration tactics in the territories that have not come under their control, where poverty and low living standards offer them a fertile ground to implant their philosophy. It is against this activity that the proposed regional defence organisation will have no effect.

Moreover, no threat of military action will save the Asian peoples from Communism unless, in President Eisenhower's dictum, they want to help to save themselves. The Colombo group of powers has shown no great enthusiasm for the proposed Seato pact. Memories of "colonialism" are still too fresh in the minds of these newly-liberated countries for them to welcome suggestions to join Western powers in an alliance against other Asian countries. For these reasons, only Pakistan has responded to Australia's appeal to the Colombo powers to join the proposed collective pact.

The Fight Against Poverty

The real problem in these countries is the appalling standards of living and the despair and backwardness which are to be found in Asia at any time but which have been tragically aggravated by years of war. The Colombo Plan was an earnest of Australia's desire to help raise Asian living standards, but measured against the money which it is providing annually for defence, its contributions under this head are abysmally low. Australia is spending about £200 million annually on defence, which will be certain to rise as the country prepares to meet its new commitments; but it is spending at the rate of only £3 million a year on economic and technical aid to the Colombo group of countries. Many people in the Commonwealth feel that a gigantic plan of economic aid to the countries of Asia and South East Asia would do much to halt the spread of Communism. But so far, nothing that Australia has done in its preliminary moves to get Seato going has suggested any effective political and economic counter-offensive against Communism.

What is the position of the Anzus pact in relation to Seato? It might seem that Anzus itself gives Australia and New Zealand a firm undertaking that the United States, the one power in the Pacific area really able to give effective military aid, will come to their support if attacked. But Australia does not get all it wants from Anzus. First, it wants to stop the aggressor before he gets to its own shores. Anzus will not enable that to be done. Secondly, the looseness of the Anzus pact does not give Australia the full measure of security that it wants. For instance, whereas an attack against one of the Nato parties shall be considered an attack against them all and each will assist the party so attacked by taking "such action as it deems necessary including the use of armed force," the corresponding obligation in the Pacific pact is much weaker. Here each party agrees that it would act to met a common danger "in accordance with its constitutional processes" which could well mean that the enemy would have attained his objectives before the constitutional processes began to work.

Australia hopes that it will be able to gain both Western and Asian support for the proposed pact. The pledge of military support is a earnest of co-operation with the United States. But if the Asian countries are to be saved from Communism, the assault must be carried on to the political and economic front, particularly the latter; otherwise, the intentions of Australia and its friends could only be misunderstood by the Asian peoples.

NICKEL AND NICKEL ALLOYS

FURNACE ELEMENTS	Nickel alloys for long life at high temperatures; for certain special atmospheric conditions · for furnace constructional work.
DOMESTIC APPLIANCES	Nichrome' V for long life at temperatures up to 1,150°C; 'Nichrome' for temperatures up to 950°C; other alloys for less exacting conditions.
THERMO-COUPLES	'T1/T2' alloys (nickel-chromium and nickel-aluminium) for temperatures up to 1,100°C, are identical with the best-known wires formerly imported. Also Special 'Advance' (nickel-copper) for use with copper or iron
RADIO and TV FIELD	Cathode nickel, pure nickel and nickel-manganese, for sleeves, anodes, grids filaments, supports, glass metal seals, etc.
LAMP INDUSTRY	Nickel-manganese for supports, grids, and lead wires; special alloys for a variety of efficient joints between metal and glass.
SPARK PLUGS	Alloys of the correct physical properties and temper to meet manufacturing requirements in centre and side electrodes; and such as special strip for stamping out multi-point discs for aircraft plugs.
FINE WIRES	Very fine wires from .002 in. downwards in various alloys, such as 80/20 Nickel Chrome. Pure Nickel, etc., for specialised applications.

Light Problems....

.... of the WORLD'S RAILWAYS

The TILLEY Lamp Company is the only Company in the world to specialise in Kerosene Pressure Lamps for the Railway Industry. British Railways, the London Underground Railway system and railways throughout the world rely upon TILLEY Lamps, which have been developed in conjunction with actual users. The result is a range of Lamps which covers every requirement or emergency, ensuring maximum track, tunnel and machine efficiency always. If you are interested in powerful, portable, kerosene pressure lighting or heating of any kind we will welcome your enquiries.

*Model A.L.21 Hand Lamp. 2,000 mean reflected Candle Power. Burns 12 hours on 1¼ pints kerosene. Ideal for tunnel inspection or for work in confined spaces.

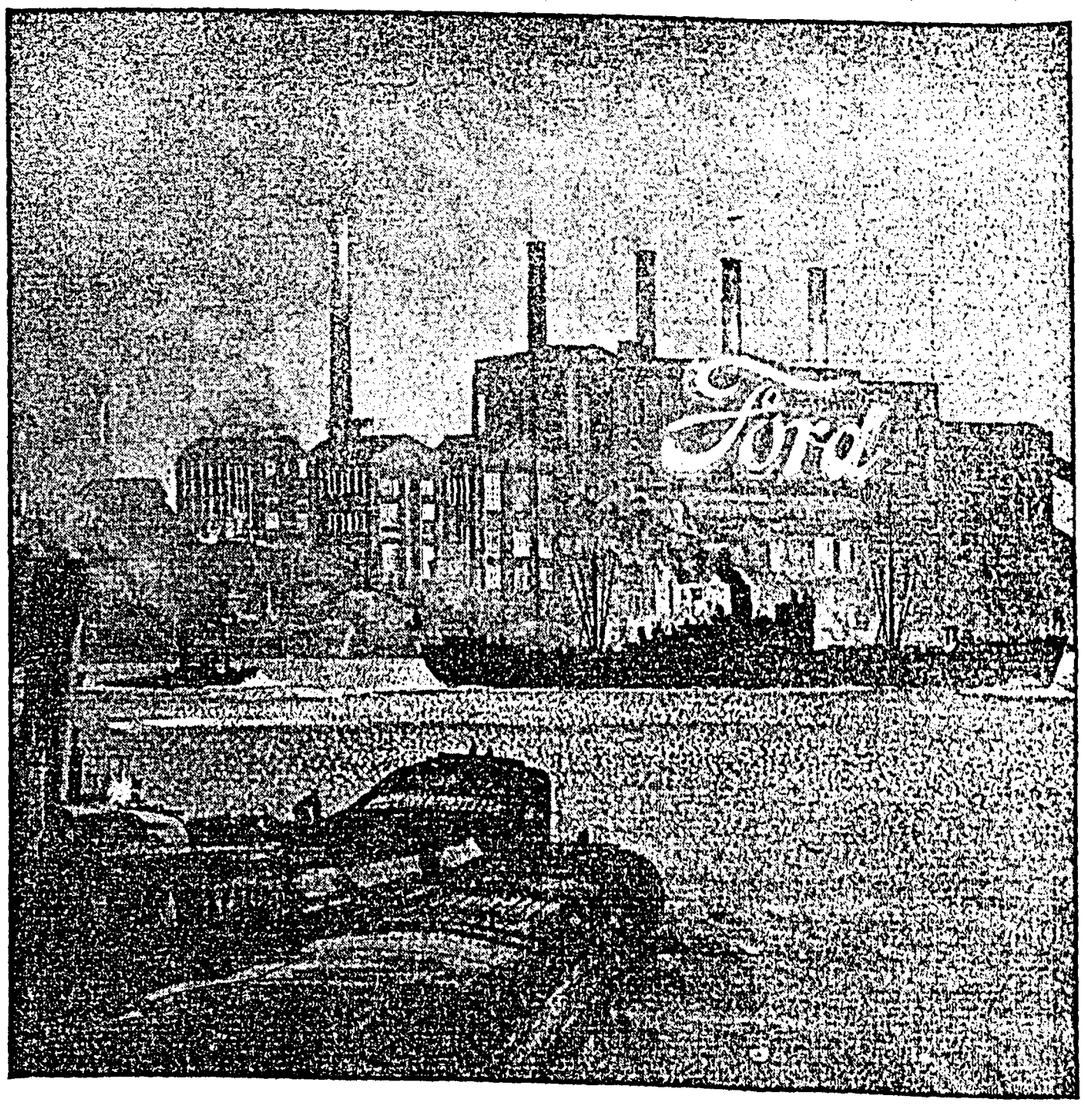
The filthy air



No. 4 IN A SERIES ON RESEARCH & DEVELOPMENT

Power stations are far from the worst offenders in polluting the atmosphere, but they can add to the nuisance unless strictly disciplined, and as large public plants they are sitting targets for public criticism. The fine flue dust produced by modern pulverised fuel fired boilers is removed by electro-precipitators, often with efficiencies so near to 100 per cent. that even decimal increases are significant. Simon-Carves are building dust precipitators for several new British power stations, and are devoting much research to the important fractions which separate performance from perfection. A recent official test on a post-war plant gave an efficiency of 99.4 per cent—a figure 0.6 per cent. too low to justify any resting on laurels.

only half the story

SLIPPING DOWN THE NIGHT TIDE from Dagenham a ship steams out laden with export vehicles from the largest self-contained factory in Europe. Last year more than one fifth of all cars, trucks and tractors exported from Gt. Britain came from Dagenham. The resultant benefits help to give you a better Ford product at a lower price. But this is only half the story. To the famous Ford Jetty, only 14 miles from Westminster, come other ships laden with raw materials. This two-way use of water transport, unique in British Motor manufacture, saves time—and money. This enormous saving is passed on to the consumer, another reason why only Ford of Dagenham can offer such value.

FORD of Dagenham

THE BUSINESS WORLD

The Price of Drugs

A MEETING was held at the Ministry of Health last week to discuss the price of drugs, from which the representatives of the pharmaceutical industry left in a thoughtful mood. They feel, with some reason, that the present discussions may set the pattern of the industry's economy for years to come. Decisions on new capital projects are being held in suspense until the outcome of the talks is known. If any one thing is certain in this complicated pattern of negotiation, it is that the Ministry of Health has not the slightest desire to bring about that result. But the Ministry is under a definite obligation to make "satisfactory" price arrangements with the manufacturers. This involves the definition of some standard costing formula by which a "satisfactory" price can be measured; but the structure of the industry is so complex that a mutually acceptable formula may be difficult to find.

This is not the first time that a Government department has disagreed with its suppliers over what constitutes a fair price. The history of wartime and postwar contract costing provides examples galore. But from the outset of the national health service the sale of drugs has been complicated by certain features about their production and marketing. The industry recognises three distinct classes of product:

1. *Basic drugs.* These are listed in the British Pharmacopœia, which is periodically revised to include any new drugs that have proved their value and to discard outmoded ones.

2. *Proprietary drugs.* The industry makes and sells drugs under brand names. These are defined as "proprietary" drugs to distinguish them from the standard form of the drug as given in the B.P. (or its counterpart, the National Formulary); and the industry calls them "ethical proprietaries" to distinguish them from the nostrums advertised to the self-medicating public.

3. *Drugs advertised to the public.* The sole criterion for deciding in which category a drug falls is the way in which it is advertised. "Ethical proprietaries," although many of them can be bought by the public, are advertised solely through medical media.

When a new drug is developed, it is marketed in a proprietary form. In due course, when its medical value is proved, it will appear under a standard name in the B.P., though it may continue to be available only as a proprietary. A manufacturer looks on his proprietary products as his profit earners; they have incurred the heaviest research costs, and they are expected accordingly to bring in the bigger returns. This year, the National Health Service will spend about £17 million on proprietary drugs and £10 million on standard drugs. Proprietaries figure on 28 per cent of all prescriptions, and the greater proportion of the industry's £30 million of exports consists of proprietary brands.

★

The argument with the Ministry of Health over the cost of proprietaries started in 1949, when the Select Committee on Estimates first gave voice to the demand often repeated since, for "such regulations as are practicable to prevent excessive or wasteful prescriptions." The result of this and of subsequent reports in the same vein at one time seemed likely to start a witch hunt against proprietary drugs. It was suggested in some quarters that doctors should cease to prescribe them at all. The matter was put in the hands of a committee formed under the chairmanship of Sir Henry Cohen and appointed, not by the Ministry of Health, but by the statutory body responsible for advising the government on the running of the national health service. The prescribing of those preparations that were advertised to the public was barred and the

committee turned its attention to the 6,000 "ethical proprietaries" with the object of deciding whether they were therapeutically worth their cost.

The committee drew up six categories of drugs. Into the first went the new proprietary drugs for which there was no standard equivalent in the B.P. Into the next three went proprietaries and compounds and variants of them that were not, in the Committee's view, so superior to the standard equivalents that they merited a place in the first category. The Committee suggested that while drugs in the first category could be freely prescribed, those in the second, third and fourth should be prescribed only if the Ministry could reach "satisfactory" price arrangements with the manufacturers. In the last two categories, the Committee lumped all the proprietary drugs that should not, in its view, be prescribed at all.

The industry has been highly critical of the procedures involved in the performance of this exceedingly delicate duty of classifying drugs. Certainly, now that the work of classification has been finished and the Ministry of Health has started to act on its instruction to discuss prices of the proprietary drugs in the middle categories, some interesting facts have come to light. These suggest that there is less difference between the price of drugs in standard and in proprietary form than most of the critics had supposed.

A revised price list circulated to doctors provides a direct comparison of the prices of 121 drugs in their proprietary form and in the form of their standard equivalent. The accompanying table has been prepared from this list, which shows that 53 of the proprietary drugs cost less than their standard equivalent (the difference in several cases being the dispensing fee); 63 cost more; and in five cases the cost is identical. This list confirms the industry's contention that proprietaries are not inevitably more expensive than the standard equivalent.

There still remains a substantial number of cases where the cost of a proprietary is the higher. The Ministry of Health has asked for and in most cases received detailed costs for about 90 of the most commonly prescribed proprietaries. In a few cases the difference between the cost of the proprietary and its standard equivalent seems so wide that it is difficult to justify. In at least two cases of this kind, the Ministry of Health has taken the drastic step of asking doctors not to prescribe the products. But in the general discussions with the industry, the Ministry will be arguing a more controversial case. Several of the reputable pharmaceutical manufacturing companies have already complained of what the chairman of Distillers this week described as the "application of rigid and unimaginative principles of accountancy" to pharmaceutical costs. The successful proprietaries have to cover not only their own research costs, but also the cost of unsuccessful projects in which a company sinks its funds. It is perhaps not widely appreciated that pharmaceutical production is a highly speculative venture and six figure losses on a project are not unknown. It also has to cover the research and production costs of some of the medically important drugs that are not highly profitable because the conditions they treat are comparatively rare. All these facts the Ministry recognises and there is no serious disagreement about the need to consider the company's whole balance sheet in relation to the costs of one product. This has not, however, prevented disputes about the allocation of research costs, nor has the industry always been satisfied about the Ministry's view of allowances for plant obsolescence.

A clash of opinion is also expected over the selling costs of proprietary drugs. The only source of orders for such products is doctors' prescriptions, and it is not surprising, therefore, that sales campaigns to keep a proprietary name before the medical eye are considered a necessary and regular part of costs. In some instances, these involve extensive advertising through the medical press, backed up by literature and samples mailed direct to the doctor and sometimes even by personal visits to his surgery. Companies have used tactics of this kind to familiarise doctors with products that might not be able to stand comparison, on strictly therapeutic grounds, with other competing preparations. The industry as a whole frowns on excesses in salesmanship, which bring it as much discredit as overcharging and which frequently explain why some proprietary products do cost noticeably more than their standard equivalent. Yet the industry would never agree that average selling costs are excessive. For example, the Monopolies Commission doubted whether the advertising expenses of the insulin manufacturers could fairly be justified—though they amounted to 4 per cent of total costs, and other selling and administrative expenses to slightly less than 17 per cent, and might not have impressed an outsider as being unreasonable.

The industry's main case is weakened by the excesses of one or two of its members, and by certain doubts about the selling expenses of some of the companies that concentrate largely on wholesaling. To manufacturers whose energies are mainly concerned with research and production, the profits made on these operations appear high. Because there are doubts and uncertainties of this kind, few people believe that a cost investigation by the Ministry of Health is unnecessary; what the industry does fear is the emergence of a rigid formula that might be applied to each and every proprietary product irrespective of circumstances. The financial risks of pharmaceutical production are considerable, not only in research but also in production, for a product can become outmoded or a process superseded long before the plant to produce it has been written off. It is difficult to imagine a formula that will satisfactorily embrace all these elements in the selling prices of proprietary drugs and a periodic check on costs such as the one now in progress may prove the better way of protecting the public purse.

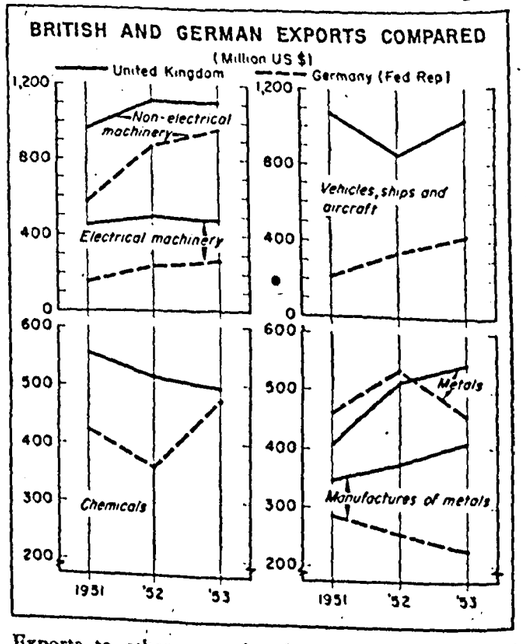
Britain in the Export Race

THE spectre of Britain pricing its exports out of world markets has not been flapping its shrouds too ominously this year. The trade figures continue to impress; the buyers' market seems less competitively ferocious than many had feared (and there are some markets and some manufactures in which the seller still has the better of the argument); and British industry has astonished itself by its ability to absorb higher wage rates. Whether it would have done so well if recession had hit the United States hard and set the rest of the world on a deflationary course is another question. The substantial improvement in British exports over the past twelve months owes a great deal, directly and indirectly, to the easy policy pursued by the managers of the American economy to avoid major recession. Before any bouquets are handed round, it must be remembered that Britain has been favoured by a general recovery in world exports of manufactures; exports from other West European countries as well as Britain have been buoyant.

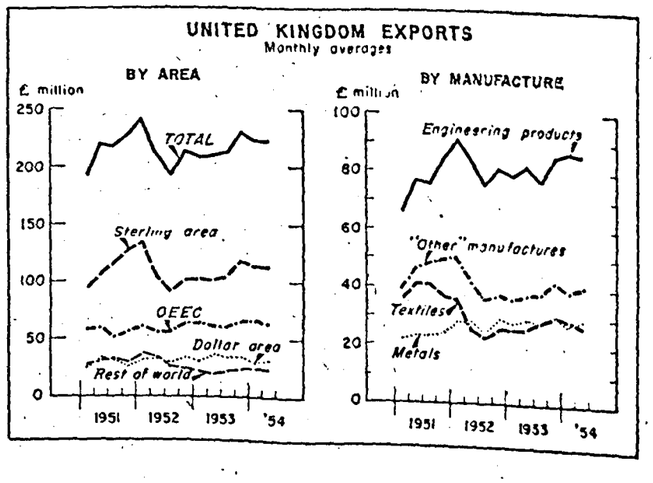
In the second half of 1953, compared with the first half, exports of manufactures from the ten main manufacturing countries rose by three per cent to $13,540 million; they appear to have maintained that higher level without making much further headway in the first half of this year. British exports of manufactures (which make up four-fifths of this country's exports) rose by 4½ per cent in the second half of 1953, to $3,000 million; and they have since risen by over two per cent, to $3,070 million, in the first half of this year. Exports of manufactures by other West European countries, apart from West Germany, rose by three per cent in the second half of last year to $3,530 million, and showed little further improvement in the first half of this year. German exports jumped by nearly 20 per cent in the second half of last year to $1,980 million (two thirds of the British figure) and have been running at much the same total this year. The only decline in exports last year was from North America, though exports from the United States have been picking up in the second quarter of 1954.



Another sign of the resilience of British exports in the face of growing competition is that Britain has not lost ground to the rest of the world in the last three years. After reaching a fortuitously high figure 26½ per cent in 1950, Britain's share of world exports of manufactures has been almost constant at about 22 per cent. This is no cause for excessive enthusiasm, for it is virtually the same share that Britain held before the war. In value world exports have multiplied three times since then. But it is useful to remind the pessimists that Britain still supplies more than one-fifth of the world's exports, and useful to remind the critics that the sterling area, to which half of Britain's exports go, is not as cosily padded a private trade parlour as they sometimes suppose. The past year's recovery owes much to the progressive relaxation of import restrictions in established markets in the Commonwealth, but the larger shipments to these markets have not been at the expense of sales to some other important areas. British

manufacturers appear to have kept up the efforts made in 1952, when the drastic restrictions imposed by the Commonwealth forced them, as exhortation never could, to spread their net wider.

Will this British share in the world's sales of manufactures be held or will it be squeezed by the United States or Germany or Japan? The share of the United States has held steady in recent years at about 27 per cent, compared with 20 per cent in 1937. The share of European countries other than Germany has been falling, but at 26 per cent it is still well above the prewar share of 21½ per cent. Although Germany's share has nearly doubled in the past four years to 13½ per cent, it is not much more than half the prewar share for Germany as a whole. Japan's share, at four per cent, is also little more than half that of prewar.



This is not an easy time for prophecy. British manufactures are now taking the measure of their foreign competitors, and the next few years will show whether the counter-attack has been successful. Yet there seems to be no essential reason why it should not be. Some water is being squeezed out of costs, not least in the engineering industries, and there is little doubt that more could be done. Increases in engineering and other wages do not appear to have placed many firms under intolerable strain. Such increases may not have evoked any greater degree of enthusiasm for increased productivity than did earlier increases; but it is at least something gained that increased productivity has probably kept pace with them. A plentiful supply of materials is also helping to raise productivity and many industrial concerns are reaping fruits from earlier re-equipment. Delivery periods have greatly improved and the impact of defence production is less burdensome. If Britain is not entering the export race one hundred per cent fit, it is in far better trim than before.

It is a race of many laps, some of which are bound to be difficult. But on others, the running is good. For example, British exports to the OEEC countries and their possessions in the first half of this year were higher than ever before. British exports of manufactures to North America, which are larger than those of any other country, suffered relatively little from the recession. Indeed, on this uphill leg, Britain is doing better than its European competitors; in the second quarter of this year shipments to the United States recovered to about the level of the first quarter of last year. Exports to dollar countries outside North America rose in the second half of 1953, but have since fallen back slightly.

Exports to other countries, however, have remained below the level of earlier years, owing partly to the hurdles that have been placed on the track by Latin-American countries.

The prospects of further expansion in the dollar markets ought to be promising; British exporters have made reasonable efforts to secure dollar trade, but it would be an exaggeration to say that they have been fighting for it. Further expansion should also be possible in Europe. Holland, small country though it is, is now Britain's largest European customer for machinery and electrical equipment; sales have risen steadily from £12.5 million in 1949 to £17 million in 1953. The oil states in the Middle East are a glittering market, and there should be fresh opportunities for Britain following the settlements in Persia and Egypt.

In these endeavours, however, British firms will be faced with more competition from Germany. The rapid expansion of German exports so far has been chiefly in Europe, traditionally its largest market. There are signs that in electrical machinery, and perhaps in other goods as well,

Germany's trade expansion in Europe is tapering off, and that its main effort is being directed towards Latin America. German firms are also penetrating the Middle East and certain Commonwealth markets, notably South Africa. A glance at the charts suggests that German competition, though it has trodden hard on some British toes already, will tread still more heavily in the future. Germany's second thoughts about export incentive schemes and the extension of long-term credits are not likely significantly to temper its competition. And though German labour is now demanding a larger slice of the national cake, British wages will not stay still.

Germany is not the only country to watch. Among other Continental countries, Switzerland is a formidable competitor in generating equipment and specialised machinery. Japan is a powerful rival in textiles (as is India) and, to a lesser extent, in shipbuilding and certain capital equipment. The United States may well prove to be the most formidable competitor of all. Moreover, in some consumer and durable goods, such as motor cars, British manufactures still enjoy an appreciable measure of protection owing to foreign discrimination against dollar goods, which would gradually disappear if sterling became convertible.

Provided that industry responds whole-heartedly to the challenge of a buyers' market, and provided a shrinkage of world trade can be avoided, there seems no real reason why Britain should not retain its present share of world exports. The volume of British exports should gradually improve with the growth of world trade that can be hoped for in the long run. The response of industry will depend mainly on the ability of the government, whether it be Conservative or Labour, to allow overseas demand to make itself effective, and to make sure that it is not swamped by unduly soft financial policies and inflation at home.

The Gilt on the Lily

WHETHER or not the wise buyer judges goods by the wrapping, the design and production of the packages in which most articles are sold in shops nowadays has become almost as important a business as the articles themselves. Some seventy years have passed by since Sir Thomas Lipton put tea into branded cartons and turned a small Glasgow grocery into one of the legendary industrial fortunes of Victorian times. The packaging industry has moved far since those days, but it expects to develop even faster in future. New materials and techniques, ingenious machines to wrap goods more elaborately and faster, new trends in retailing, higher standards of food hygiene, and an increased attention to the "point of sale" appeal of an attractive pack—all these developments help to build up a big, diverse and progressive packaging industry.

The packaging productivity team that visited the United States in 1950 estimated the cost of packaging in this country at "not less than £300 million a year." In the four years since then the industry has been growing; demand for packs and supplies of the materials to make them have increased, and so have prices. The gradual disappearance of rationing has increased both total volume of sales and competition in the food business, which is overwhelmingly packaging's biggest customer, and food companies have been using the proven value of a well-designed package to stimulate "impulse buying" and lay the foundation of new preferences. No reliable estimate of the growth of packaging business since 1950 is available; but home consumption of tinplate, paper packaging materials, and glass bottles, still the three major materials for containers, has risen by some seven per cent, while the use of plastics in packaging may have increased even more.

This expansion is making the package designer a more important member of the managing team, and he is often called in right from the inception of a new product. Research into packaging, which received a strong fillip from wartime experiences when faulty packs at times led to considerable losses, is being taken up by most firms making these materials or packages, and also by some of those who use them. Basic co-operative research is carried out in the packaging division of the Printing, Packaging and Allied Trades Association. The canning and quick-freeze trades also have their research associations. As knowledge and experience grow, so do techniques. There is a rapidly growing armoury of ingenious machines to slice, weigh, wrap, fabricate, fill, insert, label, print and seal packages at very high speeds, often in conjunction with electronic counting and inspection devices. Packing by hand is expensive, though for operations where it cannot be avoided small mechanical aids are now available, such as hot plates and irons for heat sealing of packets and thermoplastic labelling. With standard packets and high output, full mechanisation is usually worthwhile. It does not always take place at the factory. Although manufacturers are gradually catering for new styles in marketing many self-service stores, for example, prefer to pre-pack certain products themselves and thereby retain a certain amount of flexibility while this departure in retailing is still in its experimental stages.

Seasonal variations in produce supplies may discourage elaborate packaging facilities at the production point; on the other hand, pre-cooling and refrigeration can only take place immediately after harvesting. The costs of packing in bulk or in packets vary with the goods, and the different packs and transport conditions

may help to determine the point where "breaking bulk" into packets takes place. Growers of produce have taken a particularly lively interest in pre-packaging, for it is likely to broaden their market considerably. The National Farmers' Union recently helped to establish the Produce Pre-packaging Research Association, a joint research organisation for farmers, growers, and the packaging industry, which will carry out research to ascertain the products most suitable for pre-packaging, the packing materials that give the best results, and the most efficient machines and methods.

THE MATERIALS THAT ARE USED*
(Estimates)

	1950	1951	1952	1953
Paper (tons)	570,000	585,000	525,000	620,000

No single packaging material approaches the ideal; there is a wide range of materials that satisfy different packaging requirements to varying degrees. The task of the packaging designer is to determine the properties he requires and then to select the material or combination of these materials that go nearest to meeting the specifications. Recent techniques of bonding different packaging materials have widened the range of selection and revived or increased competition. Multiwall sacks —of paper with at least one layer of polythene—are now used in the flour, fertiliser, and chemical industries; and the possibility of coating hessian with polythene has not escaped the notice of the jute industry. Completely new "gimmicks," such as the aerosol can, which is packed under pressure and blows its contents out as required, have opened up new fields for the tinplate container and have also given fresh stimulus to aluminium and glass bottle manufacturers. Glass bottle makers, whose pharmaceutical and cosmetics markets have been invaded by the aluminium tube and capsule and by the polythene bottle, may be able to use this rival material to coat their glass bottles and reduce breakage.

The aerosol can, most familiar in its application as the insecticide "bomb," is one example. Supplies of cans, valves, and the propellant gas—Arcton, also used by the refrigeration industry—have improved during the last year as more firms have appeared on the scene and these pressure dispensers are now marketed or will soon be for air fresheners, shaving cream, shampoos, lacquers and paints. The paint sprayer—once certain technical difficulties have been overcome—should be a boon to the motorist whose car is always being scratched.

The can, the bottle and the carton are still the heavyweights of the packaging industry; tinplate, glass and paper are to be found in most sections of it, though there is a shifting frontier between them and some competitive materials are making encroachments on both their fields. Improvements in interior coatings, in can seaming and sealing, and a new collar-type can that can be used with a lid for dry packs in the home after it has been opened, are some of the new tricks of the tin can maker. The slump in tinplate demand in 1952-53 put out of business some capacity that was obsolete but still useful; but it stimulated canners to go into the beer, milk, and soft drinks business, where tinplate may be helped by a trend against returnable containers. Some glass jar makers and tinplate container fabricators have attempted to exploit this trend by making multi-purpose containers, suitable for use about the home once their original purpose has been served. Cans or containers made from aluminium sheet are generally too expensive in this country to compete significantly; though extruded aluminium tubes and aluminium foil have much better prospects. In the rigid box industry, conversion to continuous line production with machines recently developed has cut costs and improved quality. The growth of frozen food sales has created a large new demand for waxed cartons and a whole new family of "window cartons" that show the product have appeared.

But perhaps the most far-reaching developments in packaging are taking place in plastics. These materials provide three of the main qualities needed—visibility, protection, and lightness; and with production increasing, plastic costs have tended to fall. Polythene, particularly, has developed very rapidly; its high resistance to water, vapour, and chemicals, its toughness, visibility, and flexibility make it a good packaging material. As a film, produced in sheets or by extrusion as "layflat tubing," polythene has been used for the prepacking and home storage of foodstuffs, and as a protective bag for domestic textiles and machine parts. A polythene liner made from film turns a metal or board drum into a cheaper, lighter, and more effective container. Rigid or squeezable polythene bottles have carved out a growing market in cosmetics and pharmaceuticals; and collapsible tubes made from polythene or polyvinylchloride offer an effective though as yet expensive alternative to collapsible tubes made from metal. Apart from polythene, "Pliofilm" (rubber hydrochloride) and "cellophane" are used for prepacking food. Both have advantages that polythene lacks, and vice versa; and both a "Pliofilm-Cellophane" laminate and a polythene-coated "cellophane" have appeared on the market.

The self-service store is often suggested as the logical end to the packaging and branding developments of the last few decades. The impact of these stores upon the packaging industry in this country has only just really begun. Although well over 2,000 self-service stores have been opened in different parts of Britain within the last five years, and the rate at which they are appearing seems to be increasing, some 530,000 retail businesses still operate on the counter sales system and a large range of food and non-food products are still bought in bulk and sold retail by quantity or weight. Packaging of all goods becomes essential in full self-service to protect products from the handling they get when the shopper is allowed to roam through a store and pick up and examine everything before buying anything. A good packaging material for self service must not only protect the article. It must itself be robust and at the same time light in weight; it should, if possible, allow the shopper to see just what it contains; it should also be cheap to produce and lend itself to mechanised production. Above all, it should be attractive to look at and enhance the sales appeal of the pack. Self-service salesmanship aims at impulse buying, more perhaps than anything else. Self-service retailers want to show the price as well as the goods, which may require redesign of established packs; and with no shop assistant to answer questions, comparatively informative labelling may be preferred. But if its demands are more rigorous, self-service offers the packaging industry a considerable widening of its horizons. The super market, where the customer can buy under one roof all the household goods a family requires, may draw into the prepackaging field all the prerequisites of modern living—non-branded goods as well as branded, Lea Valley cabbage and continental delicatessen, nylon socks as well as toothpaste.

Business Notes

More Seasonable Markets

STOCK markets this week have assumed a more seasonable —and therefore less rosy—appearance. The spectacle of continuously rising prices and very active dealings in the dog days of mid-August was so abnormal that it could scarcely have been expected to last. And in industrials, at least, the pace since the Bank holiday had been exceptionally fast; a pause for breath-taking was evidently overdue. It has come this week, and the *Financial Times* Ordinary share index, which reached a new peak of 167.7 last Friday, had by Wednesday's close fallen back to 166.2—still, however, retaining a rise of over six full points since end-July. The gilt-edged market had begun to sag a few days earlier, and on each of the first three days of this week it eased further. This meant that the long-expected Electricity loan, having obviously gained substantially through being held back until after the Government's own operations of June and July, proved to be a little unfortunate in its detailed timing. A few weeks ago the market would have taken the issue in its stride; but, as it was, the announcement made after business hours last Friday became a factor in the further sagging of prices this week.

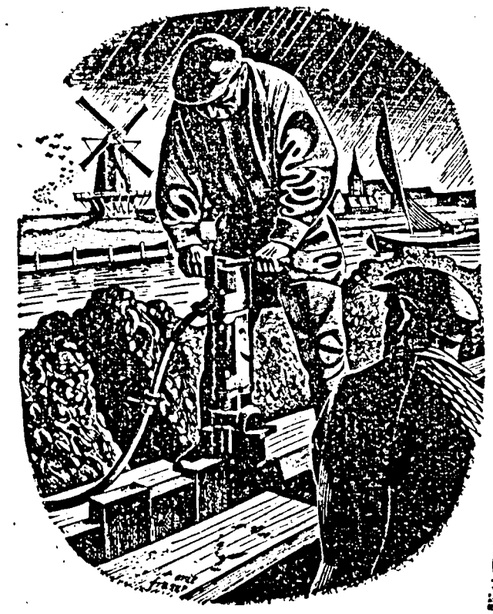
In spite of the delay, however, the BEA's borrowings this time are smaller than on any of the three previous occasions. The issue totalled £100 million, and took the form of a second tranche of 3½ per cent Guaranteed stock, 1976-79, offered at 100½, compared with the price of 99 at which the first £150 million of this stock was issued in May, 1950. Last year's borrowing amounted to £125 million, also by way of a second tranche of an existing stock—the 4½ per cent stock, 1974-1979, issued at par in April, 1953, and at 99 in April, 1952. The cutting down of the size of the issue, it is interesting to note, does not reflect any abatement of the pace of BEA demands. This year's issue is actually £4.6 million less than the amount of the Authority's temporary loans outstanding on July 31st last, whereas last year's loan exceeded the temporary borrowings (at March 31, 1953) by nearly £33 million. The change of policy may have reflected a hope that interest rates will fall still further; but, as it turned out, it helped to cushion the impact upon a somewhat uncertain market. The terms were cut very fine, for the existing tranche, having been quoted a few days previously at 101 1/16 middle, had dropped by the eve of the announcement to 101⅛, including 18s. of gross accrued interest. There was therefore no scope at all for the stags; and on Wednesday, when the issue was made, the existing stock finished at 101 3/16. It is therefore a fair presumption that a substantial slice of the stock has been taken by the

"departments" for resale as opportunity offers. There was, of course, no indication of this in the official announcement of the allotments. Applications for £250,000 or less were allotted in full, and larger applications were scaled down to 78 per cent—a slightly larger proportion than that accorded to the 4½ per cent issue last year. Upon its debut on Thursday the stock was quoted at a fractional discount, but by the close of business it had slipped to ⅛ discount in a gilt edged market that was sliding rather faster, with War Loan down ⅜ on the day, at a net price of less than 90.

Sterling Sags, and Bill Rates Rise

THIS softening of gilt edged, though partly attributable to technical factors in the gilt edged market itself, owes something to two notable developments in other financial markets. A few weeks ago the majority view in stock markets, if not also in banking circles, was that the trend of interest rates could only be downwards and that the next move in Bank rate was much more likely to be down than up. Early this month, however, many people began to have second thoughts, and the talk about an early reduction in Bank rate died down. The complacent view has now been further jolted by the action of the discount market, which last week unexpectedly cut its tender price for the week's offering of Treasury bills, so that the average discount rate at which the bills were allotted rose rather sharply. This rate, after being virtually unchanged for five weeks at around 31s. 3d. per cent, rose last Friday to 31s. 10.56d. per cent—not much less than its level of early July.

Such changes in the discount market are often no more than the technical manœuvrings of the market houses in their tactics in meeting "outside" competition, and such moves may be quickly reversed. But on this occasion the market does seem to have been responding to wider trends and to an easing of the demand for bills. The most striking of these trends is the weakening of sterling. When the intense and abnormal demand for sterling subsided after the reduction of Bank rate last May, the sterling-dollar rate slipped back from its upper limit of $2.82 and settled at around $2.81⅛. In the early days of this month it eased further, to $2.81⅛, and since then has suffered several sharper falls—carrying it to $2.81¼ by Thursday last. The rate is still comfortably above the parity of $2.80 and there is no reason to suppose that the fall is anything more than the traditional weakening that results from the payments for imports—notably of grain and cotton—at this time of the year. But it is evidence that the speculative and capital factors cannot be depended upon to run strongly and continuously in Britain's favour. The forward contracts for repurchase of dollars that were entered into last spring when money was rushing into London are now maturing; and it seems evident that these switches are not being renewed, for the premium on the forward dollar has now almost disappeared for one month contracts and is very tiny even for three months. Meanwhile, the rate for US Treasury bills in New York has risen from 0.616 per cent in early June to 0.898 per cent last Monday, the highest rate since mid-April.



Unexplained and Inexplicable

LORD KENNET, the chairman of the Capital Issues Committee, now reigns over only a shadow of his former kingdom, but it is a vexatious shadow. Two examples of issues on which the committee, as the mouthpiece of the Treasury, still does come down decisively have been before the public this week. Swears and Wells, the furriers, have been refused permission to make a free scrip issue of one new 5s. "B" ordinary share for every £1 of ordinary or "A" ordinary stock held—a one-for-four free issue. The Capital Issues Committee never states its reasons—and wisely—but the reason can be deduced. The distribution would have involved the capitalisation of £200,000 of the company's capital reserve and that would have meant using part of the £630,111 book profit which resulted from revaluing the company's freehold and long leasehold properties as at January 1st this year. The values were there; the company wanted to use them to tidy up its capital structure, but since they result from the inflation of property values official policy says they shall not be used. Instead the company has been able to capitalise only £50,000 which passes through the mesh of the official net, and the scrip issue is one "B" 5s. share for every £4 of stock held. It may take the company four years to reach its objective, but it does not stop it paying what dividend it thinks fit. It has declared an interim dividend of 7½ per cent, compared with nil last year, when a single payment of 12½ per cent was made.

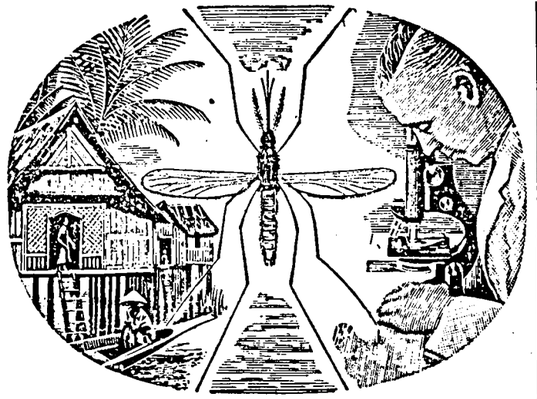
The other problem before the Capital Issues Committee is a familiar one—Mr J. Gibson Jarvie. In the course of a speech not calculated to ingratiate himself with officialdom, the chairman of United Dominions Trust discloses that his last application to raise capital was made to the CIC on July 20th, but that so far no decision has been announced. In logic the decision should be "Yes." United Dominions Trust uses its money, among other objectives, for hire purchase finance. The Board of Trade restrictions on hire purchase have gone; Treasury control ought to go too, if only because it is leaking like a sieve. The 170 companies recently formed with capitals of £50,000 or less to do hire purchase finance without Treasury control are part of the leak. Mr Jarvie mentions another—the funds that United Dominions Trust acquired by selling its shares in Ryders Discount Company. It is a sale that the trust would have considered opportune in any event. But it has contributed "something to sustain our fight against the constricting coils of the Treasury."

Data from Distillers

UNFALTERINGLY, Sir Henry Ross in his statement accompanying the full accounts of Distillers leads shareholders through the maze of accounting digits, setting them against the industrial background. He explains that the remarkable advance in trading profits from £13 million to £19.7 million, which brought in its train an increase in the ordinary dividend from 22½ to 25 per cent, was due to bigger exports of Scotch whisky and to the recovery in trade in the chemicals and plastics divisions.

Pile driving in Holland

Polishing in Sweden



Atlas-Copco puts compressed air to work for the world

Pushing back the sea is a full time job in Holland. Aiding the Dutch in their age-old battle are Atlas-Copco sheeting drivers now at work sinking piles and sheetings on the vast new Zuider Zee project. Doing a very different kind of job on the shores of the Baltic are Atlas-Copco pneumatic polishing machines. Installed on the production lines of an ultra-modern automobile plant, these and similar small hand tools are playing an important part in Sweden's growing automobile industry. As in Holland and Sweden, so in almost every part of the world—Atlas-Copco is on the job wherever compressed air is working hardest.

Atlas-Copco provides equipment for every conceivable application of compressed air. Add to this, the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to THE ATLAS DIESEL COMPANY LTD., *Beresford Avenue, Wembley, Middlesex.*

Man Against Mosquito

MALARIA has killed more men than wars have ever done. Its conquests in days gone by have played a large part in determining the pattern of civilisation. Even during the last war, its influence was felt in many theatres of operation. It often caused more casualties to Service personnel than were inflicted by the enemy. Prior to 1925, the only anti-malarial in general use was quinine. In that year the synthetic compound pamaquin was introduced, to be followed by mepacrine in 1930. Although these drugs represented a great advance in the prevention and treatment of the disease, it was not until 1944 that efforts to find a more effective and less toxic drug resulted in the discovery of 'Paludrine' in the I.C.I. research laboratories. The new drug proved supreme in the protection and treatment of all those working in malarious areas and, after being in use for some eight years, it is established in world medical practice as a vital attacking force in the fight against the disease.

In numerous countries 'Paludrine' is being used extensively by Governments, large employers of labour, the armed forces, and in countless households. In Korea, the incidence of malaria was exceptionally low among those troops of the Commonwealth Division who received the drug as a matter of routine. Furthermore, 'Paludrine' was one of the drugs carried by the successful Everest expedition. Tested in war, proved in peace, 'Paludrine' is playing a significant part in safeguarding the health of millions of people of many races and creeds. It is only one of the discoveries of world significance which have accrued from I.C.I.'s research and development programme—a programme to which the company devotes no less than £7,500,000 per year.

AIR PURIFICATION

In addition to normal air-conditioning, a vast Air Purification System makes doubly certain that the atmosphere throughout the Ediswan Lamp Factory is as clinically-clean and free of microscopic dust particles as human skill and ingenuity can contrive.

This immense plant consists of several Pumping Stations, each operated by 25 h.p. motors which deliver heat-treated, purified air via distributor ducts throughout the entire factory. Each Pumping Station circulates no less than 159,000 cubic feet (5½ tons) of air per minute! The temperature of the circulated air is precisely stabilised by thermostatic control.

This is another example of the strict control and technical care insisted upon at every stage in the manufacture of Royal "Ediswan" Lamps. Nothing is left to chance—careful testing and checking of every lamp ensures that each conforms to the highest standard of requirement.

Total exports of whisky in 1953 at 13.2 million proof gallons were the highest ever reached and releases to the home trade of 4.35 million gallons were the highest since 1947. Since the beginning of the year, when the arrangements between the Government and the trade association to control the home trade came to an end, more whisky has been released for the home market. More whisky has also been allocated for export in 1954 than in 1953, but demand is not yet satisfied. A large proportion of the stocks of whisky held by the trade are still not fully matured, but in the past year Distillers acquired "certain substantial stocks" (including partly matured stocks) which will enable the company to increase the quantity available for sale in the near future. These acquisitions are reflected in the increase in the stocks held by the group from £55 million to over £62 million. While the heart of the business is as sound as ever, its other interests represented by the industrial divisions report "steady recovery and progress."

ASSETS AND LIABILITIES

	Mar. 31, 1953	Mar. 31, 1954
	£	£
Fixed assets, *less* depreciation	16,034,964	17,197,650
Trade investments	7,471,603	7,244,652
Net current assets	70,844,965	76,000,090
Stocks	55,120,669	62,339,037
Quoted investments	2,030,111	419,137
Cash and Tax Reserve Certificates	13,085,743	14,578,700
Debenture and loan stocks	18,224,250	16,598,732
Capital reserves	7,441,011	9,129,775
Revenue Reserves	29,296,331	33,301,863
Ordinary capital	22,916,507	23,375,761

The supply of raw materials has been both freer and cheaper and on occasion Distillers has been able to reduce prices, "with a beneficial effect on sales and earnings." The recovery in the chemicals division is symbolised by the promise of a maiden dividend from British Petroleum Chemicals. Supported by Sir Henry's comment that the "favourable trend has been fully maintained during the current year," Distillers' balance sheet has acquired a brighter look.

Among the most important of the balance sheet changes is the increase in the ordinary capital and in capital reserves. Most of this represents the issue of 2 million 4s. ordinary shares at 17s. each as part of the consideration for the acquisition of the entire share capital of Train and McIntyre. The balance of the increase was the result of the conversion of a further part (amounting to £264,525) of the 1964 5 per cent unsecured loan stock into ordinary stock. Distillers has also repaid another £1 million of the 3½ per cent loan stock. The repayment of its loan stocks is a continuing liability for the company until 1960. Hence £1 million has to be appropriated from profits each year to balance the repayments. The burden is lightened to the extent that 1964 loan stock is converted, and when Sir Henry reminds holders of that stock that the terms of conversion become less favourable after November, he doubtless has the interest of the company as well as of the stockholders in mind.

Trade Deficit Halved

A BIG jump in British exports with no increase in imports almost halved the gross visible trade deficit last month. July had 27 working days, three more than June and the jump of £30 million to £247.0 million fob in the value of exports matched that increase in the working month. Last month's exports were 10 per cent above the monthly average for the second quarter and five per cent higher than in July last year. Re-exports were also higher at £9.3 million. Despite the longer month, the value of imports fell slightly to £289.8 million cif compared with £291.0 million in June, though the total was four per cent more than the monthly average for the first half of this year. The trade deficit fell to £33.5 million, against £64.5 million in June, bringing the average deficit for the first seven months of the year down to £44.0 million a month, compared with £61.5 million in the same period of last year.

UNITED KINGDOM TRADE
(£ million—monthly averages)

	Imports c.i.f.	Exports f.o.b.	Re-exports f.o.b.	Trade deficit
1953:—

2nd "	12·5	12·1	24·7
July*	12·9	11·3	24·1

* Provisional.

Exports to North America rose slightly from £23.5 million to £24.1 million. Shipments to Canada accounted for this increase, being £600,000 higher at £11.3 million, while shipments to the United States were almost unchanged at £12.9 million. Though exports to North America have recovered from the worst effects of the recession there, much ground has still to be made up. The July total was nearly 20 per cent below the level of a year ago, shipments to Canada being 24 per cent lower and those to the United States being 15 per cent lower.

More Steel Offers

NOT since the process of selling the nationalised steel companies to the public began last October has the atmosphere looked as favourable as it does now. Of the four issues that have been offered, Lancashire Steel ordinary alone remains fractionally below the offer price. The most recent offer, Stewarts and Lloyds, commands a

premium of nearly 3s. per share over the offer price of 35s. Opinion in the city, which has long been divided as to the wisdom of rushing the sales, has now hardened. Most people, including Iron and Steel Holding and Realisation Agency, would welcome another public offer in the present atmosphere of active markets. To make the arrangements in August is proving most difficult. Important people both

	Issue Price	Lowest Mark	Price Aug. 19

Stewarts & Lloyds Ord. £1.....	35/-	34/6	37/9½*

* 22/9½ in the 20s paid form.

in the financial institutions that would have to underwrite and support the offer and in the companies themselves are away.

It had been widely expected that the ordinary shares of Dorman Long and Company would be the subject of the Iron and Steel Holding and Realisation Agency's next offer to the public. That no longer looks likely because of the difficulty of assessing with prospectus accuracy the company's heavy development programme. Active preparations for a public offer are going ahead with the Whitehead Iron and Steel Company, John Summers and Sons, and Colvilles, but no decision has yet been taken as to which will be the subject of the first offer.

Free Scrip from Cunard

PARSIMONY, not mere conservatism, has often been the critics' epithet for the dividend policies of the shipping companies. Massive asset values and substantial, though fluctuating, earnings give an edge to their criticisms. The critics pressed their complaints at the last annual general meeting of Cunard Steamship Company, when they were asked to approve the mere repetition of the 16 per cent dividend. After the meeting a dissatisfied stockholder, Mr Lionel Childs, decided to register a private company designed to "exert all legitimate pressure" on the directors of Cunard to declare a 100 per cent free scrip issue and an increased dividend.

Whether it be pressure of critics, or force of circumstance, shipping boards do move in their own good time. The directors of Cunard have now announced a free scrip issue of two new £1 ordinary shares for every three held. The new free scrip issue will require the capitalisation of £5,198,910 from reserves. This figure looks substantial when set against the company's issued ordinary capital of £7,798,346, but it is dwarfed by the £33,898,540 in "capital, ship replacement, general and contingencies reserves," to say nothing of the £1,566,000 in the share premium account and the £1,238,910 balance of profit carried forward. Admittedly, the company at the end of last year had an outstanding liability of nearly £18 million on contracts for new ships but it also had over £35 million in liquid assets.

A scrip issue is nothing but a book-keeping transaction, tidying up the balance sheet, unless it also implies more liberal dividends. On the matter of dividends the Cunard directors are in the fashion in being studiously non-commital. They say: "the proposed capitalisation carries no implication as to the rates of the future dividend which will continue to be determined by the board in the light of conditions prevailing at the time." The new shares will rank only for the final dividend and not for any further interim declared in respect of the current year. An interim of 2½ per cent has already been paid and the reference to the further interim harks back to the chairman's statement that "the board will assess the situation again at their October meeting this year." Investors have grown accustomed to shadow-boxing by directors in their statements on free scrip issues and dividends and the welcome the stock market gave the Cunard announcement was unabashed; the £1 ordinary stock units were marked up from 44s. to 48s., taking other shipping shares up with them.

Peak Output of Sulphuric Acid

CONSUMPTION of sulphuric acid is as good a guide to the tempo of British industry as any of the production indices. From the record average of 170,000 tons a month in the last quarter of 1953, consumption of sulphuric acid rose to a new peak of 176,000 tons a month in the first quarter of this year, before declining seasonally to 167,000 tons a month in the second quarter. Production of acid in the first half of the year reached a record total of 1,040,000 tons, and for the whole of the year should comfortably exceed 2 million tons, compared with 1,875,000 in 1953.

The extent of the switch from crude sulphur to pyrites for acid production in Britain in recent years is remarkable. In 1950, before the sulphur shortage enforced this change-over, sulphur was used to produce 57 per cent of the acid and pyrites was used for 15 per cent. By the first half of this year sulphur was used for only 35 per cent and pyrites for as much as 32 per cent. The other main sources of sulphur for acid manufacture are indigenous anhydrite, and sulphur recovered from zinc concentrates and spent oxide. Two more pyrites burning plants, having a combined annual capacity of about 70,000 tons of acid, will come into operation later this year. Further expansion will come from anhydrite plants.

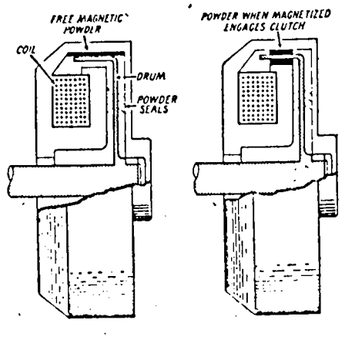
By the end of this year the capacity of Imperial Chemical Industries' anhydrite plant at Billingham, Co. Durham, should be raised by 75,000 tons to 175,000 tons a year. Solway Chemicals, an associate of Marchon Products, should have a plant of about 75,000 tons annual capacity in operation in Cumberland early next year. United Sulphuric Acid Corporation, financed jointly by major users of acid in this country, is building a plant of 150,000 tons annual capacity at Widnes, Lancs, which is due to come into operation by about the middle of 1955. Although production of acid from new anhydrite and pyrites plants is more costly than from American sulphur, their use has been officially encouraged to lessen Britain's dependence upon American sulphur. That is why imports of sulphur for acid-making have been restricted by licence to those requirements that cannot be met from other materials—with the result that there is now some spare capacity among the sulphur-burning plants. But there are signs that the industry itself is anxious to end this questionable form of protection when the new plants are established. Well over three-quarters of the total production of sulphuric acid comes from firms which use two or more of the three raw materials—sulphur, anhydrite, pyrites—and they might well prefer to have complete freedom to operate their plants in the way that suits them best at any particular time.

Brazil Dodges the Issue

BRAZIL has taken another nibble at its chronic problem of maintaining exports in the face of continuing inflation. Not for the first time, the complaint may be aggravated rather than relieved. The system of export bonuses has been extended in a way that is equivalent to a devaluation (for exporters only) of 20 to 30 per cent. Exporters of coffee are still to be paid a bonus of 5 cruzeiros, and other exporters a bonus of 10 cruzeiros, on the official rate of 18 cruzeiros to the dollar, but only 80 per cent of the value of exports will rank for this special treatment. The remaining 20 per cent will be apparently transferable at the free market rate, at present over 60 cruzeiros to the dollar. This free rate has hitherto been used solely for non-trade transactions—primarily for payments on invisible account and financial settlements. As one-fifth of export proceeds will now be convertible at the free rate, the effective rate for exports seems to be about 31 cruzeiros to the dollar for coffee and 35 cruzeiros to the dollar for other products.

For coffee, Brazil's most important export crop, the devaluation has almost certainly been overdone. The drop in demand for Brazilian coffee was not only due to resistance to the high minimum price of 87 US cents a lb fob Santos—now effectively reduced because the value of the cruzeiro is lower—it was also seasonal. When buyers re-enter the market, Brazilian export prices are unlikely to be as low as the full extent of the devaluation, and internal prices may rise still further. It would have been better to scrap the minimum than dodge round it. For cotton, the second most important crop, there is no justification at all for devaluation. This season Brazil has priced its cotton competitively, and exports have recovered sharply. The export price has not changed—there is no reason why it should. Sellers will therefore reap the entire gain, thus adding more fuel to the inflation.

The new regulations have no direct effect on British exporters. At present Brazil is using nearly all its scanty earnings of sterling to pay off the arrears of commercial debt and to maintain its imports of oil; recently some releases of sterling were made to Brazilian importers through the unique system of currency auctions—which is unfortunately to be maintained—but the amounts were quite small and the premiums paid phenomenally high. It is difficult to see how any secure basis for the restoration of Anglo-Brazilian trade can be laid until Brazil stops nibbling away at its problem by discriminatory exchange control and bites at inflation at the root.



Oil in the Steel Industry

NO other industry inside Britain since the war has gone so far as the steel industry in converting from coal to oil. The shift has made it the largest inland consumer of fuel oil, but its total demand for fuel and power is so huge that it ranks only after the electricity and gas industries

Automatic Transmission for the Small Car?

AUTOMATIC transmission is on its way to becoming universal on American cars. All the various designs offered by American manufacturers embody some form of fluid flywheel, based on the Vulcan-Föttinger patents, and first applied to car transmission by Daimlers in Britain. Unfortunately, the considerable power losses involved in the hydraulic stage of all such transmissions and the extra weight and cost involved, make it uneconomic to apply any such mechanism to small European cars. But automatic or semi-automatic transmission for such cars may have been brought nearer by a "magnetic particle clutch," developed first by the Eaton Manufacturing Co., of Cleveland, Ohio, and in its later stages by S. Smith and Son (England) Ltd., who have patent rights for all countries except North America.

The drawing shows the basic principles of the clutch. The space between the driving and the driven members of the clutch contains a powder consisting

of ferro-magnetic particles and a "dry lubricant" such as french chalk or graphite. The driving member embodies a solenoid or electro-magnet. When an electric current, of the order of 3 amps on a 12 volt system, is passed through this solenoid a magnetic field is created; the magnetic particles arrange themselves in the lines of this field so as to form a link between the driving and driven members of the clutch; and a solid drive is established comparable with that given by an ordinary friction clutch.

This clutch can be embodied in cars without, initially, any major design changes. A simple magnetic clutch would enable the clutch pedal to be abolished, and the electrical actuation of the clutch to be accomplished by switches controlled by the ordinary gear lever. Thus—provided the synchromesh mechanism of the gear box is robust enough for the heavier duty thrown on it—semi-automatic transmission would be achieved.

Further developments, however, can be achieved by using *two* such magnetic clutches, each driving a different train of gears in a redesigned gear box. There seems to be no obstacle to the development of an automatic transmission that would give the same ease of control as the most advanced type of American mechanism, but without the extra weight, or the loss of power and consequent increased fuel consumption, which the latter involves.

as a consumer of coal, directly and as hard coke. It uses more than a million tons of fuel oil and buys nearly 21 million tons of coal and 3½ million tons of coke every year. In its current statistical bulletin, the British Iron and Steel Federation considers the scope for a further shift to oil, and concludes that this is fairly large—but dependent upon the future trends of price of the two fuels.

Of the steel industry's total coal purchases more than 14 million tons go into the industry's coke ovens. There is at present no possibility of replacing any of this coking coal by oil; coke is required in the blast furnace as a reducing agent as well as a fuel. Of the other six million tons of coal, about 3 million tons is used in open-hearth steel-making, where oil has marked technical advantages; there would be less chance of replacing the remainder by oil. But some opportunity for extending the use of oil may lie in its further substitution for coke-oven gas in the steel furnaces, and the sale of the gas thus freed to town gas systems.

Steelworks get fairly considerable rebates for quantity on the published price of about £9 15s. a ton for fuel oil (though not of the order that has been suggested for the big new power station at Marchwood, so that few works consider using oil to burn under boilers). Coal prices have risen much more than those of fuel oil since before the war, and it has been this change in relative prices that has made the industry's shift to oil practicable. Even so, at the prices the steel industry pays for fuel oil, it is still about twice as expensive, ton for ton, as coal, and the advantage of some 50 per cent in calorific value does not wholly wipe out this difference in price. There seems little doubt that the trend of coal prices, even given the present pricing policies of the National Coal Board, is upward; for a few years, fuel oil prices may soften, though their medium-term trend is a question over which there is some difference of view in the oil industry. Further substitution of use of oil in steel furnaces that do not yet use it, however, may depend considerably upon yet another price—the price at which the coke-oven gas it might replace could be sold to the gas industry. And that price for coke-oven gas, which derives from a formula set in the days when the gas industry took it off the steelworks' hands as a waste product, now seems to the steelmakers to be too low.

Fifty-Eighth Variety

A FIFTY-EIGHTH variety from H. J. Heinz, Limited—appetising but non-comestible—will be on sale to the public at the beginning of November. This line is of 4½ per cent redeemable cumulative preference shares of £1 each, redeemable finally at 21s. in 1990. If markets are then firm, some shares will be available to the public at slightly over 20s. per share—a well covered 4½ per cent less than redemption price. This will be the first opportunity for the general investing public to take even a prior charge interest in the English branch of H. J. Heinz. Some years ago Helbert, Wagg and Co. placed privately without a quotation £1½ million of 4 per cent redeemable preference shares, offering as a sweetener 10 per cent of the equity of the company to the allottees. The remaining 90 per cent of the equity, which has now grown to £2,925,000 in £1 ordinary shares, is held by the parent company, H. J. Heinz Inc.

Now the time has come for the English company to raise fresh money. It has been using a Ministry of Supply factory to which the Ministry has the right of re-entry, and for greater security of tenure the company has acquired a site near Wigan on which it will build its extensions. To meet the cost, £1½ million of new 4½ per cent redeemable preference capital is being placed on September 3rd. It is proposed to raise the rate of dividend on the existing 4 per cent preference shares to 4½ per cent and to postpone the sinking fund due to begin in 1955 until 1961. The whole £3 million of preference capital will thus be merged into a single class for which a Stock Exchange quotation will be sought.

This rearrangement invites the question of a possible quotation for Heinz ordinary shares. They would be an attractive investment, for they pay 28 per cent and the accounts show no break in the company's progress. But a marketing of these shares is still far off; the parent company is not ready to part with any of its 90 per cent holding and the British shareholders are not anxious to part with as much of their 10 per cent holding as would be necessary to start a market.

Hopes from Greece

A STRONG delegation from the Council of Foreign bondholders is expected to go to the Greek debt discussions that begin in Paris on September 20th. It is also hoped Hambros Bank will send at least an observer, since Hambros are paying agents for the Greek loans in London and will presumably also have to negotiate separately a settlement on the bonds of the National Mortgage Bank of Greece. Representatives of the other main creditors of Greece—America and France—will also be there, and Mr Eugene Black, chairman of the World Bank, is being kept fully informed of the progress of the discussions; the bondholders' strong card is that Greece desires to borrow from the World Bank and the bank will naturally be interested in the country's creditworthiness.

The delicate manœuvring which has paved the way to a meeting between Greece and its long-term debtors has given no inkling of what Greece intends to offer. The summons from Greece to the bondholders' representatives to go to Athens on July 26th implies that Greece intends an offer of some sort, and the insistence of the bondholders' representatives that the meeting should take place in one of the creditor countries equally implies that they wish the subject now to be treated seriously. Even when allowance is made for its poverty, Greece has a deplorable record as a debtor. Not only have the foreign loans amounting to approximately £80 million (excluding arrears of interest) been in total default since early in the war, but even before the war Greece was for many years paying substantially less than the contractual interest on its bonds. The scale was 43 per cent of the bondholders' entitlement when Greece was invaded and payments ceased in 1941. So far the Greek government has given no hint of what sum it considers itself able to pay. But economic conditions have improved sub-

new ideas in ballet

Last year Serge Lifar presented 'Cinema' in an interesting and original programme. The theme centres round a young dancer in Hollywood, and the illustration shows Vyroubova with Lifar himself as Chaplin.

Brighter Prospects in the Factory

and the BALANCE OF POWER

BRITAIN'S FACTORIES are using more electricity. Individual electric drives for machines, electrically driven blowers, compressors and pumps, electrically controlled continuous processes, electric handling equipment . . . wherever you look, electricity is turning the wheels of industry.

Greater use of electricity in factories means greater productivity, cleanliness, efficiency and reliability—more contented workers. It all adds up to increased efficiency. How does it affect other consumers of electricity? It's very much to their advantage. Why?

It's a matter of balance. As more electricity is used in more ways, the different loads — occurring, in the main, at different times of the day— keep the generating plant more fully employed. And continuous full output from the power stations helps to reduce the cost of electricity.

BRITISH ELECTRICITY

SIX YEARS' PROGRESS — 40 NEW POWER STATIONS

50% MORE POWER

Appreciating human needs

The community depends upon steel. It is thus a national matter that the industry should prosper in order to provide stable conditions of employment and a large measure of social security for the many workers for whose welfare and health it is directly responsible.

The United Steel company has for long concerned itself with these problems. As far back as 1882 a fund was founded at one of the oldest producing units to make provision for retired employees. More recently contributory pensions schemes were established to cover every worker in the Company's employ.

At the same time the Company has initiated many reforms based upon industrial preventative and curative hygiene, with establishments of medical officers, nursing administration and adequate equipment well beyond the terms of national legislation.

stantially and the burden of transfer on the country's foreign exchange resources from any agreement will be approximately halved because about half the external bonds are already in Greek ownership.

The most interesting of Greece's sterling loans is the 6 per cent Public Works issue of 1931 for that carries a right (for which a strong fight will be made) to be paid in a variety of currencies at attractive exchange rates. The most valuable option at the moment being for payment in Swiss francs at 25.2215 francs to the £. This should make any payment on that loan worth a little more than double its direct sterling value. In general, investors should not pitch their hopes high, for no one supposes that Greece will resume full service on its loans; the 6 per cent bonds of 1931 stand at about £42, while other 6 per cent Greek bonds are standing in the region of £25.

Frozen Foods

LAST year British housewives may have spent as much as £5 million on quick frozen foods. This is less than a halfpenny in every pound of total expenditure on food; but it still marks a major expansion in this little industry. In 1951 some 8,500 tons of fruit, vegetables, and fish were quick frozen—principally peas, beans, strawberries, and some white fish. By last year the total "pack" had grown to nearly 15,000 tons. Limited amounts of poultry, game, and sausages are now being marketed in the quick frozen form, and experiments are also being made in selling the quick frozen concentrated fruit juices that have been so successful in the United States. Imports of frozen food have risen too, following the removal of import restrictions last year, but shipments have not yet regained the level they reached in 1947, when home production was tiny. The crop this year has been good, although bad weather has disorganised the packing plans of most processors. But the industry is confident that output and sales this year will beat those of 1953.

As production has grown over the last two or three years, longer runs at the factory have enabled prices of frozen foods to be kept more or less steady despite increases in some processing costs. But the price of these foods is still the main brake on expansion of sales, and the seasonal nature of the industry limits scope for cost reduction. Processors can widen the range of their products, so as to stagger freezing throughout the picking months from end-May to early October, but the crop must still be frozen within an hour or so of gathering, and this involves heavy investment in freezing equipment to handle the peak loads. Some off-season work is to be found in repacking frozen fruit imported in bulk. Special handling and storage facilities, which now allow nation-wide distribution, add further to retail prices. More than 12,000 shops and stores are equipped with "zero cabinets," but very few households boast separate home freezers or large enough ice compartments in their refrigerators to store much frozen food, and most packs have therefore to be used, or at least opened, on the day of purchase. The main advantage to the housewife is the quality of the food when it comes to be eaten and the fact that nothing is wasted; both features have also attracted many catering establishments. A pound of packed frozen vegetables, ready to be cooked, is roughly equivalent to between 1½ and 1¾ lb of shop vegetables. With fish, which have recently been frozen in special trawlers, the wastage saved averages about 40 per cent. But quick freezers have apparently to beware of doing too much of the housewife's job. Quick frozen cooked food, for instance, has not been selling at all well.

Coarse Grains Rising

IN contrast to a quiet market in wheat, trading in barley and maize has been lively this month, and the London futures market in coarse grains has had its first spell of activity since it reopened in January. Prices of coarse grains, which have climbed fairly steadily since March, have risen by another £1 to £2 a ton this month. Futures prices are also higher, though still at a discount compared with the shipment market. Bad weather is responsible for the improved demand for imported barley. This has delayed the harvest in Britain and Northern Europe by a month, and as the compounders of feeding-stuffs—like other sections of the grain trade—are still carrying minimum stocks, they have been obliged to buy more from abroad. Canadian feed barley has risen to about £25 a ton and Iraqi barley to over £21 a ton cif for September shipment. The squeeze on supplies of barley for this country was delayed a little by sales from government stocks, but these are now exhausted. The improved demand for maize results from the delay in shipments from Argentina; the ports there are congested and some maize has been too moist to be shipped. Argentina claims to have sold almost all its exportable surplus; but less than one-quarter of it appears to have been shipped so far. Sellers have had to pay penalties on their contracts, and some orders have had to be diverted to the United States, which is almost the only alternative source of maize at present.

Maize has risen to about £27 a ton for September shipment; it is relatively dearer than any other feeding-stuff. The rise is due less to the increased demand for American maize than to the latest official report on the American crop, which was estimated at 2,824 million bushels on August 1st. This was about 200 million bushels lower than private estimates, and it compares with an estimate of 3,311 million bushels on July 1st and with an actual crop of 3,177 million last year. The advance in coarse grain prices, particularly of barley, has probably been restrained to some extent by cheap offers of American feed wheat at less than £20 a ton cif. Its use in feed cake is limited, however, as is also the use of American red garlicky wheat; this wheat is still rather cheap at less than £22 a ton cif and is being bought for milling as well as for feed purposes.

This season prices of home-produced and imported coarse grains, and of wheat also, will directly compete with each other for the first time in fourteen years. Last season the Ministry of Food was the residual buyer of home grains that did not fetch the guaranteed price, and later sold its stock at prices based on the world market. This season a deficiency payments scheme begins to operate; the farmer sells at the market price and is afterwards reimbursed to the extent that the average market price falls short of the guaranteed price.

SHORTER NOTES

Steel output in July was affected by the coke-oven strike at Margam and by certain mechanical failures at a works on the North-east coast. These interruptions, plus the normal incidence of holidays, kept output down to 263,000 ingot tons of steel a week, which compares with 371,000 ingot tons a week in June and with 276,000 tons a week in July, 1953. Blast furnace output suffered no abnormal interruptions; output was 211,000 tons a week, a record for the month.

★

The managers of Orthodox Unit Trust have announced an offer for sale of 200,000 units at 10s. 8d. each, to yield £4 16s. 9d. per cent on the basis of current prices and dividends. This group has pursued an active selling policy but the present offer is an occasion on which it has taken advantage of the removal of the ban on issues by unit trusts of over £50,000, by making the equivalent of a public issue.

★

The British Government has signed a double taxation agreement, similar to those already in force with other European countries, with the Federal Government of Germany.

★

The Treasury has announced the return to the international monetary fund of $112 million which were drawn from the fund against payment in sterling in the period 1947/8.

★

The Admiralty has dissolved its committee on the use of welding in shipbuilding and has replaced this by a new advisory committee on structural steel. The ship welding committee, which was formed early in 1943, carried out extensive experiments with welded ships, following the large number of failures that occurred in welded ships built, mainly in America, in wartime, and produced a number of reports upon the technique. Its conclusions pointed to the importance of the "notch toughness" of the steel used, a quality that had required relatively little attention in shipbuilding steel when riveted construction was used. The new committee has been set up to conduct research into the qualitities required in shipbuilding steels today, and possibly to set standards of performance for these steels.

★

Higher earnings and increased sales for the first half of 1954 are announced by the International Nickel Company of Canada. Inventories have declined from $112.4 million on December 31st to $109.6 million on June 30th.

Millions of US Dollars

	1953 1st half	1953 2nd half	1954 1st half
Net sales	176·1	162·5	178·2
Net earnings	29·2	24·5	32·6
Earnings per common share	$ 1·93	$ 1·61	$ 2·16

The dividend rate this year has been held steady at 50 cents per quarter.

★

Ind Coope and Allsopp has made arrangements to buy for cash the whole of the share capital of Trouncer and Company, comprising 38,000 6 per cent preference shares and 40,000 £1 ordinary shares. Trouncer, a private company, has a brewery in Shrewsbury and controls 63 licensed premises. It will continue to operate as a separate trading concern, brewing its own draught beers.

Company Notes

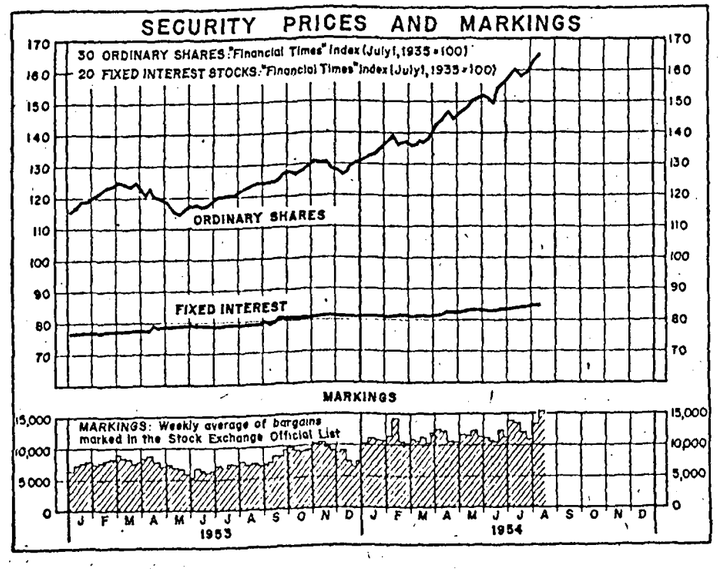
TOOTAL. The ordinary dividend of 10 per cent on a capital of £3,200,000 by Tootal for the year to June 30th was no surprise to investors, for that rate had been forecast when the company made its three for one free scrip issue last February. The dividend is equivalent to a rate of 40 per cent on the original capital of £800,000, on which a dividend of 25 per cent was paid in 1952-53. Nevertheless, after the announcement the £1 ordinary shares lost 1s. 9d. to 36s. 3d. in a weak market for textile shares; at this price the shares offer a yield of about 5½ per cent.

The company has a well established position in the textile industry and has on occasion been a pioneer, as it was in crease resisting processes and in the move among producers to sell direct to the retail trade, but on this occasion the company does not appear to have recovered from recession as fast as other cotton spinning and manufacturing groups. The preliminary report shows that gross profits before tax have risen from £868,382 to £1,114,528 and net profits after tax from £540,676 to £713,024. But a footnote explains that the net profit of £713,024 includes £207,187 clawed back from a guarantee relating to losses in earlier years by subsidiaries. If this sum is excluded the net surplus comes down to £505,837, while the previous year's net profit of £540,676 was struck after charging a loss of £189,722 made by subsidiaries. It seems that this loss represented a seasonal fluctuation, which the chairman then described as "neither unusual nor disturbing," and that it showed up so prominently in the accounts because 1952-53 was the financial year in which the structure of the company and its subsidiaries was re-organised. It is to be hoped that the chairman will explain the significance of this £207,187 in the full accounts.

INTERNATIONAL TEA. The end of rationing has forced the grocers to refurbish their ideas, and to face far more competitive conditions. Their methods of stock control have now to be tied to the will of the consumer—and not to the rules of the ration book. Some time ago, International Tea began to make the adjustment. It has tried the experiment of self-service stores. It reduced its stocks, giving itself room to manœuvre well in advance of the day when rationing finally came to an end. At the same time its profit margins have had to absorb increases in costs, particularly in wages. Hence, it may be that the tiny increase in its trading profits (from £1,735,834 to £1,755,352) in the year to May 1st masks a much more substantial increase in turnover, as it did in 1952-53.

The slight increase in trading profits has been followed by an even more meagre advance in net profits. They have risen by only £6,601 to £563,992. With such an infinitesimal difference in earnings, it is not surprising that the latest appropriation account is almost the exact replica of its immediate predecessor. In the latest year £128,319 has been retained by subsidiaries, compared with £128,593, and the same appropriation of £200,000 has been made to the parent company's general reserve; only £667 has been added to the parent company's carry forward. And, of course, the ordinary dividend has been left unchanged at 20 per cent. The only difference is that what was in the previous year a bonus payment of 4 per cent has now been consolidated into the final dividend. Though the full accounts may reveal significant changes in the balance sheet or in trading, the company's profit and loss account looks as unexciting as the yield of £4 11s. per cent on the 5s. ordinary stock units at the current price of 22s.

★



PINCHIN, JOHNSON. The full accounts of Pinchin, Johnson set out in some detail the steps that the company has taken along the road to recovery. That analysis has a wider significance than the mere recording of the progress of one paint company, for it reflects the experience of the industry as a whole after the 1952-53 recession. For the ordinary shareholder in Pinchin, Johnson and Associates the trading year to March 31st had significance, for the directors marked their confidence by restoring the dividend to its old level of 25 per cent; in 1952-53 it was cut to 20 per cent.

The company began its trading year—as did many other paint manufacturers—with sales still declining. Demand did not begin to improve until last summer. Sales then continued to expand so that by the end of the financial year in March the chairman, Mr G. R. T. Taylor, was able to report that the volume and value of sales by the parent company over the whole year were both above those of 1952-53. The profits of the subsidiaries also increased, though some of the overseas companies still found trading difficult. The company was not able to achieve any material reduction in costs; lower prices for raw materials were offset by increases elsewhere and profit margins were only fractionally higher than in 1952-53.

But lower prices helped to reduce the amount of working capital locked up in stocks. The book value of the group's stocks was reduced by nearly £1.2 million to £4 million, a reduction that was partly also due to a physical decline justified by the fact that raw materials had become more freely available. As a result liquidity has improved and the group's cash balances cover outstanding capital commitments of £700,000 by an ample margin. The size of these commitments is as much a sign of confidence in the future as the directors' comment that the improvement in sales continued in the early months of the current trading year. After the publication of the full report the 10s. ordinary shares put on 1s. to 40s., to yield 6¼ per cent.

	Years to Mar. 31, 1953	1954

10s. ordinary share at 40s. yields £6 5s. per cent.

LONDON STOCK EXCHANGE

Next Account begins: August 25th
Next Contango Day: August 25th
Next Settlement Day: August 31st

THE rise in stock market values was checked this week. The particularly heavy settlement which passed off satisfactorily may have contributed to the hesitation. The *Financial Times* ordinary share index, having climbed to the new peak of 167.7 just before the weekend, had fallen back to 166.2 by the close on Wednesday. Prices in the gilt-edged market drifted lower; this was due partly to technical factors but some selling pressure in the irredeemables developed on Thursday. By contrast Dominion and Colonial loans remained reasonably firm in a quiet market. The new Walsall loan gradually weakened to stand finally at its issue price. The new Electricity loan was quoted at ½ dis to par when dealings began on Thursday. In the banking section, Bank of Montreal put on ⅝ to 17½ on the news of the "rights" issue and then reacted sharply to 17. Foreign bonds were marked down quite sharply immediately after the weekend and subsequently the market remained quiet with prices slightly sagging.

Losses in the industrial market were quite numerous but were mostly small. The worst sufferers were the store shares, notably "Gussies," Marks and Spencer and Harrods. Motor shares—particularly Jaguar and Coventry Radiator on the denial of reports that British Motor might make a bid for the shares—were dull and paper and cinema shares also made some notable losses. The general dullness in the market was broken by the advances recorded in shipping shares after the announcement of the Cunard free scrip issue and by the firmness of tobacco shares (following the absorption of a line of shares). Scattered selling led to losses in the oil market and by the close on Wednesday Anglo-Iranian had fallen to 15½. Tea shares remained firm but rubber shares were inclined to sag. Kaffirs reacted immediately after the weekend, then rallied on Tuesday under the influence of Continental buying of the OFS issues; later on, however, the market "boiled over" and a long list of losses was reported.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany on July-December, 1948=100. (2) Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only.

Financial Statistics

EXCHEQUER RETURNS

For the week ended August 14th there was an "above-line" surplus (after allowing for Sinking Funds) of £25,966,000 compared with a surplus of £26,392,000 in the previous week and a deficit of £31,562,000 in the corresponding period of last year. This reduced the cumulative deficit to £71,406,000 (£153,586,000 in 1953-54). Net expenditure "below-line" absorbed £2,606,000 bringing the total cumulative deficit to £231,712,000 (£337,985,000 in 1953-54).

THE MONEY MARKET

THE market reduced its bid by 2d. to £99 12s. per cent, for the £250 million of bills on offer at last Friday's Treasury bill tender. This represented a rise of ½ in the rate; rates on commercial bills were adjusted correspondingly. Total applications at the tender fell by £10 million to £387.5 million and as the offer was also up by £10 million the market's allotment rose from 46 to 50 per cent, despite the fall in its bid. At yesterday's tender the offer was increased further to £260 million.

Lombard Street has had a generally comfortable week. In the period covered by the Bank return official assistance was needed by the market only on Friday last, and then it assumed only small proportions. The banks were good buyers of bills during the week; after the Treasury bill tender of Friday last they secured November maturities at 1⅛ per cent, but the abundant supplies of credit in the ensuing week induced them to buy some October maturities at the old rate of 1⅛ per cent.

On Thursday of this week the price of gold at the fixing rose sharply from 249s. 0½d. to 249s. 3d., in sympathy with the weakening of the sterling-dollar exchange rate.

The Bank return shows a further post-holiday outflow of notes of £25 million. This has permitted a reduction of £50 million in the fiduciary issue, bringing it down to £1,700 million.

THE DISTILLERS COMPANY LIMITED

SATISFACTORY RECOVERY AND PROGRESS

YEAR OF NOTABLE ACHIEVEMENT FOR SCOTCH WHISKY INDUSTRY

NEW HIGH LEVEL OF EXPORT SALES

MARKED IMPROVEMENT IN INDUSTRIAL SECTION

SIR HENRY J. ROSS ON MAINTENANCE OF FAVOURABLE TREND

The seventy-seventh annual general meeting of The Distillers Company Limited will be held in the North British Station Hotel, Edinburgh, on Friday, September 17, 1954.

The following is the statement by the chairman, Sir Henry J. Ross, which on this occasion has been circulated with the report by the directors, and accounts, for the year ended March 31, 1954:

As usual, I propose to preface my statement with a reference to changes in the constitution of the board which have already taken place or which are imminent.

In the course of the year, two appointments to the board were made—Mr H. M. Braid, managing director of John Walker and Sons Limited, and Dr F. Roffey, Controller of our Research and Development Department. Both these gentlemen have had a wide experience in their respective spheres, and will make a valuable contribution to our board.

Sir Michael F. Kroyer-Kielberg, who has been a member of our board since 1930, proposes to retire after the annual general meeting. Whilst fully appreciating his reasons for retirement, I should like to record on behalf of all my colleagues and myself, our most grateful acknowledgment of the services he has rendered to us over many years, during which time his help and wise counsel have always been freely given.

I have also much pleasure in conveying your congratulations and those of his colleagues to Sir Graham Hayman who was deservedly awarded the honour of knighthood by Her Majesty in the New Year Honours List. This recognition of his outstanding ability has given great pleasure to us all.

THE ACCOUNTS

As you will see from the accounts, the trading profit of the Group for the year to March 31, 1954, amounted to £19,717,540 compared with £13,030,747 for the previous year. Although most sections of the company's business contributed to this result, the improvement was largely due to the greater volume of Scotch whisky which it was possible to export during the year and to the marked recovery by our Chemical and Plastics Divisions. I shall refer to these in greater detail later. After charging depreciation and interest on loans, the net profit was £17,632,289 against £11,059,297. Taxation provisions required £9,805,472 and of the balance, £510,268 belongs to other participants in certain subsidiaries.

The Distillers Company's share is accordingly £7,316,549 compared with £4,101,072 last year.

The balance sheet of the company on this occasion is not comparable with that of the previous year, because we have absorbed the assets and liabilities of certain subsidiaries which have ceased to trade as separate entities. I would therefore direct your attention to the consolidated balance sheet of the Group which is not affected by this rearrangement of our activities.

As you are already aware, we acquired the entire share capital of Train & McIntyre Limited during the year and as part of the consideration 2 million ordinary shares of 4s. each were issued at the then current market value of 17s. per share. This transaction accounts for the major portion of the increase in our issued capital and in our capital reserves by way of share premium account. The balance of the increase is the result of the conversion of part of our unsecured loan stock 1964. I should perhaps remind the remaining holders that the same rate of conversion is open to them this November, after which the terms become less favourable each year.

The additions to fixed assets of some £2 million are well spread throughout the Group and call for no special comment. As regards current assets, you will observe that the value of our stocks has increased by £7 million. This is entirely due to the continuation of our programme of building up stocks of Scotch whisky, not only by the distillation of new whisky but also by the purchase of partly matured stocks when available to us at suitable prices. As a result our position is not quite so liquid as it was last year. The net excess of current assets other than stocks over current liabilities is £13¼ million compared with about £16 million last year.

APPROPRIATION OF PROFITS

Returning to the profit and loss account, I would now like to comment on the disposal of the profit of £7,316,549 available for appropriation. We have thought it desirable to strengthen the position of certain subsidiary companies, and, of the sums retained by them £1,196,928 has been transferred to reserves and £575,229 has been added to the amounts brought in, a total of £1,772,157.

We are, as you know, committed to repayment over the next few years of £1 million annually of unsecured loan stock. This was borrowed mainly to finance the increased cost of laying down stocks of Scotch whisky in the postwar years and we wish if possible to place to reserve each year a sum at least equivalent to the amount repaid. Considering, however, the continuing need for larger stocks to meet the demand for the company's products, and the desirability of maintaining our liquidity, we propose this year to transfer £2 million to general reserve.

With due regard to the foregoing factors and in view of the excellent results of the year's working, we think it right that the shareholders who have invested their capital in this great enterprise should receive some additional reward. It is therefore proposed to increase the final dividend on the ordinary shares by 1 1/5d. per share (2¼ per cent) making 1s. per share or 25 per cent for the year. It may be appropriate to mention that this rate of dividend is equivalent to approximately 7¼ per cent on the total capital employed in the business as shown in the consolidated balance sheet.

After these appropriations the balance of profit to be carried forward in the accounts of The Distillers Company is increased by £233,375, and consequently the revenue reserves of the group have been augmented by sums aggregating £4,005,532.

SCOTCH WHISKY

We have again achieved a satisfactory measure of production at our malt and grain distilleries. Last year, I referred to the fact that a large proportion of the stocks of Scotch whisky held by the industry was not yet adequately matured and available for sale. Unfortunately this state of affairs still exists although the position has slightly improved. We have, during the past year, acquired certain substantial stocks which will enable us to increase the quantities available for sale in the near future. Maintenance of age and quality still remains the controlling factor in the expansion of our sales both at home and abroad.

Sales of Scotch whisky, for a number of years, have been the subject of an arrangement between HM Government and The Scotch Whisky Association. Under this arrangement, the industry undertook to limit its sales in the home trade to a specific figure and to endeavour to achieve certain suggested targets in the export field. Whilst paying tribute to the harmonious and helpful relations between HM Government and the industry, I am glad to say that intimation was received from the Government to the effect that as from January 1, 1954, each individual firm would be left free to adopt its own pattern of trade. This was however, subject to an understanding that every effort would be made to increase our export sales and in particular, exports to the dollar areas. We have therefore now reached the stage when we can produce our whisky without restriction in volume and sell it with greater freedom than has been possible for a long time.

EXPORT SALES

The year 1953 was one of notable achievement for the Scotch whisky industry as a whole. Export sales amounted to no less than 13.2 million proof gallons, the highest figure ever recorded. This compares with a prewar figure of approximately 8 million proof gallons. In the home trade, releases amounted to 4.35 million proof gallons. This was the highest figure attained since 1947, but it is, of course, markedly less than the prewar consumption of approximately 7 million proof gallons.

As from January 1, 1954, our group companies have been able to increase their releases to the home trade to some extent. The additional quantities available have been

readily taken up and it is clear that the demand for our brands in the home market is still in excess of supply. With regard to the export trade, here again we have been able to allocate for 1954 larger quantities than were available in 1953, but this still leaves unsatisfied the demand which exists in the great majority of our overseas markets.

A large percentage of our export business is done with the United States. I am glad to say that certain of my colleagues who have recently visited this market have reported that the demand for our leading brands continues to be as strong as ever. Shipments of Scotch whisky to the United States during 1953 were the highest in the history of the industry and reached a total of 7.1 million proof gallons, equivalent to 4¼ million cases.

In South Africa the relaxation of import control enabled us to ship to that country in 1953 considerably larger quantities of our brands than we have done for several years. In Australia, also, in spite of the continuance of import control, we were able to effect satisfactory shipments in 1953.

With regard to Canada, while our business is good, it is not expanding, and I fear that our progress will remain slow unless the price of Scotch whisky is brought more into line with that of Canadian whiskey. The main factor involved is the retail price fixed by the Provincial Liquor Boards which, in most cases, is considerably higher for Scotch whisky than for the domestic article.

We are still meeting with difficulties in certain markets, especially in South America where our distributors are frequently quite unable to take forward the quantities allocated to them owing to their inability to obtain the necessary currency. As in former years, such quantities can be readily diverted to other markets which are more fortunately placed, but the consequent distortion in the pattern of our world trade is to be regretted, and is indeed, one of the unsatisfactory aspects of our export trade today.

CONTRIBUTION TO NATIONAL ECONOMY

In view of the contribution which we, as exporters, have made and are making to the national economy, I feel bound to say that we do not always appear to receive from our own government the backing which we consider we merit. There are certain countries which are permitted to ship very large quantities of wines to the United Kingdom, but in some of these countries import licences for Scotch whisky are unobtainable, and in others the quantities admitted are trifling. In cases such as these, we have sought the assistance of our government when they were negotiating trade agreements with the countries concerned, but I regret to say that in general the results have been extremely disappointing.

I have already referred to the somewhat uneven distribution of our world trade created by currency restrictions, and it is to be hoped these difficulties will tend to decrease. Otherwise, I see no reason to be other than confident regarding the future of our Scotch whisky business. The world demand is established on a much broader basis than before the war. Scotch whisky is sought after and welcomed by the citizens of every civilised country, and it is rightly regarded as a household beverage of superlative merit.

I am convinced that our traditional policy in the maintenance of quality has played an important part in building up the reputation of Scotch whisky, and I am sure that by continuing this policy we shall retain our pre-eminent position in the industry.

GIN

Once again I am glad to report a successful year's trading by our gin companies, with substantially increased home and export sales. It may be prudent, however, to add a warning note in that as whisky supplies reach the home market in gradually increasing volume, the upward trend in gin sales may be arrested, or perhaps modified.

Our gin company at Linden, New Jersey, USA has also had an excellent year. Its sales constitute a record in the history of that company.

I referred last year to our new gin-producing plant at Isando, South Africa. We have now had the experience of some 18 months' trading, and I am glad to say the position is encouraging and steady progress is being made in the sale of Gordon's gin in that market.

YEAST

As indicated in my statement last year, the demand for bakers' yeast has contracted somewhat in recent years, and this trend continued during the past year, mainly due to the lower consumption of bread resulting from the freer supply of other foodstuffs. Despite this, our yeast factories have been kept reasonably well employed. Competition for the smaller tonnage of yeast required by bakers has been keen, but the introduction by your company of process improvements and economies in distribution has enabled us to effect appreciable reductions in the selling prices charged to consumers. In an endeavour to reduce distribution cost still further, the company has entered into an arrangement with The Standard Yeast Company Limited (a subsidiary of United Dairies Limited) under which, as from April 1, 1954, although that company continues the production of its well-known brand of "Standard Yeast," our subsidiary, The United Yeast Company Limited, has undertaken the sale and distribution of its output. Reports from our distribution centres show that this arrangement has worked smoothly and has been well received by the bakery trade.

We were recently informed that under an arrangement entered into between the British and certain Continental Governments, the importation of yeast from Holland and elsewhere in Europe would be permitted on a limited scale as from July 1, 1954. There is an excess productive capacity in this country at the present time, and little prospect of any marked increase in the general use of yeast. Whilst our modern plants and low selling prices should equip us to meet any normal competition, it remains to be seen what impact such foreign importation may have upon our domestic economy.

INDUSTRIAL GROUP

I am glad to be able to report that following upon the sharp recession to which I referred in my previous statement, the year now under review was one of steady recovery and progress for most of our divisions. This reflects not only the marked improvement in general trade, but also the coming into operation of new plant and reorganisation programmes.

Most raw materials have been in free supply at somewhat lower levels, which has enabled us to reduce the prices of our products with beneficial effect upon our sales and earnings. The chemical industry continues to develop at a rapid rate, and although in Britain, because of the limitations imposed upon industry by the crushing weight of taxation, the capital invested each year does not compare with the enormous sums expended in the USA or Germany, nevertheless, the total figure is impressive and we have contributed our share.

New products of great value and wide application are constantly emerging from the chemical laboratories of the world and we have to see to it that we do not fall behind in this competitive but constantly expanding field. You will note from the reports on the work of the divisions, the steps which have been taken to broaden our range of products, either alone or in partnership with other leaders in the industries concerned.

Chemical Division. The British Petroleum Chemicals plant at Grangemouth has had a very successful year and its output of synthetic ethyl alcohol now forms a substantial part of our total industrial alcohol production. I am glad to say that we shall this year receive a maiden dividend from this associate company, and its future appears to be most encouraging. A contract has been concluded between British Petroleum Chemicals Limited and the Oronite Chemical Company, a subsidiary of the Standard Oil Company of California, USA to produce detergent alkylates used in the manufacture of synthetic detergents. This plant will be located at Grangemouth, and it is hoped will come into operation before the end of 1955. The monomeric styrene plant of Forth Chemicals Limited (a subsidiary of British Petroleum Chemicals Limited) has operated at maximum capacity, and in view of the growing demand for this material for the manufacture of polystyrene and other important uses, it has been decided to double the capacity. This work is now in hand.

Our industrial alcohol distilleries have operated satisfactorily, and the price of molasses has remained reasonably stable. Sales are at a high level, but in view of our production of synthetic ethyl alcohol at Grangemouth and in order to secure maximum economies, we have concentrated production at three distilleries and have meanwhile closed down those at Liverpool and Greenock.

Carbon dioxide sales continue to expand and the use of the bulk tanker delivery service we have instituted is increasing rapidly. A new development by your company which has aroused great interest in engineering circles, is the application of carbon dioxide for prolonging the life of machine cutting tools and at the same time very greatly accelerating the speed of machining of the tough high alloy steels used for aero-engines and rearmament products.

Sales of solvents and our range of other chemicals are satisfactory both for the home market and export, although conditions remain keenly competitive. New products are being regularly introduced, which are the direct outcome of our research and development work during recent years. Whilst the tonnage of some of the individual products is modest, in the aggregate they represent a valuable contribution to our economy.

In conjunction with the Oronite Chemical Company of California, a company has been formed under the title of Orobis Limited, in which we have a 50 per cent interest, to manufacture in this country the range of lubricating oil additives now produced by the Oronite Company in the USA. These chemical additives, which have been in use for a number of years, have become important constituents in the composition of lubricating oils. The new unit, which will be located at Hull, should be in production early next year.

As from October 1, 1953, we leased from the Ministry of Supply, the Kenfig carbide factory, South Wales. This plant, which contributes the major proportion of the carbide requirements of the United Kingdom, was originally built in 1941 by the Company as agents for the ministry, since when we have continued to manage it on an agency basis. Under the new arrangement, we are operating this unit commercially with satisfactory results.

Biochemical Division. Last year, I drew attention to the competitive conditions in world markets. These have continued on an

increasing scale, particularly in regard to Penicillin and Streptomycin. This has inevitably affected our earnings, but the process improvements introduced during the past year and extension of the range of products made will, I am confident, enable us to maintain our position in this industry.

I should like to refer briefly to an investigation which is at present being carried out by the Ministry of Health, concerning the cost of pharmaceuticals required by the National Health Service. Your Company has spent considerable sums in research and on new capital equipment in the development of antibiotics, and I fully share the views expressed by the chairmen of other companies engaged in the industry in regard to the dangers of applying rigid and unimaginative principles of accountancy to everyday business operations. The alarm they have expressed is well-founded. A broader view must be taken by the ministry if this industry is to be maintained in a healthy and progressive condition.

Plastics Division. The return to more active trading conditions early last year, was followed by a steady rise in demand for our synthetic resins, and although competition remains keen and selective, good progress is being made by widening the range of our materials.

Negotiations have recently been concluded with the Dow Chemical Company of Michigan, USA, to form a British Company, under the title of Distrene Limited, of which your Company will hold 55 per cent, for the manufacture of polystyrene at Barry, South Wales, under the Dow Company's patents. The world-wide reputation of the Dow Company in this material encourages us to believe that this new venture should be successful.

The demand for polyvinyl chloride, produced by British Geon Limited, continues to increase due to the widening field of application, and in spite of the plant extension which was completed last year, there is still a shortage of supply. A further extension is now under construction, part of which it is hoped, will be brought into operation by the end of this year.

Magnesium. As from February 28th last, our subsidiary, Magnesium Elektron Limited, ceased acting as agents for HM Government and is now producing magnesium on its own account. The excessively high cost of electric power, now exceeding four times the cost in 1939, has created serious problems, but we have been able to make such arrangements and alterations to the process to permit the plant to continue to produce magnesium at prices which at present are close to or better than those ruling in foreign markets. The Company's exports of special alloys and alloying materials to the USA, Canada and the Continent have been satisfactorily maintained.

South Africa. Our Associated Company, National Chemical Products Limited, has had a good year and the expansion schemes in the range of chemicals and plastics have made satisfactory progress.

Australia. Our Associated Company, CSR Chemicals Pty. Limited, has enjoyed a successful year in its solvents and chemical division. The new cellulose acetate flake plant, to which I have previously referred, has also operated well, but is meeting very severe competition through the sharp fall in world prices of acetate flake. It is hoped that the position will be improved by the Australian Government granting an import tariff, but in any event, it will undoubtedly take some time to build up this enterprise to a normal profitable basis.

Research. The Company continues to spend large sums of money annually on research and development which is directed to the maintenance of all our operations at the highest state of efficiency, and also to the longer range investigation of new processes and products which can be expected ultimately to expand our business. An example of the successful completion of development work on a new process that has been under investigation for several years, is the commercial operation in the USA, Canada and France, of a method of making phenol, which is a basic material widely used in the pharmaceutical, chemical and plastics industries. Useful royalties are now being received from the licensing of the company's patents on this and other processes which have been developed.

FUTURE PROSPECTS

I have no doubt that shareholders will regard the results of the past year as indicating satisfactory recovery and progress. This favourable trend has been fully maintained during the current year, but we are living in times which make it increasingly difficult to forecast with certainty. I feel I can say, however, that with our broad spread of activities, and providing no major setback occurs in our national economy, the results for this present year should be as favourable as those we are now reviewing.

STAFF

In conclusion, I should like to express on behalf of the board and our shareholders, our thanks to the management and to all grades of staff for their services during the past year. In an expanding organisation like ours, the family spirit is of the highest importance and I am glad to pay tribute to all concerned for developing that spirit which contributes so much to the strength and success of the Group.

UNITED DOMINIONS TRUST

RECORD OF SOLID ACHIEVEMENT

GROUP'S ROLE IN EMPIRE EXPANSION

MR J. GIBSON JARVIE ON ILLOGICAL GOVERNMENT REPRESSION

The thirty-second annual general meeting of United Dominions Trust Limited was held on August 18th at Regis House, King William Street, London, E.C.

Mr J. Gibson Jarvie (the chairman) presided and, in the course of his speech, said:

I am able again to report that United Dominions Trust Group figures for the year ended June 30, 1954, have passed all previous records—the sixth successive postwar record.

The profit of £1,060,122 compares with £850,200 last year.

The consolidated balance sheet shows total assets of £34,361,575 compared with £26,235,884 in the previous year. Although heavy taxation, here and overseas, took £561,482, our revenue reserves increased during the year by £323,296.

The comparative figures for the last six years printed in the accounts give a graphic picture of the Group's progress and ever increasing strength.

GROUP ACTIVITIES

London Produce Clearing House Limited has very successfully handled the large volume of wool futures contracts on the terminal market. Coupled with the active business in the cocoa terminal market, the Clearing House registered contracts in excess of £250 million during the year. The Clearing House is well equipped to handle the rapid expansion of its present business and to register and guarantee terminal contracts in other commodity markets as the need and opportunity arise.

Ryders Discount Company Limited: In June this year we disposed of the greater part of our holding. The opinion of the directors of that company that the time was appropriate to convert the company into a public company was shared by your board. In the years during which we held these shares we received a steady and satisfactory return on our investment.

The chairman referred to his visit last winter to New Zealand, Australia and South Africa and outlined the progress made by the Group in those territories and also in Canada. He informed the meeting that the newly formed subsidiaries in Australia and Canada were already making profits, and continued: As a banking institution, our risks are world-spread and there is an ever widening overseas field for "UDT" Group activity under conditions which, on the whole, are very similar to our own.

But the greatest development has, naturally, been in the parent company itself and United Dominions Trust (Commercial) Limited where the volume of new business discounted during the year exceeded £25 million, an increase of nearly 40 per cent—the larger part of which was in industrial equipment and other capital goods. No less than 10 new branches were opened in the United Kingdom during the year. You have probably seen the announcement of our purchase of the Glasgow Stock Exchange building. It is one of the finest business blocks in Glasgow and should add substantially to our possibilities for expansion when we take possession. The Stock Exchange will continue to occupy their present premises under lease.

It is also a pleasing feature of last year's business that in Credit for Industry Limited, outstanding balances of loans against security now exceed £2,250,000, while at June 30th last we were already committed to a further £500,000 in respect of accepted loans pending.

I think I am also entitled to refer to Transport Unit Finance Limited, a company formed by us with the full co-operation of the authorities, for the purpose of financing hire-purchase transactions arising out of the denationalisation of road transport. The company has not done much because the disposal of transport and properties has been regrettably slow.

The extraordinary feature is that while we have given valuable help to more than one Government, no assistance has been given to us in the provision of the funds involved.

Your company has in many ways rendered notable, though thankless, service to the nation. And I am glad to say that, even though the Chancellor and the Treasury may look askance at our work and our progress, our reputation in all industries and trades here and overseas, was never greater; nor have we ever before been able to provide so wide or comprehensive a financial service.

CAPITAL ISSUES COMMITTEE

Throughout the past four years I have striven to persuade the Capital Issues Committee of the increasing urgency for an addition to the issued capital of our company. Our last issue of capital was made in 1946. Since that time we have acquired or established nine companies at home and overseas; the number of our offices here and abroad has almost trebled; we have ploughed back £1 million of Group profits. Group assets have increased from £8 million to over £34 million. But such facts as we have repeatedly put to the Committee have apparently been assessed as inconsiderable. Rejection of our applications has been intimated with no more helpful advice than that the Lords Commissioners of the Treasury were unable to give their consent to the proposed issue!

Any company with a record of usefulness such as ours, with such a remarkable expansion of business here and overseas, and of such financial strength, should command the greatest encouragement from the Government instead of repression.

In view of all the facts, I challenge the Chancellor of the Exchequer to give one single logical reason why we are not permitted to increase our capital.

As a nation our future is full of imponderables, and I doubt if anyone under present conditions would describe it as bright. And yet, were we to recover our common sense and accept our responsibilities, we could once more assert our position as a great world power.

Yet in spite of everything, our Group of companies—the UDT Group—has done well. It has a record of which we may be proud, and it is capable of greater things.

By opening up in the Dominions and by our expansion here, there is no reason why next year should not also establish a record.

The report was adopted.

ST. MARTIN'S LE GRAND PROPERTY COMPANY

The twenty-eighth annual general meeting of St. Martin's Le Grand Property Company Limited, was held on August 17th in London.

The following is an extract from the chairman's circulated statement:

The past year has been one of all-round expansion. Rental income was £279,356 (£232,790); profit before taxation was £118,657 (£85,347) and profit after taxation was £50,455 (£37,348).

Two interim dividends totalling 9 per cent have been paid in respect of the past year to the holders of 1,296,000 ordinary shares (£648,000 issued capital). The directors now recommend that a final dividend of 1 per cent be paid on the present total issued share capital of £777,600.

During the year, the group has added substantially to its investments (1) by the purchase of the entire share capital of the Porkellis Property and General Investment Trust Limited, and (2) the purchase of an important freehold site and building in the busiest part of Buchanan Street, Glasgow.

The purchase of The Porkellis Trust has added to the group's portfolio a number of well-selected properties.

Since the end of the year under review, the parent company has made an offer, which has been accepted, for the well-known leasehold building, Adelaide House, King William Street, London, E.C.

In all purchases which the group have made in the last three years the directors have looked for improved rentals which can be secured over the next ten to twelve years as leases fall in, and we may now look forward to a steady improvement in income year by year, subject, of course, to no drastic change taking place in general trading conditions. The report was adopted.

CLIFFORD MOTOR COMPONENTS

The annual general meeting of Clifford Motor Components Limited will be held on September 8th in Birmingham.

The following is an extract from the circulated statement of the chairman, Mr S. C. Joseph:

The trading profits of the group before taxation amount to £466,664, which compares with £363,452 last year. Taxation this year totals £254,941, and there is left a net profit to the group of £211,723 (last year £158,181).

A conservative dividend policy has enabled your company to build up satisfactory reserves and we feel that this year we are justified in recommending a final dividend of 27½ per cent, less tax, making a total of 35 per cent, less tax, for the year (as against 30 per cent, less tax) and that a sum of £26,500 be capitalised from the capital reserves to be applied in issuing to the ordinary stockholders as fully paid one ordinary share of 2s. for every £1 nominal of ordinary stock held by them.

It is 25 years since the formation of your company. To mark this occasion your directors further recommend a "jubilee" dividend of 5 per cent on the ordinary stock (not subject to income tax).

Your directors thought that our employees should join in our "jubilee" celebrations and I am happy to report that this has been implemented in that our subsidiary companies last week marked the occasion by a bonus payment of one week's wages.

Competition and increased cost of production create serious problems. Constant research leading to improved manufacturing methods helps to counteract these difficulties, and we find that our ability to continue to sell at keen prices has resulted in an increased volume of trade.

NOTICES

THE EASTERN BANK LIMITED

The TRANSFER BOOKS and Register of Members will be CLOSED from September 2nd to September 15, 1954, both days inclusive.

By Order of the Board,
C. L. MANNING,
Secretary.

2 and 3 Crosby Square,
London, E.C.3.
August 18, 1954.

RHODESIA UNIVERSITY COLLEGE

SENIOR LECTURER IN ACCOUNTANCY

Applications for the above post are invited from persons who hold a recognised professional qualification in Accountancy and who have had practical experience since qualifying. It is desirable that applicants should hold a University degree in Commerce and have had some experience in lecturing.

The successful candidate will be required to lecture in advanced Accounting and Auditing to articled clerks studying for the Professional Accountants' qualification.

The salary scale attached to the post is:
£1,800 x £60 — £1,840
and is a consolidated scale, inclusive of cost-of-living allowances. The commencing notch on the scale will be dependent upon qualifications and experience.

A contributory pension scheme and medical aid facilities are under consideration.

Duties are to be assumed on January 2, 1955, or as soon as possible thereafter.

Applicants should submit before October 15, 1954, two copies of application, which should include the names of three persons to whom reference may be made, to the Secretary, Rhodesia University College, 115 Baker Avenue, Salisbury, Southern Rhodesia, from whom information regarding Conditions of Appointment, etc., may be obtained.

