we aim both ways

Beecham Buildings Ltd. operate at a high constructional speed and keep to a competitive cost which meets the building needs of expanding industrial enterprise. By manufacturing the precast reinforced concrete structure, three-quarters of the job has been completed when the components leave the factory gates. Our highly trained and fully mechanised mobile teams construct the entire building. Beecham Buildings are designed to the strictest codes of engineering practice, are truly permanent, and require virtually no maintenance.

May we advise you on your new building ?

How many ways can you use

BURY FELT?

Manufacturers want extra-safe packaging material . . . engineers want wheels and bobs for polishing and anti-vibration bases for heavy machinery . . . men and women want long-lasting attractive soft furnishings in their offices and homes . . . fashion designers want a colourful material that keeps its shape . . . and Bury Felt fits all these needs perfectly. Versatile Bury Felt *is* surprising, with a thousand and one different uses in many trades and industries, and manufactured in different types and textures to suit whatever job it has to do. We will tell you more about it if you write or telephone to:—

Are you worthy of Craven?

SIR JAMES BARRIE in 'My Lady Nicotine' said: "When he was at school, Jimmy Moggridge smoked a cane-chair, and he has since said that from cane to ordinary mixtures was not so noticeable as the change from ordinary mixtures to the Arcadia. Were I anxious to prove Jimmy's statement, I would merely give you the only address at which the Arcadia is to be had. But that I will not do. It would be as rash as proposing a man with whom I am unacquainted for my club. You may not be worthy to smoke the Arcadia Mixture"—acknowledged by Sir James to be "no other than Craven Mixture".

Try CRAVEN

Your own appreciation of such rich, cool smoking luxury will prove you worthy of this fine tobacco.

Three deeply satisfying blends

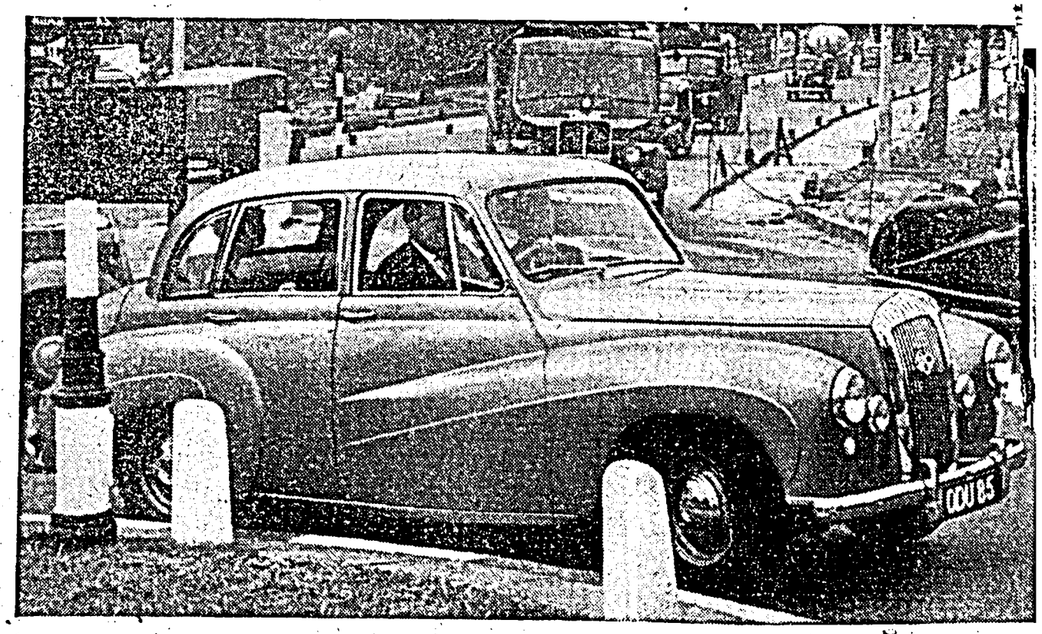
Craven Mixture 4/7 oz.
Craven Empire de luxe Mixture 4/3 oz.
Craven Empire Curly Cut 4/4 oz.

EUCLIDS *and GLASS?*

EUCLID Tractors & Scrapers are busy at the quarries of British Industrial Sand Ltd., at Redhill, Surrey, and near King's Lynn, Norfolk, removing heavy clay overburden to expose the fine silica sand used for glass making.

All kinds of industries, all over the world, depend on EUCLIDS.

Daily there is proof that EUCLIDS carry *more* loads in *less* time . . . cutting overheads and increasing profits.



EUCLID Tractors & Scrapers, EUCLID Rear-Dump and Bottom-Dump Wagons are available for sterling. Place your order now—all orders executed in strict rotation.

A complete After Sales Service is maintained for all EUCLID earthmoving equipment by the distributors.

No car ever gave such peace of mind *as the confident Daimler* CONQUEST

OUT ON THE busy trunk roads, or crawling in dense town traffic, it is the driver of a Daimler Conquest who has the best of it—for sheer enjoyment, peace of mind and safety. Why? Here are some of the reasons...

Preselector fluid transmission. For the simplest of gear-changing coupled with the most subtle control of movement, with positively no effort, either mental or physical, Daimler preselector fluid transmission is incomparable. You engage the gear you need *the very second you need it* by simply depressing the gear pedal. It is so much simpler than the ordinary gear system, is less tiring and leaves your mind perfectly free.

Automatic Chassis Lubrication. Here is constant efficiency for all suspension and steering parts—and all provided without thought or worry on your part. The lubricant is pressure-fed to the parts every time the engine warms up. Result—supreme confidence under all road conditions and in any emergency.

Laminated torsion bar suspension. Tricky bends and hump-back bridges are taken with calm assurance in the Conquest. *Laminated* torsion bars in the independent front suspension efficiently cancel out all tendency to roll and pitch.

Wide vision. Sit at the wheel of a Conquest and see how your position dominates the view from every angle. The curved windscreen, slender pillars and wide rear window combine to achieve the perfect visibility essential to safe and confident driving.

Brakes. The hydro-mechanical brakes have 11" drums and a very generous frictional area, producing maximum retardation with light pedal pressure. Braking distance at 30 mph is 31 feet.

No matter which Conquest you choose, the Saloon, the 'Century', the Coupé or the Roadster, the confidence it will give you will be a perfect match for its great performance, its comfort and its dignity.

Conquest Saloon.....£1066 plus £445.5.10 purchase tax.
'Conquest Century'.....£1172 plus £489.9.2 purchase tax.
Conquest Coupé.....£1225 plus £511.10.10 purchase tax.
Conquest Roadster.....£1180 plus £492.15.10 purchase tax.

For full details of any of these great cars and the address of your nearest dealer write to Bureau 58, The Daimler Company Limited, Radford Works, Coventry.

Influential people in over 100 countries keep abreast of world news through

TIME magazine

Five separate editions of TIME MAGAZINE, with the same editorial content, are published in English every week. One edition circulates only in the United States. The other four—the International Editions—published simultaneously, are read by important people in over 100 countries outside the U.S.
TIME's net paid audited circulation exceeds 2,000,000 copies each week. More than 903 out of every 1,000 TIME readers hold important positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products. People around the world can read *all* the week's important news—including your advertising news while it is still news. The Advertisement Manager will be pleased to give you further information.

You can buy advertising space in just the editions you want, covering the world markets in which you are most interested.

Famous advertisers like The English Electric Company Limited are using this powerful international medium to develop their world markets.

Indefatigable Helmsman

SIR WINSTON CHURCHILL, eighty years young next November, has changed the pattern of rumours about his retirement by the robustness of his latest intervention in world affairs and by what the whole country delightedly hopes is a return to his rudest health. Until two months ago it was widely believed that he might abdicate, either from the office of Prime Minister or from office altogether, immediately after the Queen's return from her world tour. Today, after his visit to Washington, the most prevalent rumour is that he will remain at the helm until well into next year, and will time his retirement to give Mr Eden several months' experience of the premiership before the general election that is expected either in the autumn of 1955 or in the spring of 1956.

This rumour may prove as false as its predecessor; the plain fact is that nobody knows—probably not even Sir Winston himself. But its currency is likely to revive a delicate controversy that was raging a few months ago. Anybody who returns to this controversy anew, or rather brings it down from the backstairs into the open, should recognise two facts. First, Sir Winston is not merely venerated; he is beloved. Secondly, his presence still raises Britain's prestige abroad as that of no other politician could do. It is only after these points have been recognised that the controversial issue should be faced: the question whether a change in the system—which is not the same thing as a change in the fact—of his personal leadership should not be made to ensure smoother conduct of Britain's foreign and domestic affairs.

The controversy about his role in foreign affairs has lost a great deal of its force—though possibly not for the happiest of reasons. At the beginning of this year it was widely assumed that Sir Winston was staying in office only under the impulse of his belief that, "because of certain things that have happened," he was in a unique position to improve western relations with Russia. It was right to give warning at that time that his endeavours for such improvement might lead merely to an exacerbation of Britain's relations with America. As a consequence of the Geneva conference, however, Sir Winston's designated successor is now (according to differing viewpoints) either surrounded with the same halo or tarred with the same brush. Nobody can now believe that Sir Winston's disappearance from the scene would weaken the force behind British striving for a policy of peaceful coexistence with Russia; the only thing that would be altered would be that the country would lose the services of the one man who is best fitted to reassure the Americans that calculated coexistence and craven appeasement are two different things. His greatness has once again become indispensable—provided it is not that particular facet of his greatness that he showed in May of last year.

There remains, then, the controversy about his mode of conducting home affairs. Here again it is his greatness that can sometimes be an inconvenience—because the modern system of British cabinet

government is not attuned to such a quality in a Prime Minister. It has not often had to put up with it, during peacetime, in the recent past. The main problem that has arisen can be simply stated: as a result of the pre-eminence of Sir Winston and Mr Eden in the government, and of their primary interest in foreign affairs, there is mounting evidence that the flow of domestic policy is now subjected to a serious bottleneck at cabinet level.

It is easy to understand how this bottleneck has arisen. Most measures of domestic policy are worked up to what is intended to be a final form either by the Minister directly concerned or under the aegis of some cabinet committee; the major measures often come before a committee of which Mr Butler, the third principal figure in the government, is chairman. The completed drafts are then presented to the cabinet; it seems to be a major difference between the Conservative and Labour governments that it is usually only at this stage, or immediately before it (or even, sometimes, quite a long time after it), that the Prime Minister has time to become really interested in the matter on hand. He often has his own contribution to make; since cabinet meetings may also tend to be occasions when Sir Winston dilates about his views on the world situation at large, it is not surprising that the timetable sometimes lags badly. There is a story that when Conservative ministers emerge from a cabinet meeting they remark to each other what a great man their leader is; when Labour ministers came out of cabinet, they remarked to each other what a lot of work they had got through. This is the difference between government by a Demosthenes and government by a doodler; it has its costs no less than its inspiration.

★

The costs of the present system have now become so manifest that they should no longer be withheld from public comment. It is no secret that the draft scheme for reorganisation of the railways, to take only one example, has been ready for months; but the cabinet has apparently not yet had time to approve it. The stories about ministers below cabinet rank, or of service chiefs, who have wasted long hours in the waiting room at 10 Downing Street only to find that the cabinet cannot reach the matter for which they have been summoned, have become too numerous to be wholly without substance. Above all, the pile-up of measures which the cabinet has not discussed sufficiently fully to reach united and convinced agreement has paved the way to what Labour calls government by the 1922 committee. The troubles about MPs' pay, about food and drugs, about development councils, and about teachers' pensions seem to have been partly due to the fact that cabinet meetings tend to be occasions for lengthy dissertations rather than for crisp progress towards detailed decision.

A further backlog of business that has arisen because of Sir Winston's preoccupations and predilections concerns the personal position of individual ministers. It is widely believed that Sir Walter Monckton wishes to return to the bar, or ascend to the bench; that Mr Lyttelton wishes to return to industry; that Lord Woolton wishes to retire both from his ministry and the chairmanship of the Conservative Party (where his most likely successor is Mr Malcolm McCorquodale); and that various other ministers (not to mention civil servants) may be ready or ripe for retirement from office. Inevitably Sir Winston's tendency, amid the rush of other business, has been to resist disturbance of the familiar faces around him as long as possible; equally inevitably, this has caused unrest among juniors who, in normal circumstances, would already have received promotion.

★

These difficulties should not be exaggerated. The government of Britain is not at a standstill. It is merely proceeding, in certain sectors, in rather uneven jumps. The remedies require thought. One obvious need is that the now inevitable re-shuffle of ministers should be made at the earliest moment. Another might well be that there should be a greater devolution of effective authority to cabinet committees. This might involve the elevation of some senior minister to a co-ordinating role over non-Treasury and non-Foreign Office matters, such as Mr Morrison filled when he was Labour's Lord President of the Council. The machinery of government moved most smoothly (although sometimes, admittedly, in the wrong direction) in the days of the Labour triumvirate, when the principal problems were sifted up to Mr Attlee through cabinet committees headed by Mr Morrison, Mr Bevin and Sir Stafford Cripps. In addition, it is important that any changes made now should look beyond the present to the day of Sir Winston's retirement; it would be a pity if the trend of events led Mr Eden, after his accession, to devote less time than is needed to co-ordination and more than he should to breathing down the neck of his successor at the Foreign Office (who will presumably be Mr Macmillan).

These are flexible principles, but the problems they are designed to solve are solid enough. It is time for Sir Winston's well-wishers to face up to them; otherwise the opportunity will be seized by those whose real reasons for chivvying him are an envious delight in belittlement. This is a time for greatness in the conduct of Britain's affairs; and Sir Winston, so long as he feels able to continue to carry the flag, is the one Briton who can readily provide it. There will therefore be general rejoicing if his robust performance in Washington can be read as a refutation of rumours of ailing strength, as another intimation of the immortality in which so many would like to believe. But the Wordsworthian analogy must end there. To those who regard the system of conduct of affairs that has grown up in his shadow, one thing is plain: it is no heaven that lies around him in his old age.

Dark Horse in the Asian Race

A DANGEROUS illusion has shown itself, among both political leaders and public, during the Anglo-American altercations of recent weeks. The problems of South East Asia have been discussed, and attitudes toward them taken up, on the assumption that only two serious alternative policies are in the running —a tightly knotted Nato-type defence pact ("Seato"), and a broader system of general guarantees of a new settlement ("Locarno"). This is a double mistake. First, these two are not alternatives; they are two aspects of the same policy. Second, they ignore the real alternative to any western policy. There is another horse in this race. This is the Chinese proposal that the peace of Asia should be maintained solely by the Asian states themselves, through "the assumption of mutual obligations."

Chou En-lai publicly unveiled this plan at the very beginning of the Geneva conference; and it was heartily endorsed by Molotov a few days later. It is, indeed, almost a carbon copy of the plan for Europe which Molotov had laid before the Berlin conference. The central aim of these twin projects is to squeeze the United States out of both Europe and Asia, which would be left under the benign leadership of the strongest power in each continent: in Europe, Russia, and in Asia, China.

The Molotov plan was received with understandable coolness by the free nations of Europe; but Chou En-lai's ideas are much more appealing to Asian eyes. There is a very real attraction, for the most sincerely democratic Asian, in the suggestion that his continent should at last have complete control of its own affairs, without any interference from the West. Chou's plan is further evidence of the skill with which the Communists have sought to identify their cause with the embedded anti-western feeling of Asia as a whole. It implies the eventual exclusion of all white influence from southern and south-eastern Asia, and naturally from Japan and the islands as well. A faint fragrance of cultural *présence* would be left to mollify France in Indo-China, and doubtless other western nations would be awarded similar consolations, but Asian solidarity would be mustered against any "intervention" by outsiders, such as a United Nations operation to defend, say, Siam from aggression.

On the surface, the Chinese do not appear to be asking their neighbours for any binding commitments to action. On the contrary, their talk is all of non-interference, non-aggression and peaceful co-existence —words which were written into their agreement with India about Tibet, and which carry a seductive echo of Gandhian ideals. The contrast could not be more striking between these gentle cadences and the firm demands for pledges of armed action made by the champions of a "Seato" pact. Only the most far-sighted Asian can be expected to see that, once his continent had sealed itself off from the rest of the world by falling in with Chou En-lai's plan, it would be merely a question of time before "peaceful co-existence" came to mean automatic acceptance of China's leadership, and obedient yielding to successive Chinese demands. For the rest, the simple slogan "Asia for the Asians" has a hypnotic brightness, and the concept of a "Mao Doctrine" a certain logic.

This does not add up to an argument against a South East Asia defence pact. In the event of foreign aggression against Siam, Burma or any other sovereign state in the region, members of the United Nations are, in any case, already under a moral obligation to go to the aid of the victim; and the western governments would be guilty of ignoring the glaring danger signals of the present situation if they failed to make any preparation against such an event. But the presence in the field of Chou En-lai's challenger makes it clear that a Seato pact would not by itself suffice to check the Communist advance in the Far East. The Communist challenge is political as well as military; and a Seato that embraced Siam alone of the Asian mainland states would not be a complete answer even to the military problem. The Colombo group of nations, faced with only two positive courses—membership of a tightly knit, western-led defence pact on the one hand, and, on the other, an apparently harmless acceptance of "peaceful co-existence" as proffered by Chou—would be more strongly tempted than ever to choose the less active and more Asian alternative. And that could mean disaster for the free nations' hopes of stemming the tide of Communism in the east.

★

It is this strength of the "Asia for the Asians" feeling, and the ability of the Chinese Communists to play upon it, that represents the real challenge that western policy has to meet—and if one merit can be claimed for British diplomacy in these recent unfortunate weeks, it is that it has seen the challenge more clearly than the Americans have done and has at least made gestures towards meeting it. What Mr Eden is attempting to do is to provide a bridge between Washington and Delhi, to create a set of relationships in South East Asia that will not lose for the purposes of peace and stability the support of either extreme pole of the free world. This involves convincing the Indians (and those other Asians who think with them) that it is necessary to draw lines, to guarantee them and to put teeth into the guarantees. This, clearly to British eyes, is what Mr Eden meant when he used the word "Locarno."

So far from meaning appeasement, he meant, as Sir Winston Churchill explained to the American press, that everybody should promise to resist an aggressor. The other side of the medal is the need to convince the Americans that a common front against aggression will be infinitely less offensive to Asian minds, and is needed fully as much as, a military alliance mainly composed of Europeans specifically created for defence against China.

The attempt to build the bridge may fail. Nobody can be sure that only one more act of Communist aggression in Asia is needed to convince the Indians of the dangers of neutralism. They may be unwilling to give any promises of solidarity even against unnamed aggression. Nor, evidently, is it possible to rely on reasonable moderation in Washington, so long as Senator Knowland is allowed to run away with the Administration's foreign policy. Sir Winston Churchill and Mr Eden may have succeeded in convincing the President and the Secretary of State that they are not bent on appeasement or surrender in Asia, but only on mobilising the widest possible degree of resistance to further aggression. But there is that other American suspicion remaining, expressed in Mr Dulles's much-quoted remark about British policy being subject to a veto from Delhi. It would be as well to be quite clear about this. There is, and can be, no Indian veto on British actions. If, in the end, it becomes clear that the bridge cannot be built, that we cannot walk with the Americans without offending Mr Nehru, or keep Mr Nehru in camp without outraging the Americans—if, in a word, we have to make a choice between them, there cannot be a moment's hesitation about it. Blood is thicker than water; and these small islands cannot survive without friends more powerful than they can find in New Delhi. Both in Washington and in India it will help towards a reasonable frame of mind for this to be made known beyond any mistaking.

But things have not yet come to that pass, and it must be hoped that they will not. In the meantime it is surely right, and infinitely worth while, to make the effort to build the bridge that will hold the free world together. And that involves taking very seriously Chou En-lai's programme for Asia. The true alternatives are not Seato or Locarno. These are both parts of a larger whole, which is essential to the peace and security of Asia. The real and menacing alternative is the severing of the links between the free nations of the west and of Asia, and the steady absorption of the latter into the Chinese orbit. It is hard to believe that either Senator Knowland or Mr Nehru really wants that.

Merrily to Market

THE end of meat rationing has been marked by modest jubilations, considerable confusion, and a burst of high prices. There were a few ceremonial burnings of ration books by Conservative Associations, although in one borough (Labour-controlled) the streets and planning committee decided that such orgiastic behaviour might cause a public nuisance. There was a nice old-world touch in the cooking of two whole lambs over a spit at a Welsh hotel. But, on the whole, the public accepted its release from the ration book with no more than a sedate curiosity.

It has been the auction markets that have supplied colour and drama to the occasion. The sharp rise, and then fluctuations, in prices, the pile-up of stock, the shouting and the pandemonium have been grist to all those protagonists (the farmers' leaders included) who insist on equating free marketing with chaos. Confusion in real measure there has certainly been—part of it due to the inexperience of butchers, farmers and auctioneers, part to the delays in the public provision of the necessary facilities. The local authorities have complained that they have not the powers to ensure adequate slaughtering. The Government, for its part, has missed a golden opportunity of concentrating slaughtering at key centres, and of overhauling market facilities, before the trade hardens into a pattern that will make improvement difficult.

But most of the seeming chaos at Smithfield and elsewhere is no more than skin-deep. The public and many participants in the auctions have forgotten, through fifteen years of regimentation, the ABC of market behaviour. This is shown by the behaviour of prices. During the last weeks of control, farmers, stirred by the alarums of their union, tried to sell more stock to the Ministry of Food than it could accept. Their surprise was considerable when the first auctions yielded prices that were generally higher than the Ministry had paid. For best quality meat, as had been expected, they were very much higher; at one period at Smithfield on Monday they reached fantastic heights. But it quickly became clear that many butchers had greatly overestimated the zeal of housewives for fresh red meat. Once the market settles down, it is still reasonable to suppose that average prices will not be much higher than they were under control—although best quality meat will still be more expensive and lower quality meat cheaper. The consumer will at last be able to suit his purchases to his taste and his pocket.

It is inevitable that this should send up the cry of rump steak for the rich and scrag-end for the poor; interpreted, this means that for the first time in years quality counts. The slogan gets what appeal it has from an English idea, born of decades of bad cooking reinforced by fifteen years of rationing, that it is wrong to eat well. Certainly there are few families in this country who cannot afford to buy good meat if they prefer it to alternative luxuries; and it is wholesome and right that they should be given the option.

The most important point to watch in the past week has not been the flurry of prices, but the way in which the marketing system has worked. The farmers' acquiescence in the restoration of the auctions was won only by the promise to underpin them with a complicated system of government guarantees; and at the same time the National Farmers' Union set out to develop alternative market channels of its own. The farmers' company thus formed, the Fatstock Marketing Corporation, has been operating this week on a large scale. It has a virtual monopoly of the sale of bacon pigs; it controls about one-fifth of the country's supplies of fresh meat; its turnover in the first week of freedom was £2½ million.

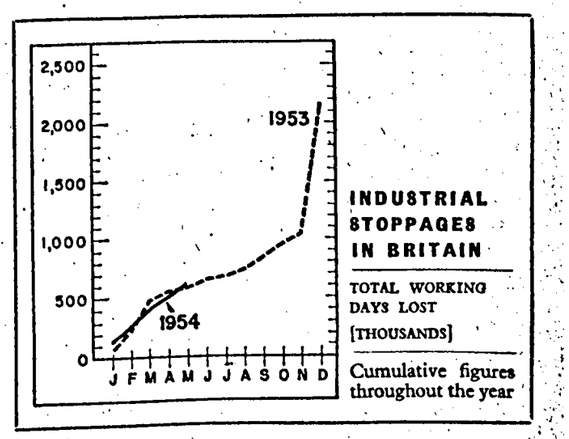
The pigs are the test case. Surprisingly, pig production has become, next to milk, the largest (and certainly the most profitable) branch of British agriculture. The value of pig sales last year exceeded the combined sales of cattle and sheep. Equally the cost of the pig guarantee (at £48 million) was, apart from milk, the Exchequer's largest liability. Pig marketing is also the field in which producer control is most eagerly sought.

★

The complexity of the problem can best be gauged by following three little pigs to market, along their divergent routes.

The first pig is consigned to the auctions. It will usually pay the farmer to breed for quality and to study the market, since the price he gets is the actual price realised, plus a 25 per cent bonus added by the Government (the rate of bonus can be varied periodically). If, however, the pig is of poor quality or the market is slack, this incentive is removed because the farmer is guaranteed a minimum price for his pig, even if this entails a larger subsidy than the percentage bonus.

The second pig goes to the bacon factory. In this case, the farmer is normally relieved of all marketing worries. The Fatstock Marketing Corporation will pay him a fixed price—which includes the percentage bonus and a further quality bonus, both paid by the Government—and will collect and transport the pig for a standard charge. For most bacon pigs the farmer will get a better price than the Ministry paid him, although there are sharp cuts for pigs of the wrong weight.



The third pig is sold direct to a butcher, is certified by a Ministry of Food inspector, and is paid for on a dead-weight basis, to which is later added the average subsidy paid that week at auctions on pigs of similar weight.

These complicated arrangements are suiting the farmers well enough; but they give rise to two awkward questions. First, why should the taxpayer underwrite pig prices so comprehensively? The idea of the percentage bonus was the laudable one of encouraging quality; but what possible need is there to make additional payments to inferior pigs (or indeed to subsidise such pigs at all)? Again, it ought not to be necessary to subsidise prices to a higher level than the old guaranteed prices. So costly a scheme cannot hope to be retained.

Secondly, what limits should be put to the growth of producers' monopolies? This problem is emerging as a much more serious one than the old bogey of monopolistic manœuvres by dealers against producers—the so-called auction rings. All the principal bacon curers, controlling 95 per cent of curing capacity, have agreed to buy their pigs exclusively from the National Fatstock Corporation. The corporation's success is based partly at least on commercial factors—on the ability to guarantee the curers a steady throughput and to get low transport costs for mass handling. By securing surprisingly favourable prices for producers, it will help to cut the cost of the pig guarantee. No doubt it is this factor that has led the Ministry of Food to sanction arrangements that would (or should) shock the Monopolies Commission to the core.

There are broader issues at stake than the fate of bacon pigs. It is the aim of the National Farmers' Union to extend producers' control from bacon pigs to pork pigs (on the argument that the two sections of the market ought not to be separated), and from there to the marketing of cattle and sheep. The fatstock marketing scheme that the union has placed before the Government is a further step in this direction. It should be decisively halted. It has not got the united support of producers; some of them are organising opposition to it. Nothing but good can come out of the competition now going on between the auction markets and the farmers' company. Nothing but harm could come of weighting the issue in the latter's favour or stamping monopoly control over the whole range of fatstock marketing.

These considerations may seem remote to the bucolic throng of butchers, farmers and auctioneers who this week are scratching their heads over some ancient puzzles. But they are really the core of the problem. Excessive subsidisation could clog up the mechanism of a free market, while monopoly control would bring it to a complete halt. In the rejoicing at the return to consumer's freedom, these dangers should not be overlooked.

Knife-Edge in North Africa

WHEN M. Mendès-France came to power two weeks ago he gave himself a month in which to reach a settlement in Indo-China. He left the world to infer that only if he were successful there would he subsequently be handling France's urgent problems in other overseas territories. His month is not up until July 20th; but he has been obliged, during its busy course, to make time to consider the affairs of Tunisia and Morocco.

The French Residents-General in both territories have been summoned home, and each has had a sorry tale to tell. Violence is on the increase in both protectorates; and its victims, particularly in Tunisia, have included those who favour working with France. Physical nervousness is therefore growing, the Bey's cabinet has resigned and the prospects of its immediate replacement are not bright. Confronted with rebellion, M. Mendès-France has taken the only possible short-term decision and has reinforced the French garrisons in both territories. But all his instincts are against taking this negative action without simultaneously preparing political proposals; work upon these is not now to wait until July 21st. The whole western world must hope that these drafts are hammered into a resolute and effective policy, for upon them hangs the security of territories full of Nato bases and sited only a few hundred miles from Europe's vulnerable underbelly. If M. Mendès-France should fall because he fails in Indo-China, it will be at the hands of opponents ill-disposed towards his liberal ideas on North Africa, and any successor cabinet is almost bound to be less well placed than he for negotiating with two restless and nationalistic protectorates.

Naturally, all dissident souls in both territories have watched with interest the train of events in Indo-China. If fellow nationalists are extracting liberty and equality from Paris by physical means, why should not North Africans try the recipe? In Tunisia, attacks of Mau Mau pattern upon lonely farms were at first written off as the work of classic desert raiders (*fellaghas*); but they are now recognised as the handiwork of a small and loose-knit but cohesive "army of liberation" drawing on Egypt for anti-colonial slogans and on American and British dumps in Libya for stolen arms. These activities are easier to contend with than a newer development—hit-and-run raids perpetrated in the neat suburbs of Tunis by young men equipped with taxis and sten guns from which bullets are sprayed at groups thought to include "collaborators" with France. In Morocco, though the countryside is quiet, attacks in the towns have been proceeding steadily for months, directed against conservative Moroccans such as the Sultan and the Pasha of Marrakech, and also against prominent Frenchmen.

There is a tendency in public opinion in France itself to favour the notion that all this upset is not native to North Africa, but is entirely due to "foreign influences." Many Frenchmen find the thought soothing because there is enough truth in it to render it plausible; but it rests on the wholly false assumption that it would be possible for a territory on a mainstream of world communications to live in a state of insulated beatitude. Of course, foreign influences have had their effect upon North Africans who receive invasions, and travel abroad, and listen to the radio; ideas have successively reached them from British sponsors of Syrian independence, from the American apostles of anti-colonialism who landed on their beaches, from the Arab League in Cairo, from the caucus of Asian and African states at the United Nations, from General Franco speaking with a Spanish Moroccan accent, and in the news from Asia dispersed by countless foreign radio stations, including Paris radio and the BBC. The latest foreign addition to this galaxy of influences is a station, said to be Radio Budapest, which has this month started broadcasting on four wave-lengths at the peak café listening hour, and calling "all Tunisian, Algerian and Moroccan patriots whose sons are today rotting in the gaols of imperialism."

But it is a delusion to suppose that North African nationalism has been nurtured only on foreign foodstuffs; ingredients just as potent reach it from France. Of these, the basic one is the modern clash between two pieces of policy that worked well in the first generation, but which today produce results that do not dovetail. Beginning in 1830 in Algeria, in 1881 in Tunisia and in 1912 in Morocco, France fertilised North Africa by populating it with Frenchmen who have by hard work, technical skill and considerable investment made it, and shown North Africans how to go on making it, well-educated, well-run, and relatively prosperous—at least by the standards of the Arab world. Frenchmen have earned and enjoyed a comfortable share of this prosperity, but, the better to do so, they have tended to gather the reins of power into their own experienced hands. It is only right to add that they have also used the revenue thus created to educate the North Africans.

By the 1950s the twin policies have matured to produce a head-on clash between Frenchmen resident in Africa and Africans who are being minted out for roles that those Frenchmen still aspire to fill. For years, division of opinion in France about how to meet this problem has encouraged its growth, for uncertainty has led, in coalition cabinet after coalition cabinet, to hopeless imprecision about what to do next, and to a see-saw policy swinging now towards concession to the nationalists, now towards repression in response to the demands of French diehards—pull devil, pull baker. The essence of the North African problem, therefore, is domestic; outside influences have merely sharpened native edges. That problem is how far the effort of European settlers entitles them to a permanent share in the management of sovereign protectorates. Both Tunisians and Moroccans refuse to contemplate co-sovereignty, which is what most North African Frenchmen would like. Can the men involved negotiate some form of government in which these Frenchmen have rights that are not sovereign rights—in which, to borrow their own word, they are co-citizens, as opposed to foreigners?

*

That has been the problem all along; it is M. Mendès-France's problem now. It is easier to solve in Tunisia than in Morocco, for in the former a combination of three extra decades of tutelage, and of the receptiveness of the Tunisian character, has bred a professional class that as yet hardly exists in Rabat and Fez. These Tunisian moderates—debonair, cultured and almost more at home in Paris than in Cairo—have this week set out in the Paris newspaper, *L'Express*, a statement of aims which, though its keynote is independence, is so full of provisions for strategic, cultural and technical "interdependence" with France that it offers an arresting contrast to the relationship open to the west in Egypt or Indo-China.

The armoury which M. Mendès-France will—if he survives—carry into the North African arena is a cabinet well-endowed with men who have always advocated negotiation—their phrase is "*un dialogue*"—with nationalists of M. Nouira's outlook and quality. M. Mendès-France himself has, as a lawyer, defended Tunisian suspects before French military courts. M. Mitterand resigned from the Laniel cabinet because of its indecision over Tunisia; M. Edgar Faure was the one minister who raised a protesting voice about treatment of the ex-Sultan of Morocco; M. Temple enjoys special relationships with many Moslem *anciens combattants*. M. Mendès-France, on appointment, created a good impression in the protectorates by taking their aspirations sufficiently seriously to furnish them with a new and separate Ministry. It is said that he wanted M. Mitterand to hold this portfolio, but held his hand because the appointment would have alienated the Radical fragment among his strange assortment of supporters. M. Fouchet, who holds it instead, is a Gaullist, but one who has publicly proclaimed his view that the protectorate treaties must be revised.

Some major handicaps confront such a team. The first is that African extremists may well interpret liberalism as vulnerability, and so continue attacks that compel maintenance of military repression. The next is that such repression, if exercised without hint of other intentions, must lead to an atmosphere in which "*dialogues*" cannot take place. Experience goes to show that stern military measures produce no long-term results of value unless they are accompanied by deeds that symbolise friendly intention—for instance, by the release of a prominent prisoner or two. Finally, the biggest handicap of all is the powerful influence wielded in Paris by North Africa's French inhabitants—living in Algeria (which is part of metropolitan France) as well as in Tunisia and Morocco. The bulk of these have hitherto favoured the *status quo* maintained by French bayonets, and—if they run true to form—may work to tumble M. Mendès-France if he propounds some more liberal policy. His latitude for manœuvre in Tunisia is broader than that available to him among the crumbling bastions in Indo-China. But it is narrow as a knife-edge all the same.

Materials for Paper

A correspondent reminds us that the Chinese make paper out of the bark of trees and plants. There is, in fact, no want of materials out of which paper can be made, for almost every vegetable substance can be macerated into pulp and converted into paper. One gentleman has, we hear, taken out a patent for making paper out of turnips. It can be made from straw, nettles, hop-bine, rice, turf, cow dung, according to a writer of the *Journal of the Society of Arts*, plantain, etc. The want is less of materials for paper than cheap materials. Rags, except as convertible into paper, are absolutely worthless. Before any vegetable or fibrous substances can be obtained in quantities, labour must be skilfully applied, because all other things are obtained cheaply by skilled labour, and there is no other than skilled labour now in existence. No plants, as the rule, grow plentifully without labour, and cannot be gathered without labour. In almost all cases, too, the substances that are fit to make paper are fit to make cloth, or something more valuable than paper, and to that they will, in preference, be applied. They will serve to make paper after they have been used for some other purpose. We cannot assert that no substance will be found in abundance so cheap as rags; but it is their worthlessness—they being the waste or refuse of consumption—in comparison with any or all the products of labour, which creates the difficulty of finding substitutes for them. For society to go on smoothly, there must be either less progress in the intellectual arts, or there must be more clothing used. What is really required is [illegible] substitutes for rags than substitutes for dear cotton [illegible] and hemp . . . so that more and cheaper clothing . . . may be supplied to more persons.

Notes of the Week

Warnings to France

At their recent meeting in Washington, Sir Winston Churchill and President Eisenhower had to embark on the unhappy if inevitable course of shaping decisions about the future of Germany without the French. And in London this week a study group of Foreign Office and State Department officials have met to see how to carry out the agreement to grant a greater degree of sovereignty to Federal Germany without waiting any longer for the European Defence Community to be born. The Bonn Conventions were linked with the EDC treaty, and the task before the officials is to cut the connection between the two. They began work none too soon, as it is evident that Germany cannot, and should not, be kept under an occupation regime by powers that want its friendship and help.

But the question must be asked, how many more decisions are to be made without France? As Dr Adenauer pointed out in his broadcast on the EDC last weekend, a European policy without or against France is impossible. Yet French reaction to the Chancellor's warnings was not encouraging. French politicians seem to be bent on taking offence when faced with facts. M. Mendès-France was perhaps justified in calling off the visit of M. Guérin de Beaumont to Bonn, as Dr Adenauer had said his say beforehand in public, but it is unreasonable for the French to pretend that the EDC is an internal matter in which the German Chancellor should not interfere.

Dr Adenauer has indeed shown extraordinary patience. He waited until the heads of the British, American and Benelux governments had all indicated that they still wanted ratification of an unadulterated EDC. But when the German Chancellor did speak, he was far more explicit than the other western statesmen, and he bluntly laid down the terms of reference for any future discussion on the EDC. He demanded that the French government should at long last honour the signature of a previous government and present the EDC treaty, as concluded with five other powers, to its parliament for ratification or rejection. It was not enough for the Assembly to be asked to give a mere expression of will about some revised treaty which would then have to be re-negotiated.

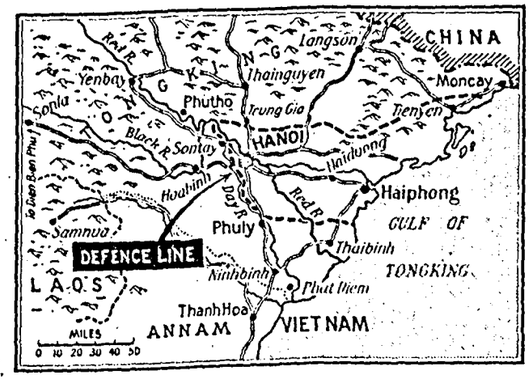
Dr Adenauer categorically warned the French that "the so-called alternative to the EDC is the German national army," and no other. Furthermore, he said, if there are to be national armies the German *Wehrmacht* must be on a footing of full equality with its allies. The Chancellor made it plain enough that this is not a development he wants, and to interpret what he said as a demand for a revived German army is to distort its meaning grossly.

Too little attention has been paid to the loophole which Dr Adenauer offered to M. Mendès-France. The EDC is not perfect, he indicated, and if the treaty is once ratified it can be modified by means of protocols. Some supplementary "interpretations" of the text have already been drafted to meet French wishes, and it is probable that the Germans, too, would want to have some improvements made from their point of view. If this line of action were followed there would, therefore, still have to be fresh negotiations. But the "protocol solution" still offers the best chance of rescuing the project of a European army from complete wreck, and Dr Adenauer has done well to bring it forward with a blunt warning about the sole alternative.

Return to Geneva

MR MOLOTOV'S return to Geneva goes some way towards justifying the risks Mr Eden has run in order to bring about a settlement in Indo-China. It is true that those in Washington who have criticised British policy as appeasement will still ask two questions. What does Mr Molotov expect to achieve by coming back? And what expectation can there really be that a settlement will not in fact be a surrender of vital western interests? To neither question can there yet be a satisfactory answer. But the sceptics who doubted whether the Geneva conference would ever reassemble with the Russian, French and British Foreign Ministers back in their seats look like being refuted. In spite of the recent military successes of the Viet Minh in Indo-China itself, Moscow and Peking still appear to want to negotiate an agreement.

When the first stage of the conference ended on June 20th and Mr Eden came back to London, there were understandable doubts about further progress. Talks which were to be continued in the military committees were to be completed by today, July 10th. Then, in theory, there was—and is—to be a crucial period of ten days between July 10th and 20th when negotiations would come to a head, and might enable M. Mendès-France to return to the French Assembly with an agreement in his pocket before his time limit expired. In practice, secrecy about the military discussions between Franco-Vietnamese staff officers and those of the Viet Minh has been complete.



There is certainly no guarantee that this inherently improbable timetable will be adhered to; international conferences are rarely amenable to such tight schedules. Only two things suggest that it may. In an admirable speech to the Assembly on Wednesday, M. Mendès-France made it quite clear that he will stick to his word and resign if there is no cease-fire by July 20th—and that his last act would be to submit a Bill authorising the dispatch of

national service men to Indo-China. Secondly, from reports of M. Mendès-France's discussions with Chou En-lai in Berne on June 23rd, it may be assumed that the Communists realise that they have an opportunity now which may not be repeated. Taken by some as a French Bevanite, M. Mendès-France has at least the advantage that no one in France seriously questions his intentions. If he failed, the war would probably go on indefinitely.

Withdrawal in the Delta

THE crumbling of General Cogny's position in the Red River delta has put local problems in an urgent and different light. It is true that for the moment the French withdrawal from the southern third of the delta has increased the strength of the garrison in Hanoi and on the road and rail link with the port—evacuation port, some people have begun to call it—of Haiphong; and this probably means that an all-out Viet Minh offensive before the end of the rains in late September would not be completely successful. But, even if the military position is temporarily sounder, no army in retreat can avoid the political and other penalties of withdrawal. The shortening of the French line has inevitably caused a particular loss of confidence among anti-Communist Vietnamese. And while a new government has just been formed with some difficulty under Mr Ngo Dinh Diem, its first act has been to protest against the surrender of territory containing two million inhabitants, many of them Catholics and ardently anti-Communist.

The other problems are military; but they also have the widest political implications. So far the French have been enabled to fight by virtue of the flow of American supplies; now officials in Washington, especially in the Pentagon, are wondering how long they should go on shipping equipment to the delta, if the battle is going to end in a super-Dunkirk.

About $1,000 million worth of arms, ammunition and vehicles are believed to be at stake in the French bridgehead in Tonking; most, if not all, would be lost in an evacuation. In addition to equipment, there is a question of men. The mere probability that the French could hold out till the autumn gives no promise beyond that. Without reinforcements they are unlikely to be able to cope with the eight attacking Viet Minh divisions, as well as with infiltration inside their lines. But there is no certainty as yet that, however great the need, even M. Mendès-France could get conscripts sent to Indo-China.

Lastly, there are the truce talks which opened this week at Trung Gia, north of Hanoi. These are the local extension of the negotiations in Geneva, which had long seemed necessary if any detailed military arrangements were to be made on the spot. The Communists have behaved, however, as jubilant victors, and the effect of the French withdrawal will be to make it even more difficult to obtain concessions from them at Trung Gia than it was at Panmunjom.

Strategy for Scarborough

IT is now clear that Mr Gaitskell will defeat Mr Bevan in the election for the treasurership of the Labour party at the party's annual conference at Scarborough next October; but it is also clear that the conference's vote on policy towards Germany will be a desperately close thing. This week the National Union of Mineworkers became the seventh big union to instruct its delegates to the conference to vote for Mr Attlee's policy of accepting German rearmament within EDC; and the Amalgamated Engineering Union, which is opposed to German rearmament, rather surprisingly joined the miners in throwing its votes to Mr Gaitskell for the treasurership. This has cleared the way for some anxious counting of heads.

So far nearly 4 million trade union votes have been committed on Germany; everybody arrives at a different tally according to his definition of commitment, but the safest generality is that they have fallen almost equally on either side. There remain another 1,000,000 or so union votes and the 1,250,000 constituency party votes to come in. The constituency parties will vote predominately Bevanite. Mr Attlee may get a majority of the remaining 1,000,000 union votes, but nobody knows whether that majority will be large enough. If the vote goes against him, he will presumably plough a middle course between ignoring it and paying something more than lip service to the fears underlying the party's decision; but the effects both on domestic politics and on Britain's reputation abroad will be disturbing.

In the contest for the treasureship, the engineers' Brutus stroke to Mr Bevan means that Mr Gaitskell is already assured of nearly 2,750,000 votes, and Mr Bevan of only some 600,000. Mr Bevan can rely on winning most of the constituency votes and some more union support, but he cannot now get within a million votes of Mr Gaitskell. Despite this, he has confirmed that he will continue in the contest. This means he will lose his seat on the executive and with it the seniority that would have made him vice-chairman of the party this October and chairman (an office of nuisance value rather than influence) twelve months later. After October Mr Bevan will hold no official post in the party, and he will be enjoyably free of all responsibility for official policy. But he will have polled perhaps 2 million or more votes in the ballot for the treasurership; he may have won a major, if silent, victory over Germany; and he will have established clearly in the minds of the party that its future leadership is a simple question of Gaitskell or Bevan. This is precisely what he wants.

Rise by Another Name

BOTH Government and Opposition have rather shamefacedly adopted a more sensible attitude towards MPs' pay, after both had behaved deplorably. It will take a long time to erase the bad impression that Parliament has created over this question. Moving for all the world like dancers mincing through a gavotte, the party leaders have circled round one another, bandying about various "hypothetical" figures, before finally reaching agreement (according to reports current as *The Economist* goes to press) on an expense allowance that will give members up to another £280 a year.

The scheme in mind is believed to give all members an allowance of £2 a day when the House is sitting, but this will not be paid for Friday sittings, when the House adjourns at tea time. Originally the Government proposed to pay £2 a day to provincial members and 12s. 6d. a day to London members, but Mr Attlee and his fellow negotiators had been told in advance by their party (especially by London members) not to accept any such differentiation. After some argument, the Government has agreed.

Final judgment cannot be passed on the scheme until all the details are known; but, on the evidence so far available, it sounds like a highly questionable piece of deception, designed to gull the public into believing that MPs are only getting some special expense allowance. But the new allowance will apparently be available to all members, irrespective of their personal circumstances and regardless of whether they attend the House. True, MPs will be able to refuse the new allowance; but equally they can decline the present salary. Having indignantly (and wrongly) thrown the strong case for a pay increase of £500 a year out of the front door, the Government has apparently sidled round to the back in order to sneak in one of about £280. If the Government really believes there is justification for a rise of this or any other figure, then it should have the courage to say so. If it insists on adopting some form of allowance, then this should be clearly related to specific expenses. A payment that is supposed to be a subsistence allowance, but is payable to an MP who is spending the day fishing, is a straightforward increase in salary. It should not be called anything else.

Information Withheld

THE only person who could make no useful contribution whatsoever to this week's debate on overseas information services was the Government spokesman, Mr Nutting. He had to reveal that, after eleven months of earnest consideration, the Cabinet has not yet reached a conclusion about the recommendations for reorganising these services made last year by Lord Drogheda's committee. The subject clearly does not catch some elder Conservatives' fancy.

Mr Nutting had to fall back on the taunt that the Labour government had not practised what Labour members now preach, and on the plea that the present administration is spending £330,000 a year more on information than it used to do. This piecemeal increase misses the point. The Drogheda Committee's main recommendation was that information (whether of the type purveyed by the British Council, the BBC, or the Information Services proper) should be viewed as a whole, with its strategy planned and its finances guaranteed over a period of years. There is no sign that the Government has been converted to this central idea. Indeed Mr Nutting implicitly denounced one aspect of it. He said that he did not believe in co-ordination (presumably including co-ordination by a permanent advisory committee of the sort that the Drogheda report recommended). Instead Mr Nutting regarded each departmental information service as "the arm of its own Minister. He is responsible for it and he must fight for it, as it fights for him."

This question of co-ordination is of much greater importance than the recommendation of the Drogheda Committee that has aroused most stir. In this week's debate many speakers criticised the committee's proposal that, if economies have to be found in order to increase information services to such critical areas as the Far East, some £135,000 a year might be saved by abolishing BBC broadcasts to western Europe. The violent reaction to this proposal has been based on an understandable muddle. The propagandist spends his most popular—but he really does not spend his most important—moments when he is talking cosily to his friends.

The Hot Seat

PRESIDENT EISENHOWER did well on Wednesday when he took issue both with those who urge the instant offer to the Peking government of a veto-wielding role in the United Nations, and with those who demand that the United States should withdraw from Uno if the Chinese are voted in. Both positions are equally absurd. A Chinese army nearly a million strong is at this moment poised in central Korea, held in check only by the United Nations force that faces it—a force drawn from fifteen countries; and Peking propagandists continue to revile Uno as an imperialist tool unfit to meddle in Korean affairs. To admit to the inner council of the great powers a government still in such defiant opposition to the world organisation itself would be fatal to the whole great experiment in peacemaking. On the other hand, if and when a two-thirds majority of governments becomes satisfied that Peking has set a different course, any individual nation that opposes this judgment to the point of withdrawal will itself be helping to wreck the enterprise that was launched at San Francisco in 1945.

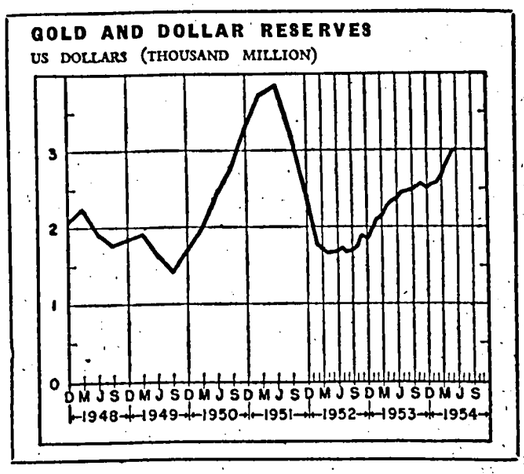
Two things need to be emphasised at this point. One is the depth and extent of popular indignation in the United States at the proposal that representatives of the government whose invasion of Korea cost so many American lives should be seated in Uno before any settlement has been reached. The belief, too often expressed on this side of the Atlantic, that this opposition is simply the work of a group of hot-headed politicians, is a most dangerous illusion—an illusion of which even the Communists would do well to beware. The other point that badly needs recalling is that the painful dilemma about the Chinese seat is essentially an artificial one. Mao Tse-tung's claim to great-power status in Uno, a permanent seat on the Security Council, and a right of veto, arises from the fact that these privileges were awarded in 1945 to Chiang Kai-shek's government, which qualified for them at that time little more than it does today.

Is the whole future of the United Nations to be imperilled by a dispute whose origins were so unreal? The true great powers did not number five in 1945; who can say how many they will be by 1960? The United Nations Charter itself requires that its revision should be considered by next year at latest. Is there not a strong case for discussing the question of the Chinese seat in the context of a general revision that would bring the charter abreast of a rapidly changing world?

Trading in an Open World

THERE are many lessons to be drawn from the history and signal success of the European Payments Union which, if all goes as is generally expected, has just entered its final year of operation. The chief lessons are that, first, international action on trade and on payments cannot sensibly be divorced; second, in the modern world internal and external economic policies are so closely related that only if countries are prepared to discuss together questions traditionally considered as purely domestic will an international trade and payments organisation be really successful.

The OEEC finance ministers who meet in London next week under Mr Butler's chairmanship will have these points very much in mind when they discuss the new problems that convertibility would bring in its train. But agreement on what the main essentials of a post-convertibility trade and payments organisation should be is one thing; what can be done about it is quite another.



If the major European currencies became convertible with the dollar, the world for which the International Monetary Fund and Gatt were invented would become much more real than at any time since the war; and the main arguments for a regional approach to trade and payments problems would fall to the ground, except as regards the transitional problems that would arise if, as is probable, all the European countries could not take the convertibility plunge simultaneously. But much valuable experience in international co-operation will be wasted if no way is found to carry over to the worldwide organisations both the freedom of discussion and the comprehensiveness of approach that have marked the interlocking discussions in the EPU and in the OEEC Steering Board for Trade. This will not be easy.

Gatt and the IMF are independent organisations meeting separately and, unlike the European bodies, infrequently; and discussion of internal policies is specifically proscribed by Gatt. The obvious remedies would appear to be some new link between the two existing organisations, some redrafting of Gatt and of the Articles of Agreement of the Fund (particularly the rules about quantitative restrictions) and the introduction of effective sanctions. But each of these remedies implies new headaches. If the link is some form of special committee, meeting frequently and advising both Gatt and the IMF on policy questions, how can it be small enough to be effective and yet large enough to be representative? Should its powers be more than advisory, and, if so, what becomes of the "preponderant voice" that the United States has, by law, in the Fund? Can Gatt and the Fund be adequately modified and interpreted without substantial re-negotiations? If not, is the United States, which has felt it premature to do more than extend the trade agreements act for one year, ready to enter into a full-fledged re-negotiation of the Bretton Woods agreements? If the EPU disappears, what means will exist of disciplining a country whose trade policies do not conform to its financial position? And, above all, is there any sanction that is really effective against a country which is strongly and persistently a creditor? Organised discrimination is sometimes suggested, but it is difficult to see how the threat to take a measure that is the inevitable last resort of the debtor countries will frighten or compel a creditor country to alter its policies. The unhappy fact facing the ministers is that an agreement in principle on what is required will lead not to an easy solution but straight into a dense thicket of very thorny questions.

Russian Shockers

SOVIET readers can no longer complain that they are deprived of "thrillers." In the last few weeks at least a dozen spy stories have been published, all with roughly the same plot—one about western agents sent to Russia to spy and sabotage, but finally caught by the long arm of Soviet law. This fiction, coupled with similar "factual" stories publicised in the Soviet press, is clearly aimed at arousing vigilance and xenophobia. It is an interesting attempt to revive the mood of the months before Stalin's death, when every citizen lived under a cloud of suspicion.

The new regime had started with a period of relaxation. Having denounced the "doctors' plot" as a frame-up, it proceeded to attack the whole campaign of plot, poison and putrefaction. Only a few months ago Soviet satirists were still allowed to mock undue vigilance and the maladive

suspicion of everything foreign. One of them, in a witty comedy, described how a Russian engineer was almost branded as a traitor by his fellow-workers because he had a foreign "royal medal." It turned out in the end that the "medal" was merely a tag belonging to a dog he had bought while on official service abroad.

The zigzags of current Soviet policy, however, are so sharp that contradictory trends are revealed almost simultaneously. While some leaders now favour a return to Stalinist vigilance and tension, others can still strike a blow for scientific freedom. Last week *Pravda* came out with special praise for Professor Einstein, who for years had been the object of violent criticism in the Soviet press. The author of the article, the academician Sobolev, took Soviet scientists to task for throwing out the baby with the dirty water, for ignoring Einstein's great scientific achievements because of his "confused" philosophy. He went even further and attacked those intellectuals who in controversy use threats and vituperation instead of a reasoned argument; Lysenko himself was named among the culprits. Moscow university's faculty of physics was accused, in barely veiled terms, of obstructing atomic research (Has Russia its own "Oppenheimer" problem?). But the reason for *Pravda's* new line is obvious. One cannot develop atom power stations if one ignores the achievements of world science; outworn Stalinist fetters hinder development in the atomic age. The struggle between those who would like to keep them and those who would like to get rid of at least some of them is not yet over.

Dr Cort's Liberty

NOBODY should feel satisfied with the explanations that the Home Secretary has so far put forward for refusing to allow Dr Cort, the American former Communist who is now Lecturer in Physiology at Birmingham University, to remain in Britain. The Home Office's case is that the only danger of imprisonment that will face Dr Cort if he returns to the United States arises from an offence that he has committed against the American Selective Service Acts; he did not report to the American authorities in this country for a medical examination, to confirm that he is still unfit for military service. If Dr Cort's political opinions had placed him in jeopardy of imprisonment, then British custom and convention would normally oblige the Home Secretary to allow him to stay; Sir David Maxwell Fyfe's ruling appears to be that those political opinions have had no direct bearing on his offence.

On the face of it, this is casuistry. The reason why Dr Cort did not report for his medical was that he had been a member of the Communist party while at Yale. He knew that he would have to list this former membership when he presented himself for induction; and he feared that American law would then cause him to be called up as a private (regardless of his medical qualifications) and that he would have great difficulty thereafter in securing any academic post in the United States. Some of the arguments that have been put forward in Dr Cort's defence are exaggerated; it is not true that, after induction, he would have been court-martialled for his previous Communist activities—provided that he had filled in his recruitment form honestly. But there can be no doubt that his political opinions lie at the bottom of the quandary in which he has now been placed.

The Home Office is usually very jealous of civil liberties, and the suspicion has therefore arisen that there is more in this case than meets the eye. It is certain that the hidden factor does not lie in pressure from the American Embassy. The Americans would probably be delighted if the Home Office allowed him to stay here; after the fuss that has been raised they will have to take proceedings against him on his return, and they know that these will be followed with yelps of delight in left-wing papers in Britain. A major problem is that if Dr Cort continued to evade military service he would lose his American nationality, and the Home Office is frightened of collecting too many stateless aliens whom they cannot deport to anywhere if they become a nuisance to or a charge upon this country. But nobody has alleged that Dr Cort would become a nuisance, or that he is not the best man for his present post. If Sir David's real reason is that he has outside evidence that Dr Cort may be a genuine security risk, or even that he is disturbed about the number of fellow-travellers who seem to have congregated in certain faculties of this particular university, then he should say so.

Civil or Military Defence?

THIS week's debate on civil defence has made at least one thing clear. The House of Commons is not divided on whether civil defence is a necessary part of peacetime preparedness for war. No one accepted the proposition that the effects of the hydrogen bomb are so awful that measures to counter them are useless. Nor was there any disagreement over the need for a much greater sense of urgency and direction to be felt throughout the civil defence organisation from top to bottom. More than one member suggested that it should be taken out of the Home Secretary's hands and given its own minister, or at least that it should be headed by a full-time director instead of by a committee of civil servants. The principal source of disagreement concerned the respective roles of the local authorities' civil defence services and the new mobile columns.

As the Home Office envisages things at the moment, the chain of command in the event of war will be from the central government, as long as it can function efficiently, through the regional commissioners, who will be appointed when war is inevitable or imminent, to the local authorities' controllers, who are already being appointed. But in addition, and transcending all local authority boundaries, there are the mobile columns (to be manned in the first instance with national service reservists of the Royal Air Force) whose duties will mainly consist of rescue work and firefighting. The relation between these columns and the local, static, forces has hitherto been obscure. The chief new piece of information given by Sir David Maxwell Fyfe in the debate is that the mobile columns are shortly to have a commander-in-chief, who will be in operational command of them in war and whose immediate task is to co-ordinate the plans for mobile columns with military plans and with the local defence services.

This appointment and the emphasis now being placed on the training of mobile columns naturally provokes the argument whether it would not be better to concentrate on achieving efficient and fully trained mobile forces, rather than on trying to recruit large numbers of half-trained local volunteers. This argument, however, overlooks the facts that, first, the local forces will have to take action before the mobile columns can arrive; and that, secondly, however intensive the local recruitment campaigns, they will rarely be able to produce the numbers wanted. There is no question of choosing between mobile or static forces. The problem is how to find and train adequate numbers of people for both.

Confusion in Kenya

THE disarray into which European politics in Kenya have fallen since the new constitution was announced shows no signs of abating. The latest manifestation of this deplorable state of affairs occurred this week. The vague but well-intentioned statement of policy which the Government produced on Monday was immediately followed by a counterblast from the European electors' union, expressing "the greatest anxiety" at the Government's "thinly veiled effort to appease influences hostile to European settlement in Kenya." The electors' union has not lately had much authority; but in this instance it undoubtedly expressed a growing grumble among some sections of the European population that their leaders in the legislative council let them down (and sacrificed "principles" in favour of "expediency") by joining the multi-racial government. Unfortunately, even men like Mr Michael Blundell and his supporters, in an effort to put up a façade of unity with their less liberal colleagues, have lately felt compelled to bring out some old and jagged racial hatchets (such as the "inviolability of the white highlands") which leaders of all races had agreed to bury during the experimental period of the new government. It is high time that the settlers realised that all vestiges of the myth of permanent white supremacy (now usually hidden under the euphemism of "predominating responsibility") have got to be banished for good.

The illusions of some Europeans that they can continue to oppose the trend to fully multi-racial rule in Kenya are made all the more foolish by the fact that the colony is now demonstrably unable to pay the costs of its emergency. Mr Vasey, the colony's realistic Finance Minister, has now finished his negotiations with the British Treasury for some relief from these burdens. It is clear that Britain will have to shoulder the military costs of the present campaign; it will also contribute heavily towards the almost equally expensive—and certainly equally necessary—rehabilitation and development schemes planned in Kikuyuland and the rest of Kenya. But in return Kenyans have a plain duty to listen to reason and the British taxpayer. Colonials should be the first to recognise that there must be "no taxation without representation"—which, in this case, means representation of more liberal views.

Canute at Uno

SOME years ago a witty Frenchman defined the United Nations as a small internationalised territory whose principal export was duplicated documents. On Monday the Secretary-General, Mr Dag Hammarskjöld, implicitly confirmed this definition. He pointed out that even the member governments could not cope with the flood of reports and other documents which their own spokesmen had called for. Mr Hammarskjöld's strong plea that sluicegates be built to stem this flood will be welcomed by all who have to do with UN matters. It has long been the custom of any delegate with nothing more useful to say on a complex subject to demand that the Secretariat should produce yet another bulky report; and it is rare for his fellow delegates to vote him down, for sooner or later they in turn may need his backing for some pet project.

More than once it has happened that, by the time a report is produced, its original sponsor is no longer attending UN meetings, and nobody else has any desire to read it, or even any recollection of what purpose it was meant to serve. All too often the only effect has been to add to the burdens both of a harassed secretariat, which has to create these mimeographed monsters, and of the reluctant foster-Frankensteins in the member nations' Whitehalls, who have to receive, house and, if possible, painlessly exterminate them. The UN organ that offends most grievously is the Economic and Social Council. If Mr Hammarskjöld succeeds in holding back the flood from that quarter he will have outdone his fellow-Scandinavian, King Canute; for this council's activity is as vast and sterile as the salt sea. Uno's economic and social work is done, in practice, by its technical agencies and departments, several of which are admirably productive; and it is difficult to see what part of that work would suffer if the council were to vanish overnight.

South Africa's Buoyant Moment

THE announcement this week of a five per cent increase in South Africa's quotas for the import of consumer goods restores the degree of liberalisation that existed until last year, when controls were tightened owing to balance of payments difficulties. This indicates the dramatic recovery of South Africa's foreign trade since the dark days of December. At that stage, when foreign exchange reserves had sunk to less than £90 million, a mere rumour of devaluation was enough to cause a crisis. Since then, however, against official expectations, the recovery has been gaining strength, and despite the customarily lean period of export earnings at this time of the year, reserves have mounted to over £123 million, having thus more than recovered the ground lost between April and December, 1953.

Since Mr Havenga's "optimistic budget" in March the mood in the Union has been one of extreme buoyancy. But it has been overdone. Certainly there is room for satisfaction in the favourable trend of the balance of payments; for the moment the position is secure. Nevertheless it has

to be remembered that imports are still restricted to only 45 per cent of the level of 1948, the last year of freedom. Moreover, the economy is at the moment marking time, getting its breath after the postwar surge of rapid industrial and mineral development. The phase has passed when huge sums had to be spent abroad on machines and equipment for the Orange Free State goldfields, and for other major capital works. But, if the South African economy is to preserve the dynamism that carried it through the boom years from 1946 to 1953, a great deal more construction work, particularly on public utilities, needs to be put in hand.

A lot has been said about the bright long-term outlook for South Africa's export industries, such as uranium and gold. No doubt there are good things in store when the new Free State mines get into their stride, and the uranium investments begin to bear fruit. But it may be longer than some people expect before the net gain becomes appreciable; for, at the same time as the new mines begin to yield gold, a number of the older properties in the Central and East Rand are falling out of production. Another dubious factor is the exceptional harvest last year, which enabled South Africa to export some agricultural products, whereas since the war it has often been obliged even to import commodities like maize. Good harvests cannot be counted on in a country like South Africa. Ffnally there is the flow of capital to the Union, which, by all accounts, has been substantial this year. This, too, is a factor liable to sudden reversals. The Union, therefore, needs to have a reserve of ample proportions. It is too early to throw caps in the air.

Obscenity at the Old Bailey

IT is doubtless as tactless to think of congratulating an Old Bailey jury on their verdict of "Not Guilty" as it would be impertinent to congratulate the judge in the same trial on his summing up; but, after the recent acquittal of Messrs Secker and Warburg, the inclination is there. These publishers, their printers, and one of their directors were prosecuted for publishing an obscene libel in the shape of the novel "The Philanderer" by the American writer Mr Stanley Kauffman. The book was described as a novel of life in contemporary New York, and Mr Justice Stable summarised it as a story of a young man obsessed with a desire for women. That was not, he said, presented as an admirable thing, nor as something which brought happiness or permanent satisfaction. To write about the act of sexual passion might be an error of taste, but was it, as the prosecution alleged, "sheer filth"? The jury, nine men and three women, refused to call the book an obscene libel, and the decision of Messrs Secker and Warburg to let the case go for trial has been justified.

The law of England on this subject has often been harshly criticised. The test for obscenity in literature is still that laid down in 1868, that a book is obscene if it tends to deprave those whose minds are open to immoral influences. Logically, such a definition can be made to look extremely foolish, but critics of it often tend to overlook two other considerations. One is that it is remarkably difficult to substitute for it any other definition, contained within a formula of words, which cannot be made to look equally foolish. The other is that the definition is not intended to be applied logically, for logic plays a small part in the common law. It is not intended as a measuring rod for use by those who use their brief authority as policemen, magistrates or local councillors to pronounce judgment on matters of taste. It is intended to be a working guide to those who are given the responsibility of judging and for whom, equally, the book is written—a common jury.

The novelist who allows his work to be published in England writes for an Old Bailey jury, or its equivalent, just as he himself inevitably sets out in his book the standards by which he asks that jury to judge him. The function of the court—and it would be difficult to exaggerate its importance—is to see that this confrontation is actual, unobscured by fashion or prejudice, and in focus. In this respect, Mr Justice Stable's summing up last week deserves to take its place alongside the judgment delivered in the Supreme Court of the United States on Mr James Joyce's "Ulysses."

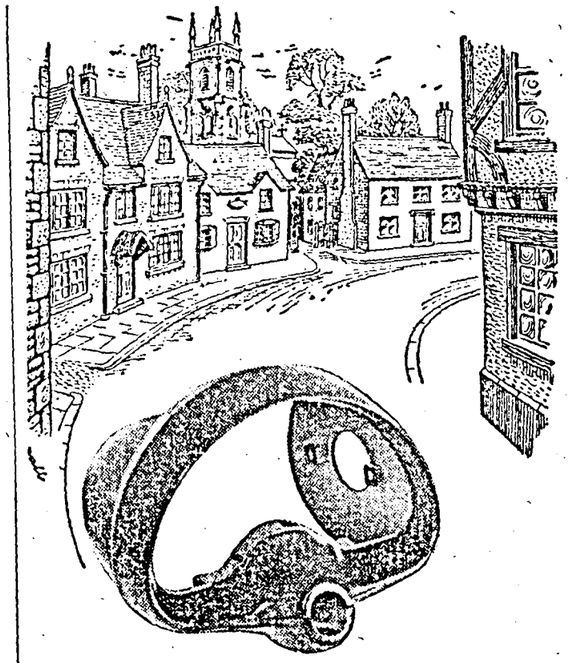
General Practice Surveyed Again

WITH only one dissentient, the British Medical Association reaffirmed, at its annual representative meeting this week, the profession's opposition to a full-time salaried service for general practitioners. In doing so, it had the satisfaction of knowing that a committee of the Central Health Services Council had just reported in favour of retaining the present system of payment by capitation fee as allowing the maximum independence for the doctor and interfering as little as possible in his relations with his patients.

The committee's report (HMSO, 2s. 6d.), which will, one cannot help hoping, be the last word for some time on this much-surveyed branch of the medical profession, now slightly more restricted in its scope than most of its predecessors. The committee, under the chairmanship of Sir Henry Cohen, was asked to consider general practice within the health service. It was not therefore concerned, except indirectly, with the wider aspect of general practice—with its *raison d'être* in an age of increasing specialisation—and makes only a brief mention of it in the report. Yet many of the points the committee discusses will be familiar: the relations of general practitioners with their professional colleagues inside and outside hospitals and with their patients; the burden of certification; economy in prescribing; standards of accommodation.

The importance of its findings in all these matters is not that it could find much that was new to say, but that its conclusions have the stamp of authority. For this reason, its views on health centres will be read with particular interest. As it points out, local authorities have a duty, under the National Health Service Act, to establish health centres at which general medical services would be provided. In fact, only four new centres have been opened since 1948, and at two of these—in London and Bristol—the rents obtainable from the doctors do not cover the running costs. But it is not only cost that prevents the general provision of health

INDUSTRY



and the Balance of Power

BRITAIN today has more electricity than she has ever had before. In the past six years, 40 new power stations have been brought into operation and power supply has increased by 50 per cent. At the same time, the demand for electricity is greater than it has ever been.

Women at home are using electricity increasingly to lighten their daily tasks. Farmers must have more power to increase production of vital foodstuffs. The railways need power—and may well need more power. The lighting of our streets is crying out to be improved. There is an increasing demand for power from offices, from cinemas, from shops. Does this present a danger that the important industrial demand may be 'squeezed out'? No!

If electricity were more widely used by factories, farms, shops, homes, offices and for street lighting—this would keep the generating plant more fully loaded. The demands on the power stations coming from these different classes of consumers would be diversified. That is to say the loads would occur, in the main, at different times of the day—and continuous full output from the generating plant would reduce the cost of electricity.

BRITISH ELECTRICITY — ELECTRICITY PROSPERITY

Economy drive

In the new Anglia and Prefect, Ford Motor Company Ltd. use a BAKELITE wood-filled material for the four-part moulding which forms the instrument panel. Practical and economical, this is one of the many BAKELITE products helping the motor industry to keep down costs. Mouldings for instrument panels and dashboard components; electrical and other parts machined from laminated sheet; grommets and cable insulation sleeving made from VYBAK materials; car bodies and press tools formed from polyester resins... the applications are virtually unlimited. And new materials are constantly being produced by Bakelite Limited, the organisation that pioneered plastics, and continues to lead in research and development.

The Elephant consults the Lion

'Between you and me,' says the Elephant to the Lion, 'there are 150,000 miles of submarine cable.'

'And between you and me,' replies the Lion, 'there are more than 200,000 miles of wireless circuits. So if I can't get in touch with you one way, I can always find you in another.'

These are round figures—or, to be more specific, round-the-world figures. On the map, the miles between the Lion of the United Kingdom and the Elephant of Ceylon, are a matter of four figures only. But the miles that link them in the chain of Commonwealth communications are many times greater.

In the United Kingdom the Post Office handles messages to and from Ceylon. The Post Office in Ceylon sends and receives messages there. Cable & Wireless Ltd. owns the cables under the sea which link the two. Indeed, it owns and maintains the whole 150,000 mile Commonwealth cable system. The Company, also, owns and operates wireless stations in the Colonial territories which relay messages between the eight senior countries of the Commonwealth, and provides a network of 114 telegraph circuits.

The headquarters of Cable & Wireless Ltd. are in London. Its day-to-day business is carried out between the eight sovereign nations of the Commonwealth; in the Colonial territories and in foreign countries in which concessions are held.

How these services are carried out is explained in a 40-page illustrated booklet "World Wide Communication", which gives many interesting details about the Company's equipment, operations and administration. A copy will be sent to you without charge if you will write, mentioning this paper, to:—The Public Relations Officer, Cable & Wireless Ltd., Electra House, Victoria Embankment, London, W.C.2.

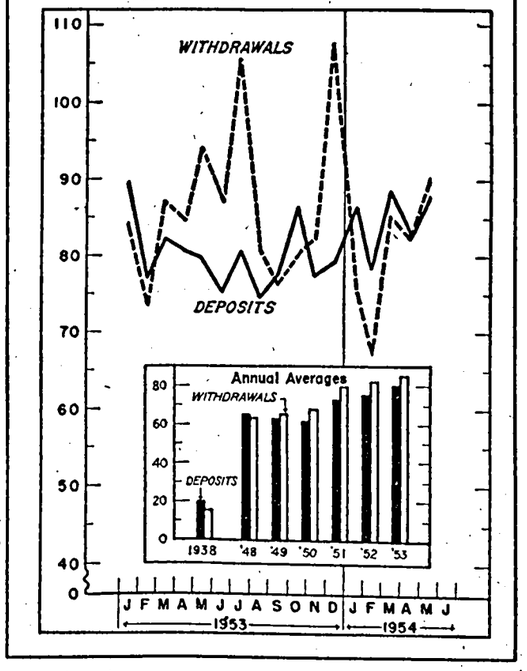
centres. The committee lists other practical difficulties, most of which boil down to a natural reluctance on the part of doctors to agree to the gamble of transferring their practices to a health centre, with all that it may imply of local authority control. The committee, therefore, comes down in favour of group practice rather than health centres. This it considers a more natural—as well as cheaper—method of securing the closer co-operation between general practitioners that is believed to be the best way of improving their standards of service and conditions of work.

"Disinformation"

In the course of a brief description of the departmental structure of Soviet security and intelligence, Mr Vladimir Petrov revealed to the Australian royal commission last week the existence of a staff whose task is to disseminate misleading information. This is apparently known as the "disinformation" directorate. The word is apt, if unintentionally so. Onlookers in free nations have long been impressed by the Communists' mastery of the art of launching a world-wide campaign of defamation or distortion on almost any theme. Within a mere forty-eight hours it is usually possible for the party press throughout the world to swing into line on even the most abstruse topic, with a wealth of artistic verisimilitude. A recent classic example was the sudden vilifying of the International Red Cross immediately after it had been suggested that that body should investigate the "germ war" charges.

Light has already been shed on that episode by the trial, in a Swiss court, of a professor who was found to have been supplying the "World Peace Council" with defamatory tales about individual members of Red Cross committees. Mr Petrov may provide further enlightenment. Meanwhile, the old adage about truth's ability to outdistance fiction looks like being upheld once more. George Orwell added to our vocabulary the grimly necessary words "unperson" and "unfact"; and the expunging from new editions of Soviet publications of all references to, for example, Beria or the Nazi-Soviet pact of 1939, shows how close to the mark he was. But "unfacts" are negative affairs. "Disinformation" is the obverse side of the same coin, and one can only be grateful to the Soviet authorities for providing such a badly needed term.

Prison for Psychopaths



The Home Office announced last weekend that local objections to the establishment of a new prison near Aylesbury have been overruled. Work can now go ahead on the first institution of a type that has often been recommended—first as long ago as 1939, in the East-Hubert report on the psychological treatment of crime.

It is generally recognised that there is a type of offender for whom the present penal system is useless. The psychopath, to give him his medical term, is the despair of his doctor even when he is not a law-breaker. He is not normally certifiable, and he is seldom suitable for admission as a voluntary patient into a mental hospital or for out-patient treatment—even if he were prepared to agree to either step. When he turns to crime, as many psychopaths do, nothing within the penal system seems to have any power to change his behaviour—in fact, as was said in evidence to the Royal Commission on capital punishment, inability to profit from experience is one of the symptoms from which a diagnosis of psychopathic personality is made.

The new institution will provide an opportunity for giving sustained treatment for this abnormality of character and for undertaking research into why it occurs. The institution will house up to 300 prisoners selected from among an estimated total of about 1,200 imprisoned psychopaths—that is, 5 per cent of the prison population of England and Wales. It will be under the control of the Prison Commission, but its head will be a psychiatrist, not a prison governor, and its officers will be specially picked and have to undergo a special course of training. Many years will elapse before the success of this new prison in dealing with the psychopathic offender can be determined; for one thing, its inmates will be chosen from those serving sentences long enough to allow of sustained psychiatric treatment. But the institution ought to have one beneficial effect immediately it is opened—which will apparently not be for a year or two. The removal to it of some of the most unstable inmates of the overcrowded prisons is bound to relieve the hard pressed prison staffs and may help to prevent a recurrence of such incidents as recently took place at Wandsworth.

Boundaries on the Move

SIR—Your recent comments on the Parliamentary Boundary Commissions' provisional determinations have encouraged me to draw attention to the following point.

It appears that the English Commission is using as an electoral quota a figure of 57,122 which is obtained apparently by dividing the number of electors in England only by the number of English constituencies. There is nothing in the 1949 House of Commons (Redistribution of Seats) Act which refers to a special English quota. Indeed, rule 7 of the Second Schedule says "the expression 'Electoral quota' means a number obtained by dividing the electorate of Great Britain by the number of constituencies in Great Britain existing on the enumeration date." The electoral quota in 1953 ascertained by this rule is 55,670.

Does this matter? Taken with another practice of the English commission I think it may. Although there is nothing in the Act directing the Commission to proceed county by county this is apparently the method adopted. The electorate of each county is apparently divided by the figure 57,122. If the result obtained by this process is less than the number of existing constituencies there is a reduction of seats—if more, then an additional constituency may be suggested.

One wonders if all this is worthwhile. In the case of London, which has now 43 seats, the division by 57,122 gives an answer of 42.45. Ergo: one seat must disappear; so for eight Metropolitan Boroughs the Commission lightly breaks rule 4a (iii) of the 2nd Schedule of the Act, which says that only in exceptional circumstances should a Parliamentary constituency run into more than one Borough. In addition 22 constituencies are changed to effect this reduction of one seat! (You refer to the fact that under the Commission's proposals Wandsworth Town Hall is placed in Battersea. A similar feat occurs in connection with Hammersmith Town Hall which will find itself in a Fulham Parliamentary division.) Were the electoral quota for Great Britain of 55,670 used, no change would occur in London and many other cities. As *The Economist* said on April 3rd "cities with more than one member are continually threatened with disruption to meet the movement of a small percentage of voters into the suburbs." This cannot be good for representing government, and certainly gives a feeling to electors of belonging nowhere.—Yours faithfully,

ARTHUR SKEFFINGTON
House of Commons

Pakistan Looks Both Ways

SIR—The last paragraph of your article of June 26th misjudges the situation in Pakistan. It has been an article of faith with Pakistanis, irrespective of which wing of Pakistan they come from, that Pakistan forms an integral whole and this ideal of one country and one nation has been demonstrated more than once in the past 6½ years.

The Central Government's intervention in East Bengal was warmly welcomed by leaders of public opinion throughout Pakistan. There is no intention whatsoever of flouting the election verdict of the people. The Provincial legislature has not been dissolved and, as soon as normal conditions have been restored to the Province, the majority party in the legislature will be called upon to form a government. The same administrative machinery which governed the Province before is functioning today, with only this exception that the powers which vested in the Provincial Cabinet now vest temporarily in the new Governor who is a civil servant.

The geographical location of the two wings of Pakistan is such that the nation as an integral whole has a deep and abiding interest in the Middle East and South East Asia, and the foreign policy of the nation and its relations with foreign countries take this fact into full consideration. A nation has only one foreign policy and in so far as Pakistan is concerned there is no deviation from this cardinal principle. It is absurd to think that the two units of East and West Pakistan have, or could possibly have, separate interests and policies in the context of the Middle East and South East Asia.—Yours faithfully,

S. M. HAQ, Press Attaché
Pakistan High Commission, S.W.1

Dr Nkrumah Returned

SIR—In your issue of June 19, 1954, you state that the Convention People's Party has signally failed in its attempt to win all the Trans-Volta Togoland seats, and this implies a victory for the Togolanders who put the unification of Togoland before any closer association with an independent Gold Coast. You also observed that the Togoland situation could, in effect, lead to a strengthening of the demand for an eventually independent Togoland.

Neither of your observations is an accurate statement of the facts. For the Togoland Congress, which is demanding the unification of British Togoland and French Togoland, won only two seats throughout the entire area of British Togoland. It did not win a single seat in the northern section of British Togoland.

The unification of British Togoland and French Togoland, which in effect implies the reconstitution of the territory known as German Togoland, would create many new problems. It would destroy the unification achieved by the Kusasi, Mamprussi, Dagomba, Gonja and Akan peoples of the northern section of British Togoland, who since the first World War have been re-united with their own people in the Northern Territories of the Gold Coast. It would also destroy the Trans-Volta Togoland Region, which was established in order to satisfy the demands of the Ewe people for the unification of the Ewe areas of the Gold Coast and southern British Togoland.—Yours faithfully,

KOFI BAAKO,
Chairman, Convention People's
Accra Party Information Bureau

Borrowed from Stalin

SIR—Your view on the Soviet interpretation of peaceful co-existence is supported by a leading article in the Moscow journal *Communist of April*, which bears the eloquent title "The march of Humanity towards Communism is irresistible." It makes the sweeping statement that capitalism has discredited itself in all directions. "But there is every reason to expect," the journal goes on, "that if the imperialist reaction dares to provoke a third world war, it will end with the complete collapse of the capitalist system."

In this long article of eight pages there is no mention of peaceful co-existence. The world situation is described as a permanent struggle between the capitalist and socialist systems, with capitalism running to its inevitable doom and the future belonging to socialism in its Soviet form.—Yours faithfully,

T. ZAVALANI
London, W.11

Leadership in New China

SIR—In your article of June 19th, the statement that "in the foreign field Liu Shao-ch'i confines himself to being President of the Sino-Soviet Friendship Association and Vice-Chairman of the WFTU" could be misleading.

Liu Shao-ch'i is not only the theoretician of the Chinese Communist party but, like Rakosi, he is a great figure in the International Communist Movement. His lectures on the "Party" and "The Education of a Communist member" are two of the prescribed text books of the Party throughout the world. It is true to say that he has had little experience in foreign affairs, but in 1948, when it became necessary to define the relationship between China and the USSR it was again Liu who produced "On Internationalism and Nationalism." This publication has formed the basis for Chinese foreign policy ever since.—Yours faithfully,

J. K. ADAIR

Proconsul of East Africa

AFRICAN AFTERTHOUGHTS.
By Sir Philip Mitchell.
Hutchinson. 288 pages. 18s.

IF Sir Philip Mitchell had retired a few years sooner, or the Mau Mau rebellion had broken out a few years later, this wise, philosophical, humane record of personal service—of men and events—in East Africa from 1912 onwards would have been judged simply as any other proconsul's memoirs are judged: for an insight into history, and only secondarily for comment on present difficulties. But as it happened, Sir Philip Mitchell handed over Kenya to his (absent) successor a month or two before Mau Mau atrocities began in full earnest. Inevitably, the reader asks himself (and watches the narrative for forebodings) "Did Sir Philip foresee what was going to happen? If he did not, what use is all this ripe wisdom? If he did, why did he not warn us—or warn Mr Lyttelton privily?"

In fact, Sir Philip's last important official action—among many that were of very great importance and lasting value—was to demand a Royal Commission to look into East Africa's desperate land and agricultural problems—problems which he well understood and had long seen accumulating; after a still not satisfactorily explained delay, he got what he wanted. But he apparently did not foresee Mau Mau even in his last year of office. In this book, perhaps wisely, he refrains from extended comment on the subject, but what he does say is not very illuminating. His attitude seems to be that beastly sects (such as Bakonikoni) and even big uprisings (such as Maji Maji) have occurred in East Africa more than we realise; Mau Mau is of a type—only more serious. But the seriousness of Mau Mau is, of course, the whole point, for no African rebellion has caused so much damage as this, or turned the searchlight so strongly on the future of white settlement.

But if on the events immediately preceding the emergency Sir Philip is unilluminating, his book as a whole sheds much light on the present state of East Africa. Sir Philip cannot erase from his mind—and vividly recreates in the reader's—the picture of East Africa as it still was when he was first appointed to the colonial service: it had then had but a few years of European administration and bore all the scars of its previous barbarism and the effects of the Arab slave trade. The complete primitiveness of the African, technically as well as socially, was then apparent, and so to Sir Philip the political and economic developments in the mere forty years that followed are breakneck in their rapidity—and stand as their own justification for British rule. In his comments on the Masai, moreover, he reveals himself no enthusiast—as some sentimental British settlers are—for the "savage gentleman." He believes firmly (having seen it in continuous action) in the British civilising mission in East Africa. To him the best African is the emerging, civilised one, whatever his shortcomings. But he clearly considers that those who overestimate the rate at which the African can absorb British culture and institutions are as recklessly at fault as those who underestimate it.

Sir Philip believed, and still believes, in a closer union of all East and Central Africa, and castigates those people who prevented it—bureaucrats, politicians and those Kenya settlers who now most ardently wish it had come about. But he admits that Tanganyika's attitude was always the obstacle—an obstacle that might ultimately have been removed if he had been able to take its governorship, offered to him in 1937 when he was still Governor of Uganda. He had at least the satisfaction of bringing the East African High Commission into existence. On the Kenya settlers themselves, he will be read with interest; for he was not popular with many of them. He finds them politically inept and dangerously liable to a rebellious contempt for Government, law and order, which has now recoiled horribly on their own heads. Critical of them as he is, Sir Philip is yet definite that European settlement did immense good in East Africa, and above all for Africans and African farming. It is because he puts African interests first, yet has seen what white settlement—particularly in Tanganyika—has achieved, that he believes in lasting partnership between the two races. For such solid, experienced insight into East Africa's basic conditions, human and ecological, this personal perspective should be widely read.

Titanic of the Air

SLIDE RULE: *the autobiography of an engineer.*
By Nevil Shute.
Heinemann. 249 pages. 18s.

ONE of the saddest moments in the annals of the British aircraft industry is the crash of the airship R 101. At ten minutes past two on the morning of October 5, 1930, on her maiden voyage to India, R 101 ran into a storm over France that rent the outer cover of her gas bags. The 148 ton airship went into a dive and burst into flames on the ground. Altogether 48 people lost their lives, including the Secretary of State for Air, Lord Thomson of Cardington, and the designer; only six of the crew escaped. A sad and sickened government wrote off an experiment in airship development that had been planned to open up the world's air routes.

The R 101 was a government project, designed and built by the Royal Air Force. A competing design, the R 100, was being built for the government by Vickers, Ltd., and the assistant designer on this project was a young stress engineer, Nevil Shute Norway, the son of an able civil servant in the Post Office hierarchy. The R 100 had made a safe and successful round trip to Canada a few months before the departure to disaster of the R 101. Nevil Shute believes that the designers of the R 101 were forced by Vickers's progress with the R 100 to put into the air an unsafe airship and to fly it under conditions that they would never have attempted had they been free to choose, and to that effect he tells his story of the men and the events that contributed to the tragedy.

Partly to find relief from the tension of work on the R 100, he turned to writing novels around the persons and episodes of his daily work. He recognised early on his limitations as a designer, and chose deliberately to be a big frog in a small pond rather than the other way round. He worked first for de Havilland, and left the company for Vickers when he realised that the competition of talent was too strong to give him personally much prospect of promotion. When the R 100 went for scrap, Nevil Shute and some of the men who had worked with him started their own aircraft manufacturing company on the promise of an order for two machines. Out of these unpromising origins grew Airspeed Ltd., a company that found its feet with rearmament and has since been absorbed by de Havilland.

These two episodes, the building of the airships and the founding of Airspeed, make up the book; it is essentially the autobiography of N. S. Norway, the engineer, and not of Nevil Shute, the novelist. The technique works well in the first half where the events compel attention without any need for dramatisation and where any first hand account of what built up to the ultimate disaster has an additional historical value. The remainder of the book would have been more interesting if Mr Norway had allowed the novelist greater discretion. His version of the growth and financial tribulations of Airspeed, peppered with complaints about the treatment of the company by its potential customers and its financial supporters, does not make it seem at all surprising that he was eventually bought out by his colleagues on the board. Good designers do not as a rule have the traits needed to make good managing directors, and it is unfortunate when events sometimes force them to double the two roles.

God and Dr Buchman

INSIDE BUCHMANISM.
By Geoffrey Williamson.
Watts. 236 pages. 12s. 6d.

