(1) Petroleum production in Canada in 1938 includes natural gasoline. 1938 figure of electricity production in Australia was for 12 months ended June 30th; figures for New Zealand represent about 87 per cent of total generation. (2) Copper and tin refer to metal production. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ended June 30th. (5) Average for first quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended September 4th there was an "above-line" deficit (after allowing for Sinking Funds) of £20,910,000 compared with a surplus of £15,622,000 in the previous week and a deficit of £23,950,000 in the corresponding period of last year. This raised the cumulative deficit to £129,678,000 (£207,562,000 in 1953-54). Net expenditure "below-line" absorbed £17,299,000 bringing the total cumulative deficit to £301,946,000 (£409,149,000 in 1953-54).

THE MONEY MARKET

CREDIT remained generally short in Lombard Street in the week covered by the Bank return. Some official help, granted indirectly through the banks, was necessary on Thursday of last week, despite the payment of some £29 million on the unconverted portion of the National Defence Loan. On the following two days market supplies of credit were adequate for demands, but this week conditions again became stringent. Considerable help was given by the authorities on Monday, again indirectly, while on Wednesday a number of houses were nearly forced "into the Bank." Day to day money was taken up to 3 per cent.

At last Friday's Treasury bill tender the offer was raised by £10 million to £270 million; and total applications fell by £24 million from their high level at the previous tender, to £398.6 million. The upshot was that although the market maintained its bid at £99 11s. 11d. per cent it secured an increase in its allotment from 47 to 62 per cent—the highest since early July. At yesterday's tender the offer remained at £270 million.

The price of gold on the London market rose steadily during the week covered by the Bank return; on Tuesday the price at the fixing reached a new peak of 250s. 1½d., and on Wednesday it rose further to 250s. 2d.

The Bank return shows a reflux of currency of only £2.2 million in the week to Wednesday last. Bankers' deposits fell by £2.2 million to £265.5 million.

COMPANY MEETINGS

PINCHIN, JOHNSON & ASSOCIATES, LIMITED

SATISFACTORY RECOVERY IN TRADING PROFIT

DEVELOPMENT AND EXPANSION CONTINUED

MR G. R. T. TAYLOR'S STATEMENT

The annual general meeting of Pinchin, Johnson & Associates, Limited, was held on September 8th at the Connaught Rooms, Kingsway, W.C.2.

The following is the statement of the Chairman, Mr G. R. T. Taylor, circulated with the report and accounts for the year ended March 31, 1954.

It is with pleasure that your directors report a substantial increase in the net profits of the parent company and in the consolidated net profits of the group.

Net profits of the parent company for the year ending March 31, 1954, were £1,144,327 compared with £872,719 for 1952/3, whilst the consolidated net profits at £1,624,572 compares with £1,256,400 for the previous year.

Taxation remains a heavy burden and absorbs 57 per cent of the consolidated net profits of the year, i.e. £929,546. After deducting profits attributable to minority shareholders of subsidiary companies, the parent company's proportion of the 1953/4 consolidated net profits is £551,180 against £422,496 for the preceding year.

You will notice that a liberal portion of the subsidiary companies' profits has been retained by them. This is desirable as the retention will assist some of your overseas companies to finance from their existing resources the building and plant extensions now in hand, and will minimise their calls for further capital.

From the parent company's balance sheet, set out on pages four and five of the report, you will observe that the value of stocks has again been reduced. Part of the reduction is due to the fall in the level of prices during the financial year, whilst the improvement in the supply position of some raw materials permitted smaller quantities to be carried without the danger of retarding our production programmes.

Cash, short-term corporation loans, Government securities, and tax reserve certificates held by the parent company again increased, being £2,361,591 at end of March, 1954, compared with £1,818,828 at the end of March, 1953. A large proportion of the cash balances is on deposit and subject to withdrawal at short notice.

The consolidated balance sheet figures include for the first time the assets and liabilities of your Canadian subsidiary company, so the figures are not truly comparative with those of the preceding year. You will note from this document that the item "Bank Loans and Overdrafts," relating entirely to overseas companies, has been reduced from £912,959 to £417,846. The easier raw material position was the main factor responsible for the reduction in the combined stocks from £5,201,934 to £4,031,695.

During their last financial year, the Australian and New Zealand group issued further debentures, the total now outstanding amounting to £409,214. Some of these companies are expanding steadily and continuously and have large capital commitments to meet during the next two or three years. It was therefore considered desirable to finance part of their capital expenditures by debentures redeemable between 1967 and 1972, the rate of interest payable thereon varying between 4½ per cent and 4¾ per cent per annum.

Shareholders' Funds at £8,278,501 reached record figures, increasing by £242,254 over the previous year. Part of the increase amounting to £77,146 arises from direct transfers to reserves, including the capital profit from the disposal of the Australian Chemical Company referred to in my statement last year, and the balance of £165,108 are retained profits dealt with through the consolidated profit and loss account.

The consolidated net profit figures for the year ending March 31, 1954, also incorporates the results of the Roxalin Company of Canada, Limited. You will be interested to know that we received a modest initial dividend from the Canadian Company although their profits were small, due mainly to large expenditures incurred in developing the manufacture and sale of new products. I am confident that your Canadian associates will materially increase their earnings in the future.

Your directors recommend the payment of a final ordinary dividend of 17½ per cent, less tax, making a total of 25 per cent for the year, less tax. If this proposal is adopted, the balance of undistributed profits to be carried forward in the parent company's profit and loss account will increase by £63,255 to £564,090.

GENERAL REVIEW

Competition in the industry remains keen, but the parent company was able to record an increase in the volume and value of sales for 1953-4 over the comparative figures for the previous year.

Your directors are of the opinion that the results are satisfactory, your company's sales and profit figures being surpassed only in 1951-2, a year of inflationary conditions.

During the period under review it was not possible to achieve any material reduction in costs. Lower prices for some raw materials were offset by increases in production and other expenses, the net result being that profit margins for each unit of output increased only fractionally over the margins of the previous year.

In general, the easement in the supply of raw materials has continued, but the difficulty of obtaining titanium pigments has persisted in retarding our full production programme. A contraction of demand was experienced in the early months of 1953-4, and during that period sales declined in comparison with the corresponding period of the previous year. A marked revival occurred, however, in subsequent months, and at the close of the financial year our main factory attained new monthly production records.

To a considerable extent, a large part of the closing months' sales occurred as a consequence of the recovery of the major export industries; thus we have made an important contribution to the national finances by the increase in our indirect exports besides maintaining a substantial direct export business.

The growing demands for your company's products has necessitated increased production, testing and inspection facilities. Extensions at our main factories have recently been completed, and other projects are in hand or scheduled for the immediate future. Details of these extensions are given in the supplement attached to the annual report.

OVERSEAS PROGRESS

Taubmans Industries Limited, of Australia, reports record sales and net profits for its last financial year. I am sure this very satisfactory result calls for congratulations to the board, management and all concerned in this group of companies. Development is proceeding rapidly, and a new self-contained factory at Sunshine, a suburb of Melbourne, is in course of erection. When completed, this will be one of the most modern paint factories in the world.

The Sunshine factory and another new Taubmans factory in course of erection at Villawood, Sydney, are also illustrated in supplementary pages attached to the annual report.

Due to delay in obtaining licences for the importation of the initial plant and to certain technical difficulties, the results of Pinchin, Johnson & Associates, SA (Pty) Limited, your South African subsidiary company, have hitherto been disappointing. I am pleased to inform you, however, that last year witnessed a distinct improvement which has become more marked in the early months of the current year. There remain many problems to solve, particularly in regard to personnel, but it is hoped that the company is now on the road to a successful future.

Herbert Evans and Company Limited, who are associated with us, are also our partners in Pinchin, Johnson & Associates, SA (Pty) Limited. The directors of Herbert Evans and Company Limited are taking an important part in the guidance of your South African subsidiary company's affairs, Mr H. D. Evans having undertaken the chairmanship, and Mr F. V. Evans the technical directorship. I take this opportunity of thanking Herbert Evans and Company Limited and their directors for their valuable assistance and co-operation.

During the past year visits were made by Mr W. T. Branscombe, managing director, and certain of your company's executives to some of your companies abroad. In recent months, the managements of the companies operating in South Africa, Australia, India and New Zealand have visited the United Kingdom for the purpose of exchanging technical and other information. It is believed that these visits, affording opportunities for personal consultation, will prove beneficial to the group.

THE FUTURE

Your company are the main suppliers in the United Kingdom of industrial surface coatings, besides being important producers of decorative and marine coatings of all types.

By long experience in the trade, constant development and research your home organisation has achieved a pre-eminent reputation and has created valuable goodwill. Our experience and research are freely available to all your overseas companies, some of whom, as I have already indicated, are rapidly expanding their activities. We have therefore reasonable grounds for our belief that our future returns from overseas investments should increase.

The world-wide nature of your organisation gives me confidence in your company's long-term progress and prosperity.

I am sure you will agree that the satisfactory results of the past year call for our special thanks to the management, staff and all other workers throughout the world for their continued co-operation and loyalty.

The report and accounts for the year ended March 31, 1954, were adopted and a final dividend of 17½ per cent (less tax) was declared on the ordinary shares, making 25 per cent (less tax) for the year. The retiring directors were re-elected and the auditors' remuneration fixed.

RIDING'S STORES LIMITED

CONTINUED PROSPERITY AND EXPANSION

The twenty-sixth annual general meeting of Riding's Stores Limited was held on September 8th in Manchester, Mr Frank B. Aldred (the chairman) presiding.

The following is an extract from his circulated statement:

Despite the restrictions imposed on hire purchase trading which continued for the full year under review, your company continued to prosper and the policy of expansion adopted by your board was not severely impaired. As you are no doubt aware, the restrictions have recently been removed, and your company can now look forward to a period of unfettered trading.

There is an increase in the revenue reserves and surplus, the future tax reserve being £58,000 and the balance of unappropriated profits £144,531. The consolidated total of shareholders' funds, including £230,000 paid up capital has increased by £76,676 since last year, and now amounts to £577,832.

The consolidated profit and loss account for the year reflects the expansion in trading and shows a combined trading profit of £316,155. There is a net profit, subject to taxation, of £121,014, from which taxation of £72,445 must be deducted, leaving a residue of £48,569. Your directors recommend a final dividend of 20 per cent less tax, making 30 per cent for the year, on the ordinary shares.

In view of the considerable expansion of trading, your board are of the opinion that the ordinary share capital should be increased by a further £50,000.

The trading figures for the first quarter of the current year show that the company's activities have achieved a most satisfactory level, and your directors are vigorously pursuing a progressive policy which includes the opening of further new and larger branches.

The report was adopted and the increase of capital approved.

CALCUTTA TRAMWAYS COMPANY, LIMITED

FALL IN TRAFFIC RECEIPTS

The annual general meeting of the Calcutta Tramways Company, Limited, was held on September 9th at 1 Queen Victoria Street, London, E.C.

Mr D. E. Webb, FCA, the chairman, who presided, said:

In July last year we endeavoured to raise the fares of the company and, taking our action as a pretext, civil disturbances were created by certain political extremists. We were eventually forced to submit the question of increased fares to a tribunal, which refused to admit the necessity for any such increase. As a result, we have had to postpone for the time being our plans for further modernising and extending the undertaking. Those plans which were already in course of execution were slowed down and are being completed as and when labour and means are available. The result has been that, in the year to December 31, 1953, the surplus earned has not been sufficient to cover the full amount to which the shareholders are entitled in any one year under the agreement with Government. The fact that, notwithstanding these setbacks, there was a sulplus at all, reflects the highest credit on our executive staff.

NEED FOR COMMONSENSE VIEW

I shall be taking up the question of an increase in fares once more when I go to Calcutta in November. Government and the tribunals in Calcutta at present contend that any capital expenditure incurred in improving the existing undertaking should be met by new capital raised outside the business. Whilst this view would be sound if a major extension were contemplated, it is not practicable where it is simply a question of modernising rolling stock, replanning track layout, strengthening substations or re-equipping workshops. In spite of difficulties, I feel confident that commonsense will, in the end, prevail, and that we shall be allowed to carry on this great undertaking in a manner which will afford the greatest benefits to all, and in particular the travelling public of Calcutta.

Turning to the accounts for the year, traffic receipts are down by £168,000. This is due, in the main, to the disturbances last July and partly to a small falling off in traffics. Expenditure has decreased by £95,000, of which the greater part related to the exceptional bonus and arrears of Dearness Allowance granted under the Tribunal Award of the preceding year.

THE SHAREHOLDERS' ACCOUNT

London expenses show little change, and £80,000 has once more been transferred to renewals and replacements account. It must be remembered that this amount is the only charge made for depreciation and is the minimum necessary to deal with the normal wear and tear of the undertaking. After providing £33,500 for taxation and charging debenture interest, there remains an amount of £78,703 to be transferred to shareholders' account against the full sum of £87,457 provided for under the agreement with Government.

Turning to the balance sheet, we have endeavoured to show once more how the capital and reserves have been spent or are represented. The additional capital expenditure has been mainly on Esplanade, which is now approaching completion and is already showing great advantages.

The report and accounts were adopted.

PYE LIMITED

MR C. O. STANLEY'S STATEMENT

The twenty-fifth annual general meeting of Pye Limited was held on September 8th in London. Mr C. O. Stanley, CBE, the chairman, presided and said:

There is nothing that I have to add to what we have already published in our annual report, except that the business of the company continues to progress at the same rate as we indicated.

Every shareholder in the company will have had an opportunity of studying our report, and in addition many thousands of firms from all over the world will have received a copy.

There are, however, still very many people who have asked that copies of the report should be sent to them. We have not been able to comply with these requests because, from an economic point of view, it is quite impossible to send each applicant an individual copy. It is also quite clear that many of the people who have applied are especially interested in a particular article which has appeared in the report. Your directors have therefore decided to publish the chief articles in half-page advertisements in the *Financial Times* and certain other papers during the coming weeks.

The report and accounts were unanimously adopted.

NOTICES

A LARGE food manufacturing combine of international repute seeks a man to act initially as deputy to the Chief Sales Manager who will be retiring within next year or so. Post which holds considerable prospects and which carries a good starting salary must be filled by a man of good education, preferably University standard and with sound background of modern marketing techniques as well as proved experience in leading a sizeable sales force. Knowledge of the food Industry desirable but not essential. Age preferably 35-45.—Write stating experience and salary required to Box 693. For right man the post is both a challenge and an opportunity.

MARKET RESEARCH ASSISTANT with 1-2 years' experience required by Crawfords Advertising Agency. Male or female, age 25 or under.—Write giving experience, qualifications and salary required, to Market Research Division, W. S. Crawford Ltd., 233 High Holborn, W.C.1.

UNIVERSITY OF QUEENSLAND
AUSTRALIA

Applications are invited for the position of PROFESSOR OF PSYCHOLOGY.

It is desirable that applicants should hold a higher degree, have taught at University level, and have carried out substantial research in at least one of the more important fields of Psychology.

Salary £A2,095 per annum.

Further particulars and application forms are obtainable from the Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is November 30, 1954.

ECONOMIC RESEARCH ASSISTANT required by leading stockbrokers for work on background to investment policy. Some experience or knowledge of City desirable but not essential.—Box 691.

UNIVERSITY OF SYDNEY
AUSTRALIA

Applications are invited for three positions of STAFF TUTOR in the Department of Tutorial Classes, University of Sydney.

Applicants should be graduates, preferably in Arts or Economics, of a recognised University. In one case, preference will be given to an applicant experienced in experimental work in parent education and with women's groups.

Commencing salary is £A1,100 per annum, rising by annual increments of £A50 to £A1,450 per annum and is subject to deductions under the State Superannuation Act.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is October 9, 1954.

UNIVERSITY OF CAPE TOWN

Applications are invited for the CHAIR OF APPLIED MATHEMATICS in the Department of Mathematics.

The substantive salary scale is £1,600 x £100—£1,950 per annum, but the scale recognised for the Provident Fund is £1,400 x £50—£1,600. There is also a temporary cost of living allowance for a married man (at present £234 per annum).

The Department of Mathematics is concerned with the teaching of both Pure and Applied Mathematics. Courses are given for students in the Faculties of Arts and Science, proceeding to the degrees of B.A., M.A., B.Sc., M.Sc., Ph.D., to students in the Faculty of Engineering proceeding to the degree of B.Sc. in Engineering, Land Surveying or Applied and Industrial Chemistry; and to students in the Faculty of Commerce, proceeding to the degree of B.Com. or to Actuarial qualifications.

The staff of the Department includes a Professor of Applied Mathematics and a Professor of Pure Mathematics. Both professors are required to take some part in the teaching of these courses. In addition they are expected to advise and guide students and to promote research in their own special branches of the subject.

Applications (with copies of testimonials) should state age, experience, qualifications and research work completed or in progress, and give the names of two referees whom the University may consult. Two copies of the application and testimonials should reach the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (from whom memoranda giving the general conditions of appointment and information on the work of the Department should be obtained) not later than October 31, 1954. An additional copy should be sent direct by air mail to the Registrar, University of Cape Town, Private Bag, Rodesbosch, Cape Town, South Africa, by the same date.

The University reserves the right to appoint a person other than one of the applicants or to make no appointment.

UNIVERSITY OF THE WITWATERSRAND, JOHANNESBURG
SOUTH AFRICA

Applications are invited for appointment to the post of SENIOR LECTURER IN ACCOUNTING in the Department of Commerce.

Applicants must be professionally qualified. Extensive practical experience, teaching experience, a University degree and ability to lecture on specialised accounting subjects will be considered additional recommendations.

The substantive salary scale attaching to the post is £1,100 x £50—£1,450 per annum, together with a temporary cost-of-living allowance of £234 per annum in the case of a married man.

An allowance is made towards the cost of travelling expenses.

The successful applicant will be expected to assume duty on January 2, 1955, or earlier if possible.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in South Africa and London, is October 12, 1954.

KUMASI COLLEGE OF TECHNOLOGY, SCIENCE AND ARTS
(GOLD COAST)

Applications are invited for the following appointments:—

3 SENIOR LECTURERS or LECTURERS (Grade A) in ACCOUNTANCY and ALLIED SUBJECTS

to take accountancy up to final professional level; membership of professional accountancy body essential.

LECTURER (Grade A) in SECRETARYSHIP and MANAGEMENT

to take courses up to level of final examinations of C.I.S. and C.S.

Now in the early stages of development, the college is autonomous, complementary in function to the University College of the Gold Coast and of comparable status. It has at present about 600 resident students and will eventually accommodate up to 2,000.

Salary scales:—

Senior Lecturers: £1,400-£1,850 p.a.

Lecturers (Grade A): £889-£1,560 p.a.

Initial salary according to experience. Posts are pensionable but temporary appointments carrying gratuities and 10 per cent higher salaries could be made if preferred. Partly furnished houses provided, rent according to salary. Free first-class passages for persons appointed, wives and up to 3 children under 13. Generous home leave, normally annual, on full salary.

Write for further information to Secretary, Advisory Committee on Colonial Colleges, 1, Gordon Square, London, W.C.1. Closing date for applications (six copies) October 4, 1954.

EXPORT RESEARCH.—Economist (40), B.Sc.(Econ.), A.I.S., practical background of banking, export, accounting, office organisation, widely experienced in economic and political intelligence, writer and lecturer on economic affairs, including those of Eastern Europe and the possibilities and limitations of East-West Trade, resigning from Public Corporation, seeks post with progressive organisation to develop export research.—Box 692.

THE BRITISH IRON AND STEEL FEDERATION requires economist with good university degree, preferably aged around 30 and with some experience in economic research or economic journalism. Salary according to qualifications and experience.—Applications, giving full particulars, should be sent by September 30th, to the Establishment Officer, Steel House, Tothill Street, London, S.W.1.

THE VALUE OF MARKET RESEARCH depends on how you interpret the results. Young executive available with 7 years' first-class experience in planning and interpreting research. Also organised the programmes which followed, both for consumer-goods and government and other services. Willing to travel.—Box 690.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for a Research Assistantship in Economics tenable for one year, with the possibility of renewal for a further one or two years. Salary £450 per annum. Further particulars may be obtained from the undersigned, to whom six copies of application, together with the names and addresses of three referees, should be sent not later than September 25, 1954.

Cathays Park, Cardiff. August, 1954. E. R. EVANS, Registrar.

NATIONAL DOCK LABOUR BOARD

Applications are invited for the post of Administrative Assistant to the Chief Welfare Officer. Candidates must have sound administrative experience in a large-scale organisation and practical knowledge of industrial welfare. Knowledge of dock conditions an advantage.

Salary scale £895 by £33 to £1,060 p.a. Assisted house purchase scheme and compulsory pension fund.

Applications on form obtainable from 9 & 10 Upper Brook Street, London, W.1, to be returned within 10 days.

MARKET RESEARCH

A vacancy occurs in a large London business organisation for a Market Research Executive. The applicant should not be over 35 and should, at a minimum, have a Degree in Economics with Statistical experience. He should have some experience in the planning and controlling of Surveys and in the preparation of subsequent reports. Write, giving particulars of age, experience, etc., and salary required, to Box 684.

BRITISH EUROPEAN AIRWAYS invite applications for a senior Methods Officer in the organisation and methods branch, head office, to specialise in the study and development of office methods, accounting procedures, and paper work systems generally throughout the corporation. This is a new appointment. Applicants should have a University degree or appropriate professional qualification, several years' experience in a responsible position, and capacity to deal with people at all levels. Knowledge of office machines and equipment, including punch card equipment, and wide experience of methods study techniques are essential. Starting salary within the scale £1,075 to £1,325 p.a. Pension scheme.—Applications, giving age and full details of qualifications and experience, to the Personnel Officer, Head Office, B.E.A., Keyline House, Ruislip, Middlesex. Closing date September 30, 1954.

EXPORT SALES EXECUTIVE. A food manufacturing firm with a world-wide selling organisation is seeking a deputy to their Export Sales Manager. Applicants, who should be in the 30-40 age group, must have had considerable experience of selling to overseas markets—preferably in the food trade—and should have a good educational background, with fluency in one or two commercial languages besides English. They must be physically fit and although normally located at Head Office in U.K. must be prepared to undertake tours of travel abroad to extend and develop markets. The post carries an immediate salary of £1,000-£1,500, according to qualifications. A suitable man will have opportunity for substantial advancement. There is a contributory pension fund.—Box 687.

B.B.C. requires Talks Producer, North American Service, to formulate ideas for and produce discussions, talks and talks features for rebroadcasting in North America. Sound academic background, good general knowledge, appreciation of style of spoken and written word, imagination, tact and sympathetic interest in people of all kinds essential. First hand knowledge of people and affairs of U.S.A. and Canada and experience of writing desirable. Salary £870 (possibly higher if qualifications exceptional) rising by 5 annual increments to £1,175 maximum. Requests for application forms (enclosing addressed envelope and quoting reference "396 Ect.") should reach Appointments Officer, B.B.C., Broadcasting House, London, W.1, within 5 days.

ENGLISH SEWING COTTON CO. LTD., requires an Economist of good Honours Degree and Post-Graduate experience (age 25/35) to organise and take charge of a new department at the head office in Manchester. This department will have two main functions:

(1) The collection and analysis of external economic data which is relevant to the activities of the company.

(2) Advising on the compilation and interpretation of internal statistical information.

The company also requires a Statistician with Honours Degree as an Assistant in this new department. Both posts will be permanent and pensionable.—Applications, which will be treated in confidence, should give details of age, qualifications and experience, and be addressed to The Commercial Director, P.O. Box 413, Manchester, marked "Personal."

BUSY EXPORT DEPARTMENT of famous company requires CLERK/ASSISTANT willing to concentrate hard on exacting and often onerous work whilst undergoing long-term training. The department is small but expanding, hence prospects are good. Age 23-30; good education (aptitude with figures essential); good health; an enquiring mind. University degree, knowledge of export procedures and of foreign languages are not essentials but would be definite assets. Salary will be according to experience but to commence, a maximum of £500 p.a. will be paid. A generous non-contributory pension and life assurance scheme operates.—Box 689.

BRITISH INSTITUTE OF MANAGEMENT LIBRARY requires additional Senior Assistant. Must be qualified librarian. University degree, experience in special library work, foreign language other than French, would be advantageous. Starting salary £500 p.a. Applications, in writing, should be addressed to The Director, Management House, 8 Hill Street, W.1, and marked "S.L.A."

YOUNG MAN, aged 27, public school, University education; completed military service; commercial experience home and overseas; seeks post with firm of stockbrokers or Investment Trust doing Investment Research Work.—Box 688.

ECONOMICS GRADUATE, aged 31, with 13 years' business experience, last two as Personnel Manager, requires similar position. Ambitious and willing to undergo further training.—Box 685.

EXECUTIVE, 30, ten years Malaya sales and administration, now on leave, desires remain U.K. Seeks responsible position with prospects. Good reference. Box 686.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

OTHER NOTICES APPEAR ON PAGE 857

INCORPORATED ACCOUNTANTS

THE SOCIETY OF INCORPORATED ACCOUNTANTS' EXAMINATIONS

EXAMINATIONS, NOVEMBER, 1954

The Society's November, 1954, Examinations will be held on the following dates:—

Preliminary: November 9 and 10, 1954.
Intermediate: November 11 and 12, 1954.
Final Part I: November 9 and 10, 1954.
Final Part II: November 11 and 12, 1954.

The centres will be Belfast, Birmingham, Cardiff, Dublin, Glasgow, Leeds, Liverpool, London, Manchester, Newcastle-on-Tyne and Southampton.

Applications on the appropriate forms must be lodged with the Secretary, Incorporated Accountants' Hall, Temple Place, Victoria Embankment, W.C.2, not later than Monday, September 20th.

NEWCASTLE-UPON-TYNE EDUCATION COMMITTEE

MUNICIPAL COLLEGE OF COMMERCE

Principal: J. L. Gayler, B.Com., LL.B., Barrister at Law

Applications are invited for the following full-time appointments:—

(a) Senior Lecturer in Management.
(b) Assistant Lecturer (Grade B) in Commerce.

Further details and application form, to be returned within 14 days, obtainable from Director of Education, Northumberland Road, Newcastle-upon-Tyne, 1.

BRITISH STEEL CASTINGS RESEARCH ASSOCIATION

DIRECTOR OF RESEARCH

The British Steel Castings Research Association, with Headquarters in Sheffield, invites applications for the position of Director of Research, to lead a team of about 18 scientists and technicians, together with clerical and library services. A metallurgist with research and some industrial experience considered. A new Research Station is about to be built and equipped. The Association is in receipt of D.S.I.R. Grant, and has connections and liaison with the works and laboratories of all the leading steel foundries in the U.K., together with a number of overseas contacts. For this reason administrative ability to work with committees, works personnel, etc., as well as the Association's own staff is of great importance. Salary, which will be in accordance with qualifications and experience, will be substantial. The Industry served by the Association produces about 225,000 tons per annum of carbon and alloy steel castings, and employs approximately 25,000 people.

Communications or queries should be addressed in confidence to the Chairman, British Steel Castings Research Association, Broomgrove Lodge, Sheffield, 10.

DUNDEE INSTITUTE OF ART AND TECHNOLOGY

DUNDEE TECHNICAL COLLEGE

The Governors of Dundee Institute of Art and Technology invite applications for the Post of Senior Lecturer in Commerce and Organiser in Management Subjects. Candidates should preferably hold a good University Degree in Commerce or Administration and have had teaching and industrial experience. The salary scale, subject to increase under 1954 revision, when finally approved, is £940 x £50—£1,140 per annum, and placing will be according to qualifications and experience.

Further particulars, conditions of appointment and application forms may be obtained from the Clerk and Treasurer, 40 Bell Street, Dundee.

GO-AHEAD Managing Directors are offered a rare opportunity to engage a young executive with unusual combination of academic, linguistic and practical qualifications. His 10 years' experience of the Export Trade are backed by the London B.Com. and B.Sc.Econ. degrees, both of them with Honours, in International Trade/Economics; he has passed all the Institute of Export examinations; travelled, his languages include perfect Spanish, excellent Portuguese, and some French, rapidly becoming fluent.—Box 682.

MERCHANDISING, ADVERTISING, SALES PROMOTION.—Top flight Executive with 25 years' successful marketing experience seeks change. Extensive knowledge of home and overseas selling and a proved record with first-rate companies. Would be willing to reorganise sales and advertising, or to take over control of existing sales organisation of large-scale concern in London or provinces.—Box 681.

VICTORIA UNIVERSITY COLLEGE
(UNIVERSITY OF NEW ZEALAND)

CHAIR OF POLITICAL SCIENCE

SENIOR LECTURESHIP IN POLITICAL SCIENCE

The Council of the College invites applications from suitably qualified persons for these appointments.

Chair of Political Science

The Chair of Political Science in the School of Political Science and Public Administration is at present vacant by reason of the resignation of Professor R. S. Parker on his taking up an appointment with the Australian National University at Canberra. The Chair carries with it the Headship of the School.

The salary will be at the rate of £1,592 8s. per annum, rising by annual increments of £100 to £1,792 8s. per annum. The initial salary will be determined according to the qualifications and experience of the appointee.

The successful applicant would be expected to take up his duties at the commencement of the second term of the 1955 session, viz., May 23rd, or as soon thereafter as agreed upon by the Council.

Senior Lectureship in Political Science

The salary will be £1,092 8s. per annum, rising by annual increments of £50 to £1,292 8s. per annum. The initial salary will be determined according to the qualifications and experience of the appointee.

The successful applicant will be expected to take up his duties on February 1, 1955, or as soon thereafter as may be agreed upon.

Allowance is made towards the cost of travelling expenses in both cases.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications for the Chair of Political Science is December 1, 1954, and for the Senior Lectureship in Political Science, October 15, 1954.

VICTORIA UNIVERSITY COLLEGE
(UNIVERSITY OF NEW ZEALAND)

The Council of Victoria University College proposes shortly to appoint a LECTURER IN COMPARATIVE SOCIAL ADMINISTRATION, and invites applications from suitably qualified persons for this post.

Applicants must have suitable academic qualifications and previous research in the fields of the Lectureship would be an advantage. Knowledge of Social Administration and services in Asian Countries would be considered a recommendation. Experience in administration, if additional to suitable academic qualification, would also be an advantage.

The salary will be £892 8s. per annum, rising by annual increments of £50 to £1,042 8s. per annum. The initial salary will be determined according to the qualifications and experience of the appointee.

An allowance is made towards travelling expenses.

The successful applicant would be expected to take up his duties on January 1, 1955, or at such other date as may be agreed upon by the College Council.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in New Zealand and London, is October 15, 1954.

BRITISH CELANESE LIMITED have vacancies for male Arts Graduates with good Honours degrees who have completed their National Service and are under age 25 for engagement as Trainees. An aptitude for working in industry is essential. Training will mainly be directed with a view to a career on the commercial side (advertising or sales), although there will be a limited number of openings on the textile production side.—Applicants should state their preference and send particulars of their qualifications and career to the Personnel Manager, British Celanese Limited, 22/23 Hanover Square, London, W.1, quoting 1072.

SPANISH Evening Classes from October 4th. All grades. The Hispanic Council, 2 Belgrave Square, S.W.1. SLO 7186.

STUDY AT HOME **B.Sc. ECON.**

This London University degree, open to all, is a valuable qualification for statistical, research, educational and welfare work. It is necessary only to pass three examinations. Wolsey Hall (founded in 1894) can prepare you for these at home. Reasonable fees, instalments. 952 B.Sc. Econ. (Final) Successes, 1925-53. Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P15.

Roads laid on PAPER

Did you know that modern roads are laid on paper? Specially treated kraft paper★goes down first. Then the concrete and reinforcements are laid, with the certainty of being fully protected until they are set and established. Similar specially prepared kraft is used, also, to "cure" the new concrete road surface—and protect it from frost. This is only one of the many ways in which Aylesford Kraft Paper serves industry; as a protective wrapping paper it has no equal. And though Aylesford Kraft is only one of the important papers made by the Reed Paper Group, more kraft paper is made at Aylesford than at any other mill in Europe.

★*Kraft paper laminated with bitumen (with or without fabric reinforcement) is used for this purpose*

There is no better Kraft than AYLESFORD KRAFT—made in Kent by British craftsmen

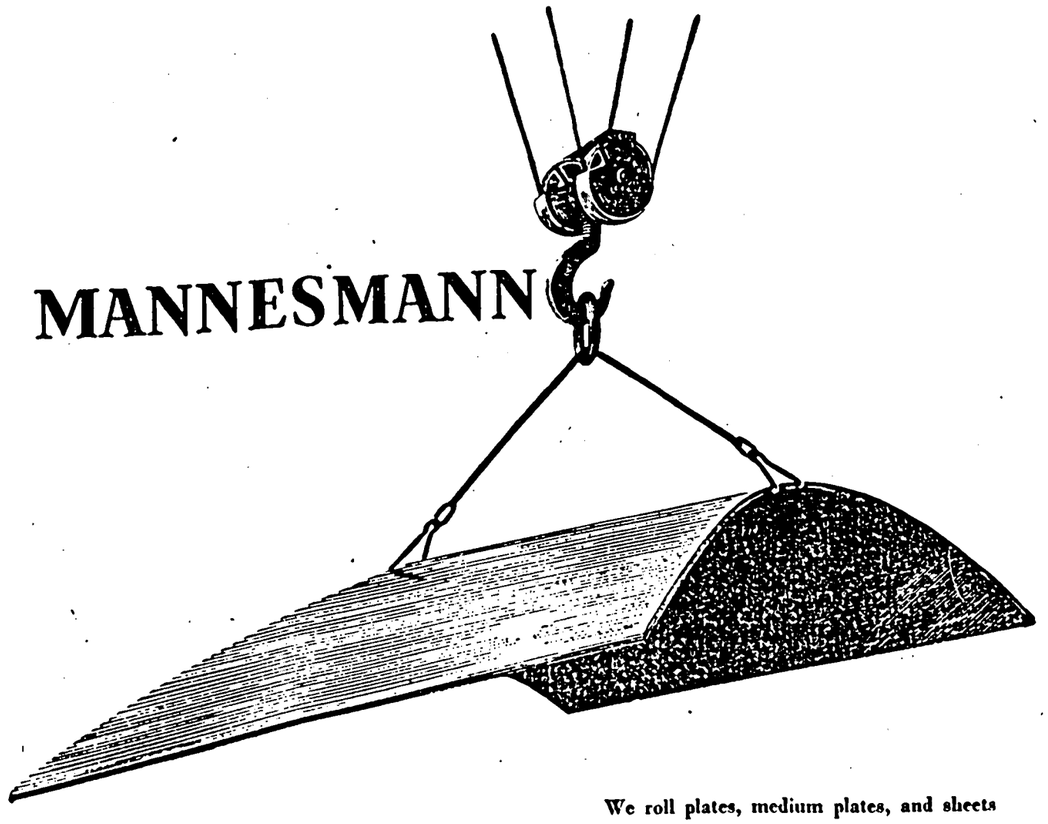
Logical way to get your advertisements *read*

IT MAY SEEM OBVIOUS, but it's sometimes forgotten: advertisements work best if they are not merely glanced at but *read*. Then they can persuade, convince, remain in the memory. That is the great strength of the written word.

Where will your advertising have the best chance of doing its job? Evidently, in a publication edited strictly for *reading*, not glancing.

A number of publications meet this requirement. Most have small circulations — but not all. Despite the pessimists' murmurs about national illiteracy, The Reader's Digest goes from strength to strength. It has more than doubled its sales in four years. It now guarantees a massive circulation of a million copies monthly. That means *several* million readers—for this little magazine is much passed on from family to friends.

Those who so much enjoy The Reader's Digest each month are essentially men and women who like to know what's going on in the world, to keep up with the latest in science, in medicine, in many other fields.



Because they are alert to new ideas, and keen to read about them, they form an ideally receptive audience for the advertiser with a message to convey.

A profitable audience, too. People like this exert a certain influence on others. In trying and buying new things, they are apt to lead, while their friends follow. They have certainly influenced many thousands of others to form one new habit: that of buying their favourite magazine.

The Reader's Digest

a magazine for READING with a guaranteed MILLION sale

We roll plates, medium plates, and sheets from high quality steels produced in our own blast-furnaces and steel works. The name Mannesmann is a guarantee of the high degree of excellence in both material and manufacture on plates and sheets for use as structural members, ranging from the heaviest weights required in ship- and bridge-building, and boiler construction, to the readily worked auto-body sheets and the highly sensitive dynamo and transformer sheets for the electrical industry.

Influential people in over 100 countries keep abreast of world news through TIME

Five separate editions of TIME, The Weekly Newsmagazine, with the same editorial content, are published in English every week. One edition circulates only in the U.S. The other four—the International Editions—published simultaneously, are read by important people in over 100 countries outside the U.S. TIME's net paid audited circulation exceeds 2,000,000 copies each week. More than 903 out of every 1,000 TIME readers hold important positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of International news, but as an introduction to the world's foremost companies and products. People around the world can read *all* the week's important news—including your advertising news while it is still *news*. The Advertisement Manager will be pleased to give you further information.

You can buy advertising space in just the editions you want, covering the world markets in which you are most interested

Famous advertisers like The David Brown Companies are using this powerful international medium to develop their world markets

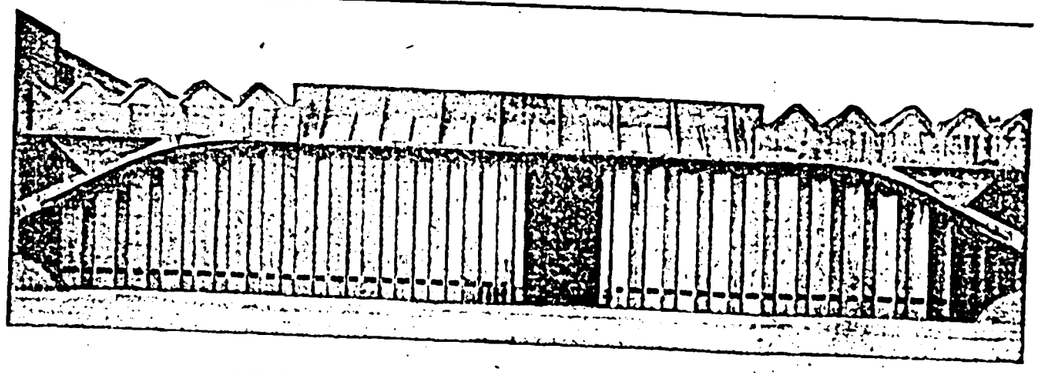
The eyes have it!

We call this the machine age. Yes, but machines are only as good as the men who use them. You cannot plan for highest productivity unless you plan the conditions in which the human element is working.

Foremost among those conditions is *factory lighting*. Walk through any factory or large office and notice *the pairs of eyes* at work. Intent. Questioning. Watching. Checking. *Alert*. Eight hours a day! No wonder practical tests show that improved lighting can lift production by 10 to 30 per cent.

With its long experience of research and manufacture the G.E.C. has perfected in Osram fluorescent tubes a form of lighting that is at least three times as efficient as filament lamps. Highly diffused, thus reducing glare and shadow. Colours to suit particular varieties of work. And a high period of 'light-life' resulting in big savings in maintenance costs.



New fluorescent powders recently developed by Osram, and the ingenious mechanical coating of the cathodes contribute to the high quality of Osram tubes. The choice of your fluorescent tubes for new installations or for replacements is therefore a matter of great importance to your business.

The G.E.C. maintains a highly qualified lighting service and specialists are available at each of the Company's branches to advise on any lighting problem.

The most complete review ever produced on

HEAT LIGHT AND POWER

in your home

Not for years has there been produced in Britain an issue of a magazine of such remarkable interest and value as the October IDEAL HOME, *out Friday, September 24th!* Published at the normal price of two shillings, it is considerably enlarged—a record-size of *204 pages, including over 40 pages devoted exclusively to warmth and lighting.*

With its wide range of expert schemes and explanatory articles, enhanced by *over 200 beautiful photographs and drawings*, this issue presents a rather exciting panorama of the many practical uses and decorative possibilities of light, heat and power in your home.

Greatly enlarged ISSUE
204 PAGES
with over
200 ILLUSTRATIONS

Here are a few of the subjects covered:

Lighting Schemes and Equipment for Every Room
Modernising the Lighting of a Country House
Complete Wiring Plan for a House
Heating Schemes for six different types of home
Central Heating a Single-storey Home
Lighting and Redecoration
Under-floor Heating
How to use Power about the House

IDEAL HOME

MAGAZINE—OCTOBER ISSUE

OUT FRIDAY, SEPT. 24—TWO SHILLINGS

At the back of all our minds

LISTEN

to the Home Secretary's broadcast
The Home Secretary, the Rt. Hon. Sir David Maxwell Fyfe, Q.C., M.P., will speak on "THE HYDROGEN BOMB AND CIVIL DEFENCE" Monday, 27th September, 9.15 p.m., after the News, B.B.C. Home Service.
On the Scottish Home Service, at the same time, there will be an address on Civil Defence by the Earl of Home, Minister of State for Scotland.

IS THERE ANYTHING we can do to prepare for the worst—a hydrogen bomb attack? Yes, there is.

However complete and extensive the destruction in the centre of the target area, there would still be a great ring around it only partly destroyed, with fires raging. People would still be alive there—many of them trapped in the fires and debris, many of them injured—all of them with lives to be saved—all looking for help to the civil defence services.

It is the people outside the target area who would have to come to their aid. They would be the ones who would rescue the trapped and injured, stop the fires from spreading, feed and shelter the homeless. *If they knew how.*

Even in the critical days of evacuation and preparation before a war broke out, there would be immense tasks for the civil defence services.

Half a million people realise all this. They are training in civil defence, and because of them, if war ever does come, thousands who might have died will live.

But still more help is wanted. There is a greater need than ever for *trained* Civil Defence Corps and Auxiliary Fire Service volunteers.

NOW IS THE TIME TO PREPARE

We are all thankful that for the present the threat of war has receded. But even though there is no crisis now, we must not relax. An organisation whipped together in a crisis would not be much good. If the civil defence services are to be a permanent part of our defences—as they must be—the time to train is now.

Civil Defence is a vigorous going concern. The A.F.S. is being equipped with new fire-fighting apparatus of the very latest design. The Civil Defence Staff College and Tactical School has trained over 3,000 leaders for the Corps. Training and social centres are being opened all over the country. Soon we shall begin training service men to take their places in mobile rescue and fire-fighting columns.

THOUSANDS MORE ARE NEEDED

But local civil defence organisations are the first line of civil defence, and thousands more volunteers are needed for spare-time training everywhere—right away.

Why not look into it? Ask about it at your Town Hall. Remember, the more men and women who train now—the fewer people will die if war should come.

YOUR LOCAL CIVIL DEFENCE NEEDS YOU NOW MORE THAN EVER

ISSUED BY H.M. GOVERNMENT

Get ahead now with the brighter, busier BIF of '55

The BIF of '55 is going to be a very lively affair—the first run *by* business *for* business.

Publicity will be bold and challenging, and will bring in many more buyers from the home market as well as from the rest of the world.

Lower Cost to Exhibitors

The basic cost of exhibiting in this new BIF will be lower than in any other comparable Fair in Europe . . . shell stand charges are down and so are those of electrical installations.

Streamlining . . . .

The London Section of the new BIF will be under one roof—Olympia. It will be streamlined in more senses than one and every corner will be busier, more alive. But one consequence is that space will be limited. Some of it has already been booked . . .

Include this revitalized BIF in your marketing programme for 1955.

BOOK SPACE NOW

Fill in the coupon below and send it to:—
British Industries Fair Ltd.,
Ingersoll House, 9 Kingsway, London, W.C.2
Or, for the Engineering and Hardware Section to:
British Industries Fair,

AUSTRALIA AND NEW ZEALAND

Improved business conditions—
get there* QUICKLY *in a
Pan American Clipper via U.S.A.

With improved trading conditions in Australia and New Zealand, now is the time to get out there quickly to present your proposition.

Your time is valuable – so you'll be interested in Pan American's President Clipper® service.

You fly via the U.S.A. This PAA way there are fewer documentation and health requirements, and there are liberal stop-over facilities. So if you also have business in America *en route*, kill two birds with one stone. Or, if you can spare the time, spend a day or two beside the surf on a Pacific island!

Meals, cigarettes and bar service are free on all PAA first-class flights. Sleeperette® service (fully reclining seats) on all Pacific flights and 'President Special' trans-atlantic service. Berths at slight extra charge. But when economy is important, there's also Pan American's comfortable Rainbow Clipper Tourist service all the way.

Consult your Travel Agent, or Pan American, 193/6 Piccadilly, London, W.1; Telephone REGent 7292. Also at Lombard House, Gt. Charles St., Birmingham (Central 1125). And at 15 North Drive, St. Enoch Square, Glasgow, C.1 (City 5744).

GREAT NEW MYSTERY SERIAL

DESTINATION UNKNOWN

by

AGATHA CHRISTIE

AGATHA CHRISTIE at the peak of her form! This will be the unanimous verdict on her latest thriller which begins, before book publication, in JOHN BULL, out Wednesday, September 22nd.

"Destination Unknown" is the story of an atom scientist who just disappeared.... Where? How? Above all—why? Other things will perplex you, too. Why did the pretty redhead *not* commit suicide? Why land an aeroplane in the desert, and then set fire to it? It's fiction but it could easily be FACT! Read it—exclusively in JOHN BULL.

Also EXTRA 8-page detachable supplement

ARCTIC DOCTOR

JOHN BULL *OUT WED., SEPT. 22nd—4D.*

POLYESTER RESINS for all industry—soon

One of the most promising industrial developments of recent years is the arrival of *polyester resin* laminates as constructional materials.

Already widely used in the U.S.A., these plastic products are soon to be more readily available in this country, because of Monsanto's increased production of the essential raw materials. These include **MALEIC ANHYDRIDE** (made in this country only by Monsanto); **PHTHALIC ANHYDRIDE**; and **STYRENE MONOMER** (made by Forth Chemicals Ltd., an associate of Monsanto).

Polyester resins are bonded with reinforcing materials, such as glass-cloth, by low-pressure lamination and then become extremely tough, yet light, replacements for thin sheet metal and similar conventional materials. The big advantages they offer include:

- *High impact strength, ability to withstand vibration, etc.*
- *Light weight (U.S. sports-car body, 9 ft. x 6 ft., weighs 75 lbs.)*
- *Easy to fabricate with unskilled labour.*
- *Flexibility and ability to adapt to design, not vice versa.*
- *Easy to clean, easy to repair (new resin is simply "moulded in").*
- *No corrosion or deterioration.*
- *Chemical resistance.*
- *Can be drilled, milled, turned, etc., and metal inserts applied, as necessary.*
- *Less painting — dyes can be incorporated during process.*
- *No large capital investment in machinery.*

Polyester resin laminates can be produced in sheet form, or in moulds of any shape or in continuous piping (withstanding great pressure and permitting fittings), rods, tubes, etc.

Monsanto, who make only the raw materials for this versatile product, will be pleased to give you all up-to-date information and details of dependable suppliers and moulders. Write to the address below today!

Mr Bevin's Mantle

MR ATTLEE will come back to Britain next week to face a mountain of trouble in the management of Labour's foreign policy. He probably does not yet understand exactly what is going to hit him. His convivialities in the East have had the worst possible effect on opinion in the United States; and that effect is going to be immeasurably strengthened if, as seems inevitable, his party casts a majority vote against "German rearmament" at Scarborough. It is now an unfortunate fact that if he should be returned to office next year, this will add to the influence of those Americans who believe that their own defence line should be built up behind instead of in front of "untrustworthy" Europeans. To millions of Americans and other foreign friends of freedom the ruling question in British politics is no longer that of whose finger is itching at the trigger, but of whose boot is kicking at the shield. They believe that Mr Attlee's is.

This is a desperately dangerous picture for Britain. It is also a quite unfair one of Mr Attlee. His definition of desirable co-existence is admittedly a little cosier than that of Mr Dulles, but it is no cosier than that of Sir Winston Churchill; his determination to fit a German contribution into western defence is almost as great as Mr Eden's—and he believes that, were he to become Prime Minister, he would be able to manage this, provided there was no outside barracking of his intricate manœuvres around his own party's floor. As so often in the history of Britain's alternative government, it is therefore necessary to explain to foreigners that the situation inside the Labour party is not really as bad as it appears; but to suggest to the Labour leaders one way in which they might make that bad appearance better.

The reassurances to nervous friends abroad can be terse but emphatic. First, whatever interpretation is put on whatever dreadful things happen at Scarborough, the apparent swing within the Labour party is not going to be pronounced or coherent enough to cow the Conservative Government's foreign policy between now and the next general election. In particular, with half the Labour movement and the whole of the Conservative movement in favour of fitting a German contribution into western defence, Mr Eden's present course will still have the representatives of three quarters of British public opinion behind it.

Secondly—provided foreign statesmen themselves stood firm—the consequences of any election that returned Labour to office within the next two years would not necessarily be dramatic. There is a simple truth here that Mr Attlee cannot very well propagate himself, so other people must propagate it for him. It is that if the Labour party expresses its immutable opposition to German rearmament at Scarborough, this will have no more effect on the eventual policy of a Labour government than if the conference expressed its immutable opposition to rainy British summers. Confronted by the success of either resolution, Mr Attlee would say that he did not personally

favour it, but that he understood the emotions behind it, and that he would try to act with this expression of opposition in mind so far as circumstances permitted. But he would know quite well that circumstances would not permit.

The quickest cure to excessive nerves about Labour's neutralism is, indeed, a glance at the calendar. The earliest moment at which a Labour Government can conceivably be returned to office seems to be the autumn of 1955, and by that time the task of fitting a German contribution into western defence is likely to have begun. The earliest moment at which a Labour government that won a secure majority in 1955 would feel obliged to go to the country would be 1959 or 1960, and by that time the process of German rearmament is certain to be complete ; either the Germans will be rearmed on the west's side facing the Russians, or they will be rearmed on the Russian side facing the west. As this situation developed it is inconceivable that a Labour government—in defiance of the wishes of its Prime Minister, his designated Foreign Secretary, the entire permanent staff at the Foreign Office, and virtually the entire British people—would opt for the second alternative. They would not therefore make any real show of hindrance to the first.

*

To Mr Attlee these must seem the facts of life ; the trouble is that Britain's allies may not appreciate them. Even although a Labour government would be unlikely resolutely to oppose a German contribution to western defence, there is a widespread fear that it might not at first feel able to work actively towards it ; and the situation immediately after the next British general election may still be one that will require such activity from Downing Street. The danger is that in the absence of such a lead, freedom's front might relapse into confusion and apathy ; and then the Americans might withdraw to the west with their protection, and the Germans might turn to the east for theirs.

There is only one way in which the Labour party could avert this risk. It would be by putting the management of foreign affairs, under Mr Attlee's co-ordination, into the hands of a man in whose vigour the free world would trust. In short, Labour now has an urgent need to find a new Ernest Bevin. The advance to realism in Labour's foreign policy that the new man would have to make, and the party obstacles over which he would have to ride, would certainly not be greater than those that characterised Mr Bevin's astonishing achievements in 1945-48.

Once this need is recognised, two candidates for the post as Labour's next Foreign Secretary should be immediately struck off the list. Up to quite recently Mr Bevan was seriously tipped at Westminster as a likely incumbent of this office ; since he can be managed by permanent officials much more easily than is generally supposed, the suggestion was not as awe-inspiring as it might at first appear. After the events of the last few months, however, it is clear that freedom's front would not survive such a shock ; indeed, now that Labour has succeeded in turning itself into a scarecrow in the foreign policy as well as in the economic field, it may have to decide to try to exclude Mr Bevan from high office permanently—even although this makes it so much more difficult also to exclude all his policies. The second candidate who must not become Foreign Secretary in the circumstances that are here envisaged is Mr Herbert Morrison. He is an even better co-ordinator of party compromises, and he might be an even better Prime Minister, than Mr Attlee ; but for that very reason, as his last tenure of the office showed, he is liable to be a worse Foreign Secretary than almost anybody else.

Another possible candidate is Mr Gaitskell. His appointment would also be a mistake. The trouble is not, as is generally believed, that Mr Gaitskell would be indispensable at the Treasury. It is that he is being groomed for the party leadership —and, quite frankly, before he is really ready for it. He is Labour's great hope for the 1960s, but if he was thrown into the centre of the party battle over foreign policy he might either wilt from it or be broken on the wheel ; his action in 1951—when he introduced dividend limitation and opposed dearer money against what must have been his trained economic judgment—suggests that he might do the former. Indeed, if Mr Attlee is re-elected and has to pick a Foreign Secretary from within the present Parliamentary Party, his most helpful choice might be Sir Hartley Shawcross.

But it must be quite clear who the best choice of all would be. The personification of Ernest Bevin is among us ; he thumped down the front at Brighton last week, scattering " Pollitt's rabbits " as he went. Three months ago one newspaper started the hare of rumour that Mr Arthur Deakin intended to enter political life when he reaches the retirement age from trade union office next summer ; the rumour was denied, and there is no doubt that as an expression of intent it was wide of the mark. But the call now needs to be revived, not as a statement of Mr Deakin's personal wish, but as an exposition of urgent national and party need. Nobody likes to urge an unwilling man to come into the political field ; it is so much more usual to urge too many too willing hacks to get out of it. But Mr Deakin should listen to the foreign policy debate at Scarborough very carefully, and ponder on the meaning that would be attached to any vote that sought to saddle the party's leaders with a policy in which they did not believe, and that opened a real danger — if Labour returned to power—of either defencelessness for Britain or else of a new 1931. Its most obvious meaning would be that, within a Parliamentary party led by tired and troubled men, his own brand of robust leadership had become indispensable.

Fears for Formosa

OF all the questions on which the people of Britain and America are from time to time divided, that of Formosa is the most constant and perhaps the most profound. It is the one in which their clash of opinion over recognition of Communist China finds its most permanent and tangible expression. For the majority in Britain, the name of Chiang Kai-shek has almost the same kind of taint about it as General Franco's ; the fact that he was an ally in the war has since been overshadowed by the corruption, autocracy and disillusioning nature of his rule. For Americans, on the other hand, Formosa represents not only the last retreat of a government on whose support the United States once lavished millions of dollars and a large slice of American prestige ; it is the final repository of a dream, of the idea that China would provide for America the kind of cultural and commercial link with Asia that India did for Britain. By their military victory on the mainland in 1949, the Communists shattered this illusion at the very moment when the United States had both reached the peak of its own power and was more consciously aware than ever before of the long-term hostility of the Communist world. Those in Britain who know the value of their American alliance can therefore ignore this background only at their peril ; the recent renewal of active fighting around the Nationalist-held islands of Quemoy has touched an open nerve in Washington.

Chinese Communist motives and aims in stepping up the tempo of this particular battle at this particular moment are by no means clear ; indeed some of the pressure this summer has been deliberately put on by the Nationalists themselves, and the Communists have done no more than retaliate. But there are at least three obvious motives for Peking to adopt a more aggressive policy towards the Chiang Kai-shek regime, and all have probably played some part in shaping recent events. The very division of opinion between the two main western allies means that to foment the quarrel with America on the issue of the Chinese Nationalists is to drive a wedge into the weakest joint in the allied armour. For, if heavy fighting once again broke out in the Far East, the Communists might reasonably hope that the United States would this time have to engage virtually without allies and with very little moral support from world opinion. Secondly, to have the Nationalists sitting in the Quemoy islands, heavily armed, provocative and well within the territorial waters of the mainland, is an affront to the dignity of the Chinese People's Republic, which even a less quick-tempered state could not be expected to tolerate ; in fact, until the recent flare-up few people in the West probably realised that the Nationalists still held any islands so near the coast. For Peking, this is a threat that must be liquidated.

The other Communist motive is the desire to move on to the next stage after pushing the war in Indo-China as far as it was profitable to go for the moment. The truce at Geneva must have released considerable stocks of equipment which would otherwise have been earmarked for use in the South. It is argued in some quarters that the Communist leaders are so keen to get ahead with their economic plans for pulling China up by its bootstraps that they would hardly welcome a fresh military drain on their resources. There is, however, no reason why industrialisation and an assault on a localised objective like Quemoy should be incompatible. And the government may well wish to distract attention from the home front. Certainly, nothing has been left to chance in the intense propaganda campaign with which Peking is now trying to rouse the country against the Nationalists. The last time, indeed the only other time, when such efforts were made was just before the Chinese flung their volunteers into Korea.

Where will all this lead ? No one who judges the Chinese by their deeds or by the ruthless canons of their Communist faith can doubt that they mean what they say, when they declare that they are out to get Formosa if they can. The grim undertones of their determination could be heard even behind the delicate clink of teacups during the Labour delegation's visit to Peking. To the Chinese Communist leaders, the struggle for Formosa is a natural and legitimate finale to the civil war. To assume anything else is to live in a grey cloud of illusion.

The immediate future therefore turns on the physical possibilities before the Communists. Quemoy itself has a garrison of three Nationalist divisions, reputedly well trained, of high morale, and in possession of modern equipment with substantial reserves of ammunition ; in the civil war Communist attacks on the islands was repelled with very heavy losses. This means that, while it is hard to see how an all-out attack could fail, Quemoy is undoubtedly a tough nut to crack, provided its supply lines and its morale hold. But beyond Quemoy, the Communist forces would be in grave danger of provoking retaliation by the Americans —whether massive or not—or of overstepping the bounds which Moscow might consider prudent and which it would be prepared to support with deliveries of arms. Outside territorial waters, in an attack on the Pescadores or Formosa itself, the Chinese Communists would have to rely on a more powerful naval and air escort than they are at present thought to possess, or than they could get from the Russian Far East Command. So long as the US Seventh Fleet remained at its post to help the not inconsiderable Nationalist navy, it would therefore seem unlikely that the Communists could reach Formosa.

Their only chance would lie in airborne landings, designed to exploit a collapse in Nationalist morale.

Mr Dulles has rightly kept both the Communists and his own side guessing about the exact lengths to which the Americans are prepared to go ; Washington's general commitment in support of the Formosa government is too well known to lead to the dangerous confusion which brought on the Korean war. But it is to be hoped that the decisions of the National Security Council in Denver have narrowed the margin of choice left to individual force commanders. For the main danger in the fresh challenge that Peking is now throwing down is political rather than military. Formosa can almost certainly be held. But at what cost in terms of American involvement in a wider war and of an agonising rift in the western camp ? The next few weeks may well see a period of crisis in the Far East as acute as any in the last five years. But, if this does come, the sure way to let it get out of hand will be to forget that that is exactly the kind of stake the Chinese are playing for. Moreover, though it may be cold comfort, the Russians do not want a wider war either and their attitude will act as a powerful brake on the hotheads in Peking.

Although the British Government is not committed by any of America's unilateral acts about Formosa, in practice London and Washington stand much closer together on this issue than do their publics. With only minor shades of disagreement, both governments consider that Formosa must be preserved from Communism. Neither at present regards neutralisation as a solution, because Peking would never accept it. Both reject the legalistic argument that Formosa automatically belongs to the China of the Peking regime because its return to China was promised in the Cairo Declaration of 1943 ; no final disposal can in any case be arranged except in a Chinese peace treaty with Japan. And both governments regard some proof of the new China's willingness to behave in a civilised manner as at least the first condition of any negotiation. Mr Attlee's recent observations in Australia do not represent the views of Downing Street.

The position taken up by the United States during the past few years means that, from the West's point of view, the initiative now lies directly in American hands. All that America's allies can do is to make up their own minds how far they could afford to go if called upon to support action by the Seventh Fleet, and to impress their views on Washington. After all that has happened, to call for anything approaching abandonment of Formosa at this critical point is patent folly ; retreat would have a calamitous effect on Asian opinion. At the other extreme, to support the dispatch of American warships and aircraft to Quemoy itself is politically unthinkable. Somewhere between a line must be found on which there would be some chance of rallying opinion in the free world as a whole. The obvious one is that already cited by Mr Dulles to the west of the Pescadores ; the Formosa Straits are in fact reasonably defensible, and this choice meets the principle of defence without undue provocation or risk of embroilment. Moreover, for the Eisenhower Administration itself, faced with the elections in November, this in fact represents the most practical compromise ; while it would now be politically impossible for the Republicans to back down on their pledges to Chiang, neither can they risk having to send all the boys back to the Far East.

There remains Quemoy itself. For the Nationalists to withdraw at this stage without putting up a real fight would be very damaging to their prestige and to their own morale. Their strongest interests demand a heroic stand, with full—if indirect—logistic support from the Americans. If the Nationalists held Quemoy as Dien Bien Phu was held, they would have done more for their cause than anything since the fall of Peking.

Surplus and Hunger

FOR the second year running, the report of the Food and Agriculture Organisation for 1953-54 shows that world food supplies have risen faster than world population. The farmers have raised their output by some 3 per cent, the net increase of mouths is only 1½ per cent ; and production per head, in the world as a whole, has exceeded the prewar level. International prices of most primary foodstuffs have fallen. The "turning point" of 1952-53, the first postwar year to show gain instead of loss on the food-and-numbers front, now looks a little more like a true turning point and a little less like a random wriggle on the road leading to Malthusian catastrophe.

So far, so good. There will be differing interpretations of these statistics. Some people will regard the improved balance of food and numbers in the last two years as the resumption of a reliable trend, a century and more old, towards greater plenty ; a trend interrupted by war and postwar dislocation, to the acute alarm of the neo-Malthusians, but to be counted on as comfortably in the future as in the past. Without supposing that it can continue without limit into an indefinitely expansible counter-Malthusian paradise of synthetic foodstuffs or planetary colonisation, one can thankfully—on this interpretation—invoke the well-known tendency of demographic squalls to blow themselves out and of technicians to make nonsense of gloomy prophecy. Others will say that this is a wildly over-optimistic structure to build on a still very small improvement, from a very low level, held over a very short time.

Both interpretations, however, miss the main point. That point, as the FAO report makes clear, is that for the second year running the global improvement in food

supplies conceals "marked disparities between regions." North America's production of food per head is now 19 per cent above the 1934-1938 average ; food production per head in Western Europe, the Near East and Africa is also appreciably above that average: but in Latin America, the Far East and Oceania "per caput production remained substantially less than before the war." Oceania—which means Australasia—does not belong with the deficit countries proper ; this well-fed, food-exporting region is merely filling up and diversifying its economic structure. The Far East, not counting the uncommunicative People's Republic of China, has improved upon its shocking postwar shortages ; but its food production per head is still 13 per cent lower than in 1934-38. Latin America, which in 1948-51 was better off, relative to its prewar standing, than Western Europe, is steadily slipping back. Nutritionally, the rich are getting richer and at least some of the poor are getting poorer—and the poor, in the context, have an uncomfortably narrow margin between their present standards and actual famine. The Malthusian bogey may look less menacing than he did, but he remains formidable enough in his own territories.

★

These are the facts behind the Malthusian controversy. They throw a revealing light on the three arguments that are most commonly used by those who engage in it. In the first place they demonstrate the essential irrelevance to the problem of hunger—except as a purely theoretical limiting factor—of the dreary global balance of food and numbers, about which so many books continue to be written. These books have no bearing on the tasks of today, or of any foreseeable tomorrow. In the words of Sir John Russell—one of the most distinguished, and certainly one of the most level-headed, authors in this field—whose "World Population and World Food Supplies" was published* this week: "Advanced countries able and willing to pay for food will, so far as I can see, always get it."

And, outside advanced countries what will matter to the hungry is not that somehow, somewhere, on some terms, more food may be produced ; but their own capacity, family by family, to produce either food or food's worth. One can qualify this statement to allow for international flows of food otherwise than in the normal course of trade ; for famine relief, and for special consignments under mutual aid programmes, whether motivated by political or strategic need or by plain human generosity. And within the richer national groups more important qualifications apply ; inadequate producers can draw for subsistence, as a matter of civic right, on the production of others. Not even the wildest Utopian, however, goes so far as to preach a supranational taxing authority—equalising, on the model of the national Welfare State, the standards of the Middle Western farmer and those of the Indian ryot. By and large, those who produce much, whether of food or of food's worth, eat well, and those who produce little eat badly. The capacity of copious producers to produce still more is neither here nor there unless the would-be consumer can directly or indirectly offer value in exchange.

★

Secondly, no order can be brought into the Malthusian controversy until it is recognised that—whatever happens to total food production—there can be no simple and painless way of cancelling out recurrent surpluses and endemic hunger. There are those who, soaked in the mental atmosphere of the 1930s, see the conjunction of increasing food supplies, unsold stocks and still unfed mouths as evidence of sheer economic and political perversity. Their attitude was summed up by a recent cartoon (in *Picture Post*, by no means a fellow-travelling organ) which showed a Chinese peasant struggling half-strangled between the uprights of a dollar sign. There must, on this view, be some hitch or blockage somewhere in the economic mechanism, impeding what would otherwise be a smooth flow of supplies from bulging granaries to hungry mouths. It is up to the politicians, bankers and economists to remove it.

The beauty of this idea is that the remedy is so entirely painless ; one abracadabra being replaced by an abracadabra of better quality, the trick is done. The difficulty is that the idea has no substance in economic fact. Whatever hitches and blockages may exist in the economic system today, they obviously do not include those arising from gross deflation and remediable by an expert and painless turn of the monetary and credit taps ; there may have been some justification for this view in the 1930s, though even then Mr Colin Clark, in his "*Conditions of Economic Progress*," plainly showed that the "plenty" sterilised by depression was a drop in the bucket and that the world as a whole was "still mouse-poor." Nor—an even harder point for the well-meaning layman to grasp—can the blame be laid on the "dollar curtain" and the tangle of currency restrictions ; there is no hey-presto solution to be expected from some super-Bretton Woods agreement that would, by sheer esoteric expertise, produce universal convertibility and a rupee acceptable in Kansas. In the 1930s there were many deficit areas within surplus countries that had a single currency system ; Jarrow was one of these. Even were the most improbably universal return to classically liberal economic policies to produce a single trading and currency area in an economically unified world, the producers of next to nothing would still have next to nothing to live on.

Talk about "man-made barriers" between actual or potential plenty and the mouths that it might feed is, in fact, mostly nonsense. In one instance, that of Japan, it is relevant ; oddly enough, it is never of Japan that

* *Allen and Unwin.* 513 pages. 50s.

one hears the argument used. Elsewhere the trouble remains what it has always been: mere, sheer, lack of productive power, whether directly or indirectly applied to the business of food-winning. Short of the quixotry (in the long run disastrously ineffective and in any case politically out of the question) which would make the millions of inadequate producers in the world permanent pensioners of the more fortunate and able, the remedying of that lack of productive power is the only way to tap the unevenly distributed plenty of the world's harvests. And it is the need for this increase in total productive power that is the third—and only really relevant—subject for discussion and action in the struggle against world hunger.

Unfortunately, it is a very difficult subject. There must be more than 1,000 million people in the world today with an income lower than the national assistance authorities of western countries regard as a tolerable subsistence level; there are less than one fifth of that number of active workers in the countries with a really advanced standard of life. It would need an extraordinary increase in the latters' saving per head (which means a cut in the consumption per head) to provide the capital needed for a serious attack on productive deficiencies in Africa and the East. Even if more capital were available, there would not be immediate openings for a great increase in productive investment in the underdeveloped countries; the way for the export of capital would have to be smoothed by the prior export of technicians and of technical knowledge. The increase in total production per head in the hungry areas is going to be an uphill, slogging, painful job, not to be short circuited, even if it may be substantially aided, by injections of Western capital and the advice of Western technicians.

The sooner it is accomplished the better; the more effectively and intelligently the West can help the better—on grounds of selfish expediency as well as of human solidarity. Nothing has essentially changed; the remedying of poverty is no more and no less desirable and urgent than it was, because the FAO can report a 1½ per cent gain of world food supplies on world population. But by the same token—and here is the lesson for the neo-Malthusians—nothing would be essentially changed were next year's FAO report to note a 1½ per cent loss. Food would still be adequately consumed by those who could adequately produce either food or food's worth; it would still be inadequately consumed by the inadequate producers, however many and hungry they might be. One World or no One World: it simply is not true, however attractive it may seem as a figure of rhetoric, to say that mankind is all in the same Malthusian boat. The most that can be said, for good or ill, is that we travel in convoy.

Soviet *Apartheid*

MR BEVAN has returned from his trip to Moscow and China with a confident claim to have "opened doors which were closed." Mr Attlee's reports are considerably more qualified. Of his conversations with the masters of Russia, he says: "It soon became clear that we could not understand each other"; of the Chinese, that "the curtain of ignorance is thicker and more dangerous than the Iron Curtain." Mr Attlee cites some instances of Chinese and Russian ignorance of the outside world that would be supremely comic if they were not so alarming in their implications; and the whole Labour delegation, it seems, came away convinced of the crying need for more Russians to see the West with their own eyes.

Indeed, a tour such as these delegates have made, far from indicating that the curtain is being slowly withdrawn, reveals very clearly how easily the Communist authorities can lift it for particular purposes that suit them, and then drop it again. There are plenty of other illustrations of this at present. British visitors in particular seem now to be reaching Moscow in increasing numbers; but the selective nature of this trend was well brought out by the case of the gentleman who tried to get a visa for the supremely harmless purpose of watching a football match. Communist hospitality consists in admitting only those whose presence furthers Communist ends in one way or another, and any visitor who thinks that he himself is forcing the door open is suffering from a strange delusion.

Yet today, more than ever before, Communist propaganda calls for friendship between all peoples. And friendship, whether between individuals or whole peoples, is scarcely possible where there is no real contact. For many years, Stalin's subjects were denied all such free contact with the outside world. The sickening business of the Soviet-born wives of foreigners was only the most dramatic expression of a policy of *apartheid* which both Dr Malan and the Tsarist police would envy. To bring out its intensity, one need only ask some simple human questions about matters taken for granted in relations between normal civilised states. How many westerners—other than trusted Communists—have even seen the life of an ordinary Soviet household? How many have uninhibited and regular contact with personal friends in Russia? How many could invite those friends to spend a holiday in private homes in the West?

The new rulers in the Kremlin have made great efforts to show the world a less scowling face than Stalin's. Some hostages and prisoners have been freed; Russian sportsmen and scientists have ventured briefly on to capitalist soil; western businessmen have become familiar with Moscow hotels (and their prices); and the number of delegations of various kinds that cross the Iron Curtain has been increased. These gestures have not failed to make their mark on the western public, to most of whom the human touch means far more than any amount of debate about co-existence. But the essential insulation of the Soviet peoples remains.

Is there any real reason why their government should end this policy of *apartheid*? Its motives in retaining it are obvious enough. The fantastic secrecy that shrouds the Soviet sphere is a powerful military weapon. On the political side, secrecy serves the Kremlin's purposes both in the domestic and in the international field. The Soviet peoples have no means of detecting the falsity of the picture that is presented to them, the picture of a non-Communist world reeking with poverty, corruption and mania for war. The peoples of the world outside—including the rank and file of the western and Asian Communist parties—are likewise unable to see for themselves whether Moscow's claims to have created a paradise on earth are true or false. Soviet *apartheid*, the party leaders argue, is essential to the maintenance of blind faith and iron discipline both at home and abroad.

★

These are strong arguments, as far as they go. Yet it can also be argued that, in the changed circumstances of 1954, the Soviet leaders would be wise to consider abandoning the weapon of secrecy. It is in some danger of frustrating what appears to be the policy of the government now in power in Moscow. If Malenkov and his associates really want to bring about a nicely calculated easing of international tension, they must think seriously about this point. For, at bottom, it is the insulation of the Soviet world that maintains the tension. Despite the Communists' claims that western fear of Russia is artificially created by malicious inventions, it is a fact that this fear arises less from what the free peoples are told than from their ignorance. The outstanding characteristic of the western public today is wariness. It shows no enthusiasm for swallowing scare stories. What does make its hackles rise is precisely the policy the Kremlin has been following—the repetition of soothing slogans from behind a bristling screen. Can Molotov achieve the degree of relaxation he claims to seek without removing the cause of this suspicion?

There are also more precise indications that the *apartheid* policy has reached a point of diminishing returns. First, the cherished device of carefully bear-led visits to Communist countries has lost much of its value. Those who report back in immaculately glowing terms on the glories of Soviet life are now treated as dupes and decoys. This was largely true even before the ground was cut from under their feet by the scathing attacks on unnecessary hardship in Russia made last year by Malenkov and his colleagues.

Second, the comparative frankness of the post-Stalin era has itself removed part of the need for secrecy. While the supreme presidium is repeating in chorus that Soviet housing is lamentable, that agriculture is on the wrong track, and that consumer goods are shoddy in comparison with western products, there is not much point in preventing visitors from the outside world from verifying these things with their own eyes.

★

Third, the launching of the Beria-Malenkov economic policy, with its shift of emphasis in favour of the common customer, should mean a reduction in the number of skeletons in the Soviet cupboard. Already some Russians are willing to concede privately that the survival of dark corners in their economy is one of the main reasons for continued restrictions on the entry and movement of foreigners. Even if, for some time to come, many Russians are still deplorably housed and clothed, the foreign visitor should receive an encouraging impression of progress.

Fourth, Soviet intellectuals have lately had a chance to air their long repressed sense of frustration under the clumsy hand of the party bureaucracy; and the world has seen for itself how bitterly frustrated they feel. How much longer will they be content without the rights which are the breath of life to their counterparts in other countries—such as the right to objective opinion, to travel freely, and to exchange thoughts intimately and at leisure with foreigners working in the same field?

All this must be obvious enough to the clearer brains in Moscow. It must also be obvious to them that to abandon *apartheid* need not involve disclosing any vital military secrets. It is human contact that is in question. It must be genuine, unchaperoned contact between individuals; no mere extension of the present system of heavily conducted tours will suffice; but have the Soviet rulers so little confidence that they fear that individual friendships will destroy the foundation of their state? Their fears should perhaps take an opposite direction. In the files of *Izvestia*, they will find a recent article by Mr Sergei Obraztsov, the puppet master who appeared this year at a London theatre. Reflecting on his journey, he wrote:

> Moscow and London are *near*—right next door. Then why is the distance so great between people? . . . Friendship between peoples is impossible without getting to know one another, without personal contact, without concrete personal friendship. This plain truth is sinking deeper and deeper into the minds of millions of people in different countries.

If the Communist leaders continue to make such friendships impossible, they may find it equally impossible ever to calm western suspicions and fears. Indeed, they will have provided further evidence that those suspicions and fears are not unjustified.

Notes of the Week

Brussels Lace?

As a fact-finding tour, Mr Eden's journey through Europe looks like yielding more results than did the Labour leaders' visit to China. As an emergency blood transfusion to save a heart that had nearly stopped beating, it has already had a notable effect; colour has returned to Europe's momentarily waxen face. There can be nothing but praise for the speed with which the Foreign Secretary has moved. Yet, with due respect to Professor Einstein, it is to be feared that in this case the equation between energy and matter does not apply; no amount of mere motion will fill the vacuum left by the French rejection of the European Defence Community treaty on August 30th.

What substance can be found to do so? The case for blowing the dust off the Brussels Treaty of 1948 and drawing Italy and Germany into it is certainly an interesting one. It is a stout little treaty; it binds Britain, France and the Low Countries to afford any one of them that is attacked "all the military and other aid and assistance in their power." Textually, it is thus a tighter bond than the Atlantic Pact, the signatories of which are pledged only to take "such action as they deem necessary" if one of them is attacked. But the Brussels group, having been absorbed into Nato, has never itself acquired the kind of strong links that Nato has developed by the creation of a command structure, a common system of bases and supply lines, and joint manœuvres over a number of years. Nor has it any supra-national characteristics of the EDC type; and there seems to be no intention of grafting them on to it. The Brussels idea offers three encouraging aspects: for France, no loss of sovereignty; for Germany, no invidious discrimination; for Britain, a means of grappling itself reassuringly to Europe within the framework of a treaty that exists and has long been generally accepted by public opinion. Yet it would be wilful blindness to regard it as anything but a poor second best to the discarded EDC; and it does not remove, though it may diminish, the difficulties of the problem of Germany's future relationship to Nato. Naked realities cannot be wholly concealed by throwing over them a veil of Brussels lace, however historic and intricately worked.

Dulles from the Blue

It is to be hoped that Mr Dulles's abrupt decision to cross the Atlantic is not as ominous a portent of Anglo-American disunity as his departure from Geneva. The descent of the Secretary of State and an imposing retinue on Bonn and London just as Mr Eden was completing his grand tour inevitably suggests the appearance on a small stage of a second star trying to jostle the first out of the way; and confusion, at the least, is the immediate result. The precise reasons for Mr Dulles's trip were not announced. But it is evident enough that two different lines of action have been favoured in London and Washington since the failure of EDC. Mr Dulles's first proposal was for a meeting of the Atlantic Council. From the Foreign Office came the suggestion that a conference of nine states should precede any meeting of the full council. This, in turn, found little favour in Washington, and Mr Eden set out on his personal tour as a substitute first step. Now Mr Dulles appears on the scene. Is he simply impatient about Mr Eden's tactics?

Some delay must certainly be inherent in any plan to negotiate within narrower limits than those of Nato some substitute for EDC, an attempt which might, indeed, end as negatively as EDC itself. Anxiety about that may be the chief motive behind Mr Dulles's action. Another, and a very rational one, might be his fear that Congress would not listen sympathetically to a new European project that appeared to have been devised under British leadership while the Secretary of State was preoccupied with the Far East. Again, one can well imagine that Mr Dulles, to whom action is the breath of life, found it personally painful to be absent from the scene of so much activity. But a visitation so brief as to leave the nettled French on the sidelines needs a good deal of justification; and it is a significant point that even in Germany opinion seems out of sympathy with Mr Dulles's haste, while Mr Eden's approach has proved popular there.

Dr Adenauer Alone

Mr Eden's visit saved Dr Adenauer from having to appear before the *Bundestag* last Tuesday with empty pockets. It would have been very difficult for him to say anything encouraging in his planned statement; the atmosphere would have been heavy with failure. In the *Land* elections in Schleswig-Holstein, the voters had clearly shown that they no longer consider the Chancellor the statesman he was. The Christian-Democrats' share of the votes fell from the exceptional peak of 47 per cent in last year's federal elections to only 32.2 per cent last Sunday. Dr Adenauer's party lost to all the others and suffered from abstainers as well. In a predominantly rural *Land*, the Social-Democrats gained the most outstanding victory, and now have the same number of seats as the Christian-Democrats.

Little comfort can be found in the fact that Dr Adenauer retained an absolute majority in Schleswig-Holstein with his federal government coalition partners. The term "coalition partner" has become misleading since the French killed the EDC. Dr Adenauer has been shot at from all sides, and the Free Democrats, the second largest party in the coalition, have taken the lead in asking him to give up the office of foreign minister. It has indeed been hard to find a friend of Dr Adenauer's in Bonn in the last two weeks even in coalition circles. He alone has placed the blame on the French; his critics, going to the other extreme, smooth over the part played by France, and forget that Dr Adenauer has not been alone as regards EDC, that American and British policy has been running on the same single track. The politicians have also become vocal who have long resented Dr Adenauer's concessions to the French, notably over the Saar. His lapse of judgment in his interview with *The Times* has injured his reputation further. And from all sides in Bonn resentment was heard about the "defamation" of the Germans in his warning that German nationalists may turn to the East. At the same time the anti-Nazis, rightfully anxious about their future, criticise him for allowing so many former servants of Hitler's regime to occupy important posts and for opening the door to a German army.

★

The Chancellor himself, before Mr Eden flew in, had made his stand clear. He demanded a plain, simple declaration returning German sovereignty, and said that Germany would not make proposals for an alternative to EDC, but would await a lead from others. He gave no guarantee that Germany would voluntarily keep its army below the strength of its allies, or otherwise relinquish sovereignty; but he indicated that this is not at all out of the question. Indeed, it is satisfactory to note that the Free Democrats too are likely to accept some form of limitation on arms production and forces, and even guarantees against any future German aggression. The "European idea" is not quite dead.

It is hard to over-estimate the way in which Germans now look to Britain to take the lead dropped by France. There are clearly dangers in the welcome given to the communiqué issued in Bonn after Mr Eden's visit. Exaggerated hopes may have been placed on the phrase which, in the German translation, gave an assurance that Britain can take part fully in the new European unity that is being planned. It would be unfortunate if disappointment with France were followed by disillusionment about Britain. There is great need for clarity on British policy, which is misconceived in many German quarters. Britain, it is thought, may be ready to lead a European "third force," which would hold a balance between Russia and America. German nationalists may indeed one day turn to the East, as Dr Adenauer warned the world, but the main idea that has gained ground since August 30th is that of German Bevanism, neutralism and co-existence with the Soviet bloc.

Opportunity at Strasbourg

Last spring, when the date was set for the meeting of the Assembly of the Council of Europe, it could not have been foreseen that the third and fourth weeks of September would be crucial ones for the European community. The Strasbourg politicians have now, fortuitously, been given a greater opportunity than they have yet had, or may ever have again, to affect the pattern of European development. The Assembly has usually found itself commenting after the fact on major developments. Given the statute under which it operates, this is often inevitable; but at a time like the present, when the props have been knocked from under established policies and agreed objectives, it is not.

During the two years between the signature and the final rejection of the EDC, many of its staunchest supporters were troubled by the fact that the treaty was not fully understood even by its friends, and that ratification by a slim majority would not constitute a real decision for a policy of European unity. It is important for those who are groping for a new approach to know now, while they are still groping, what things people feel strongly about, how much support there really is for "European unity," "closer British association," "supra-national" institutions such as the coal-steel pool, and what these words mean to different people. It is here that the Strasbourg Assembly can be uniquely useful if it will forgo the temptation to be content with platitudes, and forswear, for the next few days, a natural preoccupation with its own future. One thing in particular the Assembly, and perhaps only the Assembly, can do; that is to make clear for the guidance of ministers and civil servants how deeply the urge towards some form of European unity runs. If, despite its recent shock, the baby is still vigorous, now is the time for it to cry out.

Faithful Dobbin

The Trades Union Congress wound up at Brighton last week in good order; the conference hall was then taken over by an assembly of international magicians. Throughout the congress, the General Council remained in reasonably full control. The majority in favour of its view on "German rearmament" was disappointingly narrow; and congress voted against the council in demanding total repeal of the new Rents Act, in declaring its opposition to "any general move by employers or the state" to whittle away the ordinary citizen's "right to expect to retire not later than 65 years of age," and in calling for the abolition of entertainments duty in the live theatre. But the council got its way with surprising ease when it asked for rejection of a motion that would have opposed "any form of wage restraint"; and it steam-rollered its way through the short debate on public ownership, in a way that suggests that the average trade unionist now regards specific proposals for further nationalisation with profound boredom.

This congress showed again that any vote that commands the united support of the leaders of the seven or eight really big unions is almost certain to be carried. Among the most important of these votes, of course, are those for seats on the General Council itself. At the moment the whole congress votes in these elections; the big unions therefore manage to elect their own general secretaries and sometimes their presidents to the council, and fill up the other places with right-wing representatives of the smaller fry. As a result of this system the Communist-dominated Electrical Trades Union has no representative on the council; with

250,000 members, it is the biggest union that is not represented in this way. It is now leading an agitation for a "reform" in voting procedure, whereby the representatives of individual industrial groups would be elected by the members of those groups and not by the congress as a whole.