EXPERIENCED MANAGER, 45, well educated, widely travelled, 15 years independent commands in Industry and Commerce, seeks position.—Box 666.

MARKETING MANAGER required by Sunvic Controls Ltd. to assist General Sales Manager to organise sales promotion effort of the Company for the sale of a wide variety of instruments covering different fields. It is essential that he should have had extensive marketing experience and possesses an excellent commercial training and the ability to organise and direct staff and be able to co-operate with other executives. Whilst the products are of a technical nature and an engineering background or experience in the engineering industry would be advantageous, this is not essential.—Write, giving full details of age, experience, qualifications, etc., to General Sales Manager, Sunvic Controls Ltd., 10 Essex Street London, W.C.2.

UNIVERSITY OF BIRMINGHAM

INSTITUTE FOR ENGINEERING PRODUCTION

Applications are invited for the following appointments:

One ASSISTANT DIRECTOR, to be responsible to the Professor of Engineering Production for organising executive courses in Work Study, Production Planning, Operational Research and other management subjects, also lecturing and tutorial work in his own specialist field. Preferably applicants should be engineering graduates with experience in engineering production and industrial management positions. The appointment would be made for 2-3 years, in the first instance, and at a salary of £1,200-£1,800 p.a., according to qualifications and experience.

Three STAFF TUTORS, each responsible to the assistant Director for lecturing, tutorial and case study work on one of the following subjects:

(a) Work Study (Methods Improvements, Materials Handling, Work Measurement).
(b) Production Planning and Management Controls (Procedural Analysis).
(c) Operational Research (Statistical and Mathematical Methods).

Each tutor would require to have the appropriate training and specialist industrial experience in his own field. These appointments would be made for 1-2 years, in the first instance, at a salary of £1,100-£1,500, according to qualifications and experience. Leave of absence from an industrial company or other organisation for this period would be an acceptable arrangement.

Applications, giving full details of qualifications and experience, and the names of three referees, should be submitted in triplicate, before September 30, 1954, to the Registrar, The University, Edgbaston, Birmingham 15.
C. G. BURTON, Secretary.

MARKET ANALYSTS are required by Export Division of Ford Motor Company Limited, Dagenham, Essex. An honours degree in economics is essential, coupled with some knowledge of higher mathematics and statistics. Candidates must have a lively interest in export matters and practical experience will be a strong advantage. Knowledge of motor vehicles and/or tractors an asset.—Reply to Salaried Personnel Department, quoting reference FMR.

LOBITOS OILFIELDS LIMITED invite applications from recently qualified Chartered Accountants to fill a position about to be created in the London Head Office of the Group. The position holds very excellent prospects. A university degree would be desirable and a knowledge of Spanish an asset. Age not over 30. Commencing salary about £700-£1,000.

CAMBRIDGE UNIVERSITY HONOURS GRADUATE, 27, at present employed marketing with oil company. Public School. Army Officer. Much travelled—seeks appointment to give scope for initiative and hard work in old-established business at nominal salary with a view to eventual purchase of a worthwhile interest.—Box 673.

THE UNIVERSITY OF LEEDS

SENIOR AGRICULTURAL ECONOMIST (LIAISON OFFICER)

Applications are invited for the post of Senior Agricultural Economist to be largely concerned with liaison work between the Provincial Agricultural Economics Service and the National Agricultural Advisory Service. Salary: men—£900 rising to £1,070; women—£800 rising to £930. There is at present a bonus in addition. Applications (three copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than September 27, 1954.

EAST MIDLANDS GAS BOARD

DEPUTY INDUSTRIAL RELATIONS OFFICER

Applications are invited for the appointment of DEPUTY INDUSTRIAL RELATIONS OFFICER at Area Board Headquarters, Leicester.

The person selected will be required to have a wide knowledge of personnel management generally and, in particular, of the principles and methods of determining the salaries, wages and conditions of employment of employees in a large scale organisation. Applicants should preferably also have had practical experience of staff establishment work and of the conduct of joint negotiations on a Area or National basis.

The commencing salary for the appointment will be £1,000 per annum.

The position is pensionable and the successful applicant may be required to pass a medical examination.

Applications, giving details of age, education, qualifications and experience, together with the names of two referees, should be submitted to the undersigned to reach him not later than August 31, 1954.

Beverley House, University Road, Leicester. August 5, 1954.

A. GWYNNE DAVIES, Secretary.

INDEPENDENT TELEVISION AUTHORITY

The Independent Television Authority invites applications for the following, to act as chief assistants to the Director General:

Deputy Director General
Chief Engineer
Solicitor
Director of Administration and Finance
Director of Programme Contracts.

Reply, stating age and qualifications, to the Chairman, c/o General Post Office, Headquarters, E.C.1.

EXCEPTIONAL OPPORTUNITY occurs for a young Honours Graduate to take charge of Research Division of Commonwealth-wide business promotion organisation. BRAZIL

Commercial, manufacturing and financial information. Enquiries invited.—Littlejohn & Co., Ltd., Caixa Postal 7352, Sao Paulo, Brazil.

ADVERTISING AND MARKETING

Advertising and Sales Promotion Manager required by Company near London manufacturing range of major and nationally advertised brands for the mass consumer market, distributed through grocery and similar outlets. This is a senior position in the Company's management and the man appointed will take considerable marketing responsibility. Applicants should have experience with manufacturer and/or Agency of advertising planning and control, and especially of marketing "live" brands—preferably on the mass market. Pension and profit-sharing schemes. Replies, which will be treated in confidence, should give details of age, experience, etc., and be addressed to the Managing Director.—Box 671.

A YOUNG CHARTERED ACCOUNTANT, aged about 30 years, wishing to widen his experience of Management Accounting, is invited to submit an application for a permanent and pensionable appointment with a leading Industrial Company in its own field. Applicants of the required standard will be given a period of training in the Company's methods, during which time a salary up to £1,500 a year will be paid, but will be expected to reach £3,000 per annum in approximately five years. Some industrial experience is essential and a University Degree desirable.—Please forward full details in confidence to Box 669.

MARKET RESEARCH.—A company of high national repute engaged in the large-scale manufacture of consumer goods invites applications for a most interesting appointment. The successful applicant will be responsible to the Chief Market Research Executive for the continuous study of consumer wants in relation to the company's products, the regular scrutiny of specifications and quality through sample surveys, and the interpretation of statistical data to provide a basis for the company's product development and marketing policies. Candidates should be under 35, have a university standard of education and a wide experience in the field of market research. A knowledge of distribution problems embracing the wider issues of marketing and product presentation is especially important. Initial salary will be commensurate with the candidate's breadth of experience in this field and a figure not less than £1,500 is in mind. In addition, the company offers a non-contributory pension scheme, life assurance and other substantial benefits.—Apply in confidence, giving full details of age, education and career to date, to Box 670.

INDUSTRIAL ORGANISATION has vacancy at its Head Office in London for a Junior Economist/Statistician, who has just taken a good degree in Economics, including Statistics. Permanent position. Pension Scheme.—Apply Box 662.

TIME-AND-MOTION and Production Method. Expert wanted by substantial Leicester manufacturer of women's fashion shoes. Applications read by Managing Director only.—Box 672.

THE FACTS about Britain's electric power supply. Read "Power and Prosperity," obtainable through W. H. Smith and Son Ltd., price 1s., or 1s. 3d. post paid from British Electricity Authority, P.R.20.E. Winsley Street, London, W.1.

ESTABLISHED industrial concern in Glasgow with capital and premises available would consider taking an interest in or acquiring existing business with a view to expansion or to development of new products. Write 0280, Wm. Porteous & Co., Glasgow.

PRODUCTION.—Economics Graduate (30), 3½ years in production, experience covering shop floor, production control planning, statistics, etc., desires a change of atmosphere. Hard working, efficient and able to get results.—Box 664.

ECONOMICS GRADUATE wanted to collaborate in research in the field of Inventions and Patents for one year. Salary £700 p.a.—Box 665.

Other Notices appear on page 625.

GENERAL MANAGER (SALES)

THE GLACIER METAL CO., LTD., invites applications for the head office appointment of a General Manager (Sales). The company manufactures a wide range of plain engine bearings and standard products, employing approximately 2,500 in factories situated in London, Manchester and Scotland. The G.M.S. will be directly responsible to the Managing Director for organising, maintaining and developing the sales activities of the company. He will be responsible for working out sales policy and for customer contact. He will need to maintain effective relationships with the general managers for manufacturing and technical development. He will have as immediate subordinates technical and export specialists, representatives responsible for large customers and a sales manager, who has subordinate to him representatives for geographical areas. He will also be responsible for advertising.

Applicants need not be qualified engineers, but must have a sufficient grasp of engineering to discuss and negotiate with top level executives in the engineering industry. Previous experience of sales management is essential, preferably in engineering. The preferred age range is 40-45, but both older and younger candidates with exceptional qualifications will be considered. Salary range is £3,000 to £4,000 according to age and experience : pension with life assurance. The successful candidate is expected to merit nomination for a directorship within one year.—All applications will be treated in confidence, and should be addressed to Mr. W. B. D. Brown, Managing Director, The Glacier Metal Co., Ltd., to reach him at the Head Office at Ealing Road, Alperton, Middlesex, not later than Monday, September 20, 1954.

SENIOR EXECUTIVE

Senior Executive required by London pharmaceutical manufacturers with world-wide interests to assist in co-ordination and direction of their medical promotion activities. Previous experience in this field and of handling staff essential. This position offers good prospects for a man with vision and energy.—Box 632.

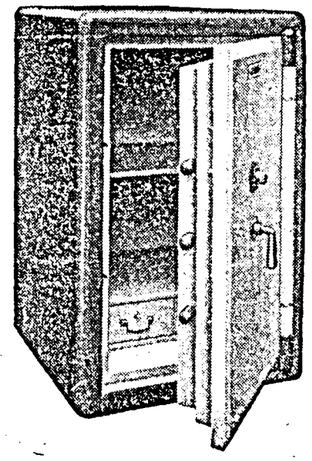
At Sui in Pakistan there is abundant natural gas. Away in Karachi there are industries which could use it for fuel. British engineers have contracted to connect the two—by 350 miles of steel pipeline carrying millions of cubic feet of gas per day.

To protect this pipeline from corrosion ten million square feet of Fibreglass tissue pipewrap will be used in field application. The contract for the whole of this pipewrap has been secured by Fibreglass Limited, in open competition. In fact Fibreglass is being used in more ways than one, for the outer wrap of 'Thermoglas', to be supplied by D. Anderson & Son Ltd., is also based on Fibreglass tissue.



Yet this pipeline is only one of many in all parts of the world which rely on Fibreglass for protection against corrosion—and the protection of pipelines is only one among the many ways in which Fibreglass contributes to the efficiency of modern industry.

Your next production? Can Lustrex help?

Lustrex*, popular polystyrene plastic by Monsanto, is really versatile. You can make many different products in Lustrex—and because it is so economical you can make them very cheaply. You can make tool-handles, and packages for tools. You can make filing trays, and fittings for refrigerators and radios. In fact you can make almost anything—from instrument panels and picnic sets to camera spools and small cable drums —in Lustrex.

Lustrex is light yet strong; it resists acids and alkalis; it does not shrink or become brittle. It is made in two grades — Lustrex for general purposes and Lustrex Toughened 1 for particularly tough purposes. Colour choice is almost unlimited.

Lustrex is supplied only in production quantities for injection moulding— it is not yet available in sheet form. Write now for full details.

*Registered Trade Mark.

Lustrex is one of Monsanto's wide range of chemicals and plastics for industry. If you have an industrial problem which chemicals might help you to solve—get in touch with Monsanto today!

Shapeless Europe

IT is tempting to say, after the breakdown in Brussels and the French Prime Minister's departure from Chartwell, that the issue between France and its allies is at last clear. There is a point in every great enterprise where failure seems preferable to uncertainty, and it seems virtually certain that the EDC treaty will not survive the debate in the National Assembly that begins today. But it would be a grave error to think that its disappearance will leave the way clear for rapid progress with alternatives. It is not certain, for example, that M. Mendès-France will survive next week's ordeal. If, by some miracle, the treaty were accepted he might well feel obliged to resign after the fundamental criticisms he made of it in Brussels. If the treaty is defeated, there are good Europeans among his majority who may choose to bring him down. And even if he survives, and brings all his prestige into the next stage of dealings with Germany, it is far from certain that the Assembly will tolerate the alternative plans that have been suggested. Those who oppose the rearmament of Germans will take no comfort from the proposal to bring Germany into Nato; those who want a united Europe will not be content with an attractively labelled military alliance. In fact, M. Mendès-France can give no guarantee that he will be any more successful with alternatives to EDC than he has been with the treaty as it stands.

In a matter of days the man who was to save France has led his country into a position of conspicuous isolation from its allies. That fact alone may sway some of the sixty-odd votes that are wavering in the chamber. If it does not, if the deputies say in effect, "We prefer to stand alone," there will have to be hard thinking in Washington, London and Bonn about what is to be done next in Europe. For France has been regarded hitherto as indispensable to any western defence system, whether it be called Atlantic or European. It is the rear area of a great allied force; across it run the communications to the ports which tap the strength of the United States and Britain; it contains an amount of sheer real estate, of permanent military construction that makes Frenchmen shrug their shoulders at American talk about peripheral strategy. In other words, any alternative plan for knitting Germany into a western defence system is exposed to a French veto. It need not, like the EDC Treaty, require positive ratification by the Assembly; but the Assembly, if it disapproves, could exert its authority by bringing down the Prime Minister.

It is important, therefore, to assess exactly in what respect France and its partners differ, what it is that a majority of French deputies want and fear. That, again, thanks to M. Mendès-France, is now easier than it was. First, it is clear that the Assembly is not prepared in spirit for a rapid surrender of sovereignty to a European body. It was the insistence of Dr Adenauer, M. Spaak and others that the supra-national arrangements of the EDC should not be delayed that

made compromise at Brussels impossible. What they held to be vital the French held to be intolerable. Even if the present treaty did survive next week, the French would advance towards a federal Europe only with caution and reluctance. This is a curious and significant fact: it means that the clauses of the EDC that offered the best safeguards against the misuse of German forces by a nationalist government in Bonn were precisely those that many Frenchmen rejected.

★

From this follows the second point. Because Frenchmen will not trust in a set of institutions to protect them against German energy, efficiency and ambition, they demand the help and protection of friends on the spot. They want Britain in the EDC—modified and reconstructed if necessary—or Britain and America more closely committed to some alternative. What has been already offered in guarantees and allocation of forces is not enough; they want more protection for a longer period. Failing this, many deputies, supported by 100 Communist votes in the chamber, would like a European understanding with the Soviet Union, if necessary at the expense of Germany.

On one or two other points the evidence is still doubtful. From time to time French statesmen have spoken eloquently of an Atlantic community, within which the European community would nestle as a kernel lies within a nut. They have seemed to prefer a large and loose club, in which France and Germany would have the company at table of America and Britain, to a tight and small club that would leave them tête à tête. They have also shown interest in setting up the scaffolding of a political community for Europe before going ahead with defence and economic organisations. And there are old and cynical minds which will advise any French premier that French policy must approach the future with room to manoeuvre, winning commitments from others but itself remaining flexible.

New elections in France or a period of stable government might bring more order into this picture. But the main features are clear enough to warn the western allies that alternatives to EDC, if needed, must be imaginative, generous and capable of growth. It will not be enough to have the EDC without the C, a military alliance that pretends to be something like General Eisenhower's allied command in 1944; or to make Germany a member of Nato under special conditions that are not accepted by other members. And it will not do to set up some structure that will face collapse if some method is one day found for the peaceful reunification of Germany. The West must win Germany and Germany must want to stay with the West: that is the supreme object of allied policy in Europe.

The conclusion is unmistakable. It is that Britain, and if possible the United States and Canada, must come even closer to Europe while the embryo of its new body politic is growing. There must be no doubt about their loyalty, their patience and their protection. If they had already succeeded in calming all doubt the EDC would have come into existence a year ago; now to get the next best thing to EDC they must try again. The crisis of the last few months between Europe, the United States and Britain has been a crisis of confidence; the trust built up by Mr Bevin, Mr Acheson, M. Schuman and Dr Adenauer has been deeply shaken. The first necessity is to restore it.

Then there is another task, no less difficult. EDC or no EDC, whether the Assembly says Yes or No by a large or a small margin of votes, the freshness and dignity of the European idea have been spoiled. The opportunity for rousing a new loyalty in Germany has slipped past. Young people in Europe have watched old people haggling over an ideal, and they have got older and sourer as they waited. Even if EDC were to be ratified now and the Bonn conventions came immediately into force they would no longer be greeted in Germany as brave and honourable gestures; they would be accepted as the pay-off after a hard bargain. If western integration and the organisation of security are not to become the object of sheer *Realpolitik*, a new political idea will have to be found, an objective that appeals to generous minds.

★

Where is the impulse to come from? Europe, without perhaps realising the fact, has come to expect ideas as well as dollars from the United States. But there is no sign of intellectual ferment in the circles around Mr Dulles. By his anxiety to be different from his predecessor, by his personal exultation in the problems of strategy and his preoccupation with the Far East, the present Secretary of State has discouraged creative thought. Arteries in the State Department seem to have hardened. So passionate has been the devotion to EDC in Washington that it would be unfair to expect fresh thinking in the midst of disillusion. Is the idea then to come from France, or from Germany? Almost certainly not. Dr Adenauer must be near the end of his tether, and M. Mendès-France is interested first and foremost, as he is entitled to be, in his own treatment of his nation's economic and social ills.

What signs are there of readiness in Britain? The consolidation of the Atlantic alliance began to waver from the moment in May, 1953, when the Prime Minister first trod the path that has led to "peaceful co-existence"—and Mr Attlee's parody of it. He is not the man to turn back. Mr Eden is more interested in the settling of disputes, the smoothing away of tension than in the initiation of ideas. His statesmanship is that of the masseur not that of the surgeon. The Foreign Office is still obsessed with the vision of an almost exclusive intimacy with the United States, to be conducted side by side with leadership of the Commonwealth and the honorary—very honorary—presidency of Western Europe. The Service advisers, while admitting in private Britain's complete involvement in the defence of Western Europe and the dominions' growing dependence on American military power, maintain in public the pretence that they can exercise effective power in three great areas. The obstacles in London to fresh thinking are formidable.

Yet events may force it out. If Germany is in some way to become a partner on terms acceptable to France, then Britain must appear to stand more solidly and visibly on the Continent, as a participant and not merely as an external guarantor. If security can be got only by integration, then Britain may be forced to take part, if only during a period of trial during which French and Germans learn to trust one another. It might well be that such a period of trial would prove how frail are the arguments that purport to show that leadership in Europe is incompatible with leadership in the Commonwealth. It might be shown that Britain commanded more influence in the world and more respect in the United States as real leader of Western Europe, than as a power pulled this way and that by the claims of Europe, the Middle East, Far East and Africa. If Britain showed itself ready to act as a European power, it might excite in the United States a new interest in making the Atlantic Community a reality and Nato something more than a grand coalition.

The moment is crucial because the struggle over EDC coincides with a determined and skilful attempt by the Soviet Union and China to split the western partners. That attempt looks benevolent and it may well have a peaceful intention; why use force, or even the threat of force, if diplomacy will do the trick? But the ultimate intention to isolate the United States from its partners and to exploit the rivalries within the free world is malevolent. The fear that once drove those partners together into such great ventures as the Marshall Plan and Nato has diminished, and none will regret the fact. But its place has to be filled by the kind of statesmanship that looks beyond imminent elections and parliamentary reputations to the future world of atomic energy, guided missiles, an industrialised Asia and a restless Africa. In what shape is free Europe, from which Britain cannot escape, to confront that world?

Defender of Defence

ON the day that Sir Winston Churchill retires—and still nobody knows when that will be—Lord Alexander has said that he will also retire from the office of Minister of Defence. This suggests that the Government will be deprived, at a single swoop, of the man whose interest and the man whose job it has been to co-ordinate the defence programme. For the Ministry of Defence exists to watch over the watchmen and over the pressures that bear down upon them; each of the three service Ministries—the Admiralty, the War Office and the Air Ministry—has been concerned partly with reshuffling its own cards to accord with changing strategic conceptions, but also partly with ensuring that the other two services do not steal too much responsibility from it.

Lord Alexander's successor will therefore have a very embarrassing task, and it will not be made any easier if he enters upon it with the reputation of having fought for one of the three service factions underneath. But if he is to be a man who knows anything about defence, he almost certainly will have this reputation. At present, there are said to be two principal candidates in the field. One is Mr Duncan Sandys, whom many Admirals and Generals regard as being "in the pockets of the airmen," with his imagination already soaring on the wings of some guided missile half-way to the moon; his appointment might be particularly ill received by the Navy. The other possible choice is Mr Anthony Head, who has been a success at the War Office and who seems to have handled his various struggles with the Air Ministry (for example, about who should control the army's helicopters and about how many aircraft he should have to fly troops home on leave) with statesmanship and tact. But if the Air Marshals fail to get one of their candidates into the co-ordinating Ministry, they might make disgruntled noises under his reins.

It is in this atmosphere that some people have set out on a search for a compromise, and they have thrown up a question that they believe should contain the seeds of one. It is: why have a Minister of Defence at all? On the face of it, there may seem much to be said for not having one. The office of Minister of Defence was originally created in order to allow the Prime Minister to act as master-strategist during the war. The idea of a super-Ministry, watching over three separate chicks, often works unsatisfactorily in peacetime. The Minister turns from one subordinate department to another, telling them that the Treasury will not allow enough money for all their plans or that they are treading on each other's (or the Prime Minister's) corns. The hands that are on the levers of action are not those of the co-ordinating Ministry; the levers are pulled lower down, although perhaps not in such profusion or in so many different directions as would occur if the departments were left entirely on their own. But this task of enforcing co-ordination—the impolite would say of enforcing compromises—is not necessarily one that only a Ministry can perform. If in the last few years directives had come straight down from the Cabinet Defence Committee and from the Treasury to the Chiefs of Staff, and if the Chiefs had been given more power (together, perhaps, with a permanent chairman), then the results might not have been very different from those that have been achieved while Lord Alexander has been at the helm.

This is the case against the retention of the Ministry of Defence in the awkward personal circumstances that are now arising. It is a completely mistaken case. For the need in the coming months will not be for some body (any body) to do the job that the Ministry of Defence has been doing in recent years. The need will be for some prominent political figure to do a job much tougher and much more important than that.

There are two reasons why new and unshirkable burdens are being directed towards the Ministry of Defence; they arise from the hydrogen bomb and from the political manoeuvres that are now in train in advance of next year's expected general election. Of these, and in this context, the hydrogen bomb is the less important. Sir Winston Churchill's dictum that the bomb has rendered all previous strategic conceptions "utterly obsolete" does not mean that it has rendered the aims of Britain's defence programme utterly obsolete too. The principal of those aims is not to enable Britain to win a thermonuclear war but to enable it to help prevent one—by standing on guard at vulnerable sectors of the free world's perimeter, and by advertising to the Communists that advances beyond these points cannot be achieved by painless infiltration but only at the risk of a world conflict. This aim has not been changed by the force of this year's explosions, nor has the paramount political need for Britain to show that it is still determined to provide its due share of manpower and weapons for the combined forces of the western alliance. All that has changed is the strategic and tactical situation in which these combined forces would operate, if the worst should befall.

★

This change in hypothetical strategy and tactics is, however, sufficiently marked to necessitate fairly extensive new planning within all three services—indeed, within all four, since civil defence is clearly more crucial than ever. It will be surprising if this new planning does not show that some switches in the direction of effort as between the services are desirable; the shares of expenditure that should be allotted to the navy, army and air force in the thermonuclear age are not likely to be exactly the same as the shares that were appropriate before the bomb burst. This means that the Ministry of Defence will have to face its familiar problems of co-ordination, of reallotting expenditure between the services, in new and particularly difficult circumstances. For this reason alone it would be folly to disband it at this time.

The hydrogen bomb has also had an indirect effect on the general—and even more crucial—political problem before the Ministry. There is now a dangerous tendency in some quarters in Britain to send military as well as civil defence to Coventry. The Coventry Council's attempt to deprive their city of effective civil defence, in the belief that this would encourage Mr Malenkov to ban the hydrogen bomb, stemmed mainly from astonishing personal arrogance, from the sort of international "political strategists" who need to be seen to be adequately disbelieved. But it was also able to exploit the vague and more widespread feeling that an atomic war, if once it started, would be so horrible that there is not much that can be done about it. And from this general bomb-unhappiness there is arising a new school of near-pacifism—a school that considers that it is extravagant, while preparing against a horror that would be too vast for any preparations to suffice, for Britain to conscript its youth to the colours for two full years and to spend on defence more than one out of every ten pounds it earns.

★

There is a very real danger that some infection from this feeling will lead both parties into paths of irresponsibility in the next few months. It is now touch-and-go whether Labour will adopt the demand for an immediate cut in the call-up period as part of its official policy. This demand would not spring from any real conviction that the forces that are now being pulled back from Suez and Korea are not needed as a strategic reserve in Britain; nor would it spring from any intensive study of the adequacy of the present call-up to cope with the increasing complexity of modern weapons. It would spring solely from Labour's desire to advocate something popular, from the party's traditional tendency to act as inverted Goerings; whenever the Reichsmarschall heard the word "culture" (which he did not understand) his first instinct was to reach for his gun, but whenever Labour hears of any defence or economic problem that it does not understand its first instinct is to throw its guns away. And, lest this should be regarded as a criticism of Labour only, it should be said that a rather similar sense of irresponsibility could infiltrate, at a slower and more stately pace, through the Conservative party in the next few months. Mr Butler is searching desperately for economies in Government expenditure that could make his pre-election budget a popular one. Without really meaning to, he might be persuaded to lay his axe at the tree of national security itself.

It is to resist these pressures that a strong Minister of Defence will be needed. If the demand for cuts or economies were allowed to bear down directly upon the individual service departments or upon the Chiefs of Staff, who are always arguing among themselves and who have, in any event, a vested interest in high military expenditure, impatient politicians might pretend to feel justified in riding over their objections to the popular policies beyond. The bulwark must be a strong Minister, a prominent member of the Cabinet, who can see the defence situation as a whole and whose resignation—if political pressures swarmed past him—would be a sign to the country that something had gone very badly wrong. The office will not be an easy or popular or rewarding one. It is for that very reason that it is essential that it should be filled.

Malaya's Rice

HAVING made a bonfire of so many out-dated controls in Britain, the Government should turn its attention to the East. There, in Malaya, rice is still rationed, although there is a glut in South East Asia as a whole, and the area is now running a surplus of about a million and a half tons a year. Moreover, the price at which the ration is sold is nearly as high as it has ever been and there is no apparent prospect of its going down, since the Malayan government holds considerable stocks of rice that were bought at peak level. At a time when the prices of its main exports, rubber and tin, have fallen on the markets of the world, the high cost of food puts a strain on the Malayan community that is increasingly difficult to bear and increasingly difficult to justify.

Perhaps this situation would not greatly matter to the outside world, if South East Asia were quietly at peace and there were no cold war. As things are, with Malaya still the scene of a critical struggle with the Communists, the very fact that the main emphasis has shifted from the military to the economic and political battle makes the effects of the rice muddle that much worse. For unless it is cleared up within the next twelve months, the Communists will gain a propaganda handle that they can exploit in every kampong in the country.

The reason for this paradox of continued rationing in the midst of plenty is fear, or rather a complex of various official fears. The first and most natural has been a fear of shortage. In the years of scarcity immediately after the war there was, indeed, a danger that Malaya would run out of food and might be held to ransom by the growers in Burma and Siam. That danger is long since past. Up till about 1949, when the International Emergency Food Council (IEFC) came to an end, bulk purchase and the allocation of rice were the only satisfactory ways of warding off famine and malnutrition. But the end of the IEFC quite rightly marked the end of a period. And while rice was by no means plentiful enough to warrant the immediate abandonment of local rationing, the position has steadily improved since that turning point. The Malayan government recently issued an apologia in the form of a White Paper, in which it asserted that, if the authorities had not been in the rice market during the past three years, the consumer would have had to pay a higher price. But the mention of three years sounds like a twinge of conscience. For if the price might have been higher without controls at the beginning of that period, it would certainly have been lower at the end.

It is easy for government servants to argue that, where there is a rationed price, a free market price would be higher. Of course it would. In Malaya the cost of special fees and licences, to say nothing of a touch of corruption, have all entered into the free market price. The government, which has a monopoly but tolerates a small free market in addition to rationing, is unlikely to sell to the free dealers at less than the official price; and the relatively small number of successful smugglers will certainly try to get something near the prevailing free market rate. Meanwhile, the consumer suffers. Not only is his cost of living high, but rationed rice is not as good as it ought to be. It has usually been kept in store too long; there is less variety of quality than there was before the war when the trade was in private hands; and, on the whole, the grades of rice available from the government are poorer than they used to be under private trading.

★

Against protests from consumers and traders alike, the government defends itself by hinting at other fears. If there is no actual shortage today, it says, there may be tomorrow. Although little is said in public, the only possible meaning this suggestion could have is that Siam or Burma will soon fall into Communist hands, and will then refuse to sell rice to Malaya. While the political prospects in Burma are improving, it is true that recent events in Indo-China have brought danger much closer to Siam. But even if Siam fell during the next few months—which is a big "if," considering the efforts about to be made at the Seato conference to prevent such a possibility—is Malaya really going to be able to save itself by stockpiling rice? Rice is notoriously a difficult commodity to store, and the stock has to be turned over virtually every season. A strategic reserve could postpone crisis only by a matter of a few months.

People in Malaya feel that one reason why the government clings to a policy which can no longer be economically justified is the human one that many of the officials concerned would lose their jobs if it were abandoned. Whether that is true or not—and it is unlikely to be wholly untrue—there is yet another official fear which may be the hardest of all to overcome. It is argued in London, even more than in Malaya, that the very danger to Siam makes it more important than ever to keep the Siamese happy. Their economy is directly geared to the price of rice, and a fall would materially help the spread of Communism. But this, surely, is to force the boot on to the other foot with a vengeance. Instead of saving Malaya by keeping up supplies, Malaya is to subsidise Siam indefinitely. If that is the real truth of the argument, then it is time a more realistic attitude were adopted, not only towards the political position in Siam, but to the bleak economic prospects at present before Malaya.

The fact is that the Siamese are at present making a good thing out of their rice. The cost of production is rather less than half the export price, and the balance goes into the pockets not only of the government, but

of members of the government. In addition, British official purchases are so timed, and are usually made in such bulk, that they set the standard for rice prices all over South East Asia. Selling governments, having made a deal with Britain, know that they can stand out for the same sort of terms from others; in certain circumstances it may even pay them to let the rice rot rather than allow the price to fall to a truer economic level.

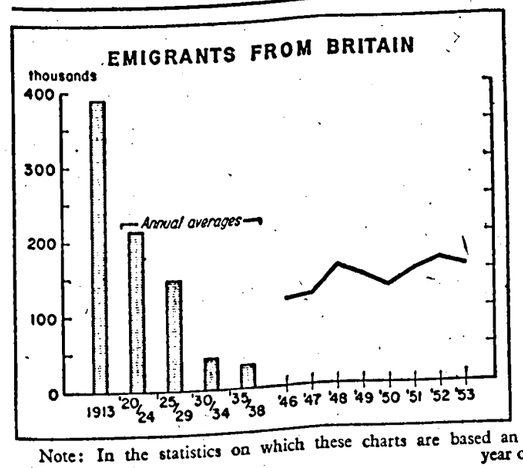
The case for returning rice to private trading has become strong. What is more, the longer the changeover is delayed, the harder it becomes to make. In Siam, the growing surplus means that the drop in the price obtainable from merchants who have lifelong experience of trade might already be enough to give the economy a horrid jolt. In Malaya, the government is bound to lose heavily on stocks bought at fancy prices. But the laws of supply and demand cannot be flouted indefinitely, except at an unwarrantable cost, and it is the people of Malaya who at present have to foot the bill. Considering the political and economic demands already being made upon them, it is quite wrong that they should continue to do so. If prosperity and political progress are to flourish in Malaya, both London and Kuala Lumpur must bring a greater sense of realism into their economic policies.

People for Export?

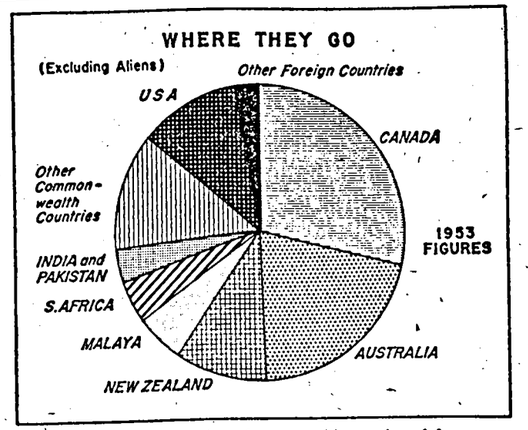
EMIGRATION, like commercial television, antivivisection and the slaughter of horses, is a subject that shatters the quiet of London clubrooms and provokes passionate letters in the columns of *The Times*. At present it is more than usually a matter for heartburning, for in spite of what is being done to promote it, emigration from Britain to the Commonwealth has fallen slightly. The Board of Trade's latest returns show that in the first quarter of this year about 33,000 people emigrated. This was some 5 per cent less than in the first quarter of 1953; and emigration in the full year 1953, amounting to some 155,000, was 15 per cent lower than in 1952. Is the postwar spurt already becoming exhausted? Does it matter if it is?

In the last nine years the policy of encouraging emigration to the overseas Commonwealth has been more vigorous than is generally credited. As far as can be judged from the unsatisfactory statistics available, Commonwealth countries have been receiving between 110,000 and 150,000 emigrants from Britain a year, and sending to Britain 50,000 or 60,000—including an unknown number of United Kingdom people who have changed their minds and come home again. Australia has received more migrants than any other country, because it is the only Dominion to have a joint agreement with the United Kingdom under the Empire Settlement Act (which was last renewed in 1952). Under this agreement the United Kingdom pays a lump sum of £150,000 towards the cost of fares, while the Australian Government contributes the rest, apart from £10 of each fare which is paid by the emigrant himself. New Zealand pays the whole passage money for rigorously selected emigrants up to the age of 45, but makes no call on United Kingdom resources on the ground that it is enough to be taking some of its more virile workers. Canada, on the other hand, takes the view that so much assistance may attract less desirable types, and it merely offers to suitable migrants the loan of their fare, which must be repaid within two years. In spite of this, Canada has been second only to Australia in its power to attract immigrants, and in 1953, after Australia's official programme had been temporarily cut by half, it was second to none. Southern Rhodesia has had to establish a quarterly quota and so far has offered no assistance. Nor does South Africa, which has little demand for white labour except of a trained technical kind.

The Dominions, up to the present, are fairly well satisfied with the rate of emigration in so far as it affects their individual development. But should Britain be satisfied too? Three arguments are customarily put forward by those who would like to increase the rate of outflow. The first—and worst—is strategic. It is asserted that it is folly to concentrate so much of the Commonwealth's industrial potential in places that would be the first and easiest targets of the hydrogen bomb. Very large segments of Britain's population and industry should therefore be moved to the overseas Commonwealth in the next fifty years, just as the Russians have moved so much of theirs behind the Urals in a much shorter period. The answer to this argument is that unless the policy were carried out on the very largest scale it would bring more weakness than strength. The industrial complex of the United Kingdom is one of only three or four in the world large and varied enough to sustain a major war effort; even so it has some deficiencies. To chip little bits off it and send them to the ends of the earth would merely increase its weakness without creating a correspondingly integrated complex elsewhere—even if it were politically possible for all the bits and pieces to be re-assembled in one country. For the policy of strategic removal to make sense would require the removal of at least a score of million people and thousands of millions of pounds worth of fixed capital. This simply could not be done in a democracy. Even to move 15 million people out of Britain over the next half century would be impossible without compulsion. It is true that a Gallup Poll taken about two years ago disclosed that one family in three would be willing to move to the



Dominions; but that was just in theory. The strategic argument also ignores the fact that Atlantic defence policy is based on deterrence by strength now, not by the absence of targets in 50 years' time, with all the weakness caused by violent upheaval in the meantime.



The second argument in favour of mass emigration is supposed to be economic; it is based on the fact that Britain cannot feed itself, and on the fear that in the long run the terms of trade will become less rather than more favourable. This forecast cannot be proved; even if it could those who support this theory ignore the fact that British emigrants do not now go overseas to grow food for Britain. They did so when there was too much food already; but now they go to work in industries that compete with British industries, often behind tariff walls, and they will eat more and more of the food that once was exported to Britain. Their emigration may well reduce the volume of Britain's industrial exports quite as much as the need for imports of food, leaving the balance worse than it was.

★

The third—and possibly the best—argument in favour of more emigration to the Commonwealth is that it may be the only way to enable the link with Britain (and the propensity to buy British) to be effectively preserved. The Dominions already try to keep up the British element. New Zealand, for example, is particularly anxious not to dilute its Commonwealth blood—apart from a sprinkling of suitable people like the Dutch. In 1953, the year of highest immigration, 29,000 people emigrated to New Zealand, of whom 22,500 were from the Commonwealth, and 15,000 of those were from the United Kingdom. In Australia, the British have accounted for about half the 800,000 people admitted since the present settlement scheme began in 1947, and this is still the proportion aimed at. The other half is very mixed; it includes 10 per cent Italian, 9 per cent Polish, and 6 per cent Dutch, as well as large numbers of displaced persons received through the International Refugee Office. But this dilution does not seriously threaten the British character of the population. In 1946 over 97 per cent of Australia's population were of United Kingdom stock; it is estimated that when the population has risen from its present 9 million to 10 million, those of British descent will still account for about 90 per cent. In Canada there is even less worry about this ethnic question, although the British are admitted on easier terms than other migrants. Any British person of good health and good character can go to Canada without the usual selection by occupation. But otherwise the Canadian Government lets things take their course. It has not been a Commonwealth course. Out of over a million immigrants into Canada since the end of the war, only one-third have been British.

The principal lesson of Canadian experience would seem to be that the British element of the population can be considerably diluted without weakening the ties that bind the Commonwealth. But is there a secondary lesson: that Britain, in the name of Commonwealth solidarity and strength, has been making an unnecessarily heavy sacrifice of skilled workers who are badly needed in a country where there is already a shortage of youth and an excessive proportion of old age pensioners? The agreement with Australia is supposed to take account of manpower needs in the United Kingdom; no attempt is made to recruit workers whose present occupation is in essential industries that are short of labour here. Some slight effort is also made to avoid taking only active workers while leaving their aged dependants behind; whole families, including grandparents, can have their passages paid if they accompany a successful applicant of under 45. Nevertheless it is obviously the skilled workers and the young people who are going. In 1953 of 65,450 people who emigrated from the United Kingdom to ports outside Europe, all but 9,000 were

Note: In the statistics on which these charts are based an emigrant is defined as one who takes up residence abroad for one year or more.

under 45. Of the 47,900 who were aged 15 years and over, 2,700 were agricultural workers and 8,500 were from the engineering and metal trades, while only 1,000 were unskilled labourers. These losses were, of course, partly offset by gains from immigration into Britain, which were particularly marked in the professional and managerial group. But there remained a loss amounting since the war to some 600,000 people, most of them active people. No one would suggest that they should have been prevented from emigrating, any more than that they should be compelled to do so. But whether they should be enticed away with assisted passages is another matter.

The Government has already given notice that it may think again about its migration policy. When the agreement with Australia was renewed last April it was for one year only—instead of two as the Australians asked—on the ground that the whole subject would be reviewed. It should be reviewed, and on a Commonwealth basis. It may seem strange to suggest yet another inquiry when there have been so many already, or to take refuge in the usual haven of unconstructive criticism by calling for a Royal Commission. But before any new decision is made the issues involved need a fresh and more dispassionate examination. This, more than most matters of public policy, is one where the true public interest requires disentangling from the emotions, natural and noble though they are, that arise on its first contemplation. The strategic situation has changed and there is a wealth of new experience in postwar migration to be taken into consideration. Would it not be possible to grant a Royal Warrant to a Commission to which the dominion governments might propose members? That, in itself, would be another welcome sign of Commonwealth solidarity and strength.

Notes of the Week

Deep Waters in Peking

IN Peking Mr Attlee and his party seem to be getting into ever deeper waters. They are not, it is true, being overwhelmed by the advantages of life in People's China ; many of the delegates clearly have their reservations about these. But in their talks with the Chinese leaders they are running the risk, perhaps involuntarily, of getting completely out of their depth.

Probably Mr Attlee and his colleagues had little inkling of the diplomatic methods to be adopted by the Chinese ; these are unusual, to say the least. The Labour party leaders are being treated as if they were certain to form the next government in Britain ; this must be slightly embarrassing for even the most self-confident amongst them. Every effort has been made to persuade them to oppose the plans for a South East Asian defence organisation that are to be discussed at the Philippines conference next month ; and Mao Tse-tung, in his first meeting with the Labour delegates, apparently made a frank attempt to persuade Mr Attlee to follow the Communist line in foreign affairs and to expound, presumably in the House of Commons, a policy that would certainly cause grave difficulties with the Americans. What exactly was said at this meeting is not known ; the Labour delegates, several of whom have their own journalistic commitments, are being consistently tight-lipped. But it is believed that Mao proposed that the United States should withdraw its Seventh Fleet from Formosa's neighbourhood, that it should cease pressing for the rearmament of Germany and Japan and that the delegates should persuade the Labour Party to follow a "more reasonable" foreign policy. What he offered in return is unspecified, but it was probably one or more Asian non-aggression pacts. Mao Tse-tung's price for peaceful co-existence is high.

There is an air of bizarre unreality about conversations along these lines between the Chinese Communists and the representatives of the British Opposition. What the Chinese hope to get out of them is obvious enough. What Mr Attlee stands to gain from them, apart from a good deal of embarrassment, is not so clear. Mao's reported demands do not even reveal anything new about Peking's policies, unless it be the fact that its active interests apparently stretch beyond Asia into Europe. What they do reveal, however, is the immense self-confidence, determination and even effrontery with which Mao and Chou En-lai are pushing their plans. If Mr Attlee and his friends grasp this, and if, moreover, they have been able to give the Chinese a better understanding of British interests, their journey might turn out to have been really necessary.

The Strange Debate

HOWEVER carefully he treads, M. Mendès-France may be faced next week with a spate of resignations and a crumbling majority. Whatever he says about the EDC Treaty in the debate opening this week-end will offend someone in his cabinet. Thus the EDC Treaty is finally launched on the parliamentary arena in the strangest and most unpropitious circumstances. The premier presenting it has just been arguing in Brussels how unacceptable this document was in its present form ; he can hardly be expected to have changed overnight from stern judge of the treaty into its enthusiastic advocate. As could be foreseen, having suffered his first set-back in Brussels, he has refused to make ratification a question of confidence. His cabinet is as divided on the issue as the Assembly itself, and any injudicious twists in his summing-up before the parliamentary verdict are bound to provoke the wrath of some colleagues.

The worst of it is that this is unlikely to be a debate to end all debates on this issue. Next week M. Mendès-France will probably not be in any better position to go ahead unperturbed with what he has always considered his primary task: to guide the economic convalescence and recovery of his country. He had found the deadly EDC controversy in his parliamentary path and decided to remove it rapidly so as to instil some sanity into French political alignments. Yet, should even the present debate, as seems very likely, hammer the last nail into the coffin of EDC, its ghost will go on haunting parliament. The problem of relations with Germany, including the oft-forgotten but crucial test of a Saar settlement, will remain more acute and urgent than ever.

There may be a majority in the National Assembly against EDC, but can at least 314 votes be mustered for any realistic alternative solution? If the debate is to serve a real purpose it must tackle this problem and give a positive answer. At worst, rejection could be clothed with so many reservations as to be almost insignificant. M. Mendès-France—whose favourite maxim is that "to govern is to choose"—could set the tone of the debate by stressing how vital is the choice facing the Assembly and asking the deputies to keep in mind the alternatives when casting their vote. On the trend and temper of the speeches made will depend the mood in which France's allies consider its future claims to confidence and patience.

The Easy Six

SIX by-elections are now outstanding, four in Labour seats, two in Tory. As the accompanying table shows, all are so safe (and would require such massive swings to change hands) that the only signs of tension are in the selection conferences of the dominant parties. Nevertheless, the six constituencies should provide a sufficiently representative cross-section of the electorate to show how it is currently thinking. There are two mining seats at stake (Aberdare and Morpeth), one typical East End constituency (Shoreditch and Finsbury), one fairly representative industrial town (Wakefield), one slice of Suburbia (East Croydon) and one plot of Tory grass roots (Aldershot). To get a complete picture a Lancashire seat would also be needed, to show how the anxious cotton workers would vote ; but if the six now vacant all show a clear swing to the right or left there should not be much doubt that this is a national trend.

Whatever the results, they cannot be of great help to the Tories. Even if there is a swing to them, they dare not face the electors while they are still trailing so many loose ends, not least the uncertainty about their leadership. Not until Mr Eden is safely installed in Downing Street (or Sir Winston Churchill clearly there for another long spell), the pensioners are getting more money, and Mr Butler has spread his rays of fiscal sunshine are the Tories likely to feel ready for an election. That means next summer at the earliest, and almost certainly not until next autumn or even later.

THE BY-ELECTIONS PENDING

	Labour Majority over Conservative at last Election (Votes)	Conservative Majority over Labour at last Election (Votes)	Swing Required to Change Seat (per cent of Total Votes)
Aberdare	27,973	...	31·6
Morpeth	16,875	...	21·9
Shoreditch & Finsbury	18,763	...	22·6
Wakefield	7,702	...	8·3
East Croydon	...	9,667	8·8
Aldershot	...	8,549	10·3

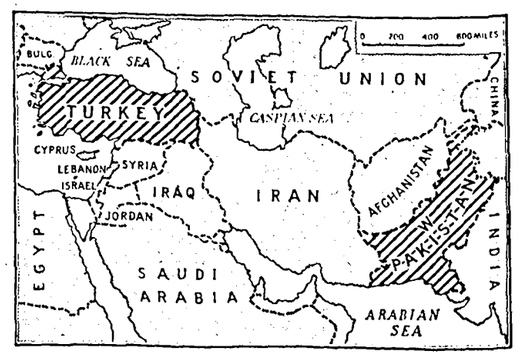
But if a swing to the right cannot help the Tories, a swing to the left can hinder them. There have for some time been ominous signs that, except over German rearmament, the Labour leadership is slipping into the groove of irresponsibility which always lies so temptingly close to Opposition parties. Good returns from the autumn by-elections would be regarded as vindicating these irresponsibilities—particularly, of course, over relations with the Communists. Labour would be encouraged to give the Government a rougher time at Westminster, and after three years of office on a narrow majority the average Tory MP is not so resilient as he used to be. If the Government wants to protect its supporters from being driven hollow-eyed, it will be wise to stir itself at these by-elections.

Too Wooden Horse

THE General Council of the Trades Union Congress is a massive organisation, with a large and able research staff. The report that it has just issued for the annual congress of affiliated unions, which will open at Brighton in ten days' time, sets down its painfully-considered views on no less than three hundred and thirty-eight matters that have been brought to its attention in the past year. It contains the lengthy memoranda that the General Council has submitted to official committees or commissions that are considering the national insurance scheme, the cost of the health service, vocational training and a long string of other subjects. It contains shorter statements of the views that the General Council has passed on to Whitehall about such matters as air pollution and the consumer's interest in agricultural marketing schemes. It contains a summary of its views on the general economic situation, and a record of the action it has taken in response to specific complaints submitted to it by individual unions.

Nearly all the lengthy statements start in the same promising way ; the recommendations on national insurance start

with an excellent practical summary that moves on to intelligent appraisal of the dichotomy between a social service and an intended actuarial fund, and the statement on the economic situation puts forward an arguable (even if not acceptable) case for slower progress in striking the shackles from Britain's vulnerable economy. But, unfortunately, all the statements end in the same dull way too.



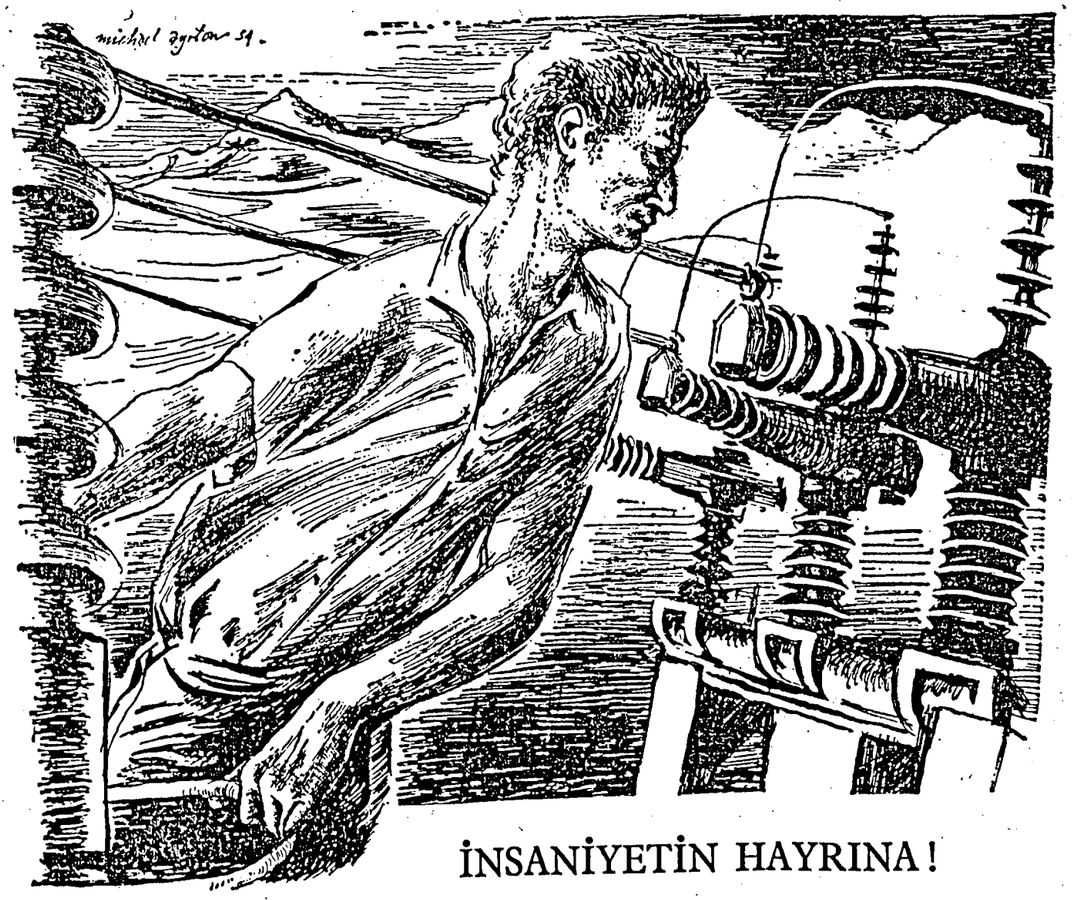
The moderation is there ("it will be of vital importance in the future to keep down costs and prices in order to meet foreign competition"). The grumbles against the rich are there ("the Government's budgetary policy and the markedly higher dividends that are now being paid are evidence that the better off are improving their already privileged position"). But originality is never there; all the proposals after all the statements are carefully aligned with utterances that have already been made, after much less thought, by the right wing of the Parliamentary Labour Party. It is impossible to believe that the able men who have carried out the factual research behind these statements have not formed original ideas of their own—about the retirement age, or about last year's seven shilling standard for wage increases, or about the way in which budgetary policy should really go. It is impossible to disbelieve that the General Council as a whole has solemnly sat on them. The General Council is a major force against extremism on the left; but, by resolutely determining that it will always propound the ideas that would have occurred to it even if it did not have all this research at its back, it is also helping modern Labour to become the least dynamic, least original and least exciting party that has ever occupied a prominent place on the British political stage.

Walking the Tightrope in Asia

MAPMANSHIP is a modern sport. Who, ten years ago, could have said whether the Iraqi frontier marches with the Soviet? Today, every tyro knows that Iran is the missing link in the chain that Americans call the "northern tier"—the defence line in Asia that began to take shape this spring when the Turks and Pakistanis signed their pact.

Wishful thinkers and tidy mapmen are now seeking signs that this gap is about to be filled. They have pounced on a recent statement by General Zahedi that "no country can afford to live in isolation," and on his spirited retort to a peremptory and tactless Soviet note of last month citing "American imperialist activities" designed to draw Iran into the Turco-Pakistani web; he replied that Iran, along with every other member of the United Nations, was entitled to join any regional pact it thought fit.

But to deduce that these preliminaries will lead to commitments, even as tenuous as those signed by Pakistan, is to miscalculate the Iranians' position and inclinations. They are not and have never been pro-western; their first thought must be for their undefendable northern frontier and how best to handle the immense neighbour on the other side of it. There is and will always be a strong body of opinion opposed to defying the Russians, and even a strong Iranian government could not afford to flout this view. A weak one could never do so, and Teheran must be expected, on grounds both of internal and external policy, to walk the tightrope in the way that it has practised, usually unsuccessfully, for some 150 years.



Graciously to accept American aid is one thing: boldly to sign assent to obligations on some dotted line is quite another. Even the West might be better off if Moscow were left guessing and grumbling, than if it were to be provoked by a weak neighbour at a spot that history has proved to be the most sensitive on the whole of the Soviet Union's southern frontier. It is a matter on which Washington should listen to British advice based on bitter experience.

Ripples Around Cyprus

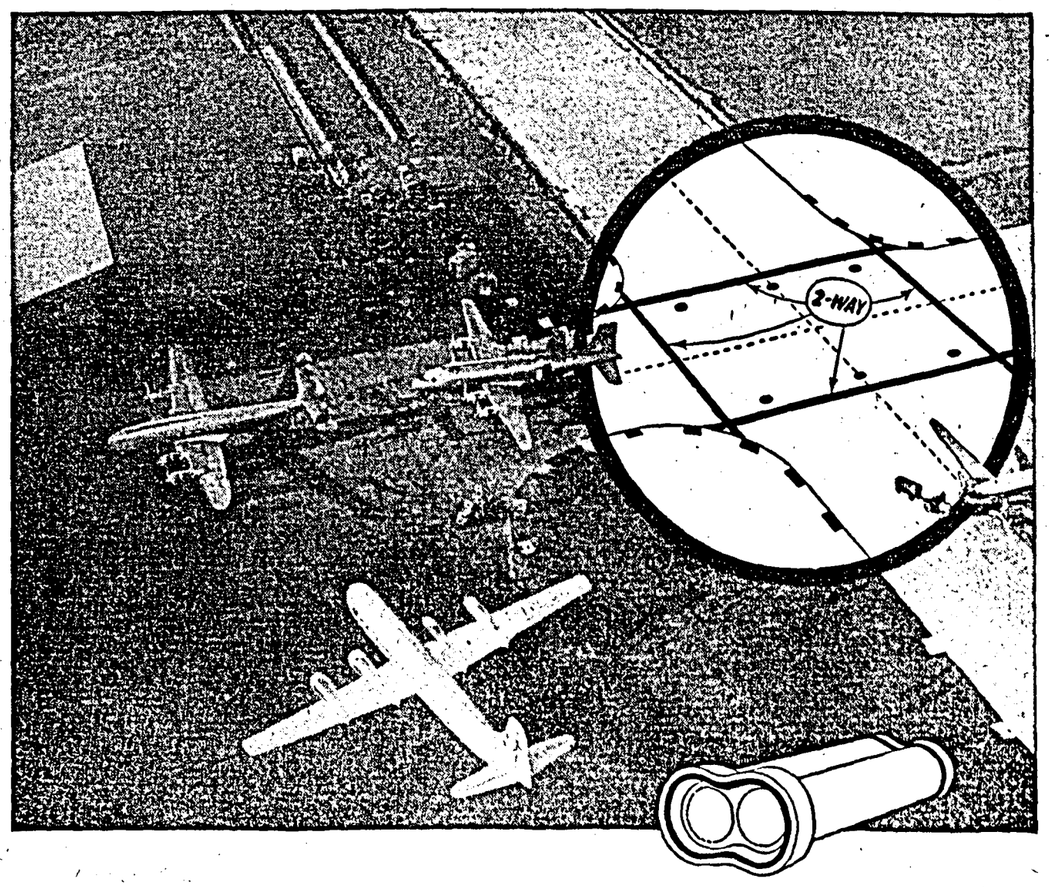
THOSE who like to think of the Cyprus problem as a simple issue—as the grievance of a people wanting self-determination and denied it only by liberty-hating Britain—must be baffled by the welter of complications presented by the news of last weekend. The Greek government, pushed to action by the Church—or right-wing—party in Cyprus, lodged in New York a request for United Nations intervention. The large Turkish minority in the island capped this move with a telegram in which its members "vehemently reject *enosis*, self-government or a plebiscite." From Ankara, M. Menderes expressed hope of "Greek moderation"; from Washington, news reached Athens of State Department counsel along the same line.

In New York, Greece's ambassador, M. Palamas, acknowledged that 30 per cent of Cyprus's population is Communist-led. In Athens, shopkeepers were permitted to close early in order to ensure a good attendance at a mass protest rally addressed by Archbishop Spyridon, during which members of the banned Greek Communist party seized their chance to hand round anti-western leaflets, 67 heads were broken and the police made some 150 arrests.

Simultaneously, the British government let the world know that its retort to anti-colonial busybodies at the United Nations would be a plea of "domestic jurisdiction," and illustrated in the current number of its annual report for Cyprus the great prosperity in the island, considerable parts of it at the expense of the taxpayer in Britain.

İNSANİYETİN HAYRINA!

HASAN IS PROUD that his job serves his country. More electricity means greater prosperity and a higher standard of living for Turkey. Hasan reckons that electricity is "*insaniyetin hayrınadır*—for the benefit of Man".



Hasan works at the Catalagzi Power Station, completed by Metropolitan-Vickers Electrical Co. Ltd. in 1948. Recently, the President of the Turkish Republic laid the foundation stone of new extensions that will double the size of the station.

Again Metropolitan-Vickers, one of the nine famous British companies that together make up A.E.I., are undertaking the work. The new contract calls for turbo-generating plant, boilers, switchgear, and all civil works, totalling some £3½ million.

A.E.I. are Associated Electrical Industries, whose Companies make everything electrical from a turbine to a torch bulb.

AEI
for everything electrical

Associated Electrical Industries are a family of companies:
Metropolitan-Vickers Electrical Co. Ltd.
The British Thomson-Houston Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Newton Victor Ltd.
Premier Electric Heaters Ltd.
Sunvic Controls Ltd.

Under an Airport Runway

If you never want to have to dig them up again put down

This is a typical runway intersection—it is a key point. Under it is a network of conduits, carrying the cables for the runway lights. If anything happens to those conduits, if they have to come up again—*two* runways will be out of action.

Think what that means to a big airport. Last year *in August alone* London Airport handled nearly 8,000 aircraft and 160,000 passengers. A lot depends on those conduits; they must be able to stay down there, doing their job—for good!

That's why they put down conduits of salt glazed vitrified clay.

Salt glazed conduits are glassy smooth and hard as nails. They are acid-resisting; sulphates in the soil cannot corrode them. The same applies to the hundreds of salt glazed *drain-pipes* that are out there too. Safe and efficient, salt glazed conduits and pipes can —and do—stay down for centuries.

Salt Glazed VITRIFIED CLAY *pipes and conduits*

NATIONAL SALT GLAZED PIPE MANUFACTURERS' ASSOCIATION

Worries of the Greeks

PHYSICALLY few islands are more blest than Cyprus, yet anger and uneasiness prevail there. A trip round its towns and villages reveals that many Cypriot Greeks are tuning in to Athens, which is paying them a gratifying amount of attention; Cyprus radio, muzzled by censorship, has grown too dull to be worth turning on. Archbishop Makarios, fountainhead of all the trouble, has uttered the forbidden word *enosis*, first in low tones in a village and, growing bolder, to the biggest crowd Nicosia has seen for many years. Cypriot distaste for violence is being flattered by use of the comforting argument that the British would like to provoke riots, in order to clap on martial law, and that these had therefore best be avoided.

Meanwhile, minds are divided among the Americans, who love self-determination but do not like encouraging Communists; and worry plagues the British and the Greek governments, the former because they do not want to make a martyr of the Archbishop, and the latter because most of their fellow members of Nato are adjuring them not to get out upon a limb.

Perhaps the solution to the matter lies in a remark made by Mr Palamas in New York last weekend. If Britain offered the Cypriots a more liberal constitution, he said, they might vote for that. The narrowness of the British offer has scared into opposition many moderate Cypriots who would like a self-governing constitution as a first stage. The British reason for hedging their offer with safeguards, such as the election of a minority of legislators and the nomination of a majority of them, was due to nervousness about the excellence of Cypriot Communist political organisation by comparison with the weak and inefficient political machinery of all the other parties. There are signs that these points are being grasped in New York and that if the Greeks there were to put up suggestions which the British could accept as a working basis, a peaceful way out of the tangle could be eventually found.

Labour and the Colonies

LABOUR'S latest declaration on colonial policy owes comparatively little to the Fenner Brockway school of thought, but it has still been written more from Mr Griffiths's bleeding heart than Mr Gaitskell's calculating head. Several new items are added to Labour's already long list of fresh calls on the British taxpayer, saver and consumer. It is proposed that there should be larger grants under the Colonial Development and Welfare Acts, bigger British contributions to the technical assistance and specialised agency funds of the United Nations, and grants in aid to a new International Development Agency that the party wants to see set up. Labour concedes that private capital will be needed, too; but it then lays down a wholly one-sided series of conditions, hedging the private investor with restrictions, threatening him with heavy taxation but offering him no guarantees, not even against expropriation.

This illustrates the dilemma underlying Labour's whole policy towards the underdeveloped areas. The party's thinkers know quite well that there are some 1,500 million people in the world with an average income below £100 a year; if each of the 150 million or so workers in Britain, the United States and other countries with an advanced standard of living voted to give 5s. a week out of their wages (which they will not), it would be just about sufficient to give each of these people a brand new hoe every year. Labour's experts know, too, that savings will not be invested in the chancy colonial field on the basis of restricted profits and without compensating safeguards. But these are facts unpalatable to the Labour rank and file; in a declaration that is to be submitted to the party's annual conference next month, rolling platitudes about progress and the multi-racial Commonwealth are needed, and the new declaration provides them in good measure.

The same is true of the political utterances in this draft, which are as vague as they are sensibly moderate. Everyone knows that "special arrangements" will be needed for territories too small to stand alone; it would have been more to the point if Labour had explained what "special arrangements" it would favour—for Malta, for instance, or Gibraltar. The Labour leaders do, however, deserve commendation for having screwed up their courage sufficiently to offer to covert rejection of Communist-sponsored colonial governments. The declaration states that "Labour's objective is to transfer power in each case to an established system of democratic government." Presumably Dr Jagan would not qualify in the western, as opposed to the Muscovite, meaning of that term.

It Did Not Happen

AN important point of principle has arisen about the pamphlet "It Need Not Happen," which Mr Bevan and five of his supporters in Parliament fired off as their principal salvo in the battle against a German contribution to western defence. In that pamphlet of 32 pages four sentences (two of them consecutive) were set down in heavy type, as centre pieces of the surrounding argument. One of these key sentences was:

> Dr Adenauer himself, speaking in Hanover in December, 1951, said: "Our chief reason for wanting to enter the European Army is to be able to recover our Eastern territories."

It now turns out that Dr Adenauer never said this. He said almost precisely the opposite: that although Germany's membership of the Atlantic community was a "most important question" for his audience (who were expellees from the East), and that although he believed that the "vital necessity" of recovery of their homeland could only be achieved "by way of a re-united Germany and by way of Europe," he wanted to emphasise that "by its very nature" EDC "can only be an association for defence." The Bevanite weekly *Tribune*, which sponsored "It Need Not Happen," contained a retraction and almost an apology last week.

Mr Bevan and his co-authors had apparently lifted this allegation, without attribution, from a speech by a French critic of Dr Adenauer—not from a speech by the German Chancellor himself. There is no doubt that they acted in good (though careless) faith, and if their misquotation had

appeared in a newspaper article simple retraction and apology in that same newspaper would have sufficed. But *Tribune* is read mainly by the faithful. "It Need Not Happen" is the nodal point of a continuing political campaign, and it now appears that one of its own nodal points is a straight though undeliberate lie. At the time of writing the pamphlet can still be bought, uncorrected, on the bookstalls; the very issue of *Tribune* that contains the retraction actually urges people to go on buying it. Mr Bevan knows quite well that heads of foreign governments cannot and do not sue British politicians for flagrant misrepresentation or libel; they had better not try. But surely he must also know that, so long as this pamphlet remains unwithdrawn or uncorrected, and if the admission published in *Tribune* last week is true, his personal honour and that of his five co-authors—they are Mrs. Barbara Castle, Mr Richard Crossman, Mr Tom Driberg, Mr Ian Mikardo and Mr Harold Wilson—will remain very much at stake.

Heads of Steam

SIR BRIAN ROBERTSON, the chairman of the British Transport Commission, is meeting the leaders of the National Union of Railwaymen and of the Transport Salaried Staffs' Association again this week-end. The third railway union, which represents the skilled engine-drivers and firemen, is staying away from this discussion. It still wants the dispute to be shunted through the remaining stages of the railway's arbitration system. Its general secretary, Mr Baty, will be away on a visit to the United States between September 9th and October 4th; and he therefore presumably does not expect or want the trouble to reach a head before he returns.

Any arbitration body that examined this dispute should—and probably would—say that the engine-drivers and other skilled workers have had a raw deal in the last twelve months, but that the unskilled and partly skilled men (who are in a majority in the National Union of Railwaymen) have had an unduly favourable one. The curious situation has therefore arisen that the NUR, which is most satisfied with the offer made to the majority of its members (although it is obliged to demand much more for its skilled minority if it is to hold on to their support), is least anxious to see the dispute go to arbitration and most ready to take early action.

The NUR knows, however, that the Transport Commission cannot afford to pay more; and it also does not really want a strike, from which its lower-paid majority would get no benefit at all. Its energies are therefore likely to be concentrated on exerting pressure upon the Government to step in with a railway subsidy, without too much more public airing of the rights and wrongs involved; all the inconsistencies of the present situation could be washed away by a subvention from the taxpayers' bottomless purse. The Government, for its part, must know that such a subvention would be the most dangerous expedient of all, however much Sir Winston Churchill may want internal as well as external peace in his time. Amid this complex pattern of organisational and personal pressures, bearing down on each of the parties involved in this dispute, it is not going to be easy for the public interest to be well served.

A Clear Win for Malan

THERE is no denying Dr Malan's overwhelming victory at last week's provincial elections. In all three provinces in which polling took place—Cape, Transvaal and Orange Free State—the Nationalist party scored uniform and considerable successes. The predominantly white electorate has given the government an unequivocal vote of confidence. People of liberal convictions, no less than the opposition parties in the Union themselves, will be tempted to throw up their hands in despair; but there is no reason for undue pessimism. Indeed, if the opposition leaders learn the obvious lessons, this could be a turning point; but the lessons are hard. First and foremost, it is plain now that the Nationalist party is solidly entrenched at least for a number of years, possibly for a decade or more. The hoped-for democratic miracle that would throw them out of office, which has long sustained the United party, is an empty myth. In the long run, however, Dr Malan and the policies he stands for are doomed. Even the Nationalist press, which has recently been timidly advocating more white immigration, is apparently conscious of the awful facts of political arithmetic.

Secondly, the anti-government white electorate must work out a realistic alternative policy to *apartheid*. The United party has recently edged hesitatingly in this direction, and promptly lost seven of its parliamentary supporters as a result. But it has not gone far enough, for merely to admit the fact of social and economic integration of white and black is not itself a policy. Mr Strauss must come into the open with the party's plans for the political future of the non-Europeans. This will lose more votes on the *platteland*, and there will be more desertions in Cape Town, but the United party will emerge stronger and with a stake in the future.

Though no doubt warmed by these gratifying results, Dr Malan and his cabinet will find the immediate problems of office no whit easier. A few more Nationalist senators might add their votes to the Coloured Voters Bill, but not enough to get the two-thirds majority needed; control of three out of the four provincial councils will enable the architects of *apartheid* to hasten their plans. But to gain their final objectives—such as full-scale *apartheid*, and a Republic—the Nationalists need many more votes. The opposition, therefore, have room and time for manœuvre which they should use.

German Strikes Hit Dr Adenauer

WEST GERMANY'S labour unrest is still on a small scale, but it may spread. The strike in the Hamburg public services has ended with success for the strikers, but this is not the end of the matter. The Federal Government has rejected a general increase of pay in the federal services on the grounds that the whole of the country's price structure would be affected. Negotiations between the *Laender* and unions on wages in the local public services have also broken down.

In Bavaria the engineering strike has not yet ended after more than two weeks, though a number of smaller works have given in to the strikers' claims. The union, as well as the employers' organisation, is in a strong financial position to hold out owing to the long industrial peace both have enjoyed; but the labour side has an advantage owing to the shortage of skilled workers which prevails in spite of there being over six per cent of the working population unemployed. Scuffles between "blacklegs," pickets and the police have died down. They are not in keeping with the sentiment of the public or of the workers, who are inclined to believe that men have a right to work if they wish.

It is fortunate that, outside Bavaria, negotiations in various smaller industries have led to settlements which can be borne without driving too many weak firms to the wall. On the whole, West Germany's economy can now bear increased wages, but its political structure would be shaken by a class struggle.

It seems likely that extremism on the part of the unions is less to be feared than a stubborn attitude among a section of the employers. The workers are disinclined to strike, and respond to the somewhat paternal ideas held by the Christian-Democrat party and employers in their ranks. The die-hard employers are, roughly speaking, grouped behind the right wing of the anti-Catholic Free Democratic party, which has been taken into the cabinet in Germany's key industrial centre, the Ruhr. But even the policy of Dr Adenauer's Christian-Democrats, generally more moderate, is likely to be influenced by the type of employer who would secretly like to prohibit all strikes. How strong this group is will be shown by the fate of a Bill to introduce co-management in the Ruhr holding companies, which Dr Adenauer is to introduce next month. The Free Democrats dislike co-management as much as higher wages, and the hard-pressed Chancellor's effort to placate the unions may well involve him in a breach with his coalition partners on internal issues as well as foreign policy.

Eating on the Rates

THE compulsory closing of the civic restaurants run by the London County Council will end another Socialist dream. Introducing the Civic Restaurants Bill in 1946, Mr Strachey and Dr Summerskill looked forward to local authorities' restaurants as instances of people meeting their social and economic needs through communal enterprise; as instruments of a national food policy; as places to which the working-class housewives could take their families to enjoy what private enterprise failed to provide for them—"good, wholesome meals" at prices they could afford.

Fortunately, the Labour Government was realist enough to insert in the Bill a clause taking away the powers to run restaurants from any local authority which showed a loss on them in three consecutive years, although in certain circumstances the Minister of Food could grant a reprieve. The caution was justified because the whole idea of civic restaurants was based on the wartime "British Restaurants," which the local authorities ran as agents for the Minister of Food. They were started in different conditions and for different purposes—to provide emergency feeding arrangements after air-raids; to meet the increased demand for eating out caused by rationing and by the absence of so many women from their homes; and to take the place of industrial canteens for the small factories. The charges made by the local authorities were meant to cover their running expenses, and the Ministry paid the rest of the bill.

The popularity of most British Restaurants during and immediately after the war was thus no guarantee at all that civic restaurants would be either popular or profitable once food became more plentiful and once the restrictions on catering by private enterprise were eased. When Mr Strachey moved the second reading of the Civic Restaurants Bill, there were over a thousand British Restaurants, of which about 150 were being run by the London County Council. Since then there has been a steady fall, and today 74 local authorities are running about 200 restaurants including the 29 in London that are now to be closed. The LCC is not the first authority to lose its powers, nor has it any cause for complaint. The Ministry of Food had already granted two reprieves for its restaurants, which had cost the ratepayers over £71,000 up to last March. If they could not be run profitably while the last vestiges of rationing remained, their future chances of doing so were very slight.

Ultimatum at the Ballet

SADLER'S WELLS THEATRE is to be "dark" for a fortnight and the provincial tour may be cancelled because of the dispute over salaries offered by the Sadler's Wells Theatre Ballet Company. The dispute deserves a place among the oddities of trade union history. It has been fought out in an attempt to get an extra 10s. a week for nine workers; the cost of settlement to the company would therefore be precisely £4 10s. a week.

The Sadler's Wells company was started after the war in order to provide ballet interpolated into opera. But since then it has grown in stature and become a ballet company in its own right. On their return from a recent tour of South Africa the artists employed by the company felt that their pay was below their station. They demanded that the new season's contracts should give them an all-round increase of £2 a week—later modified to 30s. After some haggling the management agreed to pay an extra 30s. a week to all but nine of the artists concerned, to whom they offered an extra £1. The artists, however, had been organised by Equity, and with the remarkable solidarity that is typical of the profession, they still refused to sign the contracts.

There will be some sympathy for this claim, for ballet dancers are notoriously badly paid. In the company's last season the salaries of many members were on or near the minimum of £7 a week. That minimum was too low. But the effect of Equity's new claim is to force on the Sadler's Wells' management a minimum wage £2 higher than the one that has been duly negotiated in the industry. In view of this, the management is right to stand firm on the principle that it should be allowed to judge the merits of individual members of its company. If it thinks that nine of them are not yet as talented as the rest, it should pay them less than the rest—even though it is suffering such hard kicks for such remarkably few halfpence.

Piastre or Dollar?

THE monetary talks between France and the three Associated States of Indo-China are a corollary to the Geneva conference. Postponed last week because the Cambodian delegate had not yet received his government's instructions, they have now made a belated start in Paris. The ostensible aim is to determine the future shape and allegiance of the currencies in the three states, but there is an air of unreality about these negotiations. Viet Nam's economy has been so disrupted by the war, and its future is so uncertain until general elections in 1956 have determined its direction, that it is difficult to find a useful purpose in a conference so soon after the cease fire. And while the disruption has been less pronounced in Laos or Cambodia, the economies of the two smaller states are so closely linked with, and dependent upon, Viet Nam's, particularly Cambodia's, that there also an indefinite postponement might have been advisable.

It is not hard, however, to explain the eagerness with which the three, or rather the two and a half, Associated States, have rushed into conference. It is a simple consequence of their new-found "independence," formally recognised by treaty in the case of Laos, embodied in various agreements in Cambodia's case, and the subject of two Franco-Viet Namese agreements which, though initialled on both sides are not likely to be ratified in the foreseeable future. It is intolerable for countries that have just won their independence not to have their own individual currencies. The present inter-State piastre, discredited, overvalued, abused by speculators and fortune-seekers, is a poor symbol of independence. A more inspiring, self-respecting substitute is needed.

The present Indo-China monetary union emerged from the inter-state conference at Pau in 1950. The main task of the present conference will therefore be to undo the work of the preceding one. It will be surprising (particularly to the French) if either Laos or Cambodia should seek to leave the franc zone, though anything is possible in the climate of "independence." Individual monetary units and nominal freedom will probably satisfy the aspirations of Pnom Penh or Vientiane. Viet Nam's attitude is much less certain. The tendency of Mr Ngo Dinh Diem's government is all away from France and towards America. How far Washington would be prepared to respond is problematical. One thing only is certain: the French dream of a unified Indo-China is about to crumble a little more. But now that the French have at last relinquished their insistence on keeping the franc zone intact, this might not be a bad thing. If the heavy load of the piastre could be shed elsewhere, M. Mendès-France should be delighted.

All in the Same Boat

IT is a moot point whether or not the shipwreck of the Greek royal yacht *Agamemnon*, now cruising in the Mediterranean, would end the crowned dynasties of Europe. Against such a grim eventuality, a few young princesses have been left weeping on the quay. But on board ninety-five royal, and sometime royal, personages are sailing among their realms. Ex-King Umberto looks sadly towards the shores of Italy, while the Comte de Paris scans the horizon for the sight of France. The guests from the Spanish royal house, on the other hand, may be saying to themselves that one of their finest hours is still to come; for there are strong hints that the Caudillo may choose the Infante Juan Carlos to succeed him. There is a touch of Strauss operetta about this cruise through the ancient seas with a passenger list straight out of the Almanach de Gotha.

It is easy for comment to become ungracious. One can speculate with doctrinaire irony on whether it is a proper time for royal promenades, with sucking pigs roasting in vine leaves. One can wonder what will come out of this rendezvous between so many eligible young princes and princesses near Calypso's isle. Or one can reflect on the fact that some of the dynasties aboard the *Agamemnon* have shown to best advantage without the crown.

But there is also a brighter side. From our summer of discontent we can look on this cruise as a symbol of a wiser, and in many respects happier, past. Has the expulsion of monarchy brought to certain Latin countries a stabler regime? The personal commerce of royal families provided in the past a sense of European community on which the present divided nations may look back with regret. And is it mere hazard that democracy at its most serene—be it in the United Kingdom, in the Netherlands or in Scandinavia—has been democracy allied to kingship?

Railway Disasters

There have been numerous accidents of late, confirming foreigners in their belief that as soon as Parliament rises, and the daily papers are with difficulty filled, they procure disasters or invent them to keep the public interest alive in their lucubrations. We entirely acquit our contemporaries of the foolish charge, and even of the supposition that they conceal anything, or fail to make as much of disasters which occur when Parliament is sitting as when it is dispersed for needful recreation. In the carelessness engendered by temporary success, in multiplied excursion trains, in the hurry of many persons making holiday, and in a want of strict personal responsibility, we can perceive causes sufficient to account for these disasters, without in the least countenancing the supposition of our foreign acquaintance, that such events are overlooked at another time by journals, or now in some way or other caused by their agency. . . . How to prevent such terrible misfortunes—if preventable—is the problem which engages public attention. In what is usually called a natural condition of society, the friends of the dead, when killed by the negligence of others, would demand a rigid satisfaction from those who caused the death, even to requiring life for life. . . The negligent heads of a company which causes such destruction should only be protected by the law from the vengeance of the friends of the sufferers on condition of making all possible reparation. If the directors cannot be made responsible in person, if we are wiser than to adopt the principle of life for life, they should be made heavily responsible in purse. . . . They must not be allowed to strut about the streets, claiming great honours and wealth as directors of this or that great company, and cast all responsibility to the wind. . . .

Letters to the Editor

Why America Did Not Slump

SIR—I find in the current number of *The Economist* the following astonishing statements.

"By rights, the United States ought now to be in a deep depression; the fact that it is not can be explained only by the persistent refusal of the American public to accept the diagnosis. . . . [This, and certain other things you mention] are clearly going to have a deep effect on the whole trend of economic thought. They may well force a reaction against the mechanistic model-building, the equation-hawking, of recent years."

This statement, so far as it relates to the American economy, is advanced in support of a proposition, enunciated elsewhere in the same article, namely that "public 'confidence' is, after all, an important factor in preserving prosperity." This proposition may well be true; but the verdict you pass on the American recession cannot be cited in support of it, because it is just not the case that it is public "confidence" that has saved the United States from a deep depression. It is quite true that there has been a marked fall in gross national product and that this, contrary to what some people expected, has been unaccompanied by any significant fall in private consumption expenditure; but "confidence" cannot be held to have played more than a quite minor part in bringing about this happy result.

What are the facts? I have tried to tabulate them in the accompanying table. Taking the national income figures for the second quarter of 1953 and (so far as available) the first quarter of 1954 as our guide, we find that the decline in gross national product is due almost entirely to the decline in four of its components. These four can be subdivided into two which we can call originating causes and two which must be classified as contributory or consequential causes (acceleration effects). Reckoning throughout in thousands of millions of dollars, the rate of expenditure on national defence declined by 5.9, and on other national security (largely I suppose foreign aid) by 0.8. These two, aggregating 6.7, constitute the originating causes of the recession. To them we must add the two consequential causes:

THE US RECESSION OF 1953-54

Changes in certain magnitudes between second quarter of 1953 and first quarter of 1954
(Seasonally adjusted annual rates. Thousands of millions of dollars)

Generating Factors		*Corrective Factors*	
Decline in expenditure on:—		Automatic:—	
National defence*	5·9	Corporate tax liability (decline)	6·4
Other national security*	0·8	Govt. transfer payments (rise)	1·6
Producers' durable equipment	1·7		
Inventory accumulation	11·1	Deliberate:—	
		Federal expenditure, non-defence* (rise)	1·3
		State and local govt. expenditure* (rise)	2·5
		Personal tax payments (decline)	3·3
		New construction (rise)	1·0
		Accidental:—	
		Net private foreign *dis*investment (fall)	1·4
		Confidence:—	
		Corporate dissaving†‡	5·6
		Personal dissaving†	— 2·8
Other factors—mainly a "perverse" rise in social insurance payments	1·4	Decline in personal consumption expenditures	0·6
	20·9		20·9

* Goods and services only, *i.e.*, excluding transfer payments.
† Decline in positive rate of saving.
‡ Figures for first quarter of 1954 not available (to me), figure given shows change between second quarter 1953 and fourth quarter 1953.

a decline of 1.7 in the rate of expenditure on producers' durable equipment, and a decline of 11.1 in the rate of inventory accumulation. Adding all these four together we get a total of 19.5.

If the halt, or "saucering out," in the recession were due to "confidence," all or most of this 19.5 would be matched by a corresponding volume of dissaving—or reduction in saving—by businesses and individuals. In fact the reduction in saving, the confidence element, amounts to a mere 2.8. But this total conceals contrary movements in the two components of which it is made up. Business dissaving (made up of the decline in corporate profits after tax *plus* the increase in dividends) amounted to 5.6. I will grant you that this represents a substantial element of confidence. But personal dissaving declined — i.e., personal saving increased—by 2.8; so that the behaviour of individuals tended to accentuate the recession rather than to counteract it.

The correctives of a recession may be classified under four heads: (i) "confidence," (ii) accidental, (iii) orthodox, automatic, and (iv) orthodox, deliberate. (By "orthodox" I mean orthodox in terms of the mechanistic model-building to which you refer in such surprisingly contemptuous language.) There has been a "confidence" corrective, as we have seen, of 2.8. There has been a decline in net foreign disinvestment (equivalent to an increase in foreign investment) of 1.4; this I should regard as "accidental." The other corrective factors, amounting in the aggregate to 16.1, have all been "orthodox." Of this total, automatic, or "built-in," stabilisers account for 8.0. The two components are a decline in corporate tax liability of 6.4 (people are apt to forget that before the new bill was passed the corporate profits tax was at a rate of 52 per cent), and an increase in government transfer payments (unemployment insurance and the like) of 1.6. What I call the deliberate orthodox correctives can be subdivided into those due to action by the Administration and those due to action by the monetary authorities. Due to the Administration are the decline in personal tax payments, amounting to 3.3, and the increase in non-security expenditure of the federal government, amounting to 1.3. Due to the easy money policy of the monetary authorities there has been a rise in the rate of new private construction of 1.0, and the rise in the rate of state and local government expenditure of 2.5 can be attributed largely if not wholly to this cause.

It should be emphasised that these figures are only provisional, but they indicate why it is that personal income and personal consumption expenditure have remained remarkably steady, and they show that this is due mainly to the operation of orthodox correctives, built-in and *ad hoc*, and only to quite a small extent to public "confidence."—Yours faithfully,

P. A. WILSON

London, W.1

Needless Scarecrow

SIR—Your leading article last week makes a far more rational contribution than has yet come from the non-socialist side, to what I believe to be the most important economic issue in public life. You refer to me as one of the scarecrows: but are we needless? Without trespassing on your space I can only make three bare points.

(1) I agree, and said so in the article in the *New Statesman* to which you refer, that it would be as impossible as it would be undesirable quickly to rebuild anything resembling the wartime system of controls, with consumer rationing, etc., and a future Labour Government would not attempt it. But I do not agree that it would be impossible to "slam down the hatches at the exchange control department of the Bank of England." Moreover it should be gradually possible to establish a measure of control of the volume of imports and to promote the provision of an adequate proportion of the national product for export.

(2) I agree that it is unlikely that it will be possible for the next Labour Government "to make a large and rapid transfer of a slice of the national income from one class to another." But it nevertheless seems as inevitable as it is ethically desirable, that all governments of the Left will tend towards a redistributory policy. And that, experience indicates, will be enough, in your graphic phrase, "to scare the crows." My simple thesis is that unless there is some effective measure of "crow control," Left governments are impossible.

(3) What is your solution? I am sure that you are too intelligent to suppose that the solution is to have permanent Conservative Governments. You demand "the re-emergence of a generous, idealist and dynamic Left." So do I. But do the crows?

At any rate one must be grateful for your leader, for the decisive thing for the welfare of the country is that this issue should be dragged into the light and rationally discussed. I do not pretend to have any ready made solutions. We shall all be profoundly interested if you, sir, will now expound a non-redistributory economic policy for the Left, which is what, I take it, you have in mind.—Yours faithfully,

JOHN STRACHEY

House of Commons

Truce in Babel

SIR—I regret to read that *The Economist* suggests a truce in psychological warfare. In the world wide war of ideas we have weapons which (unlike atomic bombs) the Communists can never possess.

Paradoxically, the Communists and the Nazis—see "Mein Kampf"—have been more far-seeing than the democracies in their appreciation of the importance of political warfare in a total war, which they have always realised is something much more than "military operations."

Communists—as you point out—spend much time and effort in trying to ensure that their people shall not hear or read what we have to say. They are not fools; they do this because they are afraid of the consequences of an informed and non-regimented public opinion. This is their Achilles heel which will become more vulnerable as the apparatus of education becomes more widespread beyond the Iron Curtain.

If ever the Communist nations become democratic it will happen because of non-communist ideas capturing public opinion, not through the use by democracy of military force. I wish *The Economist* would put its influence behind the opinion that democratic political warfare operations should be greatly improved and taken sufficiently seriously at Cabinet level to be put in charge of a senior minister with a Fourth Chief of Staff as his agent. The way would then be open to improve coordination with our allies and work out a long term and agreed policy. I have been pleading for many years that the simple truth which has been neglected with tragic results is that: "All actions are the consequence of ideas; if one can influence ideas one automatically influences action." Some years ago I almost persuaded a Minister of Defence to set up an inter-departmental committee to investigate the relationship between political warfare and military operations in the whole strategy of total war. I did not quite capture his mind, so no action followed. This inquiry is long overdue and would be welcomed by senior service officers. Unfortunately, politicians are more bloodthirsty and can only think of war as a body-bashing bombing activity.—Yours faithfully,

STEPHEN KING-HALL

Bordon, Hants

Full Circle on the Railways

SIR—Your statement that the 6 per cent increase granted to railwaymen in February was "originally meant to satisfy in full the claims of the unskilled and lowest paid men" is not correct.

The December terms of settlement provided for a review of the *whole* wage structure. The word in italics was inserted so that there should be no misunderstanding that the examination should commence with the bottom grades.

The NUR, catering, as it does, for all grades of railwaymen, is as interested in differentials as it is in the minimum rate, but it believes that a fair wage structure cannot be built on a foundation of £6 4s. 6d. a week. The thousands of railwaymen who are leaving the service for jobs in other industries appear to share this view.—Yours faithfully,

C. A. SWEETINGHAM

National Union of Railwaymen, N.W.1

Borrowed from Stalin

SIR—Your readers must be grateful to Mr Zavalani for confirming that he had overlooked a paragraph in the "Kommunist" article about peaceful coexistence. It is hardly fair, however, to say that the paragraph was "squeezed in." when in reality it sums up two other passages dealing with the substance of peaceful coexistence—one replying to the charge about "export of revolution," and the other setting forth the view that Socialism requires peace in order to raise living standards.

Your correspondent complains that in that article "the Russian conception appears like coexistence with a moribund"; and another has objected to passages in the same article extolling the superiority of socialism over capitalism as an economic system and a way of life. But these complaints are based on a misunderstanding. None of the passages they quote suggests that the policy of the Soviet State should be to accelerate the death of the moribund, or to force socialism on other countries. Soviet journals have as much right to represent their system as the superior, and to forecast the demise of capitalism, as journals in capitalist countries have (and widely exercise) to say the opposite. But saying these things does not mean going to war about them. Peaceful coexistence means the right, among other things, to have the most opposed opinions about one another's economic and political systems, while agreeing that, far from launching a world war to change the latter, there is positive value to both sides in agreeing to maintain peaceful relations—and even to co-operate.

Since Mr Maurice has written of some special "Kremlin Russian sense" in which the words peaceful coexistence are used, I may be allowed to mention an authoritative statement: "The Peaceful Coexistence of Capitalism and Socialism is Quite Possible," which was published in *Pravda* on July 28th. It is available in translation from this society at 6d., post free. It would be only reasonable to study what the "Kremlin Russians" themselves say, not in disjointed fragments at second hand and with interpolated comment, but in the integral text.

I fail to grasp the purpose, in present circumstances, of the other charges made by your correspondents. They surely cannot suppose that the Soviet Union has no reasoned case to make on these charges, or that it could not, if it desired, put forward at least as weighty charges itself. The point is that an agreement about peaceful coexistence which included negotiated solutions to, at any rate, the principal issues still disturbing international relations would so improve the general situation as to remove the occasion for such charges and countercharges. Are your correspondents opposed to such an improvement?—Yours faithfully,

ANDREW ROTHSTEIN,

London, E.C.1

The responsibility of a publishing house in this crowded century

EVEN IN THESE DAYS of mass production, we of The National Magazine Company believe that the taste of the man-in-the-street and the woman-in-the-street is today more highly developed than it has ever been. More than that: we believe that the so-called 'average man' and his wife are daily seeking to improve their standards of living—not only financially, but aesthetically as well.

Upon these beliefs, and upon a profound awareness of the social responsibility which we (as magazine publishers) bear to our readers, we base our editorial policy. Though each of the magazines we publish is designed to appeal to a different section of the public, they all share one positive aim—to contribute something to the art of living graciously and well in this crowded century.

A Confusion of Councils

SIR—May I comment upon certain arguments relating to rural local government contained in your article under the above heading published on August 14th?

It is misleading to lump together "309 non-county boroughs, the 572 urban districts and the 475 rural districts," and to describe them as representing "Local Government at its most local." The area of the boroughs and urban districts can be measured in acres, while that of the rural districts is measured sometimes in hundreds of square miles, and this contrast is sufficient to empty the word "local" of most of its meaning. It is likewise misleading to compile a "list of activities that are carried out by the average district council or non-county borough" because no such average authority exists.

The powers which in an urban district are exercised by the urban district council are in a rural district shared between the council of the rural district and the councils of the parishes comprising it; thus in the "list of activities" the provision of baths and washhouses is carried out concurrently, while parks and public lighting are in almost all cases the province of the parish council which may also provide allotments, burial grounds, playing fields, parish halls and a number of minor miscellaneous services.

Your article repeats again the oft-repeated error that "the parishes have been shorn of virtually all power." If this statement refers to the legal functions of parish councils the opposite is the truth. Parish councils started life with more powers than the vestries whose civil position they inherited and Parliament during the intervening 60 years has added considerably to those powers. The weakness of the rural parishes is not so much functional as financial; agricultural derating has destroyed the major part of their sources of revenue whilst, unlike other authorities, parish councils receive no grants in compensation.

In rural local government the difficulty created by the facts of geography is to reconcile the words "local" and "government." The division of functions between three tiers of authorities is an attempt at such a reconciliation by giving the countryside the advantage of the services available in towns whilst preserving the benefits of intimate democracy.

One effect of the simplification you propose is that in rural areas about 60,000 elected representatives would suddenly cease to have any share in public life. It is hard to see how this can advance the interests of democratic government.—Yours faithfully,

C. ARNOLD-BAKER

Books & Publications

The Intellectual and the Capitalist

CAPITALISM AND THE HISTORIANS.
Edited by F. A. Hayek.
Routledge and Kegan Paul. 199 pages. 10s. 6d.

IT is a commonly accepted view that "intellectuals" are antagonistic to capitalism. The American economist Schumpeter went so far as to argue that capitalism would fail to survive, not because of any failure in its economic performance, but because of the hostility engendered by the intelligentsia. It is perhaps a natural assumption for members of the intelligentsia to make, since it is so flattering to them, and it is the assumption that underlies the essays which five distinguished intellectuals, Professors Hayek, Ashton, Hacker and Hutt, and Bertrand de Jouvenal, have contributed to this book. They are primarily concerned with the historians' contribution to the creation of this hostility. It is an important subject. Our opinions on present problems take much of their colour from our interpretation of the past, and the contributors to this volume are clearly right in arguing that emotional aversion to capitalism derives a good deal of its force from the notion that the Industrial Revolution was a very bad thing for the workers. They have no difficulty in showing that this and other allied notions are myths.

The demolition of myths is always worth attempting. And the myths which these writers attack are at once particularly erroneous and unusually powerful in the formation of public opinion on economic matters. Even Conservatives and capitalists are influenced by feelings of guilt about the "horrors of early capitalism." It may, however, be doubted whether this book was the best way of going about the job of demolition. For one thing, it lacks unity. Three of the papers were written specifically on the main theme for a group of economists and historians who meet "to discuss the problems of the preservation of a free society against the totalitarian threat"; to these have been added two articles previously published in learned journals and much narrower and more academic in scope. The three papers are essentially *pièces d'occasion*, and though they must have been stimulating as lectures, they seem slightly flimsy in print. Moreover, they bear all the marks of having been prepared for a company of true believers. Anyone whose social philosophy is different, even though not antagonistic, will have the embarrassing feeling that he is eavesdropping. There are too many remarks of the kind which sparkle when made to a group of like-minded friends, but which fizzle out when repeated before a wider and more dispassionate audience. There are too many affectations of omniscience, too many partisan assertions, which will irritate even those who sympathise with the main purposes of the book. The contributors have quite needlessly run some risk that their work will be dismissed as the production of a coterie of right wing economists; which would be a pity since their conclusions on the most important points of fact are independent of any particular doctrines.

But in any case are argumentative essays, even if judiciously presented, the most effective weapons? These legends about the Industrial Revolution are only the vulgarisations of substantial works on economic history; the books of the Hammonds and the Webbs may have got the whole story out of perspective, but they were major works of scholarship, not fugitive essays. The best way of correcting wrong perspective is to redraw the picture. It is significant that much the most effective contribution to this volume is the article by Professor T. S. Ashton on the standard of life of the workers 1790-1830, which appeared originally purely as a contribution to knowledge. It does not controvert any "legends," but it creates an atmosphere in which it is difficult to talk nonsense on the Industrial Revolution and living standards. It expels the notions derived from the Hammonds simply by presenting, in a disinterested and scholarly way, a more credible version of events. Finally, is the initial assumption of the book, that intellectuals have usually been antagonistic to capitalism, a correct one? Is not this merely a generalisation from the 1930s? Or the result of the curious habit of conservative intellectuals of using the term "intellectuals" in a pejorative sense to include only those members of the intelligentsia who attack the existing order?

The Course of Socialist Thought

THE CHALLENGE OF SOCIALISM.
Edited by Henry Pelling.
Adam and Charles Black (British Political Tradition Series). 388 pages. 18s.

TO select a series of extracts from a wide range of speeches and writings and to weld the selection into a balanced and stimulating whole is never an easy

task. And even when it is well done the result is not fully satisfying. The editor's own approach stands perceptibly between the reader and the original sources—why was this put in and that left out, one is continually asking—while at the same time we are not carried along with him as we would be if he were using his quotations to deploy an argument.

This is not to criticise the way that Mr Pelling has undertaken his task. He is as well qualified for it as anyone could be. His recently published "Origins of the Labour Party" showed that his knowledge and understanding of the British working-class movement are unsurpassed, and his work on the present volume will do nothing to impair that reputation. His introduction, in which he sketches, firmly and felicitously, the recent landmarks in the not very straight course of the development of Labour party thought, is particularly good. He sees the sudden development of a "cataclysmic" mood as a result of the failures of 1931, and illustrates it well by extracts from Laski and Cripps. He attributes the subsequent return to a more confident empiricism to a combination of the success of Roosevelt's New Deal and the influence of Keynes's General Theory; and sees how this, accompanied by the centralisation of the war years, led on to concentration upon a policy of national efficiency after 1945 and to the acceptance of Mr Herbert Morrison's ideas of nationalisation by public corporation. This in turn has produced a more recent reaction with the revival of cries for workers' control and for the subordination of the efficiency criterion to more emotional considerations.

What will be the next tack in the course of socialist thought? Mr Pelling does not attempt to show us this, though he offers a shaft of optimism with the statement that "the great bulk of the British Socialist Movement is not hindered, like the German Social-Democrats early in the century, by the need to conform to beliefs which they have in practice abandoned." But there is one belief to which socialists must cling, and that is the belief that human society and human nature can and will be improved. They cannot accept Professor Oakeshott's view, quoted by Mr Pelling, that "men sail a boundless and a bottomless sea" with "neither starting place nor appointed destination." And this, in an age which has rightly lost its belief in automatic progress, makes life much more difficult for socialists than for their opponents.

Ingenuous Eye Witness

DICTATORS FACE TO FACE.
By Dino Alfieri, translated by David Moore.
Elek. 317 pages. 25s.

THE original version of this book appeared over five years ago and whether a tardy translation is really worth while is doubtful. Alfieri, before the war Fascist Minister of "Popular Culture," was launched upon his brief diplomatic career in stormy times. As Italian Ambassador to Germany from the spring of 1940 until the fall of Mussolini in July, 1943, he witnessed remarkable events; yet he writes about them with such ingenuousness and sometimes with such inaccuracy that it is difficult to take his book very seriously. It seems incredible that, devout Catholic as he is known to be, he should allow the famous Catholic Bishop of Münster, Galen, to appear in these pages as Gallern; this is one of numerous errors of the kind.

As for Alfieri's ingenuousness, it enables him to write—probably in all sincerity—"As an actor in the drama, I can vouch for the complete objectivity of my narrative." Early in the book he speaks of Mussolini's "noble and inflexible purpose of restoring the nation's dignity and prosperity and recapturing the splendours of its former might and glory." What former might and glory? Under Giolitti and most of his predecessors the Italian nation had painfully but respectably recovered from its former subjection and disunity, and then from the defeat in Abyssinia to which Crispi's ambition had led. Only a Fascist disregard for history could in any way identify twentieth-century Italy with the empire of the Caesars. And how could any serious observer of Nazi Germany state that "Everyone in Germany respected Rosenberg."

For the rest there is little to be learnt from Alfieri except about the working of his own mind and perhaps something about the psychology of Ciano. Except for an extra scandal or so about this friend of his Alfieri has little to say which has not been better said elsewhere; he confirms the fact of Hitler's romantic admiration for the Mussolini whom he nevertheless subjected to so many raw deals.

The Beginning of State Power

THE AGE OF ABSOLUTISM, 1660-1815.
By Max Beloff.
Hutchinson. 200 pages. 8s. 6d.

THIS remarkable little book ends with the sombre comment that the history of absolutism is only just beginning to be written. It is no longer possible to believe, as many historians once did, that the monarchical despotisms of the eighteenth century were but a passing phase in the steady development of the European peoples towards genuine representative government. Instead it now seems that the absolutism of these despots was really the beginning of that systematic consolidation of state power which, with the aid of modern technology, has produced the tyranny of totalitarian rule.

This idea dominates Mr Beloff's approach to his subject, and makes his treatment of it deliberately selective. Thus he concentrates on the European state system, on the political institutions of its various members, on the dynastic rivalries that shaped it, and on the facts of area, population and economic strength that were the real ingredients of state power. In so doing he has had to leave out of account much that is interesting and important in the history of eighteenth-century Europe. Yet, in the circumstances, this restriction was worth while. It has enabled him to deal directly with a single critical issue, and to say much that will be valuable to those who look to history for help in understanding their own age.

In setting the scene Mr Beloff rightly emphasises the wide differences of tradition and outlook, of social and economic experience, that existed in eighteenth-century Europe. Besides the familiar contrast between East and West, between Russia and the maritime powers, there were significant local variations in Germany and elsewhere. This meant that the spread of that French technique of monarchical absolutism, which is concisely described in a separate chapter, produced varying results in Prussia, Austria, Russia, Spain and Poland. There is a useful summary of what happened in each of these countries.

Finally Mr Beloff discusses the impact of the French and American Revolutions on this European society. He holds that the first of these convulsions displaced what had already become the anachronism of hereditary monarchy, and left the impersonal state in undisputed control. In Europe, he believes, the American ideal of an egalitarian society helped to level the traditional structure of personal and corporate privilege, which had hitherto been an effective barrier to the unhindered operation of state power. These are important matters, and they deserve a more thorough consideration than Mr Beloff has been able to give them in this short book.

Weather Experts . . .

CLIMATIC CHANGE.
Edited by Harlow Shapley.
Harvard University Press (London: *Geoffrey Cumberlege*). 330 pages. 48s.

IN a year when the British weather seems determined to be more eccentric than usual, this collection of papers by American authors may well prove of interest to a wider circle than that of climatologists. The papers fall into two main groups: those which examine the evidence for past climatic change, and those which speculate on its causes. It is an interesting commentary on the organisation of scientific research in the United States that five of the contributions, none of particular strategic interest, spring in whole or in part from university research work financed by the United States Navy or Air Force. The book has the usual defects of the symposium: the papers vary in length from 38 pages to 3; their subjects frequently overlap; and they vary in approach between the popularising and the highly technical.

Yet the symposium is a method appropriate to a subject where, for example, the evidence for climatic change is built up not only by orthodox geology but by carbon dating of plant remains, by examination of tree rings, by the study of pollen preserved in peat, and in many other ways. No one writer could ever cover all these topics with equal authority. If there is occasional disagreement between papers, then this is by no means out of place in a subject in which there is still much genuine conflict of opinion. In fact, the various authors are in fundamental agreement in attributing climatic change primarily to the sun and not, as has sometimes been suggested, to changes in the configuration of the land and the distribution of the oceans.

Two papers are of more general interest. Professor Coon restates his view of racial diversification through adaptation to extremes of environment such as are provided by climatic change. Professor P. B. Sears re-examines the work of Huntington and adds his vote towards his current partial rehabilitation. The examples he gives of the effect of climatic variations on early man in Mexico will be of interest to readers already familiar with similar evidence from Northern Europe. But the place of man in this book is appropriately small: he is overshadowed by the forces of climate, acting through millennia.

Rebel into Genius

DON QUIXOTE OF THE MICROSCOPE—*An Interpretation of Santiago Ramon y Cajal* (1852-1934).
By Harley Williams.
Cape. 255 pages. 15s.

THIS is the story of never failing appeal, written by an enthusiast about a genius, with all the ingredients of true romance. It is about a naughty boy who would not follow the orthodox training devised for his good by an uncompromising parent—and was fully justified by events.

Santiago Ramon y Cajal was the son of a country doctor in Spain, earmarked to follow in his father's footsteps. He refused to learn; he was the *enfant terrible* of his village; and whether beaten, starved or cajoled, he insisted on disgracefully wasting his time in drawing and painting. Don Justo, goaded by the perennial fear of the ordinary man that the rogue he has fathered will be inacapable of self-support, strove to safeguard the future by a steady stultification of inherent possibilities of success; but the boy's peculiar genius was nourished by obstruction and turned to account every experience in a progressive development towards an unsuspected goal. That which could not be achieved by force came about by shared adventure. Don Justo, the anatomist, was short of bones, and Santiago, the rebel, was enchanted to assist his worthy parent in shinning over the churchyard wall to make a clandestine collection by moonlight. By the time they had surmounted the hazards of building a complete skeleton, the youth was quite prepared to study anatomy, and by slow degrees qualified as a doctor.

Thereafter, he bought a microscope (with the arrears of army pay); and his skill with the razor (acquired during a disciplinary apprenticeship to a barber) enabled him to cut the most delicate sections of human tissue; and his ability to reproduce with distinction the revelations of the microscope convinced Don Justo that there must be something in drawing and painting after all. So, with years of fanatical application, Santiago Ramon y Cajal became a world famous histologist, who built the foundation upon which modern research into brain function has become possible. At 83 he was honoured by doctorates of leading European and American universities, feted by the Royal Society, a Nobel Prize winner, and even officially designated as an "Illustrious and favourite child of the province of Zaragoza."

Dr Harley Williams's treatment of his specialised subject is lively and intriguing. He has avoided technicalities and documentary references, and concentrated on the vital qualities of an interesting character, sternly suppressing everything "that would look well on a tombstone." But his summing up would, indeed, make an excellent epitaph, and comfort all late beginners: "Santiago Ramon had one of those lucky minds which teach themselves and are harmed by pedagogy."

Key Port

SHANGHAI: *Key to Modern China.*
By Rhoads Murphey.
Harvard University Press (London: *Geoffrey Cumberlege*). 244 pages. 36s.

THE theme of this book, put briefly, is the inevitability of a great port on Shanghai's particular site, which is a key position in the Yangtsze delta, with the great river highway, a large population and a vast agricultural area behind it, and the sea before it.

With this there can be no argument, but the author's further contention, that the siting was a more potent influence in Shanghai's lush development during the past hundred years than its political structure, will be generally opposed. It is surely beyond question that the security and rule of law provided by the Foreign Settlements were the foundations on which the city's prosperity was built, and it is equally certain that the vast sums invested there between 1875 and 1940, by foreigners and Chinese alike, would never have been forthcoming had the whole area been under Chinese jurisdiction. In general, however, Mr. Murphey has produced an objective, factual sketch of this unique city since it was opened to foreign trade in 1842, and he shows that its growth "set widening patterns of change in motion throughout the country"—hence the sub-title.

Most of the research for the book was apparently done during 1948-50, and it seems possible that the author was unable actually to visit the object of his study. Otherwise he would surely have avoided some serious inaccuracies—especially in his references to the French concession—and would also have gained a more correct understanding of the methods of the foreign business houses. The book is well supplied with statistics and the author has gone to some pains to verify those he uses. His figures regarding industrial equipment are, nevertheless, misleading, owing to his failure to discriminate between establishments of a size justifying the name "factory" and those which are little more than cottage industries.