MR WILLIAMSON set out to write two articles on Moral Rearmament. He ended by writing a book. That is typical. The movement does not believe in doing things by halves or in inspiring other people to do so; anyone who makes it his business to nose about is liable either to be converted to the movement himself or to go away with the feeling that there is something both bogus and a little ridiculous about it.

The first half of this book describes Mr Williamson's experiences in preparing for, and visiting, one of the periodic world conferences held by Moral Rearmament at their headquarters at Caux in Switzerland. In catching the atmosphere of these remarkable gatherings, the author is at his most successful, if at his least ambitious. In the second half he tries to analyse why he found the movement so unsatisfactory as a factor in changing the shape of the world and defeating communism—and to probe a little deeper than acolytes usually like into the organisation and finances. The ex-athletes and other happy souls who contrive to bump along in MRA without any noticeable theories on theology, philosophy, politics or economics are naturally perfectly content with "God-guidance" as a substitute for rules. But to people like Mr Williamson, the nature of the movement's hierarchy, the source and distribution of money, the position of Dr Buchman himself are subjects of enthralling importance.

The author and his subject matter were thus at cross-purposes from the start; and it is hardly surprising that Mr Williamson seems sometimes to have confused the wrong-headed with the sinister. He is not, after all, alone in having his doubts about a religious movement that dabbles so extravagantly in politics, or about the wisdom of fighting communism with a lot of catch-phrases dressed up to look like an ideology; but these views should not lead to unnecessary imputations of dishonesty. The most interesting chapter of this book is not, however, to be found between its two covers. According to Mr Williamson's own account, the trouble began only when he had written it; he and his publishers were then pursued and delayed by threats of libel action. Mr Williamson has his waspish moments; and his methods are those of a journalist looking for a story, rather than a research worker looking for the truth. But so slight a book seems hardly worthy of so much fuss.

New Look on Brazil

LES TROIS AGES DU BRESIL.
By Charles Morazé.
Armand Colin, Paris. 198 pages. 15s.

OF the younger school of French historians, those grouped about the journal *Annales*, M. Charles Morazé has made a rapid reputation as the *enfant terrible*. It would, however, be more than an injustice to leave it at that. His present contribution to the admirable series of *cahiers* put out by the *Fondation Nationale des Sciences Politiques* shows both his strength and his weaknesses. There is the usual fertility of original ideas—Monsieur Morazé gets more ideas into a page than most conventional historians or political scientists do into a volume—there are the usual brilliant and unexpected parallels, and occasionally there is some curious misconception about a familiar point that awakens one's distrust when Monsieur Morazé comes to deal with what few of his readers are likely to know much about, the politics of Brazil. Nevertheless, M. Morazé is fundamentally a serious scholar with a serious purpose. His material for this pioneer study was gathered during three years' teaching of politics at the University of São Paulo, where he was largely responsible for introducing the study of the subject in its modern form. The brevity of the book is itself deceptive, because much of the economic and political information is presented in graphical form; and behind the diagrams lies an appreciable effort in collecting and evaluating statistics.

Even those who are uninterested in Brazil itself may find the book fascinating, because it embodies a conscious attempt to apply to a totally unfamiliar set of problems those techniques of political analysis of which M. André Siegfried was the pioneer and of which M. François Goguel is the best known current exponent. From another point of view, what M. Morazé is trying to do is to reintroduce into sociology and political science the time-factor which is so neglected, particularly where the influence of American academic habits is strong. And Brazil is a particularly fortunate terrain for this experiment, since it is a place where time has been speeded up at a rate unequalled anywhere, except, perhaps, in an inaccessible Siberia. Until half way through the nineteenth century, the parallelism in the development of Brazilian and Western European politics, especially those of France, had been very marked ever since the French Revolution; but the industrial surge of the mid-nineteenth century and its political concomitants missed Brazil. Brazil had its 1848 in 1930; and since then industrial advance and new forms of internal colonisation have created new political forces based on the growing self-consciousness of new bourgeois and proletarian elements. Will the old interdependence of administration and politics persist or will Brazil follow the modern pattern of an impersonal bureaucracy and competing ideological and class parties? Much needs to happen before one can be sure of the answer, both in the economy and in the educational field. Meanwhile the aircraft, radio and television are having their impact on a country too big for the railway age to unite. It is a superb canvas, and the big brush-strokes with which M. Morazé paints in the astonishing career of Getulio Vargas (Brazil's Louis Napoleon) leave one with a wish for some more meticulous landscape.

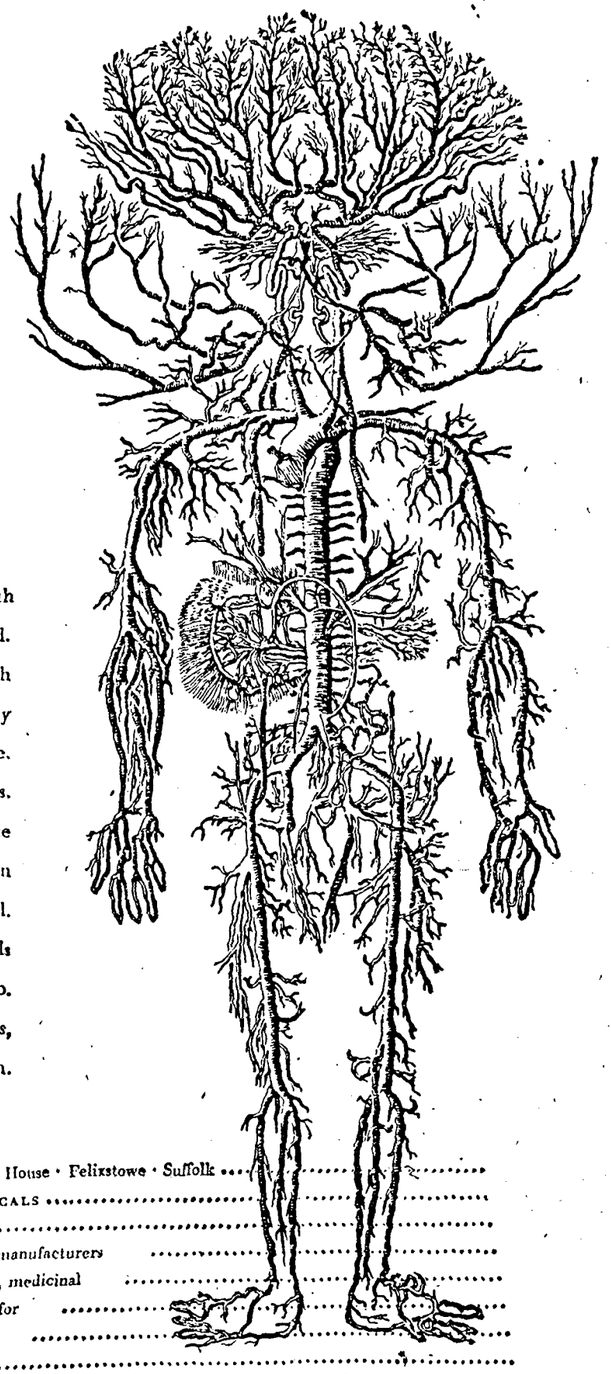
M. Morazé's combination of economic history and sociological analysis, whatever its imperfections, marks an enormous step forward from the viewpoint of a properly descriptive political science—one that transcends legal categories. We badly need similar studies of other countries undergoing or attempting a rapid change to a more highly diversified economy and social system—India for instance. For all the talk of French decadence they are more likely to come from French scholars than from some petrified academies where only the dead are interesting and respectable—the nakedly abstract and the dead.

Points for Pleasures

THE COMMUNICATION OF IDEAS.
By T. Cauter and J. S. Downham.
Chatto & Windus. 342 pages. 25s.

AT the beginning of 1953 the authors directed a sample survey of the leisure activities of the population aged 16-69 living in Derby and its suburbs. Each of the 3,000 respondents was questioned about the extent of his reading of newspapers, magazines and books; listening to radio and looking at television; cinema and theatre-going; use of public transport; attendances at pubs, churches and adult education classes; participation in various sports, hobbies and political parties; and membership of clubs and other voluntary associations. The results occupy two-thirds of the book and agree closely with those of similar studies of urban English life—the average person reads several newspapers and magazines each week and listens methodically to the BBC; additionally, if he is young he is likely to spend much of his leisure at cinemas, dance halls and sports grounds; if he is middle-class he will be more prone than others to attend church and to take part in voluntary associations.

The real interest of the book lies in the authors' "index of intercommunication." They postulate that ten of these leisure activities are important channels for the transmission of ideas and information (looking at television, listening to radio, reading newspapers, watching films, attending church, sitting in pubs, etc.). As a next step each person interviewed was awarded points—up to a maximum of ten—according to the extent of his participation in each of these activities. The possible scores could thus range from 0 to 100; in fact, well over half the sample earned between 35 and 55 points, and for different sections of the population the median score ranged from 42 to 53.



It is difficult to accept the index in its present form as anything more than a bright notion. In the communication of ideas it is unlikely that going to the cinema and reading books are of equal significance; similarly it is improbable that equal weight should be given to listening to a dance band and listening to a Third Programme discussion on "Is a Theory of Knowledge Possible?"

The book's fundamental disappointment lies in the authors' complete failure

man and tree

If nature is kind, a man may live in health to a hundred years, a tree to a thousand. Man's knowledge of the chemistry of health is increasing. Through science man is gradually making nature kinder and more predictable.

Fisons are in the business of chemicals. Their main manufacture over the last hundred years has been chemical fertilizers to enrich the soil. But they make chemicals for medicine and industry, too. Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED · Harvest House · Felixstowe · Suffolk
FERTILIZERS · HEAVY CHEMICALS
Fisons are also among the largest manufacturers in Great Britain of pharmaceuticals, medicinal food preparations and fine chemicals for Industry. Many of Fisons products in these fields are household names

it's all in FISONS field

to attempt to validate their basic assumption—that there is a direct relationship between a packed leisure life and the acquisition of new ideas. No attempt was made to establish any relationship between each person's score and his stock of knowledge and the calibre of his ideas. Until this has been done the authors' index of intercommunication could be more appropriately described as an index of the consumption of commercially-organised leisure activities.

Guide to Finance

BRITISH PUBLIC FINANCES. *Their Structure and Development*, 1880-1952. By Ursula K. Hicks.
Oxford University Press. 233 pages. 6s.

THE editors of the Home University Library assure us on their dust cover that their selected authors, besides being distinguished academically, "are skilled in the art of presenting their material, and able to unite learning with lucidity." There can be no doubt of Mrs. Hicks's learning—in the field of descriptive public finance it is unique—but in this book she scores only a moderate mark for lucidity. In part this is due to the very large amount of material which she has compressed into a small book. The difficulty is accentuated, however, by a use of statistics which is not always happy, by some apparently hurried writing and by a weakness for jargon. "Universalisation," "non-substitutability," "disequalising," "annuality," "regularisation" and "percentagewise" are a few of a long list of words that deserve the attention of Sir Alan Herbert.

An opening chapter gives a brief outline of the growth of public authorities and brings out the steady expansion of the central government and the relative decline in the importance of local authorities. The chapter on public expenditure emphasises the importance of social services and housing and poses, though it does not answer, the important question of how the demand for these services is to be kept within bounds while they are offered on terms that conceal their true cost from those who use them. The chapters on taxation and on local finance both contain much useful information in a very compact form. The discussion of "Budget balance and national balance" traces the change in views on the function of the budget, introduces the reader to a few of the ideas of modern social accounting, and suggests possible improvements in the form of public accounts. This chapter would have been made more helpful by a clearer definition of terms at the beginning and by the inclusion of specimens of the present and of the desired form of accounts. Finally, there is a fairly long discussion of loan finance and debt management. It contains some useful material, illustrated by charts, on the structure of interest rates, but on the whole the author appears less at home in the City than in Whitehall. There is some confusion about the relationship between government borrowing, bank deposits and interest rates.

The book contains a lot of good material on a subject where good books are sadly few, but it is likely to be too difficult for the uninitiated reader. Its main usefulness (as was probably intended) will be for the student with a general training in economics who requires to know something of public finance, but who lacks either the time or the inclination to read very deeply in the subject.

Shorter Notice

RETIRE AND ENJOY IT.
By Cecil Chisholm.
Phoenix House. 240 pages. 15s.

This sensible, easily-flowing, unpretentious vademecum for the retired and for those contemplating retirement does a good deal to fill a want so obviously felt, in these days of lengthening life-expectancy and shrunken "fixed" incomes, that one wonders why no one has written something like it before. Mr Chisholm deals with the nasty shocks, psychological and economic, which retirement can bring; dwells on the merits of deliberate planning—the tapering-off programme wherever possible, the attitude of "retiring-to" rather than "retiring-from"; discusses the choice of a locality and home for economy, convenience, congeniality; is realistic about budgets; gives good though necessarily very sketchy advice about health; lists forty-three ways of spare-time money-earning, some sixty hobbies, and a dozen forms of social and civic service, and moreover indicates how to set about them; and winds up with a word on the wife's point of view. His handbook is not comprehensive. (A companion volume treating budgets and earnings in more detail is due later.) Hardly a word indicates that a retired couple may have children and grandchildren, friends and acquaintances, whose existence may either ease or complicate their plans; throughout it is assumed that any roots which they may have struck are purely professional. There is not a word, either, about the problems of the really old, from the further "tapering" of activity which must gradually go on through the seventies and eighties to the possibilities of care, comfort and happiness when physical dependence must be conceded. This can, however, fairly be regarded as a separate topic and from the psychological point of view best kept so; and one can always read the *De Senectute* to be going on with.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Washington Weekend

Washington, DC

WHENEVER any British statesman is about to come to Washington American officialdom begins to burnish its armour, in deference to an unshakable national belief in the Machiavellian cunning of British diplomacy and its designs on the simple virtue of the United States. But in the week before Sir Winston and Mr Eden took wing it was clear that this time the American breastplate was being buckled on with special care. The reminder was discreetly allowed to circulate that the United States and Britain are formally allied only through the North Atlantic Treaty Organisation and in Europe, and in the columns of the diplomatic correspondents there appeared an officially inspired list of grievances against British policy. These included the now famous misunderstanding in April about the urgency with which a South Asian security organisation would be discussed; annoyance at the candour with which the Foreign Office is now mentioning alternatives to the European Defence Community and the possibility of bringing Germany into Nato. The list contained several specific grounds of complaint against British policy in the Middle East, and was capped by a general expression of regret that the exigencies of the European situation should make it necessary for the United States to be allied with the colonial powers.

On top of this came Mr Eden's speech in the House of Commons with its unlucky use of the word "Locarno," and its omission of any reference to Mr Dulles, which was accepted as a studied insult to the latter. Although "Locarno" has sent cold shivers down American spines every time the Prime Minister or the Foreign Secretary has used the word, partly because it has come to be regarded as a synonym for "appeasement," the current *malaise* of the alliance was never better illustrated than by the way in which the American press distorted Mr Eden's suggestions on South-East Asian security arrangements. But it was universally felt that the suggestion was ill-timed, the more so since Mr Eden had been guilty of breaking the rules of the alliance in the same way as Mr Dulles has so frequently done, by springing a new idea upon the world without first consulting, in this case without even informing, his partner.

In addition to these irritants, there were two other difficulties apparent before the great aircraft *Canopus* alighted at Washington airport. One was that the departure of M. Bidault and the arrival of M. Mendès-France had, in advance, rendered the Anglo-American meeting virtually powerless to take concrete decisions, either about Indo-China or about Europe. The other was that the problem of Guatemala was dominating the minds of Mr Dulles and other members of the Administration, almost to the exclusion of every other subject.

★

Under these circumstances, what is surprising is not the rather limited and short-term agreements that were arrived at, but that agreement of any kind between the four principals was possible. On the working level some useful results did emerge, a closer co-ordination of ideas on Middle Eastern policy, made easier by the probable acceptance of the new British proposals to Egypt, some new thoughts on Trieste, and a decision to try to apply the Trieste formula—namely, long joint discussions with each party in turn—to Arab-Israel relations. The meeting ratified two inevitable developments, the restoration of German sovereignty if the French assembly does not agree to EDC this summer, and the beginning of serious consideration of a South-East Asia Treaty Organisation.

Whether these decisions might not have been arrived at as easily through ordinary diplomatic channels without recourse to personal diplomacy is open to question; it is a sign of decreasing Anglo-American friction that their implementation will now be discussed in those channels. Certainly the device of preliminary bilateral talks between the British Embassy and the State Department on SEATO with each keeping its own particular friends informed, the Commonwealth and Burma on the one hand and the Philippines and Siam on the other, seems a happy one; it meets Mr Dulles's sense of urgency while not abandoning Mr Eden's point that initial planning should not prejudge SEATO's eventual membership.

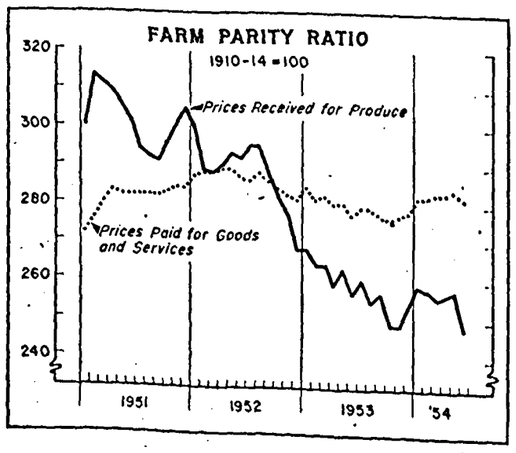
Most of what Sir Winston said to President Eisenhower will never be known, for they did much of their talking in the strictest privacy. But it was Sir Winston who dominated the week-end as far as the American public were concerned, and the largest recorded assemblage of its kind convened at a press luncheon to hear him make his plea for an examination of the possibilities of "peaceful co-existence." Certainly his dexterous handling of questions and his general sense of sober gaiety—he was looking five or ten years younger than when the American press had last seen him at the Bermuda conference—dispelled any belief that the British government is in senile hands, as certain recent American official visitors to London had reported. On the contrary, his public appearances and the

respect his words commanded have made many Americans wonder how the alliance can ever afford to dispense with his services, for there is no other European statesman, certainly not Mr Eden, who can speak with anything like the same authority to the American public. It is partly his venerableness (he was First Lord of the Admiralty in the year President Eisenhower became a Second Lieutenant), combined with the youthfulness of his imagery, partly the earthy quality which aristocratic blood confers, that makes him so much more respected by the average American than the conventional products of English middle-class schooling.

*

However, the depth of the cleavages between the American and the British attitude towards Communist China was demonstrated before Sir Winston's ship had been a day at sea on his return journey. Then Senator Knowland, the Republican leader in the Senate, stated on the floor that, if Communist China were to be admitted to the United Nations by majority sentiment in the coming General Assembly, he would quit the Republican leadership and campaign for the withdrawal of the United States from the United Nations. This started a two-day debate which showed that, except for a few of the more courageous Democrats, no politician is at this moment prepared to face the political implications of a revision of the American attitude towards Communist China.

Sir Winston's name was associated with this sudden eruption because it became known that he had warned the President that there would be a majority for admitting China at the next assembly. This warning became perverted into a superheated belief that Britain and France are prepared to back Communist China's admission as the price of a settlement in Indo-China. The result of letting this privately expressed view become public has been once again to tie the Administration's hands and eliminate any possible flexibility in the handling of Far Eastern questions for the time being.



Despite the fact that it was the President rather than Sir Winston who drafted most of the lofty sentiments of the "Potomac Charter," and although he expressed his own qualified belief in "co-existence" at his press conference, there are few indications that Sir Winston has persuaded Mr Eisenhower that his foreign policy would show a more consistent appearance if he would exert and enforce his own judgment in this field. The babel of Administration voices was more high pitched than ever after Sir Winston left, and revealed in a matter of days the extent to which the glowing phrases of the charter and the communiqué were merely a high polish on a cracked surface. There is no evidence that the President has decided whether he will choose between his party and *Time* magazine (which now advances a more intellectual form of Knowlandism) on the one hand and his allies on the other.

But the raucous aftermath of the Prime Minister's visit was perhaps inevitable, and is connected with the most important reason why Americans listen to him so closely, his capacity for knowing now what they will be thinking two years hence. This Cassandra-like quality, of which he seems well aware, has made him content to risk unpopularity on what may be his last visit, just as he did in warning them of the Soviet menace at Fulton in 1946. The sharpness of the reaction to co-existence is primarily a tribute to his power to make Americans face unpleasant realities.

On the Right Farm Road

PRESIDENT EISENHOWER'S unexpected and striking success, probably to be repeated in the Senate, in obtaining from the House of Representatives a farm Bill that moves in the direction he wants, towards flexible instead of rigid supports for agricultural products, proves that progress can be achieved along the middle of the road, in spite of Congress. It also provides a text-book lesson, which it is to be hoped the President will not forget, of the political methods by which such progress can be achieved.

From the moment when the request for new farm legislation went to Congress, the President and his Secretary of Agriculture both refused to be pushed even an inch away from the principle that high and fixed price supports are responsible for the present overproduction of farm commodities, which is imposing an unbearable burden of agricultural surpluses on the country, and that the only remedy is a flexible price system which would permit the level of supports to fall or rise with supply and demand.

When both the House and Senate committees insisted on the maintenance of supports at 90 per cent of parity—the price which is supposed to ensure the farmer a fair return for what he sells in terms of what he buys—the Administration brought indirect pressure to bear on Congress, by going on the air to put the government case directly to taxpayers and housewives, and direct pressure by reminding Republican members that, if they wanted the President's help in the election, they had better give him their help now.

On the ground thus prepared, as the Bill came to a vote in the House, the Administration threw a compromise offer; flexible price supports for the basic crops ranging from 90 per cent down to only 82½, instead of 75, per cent of parity would be accepted, but if Congress insisted on 90, and only 90, the Bill would be vetoed. This reminded representatives of wool-growing and dairying states that they might lose the special benefits the Bill contains for them, and representatives of all farm areas that a veto, leaving existing legislation in force, would mean an even sharper fall in price supports next year than the President proposes.

These clever political tactics chipped enough pieces off the farm block, never as solid as it seems, to give the President's compromise a satisfactory majority. Meanwhile, however, the parity ratio, the statistical expression of the farmer's purchasing power, is lower than it has been for thirteen years, and provides impressive evidence for the angry arguments of the congressional farm leaders; they maintain that the farmer has suffered enough recently and that the President is jeopardising the prosperity of the whole country by weakening the support given to the most vulnerable section of the economy.

Banana Split

IF the Department of Justice were concerned with psychological warfare, it would be being congratulated on the timing of its anti-trust suit against the United Fruit Company. For this firm, through the ramifications of the banana trade which is its main interest, has become the largest single investor in the seven Central American republics and exercises a dominant influence on their economies. This monopoly has thus become the symbol of "Yankee imperialism," and the Communists who have been infiltrating the area from Guatemala have made the company the focus of the anti-American feeling that they have been fostering.

When the United States played an open, even if not active, part in the Guatemalan revolution, there was a natural tendency in Latin America to believe that the State Department was concerned not so much with saving the western hemisphere from Communism as with saving the United Fruit Company from expropriation. The Department of Justice's attempt to split up the company, coming just as the revolution was settled in a satisfactorily anti-Communist way, should provide an antidote to these suspicions. It may be more effective from a propaganda point of view even than the medical supplies which were rushed to the support of the new government in Guatemala over the Fourth of July holiday, or the increased technical aid for Latin America which is being proposed in the Senate in order to "solidify anti-Communist gains."

One of the United Fruit Company's replies to the anti-trust charges is that it, a private investor doing its duty with educational, labour, health and welfare programmes, has been far more active than has the US government in attacking poverty, developing prosperity, and thus countering Communism, in Central America. Justified as are these claims, and adequately as they answer accusations that the company is exploiting the "banana republics," they have little relevance to the Department of Justice's case. This, in effect outlining the basic causes of Central American resentment against United Fruit, is that for nearly twenty years the company has imported two-thirds of the bananas brought into the United States, that it has obtained control of nearly all the banana growing land in seven countries, and of the transport facilities, on land and sea, used in marketing bananas, that it has driven competitors out of business by price cutting and coerced customers by threatening to withdraw supplies. This integrated system of operation, the company argues, is necessary as an insurance against local conditions, whether meteorological or political, which might interfere with the steady supply of bananas upon which distributors insist.

Political Dividends

IN giving the President a second large and welcome instalment of his legislative programme—approval of the tax Bill already passed by the House—the Senate executed manœuvres even more confusing than those of the House on the farm legislation. Most of the 900-page Bill, the first general tax reform measure since the beginning of the century, is too technical to make partisan issues, or even controversies for anyone but experts. But one clause, providing for tax reliefs on dividend payments, more than makes up for the lack of political interest elsewhere. Designed to reduce double taxation on corporate profits and shareholders' incomes, this clause is intended to encourage investment and is the Republican method of ensuring that the national economy will go on expanding. A more immediately effective way of doing that would be to reduce the taxes paid by lower income groups, according to the Democrats; they maintain that the real inspiration of the dividend proposal is the Republican desire to favour the wealthy and the business man rather than the wage-earner.

The Democrats were narrowly defeated on this question in the House and by the time the Bill reached the Senate floor the economic situation was so much improved that the argument for quick income tax reliefs to encourage consumer spending was weakened. But by that time also the November elections were nearer and the argument for doing something for the average voter was strengthened. Many Republican Senators felt that they dare not oppose the Democratic attempt to exempt more income from taxation unless their own party offered some alternative concession. Senator Millikin came to the rescue with an amendment borrowed from an earlier Democratic proposal. He offered a small income tax concession to most taxpayers and offset the consequent loss of revenue by a reduction in the suggested tax reliefs on dividend income.

In the end both income tax amendments were defeated, but so was all except a small fraction—exemption from taxation of the first $50 of all dividend income—of the original dividend relief proposals. As a result members of both parties will now be able to tell the electorate that they did their unsuccessful best to get income taxes reduced, and the Treasury is left with the prospect of more revenue than it asked for. However, some, if not all, of the dividend tax reliefs are likely to be restored by the representatives of the House and the Senate who must now agree on the hundreds of variations in the two versions of the Bill.

Short-Circuiting McCarthy

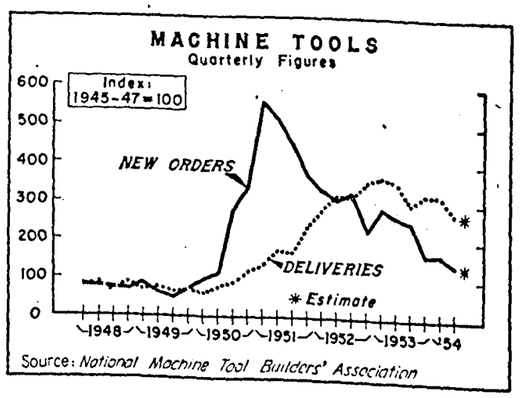
AT first sight it would seem unlikely that anything constructive could come out of hearings on the various proposals for improved procedures for congressional committees, since these hearings are being held by Senator Jenner, one of Senator McCarthy's closest sympathisers, sitting frequently as a one-man committee, one of the practices which the new proposals are designed to check. Nevertheless, the chances are better than they were a few weeks ago that the Senate may at this session adopt a new code that may even, unlike its predecessors, prove effective.

For the nine reforms which have not only been unanimously approved, but also recommended for early consideration in the Senate, by the Republican Policy Committee would be mandatory.

Previously the application of such rules has been left to the discretion of committee chairmen and this is the first time that the Policy Committee has put its weight behind mandatory proposals. This unusual willingness to yield to the pressure for reforming congressional investigatory procedures—something which only Congress itself can undertake—is further evidence of the growing strength of that pressure, which has resulted from the public reaction to the recent display of Senator McCarthy's methods on television, and of the growing belief among Republicans that they will reap more political profits next November from curbing Mr McCarthy than from encouraging him.

The Senator himself has been in hiding since the end of the hearings on his dispute with the Army, but it has been generally expected that he would return to the limelight with a renewal of his attack on the highly secret Central Intelligence Agency, which was blocked last year by the firmness of its head, Mr Allen Dulles, the Secretary of State's brother. This latest attempt to investigate Communist infiltration into the agency is being hampered by the refusal of the Department of Defence to give a security clearance to two of the Senator's more notorious investigators. Now the Hoover Commission on the reorganisation of the government has taken the initiative from him by choosing this moment—unintentionally, it is claimed—to appoint a "task force," headed by General Mark Clark, to study the structure and administration of the CIA. Senator Mansfield, reflecting the not entirely unjustified concern at the almost complete lack of congressional supervision of the agency, has also suggested that there should be a Joint Congressional Committee on Central Intelligence, comparable to the one on Atomic Energy.

Who Wants Machine Tools?



New York

THE makers of machine tools, who produced more last year than at any time since American industry "tooled-up" for the second world war, are now deeply concerned at the diminishing flow of new orders for these mechanised essentials of mass production. Since schedules and deliveries of these machines that make machines have been maintained at rates only slightly below those of last year, the backlog of unfilled orders has shrunk from the equivalent of over 7½ months' output a year ago to well under 4 months' today, and this sharp fall is expected to continue.

The main reason for the decline in new orders is the virtual withdrawal of the government as a buyer of machine tools. Unless there is a major change of policy, the Defence Department's requirements, except for replacements and spare parts, are now largely filled. A special appropriation of $250 million for the production and stockpiling, as a wartime reserve, of the "elephant tools" which take a year or more to build was made by Congress last year, but not used. This year the department has been allowed only $100 million, and much of that is to be spent on the construction of special storehouses rather than on the tools.

The industry has, therefore, now to rely on the civilian market, which, although still active, does not take the place of the government orders. Civilian users, also, have now completed most of their big tooling programmes, or have at least had the tools for them on order for some months.

More intensive competition between firms in the big machine tool-using industries, of which the automobile makers provide the most striking example, has encouraged them to buy new tools in order to cut costs. This demand is not for standard single-job machine tools, but for large and complex multiple-function tools designed individually for automatic "pushbutton" operations. Therefore, while most of the makers of these special tools have enough orders to maintain full production until well into 1955, the standard tool makers, who comprise the greater part of the industry, can in many cases already fill new orders out of stock, and are now anxiously searching for new markets.

One solution, already being widely adopted by the standard tool makers, is to go into the production of "specials" themselves. Some assistance is looked for from the accelerated depreciation allowances in the new tax Bill which, it is hoped, will stimulate orders for machine tools. Optimistic machine tool builders can also point to the high proportion of obsolescent tools still in use and in need of replacement. According to a survey made by the *American Machinist*, more than a million machine tools, or over 55 per cent of all machine tools installed in American factories, are over ten years old; nearly 20 per cent are over twenty years old.

Repairing the Slums

FROM A SPECIAL CORRESPONDENT

THE deadlock between the two Houses of Congress over President Eisenhower's Housing Bill, which arose mainly over the question of continuing even his small-scale public housing programme, draws attention to the slums which are the greatest blot on the American standard of living. The 1950 housing census revealed that, of the 39 million dwellings (excluding farms) in the United States, 7.4 million have no private flush toilet, 8.3 million have no bath, and 2 million are overcrowded on a definition (more than 1½ persons to a room) that is, by English standards, not at all stringent. It is generally accepted

that a third of America's dwellings are sub-standard, and that perhaps five million are slums. Some of these slums are far worse than anything that exists in Great Britain.

Bad housing is, however, only the worst aspect of the broader problem of urban blight. As in Britain, the early impact of industrialisation has left its grimy mark on the face of American cities, while the rate of urban growth has been still faster and the pace of land speculation more feverish. Most of those who can have fled the rotting central areas, taking their taxable capacity with them to the haven of separate municipalities beyond the city boundary. They have left behind in many big cities a formidable legacy of civic inefficiency and bankruptcy. These problems are now slowly being tackled, but their existence has confirmed the old American belief which identifies the city with vice, the country (and now the suburb) with virtue.

This urban decay has spread over broad areas. In Chicago, for example, 22 square miles are classified as blighted, and a further 56 square miles are "conservation areas"—that is, areas in which the authorities (or some of them) are fighting hard to prevent the decay growing. The influx of many thousands of Negroes, lured from the rural South by plentiful work and high wages, has added to the social problems and caused ugly undertones of racial conflict. But new Cadillacs stand in the main streets amid the uncollected rubbish; and in the slatternly wooden houses the inevitable television sets and refrigerators testify to the reality of American prosperity.

From New Deal days on, there has been no lack of federal action in the housing field; but it has been action designed primarily to protect and encourage the vast market for home ownership and has been based on a partnership between the federal government and the lending institutions. The principle of this partnership to date has been that the government has taken most of the risk (by insuring mortgages and advancing loans on generous terms), while private lending and loan associations have made steady profits. The government is undoubtedly in housing to stay, and the heated debate now raging concerns only the proper limits of its role.

*

Federal backing has certainly had an enormous effect on private housing activity, although the opportunity of insisting on high standards of design and lay-out has not been taken. But it has done nothing for that large section of Americans who, even on a generous mortgage basis, cannot afford to buy a home of their own. Houses have been going up at the rate of about 1.2 million a year, which is slightly more per head of population than the rate of building in Britain. But it has been estimated that in order to clear the slums within twenty years, as well as to provide for a rapidly growing population, the annual rate should be at least two million houses.

The attack on urban blight and slums has been a separate and much smaller part of the federal housing programme and progress has been slow because of the strong opposition of the real estate lobby in Congress.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK

Head Office: **Pine Street corner of Nassau, New York**

Incorporated with Limited Liability under the Laws of the U.S.A.

STATEMENT OF CONDITION, JUNE 30, 1954

Federal action in this field has passed through two phases and is now entering a third. The first phase, launched with enthusiasm in the heyday of the New Deal, was that of public housing loosely linked with slum clearance. But congressional and public suspicions of this "socialistic" device kept this programme throughout to a small scale. In 1949 President Truman called for 135,000 public housing units a year, but Congress never allowed funds for more than 35,000. President Eisenhower, bowing to a stiff Republican breeze, has asked for a continuation of this annual figure of 35,000, but he is not likely in fact to get even as many as that.

This represents about 3 per cent of total housing construction and cannot make much of a dent on the slum problem. Moreover, there is a stiff eligibility test for public housing in that a tenant's income must not exceed five times his rent; by contrast the average occupant of an English council house pays less than a tenth of his income in rent and rates. There are many American families too rich for public housing but still too poor to buy their own home. There are only a few public schemes, such as the unsubsidised "middle-income" projects of the New York Housing Authority, which cater for this group.

*

The second phase of federal action came with Title I of the 1949 Housing Act. This was an interesting compromise between the social reformers and real estate interests, both groups hoping to turn it to their own purpose. It provided for federal loans and grants to cover two-thirds of the loss on local schemes for the rehabilitation of "blighted" areas. The local authority was to carry out the unprofitable functions of assembling, clearing, and laying out the land, while the actual redevelopment would normally be done by private enterprise. In this way both the slums would be cleared and business would be stimulated.

This policy has been more successful from a business than from a social angle. Many slums have been replaced with glossy commercial or industrial premises or with middle-class housing, such as Stuyvesant Town in New York. In theory, a redevelopment project can be used to promote public or low-cost housing. But in practice this has hardly occurred, partly because of high site costs and partly because of the antipathy frequently existing between the separate local agencies responsible by law for public housing and urban redevelopment. The former is sometimes the preserve of social reformers, the latter has tended to be dominated by business groups.

The weakness of Title I schemes has been that they have shifted rather than eliminated the areas of urban blight. The Act does impose a duty to make some provision for the needs of the displaced inhabitants—an obligation that has been variously discharged and has often slowed up progress. But virtually none of the redevelopment schemes has brought any addition to the stock of low-income housing. The slum dwellers have moved elsewhere to add to the overcrowding of other areas. The programme's epitaph may be that it has produced small islands of grandeur in a swelling sea of urban decay.

A third phase in federal policy is now starting. The scientific case worker, dealing with the deserving poor, used to describe the final phase of her activity as "total social treatment." The Republican Housing Administrator, Mr Cole, is putting his trust in the similar concept of "total urban renewal."

A prime part of the treatment will be to coerce or persuade private owners to put their dwellings in decent condition. A whole armoury of local weapons, such as health and building regulations and zoning laws, can be brought to bear on a recalcitrant owner. The difficulties are to achieve the necessary co-ordination among the various city departments and to persuade the local public to accept the need for drastic action. That this policy can be effective is shown by the example of Baltimore, which has codified its laws, unified their enforcement, brought out violations by large-scale searches and hailed offenders before a special housing court.

Mr Cole hopes to persuade other cities to follow this example by making efficient local action a condition of federal aid. The new Bill provides that federal assistance shall be available towards the whole costs of an "urban renewal" project; and it offers federal mortgage insurance on favourable terms for the rebuilding or renovation of houses in renewal areas. It remains doubtful whether these variants of "make do and mend" will add up to a successful policy or will enable the government, as President Eisenhower hopes, to get out of public housing activity altogether. But at least the new proposals have a business-like air and will lay, for the time at least, the spectre of a large-scale programme of public housing.

SHORTER NOTES

On further consideration the steel companies have calculated that the combined cost of the increases in wages and pension and social insurance benefits granted to the trade union last week will be at least 9 cents an hour and for some firms as much as 12 cents. Nevertheless, the rise in steel prices is being held down to $3 a ton, not enough to cover the full increase in costs, in the interests of steel consumers. Most producers of durable goods are expected to absorb this increase, rather than to try to pass it on to their customers, who are showing a marked reluctance to buy even at present prices.

*

The Phillips Petroleum Company has appealed to the Supreme Court to reconsider its decision subjecting natural gas producers and gatherers to regulation by the Federal Power Commission. The Phillips petition complains that the interpretation of the Natural Gas Act adopted by the majority of the Court suggests a "sweeping extension" of federal control, more than fifteen years after the passage of the Act, to a whole industry not hitherto subject to regulation by the federal government and into an area formerly occupied solely by the states.

*

New York City plans to raise about $17 million of its $1.6 billion budget from a five per cent tax on the amusement business. The Bill authorising the new tax on admissions became effective on July 1st, in spite of the violent protests of the Motion Picture Operators and the Association of Theatre and Stage Employees against this dashing of the hopes recently raised by the reduction in the federal excise tax on entertainments.

The World Overseas

Italy Between Left and Right

FROM OUR ROME CORRESPONDENT

CALCULATED in purely parliamentary terms, the Italian government's position has recently improved. The secessionist group of Lauro Monarchists has raised its majority above the danger line, and the orthodox Monarchists, conscious of their decline in the country, can no longer be counted as a vital opposition force.

Yet one has only to look a little beyond these tactical considerations to realise that this very accession of strength has merely sharpened the divergences inside the government and, more particularly, within the main party in power, the Christian Democrats. This party has never been able to make up its mind whether its central plank should be that of defending the interests of the small group of wealthy industrialists and landowners who control practically all the levers of power in Italy, or that of pressing a programme of economic reform which would raise the deplorably low standard of both living and productivity; if this were done, it might transform what is in effect a highly authoritarian state, where the average man is a subject rather than a citizen, into something more truly resembling an Anglo-Saxon or Scandinavian democracy.

Hitherto, Signor De Gasperi, in spite of praiseworthy attempts to temper the wind, has maintained intact the existing social and economic structure. The inevitable answer has been a steady increase in the forces of the extreme Left. At the Naples Congress of the Christian Democrat party which is just over, he took his leave as leader, in fact if not in name. Discouraged and sad, he must have realised that something had gone astray with the programme which he had so obviously believed was inspired and infallible. He can now, as one observer unkindly put it, write his memoirs.

Left Formula, Right Fact

His successor, Signor Fanfani, belongs to a new and more flexible generation. He realises clearly enough the nature and extent of the problems to be tackled if the present profound crisis is to be overcome, and he has identified himself in the public mind with a vigorous programme of reforms. Whether he will be able to carry them out is another matter. But the need has never been more urgent. For the fact is that the left-wing programme usually associated with the government is now no more than a formula. The right wing has secured the acceptance of its views to the extent that there will be no attempt by the government to control the monopolistic interests which run Italian industry—under the curious arrangement by which industry pockets the profits and the State meets any loss. A ten-year plan is being elaborated, not on economic but on largely political principles, and it will be financed through the European Payments Union, with American backing; but though it may help to modernise industry, it will not have much effect in inducing industrialists to step up production and accept a lower margin of profit.

The only hopeful economic development is that the door will be open to foreign capital, which will receive government guarantees; foreign firms will probably soon be able to compete in the fields, such as oil, which are controlled by the government. The curtain of silence which has hitherto been drawn over the activities of the American Gulf Company and the Anglo-Iranian Oil Company, which have been successful in finding oil in Sicily owing to the enlightened policy of the Sicilian regional government, has now been raised, and there seems every prospect that American oil firms will start to exploit the rich deposits which are believed to exist in Italy proper.

Minister with Tied Hands

In agriculture, the trend is away from the broad, fairly long-term schemes of the *Cassa del Mezzogiorno*. The actual expenditure of the *Cassa* is now down to a tenth of what it was at the electoral period last year. The main schemes left to it are of a semi-industrial kind—roads, railways, irrigation and freezing plants. Agricultural reform is marking time. The hands of the present Minister of Agriculture are firmly tied by the party. In the field of land improvement (as opposed to land reform), the emphasis is now placed on the landowners' associations and not on government representatives.

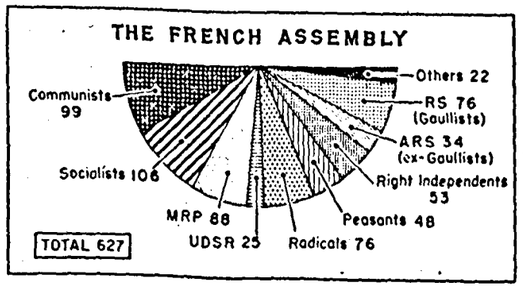
This policy has been accepted in exchange for certain concessions made by the Right concerning leases between tenant farmers and sharecroppers and the owners. On the insistence of the Social Democrats, the policy of intensive long-term investment in concentrated areas has been replaced by one of palliatives, a trickle of small dispersed schemes designed to give work and produce electoral advantages.

The prospect is a distressing one. Italy is back to the old technique of mutual compromises and no coherent policy—of "immobilism" in fact. The trends of the various factions within the Christian Democrat party do not really

correspond to any basic interests in the country. Altogether, one has the impression of a vacuum. The younger leftish Christian Democrats are still bewildered by the switch in Vatican policy about three months ago, and confusion has been made worse confounded by the probable resignation, on grounds not it is believed connected with politics, of Signor Gedda, the right-wing head of the Catholic Action.

From all this confusion, the Communists will be the main gainers. Except for a violent agricultural strike in Ferrara, they are lying low, confident that the situation is working strongly in their favour. The odds are that they will work up agitation towards the end of August, when there is great seasonal unemployment in Italy. It may well be that disorder reaches a pitch at which a strong government will have to take over. Rumours of such a possibility are now again circulating after a four months' silence.

The Scelba government, in spite of its shortcomings, has indeed made a better showing than was hoped for, but it rests on a perpetual ambiguity. Instead of representing a leftish policy based on the alliance of the Christian Democrats with the three small lay parties, it is now entangled in a morass of conflicting formulas and policies. But there seems no alternative in sight and it will presumably go on under the twin impulses of opposition to the Communists and effective support from the Right. If it can hold out till October, there will be no new election till next May. The internal situation in Italy is such, however, that the lack of enthusiasm and direction, the internal vacuum, corruption and half-hearted reformism seems more likely than ever to bring about an eventual explosion. When it comes, it will almost certainly be shattering and sudden.



EDC and the French Party Puzzle

FOR months all the blueprints for the European Defence Community have had to be kept in drawers because of the reluctance of the French Assembly to put a debate on the ratification of the treaty on its agenda. M. Mendès-France has now promised to precipitate events, and talks have already begun between the French partisans of EDC and those of its opponents who are not against any form of German rearmament. This attempt by M. Mendès-France to seek a compromise solution has met with a strong rebuff from Dr Adenauer, who has faced France with a clear choice—EDC or a national German army. Will France accept the treaty after all, or will all the western plans have to be revised because of the French veto?

It is no easy task to estimate the balance of French parliamentary forces in this battle of EDC. Much will depend on its timing, on what government may then be in power, on the temper of the Assembly and the general international situation. The calculations that follow must, therefore, be considered tentative. An additional difficulty is that the troops are not divided into two clear camps. The partisans of EDC rightly point out that, even if they were defeated, this would not mean that there is agreement among their opponents on an alternative solution. Indeed, the deputies can be broadly divided into three groups, none of them capable at this stage of mustering an absolute majority. At one extreme stand the supporters of European integration and of the defence treaty in its present form; at the other, the opponents of all German rearmament; in between are those who would accept a unified army but not one of a supranational character. The strength of this last group is hard to determine because, while the treaty itself has been hotly discussed for many months, the attitude of deputies towards alternative proposals is not yet quite clear; hence the size of the group is best gauged by a process of elimination.

The camp opposed to Germany's rearmament is obviously centred on the disciplined Communist contingent. But it also embraces about forty deputies from the extreme nationalist wings of the Gaullists, the Radicals and the Independents. Logically, the Socialist "rebels"—about half the parliamentary group, determined to defy the party whip that calls for support of EDC—should be included among this extreme group, although they have never made their position absolutely clear and some of them could probably be brought to accept a compromise. Yet, even if the Socialist waverers are included, this group can mobilise at the utmost only 200 votes.

The MRP is the only party entirely committed to EDC, but it would probably be backed by about half the deputies from the Radical and the UDSR groups; by between half and two-thirds of the conservatives (Independents and Peasants) and by those Socialists who are faithful to party discipline. Adding to these some 10 to 20 Gaullist votes,

the partisans of the treaty could muster between 260 and 290 votes, which would not suffice to carry it through.

German rearmament within Nato or within a vague European framework lacking a supranational authority finds the hard core of its support among the former members of the Gaullist Rally. These are backed by about half the Conservatives and a dozen Radicals; altogether no more than some 170 votes.

Compromise by Clipping?

Thus, none of the groups commands enough votes to assert its wishes, and herein lies the dilemma. To enable the Assembly to vote for German rearmament uncapped by a supranational European authority, the MRP and the Socialists would have to make an unthinkable *volte-face*. For EDC to be accepted in its present form, all the Socialist rebels would have to submit, carrying along with them the anti-EDC Radicals, which is hardly more likely. Indeed, successive Socialist congresses have merely proved that the whips are of no avail against so many recalcitrant deputies, headed by the most famous names in the party, and at last week's congress it was noticeable that most delegates welcomed M. Mendès-France's search for a compromise as a heaven-sent opportunity to avoid a fatal split within the party.

The deadlock thus reached explains the lines on which M. Mendès-France has set out in his search for a big majority. Since those who are resigned to German rearmament cannot agree on either of the existing solutions, compromise is being sought not by suppressing, but by clipping, at least temporarily, the supranational character of the treaty. Thus, for example, the unanimity rule in the Commissariat could be extended to, say, five years; and so could the transitional period during which a national delegate would supervise the preparatory stages of integration. A temporising formula along these lines has been advanced by the new French state secretary for foreign affairs, M. Guérin de Beaumont, who has also advocated the right to contract out after ten years. Some such looser compromise solution is clearly envisaged by the new government, and it probably serves as a basis for discussion in the present government-sponsored negotiations.

Have these a chance of success? M. Mendès-France is faced in his project with the hostility not only of the MRP but also of the determined "Europeans" among his own Radical colleagues, such as M. René Mayer, the former premier. And even should he succeed in striking a bargain within the French parliament, his labours of conciliation are likely to be lost through the refusal of the other contracting parties to revise the treaty. Yet all the evidence indicates the inability of the French Assembly to answer yes to the treaty as it stands. The deputies are well aware of western impatience with their delaying tactics; but they are also conscious of France's strong bargaining position, of the havoc its veto would play, of the weakness of a rearmed Germany faced with hostility on its lines of communication to the west. Such tacit blackmail may be resented; but it would be naïve to prepare any plans on the assumption that the deadlock in the French Chamber will be overcome by stern words from abroad.

State Enterprise in Backward Areas

BY A CORRESPONDENT

AN important though little known conference took place in March this year at Rangoon, at which experts and administrators from many Asian, European, and Middle East countries debated the function of public enterprise in economic development; the Report issued after the meeting represents a salutary clearing of influential minds.

The conference had two aims. On the one hand it attempted to answer a universal question: How can managerial efficiency, and the flexible initiative ordinarily associated with commercial operations, be reconciled with public responsibility and the accountability of the administration to the legislature? Some difficult problems were fully aired: What are the proper functions, and how much power should the responsible minister have? What role in co-ordinating investment and price policies should the central financial authority play? How can healthy relations with the consuming public be maintained? The second aim was more specific. In most Asian countries—as in many others in Latin America and the Middle East—public enterprise has tasks to perform, and difficulties to face, which have no counterpart in the highly developed economies of the world. It has to serve as the main instrument, not merely of economic progress—let alone social justice—but of drastic economic transformation. It is through state enterprise, or not at all, that the Asian countries will be able to provide themselves with that strengthened economic infrastructure—transport, communications, power, public services and so on—on which the safeguarding of existing living standards for a growing population must depend.

No Talisman

At Rangoon agreement on this point was so unanimous that no discussion of it was needed. But the delegates had to face the fact that public enterprise is not cast for the job. For instance, of manufacturing industry should the state give a lead to manufacturing industry by establishing pilot factories? And if so how should the state firms be owned and managed? Should they be part of the Civil Service? or a public corporation? or a mixed enterprise in which the state and private directors sit on the boards? Should they be permanent or be hived off eventually to private ownership and management? What should be the relationship between state firms and the private businesses, which, it is hoped will spring up in the wake of their pioneering endeavours?

It emerged from the conference that western experience is often almost irrelevant to the solution of these problems, although it is useful if only to show that public ownership is inadequate as an all-powerful talisman and universal solvent of economic and social difficulties. The lessons, however, are essentially negative. The problem of central leadership in underdeveloped countries has to be worked out afresh.

The report of the conference contains much that is elementary for more highly developed countries, which, like Britain, have had considerable experience of nationalised industries. But the question of financing public enterprises, for instance, presents itself very differently in lands where subsistence production is still normal. Not only is there very little margin for saving and investment in these Asian countries, but the very habit of saving, has different ends. Hoarding and display, rather than ultimate production, is still a major preoccupation. Moreover, there is an absence of the machinery of investment such as exists in the West. It follows that in so far as development is financed from internal resources, savings must initially be collective, and enforced through taxation. Here, the report finds there is room for "a significant increase," while warning against recourse, except in special deflationary circumstances, to deficit financing.

Good Men Wanted

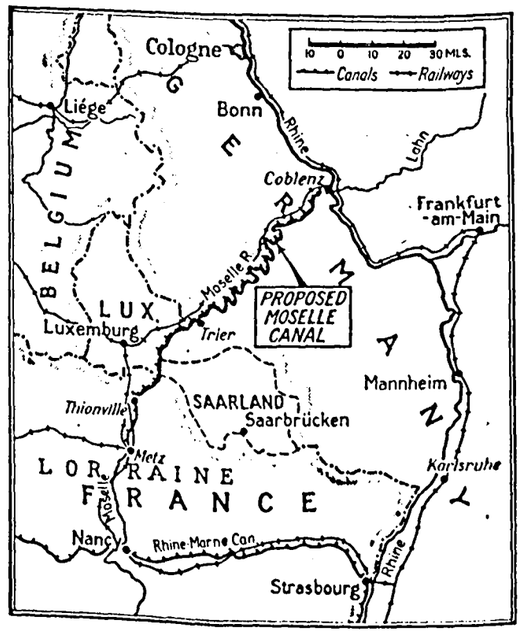
Willy-nilly the governments of these countries find themselves as capital-allocating agencies, financial entrepeneurs at the highest level. Accordingly the report devotes considerable space to the different kinds of institutions and devices that may be needed. It discusses, for instance, Pakistan's Industrial Development Corporation, which sponsors and underwrites the issue to private investors of company shares, a certain proportion of which are initially taken up by the central government, and the long-established National Development Company in the Philippines, which is primarily concerned with sponsoring new ventures. Another device discussed is the operating contract, where, for cost

plus a fixed management fee, an established private firm undertakes to manage a publicly owned enterprise; an example is the Burma oil agreement. The report concludes, in this connection, "that new techniques need to be developed for supervising this type of contract."

Perhaps the gravest handicap to healthy growth in these countries is the difficulty of recruiting first-class administrators, managers and technicians. This shortage can hardly be remedied in a hurry. Such expedients as recruitment of foreign technicians and managers on long or short term contracts, the apprenticeship of students in industrialised countries, the establishment of vocational training centres and institutes of management, the International Labour Office's training-within-industry scheme, Point Four and Technical Assistance, together with the insistence that foreign firms cooperate in training native-born talent, will, in time, remedy the shortage. Meanwhile, however, the lack of intermediate, as well as top-grade managers, calls for particular restraint in the face of temptation to build intricately constructed economic empires.

To recognise these difficulties is not to solve them. But the Rangoon Conference, in the opinion of observers, will prove to have been useful beyond its initial value as a means of exchanging views and experience. It may, as the Indian Ambassador suggested, lead to the continued cooperation of expert consultants on public enterprise in developed no less than in under-developed countries. It has at least spread among a wide circle of the educated Asian public a politically valuable appreciation of what public enterprise can—and cannot—do.

Canalising the Moselle



FROM A CORRESPONDENT

PLANS for canalising the River Moselle have been discussed off and on in Europe ever since the Congress of Vienna. The Moselle is the largest of the tributaries of the Rhine, yet it is the only one which has not been canalised. The problem with the Moselle has always been that it flows through so many different countries. Of the 167-mile stretch involved in the present plan, from Thionville in Lorraine to its junction with the Rhine at Coblenz, 120 miles of the Moselle flow in Germany, 20 miles form the Luxemburg-German frontier, 8 more the Saar-Luxemburg frontier, and the remaining 19 miles are in France. The canalisation project, though undeniably practicable and desirable, has always been at the mercy of international politics.

Technically the operation today presents little difficulty. The construction of a canal in the true sense does not arise. The work involves some dredging of the bed of the Moselle and the construction of a number of barrages which would maintain a depth of water sufficient to make the river navigable to 1,500-ton Rhine barges at all seasons of the year (at present 300-ton barges can use the river from Epinal to Thionville). This work would take four to five years to complete and at an estimated cost of about £40 million. It is proposed to create an international company known as the "European Moselle Company" to carry out the project.

An important aspect of the plan is the provision of hydro-electric power. Thirteen barrages are envisaged, calculated to produce 750 million kilowatt-hours of electricity per year, with an estimated value of £27 million. Since the project has in addition the great merit of increasing the navigability of the river, it is clear that, from a strictly economic viewpoint, it represents an unusually profitable investment.

That the project has again been revived is due to the progress made over the last fifty years in technical understanding of the problems involved. Before the turn of the

century, it was possible to construct only low barrages, and the great number of these required (about 40) made the cost prohibitive. The invention after the first world war of high dams with metallic floodgates made it possible to draw hydro-electric power from the river, and this changed the whole economic aspect of the plan. During the inter-war period a small amount of canalisation was done by the French; the river was canalised so that 300-ton barges could move from Metz to Thionville, but as for the lower stretches of the river nothing could be done while France and Germany were at loggerheads. During the second world war the Germans put the work in hand at a high priority immediately after their occupation of the whole area in 1940. The work on the barrage at Coblenz was started in 1942.

After the war the new enthusiasm for European unity raised the Moselle plan to greater eminence. Today the main opposition comes from entrenched economic interests. Some are alarmed at the prospective large reduction in transport costs, which will benefit the Lorraine ore fields and steel industry. The estimated reductions are indeed remarkable. It is calculated that the opening of the Moselle route to heavy barges would save 50 per cent of the cost of transporting Lorraine ore to the Ruhr, 65 per cent of the cost of getting Lorraine flat-rolled steel to Rotterdam

(*Continued on page 127*)

(*Continued from page 126*)

or Antwerp, and 46 per cent of the cost of bringing Ruhr coking coal to Lorraine. Naturally feeling against the project is strong on the part of the German and Luxemburg railways, which have almost a monopoly of the existing traffic. There is opposition too in the Ruhr, which, although it produces ten times as much coal and twice as much steel as Lorraine, fears the latter's competition. And finally, although to a lesser degree, the port of Antwerp fears that the increased traffic through Coblenz will profit Rotterdam. None of these objections carry much weight, and where the Ruhr is concerned it can be argued that it would benefit by the cheaper Lorraine ore which is of better quality.

At present, the problem is considered as essentially one for direct settlement between France and Germany. France officially backs canalisation, and its implementation was in fact made a condition of French ratification of the European Coal-Steel Community Treaty in December, 1951. The French consider that German approval of the project would be a practical gesture of goodwill, and lack of German support for it has provided useful ammunition for French opponents of European integration. However, the weight of opposition in the Ruhr has so far prevented even Dr Adenauer from giving it his open blessing. The operation is essentially one to be done in a European context, very possibly with the Coal-Steel High Authority taking a hand. (There was some talk recently at Strasbourg of the plan coming under Article 54 of the Coal-Steel Treaty, as an investment). The general belief is that if the EDC is ratified and European integration goes forward, this long-dreamt-of plan will come to life. It is certainly now quite irrational that it should not do so. But there will be more opposition to it than that provided by the stony bottom of the Moselle.

Leadership in New China—IV

Culture and Propaganda

THE administration of a Communist state covers a much wider field than that of a liberal-democratic regime. It aspires to organise all human activities including the whole life of the mind. All expressions of thought and feeling must be "politicalised" and made into vehicles of propaganda in favour of the Marxist-Leninist ideology; and the population, particularly the young, must be insulated from any contamination by bourgeois, individualist, cosmopolitan or reactionary ideas.

When a Communist regime has lasted long enough, the whole people will have been brought up in Communist-controlled schools and universities; but when power has only recently been acquired, there is a division between the younger generation, whose minds can still be formed, and their elders who, even if sympathetic to the revolution, grew up in a world with different mental assumptions. Direct indoctrination can be applied to the former, but if the support of the latter is sought they must be approached through propaganda suited to their habits of mind; and for this purpose the services of fellow-travelling publicists, writers and artists are specially valuable to the party.

The most prominent "cultural" figure in the Chinese People's Republic is Kuo Mo-jo, who is not formally a Communist party member, but has a position of such influence that he is popularly described as the "Cultural Premier" of China. Born in Szechwan in 1892, he was originally educated for the medical profession and graduated at a university in Japan, but preferred to follow a literary career, and in 1922 became the centre of a group of writers stirred by revolutionary ideas who called themselves the "Creation Society." Poet, essayist, literary critic, historian and archæologist, Kuo Mo-jo has always been a versatile and prolific writer, his work deeply influenced by Marxism and expressing strong anti-Western sentiments. He visited the Soviet Union in 1945, and the victory of the Communists brought him to the top of the tree. He is the president of the Academia Sinica (a number of whose former members have created a rival body in Formosa), chairman of the Culture and Education Committee of the Government Administrative Council, chairman of the All-China Federation of Literary and Art Circles, chairman of the China Peace Committee (affiliated to the World Peace Congress), vice-chairman of the Sino-Soviet Friendship Association (of which Liu Shao-ch'i is Chairman) and the winner of a Stalin Peace Prize.

Diaries for Inspection

In spite of Kuo Mo-jo's public eminence, he is for the outsiders rather than for the Communist party members themselves, who have Mao Tse-tung and Liu Shao-ch'i as their intellectual guides and must take their medicine undiluted. On the administrative side the party's control is exerted particularly through the Ministry of Higher Education under Ma Hsu-lun, the Ministry of Culture under Shen Yen-ping and the Ministry of Publications under Hu Yu-chih, Special attention is devoted to the universities, and it is in the field of higher education that the "brain-washing" techniques borrowed from the Soviet Union and improved by the Chinese are most in evidence. All university students are watched in order to discover their "thoughts" by party members among them who must continually report on them to the party; those whose attitude is unsatisfactory are transferred for special training and "mind reform" to a "People's Revolutionary University." They have to keep diaries for inspection, take part in "democratic discussion" and self-criticism meetings, submit to endless interrogations by "responsible party workers" and make public confessions of past errors and faults.

These methods applied over a period of time are usually effective, for it is extremely difficult to get by with mere outward conformity. Students who are still unreformed by a People's Revolutionary University are again transferred to a People's New Life Labour School, which is in fact a forced labour camp. The whole system, as described by young Chinese refugees who have been through the process, or some part of it, is highly organised and one of the main branches of party activity.

Stock Heroes and Villains

Under Shen Yen-ping's Ministry of Culture are the Central Drama Institute and the Central Institute of Fine Arts, two very important bodies, with abundant financial resources for mass propaganda. The latter, in conjunction

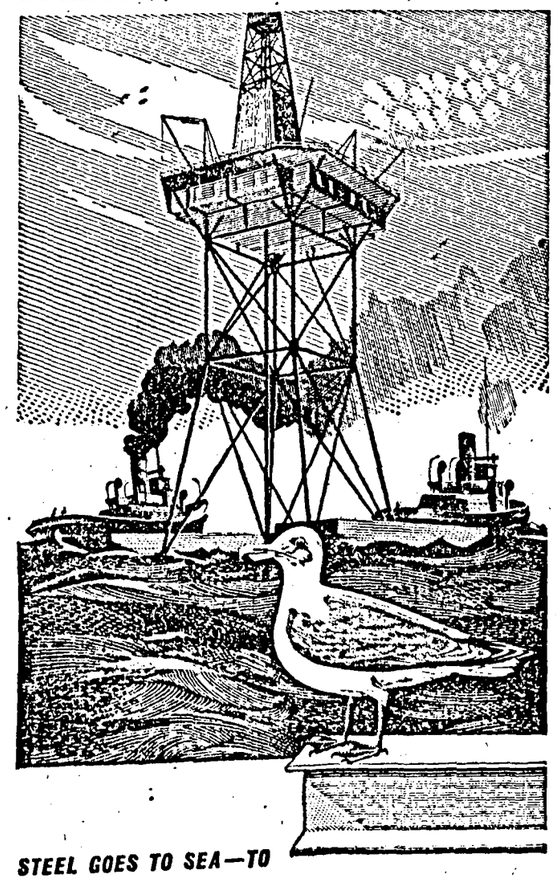
with the Communist party's Information Department headed by Lu Ting-yi, set up an "Anti-America-Aid-Korea" committee during the Korean war and brought out a "cartoon propaganda reference book" which was distributed all over China to inspire cartoons in newspapers, wall posters and so on. The Central Drama Institute similarly lays down themes and stock types of political heroes and villains to be used by actors and singers everywhere for propaganda purposes. Its nominal head is the most famous of Chinese actors, Mei Lan-fang, but behind the façade of such non-political personalities the Communist party closely controls all activity on the principle that "art is an important weapon in the ideological struggle."

Hu Yu-chih, the Minister of Publications, a former student of the Sorbonne and editor of a Chinese newspaper in Malaya, turns up again as a vice-chairman of the Chinese People's Institute of Foreign Affairs, the body which has issued the invitations to the British Labour party to send delegates to Peking this summer. This institute, of which Chou En-lai is honorary chairman, and the Chinese People's Society for Cultural Relations with Foreign Countries, which is under the patronage of Kuo Mo-jo and the China Peace Committee, are mainly composed of Chinese who have lived and studied abroad and are considered suitable for foreign contacts.

They are reinforced, in the projection of the new China for foreigners, by such well-known figures as Soong Ching-ling, the widow of Sun Yat-sen and sister of Madame Chiang Kai-shek who used to be such an influential hostess to foreigners in Chungking in the war years, and the romantic New Zealander Rewi Alley, who lives in China and has become one of the most lyrical eulogists of the Communist regime. In general, the Chinese Communists and fellow-travellers who can deal with non-Communist foreigners, and know what to say to them, are a specialised category, sharply divided from the great bulk of the party, including most of its higher leaders, who have never been outside China except perhaps to Russia. The foreign-educated and travelled are inevitably regarded with some suspicion and watched for signs of deviation, but they are very valuable to the party, and there has not yet been any great proscription which has made foreign contacts as such a dangerous liability, as they became in Russia in the great purge of 1936-38.

Big Ruhr and "Little Ruhr"

THE bogey of future American competition in steel export markets has long troubled the minds of Ruhr industrialists. They now have another worry. Among the inner circles there is increasing anxiety about the growth of the Soviet "Little Ruhr"—the coal-steel complex formed in the Moravska Ostrava coalfield of Czechoslovakia, Upper Silesia and the district between Krakow and Czestochowa. German technicians are well able to judge the nature of the threat from this quarter for the good reason that they were responsible for starting its development during the war. They know that the Upper Silesian coalfield is by nature easier to work than the Ruhr, and that the mines there and in the Moravska Ostrava area were modernised with the latest German equipment. Since the war they have kept themselves well informed about the synthetic oil plants, steelworks, and other enterprises that are rising in Poland with Russian technical aid and equipment, and when they put the facts together, they do not like the conclusions. Technical integration—the ideal of the Ruhr managers—has, they see, gone far in this particular Soviet satellite territory.



Some months ago the German head of the investment committee of the Coal-Steel Community in Luxemburg warned Ruhr industrialists about the way in which output in the "Little Ruhr" area was creeping up on the coal-steel union, and his words were repeated last week by another German authority. For the first time, it was pointed out, the Moravian-Upper Silesian-Polish heavy industrial complex is being exploited as one unit, under a single controlling hand. Its development is linked to the Soviet industrial plan, with the aim of creating a "combine" or vertical trust which will unite the iron ore of the southern Soviet Union with the coal and steel industry of the "Little Ruhr."

The figures which are bandied about in the Ruhr do not, however, bear examination. By including brown coal from the Soviet zone with hard coal, and by running the output of crude steel together with that of rolled products, planned output in the Soviet complex is made to appear much greater than that of the coal-steel community. This is misleading in view of the fact that total steel output in Eastern Europe is only about a third of that of the coal-steel union, and hard coal output about one-half.

New Plea for Trusts

The conclusion drawn by German industrialists is, naturally, that everything should be done to remove the "Little Ruhr" from the Soviet grip. But it is realised that no sound manager would plan his production on the assumption that this wish will be fulfilled, and more practical arguments are propounded. They are of two kinds. The first is that the German Ruhr must have a very large slice out of M. Monnet's American investment millions, and the second is that the Ruhr vertical trusts must be allowed to re-form in all cases where efficiency would be improved by rejoining steelworks to coalmines and processing plants. To back their arguments, Ruhr industrialists have for years past pointed to the vast size of American steel firms. Now the threat from the Soviet "Little Ruhr" is used as additional evidence that vertical trusts must be revived on a limited scale. There is no demand to reconstruct the whole unwieldly *Vereinigte Stahlwerke*; but the Allied Law 27, which prevented German steel firms from owning more than 75 per cent of the coal they need, is being challenged afresh by other concerns. The Allied High Commission, say the Germans, no longer have the power to enforce their law; that rests now with the High Authority in Luxemburg, and this body is being asked to allow some regrouping to take place in the interests of Western Europe.

STEEL GOES TO SEA—TO

SEARCH FOR COAL

BRITISH mining engineers will soon be boring for coal that lies under the sea.

A 170 foot high steel tower, which is an outcome of the wartime Maunsell sea-fort, is to be built, towed out to sea and lowered until its base rests on the sea-bed. The drilling crews will live and work on the deck of the tower, using a special rig capable of boring over half a mile into the bed of the sea. When one bore is completed the tower will be refloated and towed to the next location.

Much of Britain's future coal supply must come from under the sea. This is one of the ways in which steel is helping to ensure that supply. Last year approximately 600,000 tons of steel were used by the National Coal Board.

Travellers' Cheques at Home

Lloyds Bank Travellers' Cheques can be just as useful to you in this country as they are abroad. You can cash them at the branches of most Banks in the British Isles. Many hotels, restaurants and big London stores will accept them in payment of accounts. You can also pay fares with them at main railway stations. In fact, when travelling, you will find Lloyds Bank Travellers' Cheques more convenient than your own cheques and safer than cash.

A list of Agents in the British Isles with whom Lloyds Bank Travellers' Cheques are payable may be obtained from any branch of the Bank.

LLOYDS BANK LIMITED

USE ALL THE POWER YOU PAID FOR

Nothing put into petrol can give your engine more power than the maker originally built there. But you can use all the power he meant your car to have. The difference when you do is a revelation.

Shell with I·C·A has already worked this change in millions of cars. Many motorists have been surprised by the improvement. This is because they never realised how their cars were being held back by engine deposits, which cause pre-ignition and plug failure. The I·C·A in Shell—and Shell only—makes these deposits harmless: it prevents both pre-ignition and the plug failure. In these two ways it releases the engine's full smooth power.

SHELL WITH I·C·A

Try the two tankful test First fill up with Shell with I·C·A (Ignition Control Additive). Do not expect an immediate improvement, but Second fill up with Shell again. This will give I·C·A a chance to work on the deposits already in your cylinders. The time I·C·A takes to work varies from car to car. (It depends on the type of engine and the state it's in.) But you'll know when the process is finished, for you'll notice the improvement in your car.

IT'S A REVELATION

THE BUSINESS WORLD

Funding or Forcing Bid?

THE monetary authorities have been quick to capitalise the opportunity created for them in the gilt-edged market by the success of their cash-and-conversion operation of early June. One of the several striking features of that operation, it will be recalled, was its unexpected choice of target—a stock in the very earliest stage of its optional redemption period, instead of one of the large stocks that had to be repaid in any case in the near future. The £535 million of 1½ per cent Serial Funding Stock due on November 14th and the £735 million of 2½ per cent Exchequer Stock due in mid-February were both left for a later assault. Especially in view of their belief that the Electricity Authority cannot long delay its return to the market, most people deduced that the Treasury's next refinancing exercise would be deferred until the autumn. These expectations have now proved wide of the mark.

After the close of business on Monday last the Treasury announced an assault upon the Serial Funding Stock, by way of conversion into one or other of two contrasting new issues—a 9-10 year stock and one actually extending across the turn of the century. Until next Tuesday, holders of the Serial Funding Stock may exchange into an equal amount of new 2½ per cent Exchequer Stock, 1963-4, plus a cash payment of 10s. per cent or into a new 3½ per cent Funding Stock, 1999-2004, at the rate of £103 for each £100 of the maturing stock. Neither of the new issues is offered for cash.

The first part of this offer proved to be strictly tailored to the pattern produced in the market by last month's operation. The calling then of the National Defence Loan, 1954/58, and the simultaneous offer of a stock with a life scarcely exceeding four and a half years had immediately set in motion many major adjustments of the yield structure. Among these changes, as *The Economist* pointed out on June 5th, two were of outstanding importance. The shock caused by the assault on the 1954/8 stock at its earliest date provoked a general turning away from stocks with a relatively wide span of redemption dates, especially in the medium term section of the market. Secondly, holders of the 1954 Serial Funding Stock quickly drew the obvious deduction that, since a short bond had been unexpectedly offered in early summer, they dare not expect another short to be offered for the subsequent refinancing of their own maturities.

Many of these holders, fearing that the next replacement stock might even be as long as 15 years, thereupon started upon a feverish search for suitable alternatives of shorter life than that. The big banks, needless to say, were in the van of this movement, and at one point in the market échelon both processes acted together, and with maximum intensity. The stocks that felt the major buying impact were inevitably those having single or narrow redemption dates within ten years. But the supply of such stocks had been sorely depleted, so that the effect upon yields was violent.

This will be clearly seen by comparing the yields shown in the third and fourth columns of the accompanying table, which show the market scene as it was on the eve of each of the two operations. During this period of just over a month, while redemption yields on medium and long dated stocks and flat yields on irredeemables dropped by scarcely more than 1/32 per cent, those on the two stocks in the early 'sixties dropped by 3/16—¼ per cent. The redemption yield on the 3 per cent Exchequer stock, 1960, fell from £2 8s. 3d. to £2 4s. 9d., whilst that on the 3 per cent Exchequer stock, 1962-3, to the latest date fell from £2 15s. 6d. to £2 10s. 7d. per cent. The anxiety of the

banks and others to avoid a spread redemption date and also to keep within the ten-year range is strikingly demonstrated by the behaviour of the 1964-67 and the 1969 stocks; during this period their yields dropped by only about 1/16 per cent.

In their choice of a new nine to ten year stock, the authorities have aimed at the very centre of this concentrated demand. On the basis of prices ruling on the eve of the announcement, the indicated redemption yield on the 1963/64 stock was precisely the same as that offered by the existing 1962/63 stock. This is the measure of the further squeezing process that this operation involves. But, though the terms gave nothing whatever away, the banks and other institutional investors who need to keep their portfolios short can still count themselves fortunate—though there have been some wry grimaces among those institutional investors that had succeeded too well in switching out of their 1954 Funding stock and thus have no chips to take a stake in the new issue. This circumstance has produced a minor oddity; demand for the 1954 stock for the purpose of conversion into the 1963-64 stock has been so intense that it now yields a mere 1 per cent—appreciably less than the minimum rate for call money.

The adroitness of the tactics of the previous four weeks had made the success of this first half of the new offer a virtual certainty; and when dealings started on Wednesday in the "assented" funding stock the new stock was in effect already showing a substantial premium. There is no means of gauging how the £535 million of Serial Funding stock was spread among holders on the eve of the announcement. The discount market was known to have disposed of virtually the whole of its holdings and most of the remainder were understood to be shared between the banks and the "departments". The latter had undoubtedly taken in large lines in the previous two weeks, and a substantial part of these holdings will presumably be converted into the 9-10 year stock. A brisk business is likely to be transacted in it thereafter. In the event it will probably be found that a very substantial portion of the November maturity has been cleared out of the way.

★

For these several reasons, the City has no reservation in its approval of this side of the new operation. The results of official tactics since early June may not have been very comfortable for institutional investors, but no one questions the skill and soundness of the strategy. It has been otherwise, however, in City comments upon the second half of the conversion offer. This has caused much bewilderment in general, and not a little head-shaking among the few who think they discern in it the birth of a new and aggressive ambition.

The choice of a stock with a minimum life longer than the maximum life of any existing dated stock does, indeed, mark a radical departure. It is many years since any stock—Daltons alone excepted—has been issued with a possible life as long as fifty years. The funding stocks issued after World War I had, of course, very long maximum lives (41-71 years for the 4 per cent Funding, 1960-90, and 57 years for the 4 per cent Victory Loan, redeemable by drawings extending to 1976) and there was the well-known but small issue of Tithe Redemption stock, 1986-96, first issued in 1937. In recent years, the nearest approach to the new stock is made by the 30-40 year maximum life of Transport Stock, 1978-88, issued in 1948, and by the Gas Stock, 1990-95, issued in the following year. But these were nationalisation take-over stocks, not Treasury funding issues, and they afford no parallel to the present tactics. The contrast between the laborious funding process of the past two years, which has pushed slowly but surely up the line from 1957 to 1969, and the sudden wild leap to 2004 needs no emphasis. And there is the further oddity that this stock should have been offered solely to holders of a maturing issue most of which was more or less forced upon the banks and whose maximum life from the outset was no more than four years.

That very fact, however, provides an important clue to the authorities' intentions. Precisely because no

non-official holder of the Serial Funding Stock could conceivably contemplate switching into a 45-50 year stock, it is evident that all, or virtually all, of the conversion applications will come from the departments. If institutional investors are interested—and it has been suggested that certain types of pension trust funds may provide a modest demand—they are unlikely to participate via purchases of Serial Funding Stock, but will wait for resales by the government broker. The official tactics are odd, but their very oddity demonstrates that the authorities had not been cherishing the hope that a stock of this character could be floated by the orthodox direct appeal.

This permissible deduction from the known facts does, indeed, match the official intimation that the offer is intended to be no more than a "pilot" operation,

to discover how the wind blows among investors. Another test of this attitude will be the size of the issue; for if the authorities do not thus convert much of their Serial Funding Stock, it will be apparent that they do not look for any substantial offtake and are not intending to force the pace. But although these indications have been given, it is understandable that some City observers should have felt rather uneasy—if not about the official intentions as such, then about the risk that the speculatively-minded may misinterpret them. The gesture, even though only a "pilot" one, is evidently significant: it expresses a wish, if not an ambition. And it has been widely argued that if the authorities are determined to make such a stock "go"—and why should they not be so, if the issue is made at all?—other possibilities loom over the horizon. Notable among these, in this week's gossip in the market, is the approach to a refinancing of the £1,910 million of 3½ per cent War Loan (1952 or after). Speculative hopes have therefore begun to stir, affecting not only this stock (which rose by almost a full point in the three days) but also 4 per cent Consols (1957 or after), which rose by 1 1/16 and is now being treated by the optimists as the most promising "short" on the market.

The next few weeks will show which of these contrasting views is nearer the truth. The hopes of the optimists could not be realised without forcing tactics of a kind resembling the Dalton effort; and that, surely, would be unthinkable. Up to this moment, nothing whatever has been done in the official techniques of the past two years to justify any charge that the attitude has not been strictly circumspect. But if the Old Lady and her sister in Great George Street do not want to be misunderstood, they must now remember the precept for Caesar's wife.

Rayon Grows Rich

THE British rayon industry has just enjoyed a year of high prosperity. Both the major companies in the British market, Courtaulds and British Celanese, have earned bumper profits and announced free scrip issues. The industry can now look back on its struggles over half a century from a position of comfortable, if hard earned, affluence. Now highly respectable and deeply entrenched, the industry is just embarking on its second 50 years of life. The heart-break days for the rayon investor seem now to have changed into quiet, substantial, middle-aged progress. In retrospect the important fact remains that production continued to rise in an almost unbroken line and that, although many companies failed, to those that prospered capital was largely self-generated. Since 1913 when Courtaulds was formed with a capital of £2 million, £56 million of nominal capital (worth around £87 million on market values), has come from ploughed back profits.

Courtaulds' shareholders may feel that they have come into a small part of their inheritance this year. The total dividend, equivalent to 8 per cent on the present doubled capital, is more by one per cent than they had been led to expect, their further expectations must be tempered by the fact that the chairman has disclosed that he proposes to put into effect some time next year a co-partnership plan similar to that recently announced by Imperial Chemical Industries. This still secret plan has been under consideration since 1944, for affluent middle aged giants do not move hastily. By implication it must involve letting "all employees in the United Kingdom . . . provided they have the necessary qualifying service" into the equity of the company.

These things are done only by companies whose boards feel that they have reached a position of stability. Common sense says: (1) that the board would hesitate to make further readjustments of ranking capital for they would make nonsense of the arithmetic of the scheme; (2) that to reduce the present dividend would be a poor way of winning the loyalty of the workers. Common sense will ask three questions: (1) On what basis is it fair to let co-partnership start after shareholders have saved year after year to build up the assets of the company? (2) Should one now regard a worker's share in the equity as an inevitable addendum to wage rates and incumbent on a wealthy company anxious to keep abreast of the times? (3) Now that Courtaulds are to let the workers into the equity will the characteristic discretion about its affairs be modified? Even today, the shareholders can guess as they please. Does the giant own 70 per cent, even 75 per cent of the British rayon trade? How much smaller than Celanese is it on the acetate side?

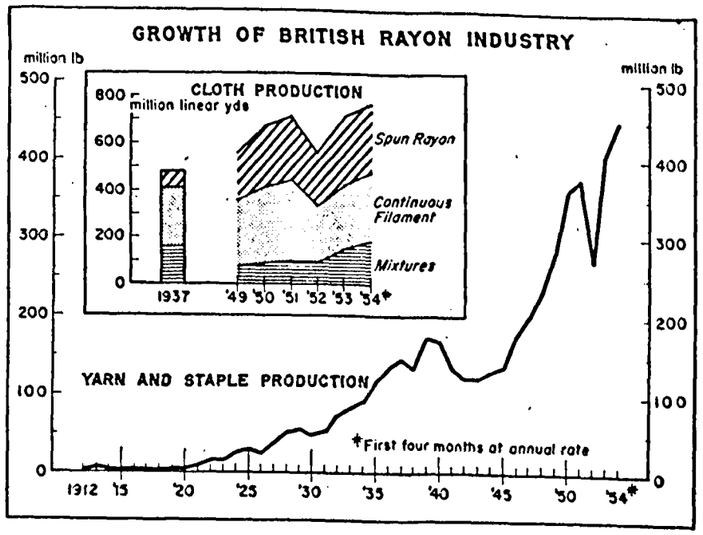
Source: Textile Organon. * Economist estimate.

Shareholders in Courtaulds have indeed shown patience as the giant has grown, putting up with modest dividends and watching the growth of vast and often idle liquid balances. They have shown patience, too, in British Celanese through a much more chequered early financial history which included capital reorgani-



sation and the funding of preference arrears but with a much more open-handed board. Their troubles, too, seem now matters of history and they can welcome the extinction of the funding certificates, the 100 per cent scrip issue and a buoyant net profit.

The rate of incursion of rayon into the preserves of the older textiles has not slackened. The war itself gave a tremendous stimulus to indigenous textile fibres in the warring and occupied countries. Staple fibre (the cut lengths of rayon filament which spinners can turn into yarn) has provided a tremendous new market. Thus the rayon producers are not only in the textile industry; they are also the suppliers of that industry's cheapest and least fluctuating raw material.

Both chairmen remain optimistic, though their fields are not identical. British Celanese as producers only of acetate do not even accept the name of rayon for their product. Their chairman Mr. G. H. Whigham expects the continuance of a good, though competitive, domestic market, but is less confident about the long term outlook for exports. Courtaulds are much the larger concern dominating the viscose field and producing acetate too (though on a smaller scale than Celanese). Sir John Hanbury-Williams gives much the same forecast—a buoyant home market and some doubts about the future of exports—doubts which concern the competitive power of Japan—and the competitive power both of cotton and of the newer man-made fibres in the United States. These doubts about the foreign markets have a doubled significance. Both companies have important interests outside this country in addition to their direct exports. Celanese is an important shareholder in Celanese Corporation of America. Courtaulds owns an investment of nearly £22½ million in subsidiaries which include the Alabama viscose staple project growing up to take the place of American Viscose Corporation, sold under duress to provide the sinews of war, TCF of Canada with associates in Australia—where the local Courtaulds venture has loudly demanded the protection of a tariff against yarn imports from Courtauld's factories in Britain—in Germany, Italy, Spain and South Africa and a subsidiary in France. Courtaulds has stated its claim in Nylon and Celanese has its plans.

But the important conclusion is that both boards of directors are behaving as though they expected growth and consolidation in the industry to continue. Neither has been dismayed by the textile slump two years ago, nor by persistent speculation about excess rayon capacity in Europe. Both are planning for a considerable increase in capacity. Courtaulds expects to spend at least £10 million on new investment, apart from the cost of a new factory at Grimsby designed to produce an annual 100 million lb of staple fibre. Celanese production will rise sharply next year when the new acetate factory at Wrexham comes into operation, and the company will spend about £5 million during the next two or three years on projects already sanctioned with the prospect of further capital expansion when they are completed. Evidently the home market is expected to absorb the extra output. Rayon exports have received a check since the days when half the cloth output went abroad; piece goods exports last year, at 16 million square yards, were barely 2 million yards above the total for 1952, a year of depression, and nearly 4.5 million yards less than in 1951.

Increased home sales are coming more and more to mean the development of new uses for rayon; the traditional outlets are being eroded at the edges by competi-

tion from cotton and to a less significant extent as yet by the newer synthetics. This has affected continuous filament yarn, the oldest type of rayon. The female leg has forsaken both silk and rayon in favour of nylon but in bulk the inroad of the newer synthetics is still small. Sales of continuous filament rayon have gone ahead only because of the rapid development since the war of an industrial market, and the almost total capture of the market for tyre cord. Staple fibre is the white hope of the future. It is the cheapest fibre on the market, and can be spun on most types of textile machinery. In the United States, viscose staple, sometimes used alone, sometimes blended with acetate or with natural fibres, has made great headway for lightweight suitings. Courtauld's new Alabama plant will make only viscose staple—50 million lb a year of it—in addition to the American viscose output. A determined attempt is being made to develop similar rayon suitings for the less kind climate of Britain and Western Europe. Courtaulds has more at stake in this than British Celanese, for Courtaulds produces nearly all the viscose staple made here, and a preponderance of the continuous filament. The table shows that production of acetate, in which Celanese predominates, is on a much smaller scale; that is why acetate staple, which sells in the United States at the same price as viscose staple, is 50 per cent dearer than viscose in this country.

The interests of Celanese stretch far outside the textile market; the company is in addition an important producer of chemicals and plastics. It is this chemical experience that makes it possible for Celanese to contemplate the production of a new synthetic fibre of the nylon type. Up till now this type of venture has been undertaken only by Imperial Chemical Industries, the sole producer of "terylene," which is also joint partner with Courtaulds in British Nylon Spinners. Celanese is also more directly involved in textile production than Courtaulds. Both companies are vertical organisations, buying the basic raw materials for viscose and acetate production, and selling finished yarn and fibre. Courtaulds sells some staple fibre already dyed and ready for colour blending by the spinners. But while Courtaulds has four big mills and some smaller ones weaving bread-and-butter lines of rayon cloth and extends into the knitwear business, it is predominantly a producer of yarn. Celanese weaves considerable quantities of its own yarns, and makes-up the finished garments.

Both companies have mapped out their places—in the textile industry, where they still have to work for their livings, and in the investors' portfolios where they claim inclusion in the list of possible textile investments—Celanese, retaining something of its speculative flavour, yields £6 10s. 11d. per cent at 27s. 6d., and Courtaulds, for the steady going, yields a mere £4 18s. 6d. per cent at 32s. 6d.

Business Notes

Bull at Large

STRONG and active buying marked the opening of the new Stock Exchange account on Wednesday. Investors were making their dispositions as though they expected the "bull market" to last as far ahead as they cared to look. And the Government has given them every excuse for holding that view. The dates of the longer conversion operation—1999/2004—just ooze confidence. But the upsurge in prices does not spring wholly from the Government's activities or from the gilt-edged sector alone. Industrials, rubbers and copper shares were fully in it. The number of stock exchange markings—at best only a rough guide to the true volume of stock exchange turnover—reached a high but not a record level. The highest figure of the week was on Monday when 15,118 bargains were marked, the highest since April 5th which was the pre-budget day. The average for the first three days of this week was 14,254 higher than any weekly average since mid-February. The indices have been reaching new peaks. The *Financial Times* industrial ordinary index started the new account on

Wednesday with a jump of 1.3 to a new peak of 158.2 and a further rise to 159.3 on Thursday. The rise in a week has been 2½ points. The government security index at 103.56 has risen half a point in a week and stands at its highest level of the year.

In the industrial share market the investor's appetite is catholic. Leaders in nearly all the main groups have been bought. Some equities with a heavy money element in their make up have naturally risen as the rising trend of gilt-edged marked a falling interest rate. ICI for example reached a new peak on Wednesday at 74s. 3d., a rise of 4s. 3d. on the week. But the strength of the market also includes a disposition to buy the old speculative favourites. The stores group in particular have been well supported. Wall Street has been offering London mild encouragement. The British gold and dollar figures come up to expectations. The level of commodity prices holds steady and investors evidently feel able to behave as though hardly a cloud were on the horizon. Certainly the level of activity through many sections of British industry holds out good hopes for the investor next year should he choose to ignore election risks. At the moment he does so choose, and he is in no mood to ponder how far high prices already discount the better industrial prospect.