This system would not, in fact, be likely to help the ETU itself; its candidates in its own section could still be voted down by the mass vote of the non-Communist AEU. Mr Horner, the Communist secretary of the non-Communist mineworkers, would certainly reach the council under this system; but he would not be accompanied by sufficient of his comrades to make real trouble. It is therefore not true to say that the right-wing composition of the General Council is due to any gerrymandering at the congress itself. It is a stable phenomenon, rather than the result of some dubious sleight of hand; and what a very fortunate phenomenon it is.

Before the Conservative Conference

WHILE Labour party factions have been noisily sharpening their knives for the coming battle of Scarborough, Conservative constituency parties have been quietly grinding their axes. The agenda for the Tory conference, which is to open at Blackpool on October 7th, has not yet been published; but it is said to be unusually heavily loaded with resolutions. This is all to the good, because it suggests that the Conservative conference is still a developing organism. At Labour conferences the excitement springs solely from what is said and done: the mechanics of the meeting and its composition are only too well known. Conservative conferences, on the other hand, are still to some extent enigmatic. The relation between the platform and the floor has not yet been fixed; the hierarchy is left wondering whether it will for ever be able to rely upon the almost blind support of the rank and file. In recent years it has seemed as though the floor were growing steadily more assertive, and a large agenda for next month's conference is a sign of vitality in the constituencies.

The Conservatives at Blackpool naturally expect to benefit from the quarrels of Labour, but though this may give them a temporary advantage they can only thrive in the long run on their own positive proposals. Some Conservative leaders believe that the Blackpool conference will be dull; but the rank and file, entering the fourth year of this Government's life, will want something better than dullness to stimulate their campaigning. Emotionally, the conference may be quieter than that of last year, when Sir Winston Churchill returned to public life and Mr Eden ended his convalescence. Since then, the party has adjusted itself to the inevitability of change; it does not, however, expect to learn anything new at Blackpool about that change's timing. In foreign affairs, Mr Eden's dominance is established. He has had his way over Suez, and the issue seems to have excited the public very little. In domestic affairs, Mr Harold Macmillan has continued to provide houses, but has tackled rents in a way which may give the Tory canvassers some trouble. The scale of national expenditure remains a nightmare to many loyal supporters of the party, but few Tories are disposed to attack Mr Butler's general financial management. Agriculture has not yet been rescued from the confusion which the Chichel Down affair revealed, though Mr Heathcoat Amory's persuasiveness should induce the conference to allow him a little more time to put things straight.

Breaking the Railway Deadlock

AT a price, Sir Brian Robertson appears to have averted a railway strike this autumn. The National Union of Railwaymen has accepted his new offer as a basis for resuming negotiations, and there is now a chance of an agreement covering all branches of the railway staff.

The NUR has agreed that the new minimum for adults should be £6 5s. a week to begin with and £6 7s. after one year's service, compared with a present minimum of £6 4s. 6d. The next step is to secure agreement on the wage to be paid to the NUR's most skilled workers—the top-rated signalmen. Their present wage rate is £8 10s. 6d. a week; the Transport Commission had offered to increase this by 4s. 6d., but it can be taken for granted that this offer will be raised in the course of the new negotiations. Once the highest and lowest rates have been settled, the Transport Commission and the NUR are to seek agreement on the grades in between. The union has for some time been pressing for a reduction in the number of grades. Since there are now as many as 66, this request seems reasonable. But as nobody can be down-graded in terms of cash, a wholesale reshuffle would mean a further sum for the commission to find over and above any increase decided on for those whose grading is unchanged.

An unknown factor in this new attempt at a settlement is the attitude of the Associated Society of Locomotive Engineers and Firemen. It and the third railway union, the Salaried Staffs' Association, have accepted the Transport Commission's invitation to a joint meeting with it and the NUR, which was due to take place on Friday. If the ASLEF agrees to resume direct negotiations with the commission, instead of insisting on arbitration, it will presumably mean that the commission is prepared to pay considerably more than the 4s. 6d. rise which was its previous offer to the engine-drivers. They themselves had asked for an increase of 26s. 6d., but they are not of course going to get it. What is also unknown, because so much remains to be decided, is the total cost of the agreement—if it is achieved. Even if it proves to be less than £6 million a year, it will still have to be found, not from a subsidy—as the NUR recently contemplated—but from higher charges or increased productivity.

When Thai fears Thai

"IMMINENT" was the adjective used by the Siamese prime minister's office to describe Bangkok's fears of aggression by Pridi Phanomyong's "Free Thai Army." Now that a week has elapsed, one is tempted to ask how imminent an aggression can be. It may be assumed, however, that the Siamese spokesman had in mind an aggression of a less formal kind than one is used to in the West. In the new pattern of warfare, subversion is as important an element as invasion, and it is becoming increasingly difficult to determine where the one ends and the other begins. In Siam's case, the threat comes equally from across the Chinese and Indo-Chinese borders. There are three villains in the piece: the exiled Pridi, who has kept Bangkok in a state approaching the jitters since he came out with an article in Peking some weeks ago, calling on the Siamese to rise against their "puppet government"; a personage called Tiang Sirikhand, reported to be the leader of a Pan-Lao party which advocates the creation of a state uniting the Laotians of Laos itself and of north-eastern Siam; and Prince Souvannouvong, "prime minister" of the Viet Minh-supported Pathet Lao state in the jungles of northern Laos.

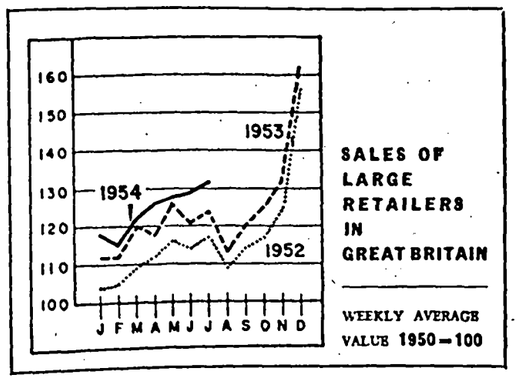
In itself, each of these movements might not present a threat that it would be beyond Siam's capacity to counter; together, linked by the dream of a Thai Federation and with the tacit military support of China and the Viet Minh, they look somewhat formidable. There is no reason to doubt the recent estimate by the Siamese prime minister, Marshal Pibul Songgram, that there are only 10,000 Communists in the whole country; but there are two or three million Chinese and several million Laotians in Siam, not to mention a potentially dangerous Vietnamese minority. Siam has, indeed, all the elements of a subversives' paradise. Whether armed attack is really in the air or not is difficult to judge, but the Siamese warning should not go unheeded: it is a clear notice to Seato that its services may be required sooner than had been expected.

After Iraq's Elections

ELECTION day in Iraq was September 12th, with an initial 300 candidates for 135 seats. But, in the event, the election took unexpected forms; 111 members were returned unopposed by September 7th and another dozen three days later, and of these, all, except two of the Istiqlal party, were independents. Even when the remaining results come in, an overwhelming majority of ostensibly non-party men is assured. The elections themselves were conducted without disorder, but the motives of so many candidates in withdrawing are not completely clear: among them, no doubt, are the fear of being shamefully outvoted, the probable loss of a deposit, or apprehension of official pressure in favour of sponsored candidates—and some effects also, probably, of the change-over from double-stage to single-stage elections.

Meanwhile, the questions of immediate interest are two: the actual allegiances and convictions of the "non-party" majority, and the probable attitude of the opposition. The nominal independents include not only a dozen genuinely non-party men, but perhaps 15 to 20 members of the Umma (Salih Jabr's National Socialists, which, as a party, boycotted the elections) and a few representatives of the recently suppressed National Democrats of Kamil el-Chadirchi and of the ill-defined "Popular Front." This leaves a more or less hard core of some 80 or more definite supporters of Nuri Said, whose own Constitutional Union party was itself dissolved, as a strategic move, immediately after he assumed the premiership. Although changes of attitude by individual deputies under various stimuli (including intimidation) are common in Iraq, it seems that Nuri has an abundant majority to support him in the Anglo-Iraqi treaty negotiations which lie ahead.

The opposition will come, as ever, from the anti-western and in certain cases strongly left-wing spokesmen, whose negative influence is apt far to exceed their numbers. These are certain to condemn the new chamber as improperly elected; but they will be able to withstand majority decisions only if they use sadly familiar methods, such as the encouragement of tribal unrest in the middle Euphrates or Kurdistan, and the incitement—fatal to the Treaty of Portsmouth in 1948—of the Baghdad mob.



Unperson, 1954

RECIPIENTS of the latest volume of the Great Soviet Encyclopaedia have found enclosed in it a discreet printed slip, on which the Moscow state publishers "recommend" readers

> to remove pages 21 to 24 from Volume 5, and also the portrait between pages 22 and 23, in exchange for which pages with new text are sent to you. The pages should be cut out with scissors or with a razor blade, the spine of the book being left intact so that the new pages may be stuck against it.

It is not a recommendation to be treated lightly by anybody within the reach of the MVD, for the entry which is thus deleted for all time from the knowledge of Soviet man is the long and laudatory biography of the late Lavrenti Beria, and the portrait that must now be piously burnt is his. The nightmares of George Orwell's "1984" have become a reality thirty years ahead of time in the vast area between Saxony and Shanghai, and Beria is already an "unperson," the record of his career "unfacts."

The space vacated by the former First Deputy Prime Minister is to be filled with an interesting assortment of items, headed by a photograph of a whale in the Bering Straits. Two distinguished Englishmen follow: Edmund Burke, "reactionary publicist and politician," and Bishop Berkeley, "reactionary philosopher and exponent of subjective idealism." This is a most felicitous choice. Burke, the impeacher of Warren Hastings, thus serves vicariously as a kind of People's Procurator in the more summary

trial of Beria; while Berkeley might well have been the first to agree that a man who can no longer be perceived cannot be regarded as having any reality. The state publishers of Moscow should be congratulated on the delicacy of their irony.

Pig–hoo–ey!

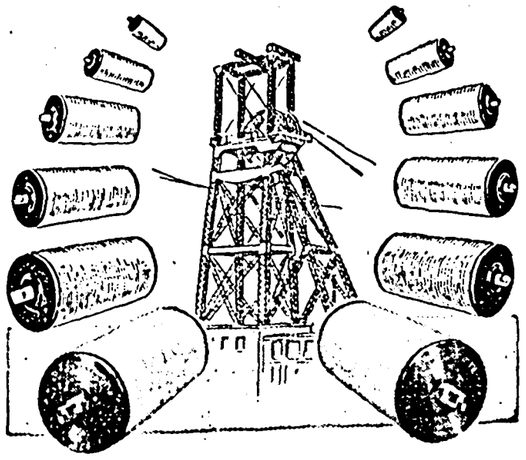
THE magic call "Pig-hoo-ey," sung in unison by Lord Emsworth and Beach the butler, was the means of urging to the trough that temperamental prize-winner, the Empress of Blandings. The call will also serve as a mournful comment on the present plight of the Fatstock Marketing Corporation, the Ministry of Food, and the Treasury. The existence of too many pigs—and particularly of too many fat pigs—is now the bane of their existence.

In the last few weeks, farmers have been offering a glut of bacon pigs to the Fatstock Marketing Corporation, the company formed by the National Farmers' Union, which has acquired a virtual monopoly over their disposal. This immediate problem has no connection with the competition of imported bacon supplies, which have been released at no more than a normal rate. The limiting factor is that bacon curers in Britain can absorb at most about 100,000 pigs a week, compared with the 154,000 pigs offered in one recent week to the corporation. The surplus pigs have to be switched to the depressed pork market—to the discomfiture not only of farmers but also of the Treasury, which has to pay a higher subsidy to cover part of the losses on them.

The corporation has evidently succumbed to the temptation to boost prices, which is open to a producer-controlled monopoly. But the fault is not wholly the corporation's. In contrast to Denmark, too few producers in Britain breed scientifically for the bacon market; to cut down the supply of unsuitable pigs, the corporation will guarantee a sale only to those producers who consistently offer a high proportion of good quality baconers. But the more fundamental need is for a great improvement in the methods of pig management and pig breeding, towards which the introduction this month of a national pig recording scheme is a small contribution. *Other needs, of course, are to adjust the relative prices of pigs for bacon and pigs for pork; and to recognise that the guaranteed prices for all pigs are excessive.*

There will, however, be pressure from a third way out: to expand curing capacity in this country while restricting Danish imports. So long as Danish farmers supply bacon at about 60 per cent of the price paid to British producers (who are now raking in total subsidies of £1 million a week) this course should be bitterly resisted.

A Union of One's Own



TO twist the tail of the Transport and General Workers' Union is now almost a registered national sport; and another opportunity has been afforded for it this week by the news that a majority of the dockers at Hull and Birkenhead intend to desert to the rival union of National Amalgamated Stevedores and Dockers. In this case criticism of the TGWU is unfair. As a result of its long and successful battle to de-casualise work at the docks, it operates under a rigid agreement with the employers. Nearly every unofficial strike that flares up at the docks is in breach of this agreement; and the TGWU is therefore usually bound to advise its members to go back to work before their grievances are discussed. The local union official who passes on these instructions is appointed by, and responsible to, headquarters in London; and he is usually regarded by dockers in his area as "one of them" rather than "one of us." To this must be added the age-old feeling of many dockers that they would like to have a union of their own, rather than a rambling organisation that they share with so many other industries. The surprising thing in these circumstances is that there have not been more breakaways already.

A breakaway has always been possible because the small NASD, which started poaching dissident members from the TGWU as long ago as 1923, has been an uninhibited alternative suitor. It has got its new opportunity largely because the recent strike at Hull was based on a genuine grievance and was not Communist-led; the youthful leaders that became prominent in the course of it have inspired intense personal loyalty, even although one of their motives in the proposed breakaway may be the belief that they can build up positions of influence for themselves in a smaller union. The proposed breakaway at Birkenhead, which does seem to be Communist-led, is being aided by the fact that the movement at Hull has made drastic action respectable.

The TGWU has refused to co-operate with NASD on the national joint council of port employers and workers, and is referring the matter to the TUC's disputes committee. This body does some very useful work in settling quarrels between individual unions; for example, it is at present doing its best to smother the quarrel between two printing unions, which at one time threatened to hold up the publication of all national daily newspapers. But the TUC has no potent disciplinary powers, and it is not going to find it easy to bring the headstrong NASD to heel. If it fails to do so, this may be the signal for more trouble—and also for less effective union representation—at the docks.

The Squire's Successors

THE impending sale by the Duke of Devonshire of fifty farms, covering 4,500 acres of land in the Peak District, raises again the question of who is to replace the large private landowner, as death duties cumulatively mop up his once broad acres. Indeed, the Derbyshire branch of the National Farmers' Union believes that it raises an agricultural problem which "justifies a national inquiry." The reason given by the farmers is rather curious. The Duke, like all good landowners, is giving his tenants every encouragement to buy their own farms; they can buy them with borrowed money, but they protest that the mortgage payments they would then have to meet would far exceed their present rents. This "hardship"—and to individual farmers it does seem a hardship—is a reflection of the fact that

Down to earth . . .

BAKELITE Plastics are down to earth—in more ways than one. Hundreds of feet below ground BAKELITE Plastics are helping to reduce fire hazard in coal mines. Rollers* for coal conveyors have self-lubricating bearings made of BAKELITE graphite-loaded materials which allow dangerous static electricity to be conducted safely to earth. P.V.C. compounds, based on BAKELITE Vinyl resins are used for the conveyor belt itself. These materials are among the many developed by Bakelite Limited which are making life safer and easier underground and in the air, on land and at sea.

PROGRESS IN ELECTRONICS

The wonder of television is already lost to the millions who see and hear in their own homes events which may be occurring hundreds of miles away. And even to those who do not yet possess a receiver, this modern miracle is hackneyed by the daily news it makes for them to read. It is already an accepted part of our lives, to be judged and debated not on its technical qualities, but on its value as an entertainment and its influence on our culture.

And yet what it is and what it may become depends largely upon the scientific research and manufacturing techniques that have converted light into electrical energy, and electrical energy into light.

Present day television would be impossible without the cathode ray tube. A beam of electrons, modulated by received signals, scans a fluorescent screen within the tube, and paints upon it a reproduction of the original scene or picture.

Mullard long-life cathode ray tubes are specially designed to maintain excellent picture quality over a very long period of service. Although highly intricate and complex devices, modern methods of production and rigid quality control permit large scale manufacture of tubes of consistently high performance.

Mullard's contribution to the development of television is, therefore, a significant one. Great manufacturing resources are supported by intensive research and development facilities, and these are at the service of an industry which leads the world in the progress of electronics.

fly **BEA** *south to sunshine*

out of the northern fog and rain . . . into the glorious southern sun. BEA flies you to blue seas, blue skies, to romantic places where the autumn and winter sun shines bright and warm. Flying BEA means more time in the sun. You're there in a few hours, by turbo-prop Viscount or luxurious Elizabethan airliner —with all your foreign currency intact; or you can pick a sterling area. BEA flies you at speed, in comfort, without fuss — and at tourist return fares— to 16 southern sunshine centres.

BEA fares cover refreshments, service, luggage, *everything* from airport to airport. It's all so smooth you touch down fresher than when you took off. Booking is simple; and better the sooner. Just ring, write or see your Travel Agent; or BEA, Dorland Hall, 14-20 Regent Street, London, S.W.1.—Tel: GERrard 9833.

TOURIST RETURN FARES *from London.*

agricultural rents remain ridiculously low; they have risen on average since 1939 by *little* more than 30 per cent, compared with around 250 per cent for farming costs and 400 per cent for farming profits.

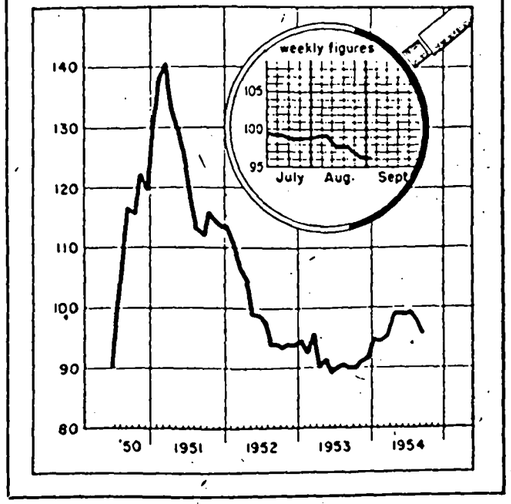
The long-term health of agriculture requires higher rents than this. But, since 60 per cent of Britain's land is farmed on the landlord-tenant system, it also requires good landlords who can afford large and stable investments of capital. The only large private purchasers likely to come forward are those rather unkindly described by the Duke's agent as "spiv landowners"—by which he means businessmen willing to sink large sums in agriculture for non-agricultural reasons. Some of the capital thus provided comes in search of the preferential tax and death-duty treatment of agricultural land; consequently it is liable to sudden withdrawal, while the schedule of improvements and rents will often reflect the complexities of the owners' tax account rather than the possibilities of efficient production. Agriculture has also a surprising number of small landlords; in some counties they outnumber the farmers. But these small men have often little capital to contribute to agriculture—and they often do not appreciate the economic possibilities of their land.

There is no solution to be found in further unilateral tax concessions to agriculture; these would merely add to the present instability and distortions. The proper remedies are threefold. First, tenants should be given more incentive and improved credit facilities to acquire their farms; they should not be given subsidised credit facilities compared with other small businesses and private people buying their own houses, but neither should their facilities be worse than those available for these groups. Secondly, the financing by partnerships or joint stock companies of fairly large self-contained units should be in every way encouraged. Thirdly, landlords should be persuaded, by tax adjustments and in other ways, both to charge higher rents and (as a corollary) to invest more new capital.

First Aid for France's Economy

IN the interval between its North African headaches and the European nightmare, the government of M. Mendès-France has found time to announce its first batch of economic decrees. These are based on the foundation of the wide powers already granted to the government by the National Assembly, and form a part of the plan to modernise the French economy through freer trade and higher productivity. Among the first decrees there are three interesting ones: the tentative liberalisation of up to 65 per cent of imports from quantitative restrictions, ahead of the timetable agreed with the OEEC; the cut in fuel and power prices for certain industrial users; and the creation of "reconversion" funds to modernise industry and assist labour mobility.

These are merely the first steps, but even these will increase the burdens of the French treasury. It is provisionally estimated that, without any radical cuts in expenditure, the total budgetary deficit (including "below-line" expenses) will for the first time exceed 1,000 billion francs next year. M. Faure, the finance minister, has expressed his satisfaction with the progress of industrial recovery combined with price stability. At the same time he asserted that everything must be done to avoid a new inflationary dose. Yet where are the cuts to come from?



When the first budgetary proposals are deposited next month in the parliamentary commissions, M. Mendès-France will soon rediscover that ministers and deputies seldom agree on the definition of "unproductive expenditure." Politically, the reduction of defence expenditure is probably the safest way out (though it is argued in Paris that such intentions were the real cause of the recent resignation of General Koenig, the Gaullist minister of defence). But not much saving is expected from this source, and the military budget must ultimately depend on the solution found for West European defence. M. Mendès-France has gained a reputation for courage, and he has the economic problem very much at heart. How boldly he can wield the scalpel will, however, depend on the majority with which he emerges from his European tangle.

The Ostrich and the Stork

AS Mr Attlee learnt in Peking, the problem of feeding swiftly growing populations—the subject of an article on page 876—does not furrow the brows of Communist leaders. On the contrary, Moscow and Peking welcome multiplication. Russian maternal stakhanovites gain the title of Hero Mother. China, Mr Attlee found, is prepared to see its population rise to 700 or 800 million in the next two decades:

> There is actual encouragement to intense fecundity. I think that the real reason is that, China being admittedly a backward country, its rulers hope to make up in quantity what they lack in quality in order to achieve a position of power in the world. It is a disturbing thought.

COMMODITY PRICE INDICATOR
1952 = 100 MID-MONTH FIGURES

There is good ground for this interpretation. It is only a few weeks since Peking proudly announced that its census takers (whose figures are rightly treated with caution by international statisticians) had totted up 602 million Chinese —a dramatic increase above the 454 million estimated in 1946. Already the impressive new figure is at the propagandists' fingertips; 600 million Chinese, we are told, cannot be denied a voice in Uno, represent the greatest market in the world, and so on. It is painfully reminiscent of the way the Nazis accompanied their clamour for *Lebensraum* with propaganda for a higher birth rate; and it is an anxious outlook for China's smaller neighbours, all of which have sizable Chinese colonies.

At the Rome conference on population, Communist theoreticians answered all such doubts not with argument but with dogma. Soviet experience, they asserted, showed that Communist economics could not fail to fill a growing number of mouths. Yet Malenkov and Khrushchév have lately revealed that Soviet agriculture is struggling with crucial shortages; Lysenko, the green-fingered wizard, is now said to have done "immense harm"; and reactionary Scandinavia and Argentina have been called in to help restock the Moscow food shops. Outsiders may be forgiven if they ask for a rather closer look at the alleged cornucopia of Communism.

Some reports from Rome described the Communist and the Catholic delegates as forming a "Micawber bloc," united by its carefree attitude to the threat of over-population. This was not wholly accurate. An authorised Catholic spokesman assured the conference that it was the duty of governments to warn their citizens of the threat, and to discourage any dangerous excess of births. The Catholic church is not wavering in its opposition to all artificial methods of birth control; but it has begun to face grim facts. Earlier in the conference Dr Julian Huxley had pictured our world as a hybrid bird, part stork, heavy laden with babies, and part head-in-sand ostrich. It seems, however, that only in the Communist sphere is the head still firmly embedded.

Surplus of Doctors?

A FEW years ago it was said that the health service could not be a success because there were not enough doctors to run it. Now it is being almost as confidently predicted that there will be unemployment among doctors in the 1960s. Last year, at the first world conference on medical education, one of the English delegates spoke of the need to balance the intake of medical students with the national need for doctors, and suggested that the University Grants Committee should undertake the task. This year's annual representative meeting of the British Medical Association carried a motion asking the Ministry of Health to set up a committee to study the problem. Last week, the Medical Practices Committee, the statutory body that fills vacancies for general practitioners, added its warning about prospective unemployment.

According to the committee's fifth report, the distribution of general practitioners is now much more even throughout the country. In 1948, the average number of patients on each doctor's list, in "under-doctored" areas, was 3,163. By the end of 1953, the average had fallen to 2,525, compared with an average for the country as a whole of 2,183. The committee's powers of altering the distribution of doctors are only negative. It can refuse permission to a doctor who wants to start a new health service practice in an area deemed over-doctored. It cannot tell him to go and practise somewhere else. Doctors have to be drawn into the unpopular parts of the country mainly by their inability to make an adequate living elsewhere. Now that general practitioners are much more evenly distributed, the coming generations of doctors will find it increasingly harder to make a comfortable living anywhere.

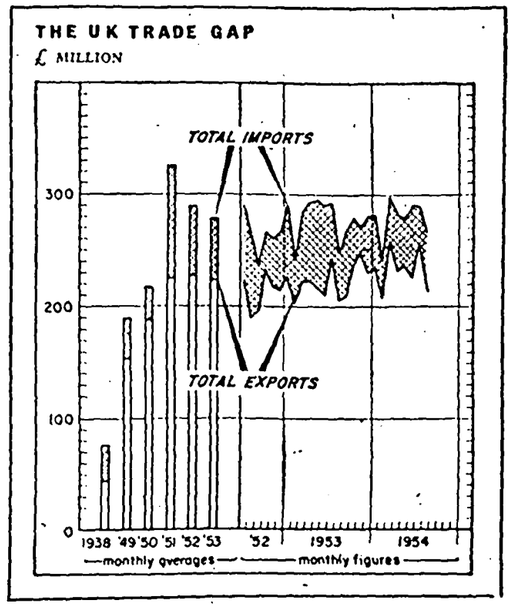
Over a long time, no doubt, the realisation of this will be reflected in a reduction in the number of young men seeking admission to the medical schools. At present, large numbers are turned away, but as many as 2,500 medical students are being enrolled each year in the United Kingdom and Eire. This year's students will not complete their training until 1960. If the Medical Practices Committee's prediction is correct, they will find it extremely difficult to find an opening in general practice; nor is it likely that hospital budgets will allow them all to be absorbed into the hospital service. Since a medical school is a particularly expensive part of a university, it would be wasteful to wait for the surplus of doctors to right itself—unless the Government is hoping to staff from it the undermanned and underpaid medical services of the armed forces. An expert inquiry into the matter certainly seems overdue.

Retribution or Reform

In the anger and indignation naturally felt at base, cruel, and wicked actions, there is at least a reason, or a justification, or at any rate a strong natural motive for flogging a child or slaughtering a man; and if experience have taught us that it is wrong to act on such a natural motive—that the extreme indignation and violence of the virtuous are erroneous like the wrongfulness of the criminal—this must be considered as one of the many very striking contradictions we continually discover, as society advances, between our impulses and the wisdom given by experience. What is called the heart, or the impulses and passions, and particularly the passions and impulses of ignorant and savage man, are too frequently at variance with the intellect to permit us to place our reliance exclusively on them. To achieve well-being man must get knowledge of himself, as well as the other portions of the material world; and as knowledge is the ultimate test of conduct, the contradiction already ascertained between our experience and the impulse which prompts to punish certain offences with flogging, imprisonment, or death, is an indication that further contradictions between our present impulses and future experience will arise. . . . The intense interest now excited by the subject of criminal jurisprudence; the numerous researches, theoretical and experimental, now making in it; and the contradictory opinions and recommendations promulgated, show that we have a great deal to learn before we can do any good by deliberately inflicting pain on some of our fellow-creatures. Perhaps, too, all these circumstances indicate the coming of a new era in penal jurisprudence, and the discovery of some new principle on which it ought to be founded.

The Economist
September 16, 1854

Enlightening the Consumer



THE Consumer Advisory Council that is shortly to be set up by the British Standards Institution is unlikely to satisfy those militants, in the Labour Party and elsewhere, who want an official and sharp-fanged watchdog to guard the consumers' interests. It should, however, provide both a useful liaison between consumer and manufacturer and a certain check on the unscrupulous minority who thrive on ignorance. The BSI Committees that were originally set up to devise "utility" standards had a necessarily narrow remit; and the Women's Advisory Committee, drawn from the women's national organisations, has proved disappointingly ineffective as a means of mobilising consumer opinion and experience. The new council, while continuing to work through these bodies, is expected to draw its main strength from the distributors, who can bring to its work both technical expertise and the benefits of long experience in dealing with manufacturers' associations.

The scope of any advisory body must remain severely limited so long as the law of libel prevents it from exposing even the most glaring deficiencies of design, material or workmanship, or falsity of advertising claims; and there is at present no question either of altering the law or of giving the new council privileged status. It is something, however, to have agreed standards to which the consumer can refer before parting with his money; and it is a great deal more to have these standards fully publicised and explained, so that the most bird-brained buyer of, say, a summer frock can immediately and automatically translate a given margin of shrinkage into "two inches less round the waist after the first wash." The standards will, of course (and here the distributors' advice should be especially helpful) need to be realistic ones. Experts are apt to have an idealist's bias against goods that, however popular with large numbers of presumably satisfied buyers, match a really low price with a lack of robust quality. The consumer may be unwise in buying, and frequently replacing, shoddy stuff; but so long as he has the means of knowing what he is doing it is no one's business to enforce on him the cult of solidity. In effect, there are two jobs to be done: that of ensuring that choice shall be informed, and that of improving the standards of personal judgment and taste by which choices are made and to which industry must eventually conform. The Consumer Advisory Council is properly concerned only with the first of these; the second is a matter of grass-roots education, in which no central organisation can do much.

Revising Military Law

FOR two years a Select Committee has been considering the form and content of the Army and Air Force Acts, which provide the statutory basis of military law. It has recently published its report and proposals, including draft Bills that could replace the Acts now in existence. The Army and Air Force Acts are a last relic of the now almost discarded belief that it is the right and duty of Parliament not only to control the Executive but also to keep in good fettle the machinery by which it does so. The army and air force still exist only on an annual basis. Parliament must take positive action each year, by passing an annual Act, to keep them in being. This is a good principle, and the committee respects it; it suggests that in future an Army and Air Force Act should have a possible currency of five years before reconsideration in detail, but that it should still need an affirmative resolution from both Houses of Parliament each year for its effective renewal.

The report of the committee is long (some 634 pages), very much a discussion of matters of detail, and on the whole non-controversial. The committee would like some clarification of the regulations governing forfeiture of and deductions from pay; it thinks that there should be no forfeiture without clear statutory authority, and no right for anyone to make deductions from a soldier's pay unless he is specifically authorised to do so either by statute or by the pay warrants themselves. The committee also wants to put an end to the limited exemptions now given to serving soldiers from some of the processes involved in the recovery of civil debts; Parliament should declare that a soldier's clothing and equipment cannot be seized for the benefit of his creditors, but it need not do more than this. Perhaps the most controversial section of the report deals with the status of civilians who accompany the forces overseas but who are not, in peacetime, subject to military law. At present, if these people commit any criminal offence they must be tried before a local court, and if punished by imprisonment must serve their sentences in a local prison. The committee proposes that these civilians should come formally under military law, which would render them liable (as the serving soldier is) to be dealt with either by a military court or by a local court—according to the nature of the offence and the treaty arrangements between the United Kingdom and the country in which they serve. Now that there is a system of appeals from military courts to a tribunal which is in effect a section of the United Kingdom High Court, this proposal seems practical and just. The report awaits Parliamentary action. It deserves to get it soon after the House re-assembles.

Letters to the Editor

Room for Japan

SIR—May I add one reason to those which you gave in your issue of September 4th why the United Kingdom should support the admission of Japan into the General Agreement on Tariffs and Trade? Many of Japan's natural export markets lie in British colonial territories; both the Japanese and the citizens of those colonial territories are relatively poor and "backward" economically; the removal of barriers to the import of cheap Japanese products into those markets would help to raise the standards of living in the colonial territories (by enabling them to purchase cheaper supplies from Japan) and in Japan (by extending the markets for its products). It is not proper for us to help sectional interests in this country by preventing the poorer members of the Commonwealth from buying their supplies at the cheapest available price. And it can only damage our political influence in Asia to treat as beyond the pale for trading purposes a Japan which is attempting to renounce totalitarianism, but sorely needs an economic background in which it can successfully confirm that decision. In the nineteen-thirties we, and other Western countries, made the fatal mistake of allowing Japan to expand by military means, while denying it the ability to expand by free economic competition. We must surely reverse both parts of this error.—Yours faithfully,

J. E. MEADE

London, N.W.1

Fizzkrieg Over Goa

SIR—I fully agree with the analysis of the Goan situation in your September 11th issue.

After a recent visit to India I should like to add a few words for the benefit of those who still think that Portuguese Goa is an Eastern stronghold of Catholicism and a real bulwark against Communism. Although leading Indian and Goan Catholics—including Cardinal Archbishop Gracias of Bombay—agree with their non-Catholic countrymen on the necessity of Goa's becoming an integral part of India, the mere presence of a Catholic colonial power on the subcontinent threatens to antagonise many Indians to Christendom in general and Catholicism in particular. The existence of pro-Portuguese native Catholics in Goa, though small in number, adds fuel to the hostility of those who regard the "Western religion" the sheer vanguard of European imperialism. Consequently, a few thousand "Portugocised" Christians in Goa must be a source of constant embarrassment to the ten million Christians in India—particularly because the vast majority of the latter are anxious to demonstrate that Christendom has no conflicting claims with legitimate Indian nationalism.

The reinforcement of Negro troops in Goa, whose arrival, incidentally, proves that Portugal, for lack of local support, cannot even raise some reliable "Goondas" like the French in Pondicherry, does hardly deter Communist aggression in South-East Asia. But their presence, as well as the otherwise desirable improvement in Portuguese-Pakistani relations, furnish new arguments for the extreme Left in India seeking to feed local suspicion about a "Goa-Karachi" axis directed against India. Moreover, should non-Communist Nehru be denied a success over Goa comparable to the one accorded to Communist Chou En-lai over Indo-China, the effervescent Indian Communists would know how to use this setback in national prestige in their propaganda against both Western intransigence and Congress incompetence.

From the continuation of the present "Catholic-anticommunist" rule in Goa Catholics stand most to lose, Communists stand most to gain.—Yours faithfully,

GEORGE A. FLORIS

London, N.W.1

Malaya's Rice

SIR—Mr J. B. Clegg, Director of Commerce and Industry, Colony of Singapore, asks me to say that prices of rice in Singapore, where there is no rationing of rice, are materially lower than they were during the period of acute scarcity.

Singapore Government is anxious to get out of the rice trade as soon as it can; and if the trade could satisfy the Government that in an emergency there would be a strategic stockpile available, it would get out immediately. Up to now, although the question has been discussed, the Government has not had that assurance.

Discussions with the rice traders make it clear, according to Mr Clegg, that traders will not carry sufficient stocks to meet demands if rice control is lifted. So the Government must maintain adequate reserves, and, to avoid waste of public money and deterioration of rice, must turn over the stockpile regularly.

Merchants will be allowed to buy any type of rice they need once control is dropped, subject to the maintenance of the stockpile, which will be bought in the cheapest markets, in fact through the trade if they can provide it at the right price.

Reports that emergency powers to take over rice stocks could be used instead of stockpiling are valueless; such powers would be worthless if sufficient stocks did not always exist, and the Government would in any case have to take over whatever stocks were available to augment its own reserves. There are no barriers to the re-exporting of rice from Singapore.

The Government is as concerned as traders are to get full supplies of cheap rice for Singapore, and has always fought for realistic rice prices. This policy it intends to pursue determinedly to ensure that there are always strategic supplies of rice for emergency conditions until a flow of supplies to the market is reopened.—Yours faithfully,

JOHN BATTEN

Malaya House

The Liberals and Education

SIR—May I, while gratefully acknowledging the notice given to the Liberal Party's Education Advisory Committee's report, comment on one point? The committee's intention is that the number of grammar school places should be fewer only for the first three years. At the age of 14 there would be an intake from the modern school which in numbers would replace the present C or lower B streams. The committee believes that the grammar schools would be strengthened by this proposal; instead of children of doubtful ability chosen at 11, they would receive children who had proved their ability in the proposed new examination to be taken at 14.—Yours faithfully,

JOHN ARMITAGE

Chairman, Liberal Party Education Advisory Committee.

Moving Britain's Meat

SIR—May I be allowed to mention one or two points on which I should like to comment in regard to the article in your issue of September 4th?

You state that livestock hauliers almost unanimously declined the invitation of United Carriers, Ltd. The facts are that well over half of those who had previously worked for Meat Transport Organisation, Ltd., applied to join but the Directors of United Carriers, Ltd. had decided not to proceed without the support of 80 per cent of these hauliers and as this figure was not attained the proposed livestock section of the company was not proceeded with.

United Carriers, Ltd., is in no sense a "caretaker organisation." Hauliers under charter to it have no guarantee of remuneration as they had under Meat Transport Organisation, Ltd., but are dependent for profit upon the earnings of the company, which, as your article recognises, enjoys no monopoly.

A large-scale organisation with experience in the handling of traffic can secure and has in fact secured operational economies which are not open to firms operating individually, and is in a much better position to obtain a high load factor. Firms who have joined United Carriers, Ltd., will have every incentive to carry on their own undertakings efficiently and economically.

So far as casual hauliers are concerned, work undertaken for the company is in many cases only part of their business. The 10 per cent deduction from their gross takings is a maximum and will be reduced if the costs of the company incurred on their behalf amount in the aggregate to less. Equitable sharing of traffic is not the only advantage which casual hauliers obtain. Apart from the operational advantages referred to above, they will receive prompt and regular payment for their services by the company which undertakes all invoicing of customers and collection of cash from them.—Yours faithfully,

P. J. R. TAPP

United Carriers, Ltd., London, S.W.1

A Confusion of Councils

SIR—In your article of August 14th entitled "A Confusion of Councils" you assert that it is at district council and non-county borough level that local government is represented at its most local and that their affairs attract local interest much more readily than those of "the powerful but remote county council." All, of course, agree that local government must first and foremost be local; but this is not a problem in the small counties, such as my own County of Rutland, where, in fact, the county council is far less remote than many district councils. The point would appear to be yet another sound argument in favour of the small administrative county; yet towards the end of your article you advocate the proposals of the Local Government Boundary Commission which "would amalgamate a few counties." Rutland was to have been one of these. Such a proposal would inevitably run counter to the existing sense of local pride and community of interest and would indeed destroy the whole "local" atmosphere; for once you cross the boundaries of geographical counties for local government purposes you cease to become local, and in the eyes of the residents of the county the administration becomes remote, impersonal and at best quasi-regional.

In any case why interfere where no great problem exists? The small county councils, in close and personal touch with the electorate, are carrying out their duties efficiently. There may well be urgent problems elsewhere, notably in the great concentrations of urban population; but I beg those concerned with formulating future plans not to include those that need little reorganising merely because others need much, but rather, in the case of small counties, to bow to the wishes of the local residents, and leave well alone.—Yours faithfully,

G. K. F. RUDDLE

The Weak and the Wicked?

MONOPOLY AND COMPETITION AND THEIR REGULATION.
Edited by E. H. Chamberlin for the International Economic Association.
Macmillan. 549 pages. 36s.

MONOPOLY is a conspiracy of bad men in top hats to exploit consumers, suppress inventions, and crush virtuous small producers; if all monopolists were jailed, the Golden Age would return. Competition is wasteful, cut-throat, anarchic and ruinous; till competition is abolished, the Golden Age will never arrive.

Monopolists are the heroes of dynamic progress, since they alone, by virtue of the size that ensures their dominance, can take long views, hire first-rate brains, foster research; to dismember these beneficent giants, or to prevent them from safeguarding themselves against the hit-and-run raids of ephemeral rivals, is short-sighted reaction. Competition is the only reliable spur to efficiency, making every business man put his best foot forward and his thinking cap on, and it also provides the only mechanism by which resources can be rationally distributed between different uses; to allow competition to be impaired is to court stagnation and distortion.

There is no such thing as "perfect" competition, for under the textbook conditions of universal knowledge and frictionless reaction all competitors would automatically combine; there is precious little "pure" competition, for product differentiation on the one hand, and economies of scale on the other, ensure that it shall always become a rivalry of oligopolists. There is no pure and secure monopoly, since every product has substitutes, however remote, and no producer can be sure that a closer substitute is not just round the corner; monopolists are competitors. Monopolistic competition provides the worst of both worlds; therefore private enterprise, demonstrably doomed to monopolistic competition, is irrational, wasteful, and has not a leg left to stand on. Monopolistic competition is a good working solution, and it only needs to be kept anxious and active to ensure, in rough but generous measure, a progress and rationality which would be hopelessly compromised were private enterprise to disappear.

Thus, at successive stages of sophistication (the last, of course, in deplorably crude summary), the debate on competition, monopoly, and the policy to be adopted towards them. The International Economic Association, at its first conference in 1951, naturally kept its arguments on the highest level, and its reported proceedings are professional rather than general reading. For the student wanting a reasonably up-to-date conspectus of economic opinion and policy "Monopoly and Competition and their Regulation" is a treasure-house. Nine "country papers," each describing the relevant economic and legal situation in one particular country, are followed by papers on the forces making for and against monopoly, on the theoretical problems of competition (Mrs Joan Robinson setting a characteristic cat among the pigeons, Professor Chamberlin taking an almost Pyrrhonian attitude on measurement), on the welfare aspect, on regulation and control, on the relation of monopoly to stability and progress, and on nationalisation.

Finally, the ensuing discussion is summarised. No resolutions are passed nor conclusions recorded; the reader is left with an intellectually uncomfortable but probably salutary awareness of extreme complexity. One does not, however, refuse to sit in a chair because the physicists have shown it to consist of an essentially unknowable whirl of sparsely scattered electrons; one may similarly side with those who preserve a rough pragmatic belief that competition, or something usually so labelled, makes for economic righteousness.

Essential Aesthete

JOHN RUSKIN.
By Joan Evans.
Cape. 447 pages. 25s.

> Ruskin himself is a very simple matter. In face, in manner, in talk, in mind, he is weakness, pure and simple. . . . To see him only confirms the impression given by his writing, that he has been scared back by the grim face of reality into the world of unreason and illusion, and that he wanders there without a compass or guide—or any light save the fitful flashes of his beautiful genius.

SO, with the real if limited penetration of the tyro novelist, wrote Henry James in 1869. And on a first impression Dr Evans's book may appear largely given over to documenting James's judgment. Ruskin emerges—and the picture is already familiar—as a manic-depressive, fixated in some state of morbid dependence on his parents and incapable of the responsibility and act of marriage; intellectually incompetent and isolated; amateurish, derivative and surprisingly ignorant in almost every field that he diffusely pro-

fessed; gaining a great reputation less with the cultivated and informed than with a recently enriched class anxious to be right about art and grateful to have it explained in terms of familiar moralistic commonplace; retreating from a trenchant if unsubtle social and economic philosophy picked up from Carlyle first into the cloud-cuckooland of St. George's Guild and finally into the terrible security of madness.

Yet Ruskin—Dr Evans clearly sees—was not "a very simple matter." For behind his genius, fitful and limited as it may have been, lay real nobility, and even a kind of power. He was far more noble indeed than either weak, absurd or crazed. Essentially an æsthete, compelled intensely to feel and able often marvellously to convey in words the sheer beauty of the visible world, he strove all his life to convey also a confused but passionate sense of that beauty as a divine language, supremely important not to the æsthete merely but to every man as a creature of good and evil. And if he dealt, in consequence, largely in nebulous elevations and edifications, he yet preserved, as long as reason remained to him, certain basic clarities and the courage to act in terms of them. Believing some participation, however lowly, in the processes of creative art to be the birthright of every human being, he turned to fight a society by which he conceived this truth to be increasingly denied. In doing so, he set his mark upon England. The Natural History Museum at Oxford is one of his aptest monuments. It is undeniably queer—the chemistry laboratory is modelled on the kitchen of Glastonbury Abbey—but it is plainly striving to express a complex of ideas, most of them good in their kind. Nothing of the sort is to be observed in later buildings in the same neighbourhood.

Ruskin was no scholar, even in his own field, and there is something pleasing in the fact that it is a great scholar who has now honoured him. For honoured he is, since the portrait is full and fair, restrained but moving. This is a book that deserves a permanent place among English literary biographies.

Six Experts in Search of a Synthesis

THE SYSTEM OF INDUSTRIAL RELATIONS IN GREAT BRITAIN.
Edited by Allan Flanders and H. A. Clegg.
Basil Blackwell. 388 pages. 30s.

THIS is frankly a text-book rather than a work of original research. Six experts—on trade union history, law and organisation, on employers' associations, collective bargaining and joint consultation—have come together to write essays on their subjects, of somewhere between 40 and 90 pages each. The method has obvious drawbacks. Each author is apt to start in the leisurely style appropriate to a book rather than to a section; by the end of his allotted span he is sometimes spinning a little wildly, trying to fit ever more facts into an ever-narrowing compass. The method also leads to a certain unevenness of style and to an unexpected order of treatment, which is bad luck on the book's principal potential reader—the student who will read it with a pen poised over his notebook.

These defects of method are regrettable because this is a book by important experts on an important subject in which there is an important gap to be filled. There is still a need for a general and simple textbook that will help the student (and the ordinary intelligent observer) to understand more clearly what makes the unions tick, which of several bewildering courses any particular dispute may take, and how industry's conciliation machinery creaks and groans and surprisingly often works—at both a factory and national level. Several recent books have filled parts of this gap, sometimes while attempting to fill the whole. This book makes another contribution, but still not quite a complete contribution, to that end. The most valuable sections are, perhaps, the excellent middle reaches of Mr J. D. M. Bell's chapter on trade unions, and the greater part of Mr Flanders's own chapter on collective bargaining. These two chapters will also help the general reader to make intelligent observations about the strange things he sometimes reads in newspapers. In some of the other chapters there is rather more about past history and rather less about present practice than one would like in a comprehensive text-book with this title; the history of industrial relations in Britain has been written many times before, principally, of course, because that history is a much easier subject than is current analysis.

The Law and the State

CURRENT LEGAL PROBLEMS, 1954.
Edited by G. W. Keeton and G. Schwarzenberger.
Stevens. 243 pages. 32s. 6d.

THIS annual series, of which this is the seventh volume, has now established itself. There is no need to thank and congratulate again University College, London, the editors and the individual contributors, although it would be ungrateful not to record the pleasure that these essays give. They are essays; the volume is not a textbook. It is diversified, stimulating, entertaining and instructive—instructive in two ways. Each contribution widens the mind; the choice of subjects and the balance between them give some glimpse of what the editors feel are the general problems of the day which the lawyer may help to solve. The main items in the current list are these: colonial administration and development (essays on the constitution in British Guiana and on law and order in Kenya); insanity in relation to crime, particularly murder; trade union activities (the tort of interference with contract); divorce (conflict of laws); international organisations (the international civil service and the international court of justice); and the legal profession in this country (which has two essays: the role of the solicitor in modern society and the cost of litigation). To many, this last item in the list will be the most interesting. It is one of a number of signs that the legal profession is, at last, beginning to doubt if its fundamental organisation is wholly perfect. The ferment has begun.

It has been obvious for some time that what might be called the upper crust of both branches of the profession, solicitors and barristers, is enmeshed in practices and traditions that have less and less relation to present-day conditions and needs. It is not that the councils of either the Law Society or the Bar are technically unrepresentative; they are popularly elected. It is that they do not represent a real cross-section of their respective branches, for the minds of the men who reach these councils were really formed twenty or more years ago. They represent the profession as it was, a private luxury paid for entirely by individuals and companies who could afford it, and, equally important, free to make their decisions over what they paid for it. That basis has not wholly gone—if it had, the legal profession would already have been shaken up as the medical profession has been. But it is changing. The principal paymaster of the profession today is the state, directly and indirectly. It pays, directly, the poor man's costs. It provokes the rich man into hiring professional aid as a guide through the jungle on the collecting side of the welfare state.

The legal profession will not begin seriously to think of changing itself until the paymaster compels it to do so, but that the paymaster, again indirectly, is beginning to do. It will take a very long time, for *amour propre* is at stake. The authors of the two essays in this volume, although protected by academic walls, breathe their criticisms and suggestions for reform in the most delicate of whispers. But it is important that the discussion should continue. While the impetus must come from outside, without revolution the legal profession, like Parliament, can only be satisfactorily changed from within itself.

Local Democracy in India

THE FOUNDATIONS OF LOCAL SELF-GOVERNMENT IN INDIA, PAKISTAN, AND BURMA.
By Hugh Tinker.
Athlone Press. 401 pages. 35s.

HAD Mr Tinker's study of municipal self-government in the Indian subcontinent been published before August 15, 1947, the average British and Indian reader would first have flipped through these pages to ascertain whether he was pro-British or pro-Indian, whether he recognised the "great work that Britain was doing in India," or whether his sympathies were with the "under-dog," and he would have read on or laid the book aside according to his prejudices. The political struggle inhibited the complaisant writer and often led to the social ostracism of the seeker after the truth in

Angela arched her wrist

"I say—he gave you a watch!" cried her friend, "Isn't it sweet!"
"This is a *Baume*" answered Angela, "And William chose it for its *good name*, its *record*—(125 years of Swiss craftsmanship) and its *reputation* for *absolute reliability*."
"Oh," said her friend. "Still—it is awfully sweet looking."

Nothing left to chance . . .

AIR PURIFICATION

In addition to normal air-conditioning, a vast Air Purification System makes doubly certain that the atmosphere throughout the Ediswan Lamp Factory is as clinically-clean and free of microscopic dust particles as human skill and ingenuity can contrive.

This immense plant consists of several Pumping Stations, each operated by 25 h.p. motors which deliver heat-treated, purified air via distributor ducts throughout the entire factory. Each Pumping Station circulates no less than 159,000 cubic feet (5½ tons) of air per minute! The temperature of the circulated air is precisely stabilised by thermostatic control.

This is another example of the strict control and technical care insisted upon at every stage in the manufacture of Royal "Ediswan" Lamps. Nothing is left to chance—*careful testing and checking of every lamp ensures that each conforms to the highest standard of requirement.*

ROYAL "EDISWAN" LAMPS

The Edison Swan Electric Co. Ltd., 155 Charing Cross Rd., London, W.C.2
Member of the A.E.I. Group of Companies

L.100

You know her well

YOU HAVE SEEN HER at the theatre, in restaurants, at the tennis club. You have admired her poise, and perhaps you have envied her youthful enthusiasm and gaiety. You have seen her at work, too—in an office, or perhaps at one of the great airline terminals. There you have been impressed by the unobtrusive smartness of her clothes, and the way in which she manages to combine neatness and efficiency with natural charm. She is, in fact, a young woman with a personality of her own, a job of her own, a life of her own—and a magazine of her own: Vanity Fair.

Vanity Fair

is a magazine for the younger, smarter woman. With the other well-known periodicals published by The National Magazine Company Limited, Vanity Fair shares one positive aim—to contribute something to the art of living graciously and well in this crowded century.

either camp. The arrival of independence has happily changed the atmosphere. Today British and Indian readers alike can take Mr Tinker's critical assessment unemotionally in their stride and benefit by the lessons to be learnt from him.

In launching municipal government in 1882, that far-sighted viceroy, Lord Ripon, hoped to provide the cities and districts with sound administrations on a popular basis, and to create nurseries to train men and women for public life in large numbers as a long-term preparation for national self-government. These hopes were imperfectly realised. Some municipalities did good work, but the average has been deplorably low. A handful of public figures, including, notably, the late Sirdar Patel and Mrs Sarojini Naidu, started their public careers in municipal work, but one of the biggest problems facing India, Pakistan and Burma today is the paucity of those experienced in public affairs. Mr Tinker shows that Britons and Indians alike must share the blame. For if the bureaucracy sidetracked Lord Ripon's reforms for more than thirty years, when they eventually did become effective, the Congress party's non-co-operation campaigns created the demoralisation and indiscipline which are partly responsible for the low average standard of municipal administration today.

Mr Tinker writes lucidly and turns a potentially dull subject into a fascinating study. It should be of interest to the non-specialist, as well as to the specialist, reader, because the problems that he discusses are of vital topical importance not merely in the Indian sub-continent but throughout the democratic world.

Confusion from Knowledge

DILEMMAS. *The Tarner Lectures, 1953.*
By Gilbert Ryle.
Cambridge University Press. 129 pages. 10s. 6d.

THESE eight witty, vivid and stylish lectures smell very little of the lamp. But they are as illuminating as they are diverting and they are concerned with something very important. Human thought, when sufficiently advanced to reflect on its own diverse achievements, is inveterately troubled by a sense of conflict between these very achievements. When we cease to think *as* mathematicians, scientists, economists, psychologists or plain men and start to think *about* the ideas and discoveries belonging to these different domains, we find that the best established truths of one discipline seem to contradict those of another or to disqualify the plainest deliverances of common sense. At the cross-roads of thought very often a formidable dilemma shows its horns.

The most familiar logical *impasse* of this kind is the apparent conflict between science and common sense. What the neuro-physiologist tells us about our eyes and ears apparently contradicts what men have come to believe by relying on these organs; his theory even seems to show that we can never by the use of eyes or ears acquire information about anything save our own sensations; worse still, the scientist himself has established this theory only by the use inside the laboratory of the same sense organs which it seems to condemn as sources of information about the world. So the kind of contradiction we have here is not like some dispute within a single discipline: no further information would settle it. We are troubled not because we are ignorant, but because we are confused; and we are confused because we do not understand how to contrast and compare different types of thinking though we may have perfect mastery of each separate field of thought.

Professor Ryle devotes two only of his lectures to the relation between the world of science and the everyday world (the use of the word "world" here is, as he says, a symptom of the confusion which has generated our puzzles) and to the connected but more complex problem of perception. He introduces us to his diagnosis of our troubles by a study of a logical argument for Fatalism and a most original examination of the "proof" that Achilles cannot catch the Tortoise. Confusions come because in reflecting upon the different concepts of different disciplines we overlook the diversity between them and mis-assimilate to some single standard type widely different sets of ideas. If we divide a race course not by marking out a fixed number of equal sections, but by marking an initial section and continually dividing the remainder in a given ratio, we are tempted to confuse the logically inexhaustible character of the series so generated with a mysteriously inexhaustible physical property of the track which Achilles has to traverse.

Similar temptations beset us in less specialised fields. So familiar a notion as pleasure, misconceived by theorists as a sensation or a process, has made possible the paradoxes of hedonism and laid the basis of a generally misleading psychology of action. Economists, conscious of their own recent move from talk of "satisfactions" to "preferences," will find Professor Ryle's discussion of pleasure specially relevant, and they will find specially illuminating the ingenious analogy between market dealings and linguistic dealings between men which he uses to show how far the formal logicians can help us out of our dilemmas. Their help may indeed be exaggerated; there is no single avenue of escape to be found by the application of the logician's formulae. Nothing can really help but a detailed exploration of the subtly varying types of concept employed in different types of thought and it is perhaps the principal achievement of contemporary British philosophy, so well represented here, to have sketched the possibilities and nature of this exploration.

Shorter Notices

COMPOUND INTEREST AND ANNUITIES CERTAIN.
By D. W. A. Donald.
Cambridge University Press. 300 pages. 20s.

Given the necessary mathematical training, the general reader who is interested in the subject will find much to profit him in this addition to the series of new text books that is being sponsored by the Institute and the Faculty of Actuaries for their examination students.

A strictly practical approach is adopted throughout the book; there are few other mathematical exercises in which the mere memorising of formulae is of less use than in the solution of problems involving compound interest, among which those relating to stock exchange transactions have an important place. The conception of the continuous accumulation of money at compound interest is given full weight. A neat analogy of this process with the growth of a tree drives home the point that the usual assumption that interest is compounded yearly or at some other arbitrary interval of time has no theoretical justification, however well it may fit practical facts.

*

LIFE AND OTHER CONTINGENCIES Volume I.
By P. F. Hooker and L. H. Longley-Cook.
Cambridge University Press. 320 pages. 22s. 6d.

The subject matter of this book, which is also written specifically for examination students of the Institute and the Faculty of Actuaries, is so technical that it is fully comprehensible only to the initiated.

Contrary to the more usual method of presentation in mathematical text books, there is a progressive approach to the demonstration in the (as yet unpublished) second volume of the more advanced general formulae. This is in line with the practical bias of each of the new actuarial text books; formality of approach is sensibly sacrificed in order to ease the lot of the reader who has a mass of highly involved matter to assimilate in the study of what is, after all, a practical science—or is it an art?

LIVINGSTONE'S TRAVELS. Edited by the Rev. James I. Macnair.
Dent. 445 pages. 21s.

Livingstone's diaries have long been out of print. Here they have been condensed, in his own words, to provide a vivid account of his travels and of central Africa before it was opened up by the European. The editor's comments are helpful without being obtrusive, and there are useful geographical notes and appendices that include Stanley's own account of the famous meeting.

A THEORY OF ECONOMIC-DEMOGRAPHIC DEVELOPMENT.
By Harvey Leibenstein.
Princeton University Press (London: *Geoffrey Cumberlege*). 215 pages. 32s.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Sharing the Atom

Washington, D.C.

PRESIDENT EISENHOWER'S speech on the sharing of knowledge about peaceful atomic power completes a major shift in American policy. This shift away from the universalist approach that characterised the almost apocalyptic Baruch Plan became apparent soon after the President's speech to the United Nations last December. Until then the United States had insisted it would continue to hug its secrets to its breast unless all powers, or at least all major powers, agreed to come into an international atomic scheme.

But although the proposals made last December for a world atomic pool required the accession of all "the governments principally involved," of which "the Soviet Union must, of course, be one," it was generally thought at the time that if the Russians failed to respond, the precedent of the Marshall Plan, which was also originally open to the Communists, would be followed. The United States would go ahead with whatever countries were willing to take part.

Its decision to do so falls well within the dictum of Mr George Kennan, in his latest book "Realities of American Foreign Policy," that world communism is one of those problems

> which can be dealt with effectively only if you learn to look away from it, not in the sense that you take no precautionary measures with regard to it, but in the sense that you do not permit it to preoccupy your thoughts and your vision, but rather insist on the right to proceed with your positive undertakings in spite of it.

The policy, in short, is an example of good psychological warfare, though it would have been even better if the President could have refrained from throwing in the routine adjective "cynical" to describe the Russians' "blocking" of his previous proposals "in the councils of the world," and if he could have made allowance for some link, however tenuous, between the new international agency and the United Nations. After all the Russians, no matter how cynical, have not got the votes to block a popular proposal in the General Assembly.

★

The agency will be set up by the United States and as many other members with fissionable material or scientific knowledge to offer as can be enlisted. So far Britain, France, and three Commonwealth countries—South Africa, Australia and Canada—have agreed to take part. Belgium and Portugal will probably be added and the offer remains open to Communist countries. Specific proposals also made by the President give an idea of the kind of international co-operation he has in mind. The United States will establish a reactor school to teach the skills of atomic industry to foreign technicians. Belgium, which has been complaining that, although it is through the Congo a major supplier of uranium, it has not been getting any atomic knowledge in return, will be helped to build a reactor of its own. The United States is to co-operate with Canada in setting up an atomic plant on Canadian soil. But the main task with which the State Department will press ahead with all speed and which will be taken up in its technical aspects by an international conference of scientists next year is to find ways of stripping the atom of its magic for those countries which have no knowledge at all. Technical help is to be offered to the underdeveloped areas where a good case can be made for the atom being the most economical source of power.

All these fresh initiatives are the first fruits of the new atomic energy legislation, which somewhat loosens the shackles of secrecy imposed on the President by the McMahon Act and which is itself part of the belated process of revising all American policies that have rested on the assumption of American monopoly of atomic power. But two special compulsions hastened the change from the original scheme for a world wide atomic pool, which could be held up by Russian dissent, to the limited and experimental but practicable version now advanced.

The first was the growing interest of areas with high power costs in the possibilities of the new source of fuel. It was first realised about a year ago, with something like alarm, that, if the United States was not prepared to offer technical atomic aid, other countries soon would and that one of the effects might be to cut off some of the American sources of supply of fissionable material.

The second factor was the feeling that it was high time that the United States disentangled itself from its difficult position over atomic disarmament. Although each side has been pressing schemes that the other cannot possibly accept it is felt that the Russians have had a distinct propaganda advantage because of the apparent simplicity of their case. This is that, whatever the merits of proposals such as Mr Eisenhower's for diminishing the national atomic stockpiles by transferring material to an international agency, first things must come first. The atomic bomb must be banned at the outset and all existing stocks destroyed.

The American predicament is all the more frustrating in that the Americans have an imaginative and far-reaching plan, which has been endorsed by a majority vote of the United Nations Assembly, as their official policy. But they cannot wholeheartedly use it in their propaganda because its central feature, the international ownership of all atomic material and the licensing of all atomic industry, is out of keeping with the present mood of the American people and Congress, at present, would never accept it. Although the Russians have never shown themselves capable of such a brilliantly disruptive move as the sudden acceptance of the Baruch Plan, the thought of what might happen if they did is enough to inhibit any very vigorous propaganda on its behalf.

On the other hand, if the United Nations Atomic Energy Commission is right in its view that no solution short of "the voluntary sharing by nations of their sovereignty in this field" is adequate because of the immense difficulties of control, it follows that no progress of any sort can be made in the direction of disarmament. The testimony published in connection with the Oppenheimer security case shows that Dr Oppenheimer reached this conclusion, because of the Russian attitude, as early as 1947 and, with the support of several members of the Cabinet, urged that the negotiations be brought to an end lest willingness to compromise with the Russians whittle away the essential principle of international ownership. This view was only overridden on the ground that public appearances must be kept up and that America's allies would be upset by any such brusque action.

Since in these particular circumstances, with both sides shouting unacceptable proposals at each other, the Russian slogans will come through the clearest, it naturally occurred to the Americans that it was time that they shifted the wavelength and shouted about something else. The proposals of last December for a pool of atomic knowledge were the result, and the need, if the initially favourable reaction was to be followed up, was for the Americans to take some actual steps in international co-operation, even if it meant the end of universalism in their policies and the switch to more modest and workable schemes.

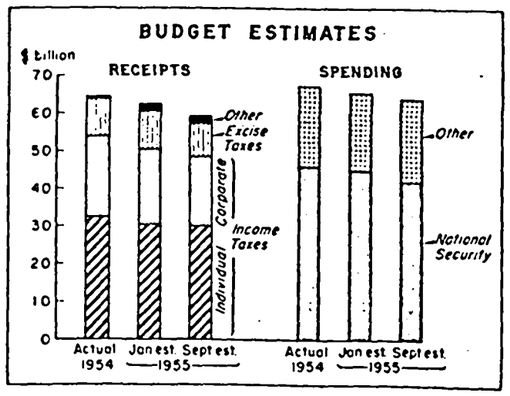
This is true psychological warfare as opposed to the attempt of this Administration to conduct foreign policy by means of bluff and slogans which injures only the nerves of America's allies. The real test of a constructive policy on atomic energy will be whether its good faith is acknowledged in the "uncommitted world." This will only be fully apparent when the international agency is in existence and the time comes for the underdeveloped countries to decide whether to accept the apple of atomic knowledge.

Storm Signals from Maine

THE hurricane which swept up the New England coast a fortnight ago was not more unexpected or more devastating—to Republican hopes, at least—than the election returns from Maine, which goes to the polls two months before the rest of the country. The old slogan that "as Maine goes, so goes the nation," which the state's rock-ribbed Republicanism has made something of a joke, is being tenderly dusted off by the Democrats, for Maine has elected a Democratic governor for the first time since 1934, when Franklin Roosevelt was at the height of his political power.

Less real significance is being attached, however, to the defeat of an admittedly unpopular Republican governor, even though this meant upsetting Maine's tradition of always giving a Republican incumbent a second term, than to the reduced majorities of the victorious Republicans. The popular and efficient Mrs Margaret Chase Smith is being sent back to the Senate, but with a majority which is not likely to exceed 50,000, compared with 100,000 in 1948 and her share of the poll has fallen from 71 per cent to about 58 per cent. The three Republican Congressmen saw their votes fall as low as 52 per cent of the total from over 60 per cent in 1952.

It is a rule of thumb that if Republican candidates in Maine secure the votes of less than 60 per cent of the electorate, the Democrats are on their way to winning control of Congress. Mr Mitchell, the Democratic National Chairman, pointed out very justly that if Republicans elsewhere lose as much ground as they lost in Maine, the 40 House seats they won in 1952 by margins of 5 per cent or less will go. Mr Nixon, the Vice-President, who was unlucky enough to proclaim that the elections in Maine would be the first test of the Administration's popularity—a statement which a week ago looked like betting on a sure thing—has at least the doubtful consolation that the returns underline his warning to Republican candidates that this year they must "run scared."



Deficit with a Silver Lining

REPUBLICAN satisfaction with the smallness of the government deficit in the year which ended in June has proved short-lived. The annual summer budget review suggests that the deficit in the year ending next June will be $4.7 billion, $1.7 billion more than it was last year, and $1.8 billion more than the President expected it to be last January. Spending continues to be reduced—the new estimates put it $1.6 billion lower than the January estimates did—but receipts are falling faster, owing chiefly to cuts in corporate, individual, and excise tax rates. The Budget Bureau now expects receipts to be $3.3 billion lower than it hoped for in January, partly because Congress insisted on cutting excise taxes more than the government wished, but also because of the failure of business activity to revive. Corporate tax receipts in 1954-55 are now put at $18.7 billion, down $1.5 billion from what was expected in January.

These estimates are based on the prudent assumption that business will continue at about the same level, although Mr Humphrey, the Secretary of the Treasury, denies that this means that the Administration does not look for any improvement. From the insistence of the budget review that the new lower levels of military spending will support "the most powerful and efficient fighting force the nation has ever had in time of peace" it is apparent that the Administration is also anxious to protect itself against the charge that it is economising at the expense of security. Total spending on national security is expected to fall from $46.2 billion last year to $41.9 billion, but direct defence expenditures will fall a trifle more, while those on stockpiling and atomic energy rise.

The new estimates make it hard for political orators to maintain, as the President claimed in July, that the Adminis-

tration has succeeded in coupling progress towards a balanced budget with large-scale tax relief. But although Mr Humphrey insists that the long-term goal of a conservative Administration is still to end deficit spending, Republicans will detect a silver lining to the failure to achieve it this year. The cash budget, which takes account

of government trust funds, and is a more accurate measure than the conventional budget of the impact of government operations on business, will show an increase in the cash deficit from $500 million to $2.1 billion—a dash of reflation after the austerities.

Foreign Aid Begins at Home

New York

THE Foreign Operations Administration, whose chief function is to administer the government's foreign aid programme, has never been allowed to be unmindful of the interests of American exporters. The American shipping industry has long been protected by the requirement that half of all government-financed cargoes be carried in high-cost American-flag ships. But, as long as the FOA based its procurement decisions on the lowest landed cost bids, this protection penalised American exporters who had to include in the bids higher shipping charges than those borne by their foreign competitors. To meet this complaint the FOA has ruled, not that the invidious 50:50 rule be abolished, but that the cost of it be shifted from the exporter to the taxpayer. American exporters will henceforth bid on the basis of foreign freight rates and, when they are forced to ship in higher-cost American vessels, the FOA will bear the additional charge.

The principle of competitive bidding for FOA procurement has in any case been virtually abandoned. The new Mutual Security Act stipulates that

> funds may not be used for procurement outside the United States unless the President determines that such procurement will not result in adverse effects upon the economy of the United States.

In two recent decisions the FOA has accepted bids from American firms which were far higher than those submitted by a number of overseas suppliers. The orders for locomotives and rolling stock for India, for example, have been split equally between the American and foreign bidders, even though a Japanese bid for the locomotives and a combination Japanese-British bid for the rolling stock were both more than 50 per cent lower than the nearest American bid.

Protection against imports is commonly justified by the need to maintain the defence potential of the United States, even at the expense of its allies. But the FOA, whose entire *raison d'être* is the strengthening of the economies of non-Communist countries, is carrying "Buy American" into the export field to the almost certain detriment of its main objectives. This is "Aid not Trade" *par excellence*. And when the chief beneficiary of its latest decision—the American steam locomotive building industry—has already lost its home market because of technological change the wisdom of propping up production by government-induced export contracts is highly questionable. For one thing, given a limit on the total funds appropriated for foreign aid, the acceptance of high cost bids must inevitably reduce the physical volume of aid made available. And it will be tragic indeed if economic developments abroad, and the widespread good will toward the United States which the generous foreign aid programme should evoke, are to be sacrificed for the benefit of small groups of high-cost producers.

McCarthy Kept in Order

THE Watkins committee, which is looking into the question of whether Senator McCarthy's behaviour deserves censure by the Senate, has completed its public hearings with such admirable dispatch that there seems no reason why its report should not be ready for the Senate to consider before the election. Those who feared that Mr McCarthy would succeed once more in disrupting the proceedings and prolonging them intolerably have been pleasantly surprised by the ability of Senator Watkins, unanimously supported by his colleagues, to keep the unruly member from Wisconsin in order.

One reason for the committee's speed is that no new evidence supporting the charges had to be taken; it was all available in the proceedings of earlier committees. And Senator McCarthy himself shortened the task by not disputing the charges, but admitting and even glorying in them. For the committee's benefit, he repeated his abuse of General Zwicker, though he tried to make it appear that he had said it was the uniform of a general, not simply United States uniform, which General Zwicker was unfit to wear. He also maintained his right—indeed, insisted that it was his duty—to use secret information obtained from government employees in his fight against communism and corruption, even though two Presidents have prohibited disclosure of information from the personnel security files without express authorisation. The Senator and his counsel tried to show that other Senators had upheld the same right, but Senator Watkins, in a ruling which Mr McCarthy protested deprived him of 95 per cent of his defence, would have none of their views.

Mr McCarthy, who to some observers seemed aware that he was at last fighting for his political life, has evidently

decided that the only reply to Senator Watkins's remorseless gavel is to throw doubt on the committee's impartiality. But he failed again in his request for an "independent" counsel, who had not taken part in the "prosecution," to help draw up the report. The Senator's other weapon—his suggestion that he could not accept invitations to speak for Republican candidates until the hearings are over—has been considerably blunted by the victory of a prominent anti-McCarthyite in the elections held this week to choose party candidates in his own state of Wisconsin.

Dewey Doesn't

FROM A CORRESPONDENT IN NEW YORK

NEW YORKERS whose memories of Mr Dewey go back to the early days of his once meteoric career listened with some nostalgia to his announcement that he would not run for a fourth term as governor of New York State. In those early days he was a young and rising District Attorney, making political capital out of the prosecution of a leading Democratic politician whom he convicted of corrupt practices. Where his predecessors had presented their case to the public through the press, he chose the radio, then relatively new to politicians, to tell his constituents in broadcast after broadcast just how good he was at killing giants. That performance won him the governor's chair in which he has sat for twelve years.

Mr Dewey's voice was firm when he told the radio and television audiences that he would not run for public office this autumn. Yet laymen as well as reporters noted that the stress was far stronger on the time element than on the refusal, and remembered how many times Mr Dewey has said that he would not run again, and then has changed his mind. He said he would not run this autumn, but what about next autumn? What about an appointment in Washington?

The political manœuvring which followed Mr Dewey's speech was rapid and smooth on both sides of the political fence. Within less time than it takes to thread a trout line and cast a fly President Eisenhower had expressed his grief at Governor Dewey's withdrawal from the race—a grief which the sceptical think may have been tempered by a certain coolness believed to exist between the two. Senator Ives, who has proved himself to be an excellent vote getter, immediately consented with appropriate modesty and becoming reluctance to accept the Republican nomination. A liberal-minded conservative, who sponsored New York's law forbidding racial discrimination in employment, Mr Ives is not involved in the racing scandals which, while they have not touched Mr Dewey personally, have cast some doubt on his ability to control his official family.

No better measure of the importance of the Republican manœuvre exists than the Democratic reaction to it. On the surface it had appeared that Representative Franklin Roosevelt would probably be the candidate chosen to run against Mr Dewey, and boasts were frequent that just as the senior Roosevelt had beaten him, so would the junior. However, the moment Mr Dewey withdrew the Democrats turned officially to Mr Averell Harriman, a candidate of greater substance and of international reputation. Roosevelt supporters, among them the Congress of Industrial Organisations, alleged that Tammany Hall, the New York City Democratic machine, made that choice because it would be easier for them to deal with Mr Harriman than with the headstrong Mr Roosevelt. Until September 21st, when the Democratic nominating convention brings the two groups face to face, there is still the chance of a costly split within Democratic ranks.

The effect of Mr Dewey's retirement in terms of the national problems which Republicans face is harder to assess. Mr Dewey used all his political skill to secure the Republican nomination for Mr Eisenhower and supported him in the early days of the presidential campaign; a number of Dewey men enlisted on the Eisenhower team and are now close to the President. Hints of coolness developing after the election became more marked as no notable honour was produced for the governor. The story is that he wanted to be Secretary of State. There have been repeated rumours that Mr Dulles would resign in his favour, first at the end of six months, then at the end of a year, but so far there has been no sign of such unexampled selflessness.

★

What Mr Dewey will do after November is still uncertain. There has been talk within his own circles that he felt the need of earning more money than the governorship paid, and that he could step into private practice at his own price whenever he chose to. But many people have noted that the Governor's curtain speech was not the utterance of a man who intends to get out of political life. Nor did his stated willingness to campaign for other Republican candidates in the autumn election sound like the promise of a man heartily sick of public appearances.

What seems more in character is a rumour that Mr Dewey and Mr Ives have made a political compact. The latter is not required by American law to resign his senatorial post in order to run for the governorship. When and if he wins, with Mr Dewey's earnest aid, he may then, as the newly elected governor, appoint the former governor to the seat in the Senate which would be rendered vacant by his election. This move, if carried through, will give Mr Dewey a national platform from which to resume his career as a rising young politician.

It should also repair his status with his party. In spite of his three terms as governor, his two attempts at the presidency, and his influence with other state governors Mr Dewey has made strangely little lasting impression on the national scene. He appears curiously isolated from both the Eisenhower and the Knowland wings of the party. At times it has seemed as though he thought that only he knew the liberal ways along which Mr Eisenhower should move, but somehow Mr Eisenhower kept forgetting to ask him for a map.

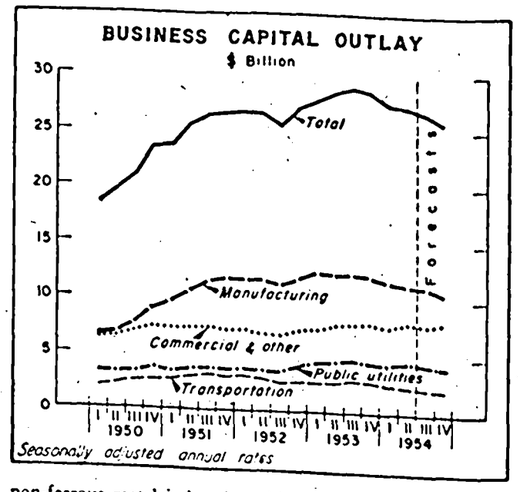
All this may be no more than evidence of the fact that the centre of political power in the United States has left New York for the Middle West. Yet at the same time, the Republican governor of a state which commands forty-three seats in the House of Representatives should be a powerful force in his party. In his own mind, and that of his friends, Mr Dewey is still a rising young man. That, perhaps, is also a difficulty. When a sudden chill interferes with the natural leavening of dough a hard crust forms on it. Whatever Mr Dewey's talents, and there is reason to think them considerable, his defeats at the hands of Mr. Roosevelt and

Mr Truman have chilled and stunted them. He is now, at a mere 52 years of age, perilously close to the position in which an older governor, Alfred E. Smith, found himself—still popular in New York, but with small chance of acceptance in the rest of the country. It remains to be seen whether he will be given a chance to redress that position from a seat in the Senate.

The Strange Case of Montgomery Ward

New York

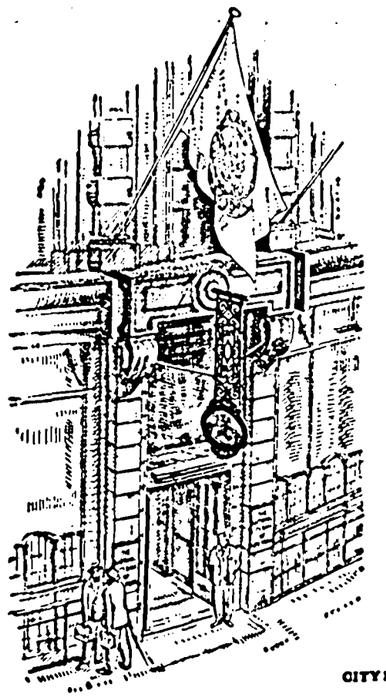
A SHAREHOLDERS' fight, likely to rival in both colour and choler the recent successful struggle of Mr Young to win control of the New York Central Railroad, has started for the control of Montgomery Ward and Company, which is second only to Sears, Roebuck and Company, the largest mail order firm in the United States. The gauntlet has been thrown down by Mr Louis Wolfson, a Florida industrialist, and Mr Sewell Avery, the 80-year-old autocrat head of Montgomery Ward, will undoubtedly pick it up.



Mr Avery, whose leadership was responsible for the firm's prewar growth, has tenaciously maintained since 1945 that a severe depression is both inevitable and imminent and has followed a persistent policy of retrenchment. The prophesied day of reckoning has yet to arrive, and Mr Avery's sole consolation is liquidity. Montgomery Ward, once described as "the biggest bank with a shop front in the United States," had, on July 31, 1954, a working capital of $594 million, with operating funds equal to nearly nine times the company's obligations, and with no less than $287 million in cash and short term US Government securities. The cost of this enormous liquid reserve has been a steady decline in Montgomery Ward's market position. This policy has cost Mr Avery no less than four presidents and over 30 vice-presidents; at one point Mr Avery was in the unusual position of being the sole officer in the company.

Now Mr Wolfson, whose operations already extend from a theatre chain to shipbuilding, from a road transport system to a profitable construction business, has declared his intention of acquiring control of Montgomery Ward by buying up stock in the market and soliciting sufficient proxies to outvote Mr Avery. His appeal to shareholders is twofold. Its main promise is to reverse the postwar policy of restriction, put the idle funds to work, and regain Montgomery Ward's old position in the market. But undoubtedly some at least of those who bid up the firm's stock from a 1954 low of $56 a share to a high of $80 at the end of August had more immediate personal interests in mind. From one of his more famous acquisitions—the Capital Transit Company in Washington, DC—Mr Wolfson paid out in dividends, in the space of three years, almost as much a share as the original purchase price, while simultaneously trebling the market value of the stock. Montgomery Ward's $300 million cash surplus could provide its shareholders with even more spectacular pickings. On both counts Mr Wolfson can expect considerable support from other shareholders. But the system of electing only three of the nine company directors each year suggests that, if control of Montgomery Ward does pass out of Mr Avery's hands before he dies, it may well take two more annual meetings—until April, 1956, to effect the change.

Investment Forecast



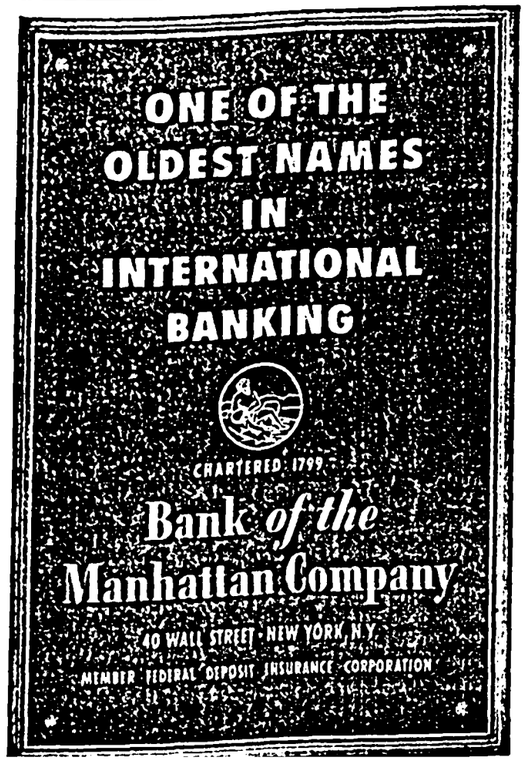
ATTEMPTS by the Security and Exchange Commission and the Commerce Department to read the minds of the nation's businessmen reveal that investment in new plant and equipment in the current year will amount to some $26.7 billion. While this represents a 6 per cent reduction from the peak reached in 1953, it nevertheless marks the second largest total on record.

Making comparisons with 1953, investment in the durable goods industries is down by 11 per cent. Mainly responsible are the contracted expenditures of the iron and steel and

non-ferrous metal industries which, having completed their expansion programmes, have cut the level of their investments by a third. On the other hand, manufacturers of motor vehicles and other transport equipment show great strength, with anticipated outlays 30 per cent above those of 1953. In the non-durable group, which shows an overall drop of 5 per cent, reductions in the textile, chemical and rubber companies are partly offset by the continued heavy investment of the petroleum industry. The largest drop of all is in the capital expenditure of the railways which, at 35 per cent, is attributed to reduced earnings and the completion of their modernisation plans.

These figures have rightly been interpreted as an encouraging sign of continued stability; the slackening in the rate of new investment, which has been evident since the third quarter of 1953, will continue to the end of the year, but there will be no sharp drop indicative of a loss in business confidence. It is an interesting fact that, while manufacturing companies as a whole intend to spend 8 per cent less this year, the large concerns, with assets of over $100 million, plan to maintain the record outlays of 1953, thus giving weight to the view that large industrial units are beginning to ignore minor fluctuations in activity in the interests of long term goals.

Trade follows this flag



In every corner of the world, wherever trade is possible, the flag of The National City Bank of New York symbolizes the march of commerce.

The National City Bank provides the means of making trade easier, safer, and more profitable. In a world of complex and changing regulations it offers business men an invaluable service: up-to-the-minute knowledge of trading conditions in all parts of the world.

The National City Bank provides this service through its network of 57 branches in 19 countries, and through its banking correspondents in every commercially important city in the world. The London branches of the bank offer, as well, an intimate knowledge of trade with the dollar countries.

A visit to The National City Bank of New York will always ensure the speedy and successful transaction of your business.

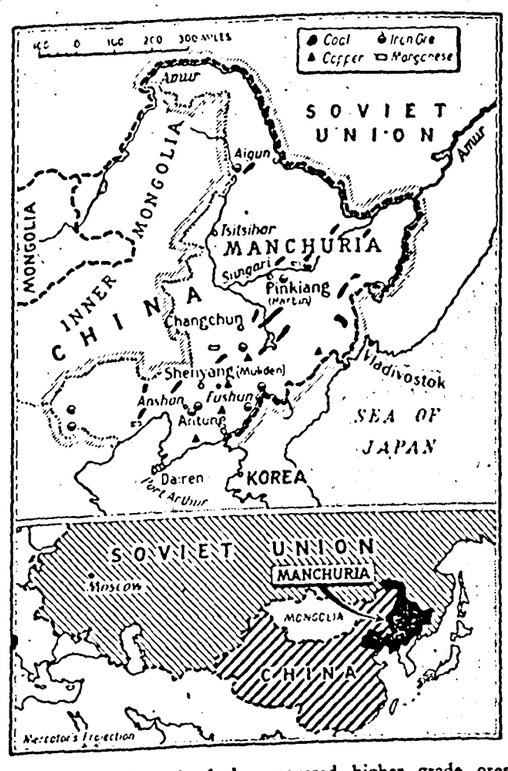
I hold every man a debtor to his profession

FRANCIS BACON (1561-1626)

Every man is a debtor to the world: to his parents; his schoolmaster; his friends and employers. He owes them his existence; his knowledge; his happiness and his daily bread.