In his final chapter Mr. Murphey looks at the future. He sees Shanghai as likely to remain in the lead, both as a port and an industrial centre. He dismisses early attempts by the Communist Government to remove industries elsewhere as failures, so far. But since he wrote, a good deal has been done to develop industrial centres in the interior, and to support them by new rail and road construction. If these and other schemes prove successful, Shanghai's future as the leading industrial centre—as distinct from the principal trading centre and port—may well be challenged.

Shorter Notice

INTRODUCTION A L'ETUDE DES BANQUES ET DES OPERATIONS DE BANQUE.
By Henri Ardant.
Dunod, Paris. 314 pages. 1,550 francs.

This book is based on a course of lectures given by M. Ardant at *l'Ecole Normale Supérieure de l'Enseignement Technique.* It is frankly technical in character, and its usefulness to readers in this country is difficult to determine. In arrangement, it is somewhat untidy and still bears the marks of the schoolroom. Indeed, in many respects, it resembles the notes of the course of lectures on which it has been based. This appears to have been quite conscious, as it is described in its blurb as *sous un format réduit et . . . une véritable encyclopédie de la banque et de la finance en France.* It is divided into two parts. The first, which resembles an incomplete directory, provides an outline of the several groups of institutions involved and the second summarises the techniques which they employ in their operations. It is the latter that is the more useful, though it is still highly compressed and, worst of all, little attempt is made to analyse the relationships which obtain between the several parts of the system. If it were to be used as a book of reference, there is a useful index.

Books Received

DESIGNERS IN BRITAIN: *Volume* 4. Compiled by The Society of Industrial Artists. Edited by Herbert Spencer.
Allan Wingate. 158 pages. 45s.
This is a comprehensive review by photography of industrial and commercial design during 1952 and 1953.

THE CRIMINAL LAW.
By F. T. Giles.
Penguin Books. 271 pages. 2s. 6d.
There are already in existence a great many books which have the intention of explaining the criminal law of England to the layman, but a "Pelican" book on this comes into a category of its own because its price must give it a wider public. The author, who is Chief Clerk at the Clerkenwell Magistrates Court, has done a very good job indeed in displaying the law, dynamically as well as statically.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Partnership with Congress

Washington, D.C.

EVERY President has his own particular troubles with Congress. Few can ever hope, under the American system of separation of powers, to be in the dominant position that Franklin Roosevelt achieved in his first term. Mr Eisenhower came to office at the end of an accumulating reaction against the Democratic, and specifically the liberal Democratic, conception of the strong Presidency. He was in the equivocal position of sharing the belief of many of those who voted for him that the President should scrupulously avoid invading the proper sphere of Congress and yet taking seriously his campaign "promises" that could only be "fulfilled" if he could direct the action of Congress. Yet the partnership between Mr Eisenhower and the Eighty-third Congress has been less barren than many predicted. This is because two of his special difficulties were exaggerated: the narrow margin held by the Republican party in both chambers of Congress and the legacy of the pre-nomination rivalry between Mr Eisenhower and the late Mr Tate, who had the support of the majority of Republican Congressmen.

It is, of course, very important that the party in office should have a majority of some sort in the Senate and House, so that it can organise the committees and hold the chairmanships. But apart from certain practical inconveniences, such as the difficulty of finding enough members to go round the committees so that the party had a suitable majority in each, the smallness of the majority has not proved crucial.

The character of Congress was not greatly changed by the election of 1952. A Democratic majority of two in the Senate gave way to a Republican majority of one, with one former Republican sitting as an Independent; the Democratic lead of thirty in the House became a Republican lead of ten. But on most important issues the conservatives were in charge of both Congresses. Whereas under Mr Truman this conservative majority—made up substantially of mid-western and western Republicans and southern Democrats—was in opposition to the Administration on domestic issues, under Mr Eisenhower it has been substantially in support of the executive. With the one exception of the farm Bill, where a particularly strong sectional group was involved, President Eisenhower has not needed to mobilise public opinion to coerce an unresponsive Congress; there have been no vitriolic veto messages on major measures and no over-riding of the President's veto.

This has been achieved partly at the price of postponing some of the more controversial issues—foreign trade legislation, for instance, and reform of the McCarran-Walter immigration law, which was not even mentioned this year—but mainly because there is considerable continuity between one Congress and another and the conservative majority had become accustomed over the years to voting for extensions of widely accepted social legislation, such as old age pensions and unemployment insurance. But when in the case of health insurance federal action was suggested in a new field, even though on an exceedingly modest scale, the President suffered defeat in the House from a combination of contemptuous liberals and suspicious conservatives.

★

Although in the struggle for the nomination Mr Eisenhower was labelled a liberal and Mr Taft a conservative, the President's difficulties have not been with conservatives as a group. If that had been the case he would have been in a permanent minority. In the first place, only a few members of Congress are openly reactionary. Secondly, many of the Administration's achievements were truly conservative—particularly its new internal revenue code which seeks to satisfy businessmen's complaints that the tax laws affecting them discouraged expansion, and the large budget cuts which have been translated this year into new appropriations that are $28 billion below those passed in Mr Truman's last year of office.

Thirdly, in the big conflicts of this Congress the conservatives have not been by any means united. The most important of these conflicts, resulting in the President's most spectacular success, was over the farm Bill, whereby an end was at last made to high rigid price supports of "basic" commodities like cotton and wheat. Here the antagonist was the farm block which straddles the division between liberals and conservatives as it does that between Republicans and Democrats.

Even the conflict over public housing which, since the arguments against the programme are almost entirely ideological, would appear to be a straight issue between liberals and conservatives, with the President on the liberal side to a limited degree, turns out, in fact, to be much more an issue between the House and the Senate. Year after year, whichever party is in power, the conservative majority in the House votes to strike out the public housing provisions which the Senate is prepared to accept.

Since the principal dispute between Mr Eisenhower and Mr Taft was over foreign policy this was the sphere in which relations between the President and his party in Congress were most delicate. But in practice Congress rolled up all its discontents into one adamant dogma: no recognition for Communist China. Too much importance should not be attached to Senator Knowland, whose advice is often proffered but seldom taken, or to the various attempts to condemn President Roosevelt's policies in retrospect by resolution or constitutional amendment. In the actual conduct of foreign policy by Mr Eisenhower and Mr Dulles there has been relatively little interference. The appearance to the contrary during the Indo-China crisis arose chiefly out of the lack of unity of decision and clarity of thought within the Administration itself. On the other hand the foreign aid appropriations, which give the Administration increased discretion over the use abroad of vast sums of money, were eased through the Senate by, of all people, Senator Dirksen of Illinois.

Finally the Administration's relatively easy passage has been helped by the tactics of the Democrats who, in the light of the President's sustained popularity, and the need to avoid open disputes between the northern liberals and the southern conservatives, have refrained from forcing many party issues. Their most important effort, which failed, was the attempt to change the direction of the tax legislation, by putting income tax concessions for lower income groups to stimulate consumption in the place of help to investors to stimulate production. The Democrats also pressed the President's foreign trade policy in the Senate after he had announced its abandonment for the year, and succeeded in amending the atomic energy Bill, so as to strengthen safeguards against private monopoly. In the last days of the session they sprang their answer to the long-endured charge that they were "soft" on Communism by moving a Bill to outlaw the Communist party, a cause to which everyone found it necessary to subscribe.

★

Although the conflicts that have gone on in this Congress have been real enough they have appeared to be greater than they are. Specifically the public impression was created that the Republican party in Congress was in general opposition to the Republican Administration. This was partly because of the long legalistic wrangle over the Bricker Amendment affecting the President's discretion in conducting foreign policy, but chiefly because Senator McCarthy pressed his assaults on the Administration with a vigour usual only when the President is unpopular. In responding to this challenge the Administration was deplorably weak. Thus a wholly superfluous air of crisis was created, which is still not dissolved, as the Senate plans to return before the election to hear a report from the Watkins committee on the Senator's conduct.

While the President is appealing to the voters to give him another Republican Congress to complete work on his programme, the chief unfinished item on his desk is the Randall Commission's report on foreign trade, which, if implemented by Republicans, would involve their repudiation of a tariff policy that has traditionally distinguished them from the Democrats. Everyone interested in trading with the United States must hope that, having felt in this year's battle of the farms the power of some of the weapons that are available to a President, Mr Eisenhower will use them with equal skill and persistence next year over foreign trade.

Off to the Elections

WITH a close race for control of Congress before them, the legislators have lost no time in getting away to a fast start. But the President and Mr Adlai Stevenson were off before them. It is no accident that both party leaders chose Illinois for the first heat. It is Mr Stevenson's home state, and one that his party should carry if he is to be entered in the presidential stakes in 1956. It is also the home of Senator Douglas, and the President must have taken particular pleasure in challenging, on his own ground, the leading prophet of "gloom and doom." Senator Douglas, who is an economist, threw professional caution to the winds last winter and led the outcry against a "Republican recession."

The President, whose theme is that the Republicans have secured peace in Asia without sacrificing prosperity at home, is probably more enthusiastic about the possible defeat of Senator Douglas than about the election of his Republican opponent, Mr Meek, a pro-McCarthyite business lobbyist whose views are repugnant to the President. Nevertheless, Mr Eisenhower managed a blanket endorsement for all the state's Republican candidates, which suggests that his preference for Eisenhower men will not be carried to the lengths of risking a seat in the next Senate.

This may be sacrificing the national interest to party expediency, as Mr Stevenson charged, but it is a sacrifice the Republican strategists were bound to demand. Since the House is likely to go Democratic, it is all the more vital to hold the Senate, and Senator Morse's defection, which is now complete, must be compensated for.

The President followed up his foray into Illinois with a television and radio speech praising the accomplishments of his Republican Congress. The real heat and burden of the campaign, however, is to be borne by Mr Nixon, the Vice-President, who is planning to speak in 23 states. This is to the liking of the Democrats, whose dismay at the tasteless attack on the President's integrity by Mr Mitchell, their own party chairman, shows they have no desire to challenge Mr Eisenhower's great popularity. In 1952, when he himself was running, he could sweep in with him only a bare Republican majority in Congress. The Democrats hope that this year, when he is not, dissatisfaction with unemployment, low farm prices and the Administration's friendly attitude to big business may turn the tables, particularly now that the Communist issue has been blunted by the fall in Mr McCarthy's prestige and the Democrats' part in outlawing the Communist party.

Anti-Communist Thunder

THE President has put as good a face as possible on the Bill outlawing the Communist party, which he signed this week. It is, of course, better now that it does not make membership in the Communist party in itself a crime, and thus, in effect, repeal the Internal Security Act, which aimed at forcing Communists into the open. But while it is now less harmful, the Bill has lost

most of its meaning; it is a loud roll of anti-Communist thunder, with very little lightning. The fact that only two members of Congress voted against it was a weightier argument for the acquiescence of the Administration than the President's rather unconvincing assertion that it would provide the law enforcement agencies with better weapons for combating subversion.

The Department of Justice expects more from the passage of less sweeping measures which were part of the President's own anti-subversive programme, such as the provision, included in the outlaw Bill, to enable bargaining rights to be withheld from Communist-infiltrated trade unions; the power given to the courts to grant immunity from prosecution to witnesses who otherwise cannot be compelled to testify; the Bill enabling the President to bar espionage and sabotage suspects from defence plants; the denial of citizenship rights to convicted Communists and the increased penalties for harbouring fugitives and jumping bail.

Many Americans have deep and justifiable misgivings about the proscription of any political party, however conspiratorial, and are shocked by the enthusiastic haste with which Congress voted to exploit anti-Communist fears. But in practice, the "immediate" denial to the Communist party of such rights and privileges as entering candidates in elections, suing in the courts, and holding bank balances is almost certain to be frustrated by precisely the same long legal delays which have postponed, for over four years, the application of the Internal Security Act, which requires "Communist-action" organisations to register or outlaw themselves. Whether an organisation which has lost its rights under one law can be compelled to accept responsibilities under another is a legal puzzle.

The new law also requires that individual members of the Communist party, who join or remain in it knowing its purposes, must register with the government, or incur heavy penalties. The Act recognises that Communist party members are unlikely to identify themselves and its liberal sponsors cynically borrowed a long list of criteria for determining who is a "knowing Communist" from their arch-enemy Mr Martin Dies. All this illiberal paraphernalia must seem singularly redundant to the Department of Justice, which proposes to go on relying on the Smith Act, under which it has already secured the conviction of eighty-one Communist leaders and which—although Congress apparently overlooked the fact—already made it a crime to belong to an organisation advocating the overthrow of the government by force.

Mutual Security for 1955

THE table below compares the final figures, of expenditures authorised and funds actually appropriated by Congress, for foreign aid in the 1955 fiscal year which began on July 1st, with the sums requested by the President and with the figures for the previous fiscal year. Most of the huge amount which was in hand at the end of that year was committed under contracts already placed but not completed; the reappropriations for 1955 cover the portion of this unexpended balance which was not yet committed although it was earmarked.

The first three of the six foreign aid programmes, which account for about five-sixths of the total expenditure, are all more or less military in nature. *Mutual defence assistance* takes the form of arms and equipment for allied countries; $200 million was deducted from the appropriation for this purpose at the last minute by the Senate, apparently because Senator Maybank thought this was the value of weapons which were on their way to Indo-China when the war there ended and which would therefore no longer be needed. *Direct forces support*, once intended mainly to help pay for the war in Indo-China, is now to go almost entirely to South East Asia and the western Pacific, probably to back up whatever comes out of the conference in the Philippines. *Mutual defence support* is to strengthen the economies of allied countries, including Greece, Turkey and Korea (which gets nearly half of this appropriation), so that they can maintain their armaments.

Development assistance is ordinary economic aid, none of it now for Europe. *Other programmes* are mainly for children, refugees (although there is nothing this year for the UN Emergency Fund) and administrative expenses, while *technical co-operation* is the old Point Four. Nearly $10 million was in the end allotted for the United Nations technical assistance programme; this is to cover the United States' contribution to the end of the 1954 calendar year, while the $18 million requested by the President was intended to last until July, 1955. The new Congress will be able to vote additional funds if it wants to do so, but the UN planners cannot count on this.

Except on this last point and on the provision of $35 million for British aircraft, where the more generous Senate view again prevailed, the Senate and House conferees tended to agree on the lower figure, for new funds, in the two versions of their appropriations Bills; the final amount was $658 million less than the President had requested. When it came to reappropriating funds, the conferees split their difference. Nevertheless, officials of the Foreign Operations Administration are reported to be very satisfied with the result. The authorisation Bill forced no important changes of policy on them and they have all the money they need for at least twelve months in hand. Furthermore the discretion given to them is immense, probably far greater than Congress realises. The cuts in spending on the various programmes can be distributed where officials think they will do least damage; 10 per cent of the money appropriated for any particular purpose can be allocated to any other purpose and 15 per cent of the total appropriated for military assistance can be moved from one geographical area to another as the Administration pleases.

$ million, rounded figures

	1954 Fiscal Year			1955 Fiscal Year				
				President's Requests for			Appropriated	
	Appropriated	Spent	Unexpended Balance, June 30th	New Funds	Reappropriation	Authorised	New Funds	Reappropriation

* Includes an authorisation of $198 million for future spending on Nato facilities (infrastructure) for which no new funds were asked.

Something for Almost Everyone

CONGRESS had plenty of warning that the President would veto the Bill providing for a straight increase of 5 per cent in the pay of 1,750,000 white collar and postal workers employed by the federal government. But the legislators who voted almost unanimously for this Bill hoped that they might thus induce civil servants to put on the President, who is not up for re-election this year, the blame for the failure of government pay to keep up with the rise in the cost of living. In fact, of course, as the President pointed out in his veto message, the fault is with Congress. For early this year he asked—and he promises to repeat the request next year—for an upward adjustment of civil service pay scales which would also have eliminated inequities and rewarded efficiency.

The lack of such adjustments in the vetoed Bill is one of Mr Eisenhower's reasons for disapproving of it. The other is that the increase in postmen's wages would add $112 million to the present deficit of $400 million a year on the operations of the Post Office and Congress has refused an equivalent increase in postage charges. The postal workers, a well-organised pressure group, complain bitterly that they are being penalised because Congress has been intimidated by businessmen who do not want to pay more for postal services, but the President insists that the two increases must be linked.

One rise in pay that Congress had no desire to approve in an election year was in its own salaries, and Senator Johnson, himself about to retire, put the Senate into a panic by proposing such a thing. Government workers have at least been given some subsidiary benefits; they now have a low-cost life-insurance plan, similar to those long offered by private employers, and they are eligible for unemployment insurance under the new Bill which will bring altogether an additional four million workers into this scheme at the beginning of 1956.

This is the first expansion of federal unemployment insurance for eighteen years and the Republicans offered another effective demonstration of how enthusiastic they are about the welfare state with the last Bill passed before adjournment, an extension of old-age and survivors' pensions. This makes about ten million more people, mainly farmers, farm labourers and local government employees, eligible for this type of insurance. It also provides for an increase in the pensions now being paid to over six million persons; the first of these additional payments will arrive, most conveniently, a month before the election.

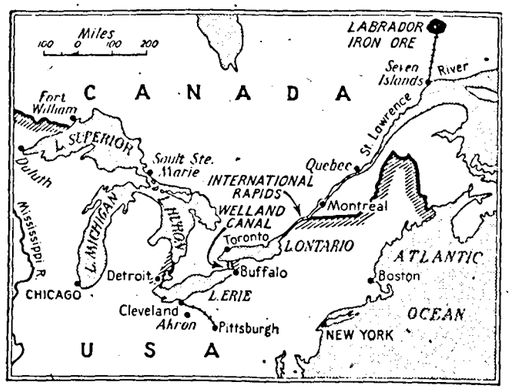
Refugees Still Waiting

Washington, D.C.

PRESIDENT EISENHOWER'S letter to the Governors of the states asking them to help him make the Refugee Relief Act work is the second time this year he has shown impatience at the slowness with which a stirring humanitarian gesture is being followed up. The original trouble was that when Congress grudgingly humoured the President to the extent of offering to victims of war and persecution 214,000 visas over and above the normal immigration quotas those Senators who disapproved of the idea—largely because "if the security checks are 99.44 per cent perfect that will still let in 1,200 subversives"—were allowed to fill in many of the administrative details. As a result of the elaborate precautions required, the number of "homeless, tempest-tossed" people who, under this scheme, have actually passed the Statue of Liberty with its generous inscription has totalled only 2,253.

Now the chief difficulty lies elsewhere. Before any refugee can be considered for a visa there must be a personal assurance from one or more American citizens that a house and job will be waiting for him. Mr Eisenhower's request to the Governors is that they should follow the good example of Mr Dewey of New York in setting up a committee to work with various religious and other voluntary groups already in the field, so that operations are not held up by the lack of an even flow of such guarantees.

Of the 30,000 people who have so far applied for the visas, only 8,000—most of them "preference cases" with relatives in America—have received them. To qualify they must be unable to return to their normal place of abode and must not be firmly resettled, and they must be able to give a full account of themselves, supported by documents, that covers at least the previous two years. This rules out, for fear of admitting agents planted by the Communists, most people who have recently escaped across the Iron Curtain, though exceptions may be made.



Hanging over the heads of all those who wish the programme well is the threat of a deadline: the last day of 1956, when the Act expires. The Senate Judiciary Committee has insisted that it will on no account countenance the use of visas not assigned by that date, but by then it is to be hoped that the President will have had some success in fulfilling his campaign promise to secure the overhaul of the basic immigration law.

Shipping on the Seaway

FROM A CORRESPONDENT IN CHICAGO

THE exchange of notes last week between the United States and Canada clears the ground for the construction of the St Lawrence Seaway by setting out each country's rights and responsibilities. Work has already begun on the great hydro-electric plant to be built on the St Lawrence near the International Rapids by the province of Ontario and the State of New York. The Seaway itself, which involves the spending of about $300 million to provide a 27-foot deep channel from the Atlantic to Lake Ontario, is now expected to be completed during 1958.

When it is open, the economic effects will be felt around the world. The hopes of the lake ports and the fears of the coastal cities illustrate the dramatic results the waterway is likely to produce. The port director of Milwaukee, whose waterborne foreign commerce totalled only 35,000 tons last year, expects to see it rise to over a

million tons annually, while the port director of New York City fears a loss of about 3,500,000 tons a year, one-sixth of the city's foreign commerce in general cargo and grain.

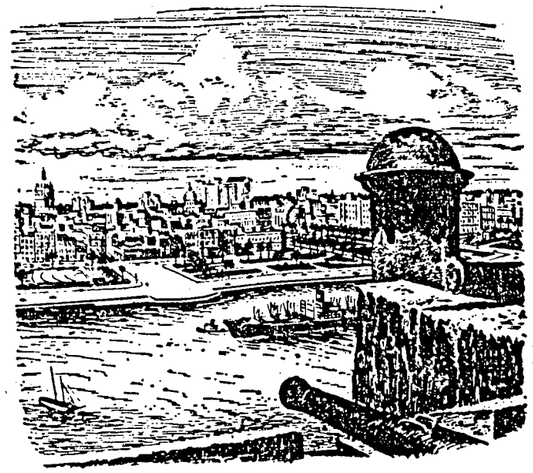
Whether these hopes and fears are realised depends on how much the Seaway adds to the 11.5 million tons of cargo which now move each year through the St Lawrence between the Great Lakes and the sea. The friendly estimate of the Department of Commerce puts the potential traffic over the Seaway as high as 84 million tons a year, but opponents of the project, such as the Chicago Association of Industry and Commerce, fix it below 20 million.

The most significant single economic effect of the Seaway will probably be to provide cheap water transportation for moving Canadian and foreign iron ore to steel mills on the Great Lakes, which turn out 35 per cent of all steel made in the entire world and supply Detroit's automobile industry, Chicago's farm equipment plants and Milwaukee's heavy machinery factories. This vast American Ruhr has always been based on low-cost lake transportation which has enabled steel mills in Chicago, Cleveland and Pittsburgh to obtain iron ore economically from the mines at the head of the lake system around Lake Superior; these reserves, however, are beginning to run low.

The Seaway promises to bring iron ore from Labrador, Quebec and foreign sources, at prices which will make it competitive with local ore. The deepening of the channel from 14 to 27 feet and the lengthening of the locks from 260 feet to 800 feet mean that the long slim lake ore boats will be able to move Labrador ore all the way from the town of Seven Islands, Quebec, to the midwestern steel centres. They have six or seven times the carrying capacity of the small ships that now use the waterway. The US Department of Commerce believes the new Seaway will ultimately handle over 35 million tons of ore yearly.

For farmers, the Seaway will mean lower transportation charges on the wheat and other grain that is exported. Today, it costs 14½ cents a bushel to ship wheat from Fort William at the upper tip of Lake Superior to Montreal. The National Grange, an American farm organisation, estimates that this will be cut by about 5 cents a bushel when it is no longer necessary to transfer the grain into small canal boats for the journey down river to points where it is reloaded into ocean-going ships. The Seaway will permit one vessel to move the grain all the way to Montreal or even to foreign ports.

A big increase is also expected in the movement of general cargo between foreign ports and lake cities. Shipping lines which operate the small boats that can navigate the present 14-foot channel have 130 in service, compared with 25 in 1948; the Lake Carriers' Association expects them to make about 300 round trips to foreign ports this year. Even with the present small boats, it is far cheaper to ship many items by water. For example, the International Harvester Company recently sent a larger crawler tractor from Chicago to Casablanca via the lakes. The freight was $586.46. The cheapest alternative route was to move it by rail to New Orleans; the cost of this rail-ship haul would have been $723.99. The exporting of automobiles on these small lake boats is increasing. When they are sent to the coast by train, automobiles must be crated in heavy wooden boxes. But in Detroit, the manufacturers' men watch the cars loaded into the boat and have found they can ship them safely uncrated. The saving amounts to $160 a car. The Seaway should greatly stimulate the use of all-water transportation to and from foreign ports by many other industries. It will be welcome to the papermakers in Wisconsin and Michigan who use Swedish pulp; the tyre-makers in Akron, with their demand for Malayan rubber; the soap producers in Chicago who need palm oil and copra. Even the Scotch whisky drinkers scattered across the midwest will benefit.



Foreign shipping companies will probably profit the most from this growing traffic. They have more small vessels that will go through the 27-foot channel than the American companies and the wages they pay are lower. Most of the ships that are now operating between the lakes and foreign ports belong to European shipping lines.

★

The Seaway will not prove an unmixed blessing. Railways operating in the eastern part of the United States will be heavy losers. Just how much business the Seaway will cost them, however, has never been authoritatively estimated. Some western railways may well benefit. They should move an increasingly large tonnage from interior points to the "gateway ports," which already draw shipments for export via the lakes from as far away as the Rocky Mountains.

Opponents of the Seaway also contend that the project will be a continuing drain on the American taxpayer. Toll revenues may be sufficient to reimburse Washington for the $105 million it has just agreed to provide for its portion of the project. But the critics argue that these expenditures are only the beginning. Deepening the connecting channels between lakes, for which no financial provision has as yet been made, is expected to cost more than $200 million. Additional millions will have to be spent to enlarge the Great Lakes harbours and build terminal and dock facilities for bigger vessels. Moreover, government projects of this type have a bad habit of costing far more than the initial estimates. And when the 27-foot waterway is completed a cry may go up for still deeper channels, for only a small fraction of the ocean-going boats in service today draw as little as 27 feet when fully loaded.

In Havana or around the world... here's what we can do for you!

Bankers aren't reporters—but most of the men in our International Department have to be both. To bring you on-the-spot coverage of global commerce, these men, together with our correspondents and representatives in all parts of the world, are constantly on the move—studying conditions, gathering information, reporting home.

If you wish to take advantage of this information service—or make use of our experienced, world-wide credit facilities—wire or write Bank of America, 300 Montgomery St., San Francisco or 650 So. Spring St., Los Angeles: attention International Banking Department.

FOREST CREATURES FLEE in terror from the holocaust of fire. A hundred miles away towns taste the burning, the sun is overcast, smoke constricts the throat. Fire, which brings blackened desolation, *could* starve the world of newsprint. Over the 7,000,000 acres of Bowaters' timber limits in the Canadian Province of Newfoundland such fire is guarded against by endless vigilance, war is constantly waged against pests and parasites, afforestation is carefully planned. This is the Bowater guarantee for never-ending supplies of pulpwood for their mills at Corner Brook, one of the largest integrated pulp and paper mills in the world.

From the mills of the Bowater Organisation in Europe and North America comes newsprint in a never-ending stream for the newspapers and journals of the world; other printing papers for magazines and reviews that carry colour and interest into countless lives; paper for the protection of food and for packages of almost infinite versatility.

Siam in the Front Line

THE collapse of the French in Indo-China has left Siam in the position of a fortress facing siege after the defeat of the field army which was covering it. As long as the French Union forces were holding out there was a substantial protective barrier against the might of its Communist neighbours, for Siam has no direct territorial contact with China and the Vietminh had their hands too full to be able to concern themselves with it. But the Geneva agreement has virtually removed the barrier. Not only has North Vietnam been turned over completely to the Vietminh; the armistice terms, which provide for Communist administration in two provinces of Laos, while forbidding that country to receive foreign aid for its defence, have legalised a fifth column which can hardly fail, with Vietminh support, to subvert it decisively within a short time. And Laos is the neighbour of Siam.

The government in Bangkok has so far maintained an attitude of defiance towards the far eastern Communist bloc, in striking contrast to the neutralism of Burma. There have been two main reasons for this. The first and more fundamental is the conflict between Siamese nationalism and the large Chinese minority within the country. The precise size of this minority (some members of which belong to settlements of long-standing and have intermarried with the Siamese) is disputed, but it is probably nearly twenty per cent of the total population, and before 1932 it had most of the trade of the country, including the vital export trade in rice, in its hands. It is, in any case, a much higher ratio of the population than in Vietnam or Burma, though, of course, far lower than in Malaya. The Siamese revolution of 1932 was partly a constitutionalist rising against the autocratic monarchy, but largely also a Siamese nationalist movement challenging the economic ascendancy of the Chinese.

Under the leadership of Pibul Songgram this movement subjected the Chinese minority to various kinds of discrimination and restriction and this internal struggle was a factor in drawing the Songgram government into a pro-Japanese foreign policy. With the defeat of Japan in 1945 the anti-Chinese policy had to be abandoned to some extent, but after Songgram's return to power in 1947 it was revived. The Kuomintang government of China, engaged in mortal civil war, was unable to do anything effective to support the interests of the Overseas Chinese, but with the unification of China under Communist rule, Siam had to reckon with the backing of a strong power for its Chinese minority. In the long run it could not hope to resist successfully if Mao Tse-tung were free to act in South East Asia. But as long as the French held Indo-China, Peking could not exert pressure directly on Siam. The only hope of holding out in a course of policy opposed to China now lies in the support of the United States—or of a group of western powers committed to containing the expansion of Communism in South East Asia.

For Siam itself, however, the issue is one of fear and antipathy towards China as such more than of anti-Communism. There is, nevertheless, a fairly strong anti-Communist complexion to the present government which reflects the differences between the recent history of Siam and that of other countries of South and South East Asia. As Siam never fell under the sovereignty of a western power the anti-imperialist appeal was much weaker there than in neighbouring lands and there was a greater continuity of the social and political order. Songgram's government joined Japan in the war in setting up the "new order in Greater East Asia," which was avowedly anti-Communist, and the war did not have the effect of letting loose Communist and left-wing resistance forces in Siam as in Vietnam and to a lesser extent in Burma, Malaya and Indonesia.

As a result of Songgram's policy his country avoided all the ravages of the Pacific war; it was neither invaded nor counter-invaded. It obtained from Japan accessions of territory at the expense of Indo-China, Burma (two Shan States) and Malaya; these had to be surrendered after Japan's defeat, but otherwise Siam got off very lightly as an ex-enemy state, mainly because the United States did not consider itself to be at war with it at all and used its influence on Siam's behalf. Songgram had to retire for the time being, but he remained something of a national hero. He was brought back to power by a military *coup d'etat* in 1947, and his return led to the exile of his principal rival, Pridi Phanomyang, a liberal of

vaguely socialist leanings who had opposed the pro-Japanese policy and become a British *protégé* during the war. Pridi's faction within Siam, in alliance with local Communists, has made more than one attempt to overthrow Songgram, but so far without success; meanwhile, Pridi himself has been looking for aid from abroad to help him get back to Bangkok. In view of the increasing American predilection for the Songgram government as an anti-Communist bulwark, he has taken himself to Peking and thrown in his lot with the Chinese Communists. The personal feud between the two Siamese politicians has thus been linked up with the cold war in the Far East.

The danger to the present regime is of two kinds. One is that a section of the armed forces, discontented with Songgram's rule and possessed by the idea—inevitably fostered by the French collapse in Indo-China and the hesitations about a Seato pact—that the new China is irresistible, may rebel and bring Pridi back as China's nominee, committed to a pro-Chinese policy. The other is that from a Laos increasingly decomposed by its fifth column, there will be Communist infiltration across the Mekong into the eastern provinces of Siam. These provinces which suffer greatly from drought are the poorest in the country, and it would probably not be too difficult to stir up enough discontent to start agrarian guerrilla action. Arms and "volunteers" would then follow. It is these possibilities, as well as that of direct military attack, that will have to be studied by the Seato conference next month.

End of the Vargas Era

THE suicide of President Vargas, following on the attempted assassination of one of his political adversaries, marks the close of a quarter-century in which the immense territory of Brazil became a nation. Save for the period from October, 1945, to 1950, when the army had forced him to resign, President Vargas exercised the supreme power which he grasped in 1930. Ranging from a revolt in Sao Paulo in 1932 and a romantic midnight defence of his palace in 1938, down to the present disorders, President Vargas's career has been a stormy one. But he gave Brazil a new sense of coherence, brought his country into the war against Hitler, and created for millions of his underprivileged countrymen a vision of a better future.

The downfall of Vargas is a result of the strategy by which he ruled his *Estado Novo*. He sought to balance against one another the forces of organised labour, the vast masses of the backlands and the army. The relationship between Catete Palace and the army was always the crucial factor in Brazil's political life. President Vargas's tremendous electoral victory over General Dutra in 1950 made the army realise that the lever of political power was slipping from its grasp. It waited for a chance to reassert itself, and found it in the dollar and coffee crises which are now afflicting the country. The President had lost his sure touch in the last months, and the bungled attempt to murder Sr. Lacerda proved his undoing.

What do the military forces now in control stand for? Brazil's army and air force of some 205,000 men are commanded by an officer corps drawn primarily from middle-class families in the Rio Grande, in Sao Paulo and in Rio de Janeiro. As these officers pass through a common cadet training and are grouped in clubs, they tend to form a powerful clique, which is staunchly conservative in its political and economic outlook and pro-western in its foreign policy. The fifty-eight generals who compelled President Vargas to resign represent the best educated and most mature element in Brazilian political life. They do not constitute one of those faintly comical yet sinister groups of colonels who appear so frequently in Latin American politics. They would probably claim that their rising against President Vargas was a rising against dictatorship based on illiteracy.

The question now is whether the new President, Sr. Cafe Filho, can restore tranquillity without major military intervention. Brazil, at present, faces two threats: first there is the possibility of a popular rising against the army; a rebellion in the backlands such as is characteristic of Brazilian history. That was what President Vargas was aiming at in his inflammatory posthumous message: "Every drop of my blood will be an immortal flame in your conscience and a sacred impulse to resist." But the "shirtless ones" to whom he was appealing have neither weapons nor leaders, and the terrible war in Bahia in 1896-7 is still not forgotten. One can look for a spell of riots and demonstrations, but not for an organised military action. The more likely threat comes from the generals themselves. Having tasted power once again, will they stay united? Is there not a Cromwell amongst them?

Much depends on the outcome of the formidable financial crisis in which Brazil now finds itself. The country is trapped between a lack of foreign exchange with which to increase production and tremendous pressure to raise wages. The decision to maintain a sky-high coffee price in the hope of obtaining dollars has proved a boomerang and in May coffee exports earned only $27 million as against a normal monthly average of $70 million. Brazil now faces simultaneously the necessity of stopping inflation and of carrying through a vast programme of industrialisation. If the country, in which over £50 million of British capital is invested, is to be helped back to financial health, outside support will have to be found. The free nations must remember that Brazil is the only effective counterpoise to Peron's Argentina, and that on its stability depends that of much of the Western Hemisphere.

BUSINESS ABROAD

Among our three-monthly reviews issued this week are:

ARGENTINA.—Economic prospects depend on foreign credits and investments.

SOUTH AFRICA.—Growing economic strength and an expanding market.

BRAZIL.—The economic situation analysed.

CEYLON.—Many plans but how much development?

Fifty three-monthly reports on seventy countries are issued to subscribers.

Let us tell you more about this and other services for those with business abroad.

NOTES FROM INDIA

(These Notes have been contributed by our correspondent in India)

Enough Food to Go Round

SELF-SUFFICIENCY in food in 1952 used to be one of Mr Nehru's favourite, and most criticised, slogans. It has been achieved, to everybody's surprise, and only two years late, in 1954. This year's cereal imports are all for stock, and there may actually be some small exports of fine rice. The achievement owes a good deal to luck: the 1952 monsoon was good, the 1953 monsoon almost perfect; the rain fell in the right quantities, at the right intervals, on the right places; and so far, this year's monsoon again promises well, despite the enormous floods in North Bihar, North Bengal and Assam. Something also was due to good planning. India's agricultural standards are steadily improving as irrigation spreads and the peasant weeds more, fertilises more and uses better seed.

This year's crop has been ten million tons, fully one-fifth bigger than that of two years previously, an increase twice as large as the biggest year's imports India has ever made. There is at last enough to go round, and India has been able finally to dismantle its great apparatus of food controls. Today a man can buy as much as he likes, of the quality he likes, where he likes, at a price he fixes with the seller, and can move it where he likes. The only remaining control is one on the zonal movement of wheat, intended to protect the Government from making too large losses on its considerable stocks. This is a sharp contrast from the time in 1951 when 130 million were rationed, on a ration that for a few months came down to 9 oz a day, when in most States only the Government could buy, when at the same time it often laid down the amounts the peasant had to sell and the acreage on which he could grow non-cereal crops, and when prices and movement were alike rigidly controlled.

All this was necessary in its time; but its disappearance has brought with it a new sense of freedom. No longer is the rice full of stones; no longer do clerk and shopkeeper meet in the black market; no longer is one confined to the rationed qualities or must the peasant pay bribes to village accountants and police check-posts. Shopkeepers have suddenly recalled a forgotten politeness. The position of the Government has been immensely strengthened, the more so because so few, apart from the Food Minister, believed that decontrol was possible so soon and so successfully. Nevertheless, even plenty has brought problems in its train. The Food Minister has had to promise to support wheat prices at £21 per ton. The 100,000 or more people employed in food control are not proving easy to absorb. Planning and agricultural improvement both meet certain difficulties in a free market. But withal decontrol is popular. Next time India is short, the Government will only control if it cannot import.

* * *

Disinflation—For How Long?

MR DESHMUKH, India's Finance Minister, is a fortunate man; he can produce disinflation even while talking inflation. This year he expects an overall deficit approaching £200 million; for next year he has mentioned one of nearly £300 million, a sum almost as great as the Central Government's whole revenue budget. And he insists steadily, and probably rightly, that the second five year plan, to begin in 1956-57, must be much bigger than the first. A figure of £1,000 million per year has been quoted, which could mean deficits approaching in size the revenue budgets of the Centre and the States put together, for it is not likely that taxation, even with some foreign aid thrown in, could find more than £400-£500 million per annum at the outside. The economists who say that the only way for India to pull itself up by its own bootstraps is to do as Japan did, and by measured doses of money creation, at once to finance and stimulate development, look like having their own way simply for lack of an alternative; for India is determined to develop.

Yet against this inflationary background, India has been showing every symptom of a textbook disinflation. Prices have dropped by 6 per cent in a year, and are now as low as before devaluation; some commodities, like pepper and pulses, wheat and oilseeds, have gone down by very considerably more. Free market wheat is less than two-thirds the price of three years ago. Government credit is firm at 4 per cent, its tap loan is being steadily subscribed, its cash balances are up; private savings, especially rural savings, are a little higher than expected; the money supply, in a bumper crop year, has gone up only moderately; the bazaars are tight for cash.

The explanation is partly that government spending takes time to get under way, and although it is going considerably faster than last year, it is still not going nearly as fast as it will in a year or two's time; partly that industrial production is running at its highest level ever, and that this may have been the biggest agricultural year in India's history. In an economy like India's, that is still only very partially on a money basis, increased production induces a more than proportionate genuine extra need for money. To a very considerable extent India can stave off inflation simply by seeing that created money is absorbed by the goods it itself brings forth; the extra crop must follow the fertiliser loan too quickly for prices to have had a real chance to rise.

* * *

Curbs on Government

PRESS and public alike have been making it clear of late that they do not like their Constitution tinkered with. The Constitution is less than five years old, but the traditions which it codifies so elaborately have been building up for a century. Parliaments, human freedom, industrial rights and the welfare state are all old ideas now in India; and they are ideas to which the public is becoming increasingly attached. Over the last four years the Courts have gradually been revealing to the people just how extensive are the rights and freedoms they gave themselves in their Constitution. In so doing, they have reinforced their always strong hold on the public's respect and affections; but the Executive has been profoundly upset. It had not realised quite how much power the Constituent Assembly was taking away from it.

A man can no longer be arrested for failure to pay income tax on the *ex-parte* warrant of the income tax

officer that the failure was deliberate ; land to rehabilitate refugees cannot be taken over at the values of 1946 ; the Government cannot take over a mismanaged mill without compensating the management ; presses cannot be confiscated because newspapers are light-minded in their attacks on Ministers or officials ; government servants cannot be dismissed if the proper procedure is not followed —a Punjab constable has been reinstated with twenty years' back pay, because he was not given opportunity to show cause against his dismissal ; municipalities cannot create private monopolies in their vegetable markets. And so on.

The Executive is irked ; so the Centre, the State governments, and the working committee of the Congress Party, have all been discussing a whole spate of amendments. The General Secretary of the party has even spoken of an amendment to enable the Bombay government to stop non-Anglo-Indian and European children going to schools teaching in English ; but such proposals definitely count as tinkering and stand little chance. The three amendments that might go through would make the amount of compensation when the State takes over private property not justiciable, would permit some restrictions on the "yellow press" (what restrictions has never been made clear ; there has been talk of scurrility and obscenity but the Indian press, though sometimes scurrilous, is hardly ever obscene) and would reduce the guarantees to government servants. And even for these the Government will have to make out a much better case than it has so far if it is to get them through.

* * *

Planning Begins in the Village

THE first five year plan ends on March 31, 1956, and the machine of government is already turning towards working out the second. To some extent this is automatic. Such departments as railways, roads and irrigation have always to be thinking more than one or two years ahead ; they already have a queue of schemes—the problems are straightforward administrative ones—priorities, the importance to be given to relative return as against, say, a fair regional division, the total number of schemes for which men, materials and money can be found. That is how the first five year plan was worked out, in the secretariats and the Planning Commission. But this time the Government is attempting something much more ambitious.

It is trying to make planning an affair of the people, to plan from the bottom, from the village, instead of from the top, from Delhi. So far the picture is complete only in Travancore-Cochin, but the idea is that at each level, in the village, in the *tehsil*, in the district, the public will decide for themselves not only what they want, but how much they are prepared to pay for it. The Government has not the money to do everything and people will often pay to help themselves, if only in labour, where they would not accept higher taxes. It is a system which has worked with great success in the community projects. A village which would offer passive resistance to a governmental increase in the land revenue, will lay a cess on itself to help build a school or a dispensary ; and project officers have been learning to accept the villagers' priorities instead of their own, and not to be too shocked if one village wants a school first, another a seed-store, a third a maternity home, a fourth a road. It is not tidy ; but it is democratic.

* * *

Illiterates into School

No country except China has an educational problem as large as India's. Four-fifths of the population is still illiterate ; the medium of higher instruction, English, is only three-quarters understood by many students ; the bias is still towards producing gentlemen of culture rather than technicians, farmers and businessmen ; teachers are too few and grossly underpaid—a university lecturer may get £3 a week, a primary school teacher £1 ; too many undergraduates take pass degrees ; there is too little equipment ; two-thirds of the nation has still to learn the national language. It is little wonder that ever since independence there has been a spate of committees and commissions on education, or that governmental policy often seems contradictory and confused, or that the public is seriously disturbed for its children.

Out of the welter of problems, however, there is gradually appearing a policy, still tentative, still beset by lack of money, but definitely there. First priority goes to primary education ; half the children of school-going age are now in school, and every child will be there, if not by the Constitution's 1960, in another ten years or so. Second priority goes to making education more practical. High schools are beginning to be equipped with small farms, primary schools with allotments. Bombay is introducing such subjects as accounts and the working of the Stock Exchange into its secondary course. Two technological institutes of university level have been opened. Each district is to have a multi-purpose high school, rather like an English modern school. New medical and engineering colleges are being opened fast. There is a slow spread of basic primary schools, whose emphasis is on learning through doing. Most students still in practice get an old-fashioned literary education only because it is the cheapest.

Third priority has been given to raising teachers' salaries. There is a University Grants Commission, and many States have increased primary and secondary teachers' salaries in the last couple of years. Finally, English is slowly being got rid of as the medium of instruction—not, of course, as a subject. It is almost out in the secondary schools ; in the universities it may still take ten years, while they translate textbooks and decide whether they prefer Hindi or the regional languages. Hindi, however, has been introduced everywhere, and at the late primary stage. India's education may still be transitional and poverty-stricken ; but the priorities for changing it have been chosen.

Italy Bereaved

FROM OUR ROME CORRESPONDENT

THE death of Alcide De Gasperi has deprived Europe of one of its greatest postwar statesmen. To the British public he was known and appreciated as the architect of Italy's impressive recovery rather than as one of the creators of the Movement of European Union. But his achievements are equally impressive on both counts and he was keenly aware of the close connection between them.

When he took office as Prime Minister in 1945 (a post which he was to hold for the next eight years) he found his country devastated by the war, occupied by the Allies, divided by recent civil strife, materially and spiritually exhausted, humiliated by defeat and politically corroded by twenty years of dictatorship. The Allies, it is true, soon departed, but it was to leave Italy, for all practical purposes, under the control of the powerful and armed Communist party.

Yet, in 1947, Signor De Gasperi took the courageous step of dropping the Communists from his government and, at the elections held the following year, he secured an absolute majority for his party, the Christian-Democrats. In collaboration with the other centre parties, he steered Italy into Nato and raised his country's prestige to a level higher than its actual strength might have warranted. He backed the Einaudi line of financial orthodoxy and stability, checked any tendency towards inflation and set the country on the road to economic recovery which has now raised industrial production to 75 per cent above the prewar level. He launched a vast programme of agricultural reform and made the authority of the state respected. In particular, his right-hand man, Signor Scelba, cleared the street of the Communists.

Pillar of Europe

But his achievements in laying the foundations of the European Community were equally remarkable and they were fittingly recognised when he was appointed President of the Coal and Steel Community. His enthusiasm for federalism was based on the clear realisation not only of the need for the closest possible integration of the anti-Communist forces but of the advantages to Italy of a counterweight to the chauvinism which Fascism had done so much to foster. No doubt, too, he was inspired by his early experience as a deputy in the multi-national Diet at Vienna where he had represented his native province of Trento while it formed part of the Austrian Empire. If the movement for European Union has struck such deep roots in Italy, the credit very largely belongs to this great statesman.

A third and not less important achievement was the healing of the breach between Church and State in Italy. The two powers had been at loggerheads ever since 1870 when the newly unified Italian Monarchy was formed partly at the expense of Papal territory. A first move to bridge the gap had already been made, after the first world war, by the Popular Party whose parliamentary group was led by Signor De Gasperi until it was suppressed by Mussolini. During and after the war Signor De Gasperi ensured close co-operation between progressive Catholics and the new democratic regime and even succeeded in building up his party, the Christian Democrats, who were merely the Popular Party in a new guise, as the main bulwark against Communism in spite of their heterogeneous composition.

In effecting this revolutionary change in the Catholics' role in Italian politics, Signor De Gasperi no doubt profited from his Austrian upbringing and experience. Although a devout Catholic, he pursued a much more independent line in relation to the Church than most of his colleagues would have done and thus avoided giving the Communists too much of a chance to beat him with the anti-clerical stick, which the average Italian is still inclined to wield.

Nevertheless, it is widely held that, under his regime, the Church has gained a very strong grip on public life, and this consideration, combined with skilfully exploited discontent with his electoral law, contributed towards his lack of success at the 1953 elections. The lay centre parties, at any rate, are inclined to ascribe the drop in their votes to their close association with a government dominated by the Christian Democrats.

Whatever the explanation, his centre coalition only obtained the most slender of parliamentary majorities and he himself was forced out of office. In party matters, too, the time had come to withdraw and, at the recent Naples Congress, he handed over to the younger and more dynamic Signor Fanfani. His farewell from the party was made painful by the clarity with which he showed that he understood the difficult road that Italy still has to travel. With unemployment still round the two million mark, the problem of the South still largely unsolved, the political climate unhealthy, and the extreme Left steadily improving its position, there were ample grounds for the acute heart searching which marked the party's deliberations. Perhaps it was those considerations, coupled with the weakening of Signor De Gasperi's unifying control, which brought out into the open many of the internal differences which had hitherto been smoothed over.

Observers at the Congress felt that a new epoch had opened for Italy. Signor De Gasperi's death underlines the break even more sharply. Well-wishers of Italy hope that its permanent difficulties will find a statesman able to deal with them with the same mastery as Signor De Gasperi solved those of the transitional period.

Co-operation in Scandinavia

FROM OUR SCANDINAVIAN CORRESPONDENT

LAST week in Oslo the fifty-three delegates to the second session of the Nordic Council—sixteen representatives from Denmark, Norway and Sweden respectively, and five from Iceland, drawn from the major political parties—congratulated one another on working through their 35-point agenda in nine days, one day ahead of schedule. Far-reaching economic proposals had been laid before the Council. At a plenary session, the delegates endorsed by an overwhelming majority (with nine abstentions) a recommendation urging the four governments to take concerted action forthwith to establish the necessary conditions for a common market in certain goods, as a first step towards a customs union. Agriculture alone is to be specifically excluded.

Although the Nordic Council is an advisory body, with

no executive authority, its recommendations carry great weight. No less than 24 Ministers, including the four Prime Ministers, attended the debates in Norway's ugly, yellow-brick *Storting*. After the historic vote on the common market was cast, Hr Erlander, the Swedish Prime Minister, invited his Danish and Norwegian opposite numbers to his official residence, Harpsund, this autumn to discuss how to put the recommendation into effect. The products that will probably be included first in the common market are furniture, chemicals, paint, porcelain, shoes and leather goods, textiles, agricultural machinery and radios.

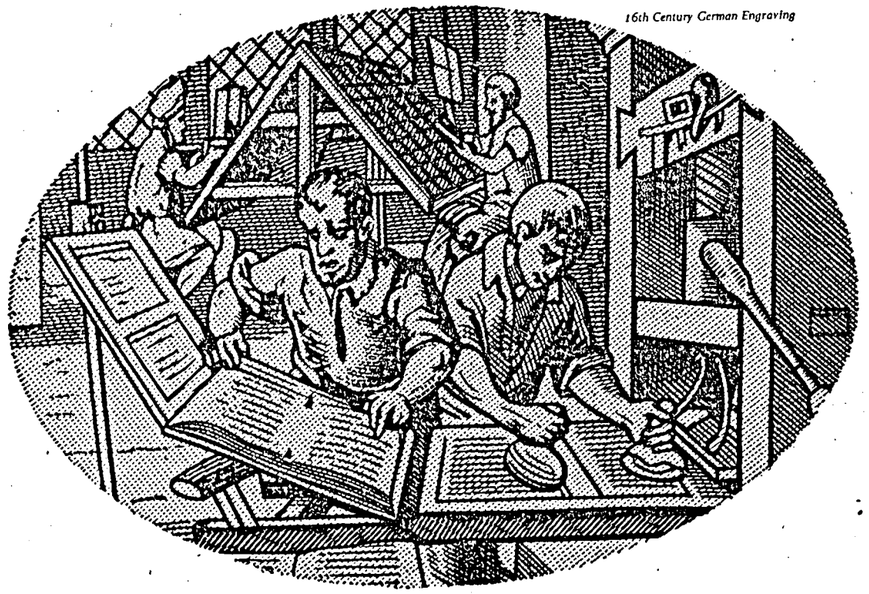
The resolution on the common market was a compromise formula framed to allay deep-rooted Norwegian misgivings. While fully subscribing to the principle of economic co-operation, the Norwegians, with their strictly planned economy and somewhat backward industrial development, feared the chill winds of Danish and Swedish competition, and held that talk of a customs union was premature. Norway is, moreover, sensitive to any threat, however shadowy, to its relatively recent independence, after centuries of alien rule. The Norwegians have been protagonists of co-operation first in specific, limited fields. Pointing to the successful model of the Scandinavian Airlines System, they proposed similar joint enterprises in steel, chemicals and textiles. Norway, too, is anxious to attract Danish and Swedish capital for the development of the country's vast resources of hydro-electric power, which it could then export to its neighbours.

The Swedes and Danes felt that Norway's proposals, admirable in themselves, did not go far enough. Earlier this year it seemed likely that they would press on with their plan for a common market together, leaving the door open for Norway to join later. Last week's happy compromise (which split the Norwegian delegation) took into account Norway's special interest in certain concrete projects and recognised that "implementation of a common market must occur gradually over an extended period," proceeding "in different ways and at different speeds in the various branches of the economy and in the various participating countries." While the Norwegian Social Democrats—the government party—felt able to support this motion, the eight opposition delegates (and one Icelander) abstained. A counter-proposal, moved by the rebels, to defer a decision until the Council's next session, thus allowing further discussion in the *Storting*, was heavily defeated. In ten to fifteen years' time, the century-old dream of a Scandinavian *Zollverein* may well be realised.

Russian Fulminations

In Oslo, the Council turned its attention to a mixed bag of minor proposals, which ranged over the whole field of Scandinavian co-operation; and it noted with pleasure that this July the common labour market became a reality, so that Scandinavians, including Finns, no longer require passports when visiting each other's countries. Several speakers deplored the absence of Finland from the Council's deliberations. The non-Communist Finnish press has recently been urging the government to apply for membership. The Soviet Union, intolerant as ever of the efforts of the free nations to work together, has violently attacked the Nordic Council. An article in *Izvestia*, clearly addressed to Finland and Sweden, described the Council as "part of the aggressive Atlantic Pact": it alleged that Sweden was being drawn into the Atlantic camp, and that it was America's aim to disturb the good-neighbourly relations between Finland and the Soviet Union. Undeterred by Russian fulminations, the northern countries will continue, unobtrusively but with quiet determination, their successful experiment in regional co-operation.

Orientalists at Cambridge



FROM A CORRESPONDENT

At this time of crises and upheavals in Asia and Africa an unusual significance attaches to the International Congress of Orientalists that has just been held in Cambridge. This is the first time that Britain has entertained the conference since 1928. More than 900 scholars in all branches of Asian and African studies have been gathered together, the majority from western countries, though a large number came also from the nations with whose languages, cultures and history these studies are concerned. One notable feature of the meeting has been the reappearance of a Soviet delegation; as part of the general increase of comings and goings through the iron curtain, a team arrived from Moscow with a formidable cargo of papers to be read to the non-Communist intelligentsia. The insistence of the Soviet Government on recognition of Russian, on an equality with English, French and German, as an official language at international conferences has created certain difficulties of communication, but at the opening session of the Congress Academician Guber first read his address in Russian and then translated it himself into excellent English.

At sectional meetings Marxist versions of Asian history, with emphasis on recent anti-imperialist liberations, are read in Russian, but printed English translations are distributed to the audience; unfortunately, the supply of these is not always adequate, so that the message has not always reached those to whom it is addressed. But the presence of the Russians and their highly topical papers have certainly lent variety and liveliness to the conference, in which, quite apart from their special zeal, there has been a strong tendency to vary with themes of current interest the more remote and erudite themes of scholarship which would have exclusively occupied attention at such a gathering a generation ago. A special booklet, under the title of "Orientalism and History," prepared specially for this conference, has attempted a general survey of the civilisations of the East and their place in world history, and raised in a challenging manner problems of the relations between East and West ranging far beyond the numerous specialised subjects discussed this week at Cambridge.

★

Correction.—In "Notes from South Africa" which appeared in *The Economist* of July 24th the distribution of seats in the Transvaal Provincial Council was inadvertently given incorrectly. The present position as a result of the 1954 elections in the four provinces is: Cape-National party 30, United party 24 (Native Representatives 2); Transvaal-National party 45, United party 23; Orange Free State-National party 25, United party nil; Natal (where the elections were held earlier this year), National party 4, United party 21.

I hold every man a debtor to his profession

FRANCIS BACON (1561-1626)

Every man is a debtor to the world: to his parents; his schoolmaster; his friends and employers. He owes them his existence; his knowledge; his happiness and his daily bread.

To his profession, he has another debt: that due to generations past whose integrity and skill have given his calling the reputation it enjoys. To them he owes his status as a worker and a thinker.

'Profession' carries a wider meaning now than it did once; and professional status, in common talk, is extended to many functions in industry and commerce. But it is not won lightly; a long record of public responsibility, and private service, must come first. How can such a debt be repaid? Only by handing on still higher standards—and a higher status—than those of yesterday, to the makers of industry to-morrow.

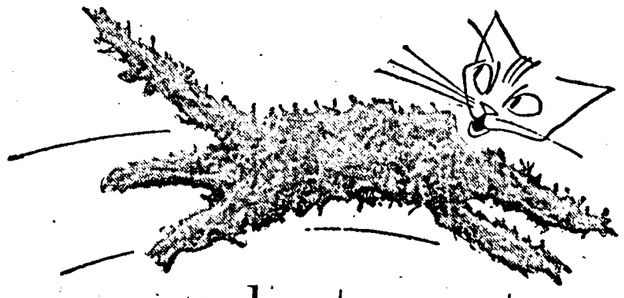
Building and Civil Engineering Contractors

COUNTING THE COST



Message for Chief Engineers and Executives responsible for new construction

WHEN YOU CONSIDER A TENDER do you know what the job will really cost? Will the work be finished on time? How much will the delay cost your Company if your new works goes into production six months late? Will there be heavy maintenance costs and production hold ups after completion of the work? Plainly, the lowest tender is not necessarily the cheapest; reliability, efficiency and quality have, in the long run, a value to be taken into account.

The time to evaluate these questions is before the contract is placed. A tender's worth is not shown by price alone. What is behind it in reputation, in experience and skill, in plant capacity? Pre-planning, method study, targeting, the right use of heavy plant and small tools, all these have an important part in the scientific approach to the problem of construction.

John Laing and Son Limited are always pleased to be called in during the initial stages of design, when experience and advice can often effect the greatest saving in time and money. In this way they can bring their full capacity to bear on a job right from the start. Behind their tender is a reputation valued far higher than the price of any contract—a reputation which the Company intends to maintain by giving complete satisfaction, not only when the contract is signed, not only on completion, but for the years to come.

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos . . .

THE BUSINESS WORLD

Britain Repays

THE British Treasury this summer has been busily engaged in tidying and clearing up its abnormal international debts. Last month the United Kingdom consolidated some $395 million of its debt to the European Payments Union, substituted for it a series of direct agreements with the several European creditor countries and put down on the counter $98,750,000 in gold or dollars with which to begin the repayment. This month it has turned its attention to its relationship to the International Monetary Fund. Britain's account there is now to be cleared of the sterling that the IMF held in excess of the amount originally subscribed by the United Kingdom. This excess, amounting to £40 million, is now being cancelled by a repurchase of the sterling, for which $112 million has been taken in dollars out of the Exchange Equalisation Account and paid over to the IMF.

To appreciate the significance of this operation, it is necessary to examine the origin of this "excess" and the nature of the IMF mechanism. When the United Kingdom joined the IMF the quota allotted to it for its membership subscription (and determination of its rights to the Fund's facilities) was fixed at $1,300 million. In accordance with the Articles of Agreement $236 million of this was paid in gold or dollars and the balance of $1,064 million was subscribed in sterling, for the most part in the form of non-interest bearing notes, which the IMF could call for payment in cash on demand. The IMF thus started operations in 1946 with a sterling holding worth $1,064 million in cash or at call. (The Fund keeps its accounts in dollars and when Britain devalued, the dollar equivalents had to be made good.) The Fund's sterling holding was soon increased because of the pressure upon Britain during its dollar crisis of 1947-48, when the postwar American loans to Britain were running out. To ease its dollar difficulties Britain utilised its right to seek aid from the Fund by buying from it, for payment in sterling, a total of $300 million of US dollars. This "sale" of sterling to the IMF brought its total sterling holding to the equivalent of $1,364 million, and this was later swollen by $4 million worth of sterling payments of interest charges on these transactions.

But when sterling recovered and certain other member countries of the IMF found it a scarce currency, they in turn had recourse to the Fund's facilities—by buying sterling from it against payment in their own currencies. The first such sales of sterling by the Fund were actually made in 1947, when the Netherlands bought sterling to the equivalent of $6 million. In 1951 Brazil made a purchase equivalent to $28 million. Then, in 1953, the year in which sterling really became a hard currency, it was bought from the IMF to the value of $158 million—by Japan, Brazil and Turkey. These purchases amounted altogether to $192 million, which left the IMF with a holding equivalent to $1,176 million, or $112 million in excess of the original holding. This is the excess that has now been repurchased, so as to restore the United Kingdom to its initial position in the Fund.

★

The Treasury statement that announced this repayment at the end of last week went out of its way to stress the fact that this was a voluntary move, that "the United Kingdom was not under any legal obligation under the provisions of the Articles of Agreement, or bound by any specific undertaking, to repurchase the $112 million, or any part of it, and the Fund has made

no representations to the United Kingdom on the subject." This is doubtless an entirely accurate construction of the Fund's Articles of Agreement, but it does not wholly accord with the statement issued by the IMF in February, 1952, about the use of the Fund's resources and repurchases of members' currencies. The IMF then pointed out that "considering the necessity for ensuring the revolving character of the Fund's resources, exchange purchased from the Fund should not remain outstanding beyond the period reasonably related to the payments problem for which it was purchased from the Fund. The period should fall within an outside range of three to five years." But the difficult circumstances that necessitated and justified Britain's purchases of dollars from the IMF in 1947 and 1948 disappeared long ago; it therefore seems evident that the spirit, if not the letter, of the Articles of Agreement required this repurchase of sterling. Indeed, even on the most liberal arrangement indicated by the IMF in its declaration of February, 1952, the repurchase should, in fact, have been made twelve months ago.

★

Quite aside from such considerations, the operation was obviously desirable from Britain's own point of view. It helps to show the gold and dollar reserve of the sterling area in its true colours, without any such special brightening as it has secured in the past as a result of the debts owing to EPU and IMF. To the extent that Britain was indebted to these two organisations, the gold and dollar reserve was spuriously swollen. At a time when the feasibility of making the pound convertible and the amount of external support that such a move might necessitate are being discussed, the British authorities naturally have no wish to see their reserve dressed up to appear even more impressive than it really is. Now that confidence in sterling runs high, there is nothing to be gained from any artificial boosting. This view was apparent, indeed, in the last reduction in the Bank rate. The cut from 3½ to 3 per cent last May was not dictated by trends arising from the domestic economy, but was intended mainly to check an excessive inflow of foreign money; if the pace of inflow of foreign funds had continued, some unknown part of the reserve would have had to have been regarded as earmarked against a future outflow of "hot" money.

Despite these special considerations the repurchase of sterling from the IMF and the preceding repayment of debts to EPU creditors both carry reassuring implications. These two operations involve a draft of over $200 million on the gold reserve; and the fact that they were launched on the eve of the autumn pressure on sterling provides an eloquent and comforting commentary upon the confidence with which the British authorities now regard the prospect of sterling. This mark of confidence was, indeed, duly acknowledged in the markets. The news of the repurchase of sterling from the IMF was followed by an immediate though short-lived recovery of sterling in the foreign exchange market at the beginning of this week. It also had a strengthening, though also not enduring, impact on the market for gilt-edged securities.

The timing of this clearing of the decks with the IMF, just before the important discussions that will take place in Washington when the Governors of the Fund meet next month, might suggest that it is directly connected with the convertibility "exercise." It has no such immediate significance. This is not the prelude to a decisive move; to judge from all outward indications, the possibility of that appears to be receding well into 1955—and perhaps beyond the next General Election. That, however, will not deter those gathered at Washington, the Chancellor of the Exchequer included, from devoting further study to the "collective approach" to freer trade and payments. The possible protraction of the delay before the hopeful travellers arrive offers no excuse for neglecting the technical preparations that should be made for "the day."

★

Among those preparations is the provision of adequate reserves of international credit for which the IMF will certainly be chosen as the main and probably the only instrument. The hope is that the relatively untried device of "stand-by" credits will fill the need. These arrangements are intended to give member countries assurance that during a predetermined period sales of exchange by the Fund will be made up to a specified amount whenever a member requests them. Attempts will certainly be made to induce the Fund to relax some of the restrictions it intends to impose on such "stand-by" arrangements—among them that they should be limited to periods of not more than six months and that they would comprise only the portion of the quota (normally 25 per cent in any one period of 12 months) to which a member would be entitled under the Articles of Agreement. In taking the initiative for any such loosening of the IMF mechanism, Britain will be strengthened by its recent repurchase of sterling from the Fund and the restoration of its position to the pristine purity of 1946.

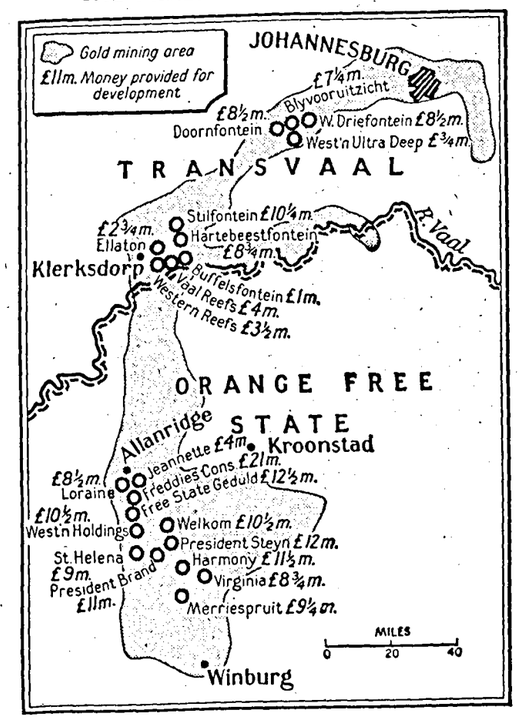
INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXXI (April to June, 1954) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1

Kaffirs' New Character

GOLD shares have been intermittently moving upwards in recent weeks, rising when other markets have been rising and declining when the general market rise has been checked. It has been a selective and fairly cautious advance centred on the new mines of the Orange Free State, the Far West Rand and the Klerksdorp area, together with the gold-cum uranium shares and mining finance house shares. Only occasionally, as happened a fortnight ago, has the tide spread to catch up the established mines of the Rand in its swell. But though the rise has not been all-embracing it has been substantial. The developing gold mine shares have touched new peaks and remain near them today. The advance is curiously timed. Gold shares do not normally move with gilts and industrials; they sit on the opposite end of the market see-saw, for investors tend to buy gold shares when they lack faith in gilt-edged and home industrials.



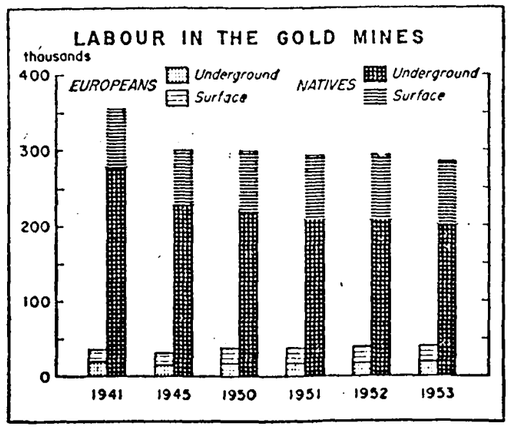
But no lack of confidence exists at home. The Stock Exchange boom has not been destroyed; profits and dividends are still rising; American recession seems to have moved away and a higher gold price seems as far beyond the horizon as it ever was. It would be absurd to suggest that the slight seasonal weakness in sterling has any relevance to the demand for gold shares. That demand must spring from other causes. One of these is French buying; another is anticipation by the more volatile investors in this country. Good profits have been made and taken in the industrial market. There are some who now feel that a moderate stake in gold shares is no more than a reasonable insurance. And if it should happen to be the approach of an election that eventually stops the industrial boom, then—runs this argument—South African gold shares would not be a bad election hedge.

But is there not something more behind the rise? Have the mines of the Orange Free State, much the most important of the new areas, caught up with their initial difficulties—rising costs, shortage of capital and shortage of labour?

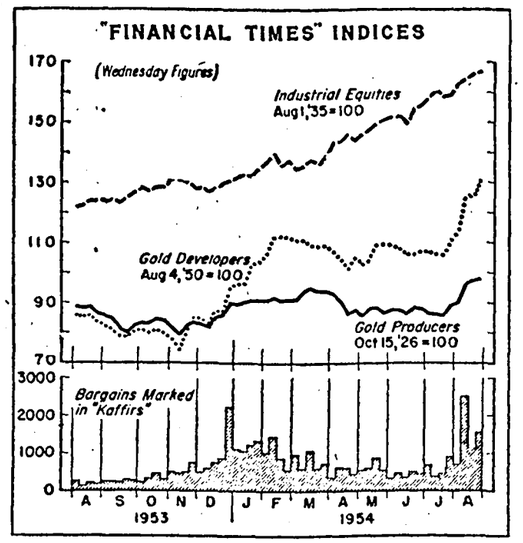
The labour shortage has not been decisively overcome. The chart shows a long term downward trend in the supply of native labour. Subsequently, there has been a better than seasonal recovery in the first half of 1954. At just over 310,000 the June labour force was nearly 37,000 higher than in December and about 30,000 more than in June last year. The figures now look encouraging; Mr Kenneth Richardson, President of the Transvaal and Orange Free State Chamber of Mines, has described the labour supply as much more satisfactory than it has been for years past. But before trying to assess the gains it will be wise to wait until December, when many native labourers return to their villages for the harvest. At best, native labour remains uncomfortably scarce though the supply of European labour has improved. Mr Harry Oppenheimer recently told the South African parliament that the present deficit is 50,000 and that by 1958 a further 30,000 native labourers will be needed. Inadequate labour means higher costs, but those cost increases fall mainly on the old-established mines, for labour is allotted by the Native Labour Committee of the Chamber of Mines, which gives developing mines a generous share.

On the score of costs the verdict must also be indecisive. Investors must expect that on the deep, heavily watered, and heavily faulted gold reefs of the OFS, costs will always be high, just as some of the new mines of the Klerksdorp area, extracting gold at shallow

THE MINES AND THEIR MONEY



Money for the New Mines	Raised Since 1945	Estimated Sum Still Needed
	£ mn.	
Orange Free State	128·6	40·0
Far West Rand	24·9	—
Klerksdorp Area	30·6	12·8
Total	184·1	52·8



On the basis of existing mines and excluding any estimate for ultra Deep Levels (Far West Rand) which is a special project whose needs cannot be assessed.

depth, can hope for relatively low costs. But as the tonnage raised in the Orange Free State increases, the rising trend of costs should flatten out. Stability at a level sharply higher than on the Rand should be reached.

When it comes to finding the capital to open up South Africa's new gold resources, investors can take heart. The back of the problem seems really to have been broken. No less than £184 million has been found for the mines of these areas since 1945—

over £69 million from the Anglo-American group, with its diamond profits to draw upon and a further large sum from the Kennecott Copper Corporation. Some £53 million has still to be provided for the existing mines, assuming the average cost of bringing an Orange Free State mine to full production to be £13 million, including housing. And the total may be raised by perhaps a further £40 million if allowance is made for possible new mines. But the task no longer

looks impossible. The present twelve mines of the OFS, the six of the Klerksdorp area and three of the four in the Far West Rand have been carried to a point which permits some confidence that their capital needs will be met.

The prizes dangled before the investor who is happy about the general outlook are more inviting than ever. In most of the new mines that have reached the production stage actual results are much richer than was suggested by the boreholes previously sunk to prove

AVERAGE DEVELOPMENT

			...

the mines. That is no surprise to geologists familiar with the limitations of the evidence obtained from diamond drilling and boreholes, but it is refreshing news for non-technical investors. The table shows some examples of actual development over the average of the last four quarters, compared with the previous borehole results from the main reef in the vicinity of the shaft. It also brings out two other encouraging facts—that the percentage of payability is abnormally high and that both the grade and payability are running much above the common experience of established mines on the Rand, three examples of which are given for comparison. Even allowing for the fact that high cost demands good ore—at least 150 inch/pennyweights—to show a profit, the facts are encouraging.

In the first five months of this year South Africa's gold production was 334,551 ounces more than in the same period of 1953. It has been foreshadowed that South Africa's total output for the year will exceed 12 million ounces for the first time since 1943. The new mines should be able to sustain a fairly high level of costs and earn a return, even ignoring the fact that several of them have been chosen for government-sponsored uranium plants. To assess that return and the fate of investment in individual mines is a matter of conjecture. One estimate of possibilities of the OFS

mines is the somewhat optimistic forecast made by Mr S. G. Menell, chairman of the Anglo-Transvaal group, that the OFS would produce an income from gold alone in the range of £100 million a year gross by 1960.

Developing gold mines pay no dividends; the optimist is not earth-bound by mere figures; calculations are attempted but fancy remains free, and opinions can seldom be disproved. When dividends begin to come in, the shares of the new mines will begin to fall into line with yields on established gold mines which have a long life ahead of them—always remembering that the South African gold taxation system contrives that a mine normally pays no tax and a high dividend in its early years and a smaller dividend when taxation begins. From such established mines investors are at the moment content with dividend yields in the range of 7 per cent to 8 per cent. British holders obtain the benefit of Dominion Tax Relief but the dividend makes no allowance for the amortisation of the wasting asset, and so contains an element of return of capital and may seem low enough.

Investors in the new mines—speculators if everyone who buys shares for a capital profit is a speculator—should remember that these holes in the ground in the Orange Free State are not cheap. In hard cash they are costing an estimated average of £13 million each to dig and equip. The market already puts a higher value on many of them. Excluding Jeannette, which is not quoted, the market capitalises the share and loan capital of the other 11 OFS mines at around £270 million, almost double the average actual cost per mine. Such high market capitalisations are not unusual in gold-mining; often share prices rocket before the first sod has been cut. If the atmosphere is right the market can rise further. The mining finance houses have certainly dealt well on the rising market and their share dealing profits can hardly fail to show an increase. The more cautious investor will tend to spread his risks by choosing a mining finance share in preference to an individual mine. He should also remember that a fair measure of success for the mines is already discounted.

Business Notes

The Buyers Return

BUYERS are back in the markets chasing their old favourites. Great Universal Stores 5s. units are over £5—a new peak. Orange Free State gold shares have been rallying strongly following the decision of the Anglo-American group to take an option in "Ofsits" at £4 a share. Anglo-Iranian Oil shares have been rallying strongly. The gilt-edged market seems to have recovered from last week's fit of indigestion and to be firming up. The *Financial Times* industrial share index reached a new record of 169.4 on Thursday, while the index of developing gold shares after touching a new peak of 130.32 on Wednesday lost only a small fraction on Thursday: the markets seem poised for one more leap forward. For the continuance of the Stock Exchange boom nothing better could have happened than the modest setback of last week. Had the advance continued without that check, the danger of a much more serious break would have become acute. A check that brings no major decline gives the jobbers the chance to adjust their books and the speculators to adjust their commitments; it makes a further advance before the end of the bull market much more likely.

In the present epoch of high taxes a long-drawn-out bull market subjects the London system of dealing through stock jobbers to a severe strain. The jobbers have had no opportunity since the war of adding substantially to their working capital, and therefore no opportunity of building up their books in the stocks in which they deal to match a market that is growing in popularity and in money turnover. It is only the gilt-edged section that can still boast really big jobbers capable of absorbing big quantities of stock without difficulty. To job "bear," that is to sell to the buying broker first and find the stock afterwards, together with pot-boiling operations such as buying "Gussies" for cash and reselling them for the new account, has become the precarious livelihood of many of the smaller industrial jobbers. It becomes difficult and dangerous in a market that is rising over a long period; technical reactions such as occurred last week reduce the danger.

Despite that reaction the demand from genuine investors still seems strong. This is naturally a period during which issuing houses and City institutions are pushing forward the re-financing operations that they have in prospect. The prompt success of the recent debenture issues by East African Power Company and by Bentley Engineering give encouragement, as does the active selling at rising prices this week of a large number of ordinary shares in F. Perkins coming partly from the original financiers of this company. It should be a good market, too, for the £10 million project which Vickers are planning. This will consist of an offer to ordinary shareholders of one new £1 share at 27s. 6d. for each eight held and a loan stock issue of £6 million 4 per cent stock at £98 10s.

Radio Breaks Fresh Ground

THE radio industry has two major innovations to show visitors to this year's Radio Show that opened in London this week: two-programme television receivers and the first VHF radio sets. For years now this very young industry has had to content itself with unspectacular if steady improvement on the domestic side that gave a misleading impression of middle-aged conventionality and made a poor showing beside the remarkable electronic developments in industrial and defence equipment. Now it faces what are probably the biggest changes in domestic radio since the start of television services. It is only within the past few months since the Independent Television Authority took solid shape and the BBC received permission to go ahead with its project for improved sound services in the VHF range that the industry could feel the future was sufficiently certain to push ahead with plans for breaking this fresh ground. The result is an exhibition that is in many ways the most rewarding since those held shortly after the war.

It is still possible to buy television receivers for BBC programmes only, but they are believed to make up only a quarter of the total on show, and they are not significantly cheaper than a comparable two-programme set. Most of the radio receivers designed for the VHF services have simply had a fourth wave-band added to the standard long, medium and short waves; there seemed to be some confusion about their actual selling prices in the opening days of the show. The purpose of introducing VHF broadcasting is to overcome the interference that is found in certain districts on the long and medium waves; this suggests that the new sets will have a restricted market. But the quality of transmission is believed to improve in these very high frequencies, and the astonishing resilience of radio sales, combined with the intense interest being shown in high-quality reproduction, may prove such impressions wrong. In 1952 production of radio sets had almost to be halved, from 2 million in 1951 to 1.2 million. The following year saw the start of a remarkable revival. Production went up from 67,000 sets in March, 1953, to 166,000 in March this year; last year's total output was 1.2 million, even lower than in 1952, but during the first half of this year output was running at an annual rate of 1.7 million.

The Widening Screen

TELEVISION production has not fluctuated as much as that of radio sets, but if its progress has been steady, it has not the same resources to fall back on as those of the more versatile radio receiver. 3-D and colour television are still the playthings of scientists and the advance of the domestic receiver has been in steadily widening the area of its screen. The 9-inch screen, which was the backbone of the postwar market, has gone for good. Its successor, the 12-inch screen—average price £56 with tax—accounts for less than a quarter of current output, 45 per cent of which is given over to 14-inch receivers costing about £66 each. The 17-inch screen, which was a novelty last year, accounts today for 22 per cent of the industry's output. As the big tubes come into quantity production, the prices of the big sets fall. At Christmas, a 17-inch set would have cost nearly £92. Now it costs a little over £86; in comparison, the price of the other sets has dropped only about £1 or so. The swing is expected to continue when today's novelty, the 21-inch screen, is put into quantity production.

While television production has been rising from 6,500 sets in 1946 to 1.1 million last year, the sets coming out of the factories have been showing a progressively higher unit cost because of this tendency to favour the ever-wider screen. This may have some bearing on the probable size of the industry's replacement demand for television receivers. Since the war it has produced 4 million television receivers, of which all but 15,000 must have been sold at home. The BBC's television services now cover 15 million households, 86 per cent of the population. Rather less than 23 per cent of these households have television licences; an unspecified number have sets but no licences. In London and the Midlands, where television is longest established, about 34 per cent of the households appear to have licences. It seems probable that saturation point for television sales lies somewhere between 30 and 40 per cent (to allow for non-licensed sets) of the number of households in an area.

What the industry does not know is how many owners of 9-inch and 12-inch sets can be persuaded to change to bigger models. The start of a second service in an area, with the prospect of spending £6 or more on an adapter for an existing set, may be sufficient to start off a replacement demand—it may also tap a new sector of the market. Television production has shown a greater seasonal decline this summer than last, when the Coronation boom mopped up dealers' stocks, and the unexpectedly modest prices being asked for two-programme sets is a sign that the industry is sharpening its competitive weapons.

Hire Purchase Set Free

WHEN, last month, the Board of Trade pulled down its structure of restrictions on hire purchase transactions it was obvious that the control over hire purchase as a whole was doomed. So it has turned out, even sooner than most people expected. The Treasury, too, has climbed down; the Capital Issues Committee has now been instructed to remove the rigid ban on issues for hire purchase finance and to deal with applications on their merits. The banks have been asked to apply similar principles in dealing with applications for advances. But the Treasury retreat is still covered by the Chancellor's warning that: "An increase in the volume of hire-purchase finance leading to an excessive expansion of consumer credit would not be in the national interest."

No tears need be shed over the passing of the detailed structure of hire purchase control. It sought to restrict the total volume of finance available for hire purchase and at the same time specifically to circumscribe the nature of hire purchase deals in a specified list of consumer goods in the hope that the limited amount of finance would thus be concentrated on capital goods. History contains few examples of people having been made to do something by

"Daddy, what is earth made of?"

That's mostly powdered rock he's playing with, you tell him—mixed with mould. It's the top of the earth called soil; in it are mineral salts, which help to feed the plants which in turn feed us.

Earth—the basic raw material. Sometimes scratched, even to-day, with Bronze Age tools, yielding a pitiable crop. Yet fertile, brimming over, where it is channelled for irrigation, ploughed, reaped, *husbanded* by power: diesel and electrical power, supplied all over the world by THE BRUSH GROUP LIMITED.

Supplied to the Sudan Gezira Board, for example, by J. & H. McLaren Ltd., a member company. Here 108 McLaren diesel engines have been cable-ploughing the land since 1927, the soil being too light for tractors. Over 600,000 acres now yield their crop of cotton and linseed; soon this same number of engines will extend the limits of fertility further still, to a total area of one million acres.

It shall not burn

At last, nuclear knowledge brings to every warehouse, factory, office or other industrial building, a sure and certain means of fire prevention which is now available to all.

WHAT DOES IT DO?
Minerva instantly detects the first trace of smoke from any smouldering material.

HOW DOES IT WORK?
The activating source of the detector is a particle of radio-active material with a theoretical life of more than a thousand years. No current is consumed while the detector is on guard. The entry of smoke triggers the detector.

HOW IS IT INSTALLED?
Each detector is no larger than an electric light bulb and can be fitted as simply.
Only one is required in a room or for every 1,000 sq. ft. of floor area.

WHAT DOES IT COST?
Only the cost of the simple wiring—the detectors and signal equipment are hired to the user by the makers at a low annual fee which includes servicing and free replacements.

Minerva—protectress of ancient cities—guards the docks and warehouses of the world's great waterways. The system will be found in stores and warehouses in London, Brussels, Hamburg, Hanover, Zurich, Stuttgart, Bordeaux, Lille, Toulouse and Gothenburg.

Bowmaker (5/-)	9/-	23/-	28/-	27/6
Gt. Universal Stores (5/-)	37/-*	83/6	98/-	100/-

* Ex dividend. (a) After 50 per cent scrip issue.

Shares of the hire purchase finance houses and of some of the retail companies doing hire purchase business have risen sharply. It is still pertinent to ask "What may happen now?" As *The Economist* goes to press United Dominions Trust still has not had an answer from the Capital Issues Committee on its application for a capital increase that was lodged on July 20. Surely the answer must be "Yes." But no test has yet been made of how the clearing banks will interpret the new injunction. In the last two years they have restricted their advances for hire purchase finance to 90 per cent of what they were before the 1951 restrictions. It seems certain that that 10 per cent cut at least must be withdrawn.

Then the established finance houses will compete more effectively with the host of new finance companies that has recently sprung up with less than £50,000 capital, and the small new financiers will tend to be squeezed—not necessarily out of business, but into the more risky channels of financing where there is no recourse against the retailer who sold the goods. The more comfortable block financing, with the trader as a party to the deal, may tend to become the preserve of the established finance company now armed with more resources. Will charges to the customer fall as competition in financing grows? Not necessarily: high though they seem, the charges for hire purchase finance contains more administration and collecting costs than pure interest, and among the small companies it is going to be the company with the good collecting service and strong local connections that survives.

Bullion Prices Rise

A NOTABLE trend during the past week or so has been the strength of London bullion prices. The price of gold in the London market has risen to over 249s. 8d., the highest level reached since the market was reopened last March; the price for silver has strengthened from 72d. at the beginning of the month and 72¾d. a week ago, to 73¾d. To some extent each of these movements is simply a reflection of the weakening of sterling against the dollar, a movement that has become more pronounced this week under the impact of considerable seasonal demands for dollars, particularly for payments for oil and sugar. By the close of business on Wednesday, the sterling rate had reached $2.80¾, its lowest since early this year. The rise in the sterling price of gold has, in fact, just about kept pace with the fall in the sterling-dollar rate, as can be seen from the fact that the free market price for gold in terms of dollars has during the past week remained steady at around $35.04. There have, however, been some special factors affecting each of these sections of the bullion market. The hoarding demand for gold from France has died down completely. The main purchases of free market gold have come from Hong Kong and the Middle East, where the demand of the metal may have been stimulated by the war of words concerning Formosa. Some European central banks have also appeared as buyers in the London market from time to time.

The substantial recovery in the price of silver from the low level of 72d. that obtained during the last ten days of July is mainly accounted for by the successful absorption of substantial amounts of Russian silver that had found its way to this market. Some of this silver was sold direct in London by the Russian authorities, but a certain amount of it represented barter silver resold here by dealers on the Continent. Some Continental countries have been offering merchandise to Russia for barter against silver, and as the Russian buyers have been prepared to pay a premium over the world price for such commodities (some of which may have come close to the strategic list of prohibited articles) the sellers who acquired silver in exchange were prepared to offer it in the London market at the relatively low price of 72d. That cheap silver has now been absorbed and the price has recovered to a point very close to the import parity with New York, where silver is quoted at 85¼ cents.

New Peaks in Tea Prices

UNLIKE coffee and cocoa, which are still below their peaks, tea prices are setting fresh records every week. At the London auctions this week clean common tea rose by another 1d. a lb to 4s. 10¾d. a lb, and medium and better qualities were 1d. to 3d. a lb dearer. The persistent shortage is the reason for the advance, and with the seasonal improvement in the quality of teas arriving in London next month, prices are likely to rise still higher. Best liquoring Assam broken pekoe, for example, which is now quoted at 5s. 6d. a lb, is still 6d. below the equivalent of the Calcutta price. The prospect of any reaction in prices looks remote. The increase of some 30 million lb in the total crop in the main producing countries in the first half of this year appears to be barely sufficient to meet the growth in world consumption. A similar increase in the second half of the year might just tip the market in the buyers' favour, but the crop outlook in North India, the largest producing area, is hardly encouraging.

The hopes of British tea blenders for an easing of prices this month have been dashed, and the most extravagant dreams of the tea producers have come true. Revenues this season must be even better than last year's, and though

costs are rising, for fewer companies are in debt to their banks. Prices of tea shares have moved a little higher in recent weeks, but whether that rise has fully discounted the present prosperity may perhaps be open to doubt.

The Viscount's Tally

SIGNED orders for the Vickers Viscount reached a total of 153 this week, with about 50 additional machines under negotiation. Trans-Canadian Airlines, which ordered 15 Viscounts last year, intends buying a further 7, bringing its total to 22, and Airwork Ltd., a few days earlier, had signed an order for 3 Viscounts. The value of the 153 aircraft and their spares is put at £44 million, nearly three-quarters of which represents aircraft for export. These are substantial sums and it is not surprising that Air Finance Ltd., the company formed last autumn to provide credit for aircraft buyers, should have played some part in the financing of the biggest order so far received. This is for 40 Viscounts (with an option of 20 more) for the American Capital Airlines. The 60 aircraft will cost Capital $67 million; the initial order for 40 will amount to $45 million, and this sum would under normal conditions have to be found by the time of the delivery of the last aircraft, in August, 1956.

This is the first time that Air Finance has provided credit for the purchase of Viscounts, although not the first occasion on which it has facilitated an aircraft sale. It was expected last year that Air Finance would ordinarily provide credit for 40 per cent of the value of the sale, and would expect manufacturers to ask for the balance of 60 per cent to be paid on or before delivery of the aircraft. Payment was to be made within three years. On such a basis, Air Finance might be expected to provide some $18 million credit for Capital's purchase.

Fresh Boost for Lead and Zinc

PRICES of lead and zinc jumped sharply in London this week following the announcement that the United States will not raise the tariffs on these metals, but will instead assist the domestic industry by increasing purchases for the strategic stock. Foreign producers will be thankful for President Eisenhower's view that the higher tariffs recommended by the Tariff Commission would confer only a marginal benefit on domestic prices—at the expense of American consumers—and be of doubtful help in reopening domestic mines. The President's decision follows the recommendations of the Randall Commission, which said that if it was necessary on solely military grounds to assure a strictly domestic source of raw materials, this should be accomplished by means other than tariffs or import restrictions, and the cost borne in the defence budget. It would have been cheaper for the Administration to grant direct subsidies to the highest-cost producers, instead of buying more lead and zinc from the domestic industry as a whole. But this would have been politically unpalatable; and as the expanded stockpiling programme of last March was partly designed to assist domestic producers, it was logical simply to accelerate these purchases.

The President stated that in the fiscal year ending next June, the government "could buy" up to 200,000 tons of lead and up to 300,000 tons of zinc. Recently it has bought about 8,000 tons of lead a month and about 15,000 tons of zinc, at the market price. The intention is to raise prices to a level that will encourage mines to go back into production and so maintain an "adequate domestic mobilisation base." The government may not need to buy the maximum quantities to bring this about. Producers' stocks, even of zinc, are not unduly large in terms of American consumption, and there should soon be a seasonal improvement in demand. The announcement contained two piquant passages. The Secretary of State is directed to seek recognition by the principal foreign suppliers of lead and zinc that, in this instance, charity begins at home, and that they "will not themselves seek to take any unfair advantage" of the programme. At the same time the Secretary of Agriculture is directed to offer to buy lead and zinc for the stockpile from foreign countries, if they will agree to take some surplus farm commodities off his hands in return. Although the American action will support world prices of these metals, the volume of raw materials being acquired by the stockpile is disturbing, however remote the danger of their release to the market may be at present. Nor can foreign countries unreservedly welcome the increasing American interference with world markets.

Fall in Export Prices

AGAINST a broad picture of buoyancy in British exports must be set one small cloud, as yet of little consequence. It is the fall last month of one point in the prices which British exports command. This, coupled with stability of import prices, moved the terms of trade another point against this country, to 101 (1953 = 100). The cause of this adverse movement was the opposite of that in April and June. In those months import prices rose, while export prices remained steady. The fall in export prices last month was the first change in the export price index since last November. It reflected a fall of two points to 93 in the export price index of metals, a fall of one point to 102 in textiles, and of one point to 97 in "other manufactures." Prices of metals have been falling, with one interruption, since February, and the fall in prices of "other manufactures" was the third in succession. These declines were only partly offset by a rise of one point to 100 in prices of engineering products, which have been almost steady for nearly a year. Among imported goods, the basic materials index rose by two points in July to 100, owing mainly to higher prices of rubber and raw wool, but this was offset by a fall of one point in the index of fuels.

The picture of British exports last month was nevertheless encouraging. Compared with the average of the second quarter of this year, the total of £246.9 million fob was 10 per cent higher and matched the increase in the working month. Exports of engineering goods were 11 per cent higher at £95 million, and exports of "other manufactures" were 12 per cent higher at £46 million. Exports of textiles rose by only 7 per cent to £29 million, but a large increase of 17 per cent to £33.5 million occurred in exports of metals. Within these broad categories the rise was somewhat patchy. Exports of electric machinery maintained the average increase with a rise of 11 per cent over the second quarter, to nearly £16 million, but exports of machinery, other than electric, showed a less than average rise of 7 per cent to £31.6 million. Shipments of iron and steel rose by nearly 14 per cent to more than £13 million. The relative fall in exports of cotton and rayon goods was partly offset by an increase of about 11 per cent in exports of woollen goods and other textiles. Among "other manufactures," shipments of clothing and footwear were 40 per cent higher at £4.4 million. Exports of chemicals, however, the largest item in this group, showed no more than the average increase of about 10 per cent to £18.8 million.

The ratio of import prices to export prices. A rise indicates an adverse movement.

The Mines Lose Men

ONE new disquieting element in the present disappointing record of the British coal industry has been a rather sharp decline in mining manpower in the last two and a half months. On August 14th there were 706,100 workers on colliery books, of whom 289,900 were face workers. This total was 200 men better than the week before; but it was about 4,000 fewer than at the end of May, some 3,000 fewer than at the beginning of this year, and about 14,500 less than at the end of June last year—when the figure was nearly 721,000, the peak of recovery in manpower attained by the industry following the serious decline experienced in 1949-50. Until June this year total manpower was rising slightly, and the number of men working at the face remained about the same; so the recent decline, which has occurred largely during the holiday season, can hardly be taken as a good excuse for the industry's failures in production this year. But its significance will be felt more heavily during the autumn, if the decline continues; and this development during a period of chockfull employment in the economy as a whole, is reviving dormant worries in the industry's headquarters.

The interrupted decline since last summer has, in fact, been the main factor in limiting the rise in 1954 coal output over output in 1953, though the miners' leaders and the Coal Board, when they agreed that five million tons extra this year would be a reasonable aim, were taking most of this decline into account. Productivity throughout the industry and at the coal face has improved slightly over last year; absenteeism is lower, and the average number of shifts worked has thus increased. The men actually employed in the industry, therefore, are not working less than last year, though the increases in productivity are hardly as yet very significant returns upon the amount of investment that continues to be ploughed into the industry. That investment, certainly, takes more men away from producing coal at the face to cutting roadways and new faces elsewhere; and the growing proportion of coal cut by machine puts up the tonnage of dirt the miners have to move. But those factors were already assumed when the industry formulated those intentions for 1954 that it is not fulfilling.

Long-Staple Contract for Liverpool

ON the eve of the withdrawal of the Raw Cotton Commission's cover scheme on August 31st, the Liverpool Cotton Association has revealed that it has now drafted the framework of a futures contract for long-staple (Egyptian type) cotton. Since futures trading began in Liverpool last May, the only hedge available to spinners has been the strictly American contract, because no other type was practicable. It is not a full hedge for American-type cotton grown outside the United States, and it is of much less value to spinners of Egyptian-type cotton. Lancashire has not been at a disadvantage in this respect compared with its competitors, for no other country has facilities for hedging long-staple cotton. And after the Alexandria market was closed late in 1952, the cover offered by the Raw Cotton Commission had to be based wholly on the New York market.

But the absence of the facilities enjoyed before the war has been keenly felt in Lancashire, and the Liverpool Cotton Association intended to introduce a long-staple contract as soon as this was practicable. It is now hoped to do so in the spring, and that a similar contract will be

introduced simultaneously in Alexandria. The contract will shortly be sent to the various interests in Egypt, who have been kept in touch with the proposals, and a delegation from the Association will go to Egypt in October for further discussions. Reopening of the Alexandria market, though desirable, is not essential to the introduction of the contract in Liverpool. But Lancashire would probably be well advised not to press the matter, at least until Egyptian traders are allowed to deal in the Liverpool market.

An Aircraft Bottleneck?

THE Ministry of Supply gave last week its first public demonstration of the test work done by its experimental establishment at Boscombe Downs and—intentionally or not—put a spotlight on one of the possible reasons behind the persistent delays in delivering some of the new military aircraft to the services. The British aircraft industry has demonstrated beyond doubt that it can design aircraft that will stand comparison with the best that any of its competitors can produce, and it has also given proof that it can put them into production and build up to a rate of output as high if not higher than that of any American factory. The bottleneck in deliveries—which, significantly, has not occurred in civil aircraft—comes during the testing period after the prototype has flown and before the machine is cleared for squadron service.

Flight testing is carried out in two distinct stages. The first is handled by the manufacturer, whose test pilots fly the prototype aircraft and report on their handling and performance to their own engineers and design staff. The second begins when the first machine is delivered to the Ministry of Supply at Boscombe Downs. This second stage is intended to test the aircraft as a military machine; the test pilots handle the aircraft as it would be flown in service. It is here that armament trials begin, no bombing or firing tests are carried out before this. It might be expected that the Ministry's test pilots would merely be duplicating and cross-checking the work already done by their civilian counterparts at the aircraft factories, but it is becoming increasingly plain that they are not. Rather they appear to be testing qualities in performance not previously covered in the manufacturers' own trials. As a result defects in the machine's development that should and ought to have been detected and corrected earlier are coming to light only at this relatively late stage.

It does not appear that the manufacturers' own test policy is necessarily at fault here. They are severely handicapped in, for example, fighter development, by the arrangement that leaves all firing trials to Ministry pilots after the civil pilot has finished his work. It is during the actual firing of modern high-speed cannon like the new 30-millimetre Aden that some of the most serious handling defects have come to light. It is possible that the new system of ordering a small batch of prototypes for simultaneous testing in place of the usual two—as, for example, the 20 supersonic P.1s recently ordered—will make it possible to eliminate the bottleneck that this division of responsibilty appears to create.

Prospects for Diesel Locomotives

IT was in 1950, the best year ever for the American diesel locomotive industry, that a British team visited the industry and prepared a productivity report that recommended the adoption of certain American practices by British manufacturers. The team was careful to emphasise the immense difference between the circumstances of the two industries—one with a huge home market based upon the "diesel revolution" through which the American railways were passing, the other with no market for main-line diesels at all and little home demand even for smaller industrial locomotives.

Since 1950 demand for diesel locomotives in the United States has fallen—calamitously for their builders, from some 4,000 a year to about 750 a year—with the partial completion of that diesel revolution, and the manufacturers are now dependent to a considerable extent upon replacement and modernisation of the existing locomotives. The situation of the British industry has not changed significantly. The British railways are building 573 diesel shunting locomotives and are still experimenting with half a dozen main-line locomotives. But British railway engineers are still committed to a preference for main-line electrification, when the time for a shift in motive power does come. Moreover, even if the railways began to shift to diesels, this would not necessarily assist the private locomotive builders. The railway workshops would probably build the locomotives themselves, buying only the diesel engines and electrical equipment from outside, as they are now building the shunting locomotives.

The British manufacturer's main market, therefore, must remain overseas—where American competition, perhaps, may become more determined. In such markets the advantages of standardisation that the Americans have enjoyed at home hardly exist, and it seems doubtful whether even their highly efficient methods of manufacture, of custom-built equipment, could offset the difference in labour cost that arises from wages at a level three times the European. But other competitors—notably Germany and Switzerland—suffer from no such disadvantages in tendering against Britain.

Hungary's Next Move

BRITAIN has made a trade agreement with Hungary, but has not yet got to grips on a debt agreement. Markets will be opened for Hungarian exports of £5.5 million—foodstuffs, bristles and a few manufactured goods—while Britain hopes to send Hungary £5 million of exports—textiles, vehicles, tin plate, pharmaceuticals and electrical machinery. To some of the holders of Hungarian bonds, which have been in complete default since 1942, it looked like a sign of weakness, and there was a little selling of Hungarian bonds early this week, prices coming down from around £21 on the 7½ per cents to about £20½. Certainly there would be no occasion for weakness. Hungary has a poor record as a debtor. And certainly the British Government has shown in the past that it knows how to

Nine Tenths

of HEAT now lost can be put back to work!

Heat which is dissipated because of the lack of proper insulation can be saved and re-directed to the purpose for which it was generated. Darlington 85% Magnesia is the material chosen for the insulation of generating stations, oil refineries, and industrial plant. Because of its high thermal efficiency up to 90% of heat generated can be put to use.

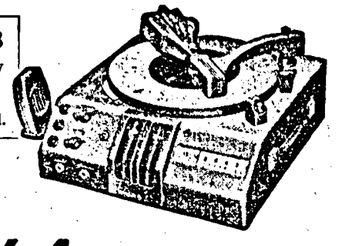
It's so simple



Simple to use . . . simple to install . . . and the saving in costs a matter of simple arithmetic! These are but some of the reasons why Emidictas are preferred by both executives and typists.

The range of machines makes possible a complete and comprehensive dictation system. There is a model with a 6 minute recording period for large and speedy letter output, and a '12 minute' model for long period dictation. And Emidicta Portables keep correspondence under control for executives when travelling.

Emidictas can be connected to provide intercommunication between executive and secretary, and, for remote dictation, a telephone attachment permits direct recordings.

harvests and health

The snake was an ancient symbol of Time
and the turning year, with its earth-seasons
of spring planting, summer growth,
autumn harvest and winter sleep.
And the snake of Æsculapius has,
since classical times, been a symbol of healing.

Agriculture to produce man's food,
and medicine to care for his health . . .

The improvement of crops
has been the main business of Fisons
for a hundred years and more,
almost since the science and production
of chemical fertilizers began.
And, in recent years, Fisons have struck roots
in the field of chemicals for medicine.
Fisons today contribute to the harvests
and health of the world.

FISONS LIMITED · Harvest House · Felixstowe · Suffolk.

take a strong line with Hungary. It broke off its long drawn financial negotiations in 1949 when Mr Edgar Sanders was imprisoned and only resumed them after his release last year.

But is the present agreement weakness? Before Hungary can be expected to start paying its debt it must be given an opportunity to earn some sterling. The opportunity has been given to earn a modest surplus of £½ million in the twelve months ending next August—an optimistic hope, perhaps, but still a chance for Hungary to turn an existing trade deficit into a surplus. And the agreement is for one year only. Hungary has undertaken to start negotiations about all claims—the bonded debt, commercial debts, nationalisation and expropriation of property—before September 1, 1955. If Hungary values the trade agreement it provides an incentive for a settlement.

The bondholders need not feel that they have been forgotten. Nor need they pitch their hopes high. There is between £20 and £30 million of sterling bonded debt, and no one yet knows what turn the negotiations will eventually take. If the British view prevails, Hungary will eventually be persuaded to make parallel offers to all her bondholders, both of the sterling and the dollar issues irrespective of whether the bonds are at present in British or foreign ownership. There is also the sum of about £600,000 in the hands of the Administrator of Hungarian property. The distribution of that is the British Government's affair. Bondholders will get the bulk of it in the form of an ex gratia payment, and it is likely that the principles that governed the German debt settlement will again be followed, i.e. "British resident" bondholders, whether of the sterling or the dollar bonds, should participate. The amount of these loans in British hands is still a matter of guesswork, but the market believes that most of the sterling issues are held in this country and is only banking on £2 to £3 per £100 on the 7½ per cent issue which has been given the maximum weighting of 1.25 in the Treasury list. Bonds of that loan with a certificate of British ownership change hands at over £20 and without it at a mere £5 to £6 per £100 stock. The price difference is far greater than the expected amount of the ex gratia payment and reflects the narrow market in bonds without declaration of British ownership.

BMC's Gas Turbine

THE Austin Motor Company's laboratories have been working on gas turbine designs for more than five years. This week it was announced that a 125 bhp gas turbine unit with a heat exchanger has been run successfully in a Sheerline chassis. Even with a heat exchanger, fuel consumption appears to be significantly higher than in a petrol engine of similar power, but the company has found the results encouraging enough to go on with the experiment. The Ministry of Supply's interest in the development of small gas turbines has given the motor industry financial backing to persist in a line of research that has so far not proved any too profitable. The Ministry some years ago gave development contracts for a number of low-powered engines, Austin's among them, partly to stimulate research and partly in the hope that a useful military power unit might emerge from the experiments.

The earliest designs for motors were, in effect, scaled-down aircraft turbines, and it was inevitable that fuel consumption under part-load—and no road vehicle runs at full power—should be extravagantly high. More recently, there have been signs that the industry was branching away from the classic turbine with its 100 or so blades fitted round a turbine disc, and was experimenting with newer forms that gave better part-load performance. Austin is known to have considered these newer designs of turbine, but has probably not gone far enough to have used one in the present engine.

Private Coal Mining

THE small mine in Lanarkshire that the National Coal Board has recently taken over from a private operator after a protracted labour dispute there is one of about 360 mines that are still operated, under licence, by private concerns. Nationalisation gave the board title to all the coal measures under Britain and to the 1,400-odd mines then producing coal. But it has never worked more than about a thousand of these itself, and it is now working roughly 880. About 200 pits have been closed. The remainder are worked under licence from the board by the companies that were operating (and in many cases owning) them before nationalisation. They produce roughly 2 million tons of coal a year, less than one per cent of the industry's total output; in terms of physical productivity, they produce it quite efficiently.

The criterion for licensing a mine is that it should have not more than "30 or so" men working underground. The latest official count published, for September, 1952, put total employment in these mines as 5,470, including about 5,200 wage earners, plus 380 working proprietors; today total employment is guessed as more than 6,000. Not all of the mines licensed are primarily coal mines; some are mainly concerned with working materials such as fireclay but take out coal as well. Output per manshift in the small mines is comparatively good—many of them are shallow workings that require much less elaborate equipment and organisation than the type of mines the Coal Board operates itself.

Under the present licences, the longest of which run until about 1960, the mine operator hands the coal over to the board for marketing, receiving the proceeds less a selling fee and a royalty in respect of the coal and the mine. Until 1950 the board in effect operated a small-scale Coal Charges Account for these little mines, making payments to some in the Northern and South-Western Divisions from the total royalties that it received from all the others, but those arrangements have now been incorporated into the particular terms of contract for each mine, while some of the highest-cost mines have been closed. The only trace of this 2 million tons of coal that now appears in the Coal Board's accounts is an item "Royalties receivable less payable"; last year the net royalties amounted to about £20,000. One clause in the licences, however, generally makes all agreements signed between the board and the trades unions with which it negotiates binding on the small mine operators; and it was in respect of a labour dispute over which no settlement appeared likely to be reached that the board decided to take over the mine in Scotland.

SHORTER NOTES

The directors of Jones and Higgins, the drapers and furnishers, have circularised the company's shareholders advising against acceptance of the offer from Great Universal Stores of £4 10s. for their shares. In the opinion of the board of Jones and Higgins the asset value attributable to the company's £1 shares is more than £6 per share.

★

A fall in income is disclosed by Telephone Properties as a result of the sale of the company's principal asset in Venezuela. Net profits after tax were down from £60,964 in 1952 to £35,252 in 1953, but the dividend is comfortably maintained at 8 per cent. Plans are to be announced whereby the shareholders will have the choice either to exchange the greater part of their stock into shares of a new realisation company or to retain the whole of their interests in the present company.

Alexanders Discount company announces proposals to make a one-for-one free scrip issue and at the same time to remove the company's uncalled capital liability. It is intended first to write down the 1,200,000 ordinary shares of £2 each with £1 paid up into the same number of £1 ordinary shares fully paid and then to make a 100 per cent free scrip issue in fully paid £1 ordinary shares. The company, which increased its dividend last year from 17½ per cent to 20 per cent, emphasises that the capitalisation of reserves does not indicate any increase in the amount to be distributed this year.

The Pakistan government's attempts to support raw jute prices by acreage control, and latterly by introducing minimum prices and even crop destruction, have now been aided by nature, though in a particularly tragic way. Severe floods in East Pakistan have inflicted considerable damage on the crop, and in the last two weeks the price of Firsts has risen by about £8 to £88 a ton, cif UK.

Company Notes

BRITISH MATCH CORPORATION. This company, holding a dominant position in the match manufacturing industry in this country, came under scrutiny by the Monopolies Commission and following the Commission's report in May of last year, a new trading agreement between the Corporation and the Swedish Match Company was negotiated to remove as far as practicable the stigma of monopoly from the company's set up. So far, so good; the recommendations of the Commission had been accepted, public concern at the existence of monopoly presumably allayed, and the present accounts do not indicate that the Corporation has as yet suffered in the process. It seems a pity that the chairman cannot leave the matter without this ungenerous comment: "During the five years since the industry was first referred to the Commission, much time and effort of many of your chief executives has had to be diverted from constructive work in your company's business to dealings with the requirements of the Monopolies Commission. It has been a heavy and costly burden both in time and in money."