Reserves in Good Stead

THE gold and dollar reserves of the sterling area rose by $32 million in June to reach $3,017 million. The increase was the smallest since January, yet it is far from disappointing. It was never expected that the exceptional rate of increase of recent months—which carried the total up by over $400 million between the end of February to the end of May—would continue after the large inflow of foreign funds to London was checked, as it was by the second week of May. Indeed, the anticipatory commercial transactions following from the exceptional strength of sterling in the spring must have had some adverse influence on gold and dollar receipts in June. Moreover, receipts of American aid dwindled to $3 million in the month, so that the net dollar surplus came out at $29 million. Of this, $15 million was attributable to a receipt from the European Payments Union on account of the May surplus, so that the surplus on "true" gold and dollar account came out at $14 million.

This achievement of a continued dollar surplus certainly seems to confirm that the spring boomlet in the reserves was founded on a position of greater underlying strength than was at first suspected. The reserves are now in good stead to withstand the immediate strain to which they are likely to be subjected in coming months. The high summer and early autumn is the season in which large payments for dollar grain are normally made, and in which the balance with Europe turns unfavourable owing to payments for tourist expenditure and imports of fruit and vegetables. Already in June Britain's surplus in EPU was down to £3 million, which falls to be settled 50-50 in gold and credit next week.

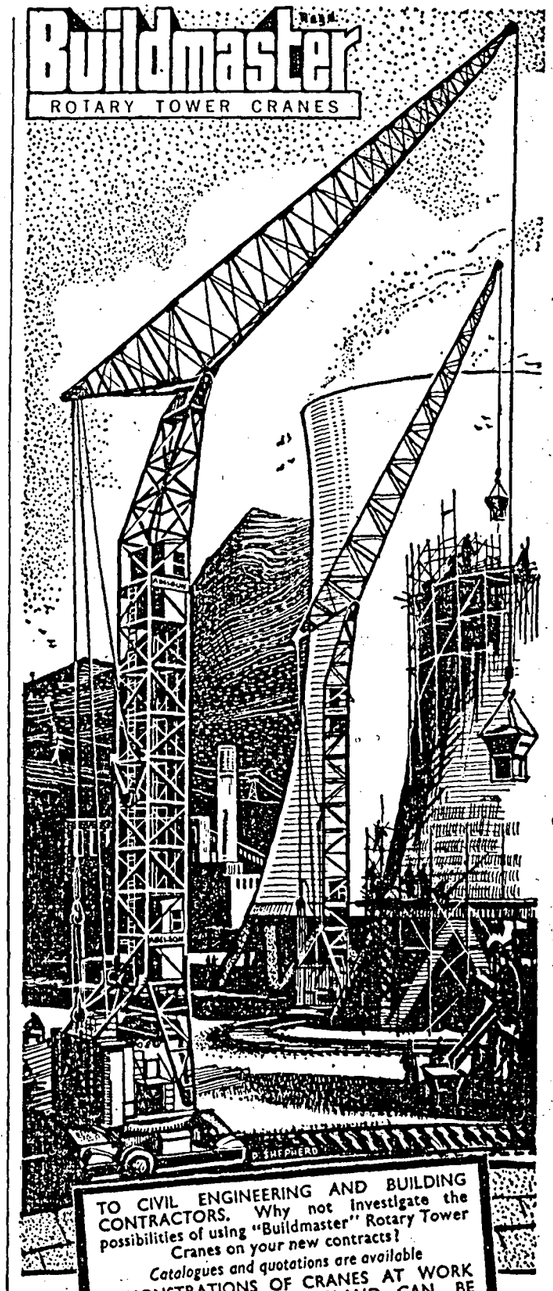
* After taking account of the payment of $181 million on December 31st for the service of United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.
† EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

Repaying the EPU Debt

NEXT month, moreover, the reserves will bear the impact of the very considerable payments that have to be made to the European creditors under the arrangements for the funding of $426 million of Britain's overdraft of $485 million with the European Payments Union. Agreement on the terms of repayment has now been reached with all the European creditors save Switzerland. Immediate payments totalling $92½ million are to be made next week to Austria, Belgium, Germany, the Netherlands, Portugal and Sweden, in proportion to the credit that these countries have extended to EPU. The payments will be made in gold or any currency acceptable to the six creditors; credit passes with these payments, and they fall outside the normal EPU settlement arrangements, but the Union will, of course, take account of them and adjust the accounts of the United Kingdom and the recipients to give effect to the gold payments.

When the immediate payments have been made there will remain a debt of $277½ million outstanding to the six countries. The settlement of this debt will impose a burden of some $40 million a year on the dollar reserves. The $159½ million owed to Belgium, the Netherlands, Portugal and Sweden will be paid off in monthly instalments (beginning next month) over a period of seven years, and carry an interest rate of 3 per cent. These payments too will be made directly to the creditors in a currency acceptable to them, and "taken account of" by the EPU. The debt of $105 million to Germany also bears interest at 3 per cent, but will be offset against the annual instalments on its postwar debt to Britain, which amounts to $21 million. These repayments will therefore simply be suspended for five years. The outstanding debt of $12½ million to Austria is to be offset in the same way, but in this case the debt to Britain will be eliminated before the EPU debt is paid, and after four years Britain will there-

a TI landscape



reveals an unexpected fact: today we live TI. The cyclist rides TI: the motorist drives with TI's help. The mother cooks TI: baby's bath water is heated TI. The farmer milks with TI and the businessman conducts his affairs in a TI setting.

Industry's calls on TI take many forms. It may be precision tubes in one of thousands of shapes and sizes, or steel, or wrought aluminium; it may be electrical equipment, rolling mills, or mechanical handling plant, or machine tools...so intricately is TI woven into the industrial pattern that nearly every constructional or engineering enterprise owes something, large or small, to TI.

Each of TI's many manufacturing companies has a mind and ideas of its own, but behind all of them are the combined skills and experiences of the many trades TI follows.

Up and up went the demand for their bottled beer. More orders to be analysed, more ledgers to be posted. In the offices of the famous brewers it was a case of "time, gentlemen, please."

Father William wanted them "cleared" fast

CHEERFUL SYMBOL of the great brewers, William Younger & Co. Ltd., Edinburgh, Father William had a problem. The country was drinking far more *bottled* beers. Orders from Customers and from their own houses poured in for the fifteen different lines of bottled ales and stouts they brew. With so many invoices to deal with, each with several lines to be posted and analysed, over and above the normal volume of Bulk Ale sales, the office departments were hard pressed to produce the up-to-the-minute sales figures the company needed.

Younger's asked Burroughs for suggestions, and after considering various other methods of handling this detailed analysis, they decided to install Burroughs Electric Duplex Calculators for the "analysis of ales and stouts" operation.

Then, seeking to speed their already mechanized Sales Ledger posting, they went to Burroughs again, and installed Burroughs High Speed Accounting Machines for *that* work also.

Result: Invoice checking, extension and analysis with the Burroughs Calculators now goes so smoothly that Younger's management can rely on comprehensive sales-figures in plenty of time to relate production to public demand. They find, too, that flexible Burroughs Accounting Machines can cope with a greatly increased volume of daily posting to "Bulk" Ledger or "Bottled" Ledger. Father William is a happy man! What about you? If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service *guarantees* its efficiency in operation.

Seen demonstrating a Burroughs Duplex Calculator in the offices of William Younger & Co. Ltd. Is Burroughs representative Mr. M. Jolly. This fast, two-answer-dials calculator is one of the machines that helped to solve the Case of the 15 Bottlenecks.

Call Burroughs *today*. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

FOR EXPERT ADVICE ON BUSINESS FIGURING CALL IN **Burroughs**

fore begin to make monthly instalments to pay off the remainder. Agreement has still to be reached with Switzerland on the arrangement for the settlement of its "share" in Britain's overdraft with EPU, put at $56 million.

No Excuses about Coal

SIR HUBERT HOULDSWORTH told the miners' conference this week that he broadly agreed with their leaders about the total number of recruits that the British coal industry now needs. But he added that these new miners are needed in the right places, not throughout the mining areas. And he bluntly disposed of any argument that this need for recruits in any way weakens the industry's commitment to raise coal output this year by some 5 million tons. That "reasonable minimum aim" was agreed upon by the National Union of Mineworkers and the National Coal Board "with existing underground manpower." Sir Hubert reminded the union conference that since the beginning of the year underground manpower had risen by 1,000, while the number of workers at the coal face had fallen by only about 700 out of some 290,000: "It is not open to the board or the union to seek to excuse the failure to achieve the reasonable aim by any arguments based on the shortage of manpower."

The industry needs to produce not excuses, as Sir Hubert said, but some 4 million extra tons of coal between now and the end of the year. Such a spurt is not impossible; in the first four months of 1951, for example, the industry achieved 3 million tons of additional output, and even last autumn production recovered considerably more than was expected. In the short run, Sir Hubert again argued this week, no great returns can be expected from the industry's heavy capital investment. He is confident that in the meantime the country's demands for coal could be met by an improvement in the industry's labour relations; last year, for example, disputes cost twice as much coal as the board was forced to import. No doubt this is true; but it is not easy to foresee any such marked improvement in labour relations. At the top, after all, these relations are surely close enough. The miners' leaders are ready enough, each summer, to join the board in lamenting the dangerous level of stocks, and emphasising the need for higher output; and to formulate their wages claim for each autumn. This year's claim appears to concern a change in the industry's weekly bonus system (which would weaken the financial incentive to full attendance), sick pay, and a revision of the whole wages structure. This last exercise has been nibbled at for years; from the union's point of view, at least, it would mean a great deal of "levelling up" in pay, and perhaps a further divorce of rewards from efficiency.

Westminster Dividend Raised

THE seasonal batch of interim dividend announcements from the big banks has this year produced one welcome surprise and one disappointment for bank shareholders. In their distributions for the calendar year 1953, it will be recalled, four of the "Big Seven" banks followed the lead that had been set by the National Provincial Bank, and broke away from their long-stabilised rates. For 1953 Barclays, Lloyds and the National Provincial each paid ½ per cent more than their former standard rates, and larger payments were also made by the Northern banks—Martins, District and Williams Deacon's. One of the two big banks that had kept its rate unchanged has now come into line: the Westminster Bank is raising its interim by 1 per cent (actual) and for the full year will be paying the equivalent of 20 per cent, which is the same rate as was paid before the 1931 crisis, when the rate was cut to 18 per cent. The Midland Bank's interim, however, remains at the rate of 16 per cent per annum that has been paid ever since then; its 1930 rate was 18 per cent. The other banks' interims were each equivalent to half the (increased) payment made for the year 1953 as a whole. Westminster £4 shares (£1 paid) rose sharply on the news, by 4s. 9d. to 90s. 6d., and encouraged a slight rise in Midland Bank shares—which, of course, slipped back after the no-change announcement.

The Westminster's increase, like that announced by Barclays last autumn, is associated with changes in the capital structure. The Westminster has paid particular attention to a trend that has been common to all the banks: the great expansion of deposits that has occurred since 1938 has steeply reduced the ratio of bank capital to liabilities. The bank obviously delayed its dividend increase until it could improve this ratio. It is now doing this by capitalising £1,767,747 of published reserve and applying this sum to pay up 5s. per share of the uncalled liability on the £4 shares, so that they will become 25s. paid (£2 of the amount remaining unpaid represents "reserve" liability, callable only in the event of liquidation). The amount taken from published reserve is being replaced by a transfer from contingency account, which is a clear indication that the way has been prepared for this move by a strengthening of the inner reserves—thanks to the rise in gilt-edged in the past two years and the good level of current profits. The opportunity is also being taken to convert the £1 stock units, which at present rank *pari passu* with the £4 shares for dividends up to 12½ per cent, into preferential "A" stock carrying a non-cumulative dividend at this rate. This is a sensible move, which ensures that the stock cannot be adversely affected if further portions of the uncalled liability on the £4 shares are paid up in future. There is an interesting hint in the announcement that the bank intends in future to treat these shares as if they were of "no par value." The interim is expressed as 2s. per share, and it is intended that the final shall also be 2s.

New Tints for Rio Tinto

WITH the apparent blessing of the Spanish Government, the negotiations between Rio Tinto and a group of Spanish financial interests for the sale of the company's Spanish assets have ended with speed and cordiality. The Spaniards appear glad to see the end of this British enclave in Spain and to welcome control over an asset so important in their economy. All the former Spanish assets and liabilities of Rio Tinto, consisting of the mines for the extraction of pyrites, sulphur and copper and

such ancillary assets as the railway and housing estates, are to be transferred to a new Spanish company. Two thirds of the capital of this new company will be bought by a Spanish financial group, consisting largely of important Spanish banks. Rio Tinto will retain one third of the new company and will receive in instalments £7,666,666 in sterling; the transfer is guaranteed by the Spanish Foreign Exchange Institute and the first instalment of £2,500,000 will be paid before the end of next October.

The price which Rio Tinto will receive looks fair, particularly when it is set against recent profit remittances from Spain to the company. The Spaniards seem to have been eager that Rio Tinto should retain an interest in the new company, and Rio Tinto will continue to provide technical services in Spain and commercial services in London. Even apart from the desire of the company to protect the interests of its staff and to retain its long historical connection, it may also prove to be a good bargain for Rio Tinto. With the Spanish in the saddle the obvious assumption is that there will be less delay in adjusting the internal selling prices of the company's products to increases in the cost of production and that far more generous exchange rates will govern the export of these products. It was, of course, the lag between rising costs and prices and the tinkering with exchange rates that has kept Rio Tinto's profits from Spain so low.

Shareholders' Hopes

Until last week the market price of Rio Tinto's ordinary shares was governed by the company's profitable investments in the Rhodesian copper companies. Now the market sees the chance of a capital distribution coupled with the possibility of high profits from Spain. That is why the price of the £5 ordinary shares went up from £26 to £34 in a week. In principle the cash that Rio Tinto receives should be distributed to shareholders. But it would be foolish to ignore some of the difficulties which stand in the way of a straightforward distribution to equity shareholders. The emphasis that the company has recently placed on exploration in Rhodesia and Canada suggests that it would like to retain some money (though this should not be an excessive sum) to meet the cost of development if these projects came to fruition. Moreover, there may be some difficulty in balancing the claims of preference and equity shareholders. The preference shares, which arose out of a share split in the 1890s, have no participating rights but they do have votes. The repayment of these shares may not be such a simple matter as the discount of 6s. 6d. on their par value of £5 would suggest. The directors deserve praise for their skill in negotiation, for the speed with which they published the details and for their promise to make an early statement on the destination of the cash.

Savoy Medley

THE Institute of Directors, in a statement last week, made two valid points on the Savoy Hotel affair. They argued, as *The Economist* did, that since Mr Milner Holland's conclusions that the Savoy scheme rested on an "invalid" use of the directors' powers were not in themselves of legal force, the law should be made certain. They added, too, that the rules laid down in the Companies Act for directors in their capacity as trustees for shareholders are minimum standards only.

Replying to questions on Tuesday, Mr Henry Strauss, Parliamentary Secretary of the Board of Trade, seemed to seek the best of both worlds. Mr Milner Holland's view was of such authority that other directors would not indulge in any such transactions in future; if they did, the matter could go to the Courts. This carries the matter no further. He also defended the absence of any disclosure in the inspector's report about the identity of the buyers of Mr Samuel's holdings: "It would have been open to the inspector to look into this matter, had he thought it relevant." There are many who would have thought this matter relevant, even though the inspector apparently did not. And on the point discussed in the report about notice of board meetings not being given to one director, Mr Strauss reiterated the inspector's conclusion that this was a mistake and "not deliberately committed for any improper reason."

Peak Demand for Steel

IN the first six months of this year about 9¼ million ingot tons of steel were produced in Britain, of which consumers in this country took about 8.6 million ingot tons—equivalent to perhaps 6¼ million tons of finished steel products. This was some 4 per cent more than they obtained in the first half of 1953, during part of which official steel allocation was still in existence. Since they were then building up their stocks of steel, and may not have been doing so this year, the actual use of steel by consuming industries in this country may have risen by as much as 8 per cent—a significant index of engineering recovery.

About three-fifths of home demand for steel is directly related to capital investment in this country, which received a stimulus in this year's budget. Exports of metal goods account for perhaps another quarter of steel consumption, and these too have shown a marked recovery. The mechanical engineering industries—here used to include machine tools, stationary engines, boilers, textile machinery, and much other "non-electrical engineering"—accounts for more than 10 per cent of home demand. The "motors, cycles and aircraft" group of industries directly takes nearly as much (some 1¼ million tons of finished steel) and indirectly consumes a high proportion of the steel originally bought by drop forgers and spring makers. Constructional engineering, shipbuilding, railway equipment, and hollow-ware account together for roughly another 40 per cent of demand. Back in 1951 the federation published estimates of the number of customers who buy steel. It calculated that though these might number as many as 150,000, some 70 per cent of the steel sold was to the 2,000 companies or organisations that bought more than 100 tons each every three months, and indeed that nearly a third was taken by 179 really big customers who bought 2,000 tons or more each every quarter. The steel industry's market is thus highly concentrated, both in terms of manufactures and of customers; and any fairly rapid change in demand for the products of certain customers can have a sharp and sudden

THE DOLLAR PRINCESS

In the bright bazaars of the Federation of Malaya and the Colony of Singapore—export centre of rubber, the world's second-largest dollar earner—the Malayan and his wife can purchase a great variety of articles made by the Western world. This has helped to make their standard of living one of the highest in all Asia.

One of Malaya's best customers is the United States of America and American dollars from the sale of rubber are helping us all in the sterling area to build up post-war prosperity.

Since 1946, out of a total production of Malayan rubber of just under five million tons, America has bought over two and a half million tons for which she has paid 1,600,000,000 dollars.

In this way the needs of a great western nation have helped in the prosperity of a smaller Far Eastern one. Dunlop, by its invention of the first practical pneumatic tyre and of latex foam cushioning, has created a world-wide demand for rubber to the benefit of Malaya and its people.

effect upon demand for particular steel products. The present boom in motor car output, for example, has again outpaced capacity to produce cold-reduced sheet in this country, and imports are still fairly substantial, while there are indications that another sudden switch from slackness to pressure is taking place in demand for the certain light rolled products.

Ferguson Quits Farming

THE resignation of Mr Harry Ferguson from the chairmanship of the combine formed only last August between his company and Massey-Harris may be the signal for storm cones to be hoisted by the motor industry. Mr Ferguson's energetic and controversial personality has been a force to be reckoned with in the farm machine industry for nearly a quarter of a century. He successfully pioneered, against considerable opposition, a system of direct hydraulic linkage between tractor and implement that turned the tractor from a mechanical horse into a properly integrated agricultural machine tool. Last month, the Standard Motor Company turned out nearly 5,700 Ferguson light tractors; the "Ferguson system" has become common practice and the restless Mr Ferguson has for some years been looking for fresh fields. He has been greatly attracted by the motor industry, most of which is showing much the same conservatism as the farm machine industry of 25 years ago.

Prototype small road vehicles (they can hardly be said to have crystallised yet into recognisable cars or trucks) have been built for him to test new theories of transmission for rear engine installations. To the motor industry a significant feature of these experiments is that the vehicles have not been built by any of the big motor manufacturers. Harry Ferguson has always used the production facilities of companies outside his chosen industry because these are less likely to be startled by unconventional designs. The market value of his holding in Massey-Harris Ferguson is more than £5 million, which gives him adequate capital backing for any new venture. The Ferguson tractor is light, and a great deal cheaper than any of its competitors, yet it is in no way an "austerity" tractor. If Mr Ferguson has the same success in his new venture, the light car market is due for a shaking up.

Profits from Films

ASSOCIATED BRITISH PICTURE CORPORATION, 37½ per cent of whose ordinary capital is held by Warner Brothers, has a fortunate record among British film companies, largely because it does not overdo the production side of its business. The solid backbone of the undertaking is a circuit of around 400 cinemas; film production and distribution are also parts of it. None of these branches of the company's activities let it down in the year ended March 31st. Gross profits rose by £145,536 to £2,213,312 and net profits after tax by £67,207. The 20 per cent ordinary dividend for the year has been merely maintained, but the company now shows a surplus of £745,000 of current liabilities compared with a deficit on that account of £35,000 a year earlier. The build up of the liquid position has been substantial, the more so since the chairman, Sir Philip Warter, announces that since the date of the accounts a little more than £1 million of the company's secured indebtedness has been repaid.

Students of the industry will read into the report and Sir Philip's statement two reflections. First, on the exhibiting side of the industry the company has not been immune from the general problems; it has managed to overcome them. Attendances at the company's cinemas declined in the year ended March 31st by 4.63 per cent but there was no impact on the revenue because the company offset it first by cutting down maintenance expenditure and secondly by showing advertising films, which it did not do in earlier years. Roughly a full year's revenue from screen advertising is included in these accounts and though no figures are given ABC seems to have found it very profitable to come into line with most other exhibitors. The economies on maintenance could at best be only a temporary expedient. The reduction in Entertainments Duty seems to have come just in time.

With the aid of a sum understood to be in the neighbourhood of £427,000 from the Eady Fund the company at least made no loss last year on production, but there must have been times in recent years when its continuance in the film production business hung by a thread. Two remarks from the chairman's speech seem significant. He explains that without a reduction in the Entertainments Duty it might not have been possible to continue to take part in production of British films. Sir Philip adds: "There are certain overall advantages to be gained by carrying on with it, provided that producers generally continue to receive assistance from the British Film Production Fund." That hardly sounds like a clarion call to rally round a struggling industry, but it is at least generous from a group that is so small on the production side and so large in exhibiting that it pays into the Eady Fund as exhibitor more than twice as much as it draws out as a producer.

The Pace of Denationalisation

THE sale of some 6,000 nationalised lorries out of the 13,200 that have been offered in "transport units" of a kind intended to attract "the small man" back into long-distance road haulage has taken the Road Haulage Disposals Board and the Transport Commission about a year. In the House of Commons this week the Opposition shed some crocodile tears about the slowness of this first stage of denationalisation, and the Minister of Transport made at least one interesting remark about the stages still to come.

These first sales—in which the record of bids accepted is certainly not impressive—were arranged to give the small man, if he wanted it, a head start in denationalised road haulage. Their indifferent success arose largely from a miscalculation of the market and the offering of a large proportion of the vehicles in units with their own premises, which the small man apparently did not want. The majority, nevertheless, have been sold to road hauliers who want to return to operating their vehicles over longer distances than the 25-mile limit of the "A" licence. The small man, by now, has perhaps been given enough preference; moreover, since the 25-mile limit is in any case to be abolished at the end of this year, the operating advantage that it is in the board's power to offer him is dwindling. The board and the commission are now moving on to sell the larger road transport businesses—either as units with more than 50 vehicles, or after formation into separate companies.

A variety of business interests have shown some interest in acquiring these larger units, and the board and commission have been discussing with prospective purchasers the particular form and size of operating units that might be sold. The Commission has decided, for example, that the existing parcels and smalls service of British Road Services, except for a few small units to be "hived off," shall be transferred to a single company of which the shares will be sold. Suggestions that large transport businesses on this scale might be formed and sold in such a way as to leave the Transport Commission part of the ownership and considerable responsibility in the management have recently been discussed. Mr Lennox-Boyd, in the House this week, agreed that it would be possible to find a way round the 1953 Act to achieve this—perhaps by selling a company as a whole to a purchaser who would then re-sell part of it to the Commission. He went on record as saying, "I would regard that as defying the spirit of the Act and I would not approve of it." He was somewhat less downright in affirming that the process of denationalisation "would be very well advanced by the end of this year," but he did not think such an anticipation "would be all that out in the event." Considering the fate of his earlier prophecies upon the subject, one must grant the Minister of Transport political courage as well as confidence.

Gem Diamonds in Demand

SO far the sale of gem diamonds gives no hint of the fall forecast by Sir Ernest Oppenheimer, chairman of De Beers Consolidated Mines, in his annual statement last May. He then said that as stocks had been run down to the minimum, supplies were below demand and sales were thus likely to be "somewhat lower" than in 1953. In the second quarter, however, sales of gem stones by South African and other producers through the Central Selling Organisation were £11.7 million, virtually the same as in the first quarter. Sales of industrial diamonds are running more closely to his forecast. The expected decline appeared in the second quarter, when sales were £3.3 million compared with £4.9 million in the first. Sales in the first quarter were swollen by unexpected purchases for the American strategic stock, and the latest figure presumably reflects the fall in strategic as well as industrial requirements in the United States. The results as a whole for the first half of this year seem to leave the producers with a margin sufficient to take most of the sting out of any drop in earnings during the remainder of the year; total sales in the January-June period were equivalent to an annual rate of £63.4 million, which may be compared with £61 million in 1953.

Questions about Options

THE practice of granting options to directors to buy shares in the companies they direct is more common in the United States than in this country, but it is growing here. Income tax and surtax at present high levels make the potential capital gain that the option may bring of great significance to a director in a high tax bracket. Many of these options confer little or no immediate benefit on the director.

The option to be given to Sir Eric Bowater (chairman of the Bowater Paper Corporation), if the shareholders agree in extraordinary general meeting, is a typical example. The proposal is that Sir Eric should be rewarded for his "unsparing efforts and outstanding leadership" by the grant of an option to buy at any time in the seven years from the date of the grant 150,000 of the company's unissued ordinary shares (in whole or in part) at not less than the market price ruling on the day on which the option is granted. It is presumed that the option will actually be granted immediately after the extraordinary general meeting, though the wording of the resolution does not make this clear. Sir Eric can profit by these arrangements only to the extent that the price of the shares rises after the date on which the option was granted—an appreciation in value which would benefit every shareholder.

Such options are not immune from criticism. Any director, particularly one in a company whose fortunes can change rapidly, can take a much longer view of the prospects for the company's equity than any outside shareholder—because of his knowledge and experience of the trade. Indeed, his own decisions can affect the value of the equity.

"Motor Business"

We have just circulated to a number of companies in the motor and allied industries a special bulletin showing how business research can help to solve their problems. If you, too, would like to have a free copy of this bulletin we shall gladly send you one, provided the supply has not been exhausted.

Please write or telephone, mentioning "Motor Business", to:

THE ECONOMIST INTELLIGENCE UNIT
22 Ryder Street, St. James's, London, S.W.1
Whitehall 1511. Extension 17

The general body of shareholders has neither such knowledge nor such influence. In these circumstances, should options be given to directors merely as rewards for past services?

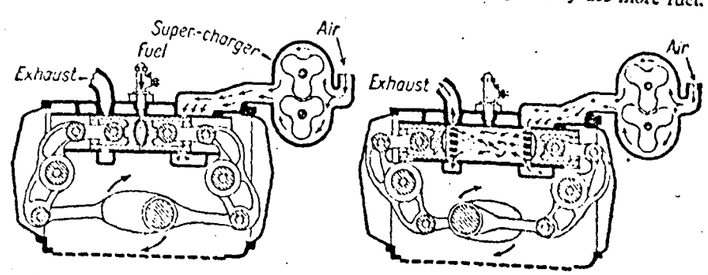
For This Relief Much Thanks

Two concessions were promised to tax payers this week. The first lowered the rate of death duty payable on small estates and the second clarified the administrative practice relating to expense allowances under a Schedule E assessment. The Chancellor accepted an amendment from the Conservative back bench reducing death duties on the smallest estates. In effect, this amendment means that no duty will be payable on any estate valued at £3,000 or less; the present exemption limit is £2,000. On estates valued at between £3,000 and £4,000 the duty will be only 1 per cent, compared with the existing duty of 2 per cent. For estates valued at more than £4,000 the present rates of duty will still apply.

In a letter sent to the members of the Federation of British Industries and the Association of British Chambers of Commerce, the Inland Revenue authorities have given details of instructions sent out to Inspectors of Taxes on the hotly debated subject of directors' expenses. These instructions are apparently not new; they seem to be a reiteration of earlier instructions, which a handful of tax inspectors may have interpreted a little too rigorously. They remind tax inspectors that: trivial items should not be unreasonably pursued; inquiries and, in particular, requests for detailed analysis should be adapted to the circumstances of the case; in general, retrospective requests for details about expenses which were subject to dispensations before 1953-54 should not be started unless there is some reason to suspect abuse; any adjustment for "home savings" is only likely to be significant if the taxpayer is away from home for a considerable time.

These instructions, together possibly with meetings between professional organisations and the Inland Revenue to discuss the type of expenses which should be allowed as a deductible charge against tax, ought to go a long way to meet those criticisms which have recently been made about the administration of the law. These complaints have not been very numerous. When representatives of the Inland Revenue gave evidence before the Royal Commission on Taxation, figures were quoted showing that out of about 500,000 cases on expenses examined by the tax authorities only in 200 had there been complaint. Of this number the authorities believed that they had been unnecessarily harsh only in 90 instances and that only in 10 had the Inspectors of Taxes been grossly in error.

The Last Development Council



The Furniture Development Council, which published its fifth annual report this week, is the last survivor of the Development Councils set up during Mr Harold Wilson's sojourn at the Board of Trade (the Cotton Board existed long before). Although its future does not come up again for review by Parliament for another three years, the Council has reached a crisis in its affairs. Its main preoccupation since it was established in 1949 has been with the evolution of performance tests for furniture. These were designed to check on the quality of construction; if a piece of furniture survives the continuous application of loads reproducing normal wear, it can be counted as reasonably sound whatever its design and however it is made. All these tests have now been completed, accepted by the industry and published by the British Standards Institution; they are, in fact, the only concrete result of the Government's scheme for minimum quality standards to be administered by the BSI.

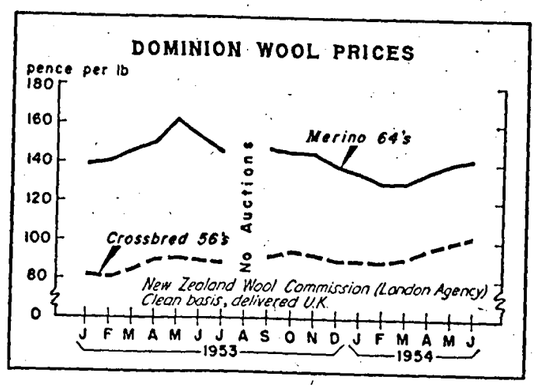
The Development Council must now find some other means of occupying its time and of justifying the compulsory levy on the industry by which it is financed. This raised £21,700 in 1953, with a further £1,800 still to be collected, and the industry is entitled to ask what it gets for its money. Some groups of manufacturers have consistently opposed the continued existence of the Development Council, and have extended their opposition to the performance tests and the standards associated with them. It will be difficult to silence these critics by providing technical information services—that they rarely use—or conferences on productivity and management, no matter how badly the industry needs such advice. The most valuable contribution that the FDC has made to date has been the introduction of laboratory facilities into an industry with no tradition of research. The small research centre that evolved the performance tests is beginning to investigate the fundamentals of furniture construction in the hope that in time it will be able to tell the industry with scientific accuracy how strong a piece of furniture will be for any given design and set of dimensions. In the long run, data of this kind might make it possible to economise considerably on materials—which make up a high proportion of total costs. The industry might be grateful for such advice in less affluent times, but at the moment it is doing remarkably well. So far this year, retail sales of furniture have been 6 per cent higher in value than over the same period of 1953.

New Ideas in Diesels

The reputation and sales of the Rootes Group—as is to be expected of a group whose founders came into the industry rather through the showroom door than the factory entrance—have been founded on attractively styled vehicles designed with a firm appreciation of what the customer wants rather than on technical innovation. But the 90 hp Diesel engine that the group has just added to the Commer range of commercial vehicles is a highly unconventional design that shows considerable technical originality. The engine has horizontal cylinders (in this case, three of them) each of which contains two opposed pistons; combustion takes place between them. Each piston is connected by a piston rod, a heavy rocker arm, and a conventional connecting rod, to a single six-throw crankshaft. Instead of valve gear, there are two rows of ports in the wall of each cylinder, one row, the inlet ports, being covered and uncovered in each revolution by one piston and the exhaust ports being covered and uncovered by the other piston. Fuel is injected according to conventional Diesel practice, but air is fed in under pressure from the supercharger and thus two-stroke operation is achieved (that is, one explosion in each cylinder for every revolution) instead of one every other revolution as with more normal four-stroke engines.

A test carried out by the *Commercial Motor* reports that a coach powered by this engine had a maximum speed of 68 m.p.h., and at an average speed of 43.6 m.p.h. the fuel consumption was 20 m.p.g. A petrol engine would probably not give much, if any, more than 10 m.p.g. in comparable conditions. A slightly lower consumption would probably be given by the highly efficient but costly Diesel engines built by the specialist heavy vehicle manufacturers; but the lower priced engines made by the proprietary Diesel engine manufacturers would probably use more fuel.

Marchon Moves on



One of the new small companies to have emerged since the war in the chemical industry is Marchon Products, Ltd. The company recently completed another stage in its £6 million development plan with the opening of a £500,000 high-pressure hydrogenation plant at Whitehaven in the West Cumberland Development Area. This plant will produce 4,000 tons of higher fatty alcohols a year for detergents, pharmaceuticals, and plasticisers. Most synthetic detergents are based on oil or coal-tar products. Marchon claims, however, that fatty alcohol sulphates, based on vegetable oils, are equally satisfactory and have been widely used already in the United States.

To provide the company's financial requirements for a period of about two years an issue of £600,000 5 per cent debentures (1974/77) has been made. The stock has just been placed privately by Cazenove, Akroyds and Greenwood and Company at £99 per cent. No quotation is at present to be sought. The company has an issued capital of £700,000 in £350,000 preference shares held by Industrial and Commercial Finance Corporation which has hitherto nursed its development and £350,000 or equity capital partly held by ICFC and partly by the founders of the business. It is contemplated that the company may ultimately require still more finance. If so it will be found by way of ordinary share issues and a quotation will be sought for both the ordinary shares and the debenture stock.

The company is likely to meet exceedingly stiff competition. Nearly 700,000 tons of detergents are being sold in this country annually, and some estimates put the share of synthetic detergents in the total at as low as one-fifth. The two principal suppliers are Monsanto Chemicals and Shell Chemicals; ICI sells on a smaller scale. British Petroleum Chemicals, the company jointly owned by Distillers and Anglo-Iranian, is putting up a substantial detergent plant to operate on refinery gases supplied from Anglo-Iranian's Grangemouth refinery. Marketing in such a field of competition will not be easy.

Wool Sales Quiet

The final series of the 1953/54 wool sales in London opened rather quietly this week. Crossbred combing wools met a satisfactory demand, particularly the finer qualities, and prices were on a par with the closing level of the May sales. There was little demand for merino wools, however. The Continent showed no interest and Bradford firms were only willing to buy at prices that were about 5 to 7½ per cent lower than in May; many lots were withdrawn. The first day's sale is not necessarily a reliable guide; many buyers wait for prices to be established before entering the market. But as far as this country is concerned, the trend of prices is not entirely surprising. Having bought considerably more wool from the Dominions in the last months of the season, Bradford firms appear to have sufficient merino wool arriving to cover their commitments. New business in merino tops is scarce and prices have been reduced slightly. The trade is in any case reluctant to add to its stocks before the start of the Dominion auctions in September provide a guide to the new season's prices.

But fine qualities of crossbred wools, which will not be offered in the Dominions until late in October, are still needed by topmakers. This is illustrated by the latest figures of activity in the wool industry in May. The summary of the Wool Industry Bureau of Statistics shows that the increase in the rate of production of wool tops—the largest use for virgin wool—was mainly in crossbred tops, output of which was the best since the war and 5½ per cent better than a year ago. The rate of production of merino tops, on the other hand, was 12½ per cent less than a year ago, reflecting mainly the continued substitution of the cheaper crossbred wools. The total rate of consumption

of wool in May, which was appreciably better than in April —though still 6½ per cent less than a year ago—was principally in topmaking; consumption in the woollen section of the industry showed little improvement.

Half Year of Capital Issues

THE flow of new capital issues has quickened with the rise in Stock Exchange activity and prices. The statistics measuring this flow are set out on page 147. They show that the new issue market remains dominated by British Government and Government Guaranteed issues. In the first six months of this year, new issues made by direct offers to the public and to shareholders totalled £540 million, compared with £450 million in the first six months of 1953. Of this total, £400 million consisted of Government issues.

The predominance of Government scrip, however, does not hide a remarkable increase in issues made by British and foreign companies; direct offers by these companies amounted to £118 million, compared with £55½ million. This sector of the market was also dominated by a handful of large issues, including those of Imperial Chemical Industries, Dunlop Rubber Co. and Rolls Royce as well as the offers for sale of Lancashire Steel and Stewarts and Lloyds. Beneath these breakers, of course, lay the swell of smaller issues; here the investment trusts (following the lifting of the ban) and the textile companies (following the revival in trade) made a noticeable contribution.

The last six months also witnessed a return to favour of fixed interest stocks, a revival associated quite naturally with the fall in interest rates. It was the smaller companies which usually raised their new money by direct offers of equity stocks, which brought the six monthly total to nearly £57 million (against about £22 million). The giants of British industry relied more on preference and debenture issues suitable for institutional investors. In the first half of the year, direct offers of preference stocks amounted to nearly £20½ million (against only £5 million) and of debenture stocks to £41 million (against nearly £29 million). As yet the flow of new issues shows few signs of slackening or of any change of pattern.

SHORTER NOTE

Roughly 3 million tons dw of tanker tonnage are now laid up throughout the world, out of a total world fleet of some 36 million tons; and deliveries of new tankers are continuing at a rate of some 4 million tons a year, some 13 million tons dw being on order at the end of last year. The surplus of tonnage has brought the average level of freights, taking time and spot charter rates as a whole, down by another 10 per cent in the last three months; but spot market rates have fallen as much as 45 per cent in the same period.

Company Notes

LONDON COUNTY FREEHOLD. London County Freehold and Leasehold Properties, the landlords of "Key" flats, are pre-eminent among the owners of middle-class flats in the London area. The Housing Control and Rents Bill means a good deal to the company. But that story remains to be told; the present report shows few changes. The dividend for the year remains at 11½ per cent (1s. 1½d. per 10s. unit). The group net revenue rose slightly from £284,861 to £295,294. The gross rental, substantially controlled by the Rent Restriction Acts, rose by £76,779 to £2,294,026; but £50,879 of that increase was represented by an increase in general rates. This is not in itself an exciting picture, but from the accounts and the directors' report shareholders can glimpse dimly the shape of things to come.

First the directors explain that their standard of repairs is such that the proposed increase for repairs under the new Bill appears to be recoverable in respect of all its controlled dwellings. Secondly the report shows graphically that its 1954 cost of repairs is roughly 3½ times and its cost of services roughly 2½ times the 1939 figure. Evidently the disadvantages of the present law are severe, even though they are offset by voluntary contributions from many tenants. A further point which investors will have to remember is that the properties are taken into account at 1925 valuations plus later additions and improvements at cost. The book value is substantially below market value or replacement value.

The directors disclose part of their intention for the current year. It is to increase the annual sinking fund provision to provide against loss on expiration of the leases or when the freehold properties require to be rebuilt. That is all the directors say; if it were the only thing they would do it would cut into, rather than embellish, shareholders' chances. Fortunately when the present Bill becomes law the company will also have an addition to its income. So it may be inferred that both the balance sheet valuation of the properties and the sinking fund provisions will rise together and that part of the increase in revenue will be absorbed into higher sinking funds.

★

BRITISH GLUES AND CHEMICALS. British Glues and Chemicals has staged a good recovery from the 1952-53 setback. In the year to March 31st sales both at home and abroad increased and trading profits, in spite of a reduction in some selling prices, more than doubled from £419,199 to £874,725. The recently introduced cold rendered tallows and glues have made an important contribution to these results. The company has also been able to reduce its stock and to reinforce its liquid balances.

In these circumstances it is not surprising that shareholders have received everything for which they have been hoping. The ordinary dividend has been raised from 15 to 20 per cent and the directors propose to make a free scrip issue of two new 4s. ordinary shares for every £1 of ordinary stock held. This dividend and scrip issue had been anticipated by the "bulls" and after the announcement the 4s. ordinary shares put on only 3d. to 15s. 9d., to offer a yield of 5½ per cent. This yield suggests that investors are already considering the possibility of a higher dividend in the current year. They may gain slight satisfaction from the chairman's comment that so far in this financial year "trading has continued to be satisfactory" and that the year as a whole will show "a reasonable profit."

The directors have chosen this year of recovery as the time for cancelling the participating rights attached to the 8 per cent cumulative preference shares. In return for the loss of these rights (which at the best mean an additional dividend of 2 per cent when the ordinary dividend is not less than 15 per cent) preference shareholders are to receive as free scrip two new 4s. ordinary shares for every £3 of preference stock in issue. Preference shareholders should benefit from this change for if the ordinary dividend is 15 per cent they will receive exactly the same income as before. If the ordinary dividend is either higher or lower than 15 per cent they will actually gain a little.

BARCLAY PERKINS AND WHITBREAD. The trend in beer consumption is still disappointing and the profits of the brewers are little more than stable. In the year to March 31st last, the trading profits of Barclay Perkins rose by only £76,374 to £1,042,671. But this brewing company is yet another which has decided to raise its ordinary dividend. The payment goes up from 6 to 8 per cent. This increase added only 6d. to the price of the £1 ordinary shares, which at 26s. offer a yield of about 6½ per cent. It was presumably the increase in net profits (from £150,659 to £275,458) which encouraged the directors to take this step; the increase in the net figure was due mainly to the reduction in the provisions for depreciation, renewals and deferred repairs.

Whitbread has had a much better time of it than Barclay Perkins. In tracing out the reasons for the advance in trading profits from £2,237,217 to £2,930,836 and the "good year" of results in general the chairman drew attention to five factors. They were: more reasonably priced raw materials; the investment of further capital in new equipment; economies arising from the redeployment of distribution stores; the demand for higher quality and higher priced bottled beers; and the writing back of sums over-provided for tax in earlier years. Barclay Perkins, by widening its interests in bottled beers and mineral waters and by its absorbtion of smaller breweries, is yet another brewery following the path on which Whitbread has made such impressive strides.

★

ASPRO. The 5s. ordinary stock units of Aspro did not lag behind other equities in the stock market advance. Investors were hoping that the company, which has a high earnings record, would break away from its conservative dividend policy. These hopes gained strength from the 100 per cent free scrip issue at the beginning of the year; they were not disappointed, for the directors have effectively increased the ordinary dividend from 17½ per cent to 22½ per cent by paying a final dividend of 13¾ per cent on the new capital of £1 million in addition to the interim dividend of 17½ per cent on the original capital of £500,000. On the basis of 22½ per cent dividend the 5s. stock units offer a yield of 6.3 per cent at the current price of 18s.

The decision to raise the equity dividend followed directly on further increases in the sales of "Aspro" and on the advance in trading profits (from £867,967 to £996,411) and in net profits (from £346,601 to £459,370). In their preliminary report the directors draw attention to a "fundamental change of policy" reflected in the purchase of the rights over two household products.

LONDON STOCK EXCHANGE

Next Account begins: July 21st
Next Contango Day: July 21st
Next Settlement Day: July 13th

THE tempo on the Stock Exchange has been quickened by Monday's two conversion offers to holders of the Serial 1¾ per cent 1954 stock. Since Tuesday gilt-edged and industrials have been moving up together. The *Financial Times* industrial index reached a new peak with the opening of the new account on Wednesday and the gilt-edged and fixed interest indices have moved to their highest points of this year. The lower yield basis implied in the conversion offer has been accepted in the market and rises have occurred right through the gilt-edged list. In the week ending on Wednesday War Loan 3½ per cent has risen ¾ to 88⅞; Savings 3 per cent 1960/70 has risen ⅝ to 95⅞ and conversion 3½ per cent 1969 has risen ½ to 101¾. Among foreign bonds Roumanians have gained, the 4 per cent Consols advancing from 20¼ to 21⅛. Peruvian Corporation stocks have improved, the 6 per cent debenture gaining ¾ to 53.

A vigorous market continued in most groups of industrials despite some signs of slowing down on Thursday. ICI have been reaching new peaks, gaining 4s. 3d. on the week at 74s. 3d. The modest premium on Stewarts and Lloyds has been easily maintained at 3d. and the other steel shares resold to the public have moved up in sympathy, Lancashire Steel gaining 6d. to 20s. 4½d. Activity in the stores group has continued. Grattan Warehouses have risen 3s. 1½d. to 50s. 1½d., "Gussies" 2s. 6d. to 84s. Among aircraft shares the recent strength of Hawker Siddeley has been fully maintained with a further rise of 2s. 9d. to 78s. 6d. The electrical and radio group has also been strong.

Rubber shares have enjoyed moderate rises in sympathy with the advance in the commodity price. Moderate rises have occurred in the mining finance house shares, central mining rising 9d. to 34s. 6d., and copper shares have been in demand, Nchanga rising ¼ to 9⅞, and Rhodesian Selection Trust 10½d. to 19s. 4½d.

(1) Petroleum production in Canada in 1938 includes natural gasoline. 1938 figure of electricity production in Australia was for 12 months ended June 30th; figures for New Zealand represent about 87 per cent of total generation. (2) Copper and tin refer to metal production. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ended June 30th.

Financial Statistics

EXCHEQUER RETURNS

For the eleven days ended June 30th there was an "above-line" deficit (after allowing for Sinking Funds) of £21,143,000 compared with a deficit of £21,472,000 in the previous week and a deficit of £11,729,000 in the corresponding period of last year. This raised the cumulative deficit to £148,382,000 (£156,419,000 in 1953-54). Net expenditure "below-line" absorbed £18,198,000, bringing the total cumulative deficit to £230,779,000 (£268,268,000 in 1953-54).

THE MONEY MARKET

CREDIT was still short in Lombard Street for two days following the credit squeeze at the half-year end. The market was, however, saved from recourse to the Bank at the penal rate by moderate official purchases, made directly from the market on Thursday of last week and indirectly through the banks on Friday. Conditions then turned comfortable, but on Wednesday last repayments of the previous week's seven-day loans from the Bank caused considerable stringency, which was relieved by considerable special aid, given both directly and indirectly.

At last Friday's Treasury bill tender, although the market maintained its bid at £99 11s. 11d. per cent, its allotment rose sharply, from 38 to 60 per cent. This was a result both of an increase of £10 million in the amount on offer, to £270 million (all of which was again allotted), and of a drop of fully £42 million in total applications, to £384.0 million. At yesterday's tender the offer was again at £270 million.

The gold market has had a quiet week. Until Wednesday, the price at the fixing remained unchanged at 248s. 11d. per fine ounce on every day of the week covered by the Bank return.

The Bank return shows an outflow of notes of £14.3 million, reducing the reserve in the banking department to £13.7 million. Government securities fell by £11.5 million, and discounts and advances by £4.5 million, reflecting the repayment of last week's borrowing at the Bank. Bankers' deposits accordingly fell by £33.7 million to £274.0 million.

The Chartered Bank of India, Australia and China was incorporated in England by Royal Charter on 29th December, 1853, and during the ensuing century its system of Branches has been progressively extended to most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these Branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its Agencies in New York and Hamburg, and a world-wide range of Banking correspondents.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

Head Office: 38 Bishopsgate, London, E.C.2.

'Realms of Silver,' Sir Compton Mackenzie's history of the Bank, has been published by Routledge & Kegan Paul. Copies of the book may be ordered through any bookseller at a cost of 25/-

CONVERTIBLE DEUTSCHE MARK ACCOUNTS

WE CAN now offer our overseas customers facilities both for freely convertible and partly convertible Deutsche Mark accounts. New and interesting business possibilities are thus opened up and, if you would like us to do so, we should be delighted either to send you a leaflet on the subject (together with a schedule of transfers), or to answer any specific enquiries that you may wish to make.

OFFER FOR SALE

1,000,000 6 per cent. Cumulative Redeemable Preference Shares of £1 each at 21/6 per Share

PAYABLE IN FULL ON APPLICATION

LISTS WILL OPEN AND CLOSE ON THURSDAY, 15th JULY, 1954.

THE OFFER FOR SALE WILL SHOW INTER ALIA:

HISTORY AND BUSINESS. Firth Cleveland Ltd. was incorporated in 1953 and carries on business as an Industrial Holding and Investment Company, covering two main fields, namely, Engineering and Allied Manufacturing businesses, and the Retail distributive trade.

ASSETS. The net assets of the Group (including proceeds of the issue of 250,000 new Preference Shares) amount to £1,718,349.

PROFITS. The combined profits for 1953 amounted to £750,588, of which the Engineering Group contributed £458,165 and the Retail Distributors £292,423. This profit, after making all necessary deductions including Profits Tax and the service of the Debenture, covers the Preference Dividend and Profits Tax thereon nearly ten times.

DIVIDEND. The dividend yield on the Preference Shares at the offered price of 21s. 6d. per share is £5 11s. 8d. per cent. less tax.

FUTURE PROSPECTS. The Group's investments cover a wide range of production and distribution and the Company is therefore well based to withstand a setback in trading in any one field. The Directors expect that subject to any unforeseen circumstances profits can be maintained at a figure in excess of the average for the last five years, namely, £615,363.

Full copies of the Offer for Sale on the terms of which alone application will be considered and forms of application are available from:—

BANKERS:

COMPANY MEETINGS

ENGLISH SEWING COTTON CO., LTD

SATISFACTORY YEAR'S OPERATIONS

CONFIDENCE IN PRESENT STRENGTH AND FUTURE PROSPECTS

ACTIVE POLICY OF EXPANSION AND PLANT MODERNISATION

MR LESLIE SHAW ON OUTCOME OF BOARD'S POLICY

The fifty-seventh annual general meeting of the English Sewing Cotton Company Limited will be held on July 29th at the offices of the Company, Arkwright House, Manchester 3.

The following is the statement by the chairman, Mr Leslie Shaw, which has been circulated with the report and accounts: I have to tell you of a further loss suffered by the board. Mr C. J. Kershaw, appointed to the board in 1951, died in July of last year at the early age of 43. Mr Kershaw entered the service of the Company in 1928 and progressed through the various stages of management until he was appointed director with responsibility for development. He was a young man of great promise and his passing at this early age has been keenly felt by his colleagues and friends. He left a widow and four sons.

Revenue for the year of the Group, excluding The American Thread Company, amounted to £1,163,000. Dividends from The American Thread Company amounted to £110,152, making a total of £1,273,152. Tax provisions are £620,248, leaving net revenue after tax of £652,904.

This represents a very satisfactory result for the year's work and the elimination of dangerous inflation in the value of stocks means that the Company's affairs are appreciably stronger than they have been in the past few years.

The accounts as presented are designed to show the state of the Company's affairs as clearly as possible and there is no point in reiterating figures. I feel, however, that I might supplement them by comment where this will serve a useful purpose. Before doing so, I would like to refer to the circular letter sent to all stockholders in December last and to the actions which have followed from that letter.

BOARD'S CIRCULAR LETTER

The letter explained the Company's position as your directors saw it in December and I am quoting it in full as part of my statement so that you can conveniently refresh your memory.

"The directors of your Company have been perturbed about the recent severe fluctuations in the price of the Company's ordinary stock and by persistent rumours of a possible offer for the stock from some unspecified source. This rumour has been coupled with suggestions for the disposal of the Company's investment in the USA.

"The mere fact of the fluctuations and of the rumours has made it necessary for your directors to consider what their duty is at this time.

"They have been made aware of three effects which are harmful to the Company.

"1. A feeling of alarm and uncertainty has spread through the Company's staff, particularly in management, administrative and technical grades. The close knit and happy relationship of all grades of the Company's employees is the result of years of careful work. Your board regard this feeling of mutual trust and regard as one of the most valuable of the Company's assets. The Company has a fine body of workers in all grades and any loss of confidence would be a severe blow to its well-being.

"2. The Company has valuable business connections in many parts of the world and is at present engaged in creating further ties. The possibility of a change in the direction of policy and the rumours of a possible disposal of the Company's American interests can be very damaging.

"3. Relations with The American Thread Company directors and executives have been built up on the basis of mutual trust and esteem and the affairs of the two companies are so closely knit as to make the mere suggestion of a possible split very harmful to the interests of both companies and, therefore, to the stockholders.

"Your board has no evidence of any major change in ownership of shares and the indications are that the fluctuation in price is caused by the fact that the bulk of the stock is held by stockholders who regard it as a secure, long-term investment.

"Your board has no knowledge whatsoever of any prospective bid or of any attempt to secure control of the Company.

"Apart from their concern about the effects mentioned above, your directors are alive to their responsibility to stockholders. Many stockholders who follow the Company's affairs closely are aware of the position of strength which has followed the boards conservative dividend policy. The Company has, however, many thousands of small stockholders who have held their stock for years and who may not be fully aware of all the implications of policy in recent years.

"After careful consideration and after obtaining the best advice they could, your directors feel that it behoves them to write to all stockholders giving their interpretation of the state of the Company's affairs as revealed in its published accounts and as conditioned by events since the 1952 accounts were prepared.

"During the past few years, trading has been conducted under inflationary conditions with substantial price rises and consequent stock inflation. This has led to large 'paper' profits and your board has thought it in the best interest of the stockholders to pursue a conservative policy of dividend distribution. This policy has been fully explained in the various 'Chairman's Statements' and supplementary notes issued with the annual accounts.

DIRECTORS' POLICY

"The board's policy in recent years may be summed up as follows:—

"1. In view of the large number of small stockholders looking to the Company for a steady income, the board has been anxious not to recommend any increase in dividend unless there was a prospect of continuity. Over the recent years, the dividend has been increased from 5 per cent per annum in 1945 to 12½ per cent in 1950-51-52.

"2. The board has been concerned to conserve the Company's cash so long as it was faced with the need for large sums of money to finance stocks at enhanced prices; to rehabilitate and re-equip the mills and to re-locate manufacturing plant where the trend in export markets indicated that this was necessary to protect the Company's business.

"3. The rapid rise in prices, in the post-war years led to inflated profits and was bound to be followed by a severe fall. It was, therefore, extremely important that the resources of the Company should be conserved against that contingency.

"The result of this policy has been to retain in the Company and The American Thread Company a substantial proportion of the profits accruing in the period since the end of the war.

"Apart from reconstruction and the financing of stocks at higher prices large sums have been spent on expansion of the two companies' productive resources. In the case of The American Thread Company, despite the fact that the retained profits since 1946 have been of the order of £2,500,000, this company, at January 3, 1953, owed to its bankers on short- and medium-term notes, a sum equivalent to about £5 million.

"It is at present operating at a low level of profit and the prospects are that very modest dividends will be received from the investment for the next few years. As reported with the 1952 accounts, the period of expansion must of necessity be followed by a period of consolidation.

"The parent Company during 1953 has recovered from the effect of the recession in 1952 and, so far as can be ascertained at present, will produce very satisfactory results for 1953. It is not possible to forecast what might happen beyond that period.

"The aggregate trading results of the parent Company and American Thread Company in 1952 resulted in a loss. Your directors maintained the distribution on ordinary stock at 12½ per cent and this was an indication of their confidence in the Company's present strength and future prospects.

"Furthermore, they transferred £250,000 from stock reserve to general reserve as an indication that their anxiety about high prices had diminished. The point was made clear in the chairman's statement circulated with the accounts.

"In 1953 we have succeeded in reducing stock substantially with a consequent strengthening of the cash position. Large

sums of money will still be required to complete mill modernisation, but, in the absence of a major recession, it is clear that your board will find itself able to pursue a more liberal policy of dividend distribution than hitherto.

"It will be several months before the board is able to determine with any accuracy the results of 1953 trading, but existing reserves are sufficient to support an appreciably higher dividend. The policy of preserving the Company's assets and maintaining a steady dividend will be followed as far as is consistent with ensuring that the market value of the stock bears some relation to the worth of the Company's undertakings. The board anticipates that the total dividend distributable in respect of 1953, will be of the order of 20 per cent on existing ordinary stock, and it is intended to declare a second interim dividend of 5 per cent payable in March, 1954.

"BREAK-UP" VALUE

"One further point remains. A number of statements have been issued from outside sources purporting to show that the value of the Company's ordinary stock on a 'break-up' basis is anywhere between £6 and £10 per £1 of stock. These calculations are of little value, because it is not possible to say what the value of the Company's undertakings would be if its entity was destroyed. The value of assets is, in the final analysis, determined by what they will earn in the future.

"Your board admits, however, that because of the devaluation of sterling and because of the policy of conservation of assets pursued in recent years, the true worth of the Company is not shown in the parent Company's balance sheet. It is broadly true to say that this applies, and after a period of inflation is bound to apply, to any soundly managed concern.

"In view of present circumstances, however, your board has decided to seek the permission of the Capital Issues Committee to issue bonus shares on a £1 for £1 basis, thus increasing the ordinary stock to £4 million.

"In conclusion your directors wish to state that they have been reluctant to issue a statement of this length, but they feel that they would be failing in their duty to stockholders if, at a time when stockholders may wish for guidance they did not comment on the decision to indicate the size of the probable dividend for 1953 and their intention to declare a bonus issue."

CORRECT APPRECIATION OF THE POSITION

There is nothing I wish to add to or subtract from the statement, but the background of your directors' thoughts might be of interest. Your board was fully aware of the position of strength which had been created by retaining in the business a large proportion of earnings. So long as prices were inflated and there was a risk of substantial loss, any prudent board was bound to feel constrained to follow a policy of conserving resources. The expected adjustment came in 1952 and was less severe in its impact than it might have been. Although the results for the year did not justify such a course, having in mind its declared policy of steady dividends and having regard to the Company's strong reserves, the board maintained its dividend distribution at 12½ per cent.

Whilst there is always the risk of further depreciation, particularly as circumstances might arise in which the "£" would increase in value and so bring about a further fall in the sterling prices of commodities, it is felt that the risks are nothing like so great as when commodity prices were at the inflated levels of the past few years. Your board had, therefore, to consider how it should deal with the changing circumstances in order to ensure that the stockholders appreciated to the full the implications of the balance sheet and accounts.

The first thing your board did was to bring up to date the balance sheets of subsidiary companies where substantial amounts had been retained for a number of years in order to provide finance for expansion and modernisation. Early in 1953 it was decided to apply to the Capital Issues Committee for permission to capitalise reserves and increase the issued capital of certain of these subsidiary companies. This was the first of many moves in a careful appraisal of the Company's assets, being a necessary preliminary to future action. It was also clear to your directors, from the trend of sales, that 1953 was likely to show a substantial recovery in earnings.

Your directors were, therefore, concerned and embarrassed by the activity in shares which arose from the unfounded rumours mentioned in the circular letter. As explained in that letter, they took the view that it was their duty to the stockholders to warn them that the market value of the shares might not fully reflect the value of the Company's business.

The proposals mentioned in the letter have been put into effect. Permission of the Capital Issues Committee to issue bonus shares having been granted, they have now been issued. This does not show in the present accounts as they concern the position as at December 31, 1953. The changes will be reflected in the accounts for 1954.

Since December, nothing has happened which gives your directors any reason to feel that their appreciation of the position at that time was not correct.

Because of the heavy borrowings on short terms, I warned stockholders that the Company was likely to receive modest dividends from The American Thread Company until its liquid position was stronger. Your board, and the board of The American Thread Company, have been examining this matter for a considerable time and I am pleased to be able to tell you that a portion of the short-term debt has been replaced by a loan of $7,500,000. It is impossible to forecast the future trend of dividends from America as this will depend on the state of trade, but your directors are glad that it has been possible to substitute for this amount of short-term borrowings a loan due serially over a period of fifteen years.

PARENT COMPANY'S RESULTS AND PROSPECTS

I now turn to the parent Company's results for 1953. I reported in my statement attached to the 1952 accounts that during the 1952 recession we had pursued a policy of "making to stock" in order to keep our mills employed and in the view that the recession in trade was of a temporary nature. Our expectations were realised and during 1953 we liquidated large stocks of thread and yarn. Sales were substantially in excess of production and consequently they represent a figure not likely to be repeated.

The satisfactory nature of the year's result does not blind us to certain underlying trends which were mentioned last year and which are disturbing in their import. We are tending to lose business in a number of foreign markets, due mainly to economic nationalism, and we have been compelled to start manufacture in some markets in substitution for production in the United Kingdom. All this represents added difficulty in doing business.

We have not been content to fight a merely defensive action, but have pursued a policy of expansion which is bearing fruit. Although it is unlikely that the parent Company will continue on the present high level of earnings, your directors have felt sufficient confidence in the future to justify the substantial increase in dividend and I see no reason why, given reasonable trading conditions, we should not maintain and possibly improve this rate of distribution.

CAPITAL EXPENDITURE

Considerable work in modernisation and re-equipment was done during the year. Our building schemes are making good progress, while machinery re-equipment continues at a steady pace. A total of £480,745 was spent on group capital account in addition to large sums on repairs and maintenance.

A note on the balance sheet shows that we are committed for an expenditure of £606,333 on outstanding contracts as at December 31, 1953. The total amounts authorised by the board at the present time are considerably in excess of this sum and we are faced with a continuance of heavy expenditure in maintaining our mills at a standard we think necessary. It will be understood that at any given time we may feel reasonably content that our plant and methods are up to date, but that from year to year our conception of what is necessary alters with the improvements in production techniques which are becoming available to us. We are determined that the equipment of the Company shall be of the highest standard, as we believe that this is the only way in which we can continue to give our workers a secure livelihood and preserve and enhance the profitability of the Company's operations.

So far as supplies are concerned we have experienced an easier year in that fluctuations in price have been less marked. The approaching cessation of the activities of the Raw Cotton Commission and our decision to buy supplies in the market, has meant that we have had to carry much larger cotton stocks than hitherto. This is not fully reflected in the accounts, but it means that at certain periods of the year we have a heavy demand for stock accommodation and for money to finance it. Despite this increased outlay of money we are convinced that the freeing of cotton buying will react to the benefit of the Company and of its customers.

ACTIVITIES OF SUBSIDIARY COMPANIES

Our knitting subsidiaries have overcome the difficulties experienced in 1952 and have had a year of full and fruitful activity. The rebuilding of our Brown Street factory at Congleton is proceeding apace and some parts of the new building are now occupied by our workers. We hope to complete the whole scheme towards the end of this year.

Our weaving subsidiary has increased sales appreciably. Margins are very poor and profits are inadequate, but there has been marked progress in the reconditioning of the mill and we are building up an efficient and useful unit which will make its due contribution to group revenue.

You will see from the president's report to the stockholders that The American Thread Company has experienced a better year. Competition in America is intense, but the Company is now reaping benefit from the re-equipment programme which has been carried out in recent years and from which further benefits will accrue.

Continuing in its intention to broaden and expand the Company's activity, the board has in the past year invested in two merchant firms.

Your board's management policy with subsidiary companies is to leave them as distinct and separate entities, operating under their own management and control, having their own business connections and producing their own trading accounts. We believe that by this method we obtain the best results for the individual companies and reap the greatest benefit for the group as a whole. Your board has other projects in mind designed to offset fluctuations of trade and to ensure the maintenance of high revenue.

EXCELLENT LABOUR RELATIONS

Relations with our workers and their unions continue to be excellent and we are receiving full and constructive help in achieving improved efficiency. Our mills, with one exception, are operating under modern work study techniques. The one remaining mill is under study at the present time—the delay being due to our unreadiness, not to worker resistance. I stress this because Lancashire operatives have on occasion been accused of unwillingness to adopt new methods. Those who know of the scars left by the depression of the 1930's will appreciate the courage which the sacrifice of old safeguards and customs entails. I must also pay tribute to the statesmanlike attitude of the unions with whom we have dealings. They are hard bargainers, but they have overcome many prejudices in their consideration of their members' true interests.

A period of intense development in thinking, as well as in techniques, has imposed a heavy burden on management, and I wish to place on record the board's appreciation of the loyalty and industry of the Company's most important assets—managements at all levels and workers in all grades.

We cannot guarantee good trade and progress in the future, but so far as lies in our power we are ensuring a continuance of the good record of the past few years.

TELEPHONE MANUFACTURING CO.

CONTINUED HIGH LEVEL OF SALES

The twenty-fourth annual general meeting of the Telephone Manufacturing Company Limited, was held on July 5th in London, Mr Fred T. Jackson, OBE, CompIEE (chairman and managing director), presiding.

The following is an extract from his circulated statement:

Our sales have continued at a high level, and 20 per cent of the turnover was exported. We are finding that competition is very keen for export business, particularly from Germany. The work we have in hand will keep us busy for the remainder of the current year, but prices are much keener and we are finding new business more difficult to secure.

I think we can attribute a great deal of our success to constant work on development, for, in proportion to its turnover, your company spends much on development and is well known for so doing.

I referred in 1951 to the establishment, in partnership, of a factory in Sydney, Australia. Progress is being made there and we think that eventually it will be very successful.

The Canadian Branch in Toronto continues to be active. I am of the opinion that in time this too will be a successful venture.

I must refer to the heavy burden of taxation which all industry has to bear. Looking ahead, this heavy taxation is bound to have a very severe effect on the country's economy, for if part of the amount paid away in taxes were utilised in industry it would produce revenue, provide employment and everyone would be better off.

The report was adopted and a total dividend of 10 per cent approved.

DICTAPHONE COMPANY LIMITED

A YEAR OF PROGRESS

MR C. KING WOODBRIDGE'S ADDRESS

The forty-second annual general meeting of Dictaphone Company Limited was held on July 1st at the registered office of the company, 17, Stratford Place, London, W.

Mr C. King Woodbridge, chairman of Dictaphone Company Limited and chairman of Dictaphone Corporation, New York, who presided, reported that sales for the first six months of 1954 indicated an additional increase of nearly 30 per cent in total sales for 1954.

Referring to the profit of the company, Mr Woodbridge said in his address: The net profit for the year 1953, after payment of taxes, amounted to 8.84 per cent on sales. Profit for the current year is running at roughly twice that figure.

Largely because of the very substantial tax burden it was possible to re-invest only 12 per cent of our earnings in our business. Elimination of the excess profits tax at January 1st last is a welcome step in the right direction, which will permit us to make more effective use of the earnings of our company.

While all departments have shown substantial increases during the year under review, our export operation is worthy of particular comment. In 1953 we exported no less than 69 per cent of our production and in 1954 our export business to date accounts for an even higher percentage of our sales. We are exporting to all free countries of Europe; to the entire British Empire, including Canada; and to an ever-increasing number of countries in other parts of the world.

We attribute the success of our world-wide business to the fact that, in sixty-six years' experience as specialists in the manufacture of dictating machines, we have never compromised with quality. Our British-made Time-Master model is a fine precision machine, constructed of highest quality components by the most skilled craftsmen available. As a result, we find ourselves to-day in the strongest competitive position we have ever enjoyed.

Despite this increasing measure of success, we are not becoming complacent. Competition is still keen and has increased during the year under review, and while we have much less to fear than our competitors, by reason of our position of leadership and the far greater experience we possess, we are by no means content. Our laboratories, both in Great Britain and the United States, are constantly introducing improvements, not only to the already successful Time-Master model, but also to our exclusive plastic Dictabelt record, which is the heart and soul of our machine.

Within the limits imposed by the restrictive taxes, we have continued our policy of expanding our manufacturing operations by bringing into our plant the manufacture of additional components. We have also continued our policy of improving and expanding facilities for handling our business in the field. Our executive offices, as well as our London sales and service office, have been moved to new and improved quarters in the West End of London.

Referring to the world-wide Dictaphone organisation, the chairman said: Products bearing the Dictaphone trade mark are being actively sold in more than 70 countries. One of the very attractive features of our after sales service of a Dictaphone Time-Master dictating machine is our Travel Service, whereby customers who are away from their offices may borrow a machine for a few days from our branches or representative in whichever city they may be visiting.

In the United States alone we have more than 20,000 users who take advantage of the Dictaphone Travel Service. Any opportunity of increasing our overseas business never passes us by, and through our overseas establishments we are able to extend full service facilities to "Time-Master" users who may be travelling in those countries where we are established.

You will, I know, expect me to refer to our parent company, the Dictaphone Corporation, which has now completed 66 years of successful trading in the USA and Canada, and it was my pleasure, when addressing the stockholders at the annual general meeting held in New York in May, to report an increase in turnover with a corresponding increase in the net profit.

Having referred to these successes, may I tell you how, in my opinion, all this is possible? Apart from the fact that we are making and marketing a good article, our success is made possible by the enthusiastic co-operation of the company's employees, who are all the time improving the quality of our production and increasing the value of the service we are able to give our customers. These factors have materially contributed to the results which I am pleased to report.

During my visits to this country I have been particularly impressed with the progressive attitude of industry and business generally, and I may perhaps be forgiven, and I am sure I shall not be misunderstood, if I suggest that this company, by the introduction of the Dictaphone "Time-Master" dictating and transcribing machine, has made a very substantial contribution to the efficiency of the many companies we are privileged to serve. These include some of the leading industrialists, banks and insurance companies. A very large number of machines bearing the Dictaphone trade mark have also been supplied to various departments of her Majesty's Government.

During the year 1953 Mr Gordon Paterson, who has occupied the position of managing director of the company since 1947, asked to be relieved of his responsibilities in order that he might, for personal reasons, return to his home in America. In his place the board has appointed Mr Robert W. Belcher, a former member of the staff of the corporation's United States headquarters.

In my opinion, the spectacular success of Dictaphone Company Limited, is another fine example of the fact that the combination of British and American people, working together under the right conditions and direction, is an unbeatable team. We have full confidence in our staff, and are sure that this business will continue to grow and progress.

I would like to express the appreciation of the board to the chief operating officials, the heads of departments on the manufacturing side, our salesmen on the road and all those who in any way contribute to the success of our company. The board is conscious that with the continuation of the co-operation and interest, which is everywhere in evidence throughout the company's activities, we need feel no concern for the future.

The report and accounts were adopted unanimously and the retiring directors, Mr C. Harold Vernon and Mr F. Graham Maw, were re-elected.

THE MERCANTILE AND GENERAL REINSURANCE COMPANY

FURTHER EXPANSION OF BUSINESS

LIFE DEPARTMENT ACTIVITIES EXTENDED

MR H. K. GOSCHEN ON CONTINUED AND RAPID GROWTH

The annual general meeting of The Mercantile and General Reinsurance Company, Limited, will be held on July 27th, at the company's chief office at Moorfields House, Tenter Street, Moorgate, London, E.C.

The following is the statement by the chairman, Mr Hugh Kenneth Goschen, which has been circulated with the report and accounts for the year ended December 31, 1953 :

Before proceeding to the report of our activities for the year, I would like to refer to the appointment of Mr D. A. Stirling to the board. Mr Stirling brings with him a valuable store of knowledge and experience of banking and finance, which cannot fail to be of great use to the company, and we count ourselves most fortunate in having been able to secure his services.

I am glad once again to pay a tribute to our officials and staff. Mr Calburn, our general manager, and his team of officials, have been tireless in their efforts to build up the company on sound foundations, and every member of the staff has co-operated loyally with them in this endeavour. The maintenance and development of our international business depend upon a high standard of personal service to the company's ceding friends. This spirit of service is shared throughout our organisation of keen and energetic men and women.

The accounts now presented show a further increase of capital. On November 17, 1953, a resolution was passed at an extraordinary general meeting, increasing the paid-up share capital once more by £50,000 by the issue of 43,000 further "A" shares of £1 each fully paid, and by the payment of a further 8d. on the 210,000 partly paid shares, which are now paid up to 4s. per £1 share.

You will be pleased to see that there has also been a further expansion of business. The net premium figure at £7,533,355 was once more a record, and means an increase of over 15 per cent against that for 1952. I must, however, sound a note of warning. During the postwar period we have been accustomed to look for a certain natural growth of our business from year to year, distinct from that due to the development of our connections. Of recent years I have referred to a lessening of this automatic trend and signs are not now lacking that, with the return of more stable monetary values, we may have to reckon with a greater stability, or even a certain natural contraction of premium income, the more so in view of the general and continuing increase in the sums retained for own account by the original ceding companies. We should not, therefore, expect that we shall again in 1954 be able to report an expansion of business at the rate which our shareholders must have come now to regard almost as a matter of course after seven years of continuous and rapid growth.

FIRE ACCOUNT

Against this background the development of the fire account must be regarded as satisfactory. But to look for any substantial growth in the immediate future would be over-optimistic and, in fact, the maintenance of the fire account at its present level, over three times that of 1946, the first full post-war year, will call for the full deployment of all our resources of initiative, service and enterprise. At the same time no opportunity is lost of exploring the possibilities of new forms and fields for our endeavours, and it is satisfactory to record that our efforts are meeting with some measure of success. The business of the fire department yielded a satisfactory profit.

ACCIDENT DEPARTMENT

The results of the accident department unfortunately show a loss under the general section This was mainly attributable to adverse results in the motor, public liability and fidelity guarantee sections. Burglary and miscellaneous business have again shown reduced profits, the latter mainly due to the heavy flood claims which the company was called upon to pay as the result of the disasters at the end of January. Aviation results improved during the year, and personal accident business showed a profit. We were not heavily involved in any major air catastrophes during 1953.

It has been noticeable that rates are being reduced for personal accident, burglary and ordinary third-party business. These classes now show a much smaller profit margin than in the past, and should the claims experience harden to any appreciable extent in the future, it is doubtful whether these classes of business can remain on a profitable basis.

MARINE ACCOUNT

The marine account shows a levelling-off of the rather rapid premium expansion in recent years. The less favourable outlook to which I referred last year still prevails, and is revealed in the harder loss experience which the account shows. This, I believe, reflects the general tendency in most marine markets where keen competition has had the effect of depressing rates. We are continuing our policy of building up the marine fund.

LIFE DEPARTMENT

The life department continued to be extremely active, and the net new business completed was once again a record at £12,599,651, against £10,440,556 in 1952. It is also worth while noting that the net premium income exceeded £1 million for the first time. During the past year, there has been an increase in requests for automatic cover, both from home and overseas territories. There are, of course, sound reasons for this. Automatic facilities help in two important ways: the direct offices are enabled immediately to accept sums considerably in excess of their own retentions and can eliminate the delays due to facultative reassurance ; moreover, a notable saving in costs is achieved by transferring much of the routine work to an organisation specially equipped, as we are, to handle it.

In 1953 we extended our activities in life within the United Kingdom by the introduction of the substandard pool for cases of raised blood pressure, and this has aroused much interest. The facilities we offer for substandard business in general are being used to an increasing extent. That we can do this on sound lines again demonstrates, I feel, the value of the professional reinsurer. The covering of a number of cases of a similar nature received from many different companies should enable the reinsurer to establish fair rating principles for these contentious classes of risk.

It will be observed that the claims by death increased considerably, but an increase in the claims must be expected as the portfolio expands. Our overall mortality experience continues to be satisfactory.

INVESTMENTS AND LOANS

You will see that the total investments and loans of the company show a further considerable increase, being approximately £2,157,000 more than the sum invested at December 31, 1952. We have continued to move cautiously from the position of a few years ago, when the bulk of our funds was in short-dated Government bonds, towards the holding of a larger proportion in medium-dated bonds and first-class industrial debenture and ordinary stocks, and we have in this way been able to participate in the general improvement which has taken place in the prices of Stock Exchange securities. There was, I am pleased to say, a satisfactory increase in the margin between the total market value of the company's securities and the value at which they appear in the balance sheet. As time goes on, however, we shall inevitably see a reversal of this trend. To cover a small percentage fall requires quite a considerable sum of money and, although at the moment we have a satisfactory margin, it is one which can very quickly disappear in a falling market. We have, therefore, thought it only prudent again to make transfers to the provisions for investment and exchange fluctuations.

CANADIAN SUBSIDIARY

Our Canadian subsidiary—The Mercantile and General Reinsurance Company of Canada Limited—has had a good year. You will see that a profit of $82,997 has been earned on the year's working, which we must consider very satisfactory, bearing in mind the heavy cost of financing new business and that 1953 was only the second year of the company's operation. As this company has now become firmly established in the Canadian market, it was felt advisable to take steps early this year to enlarge the organisation so as to be able to deal with the increasing business and provide the appropriate service to the ceding companies who place their business with us. General Sir Neil M. Ritchie, GBE, KCB, DSO, MC, has now been appointed to the post of President. We feel that his considerable administrative experience and gifts of leadership, coupled with the roots which he already has in that great country, will be of the utmost value to this promising company. Mr G. M. Huycke, QC, has taken my place as chairman of the board, and Mr D. G. Barnard has been promoted to the post of general manager. The staff is also being increased by the appointment of some technical men who have been trained in our own office. We feel that the organisation thus strengthened is now fully prepared for further expansion. I would like to extend our thanks to the board of this company for their help and to Mr Barnard for his unflagging efforts.

You will remember that in my statement last year I said that we had arranged to lease on a long term the building off Moorgate known as "Moorfields House." During the latter part of the year we moved into this building and our whole staff is now concentrated there. We now have adequate space for our needs and much improved working conditions for the staff. We regard this move an important milestone in the company's development and a valuable contribution to the efficiency of the organisation.

It is perhaps worth while noting that we now have active business relations in no fewer than thirty different countries. It is our policy to keep in close personal touch with all our business friends wherever they may be, and last year our officials travelled over 150,000 miles in order to bring British reinsurance services to these world-wide connections. It is a pleasure to pay a tribute of grateful recognition to our friends for the warm welcome and hospitality extended to the company's representatives.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS

CAPITAL EXPENDITURE EXCEEDED £5 MILLION

SIR GEORGE EARLE ON EVER-GROWING DEMAND

The annual general meeting of The Associated Portland Cement Manufacturers Limited was held on July 8th in London, Sir George Earle, CBE (the chairman), presiding.

The following is an extract from his circulated statement :

I would like to draw your attention to our total capital expenditure of over £5 million in the consolidated accounts. This was financed without the issue of fresh capital on our part, and fortunately we still have considerable liquid resources.

Last year the demand for cement was heavily swollen by defence needs and was greater than our production. Sales of our other products were satisfactory, and exports of cement and other goods were well maintained.

As we are responsible for about two-thirds of the cement production in this country, we have a special duty to keep the home market supplied and to do our full share of the export trade. The only way in which this could be done in 1953 was by importing cement from the Continent. It was an unpleasant decision that had to be made, and not a cause of rejoicing as regards profits. The cement we imported was sold at the home trade price and realised over £800,000 less than its cost ; this is the main reason for the reduction in our trading surplus.

DIVIDEND INCREASED—STAFF AND WORKMEN BENEFIT

The Associated Portland Cement Manufacturers Limited holds over 80 per cent of the British Portland Cement Manufacturers Limited, and 100 per cent of the Alpha Cement Limited equity.

For these three companies the trading surplus decreased by £625,000 to £9,094,000. We set aside £2,888,000, which is £463,000 more than the previous year, for depreciation and replacement of plant and machinery, leaving £6,206,000. Provision for taxation decreased by £1,892,000 to £3,348,000. After deducting directors' emoluments, debenture service, expenditure in connection with flood damage, share issue expenses, a subvention payment to a subsidiary company and transfers to general contingencies and dividend equalisation reserves, amounting in all to £1,821,000—an increase of £637,000—there is left for the stockholders £167,000 more than last year.

It is proposed that the major part of this increase be passed to them by way of a higher dividend. Stockholders in general have had a raw deal for many years, and the increases we have been able to make in the amounts distributable to them are still far below the rise in wages and in the cost of living.

I am glad that our staff and workmen will benefit from the increased dividend through their profit-sharing scheme.

Apart from expressing our gratitude for the investment allowance, I do not intend to talk about taxation, for practically every company chairman, including myself, has explained the dire effects of our present taxation on incentive, and also the difficulties in providing for the replacement of fixed assets. It is indeed a serious matter and Mr Butler is no doubt even more aware of the position than any company chairman ; I am sure he will do what can be done to put it right. The reason for taxation is to produce the money the Government spends, and it does seem that something more could and should be done regarding this expenditure.

FUTURE PRODUCTION

We have decided to build two new works in England, at Westbury in Wiltshire and Cauldon in Staffordshire. The grinding and packing plant at Widnes which will take its clinker from the sulphuric acid plant of the United Sulphuric Acid Corporation is finished, but it will be next year before the clinker is available. As mentioned last year, we have also agreed to purchase all the cement which will be produced from the sulphuric acid plant at Whitehaven, and to give the makers, Solway Chemicals Limited, any technical advice they may require on cement. The quality of the cement to be produced at Widnes and Whitehaven should be very satisfactory.

These four new sources of supply will give us rather more than half a million tons of annual production. In addition, our works department and research staff have certain new developments, and we shall be disappointed if these do not give us increased output from our existing works, and also reduce our fuel consumption.

The demand for cement, owing to new and improved uses, normally increases by about 5 per cent per annum. We think, therefore, that our production will be absorbed, taking the long-term view. Boom conditions cannot last for ever, but as it takes approximately three years to build a works nowadays one must, in this question of production, look some way ahead.

After reviewing the group's activities in overseas markets, the statement continues:

Further progress has been made in our production per man-hour. It was 1.5 per cent higher than in 1952, and 25.6 per cent higher than prewar. The comparative figure for our men's earnings is approximately 200 per cent above 1938 for the same number of hours worked.

The question of dust emission from our factories has again received our very closest attention during the year. I hope that the fact that since the war we have spent £789,967 on dust-prevention plant at our works will convince our neighbours that we are treating this matter very seriously.

The report and accounts were adopted and the final dividend of 2s. 6d. on each £1 unit of ordinary stock, making with the interim payment of 1s. a total of 3s. 6d. for the year, was approved.

THE MORGAN CRUCIBLE COMPANY, LIMITED

IMPROVED TREND OF TRADING

The twentieth annual general meeting of The Morgan Crucible Company, Limited will be held on July 28th in London.

The following is an extract from the statement by the chairman, Mr P. Lindsay, OBE, MC, which has been circulated with the report and accounts :

Towards the end of the last calendar year a welcome improvement in the climate of British trade became apparent, despite the opposite trend in USA. Our business has shared in this improvement and in consequence our order book has a healthier colour than at the corresponding period last year. This happy state is not reflected in the year's sales turnover which is appreciably less than in 1952-53, though the fall in foreign is relatively less than in home sales in spite of the well known difficulties with which the British exporter is confronted.

Having regard to the fall in sales turnover, I am glad to say that our net group profit, after tax, is only slightly less than that of the previous year. This could not have been achieved without a continuing improvement in management and production technique in which workers, at all levels, have co-operated.

BALANCE SHEET AND PROFIT STATEMENT

The most significant feature is the considerable growth of liquidity revealed in the amount and nature of current assets in relation to current liabilities. This is due partly to planned reduction in stocks as well as to the cumulative effect of restraint on disposal of resources. Against the increase in net liquid assets I draw attention to a small but significant reduction which has not been experienced for many years in the value of fixed assets. This is due to the near completion of a five year programme which has involved total capital expenditure of over £2,500,000. A cumulative effect of this expenditure is revealed in our profit statement by the charge of over £300,000 against depreciation, or double the amount which was incurred five years ago. Let no one infer that now we will hesitate to embark on further large scale capital investment when occasion arises.

PROSPECTS

Shareholders may assume from my survey that I look to improved results in the current year. That is so, provided of course present trade trends are not reversed. As to that, one may ask why British trade, since the dawn of 1954, has turned out better than most of us foresaw.

There have been doubtless a number of contributory factors ; a more favourable money market climate and expansion of our gold reserves. There has been also a delayed stimulus, resulting from improvement in terms of trade. I am of the opinion, however, that above all, we are experiencing now the real benefit of postwar capital expenditure and improved management, resulting from the courage and enterprise of British industry. The consequent check to rising costs, accompanied by increased production, has slowly but surely contributed to increased consumption and general well-being.

We feel that the growth of resources revealed in the balance sheet, coupled with an improvement in profit outlook, justifies a modest increase in appropriation for dividend. In consequence, the proposal in the directors' report is that the final dividend be increased 1½ per cent to 10½ per cent, making with the interim a total distribution of 14 per cent.

ASSOCIATED BRITISH PICTURE CORPORATION

INCREASED PROFITS

DIVIDEND MAINTAINED

SIR PHILIP WARTER ON BOARD'S PROGRESSIVE POLICY

The twenty-seventh annual general meeting of Associated British Picture Corporation, Limited, will be held on July 28th in London. The following is an extract from the circulated statement of the chairman, Sir Philip Warter:

Trading profits of the group at £2,213,312 show a rise of £145,536 over the corresponding figure for last year. The group net profit before taxation has increased from £1,477,275 to £1,669,857, and after providing £1,104,573 for taxation, the net profit amounts to £565,284, as against £498,077.

As a result of further progress towards the settlement of deferred repairs and the E.P.T. liabilities a further sum of £250,000 has been released from the provisions for taxation. Including the balance brought forward of £266,389, the total amount available is thus £1,058,859.

We are making substantial progress in equipping the theatres with new projection and sound systems which involve, of necessity, the expenditure of a very large sum. Accordingly a sum of £450,000 has been transferred to a development reserve.

After meeting the fixed preferential dividends, £189,750 (£181,125) and providing for a total distribution of 20 per cent on the ordinary stock (20 per cent), requiring £220,000 (£216,250), the balance carried forward to next year amounts to £199,109.

Current assets have risen by no less than £476,529 to £2,775,608, of which £1,240,147 represents cash at bank, on deposit and in hand.

It is noteworthy that this year there is an excess of current assets over current liabilities of £745,006 compared with a deficiency a year ago of £35,237. Your directors have been able, since the date of the accounts, to repay slightly more than £1 million of the secured indebtedness.

Although television continues to be a strong competitor for the public's entertainment I feel quite confident that the films coming forward in CinemaScope and other new media, as a result of the reorganisation which has been going on in the major studios, are of sufficiently good quality to ensure that the industry in this country will hold its own from now on.

The progressive policy adopted by your board in the equipment of the Corporation's cinemas with wide screens, anamorphic lenses and stereophonic sound equipment continues as fast as the component parts become available.

During the past two years I have found it necessary to be cautious in my approach to the future since it was evident that there were considerable changes taking place within the industry, both here and in America, which might result in difficult trading conditions over a long period. There is ample evidence, however, that the public's reaction to good films is as great as it ever was, and with our progressive policy of equipment for films in the new media we can look forward to a steady supply of box-office attractions once the temporary shortage of films has been overcome.

Having regard to all these factors I think we are entitled to take a much more optimistic view of the future than we have done for some time past.

WIGGINS, TEAPE & CO. (1919) LTD.

HOME AND OVERSEAS SALES EXPANSION

TRADE IMPROVEMENT CONTINUES

The 35th annual general meeting of Wiggins, Teape & Company (1919) Limited was held on Thursday, July 8, 1954, in London, Mr L. W. Farrow, CBE, the chairman, presiding.

The following is an extract from the statement by the Chairman, circulated with the report:—

I referred in my statement last year to the more promising outlook for your group for the year 1953. I am glad to inform you that the improvement in the paper trade to which I referred continued throughout the remaining part of the year. As a result of this, we were able to keep all our mills running to full capacity but even with some overtime working we were not able to keep pace with all the demands of our customers, this situation getting more difficult as the year progressed. Our stocks of finished products by the end of the year had become embarrassingly low. The prices of our main raw materials and the sale prices of our finished products remained reasonably stabilised during the year.