To his profession, he has another debt: that due to generations past whose integrity and skill have given his calling the reputation it enjoys. To them he owes his status as a worker and a thinker.



'Profession' carries a wider meaning now than it did once; and professional status, in common talk, is extended to many functions in industry and commerce. But it is not won lightly; a long record of public responsibility, and private service, must come first. How can such a debt be repaid? Only by handing on still higher standards—and a higher status—than those of yesterday, to the makers of industry to-morrow.

Manchuria—Key to China's Dream

THE much heralded Chinese Five-Year Plan is now drawing close to the end of its second year, but little has been revealed about its objectives. The recent announcement that by 1957 Chinese production should reach the Soviet level of 1932 is rather vague, and the numerous percentage figures to be found in official sources have little meaning as they are linked to unknown base years. One thing, however, is certain: the real drive is concentrated in the north-eastern part of the country. When the British Labour delegation visited Manchuria, it entered into China's industrial heartland and in Anshan it saw its most ambitious project.

Why is Manchuria the key to China's industrialisation? In the first place because of its early start. The Japanese had already done much to develop the fuel and mineral resources of the country, and Manchuria has been in Communist hands for a longer period than the rest of China. It has more skilled labour and better transport facilities. With its iron ore in the neighbourhood of coal deposits, with a wealth of non-ferrous metals, Manchuria was the obvious place for the planners to start their campaign. Most of China's resources are still untapped and, as in Russia, new industrial centres may spring up in the future. For the moment, however, Manchuria is China's Donbas, the fuel and power basis of its industrial revolution.

Manchuria's coal deposits are now estimated at between 12,000 and 20,000 million tons, less than one-tenth of known Chinese reserves. In output, however, Manchuria has always accounted for about half of the total. Under Japanese occupation Manchurian coal production exceeded 25 million tons per year; it recovered to 17 million tons in 1950 and now has probably reached its record level.

The Fushun deposits cover an area 11 miles long and 2.5 miles wide; the seams are near the surface and this is probably the largest opencast mine in the world. The coal is not of very good quality, but mixed with Penchihu coal it can be used for coking. Production is also being expanded in the Fushin mines which provide good fuel for bunkers. Penchihu is the best source of coking coal and together with Yentan provides fuel both for its own iron industry and for Anshan. In the Tunhua region good quality coal is found near rich iron deposits.

China's poverty in oil puts a premium on the distillation of oil from the shales around Fushun. The Japanese planned to get about 500,000 tons of crude oil and many by-products from this source. It is not known how much the Chinese have achieved, but according to official data, half of China's oil resources are in Manchuria.

Manchuria has over two-thirds of Chinese iron reserves. The latest Communist reports estimate Manchuria's deposits at nearly 6,000 million tons, while annual extraction has probably reached the wartime level of 5 million tons. Most of the ore is low-grade. However, both the Japanese and now the Chinese claim to have discovered higher grade ores and to have improved the refinement of the low-grade ones. The three main fields are situated in the neighbourhood of Anshan and Penchihu; they are near to one another and the coal basins. Anshan is the pride of the Chinese plan, and it is claimed that its annual output of pig iron already now amounts to 1,600,000 tons, with crude steel production at about half that level. Production is to

be doubled by 1957. While the main efforts are now concentrated on Anshan, the Chinese already speak of Tunhua as the great steel centre of to-morrow. This would be a logical development, since Tunhua is in the heart of the Tungpientao region where coking coal and high grade ore lie side by side.

Manchuria has many other mineral resources. Gold is panned in the north and mined in the south, though output was never very high. It amounted to about 200,000 ounces under the Japanese but subsequently fell to less than 70,000 ounces per year. The Chinese may now step up production to help in their drive for more trade. Rich deposits of copper, lead, zinc, magnesium and molybdenum are scattered over Manchuria. Manganese, on the other hand, is scarce. The Chinese also boast that there is much uranium in the region, though little has as yet been done to exploit it.

Altogether Manchuria has the elements necessary for rapid economic development. Its metallurgy could in the very near future feed a powerful heavy industry. The Japanese were chiefly concerned with developing this region as a source of minerals and metals for Japan's

MAIN MANCHURIAN COALFIELDS
(Million tons)

	Deposits	Record output*	Quality†
Hokang	5,000	2·7	coking
Fushin	4,000	6·0	non-coking
Tunhua	1,500	1·1	coking
Mishan	1,390	2·5	coking
Fushun	700	9·5	semi-coking
Penchihu	380	1·7	coking
Sian	270	2·0	non-coking
Peipao	203	2·0	coking

* Under Japanese occupation. † Bituminous.

industry, though they were forced by the vagaries of war to increase manufacture on the spot. The Chinese, obviously, see here their real chance to gain economic independence and to realise their old dream of industrialisation. Mukden, already a centre of production of rolling-stock, is scheduled to become the heart of the machine-building and other engineering industries. Dairen should add other branches to its shipbuilding speciality. Chemical as well as engineering industries are to grow in Harbin, Anshan, Fushun and Penchihu.

Economic figures are relative quantities. Even the most optimistic Chinese planners could not have put their country's targets for 1957 at more than 100 million tons of coal and 5 million tons of steel. This is little for such a huge country; in industrial power China would still lag behind, say, Poland in the Soviet bloc. At the same time, the Chinese assert that such output, together with a corresponding growth of heavy industry, should enable them to go ahead with less and less outside help. The Japanese for war purposes gave the initial impetus. The Chinese now look to the Soviet Union for further assistance.

The Russians at first were far from enthusiastic. When their troops entered Manchuria towards the end of the war they looted and dismantled plants. In the winter of 1949 Mao Tse-tung travelled to Moscow and after months of hard bargaining Stalin untied the purse strings in very niggardly fashion. Long negotiations were needed for any further economic aid. The Sino-Soviet railway in Manchuria was transferred to the Chinese only at the close of 1952, while the Russians keep Port Arthur until the signing of a treaty with Japan. Mao's hand, however, was strengthened by Stalin's death and in the summer of last year the Soviet Union promised to help build or restore "141 great projects," the bulk of which work is to be carried out in Manchuria. The actual level of Soviet investment is unknown, but the Chinese are clearly benefiting from Soviet know-how. There is a heavy two-way traffic, with Soviet experts travelling to China and Chinese technicians going to the Soviet Union for training.

The pace of China's industrialisation will clearly depend on Soviet aid, and the Russian leaders are faced with an awkward dilemma. Their investments could obviously mature more quickly elsewhere, while the industrialisation of the country will strengthen Mao's political hand still further. On the other hand, for the Soviet bloc this is in the long run the only way to restore the world balance of power. Besides, Moscow cannot afford to antagonise Peking. Thus there is vast scope here for really Oriental bargaining. Fifty years ago the fate of the Far East was being decided on the Manchurian battlefields, when decrepit Tsarist Russia was humbled by rising Japan. Now, that fate is once again being decided around Mukden, in coalfields and steel mills. This time the key is to be found in Sino-Soviet relations.

German Economy Set Fair

FROM OUR SPECIAL CORRESPONDENT

WEST GERMANY is once again strike-free, now that even the Bavarian bout has ended in a compromise. Both sides have learnt a lesson from the flurry. The Chairman of the Trade Union Federation, Herr Freitag, and the representative of the federation of Employers' Associations have resolved to set up an arbitration tribunal to settle future disputes before they cause stoppages. The State, it seems, is not wanted by either party and no government representative will be on the new body. It will not give binding decisions, but will certainly help to prevent future strikes.

In the meantime, wages are rising peacefully as more agreements fall due for revision. The process is all to the good for the German economy and political stability. Productivity has risen more than wages and is still increasing. Objective German economists agree with the trade unionists that deflation at this time is unnecessary and undesirable. They recommend increases of four or five per cent, or about the proportion by which new wage agreements are actually swelling pay packets.

Oddly enough, this move to avert any deflation comes while Germany is flooded with money, owing to the fact that the huge and increasing surplus in foreign exchange automatically puts an equivalent amount of Deutschmarks into the internal supply. The explanation of the paradox is, broadly speaking, that taxation absorbs the surplus and transfers it into the hands of the governments, both federal and local, and various public institutions. It does not reach the public. The Federal Finance Minister, Dr Schäffer, is indeed accused of drowning in funds, and of being too miserly in drafting his tax cuts—which have still not come into effect.

Dr Schäffer has also been helped by the great increase in employment, and by the long reprieve from a German army. The gross national product is rising more than he estimated, and he has about DM 1.5 billion more to spend than he thought when he budgeted DM 9 billion for "defence" on the assumption that the EDC would be in effect this year. He would like, on top of this bonus, to lay his hands on the surplus of unspent occupation costs which the Allies are grimly retaining for future use. All in all, Dr Schäffer is sitting pretty. He has not had to use a pfennig of the government loan issued in 1952, and this financial year he can cover all the investment expenditure "below the line" out of revenue, instead of raising another loan, as originally intended. This leaves the capital market freer for industry, which is already finding it easier to obtain loan capital for itself. Well-known firms are now able to place bond issues which offer a lower yield to the investor than at any time since the war, and the prospect of loans costing firms only 6 per cent, instead of 8 per cent, is in sight for next year. This relief still leaves the Germans paying more for their loans than the British firms, but will naturally help to make Germany still more competitive in export markets.

Increased wages and tax cuts will at the same time ensure that the internal market keeps up with expansion. If the Germans continue to be as confident about peace as at present, they will not rush to empty their pockets of goods, and so outstrip production. They will go on saving, particularly in order to secure a home. For this reason there is no need to fear inflation—but equally, Germany may not increase its imports enough to level out its balance of payments. West Germany will, it seems, increasingly be an investor overseas.

Malan Seeks for Reinforcements

FROM OUR CORRESPONDENT IN SOUTH AFRICA

THE Nationalist Party in South Africa, so long an opponent of large-scale immigration, has recently begun to change its tune. Last June the senior mouth-piece of the party *Die Burger* came out with the surprising plea for more "good white citizens" to fill the depleted ranks of skilled technicians and artisans. The theme has been echoed in other sections of the government press. Naturally, these papers claimed, the fault was not of the government's making; it was the sole responsibility of the hostile critics who painted so awful a picture of South Africa to the outside world.

This revolutionary change of emphasis gathered more strength when Dr Geyer, former South African High Commissioner in London, returned to the Union after a 7,000 mile trip through East and Central Africa, a convinced supporter of the need for greater European immigration. Here, from one of Dr Malan's closest advisers, was the green light to the rest of the Nationalist propaganda team to prepare the public for a change of direction. But despite the dawning recognition of the imperative need for white immigration, the Nationalist Party has not departed one inch from its aim of excluding from the country any but possible sympathisers and supporters of the Party. *Die Volksblad*, the Nationalist organ in the Free State, had an article comparing the success of the government's policy of selected immigrants with the dire consequences that would have followed if "the United Party had remained in power and Field Marshal Smuts's threat to import bad and good from Britain had been carried out." However, the paper concluded, it was necessary to find out whether the selection policy was "too restrictive."

Between 1945 and 1948 South Africa gained 78,055 immigrants. A peak was reached in 1948, when 35,631 entered the country; but so successfully did Dr Donges turn off the tap that in 1949 the number dropped to 14,780. The highest inflow since then is 18,473 in 1952, with a total of 77,556 for the period 1949 to 1953. In some months during this period the Union actually lost population through a higher emigration than immigration rate. Since the war the Union has attracted approximately 160,000 new settlers—one of the lowest intakes in the Commonwealth.

Skills for the Volk

For some time after the Nationalists came to power in 1948, they defended their anti-immigration policy by arguing that the "absorptive capacity" of the Union was not great enough to cope with more than a limited number of immigrants. But it soon became clear that the country's mining and industrial expansion, combined with a rigid application of the colour bar, had produced a desperate need for skilled labour. Today the country has reached the position where a grievous shortage of skilled workers in nearly every sphere of the Union's economic life is threatening to hamstring development. In the largest State undertaking, for instance, the railways, the shortage of artisans is so serious that essential work is held up and the whole transport system is suffering. This pattern is repeated in other sections of the economy, especially the engineering and building industries, while in commerce, generally, there is a definite need for men and women of enterprise and ability. In addition there is a grave shortage of school teachers in all provinces.

But as recently as May this year, Dr Donges defended his government's attitude by saying that its immigration policy had regard to the "long-term interests of South Africa," which, in political terms, has been taken to mean the political interests of the Nationalist Party. The government, he added, would only encourage immigrants who could be "properly absorbed" in the Union's economy. The powerful Dutch Reformed Church, again, is vigorously opposed to bringing Catholics or "disbelievers" into the country.

The Provincial Council elections have now persuaded some Nationalist leaders that they are no longer in any immediate danger of being politically swamped by newcomers or foreigners; and anyway there is Dr Donges's Citizenship Act to ensure that no immigrant will vote before he has been in the country six years. And on top of this is the undisputed fact that the numerical preponderance of the Afrikaans-speaking section, from which the Nationalists draw their support, is growing steadily greater, so that a few foreigners can hardly upset the Nationalists' political applecart at this stage. All this has combined to produce less timidity in some Nationalist circles about immigration.

But it is quite obvious that the immigration net is being spread to let in as many "acceptable" Hollanders and

Germans and as few Britishers as can decently be allowed. This has not been more explicitly stated than by a leading Nationalist journalist and author, Dr G. D. Scholtz, who is one of Dr Verwoerd's proteges. In a remarkably outspoken book, "Has the Afrikaner Volk a Future?" he says that immigration is essential if the Afrikaner is to maintain himself. But, he adds emphatically, the immigrants must come from Holland and Germany and must be Protestants. Moreover, he deals at length with the need for turning immigrants into Afrikaners (in this context, Nationalists) through church, school and cultural organisations—which is precisely what Nationalist practice and policy has been doing for and to as many South African children as possible.

Whether it is due to the government's lack of enthusiasm for British immigrants or whether Britons are no longer interested in coming to South Africa, the fact remains that there has been a dramatic change in the proportion of British and non-British immigrants since Dr Donges took charge of this department. Of the immigrants who entered the Union from 1945 to the end of 1953, 111,600 were British (77,600 had come by the end of 1948), 17,800 were Dutch and 15,700 were German. Between 1948 and 1953 the proportions changed considerably, the totals being 34,000 British, 14,500 Dutch and 15,000 German. In 1953 the number of British immigrants was 5,000, compared with 30,000 in 1948. In the latter year the number of German immigrants totalled 270; by last year it was 2,800.

Cynics may be excused for saying that the Malan government, having missed the immigration bus, is now advocating a pale imitation of its opponents' immigration policy in the almost certain knowledge that the trickle from Europe will never grow strong enough to make a real impact on South Africa. It is in need of skilled manpower, but at the same time it is too jealous and selfish to allow its indigenous millions of non-whites to acquire the skills.

Agenda for Sixty Nations

THE mixture of items on the agenda of the ninth United Nations Assembly, which opens next Tuesday, is much as usual. The chronic cases—Korea, disarmament, the deadlock over new members, South West Africa, Indians and *apartheid* in South Africa, Morocco and Tunisia, forced labour, funds for economic development—far outnumber the new admissions to the list. Their annual inspection is unlikely to have much effect on their condition, though the Russians may well consider this a particularly suitable moment in European affairs to offer a variant of their old cure-all for the disarmament problem.

Of those cases which are, so to speak, still on their feet, the Korean and Arab refugees are doing as well as can be expected, but the High Commissioner's European charges need more help, the bill for which he puts at about $12 million. After five years' treatment the Human Rights Conventions have been roughly completed, but their persisting weaknesses are likely to become uncomfortably evident in debate.

It is unlikely that any cases will be completely discharged at this session; and indeed the Dutch and Danish declared intention to stop sending information to Uno about the Netherlands Antilles, Surinam, and Greenland, on the ground that these territories are now self-governing, will probably provoke opposition. In the administrative field, however, the Assembly may end up with one problem the less. The United States will probably agree to abide by the recommendation of the International Court that compensation should be paid to the eleven American nationals who were dismissed for refusing to answer congressional inquiries about their alleged Communist affiliations; but it may ask that the decisions of the administrative tribunal which made the award should be subject to review by the Assembly in future.

The important new admissions to the agenda are few but fractious. The Greek request for Cypriot self-determination and the Indonesian claim to West Irian (alias Dutch New Guinea) are likely to generate some initial heat and to end with the usual, and usually unheeded, request for private negotiations. Britain will perhaps run into less trouble over its suggestion that the trusteeship agreement for its part of Togoland should be terminated; and the Assembly will at last have to take some concrete responsibility for deciding what that territory's future is to be when the adjoining Gold Coast attains self-government.

These, of course, are the problem items which will be in the limelight while the Assembly is sitting. It is worth while remembering also some other, normally unnoticed, items on the agenda, such as the reports of the technical assistance programme, the specialised agencies, and the UN Children's Fund. Generally speaking, these are going along nicely; but, unfortunately for them and for the United Nations as a whole, good news nowadays is too often no news at all.

Cedars Murmur in Lebanon

FROM A CORRESPONDENT

THE resignation of the Lebanese prime minister and his cabinet on September 8th, though not unexpected, calls attention to the intricacies of Lebanese politics and the part that these can play in determining the republic's contribution to Arab affairs. The country is the smallest of the members of the Arab League; its population, its finances, its armed forces are all unimpressive, but it has its own importance and is worth watching.

It can indeed offer a number of claims to attention. Its ports, of which Beirut is by far the best on the Levant coast, give access to a wide Arab *hinterland*, including Syria and Iraq. Sidon and Tripoli are pipeline terminals for Saudi and Iraqi oil, and the Lebanon is a great entrepôt for people and ideas as well as for goods. No window of the East has played, or is playing, a greater part in the admission of western thought and methods into nearer Asia. It has resulted from this, and from the lively minds and hearts of its inhabitants, that the Lebanon has bred a progressive type of Arab.

His cosmopolitanism is not inconsistent with fervid local patriotism, nor do Arab weaknesses of instability and hastil-

Demolition in South America

Atlas-Copco puts compressed air to work for the world

In the hands of a sculptor, small pneumatic tools by Atlas-Copco are producing work in Norway which may live for centuries. Atlas-Copco concrete breakers, in the hands of South American workmen, are demolishing relics of the past to make way for new roads which will eventually bring the benefits of modern civilisation to many more thousands of people. As in Northern Europe and South America, so in almost every part of the world—Atlas-Copco is on the job wherever compressed air is working hardest. It is almost impossible to name an industry in which Atlas-Copco has not found some justifiable application for compressed air. Add to this, the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

*Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to THE ATLAS DIESEL COMPANY LTD., Beresford Avenue, Wembley, Middlesex.

FOREST CREATURES FLEE in terror from the holocaust of fire. A hundred miles away towns taste the burning, the sun is overcast, smoke constricts the throat. Fire, which brings blackened desolation, *could* starve the world of newsprint. Over the 7,000,000 acres of Bowaters' timber limits in the Canadian Province of Newfoundland such fire is guarded against by endless vigilance, war is constantly waged against pests and parasites, afforestation is carefully planned. This is the Bowater guarantee for never-ending supplies of pulpwood for their mills at Corner Brook, one of the largest integrated pulp and paper mills in the world.

From the mills of the Bowater Organisation in Europe and North America comes newsprint in a never-ending stream for the newspapers and journals of the world; other printing papers for magazines and reviews that carry colour and interest into countless lives; paper for the protection of food and for packages of almost infinite versatility.

ness invalidate the exceptional abilities of his leaders. Among these are a score who could hold their own in any circle of administration or business, and half a dozen, with the cultured, competent and highminded President Chamoun at their head, who could take their place as statesmen in any international milieu. The Lebanese colonies in South America (whom the president recently visited), world-wide trading interests, the established position of the Lebanon as a tourist and holiday centre, and its educational establishments, notably the American University, give the country a vitality disproportionate to its size.

Its political life has not yet risen to the level of these high potentialities. Those who deplore in the Arab States the absence of a stabilising middle class will notice with surprise that the Lebanon has proportionately the largest such class in the Arab world. But it seems to gain from it in its politics little more than more frustrated white collars, more student demonstrations, more professional pressure groups, more strikes, more press extravagance, and more restless parties. These include the National Bloc, Socialist and National Front, Syrian Popular Party, Progressive Socialists, Call of the Nation Party and semi-organised independents; and for the young and lusty, a choice of (Catholic) Lebanese Phalanges, (Muslim) Najjada, Patriotic Youth Movement, or the (Communist) Partisans of Peace. The endless re-groupings and polemics of these are the more complex because they draw their support from the various strata of rich urban families, Druze potentates, middle-class townsmen, industrial workers and mountain cultivators. They also derive from the sharply divided "confessional" groups of Sunni and Shia Muslim, Druzes, Maronite Uniates, Armenian Orthodox, Armenian Catholic, Greek Orthodox, Greek Catholic, Protestants and lesser communities.

Divided They Stand

That so divided an electorate—broadly half-Muslim, half-Christian—should hold divergent views on foreign affairs, including its own place in the Arab world, is not surprising. A local minority of Christians would cut their connection (other than commercial and, in part, cultural) with the Arab world, and retire into a small pre-1914 Mount Lebanon. A minority of Muslims would amalgamate with Syria. The usual clashes on the desirability of accepting western help, on the structure of the League, and on defence considerations are resounding, as in neighbouring countries; but the country's substantial support of the League and of Arab causes everywhere will certainly continue. This has been confirmed by the recent visit of Salih Salim to Beirut, by those of the Lebanese premier to Cairo, Jordan and Iraq, and by the journeys and consultations of the president himself, for whom the Lebanon has a central part to play in Arab statecraft.

But governments of the Lebanon would contribute more solidly to the support of such views if they were themselves more stable. The "rose-water revolution" of August, 1952, swept away some abuses, but the old divisions, methods, and egoisms remain. The revolution was followed not by a strong reforming government, but first by a stop-gap ministry under the little-known Kamil Shihab, then by another under Saib Salam. The general elections of July, 1953 (with votes for women for the first time) brought many of the old gang politicians back to the Chamber, but few of the progressives. Abdullah Al-Yafi formed a mainly non-party government whose history has been that of most Lebanese ministries. There has been progress, but all too slow for the opposition, in the development projects. There has been an outcry, notably from Kamal Jumblatt's Progressive Socialists, for thorough-going social reform, met by conservative opposition to it. There have been fierce polemics on the continuance of the "confessional" form of parliamentary representation. There have been arrests of Israeli spies, riots of university students, a bomb or two, a lawyers' strike, and fierce personal recriminations.

In February, 1954, Al-Yafi resigned under pressure, but a week later could re-form his government and secure a vote of confidence, followed by another in June. Since early July, however, the position of his administration has been obviously weak. Accusations of failure to keep order, of lack of progress and of various malpractices have led first to rumours of cabinet changes, and finally, last week, to the resignation of the prime minister.

His reinstallation in office with a changed cabinet is not unlikely: the president is said to favour it. Otherwise, any of a dozen independents could succeed him, with no clear mandate and almost no hope of a smoother passage. The visit of Messrs Aneurin Bevan and Morgan Phillips and Dr Summerskill as guests of Jumblatt, the young Oxonian Progressive-Socialist leader and strong anti-Westerner, may give his party the encouragement which the electorate have hitherto withheld.

Living with a Giant

FROM OUR CORRESPONDENT IN CANADA

THE "un-Americanness" of Canada is like a sea serpent. It is submerged most of the time, and when it appears it shows in a series of waves. To picture it is to recall representations of the Loch Ness monster, though Canada's "un-Americanness" is always real. It is just as real in times when to British eyes Canada seems most American as it is in times like the present when Canadian divergences from the United States are obvious. The monster lives in the lake all the time and the most surprising thing is that it comes up for air so rarely.

There is almost every superficial reason why the Canadian public should follow United States patterns of thought. One of Canada's best historiographers, Professor D. G. Creighton of Toronto, said to a public affairs forum last month:

"It is only natural that our picture of the world should be shot through American cameras. The Canadian Broadcasting Corporation and the Canadian Press (a co-operative news agency) provide us with some independent comment and some independently gathered information. A Canadian correspondent is sent off every once in a while by some large metropolitan newspaper to report on the fortunes of a war or the doings of an international conference. But these are plainly exceptions to the general rule—brief intervals of home cooking in a very steady diet of imports supplied by the great American press associations and by columnists and news commentators who are citizens of the United States."

Canadian Sales Resistance

Canadian foreign policy, however, remains independent and sometimes strikingly different from that of the United States. In spite of all the reading and listening and televiewing matter which Canadians absorb from the United States, the Canadian public—or at least that part of it which thinks about public affairs—apparently reaches its own conclusions. These conclusions coincide with Ottawa's much more often than they agree with the dominant (and often fluctuating) US view. The phenomenon is only partly explained by the facts of history and tradition, and it is an intriguing matter for speculation how long it will continue under the steady barrage of United States publicity.

Professor Creighton takes a provocative view, saying: "For the past eight years the nation which virtually invented modern advertising has been engaged in what can only be described as the greatest sales campaign in its history, the campaign to sell the Cold War, in an exclusive American package, to the rest of the western world. Canada, which was treated as an adjunct to the domestic market, received the full impact of this promotion. To put it in commercial terms, which are in reality the most appropriate, American-packaged Cold War was outselling every other brand of packaged Cold War ten to one *in the Canadian* market."

This was certainly a graphic way of arousing Canadians to awareness of a danger. But if Professor Creighton is right in his estimate, then the Canadian government has got dangerously out of line with its own public. There are plenty of signs that this is not so. The Loch Ness monster has been appearing lately to people who were neither credulous nor intoxicated. To those who have never been sufficiently aware of the submerged "un-Americanness" of Canada—and they are to be found in Canada as well as in the United States—the monster's appearances look like anti-Americanism. The distinction between being different and being "anti" very often depends on the observer's expectation.

The closest approach to anti-American feeling for quite a while, and the most widespread, has been caused by the St. Lawrence Seaway. This is a little ironic. After years of Canadian waiting for US participation, Mr Eisenhower's administration pushed through New York's partnership with Ontario in the power project and then persuaded the Congress to build part of the seaway too. But by this time the years of waiting had brought most Canadians to the point of wanting to build the seaway alone, and of knowing that they could, once US participation in the power project was assured. So instead of being grateful to President Eisenhower for making the power project—and therefore the seaway—possible, a great many Canadians are indignant at the last-minute conversion.

At first glance, this unwillingness to have the Americans in on the seaway chiefly demonstrates the new self-confidence—or if you are so minded, the new arrogance—of Canadians. But lying deeper and more interesting is the other half of the motivation—a profound distrust of the American processes of government. More and more Canada's "un-Americanness" seems to focus in the parliamentary system. More and more the things that Canadians dislike in United States policy are being traced back to the constitutional division of powers between President and Congress. The difficulties about the seaway lie basically in the fear that the Congress will want to take a hand in deciding how it shall be run, and in many Canadian eyes the Congress appears both basically irresponsible and congenitally incapable of understanding or respecting other people's interests.

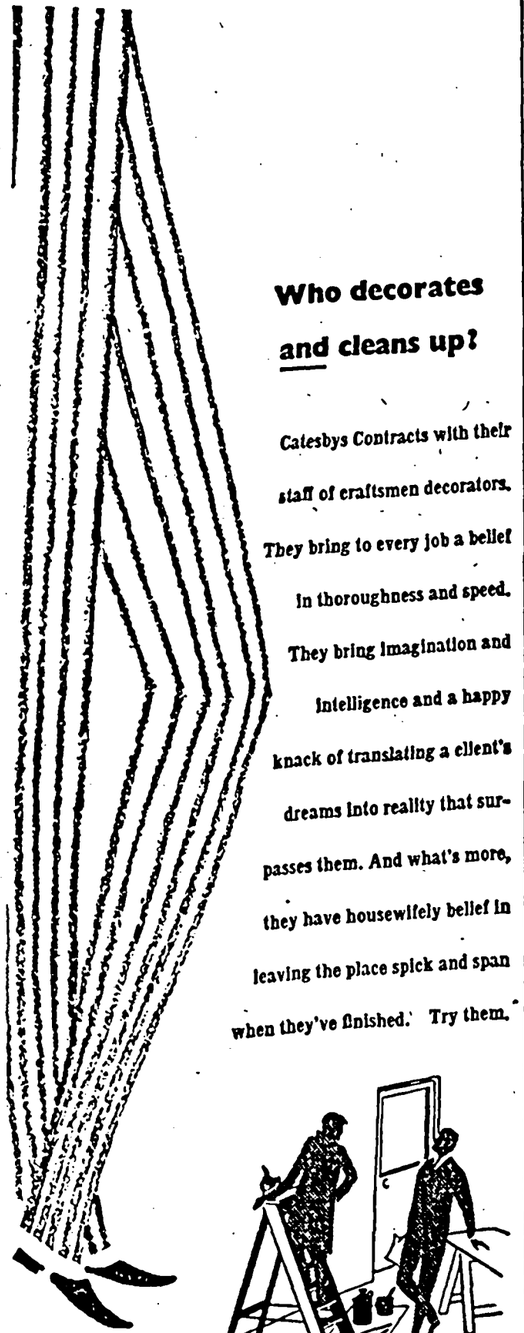
Against Luce Thinking

A constant source of very similar irritation arises from tariff policy, where again it is the vote-seeking politicians in the Congress who get most of the blame. McCarthyism is as generally loathed in Canada as in Europe and, for that matter, in many parts of the United States: again it is the irresponsibility of Congress. The China Lobby has no counterpart and arouses no sympathy here. The brand of foreign policy peddled by the Henry Luce publications, in spite of the wide circulation of *Life* and the successful "Canadian edition" of *Time*, shocks most Canadians. It is difficult not to suppose that these publications make some impression especially on their less educated readers, but their influence is sufficiently small to be only a marginal consideration—if that—with policy-makers.

Responsible members of the government and their officials will sometimes show concern at the danger of anti-Americanism. They do not spend much time worrying about mass conversions to Henry Luce. It may thus be that the "un-Americanness" of Canada is its main safeguard against anti-Americanism. Certainly it seems that the people who are most prone to forget that Canada is not America are also the most apt to complain of supposed anti-Americanism.

This, perhaps, explains the moderating conditions which apply to all such harsh judgments of Washington as have been quoted here. Minor outbursts of indignation about tariffs or the seaway or the wilder pronouncements of Senators about the cold war are a natural and harmless safety valve. Even the long-term doubts about the validity of the US constitutional system do not alter Canadian awareness that this country need not fear the grosser encroachments which small countries often have to expect from their dominant neighbours. "If you have to share 3,000 miles of border with a neighbouring giant," a Canadian will say, "it would be hard to find a better giant to share it with." To live with a giant is the peculiar Canadian problem. No reasonable person expects that that will always be comfortable.

AUSTRALIA



Tighter Import Controls?

Our three-monthly review of economic conditions in Australia, issued this week, analyses the deteriorating balance-of-payments situation. It recalls the sudden drastic cuts imposed by the Australian Government in March, 1952, which caused such dislocation of trade.

The Annual subscription to this service of three-monthly reports on 70 countries is £10 per country (or territory). Single copies of reports, including the present one on Australia, may be obtained for £3.

For information about this service, please get in touch with:

Keeping things moving

No. 5 IN A SERIES ON RESEARCH & DEVELOPMENT

Productivity reports on one industry after another have stressed the economies of mechanised materials handling. But many materials are not easily handled either mechanically or pneumatically. They may be non-free-flowing due to moisture or natural stickiness; they may be hot, dusty, abrasive, corrosive, ill-smelling or toxic; they may be subject to degradation or breakage unless gently treated. Simon Handling Engineers maintain an experimental department in which the physical and chemical characteristics of "difficult" materials can be investigated on anything from a laboratory to a commercial scale, and newly developed plant and equipment can be exhaustively tested. Since the war more than a hundred materials have been examined and many of the results incorporated in plants built for clients.

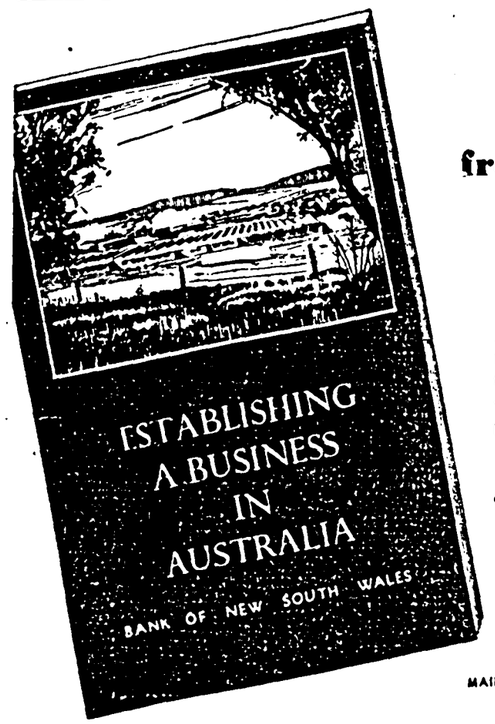
Spanning the East



Branches of The Chartered Bank of India, Australia and China under British management directed from London are established in most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents.
In London and Singapore the Bank is prepared to act as executor or trustee.

Australia
from a business point of view

This booklet will assist anyone contemplating establishing a business in Australia whether it is a small retail business or a large manufacturing company.

Written with the authority of Australia's oldest and largest joint-stock bank, it offers those who wish to start a new enterprise in that young but growing country a short account of the framework of business organization throughout the Commonwealth of Australia. It also affords some knowledge of the problems and conditions which would be met.

If you are interested in establishing a business in Australia, obtain a free copy of this book from:

Narrow Path for Gilt-edged?

THE excitements that stirred the gilt-edged market in the spring and early summer have lately subsided into a more seasonable calm. Since the launching of the £100 million Electricity issue in mid-August, price movements have been small, and slightly downwards. The market has shown a notable resistance both to the profit-takers and to the spasmodic rumblings of international politics. But it has lost the special momentum that was imparted to it by—or, rather, that it drew from—the vigour and the success of the Government's refinancing operations of early June and early July. Then, it will be recalled, the launching of the "Eternity" 3½ per cents—the funding stock that extends into the next century—was being eagerly read by the bulls as proof that the authorities were cherishing high ambitions for their conversion programme. The market's experience and the official tactics in these past two months have confirmed the view that no undue forcing of the pace was to be expected.

The problem of debt refinancing is, however, ever present, and the authorities can be depended upon to seize every reasonable market opportunity offered by the favourable conjuncture in Britain's economic circumstances. Given the high degree of activity and the extremely low level of unemployment in the domestic economy, it would be most imprudent to frame conversion plans on the assumption that gilt-edged values can safely be forced up much further. And although a continuance of confidence might conceivably produce a further fall in interest rates, even in conditions of very low unemployment, such a fall cannot be depended upon. If, therefore, the authorities recognise that they must not force the pace, the present level of interest rates is in any case a pretty satisfactory one for the Treasury as borrower.

The market is observing that the popular season for debt operations is approaching. And though it has wisely stopped "talking" War Loan up to 95 and over, it is beginning to wonder again whether the Treasury's maturing plans may provide it with a new bull point in the coming weeks. It may be that the late launching of the Electricity issue means that the phase of consolidation is not yet ended; and the Gas Council presumably cannot delay its funding issue much longer. If that is so, the grooming of the market for the Treasury itself may still lie some while ahead.

The Treasury time-table, however, certainly offers more latitude than it has done in previous years. The problem of providing for the procession of spring maturities was greatly complicated in the autumn of 1952 and 1953 by the need to meet each year's maturing tranche of the Serial Funding stocks by which the new monetary policy was launched in November, 1951—not to mention the need to carry through a further funding of accumulated floating debt. In both these years this double need dictated a funding operation at end-September or early October. But last spring the strength of the market enabled the authorities to free themselves from this constricting time-table; and early in July they disposed of all but £122 million of the £535 million of Serial Funding Stock due on November 14th next. The June operation—the cash-and-conversion issue of 2 per cent Conversion Stock, 1958-59—similarly took care of the growth of floating debt in the hands of the banks. But it did not otherwise advance the time-table, for the stock disposed of by conversion, the 3 per cent Defence Loan, 1954-58, was one that need not have been tackled at all.

Hence the authorities have still to face the big spring maturity—the £735 million of 2½ per cent Exchequer Stock due in mid-February. A further refinancing operation this autumn is therefore a virtual certainty. And,

indeed, if the authorities do in fact accept the proposition that the economic weather is unusually favourable, the programme they are likely to have in mind will embrace at least two further substantial operations during the coming twelve months or so. They are obliged to deal with £523 million of 3 per cent Serial Funding stock before November, 1955, in any case, and they may be expected to try to tackle also the £824 million of 2½ per cent National War Bonds, 1954-56. The only other immediately callable stock is the £101 million of 2½ per cent Funding Stock, 1952-57. If that were included for good measure, it would mean that, after reckoning in the £122 million of unconverted 1954 Serial stock, no less than £2,300 million of stock would figure on the programme for conversion before the end of next year.

★

The size of this programme should surely give pause to those who still chatter about an early assault upon War Loan. It is necessary if the authorities are really to capitalise the present opportunities and prepare themselves for the problems that lie beyond, but it is not an argument for bullishness about gilt-edged. Since the programme includes some big optional stocks, it would not be attempted on the full scale unless the market kept reasonably firm. On the other hand, to achieve the whole objective with safety would require care and skill ; forcing tactics would mean inflation.

It ought to mean also that the authorities in choosing their replacement stocks will pay full regard to the lessons of recent years. These have driven home again and again the virtues, in the interests of a smoothly functioning market, of a single date—or, at least, of a narrow period of optional redemption. The authorities have indeed been working on this principle recently: the single-dated stocks now total £2,300 million, whereas at end-1945 there was only one issue, of under £800 million. The volume of stocks with one- or two-year spreads has, however, declined slightly, to under £2,700 million. But if the policy has been virtuous by contrast with the early postwar years, when the supply of stocks with five- or ten-year spreads was greatly increased (it is now £2,850 million larger than at end-1945, at over £6,700 million), it has perforce been concerned mainly with issues of short or medium life ; and for those a narrow spread is virtually unavoidable.

But it is all too easy, when launching an "Eternity" issue, to discount the problems that a wide spread piles up for the future, and to take advantage of the fact that the market may then take a similarly careless view. A five-year spread may not impair the marketability of a stock while it has thirty, forty or more years to run ; the objection is immediately apparent only when the life is short. In framing their medium and long issues, the authorities ought to ponder the fact that the weaknesses of stocks with wide spreads will soon become even more apparent to the market than they are now. The calling of the Defence Threes (1954-58) on their earliest date gave the first big jolt to market thinking on this subject, and since then the Savings Bonds 1955-65 have become the most glaring instance of the anomaly thus created. Very soon, however, such instances will be multiplied many times.

In about a year from now the problem of debt refinancing will begin to assume quite a new post-war pattern. The hypothetical immediate programme sketched above will dispose of most of the special institutional stocks placed during the war years—notably the War Bond series and its successors—that had "spreads" of two years or less. Next year the Treasury will enter the phase in which the Savings Bonds series, designed for the general investor as well as for the institutions, becomes optionally redeemable—and these stocks, with some others that also become redeemable in the ensuing few years, have a spread of ten years. Between now and 1965 £3,100 million of such "ten-year" debt will become callable ; and over this same period stocks that have a spread of three years or more will become finally or optionally redeemable to the extent of no less than £5,150 million. Of this last total, £3,200 million will arise between now and 1961.

The wider spreads for so large a volume of debt will give the authorities the widest freedom of manœuvre. If the hypothetical programme for the next twelve months is left out of the reckoning, the amount of single-dated or narrow-spread stocks (two years or less) that finally mature before 1961 will be less than £1,300 million. But this freedom for the authorities may not prove to be a net advantage even for them. Conditions that cause discomfiture in the market, and impair its flexibility, cannot profit the Treasury in the long run.

The increase in the proportion of "wide-spread" stocks in the slice of debt that is nearing maturity will cause serious frictions in a mechanism upon which the Treasury has greatly depended for the smooth refinancing of debt. This smoothing has been achieved by the fact that, as each stock nears maturity, it tends to gravitate to institutional holders of short stocks, notably to the discount market, and thus is conveniently concentrated within easy reach of the "departments." But the institutional dealers cannot safely perform a similar service in "wide-spread" stocks—for this would be to turn the investment business of Lombard Street and the banks into gambling.

Unfortunately, there is very little the authorities can do to alleviate these coming difficulties—except to ensure that their new issues afford a sufficient supply of single or narrow shortdated stocks to keep the mechanism in reasonable working order for its more limited task. But the trend now is rightly towards medium and long stocks. Hence, for the gilt-edged market in its wider sense, the Treasury's exercise of its greater freedom of choice is likely to mean recurrent jolts and jars ; and these will recoil in the end upon the terms the Treasury can itself command. The moral surely is that care should be taken to avoid piling up similar trouble for the future. The spreads for even the longest new stocks should be kept narrow.

Cinemas and Circuits

FIVE years ago, hardly any accurate statistics of the British cinema business existed at all. Since then, a gentle but persistent inquisition by the Board of Trade has furnished far more than most industries in the country ever publish ; but until last year, most of the information these contained was consistently depressing. During the last twelve months, exhibitors have become able to study the figures without the uncomfortable feeling of being painstakingly measured for a coffin ; the sharp decline in business that began before the statistics did seem at least to have been checked. But the comfort that the statistics have had to offer has by no means been equal for all cinema exhibitors. Not many of them, for example, could match the very comfortable statistic offered from his own experience this week by Mr J. Arthur Rank, the biggest British exhibitor of them all:

> . . . during our last financial year, during which the number of television sets increased substantially, there was an actual increase of more than 3 per cent in the number of attendances at the group's cinemas over the year.

Once again, the Rank organisation is reflecting to an exaggerated degree a general swing in the British film industry's fortunes. And for once, temporarily or not, that swing seems to be upward.

Total admissions to cinemas, to judge from the official statistics for the last quarter of 1953 and the first quarter of 1954, may broadly have ceased to decline, and the records of Entertainments Duty collected until the end of June hint at much the same story. This is good news indeed for a business where custom had been declining between 2 and 4 per cent annually over the previous four years. But this levelling out of admissions for the cinema business taken as a whole hides a striking disparity in the fortunes of cinemas of different sizes, roughly with those above the thousand-seat level selling more seats than a year before and those below it selling less ; and the partial recovery seems to have been locally concentrated too, in London and the home counties. It is, of course, among these larger cinemas, and in the south of England, that the major circuits bulk largest in cinema ownership. So the Rank report and accounts this week, and the improvement this year mentioned by Sir Philip Warter of Associated British, have only confirmed the trade's impression that it is the major circuits that have enjoyed almost all of the recovery, or respite, that cinemas achieved in 1953-54. Mr Rank's anxiety and Sir Philip's, therefore, is to know whether this improvement in business can be maintained ; for many other exhibitors, the question is whether they can achieve it too, or whether it will remain concentrated mainly among the circuits.

Nobody in Wardour Street knows how far the factors that have been improving at least the thick end of the business during recent months—apart from the weather—must be considered special ones. Mr Rank was justifiably encouraged by

> . . . the continued rebound in our theatre business in certain of the larger television-saturated areas, where the novelty of television has fallen off and the period of instalment payments for the television sets has been completed.

That rebound has been partly the consequence, also, of technical experiment by the cinema business itself. Though stereoscopic films seen lost their novelty, that novelty undoubtedly made some quick profits while it lasted. The wider screens are becoming much better established, though the majority of independent exhibitors would probably agree with Mr Rank that "speaking from our experience the public do not take kindly to stereophonic sound in its present form." Associated British and some of the other circuits, it should be said, have shown rather more enthusiasm for this expensive development and for the new "package" techniques such as Cinemascope ; but Mr Rank has specifically written off much of the cost of stereophonic equipment installed for Cinemascope showing out of current profits as "experimental." During the year there has been some shortage of Hollywood features, offset partly by the exceptional business done by certain spectacular wide-screen features and partly by the wider showing of British feature films—some of which have been extremely popular. Television ownership for the country as a whole has continued to expand, though at a somewhat slower rate than during, say, 1952-53. Earnings and personal expenditure by consumers have been increasing during a period of industrial recovery, and though freed supplies of other things for the public to buy have grown more abundant, the return towards prewar patterns of buying may broadly have spent its impetus.

Mr Rank, at any rate, emboldened by his own gruelling ordeal of looking at British television programmes, has "no doubt that the cinema industry will maintain its important position in the entertain-

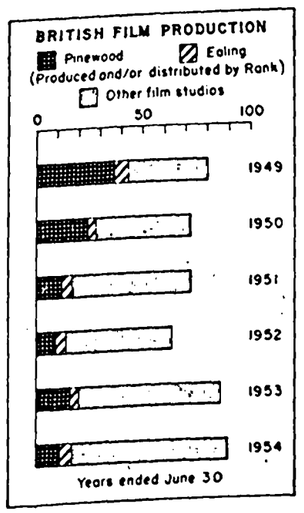
ment world" and later "no reason to doubt that we shall continue to maintain our position in the industry"—the second expression of confidence, perhaps, sounding slightly more specific. His Odeon and Gaumont-British cinemas took just under £30 million at the box-office during the year ended June 26, 1954, about £1,200,000 more than the previous year; this may be compared with total box-office receipts of perhaps £110 million for the whole industry. After paying Entertainments Duty their net takings were about £18½ million, and the group shows a profit before tax of £3,196,232 on exhibition in Britain; though Mr Rank emphasised that 236 of his cinemas, more than half the number though probably not of the seating capacity, operated at a loss of approximately £588,000 before providing capital charges, if profits on sales in the cinemas are excluded.

The Rank group, keeping its own support of feature production steady at about 15 films from its own studios and six from Ealing Studios a year, now represents a rather small proportion of the growing output of British films; but almost certainly a more profitable proportion than the whole. "On our normal method of valuation," the report records, "the films released during the year show, in the aggregate, a profit"; which, of course, includes these films' share of the Eady levy, which generally returns a feature film about an extra two-thirds of the amount it earned in normal film hire. Within the actual accounts, the group's production is merged with distribution; together these activities brought in a profit before tax of £836,813, which compares with the figure of £352,760 achieved in 1952-53 following several years of losses. At the group's theatres during the year, indeed, 12 out of the 24 most profitable films played were British, and their aggregate receipts were almost exactly equal with those of the 12 American. Remittances from the group's films shown overseas have generally increased; though in the United States their films still find it virtually impossible to get showings in "the public end of town," and Mr John Davis spoke bitterly of "people who think Norman Wisdom is just another comedian."

This improvement in the group's film business, supported by fairly steady profits from manufacturing and other activities, has made possible a continuing attempt to clear up the balance sheet. Bank loans and overdrafts have been further reduced, in spite of the employment of nearly £1 million of extra bank finance to finance current film production; loan capital repaid by the normal annual instalments; and revenue reserves built up by about 40 per cent. Moreover, the group has recently obtained licences for the completion of some cinemas begun shortly before the war, and proposes to build theatres in some of the new development towns. The high gearing of the group's capital, and the substantial sums payable in debenture interest, preference dividends, and to outside shareholders, leave the ordinary shareholder in Odeon Theatres at the end of a long queue of claimants. The ordinary dividend of 15 per cent, less tax, in fact takes £78,127 out of the group's net profit of £2,264,655. Even so, speculators in the Odeon equity (yielding a fraction more than 3 per cent) surely ignored that a company is conditioned by its history as well as its future; and both weigh heavy on this balance sheet.

★



In a copybook ending to his annual statement, Mr Rank eschews prophecy, but feels the group should hold its place in the industry,

> . . . and, if conditions beyond our control permit, . . . earn reasonable profits although I cannot promise that the level of profits earned in the year under review can be maintained.

He has, elsewhere, brave remarks about his confidence that the public will continue to like entertainment "produced with the assistance of the greatest developments of this electronic age, shown under the best possible conditions, upon screens which are not a strain upon the eye," which Bush Radio Ltd. will no doubt duly take to heart.

Whether that confidence is well placed in the industry as a whole remains to be seen. Earnings and personal expenditure on consumption may well continue to rise, and entertainment, like beer, is certainly now competing on "normal" terms with other claimants for the consumer's pound. But one significant element in spending is still rising, with the ending of restrictions on hire purchase. As Mr Davis has said, "The cinemas are competing not only with television, but with the instalments on television"; and if the advertising carried by cinemas, among other media, should persuade the British customer to behave more like an American and devote more of his income to buying conventional luxuries "on time," it might thin the margin of income that entertainment lives on. The biggest potential change here, of course, is car ownership, which mortgages income over and above the instalments (as indeed television may, considering tube life and service charges); the "people's car," like the television set, would be a direct competitor for leisure hours. At this direct level, sponsored television cannot but bring television ownership nearer saturation and to some extent widen actual listenership, however much it cuts into the BBC's audiences.

Does this imply a continued concentration of whatever prosperity this business may attain into the circuits? Immediately, while the wider screens are still spreading and the early successful films with them, the smaller cinemas may well expect their own new lease of better business. But not all the smaller cinemas in Britain have the space to show the wider-screen films effectively; and not all their owners can find the money. Various calculations of costs that have been made in the industry suggest that the larger cinemas, which get most of the business and are more strongly controlled by the circuits, also have better unit profits. The whole of the industry will benefit from the reduction of some £3½ million in Entertainments Duty conceded this year, but it is not yet clear how the incidence of the reduced taxes and the revised scale of Eady levy will on balance benefit large as against small cinemas. There seems little likelihood that circuits would now embark upon the building of new cinemas, at current prices, to compete with established independent exhibitors for the local monopoly of a good site; but some renewed wave of amalgamation may already have started, in the consolidation of some of the smaller circuits. All in all, cinema prospects look less tragic than they did a year ago. But in a business which could hardly raise new capital, Mr Rank's concern with liquidity is understandable; during this testing time the chances seem even more heavily loaded towards the competitors with the longest purse.

Business Notes

The Market Clears a Hurdle

A RENEWED firmness has spread through stock markets in the past few days, despite the pressure of new issues and the expectation of further pressure to come. The undertone has, of course, been very firm throughout; and since the recent hesitancy had been caused principally by technical factors arising from the pace of the earlier advance, this week's revival has probably been due more to the clearing up of these technical weaknesses than to the general influences of the flow of cheering economic news. That was certainly true of the industrial market. The further weakness in stores shares—and also in Kaffirs—on the eve of Tuesday's unusually heavy settlement had provoked some noticeable uneasiness, and on Monday the *Financial Times* ordinary share index dropped by 1¾ points, to 170.0. But it regained two-thirds of that loss as soon as it was apparent that the settlement would be surmounted without trouble, and then went further ahead to 171.8, or only a fraction below the peak touched at end-August.

The gilt-edged market showed only a pale reflection of these uncertainties. After its fractional easing last Friday, it has displayed an impressive resistance both to the competition from the big new industrial loan stocks and to the further rise in bill rates in both London and New York. The Vickers £6 million of 4 per cent stock went with a big bang—applications totalled £143 million and Monday's opening produced a premium of 2 points—with the result that unsatisfied subscribers were ready assembled to seize the £4 million of East Africa 4 per cent stock, oversubscribed on Tuesday. The high spots of that day were the one-way option stocks—War Loan and 3½ conversion (1961 or after) both gained ¾ of a point. This, of course, was before the renewed slide in sterling, which started to fall

again on Wednesday, and on Thursday morning dropped to $2.79⅞—its first quotation below parity for many months. In consequence gold was then "fixed" at the new high point of 250s. 8d. a fine ounce.

There is still no reason to suppose that this decline springs from any underlying weakness, despite the poor performance of Britain's dollar exports during August; the major cause can still be presumed to be the seasonal payments for imports. And one influence that is certainly not casting any shadow over the market yet is the possibility of convertibility, despite the discussions that open in Washington on Thursday, on the occasion of the annual meetings of governors of the International Monetary Fund and the International Bank. Mr Butler, when he sailed for Washington (via Canada) on Tuesday, took care to emphasise that no spectacular results could be expected to emerge from these talks. He repeated yet again the well-known pre-conditions for convertibility; and did so in terms that plainly reveal his opinion that the prerequisites are still far from fulfilment.

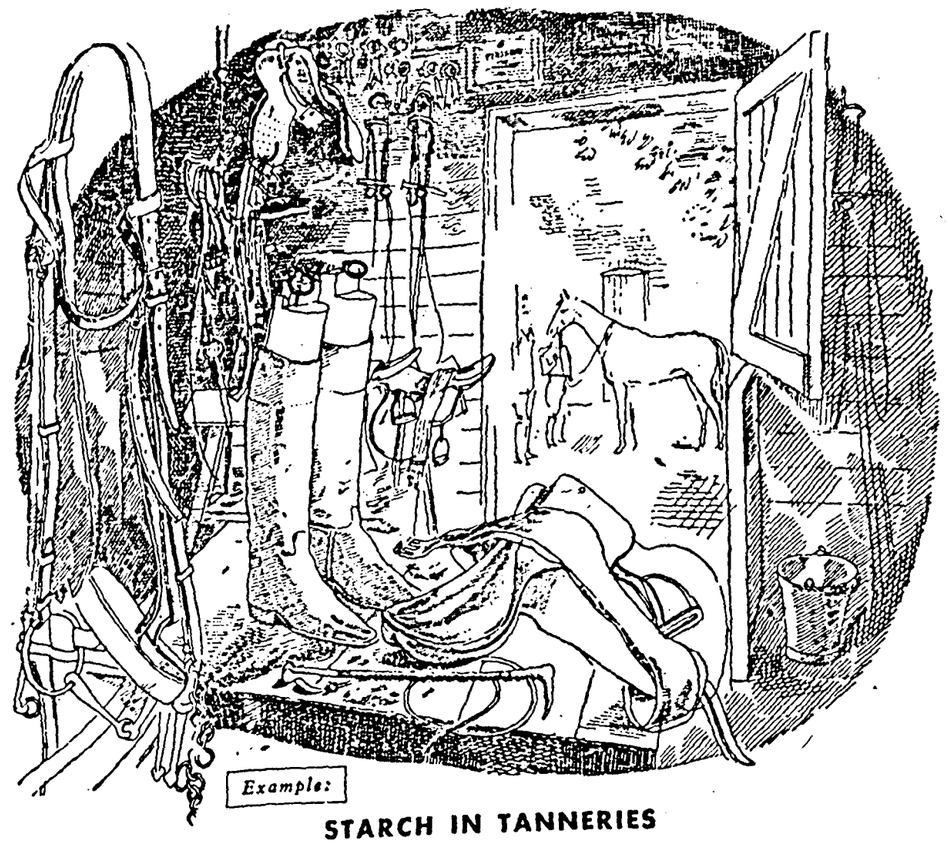
End of Blocked Marks

DR ERHARD, the German Minister for Economic Affairs, has shown a delicate sense of psychological timing in announcing the total freeing of blocked mark accounts held by non-residents. As from Thursday of this week all blocked mark balances can be transferred to and between all countries that have clearing arrangements with Germany, with the important exception of the dollar countries. This positive move is rightly described by the German authorities as "a new important step towards convertibility." Made on the eve of the meeting of governors of the International Monetary Fund in Washington, it stands in significant contrast to the cautious remarks made by Mr Butler when he left for North America this week.

The German initiative is unlikely to be followed by any substantial exercise of the rights of free transfer now conceded to non-residents. For some time past there has been an active market in blocked marks; limited transferability had been permitted for some time, and since the spring had extended to all balances originating before March 31st of this year. The upshot was that the rates for blocked marks approached so close to the official parity as to make this week's declaration little more than the official admission of an already accomplished fact. It is estimated that a total of some DM600 million of blocked marks are actually in bank accounts, representing primarily the holdings of refugees and others who left Germany before the war and were unable to take their capital with them. These balances have probably changed hands many times and for some time past have been dealt in at around $23 to DM100 as compared with the official DM parity of $23.75. In addition, a total of fully DM12,000 million is estimated to be sunk in non-resident investments in Germany which, if sold, would have been converted into blocked marks. There is obviously no likelihood that the major industrial companies, whose subsidiary plants in Germany account for a large portion of these investments, will take advantage of the new-found freedom for liquidating their investments, and the German authorities do not expect any major pressure for transfer from this source.

The continued control of transferability of blocked marks into dollars is important, since it constitutes one of the few elements of discrimination against the dollar that are still retained in German exchange control and import licensing practice. The removal of all other distinctions between capital and current Deutschemarks nonetheless represents an important move; it has carried the advance of the mark towards convertibility appreciably beyond the point at present reached by sterling on the same road.

Fuel Shortage—and Costs



MOST recent forecasts of demand for fuel over the next ten years or so have suggested that this will outrun British coal production, at least until the end of that period, and the conferences organised by the Association of British Chambers of Commerce this week broadly accepted this view. They were offered the familiar analysis of the consequences: that unless export markets for coal are to be completely abandoned, Britain must rely more on imported fuels—either coal from abroad or the fuel oil that British refineries make as one of the products of imported crude oil. The Minister of Fuel and Power, indeed, specifically recommended the assembled industrialists to consider further switching to fuel oil, in line with his own policy. But the industrialists were also looking further ahead to the advent of nuclear electricity. They were warned this could not make any significant contribution in the next ten years.

Mr Humphrey Browne, Director-General of Production of the National Coal Board, was discussing demand for coal this week from the rather different standpoint of the man who has to decide how it can be produced. He accepted the figure of 250 million tons that has been urged upon the Board as the likely demand in 1960-65, and felt that even when nuclear energy comes in that demand ought to be maintained. His own view, however, was that at times during the next decade the National Coal Board will have to be prepared to deal with minor and temporary surpluses of coal supply over demand, certainly for particular kinds of coal—an estimate that is reminiscent of Sir William MacGilvray's guess two months ago that if coal rationing ended next May it would release an extra demand for only a million tons more coal a year.

Mr Browne repeated that he had no sympathy for "the doctrine of pricing coal on marginal costs in order to restrict demand." But he remains very seriously concerned over the high cost of marginal tonnage—30 million tons of coal produced in 1953 were got at losses from 10s. per ton upwards with a total loss of £25½ million, and the most expensive 2 million tons were got at an average loss of 43s. a ton. His own immediate preoccupation is with the possibility of closing some of these highest-cost pits and releasing the men from them to work more effectively elsewhere. But he was obviously aware of the effect of present pricing policies in maintaining demand for just these costliest tons; it is a problem to which the attention of the Coal Board is increasingly being directed as the possibility of a slightly closer balance between demand and supply approaches. The board's industrial consumers were

Starch

does surprising things IN SUCH SURPRISING PLACES

Example:

STARCH IN TANNERIES

Glucose, made from starch, is used by tanneries in a number of curiously different ways. Its main use in vegetable tanning is in the finishing processes. It is used, in addition to other leather dressings, to increase the suppleness and tensile strength of the leathers. In 'chrome' tanning glucose plays a more direct part: it is used for the reduction of bi-chromates of sodium or potassium, in the presence of sulphuric acid, to form basic chromium sulphate — the main tanning agent in the 'chrome' tanning process. Glucose is also used for making a mulling solution in which sole leathers are often steeped before they are cut into soles. Mulling makes the leather easier to cut and less liable to damage during cutting. The tanning trade buys most of its glucose in the form of solid glucose 'chips.' 'Buffalo' Glucose Chips, produced by Corn Products Company Limited, the Industrial Division of Brown & Polson, are well known throughout the tanning industry.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU? When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

THE INDUSTRIAL DIVISION OF

Brown & Polson

WELLINGTON HOUSE, 125/130 STRAND, LONDON, W.C.2

Harvest and Plant

COMBINE HARVESTERS run on oil. Without this oil we should need many more men and horses to bring in the harvest.

Providing oil power for agriculture is just one of the international services of Anglo-Iranian Oil Company. From Anglo-Iranian refineries in seven countries flows a steady stream of petroleum products of all kinds. They help to fly aircraft, run heavy lorries, fire furnaces and perform a host of other vital functions throughout the world.

THE BP SHIELD IS THE SYMBOL OF THE WORLD-WIDE ORGANISATION OF

Anglo-Iranian Oil Company LIMITED

whose products include **BP Super** and **BP Energol**

still convinced that they have a right to cheaper as well as more coal; use of the price mechanism, they seemed to feel, is all very well when they are the sellers, but not when they come to buy.

Squeeze in Copper

THE price of copper seems to be charmed. Other metals have suffered sharp knocks in the past year; copper has held firm almost throughout. To the discomforture of buyers—and of some sellers, too—copper prices did not tumble after private dealings were restored in Britain; they ignored the huge surplus in Chile and scarcely fluttered during the American recession. The American stockpile rescued the Chilean surplus from the market, and cut-backs in production in the United States and Chile did the rest. The reduction in output proved to be unnecessarily severe. Consumption recovered quickly, and now strikes in the United States and Chile have accentuated the shortage of copper for early delivery. American producers have little unsold copper for shipment during the remainder of the year, and Chile has been unable to meet some of its forward sales commitments. Hence the pronounced squeeze on supplies on the London Metal Exchange, where a good deal of Chilean copper appears to have been hedged. Metal Exchange stocks have been falling week by week, and prices have bounded upwards in a narrow market.

Cash copper has risen in the past month by about £17 to over £250 a ton, and three months has risen by about £9 a ton to over £240 a ton, the backwardation having widened to nearly £10. The chief restraint upon a further rise appears to be the price policy of producers in the United States, who apparently intend to maintain their price for prompt copper at 30 cents a lb (£240 a ton), at least for some time. The advance in prices in London clearly carries with it the likelihood of a sharp reaction after a settlement is reached in Chile. The reaction may not immediately be sharp, because it will take time for Chilean supplies to improve. Even then, prices are unlikely to drop below their levels of a month ago. Until the end of the year at least, the prospective limitation of supplies and briskness of demand for copper should maintain a firm undertone to the market.

Investment in Liners

THE new P and O liner *Iberia*, which completed its sea trials last week-end and sails on its maiden voyage to Australia in ten days' time, seems likely to have cost well over £6½ million. This makes it the most expensive passenger ship ever built in a British shipyard; the *Queen Elizabeth* was completed for £6 million and has nearly three times the tonnage, though the different forms of superstructure on an Atlantic liner and one designed for Far Eastern trades may somewhat exaggerate the difference in actual dimensions.

The *Iberia* completes P and O's ship building programme for the time being, and indeed the company does not seem likely to need major replacements of tonnage for five or six years. Inevitably this has aroused speculation whether this may not be the last liner of such a size to be built by a British line unless shipbuilding prices can be moderated. Indeed some of their friends have asked whether P and O might not have been better off with a fleet of big new airliners—perhaps Britannias—in place of this magnificent ship. The *Iberia* will carry about 1,400 passengers each way, about half first class and half tourist, on the Australian run four times a year; and advocates of air transport have argued that a fleet of big airliners, with a lower initial cost, could carry more passengers in a year. None of them have suggested that air transport could deal with the cargo that the *Iberia* can carry in its 300,000 cubic feet of hold space, about half of it insulated for refrigerated cargo, and the company is clearly confident that the new liner will be assured of profitable employment throughout its operating life. But P and O is fully alive to the possibilities of the further transfer of business to the airlines, at any rate in passenger transport. It has, of course, a substantial financial interest in independent air business, including a large proportion of the military trooping to the Far East.

The building of new liners, at today's high prices, is taken by the liner companies as wholly essential to maintain the trades in which their ships operate. Companies such as P and O justify their resistance to the admission of new competitors—for example, the Japanese—to established liner conferences only by the claim that they can already offer full and modern service on the routes. This company and others are certainly making significant investments in independent air transport, in order to hedge their risks for the future. But while Britain, among other countries, follows the policy of the "chosen instrument" in regular airline operation, the liner companies will not be allowed to invest in airlines working directly over the main routes, so that the choice is not a clear cut one of maintaining the trade with one form of transport or another. Moreover, despite their apprehensions about passenger trends in the future, the liner companies are well aware that regular airline operation even today, and even with the considerable elements of subsidy that it enjoys, is still a considerably more dubious commercial proposition than running a shipping line.

Money in the Shops

THE bad weather this summer seems to have driven rather more people more often into the shops on wet Saturday afternoons. Despite the very gloomy forecasts that were made at the time in various trades, the retail business has been doing very well; and that goes for sales of clothing as much if not more than some other retail goods. Figures published by the Board of Trade for retail trade in July show striking increases of 10 per cent or more on July last year for all grades of retailers dealing in articles other than food. Prices have remained virtually stable over the last twelve months, so most of this represents the moving of more goods over the counter. Sales of food were up by some three per cent in

July: but nearly the whole of this would be accounted for by higher food prices.

Since April, clothing sales have been well up on last year. May was a bad month, but increases of 16-17 per cent were recorded in April, 20 per cent in June, and now 12-16 per cent in July. The multiples have received most of the increased business, and have done well in most lines except for the obvious failures such as summer dresses. Stocks in most shops and stores were much lower at the end of July than at the beginning, though they were still some 8 or 9 per cent above the level of a year ago. Sales of furniture and household goods probably reflected to some extent the removal of hire-purchase restrictions, even though this did not take place until the middle of the month and did not alter terms for furniture. Both the larger retailers and the independent shops, who figure strongly in this kind of business, had their best month yet, comparing this year with last. Even the independent retailers have now sold more household goods so far this year than they did in the same months of 1953, itself an exceedingly good year.

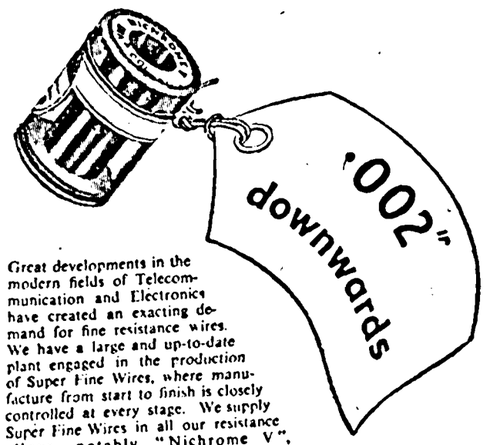
But on the whole it is the department stores and the multiples that have enjoyed most of this new business. The co-operatives had another good month in most things other than food, but by the end of July their turnover was only some 3 per cent up on 1953, compared with the increases of 5-7 per cent recorded by the stores and multiples.

ITA Gets Going

THE Independent Television Authority has now appointed its chief executive official, the Director-General, ordered six transmitters, of which one is ready to be used, and obtained applications from enough programme contractors to ensure that virtually all of its time and space on the air will be filled. This has taken six weeks; the authority hopes to be in a position to start transmitting by early autumn of next year.

By that time the technical difficulties involved in sharing facilities with the BBC, already agreed in principle, will have been hammered out. Neither the BBC nor the new authority see any merit in duplicating the network of masts and aerials that the Corporation already operates up and down the country; details such as building accommodation, responsibility for servicing and maintenance, and payment remain to be settled. Three stations will be opened up together; these will be in London, Birmingham, and in the Manchester and Liverpool area. Sir Kenneth Clark, the chairman of the authority, hopes that about a half of the population will be covered to begin with. Further stations will be established at the rate of about three a year. Marconi already has available the transmitter that will be used at the Crystal Palace site in London and two others are to be delivered by the autumn of next year. Three more transmitters are being ordered from Pye; these are smaller in capacity. By the time that these transmitters and the authority's other facilities in and out of London have been paid for, a sizeable hole will have been made in the £1 million that the authority can draw from the Postmaster-General before its programme revenue starts to flow.

About 20 applications from would-be programme contractors have been received and others are still expected. There are five large contractors who are prepared, if necessary, to take on the authority's whole network for a day or more at a time. So far only seven local contractors have applied, but once the details of proposed operations are more widely known the authority expects many more local firms to appear. How the authority will allocate time between these contractors, and indeed, the total number that it will deal with, has still to be worked out. But at least the authority, and the Government, will be able to breathe more easily now that it seems fairly certain that the authority will only occasionally be called upon to put on programmes itself.



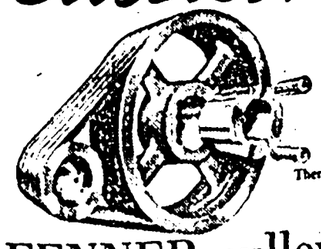
Dwindling Margins for the Airlines

THE world's major airlines have been taking stock this week in Paris of their economic situation, which seems to be deteriorating steadily as the volume of air traffic grows. In his annual report to the assembled members of the International Air Transport Association, Sir William Hildred, the director general, spoke frankly of "an economic shock wave" that had hit the industry. This seems strong language to use at a time when the airlines all over the world appear to have entered on a period of steady expansion, when traffic is rising and fleets are being lavishly re-equipped. Passenger traffic on scheduled services all over the world (including non-IATA members but excluding airlines in China and Russia) rose 16 per cent last year to a total of 46,000 million passenger kilometres. Mail traffic was up 7 per cent and cargo, 4 per cent.

While this expansion has been taking place, largely through the medium of lower fares, the margin between costs and receipts has been gradually narrowing until it is, according to Sir William, "in many cases, almost non-existent." But this does not prove that air transport is basically uneconomic. During the year covered by Sir William's gloomy diagnosis, British Overseas Airways Corporation, an operator that consistently lost immensely heavy sums during the postwar years in which air transport as a whole has become profitable, made a net profit in the order of £1 million. It is more probable that the industry is going through a period of temporary disequilibrium following a big increase in carrying capacity. There is bound to be some time-lag before new traffic appears to fill this capacity. For example, the potential passenger-carrying capacity of IATA members, which between them account for 86 per cent of the world's scheduled air traffic, rose 22 per cent during 1953; the proportion actually sold went up only 20 per cent, so that the average load carried declined.

Tourist fares have brought a new class of passenger to the airlines to fill the additional seats, but have done so at fares so low that the services will break even only when the aircraft can be filled reasonably close to capacity. Tourist flights are fast becoming the standard form of air service, and at the present time, the airlines do not see much opportunity for reducing fares any lower in order to tap a fresh section of the passenger market. There remains freight. This has been the Cinderella of air transport, relegated as make-weight to the passenger services, which yield 70 per cent of airline revenue and ruled by a patchwork jumble of rates. Most observers in the airlines would agree that the time has now come to devote the same attention to

SUPER FINE WIRE



Great developments in the modern fields of Telecommunication and Electronics have created an exacting demand for fine resistance wires. We have a large and up-to-date plant engaged in the production of Super Fine Wires, where manufacture from start to finish is closely controlled at every stage. We supply Super Fine Wires in all our resistance alloys, notably "Nichrome V", "Nichrome", "Karma" and "Advance", in sizes from .002 in. (0·05 m/m.) downwards.

LARGEST MANUFACTURERS OF V-BELT DRIVES IN THE COMMONWEALTH

A new view of TI

Isolates a modern truth: today we live TI.
Jet pilots need TI; great liners plough the seas TI.
The doctor plunges TI into his patient's arm.
The housewife cooks and washes up TI. Travel by bicycle or bus is TI travel. Sportsmen play TI.

Consider any constructional or engineering project and you are considering some part, or part of a part, that is TI. Pre-fabricated sections; steel or wrought aluminium: precision tubes of every sort and size; pressure vessels: rolling mills, electrical equipment—all this is TI territory.

Each of TI's many manufacturing companies has a mind and ideas of its own, but behind all of them are the combined skills and experiences of the many trades TI follows.

developing freight traffic that has been given over the past to passengers. When the Paris meeting is over, the IATA airlines will move on to their real business, a rate conference to be held in Venice, where it is hoped at the least to clear the ground for the formation of a new freight policy that will bring more of this kind of inanimate (and so more amenable) traffic into the air.

Mr Clore Clears the Deck

MR CHARLES CLORE, assisted no doubt by his grey eminence, Mr Sainer, has reshuffled his holdings with the dexterity of a conjuror. The conjuror's patter, "there it is, there it isn't," is almost audible. Having made his successful bid for the ordinary shares of J. Sears, Mr Clore was free to carry out his plan, with the aid of some insurance companies, of selling many of the company's freeholds and taking the properties back on long leases. By the end of last March these transactions had added about £3 million to the cash resources of J. Sears; Mr Clore was then considering further sales which would bring in another £1 million "or even more." These funds were available for investment in "sound and progressive businesses."

Two issues were left unresolved: the placing of the newly released money more firmly in the control of Mr Clore and his associates than the 25 per cent outside equity shareholding in J. Sears would allow, and the consolidation of Mr Clore's interests. Both have now been settled. A new company, Haverton Holdings, owned by Mr Clore's interests, has been formed with an ordinary capital of £2 million of £1 ordinary shares and £1 million of £1 6 per cent preference shares. Haverton Holdings owns all the issued capital of Furness Shipbuilding Company, which in turn controls Bentley Engineering (to the extent of about two million shares). That company controls the hosiery machinery company, Mellor Bromley. All the ordinary shares of Haverton Holdings have now been sold to J. Sears for £3½ million. That price is "based as to the Furness Shipbuilding Company's undertaking on a valuation by Price Waterhouse and Company and as to the controlling interest in the Bentley Engineering Company on prices lower than those currently quoted on the Stock Exchange, London, for shares in that company." (That seems to point to a potential share dealing profit if at any time J. Sears sold some of its Bentley Engineering shares in the market.)

The reshuffle leaves Mr Clore and his associates with the ace of trumps—the £3½ million in cash which arises directly from the sale of the Haverton shares but which originally sprang from the Sears transaction. Any calculation of the "profits" that have accrued is vitiated not only by the fact that not all the details are known but also because no one can be certain about liabilities for tax. Effectively, the reorganisation leaves the passive spectators, the minority shareholders in J. Sears, with the knowledge that their previously undervalued shares have been transformed into investments in an assorted bag of companies; these companies are currently earning profits of more than £1 million a year. In addition, they have a claim on the residual profits of the other Sears subsidiary, Freeman, Hardy and Willis—the boot and shoe company which now has higher rents to pay than in the past. More than this, the reorganisation, following as it does on the complete hiving off of the shoe business into Freeman, Hardy and Willis, consolidates Mr Clore's interests under the control of one holding company. It clears the deck for any further deals he may be considering.

Capacity for Coal

A COAL mine is an underground factory with moving walls, which it extends by consuming them. In selecting "the physical capacity of the pits to produce coal" as the limiting factor on output from British mines in the short term, Sir Hubert Houldsworth was concerned last week to emphasise the familiar though still peculiar circumstances of extractive industries. Current production has to be complemented by not immediately productive "development" of further coal faces and the roads and transport to serve them—plus adequate exploration and sinkings of fresh mines—merely in order to maintain the industry's capacity to produce. Current output, in such industries, can always be stepped up quickly or taken out more cheaply at the expense of future capacity; Sir Hubert argued that the industry's capacity is still impaired today as a result of the employment of such spendthrift mining methods in the war and inter-war years.

The capacity of the mining industry is indeed, in the short run, inflexible. Between the beginning of 1949 and the end of 1950 manpower on British colliery books fell by about 40,000, by which time some mines were on the verge of ceasing to be effective operating units. In the next two years manpower rose by about 35,000 back to nearly the previous level—and in all but a few areas the industry had to turn away men because it could not usefully employ them. Such rigidity certainly emphasises the danger of mortgaging future capacity for immediate output; and it is fair to say that during the last three years, since it began to increase the capital investment with which development work is inextricably associated towards the levels set in its development plan, the National Coal Board has not itself been doing this.

The effort devoted to development, of course, does not come out in the production statistics; another hidden element, as Sir Hubert pointed out, is the amount of dirt raised with the coal, which because the best seams are gone and mechanisation mostly degrades coal, has markedly increased since the war. His conclusion from these points—that the comparisons commonly made between output in 1913 and 1937 with output in postwar years are therefore largely meaningless—was probably soothing to his audience at the National Coal Board Summer School last week, as being both broadly true and convenient. His further calculations that if in 1954 the industry had as many miners as in 1913, or as many miners and the same pit capacity as in 1937, it would be producing roughly as much coal, seem rather less profitable. To distinguish the circumstances of the past from those of the present is useful in deciding how to act in future; but ifs have even less calorific value than dirt.

August Trade

AUGUST, when people flock to the seaside instead of to the factories, is always a poor month for British exports, and it cancels the benefit of the big jump in shipments during the long working month of July. As neither month is representative, the best guide is the average of July and August together. Exports last month fell by over £40 million to £205.6 million fob, but the average of £226.3 million for the two months was 5 per cent higher than that of the same period of last year and £2.5 million better than the monthly average of the second quarter of this year. Re-exports in July and August averaged £8.7

* Provisional.

million, about the same as the second quarter average. Thanks to a seasonal decline in imports to £266.7 million cif in August, the average for the two months of £278.2 million was 2 per cent less than the second quarter average but nearly 3 per cent higher than in the corresponding months of 1953. Although the visible trade deficit rose sharply to £52.8 million, the two-monthly average of £43.2 million compared favourably with the average deficit of £45.8 million a month in the first half of the year.

Exports to North America failed to maintain the recovery that began in the second quarter. The two-monthly average of £21.9 million was 11 per cent below the second quarter average and 20 per cent less than in the same months of last year. Shipments to the United States averaged £11.4 million in July and August compared with £12.5 million in the second quarter; shipments to Canada fared rather worse, averaging £10.5 million compared with £12.1 million in the second quarter.

Plunge in Cocoa Prices

SHORTAGES of commodities have the disconcerting habit —to the people financially involved—of easing as swiftly as they came. The shortage of cocoa, which caused the price to double within a year to a peak of about £550 a ton, has now eased to the extent that the price has plunged down by roughly £100 a ton. The decline was set off by the withdrawal of the minimum export price in Brazil. The mid-crop in Brazil proved to be rather bigger than was generally expected, and exporters there were already offering cocoa below the minimum price of 63.25 US cents a lb. When the minimum was withdrawn, they scrambled to press supplies on a falling market. They were joined by Brazilian speculators who had bought in the expectation of a rise, and then by sellers of French West African cocoa. The British West African marketing boards recently weakened market confidence further by selling a small quantity of 5,000 tons to British manufacturers at £425 a ton for October/December shipment; this is £20 a ton below their previous price and £70 a ton below their opening price for the new season's crop.

Selling pressure has now died away; the marketing boards have withdrawn; and most buyers are holding off to await the publication next week of the first official estimate of the main crop in the Gold Coast, the largest producer. The crop is unofficially estimated at some 230,000 tons or more, compared with last season's small crop of 205,000 tons. No estimate of the crop is likely to be reliable so early in the season, but the prospect of only a small addition to or a drop in supplies could again have a disproportionate effect on the price.

Wool Prices Steady

THE break in wool prices has been checked this week. Despite a very heavy offering at the Australian auctions, prices there have held steady except for faulty wools, and the tone of the market is firm. At the London auctions prices of merino wools, which suffered the largest decline, have rallied by about 2½ per cent, and medium quality crossbred wools are also about 2½ per cent dearer. Buyers were prepared to pay a small premium over Australian prices to obtain wool in London. In South Africa, too, the market is firmer, and prices for comparable wools appear to be slightly higher than in Australia, no doubt because South Africa is also a nearer source of supply.

Competition has become more widespread at all the wool-selling centres, and practically all the wool on offer has been sold. While buyers remain cautious, they seem to be gaining confidence in the market. The lower level of prices compared with the close of last season should in time stimulate business throughout the chain of manufacture; merino wool in particular now looks more attractive to the trade. It is still much too soon, however, to be sure that fresh weakness in prices may not occur later on. Crossbred wools still command something of a scarcity value which will be tested when larger quantities become available at the opening of the New Zealand auctions at the end of October.

The Tangle of Exchange Control

THE banks authorised to transact foreign exchange business in Britain have recently received one of the administrative series of notices issued by the Bank of England summarising in convenient form the law contained in the Exchange Control Act of 1947 and the various Treasury orders made under that Act. Although this notice breaks no fresh ground, it provides a salutary reminder of the horrifying tangle of regulations, form filling and other impedimenta that remain to bedevil the banks and their clients when they engage in foreign exchange business. In spite of the considerable simplification in the structure of exchange control that has occurred recently, particularly through the world-wide extension of the transferable account system, it still demands the concentrated attention of battalions of clerks and higher executives. The latest notice draws particular attention to this mass of negative paper work in its explanation of the various returns that have to be made to the Bank of England. When authorised banks buy and sell foreign currencies from or to their customers forms E, T1 or T2 must be held. The E forms have then to be lodged with the Bank of England on the fifth working day after the date on which the deals were booked. The T1 and T2 forms have to be lodged weekly with the Trade Control and Investigations Office of the Bank of England.

Authorised banks must also complete a return, "Return 54/1," showing their positions on the last working day of each month in all currencies for which official rates are quoted and also in Canadian dollars. Returns must similarly be furnished in respect of other currencies where the positions, short or long, exceed the equivalent of £2,000 or where spot balances held against forward liabilities exceed the equivalent of £15,000. There is yet another form, "Return 54/3," on which the authorised banks have to show their gross forward arbitrage purchases and sales in EPU currencies. These particular returns must be lodged with the Bank of England (Dealings and Accounts Office) not later than the 8th of each month. Those who count the risk of a move to greater freedom in foreign exchange matters might occasionally give a thought to the gain to be secured by the dismantling of this paraphernalia of controls by freeing for more constructive tasks the thousands who tend it directly and the even greater number in banking, commerce and industry whose time is occupied in satisfying its formalities and inquisitions.

Coping with "Free" Sugar

THE difficulties of the International Sugar Agreement, which were discussed in *The Economist* last week, have been eased for the time being. With only three months of the year to go, the International Sugar Council has at last brought supplies of raw sugar for the free market broadly into line with demand, and it has found the task easier than its earlier estimates suggested. Thanks to a substantial increase in the requirements of India and the smaller Commonwealth countries, the estimated requirements of the free market in 1954 have been increased by 466,000 tons to 4,330,000 tons. Exports from non-participating countries are estimated at 875,000 tons, and the effective export quotas of members amount to 3,709,000 tons, a total of 4,584,000 tons. Hence the surplus has fallen to the relatively small figure of 254,000 tons. The expected deficit in the exports of some members amounts to 142,000 tons, of which 100,000 tons will be redistributed among other exporters. The council recommends that members waive their right to the redistribution of the other 42,000 tons, and that Brazil, Cuba, Czechoslovakia, Formosa, the Dominican Republic and Poland voluntarily agree to wipe out the remaining surplus of 212,000 tons by a pro rata reduction in their export quotas.

The elimination of the surplus is admittedly theoretical. It may be too late for some countries to make the voluntary cuts in exports, and demand on the free market during the remainder of this year may prove to be smaller than has been supposed. But the fact that the surplus itself is now much less burdensome, and that 350,000 tons of Cuban sugar have passed into the hands of a single official seller, should enable the agreement to weather the next three months. Further crop restriction in Cuba, and a smaller European beet crop, should give the agreement a somewhat smoother passage in 1955. The council's own indication of the outlook for next year will be known in November, when it meets again to consider the estimate of free market requirements in 1955, and to assign initial export quotas. In view of this year's experience, it would seem desirable that the council should take a severe view of import requirements, and fix the quotas accordingly, supported if necessary by voluntary reductions at the outset. It may be too much to expect the council's powers to restrict exports to be strengthened, but until this is done the agreement is likely to continue to be threatened by excessive supplies for some time.