£1 ordinary stock at 31s. 0d. yields £5 16s. 2d. per cent.

Shareholders may well feel reasonably satisfied notwithstanding. The trading profit for the year ended March 31st (which covers the operating companies for the calendar year 1953) shows a rise from £2.1 million to £2.3 million in trading profits. The net profit is up from £543,000 to £585,000. The total distribution of 9 per cent is maintained with an improved margin. The bulk of the increased earnings, Lord Kindersley reports, come from the overseas companies. Home sales increased slightly last year but have suffered a reduction this year. In future shareholders are to receive their interim dividend in mid-December which is about one month later than at present and the amount of it is to be increased if profits permit, with a corresponding reduction in the final payment.

★

OCEAN COAL AND WILSONS. For years after the nationalisation of the coal mines in 1947 colliery shares were a happy hunting ground for the surtax payer; many of the companies were destined for liquidation and acute investors could find shares likely to break up above their market prices and snap their fingers at the tax collector. Those days are over; the attractive break-ups have been broken up to a point where the final result is often closely foreseen. But there is still an interest in those companies which intend to continue in business and yet have some surplus assets available to distribute. Ocean Coal and Wilsons is in that class: it is a continuing company without option, for its subsidiary, Wilsons Sons and Company, is deeply—far too deeply—entrenched in the stickiest of South American markets, Brazil. But over the last two years the company has been limiting its continuing business so that all the proceeds of the South Wales coal interests come back to the shareholders as cash. The 4s. units which at one time fell to 2s., received 1s. 6d. per share from the coal compensation and now in the form of 2s. 6d. units they command a market price of around 2s. 1½d.

In his speech this year, Mr Stacpole, the chairman, shows that the results of the South Wales compensation are calculable within fairly close limits at a doubtful further £400,000, in addition to the £2,698,560 which the company has already received on account. That and the sums which the parent has received from Wilsons Sons and Company in reduction of its debt from £1.7 million to £900,000, justify the chairman in announcing a further capital repayment of 1s. per stock unit. The board hopes eventually that the subsidiary will pay off or reduce its remaining £900,000 advances from the parent. They will then make a further capital repayment, unlikely to exceed 6d. per unit. In the indefinite future, therefore, stockholders can look forward to 1s. 6d. in cash and their units will be reduced to 1s. nominal against which the only important asset would be 2s. nominal of capital in Wilsons Sons and Company, coal and general merchants.

The market price of 2s. 1½d. thus puts a value of 7½d. on 2s. nominal in Wilsons. It may seem a fair speculation. But the chairman offers a stern warning against

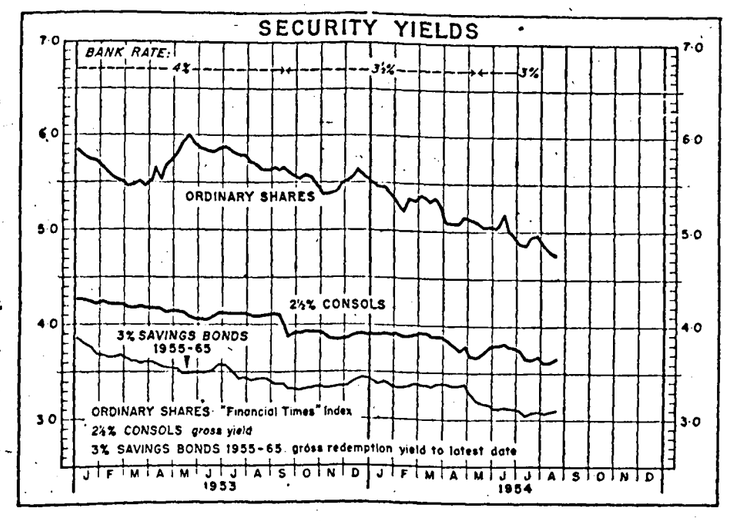
optimistic arithmetic. The turn round in the company's fortunes in Brazil has been rapid and Mr Stacpole has no illusions that recovery can continue at the same rate. He does not add, though he might, that the buyer is making himself a bull of the cruzeiro. In 1951 the subsidiary's Brazilian assets were blocked at the controlled rate of 52 to the £. At the end of 1952 they were brought in at the free rate of 120 to the £. It had fallen to 150 to the £ at the end of 1953. Now it is nearer 180 to the £. Where will the process end?

★

"OFSIT." A further plan for rearranging and extending the flow of finance into the goldfields of the Orange Free State comes in a reorganisation of the relationship between Orange Free State Investment Trust ("OFSIT"), Anglo American Corporation of South Africa and De Beers Investment Trust. The plan will, it is hoped, provide OFSIT with sufficient cash and loan facilities for it to be able in the next two or three years to extend its investments in the Orange Free State by the exercise of the rights that will accrue to it.

The plan provides:

(1) Anglo American and De Beers Investment will exercise their right to subscribe for 1 million 10s. shares in OFSIT at 60s. per share (against a market price of 76s. 9d.); the proceeds will be used to repay the 3 per cent £3 million loan from Anglo American and De Beers Investment.



(2) Anglo American and De Beers Investment will take over at par OFSIT's loan of £832,500 to Free State Geduld Mines; part of the cash will be used to repay the £135,000 drawn against OFSIT's £750,000 6 per cent loan facilities from Anglo American and the balance of those facilities will be cancelled.

(3) Anglo American and De Beers Investment also grant OFSIT new loan facilities for £2½ million at 6 per cent. These are coupled with an option up to December 31, 1957, to subscribe for 625,000 ordinary shares of OFSIT at 80s. per share. The proceeds of such subscriptions to be applied in repayment of the loan.

The net effect of these arrangements is that Orange Free State Investment Trust sees its cash holding increased by £697,500 and its loan facilities by £1,885,000, with the added encouragement that its powerful associate, Anglo American, has taken an option at 80s.

★

TOOTAL. No true recovery in profits by Tootal, the vertical cotton combine, seems to have occurred in the year ended June 30th, for the chairman, Mr A. V. Symons, confirms that the net profit of £713,000 compared with £541,000, contains a sum of £207,000 (against nil) received under a guarantee relating to the losses of the subsidiary companies in earlier years. Nevertheless a sharp recovery in business if not yet in earnings has taken place. The chairman reports that early in the company's financial year it was realised that production would be insufficient to keep abreast of the demand and that a deliberate policy of rationing to all markets was adopted and weighted in favour of the export markets. Occasion has also been taken to build up the group's stocks again. These stood on June 30th at £4.4 million compared with £3 million a year earlier. At the new level of stocks Mr Symons believes the group will be able to give "proper service on our products." With full production now running at the new mill in St. Helens the output of cloth from the group's weaving units was more than double the previous years. He hopes in the coming year to be able to provide the company's products when and where they are wanted and looks forward to a busy and active year.

LONDON STOCK EXCHANGE

Next Account begins : September 8th
Next Contango Day : September 8th
Next Settlement Day : August 31st

AFTER a week of sagging prices in nearly all sections of the Stock Exchange, a sharp turn came with the opening of the new account on Wednesday. A brisk rally then restored part of the week's losses in gilt-edged, the whole of it in home industrials and more than the whole of the setback in gold shares. The rally continued on Thursday. Gilt-edged are slightly down on balance over the week, but Old Consols at 68⅛ show no change, War Loan 3½ per cent at 90½ is down by ⅛. The longest dated of the transport stocks, the 3 per cent 78/88, which was in surplus a week ago, now stands at 90⅞, a net fall of only ½.

In the foreign bond market moderate buying for the bonds of the "Iron Curtain" countries developed, Chinese issues rose appreciably. There was bidding for the 4½ per cent Polish issue which rose 2 points to 27.

When the change in tone occurred, the big rises in the industrial market were again concentrated on those shares, particularly of the stores group, which had been active before. Great Universal Stores reached £5 on Wednesday. They and some other shares of the stores group were affected by the withdrawal on restrictions on hire purchase finance. In an active market Canadian and English Stores preferred advanced 3s. 9d. on balance to close at 37s. 3d. and New Day Furnishing, on take-over rumours, which have since been denied, rose 10½d. to 26s. 1½d.

Strong features developed in the motor and aircraft groups. Roots 4s. ordinary units were in strong demand.

In the oil group, a recovery started in Anglo-Iranian which rose ½ to 15⅝ on Wednesday.

Demand for the OFS shares on Wednesday was sharp. President Brand rose 1s. 3d. to 76s. 10½d., President Steyn rose by the same amount to 39s. 6d., while Free State Geduld rose 5s. to £5 18s. 4½d. In response to the strong tea auctions, tea shares improved slightly, but the market was not active. Rubbers were neglected.

(1) First quarter. (2) Figures calculated on the basis of a new and larger sample. (3) 1939 figures not strictly comparable with rest of series; stocks are at end of period. (4) All commercial banks. (5) Annual figures are totals for the fiscal year ended June 30th.

Financial Statistics

EXCHEQUER RETURNS

For the week ended August 21st there was an "above-line" deficit (after allowing for Sinking Funds) of £52,985,000 compared with a surplus of £25,966,000 in the previous week and a deficit of £42,321,000 in the corresponding period of last year. This brought the cumulative deficit to £124,390,000 (£195,907,000 in 1953-54). There was a net receipt "below-line" of £12,957,000, bringing the total cumulative deficit to £271,739,000 (£384,722 in 1953-54).

THE MONEY MARKET

DESPITE the ease in money during the preceding week the discount market last Friday cut its tender price for Treasury bills by a further penny—under the influence, no doubt, of the weakening of sterling and of the fact that the bill offering had been raised to £260 million (again exceeding maturities by £10 million). Total applications rose to over £398 million, but the discount houses again secured 50 per cent of their tenders; the average allotment rate rose by 4d. to 32s. 2.66d. per cent, its highest since early July.

Before the tender, credit supplies had been further eased by the demand for bills set up by the repayment of bank advances from the proceeds of the new Electricity loan.

A moderate amount of special aid was given, mainly by the indirect route. On Tuesday and Wednesday credit supplies were patchy but adequate, with the banks buying November dates at 1⅛ and Octobers at 1⅛ per cent.

Gold has naturally risen further, in line with the continued seasonal weakening of sterling; on Thursday morning it was fixed at 249s. 8d. per fine ounce, its highest "fixed" price since the reopening of the market.

The Bank return shows the reflux of another £16½ million of notes for circulation—again a larger movement than at the similar period last year.

KNOWLEDGE REDUCES RISK

The M.B.I knows Eastern Trading Conditions

Sixty years is a long time to be engaged in the complexities of Eastern trading. But in that time a world of specialised knowledge has accrued to The Mercantile Bank of India. All the benefits of this are readily available to shippers and merchants interested in opening up new trade with the East.

COMPANY MEETINGS

WILLIAMS AND WILLIAMS

PROBLEM OF EVER-RISING COSTS

The forty-fifth annual general meeting of Williams and Williams, Limited, was held on August 20th, at Reliance Works, Chester.

Mr B. A. Williams, OBE, chairman of the company, presided, and in the course of his remarks said: It is unusual for me to present accounts which do not show increased profits, but with world-wide interests we must be prepared for fluctuating results. A not inconsiderable proportion of our resources is located in this country where we have had to deal with problems that have faced not only ourselves, but many other organisations, both in regard to trade in the home and export markets to meet considerable increases in the cost of wages, materials and services, and at the same time maintain competitive selling prices and what is equally important, make our contribution, however small it may be, to the avoidance of a general raising of costs in the markets, especially housing, which we serve. Indeed, striking confirmation of this will be found by reference to the recent analysis in the Board of Trade Journal dated July 24th, page 166, of the increases in the costs since 1949 of the more important materials used in the building industry, and which points out that the re-rolled sections, angles and tees which as you well know form our basic raw material, have the unenviable distinction of showing the greatest increases of all.

I am sure there is insufficient realisation of the fact that improved results every year can only be achieved either by higher selling prices or increased turnover produced more efficiently, but the ever increasing costs of raw materials, services and labour and the frequency with which they occur, make it exceedingly difficult to maintain profit levels without increasing selling prices. However, I am pleased to be able to say that our order book at the present time is in a healthy state.

PROGRESS OVERSEAS

Considerable progress has been made in the construction of your new factories at Trenton, Ontario, and at Leopoldville in the Belgian Congo, but it cannot be expected that these will have any effect on our figures in the current financial year. Nevertheless we are confident that the upward trend in the demand for our products in these two markets will in due course prove the wisdom of thus adding to the manufacturing resources of our group.

On the other hand, I must give a note of warning that elsewhere certain of our production units notice a recession in activity, but while not making any definite prophecies, nevertheless I feel that we can view the future with a quiet optimism born of the fact that in technical development and skill in our industry, absorbed of course during a century of activity therein, we shall continue to see Williams and Williams windows and allied products in demand wherever building work is going on.

The net profit attributable to the group after providing for all expenditure other than taxation and debenture redemption, amounted to £406,867, and after providing for taxation and adding the sum of £320,241 brought forward from previous years, a balance remains of £491,267 which your directors recommend be dealt with in the manner set forth in their report. These recommendations include a dividend of 12½ per cent on the increased capital.

The report was adopted.

OLDHAM AND SON LIMITED

THREE FURTHER SUBSIDIARY COMPANIES FORMED

The thirty-fifth annual general meeting of Oldham and Son Limited was held on August 26th in Denton, the chairman, Mr John Oldham, OBE, JP, presiding.

In his circulated statement he said: My report again records a successful year.

The consolidated profit and loss account for the Group shows the net profit for the year 1953-54 before taxation at £270,750, as against £262,541 for the previous year.

After providing for British and Overseas taxation of £154,967, there remains a balance of £115,783 against £109,247.

OVERSEAS ACTIVITIES

On the general export side there has been an increase of over 50 per cent in the volume of goods shipped overseas, as compared with the previous year, and today the company is making direct exports to over 100 countries. The production of our associated companies overseas and these direct exports now represent together some 40 per cent of the Group's total production.

During the year three new subsidiary companies have been added to the overseas group—Fibrak (Australia) Pty. Limited, the Compagnie Française des Separateurs Fibrak, and Oldham and Son Central Africa (Pvt.) Limited.

The remaining members of our overseas Group—Oldham and Son Africa Limited, Société Française des Procédés Oldham, Oldham and Son (India) Limited—also report satisfactory progress.

MINING

Over three-quarters of a million miners all over the world daily take an Oldham cap lamp with them as they descend below the surface in search, not only of coal, but of gold, copper, lead, slate and more recently of uranium.

BATTERIES

Besides being used by hundreds of thousands of motorists in private car service, Oldham batteries are part of the lighting and starting equipment on many main passenger and goods carrying services.

FIBRAK

As is indicated by the formation of two further companies solely devoted to its production, the demand for the Fibrak separator continues to grow.

AIRCRAFT

Oldham batteries are used for the stringent daily demands of civil airlines such as the BOAC Argonaut fleet and are also supplied in large quantities for the jet aircraft both of the RAF and of the Air Forces of Free Europe.

NEW FIELDS

We have in the past twelve months introduced a new range of industrial lamps, based on our well-tried mining lamps, but modified to meet these new needs.

Parallel with this development, we are now producing our entirely new range of emergency lighting equipment.

The report was adopted.

I.B.E. LIMITED

POSITION OF INCREASING FINANCIAL STRENGTH

The twenty-sixth annual general meeting of I.B.E. Limited was held on August 24th at the registered offices, Slough, Bucks, Mr Robert Montgomerie (deputy chairman) presiding.

The following is an extract from the chairman's circulated statement: The accounts for the year to March 31st last show not only an improved profits position but an increasingly sound financial structure.

The consolidated net profits at £45,283, after taxation, show an increase of approximately £20,000. As the accounts indicate, this improvement has, to some extent, been influenced by the payment of a loss of profits claim consequent on a fire at one of our plants in August, 1952, and by the settlement of a double taxation relief claim in respect of several years preceding these accounts. Even so, there is a marked improvement in actual trading profits and therefore your directors have felt justified in increasing the dividend to 11 per cent.

The consolidated balance sheet shows a position of increasing strength with overall reserves and surplus of £234,346, an improvement of £21,521 over last year's figure of £212,825. The liquid position of the company with an excess of current assets over current liabilities of more than £325,000 continues to be satisfactory and places the company in a favourable position for financing expansion or new developments as they arise.

ROADS, AIRFIELDS AND PUBLIC WORKS MATERIALS

Our main products here are Colfix and Lomix Bitumen Emulsions and, as I forecast last year, the heavy cuts in road expenditure were reflected in a perceptible diminution in business. By improvements and economy in production and distribution, however, we have actually been able to earn increased profits in this section of our business and with promises of more expenditure on roads your board feels confident of maintaining and, perhaps, expanding their share of the market.

Apart from our normal business we are concentrating on one or two new developments with which, if successful, we hope to open up new fields for our products and so assist in the expansion of sales.

Industrial Products: This section of our business is concerned with the production and sale of adhesives, waterproofing and other bituminous materials. We have taken steps to expand this section which, I am glad to say, is making steady progress.

Paints: The welding of our separate paint companies into a compact and forceful unit has been completed and we look forward with confidence to an increased return from this section of our Group.

The business of our associated company in South Africa continues to develop on a sound and profitable basis.

On the technical side we have constantly endeavoured to avoid resting on our laurels and having steadily and with encouraging progress continued to work in our laboratories towards the improvement of existing products and the development of new products or fields of activity so that we can keep abreast, or ahead, of modern demands.

During the three months to date there has been a general improvement in our business overall, and if this continues, it would be reasonable to suppose that the present year will be no less satisfactory than that under review.

The report and accounts were adopted.

The Bank of Adelaide

invites all who have or would like to have relationships — business or personal — with Australia, to use its complete banking service.

Principal Offices in Australia
Adelaide (Head Office), Brisbane, Melbourne, Perth & Sydney.
LONDON OFFICE
11, LEADENHALL STREET, E.C.3
Incorporated in 1865 in South Australia with limited liability

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of Temporary Assistant Lecturer in American Studies. The appointment is from October 1, 1954, or as soon as possible thereafter, to September 30, 1955. It would be an advantage if candidates had qualifications in general American History since the Revolution, with special interests in the origins of the American Civil War. Salary within the range £450 to £550 per annum, with membership of the Children's Allowance Scheme.—Applications should be sent, not later than September 22, 1954, to the Registrar, the University, Mancheater, 13, from whom further particulars and forms of application may be obtained.

GENERAL MANAGER (SALES)

THE GLACIER METAL CO., LTD. invites applications for the head office appointment of a General Manager (Sales). The company manufactures a wide range of plain engine bearings and standard products, employing approximately 2,500 in factories situated in London, Manchester and Scotland. The G.M.S. will be directly responsible to the Managing Director for organising, maintaining and developing the sales activities of the company. He will be responsible for working out sales policy and for customer contact. He will need to maintain effective relationships with the general managers for manufacturing and technical development. He will have as immediate subordinates technical and export specialists, representatives responsible for large customers and a sales manager, who has subordinate to him representatives for geographical areas. He will also be responsible for advertising.

Applicants need not be qualified engineers, but must have a sufficient grasp of engineering to discuss and negotiate with top level executives in the engineering industry. Previous experience of sales management is essential, preferably in engineering. The preferred age range is 40-45, but both older and younger candidates with exceptional qualifications will be considered. Salary range is £3,000 to £4,000 according to age and experience; pension with life assurance. The successful candidate is expected to merit nomination for a directorship within one year.—All applications will be treated in confidence, and should be addressed to Mr. W. B. D. Brown, Managing Director, The Glacier Metal Co., Ltd., to reach him at the Head Office at Ealing Road, Alperton, Middlesex, not later than Monday, September 20, 1954.

INDUSTRIAL AND COMMERCIAL FINANCE CORPORATION LIMITED require a first-class Executive to take charge of the Corporation's Industrial Investigation Department, comprising engineers and other technicians, accountants, market investigators and others specialists. The Department has three main functions: the investigation of the businesses of new applicants; routine liaison with existing customers; and the provision of special assistance and advice to customers. Applicants for this post, which will command a substantial salary, should have first-class experience in industrial consultancy. Communications should be addressed to The Chairman, at 7 Drapers' Gardens, London, E.C.2, marked "Personal." All communications will be treated in complete confidence.

TRAINING FOR MANAGEMENT.—Pitman Home Study for all Management and Secretarial Examinations; also for Transport and Hospital Administration. Personal tuition; success guaranteed. Details of course required from Pitman Correspondence College, 84 Pitman House, Godstming, Surrey.

ASSISTANT, about 35 years of age, required by important representative, commercial and trade organisation in the Midlands, as Deputy Editor of its monthly journal. The principal requirement is an ability to write and comment constructively on current economic and legal topics. Commencing salary will be not less than £850 per annum, with prospects of advancement for the right man. Contributory pension scheme.—Write Box 674.

MARKET ANALYSTS are required by Export Division of Ford Motor Company Limited, Dagenham, Essex. An honours degree in economics is essential, coupled with some knowledge of higher mathematics and statistics. Candidates must have a lively interest in export matters and practical experience will be a strong advantage. Knowledge of motor vehicles and/or tractors an asset.—Reply to Salaried Personnel Department, quoting reference FMR.

ABBEY SCHOOL FOR SPEAKERS, 36, Victoria Street, S.W.1. (Telephone ABBey 6488.) Public Speaking, Chairmanship, Voice Production, Classes or Private lessons. Expert Industrial Tutor available for Staff Courses at firms' own premises.

YOUNG MAN (27), Ampleforth, Cambridge and the Bar, would like to work for people who will fully utilise his zest, ability and personality—preferably on sales/customers relation side.—Box 675.

TRADING OR ESTABLISHING in CANADA or the WEST INDIES?

If you are trading with or contemplating establishing a plant in Canada or in the West Indies, we can be of help to you.

Through 345 branches across Canada and 23 in the West Indies, we can provide information on business conditions, exchange regulations, exports and the establishing of branch plants.

Your enquiries will receive prompt and courteous attention.

THE BANK OF NOVA SCOTIA
108, Old Broad Street, London, E.C.2
Established in Canada in 1832 with limited liability.

BRITISH STEEL CASTINGS RESEARCH ASSOCIATION
DIRECTOR OF RESEARCH

The British Steel Castings Research Association with Headquarters in Sheffield, invites applications for the position of Director of Research, to lead a team of about 18 scientists and technicians, together with clerical and library services. A metallurgist with research and some industrial experience preferred, but a physicist or chemist with similar experience considered. A new Research Station is about to be built and equipped. The Association is in receipt of D.S.I.R. Grant, and has connections and liaison with the works and laboratories of all the leading steel foundries in the U.K., together with a number of overseas contacts. For this reason administrative ability to work with committees, works personnel, etc., as well as the Association's own staff is of great importance. Salary, which will be in accordance with qualifications and experience, will be substantial. The Industry served by the Association produces about 225,000 tons per annum of carbon and alloy steel castings, and employs approximately 25,000 people.

Communications or queries should be addressed in confidence to the Chairman, British Steel Castings Research Association, Broomgrove Lodge, Sheffield, 10.

EXPORT MANAGER

Business executive, of £2,000 per annum category. Long, excellent record in overseas field of international commerce, wishing to settle permanently in England, seeks managerial position with young, ambitious company, to organise and develop its export trade.—Box 678.

BBC REQUIRES TALKS PRODUCER in Home Sound Broadcasting, to be concerned with talks and discussions on economics and international finance. He should be able to keep abreast of developments in this field, initiating and planning relevant broadcasts with outside contributors, carrying out preparatory work and production at the microphone. Wide interests and good education (University level) essential; also first-hand knowledge of economics and fiscal matters generally. Legal or journalistic training and experience, competence in writing or editing scripted material and interest in broadcasting as a means of discussing present-day problems would be useful. Appointment on grade, with salary £870, rising by five annual increments to £1,175; or £1,065, rising to £1,465 per annum, according to qualifications. Requests for application forms (enclosing addressed envelope and quoting Reference "370" Ect.), should reach Appointments Officer, BBC, Broadcasting House, London, W.1, within five days.

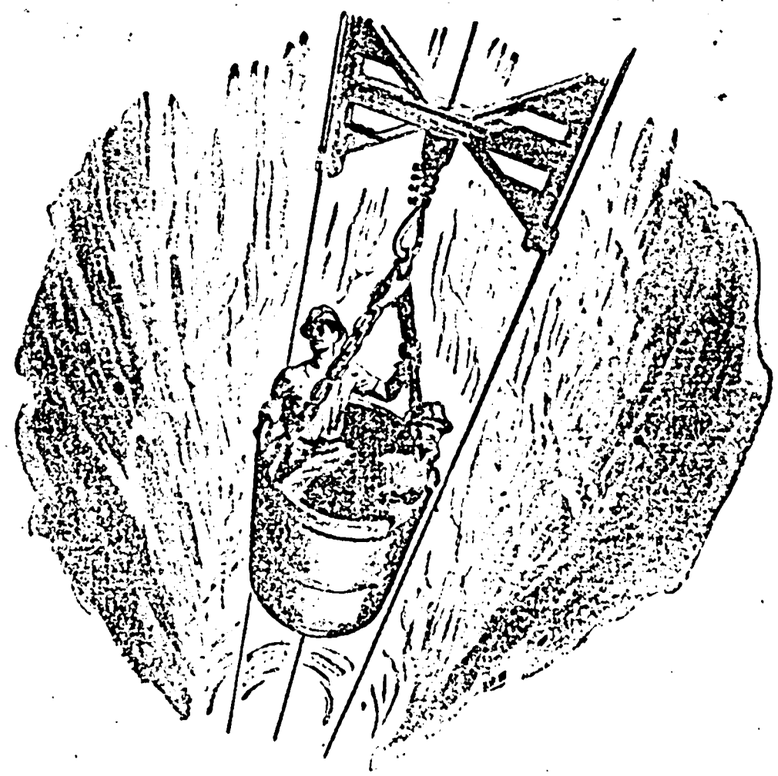
DO YOU WANT MORE BUSINESS? Then cover more territory and make more regular calls with a 1954 self-drive car. No more waiting for public transport. AUTOHALL have a fleet of over 100 1954 cars, all expertly maintained and serviced to meet your requirements. Will you ask your secretary to drop us a line for our new, informative brochure?—Autohall, Dept. 2-B, 302-306 King Street, London, W.6. Tel.: RIVerside 2881.

THE FACTS ON ELECTRICITY—new book, "Power and Prosperity," gives the full picture of Britain's electricity supply today and tomorrow. Illustrated, 122 pp., obtainable through W. H. Smith and Son, Ltd., price 1s., or 1s. 3d. post paid, from British Electricity Authority, P.R.30E, Winsley Street, London, W.1.

YOUNG QUALIFIED ACCOUNTANT required for service in Gambia as Assistant Accountant to Gambia Oilseeds Marketing Board. Five year contract at salary of £950 per annum. Gratuity at rate of £100 per annum. Tours of eighteen months. Liberal leave. Free Medical attention. Free furnished quarters. Outfit allowance £60 on first appointment. Free first-class passages on appointment and when proceeding leave. Applications, giving full details of age, education, experience and professional qualifications, to the Managing Director, Gambia Oilseeds Marketing Co., Ltd., No. 8, Buckingham Gate, London, S.W.1.

YOUNG MAN WANTED to assist in starting and later taking over the management of a small, rapidly expanding production unit, making furniture and domestic equipment in connection with established sales organisation. Preferably engineering degree and training in work study. Must have practical experience. Starting salary, maximum £1,000.—Application, in writing, to the Managing Director, Finmar, Ltd., 28, Kingly Street, London, W.1.

STUDY AT HOME **B.Sc. ECON.**



This London University degree, open to all, is a valuable qualification for statistical, research, educational and welfare work. It is necessary only to pass three examinations. Wolsey Hall (founded in 1894) can prepare you for these at home. Reasonable fees, instalments. 952 B.Sc. Econ. (Final) Successes, 1925-53. Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P15.

DIGGING INTO THE FUTURE

In the early days at Broken Hill, lack of capital made it necessary for the holders of the ground they had staked, to offer shares in order to raise money to sink a shaft to one hundred and fifty feet where they found the lode. In time, the deposit of ore was known to be of such size that it extended nearly three and a half workable miles in length. These early pioneers did not know, nor did they care, how deep it was. They were content with the riches to be had near the surface and from penetrating only a couple of hundred feet or so.

Today, men are still exploring the extensions of the lode—and still they have not reached its limits. Probing the depths of the earth, they have gone to three thousand feet and more, uncovering fresh riches at every level. They are digging into the future; a future to which no man can set a limit, for each new level exposed adds a generation to the life of the mine. During shaft sinking, men and materials are taken down in a kibble with wire rope guides. In time, this shaft will serve as an air passage for the lower levels, concreted throughout its entire depth.

But now the shaft goes down like a well and, like a well, it is wet and hot at the bottom. Cool air must be forced down there to counteract the rise of temperature—1° Fahrenheit for every 70 feet it sinks—and the water must be pumped out so that men can work. Their work as shaft sinkers calls for special skill which puts them in a class of their own, and their earnings are commensurate with their craftsmanship.

These are the men who are extending the workings—and the future—of the Broken Hill mines which have brought, and will continue to bring, prosperity. Prosperity not only to Australia but to Britain where, at Avonmouth in the West of England, there is the largest zinc smelter in Europe, processing ores which come from Broken Hill. That smelter produces the entire output of primary zinc for the United Kingdom, as well as sulphuric acid and other related products.

Lead, Silver, Zinc

The formation of The Consolidated Zinc Corporation Limited in 1949 united the bond of common interest between Imperial Smelting Corporation Limited of Great Britain and The Zinc Corporation, Limited of Australia. The two companies have for many years been associated in the development of the non-ferrous metal production of the Commonwealth. Their activities are the mining of lead, silver and zinc ore in the Broken Hill Mines of Australia and the production of zinc metal, sulphuric acid, fluorine chemicals and zinc pigments in the United Kingdom.

Flying Spot Telecine Equipment

TYPE BD 678

The equipment provides a television picture of exceptionally high quality from 16 mm. films and 2 x 2 in. miniature film slides. A 'fast pull down' type of film projector is used and a similar mechanism serves for television systems having field repetition rates of either 50 or 60 fields per second. Thus any type of fixed or moving prism system is obviated.

The 16 mm. Projector, Turret Slide Scanner, Optical Change-over Assembly, Flying Spot Scanning Unit and the PEC Amplifier are mounted on top of the steel cabinet which houses the auxiliary units and power units.

The equipment can be fully controlled locally and remote controlled for stopping and starting of the film projector, change-over from film to slides and selection of any one of eight slides.

Editions of the BD 678 are available for 405, 525, or 625 line systems

MOST MEN LIKE TO READ THE HERALD TRIBUNE...

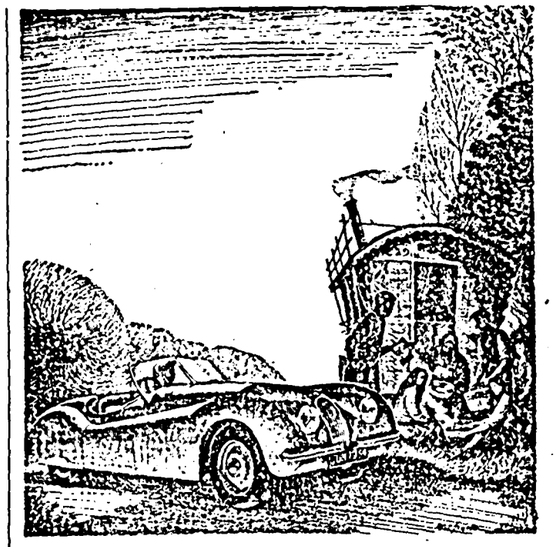
some men have to

Events today move quickly, and decisions that make the news affect all our lives, our work. That is why so many influential men in government, finance and commerce feel they must keep abreast of the daily news. The newspaper a great many of them read is the European Edition of the New York Herald Tribune.

Edited and published in Paris (and flown to Britain for breakfast-time reading), the Herald Tribune gives a clear, objective summary of the American viewpoint, with more international news than any newspaper published in Europe.

ECONOMIC & FINANCIAL NEWS

is of traditional importance in the Herald Tribune, and British leaders in these fields have come to recognize the importance of these features:



- LATEST WALL STREET STOCK MARKET REPORT, with over 700 daily cabled listings, plus a full list of the Big Board (1,300 prices) once each Monday.
- SELECTED BOURSE QUOTATIONS from Paris.
- DAILY EXCHANGE RATES on the Free Money Market in Geneva and Paris.
- FINANCIAL NEWS COVERAGE from the United States.
- THE MONTHLY ECONOMIC REVIEW, a comprehensive analysis of industry, finance and commerce. The most authoritative publication of its kind, it has been called "the barometer of European economy."

Plus, of course, a wealth of timely, provocative editorial features.

Buy a copy of the Herald Tribune regularly from your newsagent, or, for added convenience, take out a subscription. The rates are: 12 months, £7:16:0; 6 months, £4:4:6; 3 months, £2:5:6.

Send your remittance for the amount to Messrs. Seymour Press, Ltd., 221 Vauxhall Bridge Road, London, S.W.1. Or we shall be glad to invoice you.

This stamp costs one dollar—
saves thousands in shipping costs

So many have found they save by shipping *via New Orleans* that they have made this port second in dollar volume in the U. S. See how *you* can save:

1 Direct Savings in Money—

- Lower rail, truck, and barge rates to or from entire Mid-Continent U. S.
- The Port's Foreign Trade Zone No. 2 provides all the savings of a "free port."

2 Money Savings in Time—

- Shorter inland transit time, with network of rail, air, truck and barge lines. Faster handling between inland carrier and ship.
- Ample marginal wharfage and belt railroad mean no delaying "traffic jams."
- No delays due to weather—a year-round port.

3 Money Savings in Convenience—

- Complete handling equipment for all types of cargo.
- Banking facilities in New Orleans and throughout Mid-Continent—"Bank where you buy."
- International House and International Trade Mart give unique aid to importers and exporters, domestic and foreign.
- World-wide service by almost one hundred steamship lines.

Which savings are most important to you? Write for detailed information to:

port of all-important savings

THOUGHTS ON THERMAL INSULATION No 3

Unlike employees, heat losses don't check out

THERE'S A VERY good chance that a lot of fuel consumed in your works is not pulling its weight in space heating or heat processing. Why? Because lack of insulation allows it to leave without doing any work . . . and, worse still, since there is no easy way of checking, you don't know how much you are losing.

Improved insulation cuts fuel bills and there are very few factories today where insulation could not be bettered with attractive results, for, in many cases, quite a modest capital outlay. Read what the British Productivity Report on Fuel Conservation* has to say:

"In the conservation of fuel there is probably no single factor that has such common application in industry and is more important than insulation. The function of thermal insulation has been understood for a very long time, almost from the first introduction of steam to industry. It is all the more remarkable, therefore, that the financial benefits which would accrue to industry by the elimination of preventable heat loss by means of effective insulation have not received greater recognition."

Many more organisations should consider the positive savings which better insulation can provide. To help you appreciate in a practical way the better utilisation of your fuel through improved thermal insulation, Newalls offer consultation and preliminary investigation, which will cost you nothing. Get your Plant Engineer to drop us a line.

* *Published by the Productivity Council*

Issued in the interests of a better understanding of thermal insulation in industry

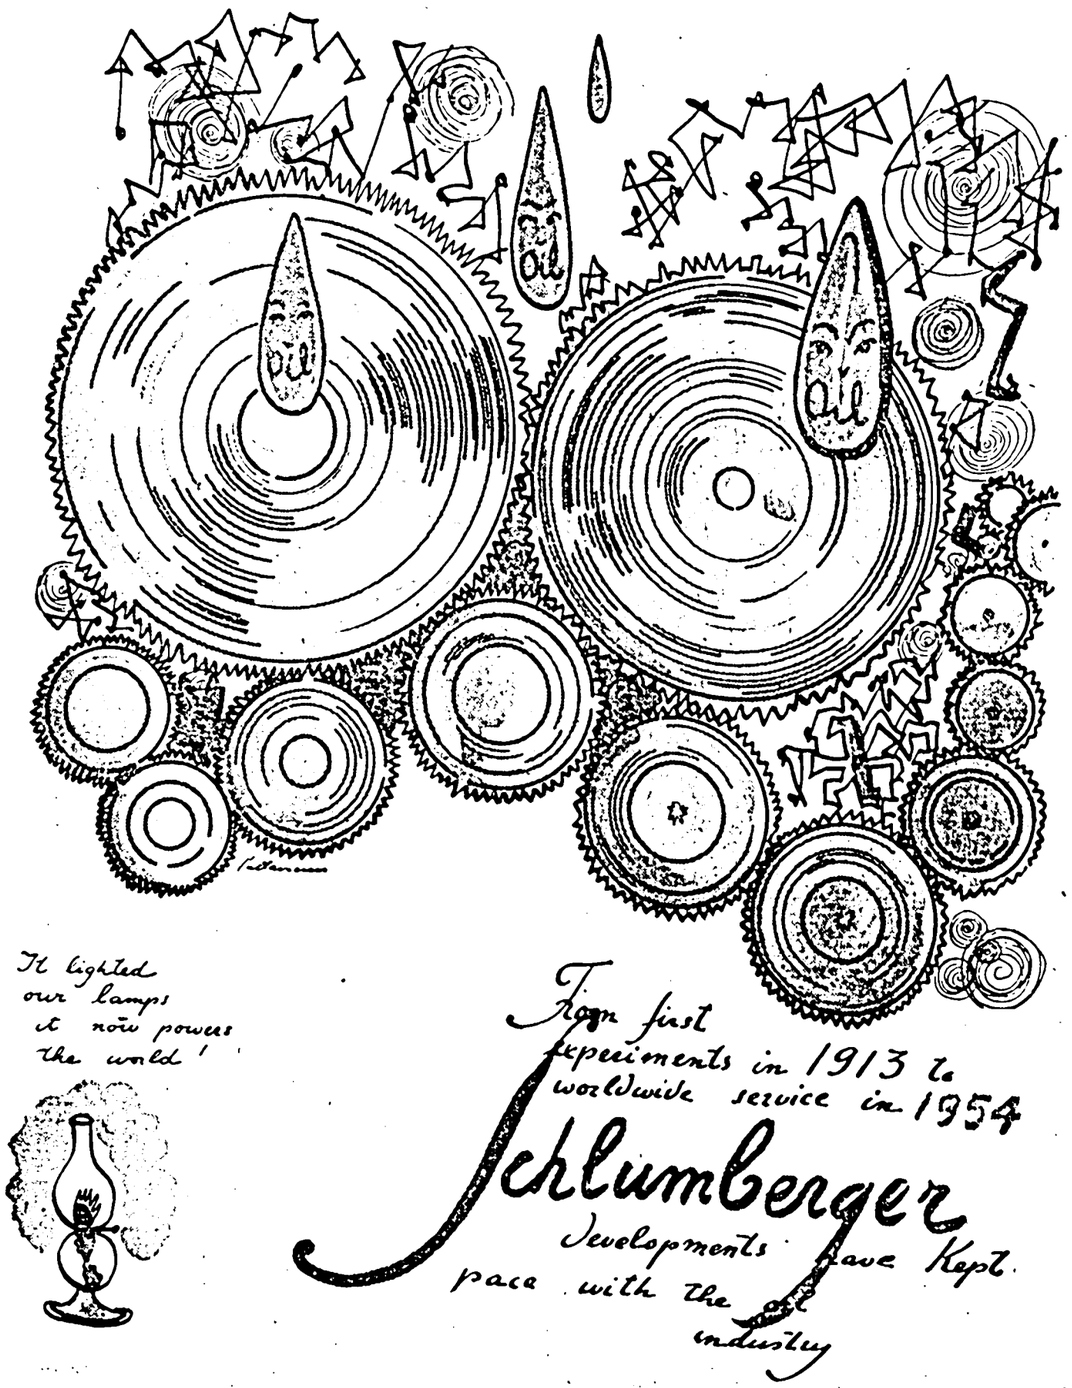
Craven his first love



THE MAN who has been tempted to smoke something else for a while comes back to Craven like the prodigal returning to peace after suffering. And how bewitchingly his "first love" welcomes him. Slowly, yet irresistibly, the cool, slow burning Craven captivates once again and holds him in its deeply satisfying spell. How right Sir James Barrie was when he said Craven "*is a tobacco to live for*".

Try CRAVEN

As the first pipeful casts its spell you'll agree that here is real smoking luxury . . . as every Craven man knows.

Three mellow, slow burning, deeply satisfying blends

Craven Mixture 4/7 oz. Craven Empire de luxe Mixture 4/3 oz. Craven Empire Curly Cut 4/4 oz.

A Vote for Paralysis

TO complete the present picture of confusion and bitter disappointment among the western allies all that is needed is a telegram from Mr Molotov to M. Mendès-France saying "Well done. Between us we killed the EDC." For what happened last Monday in the National Assembly was better than anything a Soviet Foreign Minister could hope for. Not only was the power of the Communist Party to veto French foreign policy displayed in the most decisive and public fashion, but a cruel blow was struck at confidence between the partners in the Atlantic alliance. The leaders of Western Germany and the European movement have been publicly humiliated, the Americans exasperated, and the British thrown into baffled gloom. And at the end of it all no one knows what the foreign policy of France now really is.

It is all very fine for M. Mendès-France to declare that a majority of deputies have been shown to favour the Atlantic alliance, and to declare his own faith in it. It seems more likely that his overriding political aim is to stay in power himself and to impress on France's allies the risks of making any demands on his government that might bring about its fall. He appears to think he can negotiate from both strength and weakness: from the strength of his country's central strategic and political position in free Europe and from the weakness of the economic and social system that only he has undertaken to cure. His theme is: What is France without me, what is Europe without France, what is the western alliance without Europe? It is a dangerous game he is playing, as the reactions in Germany are already showing. The bluff was tried in Brussels and failed; the question now is whether it will be tried in London and Washington.

If so, it should be called without hesitation. French behaviour over the EDC, much of it no fault of the present Prime Minister, has destroyed confidence. Pledges from Paris to do this if Britain does that, or the United States does the other, will not be believed. For even a shred of confidence to be restored it is necessary that the French government should as quickly as possible perform—not merely promise—some unequivocal act of goodwill towards the government of Dr Adenauer, something that it will defend before parliament to the point of resignation. It is against his own countrymen, not against long-suffering friends abroad, that M. Mendès-France should use his threat of *après moi le déluge*. French honour can be redeemed only by courageous action on the part of a French government. Until that happens no realistic thought about alternatives to the defence community is possible. For that very reason the need for this action is urgent; and if M. Mendès-France visits Chartwell again he should be confronted with a time-table as peremptory as that he presented in Geneva and in Brussels.

Some people will dispute the need for haste. They will say that the need for German divisions is less urgent than it was, that resentments must be given time to die down, that the whole of western

defence policy should be coolly re-examined, that when four years have been wasted a fifth does not make much difference. This is to evade the central question, as the French Assembly evaded it. That question is : Is there still time to get Germany firmly tied into the western community of free nations ? It has been Dr Adenauer's steady policy—to his honour and to our good fortune—to accept such obligations as would make it difficult for Germany in the future to break out of the western alliance or to go over to the enemies of freedom. That was the real purpose of EDC, to which "German rearmament" was a mere incidental. That policy is now close to complete ruin, and if anything at all is to be rescued from it in the short remaining time that Dr Adenauer can be expected to have authority among his countrymen, there is need for the utmost haste. There is, *it is true, no immediate danger* of the Chancellor falling from power ; nor is there any real risk as yet of a rush by German politicians to join the pretenders' court that is being established in Eastern Germany by Field-Marshal Paulus, Dr John and others. The danger is that Dr Adenauer, in order to persuade Germans to transfer their allegiance from the European to the Atlantic idea, may feel obliged to raise his terms to the occupying powers very high indeed. The process can already be seen at work ; Bonn says that the "German Contract" which was to have been the counterpart of EDC, is not good enough. A nervous, isolated and neurotic France may well be frightened off once again and try to impose another veto. If so, there will have to be straight talk from London and Washington. If the Americans and the British now find themselves compelled to give Dr Adenauer almost anything he asks for —if they are compelled, either in reality or at least in appearance, to prefer Germany to France—that is the fault of France. The poor second-best that has now to be patched up should be worked out with the French, if they will ; but without them if they will not.

★

What shape should the second-best take ? It must be something fundamental but simple, something calculated to avert a bitter clash between French and German national feeling. It should not need detailed and lengthy negotiation, and France's partners should have an obvious right to ask for it. It cannot be a straightforward acceptance of German rearmament, immediate and unconditional. Dr Adenauer does not want this, nor do the majority of Germans ; it would provoke a storm not only in the French Assembly but also in the House of Commons. Neither, apparently, can it be a straightforward acceptance of the Bonn conventions restoring limited sovereignty to the German government. For that it is too late. The limitations they impose on German sovereignty were accepted by the cabinet in Bonn a long time ago, and even then only in return for the general settlement contained in the plans for European integration. The Germans could still easily spoil everything by talking too loud. But they are on firm ground in demanding that no restrictions of sovereignty should be imposed on them that others will not accept for themselves.

In view of all these facts, there is only one practical course open. That is to work for the prompt admission of a sovereign Germany into Nato as a full and equal member of the Atlantic alliance. This would bring German defence and rearmament plans within the purview, if not under the control, of the only thoroughly integrated institution that the Atlantic alliance has produced—the supreme headquarters founded by General Eisenhower. It is second-best to EDC, but it is better than the series of bilateral treaties between Germany and the western governments that has been furtively discussed in the past. It is, of course, useless to blink the fact—on which criticism of the idea in these pages has been based in the past—that the restraints of the Nato Council are weak and that a nationalist German government, bent on mischief, could not in the last resort be held back by anything in the North Atlantic Treaty as it stands. German rearmament within Nato is a fine phrase for public meetings ; but it virtually means nothing more at present than rearmament by the side of interested friends.

★

An attempt will have to be made to tighten up the pledges that the members of Nato give to each other, both the positive pledges of the help they will give to each other and the negative pledges of the things they will not do. But this will obviously take much negotiation, and to try to do it before Germany is admitted to Nato would be to risk a repetition of the EDC farce, with a procession of impotent French Foreign Ministers constantly putting off decision and an irresponsible National Assembly finally pronouncing a veto. Risky though it is, the only possible course must be to get Germany into Nato first, and then to set about examining the further mutual pledges that the members of Nato—or some of them—will give to each other.

Would M. Mendès-France accept this programme and recommend it to parliament ? It is difficult to say. His methods and his statements have lately been too devious for any firm judgment to be possible. It looks, for the time being, as if he will first try to shift some of the responsibility for the collapse of EDC on to British shoulders by insisting that the defence community, or any other solution to the German problem, would have been possible if Britain had accepted the same sacrifices of sovereignty as France and Germany were asked to accept. This needs a clear answer, and a clear answer can be given. It does not lie in the mouth of any Englishman to upbraid the French for refusing to surrender their defence sovereignty when Britain itself has made a like refusal. But the French offence does not lie in the refusal ; it lies in the waste of so much precious time, in shilly-shallying incompetence. The British position was made clear from the start. The French knew all about it when they first initiated, then negotiated and finally signed the EDC treaty.

It remains true, nevertheless, that if Britain had been willing to go a little further into Europe, more could have been made of the idea of European integration. It is also true that, in the course of the rescue operation that is now necessary, there will have to be some British acceptance of the idea of integration. No restraints upon the Germans will be effective unless they involve some surrender of German sovereignty ; and no German sovereignty will be surrendered unless Britain will make the same, or a comparable or parallel surrender. It has always been difficult to understand why the British Government has been so very frightened of this idea. As the "Declaration of Policy" of last April put it, "Her Majesty's Government can conceive of no circumstances" in which they would wish to modify the policy of the western alliance "which embodies their sense of fellowship with like-minded nations, responds to their own interests and serves so well to secure their general aims." If the end is so much desired, why jib at the means ? The Government might well ask its advisers to set out precisely the military arguments for and against British participation, in something tighter than Nato but looser than EDC. It could seek from members of the Commonwealth definite answers to specific questions about their views on such a project. If the military and Commonwealth verdicts were favourable to a revision of British policy, then the way would be clear to demand a final decision from France in favour of complete German independence and equality within a more closely organised Atlantic group. If the verdicts were unfavourable, then it would be better to join the Americans in a thorough reappraisal of the means by which Western Europe is to be defended.

★

The issues are very grave and it is no time for tinkering. Here is a task for Sir Winston Churchill far more urgent and exacting than his long-cherished project of a *tête-à-tête* with Mr Malenkov. Indeed, the chance—it is a remote chance—of getting the Russians to make concessions in Germany depends on the western powers showing the utmost determination to organise a safe and stable balance of power in central Europe. It would be wise to assume that the United States has gone to the limit in military commitments, political pledges and economic aid. If it does not see the British, French and Germans also going to the limit, it will be fully entitled to make the agonising reappraisal of which Mr Dulles once spoke. The way would then be clear for Mr Molotov to extend gradually over central Europe the sword-stick umbrella that he unfurled after the Berlin conference. If the Atlantic organisation called Nato is torn apart by France, there is the Soviet-European Treaty Organisation called Seto waiting to take its place. The Russians would then have solved the problem of peaceful co-existence in Europe to their entire satisfaction.

Unions Under Pressure

THROUGHOUT next week the thirty-five successful, sober and mostly at least middle-aged gentlemen who make up the General Council of the Trades Union Congress will face over a thousand delegates in a crowded conference hall at Brighton, for the eighty-sixth consecutive annual congress since their now-venerable movement began. The challenges that will be thrown at the council and at the rest of the right wing are already known. There will be the usual left-wing motions calling for a ban on the hydrogen bomb ; rather picturesquely, the first of these will be moved by the National Amalgamated Union of Life Assurance Workers. There will be resolutions calling for opposition to "German rearmament" in any circumstances, and for co-operation between the separate international confederations of free and of Communist trade unions ; the General Council will resist these to the uttermost. There will be resolutions calling for more Socialism in the Labour Party's domestic programme ; the General Council will resist these so far as tact permits. There will be resolutions calling for an end to wage restraint ; the General Council still believes in moderation, but thinks that the employers and the City of London are throwing their side of the bargain away.

There will be two questions in most people's minds as they watch these proceedings. The first is: how great and how dangerous will be the pressure of wage demands this autumn and winter ? To this, the congress is most unlikely to provide an immediate answer. Whatever the motions passed, whatever the tactics used, the policy of the union leaders will in fact be in favour of some moderation, but not too much. The real question is whether continuing foreign competition will make even these moderated demands too onerous for employers to grant without a struggle that would stretch to strikes. The answer lies hidden in the mists of impending economic circumstances ; nobody should expect it to be revealed upon the floor at Brighton.

The second question is: will the unions continue to exert a moderating influence on almost every issue—including the crucial international issues that are now arising—at the annual conference of the Labour party, which starts at Scarborough in three weeks' time? At the end of last year 5,056,912 of the 6,093,822 members of the Labour party exercised their membership through the trade unions. The real importance of next week's congress at Brighton does not lie in the unions' primary industrial role. It lies in the fact that the people who meet there will have the finances, and some of the policies, of Britain's alternative government nestling uneasily in their pockets.

Will they continue to help to prevent those policies from swinging irresponsibly neutralist and left? Once again, the answer to this question can probably be reasonably optimistic. The unions are likely to exert a moderating influence on Labour's foreign policy, although nobody can be sure whether it will be strong enough to suffice; the General Council of the TUC has already voted, for example, by a majority of about four to one in favour of a German contribution to Western defence, and it did not tie this approval specifically to EDC. The country is probably going to witness next week another act in the long drama in which the trade unions try to save Labour from itself. This drama, however, is always played out in such a baffling manner, amid a cacophony of such near squeaks, that there is often widespread misunderstanding about what the generally right-wing voting at these congresses reflects. In fact it reflects an alarming two-mindedness in the trade union movement, a dichotomy that arises from the fact that the big trade unions have democratic constitutions which never quite work.

★

Only a small minority of Britain's nine million trade unionists belong to the extreme political left; the exiguous Communist vote both at parliamentary elections and at direct elections of important union officials suggests that this minority cannot account for as much as 10 per cent of the whole. Probably about the same proportion of trade unionists customarily vote Tory in ordinary elections; but they clearly do not do so out of burning conviction, for the Tories' desperate search for active Conservative trade unionists, to put on show at their own conferences, has so far unearthed only a small collection of not very successful specimens. The majority of trade unionists are clearly most in sympathy with the genuinely anti-Communist wing of the Labour Party, although they do not belong to it in any real sense. This moderate majority will usually vote in some strength at elections for important union officials, and will return men of their own persuasion; they can become immoderate about particular grievances that arise at a factory level rather than on the national political stage, and can then follow extremists who exploit these grievances in bitter if temporary recriminations against their elected leaders. But one thing that the majority cannot be persuaded to do is turn up at branch meetings, after working hours, to vote about the political resolutions or the delegates that are to be sent forward to annual meetings of their unions. Probably only about ten per cent of the membership customarily does so, and this ten per cent often contains a majority of the extremists on the left.

★

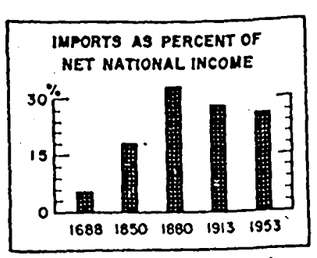
This tendency towards a sizable right-wing vote at direct elections of important officials, and towards a small but extremist one at branch meetings, explains the dichotomy with which the trade union movement is oppressed. Most of the general secretaries and other permanent officials of the big unions are moderate men; they have either been elected by direct vote or else appointed by the moderate men who have won these direct votes. Once established at a union headquarters they tend to become more moderate still; they have research staffs and other bodies at their back who damp down nonsense with sprays of hard fact. Once established, too, they become accustomed to fighting against extremists on the factory or conference floors; the constitutions of their unions usually help them to do so, despite the plethora of odd delegates and odder resolutions that scantily-attended branch and area meetings throw up. This tradition of fighting Communists and fellow-travellers is particularly true of the union leaders who reach the General Council of the TUC itself; at next week's elections for a new General Council the usual sprinkling of Communists will put up for membership, but, as usual, the vote of the whole congress will almost certainly turn them down. And herein lies the important difference—the explanation of the constant deviation to the right—between the Labour Party and the unions. To Labour leaders the extremists are the fiery heart and soul of their local parties, the only people who will turn up at political meetings and faithfully pay their dues; they are nuisances who sometimes have to be appeased if the party is to survive. To union leaders the extremists are people who are always making trouble in unofficial strikes or on conference floors; they are nuisances who need to be suppressed.

The voting at each annual trades union congress merely shows how successful or unsuccessful this task of suppression of unrepresentative minorities has been at individual union conferences in the preceding year. It does not cast a light on the movement of opinion among the broad masses of union members, but merely on the varying efficiency of the checks built up in union constitutions to the imbalances that are caused by the exiguous number of votes that are cast at branch meetings. The real significance of next week's congress at Brighton is simply that it will once again—in crucial international circumstances, with the usual unnerving uncertainty, but probably also with the usual degree of moderate success—put this system of checks and imbalances to the test.

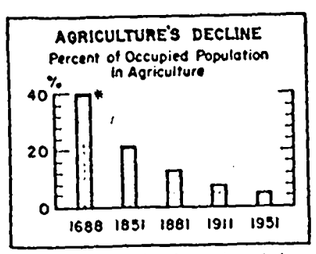
An Unbalanced Economy?

IN his presidential address to the economic section of the British Association this week, Professor Austin Robinson put forward a careful, tentative, but controversially gloomy assessment of Britain's long-term economic future. Long-term judgments are dangerous exercises, although they have the advantage that nobody will remember them if events prove they are wrong. But since this controversy could have some early implications for Britain's agricultural policy, it would be wise for present-day economists to take sides in it now.

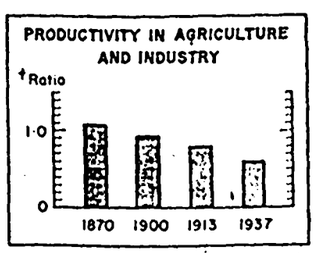
Professor Robinson based his argument on an analysis of the changing structure of the British economy, which he carried back to the time when Gregory King was first guilty of inventing macro-economic investigations in the reign of William and Mary. The statistics underlying his argument are very roughly summarised in the accompanying charts. The first chart shows the ratio between retained imports and national income at selected dates throughout the last two hundred and seventy years. In 1688 Britain was still a mainly self-sufficient economy; the real level of consumption per head at that time was only a little under half of that in 1925-34, but only about 5 per cent of the things that we consumed were bought from abroad. These imports included a certain amount of tropical foodstuffs and wine, but Britain was still at that time a small net exporter of grain. The country's dependence on imports rose steadily in the next two hundred years, to a peak of 33 per cent of net national income in 1880; since 1880 there has been a small although not continuous tendency to decline.



The second chart shows the decline in the proportion of the occupied population engaged in agriculture. It has been a continuous decline since the days of Britain's predominantly peasant economy in the seventeenth century; by 1951 the proportion of workers engaged in agriculture and fishing was only about 5 per cent—the lowest proportion for any country in the world. The third chart, based on the researches of Mr Colin Clark and relating to a shorter run of years, shows that the ratio of average productivity in British agriculture to that in British industry has declined from 1.07 in 1870 to 0.60 in 1951. In other words (if the figures for the early years are right, which is doubtful), the average worker in agriculture contributed slightly more to Britain's real income in 1870 than the average industrial worker did; but by 1937—on the stern test of market prices—he was not even two thirds as valuable to the country as the industrial worker was. At first sight, this seems to suggest that Britain has been very wise to allow resources to drift into factories and away from the land during the last eighty years; and that even now it should continue to encourage this trend.



★



But at this stage Professor Robinson cries "Wait." Ever since mid-Victorian days, he shows, the incentive to move resources from agriculture to industry has been operative in other countries besides Britain—often indeed to a greater degree than here. In fact:

> Over the greater part of the last eighty years there has been an advantage to any country anywhere (with exceptions in Australasia and South America) which moved resources out of agriculture into industry and which imported primary products. We in Britain could benefit through the fact that our technical lead, our financial resources and our geographical setting put us in the position to move more quickly than others.

Professor Robinson believes that this opportunity for quicker industrialisation—which was based on a concentration of scientific knowledge and practical expertise in this country, combined with poor transport and a lack of the technical background required for receptivity of scientific knowledge abroad—will not last. Indeed he cites statistics of the rapid drift from agriculture to industry in many foreign countries, which suggest that Britain's near-monopoly and former capacity for quick movement have been emulated already. Effective competition with our traditional exports is rapidly increasing; he believes that it will continue to increase, to an extent that will make it difficult for us to earn enough

*Minimum estimate. Based on proportion of gross national product believed to have been derived from agriculture at this time.

†Ratio of average productivity in British agriculture to that in British industry. Based on estimates made by Mr Colin Clark in "The Conditions of Economic Progress." (Macmillan, 1951.)

foreign exchange to buy so much of our food from abroad.

For this reason Professor Robinson considers that "we are progressively moving into a world in which the advantages of our nineteenth-century structure in its extreme form will be less than in the past." His conclusion is that we may have to start drifting back to the land again, that "under the pressures of ordinary market forces we must expect and be prepared to adjust ourselves to an import ratio a little nearer to that of Germany than we have today"; at present Western Germany (with 16 per cent of its occupied male population in agriculture) imports about one-fifth of its food, while Britain (with only 6 per cent of its occupied males in agriculture) imports about one-half. Although Professor Robinson would rely mainly on the price system to effect the changes in structure which he believes will be necessary, his "fear is that events may continue to require us to make changes faster than a free and smoothly working economy can easily carry them through."

This is the core of Professor Robinson's argument. It is an argument that bluntly foreshadows impoverishment for the British people; if we have to move back on to the land and towards the West German pattern of production, then we will presumably also have to move back towards the West German standard of living—which is some 15 or 20 per cent lower than ours. But Professor Robinson's case is so modestly worded, that dissent from it must be modestly worded too. There will be little disagreement with his analysis of the forces that have shaped Britain's economy in the past; the disagreement will centre solely on the way in which he thinks those forces are going to develop in the future.

★

For Britain's place in the world economy will depend not only on the things that other countries try to make in competition with us, but also on the things that they will want to buy and the ways in which those goods can most economically be made. And are the manufactured goods that the world will demand in increasing measure in the next fifty years, and the ways in which it will be most profitable to make them, really goods and ways that will tip the balance towards new and quickly learning countries and against countries with the advantage of accumulated scientific knowledge and expertise? Does the world stand at the tail-end of the old industrial revolution, in whose processes under-developed countries are clearly going to catch up? Or does it stand on the verge of a new scientific revolution—an age of jets and atomic power and synthetic materials—in which the advantages of an early start are going to be even greater than in the industrial revolution of the last century? In under-developed countries the use of labour is still cheap and the use of capital is still expensive, partly because savings are scarce but also partly because they have not got many technicians capable of using machines to the best advantage (although they are learning fast). But is this advantage to the poorer countries of the spread of knowledge not likely to be outbalanced by the fact that—in all branches of industry and even in agriculture—the most economic forms of production are likely to become more complex, more capital-intensive and more knowledge-intensive than ever? Are what economists call the "external economies" of possessing large industrial massifs, the advantages of having ancillary services and know-how and traditional skills already in being, really likely to decline? Should the manufacturing revolution of the last eighty years be regarded as a once-for-all affair? Or should it be regarded as a continuing process in which methods of production have only started on their course of becoming ever more complex—and are likely to continue along it at an accelerating pace?

★

These are the questions to be asked. They are not questions that can glibly be answered. But many people who have stared into this same crystal ball have felt a fear as cogent as, though very different from, that voiced by Professor Robinson. The fear is that if industrial production becomes more capital-intensive and more complex, this will not lead mainly to a shift in the balance of economic advantage from poorer countries to Britain; it will lead to a shift in that advantage from all countries to the United States. That is one of the reasons for fearing the continuance—perhaps one should say the re-emergence—of a long-term dollar gap, at any rate at present rates of exchange.

It is time to make a guess as bold as that which Professor Robinson has set down. The guess is that the tightrope that Britain will have to walk in its future export drive will lie through products that have a sufficiently high proportion of capital costs to enable us to compete with newer countries like Japan, but that have a sufficiently high proportion of labour costs to enable us to compete with the United States. It will be a narrow tightrope; and at the old-fashioned end—in such industries as cotton textiles—it will be crowded with Japanese and Indians and inconveniently hard-working or swiftly developing people of that sort. But at the other end—in engineering and other newer industries—there should be room enough if we are ready to fill it. That is why the key to Britain's future prosperity seems to lie with the rate of industrial investment and capital creation in these newer industries; that is why many people doubt whether a progressive Britain would really be obliged to turn more of its scarce labour resources back on to its scanty land. But will Britain's investment policy be progressive? This is another unanswerable question; some at least of those who ponder on present trends may join Professor Robinson in his role of Cassandra, though they give it a different script.

Room for Japan

JAPAN'S economy is in new straits. The signs of impending crisis have stirred Washington into action, and last week Mr Dulles foreshadowed exceptional measures to help the Japanese ride out the storm. But, while it is true that only the Americans have the means, quite apart from the inclination, to give Japan emergency aid, the task of making a lasting solution to the problem possible must lie very largely with Britain and the rest of the sterling area. Japan, like Britain, depends for its existence on international trade, and the country's economic recovery cannot be completed if Britain and other members of the Commonwealth obstruct its access to world markets.

But in Manchester, Sydney and Johannesburg it will surely be asked what concern of the Commonwealth it is to put Japan back on the economic map. Is it not rather in the interests of both businessman and trade unionist to keep the Japanese out of the market, or to divert their energies to supplying the needs of China's millions? At this point politics and economics cross. None but the most credulous fellow traveller can ignore the disastrous consequences that would follow if Japan, weakened by economic setbacks and frustrated by commercial obstruction in the free world, fell into the Communist bloc's lap with all its resources of industrial equipment and skilled manpower. That possibility cannot be ruled out. Neutralist feeling in Japan is reinforced by cherished hopes of a life-saving restoration of trade with China—hopes which are largely illusory, for the new China has made clear its reluctance to absorb Japanese textiles and consumer goods on the old scale, but which are skilfully played upon by the active propagandists of both Peking and Moscow.

The case for doing more to help Japan does not, however, rest solely on political and strategic factors. It is also good economic sense. Japan is an important customer of the Commonwealth; it bought some £50 million worth of wool from Australia and £56 million of jute, cotton and mineral ores from India and Pakistan during 1953, when its total imports from sterling countries amounted to £240 million. Purchases of this size must be paid for chiefly by exports, and in a world in which inconvertibility of currencies persists it is hardly surprising that the Japanese should seek bilateral balance in their sterling accounts, or that they should be reluctant to settle sterling debts by payment in dollars. (Here emerges one of the clearest advantages that convertibility might bring to Britain.) But this is not all. The argument that the sterling payments problems of the Japanese were purely self-imposed because of their unwillingness to spend their dollar reserves holds no water in present circumstances; for Japan's entire foreign trade accounts are now seriously out of balance.

In 1953 the country's receipts from current and capital, visible and invisible transactions were exceeded by payments to the tune of some $193 million, with the result that foreign exchange reserves declined by 14 per cent. This ominous trend has continued (although in June and July, for the first time this year, a plus sign appeared); a deficit of $177 million, nearly five times as much as in the corresponding period last year, was chalked up for the first six months of 1954. At that rate the reserves would probably be down to the minimum safety limit before the end of this year.

The Japanese government has stepped in at the last minute with a policy of deflation which, if it scarcely deserves the comparison with Crippsian austerity already attached to it, is at least medicine of the same sort. By any standards the projected reductions of imports are severe: imports of rice are cut by a third, of wheat by 10 per cent and of sugar by nearly one-fifth. In fact, however, the blow dealt to standards of consumption is not as heavy as it seems, for imports of these and other goods had markedly increased during 1952, the volume of total imports rising by some 37 per cent, that of rice imports by 10 per cent and of sugar by 38 per cent. In effect, therefore, a return to something close to 1952 consumption standards is now aimed at. The same is broadly true of imports of raw materials, which Japanese industries have been buying more heavily than they could afford, and which will also be cut if the present official plans bear fruit. But merely to say that Japan has been brought to the brink of an over-importing crisis is too simple a diagnosis; on closer examination the problem turns out to be much more complicated.

★

By all measures, 1953 was a record year for Japan. Production was up by 26 per cent and the national income by 15.5 per cent, while real income per head topped prewar standards for the first time. It was an illustration, not dissimilar to that of Western Germany, of the extraordinary recuperative powers that may lurk in a seemingly stagnant and dejected economy. But in Japan's case, in contrast to Germany's, the increase in imports was not matched by a corresponding expansion of exports. Rising production and higher money incomes and consumption standards were inevitably reflected in a higher import bill; but for a number of reasons exports failed to keep pace, while there was a marked fall in income from other sources, notably from American procurement orders—purchases of Japanese supplies for the use of the armed forces in Korea, Japan and neighbouring areas.

Exports, which increased by only 12 per cent in

volume and by a mere one per cent in value, were hampered by high costs. This was an indication of the inflation which accompanied, and partly evoked, last year's record production figures. The internal price level rose during 1953 by between five and ten per cent. It is now the object of the government's new deflationary policy to wipe out this advance in prices. Yet the fact that Japanese exports had priced themselves out of world markets was largely due to the government's own previous policies, or rather to the lack of them ; not only was the 1953 budget unbalanced, with a disproportionate amount going into public works, but control over the credit machine was lax. Some of the steps being taken to remedy these defects are wholly commendable ; last April's budget was meant to achieve a near-balance (although recent exchequer returns suggest that this will not be possible), and the policy of credit stringency initiated last September was reinforced in January. But there are already signs that the government may be unnerved by the number of business failures that are inevitable if the deflationary cure takes its natural course. Mr Yoshida and his ministers may yet be tempted to yield to mounting pressure from interested groups.

★

Not surprisingly, Japanese leaders have been seeking scapegoats to take the blame for the current crisis. The popular choice is the United States, which is accused, somewhat ungratefully, of precipitating the crisis by halving its procurement orders. It is true that the American contracts have fallen by 47 per cent, but they still amount to the valuable total of $250 million a year. Moreover the Japanese have known for many months, indeed, ever since the truce in Korea over a year ago, that the end was coming, and they have had ample time to make ready for the new situation. Some of them may feel that, being unsecured debtors, they have the United States virtually in their pocket. But the immediate outlook as regards American aid is complicated by several external and primarily political factors. The announced withdrawal of American forces from Korea will automatically bring about a further cut in procurement orders ; but, on the other hand, funds that have become available to Mr Stassen's Foreign Operations Administration as a result of the Indo-China cease-fire may now be used for offshore purchases and other forms of aid for Japan. Moreover, the economic clauses of the proposed South East Asia defence treaty will undoubtedly be of great interest to the Japanese.

But helpful as these direct dollar infusions, supplemented perhaps by loans from the International Bank, may be, they can provide no lasting solution for Japan's real problems. The Japanese economy can be saved from recurrent crises only by the righting of its grossly unbalanced trade accounts. And it is here that Britain has a special role to play—not only on account of its own large stake in world markets, but also because of its influence with other Commonwealth countries.

Few people realise the extent of Japan's postwar trading problem. The highly industrialised Japanese economy has lost not merely its footing in the areas temporarily occupied before or during the Pacific war, but also the older markets and sources of raw materials —coal, iron ore, soya beans, cotton and others—in Korea, south Sakhalin, Manchuria, and Formosa, not to mention northern China, where Japanese economic development long preceded Japanese military adventure. To strip Japan of its conquests was both just and necessary ; but there is no avoiding the conclusion that the 87 million inhabitants of the Japanese islands (which are not much larger than the British Isles) have been confronted with an almost impossible economic task. How can it be kept within the bounds of possibility ? The Americans have a fairly straightforward brief: to direct immediate dollar aid into the Japanese economy, by way of loans, grants and offshore contracts. This, according to Mr Dulles, is on the way to being done. The Japanese themselves must assume some arduous burdens: further deflation, rationalisation of industry (with a wary eye on the resurgent *zaibatsu*), and perhaps a carefully timed and prepared devaluation of the yen. The present exchange rate (£1 = 1,014 yen) is certainly out of line, but Japan's house must be put in better order before devaluation could succeed.

★

But Japan needs, more than anything else, access to markets which only British policy and influence can grant to it. What Britain can do and is willing to do will soon be put to the test. Japan's application to join the General Agreement on Tariffs and Trade will shortly be voted on, and, with powerful American support and the promise of backing from other quarters, it is now almost certain that a sufficiency of votes will be mustered. Thus mere discretion suggests that Britain should drop its obstinate opposition. Again, in January the Anglo-Japanese trade and payments agreement must be renewed ; and whatever its vocal opponents may say, the agreement has worked with fair success, without bringing in its wake the "black" perils that were so freely predicted.

Yet something a good deal more generous than mere technical agreements is needed now—something in the nature of a change of heart. The danger of economic breakdown opening the door to an anti-western government in Japan is real enough ; but it must also be appreciated how much a revival of cordial relations between London and Tokyo could do to stabilise the Far East. The British have too long been content to leave the United States to grapple alone with the complexities of the Japanese situation. Economic sense and political necessity alike now demand that Britain should not only make room for Japan in the free world, but stretch out a more friendly hand to help it take its place.

Notes of the Week

Labour and the End of EDC

THE French rejection of EDC provides Mr Attlee with an avenue of escape from embarrassment at the Scarborough Conference. Previously, there had been a grave danger that the Executive might be defeated on a straight vote about "German rearmament" ; the probability now is that it will manage to scramble through on a crooked one.

The argument within the Labour movement in the last few months has been primarily whether the party should or should not support EDC. It is true that the original Executive decision, last February, was in wider terms, and laid down as a condition that the German units should be "integrated in the defence forces in a way which would preclude the emergence again of a German military menace." Mr Attlee, in his broadcast in June, also said that if EDC failed, some other way of fitting the German contribution into western defence would have to be found. But the Executive in May went a long way towards nailing its colours to the mast of EDC—by issuing, out of the blue, a statement that EDC provided the best guarantee against the re-emergence of a German military menace. It can now claim that if EDC is shot away the party's whole course will have to be reconsidered.

For many of the waverers (among them some members of the Shadow Cabinet) such a reappraisal would be anything but agonising. It would enable the Executive to save face ; but it would not save their policy. The Bevanites and fellow travellers will strive to prevent this compromise ; they will do everything possible at Scarborough to pin the party to categorical opposition to the more direct forms of German re-armament that seem likely to follow the French destruction of EDC. But the Executive may now be able to find a way out of these difficulties by a tactic at which the platform at Labour conferences is adept: the drafting of one of those lengthy, elastically phrased, composite resolutions which can mean so much or so little—and amid which the hatchet, if not buried, at least becomes entangled powerlessly in an involved and wordy compromise.

Mr Gaitskell for Treasurer

THE final agenda for the Scarborough conference shows that nine unions and twenty-nine constituency parties have supported the nomination of Mr Gaitskell for the vacant treasurership of the Labour party. Their backing, and that of other unions (such as the miners) who have declared their support, will certainly carry the former Chancellor—and the most ardent anti-Bevanite in the party —into this key office, past the challenge of Mr Bevan. A third challenger, Mr James McGowan, from Dumbartonshire, has had the temerity to enter the field. But since he rests his claim, not on his Bevanite or anti-Bevanite standing, but simply on the grounds that he thinks he would make a good treasurer, he is likely to get short shrift.

By standing against Mr Gaitskell for this post, Mr Bevan forfeits his right to stand for the constituency section, where he has been head of the list every year since the war. This may indeed prove to be a somewhat leaner year for the Bevanites in these elections. The other five sitting Bevanite members—Mr Wilson (though it may be argued that he now belongs to a new category of Wilsonians), Mrs Castle, Mr Driberg, Mr Mikardo and Mr Crossman—should all regain their places safely. But the other leading Bevanite candidates, Mr Harold Davies and Mr Sydney Silverman, are not sufficiently well-known to be sure of making the grade. More probable winners are Mr Anthony Greenwood (though he has on many issues been a near-Bevanite), Mr James Callaghan or Sir Frank Soskice. In all, twenty-three candidates are standing for the seven constituency places. No changes of importance are likely in the trade union or women's sections.

Mr Gaitskell's arrival in the seats of power at Transport House will have to be reckoned as a political development of major importance. Unless he makes some serious blunder in internal party politics—he can at times appear not merely willing to grasp nettles but to thrust the party's nose into them—his role as third man in the party hierarchy should soon be confirmed, giving him a strong claim to the leadership after Mr Attlee and Mr Morrison. He has, moreover, a full year in which to dig himself in at Transport House, while Mr Bevan withdraws to the back benches at Westminster and to his newly acquired farm in the Chilterns. It may prove a costly year of self-rustication.

Bonn States its Terms

IT should have been clear to American and British officials that the German government would no longer accept the limitations on sovereignty contained in the Bonn Conventions. The statement issued by the Federal German cabinet on Wednesday leaves no room for hope on this point. The well-meant intention of the Americans and British to give Dr Adenauer support in the event of the French failure to ratify the EDC treaty has misfired. The Germans demand restoration of sovereignty with no limitations. They are prepared to accept agreed legal provisions governing the position of the foreign troops in the Federal Republic. These regulations would presumably give the

former occupation troops less than the extra-territorial rights written into the conventions.

The implication in the Bonn statement is that West Germany also demands the right to rearm, which was omitted from the sovereign rights granted in the conventions as revised recently by the Anglo-American study group in London. All mention of military matters was left out of the treaty when it was separated from its twin, the EDC agreement. The Germans demand sovereignty, including *Wehrhoheit*, and also the right to have diplomatic relations with the Soviet Union, a new freedom that is more attractive to some of Dr Adenauer's critics than the right to rearm. One of the main reasons, indeed, why there has been a growing determination in Bonn to reject partial sovereignty is the thought that it would actually hinder new moves towards reunification of the Federal Republic and the Soviet Zone.

It is clear that Dr Adenauer is no longer the sole arbiter of German policy. But he has not given up leadership. This can be seen from the Cabinet's opening suggestions, that consultations should now take place on European unification "with all willing countries" and on military integration with the countries that ratified the EDC (and, it is implied, with Italy). At first sight, it might seem that the Germans are tactlessly flouting France, particularly by suggesting that talks on the Bonn conventions should be held without that country. The proposals for new talks on European unity and military integration would, it is true, have come better from the Brussels "front" of EDC supporters as a body, just as it would have been better if Mr Dulles had left the rump EDC powers to call for a meeting of the Nato Council.

But there are several reasons why the German *démarche* cannot be condemned. The French are not excluded from the proposed talks on unification. Secondly, for the EDC ratifiers to hold military talks would follow the precedent set when this group, through M. Spaak, invited the French to Brussels. Finally, it is logical for the Germans to propose talks with only the United States and Britain on the Bonn conventions, because it was those countries alone who drew up the revised treaty, to be presented for approval to the French and Germans in the event of the EDC's demise. The inescapable fact remains that France has abdicated the leadership of Western Europe.

Herr Ollenhauer Gloats

THERE is something that turns the stomach in the spectacle of Herr Ollenhauer, a small man in all senses of the word, crying "Failure!" at Dr Adenauer, the statesman who has striven so valiantly to save Germany from neo-Nazis and Communists alike. The leader of the German Social Democrat party did not wait until the vote in the French Assembly to proclaim that the policy of western integration had suffered utter shipwreck. He terms it the policy of "Little Europe," a phrase that vaguely implies that there is a Greater Europe which might be united to better advantage. Not for the first time in political warfare, a misleading phrase has been invented which can do great damage to a cause—in this case, the cause of uniting the only countries in Europe that are neither neutral nor subject to Communist rule.

Herr Ollenhauer calls for a radical revision of West Germany's foreign policy and a fresh conference with the Russians. So does Herr Oberlaender, Minister of Refugee Affairs, head of the Refugee Party and former Nazi. The agreement between them is neither fortuitous nor unique. Nationalists of all parties, in the government and out of it, are now calling for a new look at a policy which has been uncompromisingly and exclusively based on the EDC. The leaders of both the Socialists and the Refugees both add that they are anti-Communist and that Germany belongs to the West; but it is hard to believe that they will support an alternative to the defence community that would link Western Germany firmly into a strengthened North Atlantic alliance.

When Herr Ollenhauer demands that the alternative should be a united Germany and a Greater European alliance within the framework of the United Nations charter, he is not thinking of an enlarged Nato. He is making an illusory proposal which is dangerous, because his phrases—and those of M. Herriot in the French Assembly—are very like those of Mr Molotov. Amid the haze of soothing words, the man-in-the-street is apt to forget that the Social Democrats still demand, and Mr Molotov still rejects, free elections as a preliminary to reuniting Germany.

Allies Seen from Washington

IT is easy to forget that in American eyes "alliances" have only very recently become respectable and that the concept of "allies" in peacetime is one which is still not fully developed. Partners of the United States would therefore do well to listen-in when Americans talk to themselves about the meaning of the relationship, as President Eisenhower did to the American Legion Convention on Monday, and as an Assistant Secretary of the State Department did the previous Friday.

The fact that the Administration, on the eve of the rejection of the EDC, took the trouble to talk at length about America's partners to a body as powerful and as nationalistic as the American Legion, and did so in terms not of impatience but of understanding, is in itself important. The idea that the United States could go it alone was flatly rejected, and the myth that alliances were only of benefit to the foreigner exploded. The suggestion that allies, even small allies, behave or should behave like satellites was firmly knocked on the head. The President and the State Department spokesman both made it quite clear that the American concept of alliance or partnership rests squarely on respect for the differing opinions of one's partners, and on the belief that there is a fundamental community of interest between these and the United States which transcends minor differences of view. These points cannot be made too often, and to have them said so forthrightly at this particular time is warmly reassuring.

Although the necessity for continuing co-operation with other like-minded countries has been reaffirmed in unequivocal terms, the concept of partnership that seems to be emerging is one that imposes certain limits on the nature of the relationship that any country, or group of countries, can reasonably expect to establish with the United States. Europe has been told politely but firmly that, although its military and industrial potential and strategic location make it the heart of the free world security system, the American approach to partnership is a global one in which no area comes first. Similarly, there is little encouragement for those who have hoped that Nato might gather strength by acquiring powers that would involve new limitations on national freedom of action. Instead, there appears to be developing the idea of a partnership which is genuine—unlike the Soviet satellite system—but in which many countries have to share: the Nato countries, the Rio Pact countries, the Anzus countries, the Philippines and Japan, and soon, it is hoped, a number of the South East Asian countries. Something loose and general is preferred to something tight and special. It is a relationship which relies for co-ordinated policy on like-mindedness rather than "supra-nationalism," and which reserves maximum freedom of action for the United States.

Landlords' Day

LAST Monday was what was described in the left wing press as Landlords' Day. Under the Housing Repairs and Rents Act landlords are now able to claim a "repairs increase" on controlled rents, amounting to twice the statutory repairs deduction, up to a maximum of twice the gross annual value. The first date on which the new rent is payable is six weeks from the serving of the notice.

The new Act is a good illustration of the very high degree of literacy that is required to cope with modern life. The Stationery Office has done its best to help, by producing two 4d. pamphlets—one on "Repairs and Rents" and one on "Grants for Improvements and Conversions"—which set out its intricate provisions in simple question-and-answer form. Even if he can understand these, however, the tenant will need to take a certain amount on trust. It will be easy enough to get a certificate from the local authority if his home is still in a state of obvious disrepair; but if he wishes to question the landlord's statement that he has satisfied the expenditure test, it means going, or being taken to, the county court—a tribunal which he may find more forbidding than the Rent Tribunals that have protected him for so long. He may also get a shock when he sees how some landlords have calculated service charges—on which, however, the final arbiter is the Rent Tribunal.

The rise in rents is likely to be gradual. Some landlords are already having trouble with newly-formed resistance movements among their tenants. Several large property companies have been getting a "voluntary contribution" from their tenants, and so have little to gain from the Act, or will not show unseemly haste in asking for more. With one exception, the shares of property-owning companies have shown little change this week. Landlords will certainly have to work much harder for an increase than landlords in Scotland, where a straight addition of 40 per cent is permitted. These belated increases will not be sufficient to stimulate the building of houses and flats to let. But they may do a little to relieve the log-jam of rented accommodation, the jealous and rigid grip on valued squatters' rights, that has caused so much misery and immobility in recent years; and, taken with the provision of grants for improvements and conversions, they may help to check the increase in slums that has been the other principal social contribution of the Rent Restriction Acts.

On Boarding Buses

THIS week's case of the man who boarded a bus in London while it was stationary at traffic lights has become a minor incident in the never-ending war between freedom and regulation. To Londoners, the facts of the incident will be familiar enough. The regulation stopping places for buses are hemmed in by queues. A bus stops in traffic and an intending passenger, more enterprising or more anti-social than the rest (the choice of adjectives at least still is free), boards it. The bus conductor, a stern moralist, intercepts him and claims that all the vacant seats are, in the light of his conscience, reserved for those at the head of the queue at the next stopping place. More often than not the offender (if offender he be) bows his head in shame at his lapse in defying the national precept of "Fair Shares for All," and dismounts.

The West African gentleman who this week appeared at Marlborough Street did nothing of the kind, whereupon the conductor suspended the bus's journey, called the police, and the African was brought before the Magistrate's Court charged with insulting words and behaviour. That, the Magistrate later said, the conductor had no more right to do than a dustman; the Court did not accept counsel's argument that a man who mounts a bus otherwise than at a recognised stopping place is guilty of an act of trespass (which, in passing, is rather an extraordinary word for the representative of a public authority to use in relation to a public vehicle dedicated to the public service). The London Transport Executive, in an aggrieved statement, later intimated that it will continue, unsupported by regulation, to allow its servants to turn away customers if they feel like it. Common sense, it said, will continue to be used—words which, when they come from a monopoly, commonly mean that the monopoly intends to continue its practices whatever a mere magistrate may say.

INDEX

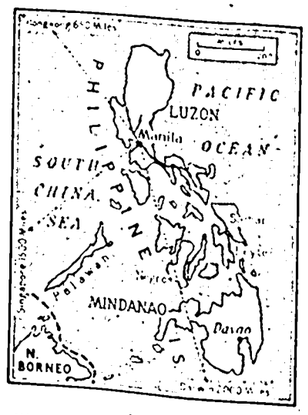
The Index to *The Economist* is published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXXI (April to June, 1954) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W1.

The moral debate on this issue has become unnecessarily confused. Of course it is wrong for active young men to jump queues in order to get home early; there are the elderly, the crippled and the women with small children who cannot board buses at traffic lights and who also wish to get home. But if there is to be any provision for compulsory standing in queues it is for the Minister of Transport to make it, not the London Transport Executive. The Minister is answerable to Parliament; the Transport Executive can hardly be said to be answerable to anyone—and everybody knows that bus conductors sometimes repel boarders not in order to protect the queuers, but because the disorderly boarding of buses offends against their views of how private individuals should behave. It is this assumed power in the hands of minor officials that is intolerable; the right to board buses when one feels like it, provided one does not harm anybody else thereby, is one of the symbols that distinguishes Britain from Prussia. The Courts will, and London Transport should, continue to remember it.

Comfortless Committee

WHEN the committee on the organisation and finance of adult education was appointed last summer it seemed a convenient way out of the Ministry of Education's impasse: a cut of 10 per cent in the estimates had just been stayed by a storm of public protest. But some awkward chickens have now come home to roost.



The present arrangement is that the Ministry pays a grant, amounting to not less than three-quarters of their teaching costs, to approved "responsible bodies" providing adult education. These bodies are the extra-mural departments of universities (which also get money from the University Grants Committee) and certain voluntary associations, of which the most important is the Workers' Educational Association. In addition, since 1944, local authorities have had to "secure the provision of adequate facilities" for adult education. Suggestions for simplifying these intricate arrangements, which in 1951-52 provided classes for 150,000 students at any one time, have not been lacking; some people have argued that the University Grants Committee should finance all the extra mural work done by the universities and that the local authorities should finance the rest.

The committee, however, is convinced that much would be lost if the present partnership were dissolved. To cut out the WEA would be to lose a missionary zeal; and to cut out the Ministry, by abolishing its direct grants to responsible bodies, would be to lose coherence. The committee's main recommendation is that the Ministry should provide more positive co-ordination. It suggests that grants should no longer be given automatically up to a ceiling determined by what the responsible body received in the previous year; but that discrimination should be exercised according to the content of courses, standards of teaching and the needs of each area. To offset this increase in the Ministry's influence, the regulations should be made more flexible; for example, the limit on teachers' salaries qualifying for grant should be lifted. The committee agrees that fees paid by students should be increased; but it says that, even if these fees were doubled, they would only bring in an additional £20,000 a year—and in 1951-52 the total cost of adult education was nearly £700,000. All this sounds very reasonable, but it is an odd report for a committee that was set up against the background of an economy drive; its proposals would involve the Ministry in higher expenditure, as well as in a new and heavy burden of work.

No Puppets in Manila

NOT since the battles of the last war have the Philippines been so prominent in the headlines. The holding of the South-East Asian conference in Manila and the presence there of Mr Dulles underlines the fact that the Philippines, though they may often be forgotten, should not be ignored. Standing far enough from the Asian mainland to be unaffected by the movements of Communist land armies, these islands are nevertheless part of the South-East Asian pattern and an important link in the defence chain of the Western Pacific.

Opponents of the whole idea of a South-East Asian alliance between local states and the Great Powers customarily dismiss President Magsaysay's regime in Manila as a mere puppet government. This is far from the truth. Although opinions vary about its efficiency and integrity, it has wide and genuine popular support. It suffers from no more than the natural disappointment that was bound to follow the inflated hopes which the energy and reputation of Mr Magsaysay had fostered. In sharp contrast to the views of the Colombo powers, the opinion in Manila is that the closer Seato resembles an automatic, closely-knit military alliance on the Nato model, the better.

In this the Filippinos go considerably further than Mr Dulles, and it is not because he tells them to. Some forthright statements have lately come from them. They emphasise exactly the kinds of points about Communism that anyone who has suffered from it knows to be true; although the Communist-led Hukbalahap movement is now negligible, this victory has not been achieved without great effort. At the same time, they are categorical about "colonialism or imperialism." President Magsaysay asserts candidly that it is in the Philippines' best interests to be a partner of the United States, even though neither he nor any other political leader could accept either dictation or interference by the Americans in internal affairs. The Filippinos, indeed, feel towards the Americans much as the Indians feel towards the British—and for the same reasons.

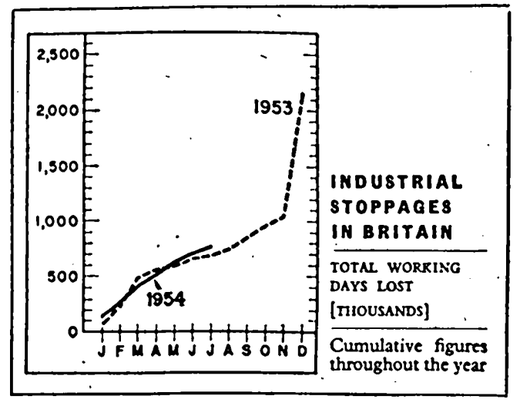
Scene Shifters in Indo-China

THE easing of censorship on reports from Vietnam has not produced an immediately clear picture. It is rather as if the curtain had been raised on a half-darkened stage, on which the stage manager and his assistants are still busily rearranging scenery, furniture and properties. It is not even easy to see who is in charge of all these confused movements. Tuckets in the wings announce the imminent but imprecise return of Bao Dai. His prime minister, Ngo Dinh Diem, is still far from being master of the situation. Former prime ministers—who are almost as thick on the ground in Saigon as in Paris—are eddying around in disturbing currents; they include the intransigent Nguyen Van Tam, whose son is still chief of staff of the Vietnamese army, and the wily Tran Van Huu, who has been talking to the Viet Minh too cordially for other politicians' taste. Viet Minh agents are hard at work almost everywhere; evacuees from Tonking are telling tales of woe on arrival in the south, while those who have chosen to remain in the north seek to make their peace with Ho Chi Minh in good time; and both the Viet Minh and the Vietnamese armies appear to be suffering large-scale desertions.

Even in French quarters there is little clarity as to future intentions. Admittedly, General Ely announced this week that France's policy was one of both complete independence and complete support for the Vietnam state; he spoke of a final transfer of power by the end of the year, and of the building up of a Vietnamese army strong enough to permit the withdrawal of most of the French expeditionary corps. The general also assured the country that France had no intention of treating Ho Chi Minh's regime as equal in stature to the government in Saigon, which remained the legal government of Vietnam. But many observers were less interested in General Ely's statements than in the movements of M. Sainteny, the French representative lately sent to establish contact with the Viet Minh. It now appears that M. Sainteny is to return to Paris for fresh consultations before paying any personal visit to the Communist headquarters. Neither the Saigon politicians nor the hopeful businessmen who want to hold on in Hanoi and Haiphong have as yet any real inkling of his powers or prospects.

Frothblowers in Canton

IN the days when members of the Labour party rejected peaceful co-existence with Falangists, Fascists and Nazis there was a well-known saloon-bar chorus—known as the frothblowers' anthem—that had the refrain "The more we are together the merrier we shall be." Now Mr Morgan Phillips, of all people, has revived it for political use during his visit to the Soviet Union and China. In a statement that he recorded for Moscow radio to broadcast to this country on August 12th he said:



> I believe that if people everywhere see each other in their homes, in their factories, in their mines and elsewhere we will see that we all belong in fact to one great happy family. At least, it is one family; let us try and make it happy.

Similar sentiments, if less convivial in tone, were expressed in April 1951 when Mr Herbert Morrison made his first public speech as Foreign Secretary. He declared then that most problems could be settled by getting around a table, only to find, for example, that Dr Mossadegh could not be made to see reason even in the comfort of his bed. Why is it that some Labour politicians find it so difficult to maintain a consistently realistic and unsentimental view of foreign affairs?

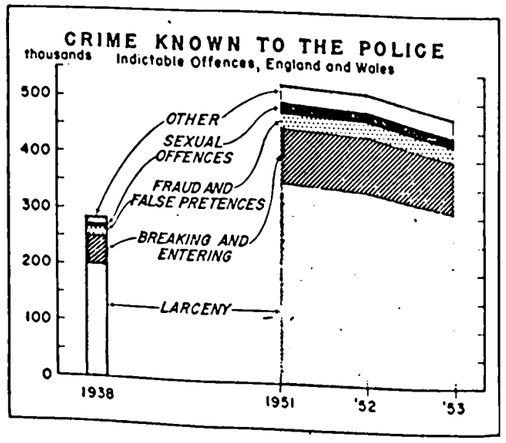
There was, perhaps, some excuse for optimistic statements in Moscow, where foreigners have found a more friendly spirit than for a long time past. But what excuse can Mr Morgan Phillips proffer for the tone of his parting press conference in Canton? He was bound to express quite genuine gratitude for the courtesy and patience shown to the Labour delegation by the highest in Peking, who had refused to have any serious dealings with the accredited British representative. He was entitled to express admiration for the effort to modernise China and a wish that its self-imposed isolation should come to an end. But he was not bound to leave his audience of journalists with the impression that only "great ideological differences" separate the new China from the democracies of the West; nor would it have been grossly discourteous to remind the Chinese that British friendship with the United States transcends all the differences that Mao Tse-tung has tried to exploit. Communist visitors to this country never apologise for their special loyalties, and would be regarded as either naïve or dishonest if they did. Mr Morgan Phillips missed an opportunity, which is unlikely to recur, to speak bluntly about the real differences between people's democracy and parliamentary democracy. Perhaps he will be more forthright in Japan, where there is at least some sincere attempt to imitate British models.

Observers will be Obstructed

THE Swiss and Swedish representatives on the Korean Armistice Commission have decided to return home shortly from what they have described as their "abortive mission." The relative degree of success obtained by the

special commission under Indian chairmanship for dealing with the repatriation of prisoners of war—even though the Communists to the very end objected to the release of the prisoners who refused repatriation—has diverted attention from the measures taken on the Communist side to prevent the Commission from performing the functions assigned under the terms of the truce in Korea. It is composed of representatives from Switzerland, Sweden, Poland and Czechoslovakia, and it is supposed to assure itself by direct observation that both sides are honouring their obligation not to reinforce their strength in men, material and installations while the truce is in force.

In the United Nations zone the Commission has been given all facilities for carrying out its task ; but in North Korea its movements have been so restricted by military regulations that it has been impossible for it to discover whether the truce terms are being kept or not. It is believed that the Communists have in fact built up new stocks of munitions and supplies since the armistice was concluded. In any case the present situation means that the Czech and Polish delegates are free to observe everything in South Korea and report it to Pyongyang, while North Korea is covered with a mantle of concealment, as if the war were still going on. In the circumstances it is felt that there is little point in having an Armistice Commission at all, and the Swiss and Swedish delegates, who have done their best to carry out their duty as neutrals, now desire only to bring their mission to an end as soon as possible.

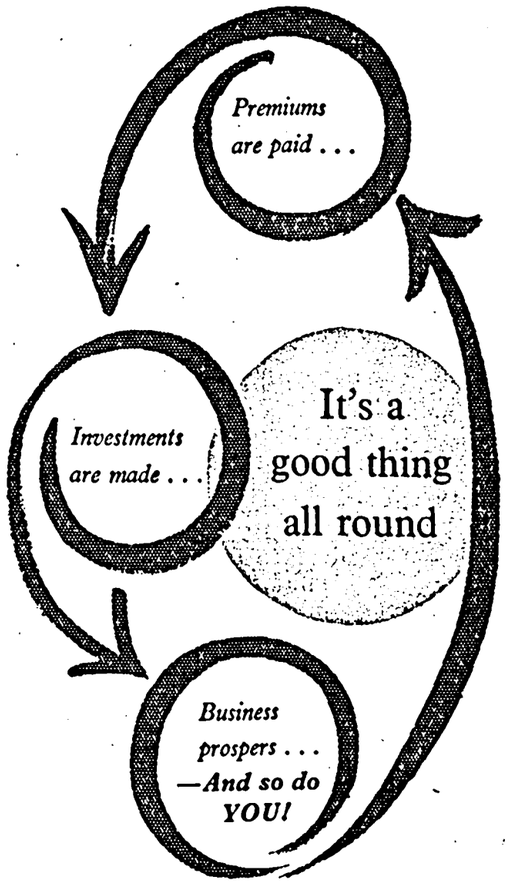


The United Nations command in Korea is not unduly perturbed about any strengthening of the Communist military position there, for it holds the view that the maintenance of peace there ultimately depends not so much on the local relation of forces as on Peking's knowledge that any surprise attack would now bring direct retaliation against China. The obstruction of the Armistice Commission's work is, however, a symptom very ominous for the future elsewhere ; the settlement made at Geneva for Indo-China depends on a neutral commission's observation of the performance of undertakings which are not only military, but also political, and much more complex than those involved in Korea. Unless neutral observers are to have more scope in North Vietnam than they have had in North Korea, the Indo-China agreement will soon become unworkable.

The Age of Crime

THERE are encouraging signs that the crime wave is receding. In 1953, for the second year in succession, there was a fall in the number of indictable offences, just under half of which were "cleared up." It is satisfactory that this fall should have been principally due to there being fewer juvenile offenders, particularly in the 8-14 age group. And as the favourite juvenile crime is "breaking and entering," it was this offence that showed the greatest reduction, with larceny second. But two-thirds of all the breaking and entering was still perpetrated by children under 17.

Some interesting comparisons can be made between male and female delinquency. Women are infinitely more law abiding: only 15,000 of them were guilty of indictable offences, compared with 100,000 men—76 females for every 100,000 aged 8 and over, compared with 549 out of every 100,000 males. The most criminal ages for males are the 'teens, especially 13 and 14 ; in 1953, two out of every 100 boys of these ages were found guilty of an indictable offence. With girls, however, the criminal ages were 16 and 17—although even then the proportion of offenders was only 0.2 per cent of each of these age groups. Both sexes settle down to a comparatively blameless old age.



Despite the general reduction of indictable offences, some types of crime increased. There were more cases of violence against the person ; and those who bewail the increase of

homosexuality should be equally concerned about the even bigger increase in rape and other offences against females, which were nearly four times as numerous as in the average of the years 1930-39. This startling increase will not fall directly within the purview of the official committee that has just been set up to inquire into the law and practice relating to homosexuality and prostitution ; but it forms a part of the background that the committee should not ignore.

Check to the Tribunals

THE Minister of Agriculture has moved swiftly to remedy some of the defects revealed by the Woollett case, which followed so disconcertingly on the heels of the scandal of Crichel Down. In that case, it will be remembered, the High Court declared that certain proceedings before a Land Tribunal were abortive because the Tribunal's members had not been properly appointed. New statutory instruments that were issued this week will effect two changes in these tribunals. First, questions of law that arise in any matter before a tribunal must now be referred to the High Court, should either party in the proceedings so require or should the High Court itself so direct. Secondly, the method of appointing the members of these tribunals is to be changed. At present, the chairman is appointed by the Lord Chancellor, the two other members by the Minister. In future, the two other

BABAÇÚ

Babaçú oil is but one of many curious commodities to be observed on the list of Britain's imports from Brazil. Its uses are perhaps less exotic than its name suggests, for the oil from the nut of the babaçú palm is one of the raw materials from which soap and certain foodstuffs can be made. Although it is not among the most important products of Latin America, you will find babaçú mentioned in the commodity market reports in the *Fortnightly Review*, published by the Bank of London and South America.

This publication is an invaluable guide for all who wish to enter Latin American markets, whether as buyers or as sellers, for it summarizes the latest reports on trading trends, import regulations and exchange control, received from our 53 branches in South and Central America. We shall be glad to send you a specimen copy, on application to :—

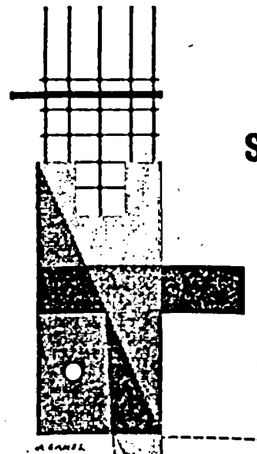
Have you a comfortable seat on the board?



Can you concentrate on the meeting or are you numb with discomfort? A call to Peter Catesby's staff of furnishers and interior decorators will soon put the matter right. Better chairs. Table at the right height. Carpet thick enough to cushion your feet and a restful colour for the walls. Result: perpetual comfort for all in the boardroom. Catesbys have a gift for transforming the glum pedestrian room into a light, airy, efficient place where the board meetings become a pleasure and you can get down to business without distractions. Why not raise the question at your next meeting?

members will be appointed by the chairman; and will be selected from panels of names drawn up by the Lord Chancellor, from lists put forward to him by representative bodies.

The decision to give a right of reference to the High Court about points of law is obviously a step in the right direction. Points of law may not arise very frequently; but the fact that the High Court is now given power to intervene if they do should help to restore confidence in the tribunals themselves, among those whose interests are completely subject to the tribunal's decision. But in the long run the decision to give greater responsibility to the Lord Chancellor in the appointments to the tribunals may be the more important. It will give at least one set of administrative tribunals a greater weight of independence of mind. It is the dominance of the Minister, himself an interested party, that is the root cause of the public fear of these bodies. What is being done in the case of Land Tribunals can be applied equally well, some day, throughout the whole network of ministerial bodies. May that day be speeded.

Rather More Irishmen

OUR correspondent in Dublin writes: In 1948 the Irish government appointed a commission of inquiry into emigration and population trends. It is surprising that no previous investigation had been made in a country where emigration is an institution and commissions of inquiry so common. Few things have influenced economic thinking and aspirations in Ireland more deeply than the fact that the population declined uninterruptedly for a full century after the famine of the 1840s. Emigration was the most obvious agent of this decline; and, before 1921, the policy of Sinn Fein relied heavily on industrialisation to stem the flow.

It is therefore a point of some political significance that between 1946 and 1951 the population increased, although only slightly, for the first time since the famine. This was not, however, the result of any decrease in emigration—which indeed was proportionately greater than at any time since the exceptional inter-censal period 1911-26. It was due to a birth-rate that is rather higher than the average in Western Europe (21.9 per 1,000 in 1941-50), which is keeping the net reproduction rate well above unity. This high birth-rate is the result of a very high fertility of marriage accompanied by a fantastically low marriage rate (only about one-third of that in the United Kingdom). The late age at marriage, and the high proportions who remain unmarried, still constitute a grave social problem.

In the new circumstances, emigration may cease to be an agent of population decline; but it is not likely to disappear so long as there is freedom of movement across the Atlantic and the Irish Sea. That freedom is impressively illustrated by the manner in which, in the early 1930s, emigration turned from its traditional course towards the United States and flowed instead to Great Britain. In 1931 there were 924,000 persons of Irish birth living in the United States and 505,000 in Great Britain. By 1940 the number in the United States had fallen to 678,000; and by 1951 the figure for Great Britain had risen to 722,000. The Irish have had what other peoples might call the good fortune to have access to two great labour markets. Nevertheless the commission pointed out that the Irish economy could, if developed, support a rather larger population than it does today. To that extent the report encourages the industrialisers; but the problem is as much a matter of skills and organisation as of capital. In the meantime, emigration permits those who remain in Ireland to enjoy a leisured if anachronistic way of life.

Aftermath in Brazil

PRESIDENT VARGAS has been laid to rest in his native city of Sao Borja. Even in death he aroused fierce passions and the army and police have had to quell pro-Vargas riots in many places. But the country has returned quickly to a sense of sober anxiety in the face of economic crisis. Brazil's foreign payment situation is critical with immediate debts of $800 million and longer term debts of $1,200 million outstanding. If the dollar crisis is not to become desperate, Brazil must sell some 10 million bags of coffee in the next three months. The new finance minister, Sr Guden, has already stated that the coffee problem is his most pressing concern. In order to stimulate exports, particularly to the United States,

Harmful Wine Duties

In 1825 the duties were reduced to 7s. 3d. on French wines per imperial gallon, and 4s. 10d. on other wines, except Cape wine, the duty on which was 2s. 5d., and there being at that period a great flush of prosperity in the land, the consumption increased rapidly for a short time, and rose between 1824-6 to 6,366,025 gallons, as against 4,712,981 gallons in 1821-3. The population had then increased to 22,300,000, and this increase gave only a consumption of .285 of a gallon per head, as against .221 of a gallon at the previous period of the lowest consumption. In 1831 the duty was further reduced to 5s. 6d. per imperial gallon; but the consumption of wine since has not kept pace with the increase of population. . . . So that while hardly another species of import—certainly no other species of beverage—has declined, and almost every one has increased wonderfully—particularly coffee and tea, which have fallen very much in price, while the duty has been reduced—wine has declined, and gone comparatively out of use. The old custom of taking away three bottles of port from table, or a gallon of claret, has happily died out, but it has not been followed by the diffusion of a moderate consumption of wine, so advantageous to the health of the people, to the extension of trade with the neighbouring countries, and to the general prosperity. Yet there is evidence in the comparatively large consumption of wine before 1800, and in the extension of the consumption on the first reduction of duty in 1825, that the people only require to procure wine as cheap in comparison as other beverages to use with moderation considerable quantities. There no longer prevails among us those habits of intoxication which might make a careful though prudish and mistaken legislator averse from reducing a duty on wine, and there is no longer a reason, either moral or financial, which should prevent a still further reduction or abolition of the duty.

The Economist
September 2, 1854

shippers are being offered a bonus consisting of the difference between the official and the Rio free rate of the currency equivalent to 20 per cent of the value of their shipment.