The volume of the production of paper at your group's mills in 1953 was very nearly equal to that of the record year of 1951. On the other hand, the volume of sales of paper produced at your mills was a record in the history of the company. This resulted in the reduction of stocks of paper to which I have referred. Trade in the overseas markets showed a considerable expansion over 1952.

PROGRESS OF MERCHANTING BUSINESS

The volume of our merchanting business both at home and overseas showed great improvement during the year as compared with the year 1952. The supplying mills both at home and abroad have been most co-operative in helping us to meet the demands of our customers.

The results of our subsidiary company, Pirie, Appleton and Company Limited, together with its group of companies overseas, which manufactures envelopes and stationery, were not altogether satisfactory but I am glad to say that the results of the second half of 1953 were considerably better than those of the first half.

Stockholders were fully informed in my circular to them dated October 22nd last as to the financial set-up of your group of companies in Australia. Satisfactory progress is being made with the building of the mill.

The trading profit for 1953 of the South African Pulp & Paper Industries Limited, in which your company has a substantial interest, showed a slight recession on that for the year 1952, but the company paid the same dividend, notwithstanding this slight setback. The erection of the new mill on the site at the Tugela River in South Africa is nearing completion and it is expected that production will commence there in the near future. I am glad to be able to report that our relations with the management of South African Pulp & Paper Industries Limited, continue to be most cordial.

DEVELOPMENT OF SPECIALITY AND INDUSTRIAL PAPERS

In my last statement I referred to our output of speciality and industrial papers and the progress made by our technological staff in their development. I am glad to be able to state that the output and quality of these papers again has improved substantially. During the past year we have reorganised a machine at our Dover mill to enable us to meet the exacting requirements of one important industrial paper, and I am glad to report that the product has come up to expectations. Our research staff has continued to foster all forms of recording instruments on our papermaking machines so that more and more of our production is coming under continuous measurement rather than being subjected to "spot" tests. We believe that this more rigid control will definitely assist the printer and the converter in their quest for the faster running of their machines and higher quality products.

THE ACCOUNTS

With regard to the consolidated balance sheet of the Wiggins, Teape Group of companies, it will be seen that, taking into account the amounts set aside for future income tax, the surplus of current assets over current liabilities amounts at the end of 1953 to £8,246,064, compared with £7,413,747 at the end of 1952.

The following shows the amounts for which fixed assets, excluding freehold land and motor vehicles, are insured, compared with the values appearing in the consolidated balance sheet:

Insured Values:—	£
Building	6,605,281
Plant, Machinery, etc.	9,592,570
	£16,197,851

Balance Sheet Values, including Freehold Land and Motor Vehicles:—	£
Total as per Schedule on page 12	9,756,603
Less: Provisions for Obsolescence and Renewals on page 6 ...	2,192,003
	£7,564,600

TRADING RESULTS

Upon turning to the consolidated profit and loss account on pages 4 and 5, it will be seen that the trading profits (subject to the items detailed on page 4) of the group for 1953 amounted to £3,873,485, compared with £2,183,935 (before adding the transfer from paper and raw material stocks reserves of which a full explanation was given in the directors' report last year). Your directors consider that this result is very satisfactory considering that in the first six months of the year the improvement in trade had only just commenced.

After adding investment income and interest received, and deducting the expenses and provisions enumerated, taxation, dividends applicable to outside shareholders and profits retained in subsidiary companies, the profit attributable to Wiggins, Teape & Company (1919) Limited, amounts to £1,347,002, which compares with £302,377 (before adding the net transfer from stock reserves) for 1952.

It will be seen that the sum of £730,000 has been transferred to general reserve. The total revenue reserves now amount to £5,092,348.

In connection with the Thomas Owen acquisition, it was necessary to declare and pay a second interim dividend before the end of April, 1954, in place of the usual final dividend. As you know, the total dividend for 1953 was brought up to 17½ per cent less income tax, 2½ per cent of which was paid as a bonus. This compares with the total dividend on the ordinary stock for the year 1952 of an equivalent of 12.381 per cent less income tax.

CURRENT YEAR'S PROSPECTS

With regard to the current year, I am glad to say that the improvement in trade has continued and our mills are working full time with a certain amount of overtime.

On the merchanting side of our business, the general trend of the paper trade has been experienced and business is good both at home and overseas, except in those markets where there are restrictions on imports.

The profits for the opening months of this year show a considerable increase over those for the same months of last year when trade conditions were not so satisfactory. Providing the present trading conditions continue during the rest of the year we should be in a position to present a very satisfactory balance sheet for 1954.

TRIBUTE TO EMPLOYEES

As you may know, the basic wages of our workpeople are arranged between the Paper-makers Employers' Federation and the various trade unions concerned. In addition to these basic wages, incentive bonuses are paid at our mills based on production and quality. This means that our workpeople are directly interested in two of the principal factors of profitability, namely production and quality.

Our pension and sickness schemes operated for the benefit of our employees help to relieve the worries attendant on old age and sickness. There is no doubt that these schemes are conducive to the well-being, happiness and efficiency of our employees.

Once again it is my pleasant duty to express our sincere thanks to all our employees, both at home and overseas, for their loyal work during the year 1953.

GEORGE WIMPEY AND COMPANY, LIMITED

FURTHER EXPANSION OF TURNOVER

SIR GODFREY W. MITCHELL'S REVIEW OF WIDESPREAD ACTIVITIES

The thirty-fifth annual general meeting of George Wimpey and Company, Limited, was held on July 2nd at the Grosvenor Hotel, London, S.W.

Sir Godfrey Mitchell (chairman of the company) presided and in the course of his speech said:

For the second year in succession we have been blessed with exceptionally favourable contracting weather, and this has helped materially in enabling your company to accomplish another substantial advance in the volume and variety of work undertaken.

In this country we have carried out an enormous amount of building, civil and mechanical engineering work, and we have extended our regional activities by establishing an organisation in Leeds to cover the area of South Yorkshire, where this development is already proving its worth.

OVERSEAS

Overseas we are working in no less than sixteen countries, and I should like to mention some of our major projects.

The Government of Turkey have awarded jointly to the English Electric Company and ourselves a contract for the construction and equipping of an £11½-million hydro-electric power project at Hirfanli on the Kizilirmak River, about 65 miles from Ankara. We shall undertake the whole of the civil engineering and construction work, and permanent electrical machinery and equipment will be supplied and installed by the English Electric Company.

Our opencast coal activities in Australia are still proceeding, and, as you may have seen announced in the press, we have been awarded a contract to win uranium ore by open-cut mining at Rum Jungle, Northern Territory.

We have reason to be pleased with the progress made in the construction of the oil refinery and harbour at Aden for the Anglo-Iranian Oil Company, since it is anticipated that this vast project, in which we are partners with Middle East Bechtel Corporation, will be completed well ahead of schedule.

In June, 1953, we commenced work on the new impounding reservoir at Wemmershoek, South Africa, for the city of Cape Town, and this important contract is now getting well into its stride.

Our contract for the naval dry dock at Karachi was completed by the due date, and civil engineering work to the extension of the Singapore power station and the construction of the oil jetty is virtually completed. Good progress is being maintained on the building work which remains to complete the entire power station.

On the Gold Coast our contract for pipelines and railway work in connection with the port of Tema project is proceeding well, and the construction of the technical institute at Takoradi is well advanced.

We continue to carry out a considerable amount of building and civil engineering work in Borneo, where we are also engaged on the construction of a second marine oil drilling platform.

Our organisation in Baghdad played a vital part during the emergency created by the disastrous flooding of the Tigris.

Although there is very keen international competition, a good deal of road work has again been undertaken in Iraq, and in Jamaica our housing contract for the Jamaica Bauxite Company has been successfully completed.

One of your directors has recently made an extended tour of Canada and, following his visit, we have opened an office in Toronto,

HOME ACTIVITIES

At home we have made a substantial contribution towards the achievement of the government's housing target by completing and handing over to local authorities no less than 18,628 permanent dwellings during the year. Of this number, 17,334 were built by our Wimpey no-fines concrete technique.

We have continued the successful development of multi-storey flats in no-fines concrete and blocks of flats up to eleven storeys have been commissioned throughout the country.

Just as our no-fines concrete houses have become an important part of the housing drive, so our multi-storey no-fines flats, because of their economy in money and time, will play a large part in the forthcoming slum clearance programme.

We are engaged in the construction of important business premises in Haymarket, London, a new factory at Dunstable for Vauxhall Motors, Limited, offices and a laboratory at Harrogate for Imperial Chemical Industries, Limited, considerable extensions to a factory in South Wales for British Geon, Limited—a subsidiary of the Distillers Company, Limited—and a number of large reinforced concrete hangars for the Air Ministry.

At the Isle of Grain Oil Refinery we continued, most successfully, to carry out a great volume of fabrication and installation of plant and equipment. Steady progress has been maintained on a great variety of building, civil and mechanical engineering at the new Chemical Works at Ellesmere Port.

We have made a good start on a considerable contract for the construction of an oil storage depot in Scotland for the Anglo-Iranian Oil Company, and work has commenced on the construction of a new power station for the B.E.A. at Ferrybridge, which, when completed, will be one of the largest in the country.

Our work on intakes, tunnels and surge shaft at Meig and Luichart for the North of Scotland Hydro-Electric Board is approaching completion, but I am pleased to report that we have secured further important contracts for hydro-electric work at Loch Shin.

During 1953 production of opencast coal declined, but even so we produced 1,844,000 tons of coal.

Because of the dearth of road construction work in this country, our asphalt road department has carried out a reduced volume of work, but has fully maintained its place in the industry.

ACCOUNTS

If you will now please look at the accounts you will see that our profit after taxation amounted to £736,855. The increase in profit and the higher level of certain of the expense items result from a further expansion of our turnover, which last year reached the record figure of £70 million.

It is proposed to pay a dividend of 10 per cent, less income tax, on our ordinary shares, and to issue to ordinary shareholders 50,000 5 per cent redeemable second cumulative preference shares of £1 each as a bonus, on the basis of one redeemable preference share for every 20 ordinary shares held.

So far 1954 promises another good year's work, but, taking the long view, there is no doubt that the industry has entered a period of very keen competition throughout the world. However, with your company's resources and the flexibility of its organisation, I feel that we shall be able to meet whatever the future has in store.

The report and accounts were adopted.

BOVRIL LIMITED

LORD LUKE'S REVIEW

HOPE OF BETTER UNDERSTANDING WITH ARGENTINE

The fifty-seventh annual general meeting of Bovril Limited was held in London on July 9th.

The Rt Hon Lord Duke, the Chairman, in his address to the shareholders, said the Company had achieved satisfactory results, in spite of unprecedented rises in the price of meat extract and a marked increase in the availability of foodstuffs in the shops.

RAW MATERIAL COSTS

A commodity like meat extract, with a limited world production and potential markets which caused violent price fluctuations, made regular users like themselves vulnerable. That was why their factory in South America was of such importance in safeguarding their supplies, but they had been able to ship only a small amount of product since the sterling permit had covered a limited tonnage. Bovril's raw materials were at present rated low in priority, but since they had been promised decontrol of meat products they hoped that would apply no less to meat extract.

PROGRESS IN NEW PRODUCTS

Sales of Bovril had naturally been affected by the higher prices, but had been maintained at a satisfactory level.

It was significant to note that the price of Bovril had increased only approximately 86 per cent since 1900, whereas many commodities had increased at least 200 per cent.

Other Bovril products had played an increasingly important role in their economy. Bovril Brand Weaning Food continued to make steady progress. The number of chemists selling this excellent product increased daily, and more mothers were using it as part of their infants' diet. Progress in the company's products made in Ireland and Canada had been maintained. They had purchased part of the business of Apollinaris relating to Four Seasons Fruit Squashes and Gold Cup Jaffajuce Orange. The latter had an exceptionally high fruit juice content, and initial sales were most encouraging.

DEVELOPMENT IN PRODUCTION AND RESEARCH

Several factors connected with their products were receiving close attention. They were searching for methods of reducing the cost of manufacture, packaging and distribution. Research was being done to see whether Bovril's nutritional properties might be still further increased, either by improving on traditional forms of production or by reinforcing existing constituents. Research would be done into all their products and into food and nutrition generally. They had invited a panel of eminent scientists to advise their research department about policy.

VISIT OF ARGENTINE STATESMEN

Conditions in the Argentine had not varied greatly though their own operations had prospered. It was to be hoped that with the end of meat rationing the public would renew their taste for the high quality Corned Beef they knew before the war.

It had been an event of great importance to welcome to this country two Argentine statesmen — Dr Remorino, Minister of Foreign Affairs, and Dr Morales, Minister of Economic Affairs. This visit was long overdue, but so was the visit of a British Minister to the Argentine when the Marquess of Reading travelled there in 1952. The new pattern of decontrolled trade in this country had been fully impressed upon the Argentines, but it was probably easier for Britain to lift controls than it was for Argentina. As a controlled economy had been established there because of this country having imposed the same for war purposes, Argentine might return to normal trading conditions when Britain did.

The trade pattern between the two countries had changed because Argentina had less meat to export and we had developed new sources of supply. Furthermore, the Argentine had found her other exports commanded less of a premium in world markets and her import requirements had not decreased. Industrialisation had made an impact, but he doubted whether the Argentine would ever ignore her traditional exports and throw over long-standing and friendly customers. He hoped this visit of Argentine statesmen would be the forerunner of many such visits so that their two countries might know each other better and renew the friendly relations of prewar years.

BOVRIL'S AUSTRALIAN ESTATES

In Australia they had struggled with a difficult problem for many years with little encouragement from successive Australian governments. The development of Australia's Northern spaces was of considerable importance to the British Commonwealth. It would therefore be advantageous for joint consultations to take place between governments and industrialists to establish the best method of communications which were a pre-requisite to any progress being made. Such a method might bring together the existing opposing views which at present ruled each other out and stultified any advance. The main arguments were between railway construction and development of the carriage of animals by air, either on the hoof or as meat. If an established policy could be agreed, then joint financing should not be too difficult.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The Chairman said that in the Consolidated Profit and Loss Account the Group Net Profit for the year was £308,000, of which £72,000 belonging to the Parent Company was retained by Subsidiaries and £184,000 was dealt with in the Parent Company's Appropriation Account. After payment of the fixed dividends the Directors recommended a final dividend of 10 per cent on Deferred Stock, making 12½ per cent for the year, and were recommending the transfer of £24,165 to Reserve for Contingencies, leaving the carry forward slightly increased at £215,088.

LONG SERVICE AWARDS

The Chairman ended by saying that without the loyalty and hard work of all the staff they would make no progress. They all regretted the necessity to have closed their Bedfordshire factory where the staff had served them loyally and happily for many years. In the year under review 12 members of their staff had qualified for the Long Service Staff Award after 30 years' continuous service.

LAPORTE INDUSTRIES, LIMITED

CONTINUED HIGH LEVEL OF DEMAND

The forty-seventh annual general meeting of Laporte Industries, Limited, was held on July 8th in London, Mr L. P. O'Brien (chairman and managing director) presiding.

The following is an extract from his circulated statement:

It may be remembered that last year I had to report a temporary setback to the progress of the company after many years of continual expansion in production, turnover and trading results. Looking back it can be seen that the previous highest recorded results of 1951-52 gained some profit content from buyers adding to stocks amounts of raw materials in excess of current needs.

During the financial year now under review the volume of business transacted attained new high levels for almost every product manufactured by each of the operating companies throughout the group. This high level of demand was continued during the first two months of this current financial year and the stock position of buyers seems to be maintained at reasonable levels as compared with what were in many cases abnormal stocks held two years ago.

GROUP INCOME EXCEEDS £1 MILLION

This is the first occasion when one has had the opportunity of announcing income for the year (before taxation) exceeding the round one million, at £1,037,839, and after meeting debenture interest amounting to £129,455 (gross) as against £14,503 in the previous year, and depreciation £309,456 against £158,369. Debenture interest in a full year amounts to £137,500 (gross) and this amount is covered 8½ times by our surplus after deducting depreciation.

Your directors are of opinion that the trading results for each operating company throughout the group during 1954-55 should turn out to be as satisfactory as for the past year.

Our group income, after taxation and an amount due to a minority member of a subsidiary company, was £619,241. Of this amount, £254,660 has been retained in subsidiary companies and therefore the net income of the parent company is shown as £364,581.

You are now asked to confirm the payment of preference dividend for the year, £6,229, and the interim ordinary dividend of 5 per cent amounting to £40,891. Of the remainder it is proposed to increase the final ordinary dividend to 11 per cent to transfer £200,000 to general reserve, and increase the carry forward by £27,186.

The capital and revenue reserves now exceed the nominal value of the issued ordinary capital, and the board has applied to Capital Issues Committee for permission to capitalise part of the reserves to enable the company to make a bonus issue of one fully-paid ordinary share of 5s. for every three ordinary stock units of 5s. now held.

We export as much of our products as we can spare and supply to many overseas countries, but our products are raw materials to domestic manufacturers, most of whom have wide export interests, and their end products make a much more valuable contribution to the balance of trade than we could effect, and consequently we feel it our duty to give first consideration to the requirements of the home market.

The report and accounts were adopted.

At the subsequent extraordinary general meeting the scrip issue proposals were approved.

SMITH'S POTATO CRISPS LIMITED

RECORD SALES

The twenty-fifth ordinary general meeting of Smith's Potato Crisps Limited, was held on July 6th in London.

Mr Fermian Le Neve-Foster, the chairman, in the course of his speech, said: Once again your directors are able to present to you an excellent report. The net profit of the group, before taxation, amounts to £364,971 as against £293,276. The net group profit, after taxation, comes out at £141,575 as against £105,715 last year.

The appreciable increase in the profits of the parent manufacturing company is not attributable to any increase in profit margins per tin but solely to the heavy increase in sales of our products. Our net margin of profit before taxation is appreciably less than ¼d. per packet.

Once again I am able to report to you that the volume of production and sales constitutes an all-time record in the history of the company and the turnover has now reached a rate appreciably over £3 million per annum. This involves the manufacture and distribution throughout the country of approaching 400 million packets of crisps per annum, a rate approximating to 8 million per week. I imagine that few, if any, packet food products can approach this record.

THE DIVIDEND

The directors have decided to pay a final dividend of 20 per cent, plus cash bonus of 5 per cent, making a total distribution of 32½ per cent and thus maintaining the record for the 16 previous years.

The board considers that the time is appropriate to recommend a further capitalisation of reserves representing a part of the profits ploughed back. It is proposed that this should take the form of a capitalisation of a sum of £41,385 of the capital and general reserves which will be applied to the payment up in full of 165,540 shares of 5s. each to be distributed among the ordinary shareholders in the proportion of one fully paid share of 5s. for every 10 shares held. At the same time the directors recommend that the opportunity should be taken of increasing the authorised share capital of the company from £500,000 to £600,000 by the creation of a further 400,000 shares of 5s. each in order that there may be a margin of unissued capital at the disposal of the board should further occasion require it.

It is satisfactory to report that our farms, belonging to the Estates Company, had a reasonably good year and made a contribution to the group profit.

Once again the results of our Australian company for the year show a nice increase on the previous year.

"NO CRISPS LIKE SMITH'S"

Our product seems unique in the unlimited variety of its outlets. Wherever food is served or sold, Smith's Crisps will be found. Children are among our most enthusiastic supporters. You hear it said in all places, "There are no Crisps like Smith's."

During the current year, so far, indications of results are satisfactory. Under the policy and inspiration of our founder and with all our resources and experience, I feel that shareholders have every reason to be confident that this company will continue to give a good account of itself and maintain, and indeed, strengthen the dominating position it has established in the trade for our famous product, Smith's Potato Crisps.

The report and accounts were adopted and the board's capital proposals approved.

BRITISH GLUES & CHEMICALS, LIMITED

IMPROVED TRADING CONDITIONS

The Directors' Report and Accounts for the year ended March 31st were issued to the stockholders on July 6th, and the following is an extract from the review by the Chairman, Sir Roger Duncalfe:

A few days after last year's accounts had been approved by your Board our colleague Mr Tom Walton passed away. He had been a director since the inception of the company and was chairman from 1921 to 1946. We owe much to his inspiration and example; we all mourn his loss.

As I anticipated when concluding my last review we now report better results. Trading conditions improved somewhat; our turnover increased; we continued to reduce our costs and upgrade our products; raw material supplies were more plentiful.

Consolidated profit for the year is £676,896 (last year £243,424 for eleven months), after all charges other than United Kingdom tax, which amounts to £359,000 leaving a net profit of £317,896 (last year £106,424). After taking into account £15,287 reduction of surplus of subsidiary companies, the profit dealt with in the accounts of British Glues & Chemicals Limited is £333,183 (last year £107,473). We have credited Appropriation Account with £100,000, arising from the accumulated taxation over-provision for past years.

After bringing in £56,260 balance of profit from the previous period, we have available for appropriation £489,443. Our appropriations are £175,000 to General Reserve, £80,000 to Replacement Reserve, and £81,400 to write off goodwill.

The directors recommend, on the preference stock, final dividends of 4 per cent cumulative and 2 per cent participating, making 10 per cent for the year, and on the ordinary stock a final dividend of 15 per cent, making 20 per cent for the year (last year 15 per cent for eleven months).

Following the above appropriations and dividends we carry forward £63,668 in the balance sheet against £56,260 brought in.

Fixed assets at £1,023.583 show little change. At March 31, 1954, orders placed by the group on capital account amounted to £60,000. Additional schemes authorised at that date involve £55,000 further expenditure but I ought to mention that, apart from normal capital replacement, your directors contemplate spending over the next seven years some £500,000 on schemes of mechanisation, fuel saving, and further process development. Because of our strong liquid position we anticipate no difficulty in providing for this programme of capital expenditure.

The item of goodwill is deleted from our balance sheet by appropriation from revenue. The present true value of our goodwill, patents and trade marks, though very substantial, is difficult to evaluate; it is certainly much in excess of last year's figure of £81,400.

Current assets exceed current liabilities by about £1,850,000, compared with about £1,400,000 last year.

General Reserve now totals £725,000, Contingency Reserve remains at £100,000, and carry forward at £63,668 is approximately £7,000 up on last year.

Our deferred repairs programme having been substantially completed during the year, we have transferred the unexpended balance of £24,000 to the credit of profit and loss account.

Our turnover showed a substantial improvement on the previous year, and some reduction in stock resulted. The improved quality of our products counteracted to some extent falling market prices. In this connection our cold rendered tallows and our new glues have made a marked contribution to turnover and profit. Despite more competitive conditions our export turnover increased, and our dollar exports to North America were reasonably well maintained in spite of the trade recession over there. We have continued profitably to use in our own works the Chayen continuous cold extraction process, and we have licensed its operation both in this country and overseas.

The directors consider it opportune to take a further step to bring the issued capital of the company into closer relationship with the capital employed, by capitalizing £220,000 of the general reserve and issuing it in the form of two ordinary shares (4s. each) for every £1 ordinary stock now held.

Capitalization issues such as this tend to create an element of uncertainty regarding the preference dividend participation, which for the full rate of 2 per cent depends on payment of not less than 15 per cent ordinary dividend. The directors hold the view strongly that it is not in the company's interest for this uncertainty to continue; they therefore propose that the participating rights of preference stockholders shall be cancelled in return for the capitalization of £70,000 of the general reserve and its issue to preference stockholders in the form of two ordinary shares of 4s. each for every £3 of preference stock held.

Trading has continued to be satisfactory during the first three months of our current financial year, and whilst the future is to some extent obscure, I anticipate that unless world conditions markedly deteriorate, the current year will show a reasonable profit.

HIGHAMS LIMITED

The forty-sixth ordinary general meeting of Highams Limited was held on July 2nd in London, Mr Eli Higham (the chairman) presiding.

The following is an extract from his circulated statement:

I herewith submit my report for the past year's trading, and I am especially pleased that the profit of the company shows a very satisfactory increase, thereby enabling your board to recommend a higher dividend for this year.

In my statement last year I referred to projected developments in the company amounting to approximately £150,000; these have now been completed, together with others, at a total cost of just over £200,000. Whilst on this point I feel that it should be a matter of considerable interest to stockholders to refer to the fact that since 1948 your company has ploughed back almost £600,000 in additional fixed assets, which indicates the policy of your board in maintaining steady progress in development and modernisation; to this amount must be added a sum in excess of £600,000 which represents the increase in value of stocks now necessary to maintain normal trading. It is a matter of considerable satisfaction that the whole of these requirements has been met without obtaining additional capital, although there has been a temporary reduction in cash resources. At the same time, I am happy to record the fact that both production and sales of the group for last year were maintained at the highest level.

Trading is still very active, and I see no reason why the company should not enjoy another successful year.

The report was adopted.

HOUSE OF FRASER LIMITED

SATISFACTORY LEVEL OF CURRENT TRADING

CAPITALISATION AND BONUS ISSUE PROPOSALS SANCTIONED

The thirteenth annual general meeting of House of Fraser Limited was held on July 8th in Glasgow, Mr Hugh Fraser, DL, JP (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The principal changes in the accounts as compared with last year are those arising from the acquisition of the ordinary capital of Binns, Limited, the profits of which became available as group earnings from April 28, 1953.

The main addition under dividends from subsidiary companies is an ordinary dividend amounting to £320,000 received from Binns, Limited, payable out of the profits of our new subsidiary earned since the date of acquisition.

In the company's balance sheet the book value of shares in subsidiary companies is stated after adding the cost of the company's investment in Binns, Limited, £2,961,363, and deducting dividends received out of pre-acquisition profits and distributions received from Binns, Limited (£1,360,000), and MacDonalds, Limited (£135,000), out of capital profits realised by these companies on sale of freehold properties.

After deducting pre-acquisition profits of Binns, Limited, the group trading profit has increased to £1,372,855, and the net profit before taxation is £1,226,775 against £605,209. The provisions required for taxation amount to £703,012 (£335,112), leaving a net consolidated profit for the year of £523,763 (£270,097). The net profit for the year remaining to members is £477,649 (£260,153), and after the appropriations for dividends and transfer to general reserve, the group carry forward is raised to £341,777 (£171,154).

CONSOLIDATED BALANCE SHEET

In the consolidated balance sheet the assets of Binns have been brought into account at book values. The total group assets are now increased by over £3 million to £8,588,310, and it will be observed that the total of current assets available at the end of the year to meet liabilities of £2,512,220 amounted to £5,030,035, giving a current surplus of £2,517,815.

The capital reserve account has been adjusted in respect of the bonus issues approved at and since the last annual general meeting, and the nominal amount of ordinary stock in issue is correspondingly increased to £564,464. As the value of net assets of Binns, Limited, brought into account exceeds the net cost of investment, there is added to capital reserve account the sum of £352,327, bringing the amount standing at credit of this account on January 31, 1954, to £2,456,054.

The state of the company's affairs has visibly improved during the year, and the progress in recent years may be readily measured from the total of share capital and reserves as shown in the consolidated balance sheets for each year since the company's stock was first publicly quoted, viz.:

(1949)	£821,335.	(1950)	£864,600.
(1951)	£913,574.	(1952)	£1,827,757.
(1953)	£3,790,265.	(1954)	£4,791,111.

The foregoing figures do not take into account recent valuations of leasehold and freehold properties which show an additional surplus of approximately £1 million.

CAPITALISATION OF RESERVES

A notice to ordinary stockholders issued with the accounts contains proposals relating to two bonus issues which will be considered at an extraordinary general meeting prior to the annual general meeting. The consent of the Treasury has been obtained for the proposed issues and the resolutions if approved, will sanction an increase in the authorised share capital of the company, the capitalisation of reserves to the extent of £587,042 10s. and the issue to ordinary stockholders in two stages of 2,348,170 ordinary shares of 5s. each credited as fully paid to be converted into £587,042 10s. ordinary stock. Application will be made to the Stock Exchanges in London, Newcastle, Edinburgh and Glasgow for quotation of and permission to deal in the new stock.

The directors do not consider that any further major adjustment of the issued share capital is required under present circumstances and the amount of any future small scale distribution will be reviewed annually.

The trading conditions experienced last year were by no means consistently favourable and the results achieved reflect very great credit on the management and staff in all stores.

The return to seasonal trading has been more marked in the current year. The first months were somewhat difficult, but trade has now reached a satisfactory level and the group earnings have been fully maintained to date. The improvements carried out at a number of the larger stores will increase their trading capacity, and if general economic conditions remain reasonably good, another successful year should be assured.

The report was adopted and at a preceding extraordinary general meeting the board's capitalisation and bonus issue proposals were sanctioned.

Note: The capitalisation proposals will be made effective as to £564,464 on July 8, 1954, and as to £22,578 10s. on October 5, 1954. Allotment letters comprising the foregoing nominal amounts of ordinary stock will be posted on July 20, 1954, and October 19, 1954, respectively.

ROYAL TECHNICAL COLLEGE OF EAST AFRICA

(Principal: Major General C. Bullard, C.B., C.B.E., B.Eng., M.I.Mech.E., M.I.E.E.)

Applications are invited for the post of

HEAD OF THE DEPARTMENT OF COMMERCE

The College, established under an autonomous Governing Council by the Royal Technical College of East Africa Act, 1954, is being built in Nairobi as the main instrument in British East Africa of higher technical and commercial education, to cater for students of all races. Teaching will be up to professional level in technical and commercial subjects, with strong supporting departments of science and arts. Mainly residential, the College is expected to contribute substantially to the social and cultural as well as the economic development of the region.

Candidates should have good hons. degree and/or appropriate professional qualification, and senior experience in a Technical College or University. In the present early stage of development, organisation and equipment will be first requirements. It is hoped to appoint Leoturers and Assistant Leoturers early in 1955 and to accept first students later that year.

Salary scale (including temporary c.o.l.a.) £1,850 x £50 to £2,050 p.a., or slightly lower for transferred staff wishing to retain Col. Govt. pension rights. (Scale quoted is for staff who would contribute to proposed College pensions scheme or maintain existing rights under e.g. F.S.S.U. or Ministry of Education, with College paying employer's contribution.)

Appointment would be made for one tour of 24-36 months in first instance with view to permanency. Partly furnished house or flat will be provided, rent £150 p.a. Staff may be required to live in hotel in first instance and would receive allowance towards additional expenses. Free first-class passages to and from Kenya will be provided for person appointed and wife, and up to equivalent of one adult fare for dependent children under 21. Leave on full salary at rate of four days for each month's resident service.

Write for further information to Secretary, Advisory Committee on Colonial Colleges of Arts, Science and Technology, 1 Gordon Square, London, W.C.1. Closing date for applications (six copies), August 12, 1954

GOOD EATING: The new monthly illustrated magazine for and about good food and drinks. First issue August, on sale July 15, 1s. 6d. per copy from all newsagents, or write to 167, Strand, London, W.C.2.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

LADY required as Assistant Secretary to run new small office for young and growing professional Association. Commencing salary £490 p.a.—Box 623. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

UNIVERSITY OF BRISTOL

Applications are invited for the post of ASSISTANT AGRICULTURAL ECONOMIST, tenable at Newton Abbot. Candidates must be graduates in Economics and/or Agriculture. Salary in accordance with the Ministry of Agriculture's scale. Further particulars may be obtained from the Registrar, The University, Bristol, 8. The closing date for the receipt of applications is July 26th.

UNIVERSITY OF ADELAIDE

Applications are invited for the following appointment:

LECTURER IN POLITICAL THEORY

Terms: Every potential applicant is invited to seek from the undersigned or from the Secretary of the Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1, a copy of the detailed conditions of appointment, which give particulars of duties, tenure, study leave, promotion, and travelling expenses.

University Film: A potential candidate in Great Britain may also borrow from the Secretary of the Association of Universities of the British Commonwealth a coloured film illustrating the University and the city and surroundings of Adelaide.

Salary Scale: Lecturer—£A1,000-£60—£1,300.

Superannuation: On F.S.S.U. basis.

Applications: Applications must include particulars of age, nationality, academic record, teaching qualifications, war service (if any) and present position; a list of publications; copies of testimonials; the names and addresses of two referees of whom inquiries may be made; a recent photograph; and a medical certificate of good health. They should be lodged in duplicate with the undersigned not later than July 30, 1954.

Further information about the post or about the University will be supplied on request to

A. W. BAMPTON, Registrar,
University of Adelaide,
Adelaide, South Australia.

COUNTY COUNCIL OF DURHAM

COUNTY PLANNING DEPARTMENT

Applications are invited for the permanent appointment of Research Assistant on Grade VIII A.P.T.—£785-£860 (commencing on the minimum).

The successful applicant will be concerned with the establishment and maintenance of an industrial bureau in the County Planning Department. He will be required to compile a register of industrial sites in the County including information on services, stability, etc.; to analyse statistical material on industrial trends, and confer with industrial developers. Applicants must have experience of industrial location work and preference will be given to graduates in Economics or Commerce.

Post superannuable and subject to medical examination. Apply with particulars of age, married or single, qualifications, experience and present salary, giving names of two persons to whom reference may be made, to the County Planning Officer, 10 Church Street, Durham, by Friday, July 16, 1954.

J. K. HOPE, Clerk of the County Council.

Shire Hall, Durham. June 24, 1954.

STATISTICAL/SECRETARIAL ASSISTANT

Interesting vacancy occurs for young lady in Managing Director's office of large well-known manufacturing company in N.W. London. This is a salaried position requiring a good appearance and address, and good general education. Candidates must be competent shorthand/typists with knowledge of tabular layout, and have an interest and aptitude for statistical work.

Applications, which will be treated in confidence, giving particulars of age, education, experience, etc., to Box 618.

This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

BRITISH EUROPEAN AIRWAYS require a Cargo Research Officer. Duties include collection and analysis of statistical data relating to carriage of freight by air and surface and consideration of future trends of aircraft cargo rates. Previous experience in research work essential, Economics Degree, or equivalent qualification, and experience in analysis of statistical information desirable. Commencing salary £635 p.a., rising to £875 p.a. Applications, giving full details, to Head Office, Personnel Officer, B.E.A., Keyline House, Ruislip, Middlesex.

MARKET RESEARCH ANALYST and Planning Officer required by progressive group of engineering companies. Senior post. Good opportunities for ambitious candidate. Age 28-35. University degree or equivalent, economics with statistics. Desirable to be familiar with I.C.E. industry. Four-figure salary to right man. Must have active imagination, statistical skill, practical outlook, tact and diplomacy, with ability to write clear reports.—Apply, in guaranteed confidence, details, age, education, positions and salaries, to Box 618.

SOLICITOR.—Public Company in the engineering industry, with headquarters in the London area, has a vacancy for a newly admitted solicitor. Initially duties will consist in the main of conveyancing and general commercial work, but the post offers widening opportunities to a young man of initiative and ability.—Please reply, giving full details, to Box 615.

ACCOUNTING Assistant required for interesting post with light engineering company. Position would suit woman student preferably with intermediate qualifications. Five-day week, canteen and recreational facilities. Write to the M.O. Valve Co., Ltd., Brook Green, Hammersmith, W.6. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

WOMAN Personnel Officer required for Perivale factory with 250-300 employees. University education and at least one year's industrial experience essential. Apply to Personnel Officer, Osram-G.E.C. Lamp Works, Hammersmith, W.6.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of Seventy Five Cents (75c) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable September 15, 1954, to shareholders of record at the close of business August 13, 1954.

By Order of the Board,
C. H. WINDELER, Secretary.

Toronto,
July 7, 1954.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. Postage on this issue: Inland 2d.; Overseas 2½d.—Saturday, July 10, 1954.

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the post of Computer in the Department of Economics. Salary £460 per annum. Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, by whom applications must be received by *Tuesday, July 20, 1954.*

APPLICATIONS ARE INVITED for the temporary posts of Senior Research Worker and Research Worker on the staff of the Director of an investigation sponsored by the Nuffield Foundation. Candidates must have qualifications in either Psychology or Sociology and experience in one of these subjects or in teaching. They must be well versed in survey techniques and be able to write clear and informative reports. For the senior post some knowledge of administration will be an additional recommendation.

The investigation commences work on October 1, 1954, and appointments will be for two years from that date. Headquarters will be in London, but the staff may be called upon to do some travelling within Great Britain.

Salaries: (a) for the Senior Research Worker, £900 p.a.; and (b) for the Research Worker, £600 p.a.

Applications, together with the names of two referees, to the Director, Nuffield Foundation, Nuffield Lodge, Regent's Park, London, N.W.1.

OUR MARKET RESEARCH DEPARTMENT continues to expand and Women University Graduates of 21 to 25 are invited to apply for positions as field investigators. They will be based in Leeds, Manchester, Birmingham or London, and will travel quite extensively from these bases with all expenses paid, and will be required to learn to drive a car if not already in possession of a licence. The work is outdoor, involves a flair for dealing with people and requires a high standard of intelligence. Prospects of promotion are excellent and, in any case, the salary is progressive. Early interviews will be arranged and suitable candidates should be ready to start work in August or September.—Write very fully, giving details of qualifications and any business experience, to Box 613.

TOP Sales Executive. A man of really outstanding ability, experience and force of character is required by a very large international firm of food manufacturers. Applicants must be of a calibre to direct, educate and control a sales-force of over 200, and to formulate a lively and flexible sales-policy for an expanding range of products. Experience of nation-wide selling in the grocery or allied trades, and a proven ability to lead men to successful results, are essential. An initial salary of not less than £2,500 is contemplated, with opportunities for promotion. A pension scheme is in operation. All applications will be treated in strict confidence. Send details of qualifications and career to Box 577.

IMPORTANT LONDON MANUFACTURERS of precision engineering equipment of world-wide repute is expanding its Sales Division and requires a Senior Executive who will be wholly responsible to the Sales Directors for market research and the preparation of long-term sales forecasts. The applicant should hold a degree in economics, have had practical experience, and possess a mature judgment and a wide knowledge of home and export markets. The post is progressive, permanent and pensionable and carries a substantial salary.—Write, with full details of age, education, qualifications and experience to Box 607.

SALES DIRECTOR of a progressive Multiple Organisation, with head office near Leicester, requires a Personal Assistant. Applicants should preferably have had some retail experience and an aptitude for statistics. A good salary with excellent prospects will be paid to the right man, who should be between the ages of 25-35.—Box 612. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

LT.-COMMANDER (E.), R.N., A.M.I.Mech.E., A.F.R.Ae.S., age 34, experienced marine, aeronautical and electrical engineering, also staff appointments, retiring shortly, seeks position with scope for energy and initiative. Willing undergo period training if good prospects.—Box 605.

QUALIFIED ACCOUNTANT (30), long professional experience (London), especially Taxation, methodical, used to handling complex detail, seeks taxation or accountancy post, with good financial prospects. Industrial experience welcome. Present salary £750.—Box 614.

SENIOR executive, Cambridge Hons. graduate, at present in Pakistan, with long experience of jute finished goods, jute mill administration and raw jute trade, seeks senior post in any administrative or commercial capacity, reply Box 619.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure.—Economic Research Council, 18 South St., London, W.1.

ACTIVE job sought as Commercial Manager, Accountant, Company Secretary. Certified accountant, chartered secretary, public school, age 41, now company secretary earning £1,600.—Box 617.

CRICHEL DOWN justifies fight of Farmers' and Smallholders' Association, 24, Austin Friars, London, E.C.2, against arbitrary dispossession of farmers. Subscription £1.

"When sand and dust threaten life and livelihood"

The control of sand drift and dust storms ranks next in importance in the life of Broken Hill, to the supply of water. Unless the former are prevented and the latter is provided, the existence of the town and the continuance of its great industry would slow down—and ultimately cease.

The drought years are those to be most feared, as at such times, the intense heat is accompanied by dust storms swept into the town by the hot wind from the Central Desert. Severe dust storms used to be experienced in Broken Hill about four times each year.

THE CONSOLIDATED ZINC CORPORATION has taken a large and active part in the incessant fight which must be maintained against this menace. Nearly twenty years ago, the policy of one of the Corporation's senior geologists—Albert Morris—was adopted. He advocated establishing nurseries on the mine to supply trees for planting throughout the streets of Broken Hill, together with the simultaneous fencing of areas south and west of the mines to prevent stock and rabbits destroying the natural regrowth of foliage. Now, the average of dust storms has been reduced to half the former number, and these should become progressively less frequent as time goes on. What was formerly a sand swept waste is now an area clothed by its natural flora.

The result has been not only to make life more pleasant for the inhabitants of the town, but also to make possible extensions to the mines working the Broken Hill lode, including those in THE CONSOLIDATED ZINC CORPORATION group. That Company has brought much prosperity to Australia and to Britain where, at Avonmouth in the West of England, there is the largest zinc smelter in Europe processing ores which come from Broken Hill. That smelter produces the entire output of primary zinc of the United Kingdom, as well as sulphuric acid and other related products.

Lead, Silver, Zinc

The formation of The Consolidated Zinc Corporation Limited in 1949 united the bond of common interest between Imperial Smelting Corporation Limited of Great Britain and The Zinc Corporation, Limited of Australia. The two companies have for many years been associated in the development of the non-ferrous metal production of the Commonwealth. Their activities are the mining of lead, silver and zinc ore in the Broken Hill Mines of Australia and the production of zinc metal, sulphuric acid, fluorine chemicals and zinc pigments in the United Kingdom.

See the NEW TAPE-RITER

with finger-tip microphone control!

DICTATION QUICK AS THOUGHT!

1 **PRESS TO RECORD**

2 **PRESS TO START OR STOP**

3 **PRESS TO RECAP**

This remarkable new microphone puts all controls at your fingertips. Three simple movements control all dictation, correction and listening back.

Here is a revolutionary development in dictating machine design.

You can sit, stand, walk about—and still dictate. Or have the microphone right at your elbow and dictate whenever you feel like it. There is no need ever to touch the Tape-Riter during dictation; the microphone switches give you complete control, complete freedom to concentrate.

With the new Tape-Riter you can save up to 40% of the time you spend on paper-work; increase your secretary's output by up to 60%. These are facts you can hardly afford to ignore.

MORE EFFICIENCY - PLUS FEATURES

- ★ Quick-change, time-saving tape cartridge
- ★ 30 minutes recording on each tape
- ★ Crystal-clear voice reproduction
- ★ Forward/back-spacing footswitch for typists
- ★ Long-life tape can be used repeatedly

To Inform..... To Influence

NEW COMMONWEALTH is not, in the accepted sense, a "popular" fortnightly. It is not to be seen on the bookstalls and is, in fact, obtainable only by subscription. But its articles are so well informed and its news service so efficient that it is read by most business men with Commonwealth interests.

OVERSEAS, both in the self-governing countries and the dependent territories, *"New Commonwealth"* enjoys an even more comprehensive readership among Government, agricultural and industrial interests. Here, too, its advertisement pages are welcomed as news—by men who are actively interested in the latest products of British industry.

NO OTHER JOURNAL shares *"New Commonwealth's"* intensive concern with all Commonwealth development plans. As an advertising medium it effectively introduces British manufacturers to all important Commonwealth buyers and influences their decision. Should it not be on *your* list of periodicals, and on *your* advertising schedule?

Why not write for specimen copies and rate cards?

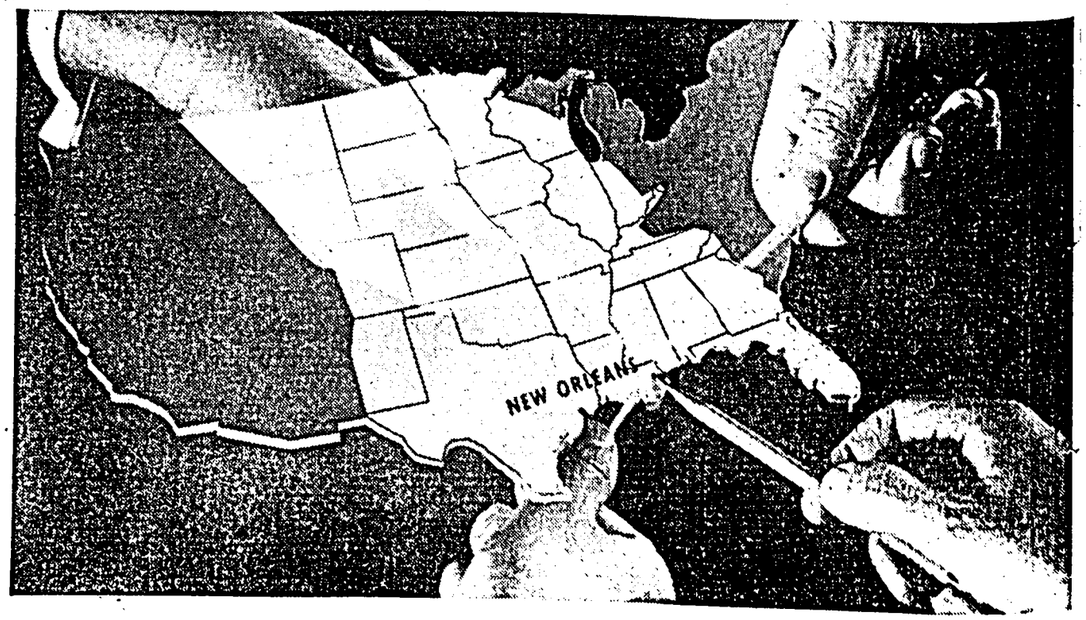
The new Mk. III Camera with 4½" or 3" image orthicon tube...

The use of the new Marconi camera BD 687 with 4½" or 3" image orthicon tube and the employment of better circuit techniques in the camera channels have reduced to a negligible degree such faults as black halos, edge effects and electronic ghosts; whilst resolution, grey scale and signal-to-noise ratios are greatly improved. Ingenious design has led to simplicity of control and provided for fully remotely controlled applications.

Besides the camera the channels BD 808/809 comprise a Camera Control and Preview Monitor, Regulated Power Supply Unit and Focus Supply Unit.

MARCONI



Complete Broadcasting and Television Systems

Marconi equipment has been installed in every one of the BBC Television transmitter stations and in the USA, South America, Canada, Italy and Thailand.

From any viewpoint, your shipping savings start here

Whether freight is shipped to or from the Mid-Continent U. S., it pays to specify *via New Orleans.* You can save from 66¢ to $5 a ton on inland freight rates alone, besides many other savings:

1 Direct Savings in Money—

- Lower rail, truck, and barge rates to or from entire Mid-Continent U. S.
- The Port's Foreign Trade Zone No. 2 provides all the savings of a "free port."

2 Money Savings in Time—

- Shorter inland transit time, with network of rail, air, truck and barge lines. Faster handling between inland carrier and ship.
- Ample marginal wharfage and belt railroad mean no delaying "traffic jams."
- No delays due to weather—a year-round port.

3 Money Savings in Convenience—

- Complete handling equipment for all types of cargo.
- Banking facilities in New Orleans and throughout Mid-Continent—"Bank where you buy."
- International House and International Trade Mart give unique aid to importers and exporters, domestic and foreign.
- World-wide service by almost one hundred steamship lines.

Which savings are most important to you? Write for detailed information to:

Because each member of the Ward Group of Companies can call on any of the others to supplement its knowledge and experience, the competence of the entire group is immeasurably increased.

Here is a picture of interdependence with a real practical meaning. It is the modern interpretation of the picture Thos. W. Ward must have had in mind when he started his business 75 years ago—a visualisation of closely integrated manufacturing resources and service departments united in the common task of helping in the development of industry and commerce. As the scope of the Ward Group's activities has extended, so has its capacity for serving its many customers throughout the world.

Your next production? Can Lustrex help?

Lustrex*, popular polystyrene plastic by Monsanto, is really versatile. You can make many different products in Lustrex—and because it is so economical you can make them very cheaply. You can make tool-handles, and packages for tools. You can make filing trays, and fittings for refrigerators and radios. In fact you can make almost anything—from instrument panels and picnic sets to camera spools and small cable drums —in Lustrex.

Lustrex is light yet strong; it resists acids and alkalis; it does not shrink or become brittle. It is made in two grades — Lustrex for general purposes and Lustrex Toughened 1 for particularly tough purposes. Colour choice is almost unlimited.

Lustrex is supplied only in production quantities for injection moulding—it is not yet available in sheet form. Write now for full details.

*Registered Trade Mark.

Lustrex is one of Monsanto's wide range of chemicals and plastics for industry. If you have an industrial problem which chemicals might help you to solve—get in touch with Monsanto today!

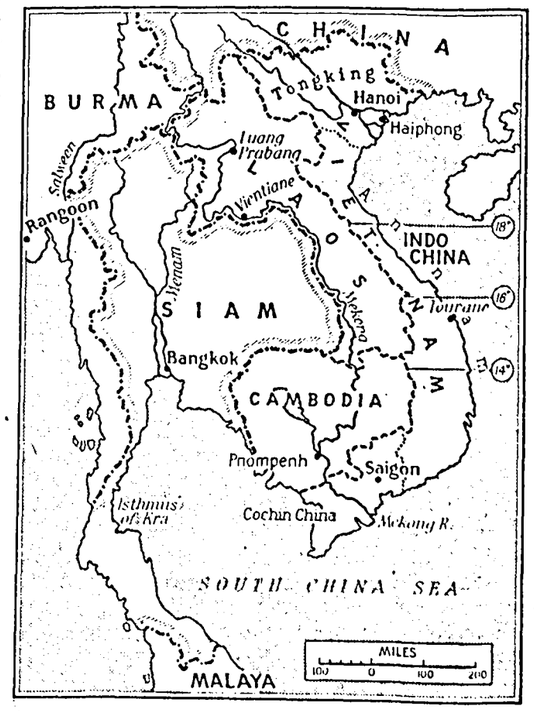
Stand or Fall

IN Indo-China, this weekend, affairs have at last reached a point of make or break. General Giap's army is poised at the approaches to Hanoi. M. Mendès-France's deadline is next Tuesday; he is pledged to resign the premiership of France if by that date he has not closed his hand upon a settlement that his fellow countrymen will accept. If he falls, much else will totter. France will have to take a swift decision whether to send conscripts to help withstand new Communist assaults. Siam will demand a special meeting of the United Nations Assembly to consider its growing jeopardy. The Indo-China war will inevitably be extended in time, and probably in space. It may be months before the nations again come as close to a settlement as they have come in recent weeks; and in those months many fateful and irreversible things may happen.



Yet, in these crucial days, the world has seen the French Prime Minister, sorely in need of his allies' support at Geneva, forced to plead openly for the return to the conference city of the American Secretary of State, who has himself been held back by fear that he would be confronted with an agreement his country could not approve; while the British Foreign Secretary has had to shuttle between Geneva and Paris, still in the role of mediator, but this time between Britain's allies. Even if one disregards all the shriller charges of appeasement and counter-charges of intransigence, the bare record of these jolts and jars among the western partners contrasts painfully with the soothing phrases about "intimate comradeship" that head the barely-dry declaration issued from Washington.

The plain fact is that at no time since the Geneva conference began has the West been agreed on the basic principles of a settlement in Indo-China. In the House of Commons this week, Sir Winston Churchill felt it necessary to defend the attempt made at Washington to express "broad and simple principles likely to command the assent of vast communities." Nobody should blame the President and the Prime Minister if their principles sometimes sound like platitudes. But what is in doubt is the relevance of the statements made at and after the Washington talks. What guidance for practical action do they offer at this moment, when the hinge of fate is groaning in Indo-China?

Dicta about the unwilling subjugation of formerly sovereign states, are scarcely relevant to the case of the Vietnamese, so many of whom passed willingly under a new yoke before sovereignty was yielded to them. Talk of peaceful coexistence is equally futile in the face of a steadily advancing army. Little consolation is to be found in reminders of the existence of the United Nations, for its machinery for joint resistance to aggression is inapplicable to a primarily colonial revolt. Nor is this the worst of the matter. Not only have the western nations failed to find a common principle that can be applied to the Indo-Chinese problem; they have failed even to find separate principles. It has been a depressing period for advocates of naked *Realpolitik*. Just as their textbooks advise, each of the major democracies has

pursued the policies that seemed best suited to its immediate national interests. The net result of these "realistic" courses of action has been a major military defeat, a sorry spectacle of disunity, and the jeopardising of each country's individual objectives.

To record these facts is neither crying over spilt milk nor indulging in vain academic argument. This week may be the last moment in which the western allies can decide to make an effective and united stand in South East Asia. It is, of course, theoretically possible that on July 20th there will be a dramatic lifting of the veils of uncertainty, and that the world will see either that all hope of an Indo-Chinese settlement has vanished, or that a settlement satisfactory enough to all parties is within grasp. But what is far more probable is that the Communist terms available when M. Mendès-France's deadline is crossed will look temptingly attractive to many eyes in France, in Britain, and in Asia, worth examination in the eyes of the French and British governments, and alarmingly suspect in American eyes. By what touchstones can it be decided whether such terms should be flatly rejected or probed a little deeper?

Now or never, all the loud talk about surrender on the one hand and intransigence on the other has to be repressed. Throughout the free nations, a conscious effort should be made to recall overriding common interests and to muster support for at least an essential minimum of terms based upon simple principles. The most elementary logic suggests that no settlement in Indo-China will be worthy of its name unless it leaves the free world with a militarily defensible frontier and with a fair chance of promoting political stability to the rear of that front. There has been too much sterile argument between those who think only in terms of strategic lines, and those who claim that Communist encroachment can be checked only by economic and political progress. Both forms of defence are essential.

For political stability, the minimum requirements are a firm stand on the integrity of Laos and Cambodia, two states where the Communists are less strong than they are in Burma; the exchange of individual Vietnamese placed in personal jeopardy by the redrawing of the lines across their already divided country; and machinery adequate to prevent the encouragement of further Communist guerrilla activity. From the strategic point of view, the bare minimum is the denial to Communist forces of southern Vietnam. Once that was in their hands, Laos and Cambodia, whose lines of communication run down the Mekong river, would be trapped; Siam would be outflanked; and Malaya would be only one jump away, as it was for the Japanese forces based in Cochin-China in 1941.

Two further points need to be made. First, no settlement in Indo-China will be stable if it is not accompanied by arrangements for joint defence in South East Asia; the Communists have no valid objection to this, for there have long been intimate military links between the Soviet Union, China and the Vietminh. Second, the hard fact must be faced that an agreed division of Vietnam, however provisional, would be an ugly addition to the number of partitions that already mar the map of the world. But those who will denounce it, whether they are Communists, Vietnamese nationalists, French or American diehards, can offer no alternative other than total war or the eventual uncorking of the whole South-East Asia bottle.

No conceivable settlement in Indo-China will be greeted with universal joy; the task is to retrieve whatever can be retrieved after a decade of waste and error — for which France is by no means wholly responsible. But a settlement along the lines here suggested would be morally, politically and militarily defensible. A so-called settlement that did not incorporate this essential minimum would be none of these things. It would neither promote "peaceful coexistence" nor prevent further "enslavements." It would be disastrous both in its effect on South-East Asia and in its repercussions for the alliance of the free nations. Better, indeed, that the Geneva conference should break up than that such a false and fatal "settlement" should be reached. It is deeply to be regretted that Britain's political leaders have failed, and failed again in Wednesday's debate, to make this clear to a Parliament and public that are still unaware of the real dangers of this critical moment.

Permanent Way?

BOYS play *trains*. *Grown men* have a superior game; they organise railways. Many of them are of the nostalgic school: there was nothing wrong with British railways in the days of the small "r" and the annual visit of the chairman of the NSEW to open the railwaymen's flower show at Exe on Wye; let competition thrive; get back to 1921 and its 123 companies. Others are members of a modern school, revelling in chaffy concepts; phrases like "functional organisation" and "*financial control in its broader aspects*" trip off their tongues, whereas a simple explanation of what needs to be done somehow sticks in their throats.

The traditional school will find no encouragement at all in the railways reorganisation scheme* published this week. "Competition in the ordinary business sense between the railway regions is impracticable" declare the Transport Commission. That is as true as the simple-minded notion that the nationalised railways could be made to behave competitively under a Conservative government instead of bureaucratically under a Labour administration was false. But if not competition, what then? The grand ideas of "co-ordination" of inland transport that informed the Transport Act of 1947 have been discarded. The commission is now intended to be primarily a railway owning and operating body. The Transport Act of 1953 told the commission to get rid of the bulk of its road haulage, abolished the Railway Executive, and called for a scheme of reorganisation for the railways. It is this scheme that the Minister of Transport has now commended to Parliament; the final stage, after the comments of both Houses have been gathered, will be to table an order embodying the scheme, which will have to be approved by Lords and Commons.

The Act gave the commission little guidance in the preparation of the scheme. There had to be certain regional authorities, endowed with unstated powers and responsible for gathering unspecified costs and statistics; the area authorities might be individuals or boards. The scheme gives a measure of precision to these requirements, but not a lot. The six railway "regions" remain, and they are not even to be re-christened "railways." They are so big that they can only be worked if they are broken up into smaller units or invigorated by "a definite measure of management decentralisation within them." To avoid a major upheaval, the commission have decided on the second alternative "for the present time." They claim that the pushing out of management functions to the regions would have three principal benefits: railway users would enjoy "a more direct and rapid contact with the railways of an authoritative nature"; the staff would lose their feeling of remoteness from management; supervision would be more effective and initiative from below encouraged.

But there is clearly no intention to test these advantages too far. The commission come inevitably to the conclusion that the area authorities must be boards, and not individuals. But they are not to be dangerous autonomous bodies capable of doing too many things for themselves. In five years the commission learned lessons that they will never forget:

> The experience of the commission between 1948 and 1953 has shown how essential it is that the authority of the commission in the scheme of organisation should be absolute. The scheme should admit of no doubt on this point. The function of the commission is primarily to determine policy, but they must have the authority to ensure that their decisions are carried out. . . . The commission are strongly and unanimously of the opinion that they alone should appoint the persons who would constitute the area authorities.

So the boards would consist of up to seven part-time members, one (or more) being a member of the commission, appointed for no more than two years. The boards would not be incorporated bodies and "for practical reasons their strength would have to be built up somewhat gradually." They will have general responsibility for supervising the railway system in their areas, improving the service and effecting economies (though they can only make "appropriate recommendations" to the commission where matters of "general policy" are involved), providing figures that the commission want, exercising such powers that the commission devolve, securing local contact with railway users and looking after the staff.

Delegation of this kind cannot do any harm; but is it capable of doing a tremendous amount of good? Already, the commission claim, they have devolved so much to the regional managers that they are left with "only the minimum powers" to fulfil their responsibilities and to ensure the best use of the resources of the railways. They retain the responsibility for the design and manufacture of equipment, labour relations of "a major character," charges, financial control, higher appointments, "the policies and principles to be adopted in railway operation," the allocation of wagons, and commercial policy in general. With these powers reserved to the commission (where many of them must inevitably remain), live area boards spurred by a sense of fulfilment towards "strong emulation" amongst themselves are a little difficult to imagine, and may be even more difficult to set up.

But the experiment may be worth trying. Boards in general charge of the regions may produce effective decisions for their areas, stimulate commercial enterprise, and tauten the driving spring of efficiency. But the big questions of policy and some matters of day-to-day working will not be for them; the commission will form policy, yet it will also allocate wagons among

* Cmd. 9191.

the regions and do business direct with large undertakings—thus straddling executive management and policy. Nor are the boards intended to be executive bodies concerned with day-to-day management; that will be the job of the chief regional manager and he, though responsible to the area board, will also have to listen to the technical officers of the commission.

With tactful care on all sides, this may be made to work. But one difficulty, surely, will be to find the precise weight of experience and personality that will keep the area boards in balance in this rather vague but evidently delicate counterpoise of commission, board, and manager. An unduly strong board might be even worse than a weak one. But the chances of a strong board are not perhaps very high, given the commission's power of appointment and its evident determination to hold the whip hand. And a strong board might demand something more exciting than the power to sanction capital schemes costing up to £25,000 (the National Coal Board gives its divisional boards power to sanction schemes costing up to £250,000) or to make staff appointments up to £2,500 salary.

But it would be unfair to criticise the scheme merely on the terms in which it is set down in the White Paper. Because it is described in guarded words, and because decentralisation turns out to be much more limited than some misguided optimists had supposed, it by no means follows that its broad principles are wrong. The commission are by statute responsible for finance and for railway charges; they cannot delegate these responsibilities. Nor in practice can they delegate wages and labour questions—if only because the unions would not let them. They can also defend their decision to retain a high degree of technical unification, imposed from the centre, by the claim that technical standardisation has produced useful economies. These plain facts circumscribe the scope for devolution of the commission's powers. But they also require from the commission a willingness to devolve what remains in a spirit of determined cheerfulness, not of grudging care. They call for the utmost objectivity in the selection of the area boards; independence and ability must be sought even if they occasionally produce results that are awkward for the commission and even if criticism sometimes stings. If the commission are looking to the area authorities for "a very real and big contribution towards increasing the efficiency of the railway industry," they will have to think big themselves. The scheme in outline suggests most clearly that the commission will be looking for subordinates. This is not the right emphasis. They should be looking for partners.

Freedom of Movement

THE pound sterling continues to be very strong. Day by day the rate of exchange bumps against its upper limit; month by month the reserves grow. Though the inflow of foreign funds has abated since the reduction in Bank rate two months ago, the world's confidence in sterling is still high. It is clear that this strength should be put to some use. The reserves, it is true, are still very small for the task they have to perform, and will have to be built up still further. But to use the strength of the currency solely for piling up gold and dollars would be to play the miser's role. Something more constructive and fruitful is generally expected. Indeed, there is a feeling that the opportunity is at hand to take another long step back from the siege economy to more normal conditions.

The expectation is that this step will take the form of making the pound sterling convertible. Discussions on this subject have now been going on for more than two years, and the Finance Ministers of the OEEC countries have assembled in London this week to carry them a stage further. Whether, after all this talk, the Finance Ministers (or anybody else, for that matter) are quite clear in their minds what convertibility means is very much more doubtful. Whether the British Government has yet made up its mind to take any decisive step is also by no means certain. In recent weeks the tendency in official quarters has been to see the future risks of a pledge to keep sterling convertible more clearly than the immediate gains, and the present indications are that the course will be to persevere with the step-by-step relaxation of restrictions—which, as a later article shows, has already gone a long way—but not to give any formal pledges, or to make any spectacular dashes for freedom.

Convertibility, however, is not the only thing that could be done with the present strength of sterling. Nor has it ever been clear why it should be thought to be the first and the most important. There is something else that, on the highest grounds of public policy and of human rights—one could almost say of public morality—should come at the top of the list. This is to restore, and in full, the basic human freedom of movement. At present the British resident is still closely circumscribed in his personal movements. He can, it is true, use his money freely for travelling within the sterling area, without having to convince any official of the "necessity" of his journey. This is something—indeed, it is a great deal. But unfortunately most of the countries of the sterling area are a long way off. Nearer home, in Europe, the British resident is still limited, except in Scandinavia, to an expenditure of £50 a year (worth perhaps £16 in prewar purchasing power) without carry-forward from one year to the next. In the western hemisphere expenditure for private travel, except for business purposes, is not permitted at all.

This is a lamentable restriction on the freedom to move around, to go visiting, to poke noses into unexplored corners—in a word, to get to know the world. It has already gone on far too long, and the time has come to stop it. It would presumably not be possible simply to abolish the controls on expenditure for private travel, which would open too large a loophole for the export of capital. But there is no very apparent reason why the method that already applies to business journeys should not be extended to private journeys—that is, to permit expenditure up to a stated maximum, say £8, per day for the number of days that the applicant actually spends out of the country. And, as with business journeys, this facility should be available in every country of the world.

★

Against any such proposal there will of course be raised the familiar argument that nobody but "the rich" wants to spend more than £50 a year for foreign travel, and that they should not be allowed to get their hands on any more of the nation's scarce supply of foreign exchange than anybody else.

There are several answers to this. The first and most practical is that, if it is true that very few people want to spend more than £50, then allowing them to do so would cost very little. To those who think that every thing should be forbidden (especially to the rich), except such activities as seem to the gentlemen in Whitehall to be in the public interest, this will not be a very strong argument. But to those who believe that the only sound principle for a free society is not to forbid people from doing what they want unless their activity would inflict real harm on somebody else, it will seem a very strong argument indeed. It is impossible to estimate at all closely what the increase in expenditure on foreign travel would be if the restrictions were removed. The total gross expenditure on travel to non-sterling countries in 1953 is put at £49 million. But this includes business travel, and the private total must have been below £40 million. At a guess, it seems unlikely that the removal of restrictions would cost more than £10 million of foreign exchange.

But the matter should not rest on practical considerations alone. Even if it be true (as it may well be) that most foreign travellers do not want to spend more than £50, it is still wrong to put a limit on the minority who do want to spend more—since there cannot be any real doubt that the country can afford it. Fifty pounds is not, nowadays, a large sum. Perhaps to many people it sounds large in one lump. But there must be many millions of people, even among those who rank for political purposes as "the poor," who spend more than that in a year on tobacco (which cost £76 million of foreign exchange, mainly dollars, last year). Neither the one form of expenditure nor the other is strictly necessary; why should one be permitted without sumptuary limit and the other not? Everybody spends his money in a different way and nearly everybody has his particular favourite form of expenditure, for which he contrives to find what his friends and neighbours think an extravagant sum of money. This is freedom. For one man it will be his car or his motor-cycle, for another drink, for others books or photography or greyhound racing. On none of these does the law seek to set a limit of expenditure, although all of them in greater or less degree cost foreign exchange. Is private foreign travel less worthy than any of these?

We have gone a long way, in recent years, by income taxes, death duties, once-for-all Special Contributions and the like, to limit the amount of money that a man can dispose of. But he is still allowed to decide for himself what he shall do with what money remains to him, and it is surely basic to free society that it should be so. It is time to insist that the principle should once again be applied to the freedom of movement.

Even this is not quite the end of the matter. Not only has the individual citizen the right to spend his money on travel, instead of on gambling or drinking, if he wishes to do so, but it is also directly in the public interest that he should do so. It is a temptation to think of foreign travel chiefly in terms of the hurried two or three weeks of annual holiday. The cultural value of this should not be despised; but neither should it be exaggerated. This is not, however, the sort of travel that is stopped (though for some people it may be abbreviated) by the restriction. It is the longer stays abroad that are now usually impossible and that it is most in the interests of public policy to encourage. Both before and after the main working years, both among the young and among the retired, there are many who have the time and inclination, and can find the means, to settle in foreign countries for extended periods in order, among other things, to get to know them. There are the writers and artists who want to live and work abroad. There are professional people and public servants who have extended periods of leave. There are students between courses. There are hundreds of other reasons which have, in all past times, led countless thousands of British men and women to live abroad for months and years at a time, to their own enjoyment, to the enrichment of the cultural heritage of the nation and to the mutual understanding of peoples. Is this sort of thing never to be permitted again? If we are to build up a real community of understanding among the nations, should not this cross-fertilisation of cultures be encouraged instead of prohibited? And is it not high time, nine years after the end of the war, to insist on making a start?

Before any expensive promises are given to foreign traders and bankers, the Chancellor of the Exchequer should first consider what he can do to restore the rights of his own patient people. He should consult his own deep concern for human values and for individual liberties, and put the restoration of the freedom of human movement at the very top of the list of things to be done with the new strength of sterling.

Africa's Insane Root

NEXT Thursday the House of Commons is to hold a debate about the situation in Kenya. This is a subject about which most members are as bewildered as they are uneasy. For Africa has presented no more baffling spectacle, no barbarity more difficult for the ordinary westerner to understand, than that of the Mau Mau movement. The emergency has now been dragging on for nearly two years ; and the actions, oaths and ceremonies of this mystic cult—which has attracted not only the passionate adherence of a few, but also the passive goodwill of the majority, of the most advanced tribe in Kenya—have grown steadily more horrible. The active terrorists, who have taken the so-called "platoon oath," are committed to kill any enemy even if he be their father or brother, to cut out their victims' eyes and to drink the fluid from their eyeballs. These are not people whom even Mr Fenner Brockway could quickly turn, through the liberal export of ballot boxes and other western appurtenances, into respectable Labour voters. It is not surprising (although it is also not excusable) that, as stories seeping through from the spot continually suggest, the counter-actions of forces drawn from settlers and loyal Africans have left some ugly stains and scars behind them.

*

How did this horror start, and where will it end ? Is the movement indigenous to the Kikuyu tribe or is it liable to spread like a bush fire across Africa ? Nobody can pretend to give a complete answer to these questions, but the House should pay careful attention next week to an expert's recent assessment. It is contained in the report*, written specially for the Kenyan government, by Dr J. C. Carothers, a psychiatrist who has spent the greater part of his working life in Africa. If its analysis is broadly correct, and most of those with experience of African conditions believe that it is, it helps to point the way in which policy should go in East Africa.

Dr Carothers's most frightening conclusion is that the conditions that bred Mau Mau are not peculiar to the Kikuyu, that the break-up of tribalism carries these, or similar, risks with it everywhere in Africa. The hurried and uneven pace at which Africans are now absorbing western ideas makes them particularly susceptible to myths and movements that relieve them of the need for personal responsibility. In their early years most Africans are still brought up in the almost unaltered rituals of a tribal life in which the checks and balances are external, and the individual is not trained to take personal decisions. African children are pampered. African adolescents are thrown unprepared to earn their livings in a harsh and unfamiliar western world. As a result they tend to look back on the past as a time when they—and their tribe—could get their own way ; and any unfavourable outside event—such as the coming of the Europeans—is not seen for what it is, but as an evil force impinging on the magic tribal circle. "The outsider," says Dr Carothers, "has no rights and if he has inspired fear and hate the vilest of behaviour is appropriate." This basic attitude seems to persist even when the African has acquired the smatterings of a western civilisation. It is made far worse when, as with the Kikuyu, the women who bring up the children have hardly begun to share in any partial enlightenment, but cling dogmatically to the old superstitions.

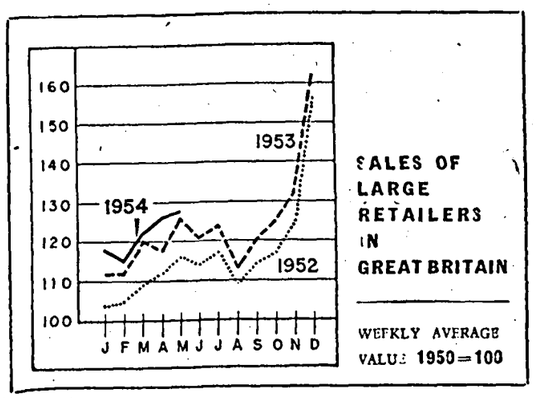
*

Mau Mau, according to this analysis, is thus the product of a situation in some ways similar to that which led to witchcraft and devil-worship in Europe in the sixteenth and seventeenth centuries. The breakdown of tribal restraints, like the breakdown of the dominance of the mediæval Church, has thrown an intolerable burden on individuals quite unused to withstanding such pressures. Retreat to the past was impossible ; advance to a Christian civilisation has either been thwarted or proved too difficult. The third solution was found—part religious, part political movement—in Mau Mau. In Dr Carothers's words "it arose from the development of an anxious conflictual situation in people who, from contact with an alien culture, had lost the supportive influences of their own culture, yet had not lost their magic modes of thinking. It arose from the exploitation of this situation by relatively sophisticated egoists." Men like Jomo Kenyatta and his associates (who themselves had a quite irrational belief in their own capacities) found it both tempting and easy to work up Kikuyan grievances into passionate hatreds. By giving a slight twist to many old ceremonies, which had begun to lose much of their original meaning, they were able to make schemes for their own advancement appear as movements that offered a new purpose and unity to a tribe that had lost its roots and bearings. Once they had sown the dragons' teeth, perhaps even they were frightened at the whirlwind they reaped ; but it should not be assumed that this experience will be a lesson for Kenyattas of the future.

Will there be Kenyattas in the future, or does the present emergency spell the beginning of the end of Kenya as both Europeans and western-trained Africans have known it ? Dr Carothers is plainly confident that the emergency will be overcome. He thinks there is nothing in the magic of Mau Mau which cannot be eliminated either by de-oathing or by demonstrating the cult's failure to its victims. "The African," he says,

* "The Psychology of Mau Mau," by Dr J. C. Carothers. Government Printer, Nairobi. 50 cents.

"shoots up from a sense of impotence to one of omnipotence and feels he has nothing more to learn.... The converse is equally true. When the power bubble is definitely pricked, this omnipotence collapses and gives place to an opposite conviction in which he sees himself again as the impotent victim of an unkind world." For this reason, Dr Carothers agrees with the widely held view that a breakdown in confidence may bring Mau Mau, as an open resistance movement, to a stop before anyone is really ready. The fact that the terrorists in the Mount Kenya district recently came so near to surrender suggests that the settlers will be given a second chance ; unfortunately, the local crassness, which—it is now clear—was partly responsible for preventing that surrender, suggests that they are in no mood to take advantage of it.



If this is an accurate outline of the colony's prospect, the crucial stage for policy in Kenya may not be now (when the overriding aim must be to grind the rebellion to ashes as quickly as possible), but in the immediate aftermath of military victory. Kenya may then be faced with a situation in which the settlers will pretend to remember that "toughness" pays ; when the Kikuyu tribe as a whole will be cowed but smouldering with new resentments ; and when African politicians will be temporarily too frightened to yield to the normally easy temptation to irresponsibility. It is quite possible that a year or so from now Kenya will appear to be enjoying peace, but will in fact be enjoying only an uneasy armistice between horrors.

*

Two conclusions for policy emerge. The first is that, after the possibly sudden end to the rebellion, the principal aim (more important even than punishment of the obscenely guilty) must be to counter the bitterness out of which a new movement could easily grow. There is no quick or simple recipe for this. The Government is already moving in the direction Dr Carothers wishes it to go—of creating villages in the reserves to replace the present scattered smallholdings, and of raising the standards of Africans in town employment so that eventually they will cease to need a precarious footing in country life. Perhaps even more important is the need to bring on the women as fast as the men, so that internal family conflicts—the most damaging of all—can be eliminated as far as possible. Progress in all these fields is bound to be painfully slow. Meanwhile, there is the uneasy news that nearly 50,000 Kikuyu are still herded in detention camps. The chaotic conditions in the reserves suggest that many of these people will be unable to rejoin their families when they are released ; the activists may well be gaining leadership over the passive supporters of Mau Mau in the camps themselves ; and the hard core of future movements may be germinating here, under the authorities' own noses, among people who have never been forced to surrender to overwhelming strength in the field. In a military sense the policy of detention camps is no doubt necessary ; but it contains the seeds of terrible future trouble, unless the screening can be finished and the camps cleared in the next few months.

The second principal conclusion touches more critically on the white population. If the unavoidable experiment of creating an African civilisation is to have a chance of success, the Europeans in Africa must practise what they preach. Many settlers will not like Dr Carothers's remarks on this score. He says, for example, "if the general white population of this colony cannot practise Christian principles in their dealings with their fellow men, both white and black, the missionaries might as well pack up their bags and go." That is frank talk. It applies with quite as much truth to the field of politics, where for years the Europeans have given a demonstration of irresponsibility which Africans have sometimes, and not surprisingly, copied. Unless leading African politicians are given an increasing opportunity to secure positions of responsibility in the new multi-racial government, it is quite certain that the most ambitious of them will resort instead to playing with fire, as Kenyatta did.

Settlers often complain that a higher standard of conduct is asked of them than their critics would be prepared to accept in comparable circumstances. Of course it is. That is the price they have to pay for living in this otherwise pleasant part of the world. They also fear that the doctrine of multi-racial government—which was reinforced this week by Mr Blundell's decision to form a United Country party which, it is hoped, members of all races will eventually join—may lead some day to the swamping of white legislators by black ones. Of course it may. The alternative lies between running this risk and blocking advancement to politically-minded Africans in a way that will inevitably drive them back to making mischief in the reserves. The alternative is between a policy that should allow the settlers to preserve their present rights in Kenya for another fifty years (nobody can tell what will happen after that), and a policy that will inevitably lead to another outbreak of Mau Mau violence even after the present horror is defeated. The settlers must make up their minds which alternative they will choose.

Notes of the Week

No West German Army Yet

SIR WINSTON CHURCHILL and Mr Dulles lost no time in revealing to their respective parliaments the result of the Anglo-American study group's intensive week of work. The political part of the Bonn conventions has now been divorced from the EDC Treaty; and Mr Dulles has stated that if the French Assembly adjourns in August without ratifying the EDC, the French government will, as a first step, be asked to join in bringing the revised conventions into force. In their new form, the Bonn conventions will not specifically give Germany the right to rearm, for the simple reason that all references to rearmament are cut out. In effect, therefore, full German sovereignty and rearmament have both been postponed. This is still not properly grasped in Germany, and when it is, trouble may be expected. Not that the Germans—except for the professional soldiers—are eager to set up an army; but they emphatically demand sovereignty, and it cannot be said that they will have it until they have *Wehrhoheit*, or the right to do what they wish in the matter of defence. Dr Adenauer is ready to accept the Bonn conventions for the sake of speed, but his coalition partners do not all agree, and the Social-Democrat leaders have always objected to the extra-territorial rights that the allies retain. When the limitations still imposed by the revised treaty are realised, Dr Adenauer may receive more criticism than congratulations—while the news that the crucial rearmament question has been postponed will be welcomed in Paris.

It is certain that Dr Adenauer will be pressed to make use of the most important new right that will be granted him by the Bonn conventions—that of negotiating directly with Moscow. That he is worried about this prospect of the demands that will be made on him may be seen from his latest broadcast. In this, he felt obliged to reply to a statement that "people say your policy has now run into a blind alley and that German foreign policy ought to be entirely remodelled."

Tails are Wagging

THE ANGLO-AMERICAN agreement about Germany has come as a great relief to Mr Attlee, whose principal concern now is not so much to secure peaceful co-existence with Russia as to maintain it with Mr Bevan. If France does not ratify EDC the Government's new alternative policy may now be nominally supported by a united Labour Party—although with the rider that "postponement of German rearmament for the time being" will be taken by the Bevanites to read "postponement for as long as possible." Unfortunately, Mr Attlee is likely to find it convenient to support this reading. His speech in the debate this week was that of a man who is being wagged by his own political tail, and who will soon be packing his bags for an unwilling visit to Communist China.

*

Meanwhile Sir Winston is faced by a rather similar show of irresponsibility on his own side of the floor. He followed a long string of other Government spokesmen this week in yet another—and heavily stage-managed—appeal at a private Tory meeting, designed to secure the silence of the back-bench Tories who have revolted against the proposed withdrawal from Suez. He was singularly unsuccessful. The rebels have announced that they will vote against any agreement that involves the complete evacuation of fighting troops, and one of them, Major Legge-Bourke, has resigned from the party. With Labour in favour of an agreement with Egypt, the Government should not be troubled by the loss of the rebels' votes, but it can still be greatly embarrassed by their speeches. There is no excuse for this revolt. The rebels know perfectly well that the military experts have been saying for months that the Suez base is no longer of strategic value and is, in fact, pinning down the men needed to form a strategic reserve. Experts are not infallible, even when unanimous, but the rebels have never shown any military insight comparable to their well-developed sense of public relations.

What should cause the Government most concern, however, is not so much the rebels' present activity as their evident intention to keep their group in being even when the Suez issue is settled. For a certain type of Tory the Suez evacuation will be the last straw, the culmination of a long series of "scuttles." The "Waterhouse group" has therefore indicated that it will remain as a rallying point for all who still have a sneaking feeling that Kipling was right. The Government is lucky that the rebels have so far failed to find a leader of any national prominence; if they did they might be able to paralyse Tory foreign policy as effectively as the Bevanites have hamstrung Labour's.

Anglo-Egyptian Relations

TORY manifestations of the pig-headed side of John Bull are inopportune at a moment when Colonel Nasser is making obvious attempts to show a more co-operative attitude. They represent feelings that few British citizens

harbour in 1954, but that all Egyptians think to be eternally typical of Britain; the chief comfort that they give is therefore to Colonel Nasser's British-baiting critics.

In several respects Anglo-Egyptian relations have in the last week or two been restored to a reasonable level. The British Treasury has this month released £10 million from Egypt's sterling balances held in London, as it was due to do under the agreement of 1951 at some date during the current year. Colonel Nasser's government, faithful to the verbal statements its members had made, has at once responded by lifting all restrictions on imports from the sterling area. Colonel Nasser has also just agreed on a new tie-up with western oil companies, the implications of which are described in a special article on page 204. Most important of all, perhaps, is the fact that the Nasser government has used its influence to cause "incidents" to dwindle to nothing in the Canal Zone. The British as well as the Egyptians stand to gain if an era of complexes and posturing is over.

German Socialist Tactics

BRITISH Bevanites have for long doggedly persisted in claiming that the German Social-Democrats shared their opposition to German rearmament. This is an illusion which should be finally dispelled by Herr Ollenhauer's broadcast last weekend. Though the Socialist leader in other respects only confused the issue after Dr Adenauer, a week previously, had clarified it, he once again made it plain enough that he is not against a German army, but only against the European Defence Community. It is small wonder that the British Labour opponents of a revived *Wehrmacht* find it hard to grasp that the German SPD objects bitterly to the one form of German rearmament that offers safeguards against a revival of nationalist militarism. The answer lies basically in the determination of the Socialist leaders to build up a patriotic party, and come to power as champions of German unity and sovereignty. The most formidable criticism of the EDC that the Socialists bring forward is that it would destroy any chance of an agreement with the Soviet Union to reunite the Soviet zone with the Federal Republic. Like Mr Molotov, though for different reasons, Herr Ollenhauer argues that the western "policy of strength" is blocking German reunion.

The German Socialists' alternative to the EDC has always been exceedingly nebulous. Hitherto it has been proposed that Germany should have an army which would somehow be innocuous because Germany would become a member of the United Nations. Now Herr Ollenhauer has squared the circle by declaring in one and the same breath that he rejected a national army and advocated a coalition force. Herr Ollenhauer seems to have ignored the fact that Dr Adenauer had just pointed out that any alternative to the EDC, whether called "coalition army" or anything else, meant a German national army which would demand full equality. The contradictions in Herr Ollenhauer's speech, and his new declaration of solidarity with France, suggest that the Socialist leader is simply trying to make political capital out of the bad impression made both in Germany and in France by Dr Adenauer's blunt warning. These opportunist tactics make the German Socialists bad guides for British Labour, and unreliable allies for French opponents of the EDC.

Hopes in Paris

THE announcement of the Anglo-American proposal to grant Germany a measure of sovereignty at an early date did not greatly disturb the mood of Paris on the Fourteenth of July. Indeed, the first French reactions were surprisingly balanced, in contrast to the lively emotion provoked by Dr Adenauer's recent broadcast and by the setting up of the Anglo-American study group. The new plan was viewed in Paris for the moment as half ultimatum, half reprieve. As an ultimatum it satisfied the faithful French supporters of EDC. But the adversaries of the treaty, who had expected considerably stronger threats, received the first news from London and Washington with a sigh of relief; the alternative did not look as menacing as it had been painted. They were particularly pleased with the fact that, whatever happens, France will not be bypassed in the negotiations, that its agreement will be sought by its allies.

Nor are the French greatly concerned by the time factor. True, Sir Winston Churchill said firmly that this matter cannot hang in the air indefinitely, and Mr Dulles asked for an answer about EDC before the French Assembly adjourns. But the time-limit had really been set by the French government itself; it was implicit in M. Mendès-France's own calendar. He had bound himself, if he gets over the Indo-Chinese hurdle without tumbling, to present his economic programme and then pass on swiftly to European affairs. If the National Assembly tackles the economic problems as soon as the results of Geneva are known, the debate on European defence could begin in the early days of August.

All this is obviously conditional on the survival of M. Mendès-France, and the government, with only a few days left to get a settlement, is naturally enough concentrating on Indo-China. Mr Dulles's visit and the decision to send Mr Bedell Smith to Geneva were greeted as most welcome gifts for France's national day. It is held that they will considerably strengthen the French hand in the last stage of the negotiations, and much praise is lavished on Mr Eden for his vital part in bringing about an American change of mind. Time is running terribly short, but there is a feeling in Paris that M. Mendès-France may still beat the clock.

Ashamed but Unpaired

THE squalid struggle over MPs' pay has left behind it the worst possible impressions in the public mind—a Government that was more anxious to avoid the appearance of a salary increase than the fact of it, an Opposition that magnified a minor piece of shabbiness into a major national issue for purely personal reasons, and the

revelation that MPs are questioned about deductible "expenses" by the Inland Revenue less closely than are ordinary people. It will be intolerable if it is also to leave behind it a permanent interference with the smooth working of the House, in the shape of a continued ban on pairing.

Labour MPs now recognise that they made a mistake when they imposed this ban; their constituents have complained that this battle over pay has been the only one in which they have been willing to attack the Government with all means in their power. To counter this criticism they are continuing the ban after the settlement of the pay claim—apparently in the hope that it will now be connected with a debate on old age pensions which they are holding on a Supply Day next week. The party leaders are too frightened to oppose this senseless subterfuge, and their Whips actually welcome the affair. It gives them an opportunity of persuading the party that all future pairing arrangements should need their sanction. This would help party discipline; but it would not help British democracy.

There is a much wider issue here than that of the convenience of a few Tory MPs and Ministers. The machinery of the House—and of British Government—is based on the theory that an MP need not attend at all times when the House is sitting. Since few days pass without a vote being taken on some matter of Government business, however obscure, there are only two ways MPs could ever be freed—by pairing or by absentee voting. The latter system works overseas but would be alien to so intimate an assembly as the Commons; nor is it really necessary, since a vote of confidence can always be foreseen in advance and a Government defeat on a minor issue—say in committee on a Bill—can usually be reversed later. Pairing is much the more sensible and convenient way of ensuring MPs a reasonable degree of freedom. It is also a good thing that, except for invalids or ministers away on Government business, pairing should be a purely personal arrangement between the two MPs concerned. An MP knows that if he behaves priggishly, boorishly or unfairly, he will find it difficult to persuade anyone to pair with him. Good manners and fair play are not such obvious political virtues that this small sanction can be thrown away, to save the face of men who are now ashamed of their reaction in a squabble which they should devoutly wish to be forgotten.

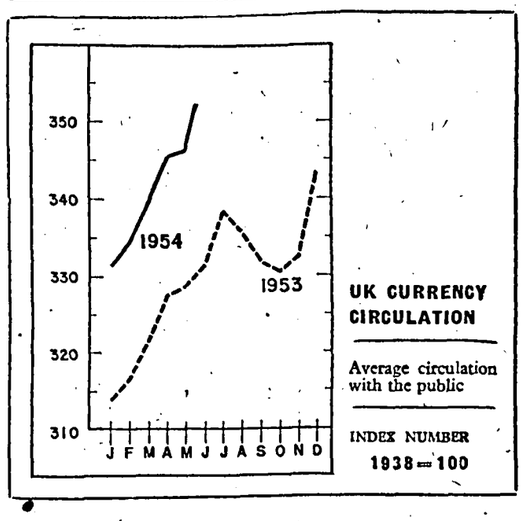
Developers' Charter?