Cheer About Chemicals

IF any fresh evidence were required to prove that the chemical industry is surf-riding as high on the wave crests as most of British industry it has been provided by the two interim statements from Monsanto and Albright and Wilson. Both companies have reported an increase in sales in the first half of the year; both of them have made full use of newly installed capacity. In the first half of the year, Monsanto's sales in Britain amounted to over £6.1 million, compared with £5.2 million in the first six months of 1953. The directors of Albright and Wilson have not published sales figures, but they describe the increase in turnover as substantial.

As an inevitable corollary, profits have gone up. Monsanto's half-year's income, before tax, has reached £888,000, nearly double the income of £489,000 earned in the first half of 1953; so too is its net income of £408,000, against £224,000. Less spectacularly, Albright and Wilson has earned a trading profit of £1,680,000 and a net profit of £430,000, compared respectively with profits of £1,370,000 and £375,000. These figures have kindled optimistic hopes about the future equity dividends of ICI as well as those of the two companies concerned. But Monsanto has merely

SAFETY FIRST AND ALWAYS

Mining is a constant war with nature. Miners have as their weapons rock drills, explosives, shovels, water and their native wits, sharpened by experience. These weapons are pitted against the vagaries of nature.

To win the metal-bearing ores from the great lode of the Broken Hill mines, men drill into the face of the rock, charge the holes with explosives, and fire them. Through safety precautions that is simple enough; but dust, one of the miners' worst enemies, must spread when charges are fired.

Experience has shown how explosives can be used to win the ore without danger. Stringent safety regulations are enforced to eliminate the hazards of the work, and special attention is paid to minimising the effects of dust and fumes.

Safety officers enforce every safety measure; every accident causing lost time is fully investigated and, where necessary or desirable, new safety precautions are introduced. The graph of accidents shows a continuously descending curve. But carelessness remains; it is, even now, the greatest single cause of accidents, few though they be.

The Broken Hill mines controlled by The Consolidated Zinc Corporation Limited are as proud of their accident prevention as they are of their contribution to the prosperity of Australia and Britain. The Corporation has created a vast industry in the two countries. This is exemplified at Avonmouth in the west of England, where the largest zinc smelter in Europe produces the entire output of primary zinc for the United Kingdom, as well as sulphuric acid and other related products.

Lead, Silver, Zinc

The formation of The Consolidated Zinc Corporation Limited in 1949 united the bond of common interest between Imperial Smelting Corporation Limited of Great Britain and The Zinc Corporation, Limited of Australia. The two companies have for many years been associated in the development of the non-ferrous metal production of the Commonwealth. Their activities are the mining of lead, silver and zinc ore in the Broken Hill Mines of Australia and the production of zinc metal, sulphuric acid, fluorine chemicals and zinc pigments in the United Kingdom.

THE CONSOLIDATED ZINC CORPORATION LIMITED

United Kingdom: 37 DOVER STREET, LONDON, W.1 · Australia: 95 COLLINS STREET, MELBOURNE, C.1

maintained its interim payment at 6¾ per cent; and while Albright and Wilson has raised its interim from 5 to 7 per cent the directors are careful to point out that this increase is designed to level out the year's payments.

Expectation will not be killed by such caution, for both companies look forward to the closing months of this year with zest. Having reported an increase in sales at home and maintained sales abroad in spite of intensified competition, the directors of Monsanto say that "general demand is being well maintained." That may be an understatement for they then add that the company's products appear to be going directly into consumption and not into stocks. The directors of Albright and Wilson are explicit; having described demand as "firm," they remark that working forecasts indicate that the volume of trade will be even higher in the last half of this year than it was in the first.

SHORTER NOTES

The Treasury has announced another of its customary conversion offers for Defence Bonds. This time the holders of the 3 per cent bonds maturing between January 1, 1955, and May 5, 1955, are invited to continue their bonds until July 1, 1955. If they accept the offer, they will be paid on that date a full six months' interest and the maturity premium of £1 per cent. Their bonds will then be exchanged into the same amount of 3¼ per cent Defence Bonds (Conversion Issue).

★

Tea prices are still climbing. In London this week common tea reached a new peak of 5s. 5¾d. a lb., a rise of 5d. in a fortnight. The increase in retail prices is now likely to amount to 8d. a lb.

★

Although Powell Duffryn's income before tax has risen from £1,476,910 to £1,810,362 and its net profits from £556,883 to £777,395 in the year to March 31st, the directors have been content to leave the ordinary dividend unchanged at 8 per cent. The completion of the company's negotiations with Socony-Vacuum will take longer than had been expected so that the date of the annual general meeting has been postponed until a little later in the year.

Company Notes

GESTETNER. Gestetner, the office machinery manufacturers, fittingly celebrated its silver jubilee year as a public company by making the greatest number of sales in its history. The company's trading profits went up from £1,140,454 to £1,260,137. Ordinary shareholders will receive bigger dividend cheques. The dividend rate has been left unchanged at 20 per cent but this year it will be paid on an ordinary capital of £1,293,504, as enlarged by the one for five free scrip issue.

The directors seem to be looking forward to another rise in sales in the current year, for stocks of raw materials and work in progress have been increased to ensure a smooth flow of production. In the balance sheet, the latest year's achievements are reflected in the rise in debtors (from £1,244,963 to £1,443,679) and the hopes for the current year in the rise in stocks (from £1,217,645 to £1,347,102). The provision of further working capital, accompanied by more fixed capital investment, has made a slight call on liquid assets but these resources are more than ample enough to meet any fresh commitments. The balance sheet figures as well as the increase in earnings should justify the forward looking yield of 4¾ per cent offered by the 5s. ordinary shares at the current market price of 21s. 9d.

INTERNATIONAL TEA. The end of rationing has been followed, to use the words of the chairman of International Tea, by "cut and thrust competition" between the grocers. The customer is now the dictator. Costs are rising; at the auctions tea has fetched ever higher prices and another increase in its retail price is promised; and fresh claims for higher wages are now under negotiation. Competition has put a ceiling on most prices. Sales of different foods have fluctuated quite widely and their future course is difficult to predict. Profit margins are uncertain and, both in the wholesale and retail branches of the trade, meagre. To keep profits up the grocers have at the very least to maintain their sales.

That ideal demands two courses of action, both of which International Tea has followed. The first is a strict control on stocks; that control must also be flexible so as to allow for changes in consumers' tastes. The company's success in this direction is indicated by the fall in its stocks from £5 million to under £4¾ million. The consequent improvement in liquid resources helps the company towards its second objective, the further modernisation of its retail stores; part of the money spent by the company has gone into the conversion of shops into self service stores. Commenting on these conversions, Mr Frank Wilson uses the imperative mood: "Turnover is our lifeblood. If self service is the solution then we must adopt it where we are satisfied that this method of trading will attract the public."

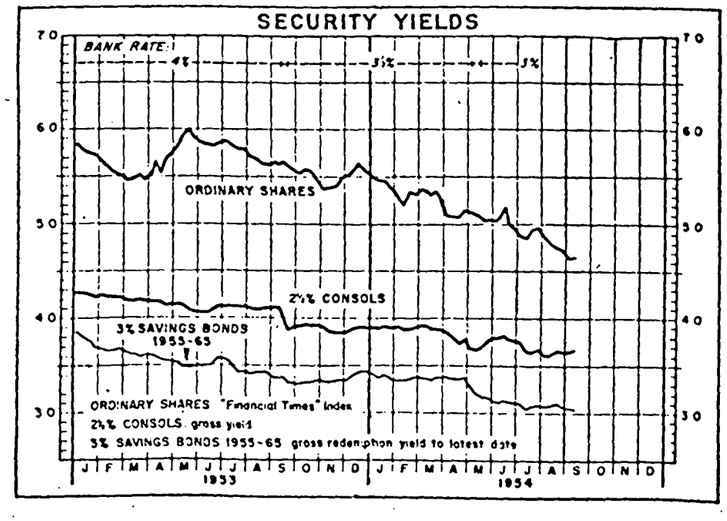
5s. ordinary share at 22s. 9d. yields £4 8s. per cent.

In the year to May 1st, International Tea may have felt only the nibble of competition. Its trading profits hardly altered, thanks to better results from the tea and preserves departments (balancing out the fall in demand for cakes and biscuits). The company may yet have to experience the full bite of competition. In the current year, for instance, the chairman expects smaller profits from the sale of tea.

If the company repeats the ordinary dividend of 20 per cent, as it did in 1953-54, the 5s. ordinary shares at the current price of 22s. 9d.—thanks to some short-sighted buying when rationing came to an end—would offer the slender yield of just over 4.4 per cent.

★

DAVY AND UNITED. British industry is still short of capital equipment. But the pace of installation is quickening. Heavy engineering concerns such as Davy and United cannot fail to do well, though they must glance now and then over their shoulders towards Germany. Full order books would not be so full if they failed to keep a strict control on costs, delivery dates and prices. Davy and United's order books are bulging—only recently has it secured an important contract from Dorman Long—and the directors feel confident of "the company's continued success over the next two or three years at least." It would be a sad case indeed if the directors were unable to be so confident, for as a producer of rolling mills and other heavy equipment Davy and United should be a prime beneficiary of the continuing development of the steel industry.



Its trading profits, which went up from £442,798 to £551,330, certainly benefitted in the year to March 31st. Unfortunately, trading profits do not tell the whole story. Net profits have fallen slightly, simply because the provision for contingent claims has suddenly been increased from £41,099 to £196,754. The directors explain that this additional provision is an exceptional amount, designed to meet the estimated cost of "abnormal rectification work to be carried out on a number of contracts for a customer." That customer has notified the company of a claim for damages, but as the company has been advised that it has a good defence no specific provision has been made against this contingent liability. Beyond stating these facts the chairman, as the matter is still under negotiation, makes no further comment though "debtors" of £1,246,506 include the sum of £117,892 in respect of this contract.

Hence, the company has had the unpleasant task of reporting a fall in net profits in a year in which it achieved the highest turnover in its history. Confirmatory evidence on this point can be found in the rise in the gross value of stocks and work in progress, before deducting instalment and advance payments, from £3,885,839 to £4,030,565. The company,

£1 ordinary stock at 35s. 2d yields £5 10s. per cent.

in spite of the increase in these instalment payments, is still short of cash. Ordinary shareholders have thus had to remain content with a repeated dividend of 10 per cent; as in the last three years this dividend has been accompanied by a tiny offer of shares (this time in the ratio of one share for every £22 of stock) at par to shareholders. The preferential terms of the issue—the shares are effectively offered on a yield basis of 10 per cent—may not altogether compensate shareholders for the five years of an unchanged dividend.

LONDON STOCK EXCHANGE

Next Account begins: September 22nd
Next Contango Day: September 22nd
Next Settlement Day: September 28th

THE stock market began the week uneasily, but prices were soon cheered up by the completion of the heavy settlement, the course of the railway wages negotiations and the firmness of prices on Wall Street. Gilt-edged prices were beginning to edge upwards on Monday and the advance broadened out on Tuesday when gains of up to ½ of a point were made by the undated and long dated issues. Dominion and Colonial loans shared in the advance, though most of the demand was again concentrated upon the high couponed issues. The rally in prices did not last long and later in the week prices did little more than to hold the earlier gains. Bank shares remained firm and Bank of Scotland rose 2s. 6d. to 68s. on the higher interim dividend; overseas banks, on the other hand, were dull and Hongkong and Shanghai fell 2 points to 98 on Monday. The main feature of the foreign market was the buying of German Government and municipal loans; some of the buying was reported to be on Swiss account.

Store shares made the biggest losses in the dull industrial market on Monday but they then led the rally which followed later in the week. In these movements "Gussies" and United Drapery were prominent. Smaller gains were reported in almost every other sector of the market and the improvement in freight rates brought in buyers for shipping shares. J. Sears, on the news of the reorganisation, lost 4½d. to 17s. The new Vickers loan stock opened at 1¼ premium on the issue price of 98½, touched a premium of 2 and then fell back to 1½ premium.

A reasonable turnover in oil shares left prices little changed on balance. In a quiet market rubber shares tended to improve but movements in tea shares were rather irregular. Kaffir shares began the week on a dull note but a brisk rally was staged later which soon broadened out to include the older producers as well as the developing mines. A revival in Continental demand helped to lift the prices of Rhodesian copper shares.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and wholesale prices in Western Germany on July-December, 1948=100. (2) Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (5) Average for first quarter. (6) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced.

Financial Statistics

EXCHEQUER RETURNS

For the week ended September 11th there was an "above-line" deficit (after allowing for Sinking Funds) of £23,555,000 compared with a deficit of £20,910,000 in the previous week and a deficit of £20,206,000 in the corresponding period of last year. This raised the cumulative deficit to £153,233,000 (£227,768,000 in 1953-54). There was a net receipt "below-line" of £1,023,000, bringing the total cumulative deficit to £321,478,000 (£439,050,000 in 1953-54).

THE MONEY MARKET

AFTER a week of tight credit conditions in Lombard Street the market lowered its bid by 2d. to £99 11s. 9d. per cent for the £270 million of bills on offer at last Friday's Treasury bill tender. Buying rates for commercial bills were later raised correspondingly, by ⅛ per cent. The average rate of discount on all bills allotted rose by 6¼d. to £1 12s. 10.75d. per cent. Applications fell fractionally to £397.8 million, but the market's allotment declined from 62 to 55 per cent.

Credit supplies were plentiful in the first half of the week covered by the Bank return but after the weekend they became uncomfortably tight. On Monday and Tuesday borrowing at the Bank was avoided only by sales of November and December maturities to the banks at 1½ per cent, ½ per cent above the prevailing rate, despite small special aid by the authorities, given indirectly through banks. And on Wednesday many houses were in fact forced to take seven-day loans from the Bank at 3 per cent, although the special buyer was again moderately active.

Turnover in the gold market was small at first, and the price dropped to 249s. 11½d. at Monday's fixing. But the fall in sterling in the middle of the week, carried the price up to 250s. 8d. at Thursday's fixing.

The bank return shows a renewed reflux of notes of £5.1 million. Discounts and advances are up sharply from £7.1 million to £14.7 million, reflecting Wednesday's borrowing at the Bank.

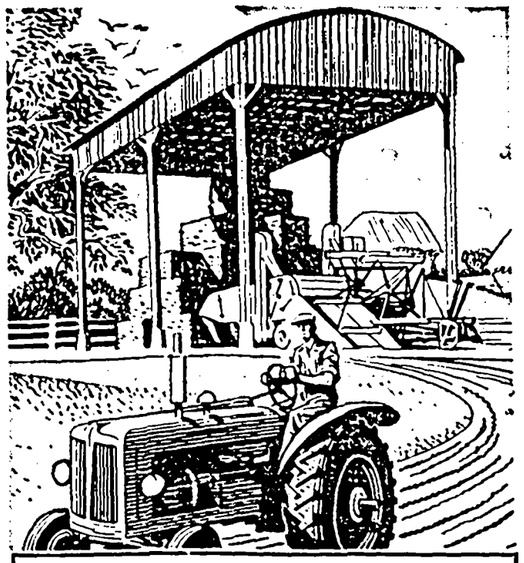
THIS JAM WAS LETHAL

Four men descending from the top of a new 250 ft. chimney were riding on the platform of a materials hoist when it stuck for a moment and then suddenly dropped several feet. Two passengers were shaken off by the jerk and killed.

The hoist jammed owing to adjacent guides being of unequal thickness, and some slack ran out in the hoisting rope. The jam then cleared itself but the brake failed to hold the platform, and this ran free until the slack in the rope was taken up.

What Vulcan *say about it . . .*

Users of cranes and hoists seem unusually accident-prone. Safety regulations should therefore be prominently displayed and meticulously enforced. Only in a few strictly defined cases may anybody at all be conveyed on a materials hoist, and never more than two people.



Engineer-Surveyors from Vulcan Insurance not only test ropes, tackle and all the winding and braking machinery of the lifts and hoists they insure, they also give every assistance to engineers in safety education and in drafting notices to users. If you already know the pains they take over boilers you will surely welcome their attention to your lifts, hoists, cranes and indeed all the plant and machinery in your care.

COMPANY MEETINGS

BRITISH MATCH CORPORATION, LIMITED

RECOVERY IN TRADING PROFITS

PRODUCTION WELL MAINTAINED

LORD KINDERSLEY'S REVIEW

The twenty-seventh annual general meeting of the British Match Corporation, Limited, was held on September 15th at Haddon House, 66a Fenchurch Street, London, E.C. The Rt Hon Lord Kindersley, CBE, MC, chairman of the company, presiding.

The following is his statement circulated with the report and accounts for the year to March 31, 1954:

THE BOARD OF DIRECTORS

Stockholders will learn with regret of the death of Mr Arthur Hacking, OBE, on July 13, 1954. Mr Hacking had been a member of the board since the formation of the Corporation and retired, owing to ill health, from the chairmanship of the Corporation and of its principal subsidiary, Bryant and May, Limited, on January 1, 1953.

At the annual general meeting stockholders will be asked to confirm the appointment of Sir Anthony J. Elkins, who accepted an invitation to join the board in May, 1954. Sir Anthony has recently returned to this country from India, where he had a distinguished career, and he brings to the board a wide experience of commerce and industry.

ACCOUNTS

Last year I had to report a set-back in the net profits of the group, due to the heavy depreciation in the value of the Brazilian cruzeiro. This year the rate of exchange on the free market, through which dividends are remitted, has fallen still further to Cr.$164 to the £ at March 31, 1954, compared with Cr.$120 at March 31, 1953 and Cr.$52.416 (the official and at that time the only rate) at the end of March, 1952. This has resulted in a further reduction in the profits brought into the group from your Brazilian investment and, at the same time, has once again given rise to a substantial loss on exchange on conversion into sterling of the net current assets in Brazil.

There has, nevertheless, been some recovery in the trading profits of the Group, which totalled £2,316,656, compared with £2,136,324 for 1953, the increase of £180,332 being mainly attributable to our other interests outside the United Kingdom match industry.

PROFIT AND ALLOCATIONS

The net profit of the Group, after taxation and the elimination of amounts applicable to outside shareholders, was £584,801, compared with £543,283 for 1953. The directors recommend payment of a final dividend of 5¼ per cent and bonus of 1 per cent, less tax, on the ordinary stock, making a total of 9 per cent, less tax, for the year. These dividends will absorb £306,281 and, after taking into account the various appropriations and transfers to reserve which have been made, the carry forward will be increased by £65,352 to £1,445,985.

You will notice that in the consolidated profit and loss account the item previously described as "Special Donation to Brymay Pension Fund" has been renamed "Past Service Contributions to Pension Schemes," and that the amount has increased this year to £64,156. The change in designation and the increase in the amount are due to the inclusion of payments under a new pension scheme set up by an overseas subsidiary.

The reduction in the "Interest of Outside Shareholders" shown in the consolidated balance sheet reflects the redemption during the year of stock held by a minority interest in a Canadian subsidiary company. Your directors are satisfied that this redemption was in the best interests of the Group.

HOME TRADE

Production of matches was well maintained during the year. Home sales were slightly in excess of those for the previous year in each of the last three quarters of 1953 but competition from abroad has been increasing steadily. This has resulted in a reduction in sales during the first quarter of 1954 and subsequently.

United Kingdom consumption during the year was 17.4 million gross boxes, compared with 16.8 million in 1953 and 17.3 million in 1952.

OVERSEAS INVESTMENTS

Your overseas investments continue to be satisfactory.

REPORT OF THE MONOPOLIES COMMISSION

In my statement last year I explained that consultations were proceeding with the Board of Trade in connection with the Report of the Monopolies Commission on the Supply and Export of Matches and the Supply of Matchmaking Machinery, which was published on May 13, 1953.

These consultations and the negotiations which subsequently took place between the Corporation and the Swedish Match Company culminated in the conclusion of a new trading agreement between the two companies and the recommendations of the commission, which the Government accepted being implemented. The friendly spirit in which the Swedish Match Company approached our difficult problems is much appreciated.

During the five years since the industry was first referred to the commission, much time and effort of many of your chief executives has had to be diverted from constructive work in your company's business to dealing with the requirements of the Monopolies Commission. It has been a heavy and costly burden, both in time and money.

ALTERATION OF ARTICLES

The board have for some time had under consideration the question of the fees payable to the directors and, at the annual general meeting, stockholders will be invited to approve an alteration to the articles which would have the effect of increasing from £300 to £500 the annual fees payable to each director, and from £600 to £1,000 the fees payable to the chairman. The present rates were fixed in 1927 and, in view of the depreciation in the value of money which has since occurred, it is considered that they are no longer adequate.

At the same time it is proposed that the articles should be amended in order to allow the executive committee of directors to consist of a maximum of 8 (at present 6) members. This will allow all the executive directors to serve on the committee.

DIVIDENDS

Until 1947 our interim and final dividends were paid half-yearly, in November and May respectively. Since then, however, the necessity to publish consolidated accounts in accordance with the requirements of the Companies Act 1948, has given rise to unavoidable delay in holding the annual general meeting, with the result that the final dividend is not now paid until September, only two months before the customary interim dividend for the following year.

In order to spread the two payments more evenly over the year your directors propose that future interim dividends should be paid on or about December 15th, one month later than at present, and that if profits permit the rate should be slightly higher, with a corresponding reduction in the final dividend.

TRIBUTE TO EMPLOYEES

I cannot complete this statement without expressing our thanks to all employees in the Group, whatever their rank or position, for their loyal and conscientious services during the past year.

The report and accounts were unanimously adopted; the formal business was transacted; the appointment to the board of Sir Anthony J. Elkins, CBE, was confirmed and the proposed alterations to the Articles of Association were approved.

ALLIED INDUSTRIAL SERVICES LTD.

RECORD PRODUCTION

The twentieth annual general meeting of Allied Industrial Services Limited will be held on October 6th at Bradford.

The following is an extract from the circulated statement by the chairman, Mr W. H. Rhodes, CBE.

During the year the factories and plants of the group have operated at the highest production level yet recorded.

After making provision for depreciation, directors' remuneration and taxation on the year's profits, the net profit (including dividends, etc., received) amounts to £241,218 which, added to the balance of profit and loss account brought forward from the previous year (and taxation adjustments in respect of prior years) gives a total of £274,062 available for allocation.

Towards the close of the year the board, with your approval, capitalised reserves to the extent of £100,000. This makes the issued ordinary capital more comparable with the

amount of capital employed in your company. It is proposed that a final dividend of 19 per cent be paid on the present issued capital.

During the past year £66,700 was expended on buildings, plant and vehicles and at June 30th last our capital commitments amounted to £61,000. A year ago I stated that contracts were being entered into to provide small extensions to two of your factories: the first extension is now operating and the second should be completed by October. Plans are now being prepared for the board's consideration in anticipation of some further factory extensions being made in the not distant future.

In connection with prospects for this present year, our combined output for July and August is higher than in the corresponding months of 1953 and in the absence of a deterioration in general trading conditions I consider it reasonable to expect that our combined outputs can be maintained.

HICKING PENTECOST & CO. LIMITED

The eighth annual general meeting of Hicking Pentecost & Co. Limited was held on September 16th at Nottingham, Mr Leonard S. Pentecost, the chairman, presiding. The following are extracts from his circulated statement:

The net profit of the group shows a slight increase over the previous year. The greater part of these profits will be paid in taxation, which still forms a heavy burden on industry.

Your directors have decided to recommend a dividend of 17½ per cent, which shows an increase of 2½ per cent over last year, leaving an ample sum to be retained in the business.

In spite of the steady advance of wages and materials, these results have been achieved by keeping the whole of our plant, with all its recent additions, working at its fullest capacity.

We have been steadily occupied in our lace and net sections throughout the year.

Our fabric sections dealing with the new synthetic yarns have made steady progress and we are in a good position to cope with all developments. Our nylon hosiery section has also steadily increased.

The new department for the dyeing and finishing of women's fashioned woollen outerwear garments in non-shrink finish is developing and we have now a considerable capacity for this class of work. We are establishing a high reputation for this process.

Whilst our factories continue to be well employed, costs both in wages and materials are still advancing and, as it is our policy to restrict increase in prices as far as possible, profit margins tend to be lower.

The report was unanimously adopted.

INTERNATIONAL TEA COMPANY'S STORES

RECORD TURNOVER

The annual general meeting of the International Tea Company's Stores, Limited, will be held on October 5th in London.

The following is an extract from the annual review by the chairman, Mr Frank Wilson, circulated with the report and accounts:

I am pleased to have the privilege of placing before stockholders my report on the trading results of the group for the year ended May 1, 1954. In spite of the many difficulties we have fully maintained our position, improved the group trading profit and slightly increased the net profit from £557,391 to £563,992. I feel that stockholders will agree that this is satisfactory.

RETURNS COMPARABLE WITH PREVIOUS YEAR

In considering the group trading profit of £1,755,352, the returns during the year were relatively comparable with those of the previous year throughout the many sections of the business. There were, however, some minor temporary setbacks in one or two smaller groups amongst our subsidiaries. Similarly, in certain of our factory units, all of which have done so well for a number of years, the results on this occasion were not quite so good. This, I feel, was occasioned by the changing habits of the shopping public. Whilst the results of the tea department and the general preserves factory were better, those of the cake and biscuit bakeries showed a slight falling off owing to a lessened demand for some of their products.

Our tea department's foresight during a period of continually increasing costs on the tea market compensated for some of the lowered profits from the other sections.

Both in the wholesale and retail departments turnover continued to expand during the period under review and reached a new record. Unfortunately, expenses also continued to increase.

Last year you will recall that in addition to the final dividend of 11 per cent making 16 per cent for the year, we added a bonus of 4 per cent, making the total distribution 20 per cent. It was the first increase in the ordinary dividend since 1947, and this year we propose to consolidate the position by recommending a final dividend of 15 per cent again making the total distribution for the year at the rate of 20 per cent. These proposals make it possible to increase the carry forward on the group profit and loss account by £8,111, to a figure of £230,134.

Our main retail company, "International Stores," our Midland retail group "George Masons," controlled from Birmingham by Mr John W. Whitworth, "Payantake Stores," chiefly operating in and around London, and most of the smaller retail subsidiaries, all had a satisfactory trading year and contributed their quota towards the final results.

IMPROVING SALES

The sales figures in many departments have shown fluctuations, but the position is improving and gradually settling down satisfactorily.

As to the future, conditions are certainly not easy today. We must be ever vigilant, watching the moves of traders and commodities, as it is in times such as these that the most efficient in our trade—those who give the best service under the most attractive conditions in their retail branches and wholesale departments—will come out on top. That we are going to do just this, is my sincere and optimistic anticipation so far as the "International" and all its subsidiaries are concerned.

DIRECTOR OF RESEARCH

The British Steel Castings Research Association, with Headquarters in Sheffield, invites applications for the position of Director of Research, to lead a team of about 18 scientists and technicians, together with clerical and library services. A metallurgist with research and some industrial experience preferred, but a physicist or chemist with similar experience considered. A new Research Station is about to be built and equipped. The Association is in receipt of D.S.I.R. Grant, and has connections and liaison with the works and laboratories of all the leading steel foundries in the U.K., together with a number of overseas contacts. For this reason administrative ability to work with committees, works personnel, etc., as well as the Association's own staff is of great importance. Salary, which will be in accordance with qualifications and experience, will be substantial. The Industry served by the Association produces about 225,000 tons per annum of carbon and alloy steel castings, and employs approximately 25,000 people.

Communications or queries should be addressed in confidence to the Chairman, British Steel Castings Research Association, Broomgrove Lodge, Sheffield, 10.

ECONOMIC JOURNALIST.—Government Department (London) invites applications for unestablished post as Senior Information Officer. Must be economists with journalistic ability to assist in preparation and editing of documents (including some for publication) on all aspects of current economic situation. Work entails both original writing and sub-editing. Previous experience in popularisation of economics an advantage. Salary range (men) £1,030-£1,230.—Write, giving date of birth, details of qualifications and experience to A.B.413, London Appointments Office, Ministry of Labour and National Service, 1-6 Tavistock Square, London, W.C.1. Original references should not be sent.

University Correspondence College *(Founded 1887)*

★ PROSPECTUS for this and other Degrees, G.C.E., etc., from Registrar,

UNIVERSITY OF BIRMINGHAM

INSTITUTE FOR ENGINEERING PRODUCTION
PRODUCTIVITY STUDY COURSES

A series of fortnightly residential executive courses on Work Study, Production Planning and Control, and Operational Research is now being arranged for next session starting in September, 1954. Production Managers and Work Study and other specialists interested in these subjects are invited to write for particulars to: Professor T. U. Matthew, Institute for Engineering Production, Southfield, 16 Norfolk Road, Edgbaston, Birmingham, 15.

UNIVERSITY OF BRISTOL

The University proposes as soon as possible to make an appointment in the Department of Economics to a newly established Chair in Accounting or in a subject dealing with Accounting in a fundamental way. Candidates should have academic and professional qualifications. The occupant of the Chair will assume responsibility for research in his subject and for teaching in the present degree courses. He will also have the opportunity, in co-operation with his colleagues, of developing research and post-graduate study in fundamental subjects relevant to administration and management.

Suitably qualified candidates are invited to apply, submitting the names and addresses of referees, to the undersigned, from whom further particulars of the appointment may be obtained.

H. C. BUTTERFIELD,
Registrar and Secretary.

STUDY AT HOME **B.Sc. ECON.**

This London University degree, open to all, is a valuable qualification for statistical, research, educational and welfare work. It is necessary only to pass three examinations. Wolsey Hall (founded in 1894) can prepare you for these at home. Reasonable fees, instalments. 952 B.Sc. Econ. (Final) Successes, 1925-53. Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P15.

WOLSEY HALL, OXFORD

MARKETING MANAGER required by Sunvic Controls Ltd. to assist General Sales Manager to organise sales promotion effort of the Company for the sale of a wide variety of instruments covering different fields. It is essential that he should have had extensive marketing experience and possesses an excellent commercial training and the ability to organise and direct staff and be able to co-operate with other executives. Whilst the products are of a technical nature and an engineering background or experience in the engineering industry would be advantageous, this is not essential.—Write, giving full details of age, experience, qualifications, etc., to General Sales Manager, Sunvic Controls Ltd., 10 Essex Street, London, W.C.2.

DO YOU WANT MORE BUSINESS? Then cover more territory and make more regular calls with a 1954 self-drive car. No more waiting for public transport. AUTOHALL have a fleet of over 100 1954 cars, all expertly maintained and serviced to meet your requirements. You can also take advantage of our guaranteed re-purchase scheme. Will you ask your secretary to drop us a line for our new, informative brochure.—AUTOHALL, Dept. 2-B, 302-306 King Street, London, W.6. RIV. 2881. Telegrams: Autohall, Wesphone, London. Cables: Autohall, London.

More than 70,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book reading library. Moderate fees, payable by instalments.

Write today for prospectus, sent FREE on request, mentioning exams. or subjects in which interested to the Secretary.

METROPOLITAN COLLEGE
(Dept. P) ST. ALBANS or call 70 Queen Victoria St., London, E.C.4

HER MAJESTY'S COLONIAL SERVICE

Applications are invited for the following post:

A vacancy exists for a Statistician (BCD.59/30/01) to undertake work in British Guiana similar to the function of the Central Statistical Office in the United Kingdom. A good academic background and wide practical experience are essential qualifications.

The appointment is on contract terms for two or three years. Salary at the rate of $7,200 (£1,500) per annum. A gratuity is payable on satisfactory completion of contract. Generous home leave on full salary; free passages provided for the officer, his wife and children not exceeding five persons in all. Intending candidates should write for application forms to the Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1, from whom further particulars may be obtained.

STATISTICAL ASSISTANT.—An interesting vacancy occurs in the Statistical Department of Kayser Bondor Limited.

The applicant should be a young Honours Graduate in Economics or Statistics. The work will involve investigations into distribution and allied marketing problems.

Applications are invited from Graduates both with or without commercial experience and should be addressed in confidence to the Personnel Manager, Kayser Bondor Limited, Baldock, Herts.

STATISTICIAN of initiative wanted by Midland Vehicle Manufacturers. Duties concern analysis of sales figures by markets, relation of allocation to production and stock records.—Box 699.

PERSONNEL MANAGEMENT ADVISERS (Men and Women) required by Ministry of Labour and National Service in London, Midlands and North-West Regions. Should have considerable experience as whole-time Personnel Officers and have understanding of principles basic to good human relations and wide knowledge of modern personnel practice. Experience in developing personnel policy and ability to assist in solution of detailed personnel problems is essential; lecturing experience an advantage. Salary according to qualifications and experience in scale: London, £1,055-£1,280 (men), £960-£1,130 (women); Birmingham and Manchester, £1,029-£1,240 (men), £880-£1,100 (women). Posts are not pensionable.—Write, giving date of birth, education, full details of qualifications and experience of posts held (including dates), to B.Y.174, Appointments Officer, Ministry of Labour and National Service, 1-6 Tavistock Square, W.C.1, by October 1, 1954. No original testimonials should be sent.

TRAINING OFFICER required by a Group of Companies engaged in electrical and mechanical engineering manufacture. Applicants must be expert and have had recent active experience in discussion group (T.W.I.) work and be capable of developing supervisory training throughout the Group. The appointment is permanent and pensionable, carrying a salary of £800-£900 p.a., depending on age and experience. The work will entail travelling between companies, but the appointment will be at Group level.—Apply by letter, giving details of age, education, training, experience and present salary, to Box 2J/J6362, A.K. Advg., 212a Shaftesbury Avenue, London, W.C.2.

BADGER *and Instrumentation Progress*

In our work as designing engineers on chemical plant and oil refinery projects, we have participated in progressive improvements typical of which are those illustrated below.

THE CONDOR GRAPHIC PANEL

This equipment installed in the Condor Refinery at Rho near Milano, which began operations in August 1953, controls the crude distillation unit as well as the feed preparation, cracking and synthetic crude tower sections of the thermofor catalytic cracking unit. It is the first major installation in Europe incorporating both miniature indicators and recorders and was produced to our order and specifications by Short and Mason Limited.

THE ADEN ELECTRONIC CONTROL CONSOLE

This installation in the Aden refinery of the Anglo-Iranian Oil Company Limited is unique in that it represents the first general application in a crude distillation unit of electrical signals in place of pneumatic transmission for indication, control and valve positioning. It was produced by Eyershed and Vignoles Limited to our specifications and order.

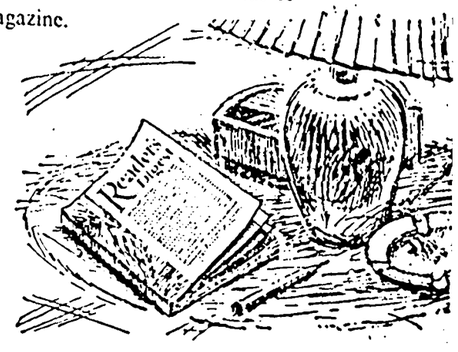
Getting people to read your advertisements

IT'S HARD TO TELL A MAN something important when his attention may be distracted at any moment. It's better to catch him at leisure, when he's ready to listen.

So with advertising. Your advertisements have the best chance of being read—of exerting the full power of the written word—if you put them in a publication edited strictly for *reading*, without sensational pictures and headlines to distract the roving eye.

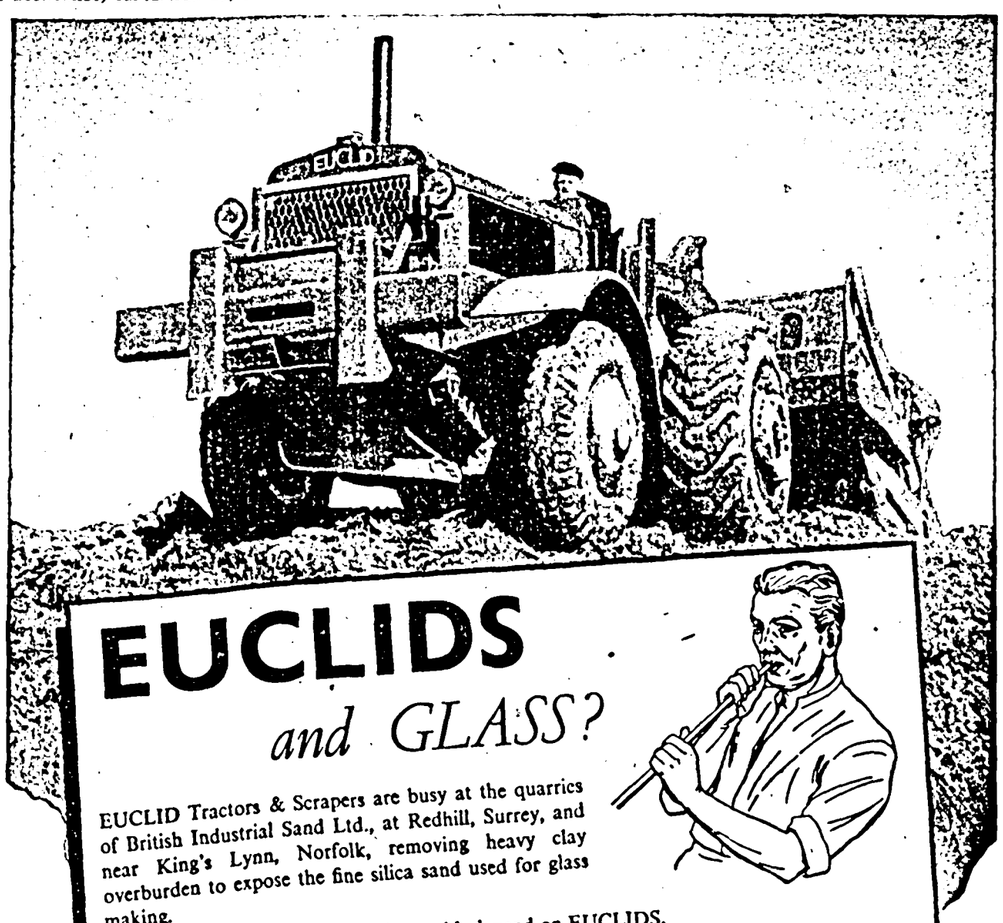
Does this mean limiting yourself to periodicals with relatively small circulations?

Not today. If there is a decline in the reading habit, The Reader's Digest hasn't noticed it. On the contrary. Simply by providing interesting reading, it has increased its sales from 400,000 in 1950 to a guaranteed million this autumn.



And that means *several* million readers. People can't keep this little magazine to themselves. They pass it on.

The Reader's Digest appeals, essentially, to men and women with a wide variety of interests, who like to keep up with what's going on in the world: *people receptive to new ideas.*



Because they also like to read, they are an ideal audience for the advertiser to address. A profitable audience, too. Such people, alert and well-informed, are apt to influence their friends—in their tastes and interests, in their purchases.

It is significant that they have influenced so many hundreds of thousands of others to follow their example in buying this magazine.

The Reader's Digest

a magazine for READING with a guaranteed MILLION sale

EUCLIDS *and GLASS?*

EUCLID Tractors & Scrapers are busy at the quarries of British Industrial Sand Ltd., at Redhill, Surrey, and near King's Lynn, Norfolk, removing heavy clay overburden to expose the fine silica sand used for glass making.

All kinds of industries, all over the world, depend on EUCLIDS.

Daily there is proof that EUCLIDS carry *more* loads in *less* time . . . cutting overheads and increasing profits.

EUCLID Tractors & Scrapers, EUCLID Rear-Dump and Bottom-Dump Wagons are available for sterling. Place your order now—all orders executed in strict rotation.

A complete After Sales Service is maintained for all EUCLID earthmoving equipment by the distributors:

An Outstanding Advance

It will not surprise any of the countless Gillette shavers, that Gillette should introduce a shaving cream. Indeed, the only thing that might occasion surprise is that they should not have done so before. Only after years of research were formulas evolved which measure up to the exacting standards they have set. Today Gillette bring to your notice their new Shaving Creams — lather or brushless — confident that here is a major achievement worthy of the Blue Gillette Blade and the Gillette Razor.

Brakes off Expansion!

Without adequate transport few firms are able to operate to their full efficiency; but, hitherto, the capital outlay and administrative overheads required for a fleet of trucks, vans or cars have prevented many organisations from achieving this goal. Now Kennings are able to offer fleets of 10 to 50 vehicles—trucks for heavy goods—vans for local deliveries—cars for executives and representatives, in a most economic manner under their Car Contract Plan. We invite you to write for full details of this business-making scheme.

- No outlay of capital.
- Reduced administrative costs.
- Simplification of Tax claims.

  The monthly contract payment for Hire and Service is a direct charge to trade expenses.
- Countrywide maintenance service.
- Stricter and easier control of your personal transport budget.
- Elimination of redundant transport.
- Provision of relief cars at little extra cost.
- We can provide a " tailor-made " service for your exact needs, and arrange the advantageous disposal of your present fleet.

Once any Burroughs machine is installed, Burroughs Service—on call always, all over the world— guarantees *its perfect operating efficiency*

DON CAMILLO'S DILEMMA

FIVE COMPLETE STORIES

in an extra 8-page detachable supplement

Laughable, Lovable Don Camillo!

JOHN BULL brings you five Don Camillo stories straight from Giovanni Guareschi's latest book—to read, to laugh at, to detach and keep.

The artist who unwittingly used a beautiful but ill-chosen model for a church fresco—the jealous lover who turned a bathing beauty into a bald-headed bride—Peppone the Communist mayor who won a Diploma with an essay on his First Communion, and who painted Don Camillo's dog red—these are among the characters who people the new, delightful, Don Camillo gems of satire in the special supplement inside every copy of next week's JOHN BULL.

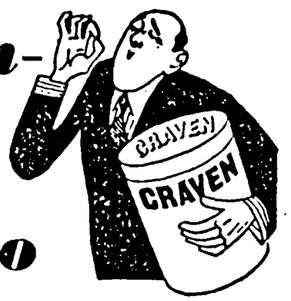
JOHN BULL

OUT WEDNESDAY, SEPT. 29 — 4d.

DO YOU SOMETIMES THINK?

that the cost of office space in central London is ruinous?

that it is hard on Jones to have to share his room with the travellers and the typists and the telephone exchange?



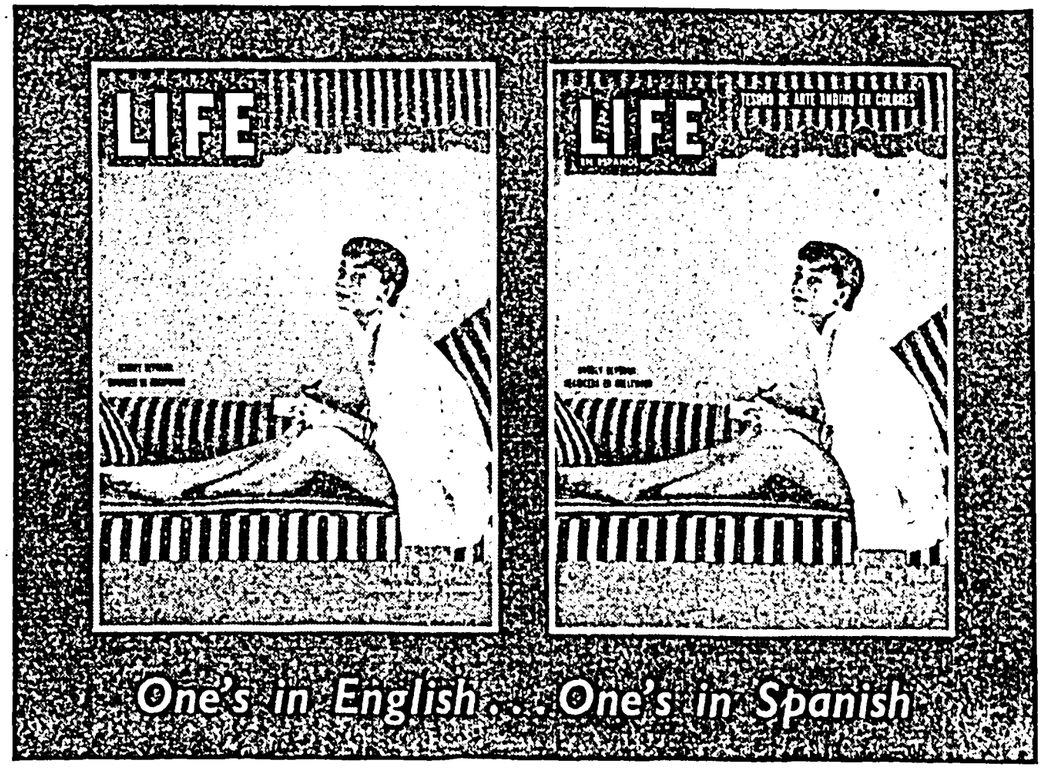
that it is a pity that some of the clever planners don't find space for you to park your car conveniently?

And if you do think just those things, don't you think, too, that a new office in a new town centre, 23 miles to the North West of London in the Chilterns might be a solution?

We are building 100,000 sq. ft. of offices over shops in units big and small at from 6/- per square foot: lifts: central heating: car parks adjacent: houses of all kinds from 30/- a week to £300 a year—for you and your staff in the new neighbourhoods.

If that outline sketch interests you, our Chief Estates Officer, Hemel Hempstead Development Corporation, Westbrook Hay, Hemel Hempstead, will fill in all the details

Craven— tobacco to live for



IN TIMES OF STRAIN and trouble a Craven smoker turns to his tobacco for comfort and solace. And slowly, but surely, the mellow and cool burning CRAVEN casts its richly comforting spell to make life easier and brighter. "*It is*" said Sir James Barrie in 'My Lady Nicotine' "*a tobacco to live for.*" Every Craven man knows how right he was.

Try CRAVEN

Obtainable in 3 fragrant, slow burning, deeply satisfying blends.

Craven Mixture 4/7 oz.
Craven Empire de luxe Mixture 4/3 oz.
Craven Empire Curly Cut 4/4 oz.

BOTH SPEAK THE SAME LANGUAGE

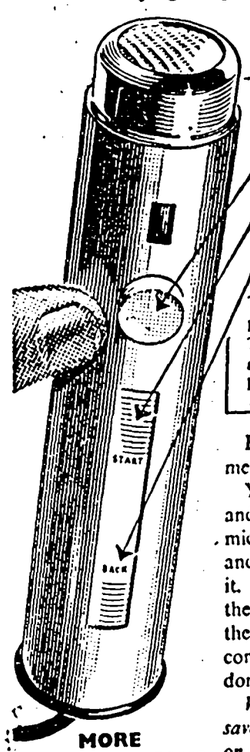
Why do over half a million people in 120 countries buy these two international editions of LIFE every fortnight?

Because both LIFE INTERNATIONAL and LIFE EN ESPAÑOL speak the universal language of pictures . . . so eloquently that the workings of an atomic submarine become as clear to a businessman in Milan as to an engineer in Lima . . . so appealingly that over 12,000,000 copies of the two editions were bought in 1953.

LIFE INTERNATIONAL's selective circulation around the world is complemented by LIFE EN ESPAÑOL's top-of-the-market coverage of Latin America. More than 9 out of 10 of the subscribers and news-stand buyers of each edition are in business, government and the professions — at far above average income and position levels.

And both editions are unique in their advertising and merchandising impact. Between their covers and at point of sale, they provide the finest printing and colour reproduction and the largest page size among international magazines.

Because each offers so great an opportunity for sales, both together get outstanding sales results. A recent coupon advertisement in the two editions drew nearly 20,000 inquiries.



If you, too, are interested in results, write for "More Facts about LIFE International Editions." Both speak the language of pictures and of sales.

Europe in 4-D

THE foreign ministers will gather in London next week for the most crucial conference to be held in this city since the war. They will arrive with furrowed brows and with gloomy thoughts at the backs of their minds. To the man in the street, skimming his newspaper headlines, this may seem strange. He may have the impression that there is already a shining new plan to fill the gap left by the European Defence Community; that there is already broad agreement on the ingenious idea of bringing Italy and Germany into the Brussels Treaty; and that a new formula has been found for control of armaments which, like a political brand of chlorophyll toothpaste, both prevents inroads into the ivory towers of national sovereignty and removes the taint of discrimination. He may well ask: why then so much caution and nagging doubt? Are we not almost home? Cannot the statesmen simply troop into Lancaster House, endorse this timely panacea and catch the next plane back to their respective capitals?

Even half of this optimism would be wholly unfounded. Despite the rich crop of smiling handshakes garnered by press photographers during last week's diplomatic marathon, the London conference will open in a foggy and acrid atmosphere of disunity. At first glance, the statements and communiqués that have been issued so lavishly bear a family resemblance; the same key phrases recur, the same eager concern for active co-operation shines out, the possibility of any complete rift between the powers is not even hinted. Yet the spectre of such a rift hangs close. At second glance, the communiqués themselves reveal how close it has come. Those issued after Mr Eden's visits to Brussels, Bonn and Rome reflected a high degree of agreement; but the Paris communiqué was suavely non-committal. Mr Dulles and Dr Adenauer seem to have got on like a house on fire, and their joint statement pointed to speedy sovereignty for Germany and to its inclusion in the western alliance without discrimination; but after Mr Dulles's visit to London, nothing could be found to say except soothing and evasive words.

Yet it would be over-simplifying the fiendishly difficult task before the London conference to represent it merely in terms of a British attempt to prevent a break between America and Germany on the one hand and France on the other. The four powers have not got four clear policies; they have not even got two. The true picture is not a flat one. It has murky depths; and the time element is at least as important here as the other three dimensions. The complex problems that confront the nine powers can, in fact, be adequately stated only under four headings; and the straightforward differences of view as to what precise shape the powers' future relations should take represent only the first of these.

These differences are themselves formidable enough. It might be thought that M. Mendès-France had narrowed them down a good deal by his Strasbourg speech on Monday. He there stressed the fact

that to make use of the Brussels Treaty would prevent any need to discriminate against Germany. He sought to allay British qualms by specifying that any new control organ should confine its scope to armed forces and arms production on the Continent. He declared that he did not propose the setting up of any new military organisation and hierarchy—"those of Nato are sufficient"—and he suggested that, given liaison between Nato and the new Brussels organ, German entry into Nato "would no longer give ground for the same apprehensions as hitherto."

There was much in this speech that was encouraging. But the questions still to be answered are the critical ones. If the "neo-Brussels" structure has none of the supra-national characteristics that France found intolerable in EDC, how effective can it be as a check on the possibility of German militarism at some future date, when both Germany's government and its thinking may have changed for the worse? Whatever the French premier may say about German entry into Nato (and he has said very little yet), will France really swallow this when it comes to the pinch? The French Assembly is still pledged to oppose the admission to Nato of any state with territorial claims; and one such territorial problem is the exceedingly thorny one of the Saar. Will Britain, even after M. Mendès-France's explanations, step into the proposed arrangements boldly enough to sustain them? And what of the United States, as to which the French premier was perhaps understandably but most significantly silent? What prospect is there that the same Americans who have encouraged European integration for four long years, only to see it crumble at the last minute, will lend to a new and flimsier venture the patient and firm support on which Europe must still depend?

Even now we have considered only the first dimension of the conference's task. No less vital are the problems of timing and priorities. M. Mendès-France seemed confident, at Strasbourg, that he could get the French Assembly to pronounce on a new agreement before the end of the year. But how can the other powers grant even this breathing space? Dr Adenauer has been under gruelling fire from critics on all sides since the collapse of EDC, and urgently needs to be able to show his fellow countrymen some concrete achievement. Mr Dulles represents a party that must face the electors in November with something that will take away the bitter taste of disillusion in Europe. Good "Europeans" such as M. Spaak are justly clamorous for action, and in Britain the opponents of German rearmament in any form are massing in Mr Eden's (and Mr Attlee's) rear. The French premier's need for time is clear enough. His sympathisers can point to his genuine desire to carry his economic programme through; and his sternest critics can see that no government of any complexion could win a majority in Paris for German admission to Nato until some of the bitterness generated on August 30th has evaporated. But the Germans are in no mood for piecemeal advancement, through Brussels to a later entry into Nato: these steps may need to be simultaneous. And can the ending of the occupation regime in Germany be held back still longer? Again, if the French Assembly jibs in December just as it jibbed in August, what then?

The third dimension is that of international confidence. The foreign ministers must still meet in the baleful atmosphere of mutual mistrust between governments that has filled the air since August 30th. Added to the older European fears of German militarism, a newer fear of a German-American "axis" has appeared not only in France but also among its neighbours and even in Germany itself. American anguish at the collapse of EDC has led, first, to a very natural loss of faith in Europe as a whole among both political leaders and public in the United States and, second, to a corresponding fear on this side of the Atlantic that the Americans may give up such a daunting struggle and extricate themselves altogether. But the sharpest mistrust centres on the French premier himself. Despite his declarations of faith in the Atlantic partnership, his Pilate-like role at the death of EDC and the known inclinations of some of his close associates have aroused deep suspicions, particularly, but not solely, in America. Against such a background, his every word is inevitably subject to the most watchful scrutiny, and if a great deal is read into his silence about the American role in Europe or his devious references to new horizons in disarmament, this is scarcely surprising. At the very best, it is an inauspicious background for a conference in which all parties will be asked to make gestures of faith in each other.

*

Finally, there is the deepest dimension of all—the problem of internal confidence within the countries concerned. M. Mendès-France has yet to obtain the toleration, let alone the support, of the French "Europeans" over whose humiliation he presided. No coherent majority is behind him; no such majority could, at the present moment, be mustered behind any French premier. In Italy, Signor Scelba has just seen his foreign minister vanish into the murk of the Montesi scandal. In the United States, the Democrats are very naturally making election capital out of what they portray as Mr Dulles's botching of Mr Acheson's plans. Nearly every one of the statesmen who sit down round the Lancaster House table next week will be looking anxiously over his shoulder at the public and the party machines behind him.

The problem is also serious in Germany, although Dr Adenauer cannot be unseated and still manages to control his unruly coalition. But there is a danger that the Chancellor may cling too rigidly to the ideal of full European union, and so alienate his own countrymen. As an article on page 984 shows, he is already attacked in all quarters on the grounds that he has put all Germany's cards on Western integration and neglected German reunification. The "European idea" is not dead, but Germans demand that it shall take practical shape, with Britain as a full partner—and that rearmament shall not block the way to agreement with Moscow on reunion. The dominant mood of the Germans is not jingo militarism; on the contrary, "third force" neutralism has grown, and the Chancellor is likely to be criticised just as much by those who want no American ties as by those who are impatient for a full role in Nato.

In sum, the task of the London conference will not be merely to dovetail together two or three plans that already have much in common, but to grope for solid ground in a European situation that is as queasy as a bog. To expect quick and easy success from the conference would be to risk fearful disillusion. The tragedy is that groups whose members are all men of goodwill are bitterly at loggerheads; and it is essential that whatever emerges from the conference should not provoke another head-on collision between "Atlantic" and "European" factions, or between champions of close integration and sincere patriots. The free world desperately needs the support of both. This is a task to challenge Mr Eden's full powers.

Two things are clearly vital. First, the new shape of Europe must be clarified with the utmost possible speed. Every day of delay deepens the apathy and cynicism that could so easily disintegrate the whole western partnership. Second, the touchstone of all that is proposed or agreed in London must be the question: will it strengthen or weaken the bonds between the United States and its allies? At a moment such as the present one, the supreme importance of the Atlantic partnership emerges more clearly than ever; and if the London talks damage that partnership, even the most ingenious solutions that can be devised to the present problems will do more harm than good.

Politics by Conference

THE two major parties will be holding their annual conferences over the next fortnight at a time when public interest in politics is probably lower than at any time since 1945. Now that the postwar atmosphere of permanent crisis has been replaced, at least domestically, by something akin to stability, most of the bread-and-butter issues which shook the hustings at the last two elections have been taken out of politics. It is not only because the election is still some way off that the politicians are failing to see the whites of the electors' eyes; the eyes are closed in boredom. To recapture public interest is a legitimate and necessary objective of all parties; it would be unhealthy if the country's concern with public affairs were to become confined to a three-week election campaign every four or five years. But there is a right and a wrong way of keeping people interested in politics and some of the advanced billing for the conferences suggests that neither party may be ready to take the right way.

Broadly speaking, politicians can appeal to the public through its head or its heart, and usually party propaganda is nicely calculated to reach both. But when a party finds itself short of intellectual argument it inevitably tends to tilt the balance towards emotionalism. The classic move for a party anxious to strike a predominantly emotional appeal is to proclaim that an election is imminent, and it is ominous that both sides are advertising their coming conferences as the last before the next election. This emphasis is quite unnecessary; there is very unlikely to be an election before next autumn at the earliest, and even if it comes then (which is by no means certain), there could be time to fit in next year's party conferences first. If the election scarecrow is flourished at Scarborough and Blackpool, the only people the party leaders will be trying to scare are their own followers.

The cry of "close the ranks" is always a particularly tempting one for a leader with a divided party, and no doubt Mr Attlee has been tasting its flavour on his way back from the East. But he has good reason for knowing that such a move never pays dividends in the long run. He thought he had solved the Bevanite crisis in 1951 by making the Scarborough conference a pre-election rally, but the storm merely broke a year later at Morecambe, and even more fiercely than it would have at Scarborough. Quite apart from the split on German rearmament, Mr Attlee's party has reached a state of division which certainly cannot be hidden and for which the only cure is honest discussion and clear decision. It is true that if Mr Attlee were to try to swathe Labour's differences in a cocoon of compromise he might be lucky enough to see a sudden crisis sweep the Tories from power irrespective of Labour's deficiencies. But that is unlikely and in any event would merely put him back in the position he found intolerable in 1951, of trying to run the country at the head of a divided party.

The Tory leaders are much less troubled by serious party divisions, but the pinpricking revolts of the summer were evidence of a certain amount of subterranean restiveness and the temptation to pitch an emotional appeal must be present with them, too. Certainly there is no institution better devised for whipping up uncritical partisan fervour than a party conference, and a Tory conference in particular. Labour manages to achieve some degree of effective working debate, but the Tory conference is never much more than a mass rally. No body of over 4,000 people, in some years spread over two or three halls, can ever

hope to be seriously deliberative, while, for all its size, the Tory conference is shorter than Labour's—two and a half days compared to four and a half or five—and the individual debates are also shorter. This year the Tories are making history by allowing their conference to be televised, but clearly they are taking much less of a risk than would Labour (except perhaps of boring the viewers) and the fear must be that the presence of the TV cameras will turn the occasion into a mutual congratulation society.

The inability of an annual conference to decide on the minutiae of current politics must be obvious to the party leaders, if not necessarily to the delegates, but the curious fiction is maintained that the conferences have a substantial degree of executive authority. In the case of Labour this is formally correct: conference decisions are binding on the party's National Executive Committee. But the Executive, even when it does not succeed in avoiding being shackled with unwelcome chains, usually manages to show the skill of a Houdini in wriggling out of them later. The Labour conference has no direct authority over the Parliamentary Party (which chooses Labour's leader) and of course none over a Labour Cabinet. The Tory conference has even less claim to authority; the creation of Tory policy is the sole prerogative of the leader (also chosen by the party's Parliamentary representatives) and the leader does not even attend the conference, only a special demonstration when it is over.

★

But both sets of leaders insist on preserving the myth that the delegates exert some direct control over day-to-day policy and it is not surprising that the delegates have come to believe it. Thus they get disgruntled when they see conference decisions ignored, and at both conferences a curious love-hate relationship has developed between the "floor" and the "platform." The "floor" never stints its idolatry of the party gods and their high priests, but it also shows a missionary zeal for staging at least one revolt against the "platform" each year. Invariably these triumphs are unfortunate, the classic case being the success of a Tory conference in forcing a glassily smiling Lord Woolton to accept the 300,000 houses pledge, which has been a millstone round the neck of the party—and of the national economy—ever since.

If the party conferences are to make any really useful contribution to the nation's political life, it will have to be primarily through discussion of wide basic issues, rather than the details of legislation or administration. It is no coincidence that the best conference debates, particularly on the Labour side, invariably take place on the broad principles of the society which the party thinks it wants to create. If the party leaders, with their daily contact with events, must control the party's conduct towards current problems, they tend, by their very proximity to practical politics, to lose sight of what are supposed to be their basic principles. This is particularly true when a party is in office. Labour's present intellectual bankruptcy dates from the 1945-50 era when all its leaders were busily putting into effect the party's earlier notions and giving insufficient thought to a basis for future action. The Tories are now getting into rather the same state, as Mr Macmillan, at least, seems to be recognising. Like Labour in 1945-50, the Tories are carrying out the more specific of their election pledges; they have ended rationing, cut taxation a little and put up lots of houses. That the rank and file should be none the less restive is a paradox to be explained partly by the unusual ossification of the party hierarchy but much more by a feeling among the faithful party workers in the constituencies that the Government has been so busy being efficient that it has forgotten to be Conservative. This is why the party reacted so fiercely to Crichel Down.

These are broad issues of the sort that it is helpful, and indeed important, for annual party conferences to discuss, and for which they are well fitted. In the postwar atmosphere of food rationing, housing shortages and class consciousness, the politicians were able to pitch their arguments at an easy level of simple slogans and catch-phrases, but now for the first time in over fifteen years there is a chance to conduct political argument on the basis not of what the meat ration will be in the next ten months, but of the type of society which is to be created over the next ten years. A few individual politicians have already raised their sights, but the parties as a whole have been left fumbling, with the result that they run the risk of seeing the next election decided on hasty judgments passed by electors slumped in apathy up to the last moment. The parties can best serve both their own interests and those of the political life of the country if they use the coming conferences not to whip up synthetic emotion, but to start marking out the ground over which the political battles of the next few years will be fought.

Asian Watering-Can

IMPORTANT new developments in the work of the Colombo Plan are likely to impose themselves at the meeting in Ottawa early next month of the fourteen-nation Consultative Committee. Questions of fundamental importance affecting both its membership and its future role in Asian economic development can scarcely be avoided. For the first time the United States will be attending as a full member, and there are hints that two more Asian candidates will be presented. Clearly the intimate atmosphere of the exclusive club is disappearing. A potentially more disruptive question, however, is that of the future relationship between the Colombo Plan and the many other schemes, existing and projected, for giving aid to under-developed countries in Asia. The most troublesome problem is the connection between the Plan and the economic side of the organisation newly conceived at Manila but as yet unborn.

From the first it has been an explicit aim to draw the United States into the Colombo Plan. All the participating countries realise that only the Americans possess the resources to give it real punch. Now, however, some of the Asian countries are having second thoughts about US membership. They are afraid that Washington will make the running; they suspect that the Americans will use the Plan to entangle the uncommitted Asian countries in their crusade against Communism. At Manila it was no secret that the British delegation favoured the Colombo Plan in preference to a new economic organisation grafted on to the South East Asian Collective Defence Treaty. This unwittingly gave the impression that Britain regarded the Colombo Plan as an alternative to the Manila pact. It is not; but an official disclaimer is needed to put doubts at rest.

In fact Mr Stassen, who is responsible for the American foreign aid programme, has already firmly denied that his government proposes to use the Colombo Plan as its main instrument for channelling economic aid into Asia. The Americans will continue to use the Technical Aid (Point Four) scheme, bilateral military and defence support agreements, and the World Bank as their main agencies. Clearly, however, it is in the interests of all the Colombo Plan countries to welcome American participation. It is a fundamental precept of the plan developed at Colombo in January, 1950, that membership is open to all countries that subscribe to its objects. As Mr Gaitskell put it at the time: "We countries of the Commonwealth have taken the initiative in this enterprise. But we certainly desire no monopoly." There are other would-be members—Japan and Siam; they too should be welcomed. Japanese participation will certainly raise doubts in the minds of some of the members of the Colombo Plan; it might create difficulties; but on balance it is likely to be an asset, particularly to the other Asian members.

But there is a danger that satisfaction with the modest success of the Colombo Plan will give rise to complacency about the general economic situation in Asia. No such luxury can be afforded. The Plan itself has as yet not made much impression on the enormous problem of economic backwardness in the area. It is difficult to guess how much external aid is needed; but a group of experts reporting to the United Nations in May, 1951, estimated—admittedly on somewhat flimsy evidence—that some $11 billion of external capital would be required each year for industry and agriculture alone if the national income per head in Asia (including China but excluding Japan) was to be raised by a mere 2 per cent per annum. Their estimates, which might in fact be too conservative, give an idea of the orders of magnitude involved. Something less than $200 million of external capital is the fractional contribution to this task made by the Colombo Plan. This does not mean that its impact is minimal, for, as experience has amply shown, helping under-developed countries is not simply a matter of pouring in money. Technicians must be trained, new skills introduced, the arts of management taught; in this work the Colombo Plan, together with the United Nations Technical Assistance Board and the American Point Four programme, have chalked up impressive results. But adequate finance is vital. It is because the financial needs of under-developed countries are so great and the available resources outside the American continent so inadequate that it is difficult to keep patience with those who suggest that Britain, in combination with the Scandinavian countries or some other such odd grouping of countries, should go ahead independently of what the American government cares to do.

★

Something of a dilemma, therefore, faces the sponsors of the Colombo Plan. To be properly effective it needs much more money; the only hope is that the Americans will come in with a massive contribution; but this will mean that the American influence will predominate, probably causing a breakdown of the unique Colombo Plan relationship. It would be a pity if this happened. Asian countries have on the whole taken to the Colombo Plan. They see in it no sign of a threat to their sovereignty, no suggestion of a political line-up in the cold war. This is a valuable asset; it should not be squandered. Irresistibly, therefore, the conclusion is reached that the Colombo Plan should not, after all, be transformed into something bigger. Let its membership be widened; let its financial resources be increased; but at all costs keep its character and role intact.

This means that the main burden of giving aid to the under-developed countries of Asia must be shouldered by other agencies and organisations. There are already several at work in this field—the International Bank, the United Nations specialised agencies, the American Foreign Operations Administration and others—but there is room for much more. A plan to create a Special United Nations Fund for Economic Development has been sporadically debated, but there is little likelihood of it taking practical shape in the near future. Of the big powers, neither Britain, the United States, nor the Soviet Union supports it.

The only other possibility in sight is the proposal to give the Manila Treaty an economic backbone. All the signatory powers have indicated their willingness to accept additional economic commitments; but until the treaty is ratified and the permanent council set up there is no telling what sums it will command. It might be a year or more before it takes shape. Nevertheless this is no excuse for side-stepping some important decisions. Is a "Manila Plan" to be the West's main answer to Communist infiltration in Asia, and if so, what will its relationship be to the Colombo Plan?

There are two outstanding weaknesses in the proposal to create at Manila an Asian counterpart of the OEEC in Europe. First, the Manila pact covers only half a dozen Asian countries, accounting for a mere fraction of the total population of the area. Moreover, most of the Asian members are already receiving adequate if not especially well directed economic and defence support aid from the United States. Second, the aid—if Washington's current mood prevails—will mainly have a military orientation. Neither argument is decisive. However small a proportion of Asia's backward people are helped to raise their economic effectiveness, it is all to the good. And there is a strong possibility that other Asian countries might be persuaded to take part informally in the economic arrangements without committing themselves to the Manila pact itself. As for the predominantly military character of the aid, it is for Britain, Australia, New Zealand and the Asian signatories to make their voices heard in Washington. They could not do better than recommend to Mr Dulles's attention a new and penetrating American analysis of the economic and political aspects of aiding under-developed countries prepared by Professor Eugene Staley.* He writes that "It is a wrong diagnosis which sees the Communist menace as mainly a military threat. . . . In most under-developed countries the politico-economic threat is the major one"; and he suggests that, given a Communist strategy that plays down military action and fosters revolution under cover of a "peace offensive," America should, while keeping its military guard up, seek true security by "putting relatively more into politico-economic strengthening of under-developed areas, and relatively less into arming them." Meanwhile, the secondary economic effects of a military aid programme should not be ignored. After all, the demonstrably successful Indian five-year industrialisation plan is in a sense still being financed largely by the residue of a British wartime offshore procurement programme.

There is, in short, no reason at all to worry whether the Colombo Plan will be superseded; it will not. The "Manila Plan," if and when it takes shape, will be complementary and not competitive. Both are needed. At present only a few drops of western aid drip from a rusty bucket; what is wanted is a well-directed shower from a brim-full watering can.

The Use and Abuse of Planning

AMID the Conservative government's bonfire of controls, one major control—that of the local planning authorities over the use and development of land—has so far survived intact. Both main parties have avowed, in general terms, their faith in the continued value of planning controls, but there has been little attempt at a specific defence of the particular controls that exist. Interference with the private use of land is justified only if it accomplishes aims which are both socially acceptable and clearly defined. Unfortunately the worth of town planning is clouded by woolly ideas which sound sensible but lack substance.

An example of this muddled thinking is the aim of conserving agricultural land, which ministers view as a prime justification of the planning machinery. This notion sounds meritorious and quite unexceptionable; everyone would agree that farmland ought not to be "needlessly" wasted. But how much extra development cost is it worth incurring in order to avoid building on the better quality land? How far should people be deprived of their back gardens in order that farms can be protected? And is there any case for building upwards in blocks of flats in order to cut down land requirements?

After seven years of the Planning Act's operation the only official guidance on these matters is that "some additional cost" is justified to protect agriculture. An elaborate machine operates to ensure that "the claims of agriculture" are fully considered before any development is allowed. But the opinions of junior officers of the agricultural land service about the quality of farms are not always a reliable guide even to agricultural requirements. They are not based on an adequate soil survey, since the money so freely spent on organisation has been less available for research. Much less are they related to any consideration of the economics of food production; it might often be cheaper to replace the food grown on a piece of valuable land by improving marginal land elsewhere than to force housing or industry to incur extra costs.

The vague zeal for agricultural conservation emanating from Whitehall has fathered some extraordinary notions. It has influenced or indirectly compelled a number of local authorities to build flats instead of houses at an extra cost that is equivalent in extreme cases to £45,000 for each acre of farmland saved. The same sum spent on upgrading hill land might well produce over two hundred times the food supply of the lost acre. It is certain that much of the money now being spent on expensive flats, and justified on agricultural grounds, would never be forthcoming were it not that the national taxpayer unwittingly carries almost the whole burden of the special flat subsidies.

What plausibility there is in the conservationist idea derives from the argument that land, once given over to bricks and mortar, could not produce food in an emergency. But this notion again has never been properly analysed. It appears from official estimates derived from local plans that prospective urban development may affect about 2 per cent of present agricultural production during the next twenty years. This figure would doubtless be larger if strong controls did not exist; but even so it would be small compared with the extra food which could be wrung from the remaining farmland in an emergency (not to mention the resources of those urban back gardens which close development reduces or eliminates). Britain is not like Japan, faced with a swelling population and no scope for emigration. Once the redevelopment of congested areas is complete, urban pressure on the countryside will slacken considerably. Certainly evidence is needed to show that land conservation would make enough difference to starvation or survival to justify the costs and deprivations that are imposed in its name.

★

This one point has been discussed at some length because it illustrates well the temptations to which official planners are liable. The local planning authorities, supervised by the Ministry, are responsible for the "co-ordination of all forms of land use," and the idea has got around that an elaborate machinery for consulting all interests and rendering a supposedly impartial decision is a fair definition of planning. This judicial analogy is very misleading, for no general yardstick for determining the right use of land could conceivably be invented (other than the discredited and partly superseded one of a free market). The actual effect of this approach is that planning permission becomes a prize to be awarded to the best behaved or most plausible applicants, or to be settled by arbitrary rules, interpreted by the whims of junior officials. If the planning authority has not got a clear policy of its own, which it can define and defend in terms of general principles, then it had much better not interfere with the speedy, silent, and genuinely impartial mechanism of the market; and half-baked ideas applied by rule-of-thumb methods are no substitute for proper principles.

There are, however, basically sound and acceptable policies for which the planning authorities, central and local, are also responsible. Three of these policies may be briefly mentioned. There is first the championship of the broad cause of "amenity." This ugly word is shorthand for a whole group of tasks which are part defensive and part creative. The protection of the nation's heritage of natural and architectural beauty is inevitably a tough struggle against ugly or unsuitable developments. The planning ministry claims that in this contest it is merely the umpire and not the advocate for the defence; but the popular view of its role as that of upholding aesthetic values against economic pressures is actually a more appropriate one. Since all the other public departments as well as private organisations are bound to devise their schemes of development in terms of minimising costs, it is well that there should be one authority to urge and sometimes to insist that it is worth paying something to avert the obliteration of the finer features of town and countryside.

Preserving existing amenities comes more easily to public authorities than creating new ones. The standards of design favoured by local councils are all too often insipid, monotonous, and conservative; but at least those councils who employ a good architect and are prepared to trust him can avoid the more egregious aesthetic blunders. But the most useful work here consists in moulding a satisfactory environment rather than in dictating building designs. In ensuring that development while reasonably spacious is compactly grouped, in reserving suitable sites for social facilities, in retaining trees and other natural features, in protecting residential areas from noxious fumes and traffic dangers—in all these matters there are now reasonably agreed standards which, actively pursued, can make a real difference to the quality of living.

Secondly there are the great tasks of urban redevelopment. In most big towns the more spectacular work of rebuilding bombed city centres is at least half-completed, and attention is being switched to the long prosaic task of redeveloping the vast areas of substandard and congested properties. The tasks in each case are the same: to sort out the present mixture of uses; to segregate harmful industries; to streamline the road system; to eliminate congested housing; and to provide a sufficiency of open spaces and of land for the modern requirements not only of dwellings, but of factories, schools, and hospitals. In all cities the shortages of space and of finance are the limiting factors which circumscribe respectively the density and the

* The Future of Underdeveloped Countries. By Eugene Staley. *Harper*. New York: *Royal Institute of International Affairs*, London. 410 pages. 36s.

pace of redevelopment. But the main cities have shown a remarkable uniformity in their choice of policies and standards, and if these can be implemented, a considerable improvement in living standards will certainly result.

The third policy is the corollary of the redevelopment programmes of the largest cities—the schemes for dispersing their surplus population to smaller towns in the same region. Redevelopment reduces the area available for housing and displaces large numbers of people. If a limit is to be put to building upwards because of its extravagant cost and social unpopularity, and if outward sprawl is not to continue indefinitely, then a part of the population pressure in London, Birmingham, Manchester, and Glasgow must be shifted to other towns. There is nothing visionary or utopian about this policy, since in all economically advanced countries there is a strong centrifugal force behind industry and population which the planner can hope to guide and accelerate.

The three specific policies here briefly outlined do not of course exhaust the scope of town and country planning ; nor are they free from considerable controversy. The wisdom of a dispersal programme designed primarily in terms of housing rather than of shifts of employment is, in particular, open to doubt. But at least these are policies which have been clearly formulated and generally agreed between the planning authorities and which hold forth definite prospects of social betterment. No controls which fail to satisfy this elementary criterion ought to be tolerated ; and it is surely time that both the law and the practice of town planning were reviewed so as to reduce the amount of interference to what is positively needed for specific purposes. A vague and dilatory brooding by public officials over the destiny of each piece of land can never be justified by talk about the national interest, the need for co-ordination, and the smallness of this island. Only the prospect of concrete benefits can warrant the imposition of planning controls.

Notes of the Week

Blurring the Issue at Scarborough

THE emergency resolution on German rearmament adopted by the national executive committee of the Labour party is a dubious manœuvre, whether the retreat from clarity is real or sham. If the official leaders are really backing away from their earlier commitments they might as well say so frankly and enjoy a peaceful, if undignified, passage through next week's annual party conference. If, as seems much more likely, they are merely trying to pretend they have changed their minds, then the Bevanites will make very sure that the deception is exposed. To find out just what the official leadership is up to, the party will have to wait for the speeches from the platform introducing the motion next Tuesday.

Not that the resolution is all evasion. It is reasonable that the executive should deal with German rearmament within the context of the German problem as a whole ; thus the resolution proves agreeably sensible by recognising that the question of free elections remains the touchstone. The Bevanites have been developing specious arguments that German rearmament should be bartered against free elections ; the resolution lays down that talks on German unity should be resumed only when the Russians permit free elections in the eastern zone.

This alone is enough to ensure a clash with the left at Scarborough, and it is difficult to see why Mr Attlee's lieutenants bothered (in his absence, but presumably with his approval) to wrap up the rest of their ideas in double-talk. With the nine-power conference taking place at the same time the executive can fairly claim some elbow room ; but it is mere evasion to propose talks with continental Socialist parties, which are collectively, and often individually, as split as British Labour. These talks are to consider "arrangements . . . for the German Federal Republic to contribute to collective security." If this sentence means anything, it must be that the Germans should be rearmed ; no responsible Labour leader has hitherto ever suggested that Germany should contribute to western defence without providing troops, and if one does so next week he will deserve and incur only contempt. With over fifty resolutions opposing German rearmament on the conference agenda, there will presumably have to be a straight vote on the issue some time next week. Defeat then would be cancelled out if the executive could get its own resolution passed, but if the conference proves merely irritated by all this shuffling the executive may yet wish that it had put on a braver show.

Tory Agenda

THE latest salutary effect of the Crichel Down affair is to provoke the Tories at their annual conference to have a debate on "the liberty of the subject." This is a topic which politicians like to discuss in Opposition but tend to find a nuisance when in office. Without Crichel Down it is hardly likely that eleven resolutions on various aspects of the subject's liberty would have been submitted to Abbey House and so made a debate necessary. The resolution on which the discussion will take place urges that the individual should have the right to appeal from decisions of the executive power to an independent tribunal. Whether the ensuing debate is as useful as it could well be will depend on whether the speakers can avoid the customary platitudes.

For the rest the agenda for the Tory conference follows fairly obvious lines. Over 30 resolutions calling for higher pensions were clearly drafted with an eye on aged constituents rather than on the Government, whose anxiety to act and reasons for delay have been made equally plain more than once. The Government, through Mr Butler, has also repeatedly made clear its attitude towards its own expenditure. This, however, has not prevented the annual sheaf of motions demanding cuts in taxation but failing to specify how the sponsors would find the money.

One or two familiar landmarks in the agenda reappear somewhat stunted. The annual clash between Mr Thorneycroft and the Messrs Amery *père et fils* is declared a draw in advance ; the debate on Commonwealth trade will take place on a motion merely calling for a revision of Gatt "if need be" in the interests of strengthening Commonwealth ties. Nor is there likely to be a repetition of last year's demonstration by the farm interests ; the new Minister is faced by suggestions couched in moderate terms. To compensate it for the loss of one of its favourite targets in Sir Thomas Dugdale, the conference is to be allowed to chivvy Miss Horsbrugh a little and even prod Mr Macmillan towards "concentrating housing subsidies on those who genuinely need them." But any chivvying of Mr Eden will be bad form. There are resolutions opposing his Suez policy and calling for a cut in national service (a rare bird in this aviary), but the motion on foreign affairs and defence which he will answer is couched in terms of simple adoration.

Aloofness on the Footplate

THE negotiations for a new wages structure for the railways have been thrown back into the melting pot. A fortnight ago the Transport Commission put an end to a deadlock by making a new offer, and last week it seemed that agreement might be reached. The National Union of Railwaymen had agreed on maximum and minimum increases, and had only to settle rates for the intermediate grades, and the Transport Salaried Staffs Association, too, had reached agreement. But the Associated Society of Locomotive Engineers and Firemen decided on Tuesday that the reported increase of 6s. 6d. offered to the footplatemen was still too far below their claim of £1 6s. 6d. to be acceptable. It is again insisting on referring the matter to the Railway Staff National Council—the usual preliminary to the industry's arbitration tribunal. It is by no means certain that ASLEF will gain more by this method ; the tribunal is made up of representatives of the other two unions and of the Transport Commission, with an independent chairman. But presumably it feels that it will not do any worse.

The council was due to meet on Friday, and its first task was to decide whether it was in accordance with the industry's constitution that the tribunal should consider a claim by one union only. If that were allowed, it would in theory be possible for the ASLEF men to get their increase through the tribunal while the other unions got theirs by negotiation. If the tribunal's award were more generous than the existing offer the commission would not only have to pay that increase to all footplatemen (including the 25 per cent of them who are in the NUR), but the NUR would presumably cease to be content with the other increases that it has negotiated. It would be surprising, however, if the award were to be more generous. The tribunal has an obligation to consider what the industry can afford—and the Transport Commission has already passed that limit. But if it were to recommend no more than the commission has already offered it might provoke again the obduracy of ASLEF. The spectre of a railway strike walks again.

The Other Communities

IN the tumult and discontent that has followed the collapse of the EDC, the functioning organs of European co-operation tend to be forgotten. Although first the uncertainty over EDC and then its collapse inevitably cast long shadows over the whole movement toward closer European co-operation, the idea of European unity has grown roots that are too deep to be easily killed. In May, 1950, when M. Schuman offered to merge France's coal and steel industries with those of other European countries, he did so in the name of Franco-German amity. At that time no one had yet dreamed of a European defence community in the now familiar sense. The Schuman plan, with its dramatic political appeal and latent economic advantages, was a new and exciting experiment. It still is. Although admittedly imperfect in many respects, a common market for coal and steel exists, and the end of exclusive national control over these vital resources is enshrined in a fifty-year treaty safeguarded by a zealous international bureaucracy. In his search for guarantees, M. Mendès-France should not overlook the military and political implications of the European Coal and Steel Community ; they are certainly not forgotten by the Germans.

Nor should the *coup de grâce* given to the EDC be taken as the end of all the high hopes for "Little Europe." Military integration is a step which must be taken eventually if the Six are to function as a true unity ; but there is no reason why it need be the second step. It was largely an accident of history that EDC came to be marked down as the next of the communities of the Six. The governments of the Low Countries, particularly the Dutch, have frequently argued that further action on the economic front was a more sensible second step.

The new pattern of defence arrangements for Western Europe which must soon emerge will undoubtedly affect the development of European economic and political institutions, but it will not remove the necessity for making the existing institutions work and evolving new ones. And the breaking of the unnecessarily rigid connection between European unity and western defence arrangements may make it easier to solve such long-standing problems as British association with the Coal and Steel Community.

Truth at Strasbourg

FEW of those who heard the Belgian Foreign Minister, M. Spaak, address the Council of Europe last Saturday can have failed to feel the appropriateness of his words in the only permanent European assembly that has yet been established. He spoke as a European at a moment when the great flow of hope and idealism in postwar Europe is sharply receding, and many people are already beginning to look upon the late 1940s as an age that is already passing into history. M. Spaak's theme was simple : German rearmament is vital to European defence ; to reject it would therefore destroy not only Europe, but also the strength of the Atlantic Pact, for America would withdraw from the Continent, and Britain would follow this example. It was sad but true that, if the question of German rearmament was put to the Nato countries, all but France would certainly agree to it. EDC had guaranteed five things: German rearmament ; some limitation of it ; no German general staff ; a step towards European unity ; and a new chance to solve some of Europe's biggest problems, including the division of Germany. Of these five, the Nato solution could cover only the first two. Nevertheless it must must be accepted.

The key point in M. Spaak's argument, that the Americans would withdraw from Europe if the Germans were not rearmed, is debatable. Admittedly this idea has been championed in Washington for over a year by a strong body of opinion ; but highly placed observers do not believe that, at least under the present Administration, the reappraisal would be quite so "agonising" as to cut Europe off *tout court*. And so long as some American stake was left, the United States would remain committed. But the essential value of M. Spaak's statement remains in any case. He showed that Western Europe can survive only on either America's or Russia's terms. There is no halfway house, and no realistic possibility of a "third force." This proposition can never be proved too often.