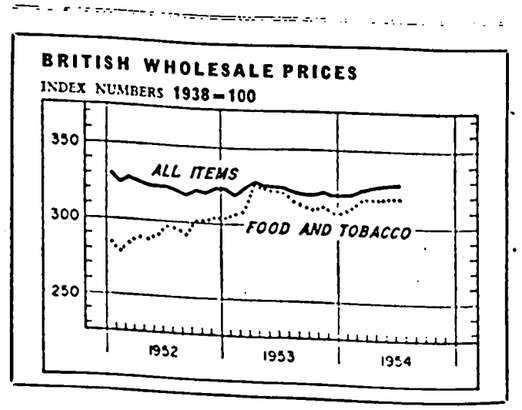
The real question is whether Brazil can improve her balance of trade situation without aggravating even further the inflation bequeathed by the Vargas regime. President Vargas doubled and sometimes trebled wages on the lower end of the scale without trying to keep prices down. The government of President Cafe Filho must introduce a period of economic austerity without incurring major unrest among the poorer classes. The nomination of Senator Guimaraes, a man of known radical inclinations, as Labour Minister is intended specifically to placate the followers of Vargas. Other portfolios, however, have had to be given to men more or less associated with the military in its anti-Vargas coup.

The political and economic balance in Brazil remains precarious. Everything depends on whether or not Brazil's creditors will help and stimulate economic development. The Germans have been quick to grasp their opportunity, as have been certain American interests such as those of Mr Kaiser. The British interest should not be forgotten, particularly in view of the fact that Sr. Guden is an old and trusted friend of this country.

Petrov in the Shade

THE Petrov inquiry has gone off on an unexpected and unfortunate tack. In its opening stages it did not spring any particular surprises; but, in spite of some efforts by the Labour Opposition to make political capital out of it, it promised to give the Australian public an illuminating picture of the whole range of Soviet undercover activities in their country—from the organisation of a fifth column to operate in time of war to the collection of tittle-tattle about obscure informers.

In recent weeks, however, it has concentrated on one particular point—the authenticity and authorship of Document J, one of the papers handed by Petrov to the Australian security service. In the process the Royal Commission has become deeply and most regrettably embroiled in Australian politics. Moreover, the doubt cast on part of the evidence presented by the chief witness naturally extends to everything else that he has told the commission; from this state of affairs the Communists are clearly the chief gainers.



Some of the miscellaneous information and gossip in Document J—it does not apparently include any defence secrets—is alleged to have been supplied by two members of the staff of Dr Evatt, the leader of the Labour party: and it was the latter's decision to undertake the legal defence of these two men, and the manner in which he is carrying out this task, that has turned the inquiry into a first-class political issue. Dr Evatt's decision, which was taken without consultation with his Labour party colleagues, has met with a very mixed reception within an already divided party; and if he fails to win his case, he may find that he has given his enemies fatal ammunition with which to shoot him down from the leadership of his party.

Moreover—and this is more important—Dr Evatt is not content to try to prove that Document J was not entirely the work of an Australian Communist journalist, as Petrov maintains, but was really concocted by the latter in order to increase his value to the Australian security service. If Dr Evatt believes this to be true, it is clearly his duty to do his best to prove it. But he goes further and maintains that the document is part of a deliberate conspiracy to injure him as leader of the Opposition by suggesting that members of his staff had been informers to the Russians. This is thrusting the Royal Commission into the political arena with a vengeance, and it is difficult to see how Dr Evatt's legal duty to his clients makes such action necessary.

Motorists in the Courts

IT might be expected that with the increase in the number of vehicles on the roads the number of prosecutions for motoring offences would rise steadily also. It might also be expected that as the congestion on the roads gets worse, with scarcely any provision of extra parking places, there would be a steady increase in prosecutions for obstruction and parking offences.

The facts, however, are otherwise. In 1953 307,000 were found guilty of motoring offences; this suggests that nearly one out of every twenty people running private cars was brought before the courts last year, but the number was still 12,000 fewer than in 1952, although 36,000 more than in 1950. Just under 53,000 of the total were parking or obstruction offences. Cases of reckless or careless driving, at 28,700, have risen by 5,000 since 1950. Driving under the influence of drink was found in 2,490 cases, having risen year by year from 2,261 in 1950. But almost one out of every three people charged with drunkenness was acquitted in 1953, compared with only one in five in 1950. Fines were the usual punishment for this offence; only 155 people went to prison without the option of a fine. This may seem to indicate undue leniency towards people who so readily risk the lives of others. But it no doubt reflects the opinion of the courts, supported by the highest medical authority, that it is only rarely that an accident can be positively attributed to the driver having taken alcohol. The commonest form of motoring offence is still speeding in built-up areas, which was responsible for more than a fifth of the £690,000 extracted from motorists by way of fines last year.

Letters to the Editor

It Need Not Happen

SIR—In your comments last week you drew attention to the fact that a statement attributed to Dr Adenauer in our pamphlet, *It Need Not Happen*, has since been repudiated by the German Chancellor. Commenting on this, you accuse my colleagues and myself of telling "a straight though undeliberate lie." In order that your readers may judge fairly whether your charge of lying is justified, we should like to state:

(1) The attribution of these words to Dr Adenauer was first made by M. Jules Moch in the French Assembly, was printed in more than one British newspaper (without repudiation) and occurs in Mr James Warburg's book, *Germany Key to Peace*, from which we took it.

(2) When our pamphlet was called to his notice, Dr Adenauer—for the first time, as far as we know—denied that he had used the words. The statement on his behalf, drafted by his personal secretary, was printed as prominently as possible on the front page of *Tribune*, and instructions were at once given that the necessary correction should be made when the pamphlet is next reprinted.

As the only two signatories now in London, we accept Dr Adenauer's statement on behalf of our colleagues, and in the new edition the misquotation will be replaced by the words he used on the night of September 7, 1953, to sum up the significance of his electoral victory. They run:

> Instead of reunification, let us rather talk about liberation, liberation of our brethren in slavery in the East. That is our aim, and that we shall achieve—but only with outside help.

Dr Adenauer has been challenged to repudiate these words also. So far there has been no reply.—Yours faithfully,

R. H. S. CROSSMAN
HAROLD WILSON

House of Commons

Shapeless Europe

SIR—In your article of August 28th you say that the supreme object of allied policy in Europe is "to win Germany on to the western side."

May I be permitted to disagree with you. Surely, the main object of allied policy should be to preserve peace and to strive to make another war impossible. This present Anglo-American policy to insist on German participation in western European defence appears to me to be almost impossible to carry out in face of French objections. The French, and not the British and certainly not the Americans, have far more right to be heard on this question. France, and not the others, except Russia, has been overrun several times by German armies, and she suffered German military occupation. A country, like Britain, that has never suffered invasion by a brutal invader, cannot understand what military invasion really means, the horrors, the sufferings, and the anguish, of the invaded country. To me it is the most astounding thing that there is a single Frenchman who is willing to see a rearmed Germany. Lord Russell's book will certainly increase British reluctance to place arms in the hands of a nation which has perpetrated such incredible brutalities and murders. Of course, the German nation as a whole is fully responsible for what was done during both world wars.

Why should such a fuss be made about the Germans? Pro-Germanism seems to be a special disease amongst Anglo Americans. President Roosevelt certainly aimed at a Europe with a totally disarmed Germany. He foresaw a neutralised Germany, and he was willing to co-operate with Russia. But his successors have completely reversed the policy of that great man. So why not revert to Roosevelt's policy and make a really serious approach to Russia? Nehru has said that it is either co-existence, or war. The real trouble is that America does not understand what war means, and many people believe that American policy is warlike policy.—Yours faithfully,

AUGUSTUS VINCENT

London, S.W.1

Truce in Babel

SIR—Your note of August 14th, to my mind, presents the problem of broadcasts to the countries of the Soviet bloc in reverse.

First, it tries to create the impression that there is a certain comparability in Soviet broadcasts to the West and Western broadcasts to the subjugated countries, and at the same time accuses the latter of "going on punching where it hurts." One could say with great accuracy that the informative value of Soviet broadcasts to the West is next to nothing. On the other hand, as one knowing well the operations of Radio Free Europe, Voice of America, the BBC, etc., I am in a position to say that although these broadcasts are prepared in a propaganda style, their contents serve the truth. One should remember that at present the West has practically no means of informing people behind the Iron Curtain other than the radio. Thus, these broadcasts represent above all the good service of informing people about the situation in the West, and in addition give them the opinions of which they are deprived.

While in the West nobody, or practically nobody, listens to the Soviet radio—in Poland, Czechoslovakia and even in the Soviet Union, Western broadcasts are an everyday need. They keep up morale, bring at least a vague hope and help to keep the people within the sphere of European culture.

Furthermore, it creates a false picture to say that Moscow, through its broadcasts, gives valuable directives to the Communists working in the free world. In fact, Moscow does not have to resort to the medium of radio; it sends its instructions through secret channels of Communist parties in the West, and distributes them via the practically unrestricted Communist press or the many fellow-traveller organisations.

I felt particularly worried about the suggestion in your article that the initiative for the "truce in the air" should come first from the West, in the name of a policy of co-existence. Co-existence is but a current political slogan which is currently maintained by Soviet policy, but will undoubtedly be abandoned as soon as it has served its purpose. For the West to accept this slogan as a basis for some permanent re-orientation of its policy, would be equivalent to building on shifting sands. It would be most unwise, in the name of such a slogan, to deprive the subjugated nations of the remaining links between them and the free world.—Yours faithfully,

BOLESLAW WIERZBIANSKI

International Federation of Free Journalists, London, W.2

[It was not suggested that all broadcasts to Communist-controlled countries should stop. It was proposed that Communist governments should be invited to restrict their broadcasting abroad to news and entertainment and that western governments should cease encouraging behind the iron curtain hopes that are in contradiction to the declared aims of American and British policy.—EDITOR.]

Needless Scarecrow

SIR—With reference to your article of August 21st, scratch the surface of its polished prose and what do you find—an ugly threat to the Labour party. In effect you say to the Labour party: "When you are democratically elected to power for goodness sake do not try and practice what you preach or else the business interests will sabotage your programme." Instead of reprimanding the business interests for their lack of patriotism and obvious dislike for the democratic process you appear to sympathise with them. Indeed what a lesson you give in the workings of democracy!

It is the old story of a capitalist minority using every undemocratic device to stall socialism. Before the war they were once led by Hitler and Mussolini. Now *The Economist* does its best.—Yours faithfully,

Manchester W. E. BAUGH

Bureaucrats in the Back Room

GOVERNMENT AND SCIENCE.
By Don K. Price.
New York University Press. 212 pages. $3.75.

CAN a society in which more than half the scientific research that goes on is paid for by the government and devoted broadly to defence remain, in the long run, free, recognisably capitalist, and progressive? And what role can science be expected to play in the government of such a society? The United States and Britain, today, fall into this category as well as Russia—where the problems of state patronage of science, though probably also considerable, differ somewhat. In America and Britain these questions of principle have often, and sometimes dramatically, been posed, but seldom seriously discussed. Mr Price's book is a useful American contribution to such discussion.

In 1952 the Federal Government provided about $1,640 million out of the $2,930 million spent on research and development in the United States; in Britain the proportion financed by the state was probably of the same order. The extent to which research has become dependent upon state support is more generally appreciated in America than here and it has there aroused anxiety among critics of business, businessmen, and scientists.

The first group of American critics has complained that under this system business—and particularly big business—profits from technological advances paid for by the government, notably in "by-products" from defence research; the vexed question of patent rights in American nuclear engineering is a current example. Some businessmen, on the other hand, have complained that this government finance, provided from taxes to which they contribute heavily, is applied to introduce an expensive and inefficient form of administrative control over the research done in their laboratories. Many scientists have complained that the security measures necessary in most government-financed research, and hence in a growing proportion of all research, hinder the free cross-fertilisation necessary to effective scientific progress; and that the bias towards applied science inherent in defence research may starve fundamental research of brains and resources.

All three groups of critics, finally, might join in questioning whether this concentration upon defence research may not prejudice progress in fields they would consider economically or scientifically more "natural." It is not easy for the Western-educated citizen to get used to the pre-emption for defence of about 10 per cent of the national product and about 50 per cent of the national research effort, as a fact of life in the economy he lives in now.

Those absolute proportions of government influence on research may now be contracting slightly, but they are likely to remain very substantial. Mr Price, drawing upon experience gained in the Bureau of the Budget and the Department of Defense, is confident that Western societies can learn to live with some such degree of government financing of technological progress, since they must; and that governments and their scientists can learn to live sensibly together. He is concerned in this book to suggest how such a system of mixed responsibility can be operated successfully in American administrative and political conditions. These conditions, and the traditional relation between American science and government, as he emphasises, differ radically from those in Britain; and his specific proposals, therefore, are of only indirect interest over here. For British readers, the book's main interest lies in the sanguine and salty candour with which this American administrator faces problems that exist here too, in essentials if not in form; but which are seldom practically discussed in public.

Both countries, it may be said, lack the kind of professional administrator of science whom Mr Price believes is becoming essential, and whose qualifications he roughs out; but the conditions of civil service from which such administrators would have to come differ utterly. Mr Price, incidentally, holds that the British administrative civil servant is "probably a great deal better than we shall ever get if we do no better than we have been doing lately"; but he wants something less "profoundly conservative" to handle science, and thinks America may be better placed than Britain to develop it.

One World?

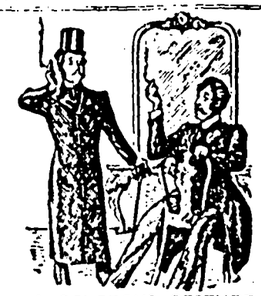
HUNGRY PEOPLE AND EMPTY LANDS.
By S. Chandrasekhar.
Allen and Unwin. 306 pages. 18s.

THIS book, the first full-length contribution by an Asian expert to a debate in which Asia is most urgently concerned, is at once a portent and a disappointment. It combines the Asian viewpoint with Western methods of thought and with one characteristically Western value judgment—that which sets up individual welfare as the supreme standard of policy. It is the voice of an equal, who finds it unnecessary to whine, screech, bluster, or make schoolboy debating points. In short, it demonstrates a conclusive victory over that obstinate and insidious political trauma that so commonly afflicts—even long after its cause has passed—citizens of once-subject nations.

So far, so good; when one turns from exposition to conclusion the portent becomes less comfortable. The voice of the equal, objectively considering the world situation and its requirements, utters unspeakable things—things quite as unwelcome to Western ears as, to the ancestor-worshipping Chinese or to his own conservative countrymen, his urgent injunctions against uncontrolled breeding. It asks for equality before the immigration laws, and for a supranational migration authority. It attacks not merely "racial" discrimination but also the taboo on racial intermarriage, holding up Brazil as a model to be emulated. It lists those areas—such as Northern Australia, tropical South America, New Guinea—which offer a living to the Asian peasant and to him only, and stakes a moral claim to them. "Hungry People and Empty Lands" constitutes, in fact, just such a challenge to Western assumptions about the human future as was foretold in Lord Boyd Orr's "The White Man's Dilemma." It is unlikely to stand alone.

This is, of course, no reason for finding it disappointing. The challenge is there, implicit in the adult nationhood of Asia, and the sooner Western opinion begins to devote sustained and rational thought to it the better. The disappointing feature is a surprising one; amateurishness in the business of authorship. The statistical matter is often far behind the times and on at least one occasion flatly contradicted in the text. Such vitally relevant evidence as that provided in Professor Dudley Stamp's "Our Underdeveloped Earth" is left unmentioned. The level of argument fluctuates between the closely reasoned and well documented, the speculative, and the superficial; one envisages Dr Chandrasekhar playing simultaneous chess, at three appropriate standards, against a championship contender, a respectable member of a suburban club, and a tyro—only all these games are paradoxically conducted on the same board. Add to these shortcomings an occasional awkwardness of style or uncertainty of idiom (matters in which the average, linguistically paralysed English reader is unreasonably censorious) and a rather unpleasing typography, and there is some risk that "Hungry People and Empty Lands" may be dismissed as one more cranky addition to the literature of a subject notoriously attractive to cranks.

That would be a great mistake. One may disagree with Dr Chandrasekhar—



A gracious welcome to your guests

on the relative importance of this or that factor, on the significance of certain data, on political possibilities, and (quite apart from any nonsense about "racial superiority") on the merits of the universal melting pot. One cannot neglect him. Defects and all, his work is at once a serious contribution to the demographic debate and a milestone on the difficult road to mutual racial understanding.

Successful Diplomat

AMBASSADORS AND SECRET AGENTS.
By Alfred Cobban. *Cape.* 255 pages. 21s.

THIS is an interesting and important book with a curiously misleading title. In fact it is an account of the doings of James Harris, first Earl of Malmesbury, when he was British Minister at the Hague, 1784-88. That does not mean it is merely a piece of diplomatic history of the conventional sort. Dr Cobban's chief concern has been to set out in minute detail what happened by carefully fitting together evidence from English, French and Dutch sources. In so doing he is able to show vividly how late eighteenth century diplomacy actually worked. He also demonstrates convincingly that chance plays a much greater part in such matters than we are usually disposed to admit, and that clear thinking and intelligent opportunism have much to do with the making of successful policy. Moreover, if, as can be plausibly argued, the real nature of international dealings has not greatly changed since Harris's time, then the book has a moral for the present day.

Indeed the situation that faced Harris in the United Provinces has an oddly modern look. It was the familiar story of the great powers meddling in a domestic quarrel, and so putting the peace of Europe in jeopardy. The Stadtholder, the feeble and vacillating William V, was at loggerheads with the republican townsmen, who called themselves "Patriots" and were determined to eject the House of Orange. They enjoyed the active support of the French, scheming to make Holland their satellite, while the Prussians also had a finger in the pie, for the Princess of Orange was a niece of the ageing Frederick the Great. Britain, friendless after the American war, was, as always, very sensitive to changes in the Low Countries. Harris was therefore charged with the apparently impossible task of destroying French influence in Holland when it seemed about to triumph. However, within four years he had brought his mission to a successful conclusion.

In telling how the job was done, Dr Cobban rightly portrays Harris as a very able diplomatist. He was courageous, astute, notably well-informed, and he never misled his own government or his Dutch friends. His French and Prussian colleagues were not so scrupulous in this matter, and they had their reward. Yet after two years of strenuous effort Harris faced a situation far more menacing than it had been when he first arrived. Then, quite unexpectedly, a stupid indignity put on the Princess of Orange by the "Patriots" suddenly made Prussian intervention a real possibility. Harris now showed his true quality. He persuaded Pitt that the French would promise their friends everything, and, when the crisis came, would perform nothing; that the "Patriots" were weak and intransigent; and that Prussian suspicions of English motives could be overcome. Convinced of this, the British government worked hard to restore the Stadtholder's authority with Prussian arms. Events proved Harris right. Less than a month after the Prussians invaded Holland the "Patriot" party had collapsed, the French were eliminated and the English connection was restored.

Scientific Commentary

THE SCIENCES OF ENERGY.
By J. G. Crowther.
Frederick Muller. 271 pages. 12s. 6d.

THE popular science writer has the choice of several styles: he can instruct (or do his best to instruct); he can entertain, with amusing anecdote and imaginative analogy; he can moralise; or he can blatantly overawe, shepherding his gaping readers through a conducted tour of the marvels and mysteries of nature. Mr Crowther is too serious a writer to be guilty of the last; but in this book he provides equal measure, roughly speaking, of the others. It is described as "a commentary for the general reader on recent advances in Astronomy, Physics and Chemistry," and it may be said at once that it is a very good one—informative, readable, thought-provoking and up to date. It is no "Teach Yourself" book, and the reader need not expect to find himself transformed into an authority overnight. But such knowledge as he has already and acquires from this book will be orientated and proportioned sensibly, a deal of historical background will be filled in (Mr Crowther's history is, on the whole, quite acceptable and at times most illuminating) and he will be given considerable food for thought.

The chapters on astronomy (or rather, cosmogony, the origin and evolution of the universe) entertain perhaps more than they instruct. Cosmogony is a happy hunting ground for imaginative theorists, and it is a hopeless task for the layman to try to discern where they leave the solid ground and take off into flights of fancy. So much of one theory contradicts the next, and the events in question are so immensely remote and so immensely long ago, that one cannot help regarding cosmogony rather as a matter of rival fairy stories, and Mr Crowther's whimsical chapter headings suggest that he is a little infected with this spirit, too. But what majestic fairy tales they are. The universe begins as the mighty explosion of a primeval atom, two hundred million miles across; matter begins when time begins, and the whole future pattern is set in the first few frantic minutes; or else, as a contrast, the universe is seen as an everlasting swirling mist, continually condensing round us and drifting off out of our remotest vision. These are thrilling chapters, and if here and there Mr Crowther seems himself to be a bit at sea, who will blame him?

Physics means, of course, "The Atom," and this is taken in rather a low key. In view of Mr Crowther's tendencies in politics, it is a relief to find that the moralising is not more obtrusive. Commendably in a book of this kind, he concentrates on scientific advance, and writes off atomic power production as a mere technological sideline and a rather clumsy one at that. He suggests that our forthcoming atomic power stations, useful enough, maybe, for the time being, will be regarded by future generations as "scientific dinosaurs." Mr Crowther considers that no discoveries have been made in physics since 1938 equal in importance to those of the twenties and thirties. The most promising, that of the new "meson" family of particles, has come about, characteristically, not through the hundred million volt atom-smashers, but through the patient inspection of simple photographic plates left for a few weeks on a mountain top.

The reader is likely to gain real illumination from the chapters on the usually unglamorous subject of chemistry, and not only on the familiar subjects of "miracle fibres" and "wonder drugs." He will understand, for instance, how the Nobel Prize came to be awarded to two almost unknown young chemists, Martin and Synge, for their achievements in such an unpublicised subject as paper chromatography—"a revolution in chemical analysis." With this, with X-ray analysis and radioactive labelling of atoms, the weapons of chemical analysis are now immeasurably sharper than before. Mr Crowther describes the sort of developments on the brink of which chemistry is now poised, unquestionably the most exciting of which is the nature of life itself.

Civilised Amphibians

TREASURE DIVING HOLIDAYS.
By Jane and Barney Crile.
Collins. 256 pages. 18s.

HOW pleasant to avert one's eyes from scudding rain on the empty beach, from the wind-tormented anchorage under its leaden skies, from the gruel-and-greens landscape of holiday England, 1954, and to consider the milk-warm, coral-flowering Caribbean. How delightful to make its acquaintance in such excellent company as that of Dr and Mrs Crile and their family, who, "skin-diving" in goggles and flippers, with "Jackie Brown" air-compressors for more ambitious work, salvaged ivory from a sunken slaver, and chipped an eighteenth century cannon out of the coral; lived on lobster, octopus and turtle, and consorted on friendly terms

with barracuda, jewfish, moray eels, and an even-tempered variety of shark. (To discourage less amiable fish, they wore black tights with ferocious faces on the rear aspect.)

One and all, jointly and severally, very nearly drowned themselves, and the reader salutes not only cool-headedness and courage but a seemingly inexhaustible good temper in face of a degree of discomfort which very few, even among the tough and adventurous, would be willing to face *en famille*. (Gliding between coral-encrusted wreck-ribs, accompanied by shoals of silvery minnows, is one thing; coping with jelly-fish-itch in camp on a desert key is another.) Incidental danger and discomfort, however, make up a minor even if essential part of the Crile story, which entertainingly traces the steps from sheer physical delight in the conquest of a new element, through the hunter's and naturalist's enjoyment of marine life and the treasure-hunter's nefarious appetite, to the disinterested but still zestful curiosity of the marine antiquarian. The book is most attractively produced, with a generous allowance of entrancing underwater photographs, and if one hilarious misprint describes blonde Susan Crile as "two-headed," who cares? Its style is high-spirited, conversational, and civilised. Matter and manner together bring a refreshing tang of that real America which, like certain wines, can rarely be induced to "travel." On all counts, the young Criles are a lucky quartette.

Cottage in the Country

ENGLISH COTTAGES AND FARM-HOUSES.
By Olive Cook and Edwin Smith.
Thames and Hudson. 50 pages and 273 plates. 42s.

THIS book is a worthy successor to the publishers' "English Parish Churches," which appeared two years ago. Mr Edwin Smith's photographs are again superb. Whether he is taking a cottage living room, with pictures of royalty and Staffordshire figures jostling each other on the mantelpiece, or the inside of a barn, with the sun shining through the chinks in the roof, or a solitary farm in a moorland setting, he has spared no pains to achieve exactly the right effect.

The photographs are beautiful enough and delightful enough to speak for themselves. They do not need the somewhat ecstatic prose that Miss Cook occasionally bestows on them in her commentary. In other respects, however, her text and notes are admirable. She explains the "cruck," and "post and truss" methods of construction—with diagrams—and shows the importance of geology in the materials used for building. (A useful geological map is given.) The photographs are, in fact, grouped according to methods of construction and materials used rather than chronologically. Thus, what at first sight appears to be a haphazard arrangement turns out, on closer inspection, to have a design and purpose. The brick cottages of Kent can be contrasted with the whitewashed farms, with sturdy porches, of the Lake District, and the rough stone buildings of other parts of the north with the carefully worked stone of villages in the south and west.

Not all the places illustrated are "old world" and pleasing. The authors have been realist enough to include a mining village or two of the last century. They have not, however, given any illustrations of modern council housing. This is a pity; examples of bad rural housing schemes, and of those where an attempt has been made to conform with local tradition and style, would have provided an interesting contrast to these pictures of the past.

Shorter Notice

INTRODUCTION TO INTERNATIONAL ECONOMICS.
By Delbert A. Snider.
Richard D. Irwin, Nanewood, Illinois. 491 pages. $8.

This is a businesslike, comprehensive, well-constructed and well-produced textbook, which fills a surprisingly long-felt want. There are dozens of competent general introductions to economic theory, all of which necessarily devote a certain amount of space to international economic relations; there are money-and-banking textbooks of which the same can be said; but the student looking for something at once larger in scale than these chapters or sections and wider in scope than the special study or monograph has hitherto—particularly if he is a beginner—been poorly served. The English student is, of course, confronted with the usual disadvantages of very high price, exclusively American bibliography, and, in general, an American slant in all matters pertaining to institutions, history, and policy. He is, however, spared the equally usual penance of wrestling with the American academic style; Professor Snider writes, if not gracefully, at least as if English rather than German were his native tongue, and he has a welcome gift for putting theory into commonsense perspective. (His chapter on "Domestic Stability versus Free Trade" is especially admirable.) It is a great pity about those eight dollars.

Books Received

THE CENTURY OF TOTAL WAR.
By Raymond Aron.
Translated from the French by E. W. Dickes and O. S. Griffiths.
Derek Verschoyle. 379 pages. 25s.
The French edition of this book was reviewed in *The Economist* on November 17, 1951.

A BIBLIOGRAPHICAL DICTIONARY OF ENGLISH ARCHITECTS 1660-1840.
By H. M. Colvin.
John Murray. 835 pages. 70s.
This book consists of a detailed list of architects and master-builders, their lives and works, both built and written. There are full cross indexes of patrons and places.

BALANCE SHEETS AND THE LENDING BANKER: *A New Assessment of Accounts and Accounting Ratios in Relation to Bank Advances.*
By J. H. Clemens.
Second edition, revised and enlarged.
Europa Publications. 271 pages. 20s.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Trade Policy Marks Time

Washington, D.C.

IT is possible to argue for hours about the achievements of the Republican Administration and of the Eighty-third Congress in most fields without persuading supporters of the government to admit that much was wrong, or the opposition to admit that substantial progress has been made in some directions in the last two years. But when the subject of foreign economic policy comes up Republicans—or, at least, those on the Eisenhower wing of the party—begin to wear a hunted look; they usually express some pious hopes for next year and change the subject as quickly as possible.

When the President delivered his "Treasurer's Report" to the nation last Monday week, he promised that foreign trade would be one of the big jobs for the next session. In his own words,

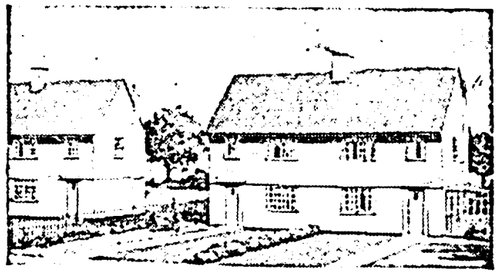
> reciprocal trade is now under earnest study and will be taken up by the next Congress. We got another year—as a result of the Randall Report—in which to study certain features of this whole business so that our friends could, with us, make a living through profitable trade.

And a few days later Mr Eisenhower wrote to Mr Harry Bullis, the chairman of General Mills Inc and one of the most persistent fighters for freer trade, to assure him that it was his "present intention to give high priority to progress in this whole field in planning for next year's legislative programme."

All this would be most encouraging were it not for the history of the last two years which suggested to Mr Frederic Collins, the Washington correspondent of the *Providence Journal*, that "the era of liberalised trade policy is always going to begin tomorrow and tomorrow never comes" and reminded him of the Chinese saying that "there is a great deal of noise on the staircase, but no one comes down." What has come down so far is, indeed, singularly unimpressive in view of the President's emphasis, in his State of the Union message in January, on the need for action this year.

If Mr Clarence Randall were not so loyal an Eisenhower supporter, he might express some resentment at the idea that his months of work did no more than provide another year in which to study "certain features of this whole business," a business that has been studied and studied since the end of the war until every last feature is familiar. But, in fact, because he attempted the impossible task of trying to reconcile completely opposite points of view, the report of his committee gave a lot of ground that supporters of a liberal trade policy had fought over and won and did not expect to have to try to recapture at this late date.

When the President admitted defeat on May 21st and announced that he had reduced his demands on Congress to a simple one-year extension of the Reciprocal Trade Agreements Act, he spoke of all that could be done by administrative action. The two most significant examples of administrative action since that time have been the award of a contract for generators for the famous Chief Joseph Dam to an American firm, despite a lower English bid, and the increase of the tariff on Swiss watches.



★

The Swiss watch decision was obviously reached in ignorance of its importance, as a test case, in the eyes of the rest of the world, and it has been hinted that it may be reversed as soon as it has achieved its purpose of getting Senator Saltonstall re-elected in Massachusetts, a watch-manufacturing centre. A similar desire to help Republican candidates in the mountain states is presumably involved in the lead and zinc decision. It is possible to doubt whether an increase in the stockpile of these metals is vitally necessary at the moment except for political purposes. But the decision to buy for the future, and thereby make the country as a whole pay for what is an aspect of national policy, rather than to raise tariffs and give a small group benefits at the expense of national policy, is one that deserves the praise, and the sighs of relief, that it has received.

However, while the Administration has, as the *Journal of Commerce* thinks, at last begun to show signs that it is coming to the end of the long detour that has taken it far afield from its broader foreign trade objectives, Congress has gone on its way undeterred by any reference to broader policy. After the President had denied the Tariff Commission's recommendation for a higher tariff on fish fillets, Congress, in a rider attached to a Bill eliminating the duty on crude silicon, increased the duty on "fish sticks"—a new invention of the frozen food trade which uses, and has enormously increased the sale of, fish fillets.

Being in a fishy mood, Congress then passed a law to ensure that proprietors of restaurants who sold alien, un-American trout should admit the horrible fact on notices hung on the wall. During the debate on this measure it transpired that

> various restaurants throughout the country are advertising on their menus "Rocky Mountain Trout" and "Eastern Brook Trout" when actually the trout they serve is foreign produced and imported into the United States.

The BIG Yellow 'CATS'

ARE PURRING BEFORE THE HEARTH

Before new hearths and homes can arise, row upon row, Caterpillar earth-movers must get to work. On building sites up and down the country, where soon there will be houses, hospitals, offices, schools and factories, you can see the distinctive yellow of the 'Cats' (world-famous nickname for these world-famous machines) and hear the powerful, purposeful throb of their engines. These are busy times for the 'Cats', speedily doing the spadework for Britain's building developments.

a TI landscape

reveals an unexpected fact: today we live TI. The cyclist rides TI: the motorist drives with TI's help. The mother cooks TI: baby's bath water is heated TI. The farmer milks with TI and the businessman conducts his affairs in a TI setting.

Industry's calls on TI take many forms. It may be precision tubes in one of thousands of shapes and sizes, or steel, or wrought aluminium; it may be electrical equipment, rolling mills, or mechanical handling plant, or machine tools...so intricately is TI woven into the industrial pattern that nearly every constructional or engineering enterprise owes something, large or small, to TI.

Each of TI's many manufacturing companies has a mind and ideas of its own, but behind all of them are the combined skills and experiences of the many trades TI follows.

TUBE INVESTMENTS LIMITED
THE ADELPHI, LONDON, W.C.2 TRAFALGAR 8633

The chief culprits in this nefarious trade appear to be the Canadians, who were probably suffering, until now, under the delusion that they had some Rocky Mountains, not to mention an East and brooks that run through it. One Congressman suggested an amendment to protect Virginia ham, saying that

> you order Virginia ham thinking you are getting a nice piece of Virginia ham, but when you get it, you know it never got any nearer to Virginia than a week before when it was murdered in Chicago, smoked, and sent down to Virginia.

The sponsor of the trout Bill, Mr Allen of Illinois, was not amused.

★

Of the minor measures requested by the President as a token of good faith for the future and as a small first instalment of the Randall recommendations, almost none got through. The Jenkins Bill, which was to simplify the procedure for valuation of imports, died; the provision of tax incentives to encourage foreign investment was removed from the tax revision Bill; the Administration's Bill to modify the Buy American Act was never introduced; the Bill to increase, from $500 to $1,000, the value of goods which returning tourists could bring into the country duty-free was shelved; and the clause in the foreign aid Bill, designed to encourage foreign investments by insuring them against loss by war or revolution, was taken out by the Senate. The only success came with the Byrnes Bill, which ordered the Tariff Commission to make a study of the whole tariff structure, and, by the time it had passed, the President's right to act on the commission's recommendations without going back to Congress had been eliminated.

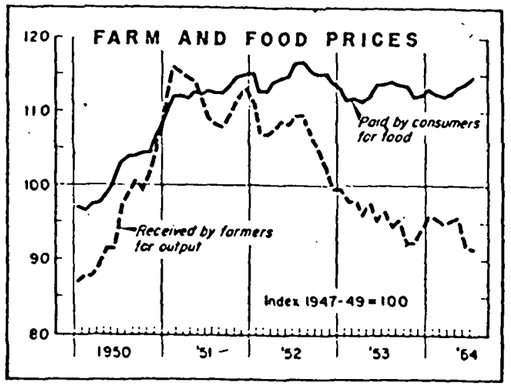
The President, therefore, has not been allowed to give the rest of the world any of the crumbs he promised. Nevertheless, the United States seems to be preparing to meet the signatories of the General Agreements on Tariffs and Trade at Geneva as the champion of freer trade. In particular, it is going to be the champion of freer trade for Japan with other countries, although, as Mr Dulles prudently observed, it is not desirable that Japanese exports to the United States should be increased. All in all, as far as foreign trade is concerned, the United States seems this year to have made a bit of an elephant of itself.

McCarthy Under Control

As one investigation of Senator McCarthy's activities ended—the Mundt committee's reports on his dispute with the Army were completed this week—another began, with the opening of the Watkins committee's hearings on the charges, presented by Senator Flanders and others, that Mr McCarthy has brought the Senate into disrepute. He did this more effectively than ever before, as far as the general public was concerned, by his televised demonstration, before the Mundt committee, of how a congressional inquiry should not be conducted. This discreditable display is not, however, one of the issues before the Watkins committee, although the Republican majority on the Mundt committee does once more suggest, in its report, some ways in which a repeat performance might be avoided.

The Mundt report is chiefly concerned with putting the blame, for the unjustifiable pressure exercised on behalf of Mr Schine, Senator McCarthy's protege, when he was conscripted, on Mr Cohn, who resigned some time ago as counsel to the McCarthy investigating sub-committee. The four Republicans who conducted the inquiry agree that there was no dishonesty on either side, but they also agree that there was bad judgment on both sides; in particular, the Secretary of the Army is condemned for appeasing Senator McCarthy and the Senator is condemned for condoning Mr Cohn's efforts on behalf of Private Schine. It had been thought that one of the Republicans, Senator Potter, might join the three Democrats on the Mundt committee, and thus make their more far-reaching censure of both Mr McCarthy and the Army authorities into the majority report. But in the end Mr Potter was prevailed upon not to weaken his party's unity just before the election, and in his turn he probably prevailed upon his Republican colleagues to make their report stronger than it might have been.

★



The Democratic minority objected particularly to Mr McCarthy's access to a confidential government document and to his encouragement to government employees to give him secret information. Such incidents make up two of the five groups of charges into which the Watkins committee has concentrated the forty-six overlapping accusations against Mr McCarthy which it is considering. The other three groups relate to his treatment of General Zwicker, to his abuse of his colleagues and to his alleged contempt for various Senate committees that have already investigated his affairs during the last three years. The facts on which most of these charges are based are well known, and the Watkins committee should therefore have no difficulty in reporting, as it hopes to do, by the beginning of October so that the Senate can consider the findings before the election.

Even more helpful in speeding up the hearings should be the strict court procedure that is being followed. Senator Watkins has already, with remarkable firmness, checked Senator McCarthy's usual diversionary and demagogic tactics; they would in any case have had less point than usual, since television cameras—and smoking, too—have been banned from these intentionally unsensational and impartial hearings. Altogether this week has given the impression that the Senate, slow as it has been to check Mr McCarthy, is at last surely feeling its way towards getting its notorious member under control and keeping him there.

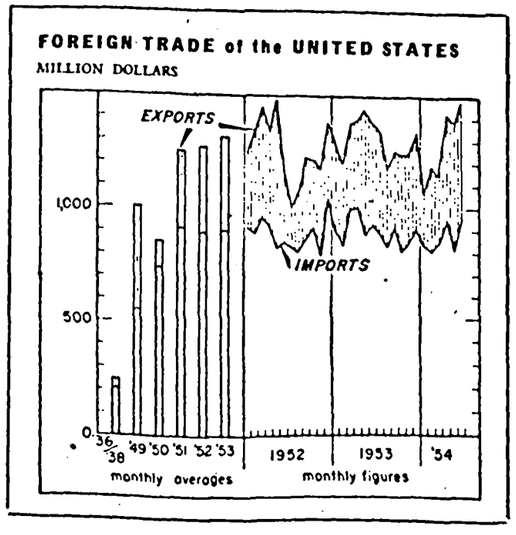
Democratic Harvest?

The spectacle of Mr Adlai Stevenson attacking the Administration's farm price law in the interests of Democratic candidates in the farm belt is a disillusioning one. Mr Stevenson's great appeal to the independent-minded voter has been his insistence that the national interest must come before that of any pressure group, however powerful. In braving the wrath of the farmers and taking a step toward lower price supports for the five basic commodities, the President and Mr Benson, his

Secretary of Agriculture, have deserved Mr Stevenson's admiration. Instead, at a farm conference of Democratic candidates at Sioux Falls, Mr Stevenson has accused the President, who admittedly made some equivocal campaign speeches to farmers, of breaking his premises to them, and

of having produced, at one and the same time, the "lowest farm prices and highest cost of living in recent years." Mr Stevenson defended high price supports cautiously, chiefly as a cushion against recession, but his audience, overriding his doubts, adopted a manifesto favouring their immediate restoration.

The Democrats are naturally anxious to prevent the Republicans from offsetting any losses they incur in the farm belt by gains among consumers in the big cities and, for statistical ammunition, they can turn to a report of the House Agriculture Committee, which was issued in the vain hope of turning the tide against lower and flexible price supports. This points out that although the prices received by farmers have fallen by more than 17 per cent since the peak reached in 1951, the housewife has felt no benefit. Further reductions in farm prices, it is implied, would injure the farmer without helping the consumer. The comparison is not quite a fair one, and plainly farm prices are not the only cause of dear food. The farmer receives only 44 cents of each dollar spent on food, and what he has lost has been more than eaten up by higher costs of distribution, processing, and elaborate packaging. If farm prices had not fallen, however, the consumer would be even worse off. The failure of retail prices to turn down is a warning against expecting the new farm law to accomplish the impossible, not an argument for retaining high support prices.



Going Slow on the Farm

BOTH the President, when he signed the farm Bill, and Mr Benson have made it clear that they do not expect a miracle this year and that they will have to wait for their justification. The increased consumption and decreased production of butter are hopeful signs that lower support prices will bring economic balance, and helped to persuade Congress not to raise the support price of dairy products, which Mr Benson had fixed at 75 per cent of parity. (Parity is an imaginary price, calculated to give the farmer the same return, in relation to the things he buys, which he had in an earlier period.) But the full programme will go into effect slowly, to lessen the shock to farmers both as producers and voters.

For one thing, the new lower price supports do not apply until the 1955 crop year. Even then, the Department of Agriculture relies more on rigid controls over planting than on the flexibility of the new supports to curb surpluses. The support prices are not going to bend very far at first. According to unofficial estimates of the Department of Agriculture, wheat is the only basic commodity whose support level is likely to drop the whole way to 82½ per cent of parity, the lowest figure at which support can be set. This would mean a price guarantee of $2.06 a bushel compared with $2.24 today. The decline will be slight for maize, rice, and peanuts, and there will be none for cotton. Congress agreed enthusiastically to the President's request that surpluses worth up to $2.5 billion should be disregarded when the calculations of supply and demand are made which enter into the fixing of the support price. Mr Benson himself expects that it will take several years to solve the problems created by following wartime policies after the emergency was over, and claims no more than that the new law points the way to better balance and greater stability.

Embargoes for the Future

THE Foreign Operations Administration has now made its contribution to implementing the agreement, worked out in Paris between America's allies, to relax the embargoes on trading with the Soviet Union and its satellites. The Department of Commerce has on its side followed this up with a loosening of its export licensing regulations, which also puts American exporters on a rather easier footing

when trying to sell behind the iron curtain. Both agencies, as was to be expected in the present political atmosphere in the United States, have maintained their bans on shipments to Communist China, North Korea and North Vietnam, even though these are somewhat unrealistic because of the close commercial connections between these countries and the Soviet Union. But in other respects the new regulations are practical steps towards making controls on trade with the Communist world easier to administer and putting them on a long-term basis which can be maintained for the foreseeable future.

Allied countries can now trade more freely with the European satellites without risking the loss of American aid under the Battle Act's once somewhat exaggerated ban on exports of military importance. The main embargoes dropped are those on various kinds of machinery and motors, mostly of the smaller types, transport equipment and a number of mineral and petroleum products. Altogether about 80 items have been freed from the Battle Act, leaving rather over 200 under restriction. The Department of Commerce, on its side, has almost halved its "positive" list, which covers strategic items which may not be sold to the Communist block. But this list still contains nearly 800 entries; it has always been more comprehensive than the Battle Act list, partly because it includes items which are in short supply in the United States and partly because the Department of Commerce seems to have taken a more rigid view than has FOA of what should be denied to the Soviet world. Export licences will no longer be required for trade with friendly countries in the items taken off the positive list, which fall into roughly the same categories as those freed from the Battle Act's embargoes. While licences will still be needed before Americans can send such exports behind the iron curtain, it is expected that permission will be granted fairly freely.

Nevertheless American traders, for the present at least, will be unlikely to take as much advantage as will their allies of the opportunities for trading with the Communist area. The main reason for relaxing the restrictions is after all to open markets for the growing output of those allies and to provide them with new sources of income to make up for the decline in dollar aid. American exports to the Soviet block have never been of much importance; even in 1947, before controls were imposed, they were valued at only $340 million, compared with a total export trade of over $15 billion. The Soviet satellites today have few means of paying for American goods and American exporters have little interest in supplying them. But at least the iron curtain will be less difficult to penetrate should the American search for export markets become more intensive.

Bankers in Waiting

THE conclusion of the Department of Commerce that the economy has continued stable during the early summer, despite continued liquidation of inventories in the durable goods trades, supports the judgment of the President that the economic decline has come to a halt. But even with the continued high levels of consumer spending and construction, there is no certainty that an upturn is on the way or that the economy will do more than mark time for the rest of the year. The failure of bank loans to business to increase during August, when they usually begin to pick up, is dampening news. The weekly reporting banks in New York City, which make about 20 per cent of the nation's loans, experienced three falls in business loans during the month; last year at this time they were rising. This follows an unusually steep decline in business loans during the first half of 1954; the level, for reporting banks throughout the country, is now over $2 billion below that of last year.

The decline is due to the liquidation of inventories by the metal trades, and the stand-offishness of food and tobacco companies and of the retail and wholesale trades, which usually seek funds at this time. On the other hand, it must be noted that some borrowers, with a high credit rating, are obtaining cash at lower rates than the banks demand in the commercial-paper market, that many corporations have large accumulations of cash in hand, and that the fact that they had to pay 90 per cent of their federal taxes in the first half of the year reduces their need for credit in the second six months.

Moreover, the reduction in reserve requirements which took place in June and July, and which was welcomed as an anti-recession measure, was less open-handed than it appeared at the time. The Federal Reserve System has mopped up a substantial proportion of the banks' new reserves by steadily selling Treasury bills, the return on which has now begun to rise. Over $800 million of these securities have been sold by the system since June, evidently in an effort to see that the money market was neither over supplied nor under supplied with cash. The outlook remains favourable, however, should the Treasury pursue its aim of lengthening the maturities of the public debt. The 3¼ bonds due in 1983, which were launched under such discouraging circumstances, are now selling at a substantial premium, and the most recent refunding operation showed not only a very small demand for cash, but also enthusiasm for the new six-year bond which investors might take instead of new one-year certificates.

Classless Education

FROM OUR SPECIAL CORRESPONDENT

IN the United States, virtually everyone between the ages of fourteen and seventeen goes to secondary school. This development is already so taken for granted as a mainstay of American democracy that people sometimes forget how recent it is. In 1890, less than 7 per cent of children in this age group were in school; by 1930 there were over 50 per cent, and today the proportion has passed 80 per cent; nine-tenths of these children attend publicly owned and operated schools. This has happened, moreover, without any nation-wide requirements being imposed by the federal government; the forty-eight states have done it themselves, each at its own pace. Providing for education is not only one of the most important, but one of the most decentralised, of government activities. Even within the states it is the rule rather than the exception for the local school districts to exercise autonomy in planning, operating, and to a large extent even in paying for, the schools.

So momentous a change as the broadening of the secondary school system to include almost everybody, instead of a select few, was bound to raise immense problems. Most of these come down to one basic question: how can education be opened to virtually everyone above the level of certifiable idiocy, while still preserving adequate opportunities for the intellectually gifted leaders of the community to receive the training for leadership?

That this may, in fact, be impossible is not an answer that most Americans will entertain for a moment. Sometimes the passionate devotion to the ideal of a classless society even prohibits recognition of the fact that children do, after all, enjoy very different intellectual endowments to begin with, and that this may conceivably mean that the especially gifted need a different kind of schooling from the rest. The very idea of dividing up secondary education into grammar schools, secondary modern schools and technical schools would be condemned by most Americans as a concession to undemocratic snobbery, and as an offence against equality of opportunity.

The prevailing practice in the United States is to have comprehensive high schools, in which there are different courses of study for, say, the future clerk who wants to learn shorthand and dispense with foreign languages; the future semi-skilled labourer who wants to study industrial arts (a rapidly growing field in American secondary schools); and the future professional man or business executive who must be prepared for a university. But within these schools, the various students will merge indistinguishably in extra-curricular activities and in some of their studies as well. Until very recently, in fact, when an American high school listed special courses of instruction for "exceptional children," this phrase was almost certain to denote those who, for one reason or another, were retarded or could not meet the normal academic requirements.

★

This situation came about through a healthy realisation of the pointlessness of forcing the dull student to repeat, over and over, a futile attempt to master the intricacies of mathematics or the subtleties of history, until he or she reached the age at which liberation from this sterile process became legally possible. The energies of many imaginative educators have gone into meeting this problem. Now, some are shifting, under the impact of desperate cries for help from university teachers and administrators, to the problems presented by the opposite end of the scale—the boy or girl of above average ability who finds too little stimulus in high school courses planned for the great middle-of-the-road majority of pupils.

But there are limits, set by financial considerations among others, to the number of different special courses or curricula which a school, especially a small one, can offer. A smaller proportion of the national income is now being spent on secondary education than was the case a decade ago—0.7 per cent as against 1.2 per cent. Much public attention is focused on the need for more money, especially for the purpose of raising teachers' pay. At the same time, the consolidation of small schools and school districts into larger ones, better able to offer diversity of training to meet the diversity of students, goes on rapidly. The number of school districts was almost halved between 1948 and 1953.

In spite of these changes, the fact that most students, gifted or not, will have broadly speaking to follow the same curriculum has led to vigorous debates over the nature of that curriculum, and particularly over the question of whether or not the basic academic disciplines are being sacrificed in favour of "Life Adjustment Education" and vocational training. Those who feel that such a sacrifice is being made, and that the high schools have all but ignored literacy in their search for "a happy and stimulating school experience," tend to blame the "Educationists," by which is meant those who teach the teachers, whether in schools of education attached to the great universities or in the state-supported teachers' colleges. It is alleged that these people have carried the philosophy of the late John Dewey far beyond anything the master intended, that they have become so preoccupied with the techniques of teaching that they ignore the substance of what is to be taught, and that in their concern for making education palatable to the majority of non-intellectually inclined children they have broken disciplinary lines and watered down essential standards.

★

The evidence for this indictment is conflicting and hard to assess. No matter what the statistics say, however, there would be few university teachers in the United States who would not agree that the secondary school preparation of many of their undergraduate students is woefully weak in many respects, and especially in the matter of written and oral expression and in intellectually disciplined critical thinking. In part, these university critics would blame the introduction of many new non-academic subjects into the high school curriculum. Courses in consumer buying (how to shop most efficiently) or driver education (how to operate an automobile) increase, while enrolment in languages and mathematics declines.

The most eminent apologists for this tendency are often unconvincing; the executive secretary of the National Association of Secondary School Principals, writing in *Colliers*, defends a course in which boys learn, among other things, how to make fudge, as follows:

> . . . boys in this foods class will derive immeasurable pleasure and satisfaction in receiving recognition (which all humans desire) from their friends for a special culinary skill when the group goes on a week-end hiking trip. . . .

His opponents might well question whether this statement constitutes an adequate criterion on which to base the selection of courses for inclusion in a school curriculum. Besides, what has happened to the American home if it can no longer teach fudge-making to the boy who yearns to know?

The advocates of traditional academic training are somewhat unfair, perhaps, in making the Educationists the scapegoats. Often it is the general public, expressing itself through the local school board, that insists on "practical" subjects in place of "abstract" or "theoretical" ones. That the public, in turn, is unconsciously influenced by an anti-intellectualism of which these quoted adjectives are a symptom, is undoubtedly true, and may to some extent be the long-run result of the Educationists' advocacy of "learning by doing." But it is also the inevitable result of trying to provide secondary education to the mass of people who in any country are not "intellectuals," and whose school lives will only be stultified if it is pretended that they are.

Going Out of Business

NEARLY thirty years ago Calvin Coolidge observed that what was needed was more business in government and less government in business, but the war and the depression provided successive Democratic Administrations, who in any event had more faith in government and less in business than Mr Coolidge, with plausible reasons for expanding rather than reducing the scope of government enterprises. These have grown so fast, and are so various—they range from giant lending operations and great dams to the ice-cream plants and moving picture studios which serve the forces—that their value can only be fixed within the generous limits of $25 billion to $40 billion.

The natural tendency of a Republican Administration is to listen sympathetically to the complaints of businessmen who allege that they could do many of these things more efficiently and more cheaply than any civil servant, and pay federal and local taxes as well; it also believes that one way of halting the expansion of the public debt is to hand over to private interests some of the functions the federal government has assumed. Spokesmen for the Administration who deny that any prodding is needed from Congress can point to the closing down of the Reconstruction Finance Corporation, the vast government lending agency; the placing of the 27 synthetic rubber plants on the auction block; and the sale of the Inland Waterways Corporation. Government agencies have been ordered to submit a list of their commercial activities and the reasons why they should not be turned over to private enterprise. The Defence Department has led the way; already the Air Force has sold half its bakeries and the Army its saw-mills.

Mr McKay, the Secretary of the Interior, may not find it so easy to streamline the Bureau of Mines, which he thinks should be relieved of operating the government's helium monopoly, and its zirconium and titanium plants, and should share with industry the burden of experiments into the underground gasification of coal and the production of oil from shale. Complaints of a new "giveaway" to private interests are the stronger because helium, zirconium, and titanium are all needed for the defence programme. While private funds are flowing into the exploitation of the last two, there is a dispiriting lack of private interest in buying the government's four helium plants, even though demand is increasing. Moreover, although the House has passed a Bill to curb federal competition with private enterprise, Congressmen sometimes change their tune when their own state is involved; plans to shut down the government tin smelter in Texas have been wrecked on the resistance of Texas's Congressmen.

Motel de Luxe

NOT long ago there was nothing "ritzy" except the names about the motels—motor hotels, offering convenient overnight accommodation to passing motorists—that line the main roads outside American towns, especially along the tourist routes. But nowadays the bare wooden cabins, hardly any bigger and certainly less comfortable than the cars parked beside them, are being replaced by luxury rooms with carpets, baths and television sets, surrounded by gardens, and often with a swimming pool and restaurant. In the process the motel has lost what used to be one of its main attractions, its cheapness; prices are often now above those in nearby hotels but in these cases, particularly in small towns, the motel will probably also be cleaner and more comfortable. Moreover in a motel there are no "hidden" charges, such as the tips and parking fees that have to be paid in hotels.

Another drawback to the modern motel is that, to be sure of accommodation in the more reputable ones, the motorist must book in advance, instead of being able to stop when he feels tired. But the development of motel chains enables the tourist to plan a cross-country trip with the certainty of a comfortable room under the same management every night. And for such travellers, the motel, usually on a bypass road or near a highway junction, grows increasingly attractive as cities get bigger and more congested, and not even a night's rest seems worth the struggle with the downtown traffic.

There are now over 50,000 motels in the United States—the number has doubled since 1948—and on some busy routes there are more motel rooms than are needed except during busy holiday periods. As a result there has been a certain amount of price cutting, but competition more often takes the form of providing additional comforts and services. The newer motels compare favourably with the big city hotels and the country and small town hotels have suffered severely. Some of these are now trying to compete by offering special rates, taking children under 14 for nothing, for example, and better garage facilities; one even emulates the motel by taking the car right up to the bedroom for unloading. Financially, however, the motels have the benefit of lower capital costs, so that they can operate profitably with a smaller average rate of occupancy than can a city hotel.

SHORTER NOTES

The Senate unanimously confirmed without debate the appointment of Mr Herbert Hoover, Jr, the son of the ex-President, to succeed General Bedell Smith as Under Secretary of State. Mr Hoover is an engineer who had little political or diplomatic experience until his successful intervention, on behalf of the United States, in the negotiations leading to the Iranian oil settlement. He will be primarily responsible for directing administrative matters, leaving the Secretary of State free to concentrate on policy.

★

The hopes of the liberal Democrats who nearly succeeded in bringing Texas back into the official fold have now been dashed by Governor Shivers's renomination. It was Mr Shivers who two years ago deserted to Mr Eisenhower and gave him the Texas vote, and the President, by telephoning his congratulations to Mr Shivers, has underlined what many Democrats regard as the Governor's disloyalty.

★

This November, for the first time, there will be over 100 million civilian Americans of voting age. The exact figure is 100,223,000, compared with 98,135,000 in November, 1952.

The World Overseas

High Tide for Malan

FROM OUR CORRESPONDENT IN SOUTH AFRICA

THE Nationalist leaders were almost as surprised by the outcome of the provincial council elections as they were by their parliamentary victory in 1948. They had hoped to hold the position achieved at the general election 15 months ago: they did not expect to poll so many more votes than the United Party in the contested seats. Little wonder that Dr Malan referred to a "smashing" victory and that Mr Strydom spoke ecstatically of the "tremendous significance" of the result. Dr Malan was no doubt thinking of the "volkswil" (will of the people) in relation to the Coloured vote; Mr Strydom was openly counting heads to see how much closer the party had got to its "destiny": the attainment of a republic divorced from the Commonwealth.

Precisely how many heads Nationalists can count on, however, is by no means clear. While jubilant Nationalists, who have for years smarted under opposition taunts about their position as a "minority party," now claim to have "broken through the political sound barrier" by attracting more individual votes than their opponents, there are serious discrepancies in their figures. The Nationalists claim, on the basis of contested and uncontested seats in all four provinces and in South West Africa, to have the support of over 618,000 voters; while the opposition parties (which in effect means the United Party) claim the support of 587,000 votes. This calculation gives the Nationalists an overall vote majority of 31,000 compared with a minority of approximately 110,000 at the parliamentary election last year. But Opposition statisticians are unconvinced. In any case, any estimate of voting strength is only conjectural, for 75 out of the 172 seats at issue were uncontested and it is virtually impossible to calculate with any accuracy what the opposing forces would have polled in these seats had they been contested.

A number of indisputable facts, however, did emerge from the election. The Nationalists now control three out of the four provinces as well as South-West Africa. Although they polled more heavily than last year in only five out of the contested 72 seats, their majorities were, with a solitary exception, considerably higher, while the United Party majorities were without exception lower. In addition the United Party lost such key seats as Edenvale and Vereeniging, in the Transvaal, and saw a number of marginal seats move into the category of safe Nationalist constituencies. What is perhaps significant is that while the United Party paid heavily for the apathy and defeatism from which its supporters are suffering, the Nationalists nowhere appear to have made converts on any significant scale. What happened was that the Nationalists came out in force to vote while the opposition, sensing perhaps the futility of it all, stayed at home.

The outcome of the election has been a severe shock to the United Party which, in the months before the Union Congress in November, will have to undertake an "agonising reappraisal" of its position. Inevitably the leadership is being condemned for timidity and vacillation; the "liberals" in the party are blaming the "conservatives"; the "integrationists" are criticised for playing into the hands of the Nationalists; and generally the air is thick with recriminations. Obviously the party will have to make up its mind before November whether it will retreat before the onslaught of the Nationalists, who maintain that integration must lead to equality and thence to the domination of the White by the non-White, or whether it will face the implications of economic integration and put the issues clearly before the country.

Whatever happens the party will probably undergo some further disintegration. At best it faces a difficult future, although it has the consolation of knowing that in spite of its weaknesses and vacillations, in spite of having reached just about the lowest ebb in its fortunes, it still has almost as much electoral support as the Nationalist Party at what must be the zenith of its power. The danger is that Mr Strauss and his advisers will interpret this as a reason to sit tight and wait for the tide to turn.

Meanwhile the Nationalists can afford to feel smug. Claiming the outcome of the election as a mandate to go ahead with its plans to take the Cape Coloured voters off the common roll, the leadership is not disclosing its intentions at the moment. Dr Malan's obtuse post-election comments on the government's plans are no doubt intended both to confuse his opponents and to placate his own restive supporters.

One thing the provincial elections did not do was to make it possible for Dr Malan to reconstitute the Senate and get his two-thirds majority for the Coloured Vote Bill. The Prime Minister, however, will not be stampeded, and it is likely that before doing anything drastic he will attempt, once again, to persuade Parliament to give him his two-thirds majority. If he fails again he will plead "obstruction" by a "minority" and may then feel himself free to take more radical action. If he wishes to take such action, the Government's hand has certainly been strengthened by the provincial elections.

Last Hours of the EDC

THE great debate in the National Assembly ended a day ahead of schedule, with a score of deputies still waiting to express their views. The climax came with the singing of the Marseillaise, drowned in jeers and insults, with cries of "sing Deutschland Uber Alles," and echoing shouts of "go to Moscow." The treaty was killed in procedural skirmishes; but, though the debate did not run its full course, the European Defence Community is now definitely dead and buried. By voting to dismiss the issue the deputies really expressed themselves on the heart of the matter: they were against the treaty. When M. Le Trocquer announced that 319 deputies had voted for the *motion préalable* to end the debate and only 264 against it, he was proclaiming a clear French veto to EDC.

How Did It Happen? The shadow of the guillotine was hanging over the debate from the very beginning. Both sides were preparing to use Article 46 of the Assembly's rules. The partisans of the treaty, fearing that it would be rejected, sought to adjourn the debate by a *motion préjudicielle*. But the same article provides for a *motion préalable* (which claims precedence over all others) to decide whether the question should be debated at all. The blame for closing the debate without giving such important backers of EDC as MM. Schuman, Reynaud or Pinay a chance to speak cannot be put on the opponents of the treaty alone. It was perfectly well known that one motion would automatically provoke the other. Indeed, there had been tacit agreement to ignore Article 46 and let the debate run its course (there were also frantic efforts to include in the proposal to adjourn sufficient praise for M. Mendès-France's conduct in Brussels to decide the government to back the proposal and restart negotiations, but these failed). When M. Chupin broke the agreement and pressed for adjournment, the next step was inevitable: M. Herriot, the veteran parliamentarian, seized the occasion to deliver a last indictment against the treaty and then to move that the question be dismissed.

★

The rôle of M. Mendès-France: Members of the government abstained from the vote. Indeed to remain neutral was the only chance of survival for a cabinet that includes both opponents and partisans of the treaty. M. Mendès-France promised a "complete and loyal *exposé*"; his speech was the masterly summing up of a judge who tries to be objective but expects the jury to decide against the prisoner. And it could not be otherwise. Having failed in his task of reconciliation, having met with a rebuff in Brussels, the French premier was bound to plead *pro domo sua*. Thus a large part of his speech was taken up with explanations of the French stand in Brussels, with justifying the modifications rejected by the other powers, and by this very fact it emphasised the weaknesses of the unchanged treaty. M. Mendès-France could not defend the treaty without disavowing his own previous statements.

He reiterated his government's loyalty to the Atlantic alliance and placed Franco-British understanding at the heart of his policy. But he refused to accept the choice as one between Wehrmacht or EDC and argued that other solutions can be found within the Atlantic framework.

The Poll Analysed: French isolation in Brussels certainly mobilised votes against the EDC. The slogan about "Europe of five against one" found a large hearing. Before Brussels more votes could probably have been mustered to back the treaty. This week, however, not only all the orthodox Gaullists and Communists, but half the Socialists and Radicals rejected the EDC. MM. Moch and Daniel Mayer (since then expelled from the party) led the Socialist "rebels," while M. Mollet, the party's secretary led the orthodox European contingent. Among the Radicals, MM. Herriot and Daladier were against the treaty and MM. René Mayer and Delbos for it.

HOW THEY VOTED ON THE MOTION*

	For	Against	Abstention
Communists	99	...	...
Socialists	53	50	3
Radicals	34	33	9
UDSR	10	8	6
MRP (Christian Democrats)	2	80	4
Peasants and Independents	31	76	11
RS (Orthodox Gaullists)	67	2	4
ARS (Dissident Gaullists)	16	14	3
Total (incl. others)	319	264	43†

* For the motion means against the EDC. † Including 23 ministers

Communist "arbitration": The figures show that Communist votes have tipped the scales, that without them the balance was in favour of the EDC. Yet such arbitration was unavoidable as soon as it appeared that no compromise could be reached between the non-Communist parties. On issues that divide parliament and country so deeply 100 deputies cannot be ignored; their votes cannot be discounted without depriving a quarter of the French population of its democratic rights. When others quarrel, the "untouchables" inevitably come into their own and even dominate the parliamentary arena.

Is there a Constructive Majority?: The fact still remains that if the government embarks on a policy distasteful to Moscow the present majority will crumble. Any proposal involving German rearmament will meet with the opposition of Communists and many Socialists. Will a looser alliance, however, find favour with the "Europeans" for whom the chief merit of the EDC was its supranational character?

M. Mendès-France asked the deputies not to cast their votes lightly and to ponder over the alternatives. Yet the debate produced only a negative answer and there are still no signs of a majority for any solution to the German problem. Probably it was difficult to discuss alternatives without knowing which formula can be accepted by France's allies.

What Next?: The French premier must now start all over again with his initial search for a compromise and a reconciliation. Will he prove more successful now when bitterness and resentment dominate the home situation, while the mood of the allies is largely determined by German impatience? His hope must be that the parliamentary recess will cool French deputies' tempers and that the allies will realise, after the initial shock, how dangerous it would be to antagonise France. Possibly, with a dose

"Daddy, what is earth made of?"

That's mostly powdered rock he's playing with, you tell **him**—mixed with mould. It's the top of the earth called soil; in it are mineral salts, which help to feed the plants which in turn feed us.

Earth—the basic raw material. Sometimes scratched, even to-day, with Bronze Age tools, yielding a pitiable crop. Yet fertile, brimming over, where it is channelled for irrigation, ploughed, reaped, *husbanded* by power: diesel and electrical power, supplied all over the world by THE BRUSH GROUP LIMITED.

Supplied to the Sudan Gezira Board, for example, by J. & H. McLaren Ltd., a member company. Here 108 McLaren diesel engines have been cable-ploughing the land since 1927, the soil being too light for tractors. Over 600,000 acres now yield their crop of cotton and linseed; soon this same number of engines will extend the limits of fertility further still, to a total area of one million acres.

of undue optimism, Paris looks towards London for an acceptable solution, if not a panacea.

The National Assembly is empty. After a passionate post-mortem, in which MM. Reynaud and Pinay finally had their say, the deputies accepted the government's proposal to disperse until November. M. Mendès-France, however, promised to recall them as soon as there are any new developments in foreign policy. The deputies can thus relax, gauge the mood of the electors and prepare for new battles. The Ministers, on the other hand, will have no time for holiday. Not only must the government produce its first economic decrees, but it will also have to take advantage of the parliamentary respite to forge relentlessly a substitute for the EDC.

WFTU Seeks a Comeback

BY A CORRESPONDENT

SINCE the free trade unions parted company with the World Federation of Trade Unions in 1949, the most effective operations of the Communist-controlled trade unions have been in the "colonial and semi-colonial countries" where the trade union movement is young and inexperienced. These operations have been given high priority. The Communist victory in China has provided both an impetus and an additional ideological justification for the correctness of this line in the form of "Maoism." It provides an invaluable second string to action through the industrial proletariat which has so often and so obviously failed to behave as the Communist textbooks say it should.

The WFTU's concentration on the under-developed areas is indeed partly a reflection of its failure to make headway in the trade union movements of the more industrialised countries. Attempts at penetration have of course gone on unceasingly. Since the split, the tactic has been "unity from below" combined with manœuvres to place upon the leaders of the free trade union movement the onus of "dividing the working class." Now that "peaceful coexistence" is tending to supplant "cold war," the climate has become more propitious for the tactic of "unity from above."

Nothing would better suit the Communist book than the restoration of the *status quo ante*, with a single world trade union organisation controlled by the Communists and their fellow-travellers and used for their purposes. But clearly the time for this is not yet ripe. After five years of separation, the resumption of conjugal relations requires a period of courtship interspersed with invitations to take a trip behind the Iron Curtain.

The preliminary overtures can be seen in the agenda of the Trades Union Congress, in the shape of three resolutions and an amendment calling for "discussions" or "talks" between the free and Communist trade unions. The objects are various: in one case, "a common programme of economic demands"; in another, "to resist the depressions and slumps"; in a third, "to consolidate world peace." The object is irrelevant, provided that it is one which will evoke a favourable reaction. The real point is the "get together." This seemingly innocuous proposal veils the assumption that it is worth while talking with the WFTU on these or any other subjects, as if it were an organisation capable of determining its own policy.

Implicitly, these resolutions treat the WFTU as an organisation parallel and similar to the free trade union organisation, the International Confederation of Free Trade Unions. Since this is precisely the position which the former has sought to establish for itself they play straight into the Communist hand. Yet they are not necessarily Communist-inspired. The unions responsible for them—the engineers, public employees, tobacco workers and vehicle builders—are "left-wing" unions, but with one possible exception they are not Communist-controlled.

The appearance of these resolutions on the Congress agenda is due primarily to the fascination which the Soviet myth still exerts over a considerable section of the labour movement. The idea of workers' solidarity is transposed to the international plane (which is feasible) and the WFTU is accepted as representing the workers (which is not). This emerges most clearly from the Tobacco Workers' resolution which calls for "talks between the ICFTU and the WFTU so that the workers of all countries can get together."

So strong is the appeal of workers' solidarity and so great the confusion about the WFTU that the normally level-headed National Union of Mineworkers has also succumbed. Another seemingly harmless resolution calling for "international trade union unity" slipped through the Union's executive and was endorsed by the Conference. At the Trades Union Congress, therefore, the considerable weight of the miners may be added to the four unions which have resolutions on the agenda.

A Tactical Blunder

The case of the Electrical Trades Union is very different. In July this union, which is Communist-controlled, submitted to the General Council of the TUC a resolution on "international trade union unity," and asked for a statement which the General Council undertook to provide. This statement, which the Council has now produced, summarises the postwar history of the international trade union movement, and rejects in no uncertain terms the proposal for negotiations with the WFTU or its affiliates. "If we were to try to negotiate," it says, "we would, in fact, be attempting to negotiate with people who have no power to do so"; and concludes, "Neither the ICFTU nor the TUC can seriously consider proposals for negotiation with organisations which have no power to negotiate."

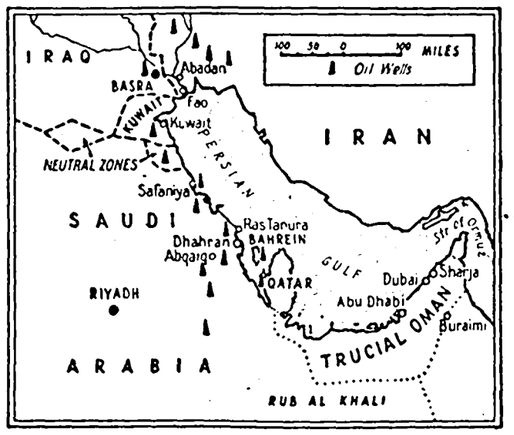
If Congress endorses this statement, as is probable, the Communists would seem to have made a tactical blunder in providing the General Council with the opportunity of giving a clear and firm lead to Congress. But a rebuff in these early stages of the campaign will not deter them. They will keep pegging away at the point of weakness which emerges even in the General Council's statement where it is thrown on to the defensive:

> The British Trade Union Movement has been in the forefront in seeking the establishment of a united world Trade Union Movement . . . it was the General Council which sponsored the Congress resolution in 1943 which called for the establishment of an all-inclusive world trade union organisation.

What the Communists are working for is a repeat performance. So long as confusion about the nature of Communist "trade unions" persists they will have material to work on.

Sheikhs' Boundaries and Frogmen

THE British Government has this week named its representative—Sir Reader Bullard—for the arbitration tribunal that may set the ball rolling for some settlements long overdue—those of the undefined boundaries of a series of Arabian Sheikhdoms along the Trucial Coast. As was recorded in *The Economist* of July 31st, a five-man body is to put a civilised end to the dispute about the ownership of Buraimi oasis. This quarrel has for nearly two years troubled relations between the Saudi Arabians and their neighbours, the Sheikhs of the coastal belt; the British Government is involved because since the turn of the century it has protected the interests and foreign relations of these Sheikhdoms. As soon as the Saudis have appointed their arbitrator, the discussions about Buraimi can go ahead. Until then the oil companies with an interest in the matter —an American concessionaire on the Saudi side of the undefined line and one of mixed nationality on the other—are observing a "neutral" area.



Buraimi is so remote that it is marked only on the best maps, and even these do not agree on what relation it bears to several boundaries. For it lies in a world so featureless that there are next to no traditional points to help with the demarcation of territory. For generations, the relative shape of a number of principalities has depended almost entirely on the personalities of Sheikhs whom a traveller not long before the war described as "a short-lived class." Till now maps have, therefore, been best drawn without boundaries, in the same way as the World Aeronautical Chart. Otherwise, they have been apt to suit the taste of their makers; for instance, the British Foreign Office, in its peace handbook of 1919, tidily located the western end of Abu Dhabi sheikhdom as adjoining the eastern end of that of Qatar, in preference to leaving an indeterminate and empty piece of coastline in between. By contrast, a map used by an American oil expert in 1951 showed the whole of the north of the Rhub al Khali (Empty Quarter) as Saudi territory, and restricted Trucial Oman roughly to the area north east of the town of Abu Dhabi. Somewhere between these two extremes there fluctuate *de facto* occupations by beduin whose allegiances also fluctuate. Dividing lines were immaterial so long as the quarter really was empty—that is, contained nothing covetable. The whole situation changes if, as is now suspected, it conceals a subsoil rich in oil.

No wonder, therefore, that there was a quarrel over Buraimi. It amounted to a trial run for establishing title to what may turn out to be valuable property. For here is one of the few landmarks in the area—an oasis consisting of eight villages. So long as its ownership remains in dispute, it constitutes a warning of the uncertainties that could poison relations not only between Arab neighbours, but between their backers in western oil companies.

This uncertainty about boundaries is not confined to landlubbers: it extends, unfortunately, to the seabed of the Persian Gulf, which is thought by more than one oil company to overlie further oilfields. If so, to whom do they belong? Offshore oil is a problem elsewhere and notably in the Caribbean. In 1945 Mr Truman proclaimed a doctrine that no one has since gainsaid—the doctrine that "jurisdiction and control over the natural resources of the continental shelf beneath the high seas" should belong to the country bordered by that shelf. This doctrine is practical, since adjacent installations on land are likely to be necessary, and it works wherever the continental shelf is a well-defined ledge to which there is no other claimant.

In the Persian Gulf, however, there is no shelf and no drop to any ocean bed; there are also shoals which emerge from the sea at low tide and raise queries about the extent of territorial waters; there are also eleven states or sheikhdoms claiming subsea rights in the gulf; there are, lastly, some which observe the three-mile limit to their territorial sea and others which proclaim a six-mile limit.

Beginning in 1949, and taking their cue from President Truman, first Saudi Arabia and Iran, and later the other rulers along the shore, unilaterally declared their jurisdic-

tion and control over the sea bed beyond their coasts; some of them added that the boundaries of such areas would "be determined in accordance with egalitarian principles" in agreement with the other states concerned "when the occasion so requires."

In 1949-50, the occasion arose. A Sheikh and two oil companies went to law because one of the Sheikhdoms, Qatar, sought to lease undersea rights round its shores to a company other than that which owned the concessions on Qatar peninsula. The latter contested the Sheikh's right to admit a second company; as the result of arbitration, it was agreed that all islands, all inland waters and all territorial waters were covered in the original land contract, but that submarine areas continguous to Qatar were not. In 1951, a similar award was made regarding the submarine areas off Abu Dhabi.

Today, therefore, in addition to the shore concessions held by the Arabian American Oil Company in Saudi Arabia, and by various subsidiaries of the Iraq Petroleum Company in the Trucial Sheikhdoms, there are two companies exploring undemarcated areas beneath the sea. Complete with frogmen, shark cages and, at times, the assistance of the world famous diver-explorer Commandant Cousteau, the Anglo-Iranian Oil Company is busy off Abu Dhabi and Dubai, and the Shell Company of Qatar Limited off the Qatar peninsula.

Submarine exploration is notoriously expensive; oil-

prospection there is said to cost anything up to seven times as much as prospection on land. Once the money risked turns out to be well spent, the chances that boundaries will be worth contesting are sure to multiply. In 1951, at the end of the Abu Dhabi arbitration case, the chief arbitrator, Lord Askwith, uttered the opinion that there were too many "ragged ends and unfilled blanks" beneath the Persian Gulf to warrant establishment of the "hard lineaments" of a rule of law. It would be wise to tie up these before oil discoveries fray them further.

Soviet Heavy Bombers

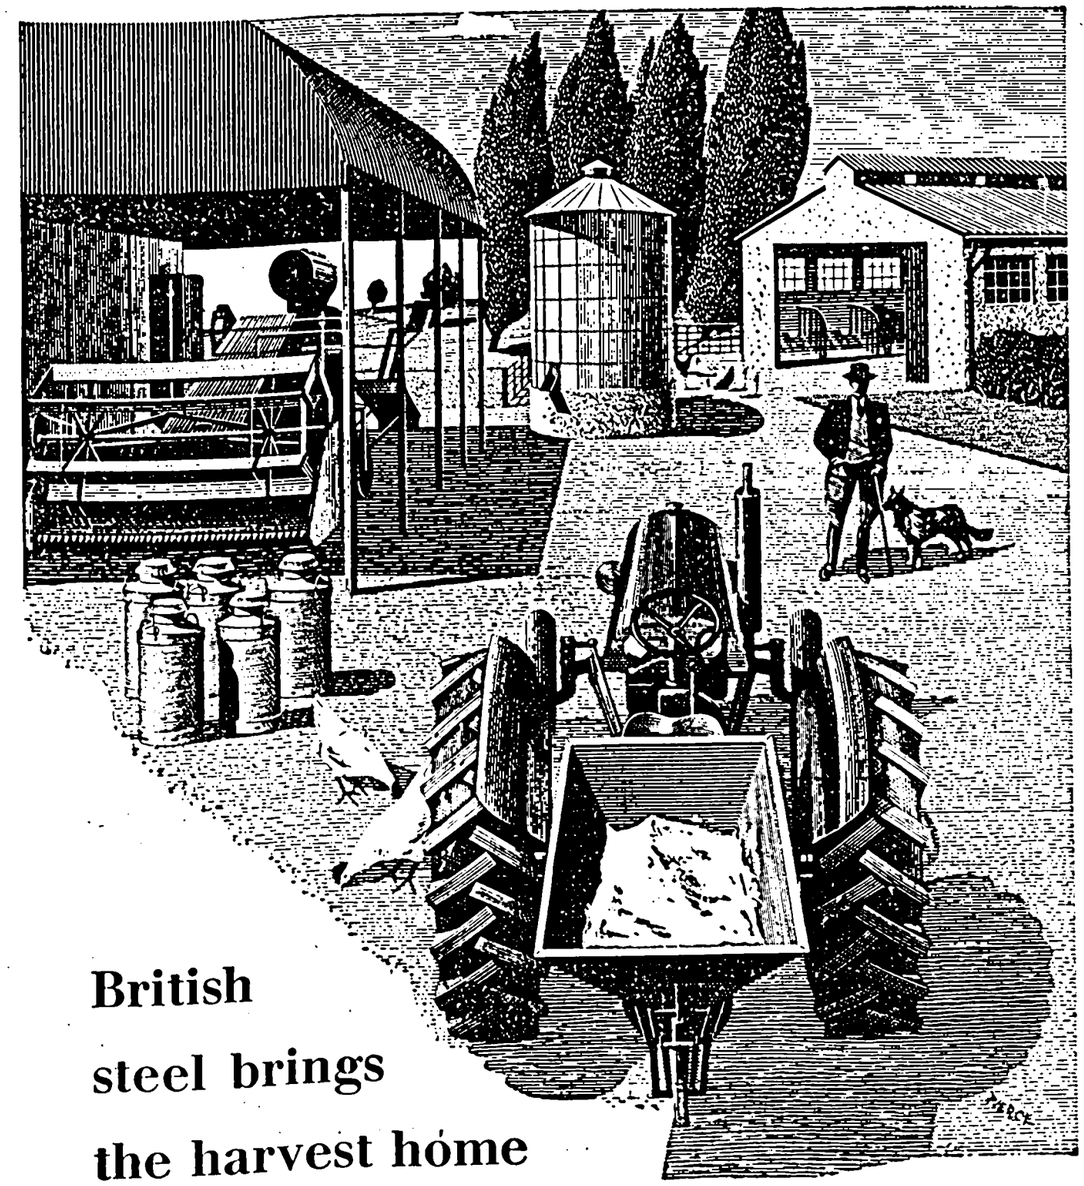
BY A CORRESPONDENT

THE development of Soviet heavy bombers falls into four distinct phases. Under the first and second five-year plans, the Soviet Union successfully developed a fleet of four-engined bombers—T.B.3s designed by A. N. Tupolev. In 1933 and 1934 the Russians possessed an operational fleet of several hundred four-engined heavy bombers. But in the second phase, the third five-year plan made little provision for the development of more modern long-range bombers and the T.B.3s were diverted to transport and training operations. In the five years before the outbreak of the war against Germany in June, 1941, the emphasis in Soviet aircraft production was on tactical light bombers and fighters.

In the spring of 1942, Stalin decided to reform the ADD Command (the Long Range Air Force) and to increase its strength and the scope of its long-range bomber operations. This was the beginning of the third phase. The only real strategic Soviet bombers, however, in the later years of World War II were the four-engined T.B.7 and P.E.8. The bulk of the long-range bomber units were fitted with American medium bombers such as the B.25C. (Mitchell) or the Soviet twin-engined D.B.3 and Ilyushin's I.L.4. By the end of World War II the effective operational bomber strength of the ADD was less than 500 bomber planes. They had no operational experience in the use of radar bomb sights or of navigational beam aids to bombing. The results they had achieved against targets in Germany, Poland and Rumania had been negligible and the standards of air crew training were low.

But since the end of World War II, the Kremlin has laid much greater stress than ever before on the development of long-range bombers. Stalin was deeply impressed by the effects of the Anglo-American heavy bombing in Germany and of course by the atomic bombing of Japan, and he gave instructions for the speedy construction of a modern heavy bomber force. In the last few months of World War II, the Russians had the good fortune to secure two or three samples of the American B.29 Superfortresses which were forced to land in Soviet Far Eastern territory. By the end of 1946 they had begun series production of a similar machine which was to be their first postwar strategic heavy bomber, the Tupolev 4; later versions, fitted with more powerful engines, were designated TU72.

This Soviet Superfortress type was originally fitted with four engines of 2,200 hp each; it can carry ten tons of bombs (or an atomic bomb) for a radius of action of nearly 2,000 miles. By 1951, however, the power of the radial engines had been stepped up to some 3,000 hp. The later Tupolev heavy bombers have a radius of combat action of 2,500 to 3,000 miles, and this is probably the maximum range of all but a few Soviet atom bomb-carrying aircraft today. It must be remembered, however, that the Soviet Union has developed flight refuelling and this should be practicable in wartime in the Pacific area due south of Alaska *en route* for the United States. It would give the latest jet or non-jet bombers a combat radius of action of over 4,000 miles.



The last official statement on the size of the Soviet strategic bomber force came from General Twining who said early in 1953 that the Soviet Union had about 1,000 four-engined Tupolev bombers in its strategic air force. But these bombers are becoming obsolescent. With a maximum speed of only 350 mph, they will be as vulnerable to attack by jet fighters as were the B.29s in Korea by Communist MiG 15s. The development of Soviet jet bombers is therefore of great importance.

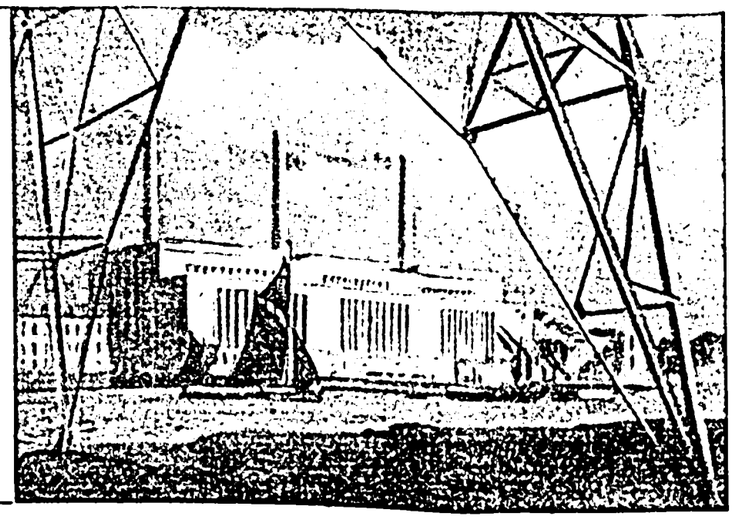
The new Russian heavy jet bomber with swept wings which was shown at the Soviet flypast over Moscow last May Day has revived speculation on the present and future operational capacity of the Soviet long-range jet bomber force. It is certain that the Russians have not, at the moment, a large number of jet bombers in their squadrons comparable with the American six-jet B.47; but they have ample numbers of medium bombers comparable with the British Canberra, such as the Tupolev 10 and the Ulyushin 28. In the first five years after World War II, the development of heavy jet bombers in Russia was slow, despite the great help received from German advisers. The 4-jet Ilyushin 16, though ready for flight trials by 1946, did not go into series production. Since 1951, however, there have been persistent reports of the development of long-range four- and six-jet bombers in the Soviet Union and the last six to nine months have yielded more precise information about them.

Progress with Jets

There seem to be at least three types of jet bombers which may shortly equip a number of the Soviet long-range bomber squadrons. First there is the bomber with six turbo-prop engines associated with the Soviet designers Tupolev, Ilyushin and Gurevich, who was one of the MiG 15 design team. This bomber has been named the TUG 75, and photographs of it were published last year. Its top speed is unlikely to be more than 425 mph so that it is much slower than the American B.52. The TUG 75 may have a combat radius of action of about 3,000 miles, which is comparable with the B.52. Then there is the Ilyushin bomber with 4 turbo-prop engines which is reported to be rather smaller than the 8-jet B.52 and probably has a combat radius of about 2,500 miles.

Finally there is the large 4-jet heavy bomber which flew in the air display over Moscow last May. This was a pure jet and not a turbo-prop machine, comparable in size with the B.52; for an aircraft of this size, the engines would need to be about 15,000 lb thrust apiece. If this is true, it means that the Russians have a jet engine as powerful as any at present in use or under active development in western air forces. The top speed of this new Soviet 4-jet bomber may well be about 625-650 mph—roughly as fast as the American B.52 or the big British bombers.

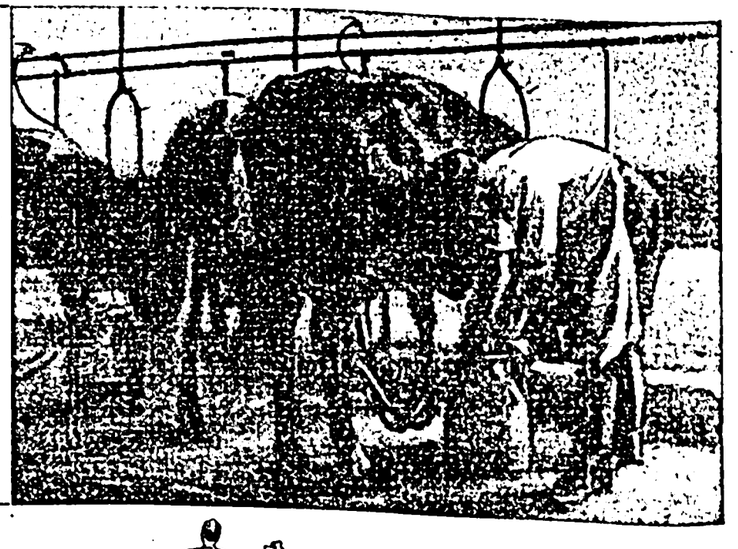
British steel brings the harvest home



A modern farmer has to be a weather-prophet, a business man, a biologist, almost a chemist — and an expert on machines. Wherever men till the soil, steel machines are there to help them. In one single month this year over 10,000 tractors and 5,000 tons of agricultural machinery left Britain for farms all over the world. No other material can do the jobs that steel does. Wherever there is steel there is British steel.

British steel leads the world

THE BRITISH IRON AND STEEL FEDERATION



'ENGLISH ELECTRIC'

More electricity for Britain . . . forty great power stations built in six years . . . and power output increased by 50 per cent! As the new turbines and generators are set whirring, as more current is produced, new transformers and switchgear distribute and control it. Much of this equipment for generation and supply is made by The ENGLISH ELECTRIC Company . . . and also much of the equipment by which electricity is put to use in the service of industry, agriculture, transport, and the private citizen.

bringing you

As electricity reaches deeper into the quiet countryside, it brings not only light and comfort, but *power* for our basic industry: food production. It drives much farm machinery —milking-machines and separators, threshing-machines, elevators and the like—and gives warmth and light to increase the yield from poultry and other stock.
By helping to bring this power to more and more country-dwellers—already to 70 per cent more farms than in 1948—ENGLISH ELECTRIC is playing its part in the vital task of filling Britain's larder.

THE BUSINESS WORLD

Popular Investment

SEVEN months ago, to a blare of trumpets, dealers in Wall Street began selling shares against regular monthly payments. The cavalry of American investors walked, trotted, but did not charge in answer to the call. Two months ago, to the blast of a single bugle, the Whitehead Industrial Trust inaugurated a similar scheme of instalment buying in this country. It must be doubted whether the infantry of British investors will break ranks to answer this summons. Yet investment is passing into the hands of institutions, and if the post-war redistribution of income is to work, the saving habit and the flow of investment must come from lower incomes more directly than through insurance premiums or pension contributions.

Britain can learn much from the United States. To learn should be to paraphrase, not simply to copy. The disconcerting fact is that while the scheme for buying shares against monthly payments in the United States has been successful enough to justify its continuance, the volume of new funds it has attracted into the stock markets has been less than was expected. At the end of five months of exhortation and advertising there were about 19,000 active monthly and quarterly investment plans on the dealers' books; about 120,000 shares, involving close on $4 million, had been bought under these schemes and total commitments to go on buying—commitments which can be revoked at will—approached $45 million. Since the initial flurry there has been a fall in the rate at which the new plans have been concluded, but, even so, between 100 and 150 schemes a day are being started. Monthly payments account for about 58 per cent of the business, with an average investment of about $70 a month. Quarterly payments, at an average rate of about $90, make up the rest. The plans have tapped a new, though tiny, market, for it is estimated that some 90 per cent of the investors under these schemes have never before owned equity stocks. It is much more a market of "white collars" than of "dirty shirts." The market has been broadened to this extent without drawing money away from the popular "mutual funds," but the inflow of business has not been big enough to make the instalment schemes a highly profitable business for the dealers themselves. Their commission barely covers the cost of launching and keeping the schemes afloat; the dealers' own outside agents may prefer to sell units in "mutual funds" where their rates of commission are higher. For the broker himself, the schemes so far are attractive only to the extent that collateral business has followed from the new contact.

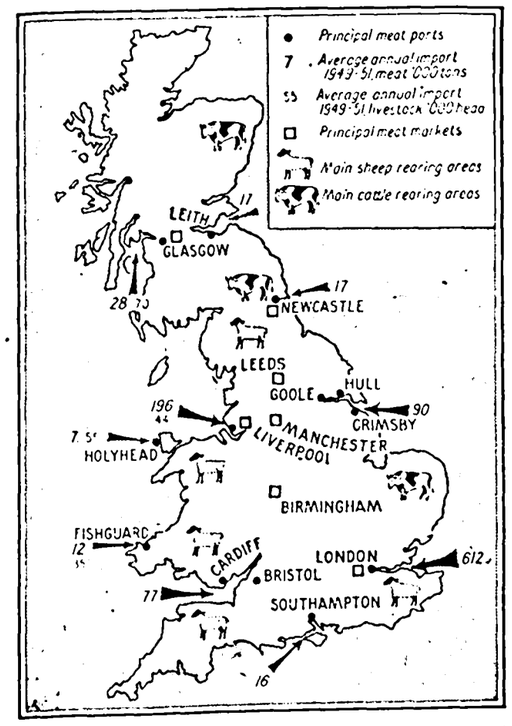
The monthly investment plans have thus only just scraped out a corner for themselves in the giant American stock market, even though they were started in the fairest of all climates. In the United States the scheme was launched just at the right moment, when stock market values first began to climb; in Britain the boom is at least eight months old. The plan was fully backed by the prestige and power of the New York Stock Exchange and supported by extensive publicity; dealers in the London Exchange cannot, of course, advertise. Above all, the American plans were inaugurated in a country where thrift is not looked upon as an outmoded virtue nor investmetnt in shares as suspicious behaviour.

What sort of chance do similar arrangements stand in Britain, where the circumstances are so much less propitious? All the evidence suggests little chance. In times of great Stock Exchange activity, officials observe some increase in the demand for the lists of brokers willing to act for individuals lacking introductions, though the brokers who put their names on that list as a matter of policy have rarely gained a worthwhile client from it. The unit trusts, the obvious outlet

for the small investor, have been selling more units than they did a year ago. But most trusts still have a large number of uncancelled units on their books, available for sale if the demand were there. It seems that the unit trusts are still attracting the type of investor whom they attracted in the past; the average new investment is still as high as £300. And the successful issue by the Bank Insurance group of units heavily weighted by investment trust shares hints, though nothing more, that the unit trust market is still dominated by the "nest egg" investor who has some inkling of the principles of investment. The failure of the scheme by the Orthodox Unit Trust to sell its units in factories against small but regular payments from wages strengthens this conclusion. That attempt broke down because the workers were apathetic and the managers had their doubts what the workers would say if the units depreciated in value.

Bravely, perhaps rashly, the Whitehead Industrial Trust has gone out into this unfavourable weather with its own scheme for selling shares against monthly cash payments. The details of its plan follow closely those of the American models, with the important difference that the trust is not a member of the stock exchange—it is an issuing house that happens also to be a dealer in stock and shares authorised by the Board of Trade. Therefore, the Trust can advertise its scheme. Any orders it receives will be passed on to brokers who will retain all the commission on the transactions. The Trust provides an expensive handling and advisory service, the reward for which will be indirect but possibly substantial. With each of its advertising pamphlets, the Trust sent out a prepaid business reply card, which the potential investor is asked to fill in if he wants details of the Trust's new issues; the hope seems to be that these new investors will swell the list of the Trust's clients receiving a slice of its new issues on underwriting terms. Reference is also made to high yielding ordinary shares as possible though risky outlets for investment; most of the Trust's new issues have been pitched on a yield basis of between 10 and 15 per cent. The danger is that the small investor may learn to think of these yields as consistent with sober investment policy.

The conclusion must be that there is little prospect for monthly instalment plans in this country. Can anything encouraging the wider ownership of shares be put in its place? There does seem to be one opportunity: that is to give a fresh impetus to the sale of trust units. The unit trust does offer the investor a spread of risks and dealing and procedures fully protected by law, though the effective cost of dealing to the investor is usually higher than in an industrial blue chip on the Stock Exchange. A fresh drive in this direction, if it is to gain any success at all, would require publicity that not merely sold a product but educated the buyer too. But no one should expect miracles.



Moving Britain's Meat

A FEW weeks ago, the 574 meat trucks that British Road Services has owned since 1947 were put up for public tender. Meat haulage businesses were specifically exempted from nationalisation; they were thought to be sufficiently well organised already under the national "pool" that began during the war and lasted as long as meat rationing. But almost one-third of the chartered meat fleet did in fact eventually fall into the hands of the Road Haulage Executive. This was through the acquisition of other road haulage businesses, including the vehicles operated by the old railway companies, and through voluntary sales. Most of this fleet has since been on charter to other firms; firstly, to Meat Transport Organisation, Ltd. (MTOL), the company hurriedly formed at the beginning of the war to operate the transport pool; and secondly, since last July, to United Carriers, Ltd. (UCL), its privately organised successor.

The appearance of UCL after the meat trade was decontrolled—an attempt to replace a public monopoly with a private organisation run on broadly similar lines—has caused some controversy inside the meat haulage business. But UCL has now obtained the support of more than three-quarters of the chartered hauliers (i.e., those engaged in meat haulage alone, and formerly under contract to the national pool), owning some two-fifths of that section of the meat fleet; and between a third and a half of the contracting or casual hauliers, with some 40 per cent of the fleet that carries meat in conjunction with other commodities, have also decided to join. As a result of preliminary enquiries amongst potential buyers, the Road Haulage Disposals Board has arranged for the BRS vehicles to be sold in six lots, one large lot containing 497 vehicles and five smaller lots ranging in size from 50 vehicles to two. Tendering will not be completed before October, but it is expected that a company will be formed by the meat carriers making up UCL to purchase the bulk of these vehicles, which they are already operating on charter. If this happens, then the proportion of chartered vehicles owned by members of UCL will rise from two-fifths to about three-quarters.

Although the members of the new organisation retain their individual entity, the form of organisation that has been adopted definitely prevents independent operation. All except a handful of member firms have subscribed £75 apiece towards the share capital of UCL, and are committed to membership for a minimum initial period of two years. Chartered hauliers hand over their accounts to UCL for collection, in return for weekly payments for expenditure incurred on work done, plus an additional 10 per cent of their own gross takings, and a share in any profits the whole organisation makes after dividends have been paid to shareholders. Casual hauliers, who must obtain their contracts through or with the approval of the organisation, receive their gross takings less a 10 per cent deduction for administrative costs and "development."

The principal advantage that a small haulier sees in such an organisation is that work will be shared out "equitably." For the fifteen years of government control this has been the established practice in the meat trade and it has apparently appeared to most of the hauliers to be a convenient arrangement worth continuing, even though the premium they pay for it is high. Meat traffic is usually one-way traffic, and UCL claims that it will be able to arrange return loads of butter, margarine, and other "clean-case" goods more ably than the hauliers could themselves. The control and "levelling out" of freight rates, the sharing of business, and the fixing of profit margins could certainly lead to the retention in business of too many inefficient firms. This has caused a number of the largest charter hauliers who are confident of expanding to their share in the business, to remain outside UCL and they may act as pacemakers in technical and sanitary improvements for the rest; but it is not a consideration that distresses many of the small men.

United Carriers will by no means have a monopoly of meat traffic. In the first place, the Ministry of Food contract with MTOL came to an end on July 5th, and anybody with an "A" or "B" licence has been able to advertise and compete for work, and anyone in the meat business with a "C" licence to carry his own meat. Although some 1,100 of the 1,500 or so chartered vehicles, which carry most of the business, will remain in the new private pool for the next two years, plus approximately 700 or 800 of the 1,800 vehicles engaged on casual work, some 20,000 or more "C" licence vehicles are run by butchers, farmers, and cold storage depots up and down the country and are "predominantly engaged" in the transport of meat. Most of this work will be local; for longer distance haulage UCL will meet with competition from the railways. Equipped with large numbers of specially insulated or ventilated meat containers and waggons, the railways have been responsible for transporting about one-third of the meat that has been moved around the country in each of the last few years. The total "lifted" by all forms of transport in a year comes to about 5 million tons, but this total includes a very large degree of double counting, arising from the movement of meat by road or rail more than once. As rail hauls tend to be longer than road hauls, the railways probably have a somewhat larger share in terms of ton-miles. With their new powers to vary freight charges, the regions should now be able to compete more effectively still with road hauliers.

Livestock movements, which in recent years have amounted to a total "lift" of about 1¾ million tons, almost equally divided between road and rail, are entirely outside the hands of UCL, even though the Government pool was responsible for transporting cattle from collecting centres to the slaughterhouses. Livestock hauliers were left free to compete for the work of carrying cattle from the farm gate to the collecting centres; they have, perhaps as a result, almost unanimously declined UCL's invitation. There are perhaps 4,000 or 5,000 vehicles carrying livestock under "A" or "B" licences and a further 5,000 or so "C" licence lorries and vans working mainly in this type of traffic.

Most of these hauliers are small men owning one or two trucks each; there are very few firms with more than 20 vehicles. In most parts of the country they have set about organising their own regional pools. These vary from the one centred in Reading, which is almost as formally organised as UCL, to others further north that have been limited merely to the working out of agreed rate schedules and to arranging contracts with the local transport officer of the Fatstock Marketing Corporation. The bacon and ham division of the Ministry of Food was inherited almost in its entirety by the Fatstock Marketing Corporation. UCL succeeded in obtaining the Corporation's meat contract, but it failed to obtain a similar contract for livestock. The regional groups of livestock hauliers will now handle

most of this business, which will, however, account for only about a fifth of all livestock movements by road. The remainder is expected to be handled by farmers and purchasing butchers using their own "C" licence vehicles or dealing direct with a local haulier.

Meat has now been off the ration for about two months. The pattern of distribution, after fifteen years of close control, will obviously take some little time to fall into decipherable shape. In 1953, meat consumption totalled 2¼ million tons, compared with 2¾ million tons before the war; just over half of total supplies came from home production, compared with just under half in the mid 'thirties. The movement of meat between farm gate, port, and the customer goes through an intricate network. Ninety per cent of recent imports have arrived at the specially equipped ports located on the four principal English river estuaries—Thames, Mersey, Humber and the Bristol Channel. About 300,000 to 400,000 head of Irish cattle arrive each year at west coast ports ranging from Glasgow in Scotland, to Fishguard in Wales. A further 16 million head are driven off British farms each year to the 3,700 licensed abattoirs. After slaughtering, the meat may be sold at one of the six or seven principal markets or at one of the hundreds of meat depots spread across this country. Some of it is stored in the 320 public cold storage depots. Eventually all of it finds its way to the 36,000 local butcher shops serving towns and villages throughout the land and to the countless catering establishments that use meat. This is an industry that has had fifteen years of security in its fetters; and for the first few months of free trading a caretaker organisation in the meat transport business may serve a useful purpose while carriers regain their feet amidst this complicated pattern. But in the long run the test is still service to the customer; and it is very doubtful indeed whether this will best be supplied by businessmen who put security before freedom to compete.

Business Notes

Wool Prices Fall

THE Achilles heel of the sterling area has been briefly on view this week. The new season's Dominion wool auctions opened in Adelaide and Sydney at the beginning of the week, followed by South Africa at the end of the week. London starts up next week and New Zealand on October 27th. So far prices from Australia show a fall of rather more than 10 per cent compared with last season's close, thus confirming and carrying a little further the marked decline at the London July auctions (the only important between seasons sale). Any monetary system that includes Australia and the Australian wool cheque (about £400 million last season) on the credit side of its balance sheet must be susceptible to downward movements in the price of wool. The present decline is not so far an occasion for either alarm or despondency; on the improbable assumption of neither a further decline nor a recovery the present fall would involve an inroad of the order of £25 to £30 million into Australia's wool earnings, and that would embarrass no one seriously.

Naturally if the decline were to go much further the occasion for reassessment would have arrived, and at the moment it is still not certain that the fall has stopped or a new basis found. It can however be claimed that the trade is not behaving as though it expected the bottom to fall out of the wool market. Bradford tops, after a downward readjustment of their nominal holiday period quotations, are closely in line with raw wool. So is the London wool futures market, but without any rush to cover in it such as both producers and consumers might have made if they had really lost faith in the commodity. Most significant, the sale of English wool in Bradford on Wednesday showed strong home trade buying at prices fully firm compared with the English wool sale in Leicester last July. This was largely crossbred wool of combing quality and confirms the verdict of the Australian auctions that the weakness is concentrated on merinos while demand for crossbreds remains strong.

Balanced Supplies

THERE is no evidence of a cumbersome surplus of wool. As supplies and probable consumption look at the moment there is a surplus this season (beginning July 1, 1954) of only a little over 100 million lb clean weight, taking the world consumption at 2,470 million lb (the second quarter's rate), the new clip at 2,550 million lb, and the surplus of American wool in the Commodity Credit Corporation at 58 million lb. The figures contain plenty of margin for error; they are based on the assumption, which is no certainty, that the surpluses in South America have been cleared apart from a relatively small accumulation of carpet quality wools in Argentina and that consumption will be maintained at recent levels, which seems justified by the fact that public spending power remains high.

It does not appear that there is any major trend adverse to wool consumption yet in operation, though there are in some countries, including Britain, signs of a shift towards the cheaper qualities of wool. The marked narrowing of the difference between merinos and combing style crossbreds has something to do with this. In one particular the trend to introduce synthetics into wool cloths has actually been checked. The US Army, after prolonged experimenting with uniform cloths containing 15 per cent nylon, is in process of placing large orders for a pure wool serge; the only question is understood to be the period over which the orders will be spread.

The exceptionally fine wool season just ended owed much in its first half at least to rebuilding of trade stocks to the level needed to carry a much increased volume of business. That refilling of the pipe line, once accomplished, will not be repeated. Had spinners and topmakers still been short, the London July auctions, which provide the only quick supplies between the seasons, would not have shown lower prices, and Bradford would not now be able to adopt a cautious buying attitude in Australia. But Bradford buyers are moving cautiously, taking full advantage from the facts that the Russians are out of the market, the Americans have about 58 million lb of Commodity Credit Corporation wool to fall back upon, and the Japanese are terribly short of sterling. These factors are still at work and prices may sag a little further. Wool is not scarce at the mills, but it remains a question whether Bradford and Western Europe are not in some need of New Zealand type crossbred wools. The New Zealand auctions do not start until late October, and wool bought there will not be available in the mills until the new year. Next week's London auctions are therefore the only source of prompt supplies.

Buoyant Reserves

THE gold and dollar reserves, when the special and seasonal factors that affected them in August have been taken into account, are still showing a heartening buoyancy—though no longer, of course, the exceptional rising trend that was enjoyed last spring. The total reserve at end-August was $2,918 million, or $95 million less than at end-July, but the figures were again dominated by a large capital payment—the $112 million transferred to the International Monetary Fund in order to reduce its holding of sterling to the basic level and thus to wipe the slate clean of the dollars that Britain bought from it during the crisis of 1947-48. American defence aid received during the month was slightly less than in July, at $11 million. If these two items are excluded, it will be seen that there was a "true" surplus of $6 million. This is the smallest surplus since last autumn; but since this, as the recent trend of sterling has plainly shown, is the period of seasonal strain, it cannot be regarded as unsatisfactory. In August, 1953, there was a deficit of $6 million, followed by one of $11 million in September.

The improvement upon the performance of last year was wholly due to the EPU portion of the account, which produced a gold receipt by Britain of $11 million (on account of transactions in July), whereas twelve months ago Britain was paying gold to EPU. The September settlement with EPU will involve a gold payment of $11 million, since Britain's account for August showed a deficit of £8 million, of which one-half has to be discharged in gold. It is understood that this deficit arises from a draft by France on her London balances in August in order to make a repayment to the British Government this month. The two operations will naturally be self cancelling.

* After taking account of the payment of $181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.
† After taking account of payments totalling $99 million in mid-July direct to creditor countries in EPU in initial settlement of the U.K.'s overdraft with the Union.
‡ EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.
§ After payment of $112 to IMF for "repurchase" of sterling.

Coal and the Boom

NO signs of any significant slackening in the industrial boom can be traced in the latest statistics of output. Production in July appears to have been about 5 per cent higher than a year before; allowing for the shifting incidence of holidays within industry, this is roughly in line with the increase of some 6 per cent achieved during the previous twelve months. In its latest bulletin, the London and Cambridge Economic Service estimates that a continued growth at 5 per cent per year would take the industrial index by the end of the year to about 130 (1948 = 100), and make the average for 1954 about 128, or 6 per cent higher than in 1953. Assumptions that output either remained constant until the end of the year at the June level, or that it regained the sharper rate of increase attained between mid-1952 and mid-1953, would give a range of 127-134 for the figure at the end of this year, but would not affect the annual average much. Indus-

try this year is benefiting from high and steady demand, full employment of machinery, much of it new, and improved supplies of materials.