"THIS Bill is not a charter for the landlord, it is a charter for the developer." This was Mr Macmillan's description of the Town and Country Planning Bill, which was given its third reading in the Commons this week after considerable emendations in committee. Landlords will certainly agree with him. Development charges have been abolished and no alternative levy will be put in their place; in this respect development will be stimulated. But the Government still wishes to preserve a strong system of public control over land use; and, in the absence of a betterment levy, it believes that the only way to make planning easy is to keep compensation cheap. It has done this by tying compensation for both planning restrictions and compulsory acquisition to the 1947 scale of development values. Even Labour members recognised that this arrangement will, to quote Mr Irvine, work out "iniquitously unfairly as between different owners of property."

The question that was not raised in the debate was whether this unfairness will ultimately be of benefit to town planning. At present, planning proposals are invariably met by a horde of objections that have to be carefully sifted at public inquiries. In most cases there is no real planning issue at stake, but simply the objector's natural wish to get the market price for his land. Farmers fight local authority schemes "in the interests of national food production," and sometimes win their case; they rarely find it necessary to strike this patriotic attitude in opposition to schemes for private development, since private developers buy them off. This shadow-boxing makes for illogical and shortsighted planning decisions. The difficulties can also be seen in the unwelcome reappearance of ribbon development. If effective town planning entails economic injustice it is bound to suffer; the real planners in the House of Commons this week should have marshalled on the landlords' side.

Training Technicians

TWO new steps have been taken to increase the supply of trained technologists that Britain so badly needs. The background to each has clearly been a decorous battle between those who recognise this need and those who harbour an unreasonable fear that an increase in the technologist's *amour propre* might impair British traditions of university education.



First, the Treasury is to spend more money on expanding higher technological education outside London. In a guarded statement to the House of Commons this week Mr Butler announced that these developments will take place at institutions—principally in Glasgow, Manchester, Leeds and Birmingham—already in receipt of recurrent grants on the recommendation of the University Grants Committee. He also stated that, to avoid "dispersal of effort," there will be no increase in the number of university institutions concerned with technical education; in particular there will be no change in the status of Bradford Technical College. These are dubious decisions. It is important that the University Grants Committee's dislike of the American habit of "debasing the currency," by calling almost any institution that deals with higher education a university, should not be allowed to get in the way of measures that might help to increase the numbers of technologists in Britain. Moreover, there is a case for arguing that the training effort should be dispersed; Britain's need for an increase in the numbers of adequately trained technologists is at present greater than its need for an increase in the quality of training for the top few.

The second new measure, however, represents a defeat for traditional attitudes. The Ministry of Education has approved the establishment of a new body called the Associated Examining Board, which will examine pupils for the General Certificate of Education—in attempted parity of esteem with the eight existing examining boards. The new board will set its own papers in all subjects that are studied in any secondary school, but will give its papers in traditional subjects a special practical slant (presumably making its French commercial) and will also provide papers in a wide range of technical subjects such as laundrywork and lithography. This venture is partly due to political pressure to please parents whose children have failed to win places to grammar schools—many of the pupils taking the new board's examinations will be those who stay on at secondary modern schools to the age of 16. But the universities have no real cause for complaint, since they need not accept the new board's certificate as an entrance qualification unless they are satisfied with it. The board should also be able to bring some order into the early studies of those who are going on to higher technical education outside the universities; and the prospect of a certificate will give an incentive in a field where an incentive is urgently needed.

More Arms for Siam

THE American decision this week to give extra military assistance in order to increase the size of the Siamese armed forces raises some interesting problems. Not least is the paradoxical fact that it may weaken rather than strengthen the Siamese regime. At present that regime has attained a certain stability through the delicate balance of support on which its various members can call; some depend on personal loyalties in the army, others on other branches of the services, particularly the militarised police. If this balance is to be upset through the expansion of one branch at the expense of others, it will undoubtedly set in motion a new chain of complex political intrigue in Bangkok.

Another serious problem is how much to spend on improving the equipment of existing forces and how much on enlarging them. In general the Siamese forces exist primarily for maintaining internal order and their equipment is poor. If they are now to be trained to defend their frontiers against whatever dangers may threaten from Indo-China, the first priority is certainly quality rather than quantity. As matters stand, Siam could in effect be defended only with the aid of foreign troops, and it would be some time before any substantial improvement could be achieved in the equipment, training and fighting qualities of its own forces.

It was against this background that the Siamese ambassador in Washington, Mr Pote Sarasin, called on President Eisenhower at the beginning of this month, and spoke of doubling the country's armed forces. At present, they total about 72,000, with 55,000 in the army, 12,000 in the navy and 5,000 in the air force. The police, numbering some 40,000, is semi-military and also serves as a border patrol. The ambassador suggested a United States programme of military aid costing $400 million over a three-year period. That would be a steep rise from approximately $160 million worth of American military assistance in the past four years. It is not known exactly how far the Americans are now prepared to go. But this seems bound to depend both on the outcome at Geneva and on the development of a South-East Asia Treaty Organisation.

East-West Trade in Hand

MR THORNEYCROFT'S statement on Tuesday about his discussion with Mr Stassen, the aim of which was the revision of the strategic controls on exports to the Soviet bloc, revealed the difficulty he is still facing. But it is a snare of his own devising, for he should have known better than to have promised Parliament results within two to three months. Revision of the control lists, which necessitates bringing fifteen other nations round to an agreed point of view, cannot be done swiftly.

It is not surprising that the differences between the British and American points of view are wide, for the two countries approach the problem from opposite viewpoints. The Americans, understandably, begin by asking "what controls do we need to ensure security?," while the British, though not unmindful of the security aspect, tend to ask "what trade are we losing by these controls?" Both points of view are reasonable; but in the present circumstances, when no one can possibly say that there is no political danger, it would be highly unwise not to play for safety. Moreover, as *The Economist* has frequently argued, the outlook for any substantial and lasting increase in east-west trade is not promising. However, the argument advanced by Mr Thorneycroft "that a shorter list [of restrictions] combined with tighter enforcement is likely to prove more effective" is unexceptionable.

Why there should be any dispute on the question of timing is hard to imagine. Here Mr Stassen is obviously in the right. To let the releases out in dribs and drabs would not only be to forgo the undeniable political value of the West's initiative, but would also cause inevitable friction among the free nations, each country imagining that others were being specially favoured. And surely no one contemplates announcing major concessions to the Communist bloc before any settlement has been reached in the Far East? To throw away the bargaining power of trade would leave the West with no cards in its hand except those of naked force.

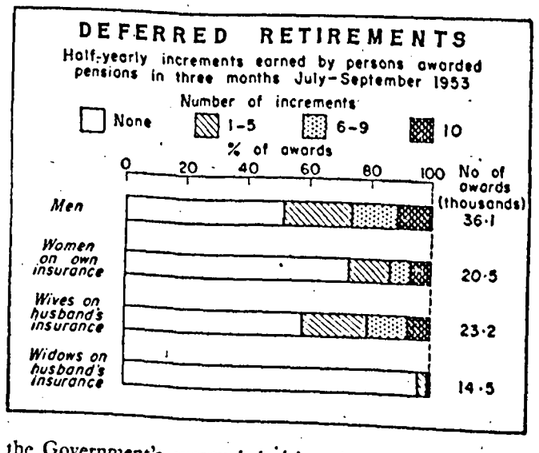
Vague Chinese Visitors

In the closing stages of the visit to Britain of the Chinese trade delegation, the tone of the mission was regrettably lowered. In yielding to the temptation to make propaganda points at his press conference last Tuesday, Mr Tsao Chung-shu, who led the delegation, jeopardised the success of an otherwise well-conceived and smoothly conducted tour. The five British host organisations were in no way to blame. Indeed, they might well take umbrage at the ungracious behaviour of their guests, who not only let their hosts down at an earlier conference arranged for them, but deliberately sought out their own particular friends, in spite of a previous assurance to the contrary.

Among Mr Tsao's tendentious remarks was a claim that Sino-British trade could "reach a volume of £80 to £100 million sterling in the coming year." As in the case of the Russian "offer" to the visiting British businessmen in Moscow last January, few people noticed that there was a proviso: "once trade relations between China and Britain are normalised." This, in Communist parlance, means a unilateral scrapping of the free world's security export controls. The Chinese "estimate" is, in fact, quite meaningless, even as a mere academic exercise in economic forecasting. As the questions at the press conference—albeit only obliquely answered—revealed, China's capacity to pay for larger imports depends on a highly problematical expansion of its narrow range of exports. It is not by coincidence that a study of China's foreign trade carrying a superficially authoritative air has been published this week by an organisation sympathetic to the Chinese point of view. It, too, arrives at an optimistic conclusion; but on closer study, the assumptions on which it is based are seen to be so nebulous that the estimate of potential trade cannot be taken seriously. The study assumes, for example, without a shadow of evidence, that such Chinese exports as rice, wheat, soya beans and tungsten are capable of rapid expansion; that Britain will get the bulk of all China's increased orders; and that China will be willing to abandon its planned policy of directing the greater portion of its foreign trade to other Communist countries. Moreover, the vital question of price is scarcely considered in the analysis.

Nevertheless, in spite of the false note on which Mr Tsao's tour ended, some good may yet emerge. At least it has been proved to the Chinese that British industry has the capacity to meet their requirements. It has, moreover, the desire to serve both old and new customers; but it demands a minimum of good behaviour and plain dealing.

Disposal of a Corpse



The Ministry of Materials is to be finally disbanded in mid-August; and, now that food rationing has ended, many people (including most Conservative backbenchers) see no reason why the Ministry of Food should not follow it. The Ministry of Food still performs a variety of functions, but most of them could conveniently be handled by other departments. The Board of Trade could look after commodity agreements, the remaining measure of scrutiny

over the import programme, and the remaining long-term contracts with overseas suppliers. Responsibility for welfare foods and for the Food and Drugs Acts could go to the Ministry of Health, and that for slaughterhouse legislation to the Ministry of Agriculture.

There remains however the crucial function of administering farm price guarantees in free market conditions. Excluding welfare payments, the subsidies now handled by the Ministry of Food total about £240 million a year. Their basic purpose is to support the prices received by British farmers, although there is a "consumer element" in some of the payments that cannot be precisely distinguished. Their administration is a highly complicated business; a fair balance has to be struck between the varying interests of producers, consumers, and the distributive trades. Moreover, the present arrangements are clearly experimental and adjustments will be necessary. Their high cost must somehow be considerably reduced, and their administration simplified. Nobody wants to keep an unnecessary Ministry in being; but these delicate tasks should not now be handed to the Minister of Agriculture who, both by habit and political necessity, can never be the consumers' champion and must always be the producers' friend.

Increasing One's Pension

At the end of last year 938,000 old-age pensions had to be supplemented by national assistance, to bring their recipients' total income up to subsistence level. The latest report of the Ministry of National Insurance (Cmd 9159, 4s. 6d.) accompanies this statistic with some information about the number of people who were able to supplement their pensions in another way—by deferring their retirement. This information may have some bearing on

the Government's eventual decision about how it will face both the plight of the old and the burden they will place on the national finances.

Under the original National Insurance Act, a pensioner could earn an increment of one shilling for every six months of work (and of contributions paid) beyond the minimum pensionable age, plus another shilling for his wife if she was over 60 years old. After five years of additional work, at

the age of 70 (for a man) and 65 (for a woman), people are given a retirement pension whether or not they continue working. Thus, the maximum number of increments that can be earned is ten, and in the middle of last year it became possible for the first time since the insurance scheme came into force in 1948 for people to have earned the full ten increments.

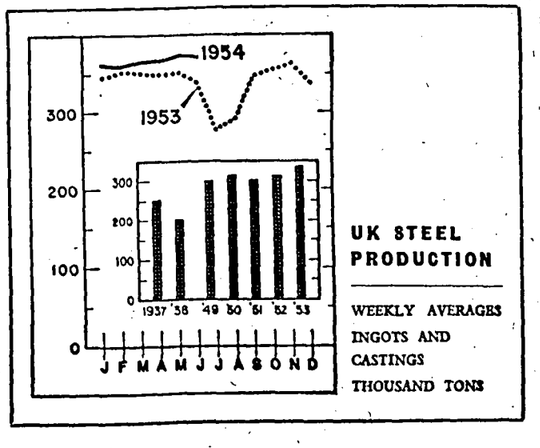
The diagram on page 184 shows how many increments were earned by people awarded pensions in the third quarter of 1953. About half the men and three-quarters of the insured women received no increment at all. On the other hand, 11 per cent of the men received the full ten. If allowance is made for the increase in the increment to 1s. 6d. in 1951, this would give them a pension of 44s. 6d., and a possible 31s. 6d. for their wives. This is well above the Assistance Board's rate of 35s. for a single person and 59s. for a married couple even if rent is taken into account. The average number of increments earned was six; at the higher rate of the 1951 Act, this would give a married couple 69s., which is just about equal to the Assistance Board's estimate of subsistence including rent. The great majority of the existing body of pensioners have not had the chance of increasing their pensions in this way. But the increments scheme may enable future pensioners to dispense with national assistance, provided the cost of living does not increase much more. At the same time it furthers the Government's policy of encouraging a longer working life.

Conservatives and Constituencies

Last weekend Lord Woolton, in his capacity as chairman of the Conservative Party, issued a sharp statement in defence of the redistribution of parliamentary seats that has been proposed by the Boundary Commissioners. The principal importance of this statement is that it seems to confirm the belief that the Conservatives will try to bring these proposals into effect, despite Labour's opposition to them. Among other points, Lord Woolton declared that the Conservatives have made a careful analysis of the commissioners' proposals for England and that this has shown how "utterly fantastic is the Labour Party's suggestion that the proposals will cost them twenty seats."

If anybody has suggested that the proposals would cause Labour to lose twenty seats to the Conservatives at the next general election—thus implying that they would increase the Conservatives' majority by forty—he has indeed been fantastic. But there is no evidence that the Labour Party has done so; on the contrary, its principal concern has been to claim that it is opposing the proposals for much more lofty reasons than those of party disadvantage. It is possible that some of the confusing public comment on this issue has been caused by widespread misquotation of a passage in *The Economist* of June 12th. In this, after deliberate and very necessary warnings about how tentative any estimates must be, it was suggested that

> If each individual elector voted in exactly the same way as he did in the general election of 1951, the proposed new boundaries should increase the Conservatives' majority by at least ten; they might increase it by twenty.



It still seems reasonable to suppose that this estimate should not be far wrong; although—as the commissioners' proposals for London and Lancashire, which were published in the middle of last month, did not hit Labour as hard as might have been expected—the lower figure may now be nearer the truth than the higher one. If the changes proposed in the boundaries of existing constituencies have the net effect of swinging three or four seats from Labour to the Conservatives—which seems a possible outcome—then they would increase the Tories' majority by six or eight; in addition, the proposals for totally abolishing some seats and creating new ones (which, so far, would lead to a recommended net increase of five constituencies) should bring some small additional advantage to the Tories.

However imprecise these calculations—and imprecision is inevitable—there can be no doubt that the advantage will be on the Tories' side. It is a pity that Lord Woolton's statement last week, instead of setting out to refute arguments that had never seriously been put forward, did not admit this. There is no allegation of impropriety in this controversy; but there is reason to question whether the inconveniences and anomalies caused by the present system of boundary revision do not outweigh its supposed democratic advantages.

Outburst at Jerusalem

General Bennike once told the Security Council that Jerusalem was a powder keg, and the unhappy events at the turn of the month showed that his metaphor was apt. During the night of June 30th, and again next day, the heaviest firing heard since 1949 was exchanged for several hours, and there were casualties on both sides of the line. Blame for starting trouble is less easy to apportion in Jerusalem than elsewhere on the Arab-Israel frontier; even an eye-witness can seldom be sure who fired first unless he actually sees what stops the bullet. Each side says that the other opened fire. The irrefutable facts are that UN cease-fire orders were given and ignored, either because they were wilfully unheard when blood was up, or because soldiers were in a position to flout them with impunity.

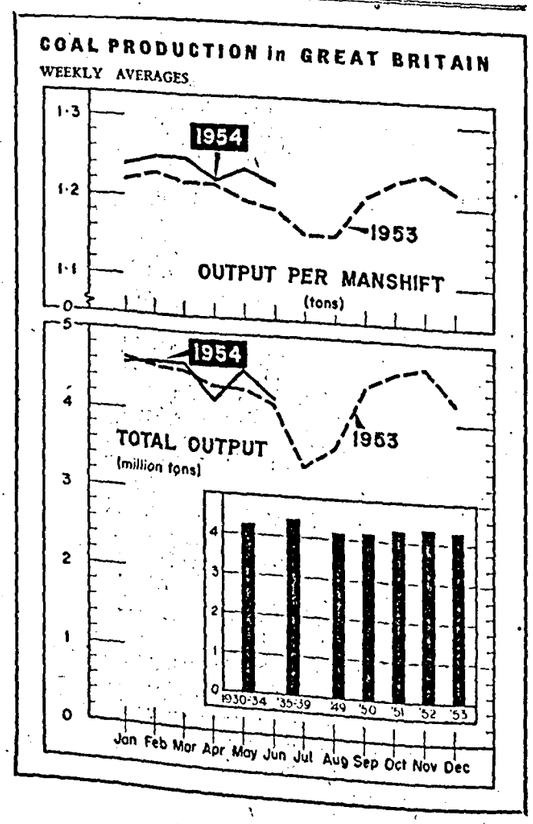
General Bennike has now made some reasonable recom-

mendations for better supervision of frontier guards by their superiors; for undertakings to refrain from retaliatory fire; for clear orders forbidding sniping; and for disciplinary action against offenders. These recommendations were declared unacceptable by Israel because they were not addressed to Jordan only. Such an attitude suggests that any strengthening of General Bennike's team by adding to its numbers and apparatus will have to be inaugurated without giving either side a chance to refuse it. Either the many nations who voted for a frontier in Palestine, or the three western powers who in 1950 declared that that frontier must not be forcibly changed, or both, must take the onus of strengthening the security arrangements. Both Israeli and Arab governments will, as a matter of course, violently protest at any change. But more supervision and quieter nights would be welcome to many a private citizen on both sides of the line.

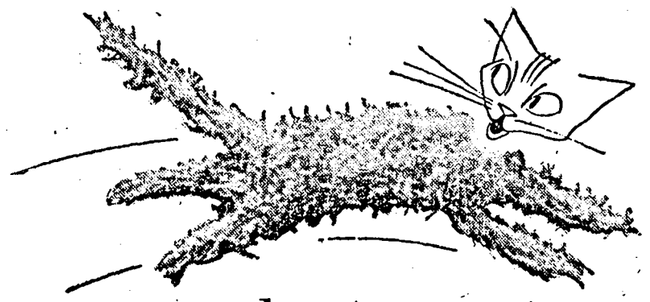
Georgian Iconoclasts

It still seems true that no prophet is sure of honour in his own country, at least not posthumously. Until last year Soviet Georgia was known chiefly as the birthplace of "the greatest figure in world history," Joseph Vissarionovich Djugashvili, and Georgian books were full of the heroic youthful exploits of the man whom the world learnt to know as Stalin. But there is to be no more hero-worship in this Caucasian republic. At a recent meeting of Georgian writers a "false interpretation of history" was deplored. In many books "not the people, but rulers and lords stood at the centre and their figures were idealised."

The language is scarcely Aesopian. Few people will have any doubt which "cult" is now being attacked. As if to drive the point home, one speaker referred to the harmful idolatry which had reigned in the Georgian republic not so long ago. Too many lyrical books look like calendars of saints, he argued, and too much bad verse gets by because it is interspersed with compliments. Thus "Georgia's glorious son," who in Moscow is being transferred from mausoleum to pantheon, is also to be deprived of his native incense and icons.



Clearing the Attic



The report of the Grigg committee on departmental records* has given the public a fascinating glimpse into Whitehall's unsorted attic. The Public Record Office has documents dating back to before the Norman conquest, which stretch along 200,000 feet, or 40 miles, of shelves; and Government departments have on their hands 600,000 feet, or 120 miles, more, which are waiting to be moved to their permanent resting place. Every day the typewriters of Whitehall hammer out a new clutch of papers, to make the confusion worse confounded.

The two criteria that determine which documents should be preserved—administrative need and historical value—have become inextricably muddled. The mess of operative acts and agreements has made the process of selection as complicated a process as it could be, and has removed from those responsible for preservation of documents a proper oversight of them. In effect the Record Office has become the servant of the departments, which can select, store and remove documents at will. Usually, the actual work of destruction falls to juniors, whose work is unlikely to be checked. And departments are not the best bodies to judge their own efficiency. The committee says, for example, that "the department that seemed best satisfied . . . has in its possession unsorted papers going back to the eighteenth century."

The committee calls for an entirely new system of selection. It says that after five years the departments should themselves prune the documents in accordance with their departmental needs; after twenty-five years the Record Office and specially designated record officers within the departments should go through the remainder with an eye almost exclusively on their historical worth. The authority of the Record Office should be enhanced and it should be placed under a responsible minister; indignant historians can then have questions addressed to him and he can chase after departmental offenders more readily than can the Master of the Rolls. The report also recommends that all papers (including Cabinet papers) should be available to the public after a lapse of fifty years. Those who write the history of the mid-twentieth century will have a surfeit of documents to study; Whitehall owes it to them not to burn too much wheat, while so much chaff is plainly being preserved.

* Cmd. 9163, 3s.

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.
Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of jetlight, the jet liners.
Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos . . .

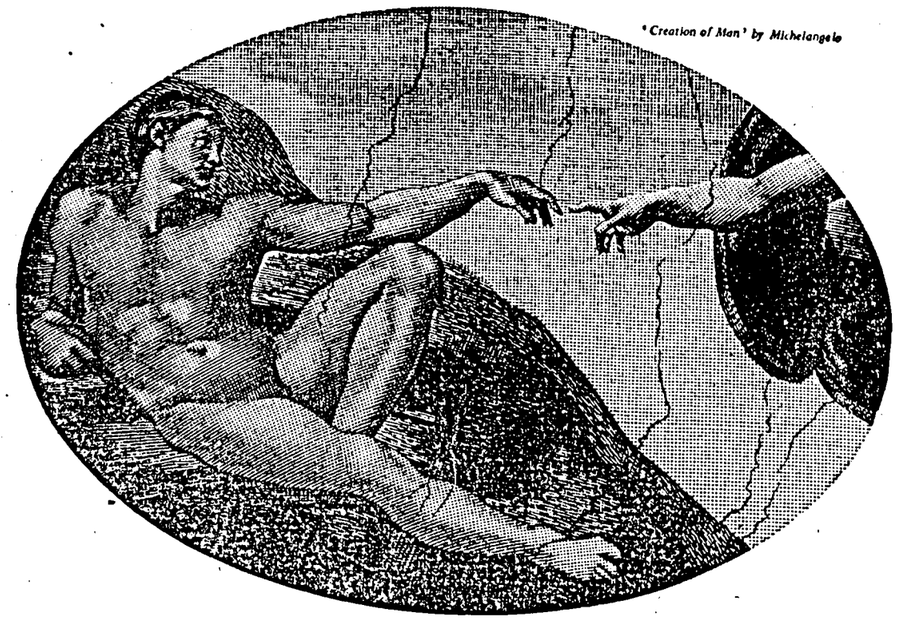
Australia
from a business point of view

This booklet will assist anyone contemplating establishing a business in Australia whether it is a small retail business or a large manufacturing company.

Written with the authority of Australia's oldest and largest joint-stock bank, it offers those who wish to start a new enterprise in that young but growing country a short account of the framework of business organization throughout the Commonwealth of Australia. It also affords some knowledge of the problems and conditions which would be met.



If you are interested in establishing a business in Australia, obtain a free copy of this book from:

'Creation of Man' by Michelangelo

Life is a privilege

RALPH WALDO EMERSON (1803-1882)

Life is a dream, a jest, a burden, we have been told; it has even been called 'a long headache in a noisy street'. It can be all these things; and it can be more. Life, for anyone, is first of all an opportunity; to dream if we wish, or to create; to plod along, or to soar; to complain, or to serve.

The lives of organisations can be as various as those of individuals. Some follow placidly in the steps of centuries; others must ceaselessly advance if they are to survive at all. But in the industrial world of to-day, there is no such choice of philosophy: each industry must constantly be seeking new methods, new tasks, and new markets.

Life is a guess, a trial, a challenge.

Life is a privilege.

Esso Petroleum Company, Limited

Muzzle for the Watchdog?

THE Select Committee that the Government proposes should be set up by the House of Commons to report periodically upon the affairs of the nationalised industries will be a considerably less powerful body than that proposed about a year ago by another Select Committee. Its purpose will be to examine the reports and accounts of the state-owned industries and obtain further information about their "current" policy and practice, not their "general" policy as the Select Committee suggested. It will not be allowed to investigate matters for which the Minister is answerable to the House already, matters settled by collective bargaining or established formal machinery, or day to day administration. It will not have power to appoint sub-committees; as for the proposed power to "send for persons, papers or records," the Government feel that the committee should normally seek its information from the industry's chairman or a representative appointed by him. Lastly, it will not have on its staff "an officer of the status of the Comptroller and Auditor General," though it will have liaison officers from the Ministries concerned.

This watchdog, therefore, will have a bark but no bite. Most of the limitations on its powers are sensible enough: the proposal for a powerful new "efficiency auditor" in particular, was probably ill-conceived. It is not easy to feel that this Select Committee will be any lasting solution to the problem of public accountability in these industries. On the other hand, some of the industries might reply that they are at present not exactly starved of scrutiny. Internal committees are examining the organisation of the National Coal Board and the British Electricity Board; London Transport is being investigated by an independent committee; and last week the Minister of Fuel and Power announced that he also had appointed one, with the task of inquiring into the organisation and efficiency of the electricity supply industry in England and Wales. This seems to be the first of the periodical "stock-takings" that were originally proposed by Mr Herbert Morrison; though possibly the sweeping developments that may change the technology of power generation in the next twenty years might in any case require some forward thinking about possible strains on the existing organisation.

Cuckoo in the Nest

LAST week's annual conference of the National Union of Mineworkers, which hit the headlines because it rejected Mr Bevan and Bevanism by such large majorities, carried the seeds of a cautionary tale. The conference passed a resolution which "considered that the time was opportune for holding conferences and discussion on the possibility of establishing trade union unity." This resolution sounded so innocuous that the mineworkers' robust and sensible president, Mr Ernest Jones, was apparently at first deceived about its real nature. It was only after they had voted for it that some members realised that they had committed their union to considering reaffiliation with the communist World Federation of Trade Unions. The hidden hand behind the resolution was that of the British Communist Party.

In the latest issue of its periodical, *World Review*, the Communist Party has obligingly disclosed where the hidden hand is striking. It lists the unions that have passed resolutions taken out of the communist programme in the first six months of this year. According to this source, 14 unions, headed by the Amalgamated Engineering Union, and with a total membership of just under two million, had by June 20th gone on record in favour of "international trade union unity"; 15 unions had adopted resolutions opposing German rearmament; and over four million trade unionists (from more understandable motives) had asked for increased pay. In addition, 18 unions had called for the banning of the hydrogen bomb; 12 unions for the abolition or reduction of the call-up; 9 unions for a reduction in armaments or international disarmament; 15 unions were "for" East-West trade; and 11 unions were "against" colonial oppression. The equivalent table that it published last year, says *World Review*, "was of extreme practical value to all those actively engaged in the trade union movement." This year, it should also be of value to any members who like to know whose tools they sometimes are.

Troublesome Factory Act

We cannot affirm—as we see strikes amongst masons, carpenters, and seamen—that the Factory Act is the cause of the strikes of the factory labourers. We believe, however, that it promotes and exasperates them. It proceeds on the principle that labour can be regulated by interference extraneous to the master and men, and encourages such interference. The agitators only wished to do that to a greater extent by their own means they had before obtained by means of the Factory Act—a control over the hours of working, and, in some degree, over the amount of wages. They failed from want of power, not from acting on a principle which the framers and extenders of Factory Acts can pronounce erroneous. . . . It is erroneous to suppose that . . . knowledge in the workmen will prevent strikes. Something more effectual than mere teaching is needed to make such injurious proceedings cease here as they are unknown in America; and we should suppose that one of the most effectual measures would be to leave factories to be regulated, like the growing of corn and the supplying of the people with food and raiment, to the full and fair operation of the principles which regulate capital and wages, and by abolishing Factory Acts and dismissing Factory Inspectors. The strikes gave the Inspectors an opportunity of showing the utility of their offices. They have done nothing useful. There is nothing said of their having exercised the smallest beneficial influence over either masters or men. They did not appear that we recollect at all on the scene. . . . The meagreness of the present report of the Inspectors, when such an interesting event has occurred in their especial department, and their satisfaction with the well-working of the Act, because a slackness of trade has permitted its provisions to be carried into effect, is, for us, a confirmation of the opinion we have long entertained, that the Act, and all which belongs to it, is not of the least benefit either to the factories or to society at large. It only causes trouble, cost, restraint, and punishment.

Letters to the Editor

The Cost of Quiet

SIR—The article in your issue of July 3rd, dealing with the noise of jet aircraft was entitled "The Cost of Quiet." If a similar article had been written by a member of the agricultural community or a householder it would have been entitled "The Cost of Noise." The full disturbance created by this nuisance is not, I think, generally appreciated. Apart from the nervous disturbance, almost approaching physical pain, which is caused on certain occasions, there is also the depreciation of property values, the interference with work due to difficulties of communication, and some degree of danger in the use of agricultural machines due to the occasional impossibility of knowing whether the machine is running or not.

The question which the politicians and the civil servants, duly influenced by public opinion, have to solve is on whose shoulders these liabilities should lie. The Earl of Selkirk said in the House of Lords on June 29th that "there is a conflict here between individual right and national interest, and we cannot pretend there is not." In consequence of the new Order in Council the owners of properties adjacent to manufacturing airfields are paying not only their due amount of the cost of defence through taxation but are also suffering a serious capital levy, together with the forfeiture of the peaceful enjoyment of their property with no legal right of redress.

Your proposal that the public should be left with the right to sue for damages is, as far as it goes, an excellent one, but it has a disadvantage inasmuch as not many people have the means to take the risk of suing wealthy aircraft companies.

I have good reason for believing that by the building of test houses 95 per cent silence can be obtained. This is admittedly an expensive operation, but it is more than probable that the total sum involved would be less than the aggregate losses in value of property caused by the noise.

So far as the incidence of the cost is concerned, apparatus installed by an aircraft manufacturing company with the aim of reducing noise would doubtless qualify for the higher depreciation allowance sanctioned for precision equipment. On this assumption, and under existing tax laws, £100,000 spent on such equipment would reduce the company's tax bill by more than £40,000 over a five year period. It could therefore spend £100,000 every five years in this way at an effective net charge to itself of less than £12,000 a year. The country as a whole would meet the remaining cost through the reduction in its tax revenue.

It may set this figure in perspective to observe that over the last five years the undistributed net profits of the three leading British aircraft manufacturing companies have averaged nearly one and a half million pounds each per year.—Yours faithfully, F. H. DU BOULAY
Cranleigh, Surrey

Warnings to France

SIR—Your enthusiasm for EDC should not have led you astray on the facts. It was not Dr Adenauer who pointed out in a broadcast that a European policy without or against France was impossible. It was Herr Ollenhauer.—Yours faithfully, ROBERT BOOTHBY
House of Commons

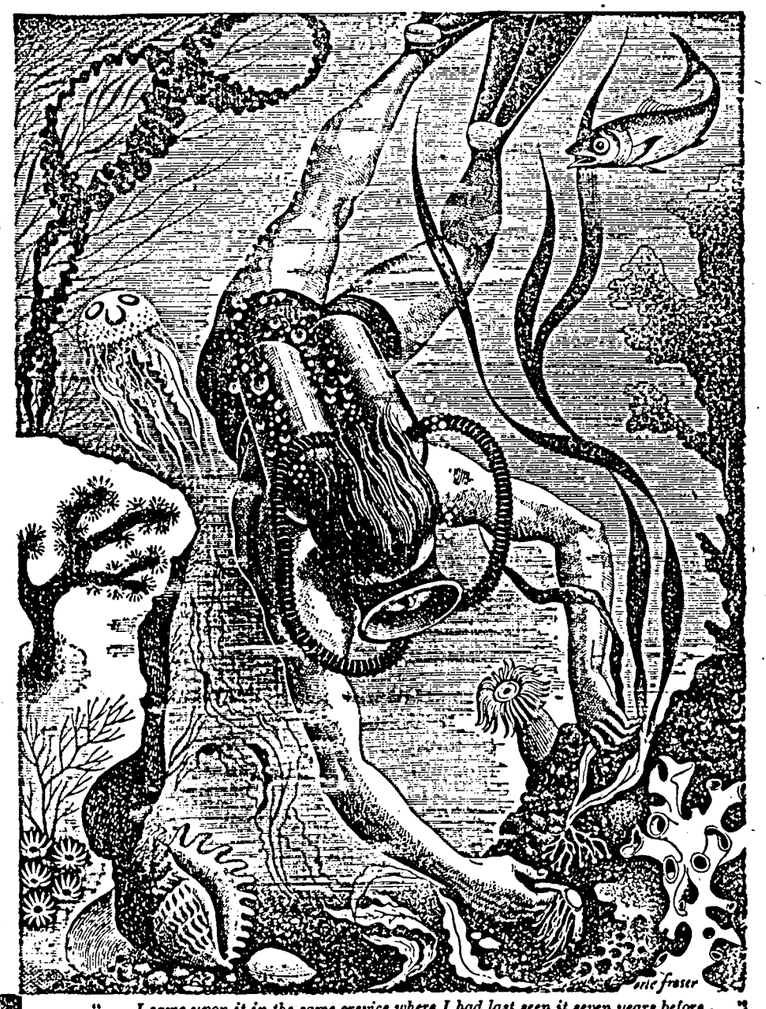
[Sir Robert Boothby is wrong. The statement was made by Dr Adenauer and echoed by Herr Ollenhauer. Here at least is a point on which they seem to agree with each other, as well as with German military experts.—EDITOR.]

Spotlight on Defeat

SIR—I greatly appreciated the wit of the reviewer of my book "Assignment to Catastrophe" in your issue of July 3rd. I plead guilty to two slips; but when your reviewer says that I must be the only man who ever heard Sir Winston Churchill say that we were capable of beating the Germans single-handed, it is he who is mistaken. Not only did he say so to me but he said so often in public. What other meaning can be placed on his declaration of June 17, 1940, when we were fighting alone, "we shall fight on unconquerable until the curse of Hitler is lifted from the brow of mankind. We are sure that in the end all will come right." And nothing can have been more emphatic than his statement to the House of Commons on June 18th, "but I can assure them that our professional advisers of the three services unitedly advise that we should carry on the war and that there are good and reasonable hopes of final victory." We were certainly single-handed then. And on February 9, 1941, "one of our difficulties is to convince some of those neutral countries in Europe that we are going to win. . . . Give us the tools and we will finish the job."

I was both flattered and amused that, having described me as highly intelligent, your reviewer should quote my own comparison of intelligence "to over-bright headlights." I feel I should have said something about tail lights also, which enable the backseat driver to comment brightly on traffic that has been overtaken and passed.—Yours faithfully, E. L. SPEARS
London, S.W.1

[Sir Winston Churchill often said that British would fight to the last and that he had confidence in ultimate victory—would any statesman tell his country that it would fight on until it was defeated? But this is not at all the same as saying that Britain was capable of beating the Germans single-handed. In the speech of June 18th, from which Sir Edward quotes, Sir Winston also said that already Britain could count on four dominions in the fight, and he always counted on America's coming in in the end.—EDITOR.]



The Measure of Private Saving

SIR—You rightly point out the significant increase in private saving which has occurred over the past two and a half years; and you argue that this trend has been as much the result as the cause of the disappearance of inflation. "The resuscitation of personal thrift is, in the last analysis, a reflection of renewed confidence in the value of money." A closer analysis of the national income statistics, however, does not seem to give unequivocal support for your conclusion.

Consider first the (realised) ratio of personal saving to disposable money income over the years 1948 to 1953. In the first three years this ratio tended to be around one and a half per cent; in 1951 it doubled to about three per cent and jumped up to nearly seven per cent in 1952, since when it seems to have remained at this level. The interesting thing is that whereas in 1949 and 1950 retail prices were reasonably stable, being in each of these years not more than three or four per cent higher than in the previous one, in 1951 and the first half of 1952 they were rising very rapidly, becoming stable again in 1953. Thus it appears that the upward shift in the "propensity to save" occurred when prices were rising and not when they were stable, and at a time when real incomes (i.e., the increase in money incomes deflated by retail prices were constant rather than increasing.

Part of the explanation may lie in the development of personal incomes over the period. Disposable money income rose considerably during 1951 and 1952 as a result of widespread wage increases; and it might be that, despite the fact that money incomes barely kept pace with retail prices, people were "misled" by the increase and did not rapidly adjust their expenditure accordingly. The slump in some consumer goods industries at the beginning of 1952 is clearly relevant here. Of course it still has to be explained why consumers did not eventually (say in 1953) adjust their expenditure to their incomes to restore the earlier relationship. The answer may lie in the fact that as a consequence of tax reductions in the 1953 budget they were able to increase real consumption considerably without reducing the proportion of their income saved. Another part of the explanation may possibly be found in a change in the distribution of aggregate money income.—Yours faithfully,
Cardiff G. W. MAYNARD

7 years under the sea*

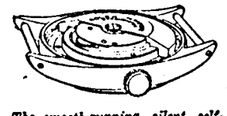
IN 1939 an under-water fisherman lost his Rolex Oyster in deep water off the coast of Greece. He could see it clearly in a crevice between two rocks, but could not reach it.

In 1946 he returned to Greece and took up under-water fishing again. Being lent a self-contained breathing apparatus, he thought of his long-lost watch. With the new equipment he was able to swim down to the sea floor. A short search of the weeds covering the rocks disclosed the watch in the same crevice where he had last seen it 7 years before. After a little attention, it kept as perfect time as it had always done.

What a tribute this story is to the superb accuracy of the Rolex movement! And how well it demonstrates the perfect protection given to this movement by the waterproof Oyster case.

*This is a true story taken from a letter written to Rolex by Mr. D. F. Pawson. The original letter may be inspected at the offices of the Rolex Watch Company, 18, rue du Marché, Geneva, Switzerland.

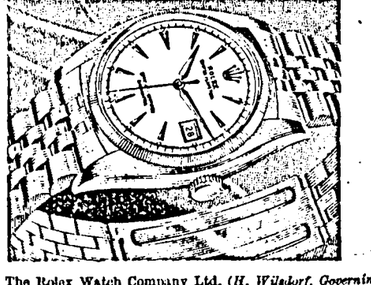
"... I came upon it in the same crevice where I had last seen it seven years before ..."



THE ROLEX OYSTER PERPETUAL, *a meticulously accurate watch whose movement is protected by the waterproof Oyster case and self-winding by the silent Perpetual "rotor" mechanism. By keeping the watch fully wound it ensures an even tension on the mainspring and gives the movement a constant accuracy rarely obtainable in a hand-wound watch.*

* * *

THE ROLEX OYSTER PERPETUAL DATEJUST, *the highest achievement in watchmaking. The Datejust is absolutely waterproof in its Oyster case and self-wound by the unique Perpetual "rotor" mechanism. And it tells the date, clearly and automatically, in a neat window cut in the dial.*



The Rolex Red Seal signifies that the watch to which it is attached has been awarded an Official Timing Certificate by a Swiss Government Testing Station, and has earned the proud title of Chronometer.

The smooth-running, silent, self-winding "rotor" keeps the Rolex Oyster Perpetual fully wound automatically, if the watch is worn for as little as 6-8 hours a day. This constantly even tension on the mainspring makes for still greater accuracy.

THE ANATOMY OF TIME

A fascinating, illustrated book, recording man's deep preoccupation with Time measurement, from the earliest recorded device to the split-second accuracy of the modern watch. For your free copy, write to the Rolex Watch Co. Ltd., on personal or business stationery.

Starch

does surprising things IN SUCH SURPRISING PLACES

Example:

STARCH IN ADHESIVES

Starch is the basis of a versatile range of adhesives which can be given a wide variety of special qualities to make them suitable for particular purposes: qualities such as quick or slow setting, great or small initial tack, resistance to moisture, harmlessness to colour, and the like. The sealing of cardboard packs is one of the many very large-scale uses of starch-based adhesives. Feculose Company Limited, one of the companies in the Industrial Division of Brown & Polson, have developed special water-resistant adhesives with great success to solve packaging problems connected with export to humid tropical countries. Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learned a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

Books & Publications

The Economics of Migration

MIGRATION AND ECONOMIC GROWTH: *A Study of Great Britain and the Atlantic Economy.*
By Brinley Thomas.
Cambridge University Press. 387 pages. 42s.

IN the period between 1815 and the 1920s some fifty to sixty million people migrated from Europe. One might reasonably suppose that we now knew all about the causes and the consequences of this extraordinary episode. But it is clear from Professor Thomas's book that several of the central questions are still open. Why did the emigrants leave? To what extent were they expelled from Europe by a series of Malthusian crises? To what extent were they drawn out by a series of development booms in the United States?

Mr Thomas identifies four great waves of immigration from Europe into the United States between the 1840s and 1914, and he shows the ways in which each of these stimulated investment in American railways and building, and accelerated the introduction of automatic machines capable of employing large amounts of unskilled labour. In Europe, on the other hand, there was a falling off of investment during these periods of intensified migration. Thus there were fluctuations in economic activity with a span of roughly twenty years in both Europe and the United States, but they tended to be compensating. This built-in stabiliser was, Mr Thomas argues, one of the basic conditions of international equilibrium before 1914. He analyses the reasons why such shifts of labour have dwindled, and has particularly interesting things to say about the effect of changes in the American social structure on the willingness of America to receive immigrants.

The idea that the fluctuations in domestic investment in England tended to offset those in the regions of recent settlement is, of course, not new, though it has not previously been worked out in such detail nor applied to so wide an area. Where Mr Thomas departs most widely from previous interpretations is in his discussion of the causes of the great bursts of emigration. It has usually been thought that these bursts were mainly determined by an increase in American economic activity, that is, by the pull rather than the push. But Mr Thomas suggests that they may have been very considerably influenced by the cycle of births in Europe, that is, by periodic increases in population pressure. Malthusian crises and expulsions of population assume in his pages a new role, and the investment booms in America become in some measure a consequence rather than a prime cause of the great waves of emigration.

Mr Thomas's conclusions in part derive from a very wide range of statistics and are in part illustrated by them. A large part of the work is devoted to correlation analysis of the relevant data, which are conveniently collected in an extremely comprehensive appendix. To this analysis Mr Thomas has brought considerable ingenuity and some credulity. When applied to a period of imperfect statistics like the century before 1914 this sort of analysis is a very slippery tool. It is useful in suggesting possible connections between events, but by itself it is not enough to convince the reader that the connections suggested were the important ones; we need to be shown a mechanism which can plausibly be supposed to have had the suggested effects. The trouble about this book is that Mr Thomas does not go behind and beyond his correlations. The book has an abundance of statistics and a number of stimulating if sometimes rather imprecise generalisations; what it lacks is an adequate middle-ground of careful and detailed explanation, linking the facts with the ideas. When the reader attempts to fill the gap he may run into difficulties. For instance, while it is clear from the figures that Mr Thomas gives that the fluctuations in emigration are related to fluctuations in the birth-rate, it is not at all self-evident that the birth-rate is the causal factor. Emigration affects the birth-rate and, since most migrants tended to be young, may have affected it severely.

This book is weakest just where works by economists are normally strong, in rigour of logic and lucidity of presentation. It is strongest where historical works by economists are sometimes weak: it deals with problems of major importance; its approach is fresh; and it ranges widely both in posing penetrating questions and suggesting illuminating answers. It is therefore a book well worth reading; it has the merits as well as some of the defects of a pioneer.

Pledge Redeemed

THE TRANSFER OF POWER IN INDIA.
By E. W. R. Lumby.
Allen and Unwin. 274 pages. 18s.

IF all Britons are glad that India and Pakistan are independent, a minority is critical of the manner in which independence was granted. These urge that the holocaust in the Punjab could have been avoided if Lord Mountbatten had insisted that British administrators should remain in charge for a year until the new governments of East and West Punjab could be organised. A few argue that the corruption and inefficiency that has to some extent admittedly increased since August 15, 1947, demonstrate that Britain should have continued its educative task for another fifteen years or so before handing over. Such criticisms are unrealistic to anyone who lived through the mounting tension of 1945-47. Mr Lumby's quietly pitched analysis, objective and often shrewd in comment, brings out what was plain to every British official on the spot: the administrative machine was crumbling in their hands. No British civil servants had been recruited during the war, while the civil, police, and military services had vastly increased in numbers and were therefore largely Indianised. Repeated British pledges of independence as soon as the war was won had created a state of mind in which tired British officials were expecting to hand over and in which Indian officials tended—some unconsciously, others consciously—to disregard British authority.

It might have been possible to reverse the set of the machine for another fifteen years of British rule if the British Government had been prepared to reason away its pledges; to dismiss Indian, and recruit British, officials in thousands; to put down a rebellion beside which that of 1857 would have been child's play; and thereafter to maintain an army of occupation of some 50,000 British troops. But it is a reasonable certainty that the British electorate would have thrown out any party that offered a programme so out of keeping with postwar sentiments. The reality was that the British were in the impossible position of being responsible *de jure* for law and order without having the power *de facto* to enforce it. The only solution was to hand over responsibility as quickly as possible to those who were ready to shoulder it. In the venomous Congress-Muslim League atmosphere, any attempt to retain control over the disputed Punjab would have aroused the worst suspicions of British sincerity, while the actual experience of the universally abused Punjab Boundary Force shows that the masses felt that their safety lay in seeking protection not from the British, who were obviously on their way out, but from the Hindu or Muslim authorities, to whom the future belonged.

Mr Lumby suggests that the reaction of Asian peoples to Western rule passes through three stages: a nationalist renaissance among the intelligentsia; followed, as Western industrialism and doctrines of social democracy spread, by a demand for radical changes in the economic and social structures that foreign rulers are unable to carry out; and, thirdly, if the demands of nationalism and reform are unsatisfied, by the emergence of Communism. He argues that Britain's timely transfer of

power has given a vast sub-continent the chance to solve its problems democratically. Mr Lumby has written an admirable study that is likely to remain the standard work on the subject until the official archives are opened.

The Town Hall's Problems

THE DEVELOPMENT OF LOCAL GOVERNMENT.
By W. A. Robson. (Revised edition.)
Allen and Unwin. 404 pages. 25s.

THIS study of certain aspects of local government, which was first published in 1931, has been altered to take account of postwar developments. Professor Robson deals at length with the structural problems of local government and more briefly with its cultural possibilities, the evolution of the local government service, and the sinister propensities of the district auditor.

A prologue, "Local Government in Crisis," carries the history of local government up to the current year. Its title indicates the author's attitude to recent events. He deplores the removal by the Labour Government of many functions from local authorities, which is in contrast with that party's earlier belief in expanding the scope of local government. There were several causes for these transfers. Mr Robson emphasises particularly the structural inadequacies of the present local government system, but also important was the passion among Labour supporters for equalising (as far as possible) the local standards and costs of the main services. This desire leads naturally to either central management or stringent central control. The administrative cost and waste of this policy and its destructive effect on local democracy have been largely overlooked—and seemingly by the Conservatives as well as Labour. The author might have treated this trend more fully.

Mr Robson gives a competent account of the sorry history of the attempts to reform local governments since 1945. He includes a just castigation of Mr Bevan, who as Minister of Health would neither admit his own responsibility in the matter (until he was about to leave office) nor allow the Local Government Boundary Commission to function effectively. Mr Robson ends with some gloomy reflections on the political prospects for obtaining reform. Since his book went to press, however, Mr Macmillan has made the outlook a little brighter.

Prisoner of the Russians

I SURVIVED.
By Godfrey Lias.
Evans. 224 pages. 12s. 6d.

THIS book relates the experiences in the Soviet Union of a young Austrian prisoner-of-war, who returned to his country at the end of 1952 after ten years of captivity and attempts to escape from it. Pepi, as he is called, was taken prisoner at Stalingrad in January, 1943. He escaped from his prison camp at Christmas, 1944, and in order to move west with the advancing Russian columns he and a friend took the extraordinary step of joining a horse transport unit of the Red Army. They were able to do this as they both spoke good enough Ukrainian and Russian to pose as Ukrainians; they obtained the necessary personal documents from a Jewish black marketeer. In this way they reached Berlin where they absconded from the Soviet Army in July, 1945.

Here the story would have ended if a pure mischance had not led to their arrest by the Russians as they made their way across the Soviet zone. Pepi spent the next seven years in forced labour camps in the Soviet Union. He was finally repatriated as a result of an amnesty granted at the request of the Austrian President.

Harrowing though many of Pepi's experiences were, Mr Lias has told his story in a light and very readable way. The book gives many interesting glimpses of the seamy side of life in the Soviet Union, though it must be said that the occasional generalisations about Soviet politics are not convincing.

The most enlightening as well as the most lurid passages in the book describe Pepi's experiences after he had received a sentence of 65 years' penal labour for alleged felony. In the penal camp to which he was then sent, he entered a grim world of thieves and cut-throats, the habits and morals of which make a mockery of any communist claim to have organised a society less disposed to encourage crime than the societies of the west. Here he came in touch with members of different semi-secret underworld gangs, who seem to have been at odds both with the Soviet authority and with each other. Pepi tells us in particular of the Black Cats, a kind of Robin Hood organisation which often distributed the proceeds of their robberies to the poor. But, understandably enough, Pepi is able to give only enough details of these gangs to whet the reader's appetite.

If it is read as a story of escape and endurance, one's interest in this book does not flag. But as a picture of even one aspect of the Soviet Union it is inevitably disappointing.

The Long View

ECONOMIC CHANGE.
By Simon Kuznets.
Heinemann. 341 pages. 15s.

OUTSIDE the field of *belles lettres*, the word "essay" has travelled a very long way from its primary meaning. An essay may be virtually a chapter in a projected book, a reprinted lecture or broadcast, a dehydrated volume—almost anything, indeed, short enough to be read at a sitting or too short to be bound between separate covers. Whatever its form, it is far likelier to be a considered and completed statement than the tentative exploration, the probing venture, that its name implies.

Dr Kuznets, with his formidable reputation for handling and analysing masses of intractable statistical matter, is one of the last writers from whom, at first blush, one would expect a volume of essays in the real sense; and indeed the most substantial item in this book—the "Relation between Capital Goods and Finished Products in the Business Cycle," originally printed in the collection of "Economic Essays in Honour of Wesley Clair Mitchell" in 1934, has nothing exploratory about it. It is a finished judgment, and a masterly one, on someone else's exploration. Elsewhere, however, and particularly in the later papers reflecting his shift of interest "from business cycles to national income to economic growth," Dr Kuznets appears as a true essayist, as much suggestive as informative, asking more questions than he answers, opening up vistas, ventilating uncertainties. In "National Income and Industrial Structures," "National Income and Economic Welfare," and "International Income Levels," he attempts to put the statistician's quantitative comparisons in a true social perspective, making a proper and realistic allowance for the differences between a fully developed market economy and one in which the bulk of economic activity remains outside the market, and between those elements of the supposedly "net" national product that truly enter into the standard of living and those (such as the transport of workers) that should properly be regarded as costs incurred in maintaining that standard.

These three essays bubble with enough ideas and suggestive possibilities to occupy several practical research workers for a lifetime. "Retardation of Industrial Growth," an earlier paper, sets out and partially verifies a hypothesis concerning the time-sequences of development, which the reader is left to link up for himself with the article on "Schumpeter's Business Cycles" or, for that matter, with the work of Dr W. W. Rostow. The last two essays, dealing with more general long-term trends and notably with the international rôle of the United States, both end with a plea for a moral philosophy. "Economic Change" has the more power to stimulate because its tentative generalisations, its effervescence of ideas, are the work of an author who knows so thoroughly the long stony road from hypothesis to proof.

Northern University

THE UNIVERSITY OF LEEDS: *The First Half-Century.*
By A. N. Shimmin.
Cambridge University Press. 245 pages. 21s.

THE University of Leeds had its origin in a small social organisation, founded in 1849, known as the Conversation Club, which in the early 'seventies, arising out of a proposal for a Leeds educational council, was instrumental in the formation of the Yorkshire Board of Education. To this board came a suggestion made by James Kitson (later Lord Airedale), a Leeds engineer, for a central college for the West Riding of Yorkshire whose purpose should be the technical training of young manufacturers and science teachers. This led to the formulation in 1872 of a scheme for a college of science, to be known as the Yorkshire College of Science, with four endowed chairs and a curriculum comprising mathematics, engineering, chemistry, mining, geology, metallurgy and experimental philosophy.

Despite a relatively small response to a public appeal for funds the college was duly opened in 1874 for the reception of students of fifteen years of age and upwards. On the opening day only one student was registered and 24 was the total full-time and part-time for the first session, rising to 80 full-time the following year. A notable accession of strength came in 1884 by amalgamation with the School of Medicine. This, founded in 1831, had won a high reputation in its field and later proved a great asset to the new university.

Out of these small beginnings has developed the great university of today, with its academic staff of over 600 and over 3,000 full-time students, and with an annual income that has grown from £3,000 in 1874-75 to £34,000 in 1903-4 and in 1952-53 to nearly £1,200,000. The buildings have been greatly extended and now include the great Brotherton Library and Parkinson Hall, while plans for the future visualise a further expansion which would create a great university quarter penetrating to the very heart of the city.

These are but items of the story—fascinating to all who have shared in its struggles, triumphs and defeats—which has been set out by Professor Shimmin as a labour of love with masterly skill and precision in the sifting and interpretation of the records. His book will be welcomed by all who know Leeds, and, despite its inevitably heavy weighting with local detail, may also be commended to all interested in the development of higher education.

Shorter Notices

INTRODUCTION A L'ANALYSE MACRO-ECONOMIQUE: 1: Les Origines.
By Jean-Claude Antoine.
Presses Universitaires de France. 290 pages, 1,000 francs.

This book, the first volume of a massive survey of macro-economic theory, deals with the history of its development from the first long-neglected origins among the seventeenth-century mercantilists down to the "General Theory." It is, in a sense, a by-product of World War II, of the enforced intellectual isolation of France which cut off French economic thought, over a crucial five-year period, from the revolutionary developments initiated by Keynes. Discovering, when the frontiers were reopened, a whole new science of economics, the author set out to explore, to bring himself up to date, and—after what must have been a really superhuman effort of digestion—to embody what he had learned in a comprehensive survey, which should spare other French-speaking students a similarly exhausting experience, and should, at the same time, link the new economics with those elements in the old that contain the seeds of its development. The result is a valuable work of reference, having no equally all-embracing counterpart in any language; but it is a work which, when one begins to consider its audience, appears to fall between two stools. It is, once the first few chapters are passed, exceedingly stiff, making free use of advanced mathematics and deploying the terminologies of successive schools with confident virtuosity, but very little mutual translation. Those well equipped to read it are likely to be professionals themselves and to need it comparatively little; those to whom it could be most useful are likely to be just plain stumped. Its ideal reader is probably an honours man early in his final year. For the limited class it deserves to rank as a standard.

★

THE UNITED STATES IN WORLD AFFAIRS 1952.
By Richard P. Stebbins.
New York: *Council of Foreign Relations;* London: *Royal Institute of International Affairs.* 492 pages. 36s.

The theme of this latest volume of the annual survey of "The United States in World Affairs," competently and carefully prepared by Mr Stebbins with the research staff of the Council on Foreign Relations, is the contrast between the Soviet strategy of world conquest and the American or Western strategy of anti-communist defence. To Mr Stebbins the salient characteristic of international affairs in the year 1952 was the continued tension and deadlock between the hostile forces of East and West—in Germany, in Western Europe and in the Asian-Arab world—and the growing fear of total war as the armaments available to both sides increased in quantity and destructive power.

Mr Stebbins is particularly concerned to show how the interests of the West suffered throughout 1952 as a result of the tendency of American policy makers to concentrate attention on the purely military threat from the USSR, thus neglecting the equally vital non-military aspects of Soviet strategy—the political, economic, diplomatic and psychological measures aimed at exploiting the latent weaknesses of the West. The most important question emerging from this study of the East-West conflict in 1952 is how, without resort to general war and without a genuine change in Soviet policy, an international settlement is to be obtained. It should provide a vital theme for the next volume of the survey.

Books Received

THE EMPIRE AND COMMONWEALTH YEAR BOOK, 1953-54.
Edited by R. S. Russell. *Newman Neame.* 453 pages. 45s.

The second edition of this year book presents a great deal of information about the Commonwealth in a convenient form. For each country it is possible to look up such facts and figures as its constitution, population, religions, education, budget, trade and communications. Figures are mainly for 1951 or 1952. About a quarter of the book is given over to a useful survey of the raw materials of the Commonwealth, showing the Commonwealth share in world production of each commodity and balance of trade in it.

MANAGEMENT OF AGRICULTURE AND FOOD IN THE GERMAN-OCCUPIED AND OTHER AREAS OF FORTRESS EUROPE: *A Study in Military Government.*
By Karl Brandt, in collaboration with Otto Schiller and Franz Ahlgrimm. *Stanford University Press* (London: *Geoffrey Cumberlege*). 741 pages. 80s.

This vast survey describes in detail the agricultural and economic implications of the German conquest of Europe. The subject matter is discussed under the headings of the different countries and areas under German occupation.

THE FRUIT ANNUAL, 1953-54: *Year-Book and Directory of the World's Fruit Trade.*
Edited by H. F. Tysser. *British-Continental Trade Press.* 532 pages. £1.

YEAR BOOK OF LABOUR STATISTICS, 1953.
International Labour Office, Geneva. 375 pages. £1 10s. paperbound. £1 16s. clothbound.

AN INVESTIGATION INTO THE PROBLEM OF ASSESSMENT SCALES.
Institute of Municipal Treasurers and Accountants.
98 pages. 20s.

BRITANNICA BOOK OF THE YEAR, 1954.
Edited by John Armitage.
Encyclopædia Britannica. 678 pages. 365 illustrations. 3 guineas.

DIGEST OF STATISTICS, *Northern Ireland:* No. 1: March, 1954.
Belfast: *Her Majesty's Stationery Office,* 59 pages. 5s.

This is the first of an official digest of statistics for Northern Ireland prepared on the lines of the *Monthly Digest.* It will be published once or twice a year.

BORON STEELS: *Production and Use.*
OEEC, Paris. 140 pages.

L. T. C. ROLT

Winterstoke

"It was a brilliant idea of Mr. Rolt's to tell the story of the Industrial Revolution through the biography of an imaginary town."
NORMAN NICHOLSON (*Observer*).

"This work postulates a town in the Midlands and diffuses through it the whole history of England.

"Fictionalised history is, ninety-nine times out of a hundred, productive of fallacy; either by the subordination of fact to the requirements of the plot, or by over-simplification, or by gross partisanship on the side of the hero. But *Winterstoke* is the hundredth case." GUY RAMSEY (*Daily Telegraph*).

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Congress on the Middle Road

Washington, DC

BARRING accidents this Congress will not need to delay its departure much, if at all, beyond the habitual target date of July 31st, and the record it is leaving behind should supply arguments for everyone in the forthcoming elections. Enough of President Eisenhower's legislative programme will, it seems, have been enacted for him to be able to declare that the Republican party has passed his test of its worthiness to remain in power; enough of it will have been dropped or postponed for the Democrats to be able to quote the President's test in evidence against his party.

Those Democrats who want to demonstrate to the voters that they are more pro-Eisenhower than the Republicans can talk about foreign policy and trade and about the rights of the executive branch. Democrats did more than Republicans for the Administration's foreign aid legislation in the House of Representatives; a group of Democrats in the Senate carried the weight of the argument against the Bricker Amendment, which would have limited the President's discretion in conducting foreign policy, and supplied more than half of the votes against it; and Democratic Senators organised an impressive demonstration in favour of the President's foreign trade policy after his own party had induced him to abandon it for this year. Moreover, during the televised hearings of the Senate's Permanent Investigating Sub-committee which, as the *New Yorker* put it, was investigating itself like a monkey looking for fleas, it was frequently made to look as if the Democratic members were the sole supporters of the Administration. On the other hand Republicans who wish to blame their opponents for obstructing the President's programme also have examples to offer: the votes in the Senate, cast predominantly by Democrats, to make Hawaiian statehood dependent on the much more dubious proposition of statehood for Alaska, and to send the suggested amendments to the Taft-Hartley labour law back to committee. Democratic votes also denied a two-thirds majority to the constitutional amendment lowering the voting age to eighteen.

Those who support Mr Eisenhower's conception of the Presidency are able to point out that, despite the "well-publicised diversions" about which he has periodically complained, he has induced an evenly divided Congress to develop a solid if unsensational body of legislation that meets his two criteria; these are that the measures should be politically "in the middle of the road" and that the men who take responsibility for them should be the regular leaders of the Republican party. The first condition, intended to sidetrack issues which have divided the country emotionally, has involved the abandonment of successive items in the programme which developed naturally out of the positions taken by Republicans when in opposition, as well as the carrying out of detailed studies to see how existing policies could be improved without arousing deep feelings. The second condition, which the President considers essential if in future the Republicans are to be considered seriously as a possible governing party, has prevented the Administration from working through *ad hoc* groups who support different sections of its programme—through, for instance, the Democratic leaders when trying to get permission to lower trade barriers further.

The President's detractors also derive arguments from these same criteria. They criticise as excessive his emphasis on the "middle of the road" in his legislative programme, on the ground that there is no standing room in the middle of some roads because of the traffic trying to pass in opposite directions. The Randall Commission's report on foreign economic policy, for example, it is argued, shows that no compromise is to be found in Congress between those who want more protection and those who want freer trade. A more radical criticism of Mr Eisenhower comes from men like Mr Walter Lippmann and the Democratic Senator Fulbright, who regard as mistaken his emphasis on a legislative programme which, while mildly "progressive," one of the two adjectives the President likes to use about it, can scarcely be considered "dynamic," which is the other. The President, they feel, should rather spend his energies on asserting the proper authority of the executive, clarifying foreign policy, and coming to grips with such threats to his Administration as the investigations of Senator McCarthy—behaving in fact more like a Prime Minister of Britain and less like a President of France.

*

Mr Eisenhower, however, is fully aware that his remarkable ability to retain popular support is related to his appearance of being, unlike many of his predecessors, somewhat above the partisan battle. He has resolutely adhered to his principle of not replying to other individuals by name; his two specific appeals over the heads of Congress to the people for support—against the Democrats' attempt to bring about further large tax cuts and in favour of his farm policy—were fairly rapidly followed by voting successes on these measures in Congress. Although he has been unfortunate in some of the Republican committee chairmen in the House of Representatives, the skill and adroitness of the Speaker, Mr Martin, and the majority

leader, Mr Halleck, have brought considerable acceptance among Congressmen of the idea, once ridiculed by Senator McCarthy, that the November election will turn on the extent to which Congress has enacted the President's programme. Mr Halleck in particular has employed pressures which are considered ruthless in Washington to induce Republicans to vote in a way contrary to their previously expressed convictions, setting the example himself by abandoning two years of opposition to the "socialist" principle of public housing.

Apart from clearing the bulk of the Appropriations Bills through the House ahead of schedule, Mr Halleck's largest single feat to date has been what the President has called the "great and sweeping victory," in which the principle of flexible price supports for basic agricultural commodities has triumphed over that of high rigid supports, even though only in a modified form. Many of the Republicans who yielded to pressure on this question are lugubriously predicting serious trouble when they get home; their only hope, they maintain, is that general enthusiasm for the President and his programme will carry them through. Similarly the Democrats are relying heavily on the farm issue to pick up seats and are thus becoming more deeply committed to high rigid supports, which is hardly cheering for those optimists who have been hoping that the party of Mr Adlai Stevenson would become the party of brains and new ideas.

★

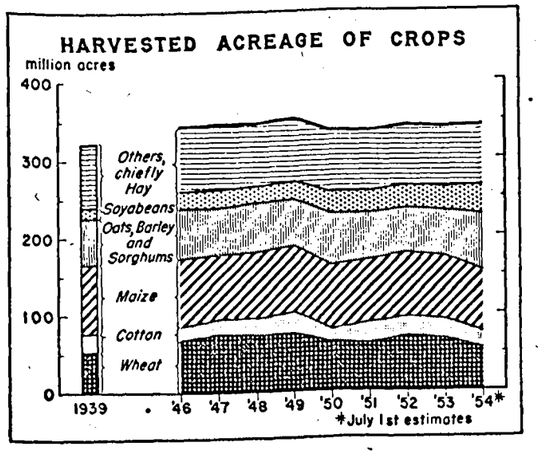
On present indications each side will have lost one of the issues with which it started the congressional session. While signs of economic recovery seem to preclude the Democrats from campaigning once again against Mr Herbert Hoover, on the slogan of "yet another Republican depression," Republican orators can hardly now repeat the President's triumphant assertion of last January that, in the field of foreign affairs, "that precious intangible, the initiative, is ours."

At Geneva the United States has been on the periphery; in the United Nations it seems as if it may shortly be on the defensive. While Mr Dulles confidently asserts that his diplomatic skill will make superfluous Senator Knowland's drastic threat of an American withdrawal from the United Nations if Communist China is admitted, the mood in Congress is one of bewilderment and dismay—bewilderment at the gulf in moral judgment between the United States and Britain, which was revealed to many members for the first time by the visit of Sir Winston Churchill and Mr Eden, and dismay at the prospect that the normal American majority in the United Nations may disappear on this question of admitting China.

The President undoubtedly spoke for Congress and the nation when he said that he did not see how any impartial country could vote for the acceptance of Communist China under present conditions. It is a long time since Americans felt so isolated and misunderstood. The feeling is shared by members of both parties, but neither has any intention of taking the blame if it can be helped. The Vice-President, Mr Nixon, is naturally trying to shift it on to the previous Administration, and its failure to check Communist expansion in the Far East, but the Democrats are equally naturally determined not to be weighed down once again by this charge.

Second Thoughts on Foreign Aid

NO sooner had the House of Representatives given the President practically all he had asked for in foreign aid authorisations than the Senate Foreign Relations Committee, spurred on by Senator Knowland, began to have second thoughts on the matter. By threatening to write into the Bill provisions requiring the United States to withdraw support from the United Nations should Communist China be admitted, and all military aid from France and Italy should they not ratify the European Defence Treaty immediately, the Senators forced the Administration to clarify its position on both these points. Once this concession had been secured, however, the committee had second thoughts again, this time about the wisdom of this attempt to circumscribe future diplomacy by current legislation, and the foreign aid Bill, as it appears on the Senate floor, is more satisfactory than seemed likely a few days ago.



On the admission of Communist China to the United Nations, the Bill contains only a requirement, proposed by Mr Knowland himself as a substitute for his original amendment, that the President must report to Congress on the implications of such a development for the United States, should it occur. And on the European Defence Treaty the committee, after a special appeal from Mr Dulles, followed the House's example in cutting off only future military aid, not the arms that have already been ordered and are on the way, should the pact not be ratified. The Senate committee also restored the various cuts and other changes, concerning loans, purchases of farm commodities and so on, made by the House, including the appropriation for buying aircraft in Britain. But the committee then applied a general cut of roughly ten per cent to all sections of the Bill except the technical aid and multilateral co-operation programmes. The total sum therefore recommended to the Senate is $3.1 billion, instead of the $3.3 billion authorised by the House and the $3.4 billion requested by the President.

Crops at Cross Purposes

AS the Senate prepared to wrestle with the President's farm programme, the July crop report, the first complete forecast of this year's harvest prospects, demonstrated once again the overwhelming abundance which has been encouraged by the present system—backed up this year by an unnecessarily generous Nature. For good weather—the much-publicised droughts and floods, however severe, have only local and temporary effects, it appears—and the scarcity of insect pests have frustrated the Department of Agriculture's desperate attempts to cut the output of farm products which end up in storage instead of stomachs. It is already costing the taxpayer $700,000 a day to store these surpluses, the government owns outright nearly $3.5 billion worth of commodities and, if Congress grants the President's latest request for additional lending authority, there will be $10 billion tied up in price-supporting operations.

As a result of Nature's bounty, although slightly less land was planted this year than last, about a million acres more will be harvested and record yields are expected, so that

total output will be little, if at all, below last year's. Strict controls on both planting and marketing have reduced acreages of wheat and cotton, although similar restrictions had little effect on maize acreages; the majority of farmers feed this grain to their livestock instead of selling it and thus becoming subject to the penalties for overplanting. The July crop report proved what was already known, that farmers, unwilling to leave their land uncultivated and unprofitable, had planted other cash crops, mainly oats, barley, sorghums and soya beans, on the acres that they were forced to take out of cotton and wheat. This means a great increase in the supply of feed grains, and will probably not only involve the government in additional direct price support operations, but may also eventually bring a glut of meat and thus a demand for price supports there too.

Nothing Congress does about farm legislation can have much effect next year, but the Secretary of Agriculture has already taken steps to prevent a recurrence of the present squeeze. The restrictions on wheat planting and marketing next season, on which farmers are to vote next week and which are certain to be followed again by curbs on cotton and maize, include cross-compliance, under which a farmer must keep to the acreage allotments set by the authorities for all the basic crops on his farm if he wants price support for any one of them; and on the 2 million larger farms, land taken out of a restricted crop can be planted only to hay and pasture if price supports are wanted on other crops. These strict controls, which have never been applied before, may force the farmers to do as the government hopes, and take some 40 million acres out of cultivation altogether, but they will be the least fertile acres and total output is, therefore, unlikely to fall proportionately.

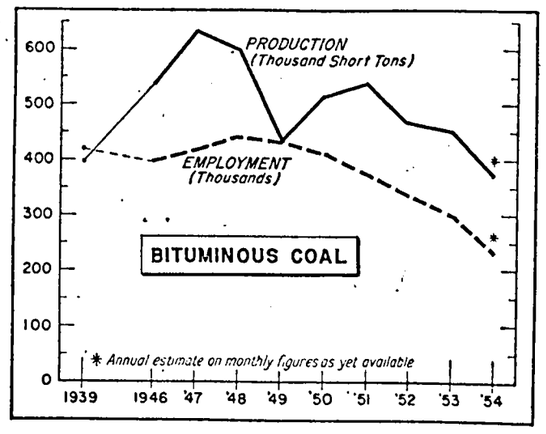
Poor State of Health

JUST as Congress was being congratulated on the helpful way in which it was now dealing with the President's legislative programme, it struck a blow at the heart of his never very vigorous health insurance scheme and almost certainly knocked it out of this session. Mr Eisenhower is, however, determined to revive these proposals, which would encourage private insurance companies, by giving them federal guarantees against loss, to extend health coverage to people who are now either not qualified for it, or not able to afford it. Unfortunately this attempt to see that all Americans have adequate medical care without compulsory insurance pleases no one except the President and his advisers. It is too debilitated to satisfy trade unionists and other liberal groups, while to the American Medical Association it seems to be infected with the germ of "socialised medicine," a diagnosis which was confirmed by the insurance companies who are also fearful of government interference. The Bill was unenthusiastically approved, largely for the President's sake, by both the congressional committees concerned, but when it came to debate in the House, with no organised support and two powerful lobbies working against it, it was quickly sent back to committee. There it is likely to stay, to the regret of the Republican leaders who had regarded it as a useful vote-getting measure for next November.

The election prospects, even if not the health of the average American, will, however, be improved by another, less important section of the President's welfare programme which has been authorised. This is an extension of the 1946 Act under which the federal government already assists states to build hospitals and public health centres. Federal assistance will now be available for homes for the old and chronically diseased and disabled; in all these categories there is a great need for more facilities. Both Houses of Congress have also approved a Bill which would provide increased federal aid to the states for vocational rehabilitation programmes for the disabled, and another Bill which is expected to pass would give the states more freedom in spending federal grants for public health purposes.

Coal's Future

New York.



SIX years ago the American bituminous (soft) coal industry broke all records with an output of 631 million short tons; by the end of last month production had fallen to an annual rate of about 370 million tons. Employment in the industry has fallen correspondingly from 442,000 in 1948 to 215,000 in April of this year, and it is hardly surprising that the United Mineworkers Union has forgone its annual demands for higher wages and has joined the coal operators in a series of desperate appeals for government assistance. The President is meeting these by the appointment of a special committee to consider what can be done to lift coal out of the present depression.

The severity of the decline in demand for coal since the turn of the year is, of course, partly due to the drop in industrial production in general. But of greater significance is the almost uninterrupted decline, throughout the last decade, in the purchases of coal for what were formerly the industry's two best customers—the railways and space heating. By the adoption of the diesel-electric locomotive, the railways have cut their annual consumption of coal by over 100,000 tons; and in homes and offices the "pushbutton" convenience of heating with fuel oils and natural gas has displaced another 60 million tons of coal a year. A part of this market may be recaptured—by coal-

burning gas turbine locomotives on the railways, and by more automatic coal-burning appliances in the home—but it is in meeting what should be the growing demand of the electric utilities, the steel companies, and the smaller industrial users that coal has the best chance of competing successfully in the long run with residual fuel oil and natural gas.

To achieve this success, however, coal prices must be competitive with those of other fuels. Already this year the delivered price of coal has gone down by some 25 cents a ton more than the usual seasonal reduction, but the poor earnings of most coal companies have left them little margin to support more aggressive price competition, unless they can first cut costs—and cut them in spite of the spectacular wage increases won by the organised mineworkers since the war. Not only have miners' wages risen faster than those of workers in competing fuel industries, but they also account for twice as large a share of total costs—over 50 per cent in most mines.

Some mineowners have sought a solution in lower wage rates under non-union operation, but the tendency to break away from the union is not by any means a strong one and, if it gains greater momentum, it will be bitterly opposed by

the organised mineworkers. An alternative attempt to lower wage costs by strict interpretation of existing labour contracts has been met by a strike. Furthermore, the miners' leader, the intransigent Mr Lewis, would rather have unemployment among miners than agree to any cut in their wage rates. It is therefore not on lower wages, but on the higher productivity of labour—at the coal face, in underground haulage, and in the transport of coal to preparation plants and consumers—that the industry is pinning its hopes.

The key to higher productivity lies in the increased mechanisation of production. The progress that is being made in this direction and its potentialities for the future will be discussed in a later article. But fully mechanised mining will not of itself solve the industry's problems. In order to capture and hold new markets, coal must be tailor-made to the exact specifications of the customer, and must be delivered, as well as mined, at low cost. The first requirement, which means that coal is now, in effect, a carefully manufactured product, is being met by a rapid increase in mechanical processing; in 1953, 53 per cent of all coal sold in America was first mechanically cleaned, washed and sized. Over 80 per cent of all coal is still delivered by rail, and any economies achieved in the mines have been more than offset by increased freight rates, but the disappearance of the coal-burning locomotive has also removed the railways' chief bargaining point. The mines, no longer tied to the apron strings of the railways' demand for coal, are now free to devise alternative methods of transport instead of the railway wagon, or to force a reduction in rail freight rates. Costs have been reduced to some extent by the increased use of rivers and canals, and by the employment of more and larger lorries for local deliveries over a wider area.

Perhaps the solution to the problem of high transport costs may lie, in the long run, in the preparation and use of coal in pulverised, or powdered, form, a form which is in any case being favoured increasingly by large industrial consumers. Taking a leaf from its competitors' book of transport advantages, such coal will move to market, like oil and natural gas, as a fluid through a pipeline, or alternatively by an overland overhead conveyor belt; plans for developing both methods are already in an advanced stage.

★

If the industry succeeds in cutting the cost of mining, processing and transporting coal, it can afford to be optimistic about the future, despite the severity of its present depression. And the longer the view taken, the better the prospects. The cost of finding oil in the United States is bound to continue to rise and, even if imports are not arbitrarily restricted, fuel oil prices in the long run are likely to increase as are those of natural gas. As the competitive fuels become dearer, a number of new uses for coal will become economic. There are already a wide variety which are physically possible: the production of synthetic liquid fuels; the underground gasification of coal; the development of the coal-burning gas turbine for locomotives and power generators; the growth of a chemical industry based on direct coal hydrogenation, instead of as a by-product of coke production; and the multi-purpose method of coal carbonisation to produce liquid fuels, chemicals and a hot char residue suitable as a fuel for power generation. All of these new uses are believed to have a commercial future, but much more intensive research is first required. The coal industry spends on research less than an eighth of what the petroleum industry spends, and publicly financed research on coal, such as the work of the Bureau of Mines on synthetic liquid fuels and the underground gasification of coal, has recently been sharply curtailed.

But despite the colourful appeal of the new uses, the biggest—and the most rapidly growing—market for coal in the future will be without question in the generation of electricity. Coal, displaced from American homes by convenient oil and natural gas, is returning in the form of the equally convenient kilowatt-hour, through air conditioners and heat pumps, washing machines, water heaters clothes dryers and the entire range of electrical appliances. A parallel growth is expected in agriculture and industry. And as cheap hydro-electric sites become harder to find, the proportion of thermal stations is rising rapidly. By 1965, according to the Edison Electric Institute, the peak load for electricity will be double the present load, and of the new capacity installed to meet the increasing demand at least 90 per cent will be in the form of thermal stations. And although the Atomic Energy Commission must eventually reverse its role as the nation's largest energy consumer, and become one of coal's competitors, nuclear energy, even in the long run, appears more likely to supplement coal than to supplant it.

But to attack new markets with these new technologies coal producers must remain flexible. The negative approaches which they and the unions are at present demanding—limitation of imports of fuel oil, the prohibition of imports of natural gas, or guaranteed government purchases of coal without regard to comparative fuel costs—are mere palliatives which will impede rather than promote the necessary adaptation of the industry to its changed environment. The advocates of restriction are many and voluble but, in view of the more far-sighted members of the industry, government assistance should be sought only, if at all, in the form of larger appropriations for research, or of an increase in the industry's tax depletion allowance to provide more money for mechanisation.

The Lattimore Serial

TRIALS for perjury are the only logical endings to the McCarthy anti-Communist thrillers, which always take the same pattern: allegations by the Senator that a government official or adviser is, or more often was, a Communist or has Communist affiliations, followed by repeated denials from the victim before one or more investigating committees. Yet so far only two of these stories have got as far as the third instalment. One of them had a happy last chapter six weeks ago, when perjury charges against Mr Val Lorwin, once employed by the State Department, were dropped by the Department of Justice and the investigator discharged for misrepresenting the case when obtaining the indictment.

There is no suggestion of irregularity in the second, more famous story, that of Dr Owen Lattimore, the Far Eastern expert who worked for the Institute of Pacific Relations, although there would seem to have been some inefficiency in the Department of Justice. For the Court of Appeals has upheld Judge Youngdahl in dismissing the vital count in the indictment of Dr Lattimore, which charged that he lied in denying to a Senate committee that he had been "a sympathiser and promoter of Communism and Communist interests." This, said the court, was too vague an accusation to be brought to trial; Mr Youngdahl's rejection of one of the other, less important, charges was upheld, but two were reinstated. The Department of Justice has now to decide whether to appeal against this decision to the Supreme Court, to drop the case altogether, or to bring Dr Lattimore to trial on the remaining counts. These are that he committed perjury in denying that he knew that various writers for the journal of the Institute were Communists, that he knew that a certain Chinese was a Communist, that a meeting with a former Soviet Ambassador had not taken place during the period of the

Nazi-Soviet pact, and that he had handled correspondence for one of the President's assistants during the last war.

Certainly these remaining counts, concerning mainly Dr Lattimore's opinions or the accuracy of his memory, hardly seem substantial enough to justify reviving a bitter controversy and involving him in the strain and expense of a trial; nor unfortunately is it likely that his acquittal on such charges would arouse enough interest to wipe out of the public mind Senator McCarthy's original naming of Dr Lattimore as the "top Soviet espionage agent in the United States." For over four years Dr Lattimore has been devoting all his energies to fighting these accusations, and he is fortunate that his employers, John Hopkins University, have stood by him; he therefore still has an opportunity to resume a constructive career. Another of Senator McCarthy's victims, Mr John Paton Davies, has no such certainty; also a Far Eastern expert, but a permanent State Department official, he has been repeatedly cleared by loyalty boards, but is now apparently once more under examination on suspicion of perjury.

Lumber out of the Wood?

THE strike, now in its fourth week, of well over half the 100,000 lumber workers in the Pacific Northwest, which produces nearly all the country's plywood and about a third of its softwood, seems to be doing more good than harm to all concerned, except the construction companies and other users of lumber who have been paying about 25 per cent more than usual for their supplies. But even prices are now coming down, although they are still far above normal, as consumers realise that there is no immediate threat of a shortage. This is mainly because many small lumber companies in the Northwest have either come to a quick settlement with the strikers or employ non-union labour; some are even said to be using men on strike from other companies to man a second shift.

Such an opportunity of increasing sales is particularly welcome to these small firms, for they find it ever more difficult to survive in an industry which has a habitual pattern of boom and bust and has for some time been one of the least prosperous sections of the American economy. The strike came when the large lumber companies repeated their last year's refusal to raise wages. The two lumbermen's trade unions, belonging respectively to the American Federation of Labour and the Congress of Industrial Organisations, had already united for the occasion in anticipation of this refusal and they presented a joint demand for an increase of 12½ cents an hour. The unions recognised that the continued decline in lumber prices made it genuinely difficult for the companies to pay higher wages, and argued that a strike was the solution for both sides, since it would push prices up, as it has indeed done, and make wage increases feasible. The strike came at a time when there would in any case have been holiday shutdowns, and seasonal stoppages of logging operations because of the danger of fire during dry weather. So it is hardly surprising that there has been little pressure for a general settlement of a strike that seems, to trade unions and lumber companies alike, to be offering them, temporarily at least, a way out of the wood of recession.

SHORTER NOTES

Nebraska voters will have the unique opportunity of choosing three United States Senators in the November elections, as a result of the death of both of the state's Senators—Mr Griswold and Mr Butler—this year. However, of the three vacancies, only one is for a full six-year term; the other two are for the last four years of Senator Butler's term, and for the last two months of Senator Griswold's expiring term. In a traditionally Republican state, the Democrats hope to benefit from the confusion which this unusual situation has caused among the Republicans; there are no fewer than eight contestants for the Republican nominations.

★

The government's principal purchasing agency, the General Services Administration, is planning a three-year purchasing programme to acquire 200,000 flasks of domestic and Mexican mercury for the stockpile at a guaranteed price of $225 a flask of 76 pounds. The current shortage of mercury has pushed the price up to $280 a flask, from $186 at the beginning of the year, and the government is in effect putting a floor under the price; this should encourage the reopening of high-cost domestic mines and thus increase the supply for the open market.

★

According to a report from the Bureau of the Census, more than seven million persons were employed in governmental positions in 1953 and drew $23½ billion in pay during the year. Of these civilian public employees, more were in local than in state or federal government service, and more were in educational and national defence work than in any other public enterprise. Although federal employment declined last year, state and local employment has continued to rise.

★

Congress is continuing the suspension of the import tax of two cents a pound on copper, but the duty will be reimposed if the price of copper falls below 24 cents a pound. It is now about 30 cents a pound and imports of copper have been running at about 35 per cent of domestic production.

The World Overseas

Indonesia Watches in the Wings

THE course of events since the fall of Dien Bien Phu has been watched very closely in Djakarta. It is not of course everyone who even knows where the Red River delta is. But those who do have been taking stock of their own situation in Indonesia itself. And for one reason or another they have mostly come to a tacit agreement on one thing; Indonesia must stay strictly neutral. If it does anything, it will sign a non-agression pact with China. It will not, under any circumstances that can at present be foreseen, join a South East Asia Treaty Organisation (Seato).

The reason for this is simple. The anti-Communists are both hushed and anti-western; they are alarmed at the developments in Indo-China but cannot bring themselves to take any decisive action. The Communists, on the other hand, are patiently as well as jubilantly biding their time. An interesting illustration of their attitude emerged some weeks ago from reports published in a moderate and certainly not pro-Communist Socialist paper. A number of left-wing groups had got together to discuss the way the wind was blowing in Geneva. The Communists among them re-emphasised the fact that with the 30 votes which they command in parliament they could bring about the fall of the present government at any time they wished. As, however, this would undoubtedly bring a coalition of the right-wing Muslims—Masjoemi party—and Socialists to power, they preferred to use their influence to blackmail the present government into carrying out policies favourable to Communist aims.

Indonesia is in fact much more likely to dance to the Communist tune than either India or Burma. Delhi's policy of neutralism is well known for its idealism, whether or not this must be regarded as starry-eyed. Rangoon is now staunchly independent, but also frightened and wary of Chinese intentions, as the visit of Mr Chou En-lai has shown. There is little that is starry-eyed about Djakarta; rather is it a centre of political intrigue, in which personal ambition and Communist tactics might at any time combine to produce a dangerous explosion. The only solidly optimistic fact that can be weighed against the reality of this peril is that almost no one who knows the Indonesians seriously expects the worst to happen. Although under considerable Communist influence, their country is at present likely to jog along for some time, without going Communist.

In politics, one of the biggest question marks hangs over the constantly deferred general election. Preparations are now going ahead more actively than they have in the past, and it seems that even the present government coalition—the Nationalists (PNI) and the Greater Indonesian party (PIR)—which fears a resounding defeat at the polls, may not feel able to postpone the contest much beyond 1955. The Communists meanwhile have already had one ingenious trick exposed. With a largely illiterate electorate, party symbols for which people can vote have to be officially registered. Until the main opposition party, the Masjoemi, protested, the Communists had managed to get the hammer and sickle quietly registered not only as their own sign but also as a general emblem for anyone not associated with any particular party.

In economics, the feature of the past year has been a worsening of the general position and a definite weakening of the national currency, the rupiah. Since last August gold and foreign exchange reserves have fallen from Rp 2,210 million to Rp 1,540 million. Government borrowings from the central bank had risen from Rp 83 million to no less than Rp 2,797 million by May of this year. And while the statutory rate of exchange is still 32 rupiahs to the pound, the imposition in March of a tax levy of two-thirds on many forms of remittance into sterling has lowered the effective rate to 53 rupiahs to the pound. Similarly, as Mr Macindoe, the chairman of the Indonesia Association, has pointed out in London, "owing to inducements and other devices the effective rate of exchange, where the import trade (into Indonesia) is concerned, works out at anything from Rp 32 to Rp 96 to the pound." A further devaluation of the rupiah is expected in many quarters.

One of the tragedies of the new Indonesia is its inefficiency. Fortunately for the people who form the backbone of the country, the peasants, nothing could apparently matter less. Their islands are rich and their basic human needs are small. And in terms of modern Asian politics it is everything to be free. There has indeed been a great feeling of exhilaration since the winning of independence four years ago. But, having advanced on to the world stage in their own right, the Indonesians cannot avoid its common problems. One of these is how they are to pay their way with a rising standard of living. Another is how to do so without resorting to the totalitarian methods inherent in Communism.

It is easy for anyone who knew the prosperity and order of the Netherlands East Indies in the old days before the war to decry the mess of the present day. But the current phase is an essential part of the process of transformation from colonial status to successful independence. Already a good deal has been learnt and it must be hoped that Indonesia will be granted the time and ability to complete the change, without falling prey to a political philosophy that

would, in the end, be a burden to the country and a menace to its neighbours.