French Socialists at the Centre

M. MENDES-FRANCE originally contemplated, it seems, only a brief stay at the Quai d'Orsay ; and by now he must be wondering whether, in assuming the role of foreign minister as well as that of premier, he has taken on the task of Sisyphus. Next week's London conference confronts him with almost exactly the same problem as he faced on the eve of the Brussels conference in August. Once again he has to try to align all those French deputies who are prepared to accept some form of German rearmament on a formula that could also be accepted by France's allies. He has to reconcile as many as possible of those who voted against EDC with as many as possible of those who voted for it. The extremists on both sides—the "ultras," as they are now called in Paris—will certainly be against him. Can he, once tempers have calmed down, find any sort of majority in the centre ?

His proposals are still too vague and too new to allow of any accurate forecast. Many Gaullists may be swayed in his direction by the smallness of the "dose" of supranationalism that he suggests. His greatest difficulty will obviously be to win over enough of the "Europeans," whose bitterness over the failure of EDC has not yet diminished. The Christian Democrats (MRP) show no signs of modifying their hostility to the premier. Indeed, there were many rumours that, as soon as the Assembly came together again in November, the MRP would press for a dissolution to prove that the rejection of EDC represented the feeling not of the people, but only of the deputies—of the *pays légal*, not the *pays réel*. But enthusiasm for this move is now cooling off. The idea of a dissolution is apparently distasteful to the President of the Republic, and the "Europeans" themselves have no wish to provoke a second French veto which would please only the Communists and disgust France's allies. They have been thinking of bringing the premier down on some domestic issue before the Assembly can debate the European problem ; but for constitutional reasons they will have less than three weeks in November during which they could secure fresh elections by defeating the government by an absolute majority.

The Socialists, now struggling to avert a new and fatal split within their ranks, seem destined to play a key role. They are naturally reluctant to bear any responsibility for nipping in the bud M. Mendès-France's reformist experiment. Both in domestic and in foreign matters, the fate of the government lies primarily in their hands ; and the key factor in the determining of their final attitude—as of that of many other deputies—is likely to be the degree of British participation in the new European system.

Troubles of the TGWU

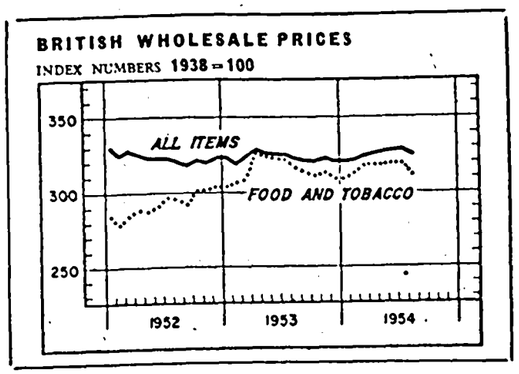
THE trials of the Transport and General Workers' Union do not get any less. As *The Economist* goes to press busmen from 55 of London's 114 garages are operating, in defiance of the union, the ban on overtime and on "rest-day" work, and there is every sign that it will extend further. Its pretext is a vague protest against rates of pay and pensions, although no specific claims have been put forward, other than the slogan "£10 a week or else." The malcontents feel that this is a particularly opportune time to exert what pressure they can, because, like all sections of the transport industry, London buses are suffering from a severe labour shortage—to be precise, from a shortage of 2,900 drivers and conductors.

The union now has to decide whether it will merely continue to withhold its support from the militants, while reminding them that their action breaks the union's agreement with London Transport to work overtime on request ; or whether it will canalise the militancy in another wage claim. In recent talks with the employers it has certainly urged that if work on the buses, with its disadvantages of irregular hours and weekend work, is to compete for labour with other industries, it must pay higher wages. A delegate conference of the union this week decisively rejected London Transport's proposal for meeting the shortage by regularised overtime working—a proposal that is certainly unpromising against the present background. On the other hand, the last claim was settled as recently as last January with an award of 7s. a week, and the time is hardly ripe for another. Whatever the union decides to do it can at least console itself with the thought that no other union is going to poach its members.

Meanwhile the breakaway in the dockers' group of the TGWU continues to spread. The National Amalgamated Stevedores and Dockers' Union asserts that over half the dockers both at Hull and at Birkenhead have now applied to transfer to it from the TGWU. It shows no sign of being impressed by the rebuke of Sir Vincent Tewson, general secretary of the TUC, who demands that it should return the purloined members. It denies the charge that it has broken the "Bridlington agreement" (which, among other things, forbids a union to organise recruitment where another union is in a majority) on the ground that the Hull dispute was over. If its defiance leads to suspension, followed at the next congress by expulsion, this would not be for the first time. It was expelled for the same sin thirty years ago, and was only readmitted ten years ago.

Success of a Mission

SIR KEITH HANCOCK has returned from Uganda after what has been, for him personally, a most successful mission. His appointment as an independent expert to advise the people of Buganda on constitutional reform was announced in February. It formed part of the Colonial Secretary's statement on the development of the whole of Uganda (including Buganda) as a primarily African state. Part of the dispute between the Governor and the Kabaka of Buganda arose from the Kabaka's wish to achieve autonomy for Buganda. The purpose of Sir Keith Hancock's mission was therefore to hammer out proposals by which Buganda's desire for self-government could be reconciled with the progress of Uganda, as a unitary state, towards the same goal. Consideration had thus to be given to the relations between the Lukiko (Buganda's parliament) and the Legislative Council of Uganda. Equally important were the problems peculiar to Buganda itself, and the relations of the Kabaka—whoever he might be—and his ministers with the Lukiko were included in the terms of Sir Keith Hancock's mission.



From the start it was intended that the Baganda themselves should have a large share in working out a solution to these constitutional problems. Sir Keith Hancock's first success was his mediation between the Governor and the Lukiko in the dispute that arose over the membership of the constitutional committee. Moreover, the speech he made to the Lukiko on his arrival in Uganda in June, in which he emphasised his independente both of the Government and of the committee, created a favourable atmosphere for the beginning of the talks. Now he has managed to secure agreement, not only among the members of the constitutional committee themselves, but between them and the Governor, Sir Andrew Cohen.

Yet the agreed recommendations on Buganda's constitution, signed last week by the Governor and by the members of the committee, are not the end of the story. The recommendations, which will not be made known for another month as they have to be translated into the native tongue, will have to be considered by the Lukiko. Even though the Lukiko itself appointed the committee, there is still plenty of scope for opposition to its recommendations to be worked up by interested parties. It is also very unlikely that the average Buganda African will be able to dissociate any references to the office of Kabaka from the person of Mutesa II. To put over the proposals will need the most delicate exercise in public relations.

Arab Eyes Turn Westward

EVEN for confirmed pessimists, it is difficult not to see in recent events in the Middle East signs of a general trend more favourable to the West. The Canal settlement (if ratified), with the careful but less unconciliatory speeches lately made by Colonel Nasser and his colleagues, is one major element in this. The Persian oil settlement (if ratified) and the correct, even cordial, attitude of General Zahedi and his ministers is another. A third is the Turkish-Pakistani agreement, and the friendly interest in it taken by strong elements in the public life of an Iraq in which, moreover, an overwhelming electoral victory seems to have fallen to the forces of stability and moderation. In Syria the Shishekli regime, which had specifically refused all western collaboration, even in the economic field, has given way to forces that will almost certainly prove more realistic. The xenophobe party in Lebanon now has no parliamentary or cabinet representation ; and the recent Arab League resolution on the Anglo-Yemeni frontier trouble was studiously moderate.

It is entirely satisfactory that Iraqi-Egyptian relations should be, to all appearances, so greatly improved since the Canal obstacle, with its obsessive claims on Egyptian interest, has been got out of the way. And with the disappearance of the bone of contention labelled "Greater Syria," and of the Iraqi-Syrian coolness of Shishekli's latter days, more real unity in the League itself may at last be attainable. It may be some time before Arab statesmen can advocate the adhesion of their countries to any specific defence scheme linked with the West. But they can, in Cairo and Baghdad and Damascus, already go further than they could, in spite of all the anti-western rancour and soreness which it must take years to dissipate. The acceptance of arms, loans and benevolent missions is a beginning ; events such as Nuri's

vlsit to England this week are helpful, and the Canal withdrawal—and perhaps a fairly imminent settlement with regard to Shaiba and Habbaniya—renders the wearisome talk of "western imperialism" beloved of Arab leader-writers more than ever an anachronism. Yet it must remain difficult to visualise any dramatic sweeping away of Arab suspicions of the West while the issues between Israel and its immediate neighbours are kept so painfully alive by frontier frictions; and the recent representations in London by the ambassadors of the Arab states revealed how wide a gulf still remains to be bridged in this respect.

Mr Yoshida Sets Out Again

MR YOSHIDA is still due to leave Tokyo this weekend on his journey to Europe and North America. His trip, already once postponed, has again been the object of strong political opposition from the left-wing Socialist party and from the trade unions, many of them under Communist influence. There is a growing neutralist tendency in Japan, and the left wing has succeeded in provoking resentment at what it presents as the prospect of closer Japanese ties with the West, particularly with the United States. Moreover, for the trip to be frustrated again would be a distinct political defeat for Mr Yoshida's Liberal government; in June, the prime minister's departure was put off after a riot in the Diet which had been staged to protest, on the one hand, against Mr Yoshida's pro-American foreign policy, and on the other, against the reactionary repeal of the police reforms introduced under the Occupation.

Although Japan is a long way from accepting the views of its fellow travellers on foreign policy, such assiduous workers can hardly fail to reap some sort of harvest from the very fertile ground on which they are sowing their seed. But, considering the relative isolation of the Japanese from the new world that has risen since the war, the prime minister's journey is very much of a step in the right direction—and in more senses than one. He will meet not only American political leaders but also, it is to be hoped, as wide a cross-section of British opinion as possible. Mr Yoshida is due to go to Canada first and then to Germany, France, Italy and the Vatican, arriving in London about October 21st; from here, he sails for the United States.

Mr Molotov, meanwhile, has chosen the eve of the tour to make some highly scented replies to the carefully phrased questions sent to him by a Japanese journalist. Moscow has lately stepped up its propaganda in favour of closer Soviet-Japanese ties, and, among other things, Mr Molotov emphasizes Russia's "readiness to normalise its relations with Japan provided Japan displays a similar readiness." He adds that the main obstacle is "the fact that certain Japanese circles follow the dictate of US ruling circles which seek to keep Japan in the position of a dependent country." Apparently Mr Molotov has forgotten that, while the western countries have signed a peace treaty which restores Japan's sovereignty and independence of action, Russia has not.

Plain Words on East-West Trade

THE Strasbourg Assembly is to be complimented on the sensible resolution on east-west trade passed by an overwhelming majority on Wednesday. It rightly emphasises "the political effect of such trade" and declares the need for it "to be considered as part of the general policy of the West towards the Eastern bloc." These are admirable if obvious points, far too frequently ignored in Western Europe. It is particularly regrettable that two British votes—one Conservative and one Labour—were among the six cast against the resolution.

The Assembly proposes the creation of a central organisation, open to all western states, which would co-ordinate all trade with the East. The purpose is twofold: to restore the balance in commercial negotiations between the East's state monopolies and the private firms and individuals in the West; and to counter the Soviet bloc's familiar technique of playing one western country off against another, one group of businessmen against their competitors. If such a plan could be drawn up and made to work it would strengthen the West's hands both economically and politically; and though there are obvious practical difficulties, it is an idea well worth pursuing.

Some woolly thinking on east-west trade is creeping in again. Recently it was reported that the deputy president of the Associated British Chambers of Commerce had declared that "the biggest short-term hope for an expansion of oversea markets lay in an increase in east-west trading." This is an obvious exaggeration; moreover, nothing is said of the dangers involved. Has it been forgotten that the Soviet government summarily cut off its purchases of Australian wool because of the Petrov affair? Did British industry fail to see the connection between the break in the Anglo-Polish trade talks and the Klimowicz incident? Responsible leaders of British industry have a duty to warn businessmen of the uncertainties in east-west trade; the government has the responsibility of seeing that dangerous political consequences do not arise from sectors of industry and commerce becoming too involved in trade with the Soviet bloc. The Strasbourg Assembly was right in underlining once again that trade and politics are inseparable weapons of Communist diplomacy.

Roman Scandals

THE resignation of the Italian Foreign Minister, Signor Piccioni, in connection with the arrest of his son for complicity in the vast Montesi scandal, has been an unpleasant warning to the outside world of the weakness of the new Italy. Not even in the elections of 1948 and 1953 were there greater possibilities of a major turn for the worse. When the fate of Europe is in the balance, it may seem particularly wrong that the average Roman should be so absorbed in the Montesi case. But the luscious details which have emerged in an ever widening stream since the body of Wilma Montesi was found on the beach near Rome, seventeen months ago, are a symptom of something much more important than mere interest in the erotic pleasures of upper-class society. They have come to represent a grave and genuine liability to the existing regime. They have been skilfully used to further the Communist cause. And their political effects on the home front may end by outweighing for Italy the significance of its attendance at the nine-power conference in London.

Signor Piccioni's resignation from the Palazzo Chigi has in fact given outward form to the link between internal and external affairs. He himself was a keen supporter of European Union, and in that respect he reflected the views of the Scelba government as a whole. But the name of young Piero Piccioni has been coupled from the start with the Montesi scandal, and a more sensitive statesman than his father might have retired long ago. No one, however, expects the resignations to end with his or with those of the two senior police officials who have already been thrown to the wolves. It will soon be the turn of the guilty parties themselves. And there is little doubt that unedifying revelations are in the offing.

These developments can only weaken the Scelba government and, indirectly, the cause of European integration. The immediate gainers have been the Communist party. But, according to our Rome correspondent, the mudslinging will also further the swing to the left inside the Christian Democrat party under Signor Fanfani, the recently elected successor to Signor De Gasperi as leader of the party. He is not at present in the government, but he is probably the most powerful man in Italy. He is busy reorganising the party so that, after breaking up the right wing under Signor Pella and the moderate left under Signor Gronchi, he may be able to lead a compact phalanx to the polls next year. Then, it is believed, he hopes to raise the present Christian Democrat vote of 40 per cent to a clear majority. This is an astute but dangerous game. Signor Fanfani can pose as the reformer only by both denouncing his predecessor's errors and implying that his leadership would bring a new broom which would sweep far outside the mere confines of the government. It is true that the Montesi scandal may shortly emerge as a turning point in Italian politics. But the turning is not likely to be such as to give democracy much cause for rejoicing.

Equalisation and Inequities

THE purpose of the Exchequer equalisation grant is to assist local authorities whose rateable value per head is below the national average; one of the consequences of its operation has been to create a "burning sense of injustice" among those county boroughs that do not receive it. In a new memorandum of proposals to the Ministry of Housing and Local Government, these disgruntled authorities have pointed out that rateable value is a poor guide to the actual wealth or poverty of a local authority. Nor do they believe that the situation will be wholly rectified by the uniform valuation of property throughout the whole country that the Inland Revenue is to undertake before 1956. This new valuation will be based mainly on rents prevailing in 1939; but unfortunately rents of similar houses varied from area to area at that time for numerous reasons that had little to do with the actual incomes of their inhabitants. Valuers have been given some discretion to correct anomalies of this type; but they will not remove all of them.

In the tangled morass of local government finance, any relief to the poorer authorities is bound to be the roughest of justice. The present system is no rougher than most. The list of county boroughs that do not now get any grant—it starts with Bath, Blackpool, Bournemouth, Brighton, and Bristol—seems *prima facie* to consist of the wealthier towns; there are some anomalies later in the list—for example, Newcastle and Manchester are among the have-nots, while Birmingham gets a grant—but oddities such as this would appear under any system. There are certainly some points of detail, as a Government investigating committee pointed out last year, on which immediate improvement would be possible. But the Minister has used the convenient excuse of disagreement among the local authorities to defer action for the time being.

However, it is none too soon to prepare for the overhaul of local government finance which must accompany the 1956 revaluation. The Exchequer grant must then be put on a broader basis and it would also be much wiser to make the grant a fixed proportion of total local government expenditure, instead of adjusting it to the actual expenditures (and hence possibly the extravagances) of individual authorities. But the more fundamental need is to provide local authorities with greater financial independence; and in this context proposals for rerating industry and agriculture deserve speedy and sympathetic consideration from the Government.

The Elusive Scientist

FOR the second time in a few weeks an authoritative body has proclaimed the need—Burnham Committee or no—to pay higher salaries to science teachers. In August a committee set up by the Federation of British Industries made some bold proposals for new salary scales that would lessen the wide gap between the earnings of scientists in the schools and the earnings of scientists in industry—not at the beginning of their careers, but in later life. Now the Advisory Council on Scientific Policy, in its seventh annual report,* urges again that if a remedy is to be found to the shortage of scientists, it must be found at the beginning of the production line, in the schools, where the problem is one of quality as well as of quantity. There is no escape from the logic of the price mechanism.

The report touches on many problems, but almost half its length is devoted to the shortage of scientists. The council expresses concern that the proportion of university students in the pure and applied science departments rose from 31 per cent in 1947 to only 33 per cent in 1953 and that these departments are now doing no more than maintaining their student numbers. Not many more potential science students are to be found in the sixth forms of maintained grammar schools, where the proportion studying science is already as high as two-thirds. There is more scope for a higher proportion in independent schools, which still tend to direct most of their brightest pupils into the arts. But the main source of more science students is an increase in the number of pupils who stay

* Cmd. 9260. HMSO. 1s.

at grammar schools until they are 17 or 18. The council refuses to be consoled by the fact that more of them do so each year: 23,000 in 1950 and 27,000 in 1953. It declares that this rate of increase is nothing like fast enough. A report on early leaving, just completed, though not yet published, by the Central Advisory Council for Education in England may have some interesting recommendations in this connection.

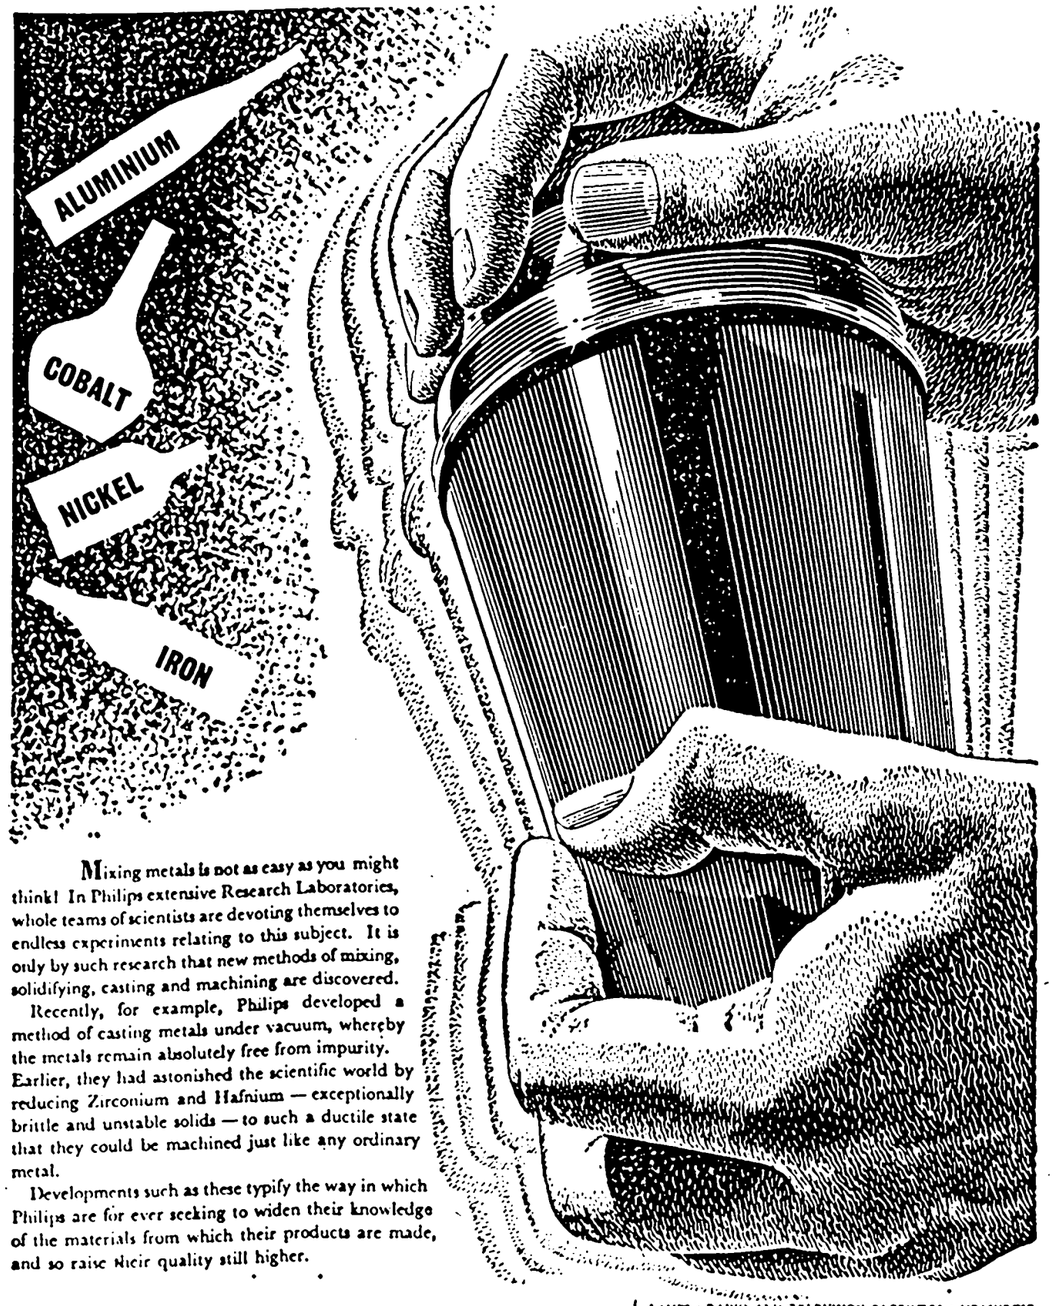
The scientific advisory council, on the other hand, refuses to be alarmed at the supposed exodus of British scientists to posts abroad, particularly in the United States. It is reassuring to learn, for example, that between 1947 and 1952 the university chemistry departments lost only 43 of their staff and research students to permanent employment in the United States, a number that represents only about 2 per cent of the country's output of post-graduate chemists.

A Chattel or a Trust?

ADOPTION has become, in recent years, more than a fashion. It has been described as a passion. Adoption orders granted in England and Wales rose from 3,000 in 1927 to 21,000 in 1946. The annual average is now about 14,000. The demand by would-be adopters far outruns the supply of available babies. In London alone it is estimated that ten approved couples are waiting for every baby suitable for adoption. The fact that these babies are so small a proportion of the country's homeless children, does not make their needs, or those of the many childless homes, any less urgent.

The appointment of a departmental committee, under the chairmanship of Sir Gerald Hurst, to look into present adoption law and practice, was widely welcomed—especially by those closely associated with adoption work, who have long felt that the present law, concentrating as it does on the "rights of the parent," often fails to achieve the welfare of the child. The report of the Hurst committee does not suggest any radical changes in the law. It aims at improving working of existing machinery. If, however, its recommendations are accepted, some of the present legal obstacles to adoption will be removed. Most welcome is the recommendation that the court should be able to dispense with the consent of the mother to the adoption of her child, if in the opinion of the court the parent "has made no attempt to discharge parental responsibilities." This would greatly benefit the many children, now in institutions, whose parents never visit them or even write to them for months and sometimes years. These same parents are able now to cling grimly to their "parental right" and refuse consent to their children's adoption. If this proposal becomes law, the old negative clause about "unreasonably withholding consent" would be dropped.

The main recommendation of the report is one that would empower local authorities to act as adoption societies, working through case conferences. The importance of employing highly trained and skilled staff in all work of supervision and visiting is emphasised. The position of the child placed privately by its parents or by a "third party" would be safeguarded by the proposal that such placings should be notified to the local authority, both by the "third party" and by the prospective adopters, fourteen days before the child is placed in its new family. The committee decided that it would be neither wise nor practicable to prohibit altogether adoptions arranged in this way, which account for one-third of all adoptions; but its recommendations should ensure that the chances of harm to the child arising from private placing should be much less than they are at present.



Dutch Budget Under Blue Skies

DUTCH budgetary methods are in sharp contrast to British procedures. The budget presented on Tuesday was for the financial year beginning next January 1st. The revenue changes that the Finance Minister suggested have yet to be translated into Bills which will be put before parliament during the coming year, and they will only have effect from January, 1956. The Dutch taxpayer must, therefore, wait another fifteen months for substantial cuts in taxation totalling 500 to 550 million guilders (about £50 million). Whether he will be tempted to anticipate his windfall is a question that must puzzle the statisticians in The Hague. Clearly, however, no Dutch budget can acquire the same atmosphere of drama as the British.

Both the Queen's speech and the budget message breathe an air of confidence, indeed of success. National income has risen by five per cent; industrial production is up; employment is high—too high, in fact; and the balance of payments position remains sound. State revenue has, therefore, been buoyant, and since there are no immediate signs of returning inflation it was right and proper of the Minister to cut taxes. This time he has chosen to put the money directly into the pockets of the consumers. Pay-roll taxes and income taxes are expected to be reduced by some 210 million guilders. In part this will merely be compensation for the second general rent increase anticipated next year; but the wage-earner can expect another increment from the 6 per cent wage increase recommended by the Foundation of Labour. Consumers will gain also by changes in purchase tax that will cost the exchequer about 180 million guilders. Industry will get little direct benefit, although it will welcome the release of spending power. However, half of the special defence tax imposed in 1951 will be remitted at a cost of 60 million guilders. No remarkable changes in state expenditure are anticipated, though defence spending has been levelled off at 1,350 million guilders (£127 million) a year. A budget deficit of 568 million guilders (£53 million) should not prove difficult to cover in the present liquid state of the capital market.

There are, in fact, few economic clouds over the Zuider Zee at the moment, and those on the horizon are only mildly threatening. The housing shortage remains the most pressing problem. The government promises a new drive. Shortages in the labour market—an exceptional problem for the Netherlands—hold out the danger of inflation-breeding bottlenecks. No doubt the government will cast its eye over the emigration programme. The foreign trade position, though comfortable at present, is never entirely certain. Like Britain, the Netherlands has to be on the alert for adverse changes in its export markets, and is kept on its toes by those fickle creatures, the terms of trade. These, how-

Mixing a metal cocktail

Mixing metals is not as easy as you might think! In Philips extensive Research Laboratories, whole teams of scientists are devoting themselves to endless experiments relating to this subject. It is only by such research that new methods of mixing, solidifying, casting and machining are discovered.

Recently, for example, Philips developed a method of casting metals under vacuum, whereby the metals remain absolutely free from impurity. Earlier, they had astonished the scientific world by reducing Zirconium and Hafnium — exceptionally brittle and unstable solids — to such a ductile state that they could be machined just like any ordinary metal.

Developments such as these typify the way in which Philips are for ever seeking to widen their knowledge of the materials from which their products are made, and so raise their quality still higher.

and the BALANCE OF POWER

IN THE BUSY INDUSTRIAL NORTH, trains running from Manchester to Sheffield will soon be electric. In the Southern Region, plans are well advanced for the electrification of 200 more route-miles, covering extensions from Gillingham and Sevenoaks to Ramsgate, Folkestone and Hastings. And in the Eastern Region, the Liverpool Street–Shenfield system is to be extended to Chelmsford and Southend. More plans will follow.

There are good reasons for using electricity on the railways. Electric trains are clean, powerful, fast — and they use the nation's coal resources more efficiently. Greater use of electricity for transport is good news for all consumers of electricity. Why?

It's a matter of balance. As more electricity is used in more ways, the different loads — occurring, in the main, at different times of the day — keep the generating plant more fully employed. And continuous full output from the power stations helps to reduce the cost of electricity.

SIX YEARS' PROGRESS — BRITISH ELECTRICITY — 40 NEW POWER STATIONS

80% MORE POWER

A Way Found Out

'I HAVE OFTEN THOUGHT', said the inventive English genius, Dr. Robert Hooke, 'that probably there might be a way found out, to make an artificial glutinous composition, much resembling, if not full as good, nay better, than that Excrement, or whatever other substance it be out of which, the Silk-worm wire-draws his clew'. That was in 1665, but two hundred years were to pass before the scientists' search for ways and means of producing textile fibres artificially began in earnest. Today, we may be thankful that their quest has been successful, for the demand for textiles now tends to outstrip nature's own resources of the cotton plantation, the silkworm and the sheep. Noteworthy among the new man-made fibres of today is one perfected in the laboratories of I.C.I.'s Nobel Division. Known as 'Ardil', this new fibre is soft and warm—and unattractive to moths. Fabrics containing it are endowed with a silky, smooth handle, and a friendly 'feel'. Equally important is the fact that 'Ardil' is available in exactly the deniers and staple lengths that the textile manufacturer needs, while its price is low and stable.

A new I.C.I. factory, built at Dumfries at a cost of £3,000,000, is capable of manufacturing 'Ardil' staple at the rate of 20,000,000 lbs. a year. The staple goes to the spinners to be blended with other fibres and to be spun into yarn; the yarn then goes to weavers, who transform it into fine, soft fabrics, which can be made up into coats and suits, and warm, light-weight winter dresses, or—such is the versatility of 'Ardil'—into carpets, blankets and rugs.

'Ardil' is made, by a complex chemical process, from the protein of the groundnut, which grows abundantly in many parts of the Commonwealth. It is, therefore, not only an outstanding new material for the textile trade but an example of how I.C.I. research and development are helping to put the natural resources of the Commonwealth to fuller use.

Imperial Chemical Industries Limited — ICI

ever, are problems of another day, and the Dutch government can feel justified confidence in the solid appearance of the country's finances and the rosy economic outlook.

China's Useful Weakness

CHINESE propagandists often dream aloud about the industrialisation of their country, but they seldom back these dreams with hard facts and figures. Peking has now finally produced a report on the economic development in 1953, the first year of the Chinese planned era. The pace of industrial progress, however, is camouflaged by cryptic and almost meaningless percentages. Indeed, the only absolute data given refer to agricultural production, and even these are of a very general nature.

It is claimed that in spite of poor weather conditions last year's grain harvest was slightly higher than in 1922. The wheat crop was unchanged but rice yield apparently increased, though not substantially. The total output of food crops is put at 165 million tons. Cotton production, on the other hand, fell to 1,170,000 tons. Only very moderate increases are claimed for livestock, and altogether the agricultural progress report sounds a very modest note.

About industrial production there is more optimism but even less information. One may be confirmed in the belief that the Chinese planners are still going ahead with the idea of building their main industrial base in the north-eastern part of the country, but nothing concrete has been disclosed about either the actual or the planned rhythm of development. Impressive percentages are linked to an unknown base-year. All that is certain about output in 1952, on the eve of the five-year plan, is that it was ridiculously low for such a vast country. Paradoxically, this economic weakness may be one of the sources of China's boldness on the international stage; China still presents very few objectives vulnerable to nuclear or even conventional bombing. There may be solid support here not only for the common assumption that more industrialised Russia is the more sober partner in the eastern alliance, but also for the interesting speculation that China will become less truculent when it has more to lose.

Doves Over the Baltic

NOWHERE has the "post-Geneva mood" been more vigorously exploited by the Russians than in Scandinavia. Soviet warships have paid unprecedented courtesy visits to Stockholm and Helsinki, and great pains have been taken to see that their crews left a good impression. Mr Molotov has attempted, with very limited success, to win from the unhappy Finns some degree of approval for his "European security treaty"; and President Paasikivi has been awarded the Order of Lenin (whose only other non-Communist recipient was the luckless King of Rumania). Instead of shooting up Danish fishing vessels and shooting down Swedish flying-boats, the Russians have been offering to co-operate with Sweden in joint air-sea rescue arrangements. Last week this new atmosphere of summary calm over the Baltic was disturbed by reports of an unidentified submarine being detected uncomfortably near to Stockholm; and there have also been stories of Norwegian vessels drawing warning shots from somewhat trigger-happy Russian sailors in the Gulf of Finland and in Arctic waters. But these incidents marred rather than mitigated the new peace offensive across the narrow Baltic.

Its most colourful expression has been a "peace cruise" by the Polish ship *Batory*—best known, in the outside world, for the series of appeals for political asylum in the West made by members of her crew, including one former captain; the twelfth of these refugees walked into a London police station on Wednesday. A few weeks earlier, the *Batory* was taken from her regular service routes—the loss being presumably made good by the Polish taxpayer—to make a leisurely trip round the Baltic, calling at Scandinavian, Polish, and East German ports, and then visiting Leningrad, with some 560 "peace partisans" from Sweden, 110 from Finland, 80 from Denmark and 20 from Norway on board. Thousands of people were mustered to give them an impressive welcome at Leningrad, and according to Tass the air was thick with doves. Only one thing has marred this festive programme: the resounding apathy which has been the reaction of the vast majority of Swedes and other Scandinavians.

Expedition to the Crimea

After our remarks last week upon the expedition to the Crimea, our readers would be prepared for the satisfactory news which have been received of the safe landing of 58,000 men on the shores of that Peninsula. . . . An impression gains ground both here and abroad that the Russians will not be able to offer any serious resistance to the operations and the plans of the combined army of the allies; and that, in consequence of feeling how entirely inadequate they are to a successful resistance, they will rather retreat and leave their invaders in the undisputed possession of the Crimea. It has long been foreseen that one of the most effective means of defence which Russia could offer . . . would be to retreat with her army beyond the inhospitable steppes which extend across Southern Russia, and coil herself up within her own fastnesses, within an immense territory which would be clearly inaccessible to any foreign army. Some months ago, we discussed such a policy on the part of Russia as being not only probable, but if resorted to, as one of the most difficult for the Western Powers to cope with. Except on the shores of the Black Sea and the Baltic, Russia may consider herself safe against a foreign enemy, so long as the German Powers are nominally at peace with her. And it must be admitted that there are few powers in the world who are so independent, under the actual circumstances of the country, of external communication, as Russia. We may destroy her forts, her ships, her naval power—all of which, for any useful purpose, have been in abeyance during the whole of the present season—but so long as she has so large a territory bearing so fruitfully all that is required for the rude diet and the ruder clothing of the people and, especially, so long as her surplus produce finds an easy road to the markets of the world over her extensive western frontier through Germany, Russia may . . . refuse to treat, and abide the chance of events. . . .

The Economist

Dangerous Figures

STATISTICS can be useful, boring, or dangerous. Mostly they are dangerous. Such is the case with a publication put out last week by the Organisation for European Economic Co-operation (OEEC). It brings together within a single volume estimates of the national product in twenty countries, which, though they have been previously available, have been scattered over many different sources.

For the economically sophisticated it is a valuable book; but there are pitfalls which, in spite of a warning in the introduction, have already trapped many of the unwary. Some people, assuming these to be an entirely new set of figures, have made the mistake of thinking that totals on the same line across the same table are fully comparable. This is not so with direct comparisons of national products, since the normal method, as used in the present OEEC study, is to convert totals expressed in national currencies into a common unit (dollars) by the simple but deceiving method of applying the official exchange rate. Moreover, comparisons of percentage changes in national product per head, capital formation or other components of the national product in the different countries are not especially meaningful, because an arbitrary starting point, which might have been a year of great prosperity in one country and depression in another, has to be taken as the base.

There are important uses to which these tables can be put; but it is a mistake to read more into them than the figures and the method of their presentation permit. It is wrong, for instance, to attempt direct comparisons of real national product. Several months ago the OEEC published a pioneering study which, if fully developed, would make these comparisons possible. Unfortunately, judging by the rash conclusions that have generally been drawn from this latest and less sophisticated document, most people must have written off the earlier and more penetrating study as a waste of time.

★

Correction.—On page 727 of the issue of September 4th, the marriage rate in Ireland was stated to be only about one-third of that in the United Kingdom. Owing to the fact that the Irish statistics record numbers of marriages and the British ones the numbers of persons married, the ratio is, in fact, about two-thirds.

Letters to the Editor

Malaya's Rice

SIR—I read with interest the article in your edition of August 28th and Mr O. A. Spencer's reply.

Criticism of control of rice after the need for control has ceased applies generally and not solely to Malaya. Government intervention has led to a paradoxical situation in which rice prices reached fantastic levels, as Mr Spencer admits, while large unsold stocks are rotting. It is true that other Asiatic countries are also buying on government contracts, but there is no indication that HMG, which freely intervenes in South East Asia's rice affairs, seeks to dissuade them from a policy which recently has brought much benefit to sellers and little to buyers. In any case the relations of certain of these buyers with the governments in the exporting countries concerned differ in many respects from ours. It is undeniable that Malaya at a time when she was overstocked with rice was buying large quantities for future delivery on a falling market. While, therefore, there may be differences of opinion regarding the necessity for continued Government control, the claim in the White Paper that this control has succeded in safeguarding supplies at the minimum cost is altogether unfounded. —Yours faithfully,

HAROLD SANDERSON

Sevenoaks, Kent

A Vote for Paralysis

SIR—May I express the mixed feeling with which I have read your article "A Vote For Paralysis"?

We French want peace. Three times in eighty years Germany has plundered and ruined us. For eight years we have fought in Indo-China. We think Communism is a system of ethics which cannot be destroyed by arms. We feel that if we were Russians we would require guarantees before allowing the reunification of Germany which has plundered Russia twice in fifty years and killed eleven million of its people less than ten years ago. We also admit that Germany wants to be reunited. But we know that if you give arms to the Germans they will use them to unite Germany and roll back the Oder-Neisse line. We French cannot back German rearmament before we are satisfied that all chances of agreement with Russia have been exhausted.

If there must be a German army, let it be "world-controlled." Would you English with your Commonwealth responsibilities ever resign your sovereignty or control over your forces? We have our Union Française and why should you urge us to do what you would never consent to?

So why attack the first French premier who has allowed the question to be put to the Assembly? His predecessors misled you about the true state of French feeling.

We are as good Europeans as you. And if you are, why don't you join us? —Yours faithfully, MAURICE VOREUX

Roubaix.

★

SIR—It has seemed clear for many years to those who have supported a closer British integration with Western European States in the political, social, economic and military fields, that the EDC project would fail without an assurance of close British participation. The French, without Britain, fear German domination of the proposed European Army. The EDC plan has now collapsed because the French could not accept it without the British participation that Mr Churchill's famous speeches of 1946 had led them to expect.

Although the British argument is that Commonwealth and Imperial ties make impossible too close an association with EDC, the argument has already been belied by two wars. We cannot fail to go to the assistance of France if assailed and in two wars we have, eventually, accepted integration and a supreme foreign command of our armed forces. Past experience suggests that what we should have to do in any case in event of war, we should do now in peace and comparative comfort instead of improvising in emergency.

Few in this country understand the debilitating impact of the Nazi regime and the war on the social and political morale of France and Germany. It is not sentimental to say they need sincere brotherly leadership from a country not so contaminated as themselves. We are the country best fitted to give it and to act as a catalytic agent between two communities who will otherwise drift dangerously apart. Our opportunity is great and it is not yet too late. The opportunity is ours and much of the blame will be ours if the chance of this century to secure peace and reason in Europe is thrown away.—Yours faithfully,

Kew, Surrey. D. K. WINSLOW.

The Politics of Cocoa

SIR—In your issue of September 11th your Gold Coast Correspondent supports at length the restriction of the price paid to the producer of cocoa to £134 a ton, which is about one-third of the market price. The rest is taken in export duties and does not reach even the Marketing Board. The principal arguments advanced are that a higher price would not increase output; and that it would lead to inflation, while the restriction of the price increases the rate of saving and thus serves to develop the economy. Even the pretence of stabilisation has been abandoned as a justification for the drastic policies.

(1) The suggestion that output is unaffected by price postulates wholly abnormal conditions of supply which would apply, if at all, only when producers cannot shift between activities and crops, which is certainly not the case in West Africa. Output, especially in the long period, is necessarily largely a function of price, since the establishment of new capacity and production for the market are not profitable in outlying areas unless the price after covering transport costs still yields a return more attractive than can be secured from other activity. If the output of export crops did not respond to prices it would be impossible to explain the rise of the West African export industries. For cocoa this elementary general analysis has been overwhelmingly confirmed by specific evidence of various official and unofficial surveys. Amidst the mass of figures quoted by your correspondent there is somewhat surprisingly no reference to the relation between the producer price and the market price, nor to the rise in the price of imports since before the war. Since the start of statutory marketing in 1939 the producer has received on the average one-half of available proceeds; now he is to be restricted to one-third. This cannot fail to affect output.

But even if it were true, as it is not, that output is unaffected by price, this would still not justify the under-payment of the producer. Is it suggested that when workers respond to higher wages by working less (i.e. take out some of their higher income in the form of leisure) their wages should therefore be reduced?

(2) Your correspondent writes: "If a higher price is paid to the cocoa farmer, the immediate result is inflation. If the balance is retained by the Government, it is available for productive investment to strengthen the base of the economy." Control of inflation and compulsory saving belong to the sphere of general fiscal policy to enable their burden to be distributed over the community as a whole. The prolonged under-payment of producers by statutory bodies, ostensibly established to promote their interests by stabilisation, has brought about the imposition of a wholly disproportionate burden on these producers in the pursuit of these policies. Indeed the entire burden of these policies falls on the producers of export crops. In the Gold Coast the exemption limit for income tax is about £300 a year while taxpayers with £1,000 a year pay 1½ per cent and with £10,000 about 31 per cent. Compare this with the position of the cocoa farmer. A recent official survey in Nigeria found that in 1951-52, when the producer price was £170 a ton, the gross proceeds of most of the cocoa farmers were not more than £50-£60 a year. In the Gold Coast the producer price is £134 a ton and the farmers' proceeds are therefore likely to be less; their net incomes are, of course, much lower still. Yet about two-thirds of the average proceeds are to be withheld from them. It is also of some interest that the surplus of the Cocoa Board and the proceeds of the cocoa export duty greatly exceed total government gross capital formation in the Gold Coast. The sacrifices are not borne by those who so warmly advocate their imposition.

The alleged inflationary effect of a higher producer price is much more complicated than suggested by your correspondent. If imports are freely available (i.e. unless the United Kingdom refuses to make supplies available to the Gold Coast or the foreign exchange necessary to buy them), an increase in producer prices will not raise internal prices greatly but will chiefly bring about increased imports. Of course, as long as producers spend part of their higher incomes on local products there will be some increase in the cost of living. This may even be desirable. The rate of exchange between the West African £ and sterling is fixed. An improvement in the terms of trade of the local population postulates a rise in local prices and incomes relatively to import prices. Only thus can the local population buy more imports with the same amount of work. In these conditions the higher cost of living is part of the process of readjustment of the structure of incomes to higher levels when terms of trade improve and the rate of exchange is fixed. But although these changes may be necessary they raise great political difficulties chiefly because the urban population is much the most influential section of public opinion and naturally resists any changes affecting them adversely, even though their incomes are generally far higher than those of the rural population, including the cocoa farmers.

Your correspondent implies that cocoa farmers do not save or invest. This disregards the enormous cocoa acreage; the establishment, improvement and extension of holdings is a most important form of saving and investment in under-developed countries. Much of the discussion of capital formation in under-developed countries is vitiated by the disregard of this form of investment. The ready sales of equipment by merchant firms to private purchasers also confirms that the population is prepared to save and invest. These forms of investment may well prove more productive than the accumulation of sterling balances or some of the large scale public projects which in under-developed countries especially so often take the form of conspicuous rather than productive investment. The under-payment of producers also retards the spread of the money economy by adversely affecting new planting. Thus even though compulsory saving may raise the proportion of income saved, the growth of income may be retarded and its level reduced by the particular form of compulsory saving.

Since 1939 the retention of a large proportion of the sale of proceeds from export producers has made private saving difficult, if not impossible, for very many, particularly in view of the rise in import prices. This may well prove to be the most important and serious long-term result of the operation of statutory marketing.—Yours faithfully,

P. T. BAUER

Gonville and Caius College, Cambridge

The Price of Drugs

SIR—Your recent article on the cost of drugs suggests to those who have spent a lifetime in the pharmaceutical business that, as with the roads, the Government is failing, most lamentably, to take the long view.

From what the chairmen of the larger pharmaceutical companies have said publicly, it is clear that if the Government insists on a system of rigid price control, then pharmaceutical research in this country will come to an end. In the main competing countries where the same control of profit is not envisaged, and especially in the United States, Germany and Japan, chemotherapeutic research will thrive. Those in this country responsible for the marketing of those new products will have no option other than to sell at world levels for those products of research. No manufacturer abroad could allow a state of affairs to exist where his specialities were selling in the United Kingdom at lower prices than elsewhere.

Because of recent changes in the patent law regarding medicinal products, the argument of the British Government might be that we will deal with this situation by making the drugs ourselves through the grant of compulsory patent licences, either to Government-owned or Government-sponsored organisations. Not only would this step be criticised most severely in the countries in which the inventions were made, but the authorities in those countries would have to take counter measures which would allow the grant of compulsory patent licences in their countries, not

only for drugs and processes for making drugs but for all products.

It is agreed that this country can remain economically solvent only if we are able to continue to produce goods that are technically in advance of what are produced elsewhere. In the main, those technological advances are safeguarded by patents taken out in those countries to which exports are planned. If conditions arise whereby we are no longer able to secure adequate patent protection, then the scientific and technical advances in our industry will be incapable of proper exploitation abroad.

The Government, before embarking on price control in a limited field, should think carefully about the long-term repercussions that will affect industry as a whole.

There is one very simple and fair solution to the cost of drugs problem in the national health service. Other countries insist, for the imposition of duty, on the disclosure of a current domestic value. In the domestic market, the Ministry of Health should insist upon manufacturers providing an undertaking that they were not offering their products under the national health scheme at prices higher than the "current export value."—Yours faithfully,

JOHN COCHRANE

Hazlemere, Bucks

End of the Vargas Era

SIR—Your comment of August 28th suggests that a military government may assume power as a result of the latest developments or of popular uprisings in the interior. However, at present there is not the most remote possibility of the formation of a military *junta* on the lines of the well-known *pronunciamentos* that still occur in certain South American countries. Despite the fifteen-year hiatus in democratic progress caused by the introduction of the *Estado Novo*, Brazilian political tendencies reject any form of arbitrary government, and the armed forces today constitute the chief support of the democratic regime. Within one decade they have had two opportunities to seize power: in 1945, when Senhor Vargas's autocratic rule was broken, and again this August. In 1945 the armed forces entrusted the government to the president of the Supreme Court, and this time they have called upon the Vice-President.

Nor need a Communist rebellion be feared, for the Communists have neither the human nor the material resources for such an adventure. The workers will probably press with more vigour the claims which were not successful under the previous government, but the new government is ready to consider reasonable demands arising from the economic crisis.

Despite the unfavourable economic situation, Brazil offers very good opportunities for foreign investment in both new and existing industries, for it is certain that the political instability of the present moment, which is partly due to the approach of the parliamentary elections, will not affect the conditions that favour such investment.—Yours faithfully,

SEBASTIAO VEIGA

Rio de Janeiro

Why America Did Not Slump

SIR—I cannot resist the temptation to get with one stone two birds who wrote in your issue of August 28th. Mr P. A. Wilson attempts to belittle your journal's previous reference to the part which confidence played in averting a slump in the United States during 1953 and 1954. Had Mr Wilson been close to America during the two slight recessions of 1948-49 and 1953-54, he would have been well aware of the immense influence thereon of lack of confidence in the first case and of confidence in the second. In 1948-49, Americans were literally searching for the expected postwar slump around every corner, and they quite expected its proportions to compare with those of 1930-33. Hence there was prevalent a general expectation that prices and values would fall precipitately, which in turn led to marked consumer resistance, and to what was in fact a minor flight from the US dollar. The first result was only slowly checked by the Truman Administration's pump-priming activities, and finally by realisation of the inflation generated by the Korean war. The second was evidenced by the entry to Canada of some US $400 million in the fall of 1948, somewhat to our embarrassment, due to its inflationary pressure. This latter did not in the ordinary sense increase American external investment, although figures could only show it as such—it was "hot" or "*funk*" money with no mistake about it. It thus reflected lack of confidence.

How different was the situation a year ago? When an over-accumulation of inventories led to a reduction in the gross national product, there was no general expectation of lower prices or, shall I say, of a sufficient fall in prices to merit waiting for. A slight fall in consumer demand reflected very temporary saturation in several lines rather than price resistance—this in spite of the fact that the Eisenhower Administration was previously known to be committed to a reduction of Government expenditure in an attempt to balance its budget, and practised no pump-priming other than influencing lower money rates. Here were circumstances more favourable than those of 1948 for lacking confidence, yet none was shown except by a small minority of the less stable of the Wall Street fraternity, many of whom doubtless had their own good bearish reasons to talk depression. As always, figures can only tell part of the story.

The immeasurable and intangible factor of confidence appears to present an insoluble problem for Mr John Strachey, according to his letter in your same issue—how to maintain confidence and remain Left at the same time—poor Mr Strachey. Could he not answer his own challenge to *The Economist* to produce a policy for the Left which does not involve re-distribution of wealth? He has only to look at Canada to observe the minimum of re-distribution and the function of the second highest living standard in the world. Over the last twenty to thirty years we could not re-distribute wealth because we lacked sufficient developed wealth to re-distribute, so we just distributed more to all as we created it. More recently, we have penalised high incomes, but not to the extent where new millionaires are not being made quite frequently, while most everybody else, at least considers himself an owner or a potential owner of wealth—in other words, a capitalist or a potential capitalist. Mr Strachey could learn from us how to benefit all the people instead of obstructing all by trying to benefit only a certain class at the expense of the others. Flirt with confidence, Mr Strachey—she's quite a girl who for you could solve an otherwise insoluble question, but you will have to put your country before your party before you can date her. If you can do that, Britain's enduring tolerance of the existence of your Socialist party will have proved its wisdom.—Yours faithfully,

JOHN R. HORNE-PAYNE

Vancouver

Sharing the Atom

SIR—Some of your readers may have drawn a false impression from the statement in last week's article that "the United States is to co-operate with Canada in setting up an atomic plant on Canadian soil." Canada's first low-power reactor was completed in 1945; the second, known as NRX, has been in operation since 1947, and in 1949 the then Director of Reactor Development of the US Atomic Energy Commission stated that "the reactor of the most advanced design and performance is in Canada." A third reactor, called NRU, is now under construction, and its completion in early 1956 is hoped for.

What the United States is doing with Canada is to start working out its first "agreement for co-operation" under the new Atomic Energy Act. The contractual agreements between the two countries for the exchange of materials are also being reviewed. Canada sells the United States uranium oxide, and buys it back in the form of uranium rods which form fuel for Canadian reactors. As soon as the new reactor, NRU, is operating, the United States will also buy back irradiated rods from Canada which it can then process into plutonium.

Canada is also obtaining some equipment for the new reactor from the United States, but its design and operation are wholly Canadian. Because of US secrecy imposed until now, Canada has been unable to draw on US technical experience, although it has benefited from a continuous free exchange with Britain.—Yours faithfully,

Popular Despot

LOUIS NAPOLEON AND THE SECOND EMPIRE.
By J. M. Thompson.
Basil Blackwell. 354 pages. 32s. 6d.

THOSE who believe that French history since 1789 holds a key to present-day France cannot help but turn to the period of the Second Empire between 1852 and 1870. After the relative stability of the *ancien régime*, the country that Carlyle called "vapouring, vainglorious, gesticulating, quarrelsome, restless and over-sensitive France" saw a succession of revolutions and constitutional experiments. The release of the people from one form of slavery in 1789 had seemingly submitted them to another. Underneath the surface there were inner weaknesses in the constitution of society.

One way of looking at Napoleon III is as a symptom of some of these weaknesses. Another is as a product of the romantic movement. His own life was full of romance. A poor, unregarded political prisoner eventually made himself into an emperor, and then lived to return again into a private life of insignificance at Chislehurst. In the interim he had become the first exemplar of that new and dangerous phenomenon—the democratic despot. Possessing enough of the authentic Napoleonic *flair* to seize on the fact that Frenchmen were more interested in equality than in liberty, he took real pains to foster the welfare of the poor, and succeeded in purchasing what seems to have been the enthusiastic co-operation of the common people in Bonapartism. This in all likelihood will prove the chief interest of his history to most readers today.

It has often been regretted than Mr F. A. Simpson lost heart thirty years ago and left incomplete his fascinating study of Louis Napoleon. Mr Thompson's new book is on a slighter scale, but does at least cover all the ground. It is not quite so authoritative as his own earlier books on the French Revolution and Napoleon Bonaparte, for he now moves less surely among his sources. What he gives us is a clear, straightforward political narrative which is easy to follow. Mr Thompson is not at pains to challenge accepted views, to suggest lines of controversy or to search out enigmas; nor is he much concerned with the cultural and social history that is usually invoked to give this period more life and significance. He is least successful (as others have almost invariably been) on the Emperor's Italian policy, and here many chronological errors have slipped into the text. His best chapters are those connecting up Louis with his greater uncle, and describing the influence of the Napoleonic idea on French history. Then the years leading up to the *coup d'état* of 1851 give the dramatically exciting story of how this exiled adventurer with his German accent, financed in part by the city of London, forced his way to power in France. Thereafter the tale becomes more prosaic.

The conclusion is that Louis "was a man too small for the great things he set out to do." Rarely was his policy consecutive or clear. When the end came in 1870 at Sedan, it is suggested that this was due more to the irresponsible folly of Louis than to the knavery of Bismarck. Mr Thompson is one of those historians who says he likes leaving the verdict to the reader; but he makes it hard to escape conclusions about the inherent weaknesses of dictatorship, and about the more general political weaknesses of modern France.

A Too Ingenious Paradox

INFLATION AND CAPITAL.
By F. V. Meyer.
Bowes and Bowes. 75 pages. 12s. 6d.

MR MEYER has a new way of estimating the national capital, by capitalising the portion of the national income that represents wholly or largely the earnings of capital. Unfortunately it is not a very good way. It suggests that the real value of the national capital at home fell by 30 per cent in the seven years between 1939 and 1946, when we were devoting so many energies to blowing capital to pieces; and then suggests that it fell by another 30 per cent in the six years between 1946 and 1952, when we were devoting some of our energies to building capital up again.

It is not fair to Mr Meyer to proceed to the deduction that, whether we have a hydrogen bomb war or not, we will soon have no roads, buildings or machinery left. Part of the oddity seems to arise from the fact that recent investment has gone largely into forms of capital that are cheap in relation to the general price level and into what Mr Meyer calls "shorter-lived" capital; he may have the germ of an important point here, and when he has made a correction for it he finds national capital (at constant profitability, in £s of 1952 purchasing power) to have been £50,515 million in 1938, £37,802 million in 1946 and £35,505 million in 1952. Even this suggested trend, however, is plainly too gloomy. The hard fact is that in a world of differing balance sheet conceptions, of trade unions, political pressures on the price system, and differing degrees of capital utilisation (which do not, contrary to Mr Meyer's assumption, lead automatically to neatly proportional changes in an asset's life) changes in reported profits are not accurate measures of changes in the capital stock from which they come. These misfortunes rob most of the value from this otherwise brave statistical exercise.

Westwards from China

SCIENCE AND CIVILISATION IN CHINA: *Volume I: Introductory Orientations.*
By Joseph Needham.
Cambridge University Press. 356 pages. 52s. 6d.

IT seems quite extraordinary that one man (with whatever competent help) should set about obtaining a thorough grasp of the vast mass of writings on almost every subject in which may be imbedded some nugget of information bearing, directly or indirectly, on the subject of science and civilisation in China. The material includes not only what has been produced in China through more than two millennia, but also the works of Sinologists in several Western languages in the last two centuries and more—not to mention writings in other Asian languages. That the results should eventually fill seven large volumes is not surprising; but it is remarkable that, after carefully evaluating the reliability of all these sources, the author's findings should be presented so lucidly. Indeed, there are in this volume not more than one or two paragraphs that present any difficulty to a reader completely without scientific training.

In this first volume, after a good many necessary pages of introductory material explaining the method of inquiry and the apparatus used for its presentation, there is an outline history of China, written, of course, with special reference to Chinese science. Apart from this special reference, however, these pages are in effect a very readable general history of the area and its people: they incorporate the most recent findings of archaeology and of modern critical Chinese historians and compare favourably with anything else of the sort available in English.

The remainder of the volume discusses the travel of scientific ideas and techniques between China and Europe. This is not, indeed, a virgin field, even as regards books in English, but here Dr Needham's work definitely supersedes all earlier explorations, and it is for this section that the volume is likely to be lifted most often from the shelves. It may come as a surprise to some readers to learn that, from the dawn of history until about the fifteenth century, China, as compared with the West, had the more to give in technology as well as in scientific thought and method. It is commonly known that gunpowder (and not only for fire-crackers), the magnetic compass, paper, printing and porcelain had their origins in China; but the

length of the list Dr Needham is able to give (after the most critical sifting) of other mechanical techniques and so on that travelled westward from China will still be found surprising. Why China should have lagged behind the West in recent centuries is one of the chief problems that Dr Needham sets himself to investigate in the subsequent volumes.

Perhaps some readers will be annoyed by Dr Needham's individual adaptation of standard and fairly generally accepted romanisations, especially of well-known names, though for those who can read the Chinese ideograms, the footnotes should prevent any serious confusion.

From Levellers to Hobbes

A HISTORY OF POLITICAL THOUGHT IN THE ENGLISH REVOLUTION.
By Perez Zagorin.
Routledge & Kegan Paul. 215 pages. 15s.

THE political writings and even history of the English Revolution may at first appear so well-charted a sea that nothing new remains to be discovered. Left-wing writers in particular have jostled each other in their search for the lost Atlantis of radicalism. Yet a period so rich in political thought, ranging from Leveller doctrines with their stress on consent and natural rights to the mechanistic system of Hobbes, "the great Columbus of the golden lands of the new philosophies," can still return argosies. This century has seen a revaluation of Hobbes by the philosophers, while historians are discussing the validity of the classical theory that the century preceding the Civil War saw the rise of the gentry and a consequent shift in political power.

Mr Zagorin, a young American scholar, has written a well-informed book, based on wide reading of the contemporary pamphlets. He has firmly anchored his account of political thought to the historical background, and linked the ideas of the various groups and personalities to their political and economic setting. Starting with the Leveller protest against political and economic privilege, he proceeds to the theorists of the Commonwealth and Protectorate, who reflected the government of oligarchy and dictatorship by invoking, like Cromwell, the law of necessity, and urging that possession of power in itself warrants obedience. The conservatism of the Protectorate is reflected in Milton, who despised the "mad multitude" and advocated government by the virtuous and well-bred. Mr Zagorin analyses Harrington's ideas and points out that, contrary to the usual seventeenth century scepticism of the value of history, Harrington used it to demonstrate that a gentry republic was a logical necessity. Finally he shows how Hobbes arrived at his doctrine of sovereignty.

Mr Zagorin's account, though not original, is thorough and fair. But there are serious faults. Thus he calls Winstanley, who tried to establish a Communist Utopia, "one of the pre-eminent political thinkers of his time," while his sympathies with the social protests of the Fifth Monarchy men leads him to minimise their totalitarian outlook. Mr Zagorin is also naive in holding that the Protectorate failed to survive because it refused to carry out a left-wing programme. He does not treat of Hobbes's revolutionary approach to the use of words and definitions. And his assertion that "we shall learn the nature and causes of the English Revolution far better from Harrington's work than from Clarendon's history" ignores the strength of the argument that property followed power rather than, as Harrington had it, power followed property. Yet this book remains an honest, lively and useful account of the political thought of the period.

Escaping to the Japanese

PRISONERS' BLUFF.
By Rolf Magener. Translated from the German by Basil Creighton.
Rupert Hart-Davis. 239 pages. 12s. 6d.

ROLF MAGENER and Heins von Have were two German internees in India, who escaped from the British camp at Dehra Dun at the same time as the now famous Heinrich Harrer. While Harrer made his way north into Tibet and history, Magener and Have bluffed their way east by railway to Chittagong, and thence across the front line to join their bewildered allies the Japanese. The escape was not as remarkable as it may seem. At any one time in the civilian-controlled India of 1944 there was an amorphous collection of military or semi-military people drifting to and from the front. Two white men, vaguely disguised as British officers, with sufficient money and passable English accents, would not have had great difficulty in joining this stream. Indeed, although Herr Magener believes that he was helped on his journey by astonishing good luck, the British reviewer must hasten to disillusion him; he seems to have had to skirt round more checks of passes than the average British officer may remember besetting him. The final dangerous dash across the fluid front line and often deserted mountains of the Arakan was also achieved by more than one British evader or escaping prisoner of war. Some shot-down aircrews reappeared along this path without realising that they had been in what was nominally Japanese-held territory at all.

The value of this book is not therefore as a saga of any particularly remarkable escape; still less is it an adventure story of the calibre of Harrer's tale of Tibet. Its fascination for an Englishman is a familiar one, that it throws more light on what happened on the other side of the hill. There is an unconsciously revealing sketch of how German internees settled down in the mass at Dehra Dun; by British prisoner-of-war standards they showed a singular lack of brotherly co-operation in the planning of escapes, and over some of the internees a professional wrestler seems to have established an unquestioned but unpleasant rule of brawn. Even more intriguing is Herr Magener's description of conditions in and immediately behind the Japanese line in Burma, where these ferocious men of blood, rice and bamboo, with rusty rifles but not much else, somehow stood out against and threatened for so long the empire of iron and internal combustion engines on our side. There has been no sober re-appraisal of the Burma campaign, of the sort that opposing generals and war correspondents have provided in such full measure for the struggle in Europe. One of the incidental virtues of Herr Magener's story is that it may help to raise doubts whether that campaign was always efficiently conducted.

Potted Partridge

THE CONCISE USAGE AND ABUSAGE.
By Eric Partridge.
Hamish Hamilton. 219 pages. 8s. 6d.

SEVEN years ago, in "Usage and Abusage," Mr Partridge produced a guide to the writing of modern English that was as much a work of scholarship as a handy reference book. Doubtless, fifty years hence, someone will modify Mr Partridge's views just as he himself has brought Fowler up to date. But one can feel sure that as authorities for the writing of English neither Partridge nor Fowler will be supplanted. When they agree, they are a formidable combination; when, rarely, they disagree, it is a brave writer who flouts both of them.

In this book Mr Partridge has abridged "Usage and Abusage" and in some places brought it up to date. Since the very theoretical matter has been left out, "The Concise Usage and Abusage" is more clearly intended to be a guide to good English than was its parent, and in most respects it fulfils its purpose admirably. Occasionally Mr Partridge's style is so taut—the publishers' own word for it—that one has to concentrate very hard to follow him. Nor is it always easy to grasp when he is quoting from other authorities and when he is giving his own views. But he leads us confidently through fused participles and confused participles and other pitfalls of English grammar. Moreover, after laying down the rules and the authorities' views on them, he sometimes shows how a different and simpler construction would have avoided grammatical difficulties altogether.

In a future edition Mr Partridge might consider adding "procrastinate" and "prevaricate" to his common catachreses, and he might have said much more about the modern tendency to abuse "of course." But one is glad to see "protagonist" and "to claim" put in their proper places. What is surprising is the absence of any comment on transitive and intransitive verbs. Americans can warn that something will happen. Does Mr Partridge forbid Englishmen to do so? Or does he accept that they can do the same?

THE HISTORY OF UNILEVER

A Study in Economic Growth and Social Change

by CHARLES WILSON

This is a full and objective account of the growth of this great organisation. It is an attempt to set the development of the Concern against the social and economic background of the times, to illuminate forces and motives, and to appreciate the parts science, circumstances, and personalities have played in the building of the whole structure.

The author is Fellow, Bursar, and Director of Studies in History at Jesus College, Cambridge, and a University Lecturer in History. His published works include *Anglo-Dutch Commerce and Finance in the 18th Century*, which was the result of research in Holland before the war.

4 collotype portraits, 11 maps and line illus., 15 graphs and 9 charts in colour, 1 folder. Two volumes, 45s. net per set.

Democrats Count Their Chickens

Washington, D.C.

ONE thing that is clear from the conference of Democratic party leaders, who at Indianapolis last week-end officially launched their election campaign, is that, where political slogans are concerned, old friends are still considered best. Although Mr Truman was ordered by his doctors not to attend he sent along a familiar score for the bangers of big drums. The "rich man's budget" and "the plundering of our natural resources in the interest of a few big bankers and big corporations" are to be the main themes, together with the attempt to "bankrupt the farmer" and "put labour in its place" and the adoption by the Republicans of defence and foreign policies which "weaken the position of the free nations in the fight against Communist imperialism."

It is impossible in advance and difficult even in retrospect to apportion the relative significance of national and local issues in an election. But it can safely be said that the personality and views of the candidate and the local issues count for much more in every American election than in a British one, and that they tend to be more important in the American elections that occur in the middle of a presidential term than in the ones in which the Presidency is also at stake. However, this year a net loss by the Republicans of only three seats in the House of Representatives and one seat in the Senate would place the organisation of Congress, the committee chairmanships and the power of arranging the business into the hands of men who will want to spend the next two years preparing the ground for electing a Democratic President in 1956. The Republican Party is therefore trying to turn this election into a plebiscite on the record of the Eisenhower Administration. The Vice-President, Mr Nixon, has said frankly that a Democratic victory would "ruin" the rest of the President's programme, and the President's chief assistant, Mr Adams, has said that it would be one factor that might lead Mr Eisenhower not to run for a second term.

The Democratic tactic is not to overlay local problems by a national theme so much as to select those broad slogans which can be best adapted to local situations. By far the most important of these is the increase in unemployment. This, rather than the much more publicised issue of farm prices, will be the main theme of the Democratic campaign. It is true, as the Republicans say, that this year's recession has been much slighter than had been predicted, and has evidently flattened out, and Republican speakers from the President downward will continue to taunt the false Democratic prophets of "gloom and doom." But even so, there are now three and a half million unemployed, and a remarkably high proportion of them live in the 103 constituencies which are generally considered marginal. Since 65 of these seats in the House of Representatives are at present held by Republicans as against 38 held by the Democrats, much more is likely to be heard about unemployment during the campaign than is really justified by the state of the economy.

The farm issue is considered less promising by Democratic party organisers simply because most of the truly rural seats are heavily Republican. Except in a few statewide elections for the Senate and in marginal districts which contain both rural and urban voters, the unpopularity among some farmers of the decision to end high rigid price supports for some crops is not likely to do more than reduce Republican majorities.

★

The tax law is the principal item of new legislation which the Democrats want to debate—not, of course, the full 1,000 pages of it, but their simplified chart which shows on one side the enormous tax saving accruing to "the Lion Corporation (very large)" and on the other the rather miserable saving that goes to "Mr A. Lamb (income $4,500)." This approach is linked by way of the "greed" of the "selfish private interests" which "finance" the Republican Party to the grand old theme of the "give-away." Although to a foreign ear this sounds like a Republican description of foreign aid, on Democratic lips it refers to the "plundering" of the national domain. This includes federal land (in Montana a Republican measure to give grazing rights in the national forests to big stock-breeders is a burning issue), natural resources such as under-sea reserves of oil, and anything in which large sums of public money have been invested.

The controversies stirred up by the present Administration's policy of "partnership" between public electrical projects and the private utilities, which supporters of public enterprise consider a "giveaway," are major issues in such states as Oregon, Washington, Montana, and Idaho. The hotly contested sections of the atomic energy law, defining the opportunities for private enterprise to participate in developing the new source of power, will be cited to the same purpose.

While the Republicans will obviously want to make much of such generally admired achievements as the cutting of federal expenditure and the withdrawal of the federal government from extraneous business pursuits, the Demo-

crats will be able to exploit the local discontents caused, for example, by the reduction in money available for such popular purposes as soil conservation and by the shutting down of government-operated firms. The Democrats have higher hopes for the recapture of Nevada's one seat in the House of Representatives now that the closing of the government's titanium plant in that state has been followed by news that a private firm in Ohio has been given a contract to supply the metal.

★

The Democratic leaders have been trying for weeks to fight back the *hubris* that they feel rising within them. They realise that it would not become the party of Mr Truman to forget that the election of 1948 showed the fallacy of relying on the automatic working of "historic trends." It is usual for the governing party to lose ground in the election in which the presidency is not at stake, but there is still Mr Eisenhower's popularity to be reckoned with.

But discount as the Democrats may the individual signs that could trap them into over-optimism, cheerfulness keeps breaking in. If they can hold all their present Senate seats (though this may be harder than they think) and win Kentucky, where the popular former Vice-President, Mr Barkley, is expecting to make a come-back into public life at the age of 76, and New Jersey, where the admirable Republican candidate, Mr Clifford Case, is being badly harassed by reactionaries in his own party, they will have a clear command of the upper house. As for the House of Representatives, they are convinced that the themes they have struck at Indianapolis will win them a sufficient net advantage in the marginal districts. Their new but tempered optimism rests on the conviction that they have detected among the grass-roots a generally mounting dissatisfaction with the "lack of leadership" in home and foreign affairs of the Eisenhower Administration.

Moreover, it would be asking too much of human nature for the Democrats not to find some sort of national trend in the result of the early election in Maine, which reduced the majorities of every Republican candidate. The memory of 1948, however, remains a sobering thought to election organisers and election predictors alike. Of one thing the Democrats are certain: money and energy will not be spared by their opponents in a desperate attempt to turn November into a general vote of confidence.

Mr Benson Relents

THE spreading of the drought, which has cut crop estimates and endangered feed for the nation's cattle, has provided a good reason for the Administration to abandon the most drastic of its controls over agricultural production. Last June, at the end of a year which brought the government's investment in farm surpluses to over $6 billion and saw losses on the support programme reach a peak of $419 million, Mr Benson, the Secretary of Agriculture, reluctantly imposed the strictest acreage controls which had ever been applied. In order to be eligible for price support on any one crop, farmers had to comply with restrictions on all, and in addition to this "cross-compliance," they were prohibited from growing anything except hay and cover crops on their idle acres. This was to make certain that surpluses controlled at one point did not bulge out elsewhere, but with over 35 million acres scheduled to be withdrawn from cultivation, the effect on farmers' incomes was bound to be acute.

Last week Mr Benson relented. Farmers must still observe the restrictions on crops whose acreage is controlled, but they can grow anything else they wish, with the exception of certain vegetables, on their idle land. Most of the feed grains, to which the farmers are expected to turn to supplement the forage which has been burned dry in the south and west, are supported at 85 per cent of parity, that mystical figure which is supposed to represent a fair return to the farmer in terms of the prices he receives and those he has to pay. It is possible that these supports may be lowered on next year's crops, to discourage a glut, but this will not be decided until the October crop report is available, and probably not until after the election.

Mr Benson insists that the relaxation was undertaken in response to changing conditions and the farmers' real needs, not under the political pressure which he has shown himself remarkably able to resist in the past. Thirteen states have been declared drought disaster areas, which entitles them to the increased federal subsidies on feed and the cost of shipping it to them. Moreover, since last June, Congress has empowered Mr Benson to reduce price supports on farm commodities which are being overproduced; he has just announced that the new support price for wheat will be fixed at the lowest permissible figure, 82.5 per cent of parity, about $2.06 a bushel. Nevertheless, the news that Mr Benson himself can be flexible is welcome to Republicans who suspect that restrictions on production are even more unpopular with farmers than the prospect of slightly lower government price guarantees.

Mergers in the Mode

THE Department of Justice is taking so careful a look at the proposed merger of the Bethlehem Steel Corporation, the second largest steel concern, with the Youngstown Sheet and Tube Corporation, that suspicions have been aroused that it is going to withhold its approval. This would be a sign that the Administration, which the Democrats accuse of a bias toward big business, feels the time has come to halt the tide of amalgamations which have been so noticeable in the banking, textile, automobile, and hotel industries, and have even tied together enterprises in such unrelated fields as locomotive-building, steel, and rubber. A month ago, Mr Barnes, the head of the anti-trust division, expressed his concern and promised to examine every important merger. It is not that the number of them is increasing; this is lower than it was in 1952 and 1953. But the firms involved are larger and better known. Mr Celler, who will head the Judiciary Committee if the Democrats win control of the House of Representatives, means to ask for an inquiry when Congress reassembles.

Under the Republicans, bigness of a merger, by itself, is not necessarily incriminating; the test is whether it would substantially reduce competition. Applying this "rule of reason" in the automobile industry, the green light was given recently to the consolidation of four hard-pressed independents into two firms, on the ground that this would enable them to compete more effectively with the big three. Polite requests for information have, however, been sent by the Department of Justice to the management of the Hilton Hotels, which recently absorbed the Statler chain, and to the *Washington Post*, which became the capital's only morning newspaper by swallowing its rival, the *Times-Herald*.

The two steel companies, unlike the automobile independents, are not in financial trouble which would justify a merger "to save competition." On the other hand, together they would control only 19 per cent of the country's steel making capacity, compared with 31 per cent owned by the US Steel Corporation. Moreover, their operations are to a large extent complementary rather than directly competitive. The acquisition of Youngstown's Chicago plant would enable Bethlehem to use cheap Mississippi River transport to sell in the south-west, which it cannot reach today.

Yet there is a feeling that the companies will not find it easy, particularly in election year, to convince the Department of Justice that their plans would not violate the Clayton Act. Even if they fail, they can still go ahead. But in recent years no large merger has been completed over the objections of the anti-trust division and at the risk of a suit to break up the new firm.

Tariffs and Surpluses

THE Administration has been sounding businessmen, protectionists, free traders and even the League of Women Voters for their views on American participation in the General Agreement on Tariffs and Trade (Gatt). On such a controversial issue no clear consensus of opinion could be expected, but the hearings did give some support for the bigger and better Gatt and the government hopes to promote at the forthcoming meeting of signatories at Geneva.

In its attitude to Gatt, the Administration is strongly influenced by the need to gain for the agreement the Congressional approval which has never been secured. This anomalous situation has enabled protectionists to criticise Gatt on the grounds that it represents an unconstitutional use of executive power. The government is likely, therefore, to press for a reshaping of Gatt, both in its internal structure and in its policies, to a form that is more acceptable in the eyes of Congress. In particular, the US delegates at Geneva will strongly urge a sterner policy towards quantitative import restrictions, which have hitherto been treated leniently by Gatt.

But the real problem for the Administration is to convince its trading partners of its good intentions. In championing a stronger Gatt it will have to defend its dilatoriness in carrying out promised trade reforms, and in opposing quantitative import controls it has to allow for its own restrictions of farm imports and its need to dispose of large quantities of farm surpluses abroad. President Eisenhower recently reiterated his trade programme and gave assurances that the recommendations of the Randall Commission were still fresh in the hearts of the Administration. Moreover, by refusing to grant the tariff increases recommended for lead and zinc and, more recently, for hand-blown glassware, the President hopes to have allayed the fear that the raising of duties on Swiss watches represented a retreat towards protectionism. But even if these professions of faith carry weight at the conference table, the delicate question of the sale of surplus foodstuffs "at competitive prices" will certainly stir up trouble. Shipments under the recent Surplus Disposal Act, which provides for the sale for foreign currencies of up to $700 million worth of farm foods over the next three years, are due to start shortly. Competing exporters of these products will not easily be reassured by US promises that their shipments will not disrupt world trading patterns.

Atomic Dissenter

DR HENRY SMYTH, the author of the famous government report on atomic energy and consultant during the war to the Manhattan Project, has resigned from the Atomic Energy Commission nearly two years before his term was due to expire. Dr Smyth pointed out in his letter to the President that he had told Mr Strauss, the chairman, as long ago as February that he proposed to return to Princeton this autumn. This suggests that Dr Smyth's disagreements with Mr Strauss are not the only reason for his departure, but with his going, the chairman loses his most formidable critic and the commission its most independent voice.

Dr Smyth was the only member of the commission to dissent from its decision in the Oppenheimer security case, which is still the subject of concern in the United States; he opposed amending the Atomic Energy Act to permit "one-man rule" by the chairman; and he was one of the three commissioners who objected to the President's order to sign an agreement—the Dixon-Yates contract—with a private firm for electricity to be supplied to the Tennessee Valley Authority.

Dr Smyth's place will be filled by Dr Libby, who is also an atomic scientist of distinction, but who so far has shown no signs of Dr Smyth's breadth of interests. With this appointment Mr Strauss will head a commission composed, with one exception, of men appointed by President Eisenhower.

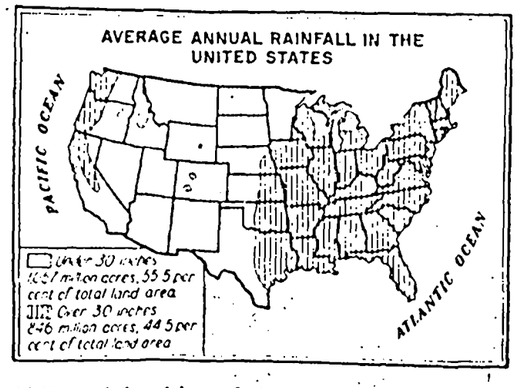
Housing Clean-up

THE investigations of Senator Bush, and his fellow-members on the Senate Banking Committee, into the financial operations carried on under the mantle of the Federal Housing Agency have produced a wealth of detail to satisfy those who relish public scandals. The loose wording of the 1942 Act enabled builders of rental housing projects to divert to their own pockets varying sums of government guaranteed mortgage money without actually contravening the law as it then stood. Abuses of this sort,

which are calculated to have cost some $110 million, have arisen through the distribution, as "windfall" profits, of the excess of insured mortgage money over the actual costs of construction. To justify borrowing more money than was necessary estimated costs were in some cases deliberately inflated when the approval of the Federal Housing Authority was sought, while in other cases the actual standards of construction fell far short of the original plans; one block of flats is already said to be crumbling.

Prompted by Senator Byrd, the government is now searching for ways in which to reclaim these ill-gotten gains. One is provided by a clause in all the original contracts providing that only the "earned income" of the corporations set up might be distributed to stockholders. In nearly one-half of the cases being scrutinised stockholders received windfall profits, but any action taken by FHA involves complicated legal issues and is by no means assured of success. At least there will be no repetition of these practices. The 1954 Housing Act has carefully closed the doors to the profiteer; but there remains the question of whether its new restrictions and the less tempting mortgage facilities offered have not also shut out new construction of rental housing. It is significant that applications to FHA for mortgage approval for such projects have already fallen off sharply.

While these abuses can reasonably be laid at the door of a Congress that was anxious to encourage the construction of rental housing at all costs, FHA, it now appears, has not played an entirely innocent part. An investigation carried out on behalf of the government charges Mr Clyde Powell, a Democratic appointee and director of the rental programme until his dismissal last April, with accepting substantial bribes from contracting firms. The case against Mr Powell has been strengthened by his refusal on two occasions to defend his official conduct before the Senate Banking Committee on the grounds that his testimony might incriminate him. The grand jury investigation ordered by Mr Brownell, the Attorney-General, provides a timely reminder of Democratic "corruption in government" which Republicans are trying to keep alive as a campaign issue.



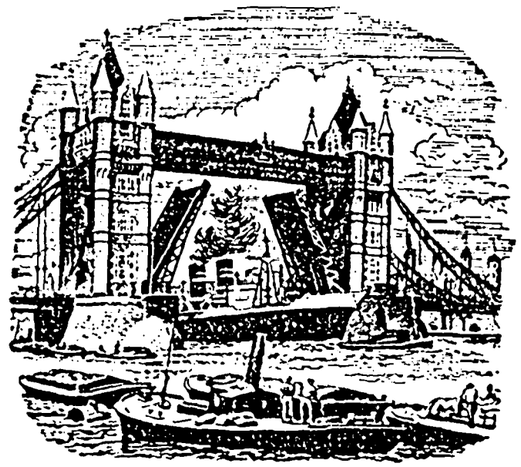
Dividing the Waters

FROM A CORRESPONDENT IN COLORADO

ON the average about 30 inches of rain a year fall on the surface of the United States, but the laws of the skies decree that the western half of the country gets an average of about 20 inches and the eastern half about 40 inches, with the dividing line drawn sharply down the Great Plains. This is the historical pattern even though it is often varied temporarily by such phenomena as the recent floods in Texas and the drought which preceded this autumn's hurricanes on the east coast. This geographical division has led to an equally sharp split in the national mind on water policy. The principal concern in the eastern half of the country has been to get rid of unwanted water; in the western half it has been to store water, in order to supplement a daily supply that is too scanty to nourish crops. In the growing western communities the fulfilment of hopes for the future depends ultimately on supplies of water.

There has also been a similar split in the government's attitude to efforts to increase inadequate supplies of water and to those directed at protecting property and life from damage caused by too much water. Thus for the past quarter of a century the federal government has assumed virtually the entire burden of flood control work, following its tradition of paying all the costs of river and harbour improvements for navigational purposes. On the other hand, those who benefit from works, also undertaken by the federal government, to supply hydro-electric power and water for irrigation in the semi-arid west, have always been expected to contribute all that they reasonably could towards the cost of these projects. This difference of approach is further underlined by the fact that two rival and competing federal agencies, the Army Engineers and the Bureau of Reclamation, have been in charge respectively of flood control and navigation undertakings and of those for irrigation.

Of late years the country's water problems have been complicated by such factors as the growing pollution of rivers and other sources of water by cities and factories; the depletion of underground supplies formerly thought inexhaustible; the recurring droughts in the west which are felt more and more severely as the region becomes more



thickly settled and its agriculture more intensive; the increasingly aggressive insistence of the Department of Agriculture that it too should be allowed a share of the water development and flood control programmes; and finally by mounting controversy over the governmental, economic and social aspects of the question.

President Truman's commission on water resources policy in 1950 made some excellent recommendations which were unanimously ignored. These followed some tentative suggestions by the original Hoover commission on the reorganisation of the government. Many other studies have also been made, such as the one completed only last year on the special problems of the Missouri Basin, and valuable basic work has also been done by agencies like the Geological Survey and the Bureau of Reclamation. Now a task force of the new Hoover commission has completed hearings on the water problem, and is expected to report some time this winter, perhaps before the new Congress meets.

The older Hoover commission was supposed to study only ways of simplifying the structure of government and of

What's your rate of calculation?

You can add, subtract, multiply or divide at the rate of one or two simple sums a second. The more complicated the sum, the longer it takes—and the more likely you are to make mistakes. But the most complicated mathematical problem you can think of is solved in "practically no time at all" on the ELLIOTT 402 Digital Computer. This latest development in the ELLIOTT series of high speed computers works at electronic speed continuously and without error.

ELLIOTT BROTHERS (LONDON) LTD. have played a leading part in the development of high speed computers and in their application to scientific and industrial research and design problems. In the 402, ELLIOTT now have in production the most advanced computing machine of its type—compact in design, moderate in cost, simple to install and maintain and economical in operation.

The ELLIOTT COMPUTING SERVICE has already made important contributions to the solution of a wide variety of Research and Design problems. Staffed with ELLIOTT mathematicians with years of experience in High Speed Computing, this Service is now being considerably expanded to meet increasing demands.

saving money, although it at times over-stepped this limit; the new one is empowered to make recommendations on basic government policy. In the case of water there is every indication that it will take full advantage of this, but only as far as concerns the question of whether hydro-electric power should be developed under public or private auspices. And on this point the hearings in Denver, Colorado, and elsewhere left the impression, on both spectators and witnesses who favoured public power development, that this question is already settled in the minds of the members of the task force in favour of private power, that, in short, the task force is simply another instrument being used by the present Administration to cut back public electricity development as much as possible on behalf of the private power companies.