Only one material, for a time, seemed liable to limit the growth of output this year. The bulletin comments upon the slow rise of coal output, particularly by comparison with other sectors of the economy, and its possible implications. In the last five years industrial output has risen by more than 20 per cent, while coal output has risen by less than 9 per cent. Industry, including gas and electricity, increased its consumption by only 11 per cent, while the railways have cut their consumption by a million tons a year; supplies to other consumers have been broadly unchanged. Over the five years, fluctuations from the general trend have been taken care of by using stocks of coal and varying exports and imports. But stocks offer smaller margins this winter; the surplus coal saved in 1952-53 has by now mainly been used up.

On August 21st total stocks of coal amounted to about 16 million tons, 1¼ million tons less than a year before. Cumulative output from the mines, at the end of last week, was just under 2½ million tons up on the year. Nobody in the industry now hopes that the increase of about 5½ million tons that was aimed at by the Coal Board and the miners' leaders can now be achieved; it is being questioned whether the increase during the full year will actually exceed 3 million tons. The London and Cambridge bulletin, working on figures to mid-July, holds that stocks at the beginning of the winter might total about 18 million tons, much less than in 1952 or 1953, and considerably less than the industry now considers desirable in consumers' stocks alone. That assumes imports of about a million tons, which may certainly be as much as the Coal Board can land by the end of October; but the current indications are that it may bring in considerably more coal than that during this winter.

Gussies Opportunities

BOUNDING along at record prices (they touched 115s. 6d. on Thursday) the 5s. ordinary shares of Great Universal Stores mark the investors' satisfaction with the record dividend and profits for the year ended March 31st. The buoyant market also shows investors' conviction that the period of growth in that enterprise is not yet over. Mr Isaac Wolfson, the chairman and managing director, does not dissent from that view. His speech which accompanies the full accounts gives this summary:

> Given normal circumstances, I have every confidence that the expansion we have seen in the past will continue in the future, and that our turnover which, I am of the opinion, is already as great as any similar undertaking in Europe, has many opportunities for further increase. Finally, I am pleased to state that for the period to date sales volume and consequent profits again show a satisfactory increase as compared with the same period last year.

What are the factors in the expansion that has carried the consolidated balance sheet total up to £80.3 million on March 31st, compared with £67.2 million a year earlier? There is first the company's vigorous policy of expansion. Mr Wolfson is for ever buying something (though he has also been doing some judicious pruning on the manufacturing side of the business). And he is still buying; on Thursday he announced that he had on August 31 sought permission to issue one "A" ordinary share in exchange for each ordinary share of Jones and Higgins. Thus he improves on his previous offer of £4 10s. and Henry Ansbacher's offer of £5, after the Jones and Higgins directors had dug in their toes and announced that the shares were worth £6 on asset values. Secondly, there is the group's mail order business—its traditional backbone—which Mr Wolfson announces has developed significantly during the year, and last but not least there is hire purchase.

The group accounts show gross hire purchase debts of £40.4 million, compared with £33.5 million, and other instalment debts (not strictly hire purchase) of £11 million, compared with £7.5 million. The accounts cover a period before the hire purchase restrictions were withdrawn, but in furniture, which is one of the biggest (textiles and clothing is the biggest) sections of the business, hire purchase was not recently restricted. There is nothing apologetic in Mr Wolfson's attitude to hire purchase. He believes that it contributes to a higher standard of living, good citizenship and responsibility. Who finances this enterprise? Great Universal Stores does not apparently discount his hire purchase paper in the market to any great extent. The group has no overdraft in this country, but has borrowed from the banks £2.7 million, against £2.3 million; for the Canadian and South African businesses he has other loans of £607,000, against £398,000, and his creditors, accrued charges and bills payable are £19.8 million, compared with £18.1 million. By far the greatest part of this last item is matched by physical stocks of £16.2 million, against £16.1 million.

Save to a small extent, the hire purchase finance is therefore being financed with shareholders' money; the reserves (including tax reserves) of £27.1 million, against £20.7 million. The group has carried £3.2 million, against £2.4 million, to revenue reserves this year. But shareholders, who reap the benefit, should have no complaints.

Wide Screens and Small Cinemas

THE improved trading results announced this week by the J. Arthur Rank Organisation (which are discussed in a Company Note on page 766) offer fresh evidence that the sharp decline in business at the box-office experienced between 1950 and mid-1953 has for the present been checked. But they also tend to confirm what the recent Board of Trade statistics of the cinema trade have suggested—that it is the large cinemas which have achieved the lion's share of this modest recovery, leaving a significant proportion of the independent exhibitors who operate smaller halls in circumstances that are still worsening.

Those hardest hit are not the very smallest cinemas, tiny halls with fewer than 250 seats; such village cinemas often enjoy a monopoly position simply because more powerful competitors can find more profitable ways to employ their money than by opening other cinemas nearby. It is the cinemas with between 250 and 1,000 seats—which will include a large proportion of small urban halls that are subjected to the competition of the circuits' "super-cinemas"—that were continuing to decline in admissions and net takings until the reductions in Entertainments Tax and the recent effective reduction in the Eady levy began to operate. These small cinemas cannot manage with the tiny staff of the village halls; their wages costs alone account for a significantly larger percentage of net takings than wages in the largest cinemas—where business has in any case been improving in the last twelve months.

Some share of the credit for halting the general decline in cinema business, guess it how one will, must go to the wider screens and the three-dimensional novelties that have blossomed in British cinemas since last summer; and this is the grimmest omen of all for the small cinema. Not all of these cinemas are physically large enough to instal wide screens without sharply reducing the number of saleable seats. But the difficulty that affects most of them is simply finding the money to convert for these new visual techniques; the much higher initial costs of "stereophonics," for what that is worth, may put such added refinements quite out of reach. It is hardly surprising that such independent exhibitors should constitute a very hard core of opposition to suggestions that the exhibitors should make any considerable concessions to other sections of the industry when it comes to sharing out the benefits of reduction in Entertainments Duty. They cannot afford the generosity of the larger circuits—who have of course a foot in more than one of the industry's camps.

A Plum from Vickers

AFTER Vickers had reacquired the majority interest (75 per cent this time) in English Steel Corporation and after it had become evident that orders for the Viscount were rolling in, the reappearance of the company as a big borrower in the capital market causes no surprise. Yet the absorption of working capital into this great engineering, shipbuilding, aircraft manufacturing and armament group is noteworthy. No less than £15.3 million government stock (which realised £14 million cash) came in in 1951 from the nationalisation of English Steel. Vickers paid out £7½ million to re-acquire its stake in the equity. The whole of the remaining £6½ million and all the rest of the liquid assets at the date of the last balance sheet have been virtually absorbed into the business and the group is now a borrower from its bankers. Moreover, it is worth remembering that English Steel is no longer financed wholly by its owners—Vickers and Cammell Laird: £10 million of Government money remains in the business on a prior charge, of which Vickers has in effect the benefit of £7½ million.

So Vickers comes to market—technically to its stockholders and debenture holders for money—and the offer is such that the money will be forthcoming eagerly. Shareholders are offered, as briefly reported last week, 3,078,871 ordinary £1 shares at 27s. 6d. in the ratio of one for eight and without participation in the interim dividend due in October this year, which the board now reveals will probably be 2½ per cent. The existing ordinary shares stand at 39s. 6d., so that stockholders are offered something worth while. The new shares were quoted at 13s. 6d. premium when dealings began, then touched 14s. premium before coming down to 13s. 1½d. premium.

For the bulk of its new money Vickers is in the fashion in issuing an unsecured loan stock—£6 million of 4 per cent stock 1962/69 at £98½. It is offered—not as rights—to stockholders and debenture holders. They should use their opportunity. The stock is likely to enjoy a ready market with the institutions. Redeemable at £102 between 1962 and 1964, at £101 between 1964 and 1967 and finally at par after 1967, it gives a running yield of £4 1s. 3d. per cent, a redemption yield of about £4 3s. to redemption at the last date and of about £4 10s. to redemption at the earliest date. It enjoys attractive security in that the company will be precluded from creating additional mortgages in front of it for more than about £2,850,000 and the operating subsidiary Vickers-Amstrongs will be forbidden to raise mortgages outside the group, while its temporary borrowings will be limited to about £4 million.

Flanked by the directors' cautious forecast that Vickers group earnings this year will not be less than those for 1953 and by balance sheet assets of more than £62 million, the institutions may think the new stock is just what they want and be willing to pay a modest premium for it. The board is fortunate in being able to woo those powerful investors without neglecting the true interests of the company. Apart from the possibility of English Steel being re-nationalised, there is justification for an armament company such as Vickers raising part of its capital by medium term finance. Sooner or later the peak of rearmament must pass and it would be handy to have some capital falling due for repayment just when the volume of stock and work in progress was running down.

FCI Lends More

FINANCE Corporation for Industry, the City institution that finds finance for big industrial enterprises to which for one reason or another normal sources of finance are not available, has again increased the scope of its activities. For the year ended March 31st,

Are you

Whitehall 1511 Extension 114

the chairman, Lord Bruce, announces £11 million of new business compared with between £4 and £5 million in the previous year. The record is the more remarkable in that the biggest of the Corporation's activities—the financing of the steel industry—was declining during the period. In the period when steel was threatened with nationalisation but not yet nationalised Lord Bruce made it his special task to help the industry find the money for its great development programme. With the Steel Company of Wales a big customer the investments in steel had by March of last year reached nearly £39½ million. This year the investment had come down to £36.3 million and the Corporation obviously could have reduced its steel investments further by calling upon the Realisation Agency to take over with Government money.

But Lord Bruce is in no hurry to get out of steel. He foresees a new demand for finance from a newly constituted privately owned steel industry, and in his mind but not on paper, holds the steel money available for steel again. Meanwhile the Corporation has received a handsome sum (£2½ million) in compensation for the loss of its rights to convert its loans largely to Steel Company of Wales into equities—a right that was lost when steel was nationalised. The compensation brings the Corporation's net profit for the year up from £200,962 to £2,652,474, and the whole profit is again employed in writing down investments; the institutions who have subscribed the share capital are not greedy for dividends.

The non-steel activities of FCI have been expanding. The non-steel investments are up from £21.4 million to £22.6 million and the commitments for future loans from £11½ millions to £18.3 millions. When allowance is made for the fact that these figures conceal some substantial repayments of investments—for example the sale of the Perkins shares—the growth has been substantial. It includes the backing that has been given to Air Finance. And it includes some quite exceptional risks that the corporation has thought it right to take in the public interest. One of these—the sinking of £8½ million into Petrochemicals—is still in the category of "risk capital." The company is, however, now understood to be making a trading profit, though not yet enough to cover depreciation and interest on borrowed money. Some day, no doubt, a capital reconstruction will have to take place.

Local Financing

THE Treasury has now fulfilled the Government's promise of June 4th to relax some of the rules under which local authorities borrow money from the Public Works Loans Board. The effect of the letter that has been sent to local authorities is that the Public Works Loan Commissioners have been given discretion to waive for certain loans the condition requiring the loans to be repaid in the maximum period authorised for repayment by the sanctioning department. Thus local authorities who finance their programmes can, if they wish, borrow shorter (and therefore cheaper) money from the PWLB than implied by the length of the relevant sanction. The concession came into force on August 30th and does not apply to any advances made before then. Nor does it apply where there is any Exchequer grant directly or indirectly linked to the loan charges. Obviously it would not be practicable to allow the local authority to repay more quickly if the burden of that quicker repayment fell on the Treasury in the shape of an increased grant.

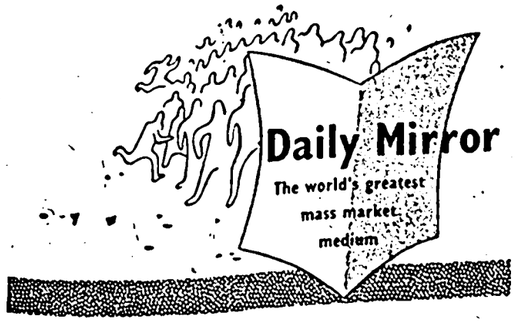
That rule makes the concession applicable to loans for housing but excludes the financing of schools from it. In borrowing for schools, repayment will still have to coincide with the period of the sanction. It may be doubted whether even with housing local authorities will make much use of the concession. Sixty year loans at the PWLB's long term rate of 3¾ per cent is not an unusual term for such borrowing. To get the next cheaper tranche of money (3½ per cent) the local authority would have to come right down to 15-year borrowing and would have to repay by instalments in that period; the burden of such quick repayments might react heavily on the rates. The Treasury's concession does not really compete with the main attraction which borrowing through the market or through private mortgage holds out to the local authorities. Loans floated through the market are not amortised by regular repayments and the immediate burden on the rates is less, even though the market rate of interest is often no lower than the government's.

Ships at Fixed Prices?

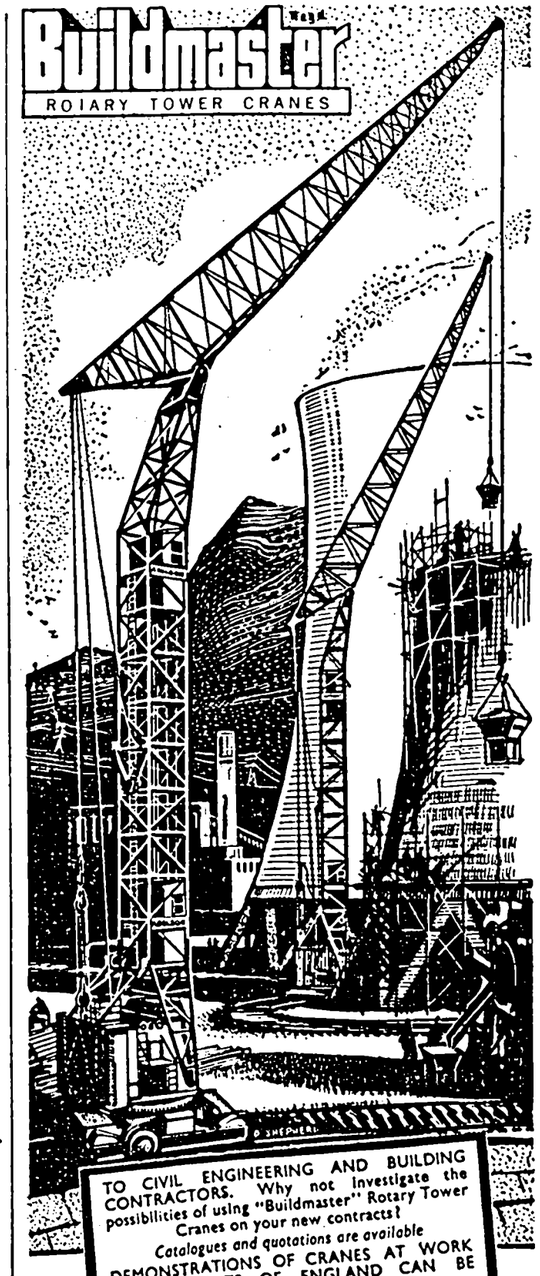
WITH a fleet of ships entered in the books at a net value of over £21 million and with uncompleted liabilities for ships under construction of nearly £10 million, the chairman of Furness Withy, Sir Ernest Murrant, has a right to strong views about shipbuilding costs. In his statement with the annual accounts of Furness Withy, accounts which bear the mark of lower freight rates, a smaller volume of business and high operating costs, he argues that now the Government has done its part with the 20 per cent investment allowance it is the turn of the shipbuilding industry to make its contribution. Sir Ernest hopes, of course, that the investment allowances are not the last concession that the Government will grant to the shipping industry, but his principal plea is that the shipbuilders themselves should reduce costs by achieving higher productivity and, of far greater immediate importance, accepting orders at fixed prices. All the customers of the British shipbuilding industry, both at home and abroad, would endorse that plea.

The shipbuilders themselves are also becoming aware that it is the customer that now calls the tune and they are beginning to listen to such arguments as Sir Ernest's with anxious sympathy. They realise that, even though the liner companies may wish to replace their obsolescent ships methodically if they are not to lose their share of the market, a prolonged period of low freight rates is sufficient in itself to discourage shipowners from placing orders for new ships. They realise too that the ship-owners may worry whether ships built in recent years at a high capital cost will turn out ultimately to have been sound economic propositions; that risk looms all the larger if new ships have to be ordered at prices that automatically slide upwards with every increase in costs.

Many shipbuilders are therefore aware that fixed prices and firm delivery dates will have to be quoted if the flow



Are they going your way?



Young families today are going places. That's why they are so vital to you and your business. Right now many of them may not have as much money as you would like but they are planning for the future. Do your products come into their scheme of things? Are they going your way?

With its strikingly realistic presentation of news, its fearless facing of facts, the Daily Mirror appeals powerfully to vigorous, young readers. In fact, according to the I.I.P.A. Survey, the Daily Mirror has over 1,700,000 more readers under 45 than any other national daily. These are the people with the longest buying years ahead of them—a generation with an ambition to possess lovelier and better things.

With the biggest daily net sale on earth, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. *And—Daily Mirror readers are young readers. Your customers today—next month—next year.*

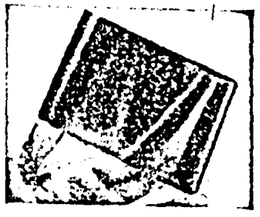
On the Chairman's desk at Ransomes and Rapier



The Right Honourable Richard Stokes, M.C., P.C., M.P., is also Chairman and Managing Director of the famous engineering firm of Ransomes and Rapier Ltd. and Managing Director of Cochran & Co. (Annan) Ltd. On his desk you will see signs of the busy life he leads : a scale model of his firm's new Walking Dragline, and his Dictaphone Time-Master dictating machine.

ON THE DESKS of men of the calibre of Mr. Richard Stokes—men whose business lives are full and successful—this trim little dictating machine, the Dictaphone Time-Master, is often to be found.

Their time is precious. The Dictaphone Time-Master saves them time. Their ideas are more valuable still. The Time-Master records them instantly at any hour of the day or night. And by dictating the Time-Master way they leave their secretaries time to be real *assistants*.

Dictaphone Time-Master is a dictating machine as simple to use as your telephone. Yet, as many thousands of business men all over the world have discovered, it can double your capacity to get things done. Indeed, old-fashioned methods of dictation may be robbing your business of thousands of productive hours.

Why not try the Dictaphone Time-Master dictating machine on your own desk? Without obligation, of course. Telephone or post the coupon to-day for a free trial.

Plastic Dictabelt records are "inside secret" of Time-Master. Each takes 15 minutes dictation, folds flat, can be mailed, filed.

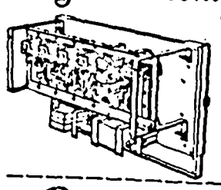
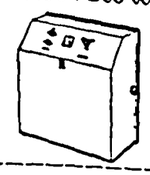
WATCHMAN PROTECTION

one of the TR SERVICES. **The maximum security and protection so far achieved is provided by this unique service, which is based on equipment evolved after many years of research.**



Intruders discovered—pressing button sounds alarm.

Cable cut—Alarm automatically sounded.

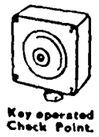


Watchman put out of action—Alarm sounds if patrol is not completed.

Programme Control Unit

FOR automatically determining the time at which each patrol is to be commenced. These times are unknown to anyone, including the Watchman himself, until indicated by the Patrol Recorder.

Patrol Recorder



FOR indicating to the Watchman when to start each patrol, recording each properly completed patrol and warning if patrols not so completed.

Check Points

Key operated Check Point with Alarm push.

Key operated Check Point.

FOR ensuring that only properly completed patrols are recorded and that an alarm is automatically sounded if any patrol is not carried out at, and within, the correct times. Alarm pushes at Check Points are optional.

TR SERVICES include also the installation and maintenance of Internal Automatic Telephones with loud-speaking facilities, Synchronised Clocks, Time Recorders, Time Signals, Works and Office Loud-speakers, Fire Alarms, Centralograph, etc.

Full details of this unique system free on request.

of new orders is not to fall to a trickle. Foreign yards are doing so, and quoting cheaper prices: as Sir Frederick Rebbeck of Harland and Wolff said this week, for the British price of a large passenger vessel a Continental yard could often build another smaller ship as well. Yet the British shipbuilders still have a constant fear of further increases in the price of steel, coal, transport and wages. Shipbuilding prices did not begin to level out as early as the prices of other capital equipment, and they have risen this year by about 2 per cent. The industry can now, it is true, obtain its steel plate more readily; but the plate also costs more than it did, though it still compares well with the prices foreign builders have to pay. Moreover, the industry is faced with the demand for a new wages structure based on a higher basic wage all round. But the time may be close at hand when the competitive state of the international market may compel the builders to shoulder more of the risk of losses on contracts than they have been inclined to accept in recent years.

Foreign Exchange for Emigrants

THE movement towards the convertibility of sterling has this week been carried another step forward—and this time by a move that favours the resident, whereas most of the previous moves have favoured the foreign holders or users of sterling. A general relaxation took effect on Tuesday last in the restrictions on transfers of funds by emigrants from the United Kingdom to their new country of permanent residence. Emigrants from the United Kingdom to countries outside the scheduled territories are now regarded as residents of their new adopted country as soon as they have left the United Kingdom, instead of at the end of four years. The main effect of this is that these emigrants can now convert the whole of their sterling income into the currency of the country in which they reside and are no longer restricted in such transfers to the exiguous amounts of the travel allowance. The other freedom that flows from the immediate redesignation of their status in the eyes of the Control is that they can transfer their sterling securities and blocked sterling to other non-residents, and can, therefore, export forthwith the whole of their capital through the market for "security" sterling at a cost that is now no greater than 1½ per cent discount on the official rate of exchange. Perhaps the most remarkable facet of the Treasury notice announcing these changes is the attention that is officially drawn to these facilities for exporting capital through the well-known but quite unofficial market in security sterling. These changes will relieve the Bank of England and the authorised banks of a great deal of administrative labour.

The other main concession to emigrants refers to the so-called "settling-in" allowances. Until last Tuesday any emigrant to a non-sterling country other than OEEC countries was allowed a total settling-in allowance of only £1,000, plus £250 for each dependant up to a maximum of £2,000 for each family unit. For emigrants to OEEC countries the maximum allowance per family unit was £5,000. These settling-in allowances could be withdrawn over the period of four years before the emigrant acquired non-resident status. Now the settling-in allowance has been increased to £5,000 for all countries outside the dollar area, and it can be withdrawn in full as soon as the emigrants have left the United Kingdom instead of in instalments over four years.

The foreign exchange cost of these various concessions—it arises principally from the freeing of income transfers—is estimated at about £1,000,000 a year, and will be incurred mainly in dollars. This estimate ignores the additional cost of emigration allowances for people who would not have emigrated but for these changes, but it includes the additional transfers that are now likely to be sought by persons who have emigrated within the past four years (and so have not previously acquired non-resident status) and have not yet drawn the whole of their settling-in allowances. The amount involved is not large, but the principle at stake in these relaxations is sufficiently important to make them rank among the major steps so far taken in the direction of a genuine convertibility of sterling.

Credit Trend in August

AT first glance the latest figures from the clearing banks suggest that the trend of credit expansion may be steepening. In the four weeks to August 18th net bank deposits rose by nearly £35½ million, compared with an increase of £27½ million in the corresponding (five-week) period last year and £23½ million two years ago (when the return also related to five weeks). The comparison with both these earlier years is, however, distorted by the effects of the heavy repayments of bank advances that were then being made out of the proceeds of issues by the BEA and the Gas Council. This year's BEA loan was actually floated on the banks' August make-up date, so that the consequential repayments of bank advances came too late to affect the banks' figures. Their total advances rose during the four weeks by £5½ million, whereas in the two previous years they dropped by £53½ million and £68 million respectively—or by appreciably more than the probable amount of the special repayments. Despite the absence of such repayments this year, the private sector of the economy

† Ratio of assets to published deposits.

slightly reduced its net requirements for bank credit during the four weeks—principally because of a rather sharp reduction, by £11½ million, in the banks' portfolios of commercial bills.

In other words, the month's credit expansion was wholly attributable to the demands made on the banks by the central government—borrowings that are principally reflected in an increase in the banks' holding of Treasury bills by nearly £35 million and in their call money by nearly £10 million. Even so, the Government's intake of bank credit during the four weeks is hardly more than half as large as in the five-week period last year. Most of this difference can be accounted for by visible changes in the Government's domestic finances. During the periods most nearly comparable to that covered by the banking figures the Exchequer swung from an "overall" deficit of £50 million last year to a small cash surplus this year. Net receipts from Tax Reserve Certificates and small savings were somewhat larger but, on the other hand, owing principally to the difference in the length of the two periods, the net decline in the note circulation was much bigger this year than last. Because of the large seasonal fluctuations in the note circulation from week to week and even from day to day at this period, the lack of alignment between the banking and Exchequer figures is liable to produce a more serious distortion than usual. On this occasion, it would, therefore, be unwise to try to draw conclusions about the extent—or even the direction—of "departmental" operations in the gilt-edged market.

Tidying up in Steel

THE Iron and Steel Holding and Realisation Agency and its City advisers still hope to be able to make at least two public offers of nationalised steel companies between this month and Christmas. High in the list for resale to the public are Whitehead Iron and Steel Company, John Summers and Sons, and Colvilles. In preparation for the resale of Colvilles to the public the Agency has transferred to that company two small companies whose previous owners did not wish to buy them back, so that when Colvilles ordinary shares are offered to the public Dixon's Ironworks and the Etna Iron and Steel company will also be denationalised.

Dixon's, with an issued capital of £318,666 in 100,000 5 per cent cumulative preference shares of £1 each and 218,666 £1 Ordinary shares was hived off from William Dixon whose collieries were also nationalised. The company makes about 150,000 tons of pig iron a year and its coke ovens at Govan supply part of Glasgow's gas. The company has a poor record. Net losses of over £200,000 have been shown in each of the last two financial years. The company was nationalised for £250,538 in government stock. Etna Iron and Steel Company rolls light bars and sections at Motherwell; the company breaks even with a small profit and was nationalised for £333,333 in Government stock. The nominal prices at which these two units have been transferred to Colvilles has not been disclosed. It is clear that they make a comparatively small addition to the total of that group's worth and that the Agency would have found it difficult to sell them in any other way.

Anglo-Japanese Trade Disappoints

THE course of Anglo-Japanese trade and payments is to be reviewed in discussions between officials of the two countries that are to open in London next week. This mid-year review was anticipated when the Anglo-Japanese agreement for 1954 was negotiated, but it was to occur only if one or other of the parties called for it. The initiative has in fact been taken by Japan, because the Japanese are seriously disappointed at the way in which the arrangement has worked. In one respect there has been an improvement since the beginning of the year; payments between Japan and the sterling area are now in approximate balance, whereas a few months ago they were still running strongly against Japan. This equilibrium has been achieved, however, at a level of trade that is considerably lower than was envisaged when the 1954 agreement was negotiated. The agreement assumed that the two-way flow of trade between Japan and the sterling area would total about £400 million a year; actually, it has recently been running at about £250 million a year. The major reason for this disappointing performance is the comparatively high price of Japanese exports.

The Japanese contend, however, and with some force, that the disappointing level of their exports to sterling countries is due not so much to their inability to compete in price and quality as to their inability to compete at all—because since in many markets, including the United Kingdom, the Colonies and the Dominions, they are shackled by quotas and other forms of quantitative restrictions against which no competitive virtues will avail. Their resultant shortage of sterling, they argue, prevents them from buying from sterling countries on anything like the scale that was contemplated when the 1954 agreement was negotiated. The Japanese representatives will, therefore, try to persuade the British authorities to concede a further relaxation of British and Colonial import restrictions on Japanese goods. They will also endeavour to secure from London a promise to try to persuade the Dominions—and Australia in particular—to relax their restrictions. In addition, it will be surprising if these London talks, although conducted only at the "official" level, do not include some reference to the Japanese application for full membership of Gatt. This is an issue that will loom large at the forthcoming meeting of the contracting parties in Geneva, where the opposition to Japan's full accession is still likely to be spearheaded by the United Kingdom—and this attitude may be relevant to the problem of the present disappointing level of trade between Japan and the sterling countries.

Harpoon at a Venture

FOR the first time since before the war the whaling expeditions are preparing to set out for the Antarctic without a British Government department waving them off with a firm bid for part of their catch. Yet they are going in greater strength than last year. Nineteen expeditions—not all of them interested in the British market—will be setting out, compared with seventeen last year. The Pana-

Malleable castings annealed in 48 HOURS!

ONLY Gloucester can anneal blackheart malleable castings in 48 hours because Gloucester is the only foundry in Britain with the advanced new elevator-type electric annealing furnace. Complete mechanisation, long experience and exacting control of quality are the other reasons why Gloucester can offer you fast service, consistent quality and high output of malleable and grey iron castings. Call in the Gloucester man at the earliest stages of design. His advice can save you time and money.

The Elephant consults the Lion

'Between you and me,' says the Elephant to the Lion, 'there are 150,000 miles of submarine cable.'

'And between you and me,' replies the Lion, 'there are more than 200,000 miles of wireless circuits. So if I can't get in touch with you one way, I can always find you in another.'

These are round figures—or, to be more specific, round-the-world figures. On the map, the miles between the Lion of the United Kingdom and the Elephant of Ceylon, are a matter of four figures only. But the miles that link them in the chain of Commonwealth communications are many times greater.

In the United Kingdom the Post Office handles messages to and from Ceylon. The Post Office in Ceylon sends and receives messages there. Cable & Wireless Ltd. owns the cables under the sea which link the two. Indeed, it owns and maintains the whole 150,000 mile Commonwealth cable system. The Company, also, owns and operates wireless stations in the Colonial territories which relay messages between the eight senior countries of the Commonwealth, and provides a network of 114 telegraph circuits.

The headquarters of Cable & Wireless Ltd. are in London. Its day-to-day business is carried out between the eight sovereign nations of the Commonwealth; in the Colonial territories and in foreign countries in which concessions are held.

How these services are carried out is explained in a 40-page illustrated booklet "World Wide Communication", which gives many interesting details about the Company's equipment, operations and administration. A copy will be sent to you without charge if you will write, mentioning this paper, to:—The Public Relations Officer, Cable & Wireless Ltd., Electra House, Victoria Embankment, London, W.C.2.

CABLE & WIRELESS LIMITED

Electra House, Victoria Embankment, London, W.C.2

manian "Olympic Challenger," property of Mr Onassis, which did not go out last season yet will go this season, and there will be three Japanese expeditions compared with two last year. The others again are nine Norwegian expeditions, three British (two by Salvesen and Co. and one by the United-Hector Whaling group), one South African (Union Whaling), one Dutch and one Russian.

A year ago much of the British whale catch was sold to the Ministry of Food at £67 10s. a ton before the expeditions started. It proved about the lowest price of the season; up to £80 a ton was paid for smaller parcels later. This year, with the Ministry of Food out of the margarine business, whaling companies will have to sell direct to the manufacturers. The Unilever group is much the largest, but by no means the sole prospective buyer. None of the British expeditions has yet reported a forward contract to cover any part of its expected catch. But it is still possible that one or more of them may still make a limited forward sale.

This year private enterprise is taking more risks than it normally does even in this risky business, for in an idle market no one can say with assurance what the present price of whale oil is. It seems at least certain that any deal made at present ought to be priced somewhere between last year's bulk contract price of £67 10s. and last year's top price of £80 a ton. Palm oil, which is in some ways competitive, has been falling; it now stands at £75 a ton cif compared with £80 a month ago, and whale oil is normally £3 to £5 a ton cheaper than palm oil. Prices seem unlikely to rise much from that range while the United States sits over the edible oil market with its great surplus of cotton seed oil, but they can fall.

Barclays DCO Tidies Its Capital

BARCLAYS Bank DCO—this is now to become the official form of the bank's title—is following in the steps of its elder sister in deciding to simplify its capital structure. When the bank was formed in 1925, it was considered prudent for Barclays Bank to provide it with an additional reserve in the shape of uncalled capital. Accordingly, Barclays Bank subscribed for 500,000 "B" shares of £5 each on which it paid up only £2 a share; and, in consideration of Barclays assumption of this uncalled liability, the "B" shares were given voting control of the new bank. Now the need for any such supplementary reserve has long since passed, and it is proposed to merge the "B" shares with the £8,276,875 of £1 fully paid "A" shares; but Barclays Bank will continue to have voting control because it has also a considerable holding of the existing "A" stock.

This rearrangement is to be brought about by the payment by Barclays Bank of the £1,500,000 of uncalled liability on the "B" shares and by a further payment of £1,875,000 representing the difference between the nominal value and the market value of the £1,500,000 of "A" stock into which the "B" stock newly acquired by Barclays Bank will in effect be exchanged. Altogether, therefore, Barclays DCO will be receiving from Barclays Bank £3,375,000. These new resources will enable it to achieve, in its turn, a notable simplification of the capital structure of its subsidiary company, Barclays Overseas Development Corporation. At present, half the capital resources of the Development company are in the form of £3 million of 2 per cent unsecured notes held by Barclays Bank. Barclays DCO will now increase its own investment in the Development Corporation by £3 million, thus permitting a retirement of the notes. In terms of cash, the net effect of the operation is relatively small. It represents simply a transfer of £375,000 from Barclays Bank to Barclays DCO. But the tidying up will certainly be advantageous—especially, no doubt, for the Development company, which should be put in a position to look to outside sources for any further capital it may need to finance its expanding business. The new DCO capital will not rank for dividend for the year ending September 30th, and the chairman's circular to stockholders expresses the cautious opinion that it "will not adversely affect" the rate of dividend on the "A" stock.

The Port and the Power Station

"BLYTH A," the first section of the new power station that the British Electricity Authority proposes to build at Blyth, near the mouth of the River Lyne in Northumberland, is now planned to contain four generating sets of 120,000 kW installed capacity each; and the increase in fuel capacity that is mentioned for the station when finally completed suggests that its eventual capacity may rank among Britain's largest stations. This first section which BEA has included in its programme up to 1959, will at the outset take about a million tons a year, and the consumption of the completed station is put at 3 million tons a year.

Such an individual demand for coal can be a very significant factor in the whole marketing of a division's coal output, and this seems to have been responsible for the rather odd, sad comment by local National Coal Board officials that this would further curtail the amount of coal they could ship through the port of Blyth, which was already "crying out for more coal to ship." At the nearby Lynemouth Colliery, it may be noted, the complete reorganisation now in hand has included the installation of one of the largest coal washeries in Britain, which can handle about 1½ million tons a year. Had this power station originally been counted as the main market for the colliery, such a washery would probably never have been put in; coal for a power station needs little preparation before delivery. In fact, however, Coal Board headquarters in London are undismayed by this shift in their local market, of which they have had considerable notice; Lynemouth coal will continue to be shipped—mainly coastwise to the south of England—to customers who want prepared coal, while the untreated smalls for "Blyth A" will be supplied from other collieries in the division. Even this first section of the station, of course, has yet to receive the consent of the Minister of Fuel and Power; at the present rate of construction of big power stations, "Blyth A" will not be coming into the Northumberland and Durham coal market for several years.

SHORTER NOTES

Details of the contract between Vickers-Armstrong and Capital Airlines for the sale of 40 Viscounts have now been published. Capital Airlines will purchase the aircraft at the standard price on deferred terms, with payments spread over five years from the date of delivery. Interest will be paid at the rate of 1¼ per cent over Bank rate; as security Vickers-Armstrong will have a mortgage on the aircraft until the final payment is made. In addition from a specified (but not yet published) date Vickers-Armstrong will be given, subject to certain conditions, an additional security over the existing Capital Airlines fleet. Under its arrangements with Air Finance Vickers-Armstrong will receive payment in full from that company on delivery of each aircraft and repayment to Air Finance will be made as instalments are received from Capital Airlines.

★

Following the sharp rise in jute prices in Pakistan the Jute control in Britain which supplies part of the Dundee industry's requirements from its accumulated stocks has raised its selling prices. The increase, which varies according to grade, averages about £8 10s. per ton and is intended to bring prices into line with world prices. The control's selling prices of imported jute goods of hessian type have been correspondingly increased. The new prices took effect on August 31.

★

The British Government announces the abandonment of the home flax scheme as from the harvesting of the 1955 crop. The scheme, which was started during the war to meet the needs of the industry in Northern Ireland for seed at a time when most of the normal sources of supply were over-run by the enemy, has latterly been costing about £210,000 a year. Between 2,000 and 3,000 tons of seed and about 2,000 tons of flax have recently been produced; about 1,000 people have been employed in the ten mills; five of these will close after this year's crop and the last five will continue operating into the autumn of 1956. It is understood that the Northern Ireland Government has been consulted.

Company Notes

ODEON THEATRES. The extraordinary answer that the stock market gave to the payment of an ordinary dividend of 15 per cent, less tax, by Odeon Theatres after four dividend-less years was to mark the 5s. shares down by 4s. 3d. to 20s. The "bulls" had over-reached themselves, in looking for tax free dividends of 10 per cent, 15 per cent or even more. Having over-shot one target they failed to range on another, for the announcement by Gaumont-British of an increase in its ordinary dividend from 7½ to 12½ per cent, less tax, for the year ended June 26th, was followed by a rise in the price of the 10s. shares of 3d. to 11s. 9d.

One reason for this curious behaviour is that while Gaumont-British has reported an increase in net earnings Odeon Theatres has reported a slight decline for the same period. Odeon's net profits in the year to June 26th fell from £1,190,532 to £1,031,080; the explanation is that the increases in taxation (from £2,612,257 to £3,259,474), in depreciation and audit fees (from £1,486,867 to £1,634,570), and in payments to outside shareholders (from £936,121 to £1,233,575) have more than absorbed the rise in trading profits from £6,837,496 to £7,704,084. The increases in tax and payments to minority interests are a direct reflection of higher profits in the accounts of subsidiaries. The Gaumont-British statement, on the other hand, shows that while trading profits have risen from £3,124,347 to £3,627,052 the charges for depreciation and taxation show little change; hence net profits have jumped from £361,065 to £662,027.

The other reason is simply that some investors (including, no doubt, some short-term speculators) have been illogical. They have seized upon the bull points: continuing retrenchment in film production (reflected in the reduction in bank overdrafts by a further £637,199 and in loan capital by £622,690) and better attendances in the bigger cinemas during a wet summer. But they have forgotten that prudence has still to be the motto of the cinema industry. Television which will soon offer a choice of programmes and which may reach a bigger market now that the hire purchase restrictions have been removed remains a threat that the cinema industry cannot yet measure. And if audiences are to be attracted to the cinemas by the novelty of the wider screen costly alterations will be needed. Mr Rank and Mr Davis must have been fully conscious of the prospective need for money when they decided to tuck away £1 million in the general reserves of Odeon Theatres (while paying out only £78,127 to ordinary shareholders and £90,750 to preference shareholders). They must also remember those days not so very long ago when they owed their bankers £16 million.

★

BEECHAM GROUP. The trading profits of the Beecham Group rose sharply, carrying ordinary dividends up with them, in spite of a decline in the value of sales. Total turnover in the year to March 31st fell from £25.1 million to £23.5 million. The whole of this decline is more than accounted for by the fall in the income (from £5.9 million to £3.1 million) earned from sales by the wholesale grocery companies. For some time past the Beecham group has been pulling out of the wholesale grocery trade and redeploying the released resources in its major and presumably more profitable field of activity, proprietary drugs and toilet preparations. Since the end of the financial year it has severed its last connection with wholesale grocery by disposing of its interest in the one remaining subsidiary in that trade. The policy seems to have had some success for the rise in trading profits in spite of the decline in total sales can be attributed directly to the decline in the cost of "raw materials, supplies and services" from £15.5 million to £12.8 million.

	Years to Mar. 31, 1953	1954
Consolidated earnings :—	£	£
Proprietary sales	19,193,361	20,410,458

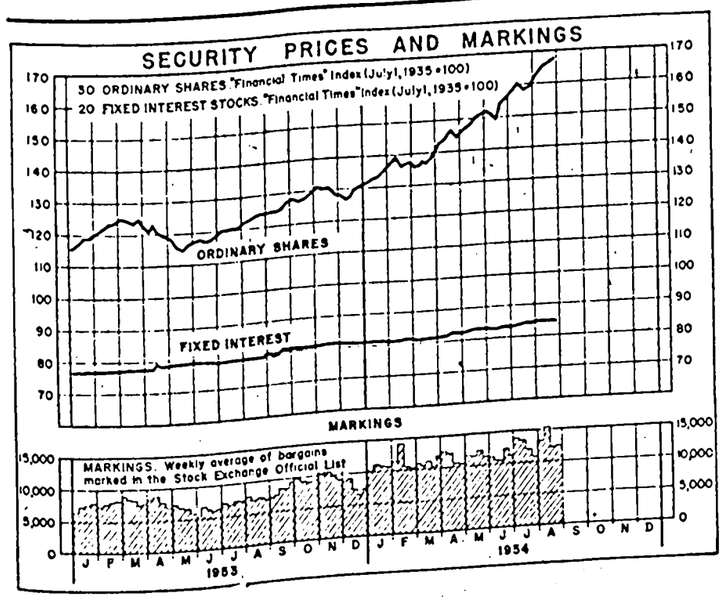
Ordinary capital	1,850,000	1,850,000

2s. 6d. deferred ordinary share at 21s. 10½d. yields £5 14s. per cent.

* Equivalent rate on ordinary capital of £3,700,000 after 100 per cent free scrip issue.

At home the total sales of the group's proprietary products rose from £10.9 million to £12.2 million. On the surface it appears that total export and overseas sales by the group have remained unchanged at £8¼ million; but sale figures for both Brazil and Mexico have been expressed in depreciated exchange rates and this has had the effect of reducing their sterling value by about £600,000.

At the same time as the Beecham Group has been severing its connections with the grocery trade (and building up its interests in Coca-Cola, which will not make any significant contribution to profits for some time), it has been simplifying its structure. A number of subsidiaries have been placed in voluntary liquidation—a reflection of the deliberate policy of concentrating business in each major overseas market in the hands of one operating company. Minority preference shareholding interests of a nominal value of £922,000 have been eliminated and the cost of £1,095,000 has been met from cash resources. The next accounts will show the savings in dividends and profits tax which should follow; in a full year they will amount to about £91,000. The concentration of the business into the hands of a smaller number of companies and in the group's most successful field of endeavour has already been interpreted as meaning greater profitability, leading on to the further suggestion that the payment of an interim dividend of 10 per cent on the new capital of £3,700,000 foreshadows a full year's dividend of 30 per cent, compared with the equivalent rate of 25 per cent in 1953-54.



★

A. C. COSSOR. As the directors predicted when 1,600,000 5s. ordinary shares were issued at 6s. each last October, A. C. Cossor, the radio and television company, is maintaining a dividend rate of 10 per cent on the enlarged capital of £1 million. The new issue allowed the directors to pay bigger dividends on the equity by reducing interest charges; the proceeds of the issue of £454,525 were mainly responsible for the reduction in bank overdrafts from £793,433 to £217,236. Hence, in the year to March 31st, "bank and other interest" charges went down from £50,734 to £29,881.

The new issue gave the directors a freer hand at the time when the group's working capital needs were rising; stocks and work in progress, for instance, have risen from £2,504,496 to £2,803,216. This increase, whether it was fortuitous or deliberately planned, came at the right time, for it preceded the improvement in sales which has taken place since the close of the financial year. In that year, turnover rose only slightly — from £7,250,000 to £7,340,000—but profit margins were expanding and trading profits went up from £464,917 to £527,419. Along with the other manufacturers, Cossor benefited from the heavy "out of season" sales of television sets induced by the Coronation; towards the end of the year, however, television sales began to flatten out. Sales of radio sets, on the other hand, were "unusually low" at first but later took a definite turn for the better. The current year of trading began with some slackness in the sale of television sets but demand has now revived following the removal of the hire purchase restrictions. The chairman, Lord Burghley, says that the directors now "look forward to a better year than at one time seemed likely."

	Years to Mar. 31, 1953	1954

LONDON STOCK EXCHANGE

Next Account begins: September 8th
Next Contango Day: September 8th
Next Settlement Day: September 14th

HAVING jumped by 1.1 points on Monday to a new peak of 171.9, the *Financial Times* ordinary share index had fallen back to 171.1 by the close on Wednesday. The rejection of the EDC treaty by the French checked the advance in prices. Government securities, on the other hand, were a little dull at first in the face of small routine selling orders but then turned firmer on Wednesday. In the foreign market, German and Japanese issues slipped back until Wednesday when a modest rally was staged.

Store shares led the fresh advance in prices in the industrial market on Monday. Radio shares also continued to improve in response to the reports of large sales; tobacco shares were active and "Bats" gained 1s. 10½d. to 45s. 1½d. The new Vickers shares opened at 13s. 6d. and then touched 14s. premium, but later in the week the old shares came down to 39s. 6d. and the new shares to 13s. 1½d. premium. Later in the week there were falls of a few pence in most of the leading industrial shares but building material and shipping shares resisted the trend. So, too, did brewery shares after the announcement from Watney that the dividend had been increased from 17 to 20 per cent. Store shares also continued to go ahead following the lead of Debenhams (which spurted 3s. to 48s. 6d. on Wednesday) and "Gussies." The feature in the oil market was the drop in Anglo-Iranian to 15½ on reports from New York on the arrangements for the compensation payments to the company from the other members of the consortium (which are reported to include a 15 per cent cash payment to Anglo-Iranian in three equal instalments).

OFS issues continued to set the pace in the Kaffir market where prices advanced quite rapidly. President Brand, Free State Geduld and Freddies Consolidated were in the van of the advance and later on they were joined by the finance house, Anglo-American; that company's shares had been pushed up to 8¾ by the close on Wednesday.

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year; annual figures relate to October survey. (6) Revised series, based on Liverpool spot market prices as from July 1, 1954.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade and exports are seasonally adjusted; Belgium includes Luxemburg. (3) Average of first quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended August 28th there was an "above-line" surplus (after allowing for Sinking Funds) of £15,622,000 compared with a deficit of £52,985,000 in the previous week and a surplus of £12,295,000 in the corresponding period of last year. This reduced the cumulative deficit to £108,768,000 (£183,612,000 in 1953-54). Net expenditure "below-line" absorbed £7,620,000, bringing the total cumulative deficit to £263,737,000 (£380,191,000 in 1953-54).

THE MONEY MARKET

CREDIT supplies have been short this week, and on four of the six working days covered by the latest Bank return the market has needed special aid, mostly given through clearing banks. The discount market, after the two successive reductions in its application price for Treasury bills, last Friday maintained its bid at £99 11s. 11d. per cent; and, although total applications for the £260 million on offer rose by fully £24 million to their highest for five weeks, the market allotment dropped only fractionally. The average discount rate rose slightly, from £1 12s. 2.66d. to £1 12s. 3.19d. per cent offered.

The shortage of credit kept discount rates firm throughout the week, and on several days clearing banks were able to secure November maturities at ½ per cent above the "basic" rate of 1⅛ per cent.

The week's reflux of currency amounted to only £4 million, but as the reserve already stood at almost £50 million the authorities have been able to reduce the fiduciary issue by a further £25 million, thus restoring it to the basic level of £1,675 million that last obtained in early June.

In consequence of the further easing of sterling against the US dollar—the rate closed at $2.80⅞—the sterling price of gold reached a new peak of 250s. a fine ounce at Tuesday's fixing, and late on the previous day had been dealt in at 250s. 1d. On Wednesday, however, a slight improvement in sterling brought the gold price down to 249s. 10½d.

THE LONDON OMNIBUS

A VEHICLE OF INFORMATION

In this horse-drawn covered waggon the citizens of Edwardian London trundled on their venturesome way between Liverpool Street and Regent Circus via Holborn.

May we now remind you of another public service? For more than two centuries, an omnibus collection of all sorts of insurance policies has been built up by the London Assurance. Here's a few of them:

SCHOOL MASTERED

Sooner or later, fathers come to think of their children in terms of education. And it's never too soon for the prudent parent. By taking out our Educational Policy really early on, he makes light of heavy school bills to come.

PRECAUTIONARY MEASURE

Fires in firms come in many different sizes. It may be a smoulder in a waste-paper basket. It could be a case of everything going to blazes. And the burning question is: have you a large enough insurance cover to meet every emergency? If not, then we suggest you get in touch with us before anything really alarming happens.

FIRM POLICY

Many hundreds of Staff Pension Schemes, large and small, have been organized by the London Assurance. We can therefore offer to firms and organizations that may be considering such a scheme the advantages of wide experience, in a subject which requires real understanding.

GENERALLY SPEAKING...

If you would know more about any of the policies outlined here, if we can provide information about any other particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1, King William Street, Dept. W.6, London, E.C.4.

COMPANY MEETINGS

METAL INDUSTRIES LIMITED

STATEMENT BY MR R. W. McCRONE TO THE THIRTY-FIRST ANNUAL GENERAL MEETING

The following is a statement by Mr R. W. McCrone to the thirty-first annual general meeting of members of Metal Industries Limited held within the registered office of the company, 145 St. Vincent Street, Glasgow, on Wednesday, September 1, 1954.

PROFITS

The consolidated profits of the group for the year after depreciation are reduced from £1,477,905 to £754,046. This is the result of less favourable trading experience by almost all of the operating companies and of stock and trading losses in the engineering division. These separate adverse results when aggregated to give the group position have produced a total which inevitably is in sharp contrast to the summation in the previous year of relatively favourable individual earnings. I shall explain the position of each company more fully in the course of these remarks.

The net charge for taxation at £421,096, against £858,971 for the previous year, has benefited by excess profits levy recoverable of £75,347 and previous year adjustments of £13,952, and net profit after allowing for proportion of a subsidiary company loss attributable to outside shareholders becomes £343,140 against £612,070 a year ago. The allocation to general reserve has been reduced to £150,000 and, after making minor provisions and setting aside the amount required for the proposed ordinary dividend, we have a total of retained profit in the group to carry forward of £446,071 against £511,494 brought in.

DIVIDEND

In view of the change in the fortunes of the operating companies which became apparent in the late autumn, the interim dividend on the ordinary stock was reduced from 4 per cent to 3 per cent less tax and a statement was made that a reduction in the final dividend rate was to be expected. There has not been any recovery as yet in earnings and the directors have felt it necessary to make a reduction in the final dividend. The rate of 6 per cent, less tax, now recommended makes a total ordinary dividend for the year of 9 per cent, less tax, against 12 per cent a year ago.

BALANCE SHEET

The parent company balance sheet shows little change of moment apart from net additional advances of approximately £300,000 to subsidiary companies for finance of their approved programmes.

The consolidated balance sheet shows a reduction of £764,431 in stocks and work-in-progress which, to the extent of £222,805, is occasioned by writing off stock and commitments in excess of current programmes and otherwise is attributable partly to a certain economy achieved in stock levels and partly to contraction in the trading position. The surplus of current assets over current liabilities remains satisfactory at over £4 million.

INVESTMENT

There has not been any change in the holding of ordinary stock of The British Oxygen Company Limited, which remains at £1,500,000. This at the date of the balance sheet had a market value of £3,975,000 which was over £1 million in excess of the book value. Income from this investment included in the accounts at £225,000 gross is practically equivalent to that of the previous year which was derived partly from a differing holding.

OPERATING COMPANIES

I shall now deal with the position of the individual companies.

Electrical Division.—The companies of this division are engaged in the manufacture of electrical switchgear and motor control gear and all experienced considerable changes in demand and had to carry increased costs. In the result outputs were maintained but profits were at a less rate. Energetic steps which have been taken to adjust the electrical organisation to meet the new conditions are already becoming effective although they will take time to be translated into a confirmed improvement in earning capacity. The strengthening of the research and developing sections mentioned last year has proved of value and much special work was undertaken last year from which the benefit will lie in the future.

A contemplated extension in South Africa of the activities of our electrical subsidiary company there has unfortunately been delayed through the untimely death of the managing director in Africa which we greatly regret. A successor has recently been appointed and this should enable matters to proceed as planned.

Metals Division.—I told you a year ago that Cox and Danks Limited and John Allan and Company (Glenpark) Limited, had had lower profits as a result of wide variations in prices and unsettled conditions. Unfortunately conditions in both the ferrous and non-ferrous scrap metal trades have remained difficult and profits of these two companies have again been lower. In the case of John Allan and Company there was the further factor of considerable and costly development work undertaken without any benefit to the year's operations, but with expectation of an enhanced position in the future.

In shipbreaking we had a favourable year with the yards well supplied with work. We were thus enabled to improve organisation in many directions and to earn profits at an improved and more normal level.

Engineering Division.—Sentinel (Shrewsbury) Limited had a difficult year and has been unable to pay any ordinary dividend. Its trading position was affected by a slackening in orders for certain lines of capital goods and by cancellations, and the directors found it necessary latterly to deal with a situation of unbalanced stocks and commitments which they had hoped would be resolved over a period given reasonably favourable conditions of trading. Unfortunately conditions were not favourable and it was decided accordingly to adopt a realistic view against present and contemplated activities and to write off stocks unlikely to be absorbed in a reasonable period by present production and to provide for items rendered redundant through changes in demand. The amount written off was £222,805 and this naturally had a very adverse effect on the situation of the Sentinel Company bringing about a net loss of £177,437 which has formed a deduction in computing the consolidated earnings of the group.

This disappointing result for Sentinel I regard as being in large measure the clearance of an accumulation of difficulties originating in earlier years, aggravated by the slackening of trade in their principal lines. I am glad to say on the other hand that Sentinel machine tool manufacture has been satisfactory and that improved results are being obtained from their other speciality lines.

Fawcett Preston and Company Limited made a small loss which was almost wholly the result of a shrinkage in orders for the particular types of capital goods in which they are primarily interested. Benefit is now being felt from strengthened management and there is a growing appreciation of the special facilities and experience of this company in the construction of hydraulic presses and in heavy steel fabrication, as well as their resources in light sheet metal work where they render considerable service to other group companies and conduct a substantial business with outside customers.

Ferrous Castings Limited experienced a severe falling off in orders and a sharp reduction in margins early in the financial year and for a number of months the foundry was working only a four-day week. Towards the end of the financial year there was a material recovery from this position, but this was too late to balance the results of the year which ended in a small loss.

DIRECTORS AND MANAGEMENT

I record with great regret the loss to the board through the death of Commodore T. McKenzie, CB, CBE. Commodore McKenzie conducted with great success the highly skilled and hazardous work in the earlier days of the company of salving many of the capital ships of the ex-German fleet from Scapa Flow and in the late war rendered signal service in charge of ship recovery and salvage work in the northern seas and afterwards in the clearance of sunken shipping from the ports and harbours of Western Europe. His unique knowledge and experience was of great value in our deliberations.

The directors are very conscious of the breaches in their ranks which have occurred recently. It is their intention to appoint additional directors when the opportunity occurs and any appointments will, of course, be submitted for your approval in due course.

In an adverse time such as we have experienced in the past year a considerable additional burden of work falls on the

directors of our operating companies and on their leading officials and their staffs. Such has certainly been the case in the past year and I take this opportunity of acknowledging the constant effort and loyal endeavour of all concerned to meet the difficulties and to make progress. I am sure this loyalty and enthusiasm augurs well for the future and that it will be of the greatest value to us.

PROSPECTS

I expect that we shall again receive a satisfactory dividend from our holding of ordinary stock of the British Oxygen Company Limited, in accordance with the indications given in the chairman's remarks at the last annual general meeting.

In the Electrical Division, orders are improving, and this, if continued, will help present difficulties of maintaining a balanced and economic production and of absorbing increased costs.

In the Metals Division experience is still very much in line with last year. The course of trade for Cox and Danks and John Allan and Company is difficult to forecast when there are so many factors, but I am hopeful that there may be some improvement. Shipbreaking has made a good start, but the supply of ships, as is usual, can be seen only for so many months ahead, and the outcome of the year remains very much subject to that supply.

In the Engineering Division, Sentinel (Shrewsbury) Limited is making progress particularly with machine tool work and other lines. Unfortunately, this has been offset by a substantial reduction in the rate of delivery called for on Government contracts, which has brought the volume of work on hand below requirements. Most strenuous efforts have been made and continue to be made in a number of constructive directions to improve Sentinel's position and to obtain additional work suited to their capacity. Ferrous Castings Limited, I am glad to say, are experiencing a considerable improvement in orders, and Fawcett Preston and Company, Limited, are handling a greatly improved volume of enquiries, from which it is reasonable to suppose additional orders may eventuate, so that I think we may expect the profits of these two companies to show some betterment this year.

The directors and the Subsidiary Company directors and all concerned are working very hard to improve our situation, and I am confident that our efforts will meet with success. It must be recognised, though, that such efforts, however resolute, cannot alter the situation overnight, and cannot in a short time produce new products from the factories or quickly obtain orders for any product from new sources. All that takes time, but, nonetheless, I am hopeful that some part of the effort will be reflected in the results to be presented to you next year, although it is not to be expected that our profits are quickly to be restored to the higher levels of the past two years.

FURNESS, WITHY AND COMPANY

BURDEN OF EXCESSIVE TAXATION AND INFLATED SHIPBUILDING COSTS

GROUP'S POSITION OF FINANCIAL STRENGTH

SIR ERNEST H. MURRANT'S STATEMENT

The sixty-third annual general meeting of Furness, Withy and Company, Limited, will be held on September 22nd at Furness House, Leadenhall Street, London, E.C.3.

The following is an extract from the circulated statement by the chairman, Sir Ernest H. Murrant, KCMG, MBE:

In my statement last year I indicated that the immediate outlook regarding both rates of freight and volume of business, coupled with operating costs remaining at a high level, was not re-assuring. The figures now presented unfortunately confirm that indication, and our experience has been similar to that of other shipping companies engaged very largely in cargo transport. After bearing all administration costs and providing for contingencies, the profit on ships' trading is £4,087,415, to which is added dividends on trade and other investments £609,322, a total of £4,696,737. It is a substantial figure, but £1,964,086 falls due to be deducted for depreciation on fixed assets and another £1,162,091 for taxation. Various other deductions are shown clearly in the account (including £444,355 representing the company's proportion of the profits retained by subsidiaries), leaving £692,936 net to be dealt with in the parent company's appropriations. What your board recommend is that £250,000 be transferred to fleet replacement account, and (after providing for the preference share dividend already paid) that £396,000 be distributed to ordinary stockholders by way of a dividend of 10 per cent and a bonus of 2 per cent, both payable, less income tax. These recommendations, if approved, will leave £407,800 to be carried forward, compared with £402,114 brought in.

PROBLEM OF HIGH REPLACEMENT COSTS

Notwithstanding all that has been achieved in the post-war years (our own group alone has spent some £17 million on new ships in the past five years), the problem of replacement is still acute and will remain so and become increasingly more difficult, so long as the twin handicaps exist, namely, excessive taxation and inflated shipbuilding costs. It would seem that the Government intend the shipping industry to be satisfied with the 20 per cent investment allowance, at any rate pending more drastic remedies that it is hoped the Royal Commission will recommend, and therefore it should now be the turn of shipbuilders to contribute something to the solution of this obstinate problem.

For many years past, with one short-lived interval, shipowners have been obliged in their shipbuilding contracts to accept conditions which were not far removed from signing a blank cheque. Estimated costs, on which contracts have been based, have invariably been very substantially exceeded, due to increases in the price of materials and labour during the interval between contract and delivery and the burden of such increases has fallen upon shipowners. Shipbuilders have shouldered very little, if any, of the risks involved in these one-sided arrangements. I suggest, therefore, that the first step shipbuilders can take, and should take as quickly as possible, is to quote for orders on a fixed price basis. The second step, I suggest, should be towards reducing costs by greater productivity, not measured by value, but by increased effort, whether by man, machinery or management. It is becoming increasingly difficult to persuade shipowners to continue signing blank cheque contracts, or any contracts at all, unless prices are competitive and in conformity with earning value.

BOARD'S PRUDENT DIVIDEND POLICY

No doubt stockholders will expect something more to be said than the passing reference already made to the recommended dividend and bonus of 12 per cent. The accounts which accompany this statement reflect the prudent policy which your directors have followed and of which stockholders have consistently approved. In the result a strong financial position has been built up and earnings have permitted the distribution of a reasonable rate of dividend. It would be quite easy to capitalise part of our accumulated reserves and make a scrip issue to stockholders, but it is the board's responsibility to satisfy themselves that some good purpose would be served thereby. Once reserves have been capitalised they cannot be used for any other purpose; capitalisation does not in any way increase the gross earnings or the disposable net earnings. The contrary is more likely to be the case in respect of shipping companies, as the process of replenishing the reserve funds would then need to be intensified. It may well be that at no very distant date some part of the reserves which your company has put to fleet replacement account will need to be used for the purpose for which that account was established, namely, to write off the inflationary element in the cost of post-war built ships. The point is that if these reserves were to be capitalised, they would no longer be available for that purpose, and in present circumstances your board do not consider that any good purpose would be served, nor would it be in the best interests of the company (and consequently of stockholders) to adopt any such procedure.

THE OUTLOOK

It is more than usually difficult, in existing conditions, to attempt to assess the outlook. In any event, it is impossible to generalise within the scope of a statement of this nature, as conditions vary in different trades, some of which are more affected than others by political and semi-political considerations. Fortunately our interests are so widespread that, taking the group as a whole, adverse trends in one direction may be offset by reverse trends in another. In the meantime, however, in the open freight market for bulk cargoes, owners of ships under various strange flags appear to be willing and able to accept rates which are below an economic level.

There are a number of encouraging factors which put brighter colours into the picture. We have renewed our contract with the Bermuda Trade Development Board for a further period; we have a fine modern fleet of ships; we have a strong balance-sheet and a lively management in widespread trades and diverse activities, and a goodwill which cannot be measured in terms of physical values. But for any increase in net earnings we must look for an improvement in gross freights and a reduction in operating costs, coupled with better and more settled political conditions in many parts of the world. The immediate prospects of any such improvements are not very encouraging.

TATA IRON AND STEEL CO., LTD.

MR J. R. D. TATA ON THE OUTLOOK

The annual general meeting of the Tata Iron and Steel Company, Limited, was held on August 26th in Bombay, Mr J. R. D. Tata (Chairman of the Company) presiding.

The chairman, in the course of his speech, said that while the country was not yet wholly out of the woods, the fact that most of the unfavourable trends so prominent during 1946-52 years had either been reversed or brought to a halt reflected credit on Government's management of the country's financial and economic affairs in the last few years.

Referring to the need for a new approach to the role of free enterprise in the mixed economy, the Chairman gave expression to the belief that progress would have been greater and quicker if the private sector had, during these years, been in a position to make the full contribution of which it was capable to such progress.

NEED FOR NEW APPROACH

"There are, however," observed Mr Tata, "some prerequisites. Members of Government and Parliament should, I respectfully suggest, cease giving the impression that the present policy of a mixed economy is a temporary affair and a mere step in the direction of full-fledged socialism or state capitalism."

Continuing, the Chairman said: "More important perhaps than anything else is the need to shed certain preconceptions which have long coloured official and political thinking in our country. For instance: that the profit motive is dishonourable; that profit is synonymous with profiteering; that industrialists as a class are inefficient or dishonest or both; that about 3 per cent net is a fair return on risk capital; that the population problem will solve itself; that mechanisation means unemployment; that it is more important to impoverish the rich than to enrich the poor; that a welfare state can be built without first creating the means to pay for it; that nationalisation creates additional wealth; that centralised State enterprise and management is socialism."

Mr Tata drew attention to the remarkable change that had taken place in the United Kingdom in the last year or so since official policies in the economic sphere had been reoriented towards releasing and stimulating the productive energies of business and industry and freeing them from the burden of bureaucratic controls and ideological uncertainties which had benumbed them since the war.

Mr Tata felt sure that if the Indian Government would similarly try for a while the experiment of freeing the private sector from its present handicaps and uncertainties and allow it the necessary incentives and scope for initiative, they would be surprised at the results. No one would seriously suggest a return to complete laissez-faire in economic matters. Besides taking active part in expanding the economy, the State had to exercise general control over the economic activities of the country to prevent undesirable trends, to provide essential services within society's capacity to bear them and to protect the under-privileged. "I submit," said Mr Tata, "that these objects are not served best by policies which tend to paralyse enterprise and initiative, encourage low labour productivity and concentrate economic power in Government to a self-defeating extent."

In this context, the Chairman expressed the hope that the lead given by the Congress in the resolution on industrial policy passed at the recent session of the All-India Congress Committee at Ajmer and the remarks made by the Prime Minister on the occasion would soon be reflected in the economic policies of the Government of India.

Apart from the problem of population, India's economic problem was fundamentally one of production. While welcoming the great power and irrigation schemes in the public sector and the Governmental action in the fields of agriculture and cottage industries, Mr Tata stressed that the contribution which the private sector could make to the expansion of India's economy was potentially as great. "This, however," said the Chairman, "will require the creation and maintenance of an atmosphere in which the investor, his faith restored, is willing to risk his money; men of ability and vision, freed from uncertainties and inhibitions and from their present sense of frustration, are able to apply their energies and resources to constructive purposes, and labour, properly led and fortified by the recognition of its status and legitimate interests, contributes a full day's disciplined work to the common task."

RATIONALISATION

Dealing with the subject of mechanisation, Mr Tata said: "The age-old antagonism towards the machine is rooted in the belief that the mechanisation of industrial processes automatically leads to unemployment. The machine has in fact proved itself to be the greatest creator of jobs that ever existed. In Britain, within a generation after textile workers had smashed spindles and power looms, ten times as many men were engaged in the textile industry as before these inventions." He added that in the United States between 1939 and 1953 alone employment in manufacturing industries increased by 75 per cent, notwithstanding the fact that it was in these very industries that mechanisation had made the most spectacular advance.

Mr Tata then went on to question the proposition that if men at work today were allowed to continue to operate antiquated machines and processes, their employment would be secure. "A notable refutation of this tendency," he stated, "to mistake stagnation for stability came recently from the Minister for Labour of the State of Uttar Pradesh, who pointed out that during the last four years between ten and fifteen thousand workers in the leading textile centre of Kanpur had been retrenched not because there had been rationalisation but precisely because there had been no rationalisation."

Mr Tata was not unaware of the difficulties and hardships that hasty mechanisation would cause in India if introduced without proper care and thought in each case. He then outlined the obligations that should be fulfilled by management desirous of putting through measures of mechanisation and modernisation, such as ensuring efficiency in management, absorbing as many redundant men as possible in other jobs, helping the State wherever possible in retraining those rendered surplus, paying generous compensation to those few whom it may not be possible to retain in employment and showing an unequivocal readiness to share with the smaller number of employees that remain and with the consumer the benefits of cheaper production.

"The choice before us," warned the Chairman, "is not between modern industry and old-fashioned industry, but between modern industry and no industry at all. There is no half-way house. Either we shall build a highly productive and happy society in which workers have, thanks to the machine, regained their dignity, or we shall sink back into a primitive form of society condemned, by the inexorable increase in our population, to growing poverty and despair."

GOVERNMENT STEEL WORKS

Mr Tata referred to the decision of the Government of India to build a steel plant of an approximate capacity of half a million ingot tons and their agreement with two German firms of equipment manufacturers for the construction of the plant. He welcomed the decision in so far as it constituted a major step in the development of the Indian steel industry, but regretted that Government did not think it worth while to hold consultations with the industry or to seek its views, let alone its assistance.

ACCOUNTS

Turning to the operating results for the year under review, the Chairman drew attention to the important measure that had been initiated in providing in advance for the substantial increases in taxation which would arise in future years after the heavy depreciation allowances on the new plant additions had been worked off.

The year's accounts showed that for the first time in over thirty years, capital expenditure had substantially exceeded the year's provision for depreciation even after taking into account the separate allocation to plant rehabilitation reserve.

The financial statistics in the Company's annual report brought out clearly the policy consistently followed by the directors of ploughing back into the physical assets of the Company every rupee set aside over the years, a policy which had enabled the Company to maintain its earning power unimpaired.

Similar satisfaction could not, however, be derived from the production statistics in the annual report. "Although it was impossible to expand capacity during the war years," observed Mr Tata, "we had a great opportunity of doing so after the war. Particularly in a backward country with an ever-growing population like ours, it is the duty of industry to keep pace with the growing demand. Although we have failed in that duty, it would be unfair to blame the company for not having risen to the occasion. The prime responsibility must rest with the policy, initiated by the Tariff Commission and adopted by Government, of restricting steel prices during these years to less than half the import prices and to a level calculated to yield a net return of only 3¼ per cent on new capital expenditure. We have throughout protested against this policy which in the long run has cost far more than it has saved. By making it impossible to raise fresh capital for expansion, it has compelled the country to import large quantities of steel each year at very high prices. A moderate increase in Indian retention prices, while still leaving the cost of steel at a much lower level than that of imported steel or other commodities in relation to pre-war levels, would have enabled the industry, from internal savings and from fresh capital, to increase production and so to save the country many millions annually."

FUTURE PROSPECTS

Mr Tata expressed the belief that, everything going well, output should, with the

completion of the modernisation and expansion programme now under way, rise steadily during each of the next three or four years, when finished steel output would be 150,000 tons higher, that is, about 20 per cent over that in the current year.

While the Company would make a profit of about 150,000 tons more than at present, the rate of such profit per ton would depend on the level of costs and prices at the time. "Provided labour plays its part," said Mr Tata, "we may, I think, expect that the heavier burden of depreciation will be largely off-set by the fall in costs resulting from the increased efficiency and output of the plant. If so, our profit will be determined mainly by the then prevailing level of steel prices which itself will depend on whether Indian prices are still controlled as they are today. If control is terminated, sales realisations must then depend largely on what world prices on the one hand and Government's import and fiscal policies on the other will be at the time. While I cannot venture a forecast on these two factors, it would seem reasonable to assume that Government would not at any time permit unrestricted imports to compete unfairly with Indian steel."

The Chairman felt that they could be certain that even after the completion of the Government's steel works and of the additions to the capacity of the existing plants, there would be no over production in the country and he saw little prospect of capacity catching up with the country's demand for the next fifteen years or more.

"Our future prospects," the Chairman concluded, "will depend mainly on the extent to which we keep our plant up-to-date, our operations efficient and our costs low. Provided artificial obstacles are not put in our way and labour costs do not get out of hand, there is no reason why we should not maintain our competitive power and earning capacity."

The report and accounts were adopted.

ANGLO-EGYPTIAN OILFIELDS

INCREASED EARNINGS

The annual general meeting of the Anglo-Egyptian Oilfields, Limited, was held in Cairo on August 25th.

The following is an extract from the statement of the Chairman (Mr H. M. Jones):

My predecessors in their statements have referred extensively to the predicament in which the oil industry has found itself as a result of the policies pursued by the Government in past years and to the consequent increasing drain of oil imports on Egypt's foreign exchange resources. Your company's operations had been dominated by uncertainty and insecurity.

AGREEMENT SIGNED

In such a climate investment cannot flourish, and without investment the standard of living, especially in a country with a rapidly increasing population such as Egypt, must inevitably decline. The present Government in Egypt is deeply conscious of the logic imposed by these facts, and, after prolonged negotiations, agreement in principle was achieved in February of this year and an agreement was signed at the end of June. The two principal issues were the price structure and the granting of leases and licences. The negotiations were exacting and it would be wrong for me to pretend that your company has achieved all it wanted. The price agreement has been signed and the terms of the lease over the Ras Matarma area have been settled. However, unexpected difficulties have arisen over the terms of the exploration licences, but the difference of opinion has been reduced to one point only and we are hopeful that this will be settled in the near future.

The capital structure of your company was last changed in 1920, and the issued capital is now quite out of line with the true worth of your company and with the value of the assets employed in the business. Now that the future can be approached with a greater degree of confidence, it is desirable to establish a more realistic relationship between the issued capital and the money employed in the business.

THE YEAR'S REVENUE

The net revenue for the year 1953 after providing £522,366 for Egyptian taxation amounted to £2,269,352, as against £949,935 for 1952. The increased net earnings were due to more favourable oil prices in 1953 and to expenses being £555,712 lower.

It would be quite fallacious to regard the so-called "net earnings" of a company as being a fund which is freely available either for distribution to its shareholders or for unrealistically increasing wages and benefits for employees. A company must look to its net earnings to provide the essential flow of funds to enable it to maintain its place in the industry. It is for these reasons that we are obliged to continue the sound financial policy of retaining in the business a large part of our net earnings.

Although the total production from all fields during 1953 was only slightly less than that during 1952, it is estimated that A.E.O.'s share of the production from all fields in 1954 will be some 10 per cent less.

The resolutions giving effect to the board's capitalisation proposals and amending the Articles of Association, which had been previously approved at a class meeting of "B" shareholders, were sanctioned and the report and the accounts adopted.

WM. CORY AND SON, LIMITED

GRADUAL BUSINESS IMPROVEMENT

The Hon F. A. Leathers presided at the fifty-eighth annual general meeting of Wm. Cory and Son, Limited, held on August 26th in London.

The following is an extract from his circulated statement:

Your business gradually improved throughout the year. The sellers' market has been left behind, and business can be obtained only in the face of the fiercest competition.

The bulk of the business carried on by the Cory Group is based on the services it renders in the distribution of fuel.

The purchase of coal for home consumption is conducted by either the seaborne or railborne department. Each has substantially increased its tonnage.

The colliers which your company owns were well maintained during the year. The financial result of the fleet's trading has shown an important increase. We felt it necessary, notwithstanding the high cost of shipbuilding, to order during the year two new ships. Since the end of the year, orders have been placed for three further vessels.

Wharves for the handling of coal—and other products—are maintained in the Thames and Medway and at other ports. The total tonnage of all commodities has increased and includes a substantial volume of sugar discharged at our Purfleet wharf, where an up-to-date battery of cranes has been installed. New cranes have been ordered for our other discharging berths. The wharves themselves have been examined for possible renewal.

The barges which carry part of the coal to destination are under the control of the lighterage department. The financial return has been maintained. Your group is the largest owner of tugs and barges on the River Thames. These convey not only coal but general merchandise and petroleum products. During the year a number of new craft was added and plans are in hand for further tugs and barges to be ordered.

Exports of coal from this country have remained disappointingly low. The continental countries of Europe have needed to import less quantities of coal from the United States.

The oil department has enjoyed a successful period, with the tonnage showing a considerable increase.

The new venture entered into with Shell-Mex & B.P. Limited for the distribution of certain of the products of that company has proved most beneficial.

Our associated company in Northern Ireland had a much more successful trading result.

In the Union of South Africa the unsatisfactory state of affairs in the transport of coal is seriously cramping the coal export trade.

The report was adopted.

C.V.A. JIGS, MOULDS AND TOOLS, LIMITED

MR E. ARON'S STATEMENT

Mr E. Aron, the Chairman, in a speech to the shareholders of C.V.A. Jigs, Moulds & Tools Limited, at the annual general meeting held at The Old Ship Hotel, Brighton, on Friday, August 27, 1954, referred to the purchase by the company of all the remaining shares in E. H. Jones (Machine Tools) Limited, thus making that company a wholly owned subsidiary of C.V.A. Mr Aron presented the consolidated accounts of the group.

He pointed out that the net profit of the group, before taxation, for 1953 amounted to £163,666. After taxation this was reduced to £108,095, from which loan stock interest and preference dividends, together with ordinary dividends at 6 per cent, the same rate as in previous years, had to be deducted, leaving a balance of £82,002 for the year.

After transferring £50,000 to general reserve and making other adjustments, there remain £26,198 in the subsidiary company, and £31,585 in the holding company as undistributed profits to be carried forward to next year.

Mr Aron referred in his statement to the unfair burden of taxation on an industry with such a relatively high capital investment in plant and machinery, and pleaded for a new outlook in the approach to re-equipment of industry with capital goods by giving far higher capital allowances for the use of machinery and plant, before taxation starts.

He expressed confidence in the future and paid tribute to the support given to him by all employees of the company.

The report and accounts were adopted.

CROPPER & COMPANY LIMITED

(Carton Manufacturers)

SATISFACTORY YEAR'S TRADING

DISTRIBUTION RAISED TO 47½ PER CENT

MR FRANK W. J. SMITH'S STATEMENT

The fifty-seventh annual general meeting of Cropper & Company Limited was held on August 26th at the registered office of the company, Thatcham, Berks, Mr Frank W. J. Smith (chairman and managing director) presiding.

The secretary (Mr E. G. Hadcock, ACA) read the notice convening the meeting, and Mr W. H. Woods, of Messrs Deloitte, Plender, Griffiths and Company, the auditors, read the report of his firm.

The following is the chairman's statement which was circulated with the annual report and accounts:

I have pleasure in presenting the report of the directors and the accounts for the year ended June 30, 1954, which reveal the results of what I trust you will consider a satisfactory year's trading. The profit for the year, before taxation, amounts to £270,676, as compared with £246,617 last year. From this must be deducted the estimated taxation for the year, amounting to £152,259, leaving a net profit of £118,417. After adding over-provisions for taxation made in previous years amounting to £13,176, and the balance brought forward from last year of £49,991, and deducting the net cost of the preference dividend of £6,052 and the interim dividend of 12½ per cent on the ordinary shares, amounting to £18,378, there remains a disposable balance of £157,154.

The directors recommend the payment of a final dividend of 35 per cent, which, with the interim dividend paid last January, makes a total of 47½ per cent compared with 42½ per cent paid last year.

STRONG FINANCIAL POSITION

It will be seen from the balance sheet that the reserves previously held for replacements, possible future bad debts, falls in the value of stocks and excess profits tax postwar refund have now been transferred to general reserve, bringing the total to £525,313. This figure the directors propose to increase by the sum of £60,000, bringing the total of the general reserve to £585,313, a figure which is more than double the issued ordinary capital of the company.

Reference to the consolidated balance sheet reveals the exceedingly strong position of the group. Current assets amount to £1,625,013, against current liabilities of £376,548, and, as I have mentioned before, the fixed assets which appear on the balance sheet at £452,189 are worth many times this figure, as is also our shareholding in our associated company, Colthrop Board & Paper Mills Limited.

HEALTHY ORDER BOOKS

I am happy to state that the order books of both parent and subsidiary companies are in a very healthy state. In both companies new plant of the latest design is being installed, a process that will continue and will result, I have no doubt, in an improved output and an increased demand by us for board. We are, therefore, materially interested in the acquisition of the new board machine the Colthrop Board & Paper Mills Limited are about to install and will, when necessary, give all the financial assistance we can to enable that company to carry out its project, as it is most essential to ensure that our supply of boards is maintained.

I would like, in conclusion, to take the opportunity of thanking my co-directors, the staff and all our employees for their co-operation and loyalty during the past year, without which the results before you could not have been achieved.

CHAIRMAN'S ADDITIONAL REMARKS

The chairman, addressing the meeting, said: Gentlemen, as the report and accounts have been in your hands for the time prescribed by the Companies Act we will, with your permission, take them as read. (Agreed.)

When we met a year ago I mentioned that we had then reached a stage of more stable trading. I am happy to say these conditions were maintained throughout the financial year under review, and are reflected in the improved figures before you.

I have brought to your notice on previous occasions the strong financial position of our company and our subsidiary company, Containers, Limited, and have pointed out that the fixed assets are shown in the balance sheet considerably below their market value. The current assets on the consolidated balance sheet stand at £1,625,013, against current liabilities of £376,548.

COLTHROP BOARD AND PAPER MILLS

The shares we hold in our associated company, Colthrop Board & Paper Mills, Limited, appear in our balance sheet at £69,192, but the present market value is in excess of £600,000. I mention this asset in particular because you will have read in the press of the financial arrangement our associated company has made with Albert E. Reed and Company, Limited (subject, of course, to the consent of its shareholders to an increase of capital and also to the consent of the Capital Issues Committee). I consider the arrangement will be of the utmost importance to our group of companies. Under the terms of the arrangement we have agreed to purchase a further 25,000 Colthrop Board & Paper Mills, Limited, shares at £5 5s. per share at a total cost of £131,250. We shall therefore retain approximately the same percentage holding in the Colthrop Board & Paper Mills, Limited, as we do at present.

Moreover, we are assured of an increased supply of board when the new board machine which our associated company is erecting at Thatcham comes into production in about three years' time. Each year our board consumption grows as we continue with our policy of expansion and modernisation, and it is a source of great satisfaction to know that our future requirements of raw materials will be readily available from our associated company to meet our needs.

THE DIVIDEND

I will now propose the resolution dealing with the report and accounts, and after it has been seconded I shall be pleased to answer any questions you may wish to ask. I propose: "That the report of the directors and the accounts of the company for the year ended June 30, 1954, be, and they are hereby, approved and adopted; that a final dividend of 35 per cent, less income tax, be paid to ordinary shareholders registered at the date of this meeting; that £60,000 be transferred to general reserve; and that £45,696, the balance of the profit and loss account, be carried forward."

Mr Stuart W. Butters (assistant managing director) seconded the resolution, and there being no questions it was put to the meeting and carried unanimously.

The retiring directors (Mr Angus Marshall and Mr H. F. Smith) were re-elected, and the fee of the auditors (Messrs Deloitte, Plender, Griffiths and Company) was duly fixed.

TRIBUTE TO CHAIRMAN, DIRECTORS AND STAFF

Mr G. A. Day, in proposing a cordial vote of thanks to the chairman, directors, staff and workpeople of the company, said that it was an honour and pleasure for him to have the opportunity of proposing a vote of thanks to the chairman, Mr Frank Smith, for his astute command of the affairs of the company which together with the loyal support of his co-directors and the staff, had produced results which were, to say the least, very satisfactory. The immense strength of the balance sheet had been further improved during the past year and, as the chairman had said, the investment in the associated company, Colthrop Board & Paper Mills Limited, now had a market valuation of over £600,000, which was, in fact, more than twice the issued ordinary capital of Cropper & Company, Limited. The shareholders knew that the company's affairs were in very competent hands and no matter what eventualities might arise, they would be most effectively dealt with in a proper manner. He concluded by expressing gratitude to the chairman for his successful leadership of the company during the past year and the hope that success and good health would remain with him for many years to come.

Mr P. B. Brown seconded the motion and it was carried unanimously.

The chairman said he was very much obliged for the kind remarks which had been addressed to him and he was glad the proposer of the resolution had included his colleagues and the other executives and the workpeople of the company. They had all worked most loyally and enthusiastically—otherwise the directors would not have been been able to put such satisfactory figures before shareholders—and he had no doubt that such conditions would continue.

The proceedings then terminated.

THE GLOBE TELEGRAPH & TRUST COMPANY

ANOTHER YEAR OF PROGRESS

SIR EDWARD WILSHAW'S REVIEW

The eighty-first annual general meeting of The Globe Telegraph & Trust Company, Limited, was held on August 27th in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the chairman) presided and, in the course of his speech, said:

The accounts again show that we have had another year of progress. The gross income has risen by £62,792 to £670,550, at which figure it is £110,000 higher than two years ago; in other words, over a period of two years our income has increased by very nearly 20 per cent. I should indeed be optimistic if I anticipated the continuance of so high a rate of expansion, but, apart from any general recession in trade, I do expect that the income of the year now current will at least be equal to that of the year just ended.

The earnings for the year, before providing

for taxation, are £496,684, which is £63,006 higher than last year. Income tax requires £221,314 and leaves net earnings of £275,370 this year, against £230,645 for the financial year ended June, 1953, which is an increase of £44,725.

In the balance sheet you will see that whilst the capital is unchanged at £3,882,201, the capital reserve has been increased by £58,213 to £470,758, the general reserve by £50,000 to £400,000, and unappropriated earnings by £33,201 to £197,033. The amount of the debenture stock is unchanged at £3,542,704.

On the other side of the balance sheet you will see that the invested funds now amount to £8,498,857.

In the classification of our investment portfolio you will see that the total sum is £13,166,720 compared with £10,304,988 a year ago. You will see that 84½ per cent of this sum is represented by quoted investments.

FORMATION OF CANADIAN COMPANY

As I have often said, we endeavour to give full support in a tangible manner, not only to industry in this country, but also to industrial enterprises in our overseas Dominions and Colonies. In pursuance of this policy, we have, as you are aware, a substantial interest in investment companies both in Northern and Southern Rhodesia and in the Union of South Africa. Now we are participating in the formation of a similar company in Canada and we hope as a result of our enterprise, to share in that great Dominion's future prosperity. It is our intention, through the medium of our new associated company, to help in urging forward that prosperity by investment in selected securities which will, we feel sure, ultimately redound to your benefit as well as to that of the Dominion itself.

The funds at our present disposal are fully invested and I think you will agree that we may claim that they are satisfactorily and profitably invested. In business no one can afford to stand still, for to do so brings about the loss of the momentum which is necessary to carry one forward, and it is with this in mind that we have under consideration the question of addition to the capital at present at our disposal.

The report was adopted and a total dividend distribution of 9 per cent was approved. This dividend compares with 7 per cent paid in 1950/51, and 8 per cent in 1951/52 and 1952/53.

GEORGE SWIFT AND SONS (HOLDINGS)

(Manufacturers of Specialised Machine Tools)

RECORD TRADING PROFIT

The twelfth annual general meeting of George Swift and Sons (Holdings), Limited, was held on August 25th at Halifax.

Mr W. P. Eastwood (chairman) presided, and in the course of his statement said: Once again the group output has reached a new peak, resulting in a record trading profit, and in round figures this amounted to £130,000 (against £113,000 in the previous year). From this must be deducted depreciation and various administrative charges, totalling £26,500, leaving a net profit before taxation of approximately £103,500. From this figure the Inland Revenue will take no less than £64,500 or once again almost two-thirds of the net profit, leaving your company as very much the junior partner in the transaction with a modest £39,000, out of which it must pay to the shareholders a reasonable return for the use of their capital invested and retain the balance with a view to financing the necessary re-equipment and expansion of the business.

NEED FOR TAXATION REDUCTION

It is, however, gratifying to note that, with effect from January 1st of this year, there was removed from the Statute Books the charge to excess profits levy—a tax as unfair in its incidence as it was penal in its effect. It is to be hoped that further reductions in taxation will be forthcoming in the near future.

The charge in the profit and loss account for depreciation is in the region of £13,000 as compared with £9,000 in the previous year. This increase is accounted for by the fact that we have purchased a fleet of road vehicles, including a very heavy 8-wheeler, in order to enable us to undertake our own transport.

Since the company was made public in 1942, the total net profits before taxation for the twelve years have amounted to £643,000. Of this sum, taxation in its various forms has taken no less than £420,000.

DIVIDEND AND BONUS

I pay tribute again to your management, staff and works, for the results they have attained, despite the many handicaps under which they have had to labour. On the other hand it has not been entirely due to their efforts that these satisfactory results have been achieved, as the shareholders have also subscribed in no small degree, in as much as roughly £120,000 has been spent on buildings, plant and equipment since the company became public.

The workers and staff have benefited throughout the period in relation to these results by means of various bonus schemes, etc., and it is felt that the time has now come when you as shareholders are entitled to some recognition of your share in this achievement. To this end, therefore, it is proposed that in respect of the year ended March 31, 1954, there be paid the additional 4 per cent participating bonus on the preference shares, making 10 per cent altogether, and that ordinary shareholders receive a dividend of 10 per cent plus a further 10 per cent bonus, making 20 per cent for the year in all.

So far as next year is concerned, all I can say is that once again we have a very full order book, and barring unforeseen difficulties, we can look forward to another successful period of trading.

The report and accounts were adopted.

GOLDEN HOPE RUBBER

SIR ERIC MACFADYEN'S ADDRESS

The forty-eighth annual general meeting of the Golden Hope Rubber Estate, Limited, was held on September 1st in London. Sir Eric Macfadyen, the Chairman of the company, presided. The following is an abstract of his address:

In my address last year I advised you we had then recently purchased very cheaply two estates at Rompin, Negri Sembilan, the property of local companies. We decided to accept an offer to take over one of the two and to retain only the other—of 970 acres planted adjoining our existing Bukit Pilah Division.

The year's output was 7,452,176 lb, including for the first time a full year's crop from the former Lumut Estates. We recovered from the Replanting Cess Fund £46,067; revenue from investments was £13,441, and the total profit before taxation was £141,416, against £201,843. Taxation in Malaya and the United Kingdom absorbs £64,857, leaving us with £76,559, against £117,323. We brought forward £40,491, and with a further £2,723 net received in respect of our War Damage Claims and a small surplus of £927 on disposal of fixed assets, there emerges an available balance of £120,700. We transfer £15,178 to Cultivation and Replacement Reserve and appropriate £13,526 to Development. We recommend the payment of a dividend of 15 per cent, less tax, absorbing £55,205 and, on this distribution being approved, the amount to be carried forward will be £36,791.

All divisions are reported to be well upkept; they are being tapped on conservative systems, our objective being low costs per lb rather than high outputs per acre.

The report was adopted.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £250 or £300 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved university.—Applications should be sent not later than September 15, 1954, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE Labour Party invites applications for the post of Research Assistant to specialise on research connected with economic and financial problems. Knowledge of economics and the Labour Movement and drafting ability essential. Salary £602-£702.—Application forms, to be returned with specimens of written work not later than Saturday, September 18th, from Morgan Phillips, The Labour Party, Transport House, Smith Square, London, S.W.1.

FINANCE COMPANY (with main emphasis on Hire Purchase) in London, with substantial resources desires to appoint a General Manager with comprehensive knowledge of this field of finance and ability to develop the company's business. The position is one with considerable prospects, and the salary will be appropriate.
Reply in confidence, to Box 683.

MARKETING MANAGER wanted by S. Simpson, Ltd., makers of the world famous DAKS clothes. Must have knowledge of selling, advertising, presentation and promotion with ability to organise and inspire sales force at home and overseas.
Knowledge of clothing trade desirable but not essential. The position is important, permanent and progressive.
Applications, in writing, giving full details of experience, age, positions held, will be regarded as confidential, and should be made to H. Balcon, Deputy Managing Director, S. Simpson, Ltd., 92-100 Stoke Newington Road, London, N.16.

ACCOUNTANT BOOK-KEEPER required. Applications are invited from well educated young ladies experienced in this sort of work. Salary according to experience. Pleasant working conditions with good prospects.—Write in confidence, stating details of education and previous experience, to Box 680.

BRITISH CELANESE LIMITED have vacancies for male Arts Graduates with good Honours degrees who have completed their National Service and are under age 25 for engagement as Trainees. An aptitude for working in industry is essential. Training will mainly be directed with a view to a career on the commercial side (advertising or sales), although there will be a limited number of openings on the textile production side.—Applicants should state their preference and send particulars of their qualifications and career to the Personnel Manager, British Celanese Limited, 22/23 Hanover Square, London, W.1, quoting 1072.

Established 1858

BANKERS

We specialise in all financial transactions with The Netherlands

54, 55 & 56, THREADNEEDLE STREET, LONDON, E.C.2

UNIVERSITY COLLEGE OF WALES
ABERYSTWYTH

Applications are invited for the post of Research Assistant in the Department of Economics for a period of up to two years. Salary £550 per annum, rising to £650 for the second year.
Applications, together with the names of three referees, should be sent to the Registrar, from whom further particulars may be obtained, not later than September 15, 1954.

SCHOOL OF ECONOMICS, DUNDEE

Application may now be made for entry to the following courses in October, 1954.
B.Sc.(Econ.) London with Honours in Economics or Economic History or Industry and Trade.
General Certificate of Education of London University in Social Science Subjects.
Post-Graduate Diploma in Business Administration.
The School of Economics is to be incorporated in the University of St. Andrews within the next two years. Arrangements will be made for providing students who have not completed their courses by the time the University takes over the School with special instruction to enable them to complete their work for the London Degree.
Application forms and copies of the Calendar may be obtained from the Secretary, School of Economics, Bell Street, Dundee.

SENIOR SCIENTIFIC OFFICERS, Scientific Officers, Patent Examiner and Patent Officer Classes. The Civil Service Commissioners invite applications for pensionable appointments. Applications may be accepted up to December 31, 1954, but early application is advised, as an earlier closing date may eventually be announced. Interview Boards will sit at frequent intervals. The Scientific posts cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. In biological subjects the number of vacancies is small: individual vacancies exist at present for candidates who have specialised in palaeobotany, foraminifera, malacology and lichenology. The Patent posts are in the Patent Office (Board of Trade), and Ministry of Supply.
Candidates must have obtained a university degree, with first- or second-class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification; or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1954 may apply before the result of their degree examination is known.
Age Limits: Senior Scientific Officers, between 26 and 31, but specially suitable candidates under 26 may be admitted. For Scientific Officers and Patent Classes, between 21 and 28 during 1954 (up to 31 for permanent members of the Experimental Officer class). Salary (London). Senior Scientific Officers: (Men) £975-£1,150; (women) £845-£1,025. Scientific Officers: (men) £470-£855; (women) £470-£750. Patent Examiner and Patent Officer Classes: (men) £440-£760 (rates under review). Women's rates somewhat lower. Somewhat lower rates in the provinces.
Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S/53/54 for Senior Scientific Officers, and S/52/54, S/128/54 for the other posts.

NATIONAL GALLERY. A vacancy exists in the laboratory for a Senior Scientific Officer (Chemist). Duties involve the analysis and testing of materials used in the Conservation Department, and assisting in the development of new techniques. An interest in chromatographic methods would be advantageous. Opportunities exist for research. The general qualifications and conditions are as set out in the main advertisement above. Candidates for this post should quote S4363/53/54, and the closing date for applications is September 23, 1954.

"GOOD EATING," the new monthly illustrated magazine for and about good food and drinks; September issue now on sale, 1s. 6d. per copy. Annual subscription £1.—167 Strand, London, W.C.2.

STUDY AT HOME
B.Sc. ECON.
This London University degree, open to all, is a valuable qualification for statistical, research, educational and welfare work. It is necessary only to pass three examinations. Wolsey Hall (founded in 1894) can prepare you for these at home. Reasonable fees, instalments. 952 B.Sc. Econ. (Final) Successes, 1925-53. Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P15.

IMPORTANT IF YOU RUN A MARSHALLING YARD . . .

[Interesting—even if you don't]

The Mitchell Wagon Marshalling System is an advanced—indeed, a revolutionary—way of handling. On the sidings of the National Coal Board and the British Electricity Authority, for example, it handles coal supplies at far greater speed and in far less space than has been achieved by any other method since railways began.

THE MITCHELL SYSTEM is mechanically operated and electrically controlled. It moves empty or loaded wagons from track to track at the touch of a button. It works unhampered in all weathers, without internal shunting, man-handling, locomotives, capstans or other impediment to low operating costs and low maintenance. By eliminating balloon sidings it reduces first-cost immensely by saving at least 50 per cent of space, and makes possible the siting of plant on hitherto unsuitable ground. It has no limit in size or capacity. Its complete flexibility makes it adaptable to any individual handling problem. By pioneering this and other advances in mechanical handling equipment, Mitchell Engineering Ltd. is making an important contribution to efficiency and economy in industry.

İNSANİYETİN HAYRINA!

HASAN IS PROUD that his job serves his country. More electricity means greater prosperity and a higher standard of living for Turkey. Hasan reckons that electricity is "*insaniyetin hayrınadır* —for the benefit of Man".

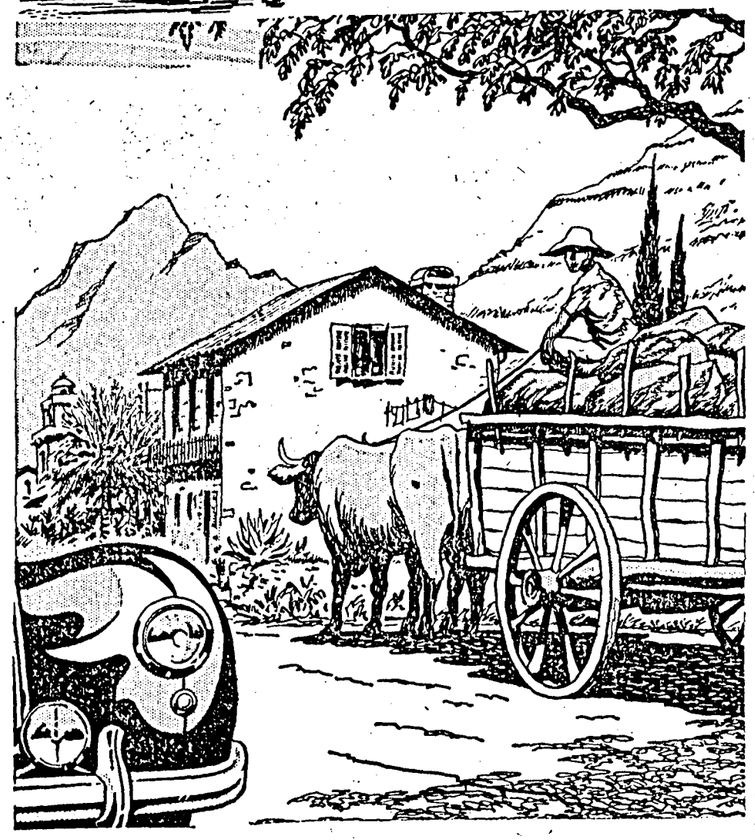
Hasan works at the Catalagzi Power Station, completed by Metropolitan-Vickers Electrical Co. Ltd. in 1948. Recently, the President of the Turkish Republic laid the foundation stone of new extensions that will double the size of the station.

Again Metropolitan-Vickers, one of the nine famous British companies that together make up A.E.I., are undertaking the work. The new contract calls for turbo-generating plant, boilers, switchgear, and all civil works, totalling some £3¼ million.

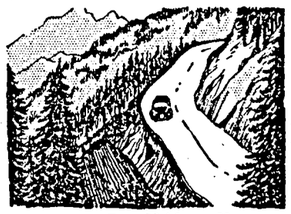
A.E.I. are Associated Electrical Industries, whose Companies make everything electrical from a turbine to a torch bulb.

AEI

for everything electrical



Associated Electrical Industries are a family of companies:
Metropolitan-Vickers Electrical Co. Ltd.
The British Thomson-Houston Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Newton Victor Ltd.
Premier Electric Heaters Ltd.
Sunvic Controls Ltd.



FROM OXFORD

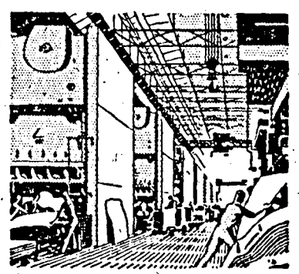
to the highways of the world

Oxford is not only one of Britain's loveliest cities—rich in antiquity, graced by the beauty of age, mellow with centuries of learning —it is a city powerful also in the industrial life of Britain. From Oxford, British cars travel to the four corners of the world.

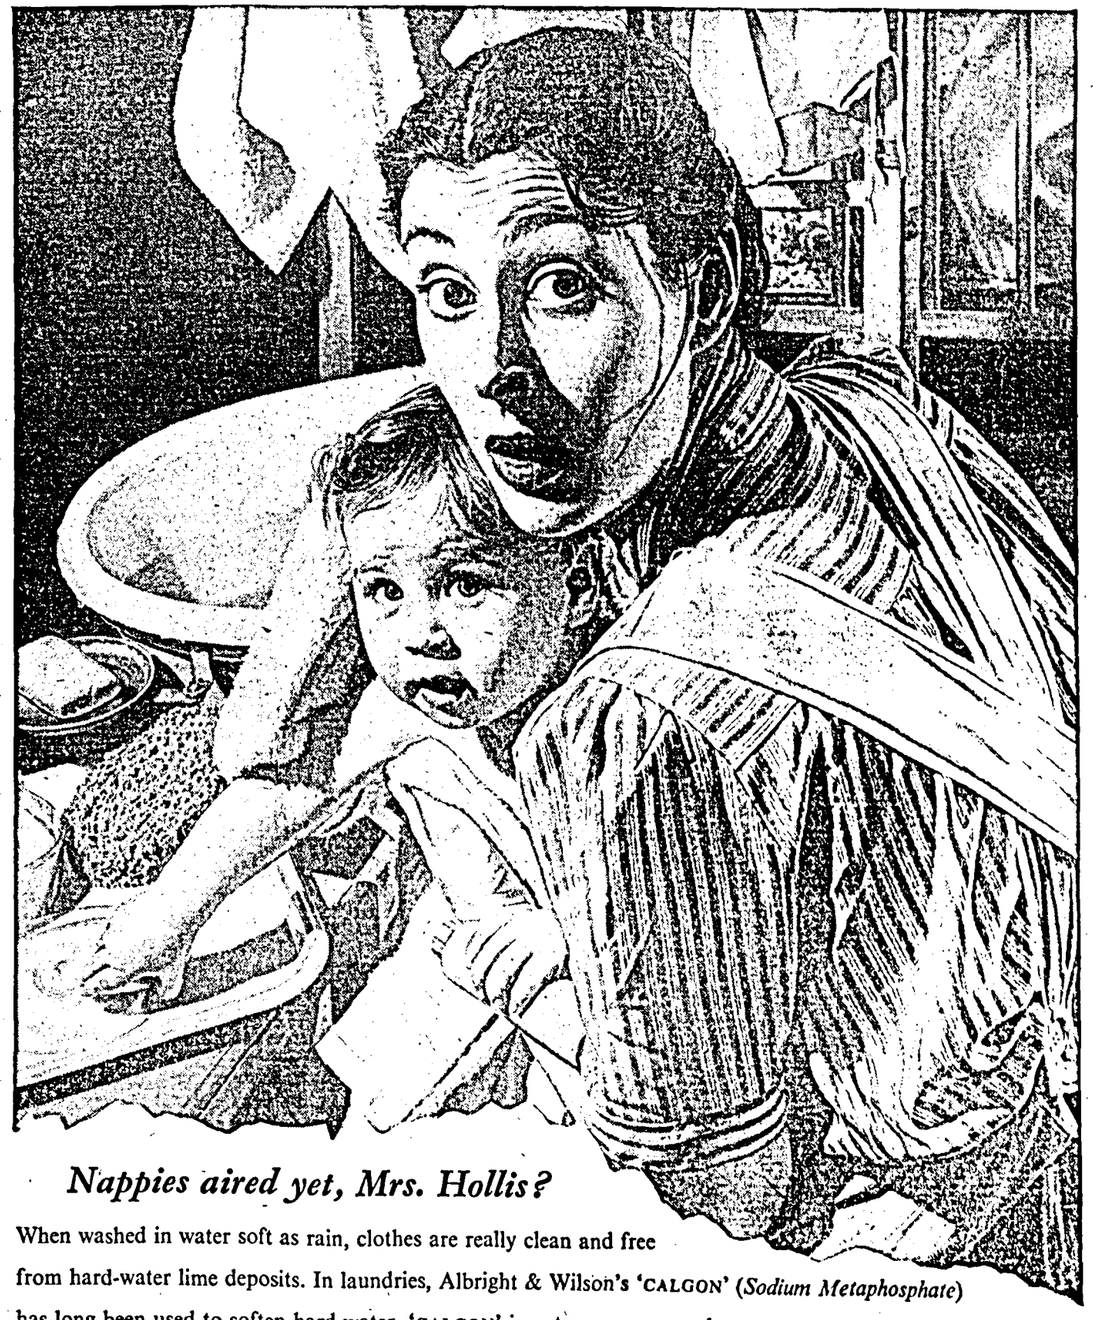
Trans-Canada *From Halifax to Vancouver, across Prairie or Rocky Mountains, British cars in their thousands serve Canada. The majority have bodywork by Pressed Steel.*

Rolling down to Rio *Brazil, Argentina, Uruguay, Central America....the New World knows well the dependability of British cars — and the strength of Pressed Steel bodywork.*

Under Mediterranean or tropic suns, in the rain and snow of the Northern hemisphere or the humid heat of the East, Pressed Steel bodywork maintains and enhances the British tradition of craftsmanship in engineering.



Cars are one of Britain's greatest, and most valuable exports—earning vital hard currency, maintaining employment, building prosperity. Pressed Steel Company Limited is proud to be associated not only with many of the most famous names in the British motor-car industry, including Austin, Daimler, Hillman, Humber, Jaguar, Morris, Morris Commercial, M.G., Riley, Rover, Singer, and Wolseley, but with other manufacturers yet to achieve world renown.



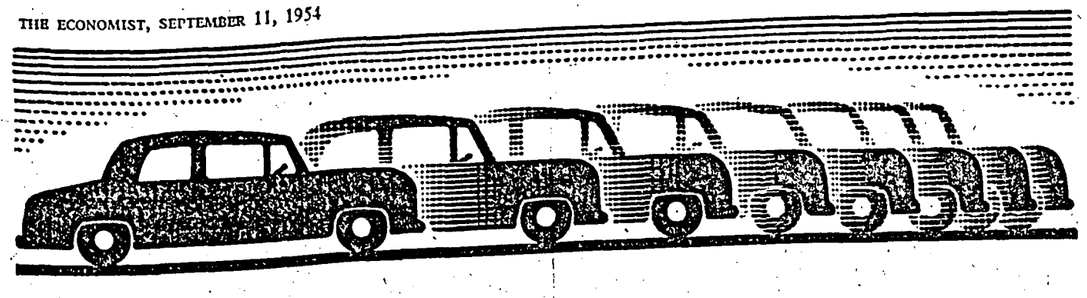
PRESSED STEEL COMPANY LIMITED

Britain's largest Independent Manufacturers of

CAR BODIES

Factories: COWLEY, OXFORD • TIDBALE, BERKSHIRE • LINWOOD, SCOTLAND.
Head Office: COWLEY. *London Office:* SCEPTRE HOUSE, 169 REGENT STREET, W.1.
MANUFACTURERS ALSO OF PRESTCOLD REFRIGERATORS, STEEL RAILWAY WAGONS, AGRICULTURAL IMPLEMENTS AND PRESSINGS OF ALL TYPES.

Nappies aired yet, Mrs. Hollis?



When washed in water soft as rain, clothes are really clean and free from hard-water lime deposits. In laundries, Albright & Wilson's 'CALGON' (*Sodium Metaphosphate*) has long been used to soften hard water. 'CALGON' is not a soap, nor a detergent, but simply a water softening powder. It is now being distributed through retail shops for all home uses.

A sample of Calgon will be sent on request.

Brakes off Expansion!

Without adequate transport few firms are able to operate to their full efficiency; but, hitherto, the capital outlay and administrative overheads required for a fleet of trucks, vans or cars have prevented many organisations from achieving this goal. Now Kennings are able to offer fleets of 10 to 50 vehicles—trucks for heavy goods—vans for local deliveries—cars for executives and representatives, in a most economic manner under their Car Contract Plan. We invite you to write for full details of this business-making scheme.