For the British, the most immediate practical result of all this is to threaten the gradual elimination of some £150 million worth of commercial investment. British and other foreign firms are being confronted with immense and, it would appear, increasing difficulties. Every kind of obstruction is put in their way in respect of remittances abroad, entry permits for their own nationals, the employment of labour, the use of housing, the employment of Indonesians on their staffs, taxation, security, long-term planning and, not least, form-filling; the returns from one firm are recently reputed to have had to be dispatched in five wooden packing cases.

For the West as a whole a country as strategically placed as Indonesia is bound to be important. Although it has lately dropped out of the headlines, it remains to haunt the planners in the shadows. The Indonesian government has just made the gesture of finally breaking the formal Union which remained with Holland. At least an element of luck looks like being needed if it is not in time to forge some kind of new link with the Communist empire.

Nasser's Deal in Oil

BY a new agreement with foreign oil companies which Egypt's *junta* signed on June 26th, Colonel Nasser has displayed that he has practical notions about how to turn an adverse tide in the affairs of an underdeveloped state. For nearly ten years, Egypt and several of its neighbours have offered the anomalous spectacle of statesmen fending off foreign proposals likely to contribute to new investment and greater freedom from want. Their motive has been fear of the snares that they think underlie any scheme that is simultaneously of advantage to the west. In refreshing contrast to certain predecessors, Colonel Nasser has seen that there is no future for Egypt if its statesmen simply coast in neutral gear. He has therefore cut the nationalist cackle and signed an agreement with four major western oil companies on the development of Egypt's oil industry. Naturally, the four companies stand to benefit if all goes well, but so do the Egyptians.

A point Egyptians do not readily comprehend is that their oil industry is not as tempting to the foreign investor as those of some of their neighbours. Oilfields in Egypt have proved difficult to find and are apt to be faulty when discovered. Production has over the last few years amounted to only about two-thirds of consumption; the latter is rising and the former failing unless reinforced by new discoveries. The balance of consumption has to be bought out of foreign exchange resources that are in short supply. A logical government would have given every encouragement to anybody willing to finance prospection for, and exploitation of, new resources.

But nationalists are not logical. Successive governments have for years set less store by increasing home production than by clipping the wings of the only people capable of doing this for them—the foreign oil companies. Monuments to this phase of nationalist thinking are the anti-foreign Companies Law of 1947, a Mining Law of 1948 that confined the exploitation of discoveries to Egyptian companies, and the imposition of arrangements about selling prices that deterred any oil company from increasing its stake in Egypt by rendering the yield on its end-product a matter of chance. If in a country that is part-producer, part-importer, oil companies are to plough profits into expansion of production, they must be allowed some latitude as to the price at which they sell oil some of which they have to import at prevailing world prices.

In the name of nationalism, successive Egyptian governments shut their eyes to this fact of life. Broadly speaking, they required the companies to sell certain oils, and notably kerosene, below a price based on economic value and known as the "justified price"; in compensation, other oils were to be sold at a price above that level and any unbalance was to be adjusted out of a Price Stabilisation Fund to be furnished by the Egyptian Treasury. In fact, the very basis for assessing the justified price was often in dispute and more than one cabinet left the Stabilisation Fund in deficit over considerable periods. The oil companies were at times operating at a loss to produce Egypt's import requirements. One of them—Jersey Standard—cut its losses and pulled out in 1950; the others—notably Anglo-Egyptian Oilfields and Socony Vacuum—hung on in hopes of better times.

Neguib's revolution raised these hopes only to dash them. His team amended the Company Law and introduced a law designed to promote foreign investment; early in 1953 it also introduced a new Mining Law that permitted non-Egyptian oil companies to exploit discoveries. But it still hedged foreigners about with onerous deterrents to enterprise. Illogically, at the same time as it proffered its new inducements, the Neguib government dealt new blows at the surviving foreign oil companies; notably it repudiated a price agreement that they had reached with the Wafd in 1951 and refused them the priority rights to prospecting licences that they had been granted in 1948-49—in a word, denied them the fruits of some expensive pioneering. If the *junta's* policy was to woo the foreign investor, it looked as if its right hand did not know what its left hand was up to. One or two small independent oil companies nibbled at new ventures, but their capacity for investment was a mere drop in the bucket of Egypt's needs.

Starting the Ball Rolling

Colonel Nasser seems to have a realistic appreciation of the hard fact that if the cost of extensive development of the oil industry is to be met, no one is in a position to do it except the established oil companies. His virtue is that he has flouted prejudice in order to start the ball rolling.

The advantages of last month's new oil agreement are that it settles tariffs and pricing to the satisfaction of both parties, that it gives the old-established companies up-to-date prospecting licences in parts of Sinai where they have already spent some £E4 million, and that it holds out promise for Egypt that they will in the next three years spend a further £E4½ million on improving production, refining and workers' welfare. It also holds out hope that the Treasury will by instalments make good the deficit in the Price Stabilisation Fund.

Contrary to oriental belief, an agreement on paper is not progress in being. The oil companies know that their operations are still dogged by prospects of frustration and delay; their hard-earned experience suggests that, however willing the *junta*, performance may lag behind intentions because Egypt's administrative machine responds only creakingly to any new demand put upon it. The companies are capable of putting sustained effort into working the deal, but matching effort by the Egyptians will be necessary if it is to work out as both parties would wish. Whether Colonel Nasser can infuse the necessary continuity into Egyptian practice remains to be seen. If he can, he may entice other foreign investors into Egypt.

First Steps in Federation

THIS is the season of budgets in Central Africa. Each of the three territories comprising the new federation continues to have its private agonies; but it was the first federal budget, which Mr MacIntyre, the Finance Minister, is now piloting through the federal legislature, that was awaited with special interest and anxiety. Not only has the Federal Government assumed responsibility for the general economic advancement of the new unit, which, among other things means that for the first time the main taxes are to be raised federally rather than territorially, but the Government stands more than most governments on its economic record. In the debates over federation the theme song of its proponents was an economic one—that federation would bring the territories prosperity which would be far harder to achieve in isolation. It was more than usually important, therefore, for the Federal Party to be able to report progress and to hold out prospects.

The Government has passed both these tests. Mr MacIntyre's budget provides solid enough proof of the advantages of centralisation. Most Europeans will be noticeably the better off for it. Federal company tax is to stand at 6s. 3d.; even if territorial governments continue to levy the full impost allowed by law for their own purposes (20 per cent), this will still in most cases mean a lower rate of taxation than in pre-federation days. The same applies to income tax; and allowances continue at a rate that is said to be necessary in a pioneering country, but which would seem utopian to the British tax-payer. A married man with two children, for example, pays no income tax at all until his income reaches £1,250 a year. But the most unexpected, and the most pleasant, relief comes in the extent to which Mr MacIntyre has been able to level out territorial tariffs as a first step towards building a customs union betwen the three territories. As a result the cost of spirits and tobacco for the Europeans in Southern Rhodesia has tumbled—and the African has been offered his bread and circuses in the shape of a reduction in the price of native cigarettes to one penny a packet.

Rival Power Schemes

For the future, Sir Godfrey Huggins has announced a £70 million development plan—a utility model as development plans go, but one which, given moderately fair economic weather, will stretch the federation's internal and external fund-raising powers to the limit. The federation's future rate of expansion is so much at the mercy of imponderables, such as the world price of copper, that in three years' time the pattern for investment may appear either over-ambitious or puny. But as a working model, the plan concentrates on the right things. Better transport is still the federation's first need; the plan envisages spending £30 million on it during the next three years, and the money will not be wasted. For the rest, it concentrates on two things—better social services, schools and the like for which African demand now far outstrips any foreseeable supply; and hydro-electric power for mines and industry.

It is this last item which presents the federation with its first really thorny problem of territorial *amour-propre*. There are two hydro-electric schemes afoot; the Kafue project in Northern Rhodesia and the Kariba project in Southern Rhodesia. Until a few months ago Sir Roy Welensky and the northerners thought their scheme was in the bag. Kafue could provide the power for the copper-belt by the time it was needed; and the Southern Rhodesian government raised no objections, provided that its chances of raising funds through the central government were not prejudiced. But experts now say that Kariba can supply the power earlier than was previously expected, and since the two projects are now clearly in competition for federal funds Mr Garfield Todd, the new Southern Rhodesian Premier, felt justified in backing his horse strongly. Feelings indeed ran so high that the Federal Government has imported two independent French experts to go into the whole position before deciding what to do.

This quarrel is symptomatic of the sort of friction that is bound to develop during the settling-in period of federation. Contrary to what politicians in Britain said, the pressure point is not racial politics but the natural jealousy of the three territories. This alignment is at present minimised by the strength of the federal party in the central legislature, and by the concentration there of all the most influential politicians of the *ancien régime*. The opposition—the Confederate party—was annihilated at the polls, only its leader, Mr Dendy Young, being elected to parliament. It has since committed near hara-kiri. Most of its leaders resigned early this summer in protest against the nationalist tendencies of the party's hard core; and Mr Dendy Young is now left as an uncomfortably isolated head of an increasingly ultramontane body.

Badinage and Bustle

Political interest has thus tended to swing from the centre to the wings, where new faces are to be seen and new names are being made in the territorial legislatures. These bodies are still very important. They have direct control over native policy; and, in the wrong hands, could make life very difficult for the central government. Perhaps the most remarkable change occurred in Northern Rhodesia, where the young and relatively inexperienced Mr John Roberts has taken Sir Roy Welensky's place as leader of the unofficials on the legislature, and immediately substituted a policy of co-operation with the still powerful official element in the government for Sir Roy's own peculiar mixture of badinage and bustle.

In Southern Rhodesia, an important new figure has emerged in Mr Garfield Todd, who has stepped into Sir Godfrey Huggins' shoes with more assurance than anyone would have believed possible a year ago. This ex-missionary, whose liberal reputation hides some practical common sense, has gained considerably in popular esteem from his firm handling of labour problems since he took office. He did not hesitate to call out troops at the time of the African strike at Wankie collieries early this year; he showed equal decisiveness in June, when he nipped the illegal and foolish European railway strike in the bud and deported its leader to England. The logic behind this firmness—apart from the crippling economic consequences

of a strike—is that Mr Todd believes that African progress can come only through discipline all round—and particularly from the Europeans. A committee is being set up this summer to sort out the vexed problem of African trade unions in Southern Rhodesia ; and it is consequently all the more important that, if, as is expected, they are legalised, they should not have an object lesson in irresponsibility from their white colleagues.

In Mr Todd's way, Southern Rhodesia is tackling African advancement sensibly. It believes in decent housing for Africans and proper economic conditions which will prevent shanty-town industrialisation ; it believes in better health and education. Its hesitancy about giving the Africans the vote is not all hypocrisy. Southern Rhodesia has a common roll, and Africans will increasingly make use of it. Federation may in fact have speeded up African emancipation rather than the reverse. In Nyasaland, Mr Lyttelton has agreed to greater African representation in the legislature and a land settlement that has made the plantation owners writhe. On the copper-belt, African and European trade unionists still confront each other, but the balance is tipping in favour of the African demand for better jobs at a rate lower than the fantastically high European wages.

The good sense of Central Africa is, in fact, all the more remarkable for the tantrums that are being thrown to East and South. How long, or whether, this will last is anyone's guess. But the first steps taken by the federation indicate that its critics were wrong and its advocates were right—and not only in the economic sense. In the battle of ideas, the liberals of Central Africa are turning down Malanism flat. They may even be raising hopes of liberalism in South Africa more than anyone yet suspects. If that is the case, they are doing without fuss just what was hoped of them.

The MRP in Limbo

LAST May the *Mouvement Républicain Populaire* (MRP) held its assizes in a mood of optimism and seemingly unbounded confidence ; last week-end its national council deliberated in gloom and bitterness. Two months ago the congress saw the party firmly entrenched in power, clinging to its monopoly in foreign affairs and, on the basis of a couple of victories in by-elections, it had high hopes of further success at the polls. Now the Christian Democrats have lost the *Quai d'Orsay* and have been thrown from the government into opposition.

The MRP is not used to opposition. With the exception of a few odd weeks it has had seats in the cabinet throughout the life of the Fourth Republic. Still, after the victory of M. Mendès-France its leaders promised to play their new role constructively. Those who hoped for quick proofs of that determination, or who saw in the appointment of M. Robert Schuman as rapporteur on foreign policy a search for a compromise with the new majority, must have been disappointed by last week's meeting. Since the MRP's conduct of foreign policy is now under fire its retrospective defence was only natural. But most of the council's time was taken up with attacks on the "myth of Mendès-France" and by questioning the latter's good faith. In fact the main reproach against the new premier—that he has put the question of European defence into the background—sounded somewhat hypocritical in the mouth of Christian Democrats who had not refused to sit in successive governments which had not even dared to set a date for a parliamentary debate on EDC.

The MRP may well not have recovered as yet from its unexpected setback or it may hope for a quick return to office. But however long it has to stay in the purgatory of opposition, the sudden fall from parliamentary grace was clearly a profound shock. Though the voices clamouring for a change were drowned last week in the general temper of mourning and revenge, there is a *malaise* in the Christian Democratic ranks which cannot be camouflaged by discipline and nearly unanimous resolutions. Indeed, there were already signs of internal dissension even behind the bright façade of two months ago ; there were the contradictions between progressive activists and conservative electors, between the party's left-wing social slogans and its right-wing political alignments.

Drifting to the Right

The MRP is a young party heir to an old tradition. Up to the last war the French Catholics had no political party of their own, though the conservative groups had the backing of the Church. But there were many Catholic groups (such as *Le Sillon*, a direct ancestor of MRP) trying to reconcile social reforms and the teachings of the Church. These progressive, anti-Munich groups as well as various Catholic youth and working-class movements were cemented together during the Resistance. After the liberation they emerged as a single party with wonderful opportunities. In fact, the opportunities proved probably too good for the purity of the new movement of progressive Catholicism. With the bulk of right-wing leaders discredited as collaborators, this new party, backed by the Church, inherited many conservative voters and with over five million votes became the strongest non-Communist political body of the Fourth Republic. True, the MRP lost much of this electoral ballast when De Gaulle's Rally swept the country in 1947. Still, even, now it is electorally strongest in the traditionally conservative clerical districts.

It has been the task of the leadership to bridge or at least to conceal the growing gap between the reformist activists, the *militants*, and the conservative electoral *clientele*. This has been made easier by the consitution of the party, by the strong representation of the parliamentary group in congresses and councils. But the reformists could not stop a steady drift rightwards. There were many reasons for this drift in addition to polling strategy. The question of lay or religious education, for example, divided the Christian Democrats from the traditional left. Even the uncompromising European policy of the MRP has tended to push it towards the right. But, above all, it decided to stay in office at a time when the governmental pendulum was swinging away from the left. With the Socialists in opposition, Christian Democrats found themselves serving under the conservative leadership of MM. Pinay and Laniel.

To defend this position they used the argument previously advanced by the Socialists that it was done in order to save the Republic and prevent the pendulum from swinging any further. Whatever the reasons for its presence, the MRP had to share the blame for errors of government policy. A paradoxical situation was reached last year when Catholic trade unions struck against the decrees of a government in which MRP ministers were represented. The North African policy of the government also provoked the wrath of many supporters. The eminent Catholic writer, François Mauriac, with all the passion of a lost love, charged the MRP ministers with having become corrupt with power and with having North African blood on their fingers.

M. Mauriac's strictures carried less weight than successes in by-elections. Yet these very successes strengthened rather than weakened the contradictions within the party and widened the gap between rank-and-file and the leadership; they were due chiefly to Gaullist losses, to the recovery by the MRP of conservative voters disappointed with the failure of their Gaullist gamble. Thus the dilemma facing the heirs of progressive *Le Sillon* is greater than ever. After ten years of almost uninterrupted power, the MRP finds itself out, though nobody knows for how long. One should not expect the party to revise its European policy in opposition. But this temporary setback could prove of great value if it were to lead the Christian Democrat leaders to decide whether there is room in France for a socially progressive Catholic movement.

Encouraging Soviet Farmers

SOVIET agriculture is again in the limelight. In the interval between spring sowing and harvesting the central committee of the party held a special session on agriculture and issued lengthy directives on the subject. A large part of it is devoted to a catalogue of regional and general shortcomings as well as to practical recommendations for the farmers. The general conclusion seems to be that to step up agricultural output the treatment prescribed by Khrushchev must be continued and intensified. In other words, the order of the day for agriculture is still both more incentives and more conquest of virgin land.

When Nikita Khrushchev launched his policy of incentives last September the emphasis was on vegetables, meat and dairy products. Now, however, the problem of grain is probably the most acute and incentives are to contribute to its solution. Compulsory grain deliveries by the farms are reduced, while quotas from farmers' private plots are completely cancelled. The government hopes that this loss will be more than compensated for by larger state purchases at higher prices. It still has faith that in spite of last year's unsuccessful experiments the countryside will respond to money pulls. It is now openly admitted that last year the supply of most agricultural products fell far short of expectations. But the planners are convinced that the chief reason was the lack of goods in the rural shops to tempt the peasants and that this can be remedied.

The main jump in grain output, however, is expected to come from the reclaimed land. The drive to extend the area under cultivation in Kazakhstan and Siberia is still in full swing but progress reports are somewhat mixed. On the one hand, 3.6 million hectares of virgin land have apparently already been brought under grain, though the plan foresaw only 2.3 million hectares at this stage ; on the other hand, there are alarming reports about the conditions in which some of the pioneers have to live and work. The erection of houses, vital in this cold climate, lags behind schedule and newcomers do not always get the tools they need.

The real test will come next year when about 20 million tons of additional grain should be provided from 13 million hectares of new land. Another reason for the government's concern about any shortcomings likely to discourage prospective settlers is the apparent intention of the Kremlin to transform this emergency operation into a full scale colonisation movement. The 140,000 who have already moved into the hitherto unexplored territories are only a vanguard. It is significant that to encourage collective farmers to migrate and settle down the state offers a free passage for the family and good credit for building a house, buying a cow and so on. To emphasise that the 13 million hectares are merely a prelude the central committee has now asked all the authorities involved to present in three months' time plans for the further reclamation of virgin and waste land, in particular in Northern Kazakhstan and Western Siberia (Khrushchev himself has just attended a special agricultural conference in Novosibirsk). New railway lines are also to be built to provide outlets for surplus grain. The planners clearly visualise this area as the biggest Soviet granary of the future.

These grandiose plans of expansion, however, are for tomorrow. Today the Kremlin is faced with the urgent tasks of rapidly improving the diet of the average Russian town-dweller and of getting the necessary agricultural raw materials for light industry. For the moment the situation is still critical. There are shortages of meat, vegetables, dairy products and grain, particularly fodder grain, indispensable for livestock breeding. To keep their pledge to the consumers, the new Soviet leaders will have to spur on the farmers to a tremendous effort in the next twelve months. The contribution of new land may prove of very great value, but much will depend on higher yields and larger supplies throughout the country. Will the planners be able to supply enough consumer goods to attract the peasants ? Will lesser burdens result in higher production ?

All these are vital questions for the new regime and this is why the party keeps on prodding the countryside. This is the third time within ten months that trumpets are blown and new marching orders issued. And there is still a note of the utmost urgency in the appeal. The political future of post-Stalinist Russia will be greatly affected by the success or failure of Nikita Khrushchev's policy of incentives and land conquest.

Indians in Ceylon

FROM OUR CORRESPONDENT IN BOMBAY

IN the seven years since India and Ceylon attained their independence the dispute between them over the million people of Indian origin in Ceylon has never stopped simmering ; and at the moment it is threatening to flare up into a blaze. Last week Sir John Kotelawala, the Prime Minister of Ceylon, complained of a Press interview by Mr Desai, the Indian High Commissioner, in which the latter accused the Ceylon government of "dishonourable action" and said that unless it accepted amendments to the constitution concerning residents of Indian origin, the India-Ceylon agreement would be regarded as null and void.

Yet there has always been a theatrical quality about this quarrel; Indians and Ceylonese remain brother democrats, brother Asians, in Western eyes sometimes brother neutralists. The melodramatic way in which Ceylonese ministers talk about getting rid of their Indians does not stop them from following a foreign policy largely, but not wholly, in sympathy wtih India's, nor produce in them a fear that India will retaliate with anything stronger than persuasion.

The dispute is a direct result of independence. Before independence Indians and Ceylonese alike were British subjects. Independence was granted to Ceylon, however, with no safeguards for its Indian population and the new government set out at once to get rid of as many Indians as possible; to do so had long been an objective of most politically conscious conservative Sinhalese. The Sinhalese constitute the majority of Ceylon's population, and all its peasantry and aristocracy, but their distaste for trade and for paid labour had left a gap that Indians had filled. The tea-plantations which provide Ceylon with two-thirds of its exports rest entirely on Indian labour, as do, for example, the Colombo docks; and the shopkeepers and small importers-exporters are nearly all Indians. The population of Ceylon is, however, increasing at the record rate of 3½ per cent per annum. To the Sinhalese it seems that the simplest way to provide for this increase is to take over the Indians' jobs, if not today, at least in years to come. They are also reluctant to leave the Indians the right to free education or to a share of the new land being reclaimed in the mosquito ridden interior. Moreover, the United National Party is anxious to disfranchise the Indians, who are usually political opponents.

The Ceylonese constitution prohibits direct discrimination. The government's approach was therefore, ingenious. It refused to take the obvious course of granting Ceylonese citizenship to all those resident in Ceylon in 1947 who wished for it; this is roughly the definition Indians and Pakistanis are following for their citizenship. Instead two classes of citizens were created: citizens by birth and citizens by registration. Since most of the Indians now in Ceylon were born there, the Ceylon government could not accept the normal definition of citizenship by birth—that the person himself should have been born in the country. Under the Ceylon Citizenship Act either he and his father or his father and grandfather must have been born in Ceylon, and the onus of proof is on the applicant; this is no small task for an illiterate Indian labourer when birth records have in the past not been customary.

Indians were, however, partly provided for by the Act for Citizenship by Registration, for Ceylon would like to keep the prosperous Indians, and also a core of necessary labour. One can become a citizen by registration if one can prove reasonable means of livelihood—not always an easy task for a plantation labourer on a weekly wage—if one can furnish proof of having lived continuously in Ceylon with one's family for 7 years prior to January 1, 1946 (for 10 years if single) and if one can prove intention during that period of becoming a permanent resident. India does not object to the definition in itself, but to the way the law is administered in practice. To prove an intent in retrospect is always difficult, and the law is being so strictly interpreted that of late three-quarters of the applications have been turned down.

Of the million Indians in Ceylon, 150,000 have taken out Indian passports and of these 80,000 have already left. Of the remaining 850,000, Mr Senanayake—when he was the Premier of Ceylon—guessed to Mr Nehru that 400,000 might obtain Ceylonese citizenship, though it now looks as if the number might be lower, and at the present rate the process will take several years. The rest Ceylon regards as Indian, India as stateless. India will not accept as citizens people who declare themselves Ceylonese; it did, however, agree with Ceylon that the Ceylon government might offer inducements so that people would ask for Indian citizenship. India had in mind such measures as permission for applicants to take their capital with them on retirement or a special provident fund for estate labourers with a rising scale as inducement to leave sooner for India. What Ceylon has in fact done is to talk of denial of employment, of rice rations, and of free education, to non-Ceylonese. India does not accept these as inducements; they are in fact rather feckless threats. Ceylon cannot do without Indian labour so long as Ceylonese labour has not filled the gap, and rice is plentiful off the ration. Finally, India has backed up its view that the stateless are not Indians by prohibiting travel to India except on a visa, and visas can only be affixed to passports.

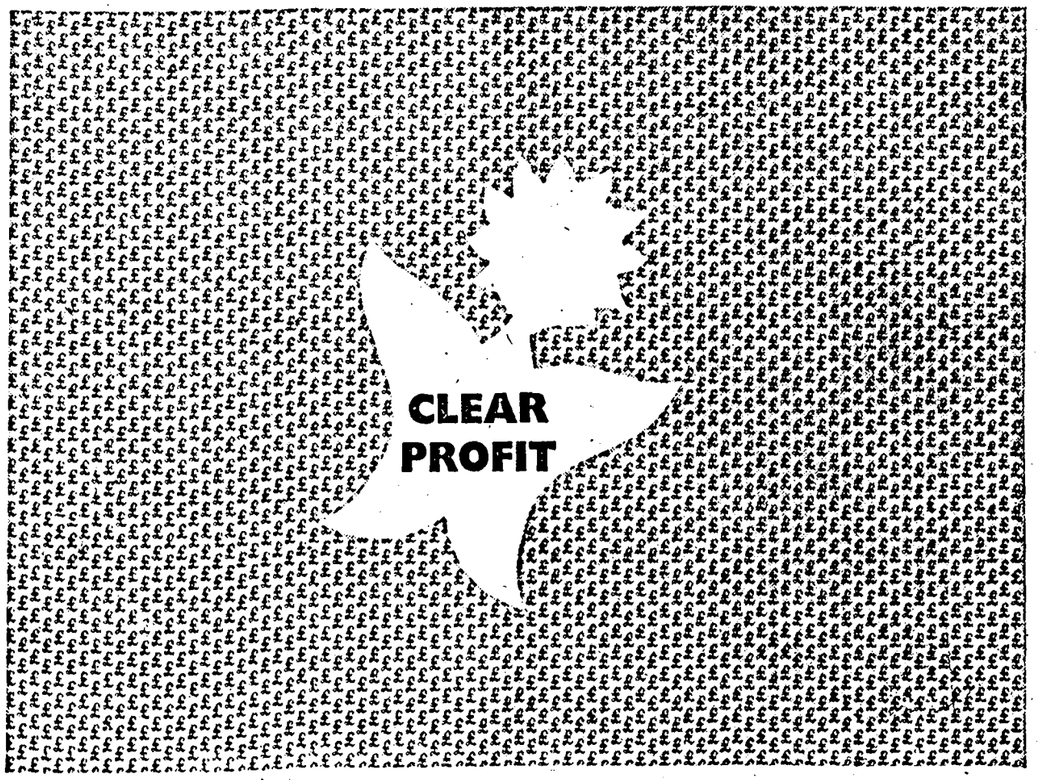
Thus the ball has been neatly smashed back into Ceylon's court. It cannot get rid of its Indians, for India will not take them unless they freely wish to come. All Ceylon can do if it will not absorb them is to mistreat them: patient though Indians are and disinterested though the Indian government officially is, for so small a country next to so large a country to do that might be foolish.

Journal of Geneva—X

NO important developments took place during the tenth and eleventh weeks of the Geneva conference. In the absence of most of the chief protagonists the conference marked time and waited the outcome of the three sets of military talks between the Viet Minh and the Vietnamese, the Laotians and the Cambodians; the first started on June 2nd, the second on July 6th, and the third on July 7th.

July 8th. Mr Molotov returned to Geneva.

July 9th. A restricted session on armistice arrangements.



July 10th. M. Mendès-France arrived and dined with Mr Molotov.

July 11th. M. Mendès-France had a number of private meetings including one with the Viet Minh Foreign Minister, Mr Phan Van Dong. This was the first meeting between the chief French and Viet Minh representatives.

July 12th. Mr Eden and Mr Chou En-lai arrived and a number of private meetings were held.

July 13th. After a series of private meetings M. Mendès-France and Mr Eden left for Paris to meet Mr Dulles. The first private meeting between the heads of the Vietnam and the Viet Minh delegations took place.

July 14th. After further meetings in Paris with Mr Dulles, Mr Eden and M. Mendès-France returned to Geneva and Mr Eden immediately got in touch with Mr Molotov. After the three-power talks in Paris it was announced that Mr Dulles had explained "the limitations" which his government wished to observe with regard to the Indo-China talks at Geneva, but that Mr Bedell Smith would return to Geneva at an early date.

Gas burns clear and clean. It does not waste its substance in smoke. By the time the gas comes to your burners the smoke has been put to work by the Gas Industry in a hundred different ways, all of them beneficial, all of them contributing to keep down your fuel costs. Apart from fighting unhealthy smog, the filthiest and the most expensive blanket in all history, gas gives you a clear answer to the question: What is the true cost of my fuel? Your bill is for fuel used. Gas needs no special equipment for handling or storage, no replacement stocks, no extra labour to look after these things. Delivery is continuous, of legally guaranteed calorific value. Clearly, there are advantages about gas that you should consider in your plans.

Clear Guidance

THROUGH your Area Gas Board you can bring the full resources of the Gas Industry to bear on your fuel problem. The Boards' Industrial Gas Engineers are always available for consultation and their services are free. Get your secretary to fill in these details (or pin this advertisement to your letter heading) **and send to your Area Gas Board or to the Gas Council, 1 Grosvenor Place, London, S.W.1.**

to designers for industry

Industrial Designers and Managers of Design Departments may like to know that in the B.I.P. Group there is a department that can be considered complementary to their own organisation. In the development of a new product or the modernisation of a well-tried one, the thought may arise at some stage "Can plastics help us here?" This is the point at which it is a good idea to consult our Product and Mould Design Service. Staffed with technicians and draughtsmen who are specialists in all sides of plastics and plastics moulding, it is in a strong position to help in a practical and unbiased way.

B·I·P GROUP

The most comprehensive service in plastics

THE BUSINESS WORLD

How Convertible is Sterling?

THE assembly of Finance Ministers of Western Europe at Church House, Westminster, this week, under the chairmanship of the Chancellor of the Exchequer, has rather ostentatiously shunned the designation of a "convertibility" conference. This is to avoid giving the impression that any decisions upon moves to convertibility might quickly follow the London meeting. They will not do so. This is the first of a series of ministerial meetings organised by the Organisation for European Economic Co-operation to inquire into the effects that a possible move to convertibility would have upon the future of the European Payments Union and upon the code of trade liberalisation that has grown up under the ægis of OEEC. This, therefore, is not a conference to achieve "convertibility" but one to discuss the hypothesis of convertibility. Finance Ministers and their retinues of experts do not, however, journey to London merely to consider the hypothetical consequences of forlorn chances. The fact that this "Working Party of Ministers" has begun the formal consultations that are due to be completed by November 1st next for report to the full OEEC Council is yet another straw showing the direction of the strong wind now blowing the principal currencies of Western Europe towards convertibility.

The talk is of a "collective approach" to this goal, i.e. of a joint movement by the major European currencies. It is evident, however, that in this movement sterling must combine the roles of spearhead and lynchpin. Sterling is the currency in terms of which something like half the world's trade is transacted and in which, therefore, appropriate working balances are maintained by banks and traders in every country in the world; it is therefore upon sterling that the strains of convertibility will be concentrated. Many Continental politicians and bankers may have been more vocal in their support of the cause than any British spokesman, but even the Germans have been careful to point out that they will only move to convertibility for the Deutsche Mark five minutes after the step has been taken by London.

Since the convertibility of sterling is the key to the whole problem, it will greatly help the discussion of what emerges from the London meeting—and of what later will be decided in Washington at the IMF meeting and in Geneva when the General Agreement on Tariffs and Trade is reconsidered and re-written—to inquire how near to convertibility sterling has already approached and whether, in fact, the present clamour may not be knocking at a door that is already ajar.

The answer to this question does not lie merely in the facts of exchange control and the technical facilities that now exist for converting sterling, whether resident or non-resident, into other currencies. It lies also in the facts of import policy and, in particular, of the operation of import licencing and of discrimination against imports from dollar countries. Nowhere within the sterling area is exchange control the instrument of import policy. If imports have been licensed or are admissible under open general licences, any foreign exchange that is required for them is provided automatically. That is true not only of the United Kingdom but of the rest of the sterling area. The RSA countries have automatic access to the central pool of foreign exchange maintained by the Exchange Equalisation Account in payment for any imports they sanction. To that extent, therefore, the sterling balances of these countries are (and always have been) convertible.

Judged, however, by this test of freedom to import, the progress that has been made by sterling towards convertibility is still modest. It is true that about half the dollar goods that enter the United Kingdom come

in free of any import restrictions. Most of the staple commodities such as cotton, oil and grains are imported into the United Kingdom on open general licences, and even though they have to be paid for in dollars, they do not have to overcome any discriminatory hurdles. But the rest of Britain's imports from the dollar countries remain much hampered by import licensing. There are many types of goods that Britons might wish to buy from the United States, goods ranging from motor cars to textiles, for which licences are still unobtainable. If, therefore, the British and Commonwealth concept of the collective approach to convertibility is one in which that objective is subordinated to the desire to maximise international trade, a great deal more remains to be done in dismantling the discriminatory restrictions on imports into the sterling area before genuine convertibility of sterling is achieved. This is an issue on which the American delegation to the London talks will have spoken in very much the same terms as the Americans spoke during the Anglo-American financial negotiations of 1945. There is this to be said for their exhortations on nondiscrimination: it is only after a further dismantling of the existing restrictions that the real capacity of sterling to withstand the strains of convertibility, and to justify the present rate of exchange, can be assessed. So far as import policy is concerned, therefore, the gap that remains to be bridged before genuine convertibility is attained is still considerable—though it has been narrowing in recent months.

The claim that convertibility is an all but accomplished fact usually rests on the more technical and financial aspects of the exercise, namely on the ability of holders of sterling to convert it into any other currency, including dollars. In considering this problem two distinctions have to be made. The first is between sterling held by residents and non-residents of the sterling area, and the second between sterling that is the product of current and of capital transactions.

The resident of the sterling area must still view convertibility as a distant and hazy prospect. He is still hemmed in by exchange control and is likely to remain so for a considerable time to come. He still has to resell to Exchange Control the foreign exchange proceeds of his sales in most non-sterling countries. He is severely restricted as to the amount that he can take with him for travelling in non-sterling countries; and, for his pleasure travel, the whole dollar world is still forbidden ground. If he emigrates, the amount of capital he can take with him is restricted. The resident who chooses to live in a non-sterling country will be fortunate if he succeeds in transferring to his foreign domicile—even if he has a substantial income in sterling—a larger part of that income than the derisory annual travel allowance. These restrictions on resident sterling are maintained in order to prevent the export of domestic capital. If all restrictions were taken off the travel allowances and if exporters did not have to offer their "specified" currencies to the Bank of England, the new freedom would provide wide gaps for the outflow of domestic funds. Some restrictions on the export of capital must probably remain as part of the permanent structure of economic organisation in a country as heavily burdened by taxation as is the United Kingdom; the mechanism of exchange control as applying to current transactions is therefore likely to remain in being for a long time to come. It is true that the British resident can now buy dollar securities without paying any appreciable premium for the privilege. This, however, he can do only in so far as other residents are feeding the supply of these securities; any sudden rush into dollar securities by residents of the sterling area would cause a rapid resurgence of the premium at which these securities are quoted in the London market.

★

The approach to convertibility for sterling held by non-residents has been much more impressive. The great bulk of the sterling that flows into American hands has always been automatically convertible into dollars. And all other current sterling acquired by non-residents is now, with very minor exceptions, freely transferable throughout the non-dollar world; but it cannot be transferred from a "transferable" to an American account. Transferable sterling can, however, be converted into dollars in free markets that function in many financial centres, though not in London. Through those markets it has this week been convertible into dollars at a rate of around $2.76½-77. Moreover, since the advance from strict bilateralism in Britain's payments arrangements and the reopening of free commodity trading over the whole world, there has been an inevitable loosening of exchange control and a loss of efficacy in its performance. The result has been that any non-resident acquiring current sterling—or even capital sterling—has been able to exchange it into any currency he wanted, and in recent months he has been able to do so almost without loss.

This *de facto* ability to convert is not, however, tantamount to formal convertibility. In the first place, the facilities obtainable through these free markets in transferable and security sterling involve no binding commitments on the part of the Exchange Equalisation Account. This is not convertibility of the kind that confers direct access to the gold and dollar reserve. The rates at which these free dealings in sterling have taken place have approached parity; but if there were to be increased pressure on transferable sterling, it would reflect itself in a widening discount and not in a drain—or, at least, not in any corresponding and direct drain—upon the reserve. Secondly, since there is no official commitment to convert such sterling into dollars, there is no temptation for the non-dollar countries concerned to regard their sterling balances as the equivalent of dollars and, therefore, to loosen their restrictions on dollar imports on the confident assumption that they will be able to use their sterling to pay for those imports.

It is sometimes suggested that the indignity of having sterling quoted and dealt in (even though at parity) in these "hole and corner" markets could be removed by tolerating a market in transferable sterling in London. Such a move has sometimes been proposed as an "administrative" step towards convertibility. It would, however, be much more in the nature of a short-cut to complete convertibility—on the basis of a fluctuating rate of exchange. A market in which transferable sterling could be converted into dollars in London would imply freedom to move sterling from transferable to American accounts. This would be tantamount to a declaration of convertibility, though at rates that might float well outside the present spread of official rates.

The approach to the convertibility of non-resident sterling and the narrowing of the discount on transferable sterling have been considerably helped by the freeing of staple commodity markets in Britain. In many of these markets both the resident and non-resident can now buy in sterling, irrespective of the currency in which the goods were originally bought. For commodities with a substantial dollar content, and notably for grains and cotton, a general rule is that re-export of goods originally paid for in dollars can be made only against payment in dollars. But this rule is being gradually relaxed; a significant illustration of this trend has been provided this week by the permission given to sugar merchants to resell in terms of any currency sugar that may have cost dollars. Even where the "dollar-for-dollar" rule obtains, as in cotton and grains, the fact that imports for domestic consumption can be made without reference to the country of origin and to the currency in which payment was made has involved a considerable approach to the goal of convertibility.

If, for example, non-residents had excessive holdings of sterling and were thus led to buy sterling wheat and bid it to a premium, the result would be that the domestic buyer would concentrate his purchases on cheaper dollar wheat. The freeing of commodity trading has provided scope for commodity arbitrage through "cheap" sterling, and it is largely through the functioning of these markets that world prices in staple commodities have become more closely integrated and that at the same time the discount on "cheap" sterling has virtually disappeared. It is, in fact, through the operation of these free commodity markets that the greatest progress towards effective convertibility of sterling has been achieved.

But even when these several trends have been rated at their maximum worth, and when the weight has been given to the fact that sterling is now in comparatively short supply overseas and stands well in the free markets, it remains clear that, on the wider tests of what constitutes convertibility, there is still a considerable gap between the *de facto* facilities that exist today for non-residents and convertibility *de jure*. And it is to the possible effects of *de jure* convertibility that the discussions at this week's meeting have been addressed. The distinction between the two is still of fundamental significance. But it is also clear that a retreat from the "administrative" convertibility that exists today would be much more difficult and damaging to secure than would have been true two or three years ago, when the whole system had been much less fully developed, and when no such superstructure of confidence and hope had been erected upon it as that which has grown up in recent months.

Profits in Prospect

FOR the first time since *The Economist* began to analyse company profits in 1908, the accounts of over a thousand companies have been received in a single quarter and put through the statistical mill. The profits and balance sheets of 1,007 companies, published in the quarter to June 30th, are collated on pages 229 and 230. Well over three-quarters of the 822 industrial companies caught in this sample drew up their accounts at or after December 31, 1953, and these include most of the leviathans of British industry and of international trade. Their reports cover a year in which industrial production rose by about 6 per cent, bringing with it an increase of over 9½ per cent. in the combined trading profits of the 1,007 companies. This advance, from £735 million to £805½ million, tallies closely with the 9 per cent increase in profits reported by the 537 companies that issued their accounts in the previous quarter.

This was part of the ground swell that sent the rising tide of equity values rolling along Throgmorton Street. Bigger dividends fed the current. In all, the 1,007 companies paid out in net equity dividends nearly £94 million, compared with their previous year's payments of £80 million. An unknown portion, certainly well under £4 million, of the apparent increase of £14 million, was due to the change in the standard rate of tax in the 1953 budget. In the previous year the interim dividends and a few of the early final payments bore the old 9s. 6d. rate. The companies, too, fed the current of Stock Exchange buying by investing more of their resources in quoted securities. As raw materials became more readily available and prices steadier, the task of providing working capital became less formidable both in fact and in prospect. The 1,007 companies still had to carry stocks worth over £1,508 million, but this figure was only £6 million higher than their commitments a year earlier; the engineering and iron and steel groups alone added about £12¾ million to their stocks. They

were thus able with the help of ploughed back profits to reduce their bank overdrafts from £169 million to £155 million and to reinforce their cash balances, bringing them up from £544 million to £565 million. They were also able to add nearly £5½ million to their holdings of gilt-edged securities (carrying the nominal value of the portfolios up to £173 million) and over £28 million to their portfolios of other quoted securities, bringing the total up to £269 million.

Greater liquidity, higher profits and a genuine feeling among many directors that the shareholder should have a fairer crack of the whip all contributed to the increase in dividends. Only among the rubber companies, whose profits inevitably fell sharply, were equity dividends smaller than in the previous year. But not all industrial groups shared in the rise in profits. The shipping, engineering and electrical manufacturing groups, reported declines in trading profits, while the profits of the tobacco, iron and steel, "miscellaneous manufacturing" and oil companies hardly changed. The biggest advances, apart from those reported by the tea companies, came as expected—from the textile companies and from those other consumer trades whose earnings are well back along the road to recovery. Profits in the capital goods industries (with the notable exception of the building industry) merely held steady following a long period of unbroken advance.

In outline that was the statistical reflection in the mirror. But, like Alice, the investor has to go through the looking glass. There he will see an orderly, and

not an incomprehensible, game of chess in progress. The opening moves have been made to the accompaniment of chairmen's comments that profits in the current year will be "satisfactory"—as good as those reported in 1953 or perhaps a little better. The end game cannot be exactly predicted but, at least, the danger of the White Knight of the American recession jogging across the board, knocking the pieces over, now seems more remote. Production so far this year has been running between 6 and 7 per cent higher than a year ago and it is a reasonable assumption that the trend in profits will follow in its wake. But the rate of increase in profits may begin to flatten out within the next twelve months. In the textile and consumer goods trades, the investor can expect the recovery in profits to continue, but a year from now it may not be so marked. In the capital goods industries, where production is high, he can expect profits at least as good as those just reported; but any sharp advance seems ruled out by the recent wage increases and by more competitive prices overseas. Within these broad categories there are, perhaps, some likely winners, including the building, paper, motor and aircraft groups.

One question that the investor must ask himself is whether the first six months of 1955 will produce a spate of dividend increases to match those of this year. Recent dividend increases were both a reaction to the period of undue restraint and a reflection of the greater feeling of confidence and stability. But even if that confidence tempts industry to tie no more than modest funds in additional holdings of stocks, British industry may still be inclined to regard this year as an opportunity for fixed investment (requiring the support of profit retentions and liquid resources). The Chancellor's investment allowances and lower interest rates may well encourage industry to take this view. Indeed, the present high rate of production in the iron and steel industry already suggests that capital investment has been given a high priority. The demise of EPL and the institution of investment allowances will leave the companies better off, but how much of that wealth will go into the pockets of the ordinary shareholder is a matter for conjecture. To this there may be a footnote: if another Labour government seemed in prospect a year hence, dividends would be liberally increased for fear of dividend limitation when it came into power. But then share prices would be falling, too.

Naturally if earnings are high and seem likely to remain so, investors will be content with more modest yields, but shareholders must now consider how far the rise in equity values is a reflection of the actual increases in earnings and dividends, and how far it also discounts further increases. The slack season of dividend and profit announcements is now at hand and gives them the opportunity for re-assessment. The profits and dividends published in the next three months should be as good as those of recent months, but they may not be so stimulating to market values. A gentle climb in share values over this period is perhaps what the investor should hope for. He might be wrong if he counted on the giddy rise in prices continuing indefinitely at its recent pace.

Business Notes

Official Tail and Market Dog

THE pace in the gilt edged market has grown even hotter in this past week, and has actually diverted interest—in market discussion, if not in dealings—from the still booming industrials. A succession of favourable influences has impelled this advance—the confident mood of the Chancellor in his pep talk to a Conservative gathering at the weekend, the spreading effects of official skill in the two conversion operations, and the evident progress of M. Mendès-France's negotiations for a settlement in Indo-China. On Wednesday, too, the market drew lavish conclusions from a reduction of the rate of interest on tax reserve certificates, while on Thursday a new and potent stimulus came from the results of the second conversion, the period for which had closed two days before.

The outcome of this operation is a worthy successor to last month's cash-and-conversion issue of the 2 per cent 1958-59 bonds. No less than £413 million, or over three-quarters, of the £535 million of 1¼ per cent Serial Funding Stock due next November was tendered for conversion, which means that in these past few weeks the authorities have dealt with the bulk of this year's obligatory maturities and some 90 per cent of the £321 million of Defence Threes that were only optionally redeemable. Almost exactly two-thirds—actually £274 million—of the latest conversion applications were for the new 9-10 year stock, the 3¼ per cent Exchequer stock, 1963-64, which is of somewhat larger amount than had at first been expected. A substantial proportion of these applications certainly

came from the "departments," but it can be presumed that the large official purchases of Serial Funding stock in recent weeks have been comfortably offset by sales of other stocks at rising prices. The remaining third of the total conversion applications was for the new 45-50 year stock, 3½ per cent Funding 1999-2004; the £139 million thus subscribed much exceeded the first estimates. The preponderant part of this experimental issue has unquestionably been subscribed by official agencies, but its size suggests that some institutional investors have shown interest at the very outset, instead of waiting for the Government broker to offer it from official portfolios. It also seems reasonable to deduce that the behaviour of the market—especially in irredeemable stocks—has induced the departments themselves to take up a larger amount than they might at first have expected to do.

The market, however, is now really trying to make the tail wag the dog—or, rather, it is assuming that that is what the authorities must try to do. But animals of this peculiar versatility dwell only in Daltonian circuses where whip-cracking and shouting bring them to heel. The fact that the authorities may hope to sell to highly specialised institutional investors a few tens of millions of 45-50 year stock on a yield of around 3⅝ per cent is no basis for arguing that they will soon be able to cope with the refinancing of over £1,900 million of callable 3½ per cent War Loan that is widely held by the general public. Yet it is upon this dog-wagging hypothesis that most of the speculative buying of irredeemables is now being based. War Loan has gained some 3 points in ten days and now stands at well over 90. The Electricity Authority and the Gas Council must be thankful, now, that they had to keep their places in the would-be borrowers' queue. The gilt-edged prospect may be set fair, and in good times the speculative buyer invariably forgets the value of a date. But British weather is unpredictable; and the speculators should be reminded that two years ago War Loan stood at under 73.

World Bank's Second Visit

With the support of six of London's foremost issuing houses, the International Bank steps out into a "bull" market to launch its second sterling issue—£5 million of 3½ per cent stock 1969-74 at a participated issue price of £98 and a yield to redemption on the last date of £3 12s. 10d. per cent. The terms—15 to 20 years on a 3½ per cent stock at a discount—are an almost exact replica of the Bank's previous sterling issue, the 1956-71 issue of 1951. That stock has been a great success: issued at £97 it now stands at a middle price of £99 and its redemption yield to the latest date is down to £3 11s. 7d. The difference between the two stocks is that whereas the 1951 issue was made to yield about 5s. per cent more than on a comparable gilt-edged stock, it is now necessary to concede only 2s. 6d.

The Bank deserves and will achieve success for its issue. It is non-trustee and not guaranteed by any government. But it is entirely satisfactory for the most careful investor and a gift to those who are not liable to the standard rate of tax. It carries the great boon of exemption from tax deduction at source—not of course exemption from inclusion in the tax return of the British resident holder. But non-resident investors and the charities will seek it out. The British Treasury does not now give that concession on its own stocks. Nothing but the Bretton Woods Agreements obtain it for this issue.

The intention is that the proceeds of the issue shall be used to meet the needs of the Bank's borrowers for sterling for the purchase of goods and services in the United Kingdom. In other words it finances capital exports from the sterling area to non-sterling areas, perhaps a surprisingly timed operation when the British Government has recently agreed to make up to £60 million of its sterling subscriptions to the Bank available for lending in the Commonwealth and when the Federation of the Rhodesias and Nyasaland has recently turned to dollar sources for its first loan. That is a problem about which investors need not worry in assessing the loan. For them the main security is the 80 per cent uncalled capital of the bank which the 57 member governments are bound to provide if necessary, and which is almost equal to an indirect guarantee by those governments.

Freedom for Sugar Traders

Raw sugar has now joined the ranks of the "dollar" commodities that can be freely sold in London for payment either in sterling or the currency of the overseas buyer. Participants in the official market scheme are now also free to buy and hold stocks of refined sugar in any part of the world. The one remaining restriction is that foreign refined (but not raw) sugar originating in the dollar area must be sold for dollars. Presumably this restriction is designed to help the Ministry of Food to dispose of its stock of raw sugar via Britain's export trade in refined. This latest extension of the convertibility of sterling will do much to restore freedom of trading in the "free" world market, and gives the London sugar trade the opportunity to re-establish itself fully as the centre of that market. The trade's opportunities are enlarged and it can reopen a futures market in raw sugar. The dollar cost of the new facility—if indeed it does cost dollars—is considered to be amply compensated by the increased usefulness to foreigners of London's commodity markets and of sterling as a means of payment.

It is hoped to begin trading in futures before the end of this year, with March as the first delivery month. The contract will probably be similar to its prewar counterpart, with cif London or Liverpool, for minimum lots of 50 tons, as the basis. The major anxiety concerns the huge official stock of raw sugar overhanging the market, but it is expected that arrangements for the orderly disposal of this stock will be announced fairly soon. Initially, the scope of the futures market must be much narrower than before the war, for the Ministry will still be the sole buyer of Britain's domestic requirements of imported sugar—about 2 million tons a year. But the market should be broad enough to be sound. British refiners need about 650,000 tons of raw sugar a year for refining and re-export. Hence there should be an ample spot stock, and the big international trade which British firms do outside these shores should ensure that the market will attract sufficient foreign support. Participants in the sugar market scheme will be able to arbitrage between London and New York. A futures market is also to be opened in Hamburg, trading in refined sugar, fob Hamburg or other Continental ports.

But Less Freedom at Home

Imports of raw sugar for Britain's domestic requirements are unlikely to be returned to private hands before the middle of next year. Even then, the domestic trade will be far removed from a free market. The trade in imported sugar—and in home-produced as well—is heavily circumscribed. Under the Commonwealth Sugar Agreement the Government guarantees a market in Britain for up to 1,568,000 tons of Commonwealth sugar a year, at a fixed price which is now appreciably above the world price. A further quantity of up to 730,000 tons a year finds a market in Britain or in Canada under the benefit of Imperial preference. The Government is also a member of the International Sugar Agreement, which is designed to maintain the world price within a range of 2.35 and 3.45 US cents a lb, fas Cuba, and limits the total movement of sugar under the Commonwealth Agreement. The Agriculture Act of 1947 guarantees the home producer of sugar beet a minimum price and a market for his crop. The Sugar Industry Acts of 1936 and 1942 regulate the home beet industry and the British Sugar Corporation, which processes home beet into raw sugar and refines over half its output of some 700,000 tons of raw sugar a year. A part of this legislation, the Sugar Refining Agreement between the Corporation and the other refiners, regulates the marketing of sugar for home consumption at agreed basic prices. Competition from imported refined sugar is also restricted by a "penal" rate of duty. The international agreements will certainly continue, and radical alterations in the domestic agreements are unlikely.

The chief problem is to ensure that Commonwealth fixed price sugar and home production are fully taken up in competition with the cheaper sugar available on the world market. No system of deficiency payments appears to be possible in sugar; it would be unacceptable to the Commonwealth producers and impracticable for the home beet industry. One of several possible solutions would be for the Ministry, or another department, to sell Commonwealth fixed price sugar to the trade at the world price, and to recover the loss from public funds or by increasing the import or excise duties. Either the consumer or the taxpayer must in the end foot the bill. For the home industry, the existing powers to ensure the disposal of the crop may be maintained; and the effect on the Corporation's income of a lower price for raw sugar may be dealt with under the present scheme, whereby the Government takes the benefit of any "surplus" or makes up any "deficit." Some changes in the legislation, however, will almost certainly be required, and may be announced in the autumn.

First Half-Year's Trade

British exports dropped by £11.2 million to £217.7 million fob last month. Although June had 24 working days, two fewer than in May, the drop still appears to be rather sharp, for exports in April, which also had 24 working days, were valued at £224.9 million. Nevertheless, the average monthly value of exports in the second quarter, at £223.8 million, was almost equal to the first quarter's average of £224.4 million. The improvement has thus just, and only just, been maintained. In the last three quarters the average monthly value of exports has been disturbingly stable, albeit high. In comparison with the first half of 1953, however, exports this year have been seven per cent higher—and imports one per cent lower.

Imports in June were valued at £291.0 million cif including £7 million worth of aircraft received as a gift from Canada. Excluding that gift the figure of £284 million was still £3.6 million higher than in May—a substantial increase if allowance be made for the short month. After a long period of stability, the average monthly value of imports rose by about £11.0 million to £284.6 million in the second quarter. In view of the steady growth in British industrial activity the rise might have been expected to occur earlier; its gradualness owes much to terms of trade that can hardly remain so favourable.

With re-exports almost unchanged at £8.8 million, the gross visible trade deficit in June rose sharply by £22 million to £64.5 million. The average deficit for the first half of 1954, at £46.1 million, was still 28 per cent less than in the same period of 1953. Exports to North America in June fell by £2 million to £23.5 million; shipments to the United States again rose slightly to £12.8 million but shipments to Canada fell by £2.2 million to £10.7 million. The monthly average of exports to North America in the second quarter was 10 per cent higher than in the first, but the average for the first half of the year was 12 per cent less than a year ago.

Towards a Fuel Policy

Certain unwonted enthusiasts for economic planning from the Conservative back benches used the debate on the second reading of the Gas and Electricity (Borrowing Powers) Bill last week to ask the Government when it proposed to issue a White Paper on capital investment. They obtained no answer; the Treasury took care to have no spokesmen on deck. Nor did they get from Mr Geoffrey Lloyd any inkling of the relation between the scale of capital expenditure that he envisaged for the nationalised fuel industries and the total amount of resources that the Government expected might be devoted to investment in the British economy over the next few years. What they did get was an extremely significant outline of the Government's policy for the future development of the fuel industries.

The Minister estimated, at the outset, that between now and 1960 some £450 million would be invested in the coal industry, £366 million in gas, and £1,440 million in electricity. This massive investment in energy would supply a demand for electricity estimated to be by 1960 some 54 per cent higher than in 1953, and a demand for gas 16 per cent higher; the Minister did not suggest how much more coal would be wanted or could be supplied by then. The two secondary fuel industries, however, would together require some 16 million tons extra. Mr Lloyd said that obviously the load on coal would have to be lightened. Construction of nuclear power stations of an advanced type would be undertaken before 1960, but it would be some time before

nuclear power base-load stations could make "a massive contribution." Another fuel to lighten the load on coal was needed, the only possibility being oil. At one power station that is being built, Marchwood on Southampton Water, the Esso Petroleum Company would supply oil at a price that made the cost of generation from heavy fuel oil the same as from coal. Marchwood was, therefore, to be equipped for coal or oil firing; and a number of other stations, which at the maximum could account for some 10-11 million tons of coal a year by 1958-59, might also be equipped for dual firing. The gas industry was to erect 13 or more plants for the complete gasification of fuel oil, which might save about 400,000 tons of good carbonisation coals a year.

Investment in Fuel

OF the £2,256 million that it is proposed to invest in the nationalised fuel industries between now and 1960, the Gas Council expects to borrow some £274 million from the public and the British Electricity Authority about £1,000. It is not clear how much of the £450 million to be invested in coal will be provided from the National Coal Board's internal resources, but none of it, under the present system, would be raised by any public issue; the Coal Board enjoys the power to obtain its new capital from temporary advances by the Minister of Fuel and Power that are later funded into long-term loans. The two secondary fuel industries' public issues of stock are, of course, guaranteed by the Treasury.

The bill introduced last week will raise the Gas Council's borrowing powers from £250 million to £450 million, and those of the British Electricity Authority from £700 million to £1,400 million. It comes only just in time for the two authorities. Authorisations issued by the Treasury this week for borrowing during the third quarter of this year would leave only £10 million of reserve borrowing power for gas, and £45 million for electricity within their existing legal limits.

Hire Purchase Half Free

THE Board of Trade's decision to revoke all its statutory instruments controlling hire purchase trading and leave that type of trading alone was no great surprise to hire purchase traders, though it took the Stock Exchange by surprise and lifted the shares of the companies most likely to be affected. Those were the radio shares and the shares of the hire purchase finance companies, and not the furniture and clothing trades engaged in hire purchase. The Board of Trade was in a difficulty. It has been controlling hire purchase by means of a statutory instrument which required minimum initial deposits of 33⅓ per cent and maximum contract lengths of 18 months (for bicycles the figures were 25 per cent and 12 months). This applied over a selected range of goods which did not include domestic furniture, in which there is a large business. The recent case of Regina *v.* Proffitt legalised an extended hiring agreement on wireless sets with three options at its end: (1) If the order was rescinded the goods passed to the hirer. (2) If control remained the customer could continue at a pepper corn rent, or (3) The customer could continue at a rental including free maintenance. It therefore became possible to make extended hiring agreements for longer periods and without the 33⅓ per cent deposit. The Board of Trade must have realised that its control order was dead and that it must either devise a new statutory instrument or abandon control.

Oddly control has been abandoned by the Board of Trade but not by the Treasury. The Treasury request to the banks of 1952 that they should cut their loans to hire purchase finance houses by 10 per cent and its instructions to the Capital Issues Committee not to allow them to raise new capital remain in force. The immediate consequences seem clear. Hire purchase sales pressure in the goods that have so far been controlled will tend to increase. Initial deposits will tend to fall from 33⅓ per cent to 25 per cent and hiring agreements to be lengthened from 18 months to two years. But for the moment money will be relatively scarce for hire purchase finance and therefore dear. The opportunities for the swarm of small new finance companies which are uncontrolled because their capitals are under £50,000 remain bright, until Treasury control is also withdrawn as ultimately it must be.

Foreign Exchange Commissions Cut

AN appreciable cut in the cost of foreign exchange dealing in London will become effective from next Monday. For many years the authorised banks have, by agreement among themselves, charged a commission of ⅛th of one per cent to their clients in respect of purchases or sales of foreign exchange. This commission was agreed, and its amount fixed, at the time when the authorised banks acted purely as agents for the Bank of England and when, therefore, the commission was their sole source of revenue from foreign exchange business. Since 1951, however, the authorised

"BOMBS AWAY" — The story of the R.A.F. Bomber NO. 5 IN THE SERIES ON THE AVRO VULCAN

Storm in a Test Tube

The first test flight of every newly-designed Avro aircraft is made in a laboratory wind tunnel. The air, many times faster than a tornado, hurtles past an exact model of the aeroplane. A delicate balance, measuring the forces on the model to an accuracy of one ounce, shows designers how the new design will perform in actual flight. In addition, giant rigs are constructed so that complete full scale replicas of the aircraft systems can be tested and specimen components tortured to breaking point before flying trials begin. Inevitable snags are thus exposed and later modification avoided. Shown in the wind tunnel of our picture is a model of the Avro Vulcan, the world's first 4-jet Delta Bomber. This is the aircraft whose revolutionary planform best fulfils the needs of long-range, high altitude flight with heavy loads at near-sonic speeds. The success of the audacious new shape is a fine tribute to the pioneering genius of the Avro team: to the thinking of the designers and technicians; to the painstaking care of the model makers and those who use the models; to the know-how of the production engineers and the skill and enthusiasm of the men and women in the workshops; to the research engineers, specialists and test pilots. Thanks to these and a courageous and virile management, the Avro Vulcan is now in super-priority production for the Royal Air Force.

A. V. Roe & COMPANY LIMITED/*Manchester*

MEMBERS OF THE HAWKER SIDDELEY GROUP / PIONEER . . . AND WORLD LEADER IN AVIATIC

banks have been given the right to deal among themselves within the permissible spread of official rates, and during this period they have earned both the commission and their normal dealing turn. It is not surprising, therefore, that some undercutting should have taken place. It has come mainly from merchant and American banks that cater chiefly for large business and that have been prepared to trim or waive their commission and depend for their profits on the dealing turn. The clearing banks, which must necessarily handle a large volume of small foreign exchange business for their ordinary customers, have become increasingly concerned at this competition. They have now reached an agreement with the object, and in the hope, of avoiding further rate-cutting. This agreement, to which all authorised banks subscribe, will limit the ⅛ per cent commission to deals of £5,000 and under (subject to a special scale of charges for transactions under £100). The commission on larger deals, whatever their size, will be £6 5s., which is the ⅛ per cent on the limit of £5,000. The new arrangement provides an admirable illustration of the beneficial way in which competition can still operate. It should further serve to reinforce the position of the foreign exchange market in London.

Building Society Argument

THERE is evidence of a sharp difference of view within the building society movement on the line that should be taken on mortgage charges. Rumour has it that the big brother of the movement, the Halifax Building Society, was alone at last week's meeting of the Association's Council in arguing for a reduction of mortgage rates. The next few weeks will show whether a united policy can be evolved or whether, in its absence, the Halifax will be ready to take independent action and the others ready to hold firm in the face of it. If the Halifax cut its mortgage charges it would be obliged by the rules of the association to give at least a month's notice before making any announcement, so the outcome of the argument may not be immediately apparent.

Opinion in the movement, even among those who least welcome a reduction in mortgage rates, is that the Halifax is likely to make a move—conceivably a reduction of ½ per cent to 4 per cent—in mortgage charges. Such a reduction in its mortgage rates would imply no reduction in the rate of interest paid to shareholders in the Halifax Society since it now pays only 2¼ per cent net to shareholders. But it might force other societies which reduced their mortgage rates to cut their shareholders' interest from 2½ per cent net to 2¼ per cent. It is the responsibility of a mutual society to hold the balance fairly between borrowing and lending members, and if the present lowering of interest rates is a major trend, and not a flash in the pan, members are bound to recognise it as such.

Not the least forceful part of the argument for reduction of the societies' rates is that local authorities using money drawn from the Public Works Loans Board are now lending to house buyers at 4 per cent; no current figures are available, but there are indications that they have been doing an increased business since rates came down. The difficulty in which societies find themselves is slightly—but only slightly—increased by the fact that the "composite rate" of income tax which the societies pay on behalf of their members is expected to work out this year a few pence higher than last year's figure of 4s. 10d. in the £.

Manpower for the Boom

AT the end of May more people were at work in Britain than ever before, and by the middle of June the rate of unemployment was down to 1.1 per cent. Buoyant industrial output, and in particular the quickening of activity in engineering, was bringing about general shortages of labour in certain areas, and fairly acute shortages of skilled labour much more widely.

The labour force in "engineering, metal goods, and precision instruments" was about 69,000 larger than a year before; there were 50,000 more workers in the vehicle industries, and even the fairly stable labour force of metals manufacture was up by 4,000. Out of an increase of some 212,000 in total civil employment since May, 1953, therefore, these metal-using industries had collected about 60 per cent. Chemicals and allied trades had gained 20,000 people; the textile industries 30,000; food, drink and tobacco 14,000; and other manufacturing industries 61,000. But the basic industries, together, had a labour force 46,000 smaller; the building and contracting industries, presumably because the weather this May was worse, had 11,000 fewer workers; and though the distributive trades had swollen by 35,000 people, there had been declines in other service trades and in administration.

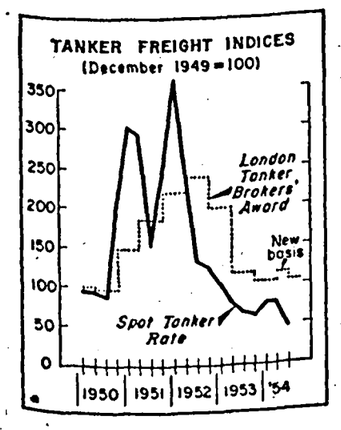
Tax Certificates' Rate Cut

A NEW series of Tax Reserve Certificates became available on Wednesday and issues of certificates of the third series ceased. The new certificates bear interest at the rate of 1 per cent per annum tax free instead of the 1¼ per cent payable on certificates issued since 1952, but in all other respects the terms of issue are unchanged. Tax certificates may be tendered within two years of their date of issue in payment of income tax, surtax, profits tax, and land tax. This reduction marks another, and rather belated, adjustment of official rates to the big change that has occurred in the pattern of money rates and short bond yields in the past twelve months.

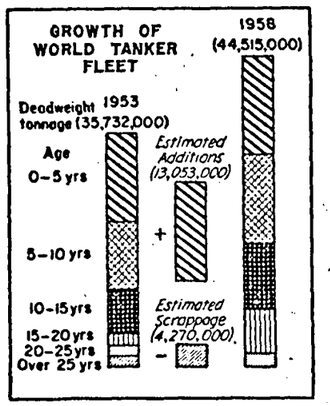
The rate on tax certificates, however, has never been highly responsive to market conditions, and only four different rates have obtained since the first issue was made in 1941. The rate then was 1 per cent; it was reduced to ¾ per cent as part of the Daltonian drive in 1946, and raised to 1¼ per cent in 1952 after the increase in Bank rate to 4 per cent. The interest has always been free of tax. Partly because of the higher level of business profits and partly because of the delay in reducing the rate, the flow of money into tax certificates has recently been unusually large. In the current fiscal year, the Treasury's net receipts under this head (up to July 10th) have amounted to £142 million, compared with only £63 million in the similar period last year.



Sterling for Egypt

TWO sensible steps taken by the British and Egyptian authorities will enable British exporters to trade on an equal footing again with their competitors in the Egyptian market. Britain has now released the £10 million from Egypt's blocked sterling balances to which Egypt is entitled each year under the Anglo-Egyptian financial agreement of 1951. The Treasury is free to make the release at any time in the year, but it has normally done so early in the year. This year, however, the Egyptians' request for early release was refused—obviously on political grounds. The release now has presumably been made both as a gesture of conciliation and on grounds of realistic self-restraint.

The Egyptian Government has responded to the Treasury's action by re-introducing facilities for imports from the sterling area. It had retaliated early in the year by restricting most sterling imports and imposing a total ban on many of them. Now a long list of goods has again been made eligible for imports against sterling. The consumer goods concerned may be imported against sterling held on "import entitlement account"—that is exchange that derives from the retained earnings of Egyptian exporters and that can subsequently be used by importers. This sterling stands at a small premium. For imports of machinery and goods made to order sterling will be supplied by the authorities at the official rate. The consumer goods expected to benefit most from the relaxations are vehicles and woollens. But there should be a considerable fillip to the whole British export trade to Egypt; Britain has recently been losing ground substantially there, particularly to Germany.



Standard Calls It Off

THE merger talks between the Standard Motor Company and Rover that have been dragging on inconclusively for five months, now seem to have broken down completely. This week's announcement is careful to point out that the merger had been regarded as a financial arrangement only, with the two companies retaining their separate identities and that both sides have come to the conclusion that "the present moment is unsuitable to carry into effect a financial merger of the two concerns, but the possibility of such an operation will not be lost sight of." One non-financial result, of course, would have been to strengthen the experience of top management available to Standard since the sad and sudden retirement of Sir John Black. Forward planning in the motor industry calls for a specialised skill and judgment that is not easily replaceable. Standard's output during June was running at the highest level yet reached by the factory—632 cars and tractors a day. But it takes perhaps four years to put a radically new model into production,

Too Many Tankers?

TANKER freight rates this month are at their lowest level since the middle of 1949. Over 150 tankers have been laid up; others have been sold for breaking up. This depression coincides with the fruition of an immense tanker building programme which is likely to unload up to 13 million tons d.w. on to the market during the next few years. If all tankers over 25 years of age should be scrapped, the world fleet at the end of 1958, according to estimates by the Sun Oil Company shown in the second chart, may exceed 44 million tons, over 40 per cent larger than the fleet in use last December.

and Standard will soon have to consider the probable replacements for its modified Vanguard and new Standard 8 models that went on to the market last year.

Buoyant Holiday Spending

HOLIDAY spending is now getting well into its stride; and so far it appears to be proceeding at a faster rate than last year. The increase of £50 million in the fiduciary issue made this week, the third of the year, has been made a fortnight earlier than usual. It raises that issue to the record level of £1,725 million, and brings the total increase since January to £150 million, compared with £125 million last year. The active note circulation (which includes till money held by the commercial banks) is now, at £1,676 million, £109 million above its level twelve months ago. This is a substantially bigger increase than the £82 million recorded in the previous twelve months, but a somewhat smaller one than the £117 million experienced in 1951-52.

The rise in the level of the note issue above that of a year ago is primarily a reflection of bigger demands for currency in the second half of 1953, in the early spring of this year and in the last fortnight. The rise in the note issue in May and June together was only a little larger this year than last —£35 million against £31 million. The pattern of the increase was, however, markedly different. In 1953 the active circulation rose by £18 million in May and by £13 million in June; this year it rose only fractionally in May and by fully £34 million in June. The evident cause of the divergence was the Coronation, which brought early holiday spending a month or so forward last year.

By the beginning of July, 1953, this special influence was presumably weakening, yet the outflow of notes into circulation has been considerably greater in this past fortnight than it was in the corresponding weeks last year—£29 million, against £22 million. Retail prices have certainly been as stable in recent weeks as they were at this time last year, so that it does appear that seasonal spending has been remarkably unaffected by the unseasonal weather.

Quiet Trading in Cotton Textiles

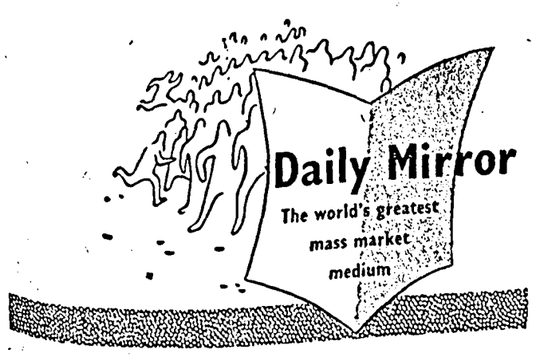
THE cotton textile industry is undergoing a trying time. Business in the home and several export markets is quiet. The merchant converters—who built up large commitments to make sure of obtaining their requirements when delivery periods were long—are cutting down, and the flow of orders to the mills has fallen considerably in the past two months. So far this has not been reflected in the figures of output, for the mills generally have work on hand for two months or more. In May, the latest month for which figures are available, output of cotton, rayon and mixture cloths reached an average rate of 57.48 million linear yards a week, the highest since November, 1951, and output of all single yarns was high before the holidays began last month. But the holiday period will be a blessing to some spinning mills, especially to the minority that has been forced to put a part of its output into stock. Holidays apart, the fact that orders are being received in lower volume than current production should be a positive gain to the industry, for it enables delivery dates to be reduced.

The reasons for the slackness of business appear to be basically seasonal, although there is some apprehension about the outlook in September and beyond, when buying ought to pick up again. The current level of raw cotton prices is distrusted here and abroad, and it is usual for fresh business to be delayed until the first estimate of the American cotton crop has been published early in August. Buyers are also inclined to await the result of the American Administration's efforts to introduce more flexible support prices for cotton and other crops next season. In the home market, which now absorbs about two-thirds of Lancashire's total output, sales of summer clothing have been handicapped by the poor weather. In the export markets, sales to Australia have been satisfactory, but the industry is meeting increasing competition elsewhere, particularly in some Colonial markets where India now appears to be as strong a competitor as Japan. The full force of the buyers' market has been a long time coming. During the postwar inflation price was not all-important, and during the recovery from the 1951-52 recession delivery periods were often the decisive factor. In future the volume of goods sold abroad by Lancashire will depend on its ability to be competitive on both price and delivery.

The Banks' Half Year

THE mid-year balance sheets of the clearing banks, nearly all of which are now available, reveal a striking expansion of deposits—both by comparison with the figures for mid-1953 and with those for the May make-up. This trend has been common to all the "Big Five" banks, though not to the northern institutions. Among the big banks, by far the largest movement is shown by Barclays, whose gross deposits have risen over the twelve months by almost £74 million, to £1,381 million, at which point they are only £7 million less than the deposits of the Midland Bank, which previously has always had a clear lead. Among the northern banks, Williams Deacon's shows a moderate rise in deposits, the District a fractional one and Martins a small decline. Glyn Mills's deposits are also down. Advances experience among the big banks has been more patchy: Lloyds Bank's advances are £10 million less than at mid-1953, but the other nine English clearing banks all show an increase, the biggest movement being the £24.8 million rise achieved by the Midland.

All the big banks, as expected, are carrying substantially larger investment portfolios than at this time last year, but their rise since the May make-up seems to have been small, which is rather surprising in view of the Government's cash-and-conversion operation of early June. Easily the biggest rise over the year is that in Barclays portfolio, which has risen by over £50 million, thus absorbing the bulk of the big addition to deposits; this bank's advances expanded only moderately, by £21 million. The Midland's portfolio has risen by £40 million and, in view of the recent



Here comes your future

Yes, your future. For she is one of the vital younger generation whose decisions can affect your business for years ahead. Keen and vigorous .... receptive to new ideas, she is forming buying habits today which may last for the rest of her life.

With its realistic approach to the problems of our time the Daily Mirror has gained the biggest daily sale on earth (it exceeds 4,600,000) and offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies.

But what is so vital to you as an advertiser is that the majority of its readers are young readers. *By advertising in the Daily Mirror you can make them your customers today .... next month .... next year.*

The BIG Yellow 'CATS'
ARE PURRING BEFORE THE HEARTH

Before new hearths and homes can arise, row upon row, Caterpillar earth-movers must get to work. On building sites up and down the country, where soon there will be houses, hospitals, offices, schools and factories, you can see the distinctive yellow of the 'Cats' (world-famous nickname for these world-famous machines) and hear the powerful, purposeful throb of their engines. These are busy times for the 'Cats', speedily doing the spadework for Britain's building developments.

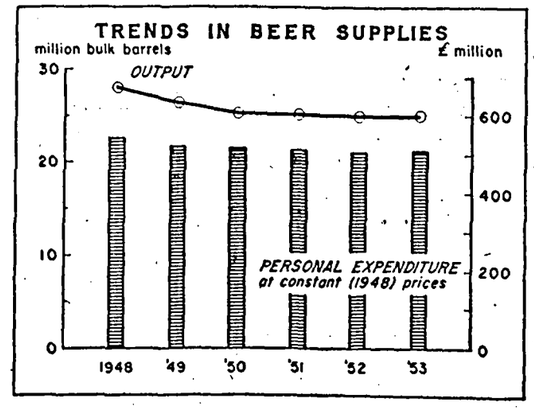
tendency for the banks to venture a little longer in their investments, it is interesting to note that the Midland again records that over 90 per cent of its Government securities mature within 10 years. As expected, the figures as a *whole* show that the tendency for the banks to switch from call money into bills became more pronounced during the closing period of the half-year; call money is down both by comparison with May and with mid-1953, while the bill portfolios are substantially larger than in May but smaller than at June 1953. A sharp increase in the cash holding at the close of the half-year, however, makes an ephemeral distortion, so that it is impossible to gauge from these figures the precise underlying relationship between call money and bills.

Change in Retail Trends



THE generally high level of retail sales conceals an unexpected shift in emphasis from clothing to more durable household goods. It did not become really noticeable until May, when the persistently cold weather began to take its effect on seasonal clothing sales. This trend has probably become more pronounced during the subsequent six weeks. Up to the end of May, food sales this year (the retail year beginning on February 1st) were on average two per cent higher than in the same period of 1953 and sales of other goods, 5 per cent higher. These average results conceal big increases in the sales of some categories of goods and a significant drop in others. In May itself, the independent shops reported a drop in all kinds of clothing and shoe sales compared with the previous May, and so did the department stores. This was somewhat offset by an increase of between 8 and 9 per cent in multiple shops' clothing sales and by mixed results from the co-operatives.

During April, all these shops were doing a booming trade in clothes; they were reporting sales increases of 12 and 22 per cent on the previous year, led as usual by the multiples. The unexpectedness of the check to sales in May is reflected in the rise in the value of the clothing stocks held by the shops. At the end of the month there was 14 per cent more merchandise of all kinds on the shelves than there was a year before, while the comparable figure for April was only 9 per cent. Most of the increase was in clothing; shoe stocks, for example, were up 20 per cent.

To offset these results, there has been a steady growth in furniture sales and also those of household goods. The independent shops, which figure strongly in this kind of business, had a 12 per cent rise in their furniture sales in May, and the department stores one of 9 per cent. Hardware sales were up between 7 per cent (the independents) and 12 per cent (the department stores). Radio and television sales could hardly hope to come near the pre-coronation peak of May last year, and the drop in radio and electrical goods seems to have averaged 20 to 26 per cent. Bad weather on the one hand, and an expanding rate of building on the other seem to be at the back of these changes. They soften temporarily the competition between department stores and multiples for the dominant position in retail trade, for the stores sell much of the durable household equipment, and earn on average a higher profit from it than they do from clothing sales that are made in direct competition with the multiples.

Mild or Bitter?

MONTHLY figures of beer output so far this year do not seem to support the impression that the postwar fall in consumption had ended in 1953. For the first five months of this year, to the end of May, output has been 9,024,000 bulk barrels, compared with 9,616,000 in the same period last year, a drop of 592,000 barrels, or 6 per cent. But these figures do not tell the whole story. There seems to have been an over-estimate of demand for the Christmas, 1953, trade, so that stocks were left over, and that brewing in January this year was lower than it would normally have been. The Siberian spell in the early months of the year, too, must have discouraged visits to the pub.

Thirdly, output in May last year was inflated by preparations for the Coronation; all the draught beer and much of the bottled beer for the celebrations was probably brewed in May.

This summer, again, bad weather will have affected demand for beer. But for that, the industry as a whole might have been able to look forward to a better figure for this June than for June last year: disappointing sales in the Coronation season left some beer in stock, so that June output last year was lower than it might have been. Whatever the movement in total sales, the continuing trend to bottled beer, which sells at higher prices and is generally more remunerative than draught, may mean that total expenditure and profits on beer as a whole will be maintained.

SHORTER NOTES

The Matchwood Working Party set up in 1950 at the suggestion of the Board of Trade to investigate whether there are types of timber suitable for making matches available from soft currency sources, to replace the poplar and aspen now bought from Canada and Europe, has reported that there are not.

In the first quarter of this year, during two months of which the National Coal Board was paying increased wages estimated to cost it some £9 million a year, it showed a surplus of £754,461 after providing £3 million for tax and £4,650,000 for interest due to the Minister of Fuel and Power. It was not until May that the board, stating that it could foresee a deficit of £17 million on the whole year, raised its prices by an average of nearly 5 per cent.

★

The directors of Hawker Siddeley have set all doubts at rest on the size of the ordinary dividend after the 100 per cent free scrip issue. In their announcement explaining that the Treasury has consented to this issue, they announce that subject to the usual proviso of "unforeseen circumstances" the final dividend on the new capital of £11,644,700 will be 7½ per cent. On the old capital the full year's rate would thus be equivalent to 21 per cent, compared with the dividend of 15 per cent paid in 1952-53. The belief that the scrip issue meant higher dividends has been amply justified and after the news the £1 ordinary shares gained 3s. 7½d. to 80s. 10½d.

★

In the Table of equity share prices in *The Economist* last week the par value of the Dunlop units was accidentally given as £1. They are now quoted in the 10s. form.

The directors of Pinchin Johnson, who a year ago reduced the ordinary dividend from 25 to 20 per cent, have now restored the rate to 25 per cent. This restoration follows the recovery in gross profits (from £1,546,807 to £1,976,218), and in net profits (from £538,241 to £695,026). After this announcement, the 10s. ordinary shares gained 9d. to 41s.

★

Arrangements for the resumption of private trading in raw jute have been completed and import licences will be issued shortly. The Jute Control's remaining stock will be bought by the Dundee mills. The return to private trading in jute goods is still a long way off.

★

Considerable offers of Russian silver on the London market on Friday of last week led to a sharp drop in the price from 73⅛d. per ounce to 72⅛d. from the weekend. On Tuesday the price recovered by ⅛d. The actual amount on offer cannot be estimated but the market complains of some clumsiness in the method. Lots of between 20 and 40 tons have come from various Continental centres, probably suggesting a much larger offering than in fact exists. The sensitiveness of the price was largely due to the fact that domestic demand for silver is, at the moment, exceptionally quiet, and that at the first hints of Russian metal being on the market the demand for exportable silver also dried up.

Company Notes

LAND SECURITIES INVESTMENT TRUST. A decline in rent income and no news of the big capital profit levied from his Savoy Hotel deal is not what investors expect from the dynamic Mr Samuel, chairman of Land Securities Investment Trust. The accounts gave the "bulls" of the 10s. ordinary stock units a tumble. These shares have been bought not so much in the belief that the dividend would be raised this year (for even the most optimistic could not ignore the chairman's warning a year ago that profits in 1953-54 would show a fall) but on the prospect for Mr Samuel and his big property deals.

The gross rents received in the year to March 31st were £1,122,492, compared with £1,247,861; net rentals also declined, from £737,042 to £655,858. The latest dividend of 12½ per cent, which is not covered by the year's earnings and is partly paid out of a draft on the carry forward, is within a fraction of the dividend of 45 per cent paid on the capital of £275,000, before the free scrip issue raised it to £1 million.

Mr Samuel explains that it is the company's policy to let its properties on full repairing leases to tenants of high standing; these tenants include some of the giants of British industry. The company has had to bear heavy costs of conversion of its old and newly purchased properties. Ultimately, these conversions enhance the value of the properties but they often entail a loss of rent until the properties are re-let.

There is another side to this policy. The acquisition of much new property has involved the company in borrowing more on mortgage. In the last financial year, the company's mortgage and debenture loans increased from £8,526,697 to £11,883,153. This increase, together with an increase in interest rates on the mortgages, brought interest charges up from £352,291 to £458,255—a major element in the reduction of net profits from £108,408 to £30,429.

	Years to Mar. 31, 1953	1954
Consolidated earnings :—	£	£
Gross rentals	1,247,861	1,122,492
Net rentals	737,042	655,858
Total income	750,307	674,855
Loan interest	352,291	458,255
Taxation	184,295	94,387
Net profit	*108,408*	*30,429*
Ordinary dividends	66,825	68,750
Ordinary dividends (per cent.)	45	12½
Added to carry forward	59,851	*Dr.38,321*
Cons. balance sheet:—		
Freehold properties	3,731,171	5,131,181
Leasehold properties	6,982,788	8,436,956
Cash	387,847	841,021
Mortgages, etc.	8,526,697	11,883,153
Reserves	1,524,207	878,308
Ordinary capital	275,000	1,000,000

A year ago when he foresaw this reduction Mr Samuel remarked that profits in 1954-55 "should show a considerable increase" over the 1952-53 earnings. In his latest statement, after drawing attention to losses on new properties awaiting re-letting, Mr Samuel has had to qualify this forecast. He now explains that profits in the current year will be of the order of those earned in the year to March 31, 1953. He adds that over the next few years the company's net income should improve considerably. Over these years, naturally, the company will have to face competition from the new offices being built in London. After Mr Samuel's statement the 10s. ordinary stock units were marked down 3s. 6d. to 44s. At that price, they offer a yield of £2 17s. per cent. Mr Samuel has not told shareholders what profits were made on the Savoy Hotel deal nor what he has done with them. Shareholders may wonder if there is any connection between this deal and the repayment of the preference capital of United City Property Trust, the subsidiary which had lent at the end of March, 1953, over £1¼ million to the holding company. The separate accounts of this subsidiary have not been published for the year to March 31st last. Mr Samuel should set all questions at rest at the annual general meeting.

★

BURBERRYS. The directors of Burberrys, the weatherproof clothing manufacturers, have chosen surgery rather than medicine to bring the company back to health. They report a decline in trading profits—from £159,377 to £103,069. The ordinary dividend has again been passed; the last payment was 5 per cent in 1950-51. The directors attribute the decline in profits to "more difficult trading conditions affecting the overseas establishments, the loss of service trade, and unforeseen difficulties which slowed down the reorganisation of factories."

The surgeon's scalpel the directors have chosen is the familiar one of selling off the freeholds of the company's properties and then taking them back on long leases. The real value of the company's freehold and leasehold properties is much above their book value of £627,878. The scheme to realise this "hidden reserve," and to use the proceeds to pay off a substantial part of the preference capital of £1 million, has not yet been completed. But arrangements are in view, subject to the consent of the Capital Issues Committee and the Court, to sell the freeholds on most of the company's London properties to an insurance company and to take back 99 years leases on these buildings. Further arrangements have been made for the "sale of certain properties no longer required and/or the raising of a mortgage primarily on the company's factory premises in the Reading, Basingstoke and Manchester areas." These arrangements will produce about £1 million for capital purposes; after the sales and mortgages are completed the company's bankers will "ensure the provision of working capital." The directors hope to produce the capital reorganisation proposals in the early autumn.

How do these arrangements affect the ordinary shareholder? He may benefit from the repayment of most of the preference capital; but in return, it seems, he will have to accept a higher rent roll on the leasehold property, higher mortgage interest charges, and interest charges on any money lent by the banks to finance the company's working capital requirements, and unlike the preference dividends those are payments which have to be made whether profits are earned or not. Until the capital reorganisation proposals are published, he will not be able to tell whether the value of his equity will be enhanced. After the announcement of these proposals and results, the company's £1 "A" ordinary shares fell 1s. 3d. to 12s. 9d. and the £1 "B" ordinary shares 9d. to 16s. 3d.; the £1 preference shares also lost 7½d. to 19s. 6d.

★

W. H. SMITH AND SON (HOLDINGS). Sometimes a dividend increase is so well foreseen that the actual announcement, notwithstanding higher profits, has been followed by a drop in the shares. That has been the fate of the "A" ordinary shares of W. H. Smith and Son (Holdings), the booksellers and stationers. The dividend on the "A" and "B" ordinary shares has been raised from 12 to 14 per cent but the "A" shares fell to 60s. 9d.; these shares offer a yield of £4 11s., about 5s. below the average "blue-chip" yield.

The increase in the dividend followed the slight advance in gross profits (from £1,792,575 to £1,811,629) in the year to March 28th, and in net profits (from £727,766 to £775,507). These increases suggest that the company has again been able to counterbalance the rise in costs (particularly of wages) by a further increase in sales. It is the stability of profits and the well established reputation of the company that has given its shares their high standing in the market. The latest year's results have done nothing to damage that status.

LONDON STOCK EXCHANGE

Next Account begins: July 21st
Next Contango Day: July 21st
Next Settlement Day: July 27th

GILT-EDGED stocks, with buying concentrated upon the undated and long dated issues, stole the limelight in the market this week. Dominion and Colonial issues, particularly the high couponed stocks and those standing under par, joined in the rise while the recently issued Birmingham loan advanced ⅞ to 2¼ premium. Insurance shares also rose sharply, with Prudential "A" moving up ½ to 43⅛. In the foreign market German issues were depressed at first but regained their earlier losses when buyers came into a thin market. Rumanian bonds were marked down on Monday on suggestions that a year may elapse before any payment is made, but these too began to improve later in the week. Bagdad Light and Power fell from 61s. 3d. to 55s. on the news that the Iraq Government had not given notice to the company that it intended to purchase the undertaking at the end of this year.