The chairman of this task force is ex-Admiral Moreell, who once declared that income tax was a communistic conception; another member is Governor J. Bracken Lee of Utah, who would like to reduce the federal government to a loose confederation, with the states collecting all taxes and handing over as much as they see fit to the central government. Nearly all the other members think along the same lines, even if they do not go so far.

At all the hearings on water, interest drifted in an unconscious and almost automatic way to this one question, an issue in this year's election and probably in 1956 as well, of how the great hydro-electric potentialities of the United States are to be developed in future. In Denver, for example, considerable testimony was given and weighty facts revealed about the way in which the growing burden on the west's slender streams has turned such rivers as the Missouri, in the imagery of one witness, "into sewers a thousand miles long." Other evidence dealt with the rapid exhaustion of underground supplies, how to redeem salty or alkaline waters by chemical means, the possibilities of cloud seeding and so on. But all this discussion of the vital problem of how to find enough water for the country's future long term needs was received with only languid attention, and all real enthusiasm was reserved for the less fundamental, but more immediately important, political controversy over hydro-electric power.

Flying on Credit

New York.

WITH exhortations to "fly now, pay later" and "let yourself go" the American traveller is being encouraged, by almost all of the major airlines, to sample the joys of flying on credit. For some years the airlines have felt that international travel was not receiving its "fair share" of the consumer's larger income. Low fare tourist flights, which already account for over 30 per cent of the airlines' transatlantic revenues, family fare plans, and group travel arrangements for businesses and clubs—all have been introduced to promote air travel. But the basic fault, the airlines felt, was that air travel was too hard to buy. Pleasure travel must compete with attractive alternatives such as motor cars, television sets, refrigerators, and other desirable household appliances—all available, and over half of them bought, on the instalment plan.

The various "pay later" and "easy pay" schemes introduced to overcome this drawback have several features in common: a 10 per cent down payment, with the balance payable in monthly instalments over periods varying from 12 to 24 months; and provision for the inclusion of connecting fares on other airlines, for overland travel, hotel charges abroad, sightseeing tours, and in some cases the entire cost of the holiday. The variations are in scope and cost, and in the ease with which credit can be obtained. Pan American World Airways and, more recently, Trans World Airlines, have nationwide schemes. The charge for the service, analogous to the interest rate on a loan, is approximately 12 per cent per annum on the initial balance outstanding; thus if the loan is repaid over a period of 12 months, the effective interest rate approaches 22 per cent. Both schemes are operated through finance companies, although the airlines assume the ultimate risk of default. Only two out of every ten applications have so far been rejected. The alternative method, adopted by such airlines as Sabena Belgian Airlines and the Scandinavian Airlines System, Inc., is to sponsor a plan in conjunction with a bank. While the effective interest rate on the loan is much lower—in the New York area the banks charge only about a third as much as do the loan companies—the airlines are unable to offer a nationwide service, owing to the absence of branch banking facilities and the variations in bank interest charges throughout the country. It is also, in general, more difficult and takes longer, to obtain credit approval from a bank.

Pan American, which introduced the first nationwide scheme last May, reports that it has already done $1,500,000 worth of business under it, of which some 90 per cent is thought to be new business—journeys which would not have been made at all in the absence of a time payment plan. Such is the apparent success of travelling on credit that the Hilton Hotels Corporation, which has just acquired the Statler chain, is considering the introduction of a similar scheme for hotel bills.

SHORTER NOTE

Mr Averell Harriman, backed by the Democratic machine of New York City, won the Democratic nomination for the Governorship of New York State on the first ballot, by 541 votes to 217. Mr Franklin Roosevelt, Jr, who had retained some hopes that the convention might be stampeded in his direction, then moved to make the choice unanimous, thus ruling out an open split in the party. Mr Harriman, who has never before run for elective office, although he held many high posts under Democratic Administrations, will be opposed by Senator Ives.

*

"Travl-Bake," a mobile bakery on wheels, is a converted bus equipped with a specially designed revolving oven, which serves mid-west housewives with freshly baked bread and cakes at their front door. The success of "Travl-Bake," is attributed by its inventor to the fact that "housewives insist on freshness in bakery products, and they know goods are fresh if they can see them come out of the oven."

The World Overseas

Dr Adenauer's New Outlook

FROM OUR SPECIAL CORRESPONDENT

GERMANS in Bonn were gratified at the obvious mark of esteem shown by Mr Dulles when he flew to see Dr Adenauer and not M. Mendès-France ; but they were surprised that the word "integration" appeared in their joint communiqué. Almost everyone had thought, and many had hoped, that Dr Adenauer would have reduced his aims to more realistic proportions after the failure of the EDC. What can he be thinking of integrating now, it was asked ? Only a vague and unofficial answer came, to the effect that something more than the coal-steel pool might be achieved in the economic field.

Looking back on the wreckage of the EDC, it is not hard to see how much this plan depended on the fortunate combination of statesmen in Paris, Bonn and Rome after the war, on the division of Germany and on American economic aid. Dr Adenauer had a unique chance, owing to the constellation in Europe. Germany was divided and cut off from its Prussian heart ; Prussia itself was dissolved, and the tradition of Eastern conquest and settlement which began with the Teutonic Knights was broken. The Junkers who formed the backbone of the Prussian army were expropriated, and lived as penniless refugees in the west. Hatred of Russia and Communism was a live force, driving Germany westwards. With France Western Germany also had a long tradition of war, which is not exclusively one of Teutonic aggression ; but the opportunity for starting a new era of friendship was great. This was partly due to the predominantly Catholic faith in the west, which inevitably meant that West Germans and Bavarians felt links with Rome and Paris, as well as with Königsberg. German Protestantism is bound up with Prussia and has a tradition of absolute obedience to the ruling monarch or other state authority. Though many valiant Protestants opposed Hitler and now oppose German Communism, on the whole the nature of the German Evangelical Church, and the fact that its stronghold was in central and Eastern Germany, have lessened its active resistance to the Soviet and German Communist rulers, and made it produce champions of reunification and neutralism.

Dr Adenauer, it can be seen, was able to come to an agreement on European integration largely because his partners were men of like mind—M. Schuman and Signor De Gasperi—and because France had in M. Monnet another personality with bold ideas for ending German domination in a way that offered advantages to all parties. The Chancellor's overriding aim was to end hostility with France and create a political union out of the need for common defence against the atheist, aggressive menace from the east. His policy was given powerful support by Stalin. Apart from the shock of Korea, Stalin's tactics in Germany played into Dr Adenauer's hands. Herr Ulbricht was ordered to build up a Communist state with a depressed standard of living, and to cut it off from the Federal Republic. Western Germans grew away from their fellow-countrymen, and fear of Russia increased, with advantage to Dr Adenauer. At the same time as the split with the east was most acute, the Federal Chancellor won respect by establishing stability—the greatest desire of all Germans—comparative prosperity and renewed prestige for his country in the world. Except for the Social-Democrats and Communists, most German political leaders accepted the fact that Dr Adenauer was placing western integration and rearmament before German reunion. Many did so with reserve, because they never quite agreed with Dr Adenauer's argument that his policy was actually helping and not preventing agreement with the Soviet Union on reunification in freedom.

The New Charlemagne

Dr Adenauer's policy was, therefore, criticised by his partners, even before it became apparent that it would fail. His apparent readiness to give up German claims to the Saar was the last straw, and leading members of the coalition declared openly that there must be an end to the policy of *Vorleistungen*—that is, of German advance payments to the French. Dr Adenauer, it was said, wanted to re-create the empire of Charlemagne, which knew no difference between French and Germans and reached only to the Elbe. Germany, declared some critics, in spite of its key bargaining position, had no foreign policy of its own with which to secure reunion. And in the anti-Hitlerite ranks there was increasing fear of the former Nazis who occupy leading posts in Dr Adenauer's government and civil service. There was no general cry for an army. On the contrary, the idea of a new *Wehrmacht* set up in divided Germany is regarded with varying degrees of dislike by most Germans for one reason or another. The advocates of rearmament were, and still are, those who see the need for common defence against Soviet aggression, and those who want an army in order to put weight behind Germany's demand for reunion.

Dr Adenauer's triumph in last year's Federal elections temporarily hid the fact that he was gambling on France. And he has lost the gamble. The vote on August 30th in the French Assembly has altered the situation in Germany. The change is to be noted in Dr Adenauer as well as his critics and the public. The Chancellor is much "tougher" with France than he was. He suspects M. Mendès-France, and there is serious incompatibility between the Catholic, Communist-hating German and the subtle, anti-clerical, radical Frenchman.

This is a change, but the main shift in the German political scene is among Dr Adenauer's critics and the public. He is branded by politicians as a failure who has secured neither reunion nor a new era of friendship with France. The critics are now vocal and insistent that a new foreign policy must be followed, based on the slogan "Reunion first and foremost." France is not blamed as much as the Chancellor by political leaders ; on the contrary, effort to form a new front is emerging between the opponents of Dr Adenauer and the anti-clerical French parties.

The defection of Dr John and Herr Schmidt-Wittmarck to East Berlin was called a "crisis of confidence in the government" by the opposition in Bonn and undoubtedly did some harm to the government and the German democrats. Neo-Nazis and Nationalists are now raising their heads with the charge that men who helped Hitler's enemies in the west or east are and always will be traitors. But the men of July 20th received spontaneous applause when they were defended in the *Bundestag*. And Dr John, branded as a traitor, has done no good to the Communists. The effect of post-Stalin tactics in Germany is, on the other hand, likely to be a serious factor, which is making Germans think more of reunion and less of rearmament. Herr Ulbricht is in the background and "peaceful coexistence" to the fore. Barriers are lowered, and the traffic of Germans passing back and forth across the zonal frontiers is said to be as great as before the war.

It is therefore unquestionably a changed situation that Dr Adenauer has to face since he first set out to build a new Germany. But he has not given up and will not while his health lasts. He is still master of his cabinet, and the constitution prevents him from being overthrown. For the next three years, therefore, there may still be time to link Germany with the west.

Diem is Losing the Battle

THE wider battle for the control of Vietnam is being lost, to all appearances, in the confused struggle for power now rending the Nationalist south. The longer the crisis goes on, the greater the gains to the Viet Minh ; for in the wider sense, this is a battle for the loyalties of the ordinary Vietnamese men and women who will decide the fate of their country at the polls in 1956. The dilemma of the present Nationalist regime is that it is authoritarian but lacks real authority. Since there is no national assembly, and provisional elections, even in southern Vietnam alone, are highly unlikely, arbitrary rule is inevitable. The alternatives are either a chaos even more widespread than at present, or a "strong" government. In the context of today's realities, this would mean a military government, for only the Vietnamese National Army commands sufficient power to unite the divergent groups and sects which have transformed the South into a political bear-garden.

The collapse of the Diem administration needs an explanation, for it is just over two months since it came to office amid fervently expressed hopes that here, at last, was something different—a truly nationalistic and unblemished team that would end, once and for all, the corruption and maladministration of previous governments. After the high expectations he aroused, it is easy to be harsh in one's judgment of Mr Ngo Dinh Diem ; but it is as well to remember that he inherited a situation so desperate that even the most experienced of statesmen might have been pardoned for failing to solve the problems he faced. And experience was precisely what Mr Diem lacked: twenty-one years in a self-imposed political wilderness are useful for the creation of a legend, but valueless for solving problems as vast as those that followed the partition of Vietnam under the Geneva truce agreements.

Nor was his team of ministers any more experienced than their leader: in his concern for a complete break with the immediate past, Mr Diem had chosen men who had not served in any previous Saigon administration since the 1949 government headed by the Emperor Bao Dai on his return from exile. In the absence of experience, verbal fanaticism became a substitute for action. The military collapse in the Red River Delta, and the problem of evacuating as many anti-Communists from the North as were willing to be moved, overwhelmed the prime minister and his assistants. In the South, the re-emergence of the Viet Minh in countless villages and the establishment of a parallel Communist administration have found the government paralysed by its own inability to act.

Flight and Infiltration

In the event, the evacuation from the North has been more successful than was being predicted some weeks ago, but Mr Diem himself can claim little credit for the improvement. Some 300,000 refugees have now been moved southwards, together with a cargo of almost equal importance: 275,000 tons of equipment and 4,350 vehicles. In the early days of Diem administration, the Nationalists were talking of a million evacuees—a figure unlikely to be even approximately reached now that the main first wave of evacuation is dying down. In those early days, francophobia led Mr Diem to refuse all offers of French help in the evacuation. Instead, he appealed to the United States. Fortunately for his cause, not only did the Americans (and the British, too) respond immediately, but the French ignored the snub and carried on with the evacuation.

The resettlement of so large a number of refugees has also, and inevitably, proved beyond the resources of the Vietnamese government. There is no shortage of land, which has been made available in Annam in reasonable allocations, but there is a catastrophic shortage of housing, agricultural implements and even money for the subsistence of the evacuees until they are able to stand on their own feet. In the face of these problems Mr Diem is almost completely dependent on American aid.

Of equal importance in the long run is the problem of Viet Minh infiltration in the villages of Cochinchina ; and here American aid is almost irrelevant. Left to its own resources, the government has proved quite incapable of countering Communist propaganda, which has taken such audacious forms as the open display of election posters showing portraits of Ho Chi Minh and Bao Dai, with the caption: "Which one do you choose ?"

The crisis of the past fortnight should be seen against this background of administrative impotence. The National Army, which now numbers some 270,000 men, under 7,500 officers, has been gradually emerging as a powerful political force. Its chief of staff, and eventual commander-in-chief when the French command hands over its authority at the end of the year, is General Nguyen Van Hinh, a former distinguished pilot in the French air force and one of the ablest men to have appeared in postwar Vietnam. General Hinh has made no secret of his disagreement with the policies of the chief of state, Bao Dai, or of his dissatisfaction with the inertia of the Diem government. Believing himself to be politically threatened by this attitude, Mr Diem ordered the general to go on leave in France; when the general refused to obey, the crisis began.

From the outset, the prime minister's position was untenable. In terms of power, he was solely dependent on the protection of the police, itself under the control of General Le Van Vien, a close friend of Bao Dai's. General Vien, who holds a controlling interest in the Grand Monde, the largest gambling establishment in the Far East, is the head of the Binh Xuyen sect, a non-religious band of privateers with its own army. General Hinh is believed to disapprove of Binh Xuyen control of the police and there exists an intense rivalry between the police and army.

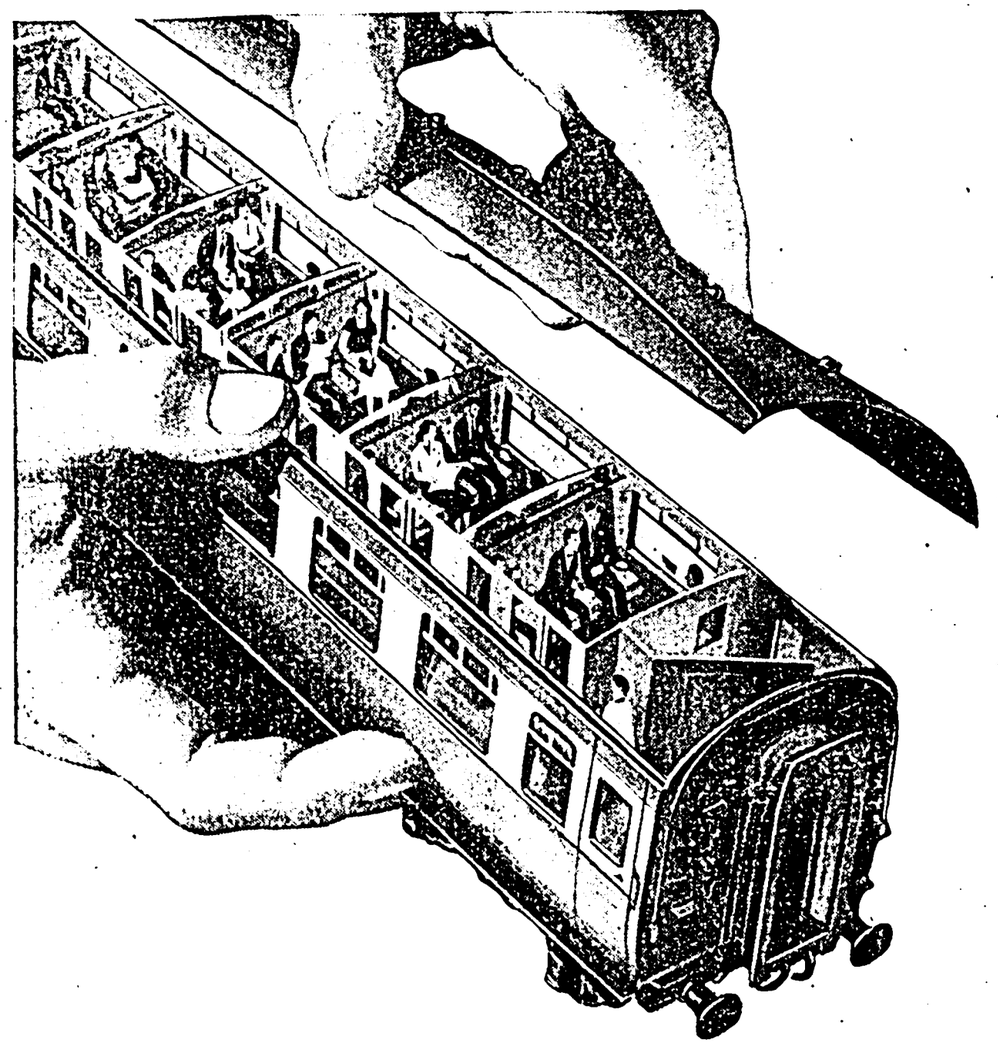
In an attempt to strengthen his position in the face of General Hinh's defiance, Mr Diem brought a third influential general, Nguyen Van Xuan, into his cabinet as Defence Minister. It was a desperate move, for some weeks ago General Xuan, who headed the Provisional Government of Vietnam in the confused period between the start of the Indo-China war and the return of Bao Dai, was agitating against Mr Diem and putting himself forward as a candidate for the premiership. The interesting point, however, is that Xuan is an outspoken opponent of Bao Dai, upon whom, in the final analysis, Mr Diem himself is dependent for his continuance in office. In an interview four weeks ago, General Xuan said that no one could guarantee Bao Dai's safety if he returned to Vietnam.

Sects in the South

The position of the powerful southern sects should not be overlooked in an analysis of the Vietnamese crisis. Apart from the Binh Xuyen, the main ones are the Caodaists and the Hoa Haos. Between them, these important religious groupings, who are united by an alliance and implacably opposed to the Viet Minh, number some three million adherents and have some 58,000 men under arms. Until recent months, they were firm supporters of Bao Dai, but three weeks ago the Caodaist Superior, Pham Cong Tac, though reaffirming that he supported the Emperor "body and soul," called upon him to stay in Europe as a roving ambassador of Vietnam, rather than return. A persistent obstacle in the path of Nationalist unity has been the resistance of the sectarian armies to absorption in the National Army, though in theory they have already been incorporated. For obvious reasons, General Hinh has been pressing for their physical absorption.

The situation remains explosive. Though General Hinh has never expressed any political ambitions, he may be driven to seize power by the extremists among his staff. Physically, a military *coup d'état* would present little difficulty. On the other hand, the fact that both Hinh and Diem have appealed to Bao Dai to arbitrate in their dispute suggests that Hinh has ruled out precipitate action. General Vien has just returned to Vietnam after consultations in France with the Emperor, and it may be assumed that he has brought back the chief of state's instructions for dealing with the crisis. Whether the Army will accept a ruling brought by General Vien remains to be seen.

In the meantime, a series of terroristic outrages in Saigon, and the assassination of the Laotian Defence Minister in Vientiane are a clear reminder that the Viet Minh will take every opportunity of exploiting any weakness that manifests itself in the non-Communist areas of Indo-China. It has never been more necessary for the Associated States to establish strong and unified governments, if they are to have any hope of survival in the months ahead.



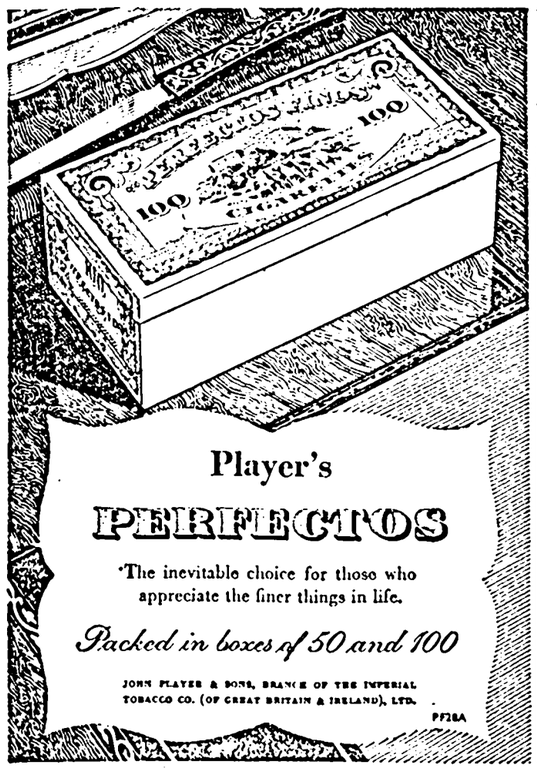
Firebrands in Persia

BY A CORRESPONDENT

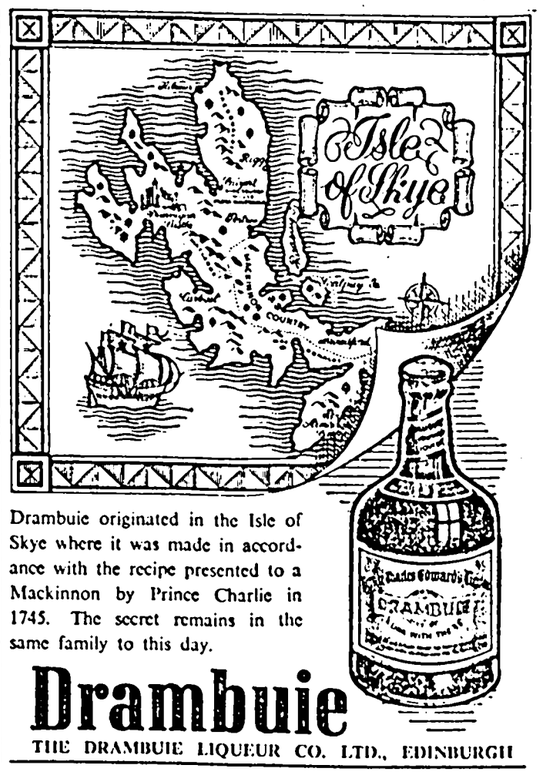
THE feeling strongly prevails, both in Teheran and in the capitals of the Consortium countries, that the oil agreement signed in the small hours of September 19th will be ratified in the Persian Majlis and Senate. It represents months of patient negotiation by Mr Howard Page and his colleagues, with ministers a world away from the crude follies of the Mossadegh era. It is vitally important to Persian economics that it should come into force at the earliest moment, with a stream of oil and money to follow closely after. The Shah has blessed it unequivocally, its benefits to the country are unquestionable. Is rejection, then, at all probable; and what, in fact, are the likely sources of opposition?

They are not expected to be lacking among either the politicians or the masses of a country which is still generally ignorant of industrial realities and habituated to dire poverty, and whose xenophobe emotions have been excited by two years of hysterical misgovernment. Opponents of the agreement are and will be opponents of the Zahedi regime, with little or no regard to the precise terms of the oil settlement. The meticulous care with which this has kept within the Nationalisation Law of May 1, 1951, will not excuse it. Nor is it difficult to distinguish the opposition elements which now survive—partly submerged—from the Mossadegh period and were then the pillars of his strength.

The National Front, whose survivors on both right and left wings are still very much alive, includes the mass of those to whom Mossadegh's forms of oratory and statecraft appealed, and the convinced anti-monarchists whom Riza Shah's regime not unnaturally bequeathed to Persian politics. The specifically pro-Mossadegh faction is still large though unstable, and with it can be grouped the small, semi-Fascist Iran Party, the Pan-Iran Group, and the Third Force whose natural weapons are violence and personal intimidation. Distinct from these are the unorganised intelligentsia or parliamentarian elements, to whom an authoritarian regime such as the present is irksome and frustrating, and who would join in any forces aiming at its downfall. Ranged with them in bitter hostility to Zahedi—and, substantially, to the Shah—stand the men of religion; the Fidayan-i-Islam and their associates led by Mulla



Take a train.....



In any modern railway carriage steel sheet plays a vital part. If you travel by car, you travel in steel sheet. So does the child in his pram. Go by land, sea or air and steel sheet is under your feet or over your head. Here then is the steel of today — and tomorrow. And it is the steel made by John Summers. In 10 years production at the Shotton works has doubled. And still the building and installation go on—to reach a target of more than a million ingot tons annually. Still the sheet rolls forth by the mile. John Summers is a family firm with a 100-year-old past and a shining future.

600 GROUP

54/1118

Ayatullah Kashani. This small, but far from negligible group, whose record of bigotry and bloodshed in the political field is little creditable to the religion they profess, will fight the regime and the agreement with all their power. Kashani's own son is in the Majlis.

The Tudeh party, originally a liberal reform-seeking body, has long been "sold out" to Communism. It has developed a country-wide organisation, led by some good Moscow-trained activists (certain of whom operate also in workers' groups distinct from the Tudeh programme). It has every interest in the fall of Zahedi. Nothing could suit the Tudeh members worse than a stabilised Persia, hopeful of development and able to pay for it: nothing could please them better than anarchy followed by a republic which would be a satellite to the USSR. Under Mossadegh, with whom it formed a tactical alliance which he believed he could control, the party penetrated deeply into the army, police and civil service. After August, 1953, it lost strength and members, and General Zahedi last winter "purged" the services to an extent then thought adequate for the restoration of an almost vanished discipline, and succeeded in detaching the less extreme civilian elements.

The Tudeh Conspiracy

But by the early summer of 1954, the party was again fully active with its posters, half-clandestine meetings (often camouflaged as wedding or circumcision feasts), and street demonstrations. It was ready for any possible form the threatened oil agreement could take. Counteraction was taken by the administration, with arrests of sympathisers from July onwards. Late in August there was announced the detection, through house-searches and a captured code-book, of a widespread conspiracy in the armed services and the schools. The arrests of officers in the army and police have been variously reported as 250, 400, or even 500. Complete success is claimed in breaking up an elaborately organised Tudeh-inspired movement which had involved scores of officers, including some of colonel's rank and many in positions of trust. It had branches at Abadan, in the Teheran Law School and elsewhere. Many, it is claimed, have confessed, and there is confidence that all is now well. But the part to be played by the Tudeh party in attempts to wreck the agreement, by violent subversion if need be, cannot be assessed as yet.

The representation of all these heterogeneous elements in the Majlis and Senate is small, and probably does not exceed a dozen members; nor are these, whom M. Qanatabadi seems to lead in the Chamber, particularly formidable. The government party will easily outvote this handful of irreconcilables, and will refuse, no doubt, to be trapped into the delays at which they will aim. The agreement will be ratified. But it is perhaps too much to hope that thereafter loyal acceptance will succeed to criticism; the recourse of out-voted middle-eastern politicians, more especially if led or supported by Communists, is to the mob and sometimes to the assassin.

The fate of Ali Razmara in 1949 cannot be forgotten, nor the violent street disorders which in July, 1952, sealed the fate of the four-day ministry—appointed by the Shah, and initially accepted by the Majlis—of Qavam-al-Sultana. To escape such dangers, if they should arise, with their incalculable damage to Persia, may well call for all the firmness and wisdom at General Zahedi's and the Shah's disposal, and for the closest mutual collaboration. Thereafter, if a longer period of internal security is to be enjoyed, the sincerity and effectiveness of the present government's programme of social reform, and the widely beneficial spending of the money shortly to be available, must be shown by visible and practical measures.

King Coffee's Shaky Throne

ON the third of October Brazil is going to the polls to elect a new Senate and Chamber of Deputies. This election is crucial because it represents the last phase in the Vargas crisis, and because it takes place at a moment when Brazil is in grave danger of an economic collapse. President Café Filho has had the courage to bring the grim facts before the public. The budget for the fiscal year 1955 already shows an estimated deficit of 15 billion cruzeiros and is expected to be several billion higher when congressional appropriations are all in. The country is in the grip of inflation, and during August alone there was an increase of three billion cruzeiros in paper currency.

Brazil's internal problems, moreover, are closely connected with its ever-increasing dollar deficit. In July and August the Bank of Brazil purchased $60 million. But as Brazil's dollar spendings are exceedingly high—particularly for commodities such as oil—the dollars dwindle rapidly. The new regime is acutely short of dollars with which to meet import payments or cover the dividends and earnings of foreign investors. The new finance minister, Dr Gudin, has outlined plans calculated to improve Brazil's balance of trade. He has promised that the government would undertake an active programme to encourage foreign capital and reduce trade restrictions. Although he would not contemplate complete convertibility of the cruzeiro in the near future, Dr Gudin stressed his intention to provide flexible and advantageous rates of exchange for the export market. Above all, the new government means to attempt a strictly disinflationary monetary policy, and is considering a more severe attitude towards the banking system with its tendency to over-extend in real estate activities.

These are excellent ideas, but in Brazil—as in so many Latin American countries—financial good intentions pave the way to political trouble. A disinflationary policy will run straight into the problem of how to raise minimum wages and maintain the public works programme with which the government seeks to satisfy the restless working classes Any large-scale encouragement of foreign participation in Brazilian capital expansion is likely to arouse nationalist opposition. With an election looming, President Café Filho must try and reconcile fiscal needs with political facts. If he fails to do so, the spirit of the late President Vargas will walk ominously abroad.

Finally, there is the all-embracing problem of coffee. If Brazil does not succeed in exporting some ten million bags in the next months the present crisis will get entirely out of hand. Owing to the fantastic rise in Brazilian coffee prices before the fall of Vargas, consumer resistance in the United States has reached a high point and other coffee exporters, such as Mexico, have entered the market. What the new regime must do is to reduce prices without fatally lowering the wage standards on the plantations. Brazil must receive outside help, and it is more than likely that the United States will step in to ease the very grave

situation. Already barter agreements have been arranged to exchange American wheat for certain strategic minerals such as monazite. But whether a devaluation of the cruzeiro can be long avoided is doubtful.

Scarecrows in New China

THE collectivisation of the vast Chinese countryside is still in its very early stage, but acute growing pains are already reported. The mass of the Chinese peasantry is still working independently or in loose association through "mutual-aid teams." Yet the producer co-operatives, which should be the spearhead of the collectivisation drive, apparently do not fulfil their function. The Peking *People's Daily* has sounded the alarm: the producer co-operatives are not productive. Less than one third play their role properly; more than a half show no advance in output, while production is actually falling in the remaining ones.

Though floods have devastated fields this year and every ounce of grain is important, the lag in production is not the only cause of alarm. Producer co-operatives are still too few to affect output greatly. At the beginning of this year, out of China's 110 million households nearly half were grouped in seasonal or permanent "mutual-aid teams," but less than 300,000 were amalgamated into 14,000 producer co-operatives. The subsequent drive surpassed the forecasts of the planners and by June of this year the number of co-operatives rose to 90,000. Even so, in the northern regions, where they are most widespread, they still account for barely five per cent of total arable land. According to the official plan only one-fifth of the rural population will find itself in co-operatives by 1957.

The role of the co-operatives, moreover, was to act as a model and a magnet to attract the peasants to the collective system, and this is why their failure is particularly painful. Fearing that coercion would provoke an upheaval, Peking wanted to induce the peasants to join by promises of prosperity. But it is now admitted that in many cases "the income of co-operative members had decreased"; in this way the models "failed to establish a good reputation among the masses." The party is chiefly blamed for this state of "anarchy." It apparently does too little to co-ordinate the work in the countryside, concentrates on a few pilot projects and neglects the backward co-operatives. Above all, it does not get down to earth and issues general directives which ignore the vital problems of accountancy and incentives. As a result many farms, instead of being centres of attraction, act as scarecrows in the Chinese countryside.

All this is the more awkward as the co-operatives themselves are only an intermediary stage, the stepping stone to collective farming on the Soviet model. Chinese producer co-operatives should not be confused with Russian *kolkhozy*. The Chinese farms are a mixture of private and collective ownership. The land and some equipment is still owned by individual peasants, who get a rent for it. The remuneration of the members is, therefore, still divided into rent and wages. The ultimate objective is, obviously, to eliminate rent according to the Soviet model. As *People's Daily* has put it:

"Our principle is gradually to decrease the ratio of land reward and to increase the ratio of labour reward . . . until we finally realise the system of distributing income according to the amount of work done."

Thus there is no question of abandoning the final objective of large-scale collective farming. If anything, the establishment of co-operatives has been speeded up in recent months. The Communists may have swallowed more than they can chew at the moment. In general, it is no longer the fashion in the Soviet bloc to paint everything in bright colours and camouflage every failure. Mao Tse-tung apparently does not want to follow Stalin's cruel path in the countryside. But, it is no easy task to overcome the peasant property instinct and to coax smallholders into collectives. Hence the present pressing appeals to the regional and local party authorities to make the co-operatives pay and to render them as attractive as possible. In rural China the political future of the regime will be greatly affected by the manner in which it copes with what Lenin called the infantile diseases of collectivisation.

Breathing Space in Denmark

FROM OUR CORRESPONDENT IN COPENHAGEN

IT is over a fortnight since, at the insistence of the opposition parties, the Danish *Folketing* was hurriedly recalled from its summer recess to scrutinise the Social Democrat government's emergency programme, put forward to meet the steadily worsening balance of payments position. But a solution of Denmark's economic difficulties seems today as far off as ever. The chamber met in an atmosphere of crisis; and it was generally expected that the three-day debate would culminate in a show-down between Hr Hedtoft's minority government, which can muster 75 votes, and the Liberals and Conservatives, who together have 73. Clearly the attitude of the Radicals (14), and to a lesser degree of the single tax party (6) and Communists (8) would be decisive.

Deputies urgently summoned to this crucial debate arrived with the snow of Greenland and the dust of Pompeii on their boots. The proceedings ended, however, in anti-climax. A motion of censure tabled by the Liberals and Conservatives was not put to the vote. Instead a Radical motion to refer the government's proposals to a parliamentary commission was carried by 91 votes (Social Democrats, Radicals and single tax party) to 69 (Liberals and Conservatives), with the Communists abstaining. But the price that the neutralist Radicals intend to exact for signing the government's reprieve may well be higher than the Social Democrats are willing to pay. In particular, it is rumoured that further sizeable cuts in defence spending would probably lead to the resignation of the Defence Minister, Hr Rasmus Hansen.

The government's emergency programme, which the 17-man parliamentary commission is now examining, envisages economies of Kr.600 million over the next one and a half years. (Neither devaluation, nor imposition of quantitive restrictions on imports, seem to have been contemplated.)

Hr Krag, the Minister of Economics, has stated that the programme aims to increase budget surplus and revenue, reduce consumption and investment, encourage saving, and stimulate export earnings. The Finance Minister, Hr Kampmann, has given assurances that funds accruing from the economies will not be paid out until the crisis is surmounted. The government's two-point plan proposes raising the company tax and levying surtax; reducing tax relief for house repairs; higher taxes on beer, spirits, tobacco, petrol and motor vehicles; increased railway fares, railway freight charges, and postal rates; tariffs on textiles; premiums on savings; and increased export credits. So far only the two last, together with a Radical proposal to tighten up credit terms on hire purchase transactions, have progressed from the commission to the *Folketing*.

Radical objections have already led to the proposals on tariffs, company tax and surtax being dropped. Although reticent about their aims, the Radicals are believed to oppose most of the government's remaining proposals: they will undoubtedly press for cuts in public building and defence. Radical cageyness is matched by that of the Liberals and Conservatives, who confine themselves to maintaining that the government, having manifestly lost the people's confidence, should now submit to elections. According to the opposition, any concrete proposals advanced by them would be pounced upon with whoops of joy by the government, which could then take full credit for success, while having a scapegoat handy.

Outlook Daily Darker

While the parliamentary commission pursues its piecemeal endeavours, which can at best only result in the emergence of a dangerously enfeebled version of the government plan, the payments position continues to deteriorate. The July import surplus of Kr.208 million was an all-time record. August figures, when published, are likely to be equally disquieting. Stocks of raw materials, which were believed to have grown substantially after heavy buying in the first half of 1954, are a fraction less than at the same time in 1953, and 12 per cent lower than at the New Year, although grain and feeding-stuffs are up. By mid-September, the foreign exchange deficit of the National Bank was Kr.130 million, taking into account an extraordinary payment of Kr.20 million received from Western Germany for post-war maintenance of German refugees. Although Denmark still has reasonable short-term liquidity, with a dollar reserve and EPU credits to draw upon, the long-term outlook grows daily darker.

Factors beyond the Danish government's control have contributed to their troubles. The breakdown of trade talks with Russia, protracted and fruitless negotiations with Britain over bacon and butter, and the partial failure of the harvest have had a cumulative psychological effect. The government are anxious to avoid, or at least postpone, an election. A repetition of the events of 1950, when a similar economic crisis forced the Social Democrats into opposition, while their opponents cleared up the mess, would harm the party immeasurably. The Radical party, having acted as midwife at the present government's birth, and enjoyed the sweets of power without responsibility, is now nervous of sharing the electorate's displeasure with its protegé. Meanwhile, the Liberals and Conservatives are convinced that, given enough rope, the government will hang itself.

Radicals and Social Democrats may find sufficient common ground to stave off elections for the present. Hr Hedtoft has gained a breathing-space through the Radicals' tactics—but whether of months, weeks or days is anybody's guess.

More Rice Than Rubber

AMONG the distinguished guests visiting Peking this year, Ceylon's Trade and Commerce Minister, Mr Shirley Corea, who leads the trade delegation due there shortly, is likely to have the longest and most arduous sojourn. His difficult brief is that of driving as hard a bargain as possible in the third renewal of the rubber-rice pact. It would not be surprising if the difficulties led to a breakdown, though both sides will do their best to avoid it.

The basis of the rubber-rice agreement rests on two facts: China's need for rubber, which it finds hard to satisfy because of the United Nations' embargo; and Ceylon's shortage of rice. Circumstances have changed both these conditions. On the one hand, now that the fighting has ended in Korea the Chinese high command may calculate that they need less rubber. As against this, however, it is widely believed, though never fully confirmed, that a proportion of the rubber goes by the long haul across Siberia in payment for supplies and services given by the Russians and the Eastern European bloc. The Communists might be banking, moreover, on an early relaxation of the UN embargo—the Labour Party mission and modifications in the Battle Act list may have given them encouragement—and therefore feel less disposed to pay Ceylon's price, which is above that obtaining in world markets.

The second leg of the bargain is equally shaky. Rice supplies the world over have grown enormously; the problem now is a matter of disposing of surpluses. There is said to be a surplus of about 100,000 tons in Ceylon at the moment, and because suitable storage space is inadequate it is proving a headache for the authorities. Home production has, in addition, been rising and now accounts for more than half the country's needs. Ceylon's neighbours also have been pressing offers—at tempting prices—on the government. A minimum of 200,000 tons has already been contracted for from Burma and there is news that Pakistan has come out with an interesting bid. India, too, is said to have 200,000 tons of rice for export. In fact, Mr Corea has to carry with him the burden of some 50,000 tons of Chinese rice left over from the previous year, which he hopes to be able to unload in Japan.

The outlook is thus far from promising. Ceylon still values its rubber-rice pact and would like, furthermore, to increase its general trade with China, but the government is aware of the difficulties. It has always been a curious transaction: China, normally a net rice importer, turns into a rice exporter and pays abnormally high prices for supplies of rubber considerably in excess of its normal requirements. There is, however, one saving feature in this year's bargaining: China, because of the disastrous floods, might have less rice to sell. The outcome could, therefore, be a cut in the quantities of both rubber and rice, with prices of both being brought into line with the world.

Must Evatt Go?

FROM A CORRESPONDENT IN SYDNEY

IT is expected that the present leader of the Australian Labour party, Dr Herbert V. Evatt, will have been displaced within six months. Dr Evatt's friends say that he would quit immediately if he could find a vacancy similar to the High Court bench which he left a decade ago. At this moment this controversial political figure is fighting for his political life. Behind him he has a divided and bickering party. The bickering is no figure of speech. At a recent Labour conference, two veteran members started throwing punches and were restrained with difficulty.

One of Dr Evatt's biggest troubles is that he is an incorrigible individualist, a breed of which the average rank and file Labour man is perennially suspicious. He has been too long accustomed to handing down rulings from the bench to fall easily into the party policy of "majority decision." His immediate troubles began when he "high-handedly" took charge of Labour's 1954 election policy and forced it on reluctant candidates. As a policy "with something in it for everybody," it was found that there was nothing in it for the Labour party when Labour lost the elections. Future historians probably will conclude that it was Dr Evatt's misfortune to have coincided in political time and space with perhaps the greatest controversy in Labour party history, namely, the question of "socialism in our time."

Since 1947, when the Australian people made it clear that nationalisation on doctrinaire socialist lines was not acceptable to them (in Labour's attempt to nationalise all Australian banks) the party has been steadily disintegrating. Old style Labour politicians who saw the party thrive on strikes, the class war and the like, are scandalised that "socialism in our time" is not acceptable to new style Labour politicians, the people who regard politics as a "safe job" and not as a road to martyrdom. In the midst of this party controversy, Dr Evatt came to power. His leadership, therefore, inevitably represents, in Labour eyes, an attempt to resolve this historical crisis in party affairs.

Devil's Choice

Because Australian elections are decided by a so-called "swinging" or unattached vote, the Labour leader has attempted to follow a middle course between militancy and non-militancy. The attraction of this course, as interpreted by Dr Evatt, was that it provided a "middle ground" between the extremes of Liberal Government and Communist policies. This was a highly dangerous theory, since the government was the only party which could be attacked with any hope of Labour gaining political office. Consequently, as the extremes of Liberalism were attacked, the Labour Party increasingly emerged, in the public eye, as the protector of the extremes of Communism.

But Dr Evatt did not take the field as the champion of Communism. Rather, he fought as the champion of "personal freedom." This was the case in 1951 when he almost single-handedly defeated the Liberal government's legislative attempts to outlaw the Communist Party as a "subversive organisation." This victory confirmed his newly won position as Labour's leader. But it also confirmed, in the eyes of Labour politicians, that he was well left of centre. The Evatt "middle course" had produced a devil's choice for those who henceforth must support Liberalism if they wished to attack Communism or Communism if they wished to attack Liberalism.

It was at this point that the anti-Communist elements in Labour ranks suddenly remembered that their party had succeeded only when led by a "real Labour man," meaning one who had come up the hard way through the rough and tumble of unionism. Such talk aroused anew Labour's traditional suspicions of an "intellectual" leader.

Looking at Dr Evatt's political future, this very background would seem to be his greatest handicap. Had he never come from the High Court bench, it is altogether possible that he never would have seen the legal holes which he exploited so successfully in defeating the Liberal Government's anti-Communist legislation. His attack is almost invariably along legal lines. But this very tendency divides his immediate parliamentary supporters. Unable to follow his line of legal thought, these worthies are reduced to political impotence on the sidelines. It is an undignified position and no politician, however much he may hero-worship his leader, cares to appear in such an uncomplimentary role. Hence the complaints about the leader's "high-handedness" and his alleged disregard for the party's federal council and its policy decisions.

The Cable to Paris

From Dr Evatt's standpoint, the Petrov affair was made to order. It presented a legal problem wrapped up in a political one, that is, the unearthing, through a royal commission, of a Communist plot against national security. Realising this, new style Labour politicians obviously were praying their leader would not intervene and again place his party in the position of attacking a government attempt to unearth the underground comrades. Yet that is precisely what he did.

Dr Evatt saw the Petrov affair as just another government attack on "personal freedom." He publicly warned against government "smear" attacks despite Prime Minister Menzies's assurances. The climax came when, after strongly criticising the conduct of the three eminent royal commissioners themselves, Dr. Evatt denounced the proceedings as a "political conspiracy" against himself as Leader of the Opposition. When refused further leave to appear before the commission, he then attacked the French government for its arrest of Madame Ollier, a diplomat named by Petrov as an MVD agent in Australia.

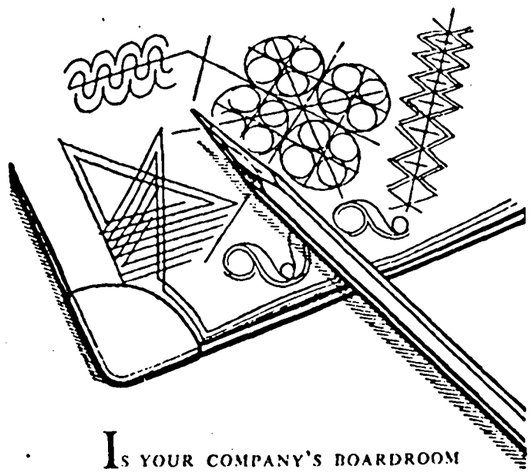
This unprecedented spectacle of an Australian Opposition Leader cabling criticisms direct to a foreign government on the handling of its own affairs has given wider meaning to the Labour slogan: "Evatt must go." In attacking the French government, Dr Evatt has done more than shock his party to the core. He has more closely identified it with the Communist party, and he is alienating all those new style Labour politicians who wish to "play it safe."

To their way of thinking, Dr Evatt is not only spoiling Labour's good name as a champion of democracy, he is also threatening their jobs, their livelihood as politicians. The question, therefore, is not whether they continue to admire and follow their leader, but whether they continue to admire and follow politics as a well paid vocation. The more dismal that prospect becomes, the more convinced they will be that "Evatt must go."

İNSANİYETİN HAYRINA!

HASAN IS PROUD that his job serves his country. More electricity means greater prosperity and a higher standard of living for Turkey. Hasan reckons that electricity is "*insaniyetin hayrınadır* — for the benefit of Man".

Hasan works at the Catalagzi Power Station, completed by Metropolitan-Vickers Electrical Co. Ltd. in 1948. Recently, the President of the Turkish Republic laid the foundation stone of new extensions that will double the size of the station.



Again Metropolitan-Vickers, one of the nine famous British companies that together make up A.E.I., are undertaking the work. The new contract calls for turbo-generating plant, boilers, switchgear, and all civil works, totalling some £3½ million.

A.E.I. are Associated Electrical Industries, whose Companies make everything electrical from a turbine to a torch bulb.

AEI *for everything electrical*

Associated Electrical Industries are a family of companies:
Metropolitan-Vickers Electrical Co. Ltd.
The British Thomson-Houston Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Newton Victor Ltd.
Premier Electric Heaters Ltd.
Sunvic Controls Ltd.

Are you bored in the boardroom?

IS YOUR COMPANY'S BOARDROOM impressively but monumentally dull—a room still sacred to the memory of an august founder? Or is it a pleasant place in which to meet—a background for clear thinking, and brisk discussion?

This surely is what it should be—a room which reflects the Company's present day character and outlook.

Our design studio has many such boardrooms to its credit, as well as furnishing schemes for whole office blocks, hotels and ships—both in Britain and abroad. You will find us just as helpful if you are looking for a desk to suit an executive.

If you would like to see what we can do, tell your secretary to write for our booklet, *Furniture for Special Needs*. Better still, visit our new Contracts Showroom and look round for yourself.

HEAL'S

TELEPHONE MUSEUM 1666

ICFC

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

The Corporation is ready to consider applications for capital to purchase additional buildings, plant and machinery, or to provide increased working capital to further the expansion of business. Consideration will also be given to new ventures which are soundly conceived and adequately sponsored.

Please ask for our new booklet—"Capital for Business and Where to Find it".

THE BUSINESS WORLD

IMF at the Ready

THE "routine meeting" of the International Monetary Fund, as the Chancellor of the Exchequer described it on his departure from London, is obviously dominated by and dedicated to the great debate on convertibility. It is altogether fitting, therefore, that the first chapter in the annual report of the Executive Directors should be entitled "The Prospects for Convertibility." This latest report is not, as might have been expected, another stirring call to the righteous cause. It is a sober restatement of the essential conditions that must be fulfilled if convertibility is to be not only a feasible but an enduring achievement. The report lays its main emphasis on the present state and prospect of the dollar gap, and secondly on the part than can be played by the IMF in providing that cushion of international credit without which convertibility might all too easily become the begetter of increased restrictions on international trade.

On the first of these issues the IMF report is decidedly optimistic. It points to the contrast of economic developments in the latter part of 1953 and the early months of 1954 in the old and new worlds and to the increased production of certain agricultural and industrial commodities in non-dollar countries, which made them far less dependent on dollar imports than they had previously been. It points out that the volume of United States exports tended to fall despite a considerable decline in the degree of discrimination applied against them. The result was that even leaving out of account economic aid from the United States, the dollar receipts of countries outside the United States (including receipts from off-shore purchases), exceeded their dollar payments. In 1953 the sterling area achieved an over-all surplus as well as a surplus with the dollar area. This improvement in the international payments situation "indicated the increasing ability of non-dollar producers to compete successfully with the production of the United States." It was signalised by an expansion of gold and dollar reserves outside the United States and by stronger quotations for inconvertible currencies.

This improvement in the payments accounts of non-dollar countries between 1952 and 1954 has been associated with stable prices and with comparative freedom from inflationary pressures—and with a share of good luck. The terms of trade have unquestionably helped the sterling area, and so have the expansion of offshore purchases and other US Government expenditure abroad. But the element of good management has been far more notable than that of good luck and the IMF report sets out the important causes of the improvement:

> The general enhancement of productivity and the expansion of dollar competing supplies in Europe and in the sterling area, which are the fruit of earlier investment and reconstruction policies . . . the adjustment of Europe's relative cost levels following the devaluations of 1949 . . . disinflationary monetary and fiscal policies, which have had the effect of eliminating or reducing excess demand and of checking price and wage increases.

From all this the IMF implies that the chronic want of balance in the current payments of the United States with the rest of the world is a thing of the past; it suggests that further substantial reductions and ultimate elimination of discriminatory restrictions on dollar imports can now be contemplated by many countries without the risk of serious disturbance to their balance of payments or to their domestic economies. A special pioneering role has been played by sterling, and the IMF report hands several bouquets to the pound. It stresses that wider convertibility for sterling is a necessary condi-

tion for any further advance in this direction by other countries, even those where economic conditions are particularly favourable. It welcomes the gradual relaxation of import restrictions and of domestic rationing in Britain, the restoration of many commodities to private trade, the reopening of commodity markets, and the wider measure of freedom given to the foreign exchange and bullion markets. All of these are genuine and substantial steps in the direction of convertibility. It does not, however, wish to see these steps hastened. "The goals of complete liberalisation and convertibility are being approached gradually and with caution and it may be expected that a similar attitude will characterise the further steps that are likely to be taken in this direction." This is certainly an apt curtain-raiser for an unsensational performance at the meeting that began in Washington on Thursday.

Having given its "all clear" on the dollar gap, the IMF report then tackles the second theme of its convertibility exercise, namely, the adequacy of the reserves in the non-dollar world. These are still regarded as being in need of reinforcement:

> If reserves are inadequate it might become necessary to abandon convertibility and to reintroduce exchange restrictions. Notwithstanding the remarkable improvement recently recorded fears still prevail that present monetary reserves may not be adequate to cope with contingencies.

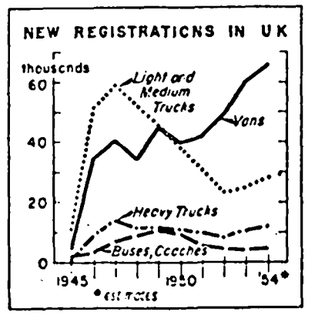
Adequate reserves will be needed, in the view of the Fund because convertibility (unless it is merely a legal recognition of a *de facto* situation) is likely to put exchange markets and reserves under some pressure, at least in the short run. It is also pointed out that pressure on reserves may arise as a result of increased domestic demands for dollar goods. There is one passage in the report which significantly suggests that there may be other ways of keeping external payments and receipts in balance than drawing on reserves and that "in some situations this means the timely adjustment of exchange rates." But even with this veiled introduction of the principle of floating rates, it is evident that an expansion of external reserves will be needed if the move to convertibility is to be made compatible with expansion of trade.

★

The IMF stands ready to fill the need. In self-defence against those who may expect too much it points out that the Fund's policy must be directed towards protecting the revolving character of its resources and that it must accordingly apply the principle that currency purchased from the Fund should not remain outstanding beyond the period reasonably related to the particular problem in respect of which the currency was first purchased. By a decision reached in February, 1952, it was suggested by the Fund that as a general rule this period should be from three to five years. It was also agreed at that time that for drawings within the "gold tranche" (that is, the proportion of a member country's subscription paid up in gold or dollars) members could draw on their facilities virtually without requiring the sanction of the Fund. These decisions were made effective until the end of 1953 but have now been extended *sine die*. That is the first direction in which the interpretation of the Fund's Articles of Agreement has been made somewhat more elastic.

A second and much more important illustration of this greater elasticity is provided by the restatement of the Fund's policy on "stand-by arrangements." These stand-by arrangements were intended to give member countries an assurance that they could count on the Fund's assistance in circumstances where access to its resources would serve the general objectives of the Fund. Initially, it was agreed that the credits granted under standby arrangements would be limited to periods of six months. It has since been announced that where standby arrangements may be required for longer periods—as for example in connection with positive programmes for maintaining or achieving convertibility—the necessary extension of the arrangements will in fact be granted. This decision also will continue in effect without any time-limit.

★



A final illustration of flexibility is provided by the fact that last year the Fund, for the first time, made use of the provision in Article 5 of the Articles of Agreement; this allows some modification of the normal limit on members' borrowing (that is, the amount that will not increase the Fund's holding of the member's currency by more than 25 per cent of the member's quota in any twelve-month period). One of these waivers was connected with a straightforward exchange transaction, and two others with standby arrangements.

This emphasis on flexibility should help the closer co-operation between the IMF and the European Payments Union, for which a strong plea is made in the annual report of the Managing Board of the EPU published in Paris this week. This points out that because it provides member countries with the machinery enabling them to adopt and maintain liberal trade policies, EPU will still have an important part to play during the transitional period pending a world system of convertibility. The flexibility of which the IMF is now capable—and which stands in happy contrast to the rigidities of attitude and techniques that constricted its policies in earlier years—will be put to exacting tests in the near future. These will occur in such matters as the provision of standby facilities for member countries and in closer co-operation with the European Payments Union; but most especially in the greater co-ordination with the trade rules of GATT which will certainly be called for when the reconsideration of that General Agreement on Tariffs and Trade takes place in Geneva towards the end of this year. It is, indeed, on the achievement of international working codes of trade and payments policies, and of appropriate harmony between them that the approach to convertibility on the part of sterling and other currencies now depends.

Higher Gear for Lorries

BRITISH manufacturers of commercial vehicles will be making their customary brave show at their annual exhibition at Earls Court this week-end with rather more reason to feel brave than they have had for the last three years. As the latest statistics of the industry show, production of commercial vehicles has at last begun to climb upwards, for the first time since 1950. The revival is still small—at the end of July it amounted to no more than a 7 per cent advance upon the depressed 1953 figures—but if it continues at the present rate for the rest of the year, 1954 may turn out to be almost as good as 1951, when 259,000 vehicles rolled off the assembly lines.

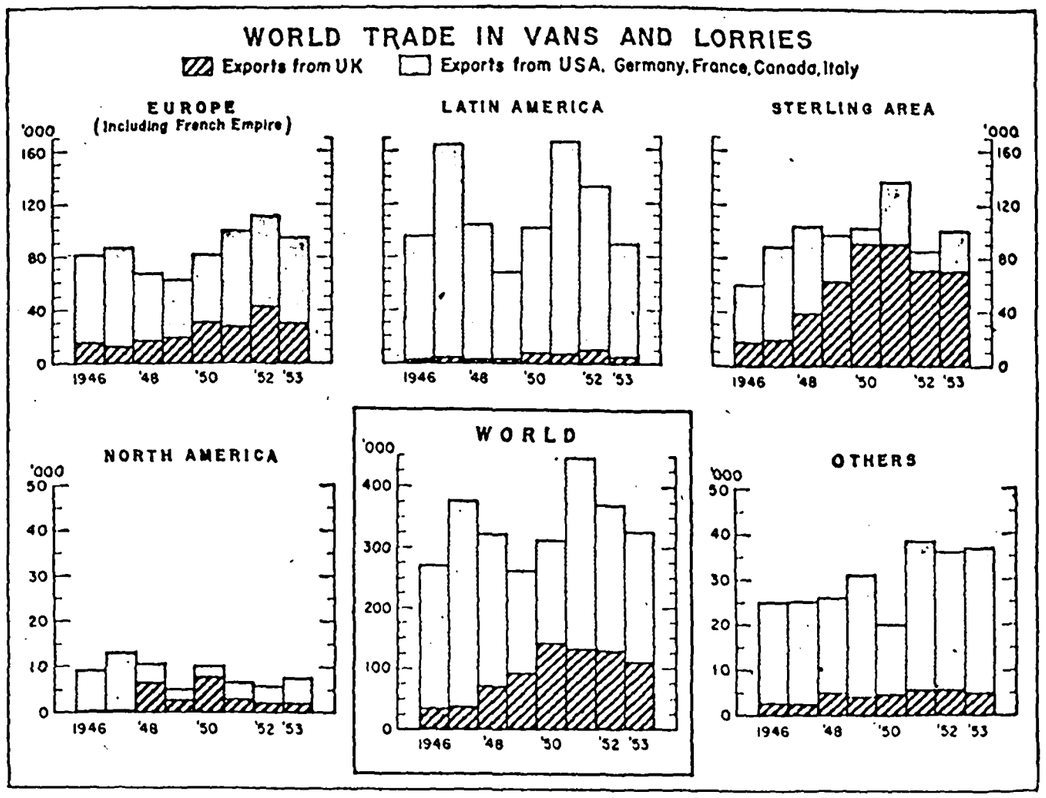
At the moment this recovery is precariously balanced upon bigger sales in foreign markets. The home market, which for so long has provided the van and lorry makers with a firm base for their export ventures, growing from 100,000 to 130,000 vehicles in the last seven years, dipped slightly at the beginning of this year. The latest return for July provides somewhat better news. Signs of improvement in the world market, on the other hand, are much more definite. The recovery started about a year ago, and has been felt by all the main producing countries. American manufacturers, for instance, have been shipping five vehicles this year for every four they sold in 1953. The United States, Britain and Western Germany still tend to sell commercial vehicles in different markets, separated either geographically or technically. The overlapping fringe between these markets, where intense competition takes place, has been widening. But it is mainly in the British industry's traditional markets that its successes this year have been chalked up; on the fringes, they have not.

Almost a half of the industry's exports in 1953 went to Australia, New Zealand and sterling area countries in Africa and south-east Asia—and shipments to these markets rose by 25 per cent in the first six months of this year. Elsewhere sales increased by 9 per cent or less. In Europe, where German competition is naturally fiercest, the British industry has made some notable advances in Portugal, the Low Countries and in Scandinavia, but in general British makes have not been making quite as much ground as some of their competitors. Complaints about competition during the recent recession competition tend to obscure the very creditable record the industry has built up for itself since the war. In the 'thirties British manufacturers had less than a tenth of the total world trade in trucks and 'buses; by 1950 they had carved out an export business larger than any other country. This leading position was lost as the world market shrank between 1951 and 1953, and the Germans started to push their way in again, but even in 1953, at the bottom of the trough, out of every three vehicles sold in export markets one had been made in Britain.

Will British firms be able to hold on to this substantial share of world business, or even increase it by venturing further on to the fringe markets? Glowing reports from salesmen in Australia are being tempered by the latest balance of payments stringency in that country. In other markets the easing of the dollar shortage has already lightened the task of American salesmen—as convertibility would lighten it further. The 25 per cent drop in domestic deliveries of commercial vehicles to the American home market has made United States manufacturers more than normally anxious to see their overseas sales graphs rise, though as yet there is no sign of "dumping." But if British goods and passenger vehicles are going to expand further they will have to face this competition and seek new markets in other parts of the world, particularly in Latin America where a quarter of the world's trade in these vehicles is to be found.

In future the industry will be playing more regularly upon its main opponent's own ground. Overseas needs in price, delivery, service, credit terms, and above all vehicle specifications will demand greater attention. At Earls Court this week makers are able to show that progress has already been made in the last direction. Heavier trucks designed specifically for work in overseas operating conditions have been given greater engine power rather than lighter weight or lower fuel consumption; passenger vehicles, however, are being built with lighter materials and underfloor engines to give lower operating costs and a bigger payload. The recent change in the regulations governing the dimensions and weights of goods vehicles using British roads was designed to help the industry to cater for the home and overseas markets at the same time, but the manufacturers still find that these markets are substantially different in their requirements.

Progress has also been made in the quest for lower vehicle and operating costs. Under the pressure of competition, prices have been forced slightly downwards over the last year or two. Large fleet owners have been getting larger discounts for multiple orders; and some overseas distributors have been paring down their margins. The lightening of order books has enabled most distributors to clear most of their arrears of orders, and delivery dates are noticeably shorter.



This search for economy in manufacture as well as design has brought several changes to the heavy and medium truck and 'bus industry, traditionally made up of some thirty or forty firms spread right across the country. Vehicle makers have moved backward into the engine and component fields, and forward to build up chains of assembling and manufacturing plants overseas, thus conforming to the tendency for erstwhile overseas customers to cultivate their own industries. Recent amalgamations at home have tended to make the two largest manufacturers of heavy vehicles, Leyland-Albion, and Associated Commercial Vehicles, even larger. Standardisation of components, on the other hand, has not been pushed very far in an industry of fairly short runs and a wide range of models. In the field of light to medium trucks, where American competition has always been strongest, the trend towards smaller diesel vehicles has gathered pace. The big car manufacturers, who can apply the methods and some of the components used to make cars to the construction of vans and small lorries, have now brought out vehicles of up to 3 tons unladen weight, equipped with their own interchangeable petrol or oil engines. Gas turbines are still under development for heavy commercial vehicles by several firms here and in the United States, but high fuel consumption and high initial costs still put the date for use outside the military field well into the future.

New registrations of diesel vehicles under 3 tons unladen weight have doubled in the last twelve months. By 1955 the industry expects to have 15-cwt, possibly 12-cwt, diesel-equipped vehicles on the market. Diesel engines may be cheaper to operate in the long run, but they also make a vehicle heavier; this is particularly important for vehicles of just under 3 tons unladen weight, at which point speed restrictions are imposed. But the efforts of vehicle designers to put lighter chassis and bodies on vehicles have been very successful; body makers, particularly, are becoming significant customers of the aluminium and plastic material industries. The exhibits at Earls Court illustrate new developments in this field as well as the way in which cab and vehicle design has improved, to the greater comfort of the driver and the greater safety of other road users. Articulated vehicles, mechanical loading devices mounted on the vehicles themselves, and the growing use of containers that can be handled just as easily by rail, road, or on the industrial truck inside the factory, are further examples of the way in which improved design is making road transport more efficient.

The dip in sales on the home market so far this year has been confined mainly to light and light-medium trucks in the 1½-ton to 2½-ton class, operating under "C" licences. For more than a year registrations in this size group have been falling. How far this drop is occurring because "C" licence holders are hoping to place with professional hauliers more of the occasional traffic that they have recently been carrying themselves in their own middle-weight vehicles is a matter of conjecture. This tendency seemed already to be discernible before nationalised transport began to sell off vehicles; it may increase as competition returns. But the industry is wondering whether the denationalisation of road haulage is not having other effects upon its market at home.

So far, the Road Haulage Disposals Board has sold nearly 8,300 of the vehicles owned by the nationalised British Road Services. Although the money to pay for these vehicles has been made fairly readily available by finance companies, the spending of £10 million in less than a year on these second-hand trucks is unlikely to leave the market for new vehicles entirely unaffected. Some two-thirds of the purchasers of BRS vehicles have been existing hauliers, willing to spend substantial sums on vehicles in varying stages of dilapidation merely to buy their way into long-distance haulage. To do this they might well be prepared to countenance a delay in their replacement programmes, such as these are, or in the rate at which they add new trucks to their fleets. The BRS fleet was only a small fraction of the total number of goods vehicles in use, though a more significant proportion of the heavier vehicles. Even at this stage it seems likely that nationalised transport will be left with a respectable fleet numbering perhaps 15,000-18,000 lorries, though its replacement programme at present obviously cannot assume so large a fleet. Since 1948 between £71 million and £93 million has been spent each year on new road goods vehicles; but nationalised transport has in fact contributed no more than £6-7 million, with the "C" licensed purchases forming the bulk of new registrations. Military orders to the tune of £80-90 million in each of the last few years have been adding further to the turnover of sections of the industry.

Although attention has naturally been focused upon the activities of the Disposals Board, it is still concerned with transferring the ownership of barely two per cent of the goods vehicles running on British roads. With an economy generally booming, particularly in the retail business where increased competition may lead back to greater use of delivery services and mobile shops, and the deliberate encouragement given to investment in the budget this year, manufacturers of commercial vehicles are hopeful that they can keep home sales slightly on the increase. Even the bus and coach makers have found their orders going up. But will the Government press ahead in making the road system adequate to carry the extra road traffic that these bigger sales of vehicles will bring?

Business Notes

Retreat and Rally

WHEN the last Stock Exchange account opened three weeks ago, hopes were still running high. Prices were hardening after an earlier relapse and speculators were buying store shares. But hopes were certainly dashed when the bull market in store shares was punctured. A parallel situation developed at the beginning of the new account this week. On the first day, there was a selective demand for equities, concentrated on oil shares, OFS developers, uranium producers and later on copper shares. This rally, which broadened out slightly on Thursday, may be little more than the usual reaction to the pronounced weakness in the market at the end of a difficult account, which had left operators in store shares and to a lesser degree in gold shares with stinging losses; these they tried to cover by undoing their original purchases and selling other equities. As a result the *Financial Times* ordinary share index, which at the beginning of the old account stood at 171.4, had fallen by the end of the account to 169.9, precisely 2 points lower than the all-time peak touched on August 30th. In spite of the selective rally in prices on Wednesday, the index slipped again, to 168.8, but buying was then concentrated on shares outside the industrial blue chip range; the only market leader that was really in demand was ICI, in advance of the interim dividend of 4 per cent.

The shake-out in store shares—and a dismal settlement day in prospect—must cause the hopeful operators in industrial equities to pause for reflection. So, too, must the switch in interest to Kaffirs, a portent which is sometimes associated with weakness, rather than strength, in the industrial market. There are, too, many new issues, as well as the Imperial Tobacco loan stock offer, hanging over the market. And there are more—the autumn refunding operation, a Gas Board loan and probably further steel issues not far over the horizon. Gilt-edged prices, however, are edging up; the tap price of "Eternity 3½'s" was raised another ⅛ to 97⅛ on Wednesday and the pointer of the economic barometer is still higher than "set fair." But retreat and rally usually imply the need for realignment and consolidation.

The Wounded Speculators

SPECULATORS in that hive of speculation, the store shares group, had a sad time in the stock exchange account that ended on Tuesday. Early in the account the bulls had charged recklessly on, lured more by the newly quoted stocks of Canadian and English Stores than by the better known counters. But the bull as well as the bull fighter knows "the moment of truth." A pause for reflection was enough to bring prices tumbling. In particular, speculators had to reflect on some awkward questions: how soon would Canadian and English Stores pay a deferred ordinary dividend of 250 per cent (a rate on which distributions on the other three classes of this company's shares turn) and how long would its managing director let the company have the interest-free use of his loan of up to £3½ million? Nervously reckoning the heavy losses which faced them when settlement day came round, some of the speculators had to sell in the falling market. Having burnt their fingers, they were not so prominent in the market on the first days of the new account; since some of the stocks had suffered so badly the significance of their slight rally may be little more than technical.

Special factors are always at work in this sector of the market, influencing the prices of individual stocks. Recently there has been a long list of them: the offer by Great Universal Stores for the shares of Hide and Company; the

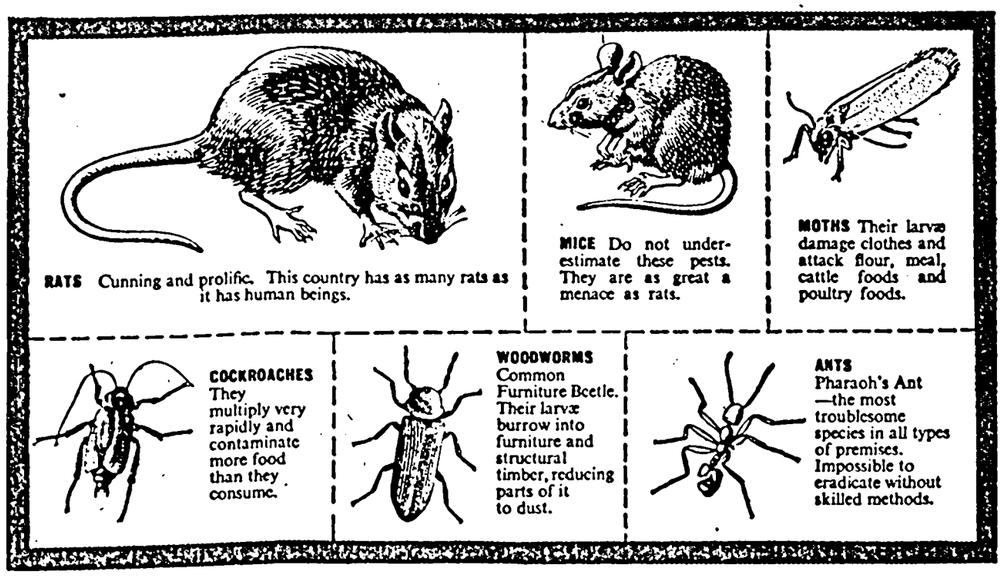
*Based on last full financial year's dividend, after adjustments for free scrip issues. 14/- shares.

counter offers by Great Universal Stores and Macowards for the shares of Jones and Higgins; and the maintained interim dividend of United Drapery Stores on its ordinary capital as increased by a 100 per cent free scrip issue. But these factors all spring from the same root. The continual process of bid, take-over and amalgamation gives the market speculator his chance because he knows that there are undisclosed asset values in many of these companies' properties. (The directors of Jones and Higgins, for instance, put an asset value of £6 on the company's shares.) The directors know it, too; hence they are more liberal than most with their dividends and scrip issues. Such blue chips as the Woolworth ordinary stock stand on a different footing; here earnings are the key. Inevitably, the announcement of a 50 per cent free scrip issue from Woolworth sent dividend hopes soaring and the price of the 5s. ordinary stock units up to a new peak of 90s. 3d. on Thursday. But in all these cases, speculation was doing its job of trying to establish a true economic price.

Activity in the Capital Market

THE ability of both private and institutional investors to absorb new capital issues is being tested to the full. There was little of the customary respite in the capital market during the holiday months and now September has brought its usual spurt in activity. The successful "rights" issue by Vickers, which was covered more than one and a half times by excess share applications alone, served as the prelude to two other "rights" issue of a smaller calibre. The impending "rights" offer by Olds Discount of 920,000 5s. ordinary shares at about 12s. each (compared with the current market price of 22s. 6d.) is a direct successor of the easing of the restrictions on hire-purchase credit. The directors of this industrial banking company, which has a considerable interest in financing hire-purchase contracts, state that the business has been running at a higher level than in 1953. The second "rights" issue, that by the British Tabulating Machine Company, is also designed to provide additional capital. In addition to the "rights" offer of 356,250 £1 ordinary shares at 22s. 6d. each, some 168,750 £1 ordinary shares are being placed at par with the Finance Corporation for Industry. That issue is linked with the offer to the public of £2,250,000 of a 4½ per cent debenture stock (1975-80) at 98½, for these loan proceeds will be used to repay an outstanding loan of £2,250,000 from FCI.



A further claim on the purses of British investors is made by a repatriation of British capital from the United States arranged by Lazard Brothers. This house has agreed to buy from the Electric Storage Battery Company of Philadelphia its £1,573,688 holding of the "A" ordinary stock of the Chloride Electric Storage Company, which will be offered to the public at 63s. each, free of stamp. In the opposite direction to this offer stand the arrangements for financing the construction of Roan Antelope's new electrolytic copper refinery at Ndola, in Northern Rhodesia. The estimated development cost of £3 million will be met as to two-thirds by the producer, Roan Antelope, and as to one-third by a consumer, British Insulated Callender's Cables, by periodic subscriptions at par for the ordinary shares of Ndola Copper Refineries. Many facets of the capital market—the export and repatriation of capital as well as domestic issues—have been on display this week. They have this in common: by making their calls on investible funds they must ultimately have some effect on stock market values.

Building Societies Argument

THE attempt to stir up newspaper readers to demand a reduction of the rates that building societies are charging for mortgage loans is not a very helpful contribution to a matter of serious discussion. There has been evidence for at least two months past that sharp differences of opinion about mortgage rates were exercising the building society movement. Last July, rumour credited the Halifax Building Society with the intention of reducing its mortgage rates—from 4½ per cent to 4 per cent—and this, the largest member of the movement, is now thought to be preparing

These Loathsome Pests

. can destroy your good name—ruin your goods!

CALL IN THE D SERVICE NOW!

Are these hideous pests invading your property, spreading disease, offending all who see them and costing you pounds? It is no use merely driving them away—pests are sure to return. That is why tackling them unaided is a waste of your time and money. Only the expert can do this job efficiently, economically and safely. The one *permanent* remedy is the D Service.

What the D Service does

This nation-wide service, operated by Disinfestation Ltd., deals scientifically and decisively with all manner of pests. It has branches in every county, staffed by men skilled in the latest methods of pest destruction.

The action of the D Service is three-fold—

Detection. Experienced surveyors examine your premises and decide the nature and extent of infestation.

Diagnosis. Experts map out the source of invasion, the route taken by pests and the places where they breed.

Destruction. The particular pests involved are scientifically *destroyed*—not merely driven away.

Nor does the D Service stop there; re-infestation is guarded against by regular inspection. Act now! Every day you delay, the pests are multiplying and more damage is being done. Fill in and post this coupon right away. All enquiries are treated in strict confidence.

DUKE'S COURT · DUKE STREET · ST. JAMES'S · LONDON · S.W.1 and throughout the world

for this reduction from October 1st. This week, Mr F. E. Lumb, the chairman of the Building Societies' Association, spelled out, more explicitly than earlier statements of the Association had done, its reasons for differing from the intention of the Halifax to reduce its mortgage rates.

It is a reasoned case; whether it is a conclusive case depends on the accuracy of the Association's judgment on the reactions of building society shareholders to a reduction in the rates paid to them. For, in Mr Lumb's view, the present margin between a 4½ per cent borrowers' rate and a 2½ per cent investors rate is fully absorbed:

Estimated tax liability	£1 1s. 0d.
Management expenses	11s. 7d.
To reserves	7s. 1d.
	£1 19s. 8d.

Management expenses per cent have fallen (as they should, given the movement's expanded resources) and the reserves have not been excessively expanded. Therefore, the key to lower mortgage rates, in the Association's view, is the acceptability of lower investment rates. And given the competition of other savings media and "the evidence that our present funds, large as they are, are insufficient to meet the current demand for mortgage loans," the Council of the Association "has no hesitation in stating its considered opinion that the share rate should remain at 2½ per cent for the present"—a rate to which it was raised in 1952—and that 4½ per cent for borrowers is "fair and reasonable."

The fact remains, however, that the Halifax seems to attract money at any average rate of 2¾ per cent. Its intended reduction of mortgage rates to 4 per cent thus implies that it can work on a margin of 1¼ per cent. It is unlikely that the Halifax will depart from the stringent lending standards that it has always imposed and set a booming pace for new advances, but the fact that it will be lending on level terms with the local authorities will not leave the other large societies in a comfortable competitive posture. Sooner rather than later, some of them will be irresistibly impelled to re-examine the relation between their borrowing and lending rates, and to see whether all the factors are so immutable as the Association has argued this week.

Humility in the Coal Board

The terms in which Sir Andrew Bryan last week discussed "the acute tensions" within the National Coal Board "that threaten to strain the industry beyond its breaking point" were deliberately oracular; but he made it clear that he was not talking about labour relations alone. The human problems that now beset the board, in his view, are more subtle and complex than any simple projection of "the old strife between the cloth caps and the silk hats"; indeed, they have yet to be fully identified, let alone solved. Two major elements in such problems, he felt, were the size of the industry, though this had its advantages as well; and the peculiar legal allocation of responsibility for mining to owners—now the one huge nationalised coalowner—and to managers, which he thought exaggerated the tendency in all large organisations to look at all problems "from the top downwards." In his own view, the proper responsibility of every executive, at all levels in the hierarchy, was to explain the technical objective, and then apply himself to finding how to help his subordinates to get on with the job.

Sir Andrew is one of the country's most distinguished mining engineers, and he has a probably unequalled knowledge of the way in which morale affects mining. It is useful to have a member of the board concentrating on the significance of these problems, which certainly are straining the industry's chain of responsibility. Most outside observers would probably agree that they arise mainly from the vast size of the Coal Board—plus perhaps the further fact of public ownership, with the continued, pitiless and not always understanding public scrutiny which that involves. Moreover, an industry dependent to so large a degree upon human effort, despite mechanisation, must put its human relations high on every agenda, and Sir Andrew's interest in "the work of the social scientist in industry" is understandable.

Nevertheless, not everyone will accept his chosen emphasis without hesitation. Technically, the immediate need of the coal industry is perhaps to spread the benefit of a dangerously small supply of first-class managing talent—in all branches—as widely as possible through the mines that it hopes to keep operating. If that should generate further internal tensions in the short run, as is likely, such troubles are something that the Coal Board has to live with for a while. So much the more need, admittedly, to identify the tensions and try to dissolve them, and to make the influence of the industry's too few good men everywhere as acceptable as possible. But whether this is quite the right time to demand more humility from managers in coal—and particularly at each individual pit—is highly questionable.

Talent for ITA

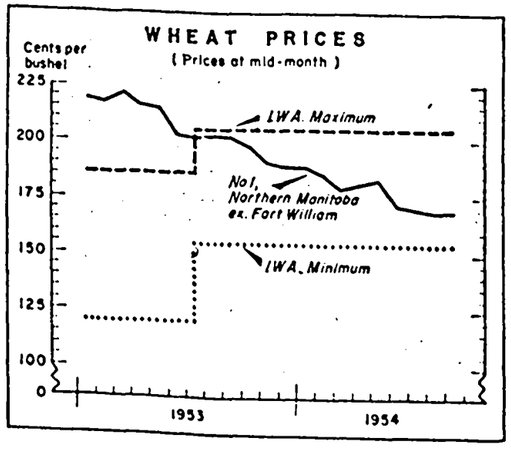
Talent is generally considered to be the most scarce resource in running television programmes, and the BBC has for some time quietly been signing up a number of its most valued performers to long-term contracts, at fairly generous rates, that will preclude any programme contractors to the Independent Television Authority from overbidding their services. The latest entrant to the field of would-be programme contractors to the ITA seems to be primarily organised with this principle in mind; it constitutes a very formidable assemblage of contractual claims on the talent that television must use. This Incorporated Television Programme Company unites two of the largest organisations in the theatre business, a very large performers' agency, the main British representative of commercial radio interests abroad, and representatives of the cinema and publicity businesses.

It is, therefore, a very powerful newcomer, with whom some of the names already disclosed among intending programme contractors may not find it easy to compete. Those in the field already include Granada Cinemas, Odhams Press, and the Associated Broadcast Development Company, an organisation formed by radio and film companies that can probably call upon greater administrative and technical resources than any other private group, but has not as

yet indicated which performers it can corral to present. Associated British Film Corporation, the second of the country's film combines, has an application in to the ITA that now appears to be more serious than the merely defensive applications put in by some other companies in businesses with which commercial television may compete. The J. Arthur Rank Organisation this week consolidated its interests in screen advertising and the making of short advertising films, mentioning specifically that it would be prepared to make short programmes for television; but it repeated that for the present it would not apply to become a programme contractor.

British Bicycles in America

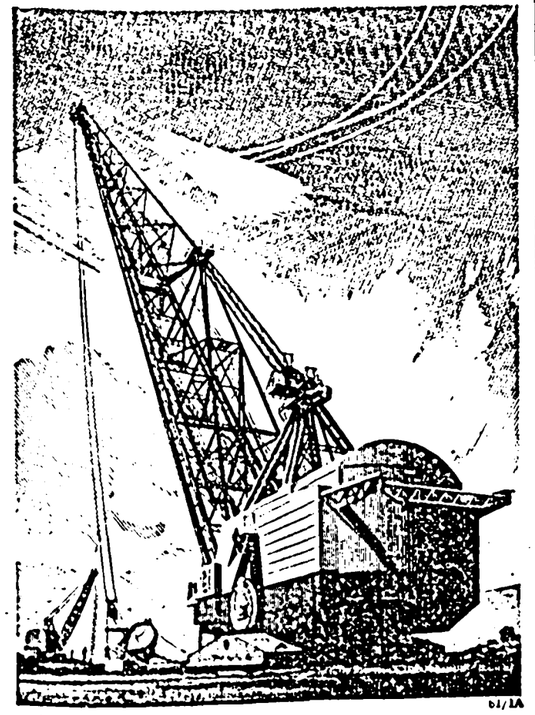
IN 1953 the United States became Britain's most important overseas customer for pedal cycles, and has remained so this year; and Britain is by far the largest supplier of foreign bicycles on the American market. Last year's exports to the States totalled more than 400,000 machines, about a fifth of Britain's exports and two-thirds of America's imports; during the first eight months of this year the numbers sent there from Britain have increased by about 12 per cent while total sales of American-made cycles, according to their trade lobby, have fallen by about 45 per cent. This is the background against which the American cycle manufacturers this week began presenting their case for increased protection before the United States Tariff Commission.



It is worrying the British cycle industry considerably. The success of the foreign cycle, and particularly of the British makes, in the United States, seems to have stemmed primarily from the fact that it is a real means of transport and not a blown-up toy motor-cycle. The showy, clumsy American cycle, weighed down by its thick frame and wheels as much as by the dummy petrol tank it often carries, was at one time considered something that the American cyclist would never consent to give up; but since 1950, when sales of foreign cycles for the first time began to form a significant share of the American market, he has been registering his vote with dollars for something less ponderous. The American makers, so far, have not altered their own designs to any great extent, though some of them have begun to distribute British cycles under their own trade names, and one or two have begun to make lightweight cycles. But the current tariff—which ranges from 7½ to 15 per cent—does not prevent British and other foreign cycles from competing on price; hence the more traditional American industrial reaction to competition from overseas with a cheaper and better product.

Reprieve for Wheat

NATURE sometimes steps in to relieve her own—and man's—prodigality. Bad weather has probably rescued world wheat prices from the threat of a further decline this year. After three bumper harvests in succession, Canada's wheat crop has been drastically reduced. In the United States the total crop will be smaller than was expected when the acreage restrictions were announced. The reductions in North America are admittedly trivial in relation to the total supply, but they have at least prevented the surplus from getting worse. Poor harvests in most European countries, and the running down of stocks, have increased the demand on the world market. Buyers are still cautious, but they are perceptibly less bearish than



NORTH AMERICAN CROPS
(Millions of Bushels)

	Carry-over into 1954/55	Aug. 1st Estimate	Sept. 1st Estimate	*1953/54 Crop*
Canada	583	513	378	*614*
United States ...	903	978	962	*1,169*

before. Prices may well hold steady for some time, or even rise a little. When the International Wheat Council meets in London next month, the atmosphere should be more relaxed than at its earlier meeting in June.