- No outlay of capital.
- Reduced administrative costs.
- Simplification of Tax claims.

  The monthly contract payment for Hire and Service is a direct charge to trade expenses.
- Countrywide maintenance service.
- Stricter and easier control of your personal transport budget.
- Elimination of redundant transport.
- Provision of relief cars at little extra cost.
- We can provide a " tailor-made " service for your exact needs, and arrange the advantageous disposal of your present fleet.

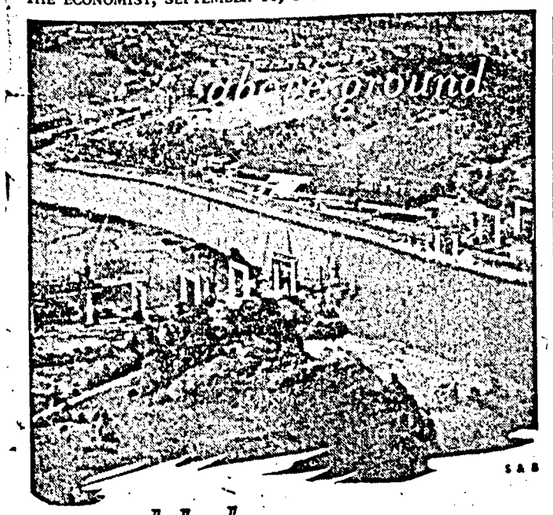
Manufacturers of metal windows, steel doors and door frames, Aluminex Patent Glazing and light steel fabrications all over the world. Head Office: Williams & Williams Limited, Reliance Works, Chester, England

How much electricity in an eel's tail?

IN OUR SEVENTY-FIVE YEARS of electrical experience, that is something we have never been asked to measure, which, when we come to think of it, is a little surprising. For every day we are called upon to supply equipment for measuring, generating or utilising electrical energy. And the many users of our products have found that there is a certain additional quality about them which is beyond all measure. That's what we were hinting at when we referred to seventy-five years. Like the eel, we've got a lot of electricity behind us.



When it comes to electrical equipment . . . you've got to hand it to

Crompton Parkinson LIMITED — ELECTRICAL EQUIPMENT

NOTE: Curiously enough, the electric eel (Gymnotus Electricus) is actually a fish. It gives a greater shock than any of the other fishes endowed with electric power. Its electric organs are situated on the back of the tail and along the base and sides of the anal fin. They are capable of giving shocks sufficient to kill other fish and small mammals.

MAKE YOUR OWN INDUSTRIAL FILMS

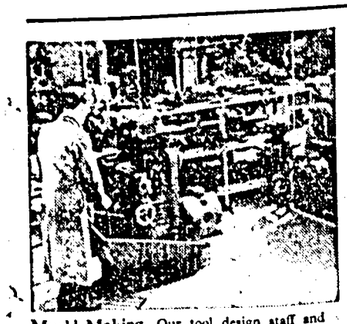
Films can help your business in so many ways—by stimulating goodwill—by increasing productivity—by promoting sales.

FILM WORKS WONDERS:—

TRAINS YOUR STAFF by showing how it's done.

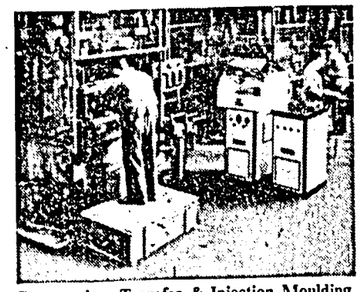
SPEEDS PRODUCTION by time and motion study.

SELLS YOUR GOODS in any part of the world.



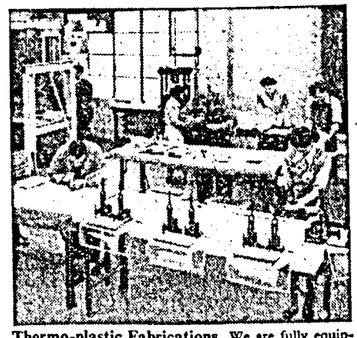
With modern 16-mm. Cine Equipment it does not require specialised skill to produce films of professional quality.

We can supply the equipment and show you how to use it.



Films made by your own organisation will obviously fit your particular requirements better than those made by outside help—and save you a lot of money.

Our service includes a comprehensive library list of Industrial films for hire.



WALLACE HEATON LTD.

Mould Making. Our tool design staff and cool room is equipped to design and make any type of mould from a simple single cavity to a complicated multi-impression mould.

Compression, Transfer & Injection Moulding. With modern presses, from 10 to 750 tons capacity, fitted with the latest pre-heating and control equipment, we produce consistently high quality mouldings. We also have modern injection moulding equipment.

Thermo-plastic Fabrications. We are fully equipped to produce from the smallest to the largest fabrications from sheet thermo-plastic materials. Our high aircraft standard is maintained in this department.

Plastic Mouldings, Glass-Fibre Laminates, Thermo-Plastic Fabrications

We offer you the services of a self-contained unit, including research and development laboratories, organised and equipped to design and manufacture economically any class of moulded or fabricated component. We specialise in the design and manufacture of Radomes.

If you are a user of plastics, if your product can be made in plastics, if you have a plastics problem—SEND US YOUR ENQUIRIES or ask our representative to call.

Patience for the Pound

THE Finance Ministers of the world will soon be converging on Washington; the eagerly awaited series of autumn discussions on freer world payments and trade is about to begin. Mr Butler will cross the Atlantic next week, and will not come back to this country until October 5th. His main purpose is to attend the annual meetings of the Governors of the International Monetary Fund and of the World Bank, which will take place in Washington between September 24th and September 29th; but after these meetings the Commonwealth Finance Ministers gathered there will snatch the opportunity for consultation. Before Mr Butler comes back, Commonwealth trade officials will have met in London to discuss the line that they will adopt at the forthcoming and fundamental review of the General Agreement on Tariffs and Trade; this review of Gatt will open at Geneva on October 28th.

In all these discussions, the Commonwealth's famous "plan" for sterling convertibility will take pride of place; but it now seems less likely than it did that this plan will be translated into early action. Three months ago there was still every reason to believe that the British Government hoped to make sterling convertible by or before next spring. Because of certain political things that have happened, and still more because of other political changes that the Government thinks may be going to happen, there must now be some retreat from this conviction. Not for the first time since the plan was conceived at the Commonwealth Conference of December, 1952, it is necessary to look anew at the what, when and why of this venture.

Information that has leaked in foreign capitals has by now provided a fairly coherent picture of what the plan probably contains. It is a plan that apparently falls into two stages. At the first stage, which has been named C-day, foreigners would be given the right to convert all the sterling that they earn (and all the unblocked sterling that they already hold) into dollars, while the sterling exchange rate would be set free to fluctuate outside the present narrow range of $2.78-$2.82 to the £. At the second stage, Britain would announce its intention to move forward, within a stipulated period, to the abolition of all physical controls on imports. Moreover, it is hoped that this forward move might be fitted into an agreed corpus of international trading rules, which the IMF and/or Gatt would try to enforce on all member governments. This enforcement could not be stronger than a persuasive process of nagging Finance Ministers, of the kind that the OEEC has perfected in Europe; and the rules to be followed would have to contain many escape clauses. But it seems clear that under the intended rules, and after a transitional period, a country that was in as strong an economic position as Britain is now would not be supposed to maintain any licensing restrictions on its imports; and a country whose currency was as plentiful as the United States dollar is now would not be supposed to suffer any discriminatory restrictions against its exports.

If this—or something like it—is indeed the plan, the political barriers that have lately been raised in its way must be serious. The first of these is the attitude of the Labour party. Next year is likely to be an election year. It is possible that convertibility might be achieved during it if Mr Gaitskell could be induced to meet the plan with passive acceptance; but it has always been clear that the project would not work if he was jostled by his own left wing into meeting it with implacable opposition. Now it seems likely that he is going to be jostled that way not only by the left wing of his party, but by its right wing as well. The latest economic report of the Trades Union Congress, in its search for some grounds for criticism of Tory financial policy, leaned heavily on the view that the removal of controls had already left Britain excessively vulnerable to fluctuations in world markets. It is important to recognise what this policy of Labour opposition to freer payments would mean if C-Day were, after all, allowed to dawn next spring. Foreigners would then in effect be told "Britain is giving you the opportunity to convert your sterling into dollars. In six months' time there will probably be a general election, and the alternative government that may well be elected will probably take this opportunity away." There is little doubt what foreigners' reactions would be; they would hurry forward to utilise their rights of conversion at a fast enough press to wreck the whole venture.

★

The second political barrier that has arisen is the attitude of the restive rank and file of the Conservative party. The Tory backbenchers have not yet been told much about Mr Butler's plan; and they have understood still less. But their reactions—and those of leading industrialists—to their vague gleanings have clearly been singularly unenthusiastic. The objective of abolishing all exchange controls, starting with discriminatory controls, sounds very promising in theory; the objective of removing all import restrictions, starting with imports from Japan, sounds very nerve-wracking in practice. There is more than one marginal Conservative constituency in Lancashire that is not at all eager to set its tied customers free. Six months ago the word convertibility could still ring in Mr Butler's ears to the accompaniment of some distant drums of freedom; now it must presage for him the menacing tom-toms of the 1922 Committee.

It is impossible to judge exactly how far the "when" of the convertibility plan is likely to be delayed by this wider understanding—or assumed understanding—of the "what." But the factors making for delay seem to be strengthened by further examination of the "why" behind the plan. There have been three motives for the Treasury's attachment to convertibility in the last two and a half years. One has been the recognition that greater freedom would make for better division of productive effort and greater international prosperity; this motive remains, even although some politicians may now have decided that they do not like it. The second motive has been the belief that if Britain and Europe are to be helped in their advance, they should strike for that help while the iron is hot—which means before American aid, and with it the American feeling that aid is respectable, has tapered off into final extinction. Now, however, it seems probable that the only aid that will be forthcoming will be freer facilities from the International Monetary Fund; the IMF has made it clear that it is at liberty to provide stand-by credits, within the bounds set by its existing resources. For other measures to increase reserves—including even the rearguard hopes of increasing the Fund's resources and of securing a special credit from the Federal Reserve—the iron may be too cool already.

★

There remains the third, and least widely appreciated, motive behind the convertibility plan. It has often been emphasised in these columns that Britain could not now meet any external economic crisis by measures of import and consumption controls of the 1945-51 type; the machinery of control has been dismantled, and it cannot be swiftly re-erected. The only way in which Britain could meet a crisis now would be by depreciation of the exchange rate (together, of course, with internal disinflation). Some of the Government's advisers are convinced, however, that another devaluation under conditions of inconvertibility would spell the end of sterling as an international currency; they think that nobody would hold a currency that was not only inconvertible but was also liable to fluctuate in value. They believe that the objective in erecting defences against disaster must be to move towards a floating exchange rate, but with convertibility too.

There are good—though abstrusely technical—reasons for criticising this view; but all that needs to be said here is that the view is firmly held. And from it arises a peculiar consideration. Many people have assumed that the advance to convertibility would be speeded only if economic conditions continued to make sterling strong; in fact, the most potent reason for speed would be if economic conditions threatened to make it weak again. At the moment there does not seem to be any such threat. It will be surprising if between now and next spring it becomes necessary to make a dash for freedom, simply because a dash for restriction is no longer possible and because market forces threaten to overwhelm Britain if it stands still. The policy of standing still, or rather of edging instead of dashing forward to freedom should still be possible. And it is this policy—though with the emphasis on the forward as well as on the caution, on a more liberal import policy rather than an earlier C-Day—that should be urged on Mr Butler as he packs his brief-case this weekend for his journey across the Atlantic.

Curtain at Manila

WHATEVER may be thought of the details of the South East Asian defence treaty, drawn up this week at Manila, it clearly goes as far as is possible at the moment. During the past few years it has been difficult to get the facts about the Communist pressure on South East Asia formally recognised and agreed upon in public. Everyone could see that the Chinese and Russians were building up the Vietminh army, and that the Communist parties in Malaya, Burma and Indonesia were following a line designed in Moscow. But hesitation about upsetting Asian politicians, military weakness and the sheer difficulty of co-ordinated planning have together hampered the western powers in taking any positive, long-term international action to deal with the situation. South East Asia has at times looked like falling to the Communists piece by piece as South East Europe once fell to the Nazis. Now at least there is a plan and a declaration of intention.

Whether the plan will work is another matter. Much will depend on the backing it receives from public opinion in the eight countries represented this week at Manila. Given the wide differences in their history, outlook and strengths, it is surprising how narrow their final points of disagreement became. The chief criticism levelled at the project of a South East Asian Treaty Organisation (Seato) has been that it was being organised by outside powers which had no business "defending" South East Asia at all, and whose only stake in the area came under the heading of "imperialism." But no other conference of similar size in recent years has drawn together the common interests of nations from so far afield; indeed, unless it had, there would have been no chance of any effective action at all. Now the question is whether the new treaty will stand the test of time, and whether in the end it can draw in those states in South East Asia that have so ostentatiously held aloof from this week's deliberations.

The aim of the treaty is to put a stop to further Communist erosion in the area. But the negotiations that led up to it at once posed two fundamental questions: whether it was politically wise to define the aim so clearly, and what the limits of the area should be. When Mr Eden insisted that Britain could not consider any formal negotiations about Seato until after the Geneva Conference, he was supported on both sides of the House of Commons, though for slightly different reasons; some on the Government benches felt that the risk of tickling American tempers was worth taking in order to try to hold out for Indian approval, and many of the Opposition favoured delay in case the Chinese should take offence and the Geneva conference break down. But none doubted that a South East Asian treaty, if it came about, must and would be aimed at preventing Communist aggression. In the event, however, Lord Reading, with the support of certain other delegations, has succeeded in opposing Mr Dulles's desire to use the word "Communist" in the text of the treaty. The British felt that anything other than a general security pact might have a bad effect among the onlookers on the sidelines, notably in Delhi; Mr Dulles argued that unless the treaty was clearly marked as anti-Communist, he might have the door slammed in his face when he came to recommend it to Congress. The final compromise has been that the Americans will attach to the treaty a memorandum on their own views.

Of the eight powers—Britain, America, France, Australia, New Zealand, Pakistan, the Philippines and Siam—half are members of the Commonwealth. And although Sir Zafrullah Khan emphasised that his presence did not mean that his country stood committed to accepting the final treaty, the presence of Pakistan marked its membership of both the Commonwealth and Colombo clubs. It raised, however, the two issues of Communism and the delimitation of the area in an acute, practical form. The British desire for a vague formula received a rebuff when it was realised that Pakistan hoped to be able to invoke the Seato treaty if attacked by India; nothing, it may be supposed, could have been better calculated to induce a more jaundiced view of the whole project in the ranks of Delhi.

★

The treaty makers, however, having dropped the word Communist, dodged the Pakistani challenge, and two other awkward problems, by their limited definition of the area. In covering South East Asia and the South West Pacific, the treaty area is to be bounded on the north by parallel 21°30'. This neatly passes south of Pakistan and also of Hongkong and Formosa. It may be argued, particularly at the present moment, that after the free rump of Indo-China—Laos, Cambodia and South Vietnam—Formosa is the next most obvious target of Chinese attack; Mao Tse-tung, indeed, has shown a Hitlerian technique in tackling one objective at a time, in leaving Indo-China till Korea had been dealt with, and in stepping up the pressure on Formosa only when Indo-China had reached a lull. But, whatever the outcome of the present shooting at Quemoy, to have tried to include the Chiang Kai-shek regime in Seato would have wrecked the chances of the present treaty and would have barred all hope of getting any other countries in the area to accede to it in the future. To balance the recognition that the Americans must be left to hold the fort with Chiang in Formosa, Hongkong has also

been excluded from the treaty and left to British protection. Although this is a pity, the conditions for the colony's continued security are so special and peculiar that the lack of a formal guarantee from the other Seato powers will probably make little practical difference to Britain's position there.

★

The limitations of the new treaty have, in fact, become more obvious than its advantages. Perhaps for this reason it has been received with an apathy that compares strangely with the heat of political passion in the early summer, when trouble over Seato took its place among the meteors which flash alarmingly from time to time across the sky of Anglo-American relations. But the truth is that to have made a start in formalising the defence relationships already existing in South East Asia is no mean achievement. Against the fact, for instance, that no very convincing statement could be made about Laos, Cambodia and South Vietnam, because specific undertakings had been given at Geneva that they would not be included in Seato, must be set the knowledge that American strength and interest have already made the Communists pause. Against the inability of the parties to agree on automatic action (Seato is consultative like the Anzus pact, and unlike Nato), and the virtual separation of economic measures from the political treaty, there is the fact that agreement has been reached on two unusual features. Consultation is promised about aggression against certain designated territories, whether or not they are members of the pact. It can also come into operation if the Communists overthrow legally constituted governments by internal subversion; the immense difficulty of defining this type of aggression without infringing sovereignty has in part been overcome by the general consultative nature of the pact as a whole.

The next task is to get the treaty ratified and to make it a factor in rebuilding confidence in South East Asia. That means much public argument, during which the treaty will be defended in different parliaments on very different grounds. Mr Dulles will be concerned to prove that it is more effective than it looks; Mr Eden will be concerned to show that it is less provocative of the Chinese than the Opposition may think fit to concede. There is a risk of confusion and vacillation in public opinion. The debaters would do well to bear in mind two points. First, that any action by the Chinese that brings Seato into action will bring danger nearer to those Asian countries that have stayed away from Manila. If, for example, a real threat to Siam were to develop, then the security of Burma could not fail to be affected. Secondly, that the organisation will develop real cohesion and power only if confronted by visible and imminent danger. Whether the new organisation becomes an active and powerful body depends to a great extent on the behaviour of China. What is true of Nato will be true of Seato, different though the two bodies are: it will thrive under Communist threats and shrivel under Communist politeness. Whether China can co-exist peacefully with it depends above all on the manners of Mao Tse-tung.

New Law for Lotteries?

THE betting laws of Britain are always good for a laugh. The promised spectacle of Labour Party supporters, pledged to the abolition of inequalities in wealth, declaiming against the evils of unearned capital gains at meetings arranged by agents who will be paid from the proceeds of a special weekly football pool for party members, is merely a better joke than many. But, when the laughter has died away, the problem this pool is designed to meet remains. Why should not a group of people, collecting money for an object which they all support, agree among themselves that two or three of their number, chosen by chance, shall also have a limited share in the cash collected? At the moment the effective counter to any such agreement is that the local Chief Constable may then feel that there has been a breach of the Betting and Lotteries Act, 1934—and the word "may" is as much a deterrent as anything in the Act itself.

The laws governing betting and gaming have become increasingly tangled ever since Parliament first set its foot on the slippery slope of attempted regulation by passing the Unlawful Games Act in 1541. The intentions of the promoters of that Act, and of all those that followed it, were no doubt excellent; better than those of Pandora when she opened her box, but the results roughly correspond. Betting has never been declared illegal. It has merely been made half-difficult to indulge in. Its contracts have been made unenforceable. It has been forbidden in streets and public libraries. Its advertising has been restricted and it has been denied to infants. Particular games with cards and dice have been banned. The general impression left by the range of statutes, from the Gaming Acts of 1738 and 1739 to the Pool Betting Act of June this year, is that betting, gaming and wagering are really wicked; but that certain forms of the wickedness must out.

Today, the gambling proclivities of the public, which, of course, have not been changed at root by two centuries of legislative endeavour, manifest themselves in three main ways. People bet on horse and dog races, which is legal if done for cash on a course and by credit anywhere else; on football pools, which have become a very big business; and by private lotteries, which range from simple draws for a Christmas turkey

to larger schemes for the support of every kind of local social and athletic activity. Betting on horse and dog races is mainly, and that in the organised football pools entirely, conducted for the profit of the organiser, the man who receives the bet. The smaller lotteries are not, and it is they (perhaps in consequence?) that are now in the dark shadow of legal uncertainty. Their newly created association, the National Association of Sports and Welfare Clubs, sent a deputation to the Home Secretary at the end of July to ask for an amendment to the existing law.

★

These small lotteries were last regulated by the Betting and Lotteries Act of 1934. Section 21 of that Act starts off boldly enough by saying: "*Subject to* the provisions of this Part of the Act, all lotteries are illegal"; but, since the Act does not define what a lottery is, that clarity is a little deceptive. Lotteries have, however, been defined in the courts, by the usual process of trial and error. The accepted summary of their decisions is that a lottery is a scheme for distributing prizes by lot or chance, but if merit or skill plays a part in determining the distribution the contest is not a lottery. The police and the lawyers are always prepared to have a tussle, at anyone's expense, over what constitutes merit or skill in this connection. Some of the small lotteries (or, rather, near lotteries) that are legally carried on are those that have fallen on the right side of this definition.

The other legal types of lottery are those that benefit from two small indulgences granted under the 1934 Act. The first of these indulgences, which does not give rise to any great difficulty, is the lottery incident to an entertainment. This is permissible on certain strict conditions: the proceeds must not go for private gain, the prizes must not be in cash and must not cost more than £10, and the tickets may be sold only at the place where the entertainment is held and while it is in progress. The scope for this kind of lottery is obviously very limited, but it should be emphasised that when a raffle is run at a church whist drive the parson is not in danger of going to gaol.

The second exemption under the 1934 Act is that a lottery may be:

(1) Arranged for its members by any society (a very wide term, as defined by the Act) which is "established and conducted" for purposes not connected with gaming wagering or lotteries; or

(2) May be arranged by any person for those who work in the same premises, or who reside in the same premises as he does.

In all cases the whole of the proceeds must go either to the prizewinners or the funds of the society; the only deductions allowed are the actual costs of printing and stationery.

The lotteries arranged by someone for those working or living with him—a category that covers the factory or the family sweep on the Derby—do not cause any real difficulty. But the lotteries organised by a "society" do. There are minor problems—the rule about expenses has proved too rigid in practice—but the basic problem is this: what does the expression "established and conducted" for purposes not connected with wagering really mean?

Apart from such media of mass entertainment as the major professional football teams, most sport today is not fully supported by what is collected at the gate. Many sports clubs, including even some that are national institutions, have therefore tried to draw funds in from their habitual supporters by devices that are technically lotteries. Their first difficulty is that their supporters include many—probably the majority—who are not members of the club that arranges the draw (Lord's, for instance, is not wholly supported by members of the MCC). Their lottery, to be legal, must be confined to full members of the club. The second problem is that if a "supporters" club is formed as a financial auxiliary to the main body itself, such an organisation (in the eyes of many Chief Constables) of necessity becomes a body engaged in "conducting" gaming or wagering activities. It therefore ceases to come within the exemption given by Section 24 of the 1934 Act. The Chief Constable is not to be blamed; he would be deserving of blame if he decided to interpret any law in the light of what he thought it ought to be. But the result is that athletic clubs, among others, languish in a state of paralysing uncertainty; and there will be very few cricket clubs who will be able to survive for long on no more than their takings at the gate this summer.

★

That is one result. Another is that some organisations are being tempted to turn away from ordinary lotteries to set up football pools; the proposal by Labour party supporters to create their own, in Clarion Services, Ltd., is an example of this. Local political parties, like local sports and social clubs, must find money—for premises and a full-time agent and other needs. If the sweepstakes they have been running are unlawful, the football pool—which is adjudged to contain an element of skill—seems a way out. It is guaranteed by statute to be legal; and, since Mr Mulley's Act to regulate this form of betting this year, it is now respectable as well. As one Labour party secretary wrote in a letter to the Press: "Lacking concern for awkward principles, it seems a lawful way of meeting a need with a minimum of opposition." However many questions that letter may beg on the way, it goes straight to the point.

A very silly situation has therefore arisen. It is now clear that the combined effect of a rigid enforcement of the 1934 Act and of the way of escape into the newly-blessed field of football pools may not be to reduce the volume of gaming activities. These activities may merely

flow into a fresh channel, and not necessarily a more desirable one. True, the Revenue will benefit; there is a 30 per cent tax on pools, nothing on small lotteries. But the public, the sports club or political party, and the national interest will not benefit. The expenses of running a legitimate pool are heavy. There are registration fees to the local authority to be paid, a statutory "accountant" to be employed, and staff and general expenses will creep up. The result may be a mounting pressure to extend the basis of support given to the pool, until the pool itself may become more important than the activity it was originally designed to help.

It is always possible to argue that it is time the betting laws of this country were given a thorough overhaul, and there is a three-year-old report of a Royal Commission which adumbrated the lines on which this might be done. But Parliament has avoided doing anything of the sort for the last two centuries, and it is foolish to look for any immediate change of heart; any progress that is made will only be made in very small steps. The reforms that the National Association of Sports and Welfare Clubs recently urged on the Home Secretary do not amount to much more than clarifications of the 1934 Act. It should be possible to include lotteries organised by supporters' clubs, as well as by the members of the principal club itself, in the exemptions given to the general ban. Those who ask for a revision would probably accept a limit to the cash going out in prizes; they might also accept some form of registration with the local authority, on the precedent set up by the Pools Betting Act.

The Home Secretary may reply that this Government cannot spare its own parliamentary time, that this is a proper subject for a private member's Bill. If he does, he should state clearly what changes in the existing law the Government would support if they were put forward in a private member's Bill. This would be an encouragement to a great many admirable organisations now in difficulties, and perhaps also to some private member fortunate in the Commons' own lottery next session. The Government must know that a majority of people in Britain today are not individually averse, on moral or any other grounds, to buying a sweepstake ticket in support of a local club or activity of whose work they approve. It should act promptly on this knowledge, not delay in its fears.

Germany into Nato

OF the fourteen governments that are members of Nato, nine are to tackle together the situation created by France's rejection of the European Defence Community. If they should meet shortly, as they should, more than one difference of view and interest will cut across the ties that hold them together. It will be a conference of allies among whom confidence has been badly shaken. The French are isolated and suspicious; the Germans are impatient and self-assertive; the Italians and their European partners in the Low Countries are vexed and apprehensive for the European idea; the Americans are close to exasperation; and the British are gloomy and puzzled. Only the Canadians seem likely to arrive in a cool and judicial frame of mind.

The Six Attitudes

Germany. The new and preponderant fact is that the Germans now ask for independence on fresh terms. Just what they will accept in the way of restrictions on their sovereignty—that is to say their freedom of action in all essential matters—is uncertain. They must be expected to take up bargaining positions from which they will retreat only in return for concessions from France and others. A distinction has to be drawn between their insistence on receiving the formal right to rearm as they wish—the exercise of what they call *Wehrhoheit*—and the amount of rearmament that Dr Adenauer's government would in fact wish to undertake. If it proves impossible to restrict the former, it may yet be possible to restrict the latter by free agreement of the Germans themselves. The same is roughly true of the occupation. That must come formally to an end; but the continued presence of allied troops could be freely accepted in Bonn not only as a precaution against aggression from the east but also as a stabilising factor in German politics—which some democratic Germans would privately welcome.

There need therefore be no landslide in allied policy for Germany, provided that Dr Adenauer can prove two things to men of good will in his own country. The first is that Western Germany has the freedom, if it wishes, to frame its own policy for promoting German unity; the method of uniting Germany remains, of course, subject to four-power agreement, for with a united Germany there must be a peace treaty acceptable to the Soviet Union, the United States, Britain and France. The second is that special relations with a European group or the existing Atlantic alliance are freely accepted and not imposed. Dr Adenauer's political purpose must be to take the wind out of the sails of nationalists who clamour for German freedom and Social Democrats who demand priority for German unity. He has only a little more freedom of manoeuvre than M. Mendès-France.

France. The European Defence Community has been rejected, but there is the authority of the Prime Minister for believing that a majority of French deputies want to maintain the Atlantic alliance. They want American and British friendship for its own sake; they want all possible protection of France against Soviet mischief;

and they look to the Atlantic grouping to provide in some way or other a harness for a strong Germany. If there is broad agreement on these points among most non-Communist deputies—the Communists will vote in all circumstances against German rearmament and German sovereignty—there are none the less deeply-felt differences over important details. The harness must not lie too heavily on France; it was the main burden of Gaullist and other right-wing criticisms of the EDC that it bound the French army in chains. It must be of a closely-woven rather than a loosely-knit pattern; this is what the Bidault-Pleven group has been saying, and M. Mendès-France needs their support.

Hardly any Frenchmen will be found to accept unrestricted German rearmament. If they can be brought to accept German sovereignty in defence matters it will be only in return for limitations to the size and character of the German defence contribution. Most of them will demand, in addition, guarantees that American and British forces should be present on the spot to see fair play between France and Germany. It is, therefore, easier to see what most Frenchmen will reject than what a reasonable majority of them would accept as a substitute for EDC. They will wait, or wish to wait, for clear signs of German, American and British attitudes. They will tend, especially after the passionate ordeal of the EDC debate, to think more of France's plight than of Europe's crisis.

The European Four. It is not easy to define an attitude common to Belgium, Italy, Luxemburg and the Netherlands. Confronted with M. Mendès-France's amendments to EDC at Brussels, they formed a solid front in favour of European integration. They were set on preserving not only the defence community but also the coal-steel community, the incipient political community and the European movement in general. M. Spaak was, as it were, the European Pope, confronted with the French heretic. They are likely to fight hard to preserve some relics of the European idea, almost certainly with the support of Dr Adenauer. They will cling to the hope of an EDC rump within some Atlantic club, of which the United States and Britain will be active members. They appear not to fear German rearmament as the French do.

The United States. American thinking since the rejection of EDC is analysed elsewhere in this issue by our Washington Correspondent. Here it is sufficient to say that only the Americans seem to see the strategic problem steadily and see it whole. Their view—shared by most military experts in the free world—is that Western Europe cannot be defended against Soviet attack without German assistance. The military experts of Nato—and the British Chiefs of Staff—have never wavered from this view. If it is argued either that a Soviet attack is unlikely, or that aggression would be countered mainly by air power and atomic weapons, the military reply is that no one can be certain—after Korea and Indo-China—how a threat to Europe's security might develop. If it is argued that troops on the ground are less necessary than they were, the Americans can ask "Why, then, are you so anxious that our troops and the British troops should stay in Europe?" To this Europeans reply that they expect the emergence of a German army to be the signal for American troops to begin leaving Europe. This is a fear that no President can calm with a pledge about the future; he can only reaffirm loyalty to the North Atlantic Treaty and assert the right, which the French themselves defend so passionately, to take independent decisions in such matters.

Britain. It looks as if Mr Eden is cast for the part of mediator among the nine powers. Britain is closer to Europe than the United States but further from Europe than France. It tries therefore to steer a middle course, leading it into a series of Janus-like postures. It wants German rearmament for the same reasons that the Americans want it; but it is more tolerant of French fears and objections than they are. It is attracted by the idea of an Anglo-German understanding, but not at the expense of the Entente Cordiale. It is prepared to see some of its divisions and squadrons under Nato commanders (they are already), but it will not give up the final authority over its forces in Europe. It wants Western Europe to form a tightly organised and permanent club; but has refused so far to become more than a country member itself. It might accept tighter links within Nato provided that it is never committed more than a degree or two further than the United States. It believes that some attempt at peaceful co-existence must be tried, but it sees no ground yet for relaxing military preparedness. It will not, therefore, abandon German rearmament as many Frenchmen would wish; nor will it allow German reunification on present Soviet terms, as some Frenchmen and Germans would prefer; nor will it discuss the problem of Germany with Moscow—as many Frenchmen and Germans wish—until Mr Molotov has indicated that he has new terms to offer.

Canada. The Canadians are entitled to attend this conference for three reasons. First, they have been unflagging in their effort to make out of Nato something more than a military alliance; secondly, their brigade group in Germany is an important part of Europe's defence, both militarily and symbolically; thirdly, they can speak more frankly about Commonwealth attitudes to British involvement in Europe than the British themselves care to. They may well play a decisive part in keeping the broad vistas of the Atlantic alliance before the eyes of European experts who have to hack their way through a jungle of technical detail.

Possible Solutions

The layman who proposes solutions to such a conference is, perhaps, foolhardy. But public opinion in a dozen countries is deeply and intensely involved in the issues the Ministers will face. And it is only too clear that statesmen and officials are in no mood or condition

for thinking out plans that may involve them in further loss of face. France's rejection of EDC has made people wary of appearing to be starry-eyed. The public may therefore join in with a good conscience. Basically the problem is one of restoring confidence and only the conference itself can do that. But one or two other points are clear. First, there must be some gesture of good will from Paris to Bonn. Secondly, Dr Adenauer has to be shown new ways of accepting obligations that will reassure non-Communists whose minds are scarred by memories of Hitlerism. Thirdly, those obligations must be somehow underwritten by Britain and the United States in a manner that Frenchmen will believe to be proof against changes of feeling and policy in London and Washington.

It is a difficult circle to square, but past experience suggests that a solution would best be sought firstly in the military sphere. In Nato there is real military integration, real enough to set some restraint even on the Pentagon and Whitehall. Can German staffs and forces be so integrated with the Nato staff and forces that a new General von Seeckt, working in Bonn on a new model Wehrmacht, would find his hands tied and his top secret papers under scrutiny? That is the essence of the problem. Perhaps it could be dealt with in this way. Suppose:

1. that France agreed in principle to German membership of Nato in return for an agreement that Germany would limit its armed forces to a size that would always be a fraction of combined American and British forces in Europe—say five divisions against ten. In other words, if American and British forces were reduced so would the German be.
2. that Britain agreed not to reduce its forces in Europe without the consent of Nato.
3. that the United States agreed to supply arms to Germany only through a Nato organisation.
4. that Canada agreed to provide facilities for arms to be manufactured in Canada for a European armaments pool, with the aid of American capital and German industry.
5. that all of the European governments concerned, led by France and Germany, agreed to conduct in common all research and production for scientific warfare.

To every one of these suggestions there are strong political, military and practical objections, most of them based on the desire to maintain sovereignty in this or the other particular. But without proposals that do infringe everyone's sovereignty in one way or another the conference will fail to extricate itself from the morass into which they have wandered. And unless account is taken of the vast changes in arms and military thinking that lie ahead no new Nato plan will survive half a decade.

Notes of the Week

Defeat at Brighton

THERE is now little prospect that Mr Attlee can lead the Labour party to be helpful in the diplomatic struggle to fit Germany painlessly into Nato. The General Council of the Trades Union Congress grasped the nettle of this controversy at Brighton this week, by putting down a blunt motion that urged "the speeding-up of complete plans for effective Western defence which will enable Germany to bear its share." Congress passed this by 4,077,000 votes to 3,623,000, a majority of less than 455,000. As far as can be judged, the unions that voted with the General Council will deploy about a million and a half less votes at the Labour party's conference at Scarborough than they did at the congress; the voting strength of the unions that opposed the General Council will fall by rather less. The majority in the trade union section at Scarborough for any straight motion about Germany—the sort of motion which Mr Attlee would like—might not be wholly eliminated; but it would be exiguous. The issue would then rest with the million or so votes of the constituency Labour parties; and about two-thirds of them are Bevanite, sometimes even crypto-Communist, controlled.

Mr Attlee's only hope now is to avoid a straight vote at Scarborough. This will not be very glorious, and it will also not be very easy. It will not be glorious to have to say that, in the summer when the front on which freedom and peace depend was built up, his only contribution was to try to dissuade the party that he leads from active treachery to the cause that he knows to be right. It will not be easy because the Bevanites are howling for a straight vote; they now have the woolly brand of pacifism that made Labour so ineffective in the thirties, the proved pervertibility of their party's constitution, and the fact that their campaign has apparently not been harmed by being based here and there on some quite shocking untruths, working in confused alliance on their side. The only helpful thing that can be said at the moment is to wish the poor leader luck.

Disappointment After Sunshine

THE vote at Brighton was the more unfortunate because it came at the end of a week in which everything had gone right for Mr Attlee and his supporters in the party. He had said some of the right things about his visit to China, in Hong Kong and in a London evening newspaper; he had been fortunate enough to be attacked in *Pravda*. His object of being able to say that Mr Bevan is not quite right about China—which was his main reason for going East himself—had been strengthened by the report that a miner at one of the Chinese coal mines which the delegation visited had been publicly executed a few days before, because he had broken a machine. And Mr Attlee's reputation as a moderate and sensible Labour leader had been enhanced by juxtaposition with Dr Evatt.

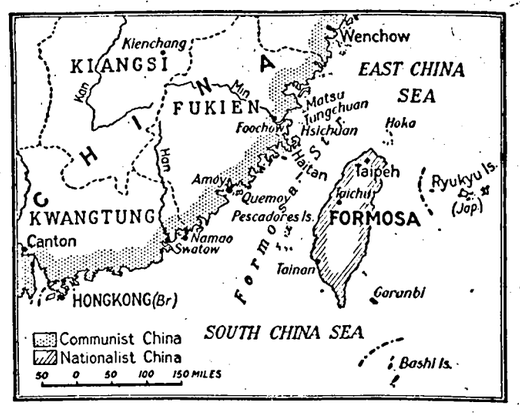
Above all, the latest Gallup poll has shown a clear swing to Labour. When allowance is made for the redistribution of the preferences that are Liberal in casual expression but cannot be translated into Liberal votes at an election, and also for the swing back to the government of the day that always takes place on the eve of a general election, it would be unwise to judge that the Conservatives would necessarily be defeated if they went to the country now. But, for the first time for nearly two years, it does seem to be true to say that they would not necessarily win.

The Unions at Home

IN addition to all this, during the first two days' proceedings at Brighton everything had gone right—in both senses of the word. Except in the vote about German arms, which cut across normal affiliations, Mr Deakin and his colleagues were in full control. Despite some desperately hard work in the past year, the handful of Communist delegates arrived at Brighton with a bare half-million block votes—gained, stolen or strayed—in their pockets. They brought these into the open on the first day, on a procedural point that was cleverly tied to the crucial issue of "German rearmament"; it was promptly voted down by 5,884,000 votes to 1,600,000, with more than half of those who eventually voted against the Council on Germany glad to dissociate themselves in this initial tussle from their embarrassing bedfellows. By the second day the Communists had temporarily declined from a menace to a joke, as they disconsolately cast votes for each other in the elections to the General Council. The Council, of course, rode past this challenge into re-election in precisely its present form—except that those two retiring and respected stalwarts, Mr Jack Tanner and Sir Will Lawther, were replaced by men of the same persuasions and from their own unions.

On every other issue too—including a blunt refusal to indulge in any conversations with Russian and other Communist trade unions, and a recognition that an increase in old-age pensions "may mean a rise in contribution rates"—the right wing's views proved triumphant. By Wednesday evening Mr Deakin was clucking happily that "some of Pollitt's rabbits are suffering from myxomatosis, blindly staggering from one indiscretion to another." The congress's generally emollient view of domestic affairs was made softer still when the leaders of two of the railway unions, who had taken time off from Brighton for discussions with Sir Brian Robertson, announced that "some progress" had been made towards solution of the railway wage deadlock. As *The Economist* goes to press, it is reported that this progress is due to the fact that the Transport Commission has added more than a million pounds to its previous offer. Spread in the right places, among the skilled grades, this new money may be barely sufficient to prevent a strike. But there will be much bewilderment, and some suspicion, about where the Transport Commission thinks that it is going to find this additional sum.

Labour's Purse Strings



THE issue of German rearmament, and other problems of foreign and domestic policy, are not the only subjects on Labour's mind as the Scarborough conference approaches. The party has also to face some hard facts about finance, to which the unions have for some time been giving careful thought. When Mr Gaitskell reaches the post of treasurer, to which his election now seems a certainty, he will find that although the party has a reasonably solid reserve of some £193,000 in readiness for the next general election, one of its key funds—the Party Development Fund—has shrunk from £110,000 in 1951 to a mere £32,400 today. The need to replenish this fund, which was established in 1949 for publicity, propaganda and organisation, is all the more apparent because of the drop in total party membership during the past year, and of the need to prepare the ground during the next twelve months for the expected general election.

Mr Gaitskell took tea with some of the union leaders in Brighton this week, and he must have been made aware of one of their present anxieties. The union leaders have been worried for some time about the lack of good men of union stamp to come forward as would-be parliamentary candidates—and the even smaller number of these men who get past the selection committees of local parties. With so many constituency parties strongly Bevanite, the possibility of a slow but perceptible shift leftwards in the men and women selected as Labour candidates cannot be ignored. The unions who, election after election, put up the bulk of the fighting funds and five-sixths of the party's membership fees, have good reason to feel concerned at this trend, which has brought Mr Bevan at least two energetic recruits through by-elections in recent months. It will not be surprising, therefore, if the union leaders turn their minds again to a project, which was canvassed some months ago, that they should cut down their donations to the general expenses of the party, and step up their support for candidates they are willing to sponsor. They may also demand that the constituency parties should contribute more towards headquarters funds than their present 6d. a head for each of their members.

Tight Little Island

THE artillery duel between the Chinese mainland and Quemoy island, four miles away, together with the Nationalist counter-attack on the port of Amoy, have made this obscure point on the map the world's most explosive trouble spot this week. There is, so far, no evidence that the attack on Quemoy is the prelude to an immediate assault on Formosa. Quemoy, from whose shores Mao's troops were repulsed in 1950, is a Nationalist advanced post so near to the mainland that it is both insult and injury. The present attack on it is doubtless being made largely for political motives. At home, Mao can mobilise patriotic feeling by focusing attention on the existence of an enemy so close by. Abroad, Peking can hope to enlist sympathy for its desire to clean up a situation which few countries would find tolerable and so confuse people's minds about the more complex problem of Formosa's future.

Potentially, moreover, an attack on Quemoy might draw America into an exceedingly ticklish position. In the event

of further attacks on this tiny island, Chiang Kai-shek might send reinforcements from Taipeh. Suppose these, while in transit, came under air or naval attack from Communist forces. What would the American Seventh Fleet do? Although Quemoy has been explicitly excluded from its responsibilities, it would surely be involved in any air-sea action near Formosa. If this happened, Mao would have succeeded in drawing the Americans into a clash in circumstances with which their allies would have little sympathy. An invasion of Formosa by Mao might rally opinion even among those free nations which have little love for Chiang, but want no more bloodshed in the Far East; a war on behalf of Quemoy is an altogether different proposition.

It is certainly alarming to learn that American officers have been present on Quemoy, and that Congressmen and local American commanders have paid it official visits. One wonders what Californians would feel if they discovered Communist Chinese radar posts on Santa Catalina island, off Long Beach. The political disadvantages that must attend continued American involvement with Quemoy far outweigh its dubious strategic value.

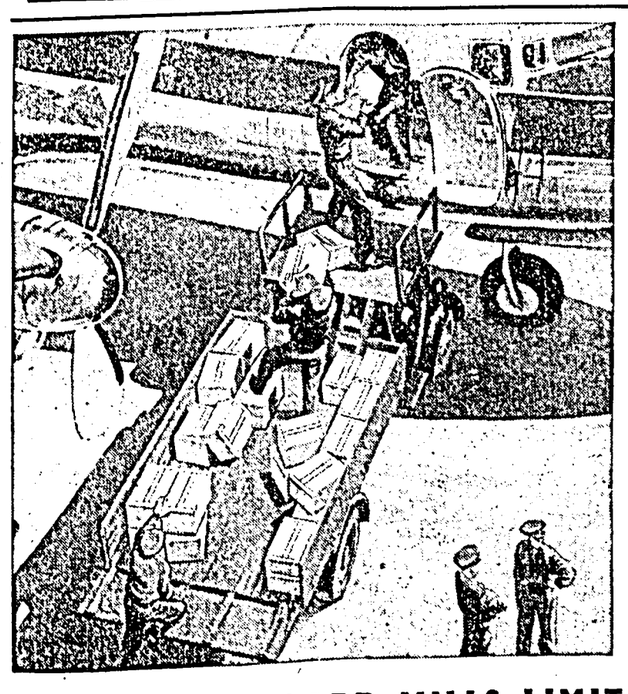
Thinning Out in Korea

PEKING has announced that seven divisions of Chinese troops will be withdrawn from Korea before November. The announcement is probably as near as one will ever get to an honest admission that the "people's volunteers" who flooded into Korea four years ago were in reality regular units of the Chinese army under regular command. The pretence that has been kept up on this point provokes some diverting speculations. Can a "volunteer," in fact, be withdrawn by a government that denies responsibility for his actions? But the "volunteers" are unlikely to have any more choice in their going than they had in their coming—which, as the Indian screening of prisoners revealed, was in many cases highly involuntary.

On the face of it, the Peking announcement is encouraging. The sooner Korea can be relieved of the massed armed forces that still confront one another there, the less long will it be a danger point on the world map. But not much optimism will survive a second glance. The Chinese forces in Korea will remain much greater than those of the United Nations. Even if they were equal, seven small Chinese divisions are not a fair equivalent for the four American divisions whose withdrawal was announced earlier this summer, and for the reduction of Commonwealth and other forces. And even if the Chinese withdrawals were in true proportion to those on the UN side, how could it be verified that they in fact took place? The Swiss and Swedish neutral observers have already described how the Communists have systematically frustrated their efforts to supervise troop movements in accordance with last year's armistice agreement.

It is thus hardly surprising that the South Koreans are clamorous about the coming American withdrawals. But they ought to address their complaints first to Mr Rhee himself, who has personally assured Congress that his troops and those of Chiang Kai-shek are capable not only of repulsing Mao's from Korea but even of capturing Peking. The Peking government hardly seems to share this view; but it remains possible that any Chinese divisions that do, in the event, leave Korea will be found new work in the neighbourhood of the Formosa Straits.

The Candid Chancellor



A FRENCH Prime Minister feels it his duty to resent public rebukes from a German Chancellor, whatever the justification for them. M. Mendès-France therefore showed admirable restraint in not reacting officially to the indiscreet remarks made about him last weekend by Dr Adenauer in an interview given to a correspondent of *The Times*. Perhaps the anti-clerical radical in M. Mendès-France sensed the special disappointment that a Catholic conservative must feel at the collapse of the Adenauer-Schuman-De Gasperi structure so painstakingly reared in the last three years. It is time that these two men had the frank talk that eluded them at the Brussels conference. If they cannot trust one another, then the prospects of re-establishing confidence between

SHREDS OF EVIDENCE

But evidence of what? Some happening, back in geological time, left behind this strange material, with its long, thin, hairlike fibres; but, so far, the fibres have kept their secret. Their present usefulness, however—a usefulness which springs directly from this unique, fibrous composition—is no mystery at all. There is scarcely a branch of industry which does not make use of Asbestos in one form or another, either for its remarkable resistance to heat, or for its other highly distinctive properties. Asbestos, we suggest, is a material well worth looking into.

Paris and Bonn will not be promising, and there is a danger that Dr Adenauer will find himself isolated.

The interview was valuable for revealing the Chancellor's fears of the future. For example, he suspects something more than coincidence in the fact that M. Mendès-France demanded for his country precisely what Mr Molotov demanded of the western powers during the Berlin conference: the break-up of the EDC if Germany should become reunified. It may have been forgotten that Mr Molotov secured from Mr Dulles and Mr Eden in Berlin an assurance that West German membership of EDC would not be binding on a united Germany, even though Dr Adenauer argued hard behind the scenes against such a view. The Chancellor clearly fears more than anything an attempt by the western powers to come to terms with the Russians at Germany's expense; it is not, therefore, surprising that he should read into some of the things M. Mendès-France has said a wish to keep open such possibilities of agreement with Moscow.

Again, it is not easy for a man of Dr Adenauer's convictions to dismiss from his mind the thought that France may think rigidity towards Germany and friendliness towards the Soviet Union will pay better than generosity towards Germany and rigidity towards the Soviet Union. Nor is it easy for him to tell the truth about German nationalism without appearing to threaten the French. What he said should be noted and remembered:

> If Germany is rebuffed by the West and wooed by the East do you not think that the new nationalism will look to the Soviet Union? This is a great danger.

It is indeed; and it is all the greater because the Russians have it in their power to offer—or to seem to offer—lures to German nationalism that the West cannot command. The EDC was one method of meeting this danger while Germany is still divided. If the French do not quickly find an acceptable substitute, they may find a new Germany policy crystallising behind the scenes, with new personalities thinking along the same lines as Bismarck. There are plenty of Germans who believe they are clever enough to "handle" the Russians; and the Russians have shown how cleverly they can handle German nationalism.

Decentralisation Real and Sham

THE Select Committee on Estimates has given a reasonably clean bill of health to the provincial offshoots of Whitehall. "The evidence seems to show," says the committee, "that departments are not maintaining regional organisations without good reason." It believes that the opportunities for economy arising from the ending of controls are being taken, despite any temptation to maintain private empires in being.

Two main classes of department came under consideration. The first are those whose work is necessarily carried on through a widespread system of local offices (the Post Office, the Ministry of Pensions and National Insurance, the National Assistance Board, the Ministry of Labour and National Service). The only question here was the possibility of either amalgamating services or sharing regional-local headquarters, for economy and public convenience. The issue of amalgamation or independence stems from wider questions of policy; the physical coalescence into joint headquarters is being carried out as fast as accommodation permits. The only objection to this policy is, apparently, the encouragement given to the clients of the Ministry of Pensions and National Insurance to turn more readily to National Assistance when the two offices are adjacent. This argument recalls the advice of Victorian architects to place the coal-cellar as far as possible from the kitchen, to encourage the domestic staff to economise fuel.

The second class contains the departments whose regional offices were originally set up as a wartime strategic measure, to forestall the possibility of paralysis by an enemy blow at headquarters in London. These offices have lived on in the controlled and semi-controlled postwar state; and they have become the centres of many controversies. There emerged in evidence all the familiar questions of staff control, compatibility of local initiative with ministerial responsibility, duplication and delay in decision. Local authority representatives argued in several contexts that regional offices should have either more powers or less; they implied that even an unpalatable decision from a local official might be better than the delays and uncertainties imposed by the filtering of all business through a regional "post office." Most of the regional organisations, however, on balance won a good word. The exception was the luckless Ministry of Agriculture, whose complex and overlapping regional organisation came in for almost universal reprobation. The committee, confessing itself baffled, suggests that "the regional activities of the Ministry of Agriculture and Fisheries should be the subject of a special inquiry by the committee of the next Session." The memory of Crichel Down suggests that the Ministry's whole Heath-Robinson structure, whose weaknesses the regional organisation does no more than reflect, should be subject to inquiry too.

The Liberals and Education

THE Liberal Party's Education Advisory Committee has produced a report with unusual virtues. It is challenging without being extravagant. The committee rightly believes that the first need is to reduce the size of classes to a maximum of 30 in both primary and secondary schools. It realises that this cannot be done without some compensating saving in money and teachers, and would achieve this by the sensible though unpopular expedient of raising the age of entry to six.

The committee is on unsure ground when it suggests remedies for the unfairness that can result from the selection of school children into different streams at the age of 11. It would like to see the division between grammar and other schools broken down, not by comprehensive schools, but by tripartite schools built around the same campus—a recommendation that would clearly be practicable in only a few cases. More controversially still, it proposes that there should be fewer grammar school places. As it stands, this argument seems very retrograde; the committee appears to suggest that if the provision of grammar school places cannot be evened out by an increase in those towns where they are scarce, they had better be reduced where they are plentiful,

to a uniform percentage of 10 to 12½ per cent of all school places in the area. The proposal is made a little—but not much—more respectable when backed by the argument that many of those who now go to grammar schools are not capable of taking the General Certificate, and may act as a drag on brighter children ; but its real saving grace is that it can become more possible as the modern schools give greater facilities for taking the General Certificate—and the committee would throw in a leaving certificate to be taken at 14 plus, in order to provide modern school pupils with a target and a qualification. All in all, this is the sort of constructive and controversial report on which the Liberals are wise to concentrate their remaining energies—although they should make it plain that they are not calling for unseemly haste in the contraction of the best schools in the educational system, for the sake of improving those which have yet to prove their worth.

Too Eager Watchdog

THE latest report of the Committee of Public Accounts raises the familiar problem with which this watchdog has long been beset. The committee's primary task is to make sure that the Government is not wasting public money ; when it does this everybody except the Government cheers. The latest report contains the usual useful revelations of individual muddles in contract arrangements, fertiliser subsidies, livestock grading, food office transactions, acquisition of buildings, framing of Health Service estimates and so on. There is a long—though not shockingly long—list of cases in which Homer has nodded and the Treasury winked.

The committee's second task, however, is to protect the public purse against tax evasion and wasteful expenditure of public money by independent bodies ; and when it does this everybody except the Government cries "nosey-parker." Thus the committee is delighted with the results of the Inland Revenue's new power to investigate receipts of bank interest, although the banks consider that this interferes with that trusted relationship with their customers on which good banking rests ; the committee wants a rather similar power to be extended to investigation of fees and royalties paid to private individuals by publishing houses and in the entertainment world. Its most controversial section, however, is another attack on the independence of the University Grants Committee. It regrets that the Comptroller and Auditor-General is still not able to inspect the books of the Universities, to examine how non-recurrent Government grants for specific building works have been spent ; and it now even proposes that he should be allowed to nose around among certain papers and records of proceedings at the UGC itself.

The UGC spends public money, and the motives of this proposal are understandable. But control over the universities has deliberately been hived off on to a non-Government body, for reasons of which most people—whether Conservative or Socialist—approve ; there is no contradiction between the view that an extension of independent scrutiny into the affairs of government is a sign of lively democracy, but that an extension of government scrutiny into the affairs of independent bodies is a sign of spreading bureaucracy. Many of the people best fitted to serve on the UGC would resign from it if the committee's proposal were effected. This project is therefore one from which the public should call their watchdog back.

France Still on the Eve

M. MENDES-FRANCE is once again searching for a European compromise acceptable both to his Western allies and to a parliamentary majority. The rejection of EDC has not lifted this burden from his shoulders. The situation is now somewhat different, but the basic dilemma remains unchanged. The final burial of the EDC gives the French premier more scope for elaborating alternative proposals. On the other hand, the resentment of the defeated partisans of EDC renders the task of reconciliation more difficult than ever. M. Mendès-France will certainly try to avoid at all costs a repetition in London of the Brussels fiasco ; yet in drafting his proposals he must keep in mind the balance of forces in the National Assembly.

The parties are taking advantage of the parliamentary recess to prepare themselves for the new battles. M. Duclos went to Moscow not only to claim his laurels, but to decide the future line with M. Thorez and the Russians. The Communists will undoubtedly oppose any proposal for German rearmament ; will they also abandon the slogan that "Mendès-France is better than Bidault"? The Socialist executive has expelled three important "rebels" from its ranks, yet the divided parliamentary troops could easily be reunited under the banner of "No Wehrmacht." The Christian Democrats have also expelled their "anti-Europeans"—two deputies and a senator—and seem to be in no mood for a compromise.

The difficulty is that any alternative solution would require a flexibility on the part of the former backers of EDC of which there is no sign as yet. If the "Europeans" are determined to carry on a vendetta against a premier whom they consider as the assassin of EDC, then the Communists will keep their veto on the foreign policy of the Fourth Republic. In reshuffling his cabinet, M. Mendès-France has made it plain that he still strives after a compromise. He has little time left to cool passions and to produce a formula that will reconcile the nationalists with the champions of "supranationality."

Tunny Trouble

OUR drab world owes a debt of gratitude to Mr Onassis, the fabulous Greek shipping magnate. Once more he is proving that the race of the merchant prince and venturer is not extinct. Rushing in where even the Norwegian government has feared to tread, Mr Onassis is sending a fishing armada into the Pacific to challenge Peru's claims over waters 200 miles off its coasts. The Onassis squadron, which includes one of the world's most modern factory ships, and some twenty catchers, will, it seems, be armed. If the Peruvians intend to enforce their claim to monopoly of the tunny catch in these waters, they may have to send out their two light cruisers—launched in 1906 and reboilered in 1934—and the six gunboats waiting at La Punta.

Some kind of brush may take place between now and the December whaling season. The possible consequences could be an international lawyer's delight. Mr Onassis is an Argentine citizen working from headquarters in Monaco and Paris, and his ships fly the Panamanian flag. For their part, the Peruvians can justly claim that their annual catch of over 110,000 tons is important to their economy, but to insist on sole rights over waters 200 miles from land is carrying offshore nationalism rather far even in these days when proclamations about the continental shelf are commonplace. The men of law may have to turn back as far as the case of an earlier "Don Pacifico" to find comparable [illegible] of complexity and bellicosity.

New York and Tel Aviv

ISRAEL is taking a tougher line towards the Arabs and the West—and it is election year in New York State. These two facts are related, but foreign observers often forget just how closely. New York's 96 electoral votes can carry the nation and, although the President's fate is not at stake this year, a Democratic victory in New York would be the writing on the wall for 1956. Moreover, it is a basic fact in American politics that New York cannot be won against the Jewish vote. In New York City alone, there are some 2,150,000 Jewish people and they go to the polls with an intense awareness of international issues.

Israel has always known how to bring into play its great hinterland across the Atlantic. The generosity of the New York Jew towards Israel is massive and straightforward, although his motives are complex. He may feel he is part of a world community which must assist its youngest and most active member. He may feel that the achievements and strength of Israel are an answer to people who look down on him at home. Finally, there are some American Jews, of a gloomier cast of mind, who see in Israel an ultimate place of refuge for their own children at some time of tribulation in the future. Whatever his motives, the Jewish voter will examine the party record on Israel and see to it that expressions of support for Zionism are written into both party platforms. In non-election years such declarations may be allowed to lapse. This year it would be political suicide for either Republicans or Democrats to disregard them.

Israel knows this, and it knows that the State Department's permission to export arms to Egypt and other Arab States has already counted against the Republicans. It knows, moreover, that if it comes to a show-down against the Arabs, money and guns will be forthcoming from the United States whatever the strong words spoken this week in the State Department. This was true in 1947, when President Truman used the fact to political advantage, and it is as true today. The Arabs have to bear this in mind as they meet in Jerusalem to discuss the Israel problem and to assess the future of American policies in the Middle East.

Finance of Flag Days

IT might have been expected that the welfare state would kill flag days. But the technique, stern or beguiling, of the ladies with trays of reproachful little emblems is still remarkably effective in stopping the morning rush to work to beg pennies for charity. Pennies, however, they still are ; people do not seem to have adapted their contributions to the fall in the value of money. In 1953, according to the annual report of the Committee on Street Collections, some £309,000 was collected in the London area—only £18,000 more than in 1939. This was rather less than in 1952, when the total was £312,000, but it was above the figure for every other postwar year. Contributions to flag days reached their peak in 1943, when £634,000 was collected in London ; they fell very sharply after the war.

The charity that traditionally provokes the most generous response on flag days is Earl Haig's British Legion Appeal Fund—selling Flanders poppies—which raised £101,000 in London, or nearly a third of the total sum contributed, in 1953. Next came Princess Elizabeth Day (child welfare) with £54,000 collected on two flag days, and Alexandra Day (for the hospitals and old people's homes). It is not true that the British will contribute more for animals than for distressed children ; it is true that they will contribute more for animals than for blind people. "Joint Animals Day" produced £20,000 from Londoners in 1953, nearly three times as much as in 1939. No other charitable cause could boast such a large increase—but that was a logical result, perhaps, of the exclusion of animals from the welfare state.

The committee—which examines applications to hold flag days, co-ordinates similar charities into groups, and advises the Commissioner of Police about the issue of permits—has attracted some attention this year by an expression of its concern at the higher level of expenses. This now averages 14.3 per cent, compared with 11-12 per cent before the war ; and an application by one charity to hold a flag day in 1954 (it has not been revealed which) has been refused because of consistently high expenses. Some increase, however, has been inevitable as the higher cost of emblems has not been matched by a proportionate increase in receipts. It is right that a watch should be kept on all this button-holing ; but it is also right to emphasise that any organisation that is allowed on to the streets of London will have shown that it is above suspicion as a ramp.

Any Room for a Little 'Un?

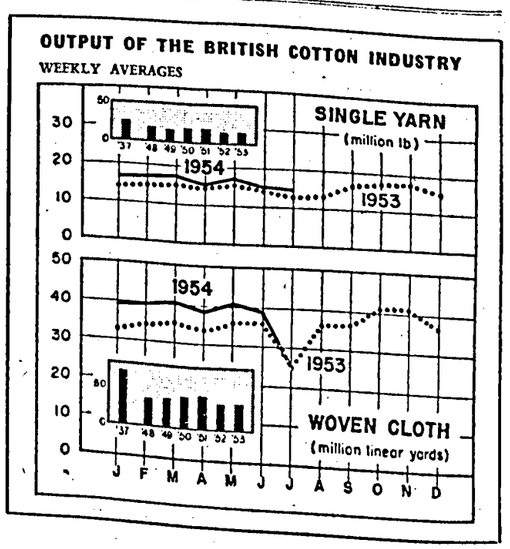
WHEN disaster overtook the attempt of the *Recorder* to carve out *lebensraum* in Fleet Street for a new daily, the moral might have been drawn that journalistic *lebensraum* in general was filled up. The *Daily Mirror*, the *Daily Express*, and the *Daily Sketch*, however, have all, in a simultaneous spirit of emulation, decided to spurn this pusillanimously Malthusian conclusion. Within a few days of one another they have brought forth young, junior

editions, aimed at an age group even younger mentally than their normal public, and designed both to entertain and edify the rising generation and to raise a crop of lifelong readers for the senior organs.

There have, of course, been children's papers before—newspapers, that is, by contrast with comics. The classic example is Arthur Mee's *Children's Newspaper*, which from the first set out to provide its young readers with an account of current events at home and abroad, couched in language that they could understand—a venture in civic education as well as in entertainment. The new juniors have a perfectly legitimate but quite different slant. Their news items are selective: they are not only for children, but about children, and about those current events in which most children take a spontaneous interest—sports, aviation, incidents concerning animals, and the like. (The *Junior Sketch* does, it is true, provide a small box in which, at the rate of 200 words a week, the parent paper's "Candidus" explains the news; in the first issue, EDC. One's heart bleeds for him.)

However deplorable to the serious-minded may be this unconcern with civic education, these early issues at all events give the impression that the editorial staffs concerned impute considerably more taste, intelligence, and generosity to their junior than to their adult readers. It is perhaps typical that the *Junior Mirror* should serialise a Biggles story, while the *Junior Express* enlists Mr C. S. Forester and the *Junior Sketch* boils down the Crile underwater saga; it is certainly typical that the *Junior Express* should incite its readers to rebellion against authority, in the shape of the X certificate barring them from the horrific science-fiction film "Them." This impishness has won a stern rebuke from the (adult) *Mirror*; a rebuke which rouses faint hopes of coming entertainment. The maxim that dog does not eat dog may be, on the whole, a useful one. But the amending reservation that dog may uninhibitedly eat pup would certainly add to the gaiety of Fleet Street.

Leipzig Overture



By all accounts the Leipzig Fair is bigger and better this year. Many western exhibitors are numbered among the eight thousand whose goods are on display. Visitors have noted a new theme on the Communist stands this year: the emphasis is more on the consumer. Only the more backward satellites like Bulgaria now exclusively show the products of heavy industry. But whether the East Germans who throng the showgrounds fingering the products of Moscow, Prague, and Peking are moved more by envy than by pride is a moot point. The show is, however, not for them; it is primarily a piece of Communist window-dressing for the edification of visitors from the west.

How trade fits into Molotov's grand strategy was expounded at length by the East German prime minister, Herr Grotewohl, when, to the dying strains of Wagner's Rienzi overture, he declared the Fair open. Reminding his audience of the Soviet Note to the western powers of July 24th, which added economic co-operation to the Soviet plan for European security, Grotewohl went on to fill in the details of multilateral trade and payments pacts which "would considerably strengthen the effectiveness of political safeguards" and "would enable the Germans to halt the remilitarisation of Western Germany." The idea of multilateral trade and payments agreements is not new. It has been raised several times by the Communist bloc at recent meetings of the Economic Commission for Europe. A payments union between Eastern and Western Europe would undoubtedly be a convenience to the Communists, but on past showing it would in effect become a one-way channel of credits from west to east.

East-West trade is the central theme of this year's Fair. To get it off to a flying start the East German government has made known its hopes for the future, which appear somewhat ambitious. Herr Grotewohl announced a target of $250 million worth of imports from Western Europe, an increase of 150 per cent over the past year's level, and spoke of sending trade missions to Latin America as well as to Near and Far Eastern countries. But most of the Communist exhibits at Leipzig were evidence of progress towards autarchy rather than of practical salesmanship. Machines from China or Rumania may be an impressive sight, but it is hard to visualise it selling like hot cakes in the non-Communist world—even if the Communist states manage to bring down their prices to world levels.

Journey to the Interior

The news that the Governor of Aden has been invited to visit the Imam of Yemen for personal discussions of outstanding problems is good news in itself. Relations between this Arab state and the neighbouring British protectorate have been thoroughly disappointing of late. In 1951 the Anglo-Yemeni exchange of letters, pointing to an amicable definition of frontiers, indicated an early end to years of unrest among the border tribesmen. But no sooner had a British chargé d'affaires hopefully established himself at Ta'izz than the crimes of the Sultan of Lahej, and his subsequent flight across the frontier, led to fresh Yemeni

claims and protests. And in 1953 rebellious Subaihi tribesmen crossed into Yemen territory, were welcomed and supported there, and proceeded to raid their own homes. This was followed by fresh attacks, encouraged by the distribution of Yemeni blandishments and money to Aden tribesmen. The incursions were supported or led by regular Yemeni troops, and distorted and recriminatory versions of them, published by the Imam, were conveyed to the Arab League.

The Governor of Aden's announcement last December that the nine sultanates of the Western Protectorate were to "federate" by their own wish led to new disorders, and to the despatch to Yemen and the protectorate of an Arab League mission of inquiry (which received from the Arab potentates of Aden by no means the answers it expected). More serious frontier violations have since taken place, accompanied by the usual accusations and rejoinders and by more Arab League head-shaking. If Sir Tom Hickinbotham's projected journey to the interior brings about any easing of the anarchic situation, this will be sincerely welcomed on the British side.

The long and sad record of Anglo-Yemeni negotiation since 1913, however, discourages optimism. The primitive and truculent statecraft practised by the present ruler, who has inherited from his father a resolute claim to the whole of the Aden Protectorate, and who needs to impress and inspire followers over whom his control is slight, is reinforced by a natural fear of the appearance on his southern borders of a united and progressive territory which must excite invidious comparisons. Moreover, the Imam's more sophisticated advisers and Arab League backers claim that the *status quo* confirmed in the treaty of 1934 precludes federation in the protectorate. All these factors combine to reduce the chances of reaching any stable agreement, or even a better, if precarious, co-existence.

Explaining the Americans

It is exceedingly difficult to speak of the great American Republic without doing its citizens unintentional injustice. Its rulers, its leaders, its spokesmen, are so directly elected and so frequently re-elected by the people; they derive their authority so immediately from the great mass of the population . . . they are so swayed by its passions and so susceptible to its changes of opinion . . . that we seem peculiarly entitled in their case to hold THE NATION responsible for the proceedings of its Government, the acts of its officials, and the language of its diplomatists. . . . Now, we have no doubt that men of gentlemanly feeling, of deep sense of decorum, of a clear perception of what is due to others, abound in America as well as here. The difference between us, and the misfortune of our cousins, are these—that such men do not at the other side of the Atlantic either elect the Government, or give the tone to the nation, or guide the language of the Press. It is not that they do not exist, but that they do not rule. With us, the educated and the upper classes have the power in their own hands. . . . In the United States, it is the mass who govern; it is they who dictate what shall be done and said; it is they who elect the Government, and whom the Government must serve; in fine, it is they who have to be *acted down to* and *written down to*. This is a grievous evil, a great embarrassment, and a sad discredit; but it must not blind us to the fact of a better and nobler order of citizens remaining overpowered indeed, but neither silent nor inactive, in the background; it must not prevent us from refusing, as often as we are permitted, to judge the nation by its *official* organs. In all likelihood, if the paramount power in England ever fell into the hands of the working classes, and the less cultivated of the trading classes, and the least scrupulous of legal and political adventurers, who now only *share* it . . . we might have nearly as much violence, folly, and discourtesy to blush for and to blame.

The Economist
September 9, 1854

Scientists on Show

Scientific discoveries are no longer announced at the meetings of the British Association for the Advancement of Science; the best papers delivered there are follow-throughs from research work that has already appeared at greater length in learned journals, while the worst represent excursions by physicists and others into the field of economics (especially the economics of under-developed areas) where their ignorance sometimes dumbfounds. Before a visible audience in which schoolboys play an increasingly larger part, and before an invisible audience with which the press and the BBC serve as connecting links, the British Association has now added to its main function of keeping scientists in different branches abreast of each other's work; for better or worse, it has become a vehicle for putting science itself on show.

So much the better for the layman, for whom the Association's meetings, divided into 13 sections and lavishly reported, always provide plenty of often unnerving titbits. At the meeting that took place at Oxford this week and last, Professor Adrian, the President, said that while the earth might weather a few hundred atom bombs, a prolonged war could render it uninhabitable because of radio-activity. But if humanity escapes the bombs it should, in the opinion of Sir John Cockcroft, have an unlimited source of power; there is enough uranium to provide the world with power for a thousand years, and by that time he was sure that "the energy of fusion of the light elements will also be turned from destructive to peaceful purposes." The other great threat to humanity, that of starvation, did not worry Professor Pearsall, who saw great possibilities of increased food production, not only through conventional methods, but also through higher yields of leaf protein, and ultimately through industrial photosynthesis.

Dr A. P. Meiklejohn, with his eye on the present, called attention to the danger, not of starvation, but of obesity.

> If you are middle aged and 10 lb or more overweight your chances of dying are much greater than your chances of getting cancer of the lung if you are a smoker.

The worst of it is, there may be no escape. Dr J. M. Tanner suspected that the endomorph (the scientific name for the plump) was born with more fat cells than others, in which case only a small increase of fat in these cells would make the poor endomorph gross. Small consolation that in his childhood, according to Dr Parnell and Miss Davidson, the endomorph was more confident and socially adaptable and less anxious than the thin child. Amid all these anxieties it is good to learn that thumb sucking is a pleasant and harmless way of passing the time, and a great deal less toxic than smoking a pipe.

Letters to the Editor

A Vote for Paralysis

SIR—For four years France has compromised the whole western cause in refusing to take sides squarely against the Soviet Union by accepting Federal Germany as a partner. As you have consistently demonstrated, Dr Adenauer and his colleagues are the West's best German friends, and it is a tragedy that French appreciation of their political value has lost the day to a blend of ostrich-nationalism and anti-Vatican prejudice. You are, however, surely quite unjust in blaming M. Mendès-France for his role at Brussels and in the *Assemblée Nationale*. How else could the French Prime Minister have dealt with a treaty in whose preparation he had no hand and which half of his own government did not support? Nor, contrary to your suggestion, is there any evidence that M. Mendès-France will shirk his responsibility to push an alternative plan for German rearmament through parliament. To assume in London in advance that the most promising French Prime Minister for years is just another crypto-neutralist is as dangerous to the western camp as the French belief that Dr Adenauer represents nothing permanent in Germany.

As you maintain, Germany in a strengthened Nato is the sole remaining possibility. But you are silent about the European philosophy of this new Nato. France must indeed be asked to accept immediate German rearmament. Germany, however, must also be asked to declare in company with the whole alliance that she renounces force as a method of frontier-revision in Central Europe. Only in this manner will Germany regain the moral status of a great country; France finally be led to disapprove of Communist terrorism in Dresden, Warsaw and Prague, and Nato settle down united in one purpose: to bring about the retreat of European Communism by proving its backwardness and hopeless sterility.—Yours faithfully, CHARLES JANSON

Brora, Scotland

Malaya's Rice

SIR—May I draw attention to a number of important omissions and mis-statements of fact in the article on "Malaya's Rice" in your edition of August 28th. You say "the Government . . . has a monopoly (of rice) but tolerates a small free market." This is incorrect. The Federation now grows more than 50 per cent of its rice requirements, and the grower is free to dispose of this as he likes (except to the terrorists of course). In addition there have usually been substantial quantities of "free" rice imported under licence, so that Government sales of rice have been between 30 and 40 per cent of the rice moving into consumption. Thus in fact the "free market" has been accounting for between three-fifths and two-thirds of total consumption.

The real questions facing the Federation Government are, first whether to keep a guaranteed minimum price for the local grower; second, whether to continue to hold a reserve stock; and third, when and how it should return the import trade in rice *entirely* to private hands. Your article does not mention the first, although (unless the Government is to face unlimited subsidies) it must have obvious implications for import policy at a time of falling external prices for rice; the other two problems are criticised rather than discussed from both points of view. Thus you dismiss the reserve stock because it "could only postpone crisis by a matter of months." But these months (and they would probably be more than your article would imply) would be the critical ones, and would give the Government time to (i) organise control of the local crop and rope it into the rationing scheme and (ii) seek outside aid in the form of rice from more distant sources of supply, perhaps even the restoration of IEFC.

You say that the rice position "has steadily improved" since the winding up of IEFC in 1949. The facts are that it got steadily worse from 1950 to 1952—from a consumer's angle—with prices reaching fantastic levels. All the principal Asian countries were scrambling to buy rice on government-to-government contracts, and what was left over both in South East Asia and in other parts of the world fetched even higher prices still. Since the Federation's imports account for less than one-tenth of the world's export surplus, the abstention of the Federation Government from these official contracts could not have broken the sellers' market; it would merely have left its merchants (and consumers) to pay through the nose.

I am also puzzled by your reference to "the cost of special fees and licences to say nothing of a touch of corruption." The free market is largely the local crop, which is hardly subject to control and, for the rest, there are no licence or special fees for imports of any significance. As for corruption, there was an Integrity Commission in active session that would have welcomed any information you or anyone else could give them.

Your endorsement, admittedly rather half-heartedly, of the argument that the Government sticks to rice because "the officials would lose their jobs" reads a little oddly in face of the Government's withdrawal from sugar, and substantial reductions in the staff and Budget of the Supplies Department which have already taken place this year.

Finally it sems to me remarkable that your article nowhere mentions the practice of the governments of the other Asian countries which are traditional importers of rice. If it did, it would have to point out that they have all bought on government-to-government contracts too, and that some of them (Ceylon, Japan, Indonesia and India) have contracts which run ahead till 1956 or later—a policy which the Federation has never adopted.

One outstanding factor in the improvement in the rice situation since 1953 has been the disappearance of India as a major importer. In 1953 production of the principal *import* countries jumped by over 4 million tons, compared with 1951-52, and this India accounted for about 3 million. This helps to bring into perspective the surplus of 1½ million; it is only about 1 per cent of Asia's output. It is to be hoped that it does not prove to be a passing surplus as well as a marginal one.—Yours faithfully,

O. A. SPENCER

(Member for Economic Affairs, Federation of Malaya)

Lymington

Ripples Around Cyprus

SIR—I am afraid that the brevity of your references to my detailed explanations on the Cyprus question may convey to your readers an inaccurate idea, at least, of what I said. Thus the need for some elaboration of the statements attributed to me in two Notes of the Week appearing in the current issue of *The Economist* under the titles "Ripples Around Cyprus" and "Worries of the Greeks":

In mentioning that "30 per cent of the Cyprus population is Communist led" I only cited the figures given by the British colonial administration. Personally I could neither question nor "acknowledge" the accuracy of this figure, for we have no access to statistics in Cyprus. If I mentioned that figure it was only for purposes of comparison with Communist strength in Greece, where Communist votes represent only 9 per cent of the total electorate. This simple comparison was to bear out my contention that, as in many other parts of the world, colonial regimes have proven a thriving ground for Communism.

Now, in a recent issue of *The Economist* your Correspondent from Cyprus estimated that die-hard Communists in the island do not exceed a few thousand. This and other evidence testify to the fact that the main body of the Communist following in Cyprus is constituted of disillusioned "Enotists" who look to the strong hand of Communism for the realisation of their national aspiration.

It is true that I spoke of the granting of a liberal constitution as a possible approach to the Cyprus question. I hastened, however, to add that by a liberal constitution I meant a constitution freely accepted by the Cypriots, guaranteeing human rights and fundamental freedoms—prominent among which is the right of self-determination.—Yours faithfully,

CHRISTIAN X. PALAMAS,

Permanent Representative of Greece United Nations, New York

Room for Japan

SIR—In your article of September 4th you state that in the Japanese economy there are signs of impending crisis which have stirred Washington and Mr Dulles into action foreshadowing exceptional measures to help the Japanese ride out the storm. In fact, the first approach of Mr Dulles to this matter appears to be [illegible] statement that Japan cannot expect [illegible]crease her exports to America.

[illegible] only speak as far as the textile [illegible]oes, but the American approach [illegible]Japanese problem started with [illegible]ding up in the spinning end of [illegible] spindles from 1.3 million to 8.5 [illegible] of the latest type of American [illegible]nery, far more modern than the [illegible]age Lancashire machinery. America [illegible]en created a demand for her cotton by loaning Japan money to purchase it, and recently the Administration has approved a further five-year loan to enable Japan to keep up the demand *and* the price. America took only 34 million yards of the fabric Japan produced last year against the 590 million yards of Japanese cloth which we took into our Empire markets. We ourselves only exported 518 million yards. Japan is already exporting at the rate of 1,200 million yards a year and has ousted Lancashire from her own traditional markets, not only in the Empire but outside, for instance in Indonesia. The policy of restricting Japan from trading in China has caused the Chinese to build up their own textile industry which, like that of India, will no doubt be competing in world markets when it has provided the requirements of its own domestic market.

I recently had an interview with one of the leading Japanese trade representatives, who admitted that 95 per cent of the Japanese were "neutral" in the East-West conflict, that any help we gave to her would influence only a slight minority, and that if and when it suited them to turn to the East, they would do so. Why then should we damage ourselves industrially and economically? We have built up an industry in which decent wages and conditions exist. We are not subsidised by the Government, and when we export it has to be on the basis of raw material plus labour costs. Not so Japan; her industry is so intimately connected with the Government that provided she gets access to markets, she can manœuvre prices any way.

We have a duty to our people in Lancashire, and already there is short-time working in some sections of the industry.—Yours faithfully,

CYRIL LORD

Genius of the Mass Market

FORD: *The Times, the Man, the Company.*
By Allan Nevins.
Charles Scribner. 704 pages. 45s.

"HISTORY," said Henry Ford, "is all bunk." Yet if there is any one person in this century who is likely to be judged to have altered the balance between the individual efforts of outstanding men and the massive social and economic forces which play the greater part in history, it was Henry Ford himself.

Henry Ford had less understanding of the way of the world than most in relation to matters unconnected with the automobile; but in his own field he had unequalled range of vision into the future. He saw better than any, and indeed often in contradiction of the views of most of his contemporaries, including many of his principal associates, four aspects of the automobile. He saw the sort of automobile that his times required, a vehicle simple in conception and in operation, robust and above all light. He saw the manufacturing methods by which such a vehicle could be made most cheaply—fundamentally nothing more nor less than the modern methods of mass production. He saw the enormous demand which could be revealed for such a means of transportation at the price which low cost production made possible. He saw the high level of wages which could be earned by the men working on such production, without prejudice to a low selling price and with advantage to the creation of a mass market for automobiles and similar products.

In this latest and most comprehensive study of the subject, the reader is not given an adequate or a just representation of the man, his methods or his achievements. This book embodies the results of a formidable mountain of research, both in the public records of every sort and in the archives of the Ford Motor Company; it gives a full and interesting picture of the mid-Western scene into which Henry Ford was born, and voluminous information about the *minutiae* of his life. But it gives little more of an impression of the qualities which distinguished Henry Ford from other men than Peter Breughel's picture of the Fall of Icarus gives of that unfortunate innovator—whose legs can just be discerned in the centre of the picture as he disappears beneath the waves. To write a vivid biography, it is not enough to have a comprehensive historian's view of the times of its hero—as Mr Nevins has; it is necessary also to be aflame with enthusiasm either for the hero himself or for the objects which fired him to enthusiasm—and no such passion has inspired Mr Nevins.

The embodiment of Henry Ford's success was of course the great model T. It dominated the world's motor-car markets in a way that no single vehicle has since approached, and indeed at its peak, with a production of more than 2 million units in each of the years 1923, 1924 and 1925, reached a figure which no other model has since attained; while the total number of units of model T—over 15 million—seems likely to stand as an automobile record for all time. Yet Mr Nevins's book, though it tells quite a lot, *obiter*, about the characteristics of the model T, does not include any sort of clear account, specification or appreciation of it.

As a measure of the achievement of the model T, it is worth quoting from a road test made two years ago by *The Motor*, that, though its top speed at 42 mph was only half that of the typical standard American car of 1954, it could accelerate from 10-30 mph in top gear in 12.8 secs, a figure within a second of that recorded by such cars as a Hillman Minx, Morris Oxford, or Vauxhall Wyvern. It could climb on top gear a gradient of 1 in 11.1, in which it matches a Mercedes Benz 300, an Alfa Romeo 1900, or a Ford Consul. The most important factor in achieving such results was the saving of weight. The model T saloon weighed—according to the same report by *The Motor*—only 13¾ cwt, in comparison with the weight, for example, of the current Morris Minor of 16 cwt or the Hillman Minx of 18¼ cwt.

It cannot be said that Henry Ford made any outstanding technical innovation in the design of automobiles; but in the methods of production he was outstanding both in using the most advanced techniques developed elsewhere and in devising new techniques. Mr Nevins's book does not relate the history of the arts of engineering production—which, as a background, would, surely, have been more relevant to an assessment of Mr Ford's contribution than the history he gives of the development of internal combustion engines. Incidentally, although neither the title of this book nor its title page and preface suggests that it only covers part of Henry Ford's life, its tale comes to an end in 1918.

Mr Nevins does much greater justice to Ford's commercial vision than to his technical and production achievements. He gives a full account of the struggle

between Ford and his earliest and principal financial backer Malcolmson. Malcolmson saw the automobile as a product to be sold to the wealthier part of the public, at prices yielding profits appropriate for luxury goods; in this he was in accord with the generally accepted view in the trade, and with the view of others who were closely in touch with Henry Ford. Ford, however, while he was ready to meet a market demand for an expensive product, was all the time insistent on the overshadowing importance of the low-price mass market. The rather scrappy financial statistics contained in this book show that at times the Ford Company, while consistently selling at a price which gave better value for money than its competitors, and led to an ever-broadening market, was at times operating on a ratio of net profit to sales far beyond the dreams of any modern mass producer of motor cars.

The Booming of Brighton

BRIGHTON: OLD OCEAN'S BAUBLE.
By Edmund W. Gilbert.
Methuen. 291 pages. 25s.

THIS is not quite the book the reader might expect. Most writers about Brighton deal with its development as a fashionable health resort and find in the Regency period the apex of their narrative. Mr Gilbert takes a much broader scope. His aim is to show "why a small fishing town has become one of the largest urban areas in England." His history covers the two centuries from 1750 to 1950 and his strongest interest is in Victorian Brighton, whose social life he considers to be as interesting and more varied than that of the Regency period.

The first few chapters deal with the growth of the holiday industry in England and with the place of Brighton in relation to other leading resorts. It was in the early Victorian period that the seaside towns snatched supremacy from the inland spas, and that Brighton equalled or surpassed Bath as the most fashionable resort. Its fashionable heyday, however, was over soon after the middle of the century for the same reasons which brought about its most rapid period of growth. The three successive transport revolutions—first the coaching era, then the railway age, finally the advent of the car and motor coach—had a special impact on the south coast town which is closest to the metropolis.

Mr Gilbert gives an interesting account of these transport developments. Before 1800, the journey from London to Brighton took one to two days; in the 1830s frequent coaches covered the journey in about five hours (not infrequently killing passengers in the search for speed records); by the 1850s fast trains achieved times of 80-90 minutes. These were boom years for Brighton. So buoyant was Victorian enterprise that a company was actually promoted to build a rival railway line between new stations near the Brighton Pavilion and Ludgate Hill, although the venture failed.

These developments brought new classes of passengers to the seaside. Even in the coaching era some London business men were resident in Brighton, and by the middle of the century the daily departure of the "stockbrokers' special" ushered in the modern habit of long-distance commuting. The second class was the day excursionist. As early as 1860, 36 trains brought thousands of cockneys to Brighton every Sunday for a return fare of 3s. 6d. each. It was a performance which British Railways ought to view with envy. One result was to push the Brighton "season" to later and later in the year; eventually it settled in the eight weeks before Christmas. Doctors were emphatic that after Christmas Brighton became unhealthy.

The problems of modern Brighton spring from these developments. Shall it cater for the day-tripper (who is said to like continuous entertainment and fun-fairs) or the visitors and residents (who mostly do not)? Shall it stick to its traditional functions or seek to attract more industry (industrial employment now substantially exceeds that in hotel and catering)? These are questions which Mr Gilbert raises without, unfortunately, dealing with them adequately.

Brighton is still an attractive town. As Mr Gilbert shows, it performs today a variety of functions—holiday resort, regional centre for a large area, dormitory town (nearly 4,000 travel daily to London), resting place for the aged, industrial town. The wonder is that the population has not grown faster—that the Brighton area has not become a sort of English Los Angeles. As it is, the population has spread over a large area of downland and is destroying the town's fine natural setting. The architectural beauty of Kemp Town has been spoilt by raucous amusements. There is a strong case for putting a halt to further growth so that Brighton can remain worth writing about; but this point Mr Gilbert discreetly avoids.

Planner Manqué

SIR WILLIAM PETTY.
By E. Strauss.
Bodley Head. 260 pages. 25s.

FEW men can have been so v
and talented as Sir Williar
Beginning as a cabin-boy with
of one shilling, he financed
education. He had a flair fo
matics but studied medicine.
he became secretary to Hobbe
member of the most advanced sci
circle of the day. But it was the re
struction following the Civil War that
gave him his opportunities. He became Professor of Anatomy at Oxford but, securing leave of absence, went to Ireland as physician to the army. Here Petty showed his unusual qualities as a man of scientific training with practical ability and an acute business sense. His direction of the survey of Irish tenures, an essential preliminary to the redistribution of land by the conquerors, revealed his administrative powers. Entering the land-market himself, he bought up debentures at cut rates and emerged as one of the biggest landowners in Ireland. He successfully negotiated the political hazards of the Restoration, was knighted by Charles II and married well. He was a foundation member of the Royal Society, an inventor and the exponent of the new science of political arithmetic. And he delighted in his fortune. "When," wrote Evelyn, "I have been in his new palace, he would himself be in admiration how he arrived at it."

Yet Petty was dissatisfied and talked of being "industriously opprest and suppresst." His Irish experiences had given him a taste for administration and power, while he shared the current optimistic creed that science and mathematics would provide the keys to political knowledge and power. Number, weight and measure could establish the relations between prosperity, population and taxation. Petty was a planner *manqué*, and Mr Strauss is concerned to discover why. He is also concerned with what he considers the ambivalence in Petty's character, in that Petty could simultaneously be a planner projecting social reform and a "gold-digger." Mr Strauss disapproves of Petty's "entanglement with material interests," but admires him as a planner; and he explains Petty's failure to obtain official

The Open Fields

The Professor of Milan*

THE PROFESSOR went swimming off Capri and he swam wearing his wrist-watch. It was waterproof—perfectly safe to swim with.

But then—calamity! The strap buckle was loose, and it came undone. Vainly the professor tried to save his watch; sadly he saw it twinkle and disappear into the green depths of the sea. And he returned to shore convinced that his watch was gone for ever.

But back on shore, he remembered the divers. They were working on sunken ships close to where he had been swimming. He asked them to keep an eye open for his watch.

The next time they dived, a week later, they remembered that request, and looked around for the watch. And—yes, they found it, and brought it gingerly to the surface.

And when on dry land they examined it they gazed at it with stupefaction. For that watch that had lain on the sea bed a whole week was still keeping perfect time.

Incredible? Not at all. The watch was a Rolex Oyster Perpetual. The waterproof Oyster case had protected the movement from salt water and the clinging, insidious sand, and the Rolex Perpetual self-winding mechanism had kept it wound. The Rolex Rotor, the secret of the success of the Perpetual, does not work on the "jerk" principle. A complete semi-circle of metal, rotating on an axis, it turns and spins at the slightest movement. And in this case, it was the gentle tug of the waves that actuated it!

Doesn't apply to you? You're not likely to drop your watch in the Mediterranean? True—but *all* watches have enemies—dust, damp, dirt, perspiration—and the sort of watch that will tell the time at the bottom of the sea will hardly be affected by ordinary hazards. A Rolex Perpetual is made to *be* accurate and *stay* accurate.

★ This is a true story, taken from a letter written by the professor concerned (Professor Cutolo of Milan University) to the Rolex Watch Company. The original letter can be inspected at the offices of the Rolex Watch Company, 18 Rue du Marché, Geneva, Switzerland.

"They found it and brought it gingerly to the surface. And when on dry land they examined it they gazed at it with stupefaction."

The Rolex Oyster Perpetual—truly a monarch among watches. The astonishingly accurate movement, perfectly protected by the Oyster case, is given added precision by the self-winding mechanism. The tension on the main-spring is much more even; overwinding is impossible. And the Rolex Red Seal is your guarantee of accuracy, because it shows that the Swiss Government have submitted the watch to their own rigorous tests and awarded it an Official Timing Certificate.

As from now, all Rolex Oyster Perpetuals are graced by the new, slimmer Oyster case, guaranteed to withstand temperatures from 10° F to 130° F and to resist pressure to a depth of 150 feet under water.

The smooth-running, silent, self-winding "rotor" keeps Rolex Oyster Perpetuals fully wound automatically.

THE ANATOMY OF TIME

A fascinating, illustrated book, recording man's deep preoccupation with time measurement, from the earliest recorded device to the split-second accuracy of the modern watch. For your free copy write to the Rolex Watch Co. Ltd. on personal or business stationery.

employment after 1660 as a result of his being "the intellectual and political heir of the Commonwealth." Since, however, Petty planned among other things the deportation of a million Irish and the conversion of Ireland into a cattle ranch, besides advocating identity cards, it is possible to understand the attitude of Charles II.

Mr Strauss's account of Petty's career and ideas is careful and sometimes shrewd, but he sets these against an oversimplified and distorted background. He believes that the revolution of 1640 was the work of the rising middle-class and traces an affinity between Petty's views and those of the extreme radicals. He considers that the Puritan Revolution gave Petty "a vision of distant shores." This underestimates both Petty's worldly ambition and the influence upon him of Hobbes and the scientific movement. ...tty's nineteenth century biographer, ...maurice, had a clearer view of the ...ctual background of Petty's ideas ...his book, which incorporates more ...tty's own writings, still remains ...st study.

Dead But Not Gone

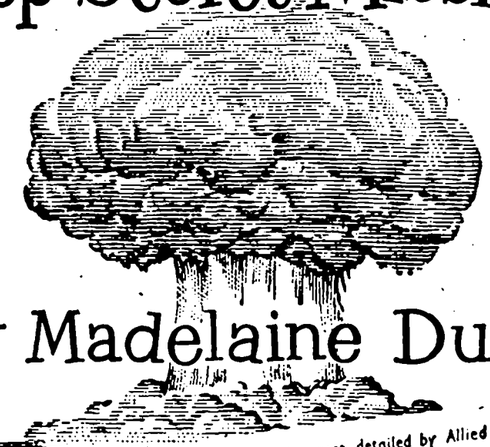
THE LATIN LANGUAGE.
By L. R. Palmer.
Faber. 380 pages. 45s.

THE Professor of Comparative Philology at Oxford is already well known as a Classic and as a comparatist. He has to his credit many learned papers and two notable works, "An Introduction to Modern Linguistics" and "A Grammar of the Post-Ptolemaic Papyri," which indicate the kind of philologist he is: austere, scholarly, dependable and extremely erudite. All these qualities are present, to a high degree, in "The Latin Language," the latest work in the publishers' important series, "The Great Languages of the World."

Although the present book is less generally readable than the volumes on French and German, it is no less solidly informative and instructive. Oddly enough, Mr Palmer is at his best when dealing with the most difficult and complex aspects of the subject: the relationship of Latin to the other Indo-European languages and the "prehistory" of the language—Etruscan, Oscan, Umbrian and so forth. He might perhaps have emphasised the point that Greek stood to Latin in almost the same position as Greek and Latin occupy in relation to English: the predominant source of the vocabulary of polite learning and philosophy, of science and technics, and also of much that is subtle and profound in the modes of thinking and in stylistics. He has failed to note how important is the Egyptian element, whether in Roman civilisation or in the lexical aspect of the language. And he says far too little about the problems of Latin etymology and rather too little about the mainly subterranean yet potent influence of Celtic.

In the more formal departments of his subject, however, Mr Palmer has done a fine piece of work, invaluable to students and useful, often suggestive, to Classical and comparative philologists.

Studies of Cultures



INTERRELATIONS OF CULTURES.
Unesco.
Her Majesty's Stationery Office. 387 pages. 14s. 6d.

THIS is not really a book about the effect of cultures on one another at all. The three essays on India, for example, have hardly a word on the changes caused in the Hindu outlook by Muslim invasions and British rule; only in the Spanish-American chapters is there a discussion on the interplay between the imported culture of Spain and the indigenous habits and beliefs of the Indians. Nor is this in any sense a complete book. There is nothing on the culture either of Islam or of Europe and only a few notes on North America.

This book is, in fact, a collection of essays on the cultures of Spain and Spanish America, India, China, Japan and the West African Negroes; and China and Japan are only represented by an essay apiece. But within these rather narrow limits, it is a very good book indeed. Except for the first, general, essay, which suffers from an overdose of professorial culture-ese, all the essays are clearly and attractively written.

Certain cultural attitudes are focused very sharply. The Spaniards are all more or less doctors trying to diagnose a disease. Once Spain was great, once her energy and courage transformed the world; yet for the last two centuries and more the Spanish-speaking countries have been falling further and further behind. The Latin American revolutions produced more dictatorships and anarchy than democracy. Spanish-speaking liberal parties are never quite liberal, Spanish-speaking industrialists never quite industrialise. What is the matter? The authors have no answer, or rather they have too many answers, from the dominance of military and authoritarian Castile as against naval, mercantile and democratic Catalonia to the ferocity of Spain's efforts as champion of the counter-Reformation and the survival into the eighteenth century of a scholastic and church-dominated educational system. They do not have very much hope either, though the Spanish-Americans see some chance that the superposition of Spanish on Indian culture which has been typical of the past may at last be giving way to a true integration. Best of all are the Indian chapters. Professor Atreya's description of Hindu monism is the best of its length this reviewer has ever seen. Mr Danilou shows how deeply Hindu artistic theory is impregnated by the general Hindu view of the world. Professor Chatterji gives a place to the pre-Aryan populations of India in the formation of Indian culture which is as obviously correct as it is revolutionary. These chapters alone make the book worth reading.

Top Secret Mission

by Madelaine Duke

The true story of a dangerous assignment

The author was detailed by Allied Intelligence to track down three missing German scientists—in whom Russia was also very interested . . . This is the TRUE story of her secret and perilous search.

Mourning for EDC

Washington, D.C.

THERE is no attempt to deny in Washington that the death of the European Defence Community at the hands of the French Assembly is what the President says it is, "a major setback" to American policy. President, Congress and country had become emotionally committed to EDC. This was to be the prize which would sanctify the policy of investing American men, money and effort in Europe and resolve the debates that had divided Taftite Republicans from Democrats and from the liberal wing of the Republican party. Above all, it was the one policy of the Eisenhower Administration for which Mr Eisenhower was more personally responsible than any other man.

This particular scheme would never have come to hold the position it did in American minds if it had been simply a means of arming twelve German divisions. It is true that the original proposal arose from the decision to rearm Germans, made under the impact of the Korean crisis, and on the insistence of the American military authorities. When the French responded by producing the Pleven Plan, the first draft of EDC, its reception in Washington was little more than tepid. The State Department, which was backing M. Schuman's policy of building up gradually a series of supra-national agencies in Europe, was worried that, since the coal-steel pool had only just been launched, public opinion was not sufficiently prepared for an army to be formed on the same basis. The Defence Department had professional doubts about the value of a multilingual army and a distaste for long constitutional debates while the enemy's camp fires were burning.

However, as the immediate danger of Soviet aggression began to recede, the American desire to see a stronger land army on guard in Europe merged with the longer-term ambition that France and Germany should end their national rivalry. This indeed would square the circle of American foreign policy and align internationalists with isolationists, for the main emotional force behind isolationism has been the conviction that European national hatreds are incorrigible.

★

French enthusiasts for federation encouraged this line of thought by arguing that something so revolutionary as European union could best be achieved as a dramatic response to an imminent danger. Many of them put pressure on the United States to put pressure on France, assuring Americans that overt American support for EDC and for a subsequent political union would guarantee their success. The most illustrious convert to this point of view was General Eisenhower and the full American commitment to the ship that has now sunk dates from his term as Supreme Commander.

Moreover, the American emphasis on EDC became increasingly insistent under the Republican Administration since Mr Dulles found himself carrying on substantially the same policies as his Democratic predecessor, yet having to demonstrate that they were either different in some way or were being pursued with much greater vigour. Once the Korean war was over, the only ways, in hard fact, that the Administration could fulfil its boast that "that precious intangible, the initiative, is becoming ours" were to wage military and political campaigns by proxy—and by the accident of geography on both Asian and European fronts the French held the proxies. Thus, the more resolute the Republicans wished to appear in the conduct of foreign policy, the more dependent they in fact become on the strength and resolution of one of America's weaker allies.

The more Mr Dulles's policy was questioned, the more he had to defend the Navarre plan by which the French were to win the war in Indo-China and the EDC plan which the French would have to ratify in the Assembly. "And so," as Mr Walter Lippmann says in his column in the *New York Herald Tribune*, "having lashed ourselves to the mast, we have gone down twice with a sinking ship."

★

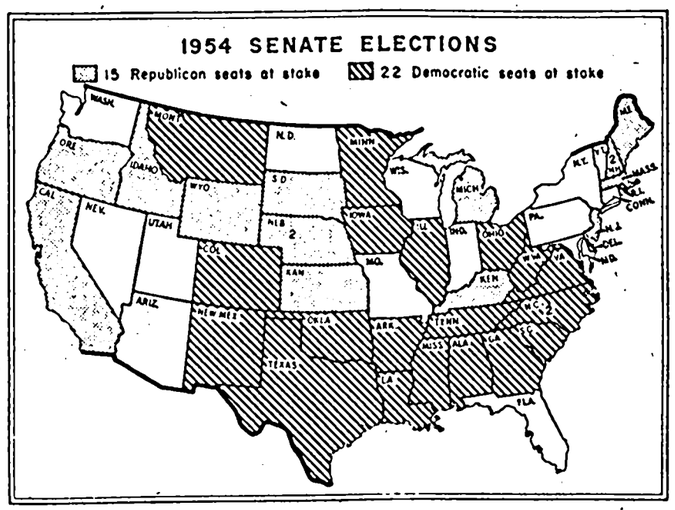
It is not quite fair to say, as Mr Lippmann goes on to do, that the Administration had "refused to consider, even hypothetically, what to do if EDC proved unworkable." Some preliminary essays in "agonising reappraisal" had been going on ever since Mr Dulles coined the phrase. The trouble was that each time a group of officials took a closer look at one of the interrelated problems of Europe they ended up by being more convinced than ever before that the only satisfactory solution was through EDC.

The truth of the matter is that, so far from Americans trying to impose on Europe an American idea, the Americans had become intellectually captivated by a European idea. The more they looked at it the more they admired it: it was creative, imaginative, subtle. It would, as Mr Dulles put it in his reproachful statement *in memoriam*, have made Western Europe at once "immune from war as between its members and defensible against aggression from without."

In short the idea seemed to the traditionally Francophile State Department to possess all those qualities most associated with the French mind. It seemed inconceivable that any leader with qualities of the same order should not endorse the policy, unless of course he was a neutralist. M. Mendès-France, when in opposition, was thought by the State Department to be a neutralist and his approach to power was viewed with some dismay. Once he had convinced the Americans that he was firmly on the western side, it was assumed that he must be in favour of EDC. The disappointment about his attitude at Brussels and in the Assembly debate was therefore total.

★

Indeed, the French action is considered in Washington to be suicidal, not because it will stop German rearmament —some other way will certainly be found of starting that— because it is felt that no German government will ever be willing to accept such permanent limitations on its sovereignty as Dr Adenauer had agreed to in negotiating EDC. As far as American public opinion is concerned Germany has worked its passage, through its rapid recovery the route of private enterprise and the puritan virtues and through its acceptance of EDC. Indeed, before the Senate departed, it acknowledged this verdict by unanimously authorising the President to recognise German sovereignty when he saw fit. American officials will have to take this into account, even though they are fully aware of the need to place some restrictions on German freedom of action. They find it difficult to see how this can be done within the framework of the North Atlantic Treaty Organisation, which was not designed for that purpose. They suspect gloomily that the final result will be the emergence of Germany as a nation state alongside France, and that the traditional rivalries will be resumed.



Fortunately, there is a certain time of grace. Congress is not in session. The policy of an American commitment in Europe has acquired sufficient momentum of its own to carry it over a reasonable period of re-thinking. The advocates of a "peripheral strategy" will of course leak their ideas to the press through the usual channels. But General Gruenther's personal influence, which is very great, not to mention President Eisenhower's, will remain on the side of defending Europe. American policy, in this immediate shell-shocked aftermath, is to remind Europe of the deadlines: the annual review of Nato commitments, to be finished by December; the running out of military aid to France next year—since under the Richards amendment no aid authorised after June, 1953, can be delivered if EDC is rejected; and the return of a new Congress next year to hold fresh hearings on foreign aid. Apart from this, Americans are inviting ideas from Europe; but in future when a suggestion is made the author will be asked to show the colour of his parliamentary coin.

Election Calculations

MR DEWEY'S apparently irrevocable decision not to run for a fourth term as Governor of New York State in November will still be reverberating through the Republican party long after the election is over. For the present it has improved the Democratic prospects in the state and thus the opposition's chances of winning a majority in the House of Representatives in Washington. The Senate situation is not, however, affected, for, although Senator Ives is replacing Mr Dewey as Republican candidate for Governor, he will not leave the Senate unless he is elected and, in that case, he will be able to appoint a Republican successor.

Nor does the death of Senator Maybank of South Carolina mean any change in the party position in the Senate; even though a dispute has been precipitated between the loyalists and pro-Eisenhower conservatives in the state's Democratic party, there is no more likelihood that a Republican could win a Senate seat in South Carolina than in any of the other eleven southern states where there are senatorial contests this year. The Republicans are equally sure of themselves in South Dakota, Kansas, Maine, New Hampshire and Nebraska. This means that, although for various reasons as many as 37 of the 96 Senate seats are at stake this year, a handful of results will decide whether the party scales in the Senate, at present evenly balanced, will be tipped to one side or the other on November 2nd; they may possibly be left in equilibrium.

The Democrats have some hope of winning a seat in Oregon, California or Massachusetts. Much brighter are their prospects in Wyoming, which they held until a Republican was appointed after Senator Hunt's death, and in Kentucky, where the beloved Mr Barkley, ex-Senator and ex-Vice-President, is the Democratic candidate in a fight which is turning on personalities rather than on issues. A McCarthyite division in the local Republican party also gives the Democrats a good chance in New Jersey, but the

nomination of weak Democratic candidates in Michigan and Idaho seems to have presented both these seats to the Republicans. They have a good chance of picking up seats in Illinois and Ohio, where a Democrat was appointed to succeed Mr Taft, although Minnesota is now thought to be in the Democratic Senator Humphrey's pocket. Colorado looks more safely Democratic than it once did, but the Republicans will be disappointed if they do not get at least one gain out of Iowa, Delaware, Montana, New Mexico or, less likely, Rhode Island.

The Democratic Senators who are in difficulties this year are those who were elected for their six-year terms in 1948 and were pulled to Washington on President Truman's bandwagon. This is one reason why the Republicans may be able to win control of the Senate in November, but for similar reasons the Democrats are expected to dominate the House. Its members are all elected every two years, and the present Republican incumbents came in on President Eisenhower's bandwagon in 1952; even so they are in a majority of only three. It is not surprising that the Republican National Committee, meeting in Cincinnati last week, decided that Mr Eisenhower must go on the road again and campaign more actively than is usual for a President in an off-year election, when his own office is not at stake.

Mr Eisenhower's task is to bring into the polling booths on November 2nd, on behalf of Republican candidates, the 5 million people who in 1952 voted for him but not for any congressional nominee. Only thus, it is argued, can the Republicans counter the traditional trend against the party in power in a mid-term election. It has also, however, been pointed out that the last time the tradition was broken was in 1934, when the political pendulum on which President Roosevelt had come to office two years before was still swinging in the Democrats' favour. Conditions today are very different, but it is at least possible that the pendulum has not yet reversed its 1952 swing to the Republican side.

TVA's Rearguard Action

THE dispute over who should provide additional electric power for the Tennessee Valley Authority, which so embittered and confused the debate over atomic energy, is not being allowed to die down. Congress sanctioned, in general terms, the President's plan to require the Atomic Energy Commission to conclude a contract with a private firm, owned by the Dixon-Yates group, to build a plant costing about $107 million which would provide an additional 600,000 kilowatts of electricity for the TVA system. This, it is argued, would replace the power which the TVA is now providing for the atomic energy plants at Paducah, Kentucky, and at Oak Ridge, and enable TVA to meet the area's growing industrial demands without the new government investment in electric power facilities which the Republicans oppose on principle and because it would mean increasing the public debt.

The objections of the TVA to the cost of the project were over-ruled and the Democrats who suspected a back-door attack upon TVA and public power had to be content with requiring the Joint Atomic Energy Committee to approve any such contracts while Congress was in session, unless the members, in writing, agreed that there was no need to give Congress a chance to object. Mr Stephen Mitchell, the Democratic National Chairman, has, however, kept the issue alive by the insinuation, which he later disowned, that favouritism to a close friend of the President was involved in the award of the contract, which was not open to competitive bidding, and by demands that the contract should be made public.

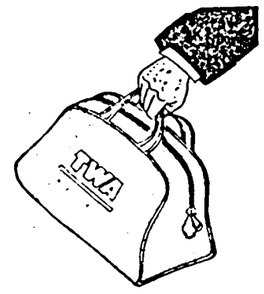
Now trouble has broken out once more inside the Administration. The TVA must work with the Atomic Energy Commission on the new contract. But the two directors appointed by Mr Truman, who were in charge until the new chairman, General Vogel, was confirmed, have publicly complained that they were provided only with excerpts from the proposed contract and that their experienced advice was being disregarded by the general manager of the Atomic Energy Commission, General Nichols. The two generals have now made peace, but General Vogel must still convert his own colleagues, who under the law can over-ride his decisions.