Equity share prices followed in the wake of the advance in gilt-edged stocks, bringing the *Financial Times* ordinary share index up to a new peak of 160.6. Gains early in the week were most marked in the electrical equipment, building material and motor groups. Profit taking, on the other hand, led to losses in the stores group. Later in the week "hire purchase" stocks enjoyed a general rise. The new Gallaher preference issue went off to a good start, opening at 3d. premium on the issue price of 21s. 9d. and closing on Wednesday at 4½d. premium. The chief feature in the market for oils was the advance in Royal Dutch on Monday by 2½ to 44¾, mainly on the strength of buying from Amsterdam. Later in the week oil shares remained little more than steady. Rubber shares were dull on a warning from America that higher prices for natural rubber might lead to the increased use of synthetic. On Monday dealers in the Kaffir market reported a selective demand for a few of the OFS issues, but later in the week in a quiet market prices slipped back a little.

Figures cover general trade as far as possible. Area totals include estimates for countries for which data are not available. Data refer to calendar years with the following exceptions in 1938:—Australia, year ending June; India and Pakistan, year beginning April; Iran, year beginning June. [1] Excludes China (mainland), USSR, and non-reporting countries of Eastern Europe. [2] Including the trade of Newfoundland in 1938 amounting to $36 million in exports and $31 million in imports. [3] Excluding trade with Taiwan in 1938. [4] Based on two months' data.

Financial Statistics

EXCHEQUER RETURNS

For the ten days ended July 10th there was an "above-line" surplus (after allowing for Sinking Funds) of £5,701,000 compared with a deficit of £21,143,000 in the previous eleven days and a surplus of £1,208,000 in the corresponding period of last year. This brought the cumulative deficit to £142,680,000 (£155,214,000 in 1953-54). Net expenditure "below-line" absorbed £23,423,000 bringing the total cumulative deficit to £248,500,000 (£280,771,000 in 1953-54).

THE MONEY MARKET

THE Treasury bill rate fell by 3/64 per cent at last Friday's tender, when the market raised its bid for the £270 million of bills on offer by 3d. to £99 12s. 2d. per cent in an attempt to replenish its bill portfolio. But as applications rose by over £12 million to £396.2 million and the offer was under-allotted by £20 million, the proportion of the market's bid to be allotted rose only from 60 to 65 per cent. The average rate of discount fell by nearly 1s. to £1 11s. 3.9d. At yesterday's tender the offer was reduced to £240 million.

Credit conditions have been varied. On Thursday before the week-end funds were short, and the authorities made substantial special purchases. On Friday conditions were more comfortable; no special aid was needed, and after the Treasury bill tender the banks bought bills at 1 5/32 per cent. Small official purchases were again necessary on Saturday and Monday, but credit then became plentiful.

Turnover in the gold market was considerable on Thursday before the week-end, and the price at the fixing rose by 1s. 3d. to 249s. 1d. per ounce. Subsequently, however, business became quieter, and the price fell steadily until Tuesday.

The fiduciary issue was raised by £50 million, to £1,725 million during the week. The Bank return shows a further outflow of notes of £14.3 million in the week to Wednesday last.

The full particulars show (inter alia) that:

1. Business: The business of **Wood & Sons Limited** was founded in 1865 by Mr. Absalom Wood and his son Mr. Thomas Francis Wood, the father of the present Chairman, and was aquired by that company on its incorporation in 1910. Wood & Sons Limited is one of the leading manufacturers of domestic earthenware in this country. Its name is well known in the Pottery Trade in most of the world markets. Its products include plain and decorated table ware, artware and vitrified hotel ware. Wood & Sons Limited has five subsidiaries which carry on business as earthenware, teapot and glazed tile manufacturers, processors of stone and flint and manufacturers of export casks and other packaging for the pottery industry.

2. Assets: The net tangible assets of the Group amount to £489,080 which is sufficient to cover the nominal amount of the issued Preference Shares and the premium payable on their redemption more than **four times.**

3. Dividend: On the realisation of the profit estimate of £86,000 (subject to tax) and in the absence of unforeseen circumstances, the Directors will feel justified in recommending a dividend on the Ordinary Shares at the rate of 15 per cent. per annum (less tax) for the period 15th July, 1954, to the 31st December, 1954.

4. Profits: The following are the combined profits (before tax) of the Operating Companies and of Bursley Manufacturing Company for the periods stated.

LORD GRANTCHESTER REVIEWS THE YEAR'S RESULTS

The following is the speech of the chairman, Lord Grantchester, OBE, at the eighty-fifth annual general meeting, held on July 15, 1954, at the Chief Office, Finsbury Square, London, E.C.2.

ACCOUNTS

The accounts for the year ended March 24, 1954, and the directors' report have been in your hands for some weeks, and I assume you would wish me to take them as read. I will not weary you with a repetition of figures which you will have studied, but confine my comment to the more significant or interesting features of the year's results.

Progress was made in all branches, and the company's income was up by £320,000. The total assets increased by £2½ million.

Claims by death were normal during the year.

INVESTMENTS

The most notable change in the accounts is in the distribution of the assets shown in the balance sheet. There is no material change in our aggregate holding of Government and Government Guaranteed Stocks. It may interest you to know that over 80 per cent of this total holding is in securities having definite redemption dates which, having regard to the nature of the company's liabilities, is considered appropriate. Accepting the view that changes in the bank rate are likely to be more frequent in the next few years than in the last twenty years, your directors also feel that this type of security is likely to fluctuate within narrower limits than those without definite redemption dates.

Holdings in equities have been increased by £2½ million. Needless to say, these purchases have been selected with great care and the stocks will be watched with the same care. If, as we all hope, British industry continues to flourish we can look forward to a modest increase in investment income in the future.

In making these investments we have had the advice and unrivalled experience of our new directors, Mr Lewis Whyte and Mr H. L. Rouse, whose assistance the other members of the board gratefully acknowledge.

We have benefited from the greater confidence prevailing in the country and the greater freedom now being allowed to private industry for initiative. I am happy to be able to report that at March 24th last the balance sheet values were in total less than the market values. It was not necessary to call upon the Investments Reserve Fund to support the balance sheet values.

VALUATION AND BONUS

We have therefore felt able to strengthen the valuation bases of the liabilities in both life branches. We have also made reversionary the 1952 bonuses which were that year declared only as interim bonuses.

In addition, fortified by what we hope is a rising interest income, we have felt justified in increasing the bonus to ordinary branch policy holders.

DIVIDEND

Your directors have recommended an increase in dividend which they hope will be regarded as a sign of faith and confidence in the continued progress of the company.

PROPOSED CHANGE OF FINANCIAL YEAR

There are two other matters of which I consider I should advise you. After very careful consideration and advice, it is the intention of the directors to change the date at which the company's accounts are made up and conform to the practice of most insurance companies of making the accountancy period end on December 31st in each year. The next accounts will therefore be made up to December 31, 1954, and will cover a period of nine months only. Your directors also intend not later than the next annual general meeting to submit a proposal to subdivide the shares in order to facilitate a freer market and to encourage a wider circle of friends of the company including policy holders and members of our staff to acquire a measure of ownership in the enterprise in which they are interested.

VISITS OF THE DIRECTORS TO PROVINCIAL CENTRES

In order to meet as many of the staff as possible on their own ground, visits by the whole board have been made to various provincial centres at which during the year they have met personally the officials of eight divisions out of a total of 16. They plan to meet the remainder within the current year. In addition, Mr Mann, Mr Reed and I have visited the two divisions leading in progress and met every member of the staff including the agents in those divisions.

These visits of the directors have created a lot of interest and I believe have helped to foster a family spirit among all who serve the company.

TECHNICAL TRADING AND INCENTIVES

More and more attention is being given today in industry to two subjects: first, improved technical training; secondly (faced with the disincentive of a scale of progressive taxation too steeply graded) the institution of incentives to employees to introduce new ideas and methods which directly contribute to expansion and which are linked in some way with the proprietary interests of shareholders. Both these matters deserve, in my opinion, most earnest consideration in relation to our business.

SELLING INSURANCE

It is prudent and necessary for all business enterprises to adapt their methods and wares to current conditions and demand. This is equally true of the insurance business; but upon us who have an organisation that literally operates on the doorstep of the home, is laid an additional duty, a responsibility—I will not say to educate—but to familiarise those upon whom we call with the choices they can make. To be able to sell life or endowment insurances we must first convince those upon whom we call of the merit of restraint — of abstaining from immediate expenditure upon some tempting indulgence. We have to fight against the prevalent fatalism engendered by ever increasing preoccupation with more and more deadly weapons of destruction. Then we have to fit the particular circumstances—not only to the right type of policy but to the most convenient method of payment. The right type of policy will be the policy where the benefits are payable to meet a need which it is anticipated will arise at a future date; first—provision against the death of the breadwinner; then to build up for the needs of old age; then to add to the joy of a whole host of anticipated happy occasions, the coming-of-age, marriage, the starting up on their own of members of the family. The most convenient method of payment will be that which fits in with the habits of the policy owner. Today there is no distinction in character among the policies available to those who find it most convenient to pay weekly, monthly, or at longer intervals. It is true that the cost of collection must necessarily be higher the greater the frequency of collection. We accept the obligation to inculcate and encourage an increasing sense of thrift to make it practicable to collect less frequently. But it cannot be too strongly emphasised that the weekly collections we make bring to every citizen the opportunity of investing (albeit indirectly) each week in British industrial enterprises and in British Government securities, for that is, in simple terms, exactly what they are doing. What is more, the success or otherwise of British industry has become a matter of significant importance to all these thrifty people. A substantial part of the profits distributed by industry today finds its way through profit-sharing insurances and pension funds into the pockets of the many who by their thrift are building capital by instalments.

PROFIT-SHARING ADDITIONS

This year the bonus distributions made by the London and Manchester are costing no less than £1,370,000. That such additions

should continue to be possible, of course, calls for skilful management and wise investment, but every worker in the great industries of the country should know that the more successful they can help to make the great industries in which they work the greater the benefit that will accrue to them and their colleagues as profit-sharing policy holders in a company like ours. They should also realise that the great drain upon industry today is the excessive level of taxation which has been absorbing as much as two-thirds of the profits of many companies, just as it is also the great drain upon personal earnings. This drain of taxation affects not only those in the middle and higher income groups through direct taxation but also those in the lower income group through indirect taxation. Everyone has, therefore, the most direct interest to press for economy in government expenditure, which alone can make possible a reduction of taxation. Lower taxation means more money in every pocket with greater opportunities for private investment. Provided an increased percentage of a rising net income is saved we should not deplore a modest increase in personal expenditure upon consumable goods, for, if this were not possible, one of the most powerful incentives to higher productivity is removed.

In my view a more widespread understanding and appreciation of the damage to confidence by threats of predatory raids upon property and personal savings, and a reduction of taxation affecting incomes to a level comparable with that prevailing in alternative fields of investment in other countries are necessary prerequisites to the restoration of full convertibility. Otherwise there is bound to be a drift toward areas where there is greater security or greater profitability for investment.

I make no apology for mentioning convertibility and its implications here, because a pound which is not convertible in the hands of a British subject is not a sound pound—the only sort of pound of which we can be proud. It is only a sound pound that will sustain purchasing power and so protect the savings of the people over a period of years, an objective with which we are so vitally concerned in our business.

Before I leave this subject, I suggest that what is needed today is not only the expansion of existing industries, but a widening of the field of investment. The continuance of Treasury controls in various forms hampers and restricts development and in some cases cramps a desirable spreading of the investment risk.

STAFF

It remains for me once again to express our appreciation of the assistance and courtesy of the directors, officials and staff of the County Fire Office, who have continued to place their experience of fire and accident business at the disposal of our staff and policy holders; and to express our thanks to the officials and staff of the London and Manchester, who have laboured to secure the results before you.

In doing this, I wonder whether I may depart from the conventional expression of the appreciation of the board to the staff for their work. I should like to include in my remarks a personal message to every member of the staff. Going about the country, I have been gratified that what I said last year was noted. Then I referred to the desire of the board that every member of the staff should work with dignity and a sense of responsibility as a person of importance in our organisation which is rendering a vital service to the public. I also expressed the hope that all members of the staff would enjoy their work as well as earn a fair reward. I want to thank those who have responded to that appeal by extra effort. But some may think that good intentions in a chairman's speech do not always materialise in action. I want to say that I am not fully satisfied with achievement—we never should be anyway—but that does not make us any less sincere in our aim. Achievement often falls short of purpose. Achievement is dependent upon an inter-play of effort between management and staff and an exchange of ideas at all levels which results in genuine co-operation.

Let us go forward together this year in which the funds with which we have been entrusted have reached the £50 million mark.

The report and accounts were adopted.

C. C. WAKEFIELD AND COMPANY LIMITED

NEW RECORDS ESTABLISHED

MORE FAVOURABLE TRADING CONDITIONS OVERSEAS

MR L. W. FARROW ON THE YEAR'S ACHIEVEMENTS

The thirty-seventh annual general meeting of C. C. Wakefield and Company, Limited was held on July 9th at Winchester House, Old Broad Street, London, E.C.2, Mr L. W. Farrow, CBE (the chairman) presiding.

The secretary read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

Since our last annual general meeting, Mr H. Y. Blades, who was a joint managing director of the company from 1938 to 1949, has resigned from the board. He was one of the original staff who started with the late Viscount Wakefield when this organisation was founded in 1899. We are deeply grateful to Mr Blades for his outstanding contribution to the interests and development of the company over a long period of years and all his friends and members of the Wakefield group affectionately wish him many years of health and happiness in his retirement.

Sir Cullum Welch, who has been the company's legal adviser for more than twenty years, has been appointed to the board and we are fortunate in securing his services as a director.

THE YEAR'S RESULTS

It gives me much pleasure to be able to announce to stockholders that the year 1953 established new records both in sales and profits for our group of companies, and the forecast which I made in my statement last year has been more than fulfilled. The group trading profit amounted to £3,274,450, as compared with £1,321,448 for the year 1952 and £1,667,931, our previous record, in 1950.

During 1953 increased sales were recorded throughout the group, both at home and overseas, and I am happy to say that the group sales of "Castrol" were a record in the history of the company.

W. B. Dick and Company, Limited, our principal subsidiary in the United Kingdom, continues to uphold its long established reputation in the particular spheres of electrical oils and marine lubricants and has made a substantial contribution towards the group profits for the year.

OVERSEAS

Our overseas branches, subsidiary companies and agents enjoyed, in varying degrees, more favourable trading conditions. I have referred in recent years to the sustained progress made by our French company which, owing to Government regulations, was not able to reintroduce "Castrol" until the middle of 1951. I am pleased to report that in 1953 both sales and profits were higher than ever before.

In referring to the volume of overseas trade, I would mention that in certain territories our oils are manufactured and blended under licence in accordance with our patents and trade marks and the sales of oils so produced by our agents have increased considerably. We are obtaining the benefit from royalty and licence fees proportionate to these higher sales. We are also proceeding with the expansion of our overseas trading by establishing subsidiary companies in certain territories formerly operated by agents and we shall ensure that we retain their co-operation and goodwill. This policy of further development of overseas trade should prove of benefit to group trading in future years.

CONSOLIDATED BALANCE SHEET

The consolidated balance sheet of the company and its subsidiary companies appears on pages 6 and 7, the principal changes being an increase of £720,172 in total shareholders' interests to £6,404,138 and the substantial improvement in group liquid resources.

The balance sheet of the parent company on pages 8 and 9 follows a similar pattern and both confirm the sound foundation of our company.

The consolidated profit and loss account of the group appears on pages 4 and 5 and, as I have already mentioned, the increased earnings have come from all sections of the group. It will be seen that the sum of £183,027 has been provided for pensions in addition to the normal charges for staff superannuation schemes. This provision represents the approximate liability, on an actuarial basis, of allowances granted supplementary to the pensions of those directors, executives and other members of the staff whose pensions were not commensurate with their salary or length of service at the date of retirement. After the usual provision for taxation and adjustments in respect of outside shareholders, the consolidated net profit of C. C. Wakefield and Company, Limited and its subsidiary companies amounts to £1,011,163, as compared with £341,557 for the year 1952.

DIVIDENDS

Your directors have recommended the appropriations set out in the consolidated profit and loss account including the payment of a final dividend of 30 per cent, together with a cash bonus of 2½ per cent, both less tax, as compared with a final dividend of 27½ per cent, for the previous year. After provision for dividends and transfers to reserves, the balance of group profits carried forward is increased from £648,363 to £692,700.

I think it is appropriate that I should take this opportunity of commenting upon the increasing number of statements suggesting that our company is negotiating or considering an amalgamation with or absorption by one of the petrol companies. None of these reports has any foundation in fact.

PIONEERS OF CHEMICAL ADDITIVES

I believe that we are now the largest independent organisation in the world specialising in the production and distribution of lubricants. We are also manufacturing large quantities of chemical additives, the development and use of which we pioneered. Research continues to enable us to maintain a leading position in the specialised field of lubrication and you will be interested to learn that our scientists have now perfected a load-carrying additive which is such an advance in its sphere that it will enable designers to improve marine reduction gearing to an extent which was previously impossible owing to the absence of suitable lubricants.

The group statistics so far available for the current year indicate a continuance of increasing sales and satisfactory trading results.

The accomplishments of the year are due in no small measure to the continued loyalty and hard work of the directors, executives and all members of the staff throughout the world and I am happy to have the opportunity, once again, of paying this tribute to them.

The report and accounts were adopted and the final dividend of 30 per cent and cash bonus of 2½ per cent, making 42½ per cent for the year on the ordinary stock, were approved.

The retiring directors, Mr W. H. Senneck, Captain G. E. T. Eyston, OBE, MC, and Sir G. J. Cullum Welch, OBE, MC, were re-elected and the other formal business having been duly transacted, the proceedings terminated.

ELLAMS DUPLICATOR

CAPITALISATION OF RESERVES

The annual general meeting of Ellams Duplicator Company, Limited, was held on July 14th in London, Mr Frederick Ellam (the chairman) presiding.

The following is an extract from his circulated statement for 1953:

The period under review has been a year of very keen competition, and whilst turnover was not unduly affected, generally speaking, selling prices were lower.

While your directors feel that, all things considered, the results are satisfactory, it is clear that every effort should be made to reduce production costs. Additional machinery of special design and improved productive capacity has been installed in the main factory and further plant of the latest design is on order at the present time.

The demand for your company's Duplicators continues to increase and we are finding it necessary to build an extension to the engineering factory to meet this increased demand.

Trade during the first six months of 1954 shows signs of improvement, and if this tendency continues the prospect for the current year is reassuring.

Your directors are recommending that the sum of £12,500 should be capitalised from the general reserve account and should be applied in issuing to the ordinary shareholders as fully paid one ordinary share of 1s. for every nine ordinary shares of 1s. each held by them at the close of business on July 16, 1954.

The report was adopted, and at a subsequent extraordinary general meeting the capitalisation of reserves was approved.

THE METAL BOX COMPANY LIMITED

SIR ROBERT BARLOW'S REVIEW

The thirty-third annual general meeting of The Metal Box Company Limited was held on July 16th at the May Fair Hotel, Berkeley Street, London, W.

Sir Robert Barlow, the chairman, presided.

The following are extracts from the directors' report and chairman's review:

PROFIT AND LOSS ACCOUNT

Group sales exceeded £43 million and constituted a record. Group trading profits before tax of £3,838,243 were £538,065 higher than a year ago, notwithstanding a reduction in the profits of the overseas group.

Profits, after providing for taxation, were £1,730,892 against £1,302,905.

THE YEAR

The year has been one of exceptional activity, both in demand for the company's production and also in the development work which the company has undertaken. The demand from the many industries which we serve has resulted in our working at practically full capacity on containers made from metal or from board.

A factory has been bought at Leicester and is being equipped for printing tinplate and the production of general line containers.

An opportunity also occurred to acquire on a share exchange basis the business of Brown, Bibby and Gregory, Limited, of Speke. This company produces labels, folding boxes and packages made from paper, plastics, and film.

Since March 31, 1954, the company has completed the purchase of Flexible Packaging, Limited, of Portsmouth. This company is engaged in the extrusion, printing, conversion, and lamination of polyethelene. By this acquisition we also obtain rights to technical information from the United States.

TINPLATE

In my review last year I stated that the demand for tinplate was, at that time, less than the supply, but I recorded my apprehension that "demand would soon again exceed supply, and that a further period of shortage would ensue until the new cold reduction mills at Ebbw Vale and Velindre came into production towards the end of 1955 and 1956."

The new mills of The Steel Company of Wales at Margam and Trostre have come into production with remarkable efficiency, and have set up what we believe to be world records of production. Despite this most commendable achievement, the fact remains that demand now again exceeds supply, and I must repeat what I said last year, "the outlook is a source of anxiety for all concerned."

EXPORTS

In the year under review we exported direct to over 40 countries, including North and South America, more than £2,200,000 of empty metal containers, nearly £500,000 of machinery, and over £2 million of ancillary materials.

Additionally, we supplied more than £4 million worth of containers to our home customers, who exported them filled with various commodities to a value of at least £35 million. In total, therefore, of our own home production at least 20 per cent was, in fact, exported.

The report and accounts were adopted.

THOMAS BROWN & SONS

RECORD TURNOVER

The fifty-seventh annual general meeting of Thomas Brown & Sons, Limited, was held on July 8th in London, Mr John M. Lawrence (the chairman) presiding.

The following is an extract from his circulated statement:

The turnover for the year under review constituted a record in the history of the company. The expansion is due to the increasing population of the State of Queensland, where the company's branches are chiefly situated; the development of secondary industries; the easing of import restrictions; the improvement in the dairying industry following the dry year of 1952; the firm price of wool; and the pursuance by our staff of an active sales policy.

The final results for the year under review show a net profit, after taxation, of £78,202. In furtherance of the policy hitherto adopted, without which the company would not today be in its present enviable position, substantial funds have been placed to reserve.

It will be appreciated that Queensland's prosperity depends largely on the price of wool, which is at present satisfactory, and on other factors, such as the export prices obtained for copper, lead, sugar, dairy products and wheat. Drought conditions prevailed over most of the Central Queensland area during the latter part of 1953, but abundant rains were experienced early in the new year. Seasonal conditions are now, however, good. Sales for the first few months of the current year show a further expansion and the prospects would appear to be satisfactory.

The report was adopted.

WORTHINGTON-SIMPSON, LIMITED

SATISFACTORY ORDER BOOK

The sixty-third annual general meeting of Worthington-Simpson Limited was held on July 8th in London, Sir Samuel R. Beale, KBE (the chairman), presiding.

The following is an extract from his circulated statement:

It is my pleasure to again submit a satisfactory report and statement of accounts in respect of our operations for 1953. The trading profit, at £642,689, although lower than the preceding year, must be considered satisfactory in the light of reduced profits from our Indian business. In April, 1953, the Indian Government prohibited the import of most pumps up to 6 inches suction, which sizes represented a large portion of our trade there. In consequence, we decided to close our Indian branch. The net profit for the year is £224,996, compared with £239,603 for 1952.

Our order book still stands at about the same high level as last year, and we are assured of a steady load on the heavy engineering side for the next year or two. Incoming business for the first quarter of this year in our trade lines of pumps is better than for the first quarter of last year.

In addition to the usual dividend distribution, it is proposed to distribute a share bonus of one new 10s. ordinary share for every twelve ordinary shares held.

The report was adopted and a final dividend of 10 per cent, less tax, making 20 per cent, less tax, for the year was declared.

At a subsequent extraordinary general meeting the bonus issue was approved.

GOODLASS WALL AND LEAD INDUSTRIES

IMPROVED TRADING RESULTS

MR J. L. McCONNELL ON COMPANY'S FINANCIAL STRENGTH

The twenty-third annual general meeting of Goodlass Wall and Lead Industries, Limited, was held on July 15th in London, Mr J. L. McConnell, the chairman, presiding.

The following is an extract from his circulated statement:

It is with pleasure that I am able to report that the group profits before taxation at the satisfactory figure of £2,472,786 show an improvement of £991,500 over those for the preceding year. Provision has been made for taxation on the year's profits and, although there is no EPL liability, this absorbs, as will be seen, rather more than 50 per cent of the profits. After making this provision and the usual adjustments for initial allowances and base stocks, and after deducting minority interests, the net consolidated profit becomes £1,060,514. The group balance sheet again discloses a position of great strength, and the improvement in the liquid position to which I referred in my last statement continued steadily until the end of the year.

I should like, however, to draw your attention to the company's own balance sheet, which shows considerable changes compared with the previous year. A few years ago the activities of the principal United Kingdom subsidiaries trading in lead, antimony and tin products were, as you know, amalgamated under the name of Associated Lead Manufacturers, Limited, which is today our main subsidiary, and in the course of last year the Liverpool paint business was transferred to Goodlass Wall and Company, Limited, which is now our main subsidiary on the paint side. This is a logical step as the result of which the company has now become purely a holding and management company.

UNITED KINGDOM COMPANIES

The trading of our subsidiary companies in the United Kingdom in the early part of 1953 was at much the same level as in 1952. Indeed, in my review of our operations at this time last year I deemed it prudent to sound a warning as to the immediate future and to express the opinion that no great improvement over the 1952 results could be looked for. However, in the early summer a somewhat unexpected all-round improvement in trading conditions developed. This was due in part to the relaxation of the steps which had been taken by the United Kingdom and other Commonwealth Governments in the previous year to stop the decline in sterling balances. In the case of Associated Lead Manufacturers, Limited, the result was a substantial improvement in demand from the battery, glass and paint trades, and deliveries in the second half of the year were at higher levels than in the first half and, I am glad to say, these higher levels have persisted so far in 1954. Improved profits were shown by all manufacturing departments; on the other hand, severe and increasing competition was experienced by our smelting and refining department, which nevertheless was able to achieve satisfactory results.

The profits of the Liverpool paint business were a record and followed a substantial increase in turnover generally: a remarkable development took place in the retail marketing of the range of "Valspar" products, among which Valspar 2-4 hour lacquer is proving particularly popular—and deservedly so. Measures are being taken to increase plant capacity and storage accommodation at the works at Speke.

OVERSEAS LEAD COMPANIES

The volume of busines done by our Calcutta companies showed only a slight change upwards from 1952, but in the absence of market losses the profits were considerably higher. Associated Lead Manufacturers (Pty.) Limited, Durban, had a favourable year and the results must give great satisfaction to the local executives responsible for them.

DEVELOPMENT

I am glad to report continued and satisfactory development in our Zircon and Special Chemical Divisions. The former is establishing itself nicely and has made good progress during the year. The latter department serves mainly the plastics industry as a supplier of stabilisers and our close technical co-operation with this industry is having beneficial results. Our research laboratory at Perivale, which serves the lead side of the business, has again had a useful year and has been particularly successful in dealing with problems arising in the factories. Our paint laboratory at Kirkby has played its part in producing the satisfactory trading results of Goodlass Wall and Company, Limited, Liverpool.

TRADE INVESTMENTS

Our holding in British Titan Products Company Limited is the most important of our trade investments. The company has had a most successful year and is planning a further increase in plant capacity. British Australian Lead Manufacturers Pty. Limited, which occupies a leading position in the Australian paint trade, is sharing in the improved trading conditions there and the results for the year to June, 1954, are expected to be excellent. Satisfactory dividends have been received from the Minnesota Mining and Manufacturing Company Limited, in which we have a small holding, and from Basinghall Mining Syndicate Limited, the proprietors of the Greenside Lead Mine. The new factory at Port Elizabeth of our associated company, Enthoven Fry Limited, is already operating at a profit and it is hoped that this company will make a steady contribution to our profits in future years.

RAW MATERIAL SUPPLIES

Except in one or two directions, no serious difficulty has been experienced in obtaining adequate supplies of raw materials. Although the London Metal Exchange reopened in October, 1952, it is not yet possible, for various reasons, for a manufacturer to carry out hedging operations with the same facility and economy as in prewar days. In the case of lead, our main metal, a substantial "backwardation" has existed throughout the year and this has been accentuated by the existence of a premium for spot lead over the current month's price. The disparity at times has been relatively substantial and the difficulty of conducting one's business under such conditions can be readily understood. As important smelters we cannot refuse to buy when supplies are available, and it is not unnatural that sellers should choose a time favourable to them to liquidate stocks. Materials take time to smelt and refine and until they are in saleable form, and can in fact be sold, have to be held at market risk. To minimise this risk, the lead content could be sold forward on the London Metal Exchange, but as the price of purchase of secondaries is normally based upon the current price of lead, "hedging" or selling forward in this way is impracticable except at a heavy loss owing to the much lower price of forward lead.

FINANCIAL POLICY

The cash position has improved by £1,737,600 during the period. A deliberate policy of stock reduction has been pursued and accounts for just over £1 million, the balance representing the surplus of our profits before depreciation, over the amounts disbursed in taxation, dividends, and capital expenditure. There are several reasons why your board thinks it desirable to retain such considerable balances. In the first place, the possibility cannot be overlooked that prices may again rise as they did not so long ago, involving a large additional lock up in stocks, and secondly, apart from the ability freely to incur capital expenditure on our plant when required, an opportunity may occur to increase our investment in British Titan Products Company Limited. This company, which is engaged in the manufacture of titanium dioxide, and not titanium metal as is sometimes thought, is, as already stated, embarking upon a scheme of expansion involving substantial expenditure of capital and a call for finance may be made upon us. In this event we should respond, as we look for an increasing income from this source in future. Titanium dioxide has taken a leading place among modern pigments and our interest in the industry compensates us for the fact that expansion in the consumption of white lead, the oldest white pigment and one which for many purposes still retains a unique value, is hardly to be looked for.

Your directors are of the opinion that the strength of the company, the adequacy of its reserves, and the satisfactory results for the year justify an increase in dividend distribution and are recommending a final dividend of 12½ per cent, less tax, on the ordinary stock, making a total for the year of 16 per cent, less tax. For the previous year a dividend of 12 per cent., less tax, was paid.

It is also recommended that a transfer of £500,000 be made to general reserve and that the sum of £495,866 be carried forward to 1954.

The steady increase in the capital employed by the company since the date of the last issue of capital in September, 1951, justifies your board in thinking that a further capitalisation of reserves should be carried out, and application has been made to the Capital Issues Committee for permission to capitalise reserves to the extent necessary to allot to our ordinary stockholders one fully paid share of 10s. for every two stock units held, bringing the issued ordinary capital up to £3,614,033. If permission is granted the necessary meeting of the stockholders will be convened.

PROSPECTS

We are reasonably busy in all sections of our business, but in some departments the terms of trade have become increasingly competitive. Under these conditions, while I hesitate to forecast with any precision the result of our operations in 1954, I find reassurance, given a continuance of active trade, in the wide diversity of our products backed by the substantial resources at our command.

The report and accounts were adopted.

BOOTS PURE DRUG COMPANY

CREDITABLE INCREASE IN PROFIT

MR J. P. SAVAGE'S STATEMENT

The sixty-sixth annual general meeting of Boots Pure Drug Company was held at Nottingham on July 14th. Mr J. P. Savage, the chairman, presided. The following is an extract from his circulated statement:

My first reference must be to the retirement of Lord Trent, who was our chairman for nearly thirty years.

What a remarkable contribution he has made to the progress of our Company. During the period he controlled and directed the policies of our organisation, the number of customers served has been quadrupled, the number of prescriptions dispensed has grown from 3 million to 35 million per annum and the profit has increased from £731,787 to £3,295,410. In addition the amount paid out in dividends to ordinary shareholders has risen from £244,799 to £1,152,000. During the same period, the staff has increased from 15,000 to 36,000, while the wage bill has gone up from £2,200,000 to £12,900,000. Against this, of course, must be set the rise in the cost of living, but I am satisfied that the wage increases we have been able to make have taken care of that, and the staff have participated in the prosperity of the Company. Finally, he retired at the end of a financial year which has broken all records for sales, customers served and trading profits. In recognition of his inspiring leadership and to retain the link with a great family, we have endowed two chairs at the University of Nottingham in pharmaceutical chemistry and in chemical engineering.

TRIBUTE TO LORD AND LADY TRENT

These chairs will serve not only as an enduring tribute to Lord and Lady Trent, whose names they will bear, but they will also be of great and permanent benefit to the company. A business such as ours must have properly trained and qualified people whether they are pharmacists in the shops or technicians in the factories. There is in particular a great shortage of chemical engineers. By endowing these two chairs we are ensuring that we have on our doorstep here in Nottingham a supply of the right kind of people who have had the right kind of training. We are also stimulating research in two fields of vital importance to the company.

I should like to thank Lord Trent for all he has done and I hope he will enjoy improved health and much happiness in his retirement.

Mr Leonard Anderson has also retired, and I am glad to have this opportunity of acknowledging his great work in the development of our fine chemicals and antibiotics production. Due largely to his efforts, we can now boast we have one of the most efficient plants in the country. Mr S. Harker-Smith has joined the board. He has been with the Company thirty-three years and became general sales manager in 1945.

PROFITS AND DIVIDENDS

Our profit at £3,295,410 shows a very creditable increase of £354,066 over last year's figure. This reflects not only our higher turnover, but increased efficiency in our operations. After making provision for tax, and allowing for the endowment of the two chairs at Nottingham University, the net profit of the group is £1,413,584 compared with £1,353,775 last year. Profits retained by the subsidiary companies amount to £273,767 this year against £380,769 last year, leaving the net profit of Boots Pure Drug Company Limited at £1,074,082 compared with £911,455. The amount brought forward from last year is £321,478 and this added to the net profit of Boots Pure Drug Company Limited gives a total of £1,395,560. Your directors propose that the final dividend should be increased from 10 per cent to 12½ per cent, making 22½ per cent for the year against 20 per cent last year. This is the first time the ordinary dividend has been increased since 1947, and the moderate increase we now propose is fully justified. Your directors also recommend appropriating an additional £100,000 for the provision of pensions. This is over and above the normal appropriation which this year amounts to £77,432 and is earnest of our intention to ensure that the staff are properly provided for in retirement. After allocating £80,000 to general reserve, £120,000 to freehold property reserve and providing for the dividends paid and proposed, the amount remaining to be carried forward to next year is £331,315 against £321,478 last year.

CAPITAL EXPENDITURE

We have embarked on the extension of our warehouses and the improvement in research facilities to which Lord Trent referred in his report last year, and we are pressing ahead with the improvement and modernisation of our shops. We are now able to meet our capital expenditure on the present level out of the funds currently available in the business.

STOCK INVESTMENT

During the year our stocks have again shown a decrease, though obviously after the big reduction of the previous year, this is relatively small. This, combined with a substantial increase in our volume of sales, has resulted in an all-time record rate of stock turnover in our retail shops, warehouses and factories, and this has played a part not only in increasing profits, but also in strengthening our cash resources.

NATIONAL HEALTH SERVICE

During the past year the Ministry of Health have made great efforts to reduce the cost of the National Health Service. Their efforts have been reflected in a significant fall in the value of each prescription dispensed and in part also in a fall in the number of prescriptions. I am quite satisfied, however, that the point has now been reached where the doctor is prescribing only what is proper and necessary for the treatment of the patient, and that the cost of the Service has been reduced to the lowest possible level consistent with the welfare of the patient and the efficiency of the Service. The Ministry are reasonably entitled to ask that where a standard preparation is just as effective as an alternative remedy and a great deal cheaper, the standard preparation should be used. But they would surely be very unwise to discourage the use of new but effective remedies merely because they happen to be expensive as is so often the case because of the heavy charges for research they have to carry. For this and other reasons a new preparation, which represents a considerable advance in medical science, may be expensive when it is first put on the market. It is at the same time true that all pharmaceutical manufacturers make every attempt to reduce prices as sales increase. One of the most widely used of the newer preparations is penicillin and the price to the National Health Service has dropped from 4/4 to 1/9 per mega unit during the last five years. It would be a pity if beneficial developments of this kind were retarded by any clamour for false economy. I am glad to observe, however, that the Minister of Health himself, during a recent Parliamentary Debate, showed that he was well aware of this danger. Nor is it true, and I speak here not only for my own company but for the pharmaceutical industry as a whole, that undue profits are being made by the manufacturers. As we have pointed out in our annual review, the overall rate of profit on our sales is only 6 per cent. In many instances we make the basic ingredients, compound the preparation and sell it in our shops, and a rate of profit of 6 per cent covering all these operations is an extremely modest one. The drug trade, moreover, is highly competitive, itself a guarantee of efficiency and fair prices.

WHOLESALE SALES

Our total wholesale business has shown a gratifying increase of 10.90 per cent. It must be remembered that our wholesale business is carrying its full share of our general overhead expenses and so is of benefit to all sections of the business.

It is perhaps not always realised what an important part in the company's growth and profits is played by the home wholesale department. For many years this business has been increasing, and in this year has broken all records.

Unfortunately our export business, like that of the pharmaceutical industry as a whole and doubtless for much the same reasons, shows a decline in sales. It has been a difficult year for our overseas subsidiaries and we have found it necessary to make provision for substantial losses. A large proportion of our export business has always been concentrated in India and the Far East. Trading conditions there have been much disturbed, and we have experienced a sharp recession in sales.

STAFF

Our staff have worked with enthusiasm and competence and their relationship with the management has continued to be excellent. Nothing can discourage Communism more effectively than to foster good relationships between management and staff, and where this is encouraged the results are shown in the prosperity of the Company and the happiness of the staff.

FUTURE PROSPECTS

The results have been largely influenced by the increased efficiency of our production plants. We are now reaping the benefit of the capital expenditure programme upon which we embarked at the end of the war, and I am quite certain this improvement in efficiency will continue throughout the coming year. On the other hand, retail distribution is becoming more difficult, because of rising costs. It is our policy that retail prices shall be kept down to the lowest economical level, but increases imposed in the cost of coal, gas, rates, electricity and transport will have the effect of making it harder to maintain the net profit except by concentrating on increased sales. During the year our retail sales have shown a steady rate of increase and we are determined that this progress shall continue.

THE SUNGEI KRIAN RUBBER ESTATE LIMITED

SIR JOHN D. BARLOW'S STATEMENT

THE FORTY-FIFTH ANNUAL GENERAL MEETING of the company will be held at Plantation House, Mincing Lane, London, E.C.3, on July 28, 1954.

The following is an extract from the circulated remarks of the CHAIRMAN, Sir John D. Barlow, Bart., M.P.

U.S. Synthetic Rubber Policy

The fluctuations in the price of rubber are well known. Since the war the price has been as low as 8d. per lb. in 1947 and as high as 73d. per lb. in 1951; today the price is approximately 21d. per lb. The present price leaves small margin for profit, after providing for replanting and amortisation of buildings and machinery.

The present depressed price of rubber is largely due to the U.S. Government's synthetic rubber policy. The U.S. Government has for the last 12 years been producing synthetic rubber and selling it to American manufacturers at a price which has been admitted to be a non-commercial price, not only by leading congressmen and high government officials, but also by the American rubber manufacturers themselves. It is only within the last year that the U.S. Government has revoked the directive compelling the U.S. rubber manufacturers to use a large proportion of government synthetic rubber.

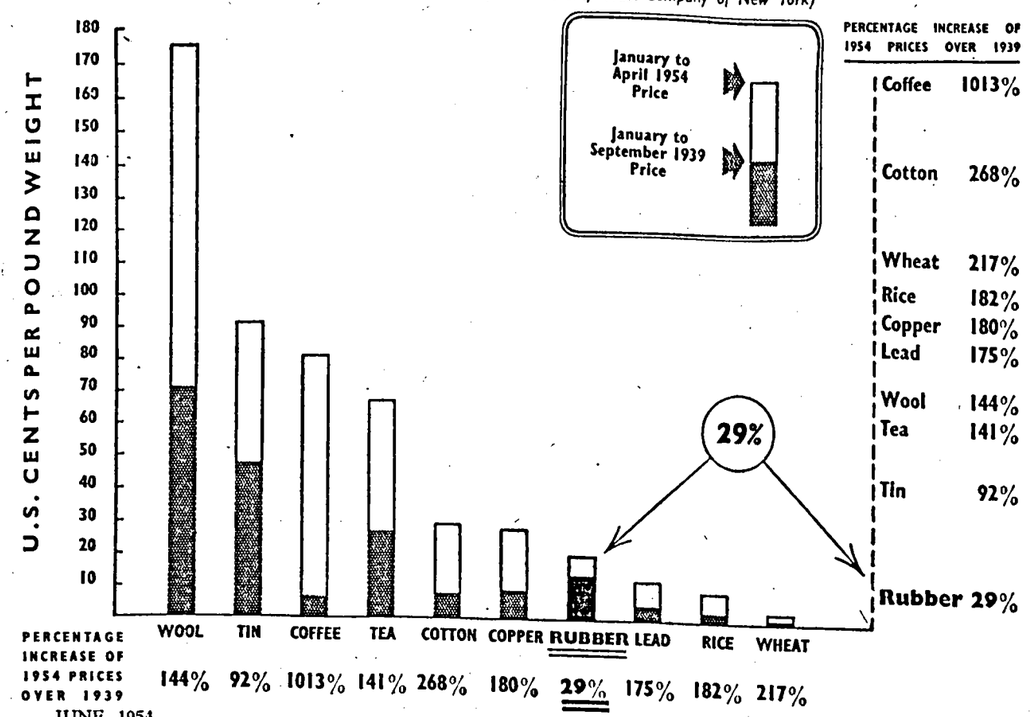
Recently a number of U.S. commercial firms, including some manufacturing companies, have submitted bids for synthetic plants to the committee set up by the U.S. Government. It is to be hoped that in 1955 the Government synthetic facilities will be handed over to private manufacturers at fair prices. All we ask is to be allowed to compete with the synthetic product on equal terms.

Comparison of Commodity Prices in U.S.A.

The table set out below shows the effect of the U.S. Government's synthetic rubber policy by a comparison of the price of rubber with the prices of various other commodities in January to September, 1939, and January to March, 1954. The figures are taken from the Survey of the Guaranty Trust Company of New York.

It is interesting to note the percentage increases in price of the following commodities between 1939 and 1954:

Coffee	by 1,013%	Wheat	by 217%	Pig Iron	by 172%	Zinc	by 118%
Hogs	„ 275%	Rice	„ 182%	Wool	„ 144%	Sugar	„ 116%
Cotton	„ 268%	Copper	„ 180%	Tea	„ 141%	Petrol	„ 100%
Rosin	„ 256%	Lead	„ 175%	Cattle	„ 135%	Tin	„ 92%



In contrast to these rises rubber has only increased by 29 per cent.

If the U.S. Government had not subsidised the production of synthetic rubber but had allowed the commodity to find its own price level, it seems clear that the price of natural and synthetic rubber would be higher today, because natural rubber is considerably undervalued in relation to the prices of leading commodities in 1954 compared with 1939. This point can be clearly seen from the table which illustrates the comparatively insignificant increase in the price of rubber.

For a commodity which makes such an important contribution to the sterling area's balance of payments position, it is indeed unfortunate that the price of rubber today has not risen to anything like the same extent as other commodity prices during the last 15 years.

COMPARISON OF WHOLESALE COMMODITY PRICES IN U.S.A. in 1939 and 1954

(Based on Wholesale Price Table of the Guaranty Trust Company of New York)

JUNE, 1954.

THOMAS BARLOW AND BRO.
PLANTATION HOUSE LONDON, E.C.3.

GILL AND DUFFUS LIMITED

SATISFACTORY RESULTS IN A DIFFICULT YEAR

ALL BRANCHES DO WELL

MR J. I. MURRAY ON THE PROSPECTS

The seventh annual general meeting of Gill and Duffus Limited, was held on July 8th at 23, St. Dunstan's Hill, London, E.C., Mr J. I. Murray, the chairman, presiding.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1953:

Before dealing with the figures for the past year there are two matters which I should like to mention. Firstly you will have seen from the directors' report that for reasons of health Mr Bennink has, to our great regret, decided not to seek re-election as a director. Mr Bennink in his capacity as a Director of British Cocoa Mills (Hull), Limited, and more recently as a director on our board, has been closely associated with our company for many years and we shall miss him as a friend and as a wise and esteemed colleague. Mr Bennink has spent a lifetime in business and his wide experience was greatly appreciated. Our best wishes go to him for a speedy recovery in health so that he may enjoy the leisure which he has earned so well.

EARNING POWER NOT LINKED WITH COCOA PRICE

Secondly, recent references to the company in the Press appear to link the earning power of the ordinary capital and therefore the value of the ordinary stock, with the price of raw cocoa. Since we are not producers of raw cocoa, nor speculators, and do not carry stocks or make forward purchases except to match our contracted sales, it is merely fanciful to link the earning power of our ordinary stock or its market value with the price of one of the commodities in which we deal. I stress this so that there should be no chance of stockholders or the investing public being misled.

The past year has not been an easy one, but you will, I think, agree that the problems which have had to be faced as a result of the exceptional trading conditions have been met and that the results achieved are satisfactory. In my statement last year, I stressed the necessity for building up the strength of the company. While we are by no means complacent, it is, I feel, a matter for satisfaction that in the course of a year we should have progressed as far in this direction as we have done.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

In order to measure the progress, it might be useful to examine in some detail the changes which have taken place in the company's profit and loss account and the balance sheet. In doing so I shall, as was the case last year, refer only to the consolidated figures.

The group profit before taxation for the year was £906,415 as compared with £730,605 in 1952—an increase of £175,810. This was arrived at after making specific provisions of £177,452 against debts due by customers in Brazil and Turkey. It was felt prudent to make these provisions in view of the shortage of sterling at present prevailing in both countries and of the fact that no one can tell when and at what rate payment may be received.

After these provisions and in spite of the very heavy burden of taxation, United Kingdom, Dominion and foreign which we have had to bear, the net profit attributable to members was £427,318. Adding to this the balances brought forward by the group at the end of 1952, there is available £704,537, of which £238,917 has been retained by subsidiary companies. Out of the balance we have transferred £150,000 to forward contracts and stock replacement reserve, £150,000 to general reserve, and, after meeting the preference dividend and paying a final dividend on the ordinary stock of 25 per cent which, with the interim of 15 per cent, makes a total distribution of 40 per cent for the year, requiring £110,000, there remains to be carried forward by Gill and Duffus Limited, a balance of £52,320, to which must be added the amount retained by the subsidiary companies, giving a group balance to be carried forward to next year of £291,237.

The effect of these allocations is revealed in the balance sheet. Against an issued capital of £600,000, the capital and surplus now amounts to £1,731,101—an increase of £315,077 on the year. Our commitments are, however, still heavy. Stock-in-trade is higher in value at £2,647,482, but this is not surprising when it is related to turnover which last year amounted to approximately £24 million and, although certain subsidiaries had £409,870 of cash, the parent company and the other subsidiary companies had overdrafts of £804,271. Nevertheless, current assets show at the close of the year a surplus over current liabilities of £1,894,487—an increase of £364,762. From these few figures it will be apparent that, although the position which we have set out to build up is by no means yet complete, it is beginning to take shape.

PROGRESS AT HOME AND ABROAD

All branches of the business at home and abroad did well. The produce department met successfully increased competition resulting from the freeing of imports; the Cocoa Mills at Hull worked to capacity throughout the year; the Canadian company again expanded its business and the development of the American company continued slowly, as we anticipated it would, but surely. West African Mills, Limited, worked successfully under difficulties, but since the close of the year the cocoa departments of the mills at Takoradi have, I regret, been closed and placed on a care and maintenance basis. These mills have only one source of supply for their raw material, the Gold Coast Cocoa Marketing Company, Limited, and since the forward price for cocoa products has been for some months considerably lower than the spot price, there was no basis on which these mills could work at a profit, at any rate having regard to the very small concessions which the West African Government felt they could make to keep them in operation. The saw mill, which was originally established for making boxes for packing cocoa butter, is still operating and it is hoped that the profit from its operations will meet some of the maintenance charges on the cocoa mills at Takoradi. There would, however, appear to be little chance of West African Mills, Limited, reopening their cocoa departments until there is a change of policy on the part of the Gold Coast Government.

Southern Cocoa Mills Limited at Reading was, as I mentioned in my 1951 statement, a unit formed to manufacture cocoa butter during the emergency of the last war. With the complete acquisition of the mills at Hull which are much more modern, there could be no object in retaining the Reading mill and the company has now been placed in liquidation. This will result in a substantial surplus over and above the price at which the shares of Southern Cocoa Mills Limited stand in our books. While we should have liked to have distributed this surplus in the form of a tax-free dividend, we felt it unwise at the present time to let the cash go out of the business, so instead we have decided, subject to the passing of the necessary resolutions, to capitalise the greater part of the surplus in the form of £100,000 6 per cent cumulative preference shares of £1 each, which will be issued free as soon as possible to ordinary stockholders in the ratio of one preference share of £1 for every 20 stock units of 5s. each held.

CURRENT YEAR'S PROSPECTS

To assess the result for the year to December 31, 1954, is, of course, a difficult task, even though we have half a year's trading behind us. In present conditions, six months is a long time in which anything can happen. Subject, however, to some major change in the situation, not at present foreseen, I anticipate satisfactory results for the year 1954. It is a fact, however, that the present price for cocoa poses enormous problems for our industry as a whole and there are sound reasons for suspecting that 1955 will be, from the financial angle, the most critical year in the whole history of cocoa. Should this be so, it will happily not find us unprepared.

In conclusion, I would like to thank the staff, both at home and abroad, for their loyalty, co-operation and successful work during a difficult year. The results achieved are a genuine tribute to their efficiency.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting the chairman said: It has been suggested that, for the benefit of stockholders, I might amplify the second paragraph of my statement embodied in the annual report and accounts.

As the press has pointed out, cocoa is, of course, only part of our business, but of 1953 it is true to say that the company's prosperity was not affected either favourably or unfavourably by the increase in the price of cocoa which, after all, only took place towards the end of that year.

To what, then, do we attribute the higher profits earned in 1953? The simple answer is that the higher profits were due to the larger turnover which, in turn, was due to the general buoyancy of the confectionery and allied trades throughout the year both at home and abroad.

It has already been explained that, since virtually all the stocks held are sold against contracts, it is most unlikely that we shall ever be in a position to make stock profits in the accepted sense, and therefore it is misleading to link the earning power and the market value of the ordinary stock with the price of one or any of the commodities in which we deal. High prices such as today exist for cocoa are a hindrance rather than a help, in that they tend to limit the trading and merchanting side of the business, because of the extra working capital required and because the greater risks involved render such busi-

ness at times unattractive. Furthermore, it will, I hope also be accepted that in the long run no commodity price level can be beneficial to us unless it is equally so to our customers, whose products, unlike ours, are sold to the public.

While, as I have pointed out before, we do not speculate in cocoa or, indeed, in any other commodity, there must be, in a business such as this, a much greater element of risk than there is in the ordinary type of manufacturing business and fluctuating fortunes must be anticipated. If, therefore, we are to achieve something in the nature of stability, it can only be done by building up very adequate reserves. In this respect 1953 favoured us well.

Finally, since my statement was issued, authoritative references have been made to the desirability, and even necessity, of seeking satisfactory substitutes for cocoabutter if present price levels should persist. Stockholders may like to know that this question has received exhaustive study by our group. We are now, in fact, producing substantial quantities of a high grade fat which offers, in our opinion, the only alternative to cocoa-butter which can be used in chocolate manufacture without seriously prejudicing the quality standard. Naturally, the production of an alternative fat has brought problems with it, but we hope this new development will play a useful part in the economy of our group during present conditions. We have been pleased to find useful outlets overseas for this new production, particularly in dollar markets.

The report and accounts were unanimously adopted.

LONDON & OVERSEAS FREIGHTERS, LIMITED

SATISFACTORY YEAR'S TRADING

INTEGRAL PART OF EXPANDING INTERNATIONAL TRADE

HIGH COST OF BUILDING

BRITISH SHIPOWNERS AT A DISADVANTAGE

MR BASIL M. MAVROLEON ON BOARD'S POLICY

The sixth annual general meeting of London & Overseas Freighters, Limited, was held on July 12th at the Baltic Exchange, St. Mary Axe, London, E.C.

Mr Basil M. Mavroleon (chairman and managing director) presided.

The following is his circulated statement:

During the year under review the company's fleet of modern tankers continued to operate efficiently and, as is to be expected where new ships are concerned, with a minimum loss of earning time.

EARNINGS

The operating surplus for the year is a quarter of a million pounds higher at £1,196,449, which, except for some £50,000 earned by the two dry-cargo ships, arose from the trading of eight tankers throughout the year and a ninth, the *London Loyalty*, as from January, 1954.

Having regard to the fact that employment has been secured for your company's ships for some time to come, it is not a matter of great difficulty to forecast the operating surpluses likely to arise in the next year or two, subject, of course, to any losses which may result from unforeseeable marine accidents, and I confidently expect a further rise in profits during the current year.

Our ships are engaged in the carriage of one of the world's most valuable and indispensable raw materials and form an integral part of an expanding international industry. We shall have our ups and downs—as you know the tanker freight market is as low now as ever it has been since the war—but in the long run the prospects are excellent.

TAXATION

No income tax is payable in respect of the profits of the period under review, but approximately £1,075,000 would have been payable to date had it not been for the incidence of initial allowances in respect of expenditure on building new ships. The sum of £275,000 has, therefore, been added to the £800,000 already standing to the credit of taxation equalisation reserve.

The investment allowance recently introduced by the Chancellor of the Exchequer goes only part of the way to assist the shipping industry in meeting the problem of replacement costs and one can only hope that this small gesture will not lose its significance hereafter.

DIVIDEND

The board, adhering to the dividend policy declared at the time the company secured a Stock Exchange Quotation, recommends the payment of a dividend of 5 per cent (less tax) for the year ended March 31, 1954. Doubtless you will be wondering whether or not I am now going to tell you what the dividend policy of the board is to be in future years. I cannot, of course, make any promises, and the board does not feel able to commit itself to any minimum or maximum figure in the future. Our capital commitments will continue to be financed out of earnings and the position will be reviewed at the close of each financial year.

Nevertheless, I think you will be encouraged to know that neither my colleagues nor I share the all-too-prevalent view that shareholders are an undeserving lot of slave-driving moneygrabbers. In this, as in all other matters, it is necessary to maintain a sense of proportion if the wellbeing of all concerned is to be ensured and there is a good deal of nonsense talked and written on the subject of profits and wages, mostly by well-meaning theorists who have little or no practical experience of business. Shareholders and wage-earners must walk hand-in-hand—they have the same interests basically. Wage-earners are very important people, but so are shareholders who save up their money to invest in industry. Without such investment there would be no wages to earn, so let us do all we can to correct the misconception that shareholders are ogres to be penalised or destroyed.

Surely there is nothing praiseworthy in making losses. I would consider it a crime to the people who work for us if we made losses as the disappearance of their livelihood would be the inevitable outcome.

The heavy burden of taxation today precludes the possibility of amassing vast profits, whether for re-investment in the business or for distribution to shareholders, but enterprisers must be encouraged to prosper for the direct benefit of workers and shareholders and indirectly for the good of the country. It is our aim to operate the fleet to provide first-class working conditions and pay for our employees and, consistent with maintaining the financial stability of the company, to reward you—the shareholders and proprietors—for investing your money in the undertaking.

FLEET

The two remaining dry-cargo ships, the *London Artisan* and *London Banker*, were sold during the year. The realised surplus aggregating £283,485 has been added to capital reserve and a further sum of £104,124, representing provisions for depreciation and special surveys no longer required, has been credited to profit and loss account.

Thus, the entire fleet at March 31, 1954, was composed of motor tankers of which the average age per deadweight ton was less than two years. I do not know of any other concern of comparable size which owns such an up-to-date fleet.

The *London Loyalty*, sister ship of the *London Victory*, was completed and went into service at the beginning of 1954. The fleet has been further augmented since the close of the financial year by the *London Prestige*, sister ship of the *London Splendour*, and now comprises ten ships with a total carrying capacity in excess of 180,000 tons.

I would like to say at this point that it is still your board's intention to operate a fleet comprising both dry-cargo tramp ships and tankers, but any idea of ordering new dry-cargo tonnage cannot be entertained until building prices come down or freights rise to a level which would make its exploitation a worthwhile proposition.

BUILDING PROGRAMME

You will recall that I made available in my review a year ago some very startling facts and figures concerning the rising cost of ships in this country and its effect on your company, the ship-building industry generally and the nation's position in the maritime world. Far from improving, the situation has gone from bad to worse, until today it would be optimistic indeed to forecast a bright future for the British ship-building industry. I am, however, an optimist and I feel sure that eventually common sense will prevail; that workers and employers will co-operate to their mutual long-term benefit, and that ship building will thrive on a competitive basis for many years to come. The sooner shipbuilders are in a position to quote fixed prices the better for all concerned. Perhaps some figures may be helpful in underlining the difficulties facing the shipowner.

The *London Loyalty* was ordered at the end of 1950 and it was estimated then that the final cost of the vessel would be £775,000.

You will see from the accounts that this ship actually cost £1,027,642, an increase of more than a quarter of a million pounds, or 32.6 per cent. An order placed today for a similar ship would be based on an estimated final cost of about £1,100,000. This figure is subject, of course, to any increases in the cost of labour and material which may come into effect before the ship is completed. Nevertheless, some Continental yards are prepared to build a similar ship for a fixed price of £900,000. Thus, it is possible to build five ships on the Continent for the price of four in the United Kingdom. Consider the effect upon the shipowning community. Not only does a shipowner who is in a position to build on the Continent obtain an extra ship to exploit in competition with the owner building in Britain, but the depreciation charges to be recovered annually from earnings are correspondingly less. Owners of British-built ships find themselves, therefore, at a disadvantage for the life of the ships by reason of the high cost of building.

It is difficult to see where all this is leading to. The position, so far as your company is concerned, is that there are on order or in course of construction six tankers, totalling 141,850 dw tons, due for delivery at intervals during the next four years and, although the contract prices of these vessels aggregated £5,715,000, it is now reckoned that they will cost about £7,550,000.

The ever-increasing cost of ships means that your board is faced with a two-fold problem. Firstly, it is necessary to ensure that the money is available to pay for the ships as they are completed. Secondly—or rather alternatively—it is necessary to decide whether or not it is prudent to seek cancellation of one or more building contracts, having regard to the facts outlined above. So far your board has not cancelled a single order, but the company's commitments are always under review. We have thought it necessary to arrange for the postponement for 3½ years of the building of one of the company's turbine tankers, which was to have been completed in October this year. Up-to-date estimates are being obtained, in the light of the recent wage increases, of the probable cost of the vessels still to be built, and when these are to hand the course of action will be decided upon.

MR H. W. MERCKEL

I am pleased to record that Mr H. W. Merckel has become a director of your company at the invitation of the board.

PERSONNEL

There are now over 500 employees on the company's pay-roll and I am pleased to acknowledge another year of efficient co-operation and service which has contributed in no small measure to the satisfactory trading results. We have, in common with all businesses, experienced isolated cases of disinterest and inefficiency, but our efforts are directed towards securing and retaining the services of the best men available. In all modesty it gives me the greatest possible pleasure to be able to inform you that reports are constantly reaching our London offices which indicate that the first-class terms of employment and the unrivalled standard of accommodation provided by your company have become bywords across the world and that the "London" ships are admired wherever they sail.

The report and accounts were adopted.

SWEARS AND WELLS, LIMITED

A RECORD YEAR

The twenty-seventh annual general meeting of Swears and Wells, Limited, was held on July 8th in London, Mr Cyril J. Ross, OBE, chairman and joint managing director, presiding.

The following is an extract from his circulated statement:

A year ago I looked forward to a maintenance of the good trading results then recorded, and it is gratifying that my optimism has been fully justified by the results of the year under review. The increased turnover and profit recorded is due to the application of progressive ideas and to the sound foundation upon which the business is based.

The consolidated profit and loss account shows a profit of £534,400 and compares with last year's figure of £421,034. The directors recommend an ordinary dividend of 12½ per cent for the year and a bonus issue to ordinary and "A" ordinary stockholders of one new 5s. "B" ordinary share for each £1 of ordinary stock held. Given a maintenance of the profit result shown for the past year, and having regard to the abolition of the excess profits levy, the directors have every confidence in their ability to maintain the same rate of dividend on the increased issued capital.

Swears and Wells continues to hold its leading position in retail fur trading in this country. In the absence of anything untoward occurring nationally or internationally, I feel confident that your company will continue to show improving trading results.

The report was adopted and the board's capital proposals were approved.

RANGALLA CONSOLIDATED

The thirty-first annual general meeting of Rangalla Consolidated Limited was held in London on July 12th, Mr Eric Davenport, ACA (chairman), presiding.

In his circulated statement for 1953 the chairman records:

The results for the year show a net profit of £30,831, which has to be compared with a loss of £1,746 last year. In view of the loss sustained in the previous year, the amount required to be set aside to meet taxation liabilities is somewhat smaller than might be expected at £10,500. The transfer of £7,000 to general reserve will restore the cash capital lost in trading and expended on fixed assets during 1952.

The year's results in our opinion justified the payment of an interim dividend of 20 per cent, less tax, paid on May 26, 1954. It is not proposed to recommend any further dividend on account of 1953.

Crop for the year at 1,442,687 lb was a record and this, coupled with an increase of 3.15d. per lb in the net average secured, and a drop of 2.45d. per lb in costs, has enabled the very satisfactory results to be achieved.

The estimated crop for 1954 has been placed at 1,475,000 lb at a cost of production of approximately Rs.1.50 per lb. This estimate is a little higher than the 1,442,687 lb obtained in 1953. Whether the estimate will be reached is at the moment somewhat problematical. Crop for the first five months to the end of May is 53,377 lb down when compared with 1953, but given reasonable weather conditions the crop position should improve. So far, net average prices have been well maintained. The report was adopted.

E. K. COLE

TURNOVER INCREASE CONSTITUTES NEW RECORD

The annual general meeting of E. K. Cole, Limited, was held on July 15th at the Queen's Hotel, Westcliff-on-Sea.

Mr E. K. Cole (chairman and managing director), in the course of his speech, said:

We have had another very good year. The consolidated figures show that the trading profit amounts to £686,677 and the net profit, after providing for all expenses, including depreciation, but before deducting taxation, is £588,832, an increase of £54,030.

The taxation liability, including Schedule D liability for 1954-55, has been provided for by the transfer of £407,500 to taxation reserve, leaving a net profit of £181,332.

I am pleased to be able to report that the turnover achieved a new high record. The net liquid assets amount to £1,964,076.

We consider it desirable to increase the authorised capital by the creation of a further 2,200,000 ordinary shares of 5s. each. As soon as the necessary consent of the Capital Issues Committee is obtained, your directors propose to offer a substantial proportion of the present unissued ordinary capital for cash on favourable terms to the ordinary stockholders.

DIVISIONAL ACTIVITIES

Radio: The industry experienced good trading conditions during the year and we were able to maintain our normal share of the market. The public demand for our television and radio increased. During the year our factories were able to produce sufficient quantities of our products to create a further record in turnover for the division. Even so, we were not in a position to supply all the demands made on us during the peak season period.

Once again the industry continued to suffer from the uncertainty arising out of the imposition of purchase tax. Until some solution of the problem is found and adopted there is bound to be uncertainty in the minds of our dealers and the public which is detrimental to the smooth running of the industry and could reflect seriously on its employment capacity.

The Bill providing for a second television programme has now passed through the House of Commons, and the Assistant Postmaster-General has stated that everything will be done to expedite the setting up of the necessary stations in order that programmes can commence during 1955. Your company is ready with outstanding models and designs to meet this new situation.

Electronics: The production and sales for Government services and commercial use continued to expand, and an important volume of export business was achieved.

We also continued to supply Government Departments in respect of direct contracts with nucleonic, radar and communications equipment.

Plastics: Trading conditions in the plastics industry continued to improve and the division was able to take full advantage of the opportunities presented.

Due to restrictions by overseas Governments, together with increased competition from foreign manufacturers, it was not possible to obtain the record turnover achieved during the previous year. However, we were able to maintain a substantial figure.

The report was adopted.

A resolution sanctioning an increase of the authorised capital was also passed.

SHEFFIELD TWIST DRILL AND STEEL

DEMAND IMPROVING

MR ALEXANDER DORMER'S STATEMENT

The seventh annual general meeting of The Sheffield Twist Drill and Steel Company, Limited, was held on July 15th at Sheffield, Mr Alexander Dormer, chairman and managing director, presiding.

The secretary, Mr Lionel Barber, FCA, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1953:

As I forecast last year, the heavy stocking of engineers' cutting tools by both manufacturers and merchants led to a reduction in the demand for your company's products during 1953. During the past twelve months the price of tungsten has fallen appreciably, which has correspondingly caused a sharp depreciation in the value of our steel stocks and has also enabled us to reduce the price of our products. All these factors have resulted in a reduction of profit for the year, which at £489,623 compares with £768,073 for the previous year. It should be mentioned that the net profit for 1953 compares favourably with that of years where the turnover was similar.

DELIVERIES EXPEDITED

Deliveries of your company's products are now ex stock, and every endeavour has been made by the company to despatch all standard tools to customers the same day as the orders are received. The company's branch offices in London, Manchester and Glasgow are achieving this aim. Further to this, our Technical Advisory Service to customers has increased its scope with gratifying results.

Orders for our traditional products dropped off during the first part of the year, but such is the flexibility of your company that we were able to obtain and undertake sub-contract work from our friends in the engineering trade. This enabled us to keep all our employees fully occupied, and here I should like to pay tribute, firstly to our office staff who have undertaken in a true spirit of teamwork a great deal more detail work without addition to their number, and secondly, to our workpeople who have shown their versatility by producing the short runs of special tools just as efficiently as the long runs of standard tools.

READY TO MEET ALL CHALLENGES

In the new competitive age we are ready to meet all challenges and your company's aim will be to continue to produce the articles quoted for by the promised delivery date.

Export sales continue to be difficult as most countries are concentrating on producing their own consumer goods, and excluding those of other countries by means of tariffs or import quotas. More help could be given us by the Government in insisting that your company's products are included in bi-lateral trade negotiations. In the meanwhile, we continue to export to the enlightened countries whose engineers and governments realise that a quality tool can be a true labour saver.

Your company has decided to increase the range of engineer's small tools, and has purchased a milling cutter manufacturing business on which we shall be concentrating to increase this company's efficiency and range, and we have no doubt that it will prove to be a very important addition in our organisation.

CURRENT YEAR'S OUTLOOK

So far this year, there have been signs of a slight increase in the demand for our products, and I see no reason why this should not continue now that our customers' stocks have been reduced.

It will be observed that a provision for excess profits levy again has to be made in 1953 and that the net profit after taxation shows only a slight decline from £205,740 in 1952 to £202,004. This being the first occasion of the need to prepare a consolidated balance sheet there are no comparative figures. Net current assets at £1,003,494 indicate your company's strong financial position, and no effort is spared in maintaining the plant and machinery at a high modern standard of efficiency.

In conclusion and on your behalf I would record our thanks to all our employees for the contribution they have made to achieve the results in 1953.

The report and accounts were adopted; the dividends paid and proposed were approved; the retiring director, Mr J. S. Webster, was re-elected; the remuneration of the auditors, Messrs Franklin Wild and Company, was fixed.

AMALGAMATED METAL CORPORATION

METAL TRADE PROSPECTS

MR WALTER GARDNER'S STATEMENT

The annual general meeting of Amalgamated Metal Corporation Limited will be held on August 5th at 93 Gresham Street, London, E.C.

The following are extracts from the statement of the chairman, Mr Walter Gardner, issued with the report and accounts for the year ended December 31, 1953:

Apart from the possible impact of the lack of sterling purchasing power in various countries on the national economy, our group is directly interested in exports: Henry Gardner and Company Limited, in addition to its metal, rubber and produce activities, has devoted much attention since the war to building up a trade in general merchandise with and through our overseas associates (notably the century-old firm of Sandilands Buttery and Company Limited, Malaya) in addition to direct sales to customers.

LONDON METAL EXCHANGE

Generally speaking, 1953 has been a year, for non-ferrous metals, of great progress towards a return to traditional and proved methods of trading, so drastically disturbed during the war and subsequently. At the beginning of the year zinc was decontrolled; this was followed in August by the freeing of copper. In August, therefore, the London Metal Exchange regained its complete prewar status and all the four non-ferrous metals have been dealt in daily since then.

I need hardly say how greatly the reopening of the Exchange is welcomed by our organisation as without a terminal market the business of the producer, the consumer and the merchant is more complicated and hazardous than need be. It is evident that the market, as the months go on, is regaining its former status as the indicator of international values and as controls and restrictions are abolished the importance of the Metal Exchange will grow.

The demand for non-ferrous metals in the USA during 1953 was well maintained and with the lifting of controlled prices in this country, the margin between the two markets became somewhat wide. Generally speaking, the lowest point reached was in the early summer and although by then signs of falling off in the USA were manifest and dire prophecies expressed, business in the UK and Europe remained, despite an atmosphere of apprehension, by no means unsatisfactory.

Although it is outside the period of this review, at the time of writing prospects for metals for the time being appear to be surprisingly free of anxieties and burdensome surpluses for one reason and another have been removed from the immediate need of realisation.

THE RUBBER POSITION

The average price of spot rubber in London in 1953 was 20d. per lb as against 28d. in 1952 and 51d. in 1951. During the current year it continued to fall, reaching 16d. early in March. Since then it has recovered under the influence of events in Indo-China and an improving world statistical position.

The lower price of natural rubber has proved competitive with synthetic and has encouraged its use in the USA. Early in 1953 the ratio of consumption was 61 per cent synthetic, 39 per cent natural. At the present moment the relationship is about 50 per cent synthetic and 50 per cent natural. If this ratio is maintained it will result in an additional consumption of natural in the USA of around 65,000 tons in 1954, even though the total consumption of natural and synthetic is estimated at 100,000 tons less in 1954 than in 1953.

The surplus of natural rubber during 1953 is now estimated to have been approximately 110,000 tons all of which, with the exception of about 25,000 tons, went into Government stockpiles. The International Rubber Study Group estimates that in 1954 the surplus of natural will be about 25,000 tons. Allowing for further small Government stockpiling it would appear that supplies for commercial purposes are about in balance.

OTHER INTERESTS

Shareholders may be interested in some items of information regarding our subsidiary company, the British Metal Corporation Limited. In my statement last year I referred to this subsidiary's investment in a Canadian registered company called Rhodesian Asbestos Limited. It is expected that production will start this autumn.

During the course of last year Goodall and Company Pty. Limited, a subsidiary of the British Metal Corporation (Australia) Pty. Limited, acquired a business in Adelaide called Lapthornes (SA) Limited. This company engages in the same type of domestic and import trade as its parent, Goodall and Company, whose activities include engineering supplies, machine tools, machinery, etc.

During the year the British Metal Corporation acquired a minor share interest in the Key Engineering Company Limited, who are licensees for and distributors of a patented form of pipe made of pitch and paper. The British Metal Corporation's subsidiary, Richard H. Keeping Limited, is assisting the Key Engineering Company in the sale of these pipes. Some of our overseas subsidiaries are also representing them in their respective territories.

During the year the British Metal Corporation (Australia) opened a branch in Cairns, Queensland, whilst the British Metal Corporation (Central Africa) has opened a branch in Salisbury, Southern Rhodesia.

VENNER LIMITED

HIGHER VOLUME OF OUTPUT

ENHANCED REPUTATION OF COMPANY'S PRODUCTS

MR ARTHUR A. ROWSE ON PARKING METER SALES

The forty-third annual general meeting of Venner Limited was held on July 13th at the registered office of the company, Beverley Way, Kingston By-Pass, New Malden, Surrey.

Mr Arthur A. Rowse, CBE, MIMechE, MICE, MIEE (the chairman), who presided, said: As the directors' report and statement of accounts for the year have been circulated I trust that in accordance with our custom they may be taken as read. I am glad to be able to state that during the year 1953 both output from the works and deliveries to customers showed a further increase, which is reflected in the higher net profit for the year compared with the preceding period of twelve months.

PROFIT AND DIVIDEND

The profit for the year after depreciation amounted to £83,266. Of this taxation on the profits to date absorbed £55,892, leaving a balance of £27,374. To this has to be added the balance of £15,345 brought forward from the preceding year and the amount of £3,000 set aside for taxation on account of EPL for 1952, which is not now required. The amount available for distribution is therefore £45,719, which your directors recommend should be allocated as under.

To dividend on 8 per cent cumulative preference shares for year ended September 30, 1953	£1,290
To addition to general reserve ...	£10,000
To a dividend of 15 per cent on the ordinary stock, absorbing, less income tax	£17,820
Leaving to be carried forward to next year	£16,609

Increased availability of raw materials and the greater regularity of deliveries to us in 1953 enabled the company to support a higher output on a somewhat smaller volume of stock and work in progress. The decrease in debtors is attributable to the company having received certain progress payments in respect of work in progress just before instead of just after the close of the financial year.

The bank overdraft is substantially the same as at the end of 1952 but trade and other creditors show a slight reduction, whilst the increase in the provision for taxation reflects almost entirely provisions necessary in respect of our liability under the excess profits levy. Since the close of the year substantial payments have been made in respect of taxation. Current assets show a surplus over current liabilities of £214,959.

ENHANCED REPUTATION IN ENGINEERING FIELD

As mentioned in my address for the previous year the building extensions started in 1952 were finished in 1953 and are proving a valuable addition to the company's manufacturing resources. The extensions are fully occupied with high precision work and there is every indication that this is likely to continue for a considerable period. The high degree of accuracy called for in the finished product has necessitated advanced manufacturing methods. The successful establishment of the appropriate technique is a source of considerable satisfaction and enhances the standing of the company in the engineering field.

Net additions to plant and machinery amounting to approximately £19,000 were made during the year to enable the company to cope with increased demands for its products. The additional plant became productive immediately it was installed.

Both buildings and plant have been maintained in a high state of efficiency and recent concessions to industry made by the Chancellor of the Exchequer are enabling the board to formulate plans for still further facilities and improvements. In this and other ways we are doing our utmost by continuous attention to factory efficiency to offset such unfavourable factors as the recent wage award and the constant increase in the cost of services, for example, fuel, power and transport. In a modern works like ours, with up-to-date planning and facilities already in operation, the means of making major savings in cost are not readily found and unless the upward trend in wages and services is arrested price increases will be inevitable and our competitive position in the export market may become adversely affected.

COMPANY'S PRODUCTS

Since I have given year by year full statements regarding our products I will confine my present comment to parking meters now coming into production at our factory. Orders from the Commonwealth have been received in satisfactory volume and a number of enquiries from other parts of the world are engaging our attention. There is therefore every indication that a reasonably successful business in these instruments can be built up in overseas markets. At home it appears there are favourable prospects for sales of parking meters for privately owned parks. Should legislation be introduced authorising the use of parking meters in the public streets we should therefore be in a position to satisfy national requirements from the outset with meters of our own manufacture, fully tested operationally in various parts of the globe and types of climate.

The battery developments continued throughout the year and although no contribution was made to profits the benefits of the development work are being strongly felt in the current year and the volume of business shows a marked increase.

Our activities in the sphere of electronics have made good progress during the year. Satisfactory contracts have been received from the Admiralty. The electronic marker buoy has proved very successful in whaling operations. There is steady progress with other designs, which are meeting with increasing acceptance.

The board's policy of development in this and other fields is the main reason for the proposed alterations to the objects clause of the Memorandum of Association which members will be asked to sanction at the separate meeting convened for the purpose: they will then also be asked to adopt new Articles of Association for the reasons fully explained in the circular letter accompanying the necessary resolution.

SATISFACTORY CURRENT TRADING

I have pleasure in informing members that since the close of our last financial year the value of orders received and of deliveries made continue to show a considerable expansion. Indications are that current trading is satisfactory.

I should like to conclude by thanking all members of the staff and works employees for loyal co-operation during the year 1953 and I feel sure members of the company will join me in this.

The report and accounts were adopted.

The retiring director, Mr Arthur A. Rowse, was re-elected and the remuneration of the auditors, Messrs Price, Waterhouse and Company, having been fixed, the proceedings terminated.

At the subsequent extraordinary general meeting resolutions altering the memorandum of association and adopting new articles of association were approved.

ARTHUR BALFOUR & COMPANY

FACTORS AFFECTING TRADING

The fifty-fifth annual general meeting of Arthur Balfour & Company Limited was held on July 9th in Sheffield, The Hon R. A. Balfour (the managing director) presiding.

The following is an extract from the circulated statement of the chairman, Lord Riverdale:

Whereas in certain former years there was an element of windfall profits and the year 1952 was considered as a return to more normal conditions, the results for 1953 bear the brunt of abnormal and adverse factors.

In a period in which trading conditions were difficult a turnover was obtained which, having regard to prices, was reasonable compared with the preceding year. Stocks at home, overseas, and in the pipeline, have been affected by a heavy fall in values, due primarily to the collapse of Tungsten prices throughout the year and this has had a substantial and adverse effect on the results.

The company also encountered a devaluation in Brazilian currency, and it has been considered prudent to apply the lower exchange rate to the stake involved by our operations in that country. We are, of course, not alone in this experience, which is a sad reward for the enterprise and effort devoted to opening up and developing our overseas markets in former years.

THE YEAR'S RESULTS

The profits of the group before taxation amount to £178,074 compared with £436,536 in the preceding year. Reference has been made in former years to the high level of taxation, and this now absorbs nearly 55 per cent of such profits.

Activity throughout the year varied and was not uniform in the production divisions, but in general was not at any time at maximum outputs.

The cash position is easier as a result of lower values but we have projects in hand and can foresee calls on our resources which are likely to make heavy calls on the available funds.

The board, after careful consideration of the factors outlined, feel they are able to recommend a final dividend of 5½ per cent, making a total of 8 per cent for the year, compared with an equivalent of 10 per cent for 1952.

It is proposed to transfer £70,000 from stock and contingency reserve and to appropriate £125,000 to general reserve, leaving a carry forward of £145,139 as compared with £140,722 in 1952.

The results of the subsidiary companies at home and overseas are incorporated in the

group profits, but their contributions show a reduction as compared with 1952.

It is with concern that I again record a further increase in wages—not effective in the figures before you—which, in the opinion of the board, is unlikely to be recovered by trading and therefore likely to affect the profit of the current period. There are also increases in fuel and power costs, both detrimental at this time.

Stability in values, particularly of alloys, is not in sight, but it is unlikely that the results for this period will be dislocated by this factor to the extent they were for 1953.

The outlook is a continuance of present conditions, but we hope to regain some of the ground lost by last year's abnormal features and if an improved trend of activity could be achieved and an increased value of orders obtained we might hope to see a marked improvement.

The report was adopted.

DENNISTOWN RUBBER ESTATES, LIMITED

A DIFFICULT YEAR

The twenty-first annual general meeting of this company was held on July 13th in London, Mr J. L. Milne, chairman, presiding.

The following is an extract from his circulated review:

The year under review proved to be a difficult one for rubber producers as the market price of our product continued to decline. Although the average spot London price for first quality sheet for the previous twelve months was 2s. 4¼d. per lb and as high as 4s. 3d. per lb for the year 1951, it was only 1s. 8d. per lb for the year under review.

Together with this fall in price there was a further factor contributing to our decreased earnings, namely a reduction of 295,282 lb in our output. This disappointing harvest was caused by a continued decline in yields and a changeover of certain areas to a lighter system of tapping which will help to conserve bark for more profitable times. Compared with £142,069 in 1952 the production for 1953 brought in only £78,426.

The profit for the year after charging taxation was £2,655 compared with £16,241 for the previous year. After crediting replanting cess refunded in respect of 1952 of £3,459, surplus on sale of equipment of £76 and taxation over-provided in previous years of £7,113 and also appropriating £7,659 to replanting account and providing for the dividend of 5 per cent paid on May 14, 1954, we are carrying forward the sum of £15,226 at the credit of profit and loss account against £14,243 brought in from the previous year.

The crop obtained for the five months to May 31, 1954, amounts to 376,100 lb.

The report was adopted.

UNIVERSITY OF SYDNEY, AUSTRALIA

Applications are invited for the position of LECTURER IN GOVERNMENT AND PUBLIC ADMINISTRATION.

The salary for a Lecturer is within the range of £A1,100-£A1,450 per annum, with annual increments of £A50. The salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful applicant.

Finance available for home purchase under Staff Members' Housing Scheme.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is August 14, 1954.

AUCKLAND UNIVERSITY COLLEGE
(University of New Zealand)

Applications are invited for the position of LECTURESHIP IN GEOGRAPHY.

The position calls for qualifications in cultural (including economic) geography, with the ability to conduct post-graduate courses in economic, historical or colonial geography. Regional specialisation outside Europe, North America and the southwest Pacific would be an advantage.

The salary scale for the position is from £800 to £950 per annum, plus a recent general wage increase of £92 8s. per annum. Three annual increments of £50 will be paid.

The Lecturer will be expected to take up his duties on February 1, 1955, or as soon thereafter as may be arranged.

An allowance will be made towards the cost of travelling expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications in New Zealand and London, is August 31, 1954.

SOLICITOR required as Legal Adviser to the Divisional Board of the West Midlands Division of the National Coal Board whose office is near Dudley, Worcestershire. Experience of the coal industry, while an advantage, is not essential, but the applicant must be an experienced, able and energetic lawyer who will take a real interest in the industry, and undertake responsibility for running a busy office concerned particularly with common law litigation, commercial work, and conveyancing. The starting salary will be according to experience, but will not be less than £2,000 per annum.—Applications, stating age, qualifications and experience should be submitted not later than August 14th, to the Divisional Establishment Officer, National Coal Board, West Midlands Division, Himley Hall, near Dudley, Worcs.

ACCOUNTANT with experience of industrial management accounting and preferably C.A. and C.W.A. for post of CONTROLLER in rapidly expanding well-founded concern in country town in South. Do not apply unless you can show by reference from leading member of accounting profession or from leading industrialist that you have sound judgment, capacity for clear exposition and ability to work with others of different outlook beyond the extent to which such qualities required by an ordinary good accountant.—Reply to Box 631.

LECTURER, two hours weekly, for Course on Administration and Management. September. Please state qualifications, experience, and when free.—Box 628.

THE Association of British Chambers of Commerce invites applications for the post of Legal and Parliamentary Secretary, commencing September 1, 1954. Knowledge of law and accountancy essential. Duties include complete service to a committee. Commercial experience desirable. Age not exceeding 35. Commencing salary £1,000 p.a. with prospects. Contributory pension scheme.—Applications, marked on the envelope "F.T.S. Confidential" should be addressed to the Secretary-General of the Association, at 14 Queen Anne's Gate, Westminster, S.W.1, to reach him not later than August 7th.

A FIRM of stockbrokers with a mainly institutional business has an opening for a graduate, aged around 25, with a good economics degree. Commencing salary £500 per annum with participation in a bonus scheme. Initially the work would be concerned with appreciations of certain aspects of British industry, but the right man would have considerable freedom to work out his own contribution to the firm with corresponding rewards.—Replies to Box 631.

WRITER.—Versatile in subject, including semi-technical interest; flexible in being able to write longish, lucid pieces as happily as short, lively comments. Ability to "think in pictures" as well as in words an advantage. Small, friendly (but hard-working) office in London. Please write, giving precisely: age, experience, minimum starting salary.—Box 633.

UNIVERSITY OF THE WITWATERSRAND
JOHANNESBURG, SOUTH AFRICA

Applications are invited for appointment to the post of LECTURER IN ACCOUNTING in the Department of Commerce.

Applicants must be professionally qualified. Extensive practical experience, teaching experience, a University degree and ability to lecture in specialised accounting subjects will be considered additional recommendations.

The substantive salary scale attaching to the post is £850 x £50—£1,150 per annum, together with a temporary cost of living allowance of £234 per annum in the case of a married man.

An allowance is made towards the cost of travelling expenses.

The successful applicant will be expected to assume duty on January 2, 1955, or earlier if possible.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in South Africa and London, is August 16, 1954.

UNIVERSITY OF NEW ENGLAND, ARMIDALE, NEW SOUTH WALES

Applications are invited for the position of LECTURER IN ECONOMICS.

The lecturer appointed will be required to prepare and conduct correspondence courses in the subject of economics for the B.A. degree. He may be required to undertake some internal teaching in addition to correspondence duties, and he will be encouraged to engage in research work.

Commencing salary will be within the range £A1,100 to £A1,450 per annum according to qualifications, with annual increments of £A50. The salary is subject to deductions under the State Superannuation Act. The successful applicant will be expected to take up duties as soon as can be arranged after the date of appointment.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is August 16, 1954.

ASSISTANT to the Secretary required by established London Publishing Company. Secretarial and accounting responsibilities and general administrative work. Age 26-30. Commencing salary £600.—Full applications (own handwriting), including present salary, when available and at least one business referee, to Box 622. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

YOUNG MEN with Public School Education or University Graduates who are seeking a good career in industry offering a variety of interests and progressive opportunities are required by leading industrial organisation.—Write fullest particulars stating age, education, subjects concerned, etc., to William Kenyon & Sons Ltd., Dukinfield, Cheshire. These vacancies have been notified in accordance with the Notification of Vacancies Order, 1952.

SENIOR FOREIGN SALES MANAGER, wide international experience commerce and industry, fluent French, German, Spanish, seeks appointment.—Please reply Box 625.

A MERSEYSIDE GROUP OF COMPANIES of diverse activities, seeks the services of a relatively young man or woman of ambition. Initially the task would be to review operations both in the field of engineering and large scale office organisation with a view to the introduction of speedier and more efficient methods. A sound knowledge of methods study, job analysis, incentive plans, etc., coupled with an aptitude for applied research in these fields are fundamental to the success of the work. A good honours degree and/or professional qualification in engineering, accounting, or statistics, would be valuable though not essential qualifications. The initial salary would be commensurate with the qualities required and satisfactory achievements would guarantee an excellent future to the holder of the position.—Apply Box 636.

BEECHAM GROUP LIMITED require a Deputy Accountant aged 30 to 40 years for a factory in the Greater London area. Applicant must be fully qualified in financial and cost accounting. Experience in budgetary control and standard costing essential. Post is superannuated and offers excellent opportunity. Four-figure salary dependent upon experience and qualifications.—Write in confidence to Personnel Controller, Beecham Group Limited, 68 Pall Mall, London, S.W.1.

ACCOUNTANT with top management qualities, preferably aged 25-35, required by Northern company. Salary £1,250 with prospects. Immediate application essential.—Box 629.

DIVIDEND NO. 268

NOTICE IS HEREBY GIVEN that a DIVIDEND of 35 cents per share upon the paid-up capital stock of this bank has been declared for the current quarter and will be payable at the bank and its branches on and after September 1, 1954, to shareholders of record at the close of business on July 31, 1954.

By Order of the Board,
T. H. ATKINSON, General Manager.

July 15, 1954.

CITY OF JOHANNESBURG

FIVE PER CENT. REDEEMABLE STOCK 1959/62

NOTICE IS HEREBY GIVEN that in order to prepare the Warrants for Interest due September 1, 1954, the Transfer Books of the above mentioned Stock will be closed from August 1, 1954, until August 8, 1954, both dates inclusive.

For Barclays Bank (Dominion, Colonial and Overseas)
(London Registrars of the above Stock)
G. A. D. HARRISON, Manager.

Circus Place,
London Wall, E.C.2.
July 12, 1954.