There is less reason now to expect the United States government to drop its price to the equivalent of $1.55 a bushel for No. 1 Manitoba wheat, the minimum in the International Wheat Agreement, and call on importers to take up their quotas in full. The government has been pressed to do this to increase American sales at the expense of the "outside" exporters, principally Argentina. The threat of such action itself has evidently induced the importers to buy more wheat under the agreement. In the first seven weeks of this season purchases totalled 2.1 million tons, one-fifth of the total quotas, and nearly twice as much as in the same period of last year. Wheat prices may still be threatened from other directions, however. If the United States pushes sales of wheat too vigorously under its expanded programme for the disposal of surplus commodities, other exporters could be forced to retaliate by cutting prices. There is also a possibility that Russia may be an aggressive seller of wheat later in the season.

Whether quarrying ore or digging a garden—Nickel helps

This Rapier W1100 walking dragline, the biggest of its kind, can take a 30 ton bite out of the ground and dump it as much as 500 feet away, all in the space of a minute. It works night and day removing the "over-burden" from the ironstone beds at Corby, Northamptonshire to help Britain produce more steel. The little motor cultivator, too, works hard on the land helping the market gardener produce more food. Its engine may be of only 1 or 2 h.p.—the dragline can call on 3000 h.p.—but it is nevertheless game for a real job of work. Nickel plays a part in both of them, strengthening and toughening the steels and alloys used for highly stressed parts. Throughout industry nickel goes into the equipment that does the toughest jobs, helping it to perform better, making it last longer.

What is she in YOUR life?

By the time the day is out they'll be engaged. He has only to pop the question. A great moment for her. A great moment for him. And a great moment for you too.

Why? What is she in your life?

She is one of the millions of young people who are looking ahead. So is he. Soon they will be forming buying habits and deciding on brands to buy. Like most of their generation, they are surprisingly discerning but they are open to persuasion, and if they choose your products now they will continue to choose them for the rest of their lives.

With its realistic approach to the problems of our time, the Daily Mirror has gained the biggest daily net sale on earth (it exceeds 4,600,000) and, according to the I.I.P.A. Survey, it has over 1,700,000 more readers than any other national daily. The majority of these belong to the vigorous, "keen to get on", younger generation. Yes, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. Daily Mirror readers are young readers. Your customers to-day . . . next month . . . next year.

Huge Expansion for Vauxhall

THE £36 million expansion for Vauxhall Motors, announced in London this week by Mr Harlow Curtice, president of its parent company, General Motors, was described as providing for the doubling of Vauxhall's current rate of exports. This was put at 57 per cent of a total output of some 130,000 vehicles a year, thus implying an increase of about 20,000 in the annual output of vehicles ; But Mr Curtice spoke also of General Motors' confidence that car ownership in Britain will expand at an increasing rate, so that the five-year programme of investment for the company may well raise total output far more than that.

Mr Curtice discounted the rumours that Vauxhall has plans to build a baby car following its extensions at Dunstable and at Luton—but he admitted that the company is thinking in terms of a smaller car than it now produces. Vauxhall, probably the industry's third largest producer, at present turns out the Wyvern and Velox, models in the medium and larger parts of the popular-priced range ; it has no car to compete with Ford's Anglia and Prefect or the British Motor Corporation's Morris Minor and Austin Seven.

Proof from Mr Clore

THE proof of any pudding is in the eating, not in the mixing. As was noted in these columns last week, Mr Charles Clore is mixing two puddings with the apparent object of separating the boot and shoe business (concentrated in Freeman, Hardy and Willis) from his other more wide-ranging interests (grouped under the control of J. Sears). Further ingredients were added to the mixture last week-end. The long expected 100 per cent free scrip issue from Bentley Engineering, taking the form of non-voting "A" ordinary shares, was announced, accompanied by the virtual promise that a dividend of 25 per cent will be maintained on the doubled capital. Another proposal will convert the preference share issues of Bentley Engineering and its two subsidiaries, Mellor Bromley and Wildt and Company, into a single class of 6 per cent preference shares ; the precise terms of this consolidation are still under discussion but it is believed they will include a small issue of the Bentley Engineering "A" ordinary shares. (There has also been a hint of another possibility, a free scrip issue from J. Sears itself.) The intention behind these moves, and those announced last week, is clear: it is to separate the boot and shoe business, which has to carry the cost of the original Sears property deals in the shape of a higher rent roll, from Mr Clore's other interests (including hosiery knitting machines and shipbuilding) which were created partly with the help of the proceeds of the property deals.

The minority shareholders in J. Sears seem to have no cause for complaint with these arrangements. They were told almost from the outset that the money arising from the property deals was to be invested in "sound and progressive businesses." The modernisation of some of the Freeman, Hardy and Willis shops also makes it clear that part of the money is being spent on invigorating the boot and shoe business. Nor should the minority shareholders forget that Mr Clore's original bid would not have appeared so worthwhile if all the money released from the Sears property deals had had to be ploughed back into the boot and shoe business to set it firmly on its feet. In any case, those shareholders who were content to retain a minority interest in the Sears equity tacitly threw in their lot with Mr Clore, and accepted the fact of his control. They may have gone along with him in the hope of a cash distribution, but they must have recognised by their investment that the final decision was his. They can hardly grumble if he has decided to invest the money and not to distribute it.

Beyond that, judgment must be deferred. The soundness of Mr Clore's choice of investments can be tested only by their future earnings record. As for Mr Clore's methods, his past history shows that he has moved in and out of various businesses, usually carrying some profit with him. Unconventional cooks who mix their ingredients with a dash cater for adventurous palates.

A More International Bank

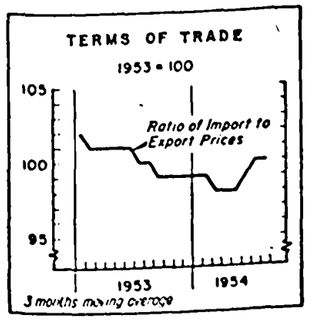
A WELCOME broadening in the sources of finance of the International Bank for Reconstruction and Development has been announced this week by the Bank's president, Mr Eugene Black. An issue of the Bank's bonds in US dollars to the value of $50 million has been placed with private and institutional investors in twenty-three countries outside the United States. This is the first such issue to have been undertaken by the Bank, though dollar bonds marketed in the United States have been available for subscription abroad. It is encouraging, therefore, that the issue was an unqualified success. Applications reached $78 million, and allotments had to be scaled down accordingly. Mr Black justifiably claims that this reflects not only the improvement in the world's dollar balance but also an increasing interest on the part of foreign institutional investors in international investment and "the willingness of the Bank's member countries to co-operate [with the Bank] even to the extent of allowing the Bank to raise a part of its dollar requirements in their investment markets."

Investors in Britain had some share in taking up the Bank's dollar securities ; it was handled by a group of six merchant banks, but it was a smaller one than many of them would have wished. The authorities did not make available any fresh supplies of dollars to finance the investment, so that participation was possible only through switching from other dollar securities.

The issue takes the form of Five-Year Bonds, maturing in September, 1959, and carrying the attractive interest rate of 2½ per cent. It carries further what Mr Black deems "the most significant development affecting the Bank over the last twelve months"—the rapid expansion of the market for its bonds abroad. A total of $225 million of dollar bonds has now been offered by the Bank in the past year ; and of this fully $100 million has been taken up by the investors outside the United States, who have also taken up issues in Canadian dollars, Swiss francs, Netherlands guilders and sterling to a total equivalent to an additional $70 million. The World Bank is becoming truly international in form as well as name.

Royal Dutch-Shell Earnings

THE directors, managers and accountants of the Royal Dutch-Shell group deserve congratulations for their half year's statement of profits on two counts. First, the stupendous task of compiling the results of this world-wide organisation has been accomplished with speed and without pretension. Secondly, the figures themselves make an excellent showing. They are, of course, subject to audit and they might be best regarded as indicators of a trend in earnings rather than as precise accounting aggregates. The group's net income before tax amounts to £124.7 million for the six months to June 30th, about £12 million higher than the untaxed profits of the first half of 1953. This improvement, which is slightly better than those shown by many of the half yearly reports of American oil companies, is in keeping with a gradual improvement in trade and firm prices for oil. The seasonal element in the profits of such an international organisation is likely to be small—at least the 1953 figures do not suggest the contrary—and for the past half year the interim results suggest most satisfactory results for 1954 as a whole.



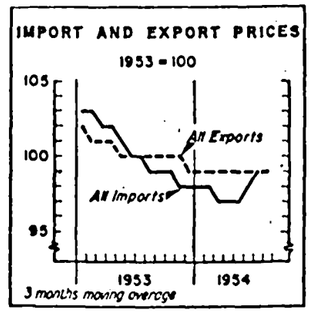
ESTIMATED EARNINGS OF ROYAL DUTCH-SHELL GROUP
(£'000's)

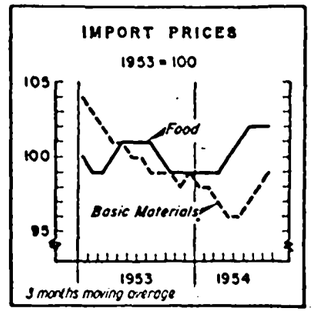
	Year ended Dec. 31, 1953	Six months ended June 30, 1953	Six months ended June 30, 1954
Net income, before tax	230,229	112,750	124,716
Taxation	83,074	43,145	46,646
Minority interests	16,742	7,083	8,877
Net income, after tax	130,413	62,542	69,193

No part of the net income of £69 million has yet been distributed to the parent companies, Royal Dutch and "Shell" Transport and Trading, which share, respectively, in a 60/40 ratio. But the figures have strengthened the market's belief that last year's dividend rates will be maintained on the ordinary capitals as increased by the 20 per cent free scrip issues ; the Shell stock units were marked up 10½s. and the Royal Dutch units to 43½ after the statement was published. Its publication and the quarterly statements that are expected next year spring directly from the listing of the Royal Dutch stock units on the New York Stock Exchange. Could not other oil companies—and, indeed, some of the leviathans in other industries—follow this lead without the help of a special spur ?

Iranian Oil Agreement

THIS week an aircraft has carried the signed original of the oil agreement with Iran from Teheran to New York. Another aircraft has taken an advance party from London to Abadan to prepare the way for restarting the refinery. The text of the agreement has been published simultaneously with Dr Amini's appeal to the Majlis to ratify it—which is bound to take some time. The agreement itself covers only the relations between the members of the Consortium and Iran ; the agreement between Anglo-Iranian and the other members of the Consortium is a separate matter ; so are the constitutions of the operating, refinery and holding companies through which





Rise in Export Prices

The recent slight worsening in Britain's terms of trade was checked in August. The ratio of import to export prices fell by two points to 99 (1953 = 100), the level that has ruled, with minor fluctuations, for the past year. Import prices as a whole were unchanged at 99 for the third successive month, but export prices, which in July fell by one point—the first change for eight months—rose by two points to 100. The rise reflected a general advance among all the main groups of manufactures. Metals, engineering products and textiles all rose by one point, and "other manufactures," the miscellaneous group in which chemicals are the largest item, rose by three points. The index figures in the charts have been expressed as a three months' moving average to illustrate the trend more clearly.

This favourable movement in the terms of trade serves to emphasise that no marked deterioration is in prospect. Competition in world markets should restrain a rise, and the buoyancy of demand a fall, in prices of manufactures. And barring another political crisis, prices of primary products are unlikely to rise much unless there is a sharp recovery in American industrial production.

the consortium will work. The treaty between Iran and the oil industry's club is, so to say, published to the world; but the rules of the club itself are not.

Hence, on compensation to AIOC, the treaty sets down the origins of the net payment of £25 million, payable by Iran in ten yearly instalments from January, 1, 1957. There is nothing in it about the consideration payable to AIOC by the other companies. It also sets out the elaborate arrangements for writing off refining and operating assets by a charge of £6,700,000 a year for ten years, and by similar ten-year extinction of new assets—all such provisions being chargeable as operating expenses and therefore moderating the net profit in which Iran has a 50:50 share. If the care that the legal draftsmen have exercised was the sole condition of success, the agreement ought to work satisfactorily for all parties. It is now for Iran to make success final and real.

Diverging Trends in Advances

THE quarterly analysis of bank advances published by the British Bankers' Association once more contains as its most striking feature a contrast between the voracity in the demand for bank finance displayed by the public sector of industry and the limited nature of the extent of the demands of the private sector proper. Total advances between mid-May and mid-August increased by £40.1 million; but of this total all but £350,000 is attributable to an increase in borrowings of the public utilities group. The first call on the Electricity loan launched to fund bank borrowing just missed the August make-up, and the utilities' borrowings have accordingly leaped to the record level of £158.0 million. Moreover, local authorities increased their borrowings in the three months by £15.4 million, bringing their total overdraft to the highest figure for three years, and net loans outstanding to personal and professional borrowers rose by a further £3.4 million. Private trade and industry, which accounts for the great bulk of the remaining groups in the classification, thus actually reduced its borrowings by some £19 million in the three months.

It is important, however, to see this fall in its true perspective. The high summer is seasonally a period in which a number of important groups, such as food, drink and tobacco and retail trade, reduce their calls on bank finance, and the fall in private trade and industry's indebtedness to the banks in this quarter was in fact much more than accounted for by the repayments of these two groups, at £22.6 million and £12.8 million respectively. Moreover, the net repayments made by the private trade and industry groups were considerably smaller than the repayments of £41.2 million made in the corresponding months of 1953. Last year, moreover, these were accompanied by repayments of £34.2 million made by the public utilities from the proceeds of the public issues of the BEA and of the Gas Council, and total advances in the three months to August, 1953, actually fell by £76.6 million, in contrast with this year's increase of £40.1 million.

The only important industrial group, apart from food, drink and tobacco and retail trade, that made significant repayments to the banks in the three months to August, was the small coal mining group, which reduced its overdraft by 30 per cent, to £1.4 million. As many as twelve of the nineteen groups that can be specifically classed as representing trade or industry registered an increase in borrowing over the three months, but on the whole the increases were quite small. The miscellaneous group increased its borrowing by £8.4 million to £117.1 million; agriculture and fishing by £7.4 million to £216.8 million; and the engineering group by £3.6 million to £135.9 million. Industry, it appears, is still adequately provided with liquid resources of its own to finance booming levels of activity without appreciable additional recourse to the banks.

Shake-out in Coffee Prices

THE coffee market is still troubled by the events of last month in Brazil. The devaluation of the minimum export price, the steep drop in prices that followed, the death of President Vargas and the uncertainty about the financial measures to be taken by the new finance minister have completely destroyed market confidence. The New York Exchange remains extremely nervous, and prices are fluctuating with each breath of rumour from Brazil. Buyers are prudently taking only their minimum needs while they await a fresh announcement by the finance minister and news of the flowering of the 1955-56 crop in Brazil. Brazilian "superior" grade coffee is now about 567s. a cwt fob Santos, a drop of some 160s. a cwt in six weeks and roughly 230s. below the peak reached early in April. Colombian coffee, which is being supported by official buying both in the interior and New York, is about $88 per 50 kilos fob, but some exporters are able to offer at about $82.

If the new finance minister, Senor Eugenio Gudin, can restore confidence to the market, the shake-out in coffee prices can do nothing but good. Extremely high prices earlier this year were turning the public away from coffee; now it is probable that consumption will recover. In the United States, which is by far the largest consumer, retail prices have been reduced by between 10 and 15 cents a lb, and some shops are charging less than $1 a lb in the bag. The shortage of coffee has not disappeared, but increased production in the smaller producing countries as a whole may offset the drop in the 1954-55 Brazilian crop. When prices fall, coffee appears from the most unlikely places.

Preparing for the Tin Agreement

THE International Tin Agreement was brought another step nearer to realisation by the meeting of the interim committee in London this week. The meeting was attended by all the signatory countries, thus constituting *de facto* the Tin Council. The statements of delegates indicated that the agreement should be ratified in time to enable the council proper to meet in December. It will then decide when the agreement is to come into force. The council will probably choose the earliest possible date, for the American strategic contracts, which are absorbing the

STEP UP OUTPUT STEP DOWN COSTS

Can you see at a glance what your furnaces contribute to manufacturing costs? Almost certainly, of course. But how far is that information broken down? Can you see at a glance the effect of your choice of refractories? You can't? Neither can many other people whose bread and butter comes out of a furnace.

Yet a change in the refractories lining a batch furnace can increase its output by 30 to 50 per cent or even more. Morgan M.I. refractories* can do this. They give you the output of four furnaces from every three—or even of three from every two ... because they soak up far less heat than firebrick.

These are not questions of technical detail, but important factors in output, that is why the choice of refractories should be considered at the highest level; where its overall impact on costs can be recognised; where the extra cost of such refractories as ours can be seen in wider perspective.

* M.I. bricks are low heat-storage refractories which can be used as a direct furnace lining up to 1540°C (2800°F). They are made on modern continuous plant under stringent quality control and every brick is ground to size. Full technical details are available on request and our furnace engineers are always pleased to have the opportunity of discussing special problems in the use of these, or any other, Morgan refractories.

The "Three R's of industry"

The three basic requirements of a successful industry are an efficient technology, commercial vision and vigorous scientific research. To foster all these at every level of the United Steel company's orginisation there have been established comprehensive recruitment and training schemes for developing the talents of all who enter the company's employ. Other schemes, planned on a long-termed basis and embracing every degree of skill and ability, provide the continuous reinforcement and renewal of staff from foreman to management level which are essential in a living organisation employing more than 30,000 people in its various undertakings. The educational policy of United Steel has recently been extended to the creation of a university fellowship in research.

FOR NEW IDEAS ✻

ON OFFICE COPYING

Is everyone in your business adequately briefed on his job? Does everyone get copies of letters, reports, memoranda, affecting his work? Are those copies accurate? Do they add too much to your typing costs? The Man from Remington Rand will be glad to analyse your office copying needs, and prescribe the equipment to meet them.

✻ *THIS IS REMFLEX*

It makes an accurate, positive copy—of anything written, typed or drawn—in less than two minutes, at much less than copy-typing cost. Any office junior can use and maintain Remflex, in any office corner. It provides a copying service that is completely reliable and can't make mistakes.
Does Remflex sound the answer to your copying problem? Let us prove that it is!

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1. Also at Manchester, Glasgow and London. Works at Birmingham, Wakefield and Birkenhead.

surplus, expire in March. If the council immediately gave the producing countries three months' notice to make their contributions to the scheme, the manager of the buffer stock would have cash to buy tin when the surplus appeared on the market.

The committee agreed on the draft rules of procedure for the council and drew up a draft agenda for its first meeting. The French proposal that the maximum price should be lowered from £880 to £840 a ton was placed on the agenda. As France had already obtained an assurance of support from certain consuming countries that also have producing interests, its proposal may be accepted. The committee also agreed to propose M. Georges Peter, chairman of the interim committee and of the management committee of the Tin Study Group, to the chairmanship of the council, and on the names to be proposed for the other appointments.

Better than a Bullock

QUITE justifiably, Viscount Halsbury this week recounted with a certain flourish the origins of Sir Harry Ricardo's new specialised steam engine—a small prime mover designed specifically for Eastern countries that cannot afford conventional fuels for the power they need so desperately. The idea—which has become the first private invention brought to fruition, or at least public presentation, with the support of the National Research Development Corporation headed by Lord Halsbury—first arose in conversations between scientists, including Sir Shenti Bhetnagar in India and Professor P. M. S. Blackett and Sir Ben Lockspeiser in Britain. Sir Harry Ricardo learned of the problem—which can be summarised in the fact that to run a 5 h.p. diesel continuously in every Indian village would involve a yearly bill of £125 million for imported fuel. He thought of substituting a small steam engine that could burn everything—from oil, gas, coal to dung.

The idea was simple enough; but to design a small steam engine that with its boiler could compete in cost with a diesel was not. The NRDC gave Sir Harry a research and development contract to turn out a prototype; then placed small production orders with engineering firms. For some months, finally, it has been testing these at the Sondes Place Research Institute, under the supervision of its consultant, Brigadier Cox, who erected the Sindir fertiliser plant in India. It demonstrated these prototypes, doing some of the jobs they might be called on to do, this week, and now hopes that manufacturers will apply for licences to manufacture the various patentable features of the Ricardo engine. The engine is intended to replace the bullock, for which Lord Halsbury had few good words to say:

> a prime mover with a high draw bar pull at low speeds; its velocity is limited at low speeds; it is useful for one month or at most two months in the year and has to be supplied with a constant fuel consumption for not less than 10 and perhaps as many as 11 months in the year. Even in respect of its one virtue, the ability to live and reproduce its kind off the land, it is hopelessly uneconomic.

Sir Harry's successor to the bullock is far more virtuous; given an acre on which sugar cane can be grown for its fuelling, the engine will irrigate 15 waterless acres to grow sugar cane for food. This is a good tale, but a small one; possibly among NRDC's other 2,500 patents—based far more often upon work done in government departments than by the private inventor—Viscount Halsbury can find some others to impress the corporation's critics.

SHORTER NOTES

In spite of the increased prices that it obtained for its coal in the second quarter of the year, the National Coal Board did not make enough profits from collieries and ancilliaries to cover the interest it has to pay, its provision for taxation, and the loss it incurred on selling imported coals at British prices. It therefore showed a deficit on the quarter of £264,905 after providing £4,650,000 for interest payable to the former coal owners and the Minister of Fuel and Power. In the current quarter, of course, it has for the first time had the full benefit of its price increase in May—which until the end of August was partly offset by the reduced prices for coal bought in the summer.

★

Dorman Long and Company is to transfer its trading activities to three new wholly owned subsidiary companies at the beginning of October. Dorman Long (Bridge and Engineering) Ltd., will take over the work of the company's structural engineering division at Middlesbrough and Luton (making a second structural engineering subsidiary in addition to Redpath Brown). Dorman Long (Chemicals), Ltd., will take over the company's coal by-products distillation at Port Clarence. The main steel-making activities of the company will be taken over by Dorman Long (Steel), Ltd. The parent company will continue, as a holding company, to co-ordinate the general policy of the group.

★

A block of 900,000 non-voting "A" ordinary shares of Amalgamated Press, arising from the sale of part of the Berry family holdings after the death of Lord Camrose, has been placed with insurance and investment companies and dealers on the Stock Exchange. The deal is believed to have taken place at a price a little below the "middle" of 38s. 9d., so that it involved about £1.7 million. Only a small proportion of the shares are available in the market.

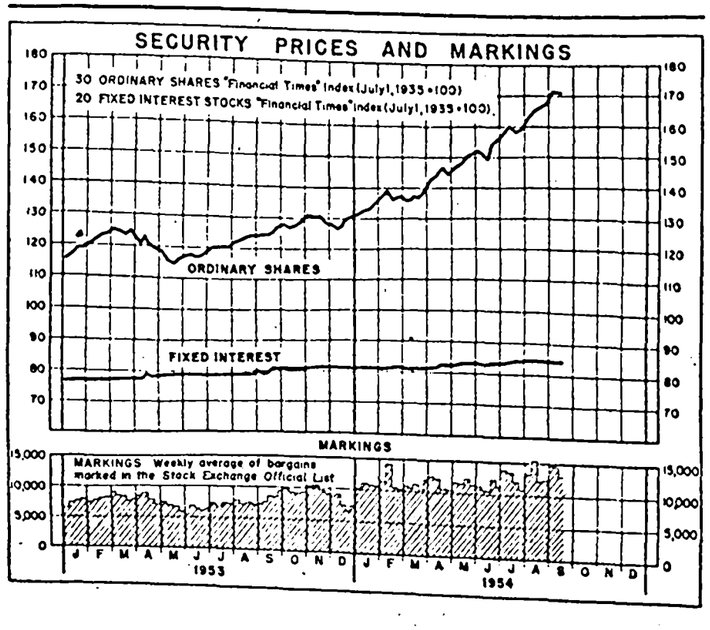
★

The squeeze in copper sent prices on the London market to a new peak on Thursday this week, cash copper rising to £274 a ton and three months' to £252.

★

The Dutch exchange control authorities have announced relaxations that extend the freedom of Dutch holders of balances of foreign currency that are blocked abroad to dispose of these balances. The balances can now be used for the purchase of foreign securities officially quoted in the country in which the balances are held, and also for the purchase of real estate. They can also be sold to other Dutch residents or to non-residents in exchange for dollars, Swiss francs or guilders in free accounts.

Company Notes



CALICO PRINTERS. From a distinctly complicated preliminary report (for the year to June 30th) from Calico Printers, one figure emerges with clarity: the ordinary dividend rate is 15 per cent, compared with 12½ per cent in 1952-53. Satisfied, and perhaps surprised, by this dividend, shareholders may feel inclined —if not obliged by the character of the statement—to leave the study of the profit figures until the full accounts are published. The parent company's net profits are shown to have risen from £216,255 to £274,587, and on the evidence of a list of increased charges it seems that trading profits must also have increased. The net profit barely covers preference and ordinary dividend payments; the appropriation of £300,000 to an overseas investment reserve has been balanced by the release of tax credits. The group's net profits, on the other hand, are shown to have fallen from £774,131 to £587,296. But the 1952-53 figure was struck after writing back £769,347 from excess profits tax provisions. Similar tax credits, though these are unspecified, appear to be included in the latest year's net profit; the assumption must be that the true cover on the ordinary dividend provided by group earnings has increased.

The directors are more specific about the course of trade. Turnover on commission printing has remained practically unchanged but turnover from merchanting has increased. At the moment the volume of trade is being maintained in the face of severe competition, but the results of certain subsidiary and associate companies are being affected by "difficult trading conditions." Another warning is that no appreciable increase in royalties (that is those arising from "Terylene" production) can be expected this year.

★

QUALCAST. Two months ago Mr J. E. V. Jobson stole the thunder of his own preliminary profits report for the year to June 30th. He then announced that the Qualcast group, better known for its lawn mowers than for its special castings, had established new records all along the line, including sales and profits. Investors did not fail to read into the statement bigger ordinary dividend payments. They anticipated the effective increase of 5 per cent with precision; on its announcement the 5s. ordinary shares remained virtually unchanged at 20s. 6d., to offer a yield of just under 4.9 per cent. The payment of a final dividend of 15 per cent on top of the interim dividend of 7½ per cent paid prior to the recent 50 per cent free scrip issue makes the total year's payments equivalent to 20 per cent on the enlarged ordinary capital of £1,070,488. In 1952-53, the full year's payment on the original capital of £713,659 was 22½ per cent, which is equivalent to 15 per cent on the present capital.

The stepping stone for this increase is the advance in profits. The group's trading profits have risen from £769,258 to £870,651. Taxation has also increased, from £352,160 to £419,249, but the latest year's provision includes £36,000 for six months' EPL, compared with a full year's charge of £45,000. Even so, net profits have advanced from £228,510 to £268,936 and this increase of over £40,000 more than covers the rise in equity dividend payments, after tax, of just under £29,500.

LONDON STOCK EXCHANGE

Next Account begins: October 6th
Next Contango Day: October 6th
Next Settlement Day: September 28th

AFTER the shake-out in equity prices, particularly in store shares, at the end of the old account, a selective rally, largely concentrated on oil shares, Kaffirs and copper shares, took place when dealings began in the new account. During this period gilt-edged prices remained firm and there was a fairly long list of rises in the prices of insurance shares. In the foreign market the two principal features were the continued buying, often on Swiss account, of the German government and municipal issues and the sudden collapse in the price of Greek bonds on the report that the debt negotiations in Paris had broken down.

Weak selling of store shares accounted for much of the decline in equity share prices at the end of the old account. Most of the leading shares in this group were marked down, with the newly quoted Canadian and English Stores stocks particularly badly hit. On the first day of the new account, though prices were moving erratically, a slightly better tone developed in this sector of the market. At the end of the old account, losses were common in other sectors of the market, notably in the radio, motor and aircraft groups. When the new account opened, however, the tone in the market improved. Radio shares staged a good rally and tobacco shares, especially "BAT's," were prominent. Rubber and tea shares were generally dull. Oil shares, having been firm at the beginning of the week, advanced briskly on the signing of the Persian oil agreement and the half-yearly results from the Royal Dutch-Shell groups; Anglo-Iranian advanced to 16½ and Shell to 101s. 3d.

Kaffir shares, which had been dull at the end of the old account, staged a very strong advance when dealings began in the new account. Much of the demand was concentrated upon the OFS developers and uranium producers. The further rise in the price of Copper led to an advance in the share prices of the Rhodesian copper producers.

Financial Statistics

EXCHEQUER RETURNS

For the week ended September 18th there was an "above-line" deficit (after allowing for Sinking Funds) of £23,036,000 compared with a deficit of £23,555,000 in the previous week and a deficit of £43,297,000 in the corresponding period of last year. This raised the cumulative deficit to £176,269,000 (£271,065,000 in 1953-54). Net expenditure "below-line" absorbed £6,069,000, bringing the total cumulative deficit to £353,583,000 (£490,348,000 in 1953-54).

THE MONEY MARKET

CREDIT has continued to be generally short in Lombard Street in the week covered by the Bank return. Before the week-end there was indeed little marked stringency; on Friday there was even a small surplus of funds, and November and December maturities were again sold to the banks at 1⅛ per cent (as against 1½ per cent earlier in the week). But on Monday credit became very tight, and aid from the authorities the form of very large special purchases of bills from the banks was passed on to the market in the form of purchases at 1¾ per cent. On the following days credit continued short, though on Tuesday the market was just able to manage without special purchases, while on Wednesday these reached only small proportions.

The market maintained its bid at £99 11s. 9d. for the 91-day maturities offered at last Friday's Treasury bill tender, and bid at £99 11s. 11d. for the 90-day maturities offered on account of the incidence of Christmas Day. The market's average allotment on all maturities rose from 55 to 64 per cent.

On Friday before the weekend the price of gold fell in consequence of sterling's slight recovery, but this week the price has again been carried to 250s. 8d. under the influence of strong demands and a further weakening in sterling to around parity.

The Bank return shows a further reflux of notes of £4.6 million. Discounts and advances are down sharply from £14.7 million to £5.7 million.

THE FIXING OF PRICES

MR LEONARD MAGGS'S REVIEW

The thirty-ninth annual general meeting of the members of United Dairies, Limited, was held on September 17th at The Connaught Rooms, Great Queen Street, London, W.C., Mr Leonard Maggs (chairman and manager director) presiding.

The secretary (Mr Ernest Evanson, ASAA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman to the members which had been circulated with the report and accounts for the year ended March 31, 1954, and was taken as read:

I am again circulating my remarks with the directors' report and accounts for the benefit of those members who are unable to be present at the annual general meeting on September 17th.

CONSOLIDATED ACCOUNTS

Although the consolidated statements published give a clear and concise picture of the financial position of the whole group I should like to draw your attention to the following:

During the year under review £1,478,400 was transferred from the general reserve of the parent company to capital account in respect to the bonus issue of £1 ordinary stock for every £3 ordinary stock held.

From October 1, 1953, the total shareholding of the Cheshire Sterilized Milk Company, Limited, with its subsidiary companies Newhall Dairies, Limited, Cheshire Transport Company, Limited, and Chester Castle Products, Limited, was acquired.

The Cheshire Sterilized Milk Company, Limited, has a modern and well-equipped processing depot at Stockport, Cheshire, and sells sterilised milk by wholesale in the district within a radius of approximately forty miles of Manchester.

Newhall Dairies, Limited, has a creamery at Aston, Cheshire, with up-to-date equipment for the manufacture of cheese and the drying of residual whey.

Cheshire Transport Company, Limited, operates all the transport incidental to these businesses.

Chester Castle Products, Limited, is at present non-trading, but is the proprietor of certain brand names.

I am happy to say that Mr A. F. S. Keeling and his sons have agreed to continue the direction of these businesses, thus preserving the family connection.

The increases in goodwill and pre-acquisition reserves shown in the group balance sheet are due primarily to this purchase. The other assets taken over appear under the appropriate headings.

The additional preference capital issued during the year, namely 300,000 shares, was part of the consideration.

The profits, less tax, during the period from October 1, 1953, to March 31, 1954, have been taken to pre-acquisition reserve.

CHANGES OF ARTICLES OF ASSOCIATION

You will have seen that there will be proposed changes in certain of the Articles of Association, the reasons for which are explained in the separate letter from the secretary.

PROVISIONS

£1,852,524 for taxation.

This amount is provided in conformity with the latest Finance Act.

Whilst the reintroduction of initial allowances (now termed investment allowances) was very welcome, the present penal rates of taxation hamper industry by taking too great a share of the profits, thus reducing what is left for such necessary purposes as replacement of assets and financing of stocks at present high prices, as well as for payment of dividends.

In accordance with our custom we are spreading the initial or investment allowances, thus increasing our provisions for taxation.

RESERVES

The following are the reserves of the group at March 31, 1954:

	£
The share premium account	41,706
Capital reserves:	
General reserve	154,543
Profits, less losses, on realisations of:	
Properties	200,128
Investments in subsidiary companies	99,582
Revenue reserves:	
General reserve	3,000,000
Insurance fund	100,000
Depreciation not required on properties sold, etc.	87,640
Future income tax	1,880,456
Profit and loss appropriation account	4,223,313
	£9,787,373

The total of the reserves at March 31, 1953, was £10,263,620, but this was before the transfer of £1,478,400 from the general reserve of the parent company to capital account, to which I have referred earlier.

COSTS AND PROFITS

Costs have continued to rise during the year under review. So long as fuel and transport costs continue to advance, both of which are important items in our industry, it is difficult to see how any halt to rising costs can be called.

During the year under review our industry continued under the control of the Ministry of Food, and margins for services in connection with liquid milk were controlled by that Ministry. In connection with milk products, with minor exceptions, the Ministry of Food continued during the year under review to buy all production.

There is no alteration in the position I reported to you last year, namely, that the latest date for which definite prices have been agreed with the Ministry of Food is September 30, 1951: for all manufacture after that date the prices paid by the Ministry of Food have been "on account" prices, which will be subject to adjustment when final prices are negotiated.

MILK SUPPLIES

During the year under review milk production continued to increase, and there being a reduction in liquid sales the quantity available for manufacture increased substantially.

It is on sales of liquid milk that the producer secures the highest return, and therefore it must be in the interests of the Government, from the point of view of subsidy, and of milk producers to keep the sales of liquid milk at the highest possible level. It is difficult to reconcile this with the Government's present policy of varying seasonally the retail prices of milk instead of keeping them uniform, as experience shows that decreases in retail prices have little, if any, effect on sales, whereas whenever there is an increase in price consumer resistance to it brings down the sales.

The cost of producing milk during the winter months is much greater than during the summer months, and the milk producer has to be recompensed accordingly. It seems, therefore, that in the interests of the national economy some steps should be taken to keep the production of milk in the winter down to a level more commensurate with liquid requirements, so as to avoid heavy winter manufacture into products which cannot return anything like the cost of the milk and which therefore involve considerable subsidisation. I was pleased to see that the chairman of the Milk Marketing Board had advocated that summer production of milk be increased and winter production decreased in order to reduce the prices of milk products.

Whilst, if this is accomplished, it will undoubtedly increase manufacturers' costs owing to greater fluctuation in the monthly quantities available for manufacture, this increase would be insignificant in the price of the products compared with the difference between the cost of winter and summer milk.

TRANSITION FROM CONTROL TO A MEASURE OF FREEDOM

The Government, which since 1942 had bought all milk from the Milk Marketing Board and resold it to the trade, discontinued this practice from April 1, 1954, and the Milk Marketing Board resumed sale to the trade without Government intervention.

The price of milk for liquid purposes at all stages, and margins, continues to be fixed by the Government, and this will presumably be the case so long as there is an element of subsidy, but the prices of milk for manufacture became a matter for negotiation between the Milk Marketing Board and the Industry.

From April 1st, the Government ceased to buy the production of milk products with the exception of National Dried Milk, which it will acquire for an indefinite period, and butter and cheese, which it is acquiring up to September 30, 1954.

As regards the remainder of the products, from April 1, 1954, manufacturers were left to carry and finance their own stocks, and to market the production without Government intervention, and they will be called upon to do the same in connection with butter and cheese from October 1, 1954.

With the exception of butter and cheese there is undoubtedly an economic world surplus of milk products, though possibly not a surplus over world needs if economic considerations could be overcome.

We are the largest manufacturers of butter in this country; indeed, I am given to understand that our Chard factory is the largest butter factory in the world. Since butter became derationed the demand for our English butter sold under "Superity" brand in our own London shops and under "Diploma" brand by the general grocery and provision trade has been very gratifying.

FOOD AND DRUGS: THE MILK (SPECIAL DESIGNATION) (PASTEURISED AND STERILISED MILK) REGULATIONS, 1949

Under this Act the Minister of Food has already specified certain areas of the country where no pasteurised milk may be sold unless it is pasteurised and bottled on the same premises. Being advocates and pioneers of pasteurisation we welcome this measure, and in order to help towards the specification of further areas of the country, and to assist milk retailers who are not in a position to pasteurise and bottle their requirements we have equipped the following of our urban and rural establishments to provide pasteurised bottled milk for retail dairymen:

Cambrian United Dairies, Limited, Marshfield, near Cardiff; Hafod Isha, Swansea.

South Eastern Farmers, Limited, Headcorn, Kent; Glynde, Sussex; Petersfield, Hants.

United Dairies (Wholesale), Limited, Calveley, Cheshire; Chippenham, Wiltshire; Corfe Castle, Dorset.

Primrose Dairy (Cornwall), Limited, St. Erth, near Penzance, Cornwall.

United Creameries, Limited, Campbeltown, Mull of Kintyre, Argyllshire.

We are also in process of equipping for this purpose two more depots of United Dairies (Wholesale), Limited—Attleborough in Norfolk and Banbury in Oxfordshire.

TRANSPORT AND ENGINEERING COMPANIES

You will be aware that earlier this year the UD Engineering Company, Limited, secured a very substantial contract for bottle washing and filling plant and crating and de-crating machinery from the USSR.

This large order is, of course, arranged for delivery over a period and we have set up a special team and additional factory space to deal with it. The first deliveries will shortly be effected.

The Engineering Company have also received a large order for a special type of refrigerating plant for HM Government, which is well on the way to completion.

I am glad to be able to say that apart from the order from the USSR, the order book is at a higher level than ever before in the history of our Engineering Company.

The Dairy Supply Company, Limited, has experienced another successful year's trading. In addition to increasing the output of cans, crates and utensils, it is now actively engaged in the manufacture and sale of specialised equipment for larger dairies and creameries both at home and abroad.

Mickleover Transport, Limited, in addition to work for other subsidiary companies, has during the year again received a number of large contracts for vehicle bodies of all kinds for commercial and Government undertakings.

The specialised knowledge enjoyed by this company has resulted in an increasing number of orders for insulated and refrigerated vehicles for the transport of dry and liquid commodities of all kinds.

The development of electric vehicles for the distribution of milk, other foods and commodities has continued.

This company is giving particular attention to research into new materials and methods which will, it is anticipated, have an important influence on the vehicle building and transport industry in the future.

OVERSEAS INTERESTS

Australia: Our new factory has operated during the year under review, but unfortunately, owing to the overdone position as regards milk products to which I have referred earlier, it looks as though it may be some time before we shall get a worthwhile return from our investment in Australia.

New Zealand: Again our subsidiary company has had a very good year's trading and earned a very satisfactory profit. Extensions to increase production are still proceeding, and it is hoped they will be completed in about a year's time.

CONCLUSION

It is impossible to predict what trading conditions will be when the transition from Government control is completed, and I will content myself with saying that your business is so organised and so equipped with modern plant, etc., as to be in a strong position for meeting whatever conditions may arise.

APPRECIATION OF THE STAFF

I should like to take this opportunity of expressing the thanks of the board, and I am sure I may include the members, to the officers and staff of the company for their devoted and efficient services during the past year.

The report and accounts were unanimously adopted and the final dividend on the ordinary stock at the rate of 10 per cent actual, less tax, making 15 per cent for the year, was approved.

The retiring directors, Mr William A. Blake, Mr Andre Bracher, Mr Leslie L. Ferris, Mr Douglas A. R. Knight, Mr Kenneth W. Pocock and Mr J. Gordon Stokes, were re-elected; and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company, was fixed.

At a subsequent extraordinary general meeting of the company, resolutions were passed approving certain alterations in the Articles of Association modifying the rights of the shareholders as between various classes of shares.

The proceedings terminated with a vote of thanks to the chairman.

PURNELL AND SONS

(Printers and Bookbinders)

BONUS ISSUE FORESHADOWED

The twentieth ordinary general meeting of Purnell and Sons, Limited, will be held on October 14th, in London.

The following is the statement by the chairman and managing director, Mr W. Harvey, which has been circulated with the report and accounts:

The profit of the group for the year, before providing for taxation, is £551,097 as compared with £358,861 in 1952, an increase of £192,236. From this profit has to be deducted taxation £255,675 and the interest of minority shareholders £1,868, leaving a balance of profit for the year of £293,554, as compared with £140,895 in the previous year. To this year's profit has to be added the balance brought forward from the previous year of £651,964, giving the amount available for allocation of £945,518. Your directors have transferred £50,000 to reserve for contingencies to meet any possible loss which may be incurred in a Canadian Investment, written off goodwill £150,000, and provided for dividends £97,807, leaving a balance to be carried forward of £647,711, which compares with £650,774 in the previous year.

The increase in the profit figure is partly due to the increased demand occasioned by Coronation publications and although all branches of the group have been working to capacity during the past nine months, considerable difficulty has been encountered in maintaining the supply of raw materials and adequate skilled labour, which may make it difficult to maintain during the current year the high rate of profits shown by the accounts under review, but I anticipate a satisfactory result.

The new packaging department has been handicapped by the delay in delivery of new machines and this department will not be in full production before 1955.

Your directors feel that the time has come when the share capital of the company should be brought somewhat nearer the figure of capital employed and with this object in view propose to capitalise sufficient of the profit and loss account balance to enable a bonus issue to be made of one ordinary share for every two shares already issued. The capital issues committee is being approached for permission to make this issue and it will then be necessary to call an extraordinary general meeting to give the members of the company an opportunity of confirming, or otherwise, the directors' recommendation.

I wish once again to pay tribute to my colleagues on the board, all of whom give their full time to the company and to express my thanks to the staff and workpeople for their services during the year under review.

AMALGAMATED ANTHRACITE COLLIERIES

A SUCCESSFUL YEAR

The thirtieth annual general meeting of this company was held on September 22nd in London, Mr John Waddell (the chairman) presiding.

The following is an extract from his circulated statement for 1953 :

Since nationalisation the company has not owned any collieries. The company has become a holding company, owning shares in The British Anthracite Company Limited. We therefore feel that the name Amalgamated Anthracite Holdings Limited would now be a more appropriate name.

The British Anthracite Company Limited has again had a successful year, the trading profit coming out at £578,496, compared with £563,463, the net profit, before taxation, comes out at £404,668, compared with £390,031 in 1952.

There is no doubt that the dividends anticipated in the circular letter to members dated April 15, 1954, are properly justified. A resolution will be moved to authorise the payment of an ordinary dividend of 3 per cent, less income tax. Although this is a very modest dividend, it is a step in the right direction, and I am happy, after all these years, to be in the Chair to propose this.

TRADING ACTIVITIES

Our activities fall into three major sections. Coal Distribution: The first deals with the distribution of coal both in this country and abroad. We are also interested in its importation and distribution in certain other countries and have subsidiary and associated companies in France, Holland, Belgium and the Channel Islands.

Investment and Finance.—I have previously referred to the Anglo-French Trust, Limited. The main aim of this concern was the reorganisation and development and regrouping of small industrial businesses.

Industrial and Manufacturing Interests.—Thirdly, we have an industrial group of companies. In this connection we have brickworks, wagon repairing works, and both electrical and mechanical engineering undertakings in South Wales.

Carbon Black has not been a project which has added to our profits. We have a half interest in United Carbon Black, Limited, and United Kingdom Chemicals, Limited, which two companies combined are one of the three manufacturers of carbon blacks in this country. Last year these companies made an agreement with United Carbon Company Inc., and this led them at the end of 1953 to a programme for completely reorganising the works to make Kosmos/Dixie blacks, which are those marketed all over the world by United Carbon Company Inc.

These companies have almost, if not fully, eliminated losses on operations in the beginning of 1954 and we anticipate that when the remodelled plant comes into action in the beginning of September they will be making useful profits, which should increase steadily.

It will be evident to members that both in the variety of interests and the geographical situation of our coal businesses in this country and abroad our structure is widely based and therefore less vulnerable to adversities in any particular industry. There seems no reason why under steady conditions we should not continue to make a satisfactory profit.

The report was adopted and the change of name approved.

NIGERIAN ELECTRICITY SUPPLY CORPORATION

GOOD RESULTS

The twenty-fifth annual general meeting of the Nigerian Electricity Supply Corporation, Limited, was held on September 21st in London, Mr George Hemmant, CMG, chairman, presiding.

The following is an extract from the chairman's circulated review:

You will have noted the small reduction of £3,696 in the revenue from power sales.

The number of units sold was 56,286,477, compared with 59,303,037 in the previous year, a reduction of 3,216,560 units. The relatively small reduction in the revenue from power sales was due to the fact that the present rather higher rates charged for power were introduced in April, 1952, and were thus in force for only eleven months of the previous year.

The reduction in the number of units sold was due largely to a prolonged 1952-53 dry season and its effect upon our reserves of water power in April and May of the year under review. The recent completion of the Jekko 2 Power Station will enable us to generate more power from the same water, or the same power from less water, and thus counteract the effects of a prolonged dry season.

The Jekko 2 Power Station, in addition to its value in enabling the Corporation to meet present demands in the dry season, will also be a most useful asset as a general reserve of power, permitting the necessary overhaul of machinery throughout the system.

Power sales to our smaller consumers showed a general increase, and bulk sales to the Electricity Corporation of Nigeria now represent 10 per cent of our total power sales.

Operational costs rose by £13,000, of which about £7,000 was due to heavier maintenance work and higher wages. The work of maintaining an extensive system of water conservation in a country subject to tropical storms of great violence must be expected to vary from year to year.

The report and accounts were adopted.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

REORGANISATION OF CAPITAL

An extraordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) was held at 29, Gracechurch Street, London, EC3, on Wednesday, September 22, 1954, which was followed by separate meetings of the "A" and "B" stock and shareholders.

Mr J. S. Crossley, chairman of the bank, presided at each meeting.

The extraordinary general meeting passed special resolutions for effecting the reorganisation of the capital of the company and the shortening of the bank's name to Barclays Bank DCO.

The special resolution approving the reorganisation of the capital of the bank was subsequently approved at the meetings of the "A" stockholders and "B" shareholders.

The chairman announced at the commencement of each meeting that stockholders who had intimated that they were in favour of the resolutions represented an overwhelming majority in each case.

The proceedings terminated with a vote of thanks to the chairman for presiding.

THORN ELECTRICAL INDUSTRIES

A RECORD YEAR

The eighteenth annual ordinary general meeting of Thorn Electrical Industries Limited, was held on September 17th in London. Mr Jules Thorn (chairman and managing director) presided and in the course of his speech said : The results indicate satisfactory progress by the group. The trading profit, at £1,054,348, has increased by £283,000, and the net profit before taxation amounts to £778,306, exceeding the previous year's earnings by more than £230,000. Taxation, at £462,740, again absorbs more than 60 per cent of the net profit.

The reserves of the group now stand at £1,118,812 and exceed the total issued capital.

Progress during the year in the Atlas Lighting Division has been remarkable and apart from the increased popularity of all Atlas products we have been fortunate in securing very substantial contracts from the Government, public bodies, municipal authorities and large industrial users.

In the export field distribution of the company's products has continued to expand, particularly in Commonwealth and "Sterling" countries. Export sales have increased by approximately 40 per cent.

Ferguson radio and television division enjoyed another record year, the turnover reaching a new high level.

I have always resisted the temptation to make optimistic forecasts, but we are now beginning to reap the benefits of the large investments and the hard work which for some years have gone into our research, development and manufacturing resources.

The report was adopted.

APPLICATIONS are invited for a superannuable appointment in the Organisation and Methods Branch at the London Headquarters of a large industry. The work involves the conduct of O and M studies, at headquarters and in the provinces, concerned with the organisation of work and staffing and office methods.

Applicants should have a minimum of two years' specialised experience relating to the work of this post, and, preferably, a recognised professional qualification or University degree, and experience in a position of responsibility in a large organisation. Salary within the range £1,070-£1,470

Write, giving full particulars of age, education, qualifications and experience (with dates), quoting this paper, to Box 704. Original testimonials should *not* be forwarded. Closing date October 7, 1954.

ASSISTANT to Advertising Manager of prominent tyre manufacturers. Age under 30. Good knowledge of advertising and ability to see work through from start to finish. Knowledge of Market Research, Statistics and Degree in Economics desirable. Person in mind should have had some years in a first-class agency or advertising department of large firm. Experience of handling Public Relations and House Organs useful.—Box 706.

ACCOUNTANT AND ASSISTANT OFFICE MANAGER required for West African branch of British company. Preferably but not necessarily qualified, some experience, capable of staff management. Young, good health and preferably unmarried. Good terms of service, regular tours, full pay leave, free accommodation.—Apply, giving full particulars, references and salary required, to Box 703.

SALZBURG SEMINAR IN AMERICAN STUDIES
SCHLOSS LEOPOLDSKRON, SALZBURG, AUSTRIA
Scholarships are offered for the following sessions:
American Politics, January 2 to January 29, 1955
Art, the Novel, and Popular Culture, February 6 to March 5, 1955
Intellectual and Social Backgrounds of American Politics, March 13 to April 7, 1955.
Lectures and Seminars at the post-graduate level. Admission is granted for evidence of ability and accomplishment. General age range 23-35. Special attention given to those engaged in public life, teaching, or creative work.—For further information and application forms, please write promptly to: Salzburg Seminar, 35 Portman Square, London, W.1.

THE UNIVERSITY COLLEGE OF THE GOLD COAST
Applications are invited for a Senior Lectureship in Agricultural Economy tenable for five years initially. Salary scale £1,500 x £75 to £1,800 p.a. Point of entry determined by qualifications and experience. Family allowance £100 p.a. per child (maximum £300 p.a.). Outfit allowance £60 on first appointment. F.S.S.U. Free passages for appointee, wife and maximum of three children. Part furnished accommodation at rent not exceeding 10 per cent of salary, unfurnished accommodation at rent not exceeding 19 per cent of salary.
Applications (six copies), naming three referees and stating full qualifications and experience, to be received by October 22, 1954, by the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further information may be obtained.

THE BRITISH IRON AND STEEL RESEARCH ASSOCIATION
Applications are invited for an interesting post in the Operational Research Section of the above Association to form part of a small team dealing with a variety of operating and organisational problems in steelworks. Applicants should be about 26-30 years old and should have an honours degree and some industrial experience. Some mathematical ability is desirable but the most important requirements are an original and lively approach to, and a flair for, problems of an economic and technical nature. The work is based on London but involves frequent visits to works and contact with management.
Apply in writing, giving full curriculum vitae and staff and men. stating salary required, to The Personnel Officer, B.I.S.I.R.A., 11 Park Lane, London, W.1, quoting "Advisory Service."

APPLICATIONS are invited for research posts in Applied Economics. Applicants should have a good honours degree; some experience of work in accounting and statistics would be an advantage. Salaries within the range £450-£900 per annum. Appointments will be for one year in the first instance.
Applications, with the names of two referees, should reach the Registrar, The University, Edgbaston, Birmingham, 15, no later than October 1, 1954.
The University, Edgbaston.

The National Executive

Met at New Delhi on 19—9—1954

TO KEEP YOU THINKING

If we are to have a race of better citizens in this country we must do more than educate them in the principles and practice of good government; we must teach them high personal standards in work and leisure, sound principles of conduct abroad and by their fireside, and the charity which, starting at home, will sweeten and inspire their relations with all their fellow-men.

HUGH LYON (The Spectator, 23rd Sept. 1949)
("The Scouter")

THE BHARAT SCOUTS & GUIDES BULLETIN

MADRAS STATE

(Approved by the Director of Public Instruction, Madras)

VOL. 4 OCTOBER 1954 NO. 6

OURSELVES

The National Executive Committee

AT a meeting of the National Executive Committee held at New Delhi on 19th September 1954, several important matters connected with our Organisation were considered and decisions taken. Members representing the States were present and Madras was represented by Mrs. Clubwala Jadhav and Mr. V. S. Ratnasabhapathy. It was decided to levy quota money for the various States at 6 pies per Scout or Guide, majority of the States being agreeable to the levy of 6 pies instead of 3 pies as before. Mr. K. G. Vaidyanathan, the National Secretary presented a short account of the activities undertaken by the Association from 1st April to 1st September 1954. It was decided to celebrate the National Scout Week always every year from 1st to 7th of October, the week being the most important week from the Scout point of view. It is also a week that synchronises with the National week when we celebrate the Birth Day of Mahatma Gandhi. It was decided to send a contingent of Scouts to the 8th World Jamboree to be held at Canada from 18th to 28th Aug. 1955 with Pandit Shri Ram Bajpai, the National Organising Commissioner as the leader of the Indian Contingent.

An All India Training Centre

The National Commissioner, Pandit Hridaynath Kunzru informed the Committee that he was successful in getting the Madhya Pradesh Government to assign to our Association an extensive area in Pachmahri for the establishment of a Central All India Training Centre. The Chief Minister of Madhya Pradesh Government, Pandit Ravi Shanker Shukla had promised to put up a building at a cost of Rs. 25,000/- for the centre. The Central Government also has been approached for a grant of Rs. 60,000/- for equiping the centre.

Deputy Camp Chief's Conference

Mr. Vivian Bose, our Chief Commissioner, Scouts informed the Committee that a Deputy Camp Chiefs' Conference is planned to be held at Pachmahri during the Christmas week this year, when the present Training scheme will be revised and a scheme suitable to our country will be drawn up. This Conference as also suggested by Mrs. H. C. Captain will be for the Deputy Camp Chiefs of both the sections. It is hoped

that a comprehensive scheme will be drawn up for all forms of Training. The Pachmahri Training Centre will in future send out Deputy Camp Chiefs, Assistant Deputy Camp Chiefs and Himalaya Wood Badge holders into the country and see that Training is run on most up-to-date and efficient lines suited to our country and requirements.

With regard to badges the Madras representatives urged on the National Headquarters to make available immediately all types of badges both basic and Proficiency. This has been agreed to by the National Headquarters subject to the approval of the National Council. The Tenderfoot badge with the Trefoil superimposed is now made available. We are glad to note that the Central Headquarters at Delhi, is moving forward.

The National Scout and Guide Week

We are happy to record that the National Scout and Guide Week from 1st to 7th October 1954 was celebrated throughout the State with enthusiasm. Reports have been received from all centres as to the manner in which this celebration was conducted. We are sure that the week would have achieved the purpose of popularising the movement and serving as a reminder to us to do our best.

United Nations Day

24th October will be observed as the United Nations Day and this year's function at Madras will be held at our State Headquarters, Wenlock Park, Triplicane, Madras. It is fitting that we the Junior League of Nations should be closely associated with the United Nations in this way. A Note on the U.N. appears elsewhere.

Seminar on Camping and Community Recreation

Dr. H. D. Edgren, Fullbright Professor of the Y.M.C.A College of Physical Education will direct a Seminar on Community Recreation and Camping for the Bharat Scouts and Guides at Wenlock Park from 15th November to 19th November 1954. Every day the Seminar will begin at 5 P.M. and close at 8 P.M. and it is open to the Scouters and Guiders of Madras State. Those who are interested are required to apply to the State Headquarters with an application fee of Re. 1/- A certificate will be issued to those who attend the Seminar regularly and are likely to be useful. Dr. Edgren is a Professor of Education, George Williams College in Chicago. He has had considerable experience in this work and is a recipient of special honours and awards for this valuable work. He is an author of several publications and it is very kind of him to have offered to run a Seminar for our Officers. We hope many will take advantage of this Seminar.

Visit to Salem

Mrs. Clubwala Jadhav and Mr. V. S. Ratnasabhapathy visited Salem on 6-10-54 to help in the work of the District Association. Several of the Office-bearers and others interested in the movement were met and interviewed. A public meeting was addressed by the State Secretary and suggestions were made at a Conference of workers for making the movement more and more useful. It is encouraging to find that Mr. Sheriffuddin the District Judge, Mr. Sabhanayagam, the District Collector and the representatives of the public including Mr. S. V. Ramaswamy, Member of Parliament, the Municipal Commissioner Mr. Menon, Mrs. Menon, Mrs. Sitalakshmi Ramaswamy and Mr. Metha and others are keenly interested in our Organisation. Mrs. K. N. Vasant Chatterji, the District Commissioner Guides having resigned, her place will be taken up by Mrs. Sitalakshmi Ramaswamy. Our Association is thankful to Mrs. Chatterji for the valuable work she had done in the past. Salem has a good team of workers with Mr. S. V. Lakshmanan as District Commissioner Scouts and Mr. K. Varadarajan as District Secretary, and there is every hope of the District making headway in the coming year. The Tamil monthly Bulletin, they are issuing, we hope, will be continued, though they have to face financial difficulties.

Commissioner's Training Course

Being convinced that the work, the Scouts have done in the matter of making roads and rural service in co-operation with National Extension Service and the Community Project, the Government of Madras has asked us to train the Block Development Officers as Commissioners, and thus associate them with Scouting so that more effective work can be undertaken in the respective Blocks. Therefore a Training Course for the Block Development Officers will be run in the first week of next month. This camp is also open to others, both men and women. Details of the Camp, can be had from the State Headquarters.

We welcome the publication of 'Thaiyar' once again from this month by the South Madras Bharat Scouts and Guides. The October issue is full of interest. In a message, the enthusiastic President Mr. C. R. Pattabhiraman welcoming the publication hopes that the Scouts and Guides will rise to great heights and we are sure they will. Mr. V. G. Gokulapala Sarma the Editor and Secretary of the Association and the District Commissioners Miss. A. Sakuntala and Mr. H. Ramanathan are to be congratulated on their sustained work for the Association and the fine lead they are giving. We wish "Thaiyar" a very useful career.

A FINE RECORD

FROM October 1, the Madras Council of the Bharat Scouts and Guides is celebrating the Scout Week in this State. It is doing so with the knowledge that the Scout movement in India maintains the popularity though it is less patronised by Governments than the new military or quasi-military youth organisations like the National Cadet Corps. How the movement retains its strength was pointed out by Sri J. B. Mallaradhya, Director of Public Instruction in Mysore at the annual meeting of the Mysore State Council of the Bharat Scouts and Guides, "Bharat Scouts and Guides claim to be the biggest youth organisation in India," he declared. From the history of the movement in Mysore he gave an impressive example of the value of Scout training as a preparation for citizenship. He said that during 36 years, since the inception of the movement in the State, not a single Scout or Guide was reported to have joined any subversive movement." They have remained a strong brotherhood, promoting the welfare of those around them.

From other lands come similar testimonies of the good work of Scouts. We will mention one-the report on the Social Services in the Federation of Malaya, for 1953, prepared by the Reference Division of the Central Office of Information, London. Referring to the fact that in Malaya "there is unquestionably less juvenile delinquency than at any time in the past five years," the report points out that much of the credit for this improvement rests with voluntary organisations, including Boy Scouts and Girl Guides, who concentrated their efforts on the development of organisations and services to help and train homeless and other unfortunate children, and thus prevent them from drifting into crime.

Sri Mallaradhya said that the Scout and Guide movement should form an integral part of the system of education in Mysore. His words are equally applicable to education in other States. It is true that the Bharat Scouts and Guides organisation functions in all States. Scout and Guide troops exist in most if not all Schools. But as Sri Mallaradhya urged, it will be beneficial to enlarge such troops and increase their activities. Such expansion is possible only with the voluntary assistance of the people; it is mainly on such support that the movement now rests; if rightly conducted it will continue to receive support.

Most State Governments, as we have remarked above, are more interested in the National Cadet Corps, mainly a creation of the Union Defence Ministry. Junior Divisions of the National Cadet Corps are being formed in schools; they are given training in Squad Drill, Arms Drill, Field Craft, Weapon Training and similar military exercises. Such training is useful, provided there is no compulsion; in certain States, however, authority is inclined to introduce compulsory military training in Schools. What effect this will have on the Scout movement it is difficult to foresee, but one thing is certain; the Junior Cadet Corps not to be regarded as a substitute for the freer, larger brotherhood of the Scouts. This deserves to be emphasised at all forthcoming Scout Week meetings.

— MADRAS MAIL

The N. C. C. or its auxiliary cannot in any manner stand in the way of the Scout and Guide Movement in our country and therefore it is not a rival Organisation. Taking into consideration the youth population in this country and the youths that are brought under these youth Movements and Organisations we can only say we have touched a very small percentage. There is still a very large percentage of youth that need to be taken care of and trained. The destitute, orphan and unwanted children in our State alone number over hundred thousand and our movement can certainly help them from drifting into crime. There is therefore more work to do and immense scope and wide area to cover.

— *Editor.*

YOUTH SERVICE

UNTIL 1939 work among young people over school-leaving age was very largely left to the many voluntary movements. Shortly after the start of the Second World War, however, the then Board of Education decided to take direct responsibility for youth welfare as part of the national system of education and invited the voluntary organizations, the Churches, and other interested bodies to co-operate The Youth Service, which provides for the leisure time activities of boys and girls between 15 and 20, is therefore to-day a partnership between the State, the local education authorities and voluntary youth organizations The voluntary organizations now receive some State aid but retain their independence of action

The Education Act 1944 (*in England* Wales) finally recognised that provision for the leisure time activities of boys and girls and for their social and physical training was a State responsibility as much as was the provision of education in school, and compelled all local education authorities to *provide sufficient* out-of-school activities for young people, either directly or by aiding the work of voluntary youth organizations Local authorities usually appoint a youth organizer to develop the service and where necessary run their own Youth Centres to provide varied activities for large numbers of young people.

Although the programmes of youth organizations vary greatly, most of them attempt to provide educational as well as social and recreational pursuits and to give a training in self-government and citizenship

Some youth organizations, notably the older movements such as the *Young Men's Christian Association (YMCA)* are mainly religious in origin and purpose; and those which have no definite affillation with a religious body generally recognise the importance of spiritual values in the formation of character.

The major voluntary organizations (Boy Scouts, Girl Guides, Boys' Brigade and kindred bodies) have a total membership of well over two million young people under the age of 21 (including those of school age).

Over twenty large national voluntary youth organizations come together in the *Standing Conference of National Voluntary Youth Organizations* which is a consultative body that takes action only in the name of its member bodies and with their consent.

Some Organizations

The *Boy Scouts' Association* (1908) and the *Girl Guides' Association* (1910) were founded by Lord Baden-Powell. The movements are based on the principle of the development of character and good citizenship in boys and girls by training them in habits of observation, self-reliance, loyalty and thoughtfulness for others, and by promoting physical fitness and a knowledge of useful crafts. They have world-wide affiliations and are undenominational and non-political in character

The *Boys' Brigade* (1883) is a Protestant religious organization. Every company must be attached to a church and a regular church attendance is a vital principle. Companies have regular drill parades, there are club rooms for games and other pastimes, and organized camping is a feature of the movement. The *Church Lads' Brigade* is a similar movement connected with the Anglican Church.

The *National Association of Boys' Clubs* and the *National Association of Girls' Clubs and Mixed Clubs* are non-sectarian bodies and the member clubs provide educative recreational facilities for young people designed to develop their mental, physical and spiritual well-being. Discussion groups, handicrafts, music and many other activities are encouraged.

The *Pre Service Organizations* for boys comprise the *Sea Cadet Corps*, the *Army Cadet Force Association* and the *Air Training Corps*. These bodies have special connections with the Service Departments and receive financial grants from them. The training of boys for entry into the armed forces which these organizations

provide is linked with training to promote their social, educational and physical development. Many police forces organize *Police Cadets*. The *Girls' Training Corps*, the *Girls Nautical Training Corps* and the *Women's Junior Air Corps* similarly prepare girls for entry into the Women's Services.

The National Federation of Young Farmers' Clubs instructs its members in agricultural subjects and rural crafts and each club has the support of an advisory committee on which local farmers are represented.

Each of the leading political parties maintains a junior branch. Members are encouraged to form debating societies and to engage in other social activities and they are trained to take an active part in party politics. Other adult organizations which have youth sections are the *British Red Cross Society* and the *St. John Ambulance Brigade*, which train their young members in first aid and home nursing.

The *Youth Hostels Association* has a network of hostels for walkers and cyclists and is closely linked with similar organizations in other countries.

The *Outward Bound Trust* maintains sea and mountain schools which offer 4-week character-building courses for boys, mostly young industrial workers whose expenses are paid by their employers. Modified courses are held for girls.

The *Central Council of Physical Recreation* gives youth organizations practical and advisory services in all branches of physical recreation. It runs several National Recreation Centres which provide training holidays for those who wish to learn new forms of physical recreation or to improve their standards under expert tuition.

The *National Playing Fields Association* is another central organization which provides amenities for the Youth Service. Its object is to secure adequate playing fields and playgrounds for young people.

Building for Peace

THE United Nations, in structure, is an international organization of independent and sovereign states. It provides machinery through which the world's people may work together and co-operate with each other to find ways and means to solve the mutual problems and to foster international understanding. The United Nations should be looked upon not as an organizational strait-jacket to the world or on the independent states which are its Members, but as an organ for free co-operation of the nations, inside the framework of agreed procedures and supported by a permanent civil service.

Every one has been yearning for peace. It is only fitting that the peoples of the world should devote themselves to the gigantic task of building a universal and lasting peace both for themselves and for future generations

Outside of the official channels for the dissemination of information about the United Nations, interested and competent people have shown their desire to participate by volunteering in 86 different countries to tell others the story of how the United Nations is BUILDING FOR PEACE During the past year, these volunteer workers have reached four and a half million people. In addition, they have spent one and a quarter million student-teaching hours in imparting their knowledge through schools and institutes of higher learning.

October 24 of this year marks the ninth anniversary of the United Nations. All those who are eager to have peace and are ready to join their efforts in BUILDING FOR PEACE, will be interested to read this brief but significant story of the United Nations:

Aims and principles: Working towards the aims of collective security, peaceful settlement of international disputes, effective control of armaments and international co-operation to advance economic and social well-being, the United Nations has provided machinery through which peoples of the world may co-operate and work together. As the bitter classes of power and ideology become more apparent in the world, the United Nations survives as the best hope of mankind.

Political achievements: Through mediation and conciliation, the United Nations helped to end bloodshed in Indonesia, Greece, Palestine and Kashmir, and the Republic of Indonesia and Israel were brought into the family of nations In Korea armed aggression was successfully repelled

Collective Security: Soon after the outbreak of the Korean hostilities, the United Nations resolved to strengthen collective security. This was done by equipping the General Assembly, representing all 60 Member Nations, with emergency procedures for recommending necessary collective action for maintaining peace in case the Security Council fails to act because of the negative vote of any of its five permanent members

Sharing Skills: From a long-range point of view, the technical operations of the United Nations and the Specialized Agencies are intended to help provide the underdeveloped areas with more of the skills they need in their effort to alleviate the miseries of hunger, disease, illiteracy and poverty. Eventually, however, the technical assistance programmes will help other countries, too, for they realize more and more that their own economic progress in their inter dependent world depends considerably on the economic health of underdeveloped countries.

The United Nations and the Specialized Agencies began their technical assistance work in a small way, with money from their regular budgets. In 1950, the United Nations and five agencies began an additional and bigger programme—the expanded technical assistance programme, financed from voluntary contributions by Governments. Since it started in July 1950, scientific knowledge and technical skills have been shared in a variety of ways and extended to nearly 120 countries and territories. For instance, long-range programmes have been undertaken to assist in the construction of irrigation schemes, increase food product, advise on the building of a harbour, or to train technicians for air fields and medical laboratories. Shorter-range projects that have already shown results include the campaigns against malaria and the work to improve cottage industries. Many of the underdeveloped countries have also contributed to the expanded programme by supplying it with professional personnel and research facilities. All of them have pledged funds for the operation.

Regional Co-ordination: Through the facilities provided by the United Nations' regional commissions, countries in Europe, Asia and the Far East and Latin America have been able to co-operate on working out solutions for many of their common problems and subsequently to lay some of the essential foundations for economic progress.

Social Improvement: As an effort to improve social well-being, the United Nations, working with its specialized agencies, is helping to provide studies and services which will improve sanitary, health and labour conditions Programmes include improvement and expansion of educational facilities and teacher training

Human Rights: The basic rights of man and fundamental freedoms for all without discrimination as to race, sex, language or religion are clearly defined in the Universal Declaration of Human Rights. The completion of two draft covenants on Human Rights by the Human Rights Commission this summer marks a milestone in United Nations efforts to clarify and define these rights

For non-self governing peoples: In accordance with the spirit and provisions of the Charter, the United Nations, through its Trusteeship Council, has been following the welfare and progress of the millions of people of dependent territories With self-government or independence the ultimate goal, recommendations are based upon annual reports submitted by the Administering Authorities of the territories under United Nations Trusteeship, information gathered by existing United Nations missions and petitions from the indigenous people. In the case of non-self

governing territories not under trusteeship, annual progress reports are submitted to the Council. Through the efforts of the United Nations, Libya became an independent state, Eritrea was federated with Ethiopia as an autonomous unit, and the former Italian colony of Somaliland was placed under Italian trusteeship to be prepared for independence in 1960. Through the United Nations, the world is kept alive to the aspirations and advancement of all peoples.

The All India Scout and Guide Week

THE All India Scout and Guide Week was inaugurated at the State Headquarters, Wenlock Park, Madras on 1-10-54 by Sri N. D. Sundaravadivelu, Deputy Director of Public Instruction and State Commissioner (Scouts) and in doing so he said that the Bharat Scouts and Guides, Madras State has increased its strength, eventhough the separation of Andhra State resulted in reducing the original strength. The popularity therefore is maintained, and the wish expressed by Pandit Nehru the Prime Minister that the movement should increase from 5 lakhs to 50 lakhs in the country is being followed with success.

The Rajah Saheb of Kollengode who presided asked the Scouts and Guides to do a good turn to some one every day and that the movement rendered service to all without distinction. He paid a tribute to Lord Baden Powell, Dr. Besant and Pandit Madan Mohan Malaviya for founding this very useful organisation and that their life is worthy of emulation by Scouts and Guides

Sri V. S. Ratnasabhapathy, State Secretary the Bharat Scouts and Guides, Madras State explained the significance of Scout and Guide week and the need for making the parents and public realise the value of the training imparted by the movement to the children. He said that the N. C. C. and its Auxiliary covered only a very small percentage of the youth population of the country and that there was perhaps more than 80% of the youth population that can still be served by the Scout and Guide movement. Referring to the Community service rendered by the movement he said that during this month 300 Scouts are rendering service for making a road at Chitlanchery near Palghat, another 100 Rovers doing similar work in Ramnad district near Karaikudy and the third batch near Tiruneermalai in Chingleput District.

Being convinced of the valuable work that the Scouts and Guides have done under the Community Project, in the 5 year plan, the Government of Madras has asked for the Block Development Officers in the State to be trained as Scout Commissioners. For this purpose the Association will run a Training Course at the Stanley Park Training Centre at Coonoor in the last week of October '54 and thus establish closer relationship with the Project service.

Mr. C. V. Naidu, District Commissioner (Scouts), Trivellore related the work done at Senchi by the Scouts of Madras in renovating an irrigation tank recently.

Miss S. P. Durairaj, Jt. State Organising Commissioner (Guides) proposed a vote of thanks to the President, State Commissioner and others. With the singing of Janaganamana, the meeting terminated. A representative gathering of Scouts, Guides, Officers and the public was present.

OUR A.S.C. WEST COAST

Sri C. V. Ramani Karikar, M.A. B L., Assistant State Commissioner; Bharat Scouts & Guides, West Coast is appointed by Government to be a member of the Project and Block Advisory Committees for Community Projects Area (Palghat).

DISTRICT REPORTS

SOUTH MADRAS

Service: Rover Scouts drawn from Prathaps and Arundales did service on Sunday the 26th September 1954 at Santhome Beach in connection with the Mahalaya Amavasya Sri K. Rajagopalan District Rover Scout Leader was the contingent leader.

Over sixty Scouts drawn from the Scout Groups—Shivajis', Subramanias', 'Prathaps' 'Siddhartas' and Ramakrishnas' and Rovers from 'Gandhiji', Mylapore' and Arundale' did service in connection with the 'mass poor feeding ceremony' and The Immersion Ceremony of Durga Devi organised by Sri Ramakrishna Mission Authorities on the 6th and 7th October. Guides drawn from Saradamani Guide Group and Rangers from Kamala Nehru Ranger Team did service during the Durga Puja celebrations from 3-10-54 to 7-10-54 at Sri Ramakrishna Mutt, Mylapore.

Posse of welcome: About two hundred Scouts and Guides of the South Madras Bharat Scouts and Guides presented a Posse of Welcome to His Excellency the Governor of Madras on 5-10-54 at 6-30 P.M. at P.S. High School, Mylapore when he presided over the Mylapore Academy Anniversary celebrations

The National Scout Week: The Scout and Guide Week was celebrated with great enthusiasm in the Scout Groups of the Mylapore area. Sri Parthasarathy Iyengar, Commissioner of Police, Sri Rajam Ramaswamy, Sri Kothamangalam Subbu and other notable figures took part in the functions conducted in a successful manner by the Prathaps, Shivajis' and Siddhartas' Scout Groups and Kamala Nehru Ranger Team A District Scout Rally was held on 5-10-54 at 4 P.M. at the P.S High School, Mylapore with Hon'ble Sri M. A. Manickavelu Naicker, Minister for Revenue in the chair There was a distinguished gathering including Sri V. S Ratnasabhapathy, State Secretary, Sri V. G. G. Rao, Ex-State Chief Commissioner, Bombay, Sri M D. Janardhan, District Commissioner, East Madras and others. The District Commissioner (Scouts) was the Officer-in-charge of the Rally. Sri C R. Pattahbiraman, President, South Madras welcomed the Minister and recounted the activities of the Groups and their services in connection with the festivals and Community Projects. The Hon'ble Minister and others went round and reviewed the Pioneering and Camp Craft demonstrations put up by the various Groups The Signalling Tower of Siddhartas', the self-propelling aerial runaway of the Subramanias', the Camp Craft of Shivajis' and the Swinging Derrick of the Prathaps' deserve a special mention. The Minister said that disciplined training, orderliness and the spirit of co-operation were essential if they were to survive as a nation. He said that the Scout Movement developed character and taught good manners to the youngsters. In his opinion the promoters of the Scout Movement were doing a National service, moulding the character of their future citizens. He wished that the disciplined training and the spirit of Scouting imbibed by Scouts should be carried into their future life and allowed to permeate into the people to enable the morale of the country to be raised Sri V. G. G Sharma, District Secretary proposed a vote of thanks.

Sea-Bathing Service in connection with Mahalaya Amavasaya

The South Madras Bharat Scouts and Guides undertook the Service on Sunday the 26th September 1954, in connection with the Mahalaya Amavasya at San Thome Beach, Mylapore Rover Scouts drawn from Mylapore, Prathaps and Arundale Rover Crews rendered service on that day from 6 to 10 A.M. Sri K. Rajagopalan, District Rover Scout Leader, was in charge of the service. Sri H. Ramanathan, District Commissioner (Scouts) was present throughout the service.

The day passed off without any untoward incident except for two cases. One lost child was restored to its parent. Another woman was rescued by one of the Rovers from being carried away by the Sea waves.

Proceedings of the Conference of Commissioners, Presidents and Secretaries of the Districts comprised in the Western Division held at Kollengode

On the 18th & 19th September 1954

Proceedings: 1st Day: 18-9-'54

Venue: Rajah's High School, Kollengode

On the invitation of Sri V. Madhava Raja, Raja of Kollengode, President District Association, South Malabar, this Conference was convened and held in the Rajah's High School, Kollengode. At the outset we have to express our gratitude to the Rajah Sahib for the extraordinary enthusiasm and the spirit of hospitality evinced by him.

Representatives of the various Districts began to arrive even from the evening of the 17th instant. There was a strong contingent from the Salem and Coimbatore Districts both by train and by car From about 8 A. M. on the 18th instant, the Rajah's High School began to hum with activity and it was really a delightful sight to see the District Commissioners, Scouts and Guides, Scouters and Flock Leaders moving about in their respective uniforms wearing scarfs of various colours. The Scout groups of the Rajah's High School was very busy in doing service to the guests. Nothing was left wanting in regard to the splendid arrangements made.

By about 10-15 A M. a group photo was taken by M/s. Razack Studio, Palghat.

Precisely at 10-30 A M. the Raja Sahib unfurled the Scout Flag, all standing alert and saluting. Mrs. C Mohini, Joint National Organising Commissioner, Guides, sung in Hindi in a melodious tone the Scout Flag Song.

The Assembly then moved to the spacious hall where the Conference was to be held. After prayer by the High School Girls, Sri. C. S. V. Ramani Kariakkar, Assistant State Commissioner, and President of the morning session, requested the Raja Sahib to declare the Conference open.

Those present included the Joint National Organising Commissioner (Guides) from National Headquarters, the Joint State Organising Commissioner (Guides) from State Headquarters, the State Organising Commissioner, Western Division, the two State Assistant Commissioners, Four District Commissioners (Scouts), One District Commissioner (Guides), Nine A. D. Cs. (Scouts), Two A. D. Cs (Guides), Twenty three Scouters, Nine Guilders, Two Presidents Five Secretaries and One Treasurer. Among the A. D. Cs. there were some who were also Secretaries of Dt. Associations.

In his very instructive speech the Raja Sahib expressed his great pleasure in that the Conference is to be held in his High School and extended a hearty welcome to those who have gathered there. He claimed the privilege of being one of the oldest Scouts in this country, having been initiated into the Scout movement by no less a leader than Lord Baden Powell, the Chief Scout. He traced the introduction of scouting in the District of Malabar while he was the President of the District Board. He said he was axious to have the co-operation of the Scout leaders. While he was at Madras he met, Mrs. Clubwalla Jathav, State Commissioner (Guides) to do something for strengthening the Guide Section in South Malabar. Fortunately, there was immediate response and was assured that Mrs. C. Mohini, Joint National Organising Commissioner (Guides) and Miss. S. P. Dorairaj, Joint State Organising Commissioner, (Guides) who were coming to Coimbatore District would be deputed to run the Flock Leaders camp at Kollengode.

It was a happy coincidence that the Conference was held immediately after the Flock Leaders training camp at Kottayam-ballam. Raja Sahib offered his utmost co-operation and support to make the movement more active, popular and he also exhorted the parents to take an abiding interest He felt that the dearth of scouters with advanced training was a handicap and suggested that the Conference may devote attention in this regard He expressed the hope that the Scouts and Guides would ask themselves at the close of each day whether they had done a good turn and if they had done they would have justified their being in the movement, with these words and invoking the blessing of the Almighty, he declared the Conference open amidst great cheers.

Sri. A. V. Krishna Iyer, Secretary, S Malabar District, read the messages received from Mrs. Clubwalla Jadhav, State Commissioner, (Guides), Sri. N. D. Sundaravadivelu, State Commissioner (Scouts), Sri. V S. Rathnasabapathy, State Secretary, Sri. E. H Parameswaran, M. L C. Palghat, Sri Rajagopalan, State Organising Commissioner, Madurai, and Mr. Hegde, M. P. Mangalore.

After this Dr. Padmanabhan, District Commissioner, South Malabar, welcomed the members assembled and thanked in a sumptuous measure the great help given by the Raja Saheb and the Scout officers, scouters and guilders of all ranks, for their hearty co-operation.

Sri. T.R. Sundaram Pillai, District Commissioner (Scouts), Coimbatore, introduced every one of those present by narrating briefly the rank held by each in the Scout field and the professional work etc , and as each one was introduced he or she stood up in their seats so that every one present came to know one another in person. After this he presented a brief review of the genesis of the idea of holding Divisional Conferences and the work done at the First Conference held at Vellakinar on 26-7-'53 and the Second Conference held on 20-11'53 at Mangalore He briefly adverted to the various resolutions passed at both the Conferences and told the members about the work ahead.

Mrs. C. Mohini presented the Warrant of Assistant District Commissioner-ship (Guides) to Mrs. M Benjamin, Government Victoria College, Palghat. The recipient suitably replied and thanked the South Malabar District Association for having afforded her an opportunity of service to sister guides.

Mr C. S V. Ramani Kariakkar as the President of the morning Session expressed his warm appreciation and the help he had been receiving in an abundant measure from the various District Officers of all ranks and also appealed for further and greater co-operation from the public He laid emphasis on the absolute necessity for concentration on quality of work for the development of the Scout movement He said it was his faith and experience that God would come to the help of all sincere workers.

Then the Conference took up discussion on some of the burning topics concerning the movement.

Afternoon Session

The members re-assembled at 2-50 P.M.

Sri V. C. Subbiah Gounder, Assistant State Commissiener, Coimbatore, was voted to the chair In his introductory speech he referred to the introduction of rovering in mills and industrial concerns and was of opinion that it could be safely tried in cities rather than in village parts. He also referred to the very important aspect of the scouting movement, namely, the imperative necessity of having spiritualist ideals without at the same time entering into discussions on religion. He laid emphasis on the importance of the building role of character of boys and girls who are our national assets.

The first lecture for the day was that of Sri J. I. Muthiah, State Organising Commissioner, Western Division. Born out of experience covering over 3 decades, he said that the composition of the Patrol system must be so arranged as to ensure a permanency. For that the boys from the lower forms must be larger in number than from the higher forms so that the one who gains experience while in the lower forms may continue the work when he goes into the higher form. He welcomed the practice of appointing A D.Cs for particular work for particular areas as this will secure efficiency of an all round type.

(To be continued)

The Joint National Org. Commissioner, Guides in Madras

THE month of September envisaged a busy period in Madras State with the tour of the Joint National Organising Commissioner-Guides, Mrs. C. Mohini.

On the 1st of September 1954 Mrs. Mohini was welcomed by the State Commissioner-Guides when there was an informal meeting of all the Commissioners of Madras city at 11 A.M. at the State Headquarters. Miss. G. R. Samuel, Headquarters Commissioner for Training gave a report of work done in Madras and there was a discussion in which the Commissioners participated. Mrs. D. L. Gopal Ratnam, Headquarters Commissioner-Guides proposed a vote of thanks. After the meeting we all met under the shady Asoka trees for lunch. The State Secretary, Sri V. S. Ratnasabhapathy also joined us.

Mrs. C. Mohini left Madras for Tiruchirapally on the 2nd night. Mrs. L. Charles, District Commissioner-Guides of Tiruchi had drawn up an interestiug programme which consisted of visiting the Guide units in and around Tiruchi and visits to the place of historical interest. Mrs. Mohini stayed with Mrs. E. Ricketts while she was at Tiruchi. She addressed the Scouters and Guiders of Tiruchi and also met the members of the Rotary Club. The District Secretary, Dr. V. K. Ranganathan made the necessary arrangements.