It is not surprising, therefore, that the AEC was unal to submit the completed contract to the congressional c mittee by September 2nd, despite its anxiety to have work started so that the power will be available by 1 This would mean asking the committee not to wait for C gress to reassemble, something which arouses Democra suspicions. The hearings have now been indefinitely post poned, quite possibly to the relief of the Administration, which cannot be eager for a show-down on so troublesome an aspect of the private *versus* public electricity issue just before the elections.

Segregation on the Defensive

THE children streaming back to school will not find, in most cases, that the Supreme Court decision banning racial segregation as unconstitutional has made very much difference. Nearly a quarter of all Americans will be going to school or to college, and nearly a third of them are in the seventeen states which maintain separate schools for white and coloured students. The fact that the Supreme Court has scheduled hearings for October, in which the Attorneys General of these seventeen states are invited to take part, to determine how the decision is to be applied is an invitation to do nothing this year.

The southern states, which present the hard core of resistance, are using the time to prepare defensive positions. The Governor of Mississippi is urging a special session of the legislature to follow the example of Georgia and South Carolina and give the state authority to abolish public education, in theory, in order to put it beyond the reach of the Supreme Court. Louisiana is asking authority to use its police powers to the same end, and in Virginia the all-white study group appointed by the Governor seems likely to devote more attention to ways of evading than of complying with the ban. But in an election year, it is asking a great deal of politicians to expect them to defy public opinion.



Elsewhere, moreover, there are many heartening signs of willingness to accept the inevitable and comply voluntarily. The District of Columbia, as befits the nation's capital, is giving a good example; it has already begun to

A dream of a flight to America . . .

'Last Saturday night I flew across the Atlantic—the way I've always wanted to go . . .

. . . with TWA on their "Ambassador" Constellation . . .

. . . it's the only all-sleeper service across the Atlantic . . .

. . . It cost me a little extra for the passenger list is restricted to just a few. But what service . . .

. . . what food, what a wonderful bed! No wonder the "Ambassador" is first choice across the Atlantic!

. . . Yes, sir, we too recommend TWA!'

The TWA "Ambassador" is for those who choose super-luxury. TWA also provides regular and very comfortable First Class and Sky Tourist services to and across America from London. Note that—*across* America too. That's why TWA knows America—such a great help to the transatlantic traveller.

"Fired? I quit!"

Read how banks helped farm machinery replace the horse

Give the grey mare above a carrot for horse sense. She retired knowing full well that only a stubborn mule would try to compete with any breed of modern tractor.

Today most American farmers (along with a good many farmers abroad) burn gas instead of oats to get their horsepower. Thus the mechanical marvels turned out by America's farm machinery manufacturers have been put to work around the world. In less than 50 years their inventive genius created machines and implements that have stepped up the plowman's daily "turnover" from 2 to more than 30 acres.

Bank money helped

But without *banks* things might have been a lot different down on the farm.

From the early steel-wheeled monsters to the most modern hydraulic-lift beauties, banks have helped manufacturers turn out faster, tougher, easier-to-use farm machinery.

How?

Well, bank loans help tractor and implement companies right down the line — stocking raw materials, accessories — gearing assembly lines to new models — freeing working capital for development and research. On the marketing level, bank loans help finance dealers, and come full circle by helping individual farmers buy tractors and implements.

What this means to you

Add all this up and you only need half a squint to see that commercial banking hoes a long row in the manufacture and distribution of the machinery used by American farmers to grow and harvest some of the biggest, most bountiful crops in the world.

This is true because of one grass-roots fact: *It's competitive banking's job to make the community's idle funds available whenever and wherever business finds opportunities for profitable enterprise.*

It follows, as reaping follows sowing, that under these conditions there are jobs for men and women, returns for investors, and a rich harvest of material advantages for Americans, rural and urban.

Chase National Bank is proud of the part it is playing in American progress.

mingle white and coloured children and expects segregation to be a thing of the past by next autumn, if it can fight off an injunction sought by white parents. Four of the border States, Tennessee, Arkansas, Missouri and Kansas, have accepted the end of segregation in principle, although they ask for time to put it into practice. Many individual school boards in the large cities along the border are breaking new ground. Baltimore, without any fuss, has abolished all of its all-Negro schools; St Louis plans to finish with segregation by next year; cities in Kansas ask for two years. This bears out the finding of the Gallup public opinion poll that the strongholds of racial discrimination are in the small towns and rural areas, not in the big cities. Their example holds out hope that the revolution decreed by the Supreme Court may prove, in the main, a peaceful one and is a reminder that not nearly enough credit is given abroad to the giant strides which the United States has made, in the past decade, to end racial discrimination.

Building Scrapes the Sky

SPENDING on new construction continues to show the buoyancy that has made it such an encouraging economic indicator for the last year; not only does it go on rising steadily, with no sign of the recession that earlier characterised the rest of the economy, but it is not even offering any evidence of the levelling-off that is now general elsewhere. All records for monthly expenditure on building were broken both in July and August and, while that was to some extent a seasonal trend, total outlays for this year are expected to exceed last year's, as they have every year since the war. The figures for new contracts being awarded

and new houses being started suggest that the building boom will be maintained for some time yet.

One reason for this satisfactory situation is that in this field the slack left by the decline in the federal government's spending has been taken up. Total expenditure on public construction is holding firm, although outlays for defence facilities have fallen substantially this year. The gap has been filled by state and local government spending on roads, schools, water supplies and sewers. The need for all of these arises partly from the backlog that piled up during the war and again during the Korean dispute, and partly from the growth in population. These two factors also of course explain the great demand for new housing which in its turn, with the related need for additional utilities—electricity, gas and telephones—is mainly responsible for the rise in spending on private building; churches also play a part. Such spending now makes up more than two-thirds of the total expenditure on construction; in the first eight months of this year, private outlays, five per cent above the same period of last year, amounted to $16.3 billion, nearly half on housing, and public outlays came to $7.4 billion. The only private spending that is declining is that on industrial, railway and farm building, but this has been offset by a particularly sharp upswing in commercial building, running 30 per cent above last year; this was restricted very severely during the Korean crisis.

There is at present no suggestion, as there has been several times in the past, that the market for new houses is reaching saturation point. The demand is based on the very plentiful mortgage funds that have been available all this year and can be had on especially generous terms by ex-servicemen through the government guarantees. Under the new housing Act, mortgage terms for all low-cost houses are now being made easier, too much so in the opinion of some bankers, who feel that the present demand for houses does not need any stimulus. It has been suggested, however, that some of the effects of the new Act have been felt in advance and that the knowledge that it was coming accounts for the recent level of new housing starts, running at a rate of over 1 million a year and higher than at any time since 1950.

Semi-Farm Votes

FROM A CORRESPONDENT IN IOWA

THE Democrats are convinced, probably rightly, that the new agricultural price law, pushed through Congress by the President after farmers had been suffering from falling prices and severe droughts for two years, provides an election issue which is likely to prove as profitable to the Democratic party next November as did revulsion against Republican agricultural policy in 1948. The extent to which farmers will actually blame the party in power for low prices and bad weather obviously depends upon how unsatisfactory these are by election day; but these factors may well decide the outcome in some of the close contests in key midwestern agricultural states, even though farmers do not necessarily base their voting decisions on such selfish and narrow considerations as are sometimes suggested.

Republicans have, however, one advantage in that the biggest farm organisation, the American Farm Bureau Federation, has fought harder and longer than the Republican party for the lower, more flexible price supports which are the main achievement of the new law, while not even the second biggest organisation, the National Grange, is opposed to them outright. Meetings and questionnaires have convinced the Farm Bureau that its members, who

include most of the prosperous commercial farmers in the midwest maize belt and many in the cotton south, are behind it on this issue.

One reason for the bureau's moderate approach to the farm price problem is that it is the youngest of the big general agricultural organisations; by the time it was founded, farmers were already a minority group, able to win in politics only by convincing the majority of the justice of their case. By 1950 only in one state, Mississippi, were there more people living on farms than off them; there were more non-farm than farm people, even in country districts, in all but five states—Mississippi, Arkansas, North Carolina and the Dakotas. Iowa, with over 95 per cent of its land in farms, has fewer farmers than trade union members. In that state, in almost one family out of five living in entirely rural areas, the head either does no farming at all or else depends in large part on other work, while in counties containing towns these "semi-farmers" may make up as much as three-quarters of the population. Elsewhere the rural character of agricultural constituencies is being subtly undermined by an influx of newcomers from the city, who live and vote as suburbanites. All this plays havoc with the traditional farm vote, never in any case very reliable, and adds yet another uncertainty to political calculations.

Congressional Bookworms

Washington, D.C.

THE Library of Congress, which is 154 years old and the largest library in the world, would seem to be a fairly tough institution. Yet this summer the Appropriations Committee of the House of Representatives began trying to nibble it away at the edges. Surveying the diverse functions which the Library has accumulated since the first appropriation of $5,000 "for the purchase of such books as may be necessary for the use of Congress," the committee advised the Librarian that he

> should be mindful the library is the instrument and the creature of the Congress. Its duties historically have been to meet the needs of the members of Congress first and to limit its service to that which can be furnished with the funds and staff available.

To sharpen this reminder, a cut in appropriations was recommended which would have meant diminished services throughout the Library; the Copyright Office, connected with the Library, would have lost $100,000, and $51,000 would have been taken from even the Legislative Reference Service. This is the branch which answers the myriad requests of Members of Congress for information, background material for speeches, and the sources of the literary quotations with which they embellish the *Congressional Record*; it can therefore hardly be regarded as a non-congressional cuckoo in the nest.

But more serious in the minds of scholars was the implication in the report that the Congress might suddenly stamp on the idea of the Library of Congress becoming a National Library, comparable to the British Museum. It would, however, take more than a little congressional boring to halt this development. The Library already performs a wide variety of services, including the printing of uniform catalogue cards and their distribution to libraries across the country, and the collection of such things as music and orientalia which no Senator or Representative is likely to need for official business but from which scholars and interested members of the general public benefit greatly. Last year, some 710,000 readers and researchers used the Library's facilities.

It was probably recognition of this, coupled with the substantial outcry of editorial writers and scholarly organisations throughout the country, that induced the Senate to temper the House's parsimony. The final compromise appropriation remains $59,657 short of the $544,293 spent last year, and the Library expects to have to abolish 65 positions on its staff. But it is possible that the new Librarian, Mr L. Quincy Mumford, may even be able to persuade the Congress, now that the issue has been raised, that the United States can afford and in fact must have a National Library, whatever pride of place the Congress may wish to retain in it.

SHORTER NOTES

President Eisenhower took time off from catch Rocky Mountain trout himself to veto the "un-American trout Bill which would have required foreign-caught trout to be labelled before being served in American restaurants.

★

The efforts of the American Federation of Labour to clean up the New York waterfront by setting up a rival trade union to the corrupt International Longshoremen's Association have failed. The ILA has now been certified as the bargaining agent for the dockers in their negotiations with the employers on a new contract; but at least the old union has had a fright which may induce it to mend its ways.

★

An agreement has been reached on wages and other benefits between the Kennecott Copper Corporation and the union, which had been on strike since the middle of August; as a result there may also be a settlement of the strike against the Anaconda Copper Company, but there is no sign of an end to the dispute with these companies that have almost halved the Chilean output of copper. The American strikes cut copper production in the United States by about 70 per cent.

★

The Department of Justice is preparing a new indictment for perjury against Professor Owen Lattimore, in spite of the fact that the Courts have already disallowed the key count in an earlier indictment. Instead of appealing to the Supreme Court for reinstatement of the vital count, the government proposes to submit to a grand jury new evidence, not considered in the previous indictment, dealing with Mr Lattimore's alleged "promotion of Communist interests" in the hope of rebuilding a sufficiently strong case to bring him to trial early next year. This procedure, as the *Washington Post* says, "suggests harassment more than it does a pursuit of justice."

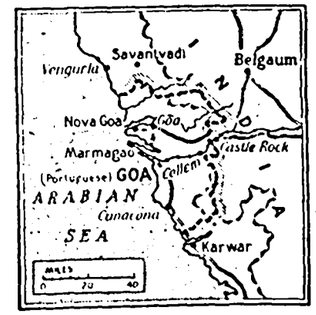
The World Overseas

Fizzkrieg Over Goa

FROM OUR CORRESPONDENT IN INDIA

MR NEHRU is right; there is something of the comic opera about Goa. It is all so small-scale, so Ruritanian. The march of the volunteers, heralded for weeks, which turns out, as a Bombay weekly called it, a fizzkrieg; the Portuguese troop movements which never affect more than a few hundred men, the Portuguese warships which are never bigger than frigates, the Portuguese evasion of their own ultimatum about neutral observers; it is all more like a South Sea romance than a modern nationalist movement.



But underneath the musical comedy and the anti-climax, Indians are deeply serious about Goa; the mere existence of Portuguese rule is to them a major proof that colonialism is quite as much a menace as Communism, and that the West is hopelessly colonial. Indians wonder, for example, why Great Britain could not have recommended its oldest ally to negotiate, as well as advising a Commonwealth partner against a violence it never intended; while British press hostility and talk of "hypocrisy" and "Hindu imperialism" have seemed to some to prove that the colonial leopard never changes his spots. To Indians all this seems deliberate spleen, for to them Goa is, quite simply, part of India, as much part of India as Calais, even when English, was of France. They regard the Portuguese claim that it is part of Portugal as merely impudent; for them no place can be part of a country from which it is separated by several thousand miles of ocean.

There is, therefore, for Indians, really nothing to discuss. Goa is a part of themselves, separated from them only by a colonialism so out-of-date that it will not even discuss its own liquidation. In India the words "Portugal" and "mediaeval" go automatically together; Goa is doubly an offence because Portugal is a dictatorship. It is not forgotten that Goa harboured Axis ships in the last war.

Links with India

On the standard tests of European nationalism, indeed, Goa is Indian. Racially, Goa's population is indistinguishable from the people of neighbouring Ratnagiri or Karwar while the inhabitants of Daman and Diu are pure Gujerati; the number of Portuguese is infinitesimal, and of mixed bloods quite small. A surprisingly high proportion of the better classes claim to have no Portuguese blood at all, perhaps because of the habit, still found among Catholics, of continuing to marry only those who were of the same Hindu caste before conversion. Linguistically, the mother tongue of Goa is Konkani, that of Daman and Diu Gujerati. Not many more can speak Portuguese than English. Religiously, Daman and Diu have a large Hindu majority, Goa itself a small one. Only in the area immediately around Panjim and old Goa, the so-called Old Conquests, is there a Catholic majority. And Goa's Catholicism, with its memories of caste, has about it a faint Indian flavour, a flavour one finds again only in Mangalore or the Bombay suburbs.

Economically, Goa is already part of India. Its connections with Portugal, beyond the Banco Nacional Ultramarino, are negligible. Its currency, many of its bigger businessmen, the labourers who work its iron and manganese and docks are all Indian. The hinterland of its port is Indian, its little railway is worked by India, and though manganese and iron ore exports have become important of recent years, the main exports of all the Portuguese possessions are still the £8-10 million a year of liquor, gold and luxuries which are smuggled into India, and the tourists and remittances which come from India. Above all, almost the whole Goan middle class are dependent for a career, and indeed for much of their higher education, upon India. There are no jobs in Goa, and the few there are are held by Portuguese or mixed bloods. Of the dozen high officials, only two are Goans, and they are recently appointed; even the Customs men, or the village headmen of Nagar Haveli have usually been mixed bloods. There are probably more Goan officers in the Indian Army than Goan privates in the Portuguese Army. In Bombay there is a Goan Secretary to Government, a Goan is the editor of the leading newspaper, a Goan will be the next chief engineer; there are Goan trade union leaders, specialists, leaders of the Bar. In Goa the Archbishop is a Portuguese, in Bombay the Cardinal-Archbishop a Goan.

Why there has been so little agitation in Goa so far, therefore, requires some explanation. Partly it is that Goa is a police state, though admittedly a rather inefficient one. There is no way for the public to express its opinion, not

even an elected municipality, and those who talk to one of the need for Goa to join India do so almost furtively. Was not Dr Gaitonde departed to Portugal and deprived of civic rights for ten years for just such a tea-table remark? Partly it is that Goa is backward and rural. The modern middle class are all in India, and those on the edge of subsistence tend to be politically apathetic. One may remember the Slovaks and Ruthenians of 19th century Austria-Hungary. Partly it is the preponderant importance within Goa of the better class, Catholic, Portuguese-speaking townsmen and landowners, some of whom undoubtedly do fear a loss of their present privileged position if Goa joins India. Rents in Goa are three times as high as in Bombay. Partly it is a real affection for Goa's special atmosphere. Goa is not austere like India ; it likes its bars ; most Goans dislike the Portuguese, but that does not mean that they want to lose their identity in a Prohibition Maharashtra. But above all, it is that the present situation suits many people in Goa very well. They have all the advantages of Portuguese citizenship and of Indian citizenship alike.

A Utopian Situation

It is a Utopian situation ; perhaps for that very reason it cannot last. The Portuguese have played their hand badly over the last few months. Their rule rests on apathy ; and they have created tension. The idea of a march of volunteers on Goa was that of India's main opposition party, the Praja-Socialists, and its intention was quite as much to capitalise on the Indian public's impatience with Delhi's caution as to liberate Goa. *Satyagrahas* are indeed the Praja-Socialists' favoured weapon, they believe they are part of democracy. At the same time as Goa, they had one in Uttar Pradesh against higher water-rates and another in Andhra against evictions of tenants.

The sensible course for the Portuguese would have been just to arrest and deport the satyagrahis as they came in. Instead, they have brought in Negro troops, and shut their border, and written loud Notes, and deported their Indian labour. It is all very upsetting for the quiet Goans. No longer can they have the best of both worlds. The remittances are almost cut off, the tourists no longer come, smuggling has become impossibly difficult, the Negro troops will have to be paid for, there will be no one to work the mines after the monsoon. Now that Indians are not to be allowed to do it for them, the Goans will have to work for their own liberation.

The Politics of Cocoa

FROM OUR CORRESPONDENT IN THE GOLD COAST

THE first all-African elected Assembly in the Gold Coast recently brought its first session to an end. Easily its most important act was legislation to maintain the price paid to the producer of cocoa at the present level—of £134 a ton—and to ensure, by graduated export duties, the diversion into Government hands of the bulk of the balance created by the extraordinarily high prices prevailing in the world market. The average for the crop year 1953-54 is about £357, and so far, for the financial year of 1954, the average price is as high as £442.

Any decision of the Cabinet concerning cocoa goes to the core of this country's economy. But its decision on cocoa prices this year has implications beyond the frontiers of the Gold Coast. A considerable controversy has arisen among overseas firms and interests engaged in the purchase of cocoa, and in the course of it the activities of the Government in Accra have come in for some criticism.

The starting point of the controversy is the high world price of cocoa. Although the prewar average was only £32 a ton and the 1946-1952 average £208 a ton, in July this year the average price rose to £488, and there were reports that advance buying at one point reached the remarkable level of £575 a ton. Two types of criticism have been put forward, both levelled at the Gold Coast Government. The first concerns the activities of the Cocoa Marketing Board which—in succession to various wartime purchasing authorities—has handled the selling of the whole cocoa crop since 1947. This Board, it is claimed, tends, by virtue of its monopoly, to force prices up. In addition, its habit of releasing cocoa for sale in limited quantities throughout the crop year—a procedure which involves withdrawing its supplies from the market altogether from time to time—creates artificial shortages and an upward pressure on prices. In the United States, the more fantastic criticism is sometimes heard that the Cocoa Marketing Board is a sinister instrument of British colonialism and its large reserves—now in the neighbourhood of £100 million—are filched from the African cocoa farmers to underpin Britain's domestic economy.

Demand Outstrips Supply

These criticisms cannot, in fact, be sustained. The Cocoa Marketing Board is virtually all-African, and the use of its reserves is limited by law to stabilisation and development in the African-owned cocoa industry in the Gold Coast. As for the supposed effect of its policy, both Mr Howard Frye, President of the Association of Cocoa and Chocolate Manufacturers of the United States, and Mr L. J. Cadbury have agreed that "the overriding fact is that world demand has outstripped world supplies." The Board's intermittent releases of cocoa have little influence on this basic situation. Indeed the manufacturers themselves, when pressed to say whether they wished to change the procedure, admitted that it was a most orderly and acceptable method of disposing of the crop.

Since the high world price is really caused by high demand and inadequate supplies, the second line of attack upon Gold Coast policy seems at least to aim in the right direction, for the basis of this charge is that the Administration is not taking the steps necessary to increase production of cocoa. The cocoa crop has fluctuated considerably since the Cocoa Marketing Board first began its purchases in 1947—between the low point of some 207,000 tons in 1947-48 and over 278,000 tons in the following year. The sharp increases in price of the last twelve months are directly related to the disappointing crop which, estimated at 236,000 tons, fell to 205,000 tons. If, therefore, the Gold Coast Government is at present neglecting to undertake policies that are open to it to increase production, then it would clearly have to bear part of the blame for the effect of low supplies on high world prices.

The critics have fixed on two aspects of policy which, they claim, work against the expansion of supplies. The more general line of criticism concerns the alleged failure

of the Gold Coast Government to invest enough of its reserves in methods designed to increase production, improve fertility and arrest disease in the cocoa industry. Out of the 1953-54 world crop, 70,000 tons were lost through capsid disease, 50,000 tons through black pod and 50,000 through swollen shoot. To this general criticism is added a strong specific attack upon the decision to hold the internal price of cocoa to £134 a ton while world prices soar beyond the £400 mark. Give the cocoa farmer an added incentive, the argument runs, and he will soon increase his output.

The criticism of insufficient attention to a programme for increasing productivity is difficult to meet because the criticism itself is difficult to define. Success in research does not necessarily bear any relation to the spending of a particular sum of money. Some discoveries come cheaply and soon. Other problems defeat years of research. Moreover, in dealing with a farming population changes, however desirable, are likely to be slow, the more so when farmers are largely illiterate and the cocoa is grown on trees planted in the main in small plots without system or any tradition of careful—let alone scientific—farming.

500 Million Trees

Given this background, it is perhaps fair to say that critics abroad appear to underestimate what has been done to stabilise and improve cocoa production. The £100 million in the stabilisation fund must remain an essential cover against an eventual fall in cocoa prices. Meanwhile the Gold Coast Government's campaign against swollen shoot should not be underestimated. Annual grants to indemnify the farmer for the trees cut out and to provide him with new trees have risen from £300,000 in 1947-48 to £2,500,000 in 1952-53, with the result that the disease has now been very largely checked. In addition the Board has set aside over £6 million for rehabilitation, £1,500,000 for research, and over £1 million for scholarships. On the debit side must be set a certain lack of contact between the main research institute supported by the Board—the West African Cocoa Research Institute—and the practical problems of the farmers. It is possible, for instance, that better liaison and greater drive would have led to an onslaught on capsid disease some years earlier. It is only now that the antidote—a DDT spray and the sprayers to use it—is becoming available. Even so, access to 500 million trees creates a formidable problem of administration.

The answer to critics can be more dogmatic on the central question of the internal price of cocoa. In present circumstances, there is nothing to suggest that a rise in price would increase output. That particular stimulus is exhausted. Before the war, the export price per ton fluctuated between £17 and £56 a ton, and the farmer probably received about four-fifths of it. Since 1947, the price paid to the farmer has increased from £74.13 per ton to £134 a ton in 1953. Under the pressure of this stimulus, a large amount of fresh planting was done, often on unsuitable land. But the cocoa tree takes seven years to come into production. Bigger crops may be expected in 1956 or 1957, but no price change this year will affect that result. On the contrary, it may even decrease output, since higher prices would enable the cocoa farmer to realise an excellent income on a smaller crop and could encourage his present tendency to leave the end of his crop unharvested.

While the argument that a higher price would stimulate greater supplies is unproven, it can be mathematically shown that a marked increase in local purchasing power would have an inflationary effect. In 1949 and 1951, when two major increases in the internal cocoa price occurred, the index of local food prices increased suddenly by 45 per cent in 1949, and by another 41 per cent in 1951. This in turn increased sharply the local rate of wages. Since 1952, the policy of holding steady the internal price of cocoa has led to a stable cost of living index and, indeed, in 1953 to a significant fall.

Yet the decisive argument for the Government's policy is one that is so familiar that it is difficult to understand why critics in more advanced economies cannot accept its force. The accumulation of capital is the only road away from the stagnation and low standards of an undeveloped economy. If a higher price is paid to the cocoa farmer, the immediate result is inflation. If the balance is retained by the Government, it is available for productive investment to strengthen the base of the economy. It is no coincidence that the Gold Coast has been able to finance from its own reserves the £10 million needed for Tema Harbour, a contract recently secured by British engineering concerns. It is peculiar, even disturbing, to African statesmen, to hear British critics attacking them for failing to pursue inflationary policies when echoes of Sir Stafford Cripps's or Mr Butler's exhortations to thrift still fall on their ears. The windfall price of cocoa is the Gold Coast's opportunity to save. Virtually alone among primary producers it is showing the political courage to do so.

Stakhanovites' Losing Battle

BY A CORRESPONDENT

THE Rumanian workers have, it appears, succeeded in destroying, at least for the time being, the stakhanovite and shock-workers' movement that was officially created in Rumania in October, 1951. For the first time the annual report on plan results for 1953 contained no mention of the movement or of its achievements. And since March the Rumanian press has completely dropped a subject that had for years formed one of its most fertile sources of news. Every day a new record used to be broken and almost every day brought forth a new hero. The different Rumanian newspapers used to compete amongst themselves to see who could first announce the new record, and first present the new hero to the public.

But in spite of all this publicity the average Rumanian worker disliked the movement from the beginning, and as time passed, his dislike changed to hatred, as he realised more and more clearly that its purpose was to exploit him even more thoroughly. The "record-breaking machine" could only lead to a regular increase in the general norms and thus to a decrease in wages. No propaganda could prevent the worker from feeling this result in his own purse. He also came to realise that the "royal fees" paid to the stakhanovites were largely covered by the economies realised in the ordinary workers' pay through the yearly increases in the norms. In time he also learned that apart from the material advantages received by stakhanovites—such as new housing, exceptional holidays, special allowances for children

—he also enjoyed a *régime de faveur* in the factory. When raw material or spare parts were in short supply, the stakhanovites were never the ones to suffer.

The stakhanovite movement thus developed in an atmosphere first of mistrust and then of open animosity. No wonder that it was not very successful. At the end of 1951 there were 1,000 Rumanian stakhanovites. By the end of 1952, according to the best estimates from the contradictory official statements, their number had reached 7,500. To give the movement a new impetus, "stakhanovite schools" were created by decree; they were compulsory for those selected. The number of stakhanovites rose in 1953 to 25,000 but after that the regime apparently realised that it had failed. With all its efforts it had turned less than one per cent of the Rumanian wage earners into stakhanovites. Moreover the stakhanovite schools had not been a success. Many of the most skilled workers took care not to pass their examinations, either through a feeling of solidarity with their fellows or because they feared the enmity of the other workers when they returned to the factory. The regime therefore evidently decided to bury the movement; and the decision to revise salary scales, announced by Gheorghiu-Dej on August 23, 1953, and passed into law the following November, was in fact the grave-stone of the stakhanovite movement in Rumania. Whether or not it will be disinterred remains to be seen.

A Hero Boycotted

What form did the Rumanian workers' resistance to stakhanovism take? Naturally there was no organised movement or resistance, nor was there any sort of open revolt. But the workers did not lack means of making their feelings known. For instance they withheld all help from the stakhanovite. This proved very telling as the record breaker depends a great deal on the help of his fellow workers. He soon found himself completely isolated, and the so-called production meetings became scenes of mutual recrimination; the stakhanovite accused the rest of the workers of boycotting him and the workers complained about the favours enjoyed by the stakhanovite. One famous coal-miner stakhanovist, Geza Kopetin, unable to stand any longer the hostile atmosphere created by his fellow-workers, wrote an open letter to the newspapers. He complained of the isolation in which he found himself and his "brigade" in the pit, of the difficulties encountered by them and the uncooperative attitude of the other miners. Nothing more was heard of him for several months, until the newspapers announced that the celebrated brigade led by Kopetin has beaten new records in a pit situated some thirty miles from its former mine. This was one of the best examples of how Rumanian coal miners deal with their "heroes."

But the method which perhaps gave the best results was the election of the stakhanovite to as many committees as possible. He was made a member of the trade union, party, sport and cultural club committees. He was also elected town, *raion*, or regional councillor and some were even made deputies. Thus after an exhausting day's work the stakhanovite had to run from committee meeting to committee meeting, to receive his electors and to take care of their complaints. He lost his sleep and barely had time to eat; and as a result many fell ill. This led at last to a press campaign, last year, against the mania of the meetings—*shedintzomania* as it was called; the chief complaints came naturally enough from the stakhanovites.

Danes South of the Border

FROM OUR CORRESPONDENT IN COPENHAGEN

A DISTURBING feature of tomorrow's provincial elections in Schleswig-Holstein is that the Danish minority party will probably lose the four seats it held in the previous *Landtag*. This would mean that the 70,000 Danes south of the German frontier would no longer have any voice in affairs at either the *Land* or the federal level, for the solitary Danish member of the *Bundestag* in Bonn lost his seat in last year's German elections. This total disfranchisement would contrast strangely with the position of the 20,000 strong German minority north of the border, which returns a member to the Danish *Folketing*.

The critical situation of the SSW, the Danish minority party in Schleswig-Holstein, has arisen from two causes: a steady falling off of support since 1948, and the new *Land* electoral law. After the war, the nominal membership of the minority soared; Schleswigers of mixed or uncertain origins sometimes declared themselves Danish in order not to share the full consequences of Germany's defeat. But although there was some truth in the scornful label *Speckdänen* ("bacon Danes"), Denmark could offer decency and democratic ideals to a shamed people, as well as food parcels. In 1945-46 the minority felt strong enough to campaign for the political separation of Schleswig and, after a period of United Nations control, a plebiscite which might return South Schleswig to Denmark. In September, 1946, Britain, as occupying power, offered the Danish government three alternatives—exchange of populations, or frontier rectification with or without plebiscite—and undertook to raise with the other occupying powers any one proposal. Wisely, Denmark declined all three. Today impartial Danish and German observers admit that the frontier fixed by the 1920 plebiscite is fair. In 1947, Danish candidates in Schleswig-Holstein polled 100,000 votes. Next year came currency reform. Since then support for the minority has dwindled in proportion to the Federal Republic's economic recovery and political advancement. It obtained 75,000 votes in 1949, 72,000 in 1950 and 45,000 last year.

Ill-Will in Kiel

The *Land* electoral law, like the federal law, contains a "five per cent clause"; to be represented, a party must gain one direct mandate, or five per cent of the aggregate vote. The law's praiseworthy aim is elimination of "splinter" parties, but unlike the federal law, it does not except national minorities. At the 1953 federal elections, the SSW vote dropped to 3.3 per cent. This spring the minority introduced a motion in the *Landtag* to bring *Land* and federal legislation in line. An ill-timed speech in Rendsburg by a Danish irredentist hothead possibly swayed the voting and, despite German Social-Democratic backing, the motion failed. A subsequent SSW motion to limit application of the clause to South Schleswig (where the minority lately polled 15 per cent) was likewise defeated. Finally, the minority appealed to the Constitutional Court, which ruled that the disputed clause was constitutional, but not necessarily binding. Denmark's Foreign Minister commented that with goodwill a solution seemed possible. In Kiel that goodwill has been regrettably lacking.

The SSW's chances of obtaining the required aggregate vote of 60,000-65,000 are now slender. There is bitterness that the presence of hosts of refugees may disfranchise the native Danes. Nor are the party's prospects of gaining a direct mandate rosy. Although Danish candidates are standing in twelve constituencies, they have only a faint chance in two Flensburg divisions. Danish allegations of gerrymandering in boundary adjustments seem well-founded. The Flensburg Danish Socialists have joined forces with the German Social-Democrats, thus weakening the united front. The German right-wing parties have sunk their differences and "ganged up" in the marginal seats. Some SSW supporters, feeling that a vote for the minority is wasted, may vote on party rather than national lines.

Since 1949, when a Social-Democratic *Land* government gave the Danes their charter in the Kiel Declaration, relations between Germans and the minority have deteriorated. The declaration, adopted unanimously by the *Landtag*, provided far-reaching political, economic and cultural safeguards for the minority. Exercising their rights under the Declaration, the Danes have launched a "cultural offensive," and there are to-day 89 modern, well-equipped Danish schools in South Schleswig compared with seven before 1945. (The German minority in Denmark has 27 schools.) Two-thirds of the teachers and a score of pastors are Danish nationals. Germans, indeed, fear that the long-term aim of Denmark, which spends 30 million kroner annually on cultural projects, is to proselytise all Schleswig. On the other hand, *Programm Nord*, an ambitious ten-year land reclamation scheme, which envisages the resettlement of 36,000 refugees from the east in South Schleswig, is also a source of friction. The Danish minority, suspecting any German infiltration of a predominantly Danish area, demands equal opportunities for natives.

Herr Lübke, the present premier of Schleswig-Holstein, has stated that if he is returned to office he will seek some means of associating the SSW in *Land* affairs. The Social-Democrats, who may gain in the elections, are pledged to make urgent representations in the *Landtag*. Recently, the influential weekly *Die Zeit* condemned the government's attitude to Western Germany's only national minority as "stupid and petty," and indicated possible boomerang effects on large groups of *Auslandsdeutsche*. Christian-Democrat intransigence has certainly violated the spirit of the Kiel Declaration; but if wiser counsels now prevail, it may still not be too late to repair the damage to Danish-German relations.

Across the Bay from China

FROM OUR HONGKONG CORRESPONDENT

HONGKONG Chinese know better than others what is going on and what is planned for the future in China. They have a thousand and one wires of communication. They see in the Soviet Union of the postwar decade the Chinese Communist expansionist state of the next decade. Least of all are they fooled about the fate of their own kith and kin who built industries, created trade, and engaged in a hundred and one constructive enterprises while civil wars and ravenous politicians raged around them. They know—none better—that having been terrorised into submission by such campaigns as the "five-anti" which led so many to suicide and ruin, these people are now facing the progressive seizure of their interests and industries by the state, without any pretence of compensation.

They, and practically all responsible members of the very important community of Chinese overseas, regard the Labour visit to Peking as very untimely. It came just after the Geneva triumph of the Communists. It came at precisely the period when the relations between the dominant Communist clique around Mao Tse-tung (led by the formidable Liu Shao-chi with his many Stalin-like qualities), and the Army commanders were more tense than at any time since the liberation. The arrogant denunciation by Liu Shao-chi in his report to the Central Committee last February of high-ranking commanders and regional civil officials had passed far, wide and deep; and the purge of all the great Field Commanders and their staffs now going on is similar to that carried out by Stalin in the days of Tukhachevsky, except that they are not executed but only deprived of place and power. The Liberation Army are now told by the Party mouthpiece that they, too, must sit at the footstool of the Soviet and modernise themselves. And, finally, they have been relegated politically to a scant minority in the National Congress, in which all the armed forces will have 60 seats, including two for the navy and ten for the People's Volunteers who fought in Korea. It was a strange time indeed to give so much face to the Party hierarchy in Peking.

Doubts Among the Overseas Chinese

But worst of all is the shaken confidence and renewed doubts of our only real friends among the Chinese—the overseas communities. The visit has had a very depressing effect upon them, just as they were getting the ear of the better men around the Nationalist Government in Taipeh, and these in turn were getting more sympathy from the Chinese communities abroad.

These are the people with whom the British deal when they buy or sell for Britain in these parts. Their lot and ours are one and the same. They are more important from a purely economic point of view than the 600 million in China at present. We have been partners in the astonishing recovery of Hongkong and of Singapore from the wrecks they were when the Japanese had done with them. Their stake in British policy is, indeed, considerable.

The Hongkong British, on the other hand, would like to see more friendly relations with Peking. They have suffered gravely from the lack of normal contacts and normal decencies of international intercourse. They never know, when they venture on a yachting trip round the island, whether they may be blown off course and into Communist custody or even shot to ribbons like the Royal Naval launch and its British crew. This seems a poor recompense for the blamelessly liberal attitude towards the Communist section of the Chinese daily press and the numerous Communist state trading agencies now operating in Hongkong.

Nevertheless, the British in Hongkong expect nothing more to come to themselves and the Colony from the Labour Party's delegation to Peking than do the local Chinese. As one cynic in downtown Hongkong has put it, as a result of the visit the Embassy and Mao's Foreign Office are now, after five years of British recognition, on calling terms!

Russo-German Rivalry in India?

FROM A CORRESPONDENT

IT is far from clear how the reported Russian offer to supply India with a steelmaking plant fits into the Indian programme for the expansion of steel production. According to the Planning Commission's last interim progress report, the Krupps-Demag financial contribution to the capital cost of the projected Hindusthan Steel Works has been fixed at a maximum figure of Rs 95 million, "the exact amount of the contribution depending on the value of the plant and equipment which may ultimately be purchased from Germany." Hindusthan Steel, to be located at Rourkela in Orissa at a total cost of Rs 750 million, has been registered as a public company, the board of directors appointed and the preliminary recommendations of the German consultants have been accepted. The latter are understood to advocate a process for the manufacture of steel which is now standard practice in Germany and which, it is claimed, will yield 8 per cent more steel with the same amount of raw material than the process at present used in India. The Krupps-Demag investment in the project is to be geared to the amount of equipment purchased from Germany. The willingness of the consortium to make this investment is understood to have been a major factor in securing German partnership in the venture. How, therefore, can this benevolent, but belated, Russian offer be fitted into an already somewhat complicated picture?

A Commanding Lead

It is true that when detailed designs and specifications are ready (probably in January, 1955) it is hoped to place orders for plant and equipment by inviting global tenders; but the Germans clearly have already established a commanding lead over any competitors who may be disposed to enter the contest. If their interest and their investment are to be retained in the scheme it seems obvious that a very large part of the plant must inevitably come from Germany, where the plans were laid.

Thus viewed, the Russian offer looks a little out of context, and in any case it might have been supposed that if Russia had a steel works available for export on special terms China would have a stronger claim on it than India, whose output, when Rourkela gets into production, will be raised to over 2 million tons per annum. Rourkela's initial capacity will be about 500,000 tons annually, but the works are to be so laid out as to permit of a further expansion to 1 million tons per annum.

In addition, both the Tatas and the Indian Iron & Steel Co. have important expansion schemes under way for which financial aid has been secured from the Government of India and the World Bank. Tatas' extensions envisage an increase in the annual production of finished steel from 750,000 tons to 932,000 tons and Indian Iron & Steel from 225,000 tons to 624,000 tons. The little Mysore Iron & Steel Works, which mostly concentrates on the production of pig iron, has installed two new electric furnaces and capacity now exceeds 60,000 tons.

It is estimated that Rourkela will take at least four years to come into production, and that during the first Five Year Plan increased production must come from existing units. The Planning Commission estimate that by 1957-58 the output of finished steel will have been boosted to 1,650,000 tons. Rourkela's output thereafter will raise the figure to over 2 million tons and any further increase will mainly depend upon the rate of progress attained in the second Five Year Plan. In it the major emphasis will be upon industrial development, which entails a continuing and expanding demand for steel.

An Islamic Forum

BY A CORRESPONDENT

THE Prime Minister of Pakistan has now informed his public that, on the suggestion of Lieutenant Colonel Nasser, the Egyptian Premier, plans are in hand for an annual Conference of Islamic statesmen, to be held in Mecca on the occasion of the Haj—the great yearly pilgrimage. Money is being earmarked, plans and a timetable evolved, and a small permanent secretariat is being set up. A member of the Egyptian Council of the Revolution, Colonel Enver al-Sadat, is to be in charge.

Although Pan-Arabism has had greater publicity in recent years than Pan-Islam—indeed the two have occasionally clashed—the relation between them is one of profound mutual penetration. Either, except in times of particular regional stress, can be the best of allies of the other. It is, in fact, inconceivable that any Islamic government, whether Arab or not, should react in public otherwise than with the most complete favour to the proposed organisation and conference. It is likely, therefore, that an inter-Islamic office in Mecca, and an annual full-dress Islamic congress coinciding with the pilgrimage, will become permanent features of eastern-hemisphere politics.

Mecca and Jerusalem

Religious solidarity apart, the practical advantage of such an organisation to the Moslim states is obvious. It will allow any one of them to mobilise the others automatically in support of its own position or protest to the world and to bring on block votes. Previous attempts to unite Islam in the twentieth century—in Mecca, in Cairo, in Jerusalem and in Karachi—have been handicapped from the start by schisms. But now certain notorious points of friction between Islamic states have been removed and Islamic leadership is becoming increasingly realistic. The presence of Israel, moreover, affords a constant focus of unified displeasure and mutual admiration. For all these reasons the new Islamic congress may achieve its express aim "to promote better understanding and greater unity among Moslims."

From the western point of view, the scheme will not elicit much enthusiasm. Although the Islamic congress may give its members a better grasp of world problems, it is hardly likely to discourage nationalism and may give scattered rancour greater force. Meanwhile, moreover, the same statesmen who have met at Mecca have planned a more immediate Islamic Conference at Jerusalem. Its object is to deal with the threat posed by the existence of Israel. That sounds all too familiar, and there is no hint of a new outlook.

Every Sunday, nearly 3,000,000 copies of this famous newspaper are sold. The day following, accounts and order forms to hundreds of agents must go out . . .

Day of reckoning: Monday!

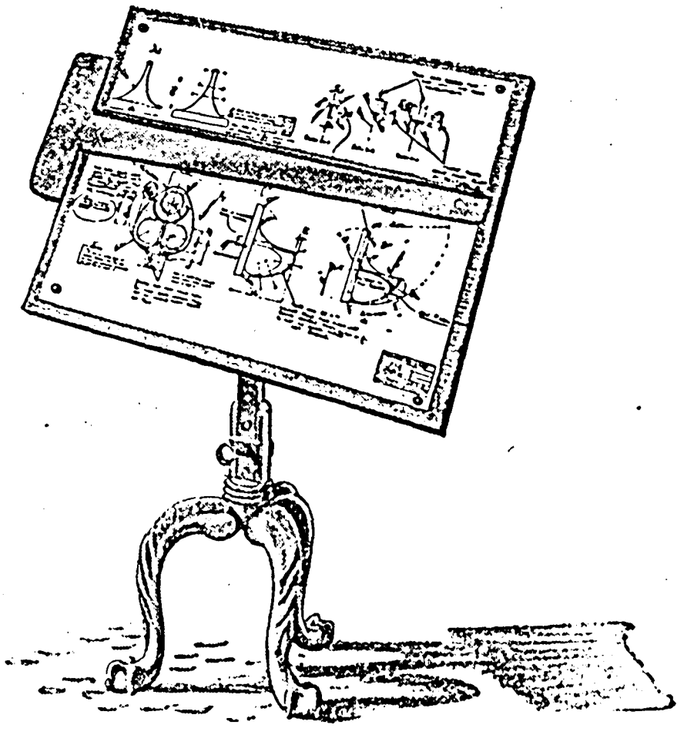
A BEHIND-THE-SCENES STORY on the workings of a great national newspaper comes from Associated Newspapers Limited. Their problem was to streamline the office system by which they control the sales operation for the ever-popular "Sunday Dispatch." Statements to all the agents were being handwritten. It threw a heavy load on office staff.

Associated Newspapers Ltd. wanted a system that could *guarantee* that all figuring on sales accounts was finalized, and weekly accounts sent out, on the Monday following the paper's publication date.

After consultation with Burroughs, they installed Sensimatic Accounting Machines to handle the postings. These are used in conjunction with an ingenious method of invoicing, by which the agent receives, *on one single form*, a statement, a receipt for his payment, and an order slip for next week's copies.

Result: So fast do these Burroughs machines serve the office that it is now *normal practice* to get "Sunday Dispatch" weekly statements prepared and *dispatched* on Mondays. Cash collection is swift and efficient and next week's orders come back in time for action by the circulation department.

One more result has been that Associated Newspapers Ltd. are now using Burroughs Sensimatics on sales accounts for their latest paper, the "Daily Sketch."



210 postings in 45 minutes—that's a normal rate of work achieved by Mrs. J. Dickens, seen preparing statements for newsagents in the offices of Associated Newspapers Ltd. Watching her use one of the Burroughs Sensimatic Accounting Machines is Mr. Paul Stark, the Burroughs man who helped solve "The Case of the Sunday Dispatch."

What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service *guarantees* its efficiency in operation.

Call Burroughs *today*. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford St., London, W.1. Sales and Service Offices in principal cities round the world.

FOR EXPERT ADVICE ON BUSINESS FIGURING CALL IN **Burroughs**

Is it a job for Plastics?

Some production jobs are just right for plastics, some can be made right by simple alterations to the drawings, some are better made in other materials. The point is, who can say? We, in the B.I.P. Group, believe that we can.

We have been in plastics from the early days. We make moulding powders, we design and make tools and presses and we are considerable moulders of our own and other materials.

In addition we maintain a Product and Mould Design Service staffed by highly-skilled, practical men who know the plastics industry from A to Z. This Service is freely at your disposal.

B·I·P GROUP

The most comprehensive service in plastics

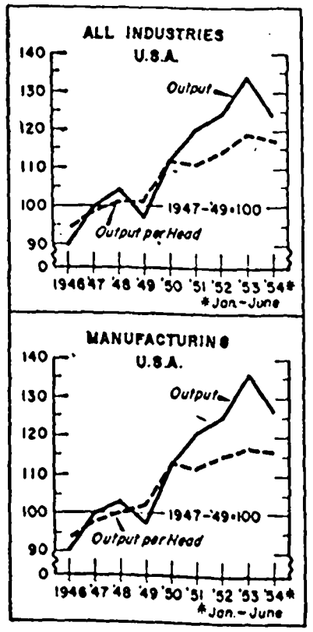
BEETLE UREA & MELAMINE MOULDING POWDERS · BEETLE POLYESTER RESINS · BEETLE RESINS FOR THE PAPER, PAINT, TEXTILE, WOODWORKING & FOUNDRY INDUSTRIES · MOULDING TOOLS & PRESSES

BRITISH INDUSTRIAL PLASTICS LTD., 1 Argyll Street, London, W.1

THE BUSINESS WORLD

In the Final Comparison

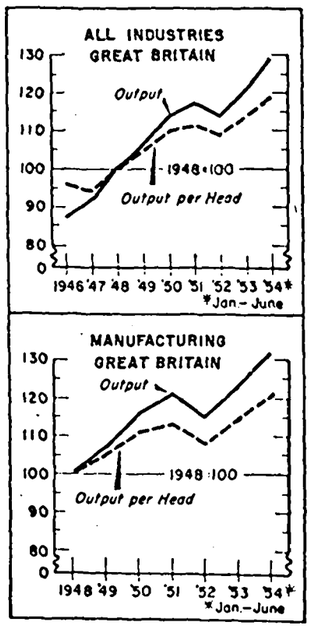
ALL the productivity reports, it was once said, had roughly the same first chapter—perhaps the teams had all heard roughly the same lecture. The remark was neither quite true nor wholly unfair. Some of the 67 teams of British managers and men that the Anglo-American Council on Productivity sent to look at American industries between 1949 and 1953 decided that they had nothing new to say about that famous "climate of productivity" and so said nothing at all; one or two made more individual comments, some of them controversial, about America as an industrial society. But certainly a considerable number of these teams, before going into industrial detail, did dwell briefly upon some pervasive characteristics of that industrial society that they felt had an over-riding influence upon the comparative performance of individual industries there and here. And the last productivity report of all, which has come after some intriguing delays from a team that went to the United States with perhaps the widest brief of any, "Industrial Engineering,"* devotes even more of its space to what it wryly calls "those clichés" about major economic and social factors in the American scene, in analysing the efficiency and growth of American industry.



In this, almost certainly, the teams were quite right. The core of the comparison between particular industries in the United States and Britain lies in the natures of the two societies—not in those particular practices, techniques, and items of equipment that the teams almost unanimously reported were not unknown in their British industries, though they were far more widely adopted in the American. The team of industrial engineering specialists, whose main purpose was "to investigate the dynamic and aggressive American approach to improvement of methods of manufacture and to continuous reduction of operating costs," were rightly concerned to analyse some of these "visitors' clichés" more fully. It distinguishes as "characteristics that may be transferable to the United Kingdom" the sharp and urgent competitiveness of the American economy, the freer supplies of finance for capital investment, the lower impact of taxation, the "non-stratification" of society, and high wages—valuing competitiveness first by a long way.

Accordingly, this team ventures into a quasi-political field from which most of its predecessors have felt themselves precluded. It recommends that monopolies legislation in Britain, which it thinks at present "tends to be ineffective," should be considerably strengthened and its range extended" to ensure competitive conditions," suggesting as a first step that all trades associations—and trades unions—should be compelled to publish any rules or agreements that are binding upon their members. It wants more effective publicity for the facilities available to small firms for obtaining finance by capital investment, revision of tax allowances for depreciation to enable more rapid writing-down of plant, and more liberal import licensing of machinery (which since this report was written has in fact begun). Its more directly industrial recommendations still concern industry in general rather than in particular. The team advocates much closer attention to costing for management purposes, both of current operations and of future projects; the extension of shift working, with changes in shopping and restaurant hours to support this; wider use of time and motion study, less for rate-fixing than for improving manufacturing methods; research into incentives and study in advance of the problems of redundancy that underlie industrial opera-

* "Industrial Engineering." Published by the British Productivity Council, September, 1954. 5s.



tives' fears of changes in technique; a higher status for foremen; and, in its own special field, the wider employment in Britain of what Americans sometimes call the "hyphenated engineer," whose main business is with making changes to reduce costs—from work study to the economic assessment of investment plans.

This last of the productivity reports is therefore, in its way, a summing up of many of the others; its recommendations draw together most of the practicable recipes for improvement in the productivity of British industry. It is, incidentally, clearer than many other contributions to the subject about what it means—and measures—by productivity. Admittedly, it uses the familiar comparative indices of output per head in America and Britain without making it clear that the "industrial productivity" so measured is labour productivity, which leaves a lot out. Such a measure of output against only one factor of input, in countries where the relations between the cost of different factors such as equipment and labour may differ considerably, is an inadequate yardstick of total efficiency in the industries or economies compared. This is a confusion far more common in Britain than in America, where the cost-conscious engineer is far more alive to just how much productivity it will pay him to buy, and to the fact that high labour productivity may not necessarily make his costs competitive. An engineer in one of the largest American electrical plants said to an English visitor last year: "We are quite honestly sure that this is the finest power turbine plant in the world, and that our productivity, if we could measure it adequately, would be the world's highest too. And we are equally aware that every time we come to tender, in the States or Britain, Brown Boveri or English Electric can almost certainly underquote us." It is possible, indeed, that labour productivity in American shipbuilding is higher than in Europe, since wages are three or more times as high and American ship prices are not quite that; but that comparison is comforting nobody around Newport News.

Trends in Labour Productivity

The accompanying charts show the broad trends of industrial production in Britain and the United States since the war, and also some very approximate indications of output per head (derived by relating the production indices to indices of total employment in the industrial groups concerned). The trends indicated here, based on yearly averages, do not radically differ for the two economies—though the absolute American level is, of course, far higher.

The industrial engineering team understood this, if they do not say it explicitly. One of the functions in which they feel the United States is ahead is precisely in this economic assessment of the degree to which it will pay to mechanise a given operation.

> It is frequently ignored that it is not always economical to instal an expensive machine. . . . Again, what is an economic proposition in America is not necessarily so here; and would probably not be so in, say, India.

"Mechanise" is a fine slogan; in practice it is wiser to calculate whether in fact it would be economic.

Understandably, therefore, the team gives some weight to the argument they heard not only from trades unionists but within management—that the aggressive demand of American unions for higher wages, which make it worth while and indeed essential for American enterprise to invest in ever more labour-saving equipment, has replaced the traditional shortage of labour in the American economy as a spur to mechanisation.

The British team, indeed, is for higher wages as a similar spur to the British economy. It notes with approval that the rising levels of earnings since the war have markedly increased the cost of labour in Britain relative to machinery. One tentative conclusion it draws, indeed, may raise some questions both for the TUC, at present counselling continued moderation, and some of their business critics who are for casting restraint to the winds—except so far as wages are concerned:

> Britain has now become a country with high labour costs. This has not always been understood, and the reaction has sometimes been the wrong one; that is, an attempt to restrain wage increases without giving sufficient thought to the need to increase the efficiency of labour because of high wage costs.

It is fair to say that the postwar policy of attempting to control inflation—not very successfully—deserves less

cursory treatment than that; and there are certainly limits to the extent to which a country dependent upon a competitive world market can seek higher industrial efficiency simply by letting labour become too costly to waste, unless its competitors are engaged in the same happy process of pulling themselves up by their own bootstraps. At the same time, if the relation between high labour productivity and a high ratio of labour costs to machine costs is accepted, some such arguments follow automatically, presuming that higher labour productivity is still considered worth aiming at. And this industrial team, again rightly, would not be prepared to accept the arguments put forward by some economists that some given level of wages, and the given level of labour productivity that it will therefore be profitable to accept, are in some way "natural" to an economy.

★

It has, indeed, been asked by some who have quite reasonably put down disparities between labour productivity in America and Britain as a consequence—to some considerable extent, though not wholly—of the relative costs of labour and machinery in the two economies, whether British industry really then has to worry so much? Does it need to invest so much in extra equipment, power at the worker's elbow, higher output per head, if it can manage without too much difficulty to undercut American costs in a neutral market—and even, on occasion, in America itself? The answer, of course, is that it certainly does. For one thing, the average American income still buys about 70 per cent more material satisfactions than the average British. What is far more significant, and is indeed becoming the main thing about which any country now needs to worry, is the rate of growth. It does not need any strained scrutiny of the graphs to be clear that efficiency in German industry has been increasing more quickly than in Britain; and indeed, it is only in the postwar period that the rate of growth in American output has been roughly matched in this country. The United States, too, is just entering upon an era of automatic control in industry that may bring about a new leap in the total efficiency of its economy. The rate of growth in the economies of Britain's western competitors still, in the long run, looks greater than here, and new competitors are coming in; and it is pertinent to bear in mind that even those competitors do not compare with the apparent rate of growth in the Soviet economy. The going, in more ways than one, is getting harder; and there will be more mouths to feed by fewer muscles in 20 years' time.

No comfortable escape for ostriches, therefore, offers itself from closer study of the productivity about which British industry has been exhorted so continuously and on the whole so rightly since the war. The whole ferment of worried discussion about British efficiency and the improvement of British management, which still continues and with good reason, may have seemed somewhat wasteful of words; but on balance it continues to pay dividends, like the interminable conferences that wreathe every decision in an American company. Another fruitful worry has developed about the amount and application of research. The Anglo-American Council on Productivity and the British Productivity Council that has succeeded it have been throughout at the centre of the ferment; and the imaginative device of Anglo-American comparison, based on the team visits and reports, has done more to lodge it in the minds of British industry than any other single idea. The significance of the visits, of course, goes beyond their immediate publicity value and the immediate action that many of the reports have produced. They jolted the set ideas of a wide range of managers in British industry; and they subjected a useful sample of fairly young and energetic people inside industry, men who are going to matter more, to that shocking and creative impact that the American scene makes on any visitor, and for which no amount of reading or study from afar can even begin to prepare the stranger.

★

Whatever one may guess as the pre-requisites of growth in any economy, it is not much more easy to be confident now than it was five years ago that Britain possesses enough of them. Monopoly is not yet more than a mildly rude word to anyone here. In the United States bigness may be the rule, but competitiveness remains a principle from which no one dare contract out, and a principle that genuinely influences practice. In Britain, cartels are still nearly as respectable as combines, and really aggressive competition is still quite widely regarded as rather vulgar, suitable for cut-price sweetshops.

Some of the social elements that accompany growth in the American economy, perhaps, are appearing in Britain as an incidental development of the Welfare State. A new lower middle-class of high wage earners and salaried people, more akin to the typical American mass consumer than any other group in Britain, is crystallising out, without the privileges to lose by accepting mass standards that some of the older professional and middle classes probably still have and certainly believe they have. Britain is becoming, inevitably, more of a "non-stratified" society than it was. Other accompaniments of the welfare economy, apparent at all levels of society, are less promising. Industry and individual alike, in this country, are inclining to seek security rather than growth in their affairs, which may well mean getting neither. The British industrial economy remains, as before, a mixture containing elements of progress and of decay—both of which are good processes to have going on in an economy. It can be said of the great productivity debate that it has shifted the balance, at least of attention, towards these elements of change, and left rather fewer areas of industry in that comfortably ossified state where it is difficult to discern that there is any change going on at all.

Less Golden Fleece

THE break in wool prices is now a measurable, uncomfortable reality. The opening of the London auctions on Wednesday has roughly confirmed the extent of the fall in prices in Australia. The drop of up to 7½ per cent in merinos and the much smaller fall of up to 5 per cent in crossbreds compared with the close of the London July auctions means that prices of merinos both here and in Australia are 10 to 15 per cent down compared with the end of last season, while crossbred wools remain much firmer with a fall of only about 5 per cent. A modest decline had been expected at the opening sales; the actual fall, though no disaster, is much steeper than had been foreseen, nor is it clear that the limit has yet been reached. Current reports from Brisbane again mention "irregularity" and the total quantity of wool to be offered at auctions the world over next week will be again much higher.

For the sterling area as a whole the implications of a fall in wool prices of this order are important but not lamentable. The decline implies an inroad of a little over £30 million (sterling) into Australia's wool earnings, and of about £9 million into South Africa's. On present form New Zealand's wool cheque escapes almost unscathed for New Zealand produces nothing but crossbred wools; but the New Zealand auctions do not begin until the end of October. Doubtless the results will show themselves first in a favourable nudge for the United Kingdom's terms of trade, as will the drop of £8 to £68 million in Malaya's rubber earnings for the first half of 1954. Both are useful illustrations of the fact that all that glitters in Britain's own terms of trade is not gold to the sterling area as a whole.

To the buyers in the woollen trade the present fall in the market is both a warning and an opportunity. In London this week as in Australia these last two weeks Yorkshire has been using the opportunity and it is to be hoped noting the warning. Bradford has had things nearly all its own way though continental buyers have been present. When buyers come in to buy and get their requirements they tend to place the next order with a limit a few pence lower. In Australia, Bradford has been doing exactly that. In London, where smaller quantities are sold (the offering for the current two weeks is 47,570 bales) the market has not so far been quite so easy. But London normally develops a premium over Australia at this season because if orders for tops or yarn have been booked between the selling seasons, wool can be supplied at the mill from London much more quickly than from Australia. So far London reports no premium though a few buyers recorded that they had bid the same prices that they are currently bidding in Australia without getting all they hoped for.

There seems to be plenty of wool about. Moreover the consuming industry seems to be growing sharply more competitive. Hence the great relative strength of crossbred wools which are cheaper than merinos and of certain types of slipe (the wool taken from slaughtered sheep). It is the better crossbreds and slipe that can be used for top-making in competition with merinos that have been so firm. Hence the relatively sharp fall of 17½ per cent in South African wool, for South Africa produces only fine merinos, though the firmness of the London market for the few South African lots on offer suggests that that fall may have been overdone.

Bradford's hopes of having a much larger say than it has lately enjoyed in the wool markets have thus been fulfilled at the beginning of this season. A combination of coincidences has kept the other main buyers out. Russia is still not on speaking terms with Australia. Japan is desperately short of sterling. American industry can rely for some time yet on the Commodity Credit Corporation's holding (variously estimated at from 58 million to 61 million lb) of domestic wool and there is every indication that the American administration wants that wool sold, at cut prices if need be, before the price support policy changes its form next spring. Meanwhile on a falling market big Yorkshire firms have

DOMINION WOOL EARNINGS*
£ million sterling

1952/53	328	67	61
1953/54	316	75	65

* Excluding slipe for which an addition of up to 15 per cent might be appropriate
† New Zealand wool income was lower by roughly one third in 1950/51 than it should have been owing to the waterside strike; it benefited in the following year as delayed shipments were made.
Sources: Economic estimates based on Figures of Commonwealth Economic Committee. Daigety & Co. Committee of London Woolbrokers

bought a considerable quantity of wool. To some extent they have been feeling their way, following each successful bid by another at a lower price. To some extent wool purchases at these prices represent the certainty of profit, since they represent covering against sales of tops made at the higher prices recently ruling.

But Bradford has on occasion backed the market wrongly. The latest figures from the Wool Industry Bureau of Statistics raise the suspicion—no more—that Yorkshire is even now treading on ground less firm than it supposes. The British wool consumption figures for July — the only indication from any quarter of the trend in the wool textile industry since the end of the second quarter of this year—show a fall. British consumption of raw wool in July was 38.6 million lb, indicating an insignificant fall in the

daily rate of barely 3 per cent compared with June, but of about 7 per cent compared with July last year. The decline seems to have been almost wholly on the woollen spinning side of the industry. Top-making (the worsted side) has been scarcely affected. The wool textile industry has certainly not turned sick; most sections of it are still jogging comfortably along, but the change, where one exists, seems to be downwards. But July is a holiday month in which rates of consumption per working day can be misleading. Current trade reports are by no means wholly adverse.

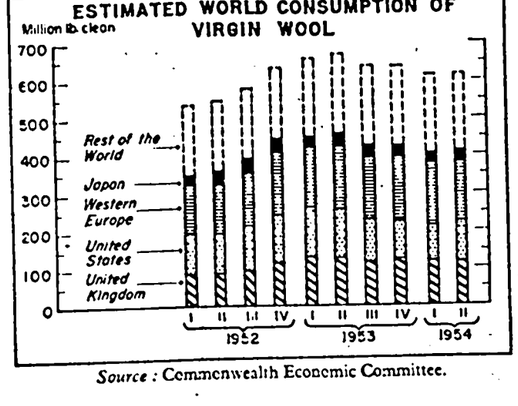
Source: Committee of London Woolbrokers modified.



The fall in the raw wool market has been fully accepted. Bradford top prices are down to parity with raw wool. London wool futures, too, have in the last week become a much more usable market than previously. The price has been closely in line with the Bradford 64s B tops, which are the basis of the contract and—what is most important to any intending operator—the backwardation has shrunk to a level at which forward transactions are not impossible. Between the current month and March, 1955, there was on Tuesday a difference of only 2¼d., compared with 6d. a month earlier. If ever there was a time when a hedge against the uncertainties of wool prices was justified, the present is one such, and on several days recently there have been signs of a useful increase in the volume of business in the futures market.

Wool now stands at the cross roads: the consumption is no longer increasing, but public spending power remains high. There are no burdensome surpluses. The whole of the huge surplus of 250 million lb in South America in 1952-3 has moved into consumption with the possible exception of a moderate quantity of carpet quality wool in Argentina. There are now no exceptional stocks outstanding except for the British strategic stock of 96 million lb and the holding of the Commodity Credit Corporation of United States domestic wool. Of the American strategic stock all but an insignificant quantity has been turned into cloth. The British stock will some day need to be rotated, but the Government has always used the best trade advice in its dealings. Russia, too, may again be an influence; the mere fact of the breach with Australia will not prevent Russia from acquiring wool when it is needed—be it through London or through an intermediary such as Poland.

The balance sheet for wool has no bankrupt look. Neither has it the look of an impending boom. A rise in trade stocks while order books were growing longer and the rate of output was growing was justified, but the trade will not wish to increase its stocks now. The indicated world clip plus the Commodity Credit Corporation's stock points to only a small surplus of little more than 100 million lb over current levels of consumption, but a small surplus when stocks are ample can have a marked effect. Next week may well decide the size of the fall. The offerings will be heavy for Perth, Sydney, Melbourne, South Africa and London will all be selling at the same time.

Business Notes

Activity in New Issues

It has not been a week of rising prices, but paradoxically the share market at present shows its best strength when it is not going up. This week the market has held steady in the face of some apathy by investors in the gilt-edged section and of some hustling out of speculators from the gold mines and the stores shares. When markets can pause without sliding away much and when a speculative position can be squeezed out at the end of an account without triggering off a widespread decline investors can feel both that a further advance is not ruled out and that when the time comes for a retreat it should be orderly.

Authorities responsible for the launching of important new issues have judged the market good enough to go straight ahead. Two projects were announced on Thursday. Imperial Tobacco Company announces Treasury consent to the issue of £20 million of unsecured loan stock. It will be a quoted stock and be offered to existing loan stockholders and preference and ordinary stockholders at £98½, with a closing date for applications of September 29th. Dealings will probably begin on October 4th. The stock is redeemable at par at latest on December 1, 1980, the company reserving the option to redeem at any time after December 1, 1975. It is likely that the present issue, like the previous issue of £20 million of 4 per cent unsecured loan stock 1960-70, now standing at about £99½, will enjoy a vigorous response from investors. It will be an attractive holding for the institutions. Including the two unquoted issues of £10 million each of 3 per cent and 3½ per cent 10-year Notes, Imperial Tobacco Company will thus have funded debt of no less than £60 million, and the bank overdrafts which stood last year at £26.9 million will be accordingly reduced. In effect, this bank debt is used by the company to finance the tobacco duty, and the effect of funding a further large slice of it seems to recognise that financing the tax gatherer is one of the company's permanent functions.

The other new issue is a small one of the trustee class. The East Africa High Commission announces an issue of £5 million 4 per cent stock 1973/6 at par. Only £4 million of the money will have to be found in London for £500,000 of the stock has already been placed in East Africa and a similar amount in this country. In comparison for example with the Ceylon 4 per cent 1973/5 also at about par, the stock seems fairly placed and the issue deserves success.

Spending and the Boom

With average earnings in industry up to just under £10 a week for men, and employment at its fullest ever, personal expenditure on consumers' goods and services appears to be at record levels. Preliminary figures for expenditure in the second quarter of the year—which cover about 60 per cent of the total—show that spending on food was at the highest level ever; on clothing and household goods, at record levels for the second quarter of any year; and on "housing"—rent, rates, water rates and repairs—another record. Expenditure on beer showed the usual seasonal rise, but was lower than a year ago. From these preliminary estimates, total personal expenditure on consumption seems likely to make a record for the second quarter.

Last week's manpower figures allow some analysis of the way that labour has been moving during the last twelve months, roughly the period of recovery after the recession first in textiles and later in some sections of engineering. There has been an increase in employment in manufacturing, offset to some extent by a decrease in employment in the basic industries, the Services, public administration, building, and transport. Distribution, as might be expected in a period of swelling home demand following the freeing of many goods from controls, has been increasing its labour force during the year. Within manufacturing, the metal-using trades have had the largest increase in manpower; the textile industries, where the labour force was rising in the second half of 1953, have again lost some labour this year. Unfilled vacancies in industry as a whole are once again far above the total number unemployed. Many companies are complaining that they cannot get enough skilled men, and some of them are short of unskilled men as well; but it is not clear that this is holding back output at all generally. A considerable amount of machinery has gone into British factories since 1951—and it is only in the last twelve months that it has begun to be fully utilised.

Hire Purchase Still Growing

August is a month in which hire purchase transactions normally tail off: people are on holiday; they have done much of their hire purchase buying from their homes in the first half of the year, and the figures do not normally recover until about February. But this year August was the first full month free from Board of Trade control, which was withdrawn in mid-July. The figures, compiled by HP Information, though they cover only part of the field in an incomplete way, suggest that much less than the usual seasonal slackening occurred in August, and hire purchase business was running far ahead of its level in August last year.

The significant fact seems not to be the modest seasonal fall in the number of new cars, motor cycles, and caravans sold on hire purchase but the high sales of second-hand cars and motor cycles in face of the normal seasonal trend. The removal of restrictions, apparently, has not yet stimulated sale of industrial machinery. Altogether HP Information (whose business does not cover such important parts of the field as domestic equipment and radio) reports a fall of about 4,000 transactions compared with the record July figure. The number of transactions reported in August was 54,000, compared with 58,000 in July and with 33,000 in August last year.

Guide to the Economy

The annual Blue Book on National Income and Expenditure is by far the most comprehensive and authoritative of the available statistical guides to the course of the British economy since the end of the war; yet its publication on Thursday evoked, as in previous years, only brief public comment. This is, of course, because the latest period to which it relates—the calendar year 1953—had already been broadly mapped by the official estimates given last April in the Economic Survey and in the Preliminary Estimates of National Income and Expenditure.* The new Blue Book, with its 88 pages of closely packed tables and memoranda, revises these estimates in the light of further information and opens out the picture by providing a wealth of detail—notably upon the share of different industries and categories of "income units" in the aggregates of production, consumption, investment and the rest. This year's revisions do not, except at one or two points, significantly alter the broad picture presented by the provisional estimates. The Blue Book is therefore of interest rather to the expert than to the general observer, and then mainly as a document of reference.

The revisions to the estimates of the broad aggregates that make up the national product and income have mostly been slightly upward, but as these revisions generally apply to earlier postwar years as well as to 1953, most of the movements shown from year to year are little changed. The gross national product for 1953 at factor cost (which excludes provision for indirect taxes and subsidies) is revised from £14,719 million to £14,796 million, showing an increase of 7.7 per cent over 1952 (against 7.85 per cent shown by the preliminary estimate). At constant 1948 prices the increase is put at 4¼ per cent. This considerable expansion in total output enabled the real value of consumer's expenditure to rise for the first time since 1950 despite the fact that Government expenditure, fixed investment and stock-building were also rising. Consumer spending rose from £8,844 million in 1952 to £9,352 million at factor cost; the increase in the real value of consumption is put at 4¼ per cent, raising real consumption to almost 1 per cent above that recorded in 1950, the previous peak year. Fixed capital formation at home rose by over 12 per cent in real terms, to £2,333 million at current prices; and there was a sizeable increase in stock-building. The value of the physical increase in stocks is now put (at current prices) at £50 million for 1952 and £201 million for 1953; earlier it had been estimated that stocks remained unchanged on balance in 1952 and rose by only £170 million in 1953.

* Discussed in *The Economist* of April 3rd.

Incomes and Savings

The estimates of personal incomes have also been revised upwards slightly for both 1952 and 1953; the figures for wages and salaries for 1953 are now given separately, and are put at £5,770 million and £2,900 million, respectively. But the estimates of incomes of professional persons and small traders other than farmers, and of receipts from rent, dividends and interest have now been revised downward for 1952. The upshot is that the estimated increase in total personal incomes between 1952 and 1953 is put at £820 million, or 6.4 per cent (at current prices) against the previous estimate of £765 million, or 6 per cent.

The Blue Book thus confirms that personal incomes rose by considerably more than consumer expenditure last year, and that there was accordingly a sizeable increase in the level of personal savings. This is the figure that is acknowledged to be perhaps the least reliable of all the estimates; it includes the depreciation provisions of farmers and small businesses and is calculated as a residual between the total of estimated personal incomes and expenditures. The estimates for all the postwar years have now been revised downward, and the effect is to present a slightly more even pattern. The estimates still show a steep increase in personal savings in 1952, and a further rise in 1953; but the expansion from 1948 to 1951 is now believed to have been fairly steady, whereas earlier estimates had suggested little change betwen 1948 and 1950. The estimates for 1952 and 1953 are revised down from £776 million to £706 million and from £928 million to £870 million respectively. Although these changes emphasise the unreliability of these particular estimates in detail, it is clear that a very considerable increase in personal savings has taken place in recent years.

Profits and Dividends

THE increase in profits and dividends of companies and corporations between 1952 and 1953, on the other hand, now appears more substantial than the provisional estimates showed. The increase in gross trading profits is put at £223 million (to £2,765 million), or nearly 9 per cent, while payments of dividends and interest are estimated to have risen from £839 million to £938 million, or by 12 per cent. This is the largest increase recorded in this item since the end of the war. After provision for taxation this left a total of £1,370 million for the finance of investment —£215 million more than in 1952. The rise in aggregate private savings has, of course, been accompanied by a further large fall in the savings of the central government, whose surplus on revenue account fell from £399 million to £218 million. For the second year in succession it was unnecessary to earmark a large part of estimated total savings to provide for stock appreciation. On the contrary, the fall in stock prices made an extra £75 million of finance available for investment. Stocks are now estimated to have depreciated by £50 million in 1952, whereas previously it had been estimated that the average prices of stocks were unchanged.

The table of "inter-industry" transactions, introduced last year to show the impact of the activities of different industries on one another, is repeated; and the analysis has been usefully extended by a new table showing the ways in which manufactured goods other than food, drink and tobacco products percolate through the economy. It is interesting to note that sales to final consumers account for little more than one-fifth of the total. Exports account for over a quarter, industrial and business uses for a little under a quarter, and fixed capital formation and current government uses for about one-eighth each.

High Demand for Steel

ONCE again, even with steel output back to record levels, there are signs of tightness in the supply of some steel products in the British economy. Output in August was at the rate of about 325,600 ingot tons a week, which is higher than in any previous August, though, as usual, affected by holidays in the industry. But demand for steel, with the continued boom, has increased more than anyone expected; the record-breaking motor industry is making it necessary to import sheet steel, and imports of plate are continuing. The industry is meanwhile exporting about 10 per cent more steel (though less sheet and plate), and could fairly easily export more of certain products if it were not for the rate of home demand. The trough of demand in the world market for steel was passed this spring, and Britain has now followed the European export cartel in raising some export prices. While the American steel industry is content to run at about 70 per cent of capacity without dumping steel abroad—and it shows no signs of changing its mind—demand overseas, as well as at home, has become brisk.

Imports of steel into Britain this year have been brought right down in volume—in July they were running at a rate one-seventh of the average in the scare year of 1952. The industry is not anxious to increase them again to any considerable extent, but would probably do so rather than limit its exports further. Its capacity is still growing, with new plant coming in for various products; and it still prefers to consider imports as a useful balancing factor in handling short-period fluctuations of demand.

Wool Credit Renewed

THE London acceptance credit to the French wool textile industry, which has been running uninterruptedly and successfully since 1947, is to be renewed for another twelve months to cover the wool season for 1954-55. This is a revolving credit that finances French purchases of sterling wool, mainly Australian. It is granted by Lazard Brothers and Co., as head of a syndicate comprising nearly thirty firms in the City, and is extended to a collective organisation, the Groupement d'Importation et de Répartition de la Laine. The credit for the coming twelve months will again be for an amount of £12,500,000, with provision for a temporary increase to £15 million during the peak of the wool buying season.

The measure of security behind the credit is strengthened by two special devices. The first is the earmarking of the foreign exchange proceeds of exports of French woollen manufactures; the second is the arrangement of forward exchange contracts in favour of Lazards to provide the sterling needed to meet the drafts as they mature. The bills drawn under the credit are normally for three months, and the total amount of trade financed as a result of these facilities has ranged between £30 million and £40 million a year in accordance with the regularity with which the credits have revolved and been used. The renewed credit runs from September 15th, and the first bills drawn under it should reach the London market in the very near future. These French wool bills have in recent years been a welcome addition to the still modest turnover of genuine commercial paper in the London discount market.

Comet Resurgent

THE Minister of Supply's statement about the commercial future of the Comet, made on the week-end before the opening of the Farnborough air show, was designed to perform the difficult task of laying to rest any doubt that might still remain about the success of the detailed investigations into the cause of the two Comet disasters over the Mediterranean early this year, and to do this without anticipating the evidence that will be given next month to the Court of Inquiry investigating the accidents. Mr Sandys made two points; his first was that the technical investigations had yielded "clear and positive" results. The infinite thoroughness with which the investigation was conducted, and the volume of resources concentrated upon it has never left this issue in much doubt. The second point

in the Minister's statement amounted to an assurance that with some stiffening of the structure, the aircraft would be able to go back into production and into service without major modification. This is the information for which the industry and the airlines have been waiting, for it affects not only the Comet, but all jet airliners of which there are a number under development.

The broad lesson of the investigations has been that, while the Comet was structurally a sound and sturdy aircraft judged by current standards, the flying conditions under which it was operated were more severe than had been supposed. The concept of "fatigue," a condition created in structural materials by individually insignificant pressure changes persisting over long periods, is a relatively novel one, and the existence of circumstances likely to set up these conditions is not—in the present state of knowledge—always easy to recognise. Now the Comet fuselage will be strengthened, and such disasters will not recur again. The aircraft industry as a whole should, however, now be asking itself whether in view of the Comet findings it might not be desirable when a new airliner goes into service, to build up the flying hours on a prototype—or their equivalent in terms of ground tests—in such a way that the prototype has a comfortable margin in hand over the airliners flying on regular services. This is not an easy target, since nothing builds up flying hours like civil operations. It is a costly process, too, when airliners cost from £500,000 to £1 million; but in this case it might have been a cheap price to pay for experience that in the event has been earned at such bitter cost.

Rhodesian Copper Profits

ONE of the two main groups of copper companies working the Rhodesian copper belt has published its preliminary figures for the year ended June 30th, the Selection Trust group—consisting of Roan Antelope and Mufulira, an unquoted company two-thirds of whose capital is held indirectly by the public through Rhodesian Selection Trust—comes through the difficult transition period with flying colours. Transition to free markets left the companies with a double task—to absorb any reduction in the free market price of copper as compared with the price previously paid by the Ministry of Materials and to refill the supply pipe line to consumers and to the market in London, using supplies that would otherwise have been available for sale.

Both tasks have been accomplished. Sales were restricted at the end of last year, while the pipe line was refilled so that for the whole year Roan sold about 3,500 tons less than its output and Mufulira nearly 4,000 tons less. But production was rising so that Roan's sales were only a little below those of 1952-53 and Mufulira's actually higher. Copper prices in the free market were lower, but by much less than had been feared, so that profits turned out reasonably well. Investors must remember that the present figures make the fourth of the year's quarterly reports. Profit and dividend statements still lie some way ahead and may differ from the figures in the accompanying table, chiefly because the allocation for replacements—always a big item—has not been decided. This year each company has made a provisional provision of £1 million. That figure may not stand, but shareholders are entitled to assume that the provision will at least be less than the £3 million charged by each company last year and then described as "exceptionally high." If there is no revision at all the profits, after providing for replacement, earned by Roan Antelope will be £8.1 million, a fall of only £1.3 million, and those of Mufulira will actually be over £1 million higher at £8.7 million.

SALES AND PROFITS
(£'000s)

Years to June 30	Roan Antelope		Mufulira	
	1953	1954	1953	1954
Copper sales (long tons)	87,307	84,467	72,981	84,467
Sales revenue	21,706	19,480	18,188	19,409
Operating and administrative costs	9,684	11,151	8,131	10,165

Replacement provision, etc.	3,000	761†	3,000	841†

* After allowing for difference in value of stocks.
† The replacement provision is calculated at £1,000,000, but this provision is subject to revision.

Preference for British Steel

THE recent study by Sir Donald MacDougall and Miss R. Hutt of the actual amount of imperial preference obtained on British exports* had much more than academic interest for the British steel industry. Well over half of all British steel exports go to the Commonwealth, and the industry obtains preferences of one type or another on about half of them. The importance of that preference has naturally been under consideration in the industry during discussions over British association with the European Coal-

BRITISH STEEL EXPORTS, 1953

Steel Community, and during the period of rather sharp price competition in the world steel market that seems for the present to have abated. Although the rejection of the European Defence Community has naturally put the whole future of Schumania, and Britain's relations with it, back into the melting-pot of discussion, formal negotiations are still supposed to start this autumn.

The British Iron and Steel Federation, accordingly, has carried out for the country's exports of steel a study similar to the wider one; and its conclusions coincide almost exactly with those of Sir Donald MacDougall and Miss Hutt for British exports in general. As the table shows, some 53 per cent of the steel that goes to Commonwealth countries obtains imperial preference, 12 per cent of it through preferences on a "specific"—£ per ton—basis, and 41 per cent on an *ad valorem* basis. On the total tonnage that it sends to the Commonwealth, the average margin of preference granted is roughly 6 per cent. The chief factor that has tended to reduce this margin since the late thirties is the rising prices of steel products; and international agreements such as GATT have precluded any reversal of this process of narrowing.

Sugar Agreement Difficulties

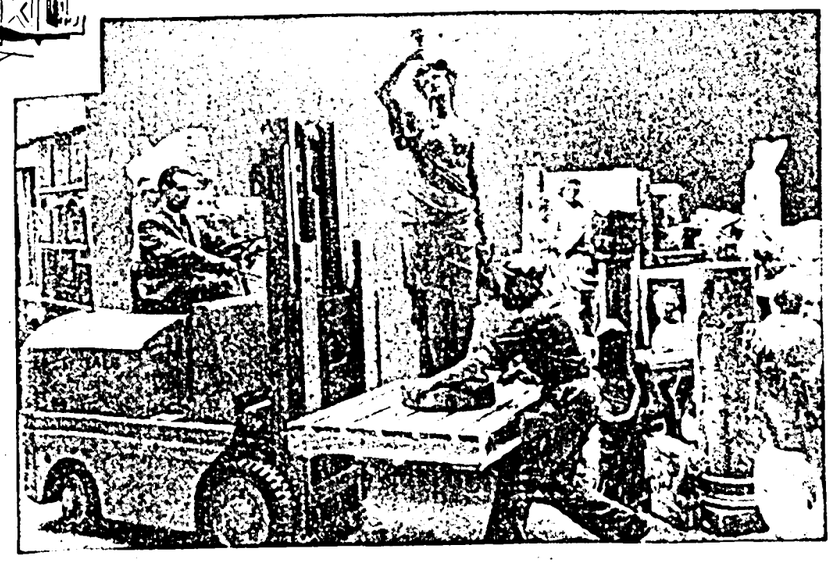
THE International Sugar Council, acting as physician to the International Sugar Agreement, has been struggling in London this week to save the life of that anæmic baby. As *The Economist* goes to press the bulletin has still to be signed. Diagnosis is not difficult: there is a surplus of sugar and an inadequate power to restrict the supply. Currently the world market price is down to around 3.20 cents per lb and is therefore below the minimum of 3.25 cents prescribed in the Agreement. Indeed the price has recently been as low as 3.05 cents. Yet there are no further powers of restriction. The Council has already cut exports of the big exporters down to 80 per cent of basic tonnages, which is as far as the agreement allows it to go. It has also suggested a voluntary cut down to 75 per cent.

Cure is much more difficult. As the Council's powers now stand, it has to rely on voluntary actions by its members for any further curtailment. The voluntary surrender of some quota has been mooted and Haiti is believed to be able to do that, but when quota is surrendered voluntarily there must always be suspicion that it would never have been used. The segregation of 350,000 tons by Cuba from what would have been exportable is a genuine contribution. And there are the usual hopes of persuading the importing countries to take more imports and draw less upon stock. Time may also be a good physician. Next season's crop should be smaller than the last. Cuba should produce less; the European beet crop may be over a million tons below last year's high figure, and the heavy British stock of Cuban sugar bought to cover the period of the withdrawal of rationing is moving off into exports of refined sugar at a reasonable rate.

Those facts, coupled with a firm intention by the Council to deal severely with next season's smaller crop, seem the best immediate hope. But it remains a question whether a surgical operation will not in the end be necessary. The weakness of any international agreement which imposes on its managers an artificial limit to the extent to which they can impose restriction is likely to be shown up sooner or later. With sugar the weakness has been shown up soon. But to get the limits to restriction removed—to get the powers of the Sugar Council increased—requires action by the governments concerned.

Still Cheaper Polythene

THE plastic polythene is now being produced at a lower price and in greater quantity than ever before. Last week ICI, the sole producers of polythene in Britain, chopped 3d. off its price, which now stands at 3s. 2d. a pound. This is the second cut this year; in May the price was reduced from 3s. 9d. to 3s. 5d. a pound. Between March, 1939, when ICI first put polythene on the market, and 1951, its price dropped steadily from 5s. to 3s. 3d. a pound. But the Korean War more than doubled the price of industrial alcohol, the principal source of the ethylene used to manufacture polythene, and polythene prices jumped to 4s. 3d. a pound. Since then ICI has been able to draw its ethylene from the oil-cracking plant at Wilton, a much cheaper source. Cost reduction has also been helped by greatly improved productivity; reactor throughput is now nearly thirty times as large as in the early days of commercial manufacture.



For a long time supplies of polythene were meagre, and even now that output has attained the rate of 20,000 tons a year the plastic is by no means easy to get. The production of polythene by the polymerisation of ethylene at very high pressures and controlled temperatures poses a complex problem in plant engineering; because this equipment is expensive and of little use, as yet, to make any other commercially useful product, increases in capacity have tended to follow rather than jump ahead of demand. Even so, when the new polythene plant at Wilton runs into full production next year, annual output in this country will amount to about 35,000 tons, and plans are already under way for a total capacity of 55,000 tons by early 1957.

This plastic is so versatile a material that ICI has little fear that this increased capacity will not be used. About a third of current output goes into the electric cable industry, where polythene is valued as a highly effective insulation material. Coated with a protective sheath of PVC, polythene cables are used for almost all submarine cables now being laid as well as for surface and other cables. Polythene film and moulded products, which together account for about 40 per cent of total output, are the fields where the biggest developments are expected. With longer runs and cheaper material costs, prices have fallen by about a fifth in the last four years; and diverse applications, from food packages to household and industrial piping, have already been used with success. As a textile, polythene yarn, marketed by Courtaulds under the trade name "Courlene," has been making small but steady progress. It has been used mainly as an interlining for semi-stiff collars and for protective industrial clothing. The latest cut in polythene prices will stimulate processors to continue their own cost reduction; already a few pence have been knocked off the price of "Courlene."

Whether you unload giant cargo ships

...or move priceless works of art

YALE MATERIALS HANDLING EQUIPMENT WILL DO IT FASTER, SAFER, FOR LESS COST

The YALE Industrial Truck is essential where rapidity, safety and economy are needed to solve any handling problems.
In ports where heavy cargo ships are loaded and unloaded, or in the Louvre Museum where priceless and fragile art treasures are stored, YALE Materials Handling Equipment will do the job faster, safer and for less cost.

'INSULIGHT' lightens labour

"INSULIGHT" Hollow Glass Blocks transmit light to the dark heart of a building or a room, diffusing it over wide areas in places where ordinary glazing would be undesirable. They cut the roar of traffic to a subdued murmur. They hold warmth in and cold out. They keep private places private. In fact "INSULIGHT" Hollow Glass Blocks do the work of walls—but walls of light.

'INSULIGHT' HOLLOW GLASS BLOCKS

PILKINGTON BROTHERS LIMITED

FOR FURTHER INFORMATION ON THE USE OF GLASS IN BUILDING CONSULT THE TECHNICAL SALES AND SERVICE DEPT., ST. HELENS, LANCS. (ST. HELENS 4001) OR SELWYN HOUSE, CLEVELAND ROW, ST. JAMES'S, LONDON, S.W.1 (WHITEHALL 5672-6). SUPPLIES ARE AVAILABLE THROUGH THE USUAL TRADE CHANNELS. "INSULIGHT" is a registered trade mark of Pilkington Brothers Limited. HGB. 14.

Danish Payments Crisis

THE Danish Parliament has been recalled from its summer adjournment this week to discuss the government's proposals for meeting the crisis in the balance of payments that has been brewing for some months and has now come dramatically to a head. The reserves of foreign exchange of the National Bank have been falling continuously since October, and by June had already dropped below the bank's short-term foreign liabilities. Denmark's imports exceeded exports by Kr. 875 million in the first seven months of this year, whereas in the corresponding period of 1953 the visible deficit was only Kr. 485 million. This widening trade gap has arisen from the fact that Denmark's export income has risen only slowly (due partly to low prices and partly to lack of adequate outlets for Danish bacon) at a time when there has been an exceptionally large increase in imports, resulting in part from an expansion in agricultural production. Even as long ago as last October the cushion of reserves was inadequate to take the impact of temporary variations in the balance of payments (the "net" reserves of the National Bank stood even then at only Kr.360 million, or roughly £18½ million). This weakness provoked some speculative purchases, which have been further increased on account of the bad harvest.

The crisis is to a large extent attributable to the increase in consumption induced by the tax reliefs and wage increases that came into effect in the spring of 1953. The authorities have recognised this underlying malaise, and are applying disinflationary correctives—a sharp increase in interest rates (the bank rate was raised from 4½ to 5½ per cent in June), a cut in expenditure on public works, increases in direct and indirect taxation, and an attempt to encourage savings through special tax concessions. So far, it is heartening to note, no attempt has been made to meet the external difficulties by imposing new quantitative restrictions on imports. The government is anxious to demonstrate that the crisis is purely temporary and does not deflect it from its aim of following any general European move to convertibility.

Denmark's difficulties have put additional bargaining power into the hands of countries such as Britain that buy Danish produce through bulk contracts. The British Government has recently refused to increase the relatively low price it pays for Danish bacon; and its sales on the home market thus continue to yield substantial profits —from which it subsidises the considerably more costly domestic produce.

Free Scrip from "Three Banks"

THREE more banks—and two of them clearing banks—are taking steps to rearrange their capital resources so as to increase the ratio of paid-up capital to commitments. These are the members of the "Three Banks" group, headed by the Royal Bank of Scotland. As already intimated, the Royal Bank proposes to increase its capital stock to £5,950,000 by a two-in-five free scrip issue to existing stockholders of £1,700,000 of fully-paid stock. It is now announced that the resultant draft upon the published reserve fund, now standing at £4,877,216, will be more than made good by a transfer to that fund of £1,872,784, so that the total published capital resources will be raised from £9,127,216 to £11 million. The dividend for the year 1952-53 was raised from 17 to 18 per cent by an increase in the final payment, and this year's interim has been maintained at the increased average rate of 9 per cent.

The Royal's two subsidiary banks, Williams Deacon's and Glyn Mills, are likewise making free scrip issues (to the parent bank) and are simultaneously raising the amounts of their disclosed reserves. Williams Deacon's will issue £400,000 of "B" shares, raising the total paid-up capital to £2,275,000, and will draw £675,000 from inner reserves, so that published reserve will be raised on balance by £275,000 to £2,275,000. Glyn Mills will issue £140,000 and will on balance raise its published reserve by the same amount, so that capital and reserve will remain equal at the higher level of £1,200,000 each.

New Money for Loraine

THROGMORTON STREET should have whistled "Sweet Lorraine" last week end. The news that the Anglo American Corporation was pumping new money into Loraine Gold Mines in return for a 20s. option on 2,750,000 of its shares sent the prices of the OFS developers up and sent the price of the 10s. shares of Loraine flying up from 15s. 10½d. to 19s. 3d. When Anglo American sets ups a 20s. target most investors in Kaffirs aim at it, just as they peppered the 80s. target for OFSIT a fortnight ago.

The details of the scheme follow the usual complicated pattern of short term money on loan for development and the replacing of these loans by equities as production draws near. The sequence is as follows:

(1) Anglo American and its associates will subscribe for 4,953,372 of Loraine's shares at 20s. each. The proceeds of the issue will pay off the £4,953,372 of 6 per cent notes now held by Anglo American and its associates.

(2) Until January 31, 1955, Loraine will be able to borrow up to £4½ million on loan at 6 per cent from Anglo American. On that date the options to buy 5,500,000 shares in Loraine at 12s. 6d. each will expire. Anglo American will subscribe for any shares not taken up by option holders.

(3) After that date the loan facilities available to Loraine will be reduced to £2½ million.

(4) In return for its further participation Anglo American will be given the option to subscribe at any time up to December 31, 1957, for 2,750,000 shares in Loraine at 20s. each; the loan facilities of £2½ million will be reduced by the amount so subscribed for shares.

So far, £8½ million—£3 million on equity stock and £5½ million on unsecured loan—has gone into the development of Loraine. Under the new arrangements another £6 million will be provided. At the end of all these operations in 1957 Loraine should have just over £14 million of equity stock and only about £550,000 outstanding on unsecured loan. As the average cost of bringing an OFS mine to full production is about £13 million, the new money should see Loraine into full production with comfort. Development

so far has proceeded satisfactorily as there has been no serious faulting and not too much water to hamper operations. Production is expected to begin next March and after that it is hoped that the milling rate will be raised to 100,000 tons a month as quickly as possible. Gold is not the only lure, for there is a good chance that Loraine will join the list of uranium producers.

At Long Last

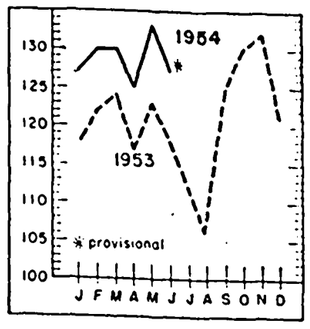
After years of frustration it is appropriate that United Dominions Trust, whose last issue of new capital was in 1946 when its total assets stood at about £8 million, is the first to slip through the gap recently chopped in the fence around new issues by hire purchase finance companies. UDT includes hire purchase finance among its credit facilities. The ban on these issues did not prevent its growth, for there were many private lenders ready to put money—money which could be withdrawn at short notice—into the profitable business of financing hire purchase contracts. By the end of last March, UDT's assets had risen to over £34 million and "amounts receivable under customers' agreements" totalled nearly £15½ million. Whether in saying "yes" at last Lord Kennet is not signing the death warrant of the Capital Issues Committee, of which he is chairman, is an open question. That Committee's functions are now reduced to a single one—the duty to say "no" to free scrip distributions with reserves resulting from a revaluation of assets.

The Trust's issue takes the form of a "rights" offer to ordinary shareholders of 500,000 £1 ordinary shares at 90s. in the ratio of one new share for every £2 of stock held. Just before this announcement the stock units rose 10s. to 163s. 9d. and on this basis the "rights" are worth 24s. 7d. The directors hope that all being well they will be able at least to maintain the current dividend of 25 per cent on the new capital. The shares have jumped further this week, to 170s., having touched 175s. at one moment.

The cash issue is to be followed—if the Treasury permits—by a capitalisation of £2,500,000 from reserves; there seems now less reason than ever for the Treasury to refuse. From the capitalised reserves the directors intend to make two free scrip issues, though not necessarily at the same time, to ordinary shareholders. Shareholders will be given 1 million fully paid 4½ per cent cumulative preference shares and 1½ million fully paid ordinary shares. They are thus given a true bonus in the shape of the preference shares and what to them must seem a virtual promise that the trust will break with its cautious dividend policy. The need to plough back profits to finance the growth of the business now looks less imperative.

Exports and Quality

Two years ago the British Import Union in Denmark gathered together some of the reactions of Danish customers to the products they were importing from Britain, and its report, containing a variety of complaints, caused some concern in Britain. Although Denmark has a small population it has always been an important market for British goods. There has been much closer attention to Danish needs by British firms since then, according to another survey carried out this year by the Union at the request of the Federation of British Industries. But there are still many complaints.



The most common complaints from Denmark, according to this survey, are that:

Apart from top-quality goods calling for traditional British craftsmanship, British prices are seldom competitive;
The quality of cheap mass-produced goods is inferior to that of competitors;
British delivery delays are frequently longer than their competitors, though delivery promises are being better fulfilled;
Some British makers seem reluctant to adapt their products to local market conditions and requirements;
Services before and after delivery are often unsatisfactory;
Packing costs are sometimes much higher than those of continental exporters.

One redeeming feature is that British terms of payment appear to give much more satisfaction now. On the whole, the engineering and chemicals come in for considerably less criticism than textiles. In the last four years the British share of the Danish market has been declining—if the heavy imports of fuel oil, in place of dollar fuel, are excluded. Complaints of bad delivery and inadequate service are too frequently heard—and not only from Denmark—for any exporter to be able to ignore them. But the remarks about quality, in many products other than those of high craftsmanship (electrical goods being specifically excluded as "irreproachable") may jolt one of the most cherished preconceptions of many British people.

Flag Restrictions on Shipping

The shipping lobby in Congress has recently succeeded in having written into the permanent legislation of the United States the principle that 50 per cent of all cargoes moved with the aid of Government funds should be restricted to ships flying the American flag. The President has signed legislation that will considerably extend the

"Yes, my dear. Tomorrow night by TCA *Super* Constellation, the way I always go now."

TCA *Super* Constellations have brought quite a new note of comfort and convenience to air travel between Britain and Canada. These giant air liners are unusually luxurious, wonderfully restful, and you can travel either First Class or Tourist on the same aircraft. They provide the most frequent service from London and Glasgow overnight to Montreal and Toronto.

Awaiting you are TCA connections that same day across all Canada, and to the major U.S. cities. Be careful to tell your Travel Agent that you wish to go by TCA, the only air line providing *Super* Constellation travel between Britain and Canada. It really will make a world of difference to your trip.

FIRST CLASS
Fully-reclining Siesta Seats, Club Lounge for your exclusive use, superb cuisine, fine wines, attentive staff.
*RETURN FARES**
London to Montreal £248.5.0.
Glasgow to Montreal £235.19.0.

TOURIST
Spacious cabins, specially-designed seats, wide windows, complimentary meals, magnificent service and splendid comfort.
*RETURN FARES**
London to Montreal £183.5.0.
Glasgow to Montreal £172.6.0.

**Approved IATA on-season Fares*

FLEXIBLE FLAMES

Some industries need a flame 20 feet long, others a mere pencil point of heat. Gas provides both and every gradation in between—a complete heat service for industry, clean, constant and infinitely controllable. The adaptability of gas is a virtue which can reward the user with lower production costs. However you put it to use, you pay only one bill for your gas. You do not have to budget for storage costs or space nor, unless your needs are exceptional, for special handling equipment and the concomitant labour. If yours is one of the 4,000 industrial processes already served by gas, you may find ideas for increasing efficiency in the latest advances in gas technology; if it is not, it could become the 4,001st. Either way the Gas Industry welcomes your inquiries.

Firm Facts

Questions about your own firm's gas usage can be answered by your Area Gas Board. The free advice and help given by the Boards' Industrial Gas Engineers are backed by full resources of the Gas Industry through the Gas Council's Industrial Gas Development Committee. The first step is to have this coupon filled in **and sent to your Area Gas Board or to the Gas Council, 1, Grosvenor Place, London, S.W.1.**

application of the "fifty-fifty" principle which has hitherto applied to Marshall Aid, Mutual Security Act and similar Government-sponsored shipments, although not without indicating that he may wish to recommend changes. That principle had been reluctantly accepted by the foreign shipowners discriminated against only as a condition of a "gift"; but the new legislation is bound to give rise to much stronger, and possibly official, protests, and both the State Department and the Defence Department have recorded objections to the statute.

Hitherto the principle has been incorporated individually in "aid statutes"; now it is to be universally applied, and cargoes carried in Government-owned ships, such as those of the Military Sea Transportation Service, are not to count towards the American 50 per cent. Further it is to apply to all cargoes financed directly or indirectly with Government funds, apparently even to the sale of surplus farm commodities abroad for local currencies whose convertibility is guaranteed by the Government, as well as to foreign aid cargoes purchased offshore. The immediate effect, in practice, may not be very considerable; but this new American move will do little to help the State Department in its efforts to prevent the spread of similar discriminatory actions on the part of other nations, such as Chile and Saudi Arabia, which can do immense harm to American shipowners as well as those who believe in the conduct of international shipping on a commercial and non-discriminatory basis.

SHORTER NOTE

Monsanto Chemicals (the British company) supports its unchanged interim dividend of 6¾ per cent with the announcement of a sharply increased profit. Subject to audit, net sales for the six months ended June 30th amounted to £6.1 million, compared with £5.2 million in the corresponding half of 1953. Income before tax for the period shows a rise from £488,886 to £887,742, and after tax was £479,545, against £223,665.

Company Notes

JOHN BROWN. The consolidated profit and loss account of John Brown and Company, whose interests range beyond shipbuilding into heavy engineering and machine tools, is an unexciting document. Trading profits show little change for the year to March 31st at £2.2 million and though net profits are slightly up the ordinary tax free dividend has been left unchanged at 7½ per cent. "Satisfactory" and "successful," are the words that the chairman, Lord Aberconway uses to describe the results of the company's subsidiary and associated companies.

The consolidated balance sheet, however has been turned almost inside out following the change in the constitution of the company at the beginning of the financial year. The parent concern's manufacturing and trading interests were then transferred to a new wholly-owned subsidiary, John Brown and Company (Clydebank), so that it became purely a holding company. Largely as a result of this transfer the capital reserves of the holding company have increased from £1,487,759 to £4,292,227 and those of the group as a whole from £1,827,838 to £4,575,015. Part of this increase, amounting to £1,730,000, represents the excess of the transfer value of the assets and business taken over by John Brown (Clydebank) over their original book value. Most of the remainder represents the excess of the sums so far received from the company's colliery properties and investments over the very conservative book values at which these assets stood on vesting day. Since the end of the financial year the company has received another £400,000 from this source, leaving "relatively little" still in that particular kitty. Exactly £500,000 of the capital reserve has been allocated as a specific reserve against the value of unquoted trade investments of £915,000. The chairman explains that these investments are in enterprises in early stages of development; the creation of a specific reserve is thus a matter of business prudence. If these enterprises prove themselves, it is to be hoped that the claims of shareholders will not be forgotten.

£1 ordinary stock at 41s. 0d. yields £7 2s. per cent.
• Tax free.

Another change in the consolidated balance sheet is the increase in the gross book value of stocks and work in progress from £15,277,142 to £16,453,590. As is usual with shipbuilding companies, John Brown has received part-payment in advance of delivery and these instalments have limited the increase in the net book value of stocks, which have risen from £5,670,972 to £6,058,185. Even so over £1,000,000 of British Government securities was realised to finance the growth in working capital.

This growth is the direct corollary of "well-filled" order books. Shipowners will welcome Lord Aberconway's warning that this "satisfactory state of affairs" particularly in respect of exports cannot continue unless costs are stabilised. He adds that costs are still rising.

★

MUREX. As a metallurgical company, manufacturing carbon-free metals and alloys, Murex is exposed to the danger of rapidly altering prices for its raw materials and of strong competition in overseas markets. When prices are rising, as they were between 1950 and 1952, the company made substantial profits on stocks; though these profits were taxed as if they were true profits, the company was able to set aside £500,000 in a stock contingency reserve. This reserve has been useful; falling prices have brought the inevitable sequel of losses on stocks. In 1952-53 the company lost about £120,000 on its stocks of wolfram, copper and other raw materials and this loss was covered by a transfer out of the contingency reserve. In the latest year, to April 30th last, further losses of about £50,000 were made on wolfram and copper stocks which required a further transfer. The directors do not believe that "any further substantial calls" will be made on the stock reserve for wolfram and copper, but they

do anticipate losses on the stocks of columbite. The fall in prices partly explains why the book value of stocks fell from £3.7 million to £2.9 million, but the decline seems to owe something also to deliberate policy; the directors were content at least "temporarily" to allow stocks to fall below their normal levels.

Throughout the last financial year, deliveries to customers in volume were only slightly below those of 1952-53, but thanks to the decline in prices, the value of sales fell by about 8 per cent, from £12,430,000 to £11,460,000. Profit margins were narrower and there was some decline in the demand for the company's more remunerative products. Hence, trading profits, ignoring the fortuitous element of stock losses, fell from £1,140,000 to £975,000; the ordinary dividend was left unchanged at 15 per cent. Profits may fall again in the current year. Wages have gone up; although exports increased in 1953-54 most of them are described by the chairman as "of an opportunist character and are unlikely to be repeated in the current year"; and while the general level of business remains satisfactory "price competition in some products continues to be severe and selling prices are, on occasion, below economic levels."

★

TRIPLEX SAFETY GLASS. Increases in the production of passenger and commercial vehicles in this country, increases in the export of vehicles and the growth in the requirements of the aircraft industry for toughened glass all contributed to the rise in the sales of Triplex Safety Glass in the year to June 30th. With the growth in sales, selling prices have been kept down, and some further reductions have recently been made. Trading profits have risen from £451,411 to £542,892; the only dark spot is the small loss made by the engineering subsidiary, Stern and Bell. The company has been content to operate with a lower level of stocks, but the increase in debtors (from £639,671 to £719,604) points conclusively to the increase in sales. These results have been achieved in a year in which the company introduced an important change in its principal product, designed to increase the size of particles into which a windscreen will shatter on impact.

Taxation made its call on profits but net earnings rose from £147,117 to £169,854 and the ordinary dividend was increased from 15 to 20 per cent. In deciding upon that increase the directors naturally made it more likely that holders of the 15 per cent preference stock will exercise the rights which will soon become due to convert their stock into ordinary shares. This option which first becomes operative in October seems attractive on the basis of current prices of 30s. for the preference and 33s. for the ordinary.

LONDON STOCK EXCHANGE

Next Account begins: September 22nd
Next Contango Day: September 22nd
Next Settlement Day: September 14th

On Monday of this week more bargains were marked than at any time since January 30, 1947. Selling of equities was appreciably heavier, but it was well absorbed and the *Financial Times* ordinary share index lost only 0.6 of a point to 171.1; at the end of the first day of the new account it had crept back to 171.4, but Kaffirs and store shares were dull on that day mainly because of cash selling by recent buyers who were unable to arrange "carry-over" facilities. The gilt-edged market remained very quiet and small losses were scattered through the list after some routine selling had taken place. In the foreign market the news from the Far East led to losses in Chinese and Japanese issues; German issues were dull at first in spite of further Swiss buying but began to pick up again later.

In the industrial market, store shares again stole the limelight, but this time it was because their prices were falling in contrast to their recent advance. Selling was reported to have been heavy and prices were marked down sharply. On the first day of the new account a few of the stocks, notably Woolworth, attracted buyers again and their prices moved up against the general trend. The opening of the Farnborough air show brought in buyers for most of the leading aircraft shares, and in their advance they took some of the motor shares with them. The shares of de Havilland, after enjoying a good rise, lost 1s. to 27s. on Wednesday on the news that Air France was claiming compensation for the grounding of its Comets. Engineering shares provided a few good features, notably Platt Brothers which gained 3s. 9d. to 36s. 9d. following the announcement of the dividend and free scrip issue. Small losses were common in the oil market. A good turnover in tea shares was again reported at rising prices. Losses occurred in the Kaffir market when profits were taken, but prices turned a little firmer when the market opened on Thursday. Copper shares remained firm on the Rhodesian Selection Trust reports.