Mrs. C. Mohini toured the districts of Coimbatore from 7th to 11th September. Mrs. I Roy Chatterjee arranged the programme for her visits to the various places and making her stay in Coimbatore a pleasant one. The Joint National Organising Commissioner-Guides visited places like Dharapuram and Tirupur and was much impressed by the handicrafts of the Dharapuram Industrial School. The tour in Coimbatore ended with a public meeting of Scouters and Guiders at the district Headquarters. Mrs. Mohini and Sri V. S. Ratnasabhapathy addressed the gathering. Sri S. Arulanandam, District Secretary helped the District Commissioner-Guides for arranging the programme for Joint National Organising Commissioner-Guides.

At the request of the Rajah of Kollengode the Joint National Organising Commissioner-Guides with the assistance of Joint State Organising Commissioner-Guides conducted a preliminary camp for Flock Leaders at Kottayambalam village about 3 miles from Kollengode. 37 Trainees attended the camp. Of these 7 members were teachers and the others were pupil teachers of the secondary section of the Rajah's Training School, Kollengode. Sri Subramaniam Iyer the Headmaster of Rajah's High School was responsible for making all the arrangements at a short notice Sri Madhavaraja visited the camp and helped the campers with all their needs. Mrs. Benjamin, Asst. Dist. Commissioner-Guides and Sri Krishna Iyer visited the camp. The camp was over on the 18th morning. It was followed by the Commissioners' Conference on the 18th and 19th September at the Rajah's High School, The Conference was well represented by several districts and useful topics were dealt with. The visit of the Joint National Organising Commissioner-Guides had a happy ending at South Malabar with the worthy appointment of Miss Saraswathy Madhavaraja as the Dist. Commissioner-Guides.

The Joint National Organising Commissioner-Guides returned to Madras on the 20th. The Advanced Training for Flock Leaders was conducted by the National Organising Commissioner-Guides and the Joint State Organising Commissioner-Guides for 5 days from the 21st September, at the Besant Scout Camping Centre at Adyar. 20 Guiders from the Madras Corporation area and one Guider from St. Thomas' Mount took advantage of the camp. Mrs. M M. Peters, the Dist. Commissioner-Guides of Corporation visited the camp on the 1st day. Mrs. M. C. Jadhav, State Commissioner-Guides and Mrs Gopal Ratnam, Headquarters Commissioner-Guides visited the camp on the last day and spoke to the Guiders. The State Secretary, Sri V S Ratnasabhapathy also visited the camp

After the busy events of one full month the Joint National Organising Commissioner Guides, Mrs. C. Mohini left Madras on the 28th September 1954. The Guiders and Commissioners whom she visited during this month were really happy to meet her and Mrs. Mohini has helped our Madras Guides and Guiders to keep up the game of Guiding.

S. P. DURAIRAJ

British Insurance

Two-Edged Expansion

IT is an established convention that British life offices set up new records each year. That was certainly true of last year, when new business, measured by the total of net new sums assured, reached another peak. From what is known and can be guessed, there seems every likelihood that the total net new sums assured by offices established in the United Kingdom both in the British and overseas markets and by the dozen or so commonwealth offices that transact a virile business in this country must comfortably have passed the £800 million mark in 1953. In the previous year, the comparable figure was about £775 million, and in 1951 it was £735 million. The ever-rising tide of life assurance business is an achievement in which the offices are entitled to take pride. But it is not in the totals themselves that the significant pointers to new life assurance business are necessarily to be found; for the totals combine two distinctive—and in some respects mutually exchangeable—types of business.

Because of the growing importance of staff scheme policies, no final judgment on the new business figures is possible until they are divided into staff pension contracts and life assurance, on the one hand, and individual policies on the other hand. The exact division of the 1953 figures in this way will not be known until later in the year when the life offices associations publish their annual statistics. For guidance, it may be recalled that in 1952 about one-third of the total annual new premium income was attributable to "scheme" (mainly pension) business; and there are some indications that the increase of scheme new business last year was at a slower rate than previously.

Other yardsticks, apart from new sums assured, suggest that the volume of new ordinary life assurance business was less favourable last year than in 1952. Here again the need for careful interpretation is important. For example, the number of new policies issued fell in 1952 and was lower again last year. But there is a growing tendency to issue a single master policy to cover a staff scheme (in which there may be several hundred individual participants) and a fall in the number of new policies that is due to this cause alone is certainly not significant. But this can hardly be the only cause; there are indications that he demand for new individual insurance—as opposed to staff scheme policies—is being barely maintained. Again, the amount of new life assurance business can be measured fairly well by the new annual premium income that results from it. The figures of the leading offices for 1953 show that new annual premium income was slightly lower than in 1952, in which year it had in turn been lower than in 1951. New deferred annuity annual premiums (these are predominantly for staff pension schemes) were also lower in 1953 than in the previous year, and also lower still than in 1951.

This evidence, provisional though it is in part, is of major importance to the life offices. Individuals and employers together took up appreciably more life assurance cover last year than in 1952. But they did not thereby increase the rate at which new premium income is being secured by the life offices. That is the factor on which keen eyes in the industry are fastened; they are not diverted from it by the considerable acceleration last year in the build up of the life and annuity funds, for this was partly a reflection of the cumulative growth of deferred annuity contributions under staff schemes. In 1952 these were running at the rate of about £50 million, and only relatively small sums were being paid in pensions. Life and annuity funds as a whole administered by offices domiciled in the United Kingdom rose by about £150 million last year compared with about £125 million in 1952 and £111½ million in 1951.

*

Indications this year suggest that new life business is running at about the same level as in 1953. There seem to be signs that new life assurance and annuity business in this country is becoming stabilised and that any material expansion in business can only come from a larger national income. A further growth in pension schemes is surely to be expected. Professional men, the self-employed, controlling directors and the life offices themselves all hope that the Chancellor of the Exchequer will find himself able next year to implement the recommendations of the Millard Tucker Committee on the taxation treatment of provisions for retirement.

In that event, an upsurge in scheme assurances and deferred annuities could be relied upon. But new business of this kind, like much of the staff scheme contributions that are now paid, would to some considerable extent

have to be regarded as a substitute for premiums that would otherwise have been paid under individual policies, mainly for endowment assurances. The inroads that the large postwar expansion of pension and life assurance schemes—including those that are privately administered—appears already to have made into the market for individual ordinary and industrial new life assurance would then be materially extended. The recent report of a research group of actuaries constituted by the Institute and the Faculty of Actuaries* examined this point and acknowledged that it was impossible to measure the extent to which pension schemes might be growing at the expense of ordinary life assurance. The direct effect on existing insurances has so far been small, for a contributor to a pension scheme would probably drop any other saving (except building society repayments) rather than drop an existing life policy. But the prospect for the future is the important question; the panel of actuaries felt that the impact of the growth of pension schemes on other life assurance business had yet to be fully tested. The establishment of specialist pension scheme departments by nearly all the life offices and by leading firms of insurance brokers, who nowadays handle a substantial number of the larger policies, suggests that this prospect is already well in mind.

Whether or not individual members of the public are able and willing to increase their volume of savings through life assurance, they are being offered terms today that are more favourable than at any time since 1939. Life assurance and annuity premium rates are based on assumptions about the future course of mortality, the cost of running the office, and the net yield that will be obtained on the invested funds. The trend of mortality rates is moving in favour of the offices in life assurance business, but against them in annuity business, which includes pension schemes. In the case of the overwhelmingly popular endowment assurance, the charge to cover the risk that the sum assured will have to be paid before the maturity date of a policy is now so small for first class lives that no further significant cheapening of premium rates is likely, even if there were to be a considerable further lightening of mortality at the relevant ages.

*

But in the case of pension schemes, long range forecasting of a quite different order is imposed on the offices. The pension of a new entrant may not start for forty years or more; and since the dice of medical progress are loaded against them, the offices are certainly not charging excessive deferred annuity premiums in relation to the increasing "risk" that the policyholder will live to a riper old age. Expenses, stated as a ratio to premiums, are at present being held steady and even reduced. For a large sample of offices, the average expense ratio, adjusted for single premium and for immediate annuity business, was 13.7 per cent last year, compared with 14.0 per cent in 1952 and 14.1 per cent in 1951. But this apparently satisfactory achievement needs some qualification. Annual premium incomes are being swollen by staff scheme deferred annuity contributions; and these materially help to reduce the expense ratio. But the rates of contribution under staff schemes do not contain an explicit margin to pay for future costs of management as large as that contained in a similar amount of premium income for whole life and endowment assurances, which are still the backbone of life business.

Interest rates are the third, and most important, factor in the determination of premium rates. The effect of compound interest over long periods is profound, and the life offices commit themselves to a considerable act of faith in discounting a given net rate of interest throughout the existence of every life or annuity contract. Given the lively competition that exists between some eighty different offices, and the secular trend towards lower interest rates that some observers hold to be probable, those offices that transact a large proportion of their business in the form of non-participating policies (nearly all pension schemes are in this category) would be less well placed than they are if they had no opportunity to hedge, if only partially, against the risks inherent in a movement of the rate of interest, either up or down, from the level current when the premium was fixed. The worst risk is that the net return on the invested funds will fall below the rate assumed in the premiums; a rise in the rate of interest, on the other hand, benefits the life offices once they have written down their assets.

These are problems that actuaries have long pondered. They have recently paid considerable attention to the associated problem of matching the assets of a life office to its liabilities so that the contractual payments in future years can in all circumstances be met out of current income and maturing investments. If a theoretically perfect matching could be achieved between assets and outgoings, an office would be virtually immunised from the effect of changes in the rate of interest. The theoretical solution of matching cannot, however, be achieved in practice; only gilt-edged stocks provide the necessary spread of investment maturity dates. The more shrewd the choice, the less will be the impact of a change in the rate of interest. But the other side of the hedge against changes in interest rates—and one more comforting to the life offices—is to transact a worthwhile volume of participating business. The considerably higher premium rates on such business provide a useful cushion; and changes in the profitability of the business are reflected in the rate of bonus declared. It is significant that, following the Prudential, the Equity and Law now offers staff pension schemes on a participating basis. Such schemes are still uncommon, whereas participating terms on individual life policies are entirely familiar. The fact that the Legal and General is again offering normal participating policies provides further evidence of the desire of the offices to avoid exposure, as far as they can, to the abnormally low interest levels of eight years ago, and equally to the consequences on the book values of their assets of the relatively high levels of eighteen months ago.

Last year, as Table IV shows, the yield on life office funds rose further. The net yield of 3.89 per cent—which is the important figure in this context—was the highest since 1939. This figure evidently owes a good deal to the rise in interest rates during the first phase of Mr Butler's flexible monetary policy—a phase in which high-class debentures could be bought on a 5 per cent basis and good equities at 6 per cent and more. But the yield on new money, and in particular on new debentures, which are a favourite life office investment, has fallen considerably during the last eighteen months and average yields this year may be lower than in 1953.

All these considerations pose a question: How long can the present favourable rates of premium for non-participating assurances and for annuities, both immediate and deferred, be continued? Existing rates have been arrived at over several years in open competition between the offices in a climate of rising yields on new money; it is this rate rather than the return on the fund of invested assets that is relevant in the fixing of premiums at any given time. The traditional caution of actuaries has maintained a useful margin between the rate of interest actually assumed and that obtainable at the time the premiums were calculated. Falling interest rates, which have reduced the gross return on high-grade debentures by a full 1 per cent since the beginning of last year, must have materially narrowed the margin between the rates that the actuaries have assumed and the rates now currently earned. But it is perhaps unlikely that premium rates for non-participating life and annuity contracts will be increased in the immediate future. Life offices move in response to firmly established trends as they emerge in the course of time, and not in response to fluctuations that may be only short-lived. Immediate annuity rates of some offices are especially attractive at the moment because of a technical tax point. Annuity funds at present bear tax on the surplus of interest income over actual annuity payments. There is accordingly an advantage, from the taxation point of view, in increasing the annuity payments up to the point of balance, and this advantage is reflected in current premiums on immediate annuities. But it would disappear if the proposals for a more logical basis of taxation for life office annuity funds made in the Millard Tucker report were implemented.

Bonuses on participating policies rose further last year as Table XI shows. Interim bonuses declared by those offices that make an actuarial valuation of their liabilities at triennial or quinquennial intervals have also been increased. The profitability of life assurance depends materially on the yield on the assets. But if yields should start to fall, no reduction in bonuses from their present rates would be likely in the short run; the next bonus declarations of offices that value at other than annual intervals will undoubtedly be considerably higher than those declared at the last valuation.

* The Growth of Pension Rights and their impact on the National Economy.

How Insurers Invest

A FORTNIGHT ago, Mr J. W. J. Levien, the chairman of the British Insurance Association, presented some impressive statistics of the growth of British insurance business and investments. He put the increase in net premium income last year at more than £40 million, distributed between the branches thus:

BRITISH INSURANCE COMPANIES—NET PREMIUMS WRITTEN

	1952	1953
	£ mn.	£ mn.
Fire	208·1	210·4
Accident	266·8	288·4
Marine	67·5	60·7
Ordinary life	260·7	279·1
Industrial life	122·3	127·1
Total	**925·5**	**963·8**

At last year's pace, the British insurance offices will this year be handling a billion pounds of premiums for the first time. And out of this sum a considerable part will form a net accretion to insurance portfolios, invested against the time when assurances become payable and against the hazards of fire, accident and marine insurance.

Mr Levien's figures of insurance investments compiled from returns made by members of the association, show a net increase in invested assets of £273 million during the course of 1953. The next table gives a general analysis of these holdings:

BIA MEMBERS—TOTAL INVESTMENTS

	1952		1953	
	£ mn.	*Per cent*	£ mn.	*Per cent*
British Government and guaranteed secs.	1,178·0	*33·2*	1,244·0	*32·6*
Mortgages	386·1	*10·9*	424·0	*11·1*
Debentures, loan stocks, pref. and guar. stocks and shares	736·1	*20·6*	805·0	*21·1*
Ordinary	431·6	*12·2*	478·8	*12·5*
Other	821·5	*23·2*	864·3	*22·7*
Total	**3,543·0**	*100·0*	**3,816·1**	*100·0*

This analysis is on a slightly different basis from that adopted in the long series of insurance surveys of *The Economist*. The basic data on the investment policy and the interest return on insurance of funds are given in the four tables on the next page. They relate to over forty of the principal offices, and they distinguish between the distribution of life funds and the distribution of non-life funds—to which different investment considerations apply.

Table 1 shows the distribution of the total assets of 44 offices. Two contrasted points emerge from it. Each year shows a major expansion in insurance funds; and each years also shows a moderate change in the percentage distribution of the funds. Last year the total assets of these 44 offices expanded by £234.5 million, whereas in 1952 the increase had been £180.8 million and in 1951 £188.8 million. The total assets of all United Kingdom registered insurance companies probably exceeded £4,000 million at the end of 1953 and in addition the funds of friendly societies transacting life assurance business (mainly industrial) may amount to about £225 million. At a rough guess, perhaps £650 million of these assets may be held abroad to cover liabilities over the free world, and of this perhaps £200 million may relate to life and annuity business.

The second point is the comparative slowness of change in the percentage distribution of insurance assets. The absolute changes are impressive: over £60 million was put into gilt-edged holdings last year, £46 million into debentures and £42 million into ordinary shares. The result of these changes on the percentages is deceptively small: a fall in gilt-edged from 30.6 per cent to 30.3 per cent (though this is fully 2 percentage points lower than at the end of 1951); a further rise in debentures to 11.9 per cent (nearly a point higher than two years earlier, which bears witness to the attractions of good debentures during the dearer money phase); and a virtually identical rise in the ordinary share percentage. A major change in investment policy has been undertaken by many offices in recent years, towards an expansion of their equity holdings; it should not be thought that such a change shows results quickly in the investment percentages, or that any given percentage distribution is the "right" one by any criterion except the security of the policy holders.

ANALYSIS OF INSURANCE INVESTMENTS AND INTEREST RATES

TABLE I.—DISTRIBUTION OF INSURANCE ASSETS.
TOTAL CONSOLIDATED ASSETS OF 44 OFFICES.

Class of Asset	1951	1952		1953	
	per cent	£ million	per cent	£ million	per cent
Mortgages, incl. policy loans	11·2	400·6	12·2	435·8	12·4

Caernarvon Castle, constructed between 1283 and 1323, is an outstanding example of military architecture of the Middle Ages. The Castle is built on a platform of rock commanding the southern entrance to the Menai Straits. This ancient monument, in the care of the Ministry of Works, is open to the public. This is one of the nation's most popular monuments, more than 123,000 people visited it last year.

BROAD ST. CORNER, BIRMINGHAM, 1

"Nineteen hundred and fifty-three saw the end of the erosion of capital values that the offices had been facing virtually without respite since the beginning of 1947. The effect of rising interest rates on the life offices is not the simple and direct one of falling capital values and improved interest earning possibilities. The offices, broadly speaking, can themselves offset the falling market values of their investments caused by rising interest rates by raising the rate of interest that they use in the actuarial valuation of their liabilities ; in layman's terms, the effect of this slightly complicated counterpoint is to release reserves which can then be used to write down the balance sheet value of the assets. A high yield on the invested funds is the main source of profits out of which the bonuses on participating life policies (and in a few offices, pension annuity contracts) are provided.

But depreciation in the market value of the assets of a life office can be counterbalanced by adjusting the interest rate assumed in the actuarial valuation of its liabilities only if the maturity dates of redeemable stocks and the proportion of short term assets (including mortgages) and of perpetual stocks (including preference and ordinary shares) are nicely matched to the liabilities as they emerge, so that lump sum and periodical benefits under life assurance and annuity policies and the means to meet them can be synchronised. Such an ideal matching of life office assets and liabilities cannot be achieved in practice ; matching can be raised to the optimum, but never to perfection. Some uncovered depreciation on investment portfolios has therefore to be accepted on a falling market.

★

In the case of non-life assets, there is no way of obtaining protection against depreciation apart from investing a high proportion of them short. This is, in fact, the practice in the investment of the general funds ; cash or its equivalent represented more than a quarter of the non-life assets of the leading offices included in Table III. Investment managers must have heaved a sigh of relief when the turning point of fixed interest security values occurred at the end of 1952. Good quality fixed interest stocks could be expected to recover, but the fact is that the Assurance Companies Act 1909 calls for a certificate that, in the aggregate, the assets are fully of the value stated and by the end of 1952 there were indications that hidden investment reserves had been considerably depleted. The recent batch of chairmen's speeches refer to the useful margin that has been re-established between the book and market value of the assets. The measure of the recovery may be taken from the Actuaries' Investment Index: last year 2½ per cent Consols gained 9.3 per cent, debentures 8 per cent, preference shares 7.1 per cent and ordinary shares no less than 16 per cent. Three per cent Savings Bonds 1965-75, which may be taken as more relevant for life office gilt-edged investments than Old Consols, rose in 1953 by 6.6 per cent.

Whatever relief insurance companies may have experienced at the relaxation of the long drawn out pressure on their investment reserves, their investment of new money last year shows that they were fully alive to the implications of rising Stock Exchange prices. The year opened with the issue of the Anglo-Iranian 5 per cent debenture stock 1974/78 at 98½ into which the institutions tumbled with enthusiasm ; it closed with the yield on new issues of good class redeemable debentures down to 4½ per cent and the

rate is now virtually 4 per cent. Fixed interest securities and mortgages accounted for three-quarters of last year's total increase in assets.

Only £12½ million was placed last year in preference shares—in 1952 they had actually fallen—and they now represent less than 7 per cent of insurance portfolios. In equities, these offices increased their stake by £42.3 per cent to 11.9 per cent of total assets. The measured trend towards increased holdings of equities continued, but the insurance companies rightly refuse to be harried into investment in ordinary shares at prices, and times, that do not appeal to them. Last year the offices were concentrating their efforts on securing yields on fixed interest stocks that were historically most attractive. Given their responsibilities to policyholders, the life assurance offices do not appreciate arguments that it is in some sense their economic mission or public duty to undertake investment in risk bearing securities because they alone are in a position to step into the role formerly played by the private saver and investor. They are acting with a sufficient sense of public responsibility in their equity policy to make such neo-Socialist arguments empty of meaning. And perhaps some of them would argue that, dividend thaw or no, equities can sometimes be purchased rather dearly when, as in present conditions, their supply is strictly limited, and they are increasingly coming into the permanent hands of the insurance offices themselves.

★

As in the 1953 survey, the yield calculations in Table IV show the gross as well as the net interest earnings of a large sample of life offices. Both gross and net yields improved for nearly all the offices last year ; but yields this year might be slightly lower than in 1953. The gross and net yields have been calculated for each office by the same formula, but because of differences between the offices in the method of provision for investment depreciation, the yields shown for the different offices may not be necessarily comparable. It is, however, clear that some offices and groups of offices consistently secure appreciably higher returns from their invested funds than do others. Gross yields ranged last year from 6.32 to 4.16 per cent ; the average yield for mutual offices was 5.29 per cent, for proprietary offices 5.09 per cent, for industrial-cum-ordinary offices 4.54 per cent and for composite offices 4.66 per cent. Net yields ranged from 4.98 to 3.18 per cent the average yields of the four types of office were 4.24, 4.19, 3.59 and 3.63 per cent, respectively. Net yields are subject to more variation between offices than gross yields because of the different basis on which taxation is chargeable on life and annuity funds.

Table II is a chastening refutation of the notion that there is some ideal investment distribution. There are nine offices that hold 20 per cent or more of their assets in ordinary shares ; there are also nine that hold less than 10 per cent in equities. Actuaries and investment managers dispute in professional argument what the ideal should be—or might be. But they know well that their success is based not on any set of rigid principles but on the application of judgment and the art of selection within a field of reference that they have, when all is said, to set for themselves. Theirs is the choice of the "right" proportions and theirs is the duty of care in making as sure as they can that these proportions are such as best serve the policyholder. They have not been lacking in that duty, even though their different conceptions of what are the "right" proportions vary so widely.

For the Patient Investor

THE long term investor who chooses insurance shares usually bats on a good wicket; the expansion of the industry sees to that. A volume of business steadily expanding through the decades and largely in the hands of old, strong companies, gives insurance ordinary shares many of the characteristics of money stocks. All the risks that normally attach to equities, save one, are at a minimum. The risk of a trading loss is inconsiderable; the risk of reduction in dividend is seldom serious, for increases are almost always well secured. The one risk that matters is of an adverse turn in money rates—for insurance shares, like bank shares, fall when Consols fall. For compensation, there are the manifest advantages of equity investment that they offer—the sturdy growth of the oak well short of maturity, and not the leggy uprush of the poplar. The past year, with its crop of twelve dividend increases from twenty leading insurance companies, following no less than eighteen in 1952, has shown once again the equity vintage of insurance shares.

But if the long range investor can hold insurance shares and feel that his grandchildren are not likely to lose by his choice, that does not imply that every day is the right day to buy. Insurance companies have another habit of which he must take account. They tend to increase their dividends at intervals; they prefer the decisive increase interspersed with long periods of stability to the idea of small and frequent adjustments. One such wave of decisive dividend adjustments has just taken place. It may have seemed more spectacular because it marked the end of the excessive stringency of the Cripps-Gaitskell period of dividend restraint. Restraint is in fact most effectively exercised, as it always was, in insurance dividends. Even after the latest increases, net dividends do not absorb much more of the companies' interest income than they did in 1950. But for a fair number of companies they may have reached a level from which further advance must await a further growth in net earnings.

That view can be sustained. The extent of dividend increases and of capital adjustment that has taken place since the thawing of the dividend freeze (which the insurance companies closely observed) has been marked. Between 1950 and 1953 the twenty leading companies listed in Table VI increased their net ordinary dividend payments by 27.7 per cent from £6.33 million to £8.08 million. In the same period, the net underwriting profits of the companies and the dividends they themselves received on their non-life investments rose by 13.1 per cent from £17.5 million to £19.8 million. The habit of paying dividends out of investment income alone and ploughing back into the general funds all underwriting profits is deeply

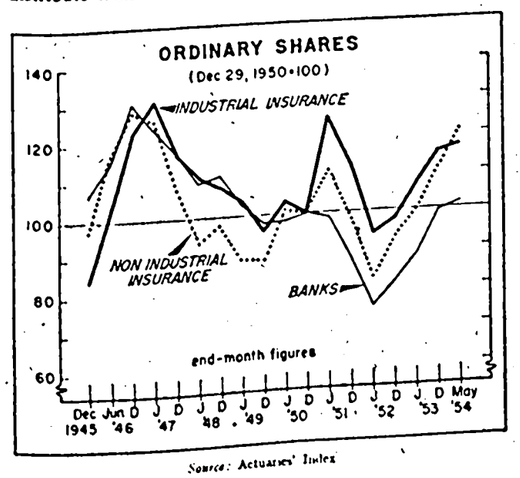
entrenched in insurance practice and investment income in the same period rose from £9.4 million to £11.8 million (25.2 per cent). Therefore the loosening of the pursestrings in the shareholder's favour (putting into reverse the over-niggardly policy that was previously enjoined on the companies) that has already taken place has done no more than absorb the increase in interest earnings during 1950-53 period.



The yardstick of comparing net interest earnings on the general (or shareholders') funds with the net dividend pay-

ment is undoubtedly a useful one for that is the yardstick commonly employed by insurance boards themselves. But it ought to be applied with somewhat greater discrimination than a rigid rule. Obviously it is a source of strength to an insurance company to be able to plough back into free reserves, year in and year out, the whole of its net underwriting profits, together with some part of its non-life interest income. But the fact is that certain companies are able to show underwriting profits that run consistently higher than those of others. Such companies can, and do, distribute their interest earnings practically up to the hilt

Source: Actuaries' Index

but are still able, as a result of their exceptional underwriting, to make additions to their reserves that compare favourably with the retained earnings of other companies.

The amount ploughed back has been maintained; it was £11.7 million in 1953 and compared with £11.2 million in 1950. But normal expansion, encouraged by inflation,

has enormously increased the volume of general underwriting business in those four years; premium income rose by £109 million to £457 million. A stable profit retention of around £11 million does not seem excessive in relation to the current volume of business. It would not be surprising if some companies were inclined to wait for an increase in underwriting surpluses before they considered the next phase of raising dividends. There are in fact fair chances of some growth in underwriting profits. Fire insurance should yield some increase; last year fire accounts had to meet heavy claims from fire and windstorms in the United States and from fire and flood at home. For motor insurance, too, the prospect is at long last rather better. After several years in the red, motor accounts are now breaking a little better than even—though no insurance man would found big hopes on a class of business traditionally as disappointing as motor insurance. The outlook for marine insurance remains gloomy. But over the whole field, underwriting profits this year might easily turn out a little higher than those of 1953. The other main item in the insurance shareholder's calculations is the prospect for

interest earnings on the general funds. It seems hardly likely that interest earnings can yield any great increase in 1954. Taking underwriting profits and interest yields together, the companies would probably do quite well if they managed to maintain in 1954 the rate of earnings that they achieved in 1953.

But it is not merely increased dividends that have lately excited the insurance share market. Substantial readjustments of capital have been made by a number of insurance companies this year; the steadily broadening basis of the business has made such readjustments desirable, for there had been little change in insurance capital for two decades, apart from a tendency towards extinguishing uncalled share liabilities. The Employer's Liability Assurance has raised over £2 million of new money (by the issue of 460,910 ordinary shares of £1 at 90s.) and has capitalised more than £1 million from reserves, making the existing shares fully paid. The General Accident has raised £1½

million by an issue of 250,000 ordinary shares of £1 at 120s. and has also paid up the uncalled liability on its existing ordinary shares by a transfer of £750,000. The Royal Exchange Assurance, perhaps more surprisingly than the others, has raised nearly £4 million of new money and has made a capitalisation issue of one new fully paid share for each original share held. In addition, the Britannic and Commercial Union have subdivided their £1 shares into 5s. units, whilst the Atlas has capitalised £550,000 and simultaneously split its £5 units into £1 units 10s. paid.

The sparkle that has come into insurance shares this year as capital structures were enlarged and dividends increased is put under the spectroscope in the Table VII which relates the dividend increases of recent years with the cover provided for each year's net payment by the net non-life interest earnings. The calculations are not perfect, partly because companies follow different practices about charging profits tax and EPL on interest income. Insurance share yields are powerfully—but not exclusively—influenced by the extent of the cover for the current dividend that is provided by net interest earnings.

The investor may find interest in comparing the final column of Table VII with column 11 of Table V. He may decide that it will be harder in 1954 to pick a company which will pay more than it was a year ago. Such a view need not exclude the obvious possibility that each individual company will behave according to the type of business, it handles and according to the leanings of its directors. Nor should it exclude the continuing evidence that insurance is still a growing industry. Much of the great rise in premium income of recent years has accrued through group pension schemes, in the eventual profits of which the shareholders have expectations. But they should not be exaggerated. Although no actuary willingly runs his head into a loss, the profitability of pension business rests on assumptions about the long-term rate of interest that have yet to be proved, and it is necessary to think in terms of a generation before true profits on this side of the business will flow in considerable volume. The shareholders' proportion of the profits from life assurance is small and it creeps through late and in low gear. But it is not negligible and it should expand.

Marine Insurance

Aggregate marine premium income of the twenty leading insurance companies fell last year to £40.9 million, compared with £46.2 million in 1952 and £44.4 million in 1951. These figures cover only part of the marine underwriting conducted in London. Half of the premiums handled by Lloyd's underwriters come from marine business; unfortunately the latest year's returns from Lloyd's appear too late for inclusion in this survey. So far as the companies are concerned, the decline in premium income last year resulted from lower commodity prices and smaller insured values for cargo; a fall in the value of cargo vessels following the break in shipping freight rates; and by the increased pressure of competition in a market whose capacity was—and still is—at least adequate for the volume of available business.

Hull insurance claims may be presented a considerable time after the end of the year to which the premium related. If repair costs rise in the meantime, the marine underwriter is carrying the risk not merely of shipping hazard but also of inflated costs. This persistent increase in ship repair costs shows no sign of coming to an end and this country shows up particularly badly compared with the cost of repairs in many continental ports. The outlook both for hull and cargo insurance business does not suggest any immediate improvement.

Transfers of profit from the marine account are by long-standing practice made after a time lag of three years, during which the account is kept open. The transfers of the twenty leading companies to their 1953 profit and loss accounts thus show the outcome of marine underwriting indicated in 1951 and not the experience of 1952 and 1953. Such transfers totalled £3.0 million in 1953 compared with £3.8 million in 1952 and £4.4 million in 1951. A continuation for some time ahead of the falling trend of marine insurance profits seems inescapable. Marine insurance funds of the twenty offices at the end of 1953 represented 163 per cent of that year's premium income, compared with 145 per cent at the end of each of the two previous years.

Industrial Life Assurance

The ten leading offices included in the table accounted in 1952 for over 90 per cent of all industrial life assurance business done in the United Kingdom. Last year they reported new sums assured totalling £249.4 million, compared with £242.0 million in 1952 and £231.3 million in 1951. The industrial assurance funds of the 14 insurance companies and 115 friendly societies that transact this business amounted to £919.0 million at the end of 1952, friendly societies' funds totalled £172.5 million, out of which, as Table shows, the Liverpool Victoria and Royal

(a) 28·0 per cent excl. non-recurring credit. (b) Average expense ratio.

Liver together accounted for £139.7 million. At the end of last year the total industrial life funds amounted to about £950 million.

Among the offices transacting industrial life assurance, the Prudential has granted its industrial branch policyholders contractual rights; such policyholders now receive the same proportion of the profits of the industrial branch as the ordinary branch participating policyholders receive of the profits of their branch. The other offices pay bonuses on an *ex gratia* basis. Last year there were some further increases in the rate of bonus declared.

Service that excels

What do you require of an insurance company? You need to know it is of good standing. *The 'General' is the third largest British Insurance Company for fire, accident and marine business.* Its rates and terms must be competitive. *The 'General' is independent and offers advantages usually unobtainable elsewhere — the* BONUS SCHEME *on fire and household policies is an example.* Above all, it must provide you and your clients with a prompt and efficient service. *The 'General' has been built on a reputation for* SERVICE THAT EXCELS.

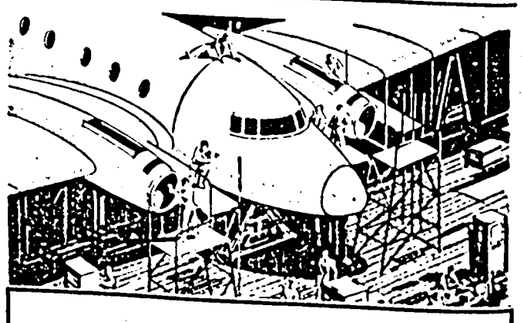
PENSION** schemes are in the **NEWS



Pension-consciousness has no class frontiers today. In the press, on "the air", in politics, the word PENSIONS has attention value . . . and is used accordingly. To be in a "pensionable job" used to be the privilege of a few, but nowadays more and more enlightened companies are introducing pension schemes for employees . . . and carefully thought out retirement plans for highly taxed executives.

"Careful thinking out" is vital whether the scheme be for "the staff" or "the executives". Principles are constant, but the special requirements of each employer must be analysed in creating a scheme to provide the most suitable terms and benefits.

Our pensions specialists are at the service of Boards of Directors and Accountants who would like to discuss pension planning.

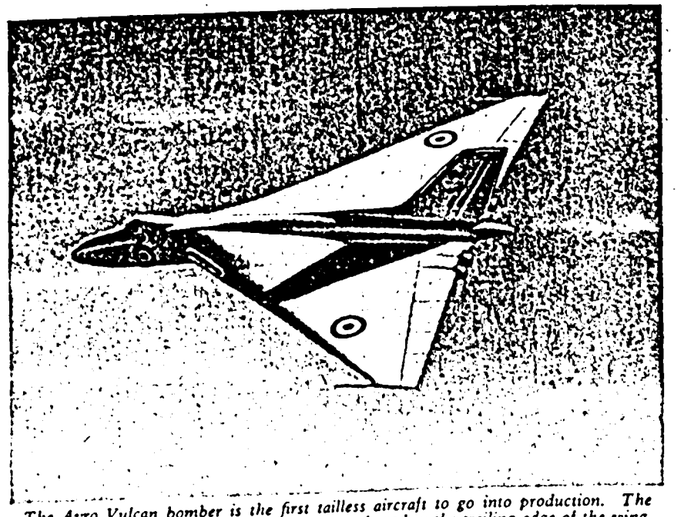
(c) In addition £9½ million in the ordinary branch and £9½ million in the industrial branch were released from actuarial reserves and transferred to investment reserves. (d) In addition £128,000 was released from actuarial reserves and transferred to investment reserves. (e) Including £30,000 outdoor staff bonus. (1) In an alternative class bonuses take the form of reductions in premiums. (2) Plus 28/-s for 1951 (bonuses for that year paid only on death, and on maturity of endowment assurances). (3) On United Kingdom policies; different rates apply overseas. (4) Rate applicable to endowment assurances; a higher rate of bonus is paid on whole life assurances. (5) Rate applicable to policies in the general section and to endowment assurances for original terms of less than 25 years in the temperance section; a higher rate of bonus is paid on other assurances in the temperance section. (6) Rate applicable to endowment assurances; whole life assurances (on which premium rates are low) participate under a tontine system. (7) Rate applicable to endowment assurances with reference to the sum assured only. c=compound bonus, calculated upon the sum assured and existing bonuses. s=simple bonus calculated with reference to the sum assured and existing bonuses.



Living in the Air

Without the Prince

THE brightest stars of the aircraft industry are, alas, also the most temperamental. A prolonged attack of stage fright has repeatedly postponed the entrance of the new fighters, the Swifts and the Hunters, into squadron service with the RAF and the new *prima ballerina*, the supersonic P.1 fighter, has not turned up this week at rehearsals. The Comet is only now showing signs of recovery after its attack of nervous exhaustion in the middle of what looked like a long and successful run. There has been some booing from the gallery and the audience is beginning to fidget.

The show that the industry has put on at Farnborough during this week is dazzling enough to placate the most restless audience, but it lasts only for one week every year. When the noise has died away, and the critics have got their breath back, they will find that the show has not answered their questions so much as drowned them. There is a growing tendency among the informed to dismiss Farnborough as a public spectacle. It could hardly be otherwise, on an occasion when the élite of the industry's pilots are commissioned to demonstrate the cream of its products; but to imagine that this is the sum total of the show is to mistake the shadow for the substance. Five thousand visitors from abroad do not make the journey to this country just to watch clever flying; they could stay at home and see it in far greater comfort in a cinema far from Farnborough's spartan amenities. The annual Farnborough display is a yardstick for the rate of progress being made in the aircraft industry, not in production but in research and development.

The show, indeed, is both a shop-window and an end-of-term report. What visitors have seen this year is first, an official refusal to allow the English Electric P.1 fighter to take part in the display. This decision is a measure of the complexity reached by a modern fighter—the P.1 is the slave of its neurotic mechanisms and it is not considered any longer advisable to let such a machine, in its first weeks of development, go through the ordeal of a public exhibition. Secondly, they saw the antithesis of the P.1, the prototype of the Folland Gnat. This prototype, the Midge, is flying with a stop-gap engine until the Gnat's scheduled power-plant is delivered next year. Then the aircraft will be supersonic in level flight—as the P.1 is today—although its top speed may not be as impressive as that of the bigger, heavier, more powerful machine.

The Avro Vulcan bomber is the first tailless aircraft to go into production. The controls normally carried on the tail are transferred to the trailing edge of the wing.

These two fighters have a link; the designer of the P.1, Mr F. W. Page, was trained at English Electric by Mr W. E. Petter, designer of the Gnat. Mr Petter, while he was at Preston, designed the Canberra bomber, and did some of the preliminary groundwork for the P.1. The future of the Gnat as a light fighter is in the balance; since its first flight last month it has given evidence of great manœuvrability, and what is not so usual these days, the

sturdiness, simplicity and lack of temperament that the designer had promised but that few people thought he would achieve.

The third new aircraft was the Comet III, even more elegantly proportioned than its predecessors, and flying free from the cloud of black doubts that have hung over its future between the grounding of the Comet I this spring and the Minister of Supply's encouraging if inexplicit statement made last week-end. This year, when there are few new aircraft on show, there are numbers of machines serving as flying test beds for new engines. Engine development and testing along these lines is the first step towards the evolution of a fresh generation of aircraft. Another step is the construction of experimental machines, usually scale models for new ideas. At Farnborough this year was the massive Supermarine 252—as highly powered as the P.1—from which the Navy's high-speed fighter will eventually evolve. There was the Short Sherpa with its "aero-isoclinic" wing (see the glossary "Vocabulary of Speed"). There was Fairey's stumpy delta that has formed part of the company's research programme on vertical take-off. Many will regret that Rolls-Royce's vertical take-off apparatus, a kind of flying sulky harnessed to two Nene engines, could not also be shown.

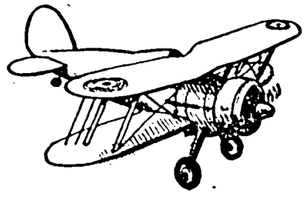
Responsibility for Delay

This is the established Farnborough pattern. First come the new engines and the experimental aircraft, then the prototypes and finally the production versions and subsequent refinements of them. This year, for example, Gloster Aircraft were able to put five delta-winged Javelins in the air at once, proof that production of a complex and costly aircraft is getting under way. The display provides certain concrete and unassailable milestones against which to measure progress. During the past years, for example, it has become increasingly plain that something was wrong with fighter deliveries as planned in the 1950-51 rearmament programme. Canberra bombers had come into service on schedule; Viscounts and Comets were delivered to the airlines and went into service on time, but the new fighters, the Swifts and Hunters ordered early in 1951 and evolved each from a long line of prototypes, are still not in service, and their record raises fears that the pattern may be repeated when the time comes to deliver the big bombers, the all-weather fighters, and the supersonic generation of machines already treading on their heels.

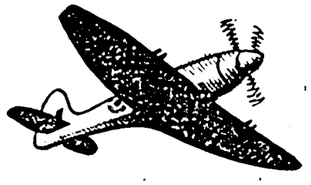
The responsibility for this sorry record is divided fairly equally between the Ministries involved and the aircraft industry. Some of the reasons for delay go right back to 1951, when the performance requirements for the two fighters were first drawn up. These were a great deal less stringent than the standard of performance that the same aircraft are expected to meet today. The power of the Avon engines in the fighters has risen from 6,500 pounds thrust to a figure in the region of 10,000 pounds. The standard 20 mm cannon have been replaced by heavier, faster firing, more powerful 30 mm cannon that were themselves only on the drawing board when the fighters were ordered. Radio, too, has changed, and combat altitudes and relative speeds. However much "stretch" may have been designed into the two machines—and the evidence suggests it was not too great—these changes in elements outside the designer's control mean modifications; modifications mean time, and time means delays. Some delay has therefore been inevitable. Its cause lies in the relaxation of international tension that gave the services time to reconsider their requirements in the light of new technical advances.

Other delays, however, have been due to defects in the aircraft themselves. Almost all aircraft go through the equivalent of teething troubles, but some are affected more seriously than others. The Swift has had a fairly unfortunate history of minor ailments, the Hunter has had to undergo one major modification and its equipment has needed adjustment. This is where the industry must bear a big share of the blame for delivery delays. It is difficult not to believe that the most serious troubles of the two fighters could not have been recognised far sooner than appears to have been the case. This is, after all, the purpose of test flying. Earlier and more vigorous action in the factories to correct defects in design could have cut months off the time it is going to take to get these machines into service. In the industry, there seems to have been a general, and understandably human, reluctance to acknowledge that the designs were capable of, or indeed needed, improvement and the faults in either aircraft do not seem to have come to light until they were handed over for testing by service representatives.

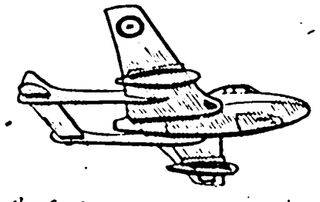
In some other countries' air forces, these troubles are allowed to work themselves out as the aircraft goes into service. The test flying that brings such defects to light is done in this country at research establishments owned by the Government, although the pilots are many of them service pilots. In other countries, this procedure is simply replaced by what amounts to test flying by certain selected squadrons. This gives the impression of rapid aircraft development and delivery, and it quickly accumulates a substantial volume of test flying experience on any given aircraft. The British procedure is slower, more methodical, and probably less costly in terms of service pilots. A trained test pilot is less likely to come to harm in a new and temperamental machine than an enthusiastic service flyer.



There is no reason to believe that delays occur at the production stage. Tooling and production seem as rapid here as in any other country; fresh modifications have in fact led to the piling up of half-finished aircraft and parts in factories while new drawings were prepared. The Hawker factories producing Hunters contain two or three hundred complete and half-complete machines waiting for their new dive brakes. The danger period lies rather in the interval after the first machine has flown and before it is cleared for service—in other words, during development flying.

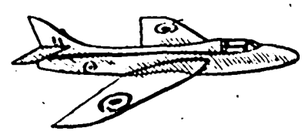


During this period, the test aircraft has to serve two masters; it belongs to the manufacturer that built and designed it, it is also the special concern of the Ministry of Supply. It is test flown by the civilian pilots employed by the manufacturer to see that it meets the design specifications. It is test flown by the service pilots at government experimental establishments to test its efficiency as a fighting machine, and it is at this second test stage, after the civil pilots have done their work, that most troubles come to light. A heavy responsibility therefore rests on the manufacturers; if their testing programmes are not sufficiently comprehensive, defects in performance that should have come to light earlier will go undetected until the aircraft has passed out of their hands and into those of the government's test establishments. This is what seems to have happened with both the Swift and the Hunter. Fortunately, there is no evidence yet to suggest that it will happen with other aircraft on order even though some, like the Javelin, have had considerable development difficulties. These were foreseen and the Javelin is running on schedule.



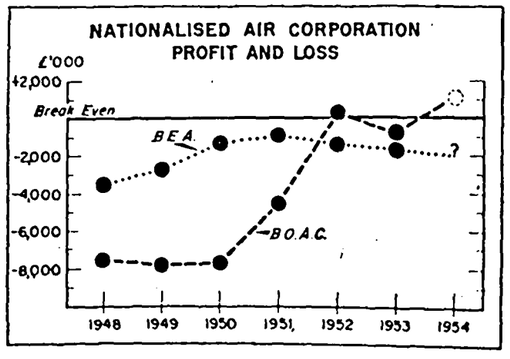
Speeding Deliveries

The Ministry of Supply has been attempting to streamline its machinery in order to cut down delays; the Minister has suggested the changes may have lopped 18 months off delivery. One of the first steps was to appoint, some months ago, a member of the Air Council, Air Chief Marshal Sir John Baker, to the Ministry of Supply and to make him controller of aircraft supplies. This means that the Air Council, when it asks for aircraft modifications, will be in no doubt about what those modifications will involve in terms of delivery delays and can weigh up whether the improvement in performance is really desirable or merely marginal. In the past they have not shown this awareness. Then, the Ministry has altered its ordering procedure so that where they once ordered two, they will now order a batch of prototypes. This should cut down delays that occur when one or both prototypes have been damaged and permit more test-flying hours to be piled up during a given period. Separate civil and military test flying will still be the rule, and the military tests do not begin until the manufacturer is satisfied with the machine. Complete telescoping of test flying is therefore not envisaged at this stage. The more complex the aircraft themselves become, the more serious, too, will be delays over which neither manufacturer nor ministry have control—delays from bad weather. A test pilot in a new aircraft must have clear weather over his airfield before he can risk take-off and landing in a new untried aircraft. In this country, all too often test flying is held up by cloud. The Americans, even the French, can test all or most of the year round, and this is beginning to pay them dividends. New aircraft have to be cajoled into the air like nervous fledgelings, and if British aircraft are moved, say to the Middle East for testing, then they are far from their factories and the constant adjustments that they need may be difficult to make.



These factors are all more serious for fighters than they are for bombers, because in a single-seat machine, everything must be done by one man, while in a bomber there is a full crew to follow the instruments. Bomber progress is, on the whole, rather more encouraging; the first of the big machines, the Vickers Valiant, is coming off the production lines now and should be in service before the end of the year. But in criticising the industry for its delays in fighter deliveries, which are at least in part traceable to defects in design and during subsequent development and to some lack of appreciation of the growing role of equipment, as distinct from the airframe, in aircraft design, it is only fair to add that had the expected emergency developed in, say 1953, there would have been no delay in putting either fighter into service. What are today regarded as faults in design can mostly be traced to a compromise by the designer who was trying, in the red heat of rearmament, to put a workable fighting machine into the air as early as possible, knowing that later, improved marks could be evolved on the production line. The tension relaxed just when their machines were undergoing test. Where the designers and the manufacturers are open to criticism is in their reluctance to adjust their own outlook to this change in circumstances. However, the record of the past few years does raise a much broader question sometimes heard in the Air Ministry as well as the industry; that is, whether the Air Ministry's own performance requirements have always been properly drafted. Some of the most spectacularly successful aircraft have been rejected in their draft stages by the Air Ministry. The de Havilland Mosquito was one; the big de Havilland Gyron engine (still unseen) was another, and the Folland Gnat may be a third. Designers are sometimes—though admittedly not always—the best judges of what is aerodynamically possible.

A span of only 20 years separates the first from the last drawing on these pages and they illustrate the remarkable evolution, from bi-plane to missile, that has taken place during the period. The first aircraft, the bi-plane Gloster Gladiator, dates from 1934. The second, the Supermarine Spitfire (1936) was the finest fighting machine of its day. The struts have gone from the wings, the fixed undercarriage has become retractable, and the nose has been fined down to reduce drag. The aerodynamic cleanness that made it stand out in its generation became a cardinal point of design once the jet engine came into service. The de Havilland Vampire (1945) is still the work horse of many air forces, but its straight wings have given way to the swept surfaces of the Hawker Hunter, due to come into service this year. The delta-winged Gloster Javelin is the prototype of a new class of fighter; carrying a massive weight of search radar to track its target, armed with guided missiles to hound it down, yet still transsonic in spite of its size and weight. It is due for service in 1956. The last manned aircraft, the American Douglas X-3, is the forerunner of those designed to fly at Mach 3, but already the manned fighter is surrendering some of its duties to wingless, almost tailless, unmanned missiles. The American Nike, shown, as is only appropriate, climbing up the page, is in service with anti-aircraft batteries.



The Industry's Balance Sheet

How big a part does the air industry play in the national economy? If to the annual turnover of the manufacturers (about £230* million) and their component suppliers (£70 million) is added that of the airlines (£50 to 60 million) the airports and navigation services (£11 million), the research and development establishments (an unknown figure, perhaps £90 million out of a total vote of £140 million) and the flying requirements of the services (about £380 million for the RAF excluding aircraft purchases), then the annual expenditure on matters to do with the building, the development and the operating of aircraft begins to approach a figure of £800 million a year. Already it involves a total of more than 600,000 people, 2.5 per cent of the working population.

This is necessarily the roughest and most ready of calculations. The Air Ministry and the Navy (a third of whose manpower is engaged now on flying duties) expect between them to spend £180 million on aircraft during the current year. The actual value of the machines produced by the industry during the same period is likely to be smaller; it was intended to hold defence production in the industry steady at about £150 million. Then, most of the industry's research and development is financed by the Ministry of Supply and no details of this expenditure are ever revealed. What these estimates do serve to illustrate is the size of the contribution made to the air industry—air transport as well as aircraft manufacture—from the national exchequer.

The airlines are no longer costing the tax-payer £11 million annually in the form of subsidies as they did in 1948. Nevertheless, in its past financial year (the accounts for which have not yet been published) British European

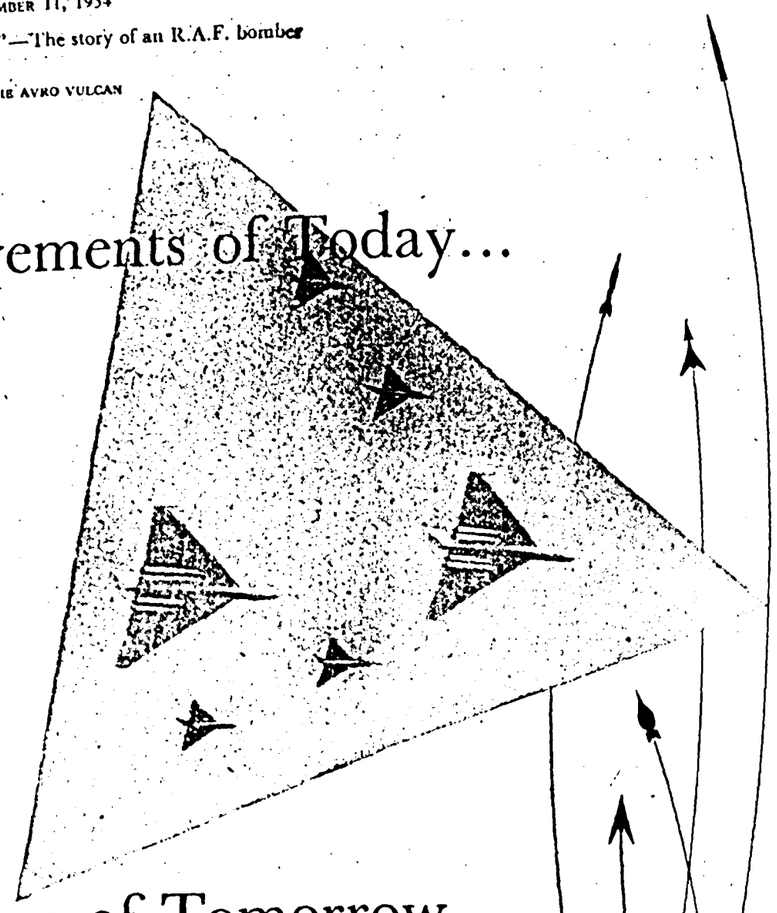
Airways is said to have had an even bigger net loss than the £1.5 million of the previous year. A vital but indirect contribution is made to air transport by the navigation services and the airports provided by the Ministry of Transport. The Ministry is spending about £11 million this year; it will get back about £3 million in the form of rents and landing fees from the airlines and a fair proportion of this will be in foreign currencies. The net cost to the tax-payer of air transport might be said to be roughly £9 million a year, on the assumption that BEA's operating losses are by now beginning to shrink.

Aircraft exports, which last year reached £64 million (most of it military), are not likely to be any higher this year. Civil production, much of it for export, is not likely to reach much more than £15 million, most of which will be accounted for by 25 Viscounts, which will be Vickers' total for the year. Had Comet production not been stopped, the civil and the export total would have been substantially higher, and will in any case increase as Britannia production gets under way. A balance sheet drawn up on this basis might therefore show that the direct contribution of the air transport and manufacturing industry is at present in the order of about £140 million allowing for some element of the value of components, and should rise as aircraft exports and air traffic both expand. On the debit side, known Government expenditure is running at the rate of about £570 million during the current financial year, and a big unknown Government contribution is being made in the form of research grants and direct experimental work carried out by the Government. It may be thought unfair to set down the cost of running the RAF (£380 million), as distinct from providing its aircraft, in a balance sheet of this kind. If it is excluded, the estimated annual turnover works out at about £370 million to £420 million, depending on the size of the unknown research contributions. To this the air transport and manufacturing industry is contributing about a third. This is quite a creditable performance.

* It is calculated that the industry produces about £1,000 per worker. Present labour force, 231,000.

Working in the Air

The British airlines employ, in round figures, about 30,000 people and more than 26,000 of them work for the two nationalised air corporations. Yet the industry's labour problem, if it can be described as such, is centred on the 12 per cent who are engaged on flying duties. The difficulties can be summed up very briefly: pilots are difficult to recruit and stewardesses are difficult to retain. In a typical big airline like British Overseas Airways Corporation, employing nearly 17,000 people, about half are ground engineers and airport staff, working three shifts a day seven days a week; fewer than 2,000 are classed as air crew.



The pilots, who can earn up to £2,395 a year, plus overseas flight allowances, and whose starting pay in the rank of second officer is £955, are the most difficult to find because the airlines want men who can already fly. When civil aviation was a small industry, the airlines relied on *ad hoc* recruitment of ex-RAF men, and during the past few years they have been able to take their pick from the steady flow of ex-National Service pilots. Now this supply has been cut off at source because the RAF will no longer give flying instruction to recruits unless they will stay in the service. Moreover, the RAF is at pains to retain the type of pilot that the airlines would most like to have.

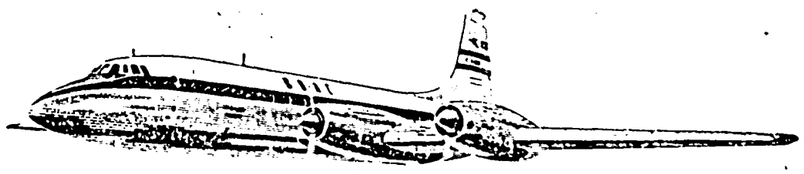
Unless a new pilot breeding ground is found the airlines face a crisis, and in the not too distant future at that. It has been estimated that the industry is going to need an annual intake of 70 to 100 pilots to keep its services manned. Most civil pilots retire between the ages of 45 and 50, although some are still flying in their middle fifties, and in the past four years BOAC's annual rate of turnover has been about 5 per cent. The airlines have sent a memorandum to the Minister of Transport suggesting that the only way to prevent the supply of civil pilots from coming to a

"BOMBS AWAY"—The story of an R.A.F. bomber

NO. 8 IN A SERIES ON THE AVRO VULCAN

Achievements of Today...

Dreams of Tomorrow



The first chapters of the Delta story have now been written. And what splendid reading they make! When the Avro VULCAN, world's first 4-jet delta bomber, made its debut in August 1952, it provided one of those rare milestones in aviation which mark a truly significant departure from conventional design. This bomber was a clear First. It was followed by other operational types in the U.K. and the U.S.A. and experimental designs in Sweden and France. As the story unfolds, this new shape so brilliantly pioneered by Avro, promises to be an arrowhead of aeronautical progress for years to come. With its remarkable performance and exceptional safety, the Delta, in developed form, will be used to provide sustained flight beyond the sound barrier. It may also prove best in those vast empty regions beyond the stratosphere where speed will be measured in thousands of miles per hour. But in the aircraft industry, dreams like this are realised only after years of intensive research and development. Avro know this and are providing their designers, technicians and production engineers with the most advanced equipment that modern science can offer. No wonder that in the half-century of their history, Avro have played no small part in man's conquest of the air – the AVRO 504, the Anson, the Lancaster, all immortals, and now the Vulcan! Tomorrow . . . ?

TURBOPROPS

THE MEASURE OF efficiency of an airliner is its ability to make a profit when carrying fluctuating loads over varying distances. It is not competitive in the world market if it does so only under favourable route and load conditions. The economics depend to a very large extent on engine life, power, and above all, fuel consumption. Modern piston engines run for 1,000 hours between overhaul, give upwards of 3,000 hp and have a fuel consumption of ½ lb per hp per hour, which in a four-engined airliner means about 1 mpg. Turbines can be expected to supersede piston engines only when they are conclusively superior on all counts.

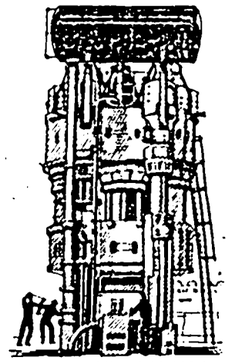
Turbines are of two sorts—the turbojet which delivers its power in the form of an exhaust jet, and the turboprop which uses its power to drive a propeller. Both types of turbine can match the piston engine in longevity and outclass it in power. It is on fuel consumption that the two types of turbine differ. The consumption of the turbojet is about twice that of a comparable piston engine. This would not matter so much if the turbojet could do double the amount of work by flying twice as fast as the piston engine, but in the event an increase in cruising speed beyond about 400 mph does not bring about a commensurate gain in average journey speed. High fuel consumption is therefore a very real difficulty to the turbojet. In order to reduce its fuel consumption as much as possible, the jet aircraft must fly high; it is, in practice, locked inflexibly to a narrow band of altitudes in the fringes of the stratosphere. And the high wind velocities at these great altitudes make close time-keeping on east-west routes difficult on a year round basis.

In the turboprop the fuel consumption problem is largely mastered because this type of turbine, unlike the turbojet, makes use of the highly efficient propeller. Moreover, the turboprop airliner can cruise economically at any altitude between 15,000 and 35,000 feet and thus, by flying at the appropriate level, can minimise the effect of headwinds and take advantage of tailwinds. This flexibility of operation is a feature of the Britannia airliner which, now in production, is powered with Bristol Proteus turboprop engines. The Proteus 755 develops 4,150 hp and is thus a good deal more powerful than current piston engines. Its consumption is some 10 per cent greater but this is more than offset by using a cheaper fuel.

A pointer to the importance of fuel consumption is that fuel costs amount to the largest single item of operational expenditure in the average airline. Thus the air transport industry's long-range vehicles capable of carrying big payloads at peak periods must also have a fuel consumption which enables them to carry economically the smaller payloads of the off-season. Piston engines do this now and airlines will buy the turbines that can lift bigger loads faster and cheaper. There is a vast world investment in the piston engine and it will only be worth staking the future on a new prime mover that is markedly superior all round. The true civil and military workhorse engine is the turboprop.

THE BRISTOL AEROPLANE COMPANY LIMITED

301 P



sudden stop is to provide a scholarship training scheme that would cover elementary flying instruction up to the minimum standard required of recruits by the airlines. To allow for wastage, about 400 boys would have to be given scholarships each year to provide for a minimum of 75 qualified pilots. The cost of the scheme—which needless to say was to be financed by the Exchequer—was put at £250,000 a year. Each pilot would therefore cost the country more than £2,500—a modest sum, perhaps, besides the £25,000 that it costs to train a bomber pilot.

The industry has no difficulty in recruiting stewardesses, rather the contrary. The girls start at £5 17s. 6d. a week and can go up to £7 17s. 6d.; in addition they get a £2 a week flying allowance. But it takes eight to ten weeks to train a stewardess, and the cost to BOAC is £200. The corporation loses on the average one trained girl a week out of a staff of about 250. In other words, merely to keep up its numbers, BOAC has to spend nearly £10,500 a year on the training of stewardesses alone. The corporation's total training bill works out at £1 million a year. At this rate of expenditure, it is not surprising that the airlines want the Government to undertake preliminary pilot training rather than to do it themselves. But this particular domestic crisis in the airlines does raise the broader problem of whether the air industry, meaning by that the airlines, the manufacturers and the flying sections of the services, will find the recruits that they need without some encouragement to private flying. Would the motor industry and the road haulage industry be as strong as they are today if private ownership of a motor-car had been squeezed out of existence as private flying has been by a cunning combination of controls and prohibitive cost? If young men could afford to fly privately, the supply of pilots, for the RAF and the airlines, might alter overnight.

Metals for the Designer

LAST week's disclosure by Henry Wiggin and Company of details of the performance of its gas turbine alloy Nimonic 95, and of its successful extrusion of hollow blade sections with axial air passages for turbine cooling, forms a fresh instalment in one of the most remarkable success serials in the history of engineering materials. From the first, aircraft development made peculiar demands for strength and lightness in materials; with the advent of the gas turbine those demands became extraordinarily stringent and relentlessly increasing. The Nimonic series of nickel-based high-temperature alloys has so far kept pace with these increasing demands, and these alloys are still used for the moving blades of every British gas turbine yet developed. Forecasts that designers would soon need to turn to metal-ceramic materials or molybdenum-rich alloys have not yet come true; partly because such materials as sintered titanium carbide have proved too brittle, in spite of their other excellent qualities at high temperatures, and partly because the development of cooling techniques has moderated the increase in operating temperatures for the turbine rotor.

Titanium, as an alloying ingredient as well as a sintered carbide, can improve performance at high temperatures; it is a significant element in most of the latest alloys. But as an engineering metal for aircraft, titanium is only a medium-weight, medium-temperature performer, and the extent to which it will be required for aircraft now on the drawing board is a matter for conjecture—and for some controversy. It is being used extensively in the axial compressors of the latest American gas turbines, in stages where light alloys will not stand the temperature and stainless steel, which will, weighs more than the designer will accept. Stainless steel is still accepted by most British designers—partly because British turbines are still slightly more efficient, and partly because American aircraft, type for type, are considerably heavier, and the American designer is therefore prepared to pay more for critical reductions in weight; the payment being possibly in performance, and certainly in money, since titanium-rich alloys cost perhaps 40 times as much as stainless steel. The second role for titanium in military aircraft may be less open to dispute if more remote in time; at speeds of Mach 1.5 to Mach 3 (see glossary), where the airframe skin temperature may reach 250 degrees Centigrade, titanium may replace the really light alloys.

High Duty Alloys' 12,000 ton forging press.

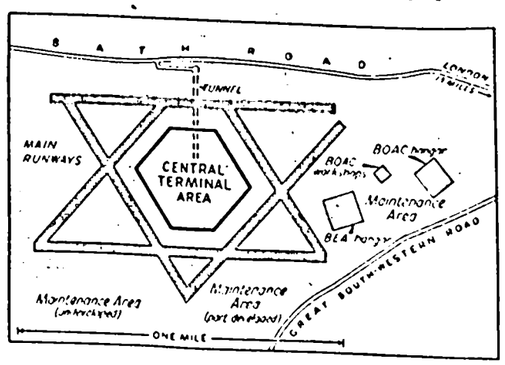
There remain elements of conjecture, therefore, in the demand for titanium for British aircraft. The plant now under construction by Imperial Chemical Industries will offer 1,500 tons of titanium sponge a year by about 1956, against an American output by that time of possibly 20,000 tons or more of finished titanium products (which represent about 60 per cent of sponge output by weight). Within the industry some concern is occasionally expressed over Britain's becoming dependent, for a metal that is so difficult to produce, on only one major plant; but not many people seem afraid that the actual volume of output will be insufficient.

Flying Saucers and the Sound Barrier

A NEW folk'ore has grown up around the aircraft industry. The gremlins of a generation ago have all but died out; some, so it is said, can still be found lurking in elderly service aircraft but the breed has generally failed to survive in a jet environment. They have given place to sonic bangs from the broken sound barrier; to the heat barrier; and to flying saucers with their space crews. Each of the new legends has a foundation of fact. The sound barrier is not the impenetrable wall of compressed sound waves it was once thought to be. There are special stresses and shock waves that make flying conditions particularly unpleasant and dangerous in the region of the "sound barrier" (more correctly, the trans-sonic zone: see glossary), but they are not by any means impossible.

Scientists are sceptical about the amount of damage that can be caused by a single sonic bang. The shock waves that create it have travelled a considerable distance before they

hit the ground and have lost much of their force. The Ministry of Supply has made some small *ex gratia* payments when damage has been claimed, but without admitting any liability. But if and when aircraft fly at supersonic speeds in level flight, and at low altitude—as the new P.1 fighter might do—then scientists talk of the shock waves spreading out cone-wise around it and raking the ground under its path. The damage caused could be considerable. Low-level test flying of these aircraft may have to take place well out to sea and there has been some suggestion that the use of these shock waves as a weapon deserves study.



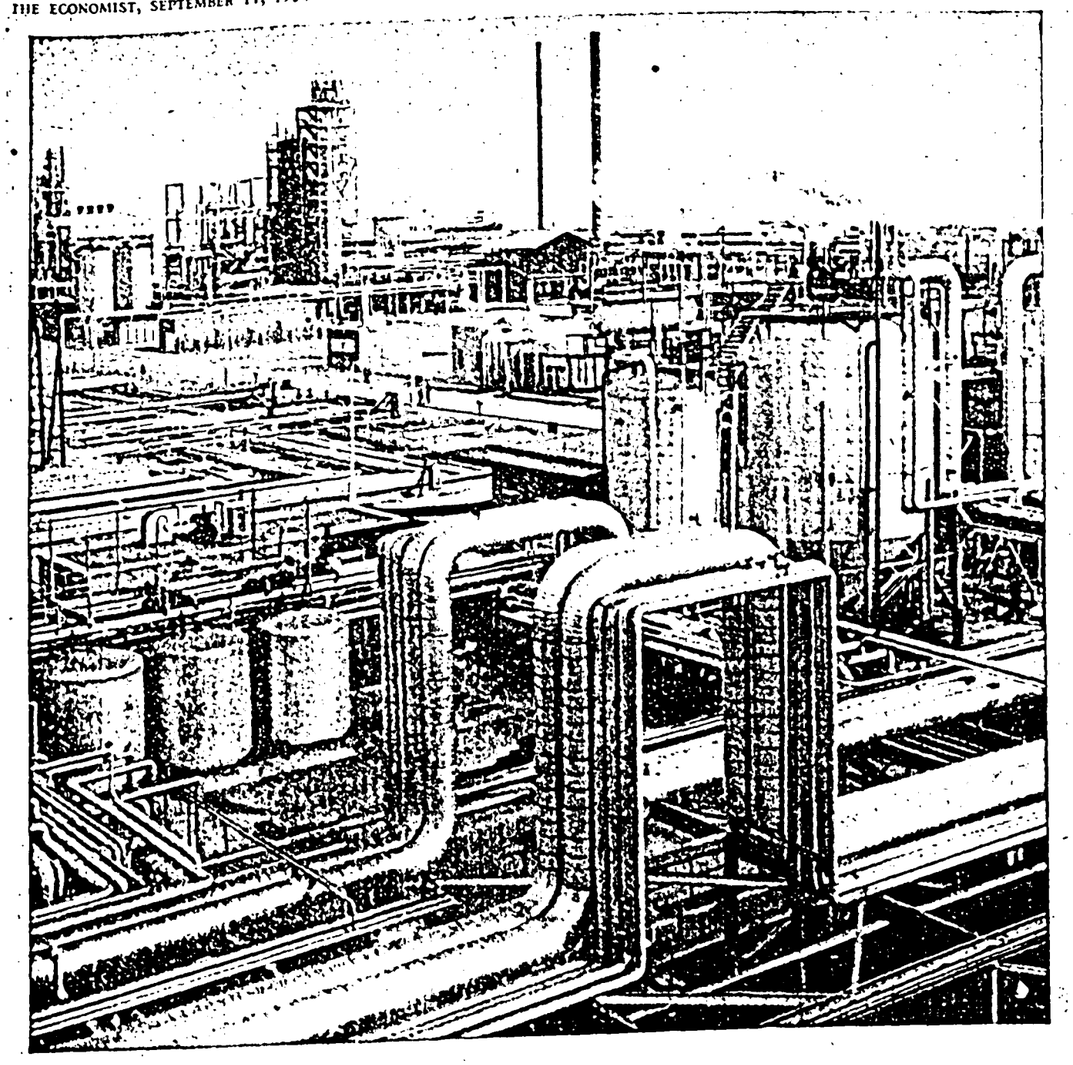
The heat barrier—the point where heat engendered by friction begins to melt the aircraft—has also a basis in fact. In the speed range between twice and three times that of sound (1,500 to 2,300 mph) heat friction will be such that designers will have progressively to provide refrigeration for the pilot (at present they are heating his cabin), to make increasing allowance for the effect of surface heat on the materials of which the aircraft is built, and finally to discard conventional construction materials altogether.

Most flying saucers turn out to be either meteorological balloons or tricks of light. For one or two, no explanation exists. It is technically possible to build a saucer-shaped aircraft, and one is under development in Canada but has not yet flown. It is also technically possible to build a space station, a satellite planet to circle the earth in its own artificial, eternal orbit. In the United States there is some pressure on the government to undertake a project of this kind, in spite of its exorbitant cost in scientific man-power. Some scientists speculate on whether the Soviet Union might not be undertaking something along these lines, and add to the store of folk lore by asking whether the occasional flying saucer is not a Russian technician who has missed his bearings on the return to earth.

The Expense of Airports

AIRPORTS represent the fixed assets of the air transport industry. There are 30 in this country that are controlled, maintained, and paid for by the Government; their annual cost—without making any allowance for either depreciation or capital charges—works out at between £3.5 and £4 million a year. Their revenue in this present financial year, mainly from landing fees, rents and the sale of concessions, is put provisionally at £3 million, including £500,000 from sales of aircraft and buildings, but neither costs nor revenue can be accurately predicted. At the present time, it is believed that a deficit of £500,000 a year is being incurred on airfield operations, excluding technical services—a big improvement since the days in 1948-49 when the airports were losing double this sum. In the foreseeable future, the Ministry of Transport may yet break even on its airport operations. It will certainly break even very soon at London Airport.

Up to the end of March, £19 million had been spent at London Airport in providing the bare essentials for efficient handling of international traffic; it will take a total of £26 million to complete the project. Present running costs are put at £900,000 a year, and income at £840,000: there is not much doubt that, unless there is a sudden drop in traffic, income will soon outstrip current expenses. What it may never do is to provide any margin for the service of the immense capital sums sunk in the airport. These have to be debited to the invisible, inassessable, but real amount of extra business brought into the country by the airlines. Most of the capital so far spent has gone on providing the three pairs of parallel runways and their approaches that give London its characteristic star shape, and make take-off and landing possible whatever the direction of the wind. In proportion,



the cost of essential navigational lighting systems, radio communication and even radar equipment, is small, although the manning of these technical aids accounts for a big part of the airport's running costs. From the pilot's point of view, London is probably the best equipped airport in the world. Its radar cover is certainly the most comprehensive, with high-altitude radar covering a 150-mile radius, short-range (15 mile) radar for controlling the approach of an aircraft to the runway and a new low-level set (just being installed) to monitor the movement of the aircraft on the ground. It is an important factor in safety, but it also makes for efficient control and cuts down congestion in the air above the airport.

The next stage is to provide some of the amenities that have so far been conspicuously absent. The central terminal area, which will hold the permanent control tower and the passenger handling buildings, is now being developed; the tunnel leading to it is already finished. Rents and concessions in this area will bring in fresh revenue, but the airport authorities are also out to induce as many international operators as they can to make London their European headquarters. The importance of rents is shown in the Ministry's estimated revenue from airports. Landing fees for the coming year are put at £1.3 million, rents and concessions and services to tenants at £1.2 million, a proportion of which will be paid in dollars. There is no reason any longer to believe the designers of London airport set their sights too high. The increase in traffic is rapidly catching up with their plans, and it is becoming apparent that if air transport is to continue to flow smoothly, this is the order of investment needed in any big international airport.

The Investors' Assessment

OVER the last three years aircraft shares have been gaining in status in the eyes of investors. Those long lean years between the wars, when public policy had turned its back on military aircraft, seem to have been forgotten. Perhaps some of the speculative prizes of the prewar years,

Aluminium Paste for Paint

The new Coryton Oil Refinery of the Vacuum Oil Company is an outstanding example of the large-scale industrial use of aluminium paint. BA Aluminium Paste was used by the Indestructible Paint Co. Ltd., for the aluminium paint applied to the many complicated structures at this Refinery.

Aluminium paint is particularly suitable for such applications since, besides providing a clean, attractive and protective coating, its high heat reflectivity reduces losses by evaporation.

THE BRITISH ALUMINIUM CO LTD

NORFOLK HOUSE ST JAMES'S SQUARE LONDON SW1

MORE POWER AT LOWER COST

The Eland is a propeller-turbine aero-engine designed for use with a single rotation propeller. It is light in relation to its power and its fuel consumption is extremely low. The small cowled diameter of the Eland (36" for 3,000 e.h.p.) gives it a very high aerodynamic efficiency.

All these factors make the Eland an engine of unusual interest to operators, and a fine example of the Napier principle: more power at lower cost.

for investors who were lucky enough to pick out a depressed company just on the point of developing a successful aircraft, have also vanished. But recently the investor in aircraft shares has not done badly. A steady demand for military aircraft now gives a solid backbone to the industry and attractive possibilities for selling civil aircraft for export adds the speculative spice. An important export business is being built up. The very fact of the formation of Air Finance with the best City backing (Finance Corporation for Industry stands behind it to the extent of £10 million) provides a hall mark of respectability.

The imagination of investors has now been fired. The market had a recent example when a BBC feature depicting Folland Aircraft and the Gnat brought a host of small buying orders for Folland shares into the market. That and hopes of a Nato order for the Gnat have more to do with the rise in the Folland 10s. shares to 22s. 6d. than the rumours (on which the market at present places no reliance) of a merger involving the company. The yield obtainable from leading aircraft shares has now shrunk to a fraction over 4 per cent, a figure which not only shows them to be popular with the investing public, but also suggests that the scope for further advance must be limited.

Lockheed XFV-1
Vertical take-off.

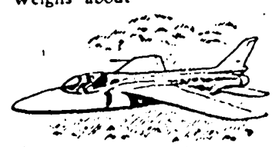
The capitalisation of the industry has, however, been growing with its profits. No less than 7 leading aircraft companies including Hawker Siddeley, Rolls-Royce and Vickers have expanded their capital during the last three years, generally on terms advantageous to existing shareholders, and more capital may still be needed. Earnings have also been expanding in the latest accounting periods. It is still a growing industry and there is no reason to assume that the expansion has reached its limits yet. But it is advisable to remember that present share prices discount considerable further growth.

Vocabulary of Speed

The language of speed has many of the features of a rapidly changing patois to which advances in technology are constantly adding new words and phrases and giving familiar terms new and unfamiliar meanings. The following glossary is designed for the layman who wants to keep aerodynamically up to date without the necessity of becoming deeply involved in technicalities.

Aircraft Types

Bomber, light. To be used mainly for attacking enemy supply lines and rear installations in support of ground troops, e.g., *Canberra.* Not to be confused with fighter-bomber. Cost £100,000.



Bomber, medium. Effective over a range of 3,000 miles, e.g., *Vickers Valiant.* Previously described as long-range or heavy. Cost £400,000 to £600,000 according to size and range.

Bomber, long-range or inter-continental. Range of approximately 6,000 miles, e.g., American ten-engined *B 36.*

Fighter. Basic day interceptor capable of sonic or supersonic speeds (see speed). At this stage, not radar-equipped. E.g., *Swift, Hunter.* Cost £70,000.

Fighter, light. Broadly defined as a stripped-down version of current standard day fighters, where the elimination of some equipment, range or armament makes it possible to reduce the size, weight and cost of the fighter compared with a standard machine. The term "light" is relative. E.g.,

Fighter, light British. Weighs about 6,000 lb compared with 16,000 lb for a Swift or Hunter. E.g., Folland *Gnat.* Fewer radio channels. Two cannon against four. Cost £25,000.

Folland Gnat
All-flying tail low position. See also P.1.

Fighter, light United States. Weighs about 16,000 lb compared with 20,000 lb for North American *Sabre* and about 30,000 lb for *Super-Sabre.* Several under development.

Fighter, ground-attack. Armoured version of a day fighter with modified sighting equipment for attacking ground targets. Usual armament is rocket and bombs. In some countries, e.g., France, special aircraft for ground attack duties only have been developed.

Fighter, all - weather. Equipped with search radar for locating enemy aircraft at great altitude at night, in cloud, or in any other condition where normal visual interception is not possible. E.g., Gloster *Javelin.* Cost £120,000.

English Electric P.1

Fighter, vertical take-off. Designed to take off and land vertically or almost vertically without a runway. See illustration. Sometimes launched from a ramp. Strictly experimental.

Altitude

High. Now considered to be in the region of 12 miles, between 60,000 and 70,000 feet. Previously only 8 miles or 40,000 feet. Still rising.

Drag. The resistance of the air to the passage of the aircraft.

Engines

Jet. A basically simple engine of three stages; a compressor to compress the air; a combustion chamber in which the compressed air is burnt with fuel; and a turbine in which the hot combustion gases are expanded. Drive comes from the force of the gases in the jet-pipe. Power measured in pounds thrust. Derivatives are:—

By-pass. Potentially the most important advance since the jet was developed. Consists of a compressor placed ahead of the main engine that feeds some partially compressed air into the engine, spills the rest round the outside of the engine into the jet pipe. Here it mixes with the hot jet gases, slows them down so that less thrust is wasted in the air outside the jet-pipe. Gives a big increase in power for lower fuel consumption. E.g., Rolls-Royce *Conway.*

Ram-jet. Dispenses with compressor and turbine. Known as "flying stove-pipe." Works only at ultra-high speeds where the engine moves so rapidly that the air is "rammed" into it and automatically compressed. Used experimentally for some aircraft, and in miniature on the tips of helicopter rotors. Needs auxiliary power to bring aircraft to speed at which ram-jet can begin to function.

Turbo-prop. The jet turbine is used to drive a conventional propeller through reduction gearing. Power measured in horse-power plus some residual jet thrust. Engines are sometimes *coupled.*

Turbo-compound; piston compound. A combination of gas turbine and reciprocating engine. Early American versions use the residual exhaust heat from a piston engine to drive a small turbine. Later British versions link a full-scale diesel and gas turbine unit, and draw off the diesel exhaust at a point where it gives the most power to the gas turbine. Great fuel economy.

Rocket. Works on chemical fuels. These are pumped into reaction chambers, and the drive comes from the force of the subsequent chemical re-

action. Rocket motors do not need atmospheric oxygen, although they frequently carry liquid oxygen, and rocket power is, unlike jet power, effective in outer space.

Fuel

Aviation gasoline. For piston engines. In the region of 130 octane; high grade petrol plus exceedingly light oil fractions.

Turbine fuel, civil. Kerosine.

Turbine fuel, military. A combination of kerosine and low grade petrol. Known as "wide cut" fuel. Used not for technical reasons but because the amount of kerosine contained in every ton of crude oil is limited, and serious shortage would occur in wartime.

Rocket fuels. Various chemicals. Industrial alcohol, hydrogen peroxide, liquid oxygen, etc.

Speed

Mach number. The principal measure of speed. The speed of the aircraft divided by the speed of sound. When both are equal, the aircraft is flying at Mach 1. At Mach 0.9 the aircraft is at less than the speed of sound; at Mach 2, at twice the speed of sound.

Speed of sound. At sea level, 760 miles an hour, falling roughly 2½ miles an hour with every 1,000 feet of altitude up to 36,000 ft.

Trans-sonic. An important range of speed that begins at about Mach 0.9 when some of the air flowing over the wings reaches sonic speed and ends in the region of Mach 1.2 to 1.8 (depending on design) when all the air passing over the aircraft has reached sonic speed. Flying conditions in this region are comparatively difficult.

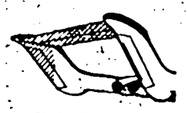
Super-sonic. Reserved for speeds above that of sound; "sonic" being applied to flight at the speed of sound.

Tails

A tail provides the rudder for an aircraft on the upright fin. Elevators on the horizontal fins damp out pitching and oscillations that would otherwise happen at high speeds, and give control during take-off and landing. At high speed the air is violently disturbed as it flows over the front of the aircraft; by the time it reaches the tail, it is turbulent and liable to put great strain on tail members. On multi-engined jet aircraft the horizontal tail must also be placed away from the jet blast.

All-flying tail. Very new. Essential on a modern high-speed fighter. In the trans-sonic region the high speed airflow and shock waves on the tail set up pressure changes that severely reduce the effectiveness of the tail as a control. If the whole horizontal fin is made moveable, and not only a small part of its rear section, these pressure changes are made more manageable. The effects of high-speed flying also explain why some of the horizontal fins on modern fighters are placed low down on the fuselage. See illustration—English Electric *P.1.* Folland *Gnat.*

Butterfly Tail



Butterfly tail is a device to save weight. The elevators on the two fins do the work of a rudder. Not widely used.

A high tail is used to lift the horizontal fins clear of the turbulent air from the body of the aircraft. Size of any tail can be reduced, the further the elevators are carried from the aircraft's centre of gravity. They become more effective as the distance increases. The upright fin has to be unusually strong to carry the weight and stress. See illustration. Handley Page *Victor;* Gloster *Javelin.*

High Tail

Twin-boom tails are used to place the tail at a reasonable working distance from the aircraft's centre of gravity without having the extra weight of a long fuselage and jet-pipe. See illustration. Widely used by de Havilland company.

Twin-boom Tail

Tailless. Aircraft carries the elevators on the wing, and has no horizontal fins. Saves weight and structural stiffening. A delta wing makes this possible. See illustration Avro *Vulcan.*

Weapons

Atomic. Principally bombs dropped from great heights (see altitude) and homed on to their target.

Cannon high-explosive. Modern British fighters are armed with cannon firing high explosive shells. Latest mark is 30 mm. *Aden* on *Hunter* and *Swift.*

Guided. Containing electronic control mechanisms, designed to seek out the target. Capable of altering course during flight.

Pilotless aircraft. An unmanned missile flying on a pre-set course. Lacks the flexibility of a guided weapon.

Rocket. Small rockets are used as armament for fighters. Guided weapons frequently but not inevitably use rocket power.

Wings

Swept. Used only for high-speed aircraft. Intended to reduce drag at high (trans-sonic) speeds by postponing the time when the flow of air over the wing reaches sonic speed. Harder to handle at low speed than a straight wing. There are many variants:

Delta. A swept wing filled into a solid triangle. Gives great strength, and provides fuel tankage that would otherwise have to go in a bigger fuselage. E.g., Avro *Vulcan,* Gloster *Javelin.*

Crescent; cranked. Swept at the root of the wing to reduce drag caused by thick wingroot, but straightened and thinned at the tip to improve handling at low speed. E.g., Vickers *Valiant;* Handley Page *Victor.*

Variable sweep. After take-off with wings only partially swept, means are provided to sweep them back more sharply in flight. Strictly experimental.

Aeroisoclinic. Design to reduce the twisting that occurs when a thin swept wing is flexed or bent. Can usefully be combined with all-moving tip controls. Short *Sherpa.*