THE SCIENCE AND INDUSTRY COMMITTEE

Applications are invited from persons with qualifications and experience in sociology, or the problems of management or allied fields, for a post with the Science and Industry Committee, which is studying the problems of speeding up the industrial application of the results of scientific research. The appointment will be for up to two years and the salary up to £1,250, according to qualifications. Further particulars may be obtained from Professor R. R. Williams, University College, Keele, Staffordshire. Final date August 16.

MARKETING MANAGER

A large and expanding company in North-West England manufacturing a wide range of industrial components wishes to appoint a Marketing Manager. The post to be filled is an important one, will be well paid, and will carry good prospects of advancement for the right applicant. Age between 30 and 35 preferred. A knowledge of market research is desirable, while an Economics or Engineering qualification and some practical experience of selling industrial components would be an advantage.—Applicants should state, in confidence, full details of age, education, experience and salary required.—Box 626.

A LARGE food-manufacturing concern with international connections, because of its continually expanding volume of business, is creating a new post at top-management level. A man with first-class marketing and administrative experience in a large organisation, preferably in the grocery field, is required, who can creatively assist the Managing Director in formulating the company's over-all production and marketing policy and in co-ordinating and directing the work of the various departments. Hence the post is only suitable for a man who can, within a reasonable trial-period, show that he is worthy of appointment to the board. All applications will be treated in strict confidence. Our own staff have been notified of this advertisement. Send details of qualifications and career to Box 578.

CYPRUS.—Graduate, age 27, ex-R.A.F. Intelligence, experience market research, engineering exports, languages, management retail trade, seeks responsible position and career in Near East.—Box 627.

MARKET INFORMATION SERVICES LTD. have a vacancy for a Research Executive. He must have had at least two years' training in normal market research techniques and be capable of carrying out the executive processes of large-scale routine enquiries with the minimum of supervision. In addition he must be prepared to learn something of the techniques of statistical social psychology, though a formal training in either statistics or psychology is not essential.—Applicants are invited to write, in the fullest detail and stating their own views as to their salary level, to the Staff Manager, Market Information Services Ltd., 24 Brook's Mews, W.1.

CHAPPIE LIMITED, manufacturers of cat and dog foods, require the services of a man or woman graduate to undertake field and office control of the National Consumer Research section of their Market Research Department. An Economics or Sociology degree and/or knowledge of Statistics would be an advantage. The work entails assisting in the selection of staff draughting of questionnaires, organising the field staff, office routine, checking field work, and appreciation of findings. Salary will be in the range of £630 to £800 and the post also carries pension, life assurance and sickness benefits under a non-contributory social security plan. This post offers an excellent opportunity for a man or woman seeking first-class market research experience. Half the time will be spent in the office at Melton Mowbray, and the remainder in the field.—Applications should be sent to the Personnel Officer, Chappie Limited, Melton Mowbray, Leicestershire.

WARDEN, GISBURNE HOUSE APPROVED SCHOOL, Watford.—London County Council invites applications from qualified women with residential experience for this post at a school reorganised to provide for 40 intelligent girls (15-17 on entry) a full mental and physical programme, including homemaking; some girls may study for public examinations. Experience and training in psychiatric social work, social science or educational psychology an advantage. Salary under review, probably £860 x £15—£1,040, less £150 for board, lodging and laundry. Pensionable.—Application form and details from Children's Officer (CII/A2/898), County Hall, London, S.E.1.

CHARTERED ACCOUNTANT with considerable business knowledge desires change of appointment. Age 40, wide experience of office and factory organisation, management accounting in industry, secretarial practice, etc.—Box 624.

EXECUTIVE DIRECTOR, 43, chartered accountant, financial controller and export director large public company, seeks senior appointment at home or overseas. Considerable experience company administration also of marketing and distribution overseas. Present salary £3,500 p.a.—Box 630.

A FIRST-CLASS opportunity is offered to a Chartered Accountant, not over 35 years of age, by an industrial company of repute. The appointment is responsible and progressive, with a scale of remuneration up to £2,000 per annum, with prospects. An outstanding personality and administrative ability essential. A University Degree an advantage.—Candidates are invited to send in confidence full details of their qualifications and posts held to Box 620.

A MEMO TO THE MANAGING DIRECTOR. More business and better business awaits your executives if they have the use of a 1954 self-drive car. Lowest possible rates. Contract hire by arrangement. Free third party, fire and theft insurance. No maintenance costs. Ask your secretary to write for our new brochure which gives full details.—Autohall, Dept 2-A, 302-306 King Street, London, W.6. Tel.: RIVerside 2881.

ORIGINALLY pioneered in the mines to produce light underground, the Oldham family of batteries now cover almost every industrial and commercial use. Most spectacular, perhaps, is their installation in modern jet-age fighters and bombers, but in all kinds of unobtrusive ways, in cars, buses, trucks; in ships, power stations and industrial installations, the Oldham Battery is the hidden source of electrical power on which complete reliance is placed. Evolved in the Denton laboratories and tried and tested throughout the world, the Oldham is the *quality* battery for extra performance, extra-long life.

Mechanical aids, like lifts, we tend to take for granted. Making sure that they work smoothly is the engineer's job and he realises the importance of damping fluids in removing some of life's buffets and bumps. Silicone fluids, used for damping all manner of mechanisms from heavy switchgear to fine precision instruments, have the great advantage that extremes of heat and cold have very little effect upon their viscosity. *These versatile fluids are distributed by Midland Silicones Ltd.*

BOTH ARE LEADERS AMONG BUSINESS READERS

Nearly every international magazine is read by businessmen. But what's important is by how many, at what level, and how often.

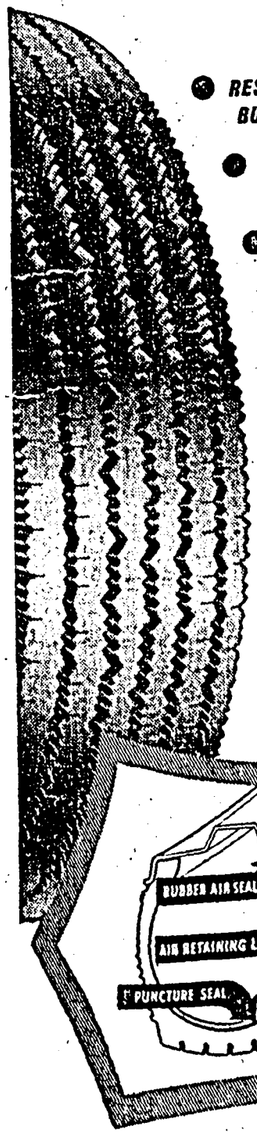
The research firm of Erdos & Morgan has been surveying leading overseas businessmen to determine which magazines they read regularly. Here's what four recent studies show:

LIFE EN ESPAÑOL is first in regular readership by business leaders in Spanish-speaking Latin America—in fact, first among more than 1100 magazines mentioned.

LIFE INTERNATIONAL, the world-wide English-language edition, is read regularly by a higher percentage of the top management men surveyed in the Philippines, Brazil and Switzerland than any other imported magazine.

These findings reflect the fact that 9 out of 10 subscribers and newsstand buyers of each edition are in business, government and the professions—at far above average income and position levels.

And both fortnightly editions, whether portraying recovery in Germany in one issue or progress everywhere in every issue, have the same powerful impact on important people. Both speak the universal language of pictures. Both provide the finest printing and color reproduction. Both have the largest page size among international magazines.



If you're interested in reaching top business executives overseas, please write for your free copy of "More Facts about LIFE International Editions." Both are leaders among business readers.

INDUSTRIAL FILMS

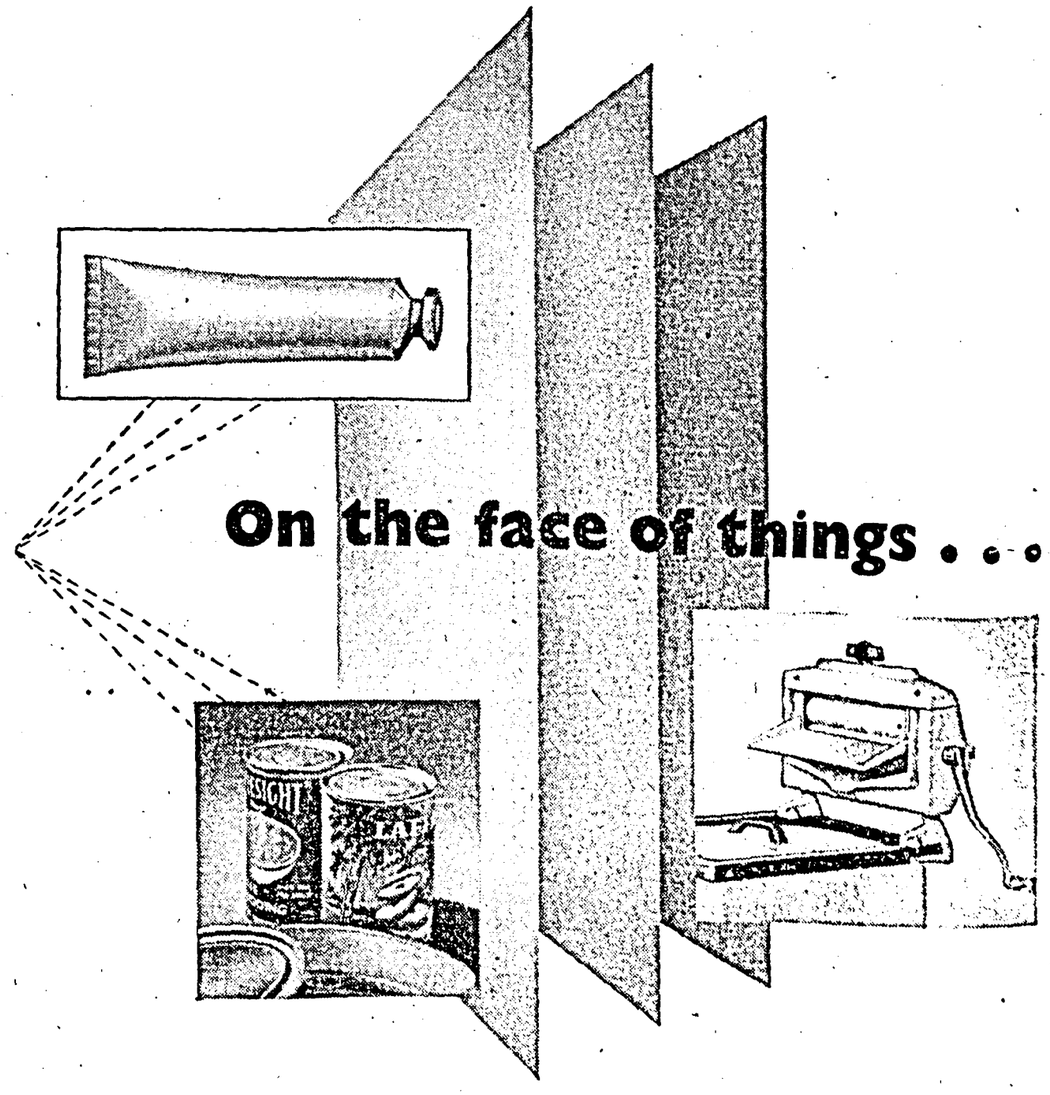
Films can help your business in so many ways—by stimulating goodwill—by increasing productivity—by promoting sales.

FILM WORKS WONDERS!—

TRAINS YOUR STAFF by showing how it's done.

SPEEDS PRODUCTION by time and motion study

SELLS YOUR GOODS in any part of the world.



With modern 16-mm. Cine Equipment it does not require specialised skill to produce films of professional quality.

We can supply the equipment and show you how to use it.

Films made by your own organisation will obviously fit your particular requirements better than those made by outside help—and save you a lot of money.

Our service includes a comprehensive library list of Industrial films for hire.

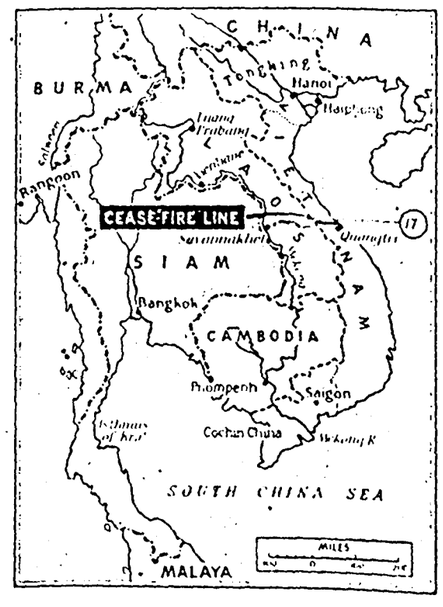
The Real Lessons of Indo-China



IF the soldiers in Indo-China can now rest, the diplomats and politicians cannot. The hectic pace of negotiation set last week at Geneva is no longer necessary; but if the new atmosphere of *détente* creates a belief that from now on the only task is to complete formalities, the consequences will be disastrous. What has been achieved at Geneva is not a settlement in the true sense of the word, but a cease-fire and a plan for a settlement.

At first sight, admittedly, there is something for everybody in the agreed terms—for France, relief from eight years of bloodshed; for M. Mendès-France and Mr Eden, the laurels of peacemakers; for Britain, the prospect of a more cordial *entente* and a more stable situation in South East Asia; for the United States, a chance of avoiding bitter internal recrimination during the coming elections; for the Indo-Chinese peoples, peace; and for their Asian neighbours, relief from fear that the fighting would spread. On the Communist side, the Viet Minh will gain, along with Hanoi, the chance to emerge from the jungle and build a new "people's democracy" with industries based on the mineral resources of Tongking; China secures not only a puppet border state, but also a new advance towards its goal of great-power status; and the Russians look forward to a general relaxation in the free world and an open door to still more conferences at which they will be able to exploit western differences. But the various plums in this rich pudding have yet to pass the test of the eating.

Let all due praise be given to M. Mendès-France and Mr Eden for the skill and patience with which they have carried through a most intricate tactical task; and let due credit be given to the Communist negotiators for their last-minute concessions. While there is no cause for rejoicing over a bargain that involves relinquishing several million people, and important towns and natural resources, to an exultant Communist army, the hard fact must be faced that the bargain might have been a much worse one, for the French Union forces had suffered grave defeats in the field and new defeats were imminent. All this must be said; but it must not blind people to the many dangers that lurk in the terms that have now been agreed. Even a cursory glance at these reveals half a dozen problems that must come to a head in future months. Will the international supervision of the armistice and the elections be paralysed by the "built-in veto" which Poland can wield? How much will the integrity of Laos be compromised if the Communists are left in armed control of the north-east part of this small state? If Viet Minh forces are evacuated from southern Vietnam, how many arms and secret sympathisers will they leave behind to harass the Saigon government? Can the unstable and infant state of Vietnam survive a *de facto* partition which places a majority of its people behind the Communist lines? And do the cease-fire terms merely assure the Communists that, within two years, they will gain by political

means what they are now pledged not to seek by armed force—control of all Vietnam, with a consequent stranglehold on Laos and Cambodia and a direct threat to Siam and Malaya?

This last question is critical. It is true that by the summer of 1956 two years of stability and progress in the south may have robbed the Viet Minh of much of the dynamic attraction which would probably win it a majority of votes throughout Vietnam if elections were held now. Ho Chi Minh has undoubtedly appealed to many Vietnamese not only because of his claim to head a patriotic and progressive movement, but also because he has been winning; if his forces now quit the south, and a sovereign government in Saigon makes real headway with overdue reforms, the picture may change. But there are no grounds for optimism. The elections in 1956 will be dominated by the relative armed strength of the two halves of Vietnam; and as things stand, General Giap's Red Army is bound to be the stronger.

In Indo-China itself, the supreme task that now faces France and its friends—with, it is to be hoped, the active help of the countries of free Asia—is to foster a truly sovereign and stable policy in southern Vietnam, Laos and Cambodia. But political and economic progress alone cannot ensure the growth and survival of free institutions in an area overshadowed by totalitarian power. If the Indo-Chinese states are to be neutralised, means will yet have to be found of assuring them that they will not be abandoned to any future aggression. The Geneva agreements in no way lessen the need for South East Asian defence arrangements; on the contrary, they provide a basis on which such arrangements could be built up.

The general reaction to the news from Geneva, however, is all too likely to be not a girding of loins in readiness for new and urgent tasks, but a mood of simple relief and relaxation. Relief is justifiable; relaxation is not. Already the Communist propaganda machine throughout the world has swung into action with the arguments that Geneva has shown that negotiation can solve all problems, that China and Russia have satisfied all demands for proof of their peaceful intent, and that the time has come to scrap all the free nations' plans for joint defence through the European Defence Community, Nato, or a South East Asian pact. In the last critical hours at Geneva, Chou En-lai was again insisting that Asian peace must be kept only by "mutual obligations" between the Asian governments. Molotov's parallel plan for Europe is again being actively canvassed; and with the ink barely dry on the Indo-China agreements, the Russians are urging a not altogether unwilling France to come back to the conference table for another debate on Germany.

The argument is plausible and the temptation strong. The Geneva agreement will encourage the already strong desire for relaxation among the free nations. But, as on so many earlier occasions, it must be realised that this would be a one-sided relaxation. Democracies, having once got it into their heads that peace can be had on easy terms, can regain a posture of vigilance and strength only by excruciating efforts. "Monolithic" states like those of the Communist bloc, on the other hand, find it easy to launch flights of doves with one hand and droves of Migs with the other. Nor is their unity likely to be much impaired by disputes, such as the free world knows so well, between those who yearn for compromise and those who are wary of all diplomatic approaches.

It is therefore supremely important to distinguish the true lessons of Indo-China from the false ones which are already being propagated. Of these true lessons, five are outstanding. First, Indo-China has shown how dangerous it is for any group of nations to attempt, or talk of attempting, what is clearly beyond its power; if, hereafter, the western governments cut their coat more strictly according to their cloth, this lesson will not have been wasted. Second, it has shown the vital importance in our age of a sincere and generous approach to the peoples who are now emerging from dependent status. In Vietnam, the Communists' worldwide strategy of identifying themselves with the upsurge of nationalism was given every assistance both by French recalcitrance and by the fluctuating policies of the other western powers; and the result was the embittering of relations between Asians and westerners not only in Indo-China itself but throughout southern Asia.

The third lesson is, perhaps, the one that needs most hammering home as far as the British public is concerned. The applause that has greeted Mr Eden's diplomatic success at Geneva has been fully deserved; but most of those who applauded have chosen to forget that British diplomacy was even in this case pivoting on a fulcrum of American power. Both Mr Eden's warning in June and M. Mendès-France's dramatic deadline this week would have been less successful in winning concessions from Molotov and Chou En-lai if the thought of the United States' armed might had not been in the minds of the Communist leaders. Tactically, the Americans have presented a sorry spectacle throughout these last three months. They have been sulking on the sidelines, tied hand and foot by the inanities of their domestic politics, and nothing could exceed in childish petulance the reaction of most of them (President Eisenhower honourably excepted) to a settlement which is fully as much a relief to them as to everyone else. But for all this, it is America's strategy, the strength and backbone that it has put into the free world—not in the past three months but in the past six years—that has made it possible to retrieve anything at all from the French collapse in Indo-China. If the Communists were willing to refrain from pushing their advantage to the utmost, it was primarily not because of Mr Eden's or M. Mendès-France's skill in negotiation, but because the Americans are strong and have shown that they will use their strength if Communist aggression goes too far.

The Communists themselves know this well enough, and their chief object in conforming to M. Mendès-France's timetable was to avoid driving France finally and unconditionally into America's arms, and specifically to detach France from America in Europe. Negotiation over Indo-China, they are now able to argue, should set the pattern for fresh negotiations in Europe, and particularly over Germany. But the fourth lesson is that this offer is a trap. Agreement to divide Vietnam is no pointer to an agreement to reunite Germany. True, in Indo-China the West has had to accept a "neutralisation" such as it has rejected for Germany. But in Vietnam the Communists have won both a military victory and a wide measure of popular support; in Germany they have won neither, and for Germany the true lesson of Indo-China is the fact that military and political weakness must lead inevitably to acceptance of Communist terms.

Finally, the fifth and most painful lesson of Indo-China is the impossibility of holding in check a dynamic and ruthlessly disciplined movement when there is no matching unity among the potential victims. In Europe, the free nations have held their line in recent years because they possessed both a joint defence organisation and an ideological bond. In South East Asia there has been neither of these things. The Geneva agreements may yet provide a basis on which to build a new unity in the region before it is altogether too late. But they also provide an awful example of what happens when unity, and unrelaxed effort behind the unity, are lacking.

Relief of Need

BOTH parties vied for the public's favour in this week's pensions debate, by bidding vehemently against each other with the public's own money. The Government is to delay an increase in national insurance benefits until "the current review of all the financial and other problems involved has been concluded," in the autumn of this year. But it has already decided that its election slogan must be to announce that it has "made good to old age pensioners, the war disabled, the sick, and the unemployed the whole of the injury and loss they suffered in six years of Socialist administration." This presumably means full compensation for the rise in prices since 1946, at least 4s. a week on standard benefits, and an additional burden on taxation or contribution rates of around £50 million a year. The Opposition has made the same pledge, and has also said that it would check the real value of benefits each year; after the Minister of National Insurance reminded them of the omission, and indicated that the Government prefers an increase in national insurance benefits to an increase in national assistance standards, some Labour members have put down a motion pledging themselves to raise national assistance standards as well.

This auction may be good politics; certainly both parties are right in assuming that public opinion does not want any Government to play the Scrooge in this matter. But the present atmosphere of competing altruism is not one that will ensure that the money that is rightly to be spared will be spent where it is most needed. The basic problem is that although public opinion has recently moved strongly in support of the aged and infirm, it is not at all clear which of two separate feelings it has been trying to express. The British people should now be asked to make up their minds. Is their primary concern that relief should be brought to the really needy, that life should be made less bleak for those who are struggling along near to a subsistence standard of keeping alive? Or are they asking for an implementation of the Beveridge principle: that everybody who has paid his proper number of insurance contributions should enjoy as of right, and without question, a pension big enough to provide a bare subsistence and no more? Is it bare subsistence for all, or rather more for those who have nothing but their pension to live on? These are two different aims; since they are also two expensive aims, a country that is faced with an ageing population will be forced to treat them as alternative—not as coincident—ways of spending a lot of money.

Although the Government seems to favour a flat increase in old age pensions and other national insurance benefits this step would not, by itself, bring any relief at all to those in the direst need. It would help

three-quarters of existing pensioners, and four-fifths of existing recipients of unemployment and sickness relief; but they would be, respectively, the three-quarters and four-fifths of those recipients who happen to be better off than their fellows. The neediest one million of the four million old age pensioners, the neediest 200,000 of the million on unemployment and sickness relief, the army of hard-pressed people who have fallen through the net of the comprehensive national insurance scheme, would gain no relief. These are the people whose incomes are at present brought up to a bare subsistence standard by supplements from the national assistance authorities, after subjection to a needs test. Any shillings added to their basic pensions or other insurance benefits would mean that an equal number of shillings would be cut off their national assistance supplements. The most logical policy in relief of pure need would be to leave the standard rates of pensions and other insurance benefits where they are at present, and to concentrate all the money that can be spared on improving national assistance grants. The really poor, those who are already on assistance, would get more, and some of the people who are just above the present and austere official definition of the subsistence line would be brought under the assistance authorities' wing.

★

Although this is the most logical policy on humanitarian grounds, it is not the policy that is likely to be adopted. There are several objections in the way. One is that it would be less popular politically because it would benefit fewer people. Another is that a spreading of the needs test might hurt the self-esteem of some of the new beneficiaries. Another is that, for a man with a wife and three children of school age, national assistance standards are already near to the minimum wage in industry; such a man may now draw anything between £5 and £6 a week—made up of the basic 59s. for a married couple, plus an allowance for rent (averaging about 11s. 6d.), plus anything from 33s. to 48s. in allowances for his children. A final objection is that the needs test, which is a personal and not a household test, may not always prick out the neediest people; some of those now drawing assistance are living with members of their families who are active earners, and may be much better off than some who are struggling unassisted in households of their own.

These, however, are familiar problems; it is no new discovery that the confining of relief to those who are really in need may not always be universally popular, may hurt some people's self-esteem, may encourage "shirkers," and may raise awkward anomalies. It was precisely in order to avoid these difficulties that the principle of sturdy social insurance was born, and it would, indeed, be very satisfactory if insurance covered all cases of need. But the fact remains that it does not; inflation has cheated the insured population of the security it was led to expect. And the dilemma also remains: which is more urgent, to restore the expectations of the great majority (which may have little to do with real need), or to deal with the actual cases of poverty (which cannot now be met by the insurance principle)? Those whose speeches are full of the pathos of poverty are inconsistent when they advocate a revision of the insurance scales. Their argument should really lead them to campaign for increased national assistance, which is a very different thing.

A great deal of money turns on the choice between these two alternatives. And in national insurance—unlike some other departments of the welfare state—there is no doubt where the bulk of the money comes from. If all the rates of benefit are to be raised to subsistence level—if, for example, the standard minimum pension of a married couple is to be raised from 54s. to, say, 70s. or more—then there will have to be a very sharp rise in the contributions. The employers' contribution is a direct tax on employment. The employees' contribution is a flat-rate poll tax of the most regressive kind. Does the public really want to put this burden on itself in order that everybody—the retired managing director as well as the retired dustman—shall be given 70s. instead of 54s. a week? Might they not prefer those who have no other resources to get 80s. or 90s., or whatever sum is needed to provide a bit more than bread and scrape? Is it really reactionary to advocate the latter?

These are the issues that the Government, aided by the deliberations of the Phillips Committee and the report of the Government Actuary, will be given an opportunity to settle before the end of this year. At the moment it seems intent on missing that opportunity, on shuffling towards a politically acceptable compromise that has been conceived in a fit of muddle of mind. The muddle should be cleared by posing three straight questions. First, is the principle of subsistence pensions for all, whether they need them or not, and whatever it may cost, still regarded as an essential objective? If so, they will have to be very bare subsistence pensions, and the insured population will have to start paying much bigger weekly contributions than it is doing at present. Or, secondly, does the country want to keep a check on the mounting cost of social insurance, while still providing something more than bare subsistence for those who have no other resources? In this case each person's pension should be actuarially related to the contributions he has made, and any supplement to bring it up to a subsistence standard (which could be more generously interpreted than it is at present) should be paid only after individual tests of need. Or, thirdly, does the country want to be wafted, by varying political pressures, along a course that will combine the worst of both plans, that will incur an enormous expenditure in the effort to avoid all needs tests, without ever succeeding in doing so? If the country does not want this unsatisfactory botch, it had better say so quickly; for this year's review may set it on such a course for ever.

After Crichel Down

THE broom that has swept through the Ministry of Agriculture has been so forceful that it has left a sense of bruise and shock behind it. The debate in the House of Commons last Tuesday was overlaid by this sense of shock, by the sympathy that is felt in any community when a widely respected man has lost his job. But these personal reactions and regrets are only the small change of the Crichel Down story. The real importance of this week's events is that it is now possible to assess more calmly the consequences of this remarkable affair for the future of British government. The scoreboard seems to show one signal victory for the public interest, and one unfinished piece of business.

The victory has been won by Sir Thomas Dugdale's courageous resignation. Present and future Ministers have been reminded that the doctrine of Ministerial responsibility is still an essential feature of British democracy; that if they fail to take early and effective action to counter potential miscarriages of justice or of policy within their own departments, they must expect to step down from office. It has at last been recognised that the complexity of modern administration, which has made this doctrine of responsibility appear the more cruel on the individual, has also made insistence upon it the more essential. There had been some falling off from this tradition during the post-war Labour Governments; to cite only two instances, no resignations followed upon the groundnuts fiasco or upon the gross miscalculation of expenditure in the early stages of the national health service. Sir Thomas Dugdale will now go down in British history as the man who has revived this tradition; and congratulations should be proffered to him along with personal commiseration.

The Labour members who thought they were supporting Sir Thomas on Tuesday seemed totally unable to understand this essential point; indeed, by assuming that a triumphant resignation in defence of a principle was merely a defeatist dismissal in response to backbench pressure, they gratuitously added insult to accepted injury. But theirs was not the only instance of blindness during the debate. Another essential point was missed by almost every speaker, by the Government spokesmen no less than by backbenchers. And it is in this respect that the debate has left the public interest saddled with some unfinished business. Can anybody be sure that there will be no more Crichel Downs, in the widest sense in which that term has become part of the English language?

When Government spokesmen claimed on Tuesday that they could give this assurance, they were referring only to the symbol of Crichel Down in its very narrowest sense—as applied to land deals. In that narrowest sense the remedial action which the Government has taken is no doubt satisfactory. In future officialdom will not hold on to land that has been compulsorily acquired for defence purposes, in order to experiment with model farms or other hobbies; the land will be offered back to the public when the military authorities no longer need it, and the former owners will generally be given special opportunities to buy it. There will also be an independent review into the way in which Crown Lands are administered, and an overhaul of the methods adopted for handling land transactions within the Ministry of Agriculture and the Agricultural Land Commission.

To official eyes, it must therefore seem that this molehill of downland has brought forth a mammoth of reform. But this is because official eyes, from the first, have been contained in agricultural blinkers. The Government has still not understood that the real reason for the public flurry over Crichel Down, a flurry that has extended into quarters that have no interests in agriculture whatever, is that this small plot of England has become a symbol for a widespread sense of public irritation; for the disgruntlement of thousands of British people who have come into contact with power-corrupted officialdom in the last fifteen years—and have been made to feel like worms in the process.

This irritation has inevitably spread as the points of contact and possible conflict between officials and individuals have multiplied with the growth of the state-directed economy. These contacts and conflicts now stretch over a wide range of licensing or rationing regulations, town and country planning dictates, and other central or local government decisions. Again and again private individuals have had cause to feel that their rights have been infringed by arbitrary official action; and they have usually had no avenue of appeal open to them, except perhaps to another member of the same official team. The only way in which this public bitterness can be set at rest is by opening new avenues of appeal, by ensuring that every private individual who thinks his rights are seriously impaired by some official action should be allowed recourse to some form of independent referee—as Mr Marten eventually was, but only after unconscionable pother.

This view will be firmly resisted by civil servants. Indeed some of them are still criticising the fact that an inquiry was allowed at Crichel Down. They say that executive action will be crippled if it is to be constantly retarded by appeals from the disgruntled; that it is unfair that letters that were meant to be private communications between officials should be dragged out into the open, to satisfy the *Schadenfreude* of the public; and that judgment on ordinary acts of state control should never be devolved upon a single lawyer, who might dislike state control for its own sake. The first of these objections has some substance behind it; if new avenues are opened for individual appeals, some road blocks must also be erected along them against purely frivolous or obstructive actions. But the second

and third objections are based on a fundamental misconception. Those who call for a much greater use of independent scrutiny in all disputes between officials and members of the public do not do so because they want to penalise the civil service, nor because they believe that injustice is often done. The essential thing is that justice should be manifestly seen to be done. As the Woods committee puts it

> The civil servant should bear constantly in mind that the citizen has a right to expect, not only that his affairs will be dealt with effectively and expeditiously, but also that his personal feelings, no less than his rights as an individual, will be sympathetically and fairly considered.

That is a principle that has been forgotten in the great rush of delegated legislation in recent years. But when they have had time to reflect on it, civil servants should be able to see its value, if only as a means of self-protection.

The battle of Crichel Down has advanced the standard of individual rights in these disputes with officialdom ; but it has not yet carried it to final victory. Before Crichel Down civil servants felt almost inviolate, and ministers had no pressing reason to pry around their departments to ensure that isolated acts of despotism did not occur ; now both parties are very much on the alert. Before Crichel Down the public felt that it could never hope to press disputes to the point of redress ; now it is licking its chops. There will be disagreement whether this should be called an attitude of vigilance or of vindictiveness ; but there will be agreement that it could lead to many more explosions as noisy as that which has just engulfed Crichel Down. The real measure of the need will not have been taken if the only result of this affair is a resolve to make enquiry into future Crichel Downs before they have reached such an explosive stage. What is needed is a new principle of government, to be applied right through the whole body of delegated powers : that no Minister and no department shall take any decision affecting the rights or property of any individual without the papers being referred—not necessarily for decision, but at least for report—to some wholly independent scrutiny.

Diplomacy and Cyprus

CYPRUS, the island of Aphrodite, is a place about which decisions are never as simple as they look. Misgiving dogs anyone who tries to take them, with the result that everyone concerned tends to evade them whenever possible. The island has therefore lived for years in a political twilight in which a civilised population of European breed—four-fifths of it Greek and the other fifth Turkish—has existed under British management, prospering materially but stagnating politically, because its Greek inhabitants will not accept any political responsibility lest to do so should damage their claim to *enosis* or union with Greece.

In 1954, several happenings have jolted the interested parties into taking decisions or stands. The most important has been the growing evidence that Anglo-Egyptian tension, coupled with new military thinking in Nato, is leading to a new pattern of defence arrangements in the Eastern Mediterranean. The corollary that more installations would be planted in Cyprus has led the British Government to attach a new importance to its legal title to sovereignty, and the *enotists* to think that they had best double their fuss before radical changes take place. Simultaneously, there has arisen in Athens a degree of dissension within the cabinet that called for a deflection of public opinion from differences at home. Cyprus offered such a topic, and when, in March, Mr Eden offended Greek sensibilities by making a frank but over-brusque declaration that there was no room for discussion of its status, the Papagos government decided to take the brakes off the campaign for *enosis* and give it its active support.

A chain reaction set in. The Greeks warmed to their subject and told the *enotists* that unless Britain would agree to talks they would bring the matter before the United Nations. The Turks, fearful lest Britain should quit the island and so reduce the immediate military help that Turkey could expect if molested, urged Greece to think twice before picking a quarrel ; they also began to fan the embers of nationalism among the Turks in Cyprus. The British appointed a new Governor and told him to stick to the tried but hitherto sterile course of offering the islanders self-government.

★

The last date for inscribing an item on the agenda of the Assembly of the United Nations is August 22nd. The Greek Foreign Office has this week announced that it intends to take the step. It is still uncertain whether Greece will raise the issue on the score of Britain's refusal to talk, or whether on that of the island's right to self-determination, or both, but whatever its complaint, certain results can be predicted. One is that there will occur a public spectacle of dissension within Nato that will be highly pleasing to the Soviet Union. Another is that, however eloquently Britain asserts legal title and Turkey proclaims minority rights, Greece can count on a majority of American, Asian and African delegates to condemn Britain for denying freedom of political choice, or else on some peacemaker to hurry to the rostrum with a resolution that will gain unanimous assent—one calling for direct talks between the parties. If the last is an unavoidable outcome, how much better for the talkers to meet now and voluntarily instead of after a storm and under pressure.

But if they are to meet now, what is there to talk about ?

The importance that the British attach to their impeccable legal right to sovereignty in Cyprus is greater than it was, for it has changed with the changing scene in the Eastern Mediterranean. In the forty years since the island became a British freehold in 1914, there have been moments at which statesmen in London were ready to think of ceding it to Greece, but a period of Russian expansion through exploitation of Communism and nationalism is not one of them. Today, the area of the Levant in which Greece, Turkey and Cyprus lie is, in terms of the only conceivable onslaught, a front-line zone that is thinly endowed with firm great-power commitments and bases. Seen from Moscow, it constitutes the soft way to Europe's vulnerable underbelly, not to mention the oilfields of the Middle East. In that area, there now remains only one foothold to which a major power holds unassailable title—Cyprus. From a strictly military point of view, Crete, with its splendid natural harbours, would make a better base than Cyprus. But experience at Abadan and at Suez has made the British Government chary of large investment in installations on alien soil. There is a heavy premium on full legal sovereignty.

Moreover, if Britain were to abandon sovereignty to Cyprus, what would it get in exchange ? It would win the goodwill of the Greek government, but governments change. It would get treaty access to bases in a Greek island, but nearby Egypt offers proof that treaties are impermanent ; the Cypriot Greek Communists openly proclaim their intent to rid their island of all military installations as soon as they can win themselves a chance to do so. Yet a third undesirable result would be the bad exchange of Greek animosity for Turkish mistrust. The alternatives are not worth the price that would be paid for them. There cannot, therefore, be any question of abandoning British sovereignty over the island. If there are to be any talks with the Greeks, that must be their basis.

★

The Cyprus question has therefore reached the stage when it is clear that neither of the extreme solutions is possible. The attitude that the British Government has hitherto adopted—that Cyprus is a purely domestic question, with which no international body has a right to concern itself, and which will not even be discussed with any foreign government—can hardly be maintained any longer. It is an attitude that is certainly sound in law, and possibly in morals. But in this day and age it will not work. There is a sufficient volume of anticolonialism, and of general nosey-parkery, at large in the United Nations to make it untenable. Since we shall be pushed off it, wisdom would suggest that we should gracefully step down first.

On the other hand, to hold out the prospect that the British will some day leave Cyprus is equally impossible. For one thing it is by no means certain that the Greek Cypriots really wish to sever all connections with Britain ; the moral conflict with which they are racked is described in a special article on page 290. For another, to adopt any such policy would be to remove the essential political foundation of the Cyprus base before it is even laid. There can be no question of abandoning British sovereignty over Cyprus, either now or "some time." The fall of Abadan and Suez may make it difficult to convince the peoples of the Middle East that any such policy will be adhered to. The greater is the need for hammering home on every occasion the essential difference: at Abadan and Suez there was no sovereignty ; in Cyprus there is. The maintenance of that sovereignty, now and in the future, cannot therefore be even discussed.

Between the two extremes, however, there is a great deal that could be fruitfully talked over with the other interested governments. It is an undoubted weakness in the British regime that it has been unwilling—indeed, on the assumptions on which it has hitherto been proceeding, it has been unable—to recognise the unquestioned sincerity and intensity of the Greek Cypriots' longing for Greekness. On every other issue they are torn by faction but on this they are one. Their British rulers will have to recognise that *enosis* is a manifestation of emotional need for opportunity and outlets that the Cypriots do not believe they can get within their British nationality but could aspire to if they were Greek.

If there can be no question of satisfying these emotions by a transfer of sovereignty, statesmanship should try to find other outlets for them. It would be well worth while asking the Greek and Turkish Governments what practical suggestions they had to make, within the assumption of an undisturbed British sovereignty. Is it possible, for example, to remove the stigma of colonial status by installing Greek and Turkish Ministers Resident, vested with some share of responsibility for administration ? Is double citizenship, for all that the lawyers shake their heads over it, out of the question ?

One merit of agreeing to talk now would be to find out if Turkey or Greece have solutions to suggest. Another would be to manifest courtesy and attention to allies ; diplomacy is at fault when it fails to give friends adequate explanations. A third—the most important of all—would be to relieve London of some of the heavy responsibility of deciding what is for the best at this weak southern tip of Nato, and to place some of the onus where it should fall, which is upon Ankara and Athens. There is, indeed, a need for firmness. But it will be the easier to be firm on the essential issue that concerns the vital interests of Britain and the whole western world if there is a willingness to show elasticity of mind on other counts.

Notes of the Week

Without Dishonour

RETURNING in quiet triumph from Geneva, M. Mendès-France is justified in asking the Assembly to grant him not merely a new lease of office but a peacemaker's laurels. He did not come to power to seek military victory in Indo-China, and he can rightly disclaim all responsibility for the fatal situation he had inherited. He merely promised, on taking office, to extricate France from this long-drawn conflict, costly and distasteful, distant yet dangerous; and he has managed to get a settlement within the dramatically short time-limit he had set himself. No critic can fairly blame him for the loss of Hanoi and Haiphong; granted the military situation, M. Mendès-France has deserved his laurels.

Indeed, most people in Paris view the terms as exceptionally good in the circumstances, and there is a certain surprise that Mr Molotov did not stiffen them at the last moment after the French premier had been embraced by the Americans. It is remarked that, with Mr Eden's help, M. Mendès-France has accomplished the extraordinary feat of satisfying Mr Dulles without incurring Mr Molotov's wrath. Time will show which of the two will have cause to regret having helped, or not having obstructed, the French premier in his dramatic bid against time and odds. Frenchmen, however, were chiefly impressed by the sight of their representative playing first fiddle on the international stage and by his Disraelian ultimatum after his predecessor's months of dallying. The Mendès-France technique has caught the public fancy, and to many Frenchmen, war weary and fearful of new sacrifices, their premier now appears as something of a *deus ex machina*.

Thus, having laid his foundation stone at Geneva, he can now begin to build his new edifice for France; but he can do so only with the parliamentary bricks at his disposal, and these have the familiar characteristic of not holding together. How can he evolve economic plans which will cement the socialist and conservative elements of his majority, or a foreign policy which will reconcile the "Europeans" and the nationalists? In Geneva the premier showed a capacity for boldness. Will he face the next items on his agenda in the same spirit, at the risk of finding his parliamentary bricks crumbling beneath him, or will he progressively revert to the now traditional pattern of patching up, which leads through compromise and concession to immobility?

Still Against the Clock

THE economic debate, which stands next on the French agenda, should provide an immediate opportunity to test M. Mendès-France's political courage. Himself an economist, he had spoken and written much on this subject while in opposition. He had deplored the lack of competition in the French economy which leads to the "survival of the unfit." At the same time he had argued that private investment was insufficient and that there must be more public financing in the basic sectors of the economy (part of it was originally to come from a cut in "unproductive," that is, defence expenditure, but any saving in Indo-China may well be balanced by a cut in American aid). In general, he claimed that the patient could not be cured without major operations, and he advocated the bold use of a scalpel. How ruthless will the surgeon prove in office?

France's economic conjuncture is quite a suitable one for the launching of "structural reforms." Industrial production has picked up after last year's stagnation. There are many signs of a general recovery: the balance of payments has improved, chiefly thanks to better terms of trade; the agricultural outlook seems good, and the budgetary position better than expected. M. Mendès-France could take advantage of this favourable economic climate and of his own greatly strengthened prestige to embark on a bold, long-term economic drive. He may, however, think it politically more convenient, with the motley coalition at his disposal, to leave the well, or rather the superficially well, alone and introduce only slight changes into M. Faure's treatment.

There is, however, another emergency to which the French premier will have to turn his attention immediately. The Indo-Chinese leak has been stopped, but there are other cracks in the French Union and other desperate calls for salvage. Little time, if any, is left if North Africans are to be prevented from following in Indo-Chinese footsteps. The friends of M. Mendès-France hope that he will waste none in producing a coherent policy of reforms, without which there is no chance, to use his own words, to "resume the dialogue" across the Mediterranean. The race against the clock is still on, and the French premier will be allowed scarcely any respite after his brilliant performance at Geneva.

Agenda for Fratricides

TRANSPORT HOUSE is beginning to echo to the sound of knives being sharpened for the Labour party's annual conference at the end of September. The preliminary agenda for this annual exercise in fratricide contains 433 resolutions; by implication, and often directly, many of these are as critical of Labour's official leadership as they are of the Tory Government. "German rearmament," of course, has provoked the most open hostility to Mr Attlee; of 58 resolutions on the subject, only one supports him.

But on many other issues, both foreign and domestic, the resolutions from the constituency parties, and from a few left-wing unions, reveal the familiar mixture of fatuity and dogmatic blindness that has been paralysing Labour policy for the past three or four years.

This preliminary agenda is recognised as a necessary safety valve, providing an innocuous outlet for the wilder fancies of the rank and file. The resolutions are in due course passed through a sieve to produce a handful of "composites" ("compromises" would be a better word) on which most of the conference debates actually take place. But Mr Attlee must be dismayed to find his party in so unconstructive a mood when preparing for what may well be its last conference before the election. He must, in particular, be alarmed by the gulf that seems to lie between the Parliamentary party and the constituencies. This reveals itself in many resolutions calling vaguely for stronger policies, and in a few that call precisely for improvements in propaganda and organisation. It can also be seen in the lack of interest that the constituencies have shown in the issues on which the Parliamentary party has fought most strongly. There are only eight resolutions on rents, seven on education, eight on the cost of living and a mere two on commercial TV—this last must be a shattering disappointment to Mr Morrison, whose campaign could not have fallen more flat.

The resolutions on economic themes follow a familiar pattern of sectional interest. The railwaymen's union wants Labour to commit itself either to taking over the capital charges of the railway or else to giving them a "block grant." The farm workers fulminate against the removal, by the departing Sir Thomas Dugdale, of a few of the feathers from their industry's bed. There are also the usual demands for more nationalisation. Mr Bevan and Sir Hartley Shawcross gave a preview of this argument last weekend, when the former jeered at "consolidation" and the latter scorned the "long haired" nationalisers. But even Mr Bevan would presumably flinch at the ideas of Mr Harold Wilson's constituents, who have tabled a resolution calling for the nationalisation of all commerce and industry, without compensation and with complete workers' control. Those who pay undue attention to the "trend of opinion" in Labour's constituency parties should remind themselves from time to time of what a very narrow band of cranks some of these parties consist.

It Would Not Happen

WHEN *Tribune* announced last week that Mr Bevan and five of his principal supporters in Parliament had written a pamphlet on the "alternative to German rearmament," it was assumed that they might be proposing to make a serious bid for the leadership of the whole anti-EDC lobby, which includes many of the Labour party's "middle-of-the-road" men. The pamphlet that has now appeared—under the title of "It Need Not Happen"*—should dispel this assumption. It is not so much a pamphlet as a patchwork—made up out of Mr Bevan's pet theme of overseas development, Mr Wilson's personal bug about East-West trade, Mr Crossman's about the H-bomb, some stock platitudes about general disarmament, about Indo-China, Guatemala, British Guiana and almost every other issue that has appeared in the foreign news. And it quite clearly is not drawn up to attract any middle-of-the-roaders; indeed it may shock even some people on the very far left.

The Bevanites' solution to the German problem would be touchingly naïve if it did not come from such clever people. They propose that Germany should be forbidden to rearm, at least for ten years, but should be unified and should then contribute all the money it would have spent on defence to a World Mutual Aid plan for developing backward areas. It is recognised that this development plan would require great self-sacrifice from other countries, particularly the United States, but "there is a great capacity for idealism in the American people." For the problem of uniting Germany, the Bevanites have a simple answer: the Russians will agree if only the West will not insist on a united Germany being free to join Nato.

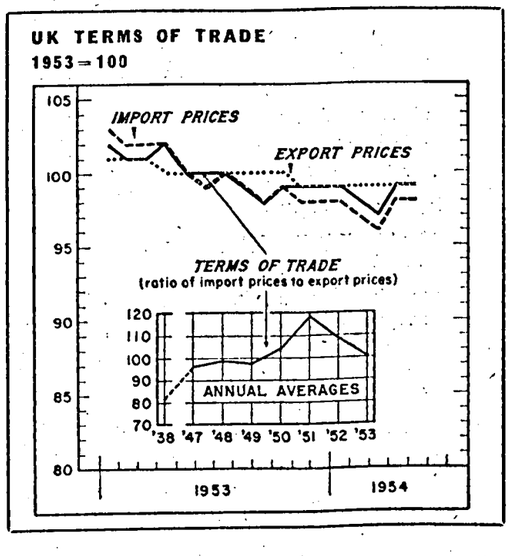
Might the Germans be a little restless at not being allowed to rearm? The Bevanites have an answer to this, too. There must be general, if gradual, disarmament. This, they feel, could be started quite easily. The West should renounce the strategy of "instant massive retaliation"; the Russians should then be invited to follow this example and to sign a convention outlawing thermo-nuclear weapons. "That would be a real contribution to the easing of the tension in Europe and to a negotiated settlement of the German problem," the Bevanites declare. At least "It Need Not Happen" should have served one useful purpose. It should have convinced the ordinary Labour voter that a Bevanite Government must not happen, if his party is not to become an international laughing stock.

* "It Need Not Happen." By Aneurin Bevan, Barbara Castle, Richard Crossman, Tom Driberg, Ian Mikardo, and Harold Wilson. A *Tribune* Pamphlet. 1s.

Mr Do Resigns

THOUGH M. Mendès-France did not after all resign, his colleague, Mr Do, the Vietnamese Foreign Minister, did. The significance of this fact can very easily be overlooked in the general relief and indeed rejoicing over the cease-fire in Indo-China. On the last hectic day at Geneva, Mr Do tried to hold up the rush for peace, if only for a moment or two, by asking that his protest be recorded against both the terms of the agreement and the manner in which it was concluded. Vietnam, he said, still objected to partition, and he himself had "failed in his mission."

Surprisingly, there has lately emerged in Vietnam both a new spirit of resistance to Communism and a new government to give expression to it. In terms of world politics, these developments have come too late to affect the issue of the eight years' war. But they may yet come to have a considerable effect on the peace and on the proposed Vietnamese elections in two years' time. Earlier this month, Mr Ngo Dinh Diem accepted office as prime minister in Saigon, after having refused it throughout the period of French rule and of the "Bao Dai experiment." He is a figure with considerable national prestige, based on his unswerving determination to reject anything other than complete independence for his country.



Two lessons may be drawn from Mr Diem's emergence at this moment. One is that so long as the shadow of French colonialism lay across the scene, the Vietnamese could never bring themselves to go all out in their fight against the Viet Minh. Now, instead of the political struggle being over, it may only be beginning. The converse of the same theme is that the mood of Asia demands that the great powers, having set up a non-Communist nationalist state, must give its leaders their head. Intransigence of the Syngman Rhee variety does not set a particularly good precedent. But there is some hope that Mr Diem may yet prove just as tough an opponent of Communism, and as a democrat rather than as a reactionary or a totalitarian.

Crossed Wires in the Balkans

THE postponement, at Turkey's request, of the signing of the tripartite Balkan military pact has given rise to a fine spate of confused comment in Athens, Ankara and Belgrade which has done little to clear the air. The three governments issued a joint communiqué saying that the conference had been postponed because the necessary preparations could not be completed in time; but the Greeks and the Jugoslavs have clearly been as much in the dark as anyone about the real reasons for Ankara's request.

The Turks have put it down to Mr Menderes's illness; but this, like all diplomatic illnesses, arouses scepticism. Nor is it very convincing to plead difficulties over the exact obligations to be assumed under the treaty. The signature of a pact of mutual assistance is, of course, complicated by the possibility that Greece and Turkey, through their obligations under Nato, might be involved in a war outside the Balkan area with which Jugoslavia was not directly concerned. But the fact that Greece and Turkey belong to Nato, while Jugoslavia does not, has all along been a major obstruction to the conclusion of a Balkan military pact; and it is unlikely that the three governments would have talked and behaved as if the treaty were in the bag if they had not got round this obstacle. If this is the correct explanation, there must have been either misunderstandings, stupidity, or last minute changes of heart. In any case the difficulty, if it exists, is more apparent than real, since it is unlikely that the Jugoslavs would in fact consider it either possible or expedient to wash their hands of any conflagration started by Soviet aggression in Europe.

The Jugoslavs take the view that the postponement has something to do with Trieste, and there is probably a good deal in what they say. Of course a Trieste settlement is most important; and of course it would be a pity to do anything that might make it more difficult for the Italian government to accept a solution that can hardly be popular in Italy. But Balkan military co-operation is also important; and it is equally a pity to do anything to jeopardise its future. Field Marshal Papagos and Marshal Tito have behaved with restraint and good sense, but Balkan friendship is still a delicate plant; it cannot be expected to grow and prosper if it has to live for long in the present atmosphere of doubt and confusion.

The Stokers' Strike

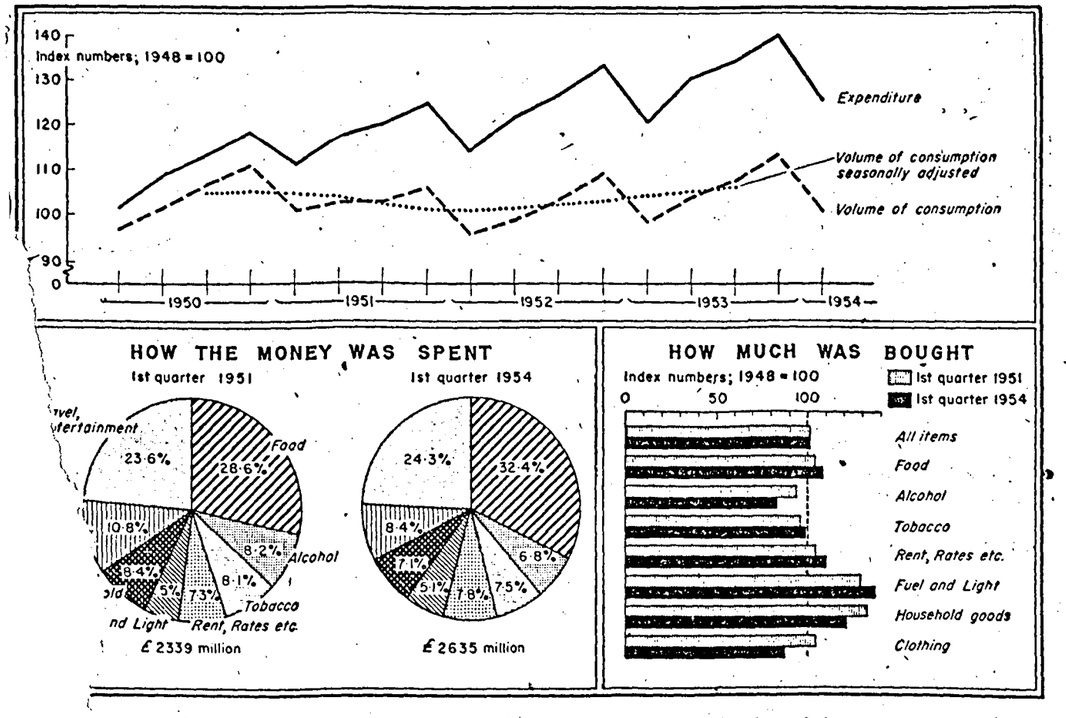
THE three hundred coke oven stokers of Port Talbot went back to full working this week, after an unofficial strike that had paralysed the largest steel-strip producing plant in Europe for a fortnight, that had already thrown 3,000 men out of work, and that had threatened much wider disturbance in many steel-using industries. The most revealing aspect of this strike is that the men were not only taking protest action against their employers. They were also—indeed mainly—intent upon persuading their union, the British Iron and Steel Trades confederation, that it had allotted them too low a status within the workers' hierarchy; when bargaining with the employers about a new wage structure it had been disposed to agree that the wages of coke oven workers should be below those of men with no greater skill and with much more pleasant conditions of work.

It is not surprising that men with grimy and heavy work of this sort should demand increased differentials; indeed it is more surprising that, after fifteen years of full employment, anybody can be found who is willing to stoke coke ovens at all. But it is a disturbing thought that a strike may now be considered the only way in which rank and file union members can show their own leaders that they are in earnest about a claim that they should be moved up higher within their own hierarchy.

Buffers to Lodging Turns

AT its annual conference last week the National Union of Railwaymen recommitted itself to accept a limited increase in the number of lodging turns, and thereby to

ct its side of the bargain to increase efficiency on the ays. Although the other major railway union, the ciated Society of Locomotive Engineers and Firemen, ll pledged to try to work towards the abolition of lodging s altogether, there is now some reason to hope that this —which at one time threatened a major railway crisis— een quietly settled for the current year, and without



ll be remembered that the original unofficial protest against increased lodging turns in the Western Region were called off when the executive of the ASLEF instructed by its members to oppose all lodging turns in the future. Later, the token Sunday strikes, which were threatened by footplate men of the Eastern and North Eastern regions against their share of the increase in lodging turns during the latter half of June, also fizzled out; the militant "all-line action committee" held a meeting at York but confined itself to a mild adjuration to union officials to press for the abolition of lodging turns through negotiation. The militants did, however, reserve their right to further action if the negotiations were unduly protracted.

The half-hearted confrontation between the union officials and the Transport Commission took place on June 30th. The Commission naturally turned down the union's suggestion that lodging turns should be abolished, and the NUR representatives added their dose of cold water. No day was fixed for any further discussions. Meanwhile the 72 new lodging turns, introduced as part of the summer service, are being worked. One possible solvent for the future—or else a loophole for a new kind of trouble—was provided in the resolution passed by the NUR last week. This declared that men in the depots should have the chance to examine any proposed new turns, and to submit alternative proposals if they wished.

Wrong Plan for Refugees?

AT the Economic and Social Council's summer session last week, the UN High Commissioner for Refugees gained a nominal majority for his $12 million scheme to

Higher Personal Spending

volume of consumption in Britain is now again as great as it was at the time of the so-called post-Korean g spree. Personal spending reached £2,635 million during the first three months of 1954. This first quarter year is always a period during which retail sales are at a seasonal low point; but this year's figure was best for any first quarter since these statistics have been published. Even when allowance is made for the in prices, the figure was fractionally (by £1 million, in terms of constant 1948 prices) above the previous for this season, which was set at the beginning of 1951. Compared with that earlier period, the public spent less on clothing and household goods, but more on food.

speed up the final settlement of the 350,000 refugees—including 88,000 still in camps—who are under his care. But the United States and Britain, whose support the High Commissioner must have if he is to carry through a scheme of this magnitude, abstained from voting. The American delegate asked for a clarification of certain aspects of the scheme, but his colleague's criticisms were more radical. The British view is that the refugees remaining when the International Refugee Organisation was wound up were to be integrated in the countries where they had found asylum, and that the High Commissioner, as the IRO's residuary legatee, should therefore concentrate on his legal and protective functions.

To this the High Commissioner replies that only in Germany was there a formal transfer of responsibility; the situation in the other countries varies from that in Austria, where the government is making considerable efforts to assimilate its refugee population, to Greece, whose government is making little or none. And in all the countries concerned most refugees are denied economic and social rights—notably the right to work—to which they are entitled under international agreement. The High Commissioner's new scheme is therefore broadly intended to do for the refugees what the countries of asylum maintain they have no means to do: it does not guarantee a solution, but is merely intended to stimulate further efforts towards one.

For the majority of the 260,000 refugees who are already partially or wholly absorbed into their countries of asylum the main need is work, and work can only be provided by the countries concerned. Four-fifths of them are *Volksdeutsche* expelled from the Danubian countries and now living in Austria. It seems likely that more could be done by the countries directly concerned—and in the case of the *Volksdeutsche*, aid might be expected from Western Germany—before recourse is had to the United Nations.

The 88,000 refugees who are still in camps, many of them for the eighth year running, are a different matter. On grounds of common sense alone they should be resettled before they are quite incapable of fending for themselves or come to feel that idleness in semi-captivity is the natural order of things. A more limited, practical programme of this kind should command the support of wavering governments and actually result in clearing a high proportion of these refugees off the books. Perhaps the High Commissioner will think again before his proposals are considered by the Assembly in the autumn.

Japan's Trade Unions Meet

THIS week the annual convention of the biggest of the Japanese trade union organisations, Sohyo, has been a reminder that there is a back door through which Communist influence could spread fairly rapidly in Japan if conditions were ripe for it. The Chinese have pressed their "heartfelt congratulations" on Sohyo, saying that "it is the ardent desire of the Chinese trade unions that, with each passing day, the Japanese working class will unite closer, Japan's friendship with China grow, and the two peoples co-operate as friends." Since the war there has been a considerable growth of trade union activity in Japan, and more than h the six million organised workers now belong to Sohyo. T next biggest organisation is the more right-wing Zen which was formed out of two dissident groups last year, a there is a very small purely Communist body.

The Japanese trade unions are important because spite of temporary setbacks, their power is growing because they represent potential vehicles for Comm propaganda. Nowhere has the worker stood in g need of an organisation to protect his interests than in J But it is essential that the development of such an orga tion should be as free as possible of political influence, it is not to be used for dangerous purposes. As things stand, the omens are none too good. Although Sohyo is not under direct Communist control, it has been drifting towards the extreme left, and its secretary-general, Mr Minoru Takano, represents the more extreme of the two main factions fighting for leadership. At this week's convention Mr Takano has been re-elected for another year, against the substantial opposition of Mr Ota's group. Mr Takano favoured what he called the political approach to labour problems and Mr Ota a primarily "economic struggle."

At the last general election Sohyo put up most of the funds for the left-wing Socialists. There now appears to be some disagreement, however, between the party and the organisation, and the party apparently supported Mr Ota at the convention. Attempts to identify the precise political colouring of Sohyo are further confused by its international relationship with the anti-Communist ICFTU and the Communist WFTU. It has hitherto rejected affiliation with either, but is now understood to support the ICFTU. If Japan's economic position were to deteriorate, clashes between employers and labour would grow both in number and bitterness. At present the Communists by no means control the trade unions, but attacks on labour's position through the stiffening of labour legislation, particularly by a right-wing government, seem bound to play into their hands.

Binding Cases

Binding cases for THE ECONOMIST *can now be supplied. These cases, made by Messrs.* EASIBIND LTD., *are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding and will hold 13 issues of the normal edition together with the quarterly Index, or 26 issues of the air edition with two quarterly Indexes. The year can be stamped on the spine. The price per case, post free throughout the world, is 11s. Orders, stating requirements clearly and enclosing a remittance, should be sent,* **not** *to* THE ECONOMIST, *but to—*

EASIBIND Ltd.,
(Dept. E), 84 Newman St., London, W.

A binding case can be sent on approval if required

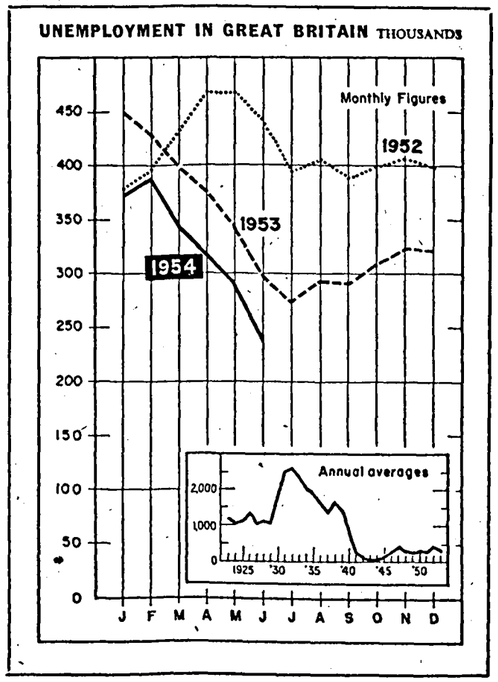
Indonesia's Yen Gap

A STORM is brewing in Japan's trade relations with Indonesia. The Japanese Ministry of Trade and Industry (MITI) has taken the drastic step of suspending the further acceptance of Indonesian textile orders. As this market has defaulted on more than 30 per cent of Japan's textile exports, the decision is bound to have serious consequences for the textile industry; but the state of Indonesia's adverse balance in its accounts left the Japanese government with no alternative. Trade debts totalling some $160 million are outstanding.

Behind these troubles lurks the old question of reparations. All the countries in South East Asia formerly occupied by Japan have outstanding claims for compensation running into many millions of pounds; indeed, it has been a matter of national prestige to make the highest bid. Not unnaturally the Japanese have tried to make the best of a bad job by offering payment in services, such as salvaging sunken ships, or building plants for the extraction of ores, in both cases with a view to serving the needs of Japanese industry. But periodic attempts to get a final settlement have failed. There is little prospect of an agreement with Indonesia, and the Japanese fear that the authorities in Djakarta plan to offset their reparation claim against the trade debts due to Japan. The fact that the Indonesians have asked for a postponement of the amortisation payment scheduled for July 1st has caused alarm in Tokyo.

The Japanese motive in seeking to clear the reparation question is not simply a matter of wiping the war-time slate clean. They see the possibility of improved trade relations as well as a chance of bettering Japan's political status, since all the countries still claiming reparations have so far withheld their accession to the San Francisco peace treaty. As it is the accepted policy of both Britain and the United States to bring Japan back into international political and economic relations, they have an interest in seeing Japan's relations with its non-Communist neighbours improved.

Gatwick's Grievance



HARD on the heels of the Crichel Down affair has come another sharp rebuke to a Government department by an independent investigator. The occasion is the report of Sir Colin Campbell's inquiry into objections to the development of Gatwick airport (Cmd. 9215. 2s.). The offender this time was the Ministry of Civil Aviation. In 1946 and 1947, and again in 1949, the Ministry gave "solemn assurances" that Gatwick would not be developed as a major airport. In 1952 this policy was reversed, and it was decided to develop Gatwick as an alternate to London airport. The unexpected volume of local opposition was the cause of Sir Colin's inquiry.

The Ministry's reversal of policy can to some extent be justified by altered circumstances, such as the impact of rearmament and the growth of air traffic. But its timing and procedure were extremely inept. The Ministry abetted the creation of a new town at Crawley, as well as private development in the vicinity, which would never have taken place if the airport proposal had been foreseen. It ignored the agreed procedure of consultation with local planning authorities and other interests; and Sir Colin finds that the resentment felt on this score by Surrey County Council and the other local authorities is fully justified. He also thinks that special consideration should be given to private interests that were misled by Government assurances.

These criticisms do not mean that the decision to develop Gatwick as a major airport should now necessarily be abandoned. Sir Colin considers that the Ministry has demonstrated the suitability of Gatwick for its particular needs; but the question whether there might be equally suitable alternative sites was excluded from his inquiry. It is clear, however, that on town planning grounds the scheme is undesirable, and that the nuisance from noise may be considerable. Whether these objections outweigh the aeronautic drawbacks of other sites is a matter that the authorities should in fairness carefully reconsider.

Main Road in Buganda

NEARLY a month ago, Sir Keith Hancock bluntly told the Great Lukiko of Buganda that in its relations with the Protectorate, and to some extent in its internal affairs, the tribe had lost the main road; it was on a side path

which led nowhere. Sir Keith is now engaged in private discussions with a committee of the Lukiko, which has been strengthened by the co-optation of two Saza (administrative) chiefs, and has been brought up to full complement by the arrival from America of Dr Kalibala, whose appointment to the committee was at first questioned by the Governor. The Uganda National Congress's ill-intentioned boycott of goods has now nearly been broken by the government; as a result the meetings are being held in an atmosphere that is cheerless but calm.

The talks are theoretically about constitutional adjustments, but the exiled Kabaka is not allowed to travel far from anyone's thoughts. As the Baganda find themselves increasingly involved in the outside world this symbol of tribal unity has become their constant preoccupation; and the difficulties now under discussion concern not only Mutesa as a man but the Kabakaship as an institution. No doubt some formula can be found to straighten out the relationship between the Kabaka—whoever he may be—and his increasingly democratic tribe. But the relationship between the tribe and the protectorate—one day presumably to be sovereign, with a black Prime Minister, as on the Gold Coast—eludes any easy solution. How, the Baganda say, can anyone who is their Kabaka ever be asked to take orders from another black man?

There is a third unresolved constitutional relationship which is not on Sir Keith's agenda. British politicians no longer dare to talk of East African federation after the explosive results of Mr Lyttelton's *gaffe* last autumn, and the Uganda people have had the most explicit assurance that there will be no federation unless they want it. Yet it is a fact that East Africa already has a customs union, common railways, and common postal services. The three territories will go forward hand in hand. It is Uganda's challenge, and East Africa's hope, that a *modus vivendi* between black and white will eventually be reached in this potentially prosperous part of the world. But one of the many prerequisites before that goal can be reached is that the black leaders of Uganda should gain the respect of the world by showing that they are capable of running their own show.

Preventing Polio

So far there is no evidence of a serious outbreak of poliomyelitis this year; but the seasonal rise in the number of cases has begun, and the peak is not likely to be reached for another two months. At any time, Britain may suddenly find itself in the middle of an epidemic like those of 1947 and 1949 or, even worse, as severe as that experienced by Denmark two years ago.

So calamitous can be the effects of this disease, and so widespread is the fear of it, that people frequently ask what precautions can be taken against it. Up to quite recently poliomyelitis, though known to be an infectious disease, was not regarded as preventable by the recognised methods of quarantine and isolation applied to, say, diphtheria. It was believed, and some authorities apparently still believe, that the polio virus—or rather viruses, since three distinct types have been identified—was ubiquitous, that many people are infected by it—and thereby obtain subsequent immunity—but that only a few develop the clinical manifestations of the disease. On this theory the isolation of the contacts of a patient in whom polio is clinically recognised is superfluous, since the virus has probably already been spread far and wide.

In contrast to this *laisser faire* attitude, other authorities believe that each of the three types of virus produces strains differing widely in their virulence. It is these virulent strains that cause the disease in anyone who has not previously been immunised by infection with a mild strain of the same type of virus. It is also held that, as Dr Bradley, of the Ministry of Health, has put it, the virus causing disease is not ubiquitous, but moves through "a narrow stream" of the population by contact from case to case. For this reason a new memorandum from the Ministry to medical officers of health emphasises that strict precautions should be taken by contacts of a polio case, particularly regarding personal hygiene. It does not suggest that adult contacts should normally be quarantined; but it does suggest that child contacts should be kept away from school and from other children for three weeks, and experimental quarantining is to take place in Taunton this summer which should yield valuable information on the epidemiology of the disease. In the meantime, the public will go on hoping that the research work on artificial immunising agents will soon bear fruit.

Morals and Commerce

Crimes seem to be epidemic like some diseases. On Thursday, at the Mansion house, Mr Joseph Windle Cole was brought before the Lord Mayor, in the custody of Daniel Forrester, upon the charge of having obtained £10,000 upon warrants representing goods which were not existence. The defendant, described as of the firm of Cole, Brothers, & Co., Birchin lane, was remanded. Thursday, too, brought us intelligence from New York, of an "unparalleled degree of excitement and anxiety in the stock and money market consequent upon the recent failure of Messrs R. and G. L. Schuyler, and the discovery of a false issue of railroad stock by the senior partner. . . ." Of late we have had several unpleasant matters of a similar description amongst ourselves, and they have been referred to the pressure in the money market. Without assigning them to it as the cause, remembering how often several crimes of the same or similar kind have happened about the same time, we must say there is something more mysterious and more inscrutable in crime than hasty men, impatient of doubt, assume, concluding that it can be suppressed by the will and the exertion of the Legislature. Into the obscure subject, rich causes of crime, particularly crimes against property, whter, are now the plague of society, we do not mean to ep its but the love we bear to trade makes us jealous o ould reputation. Existing by confidence and credit, it sh hose be above all suspicion. It cannot thrive unless tion engaged in it are of strict integrity. No informtical which can be given to it by the best-informed poli ser- economists, or travellers, or naturalists, can be half so les viceable to trade as the recommendation of those princi ed of high morality which are sometimes and falsely supp to have no part in its dealings.

The Elephant consults the Lion

'Between you and me,' says the Elephant to the Lion, 'there are 150,000 miles of submarine cable.'

'And between you and me,' replies the Lion, 'there are more than 200,000 miles of wireless circuits. So if I can't get in touch with you one way, I can always find you in another.'

These are round figures—or, to be more specific, round-the-world figures. On the map, the miles between the Lion of the United Kingdom and the Elephant of Ceylon, are a matter of four figures only. But the miles that link them in the chain of Commonwealth communications are many times greater.

In the United Kingdom the Post Office handles messages to and from Ceylon. The Post Office in Ceylon sends and receives messages there. Cable & Wireless Ltd. owns the cables under the sea which link the two. Indeed, it owns and maintains the whole 150,000 mile Commonwealth cable system. The Company, also, owns and operates wireless stations in the Colonial territories which relay messages between the eight senior countries of the Commonwealth and provides a network of 114 telegraph circuits.

The headquarters of Cable & Wireless Ltd. are in London. Its day-to-day business is carried out between the eight sovereign nations of the Commonwealth; in the Colonial territories and in foreign countries in which concessions are held.

How these services are carried out is explained in a 40-page illustrated booklet "World Wide Communication", which gives many interesting details about the Company's equipment, operations and administration. A copy will be sent to you without charge if you will write, mentioning this paper, to:—The Public Relations Officer, Cable & Wireless Ltd., Electra House, Victoria Embankment, London, W.C.2.

The Historical Vocation

THE HISTORIAN'S CRAFT.
By Marc Bloch. Translated from the French by Peter Putnam.
Manchester University Press.
218 pages. 12s. 6d.

MARC BLOCH was one of the most original and influential of French historians between the wars. For him, the object of historical research was to reconstruct a "total social situation"; specialised study was subordinate to this, and non-documentary sources could be more important than documents. With Lucien Febvre he founded the review *Annales d'histoire économique et sociale*; together they presided over a new generation of young historians as Seignobos had presided over theirs; and Bloch's canonisation among scholars was completed by his heroic death at German hands in 1944 for his Resistance activities. In Vichy France, exiled as a Jew from his chair at the Sorbonne, he wrote his last book, *Métier d'Historien*, of which this is a sensitive and distinguished American translation.

It is his account of the vocation and techniques of the historian, "the memorandum of a craftsman who has always liked to reflect over his daily task." He rejected a hard definition of history, since all growing sciences contradict the limits and methodologies laid down for them, and often find their "most successful craftsmen among the refugees from neighbouring areas." The appearance of the human element in any field of study marks it as historical subject-matter. History is the science of men in time. It is the study of human traces, whether documents, works of art, tools, stones, ruins, changes in the landscape, languages or customs; and it involves the historian in a range of ancillary disciplines as wide as the diversity of the evidence.

His historical criticism is the cross-examination of these traces, above all for information they were not intended to give. But its scope is in general confined to establishing antecedent causes in the historical process; it does not affect the fundamental structure of the past. "Taken separately, there is scarcely a word in our modern version of *Oresteia* which we may be certain of reading as Aeschylus wrote it. In its entirety, however, we need have no misgivings that our *Oresteia* is really that of Aeschylus. There is more certainty in the whole than in its parts." And criticism begins with the rational use of doubt as an instrument of knowledge, its final goal is understanding. It excludes judgment, and distrusts both "the idol of origins" and "the fetish of the single cause" as insidious forms of attributing blame. In the last analysis, historical facts are psychological facts; it is human consciousness that is the subject-matter of history. History is the science of man *par excellence*.

Thus much is perhaps the contemporary historiographical orthodoxy, and may be partially found in the writings of Collingwood and Butterfield and in Namier's consummate essay in "Avenues of History." What is it that distinguishes Bloch's statement of it beyond these? First, his range of reference. He sees historical study in relation to modern physics and mathematical theory and psychology; in a crucial chapter he discusses the point at which historical criticism "intersects the royal highway of the theory of probabilities." A medievalist and economic historian, he illustrates his argument from archaeology, egyptology, classical philology, Biblical criticism, linguistics, hagiography, the geology of the Flemish coast-line, the beliefs of Montaigne, the lies in Marbot's Memoirs, the February Days, the sociology of rumour in the trenches in the First World War. "The only true history, which can advance only through mutual aid, is universal history." It follows that history deals with the living as well as the dead, and the study of contemporary history differs from that of the remote past only in degree.

The second distinguishing feature of Bloch's statement is his treatment of the personal, that is to say, the aesthetic element in historiography. Unlike other sciences, history takes its imprecise vocabulary ("century," "freedom," "serfdom," "Renaissance," "capitalism") from its own subject-matter. To describe the delicate phenomena of human action, every historian uses to some extent a private language; his individuality is reflected in his choice of words, and he paints the past with the colours of his own experience. Unlike most historians, Bloch saw his own historical conditioning. "It is not inconceivable that our civilisation may, one day, turn away from history, and historians would do well to reflect upon this possibility."

The book begins with a question put by his son: "Daddy, what's the use of history?" Does Bloch answer it? He distinguishes between the intellectual legitimacy of history, as an intrinsically fascinating study that gives a rational classification and a progressive intelligibility of human affairs, and a more pragmatic sense of the word "use." Under the first head, he does not offer a "meaning" or "pattern" in history. That historical whole which is more certain than its parts remains undefined. The universal history he advocates is universal less in terms of the coherence of the entire human drama than of the coherence of every separate human situation. It means "civilisation" not in Toynbee's sense but in Febvre's. "To understand the attitude of the medieval vassal to his seigneur you must inform yourself about his attitude toward his God." Under the more pragmatic head, he asserts that pure knowledge is not divorced from action, and historical criticism has pioneered for mankind a new path to truth and therefore to justice.

One of his liveliest passages is in praise of the goddess Catastrophe, who helps historians by breaking open secret archives. We can add that she also compels them to write books they might not otherwise have written (Pirenne's "History of Europe" and Perroy's "Hundred Years War" are other examples) and to address a wider audience than their colleagues. If she took Bloch's life, she had first elicited from him this testament, which not only may prove to be the most influential writing of a great humanist, but is also the best explanation yet written of why, in the last century, history has become, and has deserved to become, the queen of the sciences.

Rich Traveller

THE FOUR CONTINENTS.
By Osbert Sitwell.
Macmillan. 290 pages. 25s.

SO richly is Sir Osbert Sitwell gifted as a mental traveller that had he never stirred from Renishaw he might yet have carried us enthralled on the far-ranging voyages of his fantasy. Fortunately his actual journeyings have also been extensive and unstereotyped, so that he can widen the horizons of our knowledge as well as stimulate our imagination.

He says that he toyed with the notion of entitling this book "The Four Elements," and he has indeed devoted a chapter to each of the four. This indicates the scope of the book, far more ambitious than an orthodox volume of traveller's reminiscences. Its method is deliberately discursive, its structure cunningly contrived. Amalfi, where the book was conceived, is never forsaken for long, although we are borne off to Florida, to the interstellar spaces, to Guatemala, to the Great Wall of China.

Sir Osbert draws on the memories of some forty years of voyaging, and readers of his earlier travel books will sometimes find themselves in places which they have already visited in his company; not that there is anything to deplore in this. Of his recent impressions, those concerned with postwar America are particularly interesting. It is heartening to find someone so sensitive to the harmonies of ancient civilisations able to respond with such warm appreciation to the transatlantic scene. Not

all his readers will share his belief that over the last twenty years "the American people have grown up, and attained to a full sense of the world responsibilities that their position and still more their power imposes on them"; but nobody with a spark of imagination will read unmoved his description of New York, which he presents as "a metropolis of dreams realised and unrealised."

As always, to balance his power of lyrical description, Sir Osbert has an infallible eye and ear for comedy, whether provided by human beings, animals or inanimate objects. In the last category may be mentioned the fashionable hats from Polynesia exhibited in the Bowes Museum; in the first, Euphrosyne the Jamaican maid in the Panama hotel, the sprightly Amalfitani paper-hangers and painters, and Sir George Sitwell himself; and among the animals, the circus elephants who staged a sit-down strike rather than perform to the strains of a specially commissioned march by Stravinsky.

The Only Other General

THE LIFE OF LORD ROBERTS.
By David James.
Hollis and Carter. 526 pages. 30s.

SEVENTY years ago, when the Martini-Henry was thought by many to be the mere shaft for the bayonet, Wolseley was called Britain's only general and Roberts Britain's only other general. Both deserved their titles. They were not rivals; their careers and campaigns hardly touched. The Wolseley "ring," linked with the Liberals and supporting short service enlistment, and the Roberts "ring," associated with the Conservatives, defending long service and supporting the forward policy on the North West Frontier, were far more the creations of their staffs than of the men themselves. Wolseley made his career in Whitehall, Roberts his name in India.

The dust of the Indian cantonment lies heavy on the pages of Roberts's own interim autobiography, "Forty-One Years In India," and it is well that a full assessment of his achievements has now been made. Mr James has written a straightforward biography, with the occasional flourish of adulation, the occasional defensive argument and the occasional admission of fault. Rightly, he has devoted half his book to Roberts's career after he left India—to his campaigns in the field in South Africa, on the platform in the cause of compulsory military service and at the desk striving for an adequate general staff.

Roberts began his career, as many a Victorian general did, by winning the VC; he won it capturing a colour in the Indian Mutiny. In the Mutiny he quickly and thoroughly learnt the tasks of a junior staff officer. It left one odd scar on his memory. The drunken soldiers in the streets of Delhi gave him a horror of street fighting; hence he held back the impatient cavalry at the gates of Kabul. After two successful staff appointments in the Abyssinian and Lushai campaigns, he was given command of the Kurram Field Force in the second Afghan War. After two flanking attacks at Peiwar Kotal and Charasia (where he accepted the risk of fighting before the rearmost brigade had closed up) he found himself master of Kabul. He gave himself more credit for this brilliant little campaign than for the march from Kabul to Kandahar, which captured the imagination of the Victorian public. His appointment as Commander-in-Chief in India was the inevitable sequel.

His test came in South Africa. His flank march to Bloemfontein, avoiding the obvious line of advance, opened the way for the convergent drive on Pretoria. Strategically his conception was sound; tactically, his hand appears less sure, and for that reason he must accept part of the responsibility for the dragging months of guerilla fighting that followed the capture of Pretoria. Roberts, like all generals, is something more than the battles he fought. He was right in insisting on a higher standard of musketry, in forecasting the end of the shock tactics of the cavalry, in insisting that the welfare of the rank and file must be improved and, possibly, in arguing the case for compulsory service. He was wrong about long service and, on more than one occasion, in his reliance on his subordinates. The long halts in South Africa, through a lack of supplies, suggest bad staff arrangements; if Kitchener's tampering with the supply and service organisation built up by Buller was primarily responsible for these delays, then Roberts must take the blame for giving Kitchener too free a hand.

As a man, Roberts was very likeable; he had, to quote his protege, Sir Ian Hamilton, "a genius for popularity." Surrounded by incompetence, the competent professional Roberts flashed like a heliograph. But that did not make him a sun.

The American Nation

THE AMERICAN REVOLUTION, 1775-1783.
By John Richard Alden.
Hamish Hamilton. 312 pages. 30s.

WOODROW WILSON AND THE PROGRESSIVE ERA, 1910-1917.
By Arthur S. Link.
Hamish Hamilton. 348 pages. 30s.

THERE exists no more respected co-operative history of the United States than the 27-volume series launched at the turn of the century with the title of "The American Nation" and under the editorship of Albert Bushnell Hart. Written by scholars, but readable by laymen, the series presented the latest findings and assessments of American historians in a form which was convenient and agreeable. Unfortunately the restless spirit of inquiry and improvement of American historical scholarship has made the series out of date in little more than a generation. Consequently a "New American Nation" series has now been launched under the editorship of Mr Henry Commager (who needs little introduction on this side of the Atlantic) and Mr Richard B. Morris. Well printed, pleasantly illustrated and bound, the first two volumes should win a warm welcome in this country no less than in the United States.

It is appropriate that the new series should begin with a volume devoted to the struggle for independence. For those whose interest lies principally in the military struggles out of which the new nation emerged victorious, Professor Alden's book will be ideal; his military narratives are clear, sensible, fair and, at points, original. The editor's introduction, however, says that "the American Revolution . . . was a great 'creative movement." Those who wish to know in what this creativeness consisted, how it came into being and why it so often expressed itself in such misleading forms as the behaviour of the Continental Congress, will find Professor Alden less illuminating. His analysis loses sharpness and his pen seems to flag when he deserts the battlefield for the council chamber. But it must be said in fairness that his judgment is generally balanced and his narrative always lucid.

★

PROFESSOR LINK has taken time off from his life-size biography of Woodrow Wilson (of which only the first volume has so far appeared) to execute a smaller scale study of the years 1910 to 1917. Occasionally his wider interests have overloaded his canvas, as his crowded footnotes show, but they also lend freshness and authority to what must be considered the best history of its period that has yet appeared.

The portrait is not touched up. Now that all the secrets are exposed, all the private files open, the apostle of "the New Freedom" (in the main the Wilson of these years) is seen to have feet of clay as surely as the Wilson of world order. Professor Link shows with unsparing clarity how he disappointed his supporters by his lack of any "impelling passion for social justice," by his abandonment of trustbusting, by his backpedalling even on the tariff issue and by his Palmerstonian handling of Latin American relations. Worse still, by implication, is his belated reconversion to "progressivism" on the eve of the election campaign. The reader sometimes feels tempted to endorse the verdict of Garrison, Wilson's first Secretary of War, who described his chief as "a man of high ideals but no principle."

The Wilson of diplomacy, of Mexican intervention and of the years of uneasy neutrality, emerges as less illiberal figure, but only at the cost of appearing a more muddled and ambivalent one. The full, unhappy story of Wilson's Mexican policy, which pounded so oddly of missionary zeal, surrender to chauvinist pressure and mere diplomatic incompetence, provides the reader (as it ought to have provided European observers) for the tragic events that followed in the years 1919 and

(Incidentally it is a story which, by analogy, can also illuminate for modern readers much that is puzzling about American policy towards China at the present day.)

Then comes the transatlantic diplomacy of the "short of war" years. Here for the first time Professor Link seems to fail in his historical function, by not asking the right questions—or what to a European reader seem the right questions. A certain parochialism seems to limit his vision and leads him to treat the story of America's movement towards war in terms virtually identical with those used in the United States at the time. Consequently the American leap from State Department protests over neutral rights into national belligerency remains an unexplained jump from pacifism and moral indifference to the crusade for saving civilisation. In November, 1916, Wilson was prepared even to contemplate a war against the Allies. Five months later he was seeking to lead them to victory. Here, surely, there is a missing link.

Demographers' Domain

POPULATION.
By Ian Bowen.
Nisbet and *Cambridge University Press.* 271 pages. 10s. 6d.

OF late years the economists have been almost shouldered out of the field of population studies by the statisticians, the geographers, the nutritionists and the unclassifiable apocalyptics. It is all the more satisfactory that the Cambridge Series should have been strengthened by a handbook comprehensive enough to draw these disparate studies into a single perspective. Professor Bowen's preface strikes a refreshingly undogmatic note; a connection "probably" exists between economic development and population change, and his book is an attempt to "outline how the student of economics, or the general reader, might now approach the subject." He divides it into three sections; the first is factual, giving the reader a broad notion of demographic procedures and current data; the second is analytical, beginning with an account, at once sympathetic and destructive, of Malthusian theory and going on to discuss various notions of population equilibrium, static or moving, the demand for, and supply of, labour, and migration; the third is speculative, examining future possibilities for Great Britain and for the world as a whole.

The first section is admirable, by far the best introduction available to the demographers' curious domain. The second is evidently the result of a laborious effort of compression and presents the general reader, or economic student approaching the subject for the first time, with some formidably tough reading; its summary is, moreover, rather more than fair to the neo-Malthusians—though it may well be held that most of them have asked for it. The third steers a somewhat tortuous middle course between the alarmists and the complacent; the world, according to the evidence as Mr Bowen sees it, can perfectly well support a much larger population than at present, and there is no need whatever to assume that the present rate of increase will persist indefinitely; but the transitional period will put a severe strain on human ingenuity and political wisdom and will demand more deliberate international action than at present seems likely. What that action should be, in his view, is hinted at much earlier in the book, where he deprecates any diversion to the general purposes of civilisation of resources which could be used to feed a "starving margin" of over-rapid breeders. Mr Bowen is, however, strictly honest about his value judgments; and if he forces the reader to formulate his own judgments with equal honesty, that is all to the good.

The Social Life of the Bee

THE WORLD OF THE HONEYBEE.
By Colin G. Butler.
Collins. 240 pages. 21s.

MAN has been exploiting bees for several thousand years, but he has never succeeded in domesticating them. Although he has been able to provide artificial nest-sites, from which the honey can be extracted more easily—for two species of honey bee which happen to prefer to nest in cavities—attempts to breed strains particularly suitable for human convenience have been started only recently and achieved only limited success. To be exploited successfully, these wild animals have to be understood—no mean task, for the world they live in is very different from man's: it is a world of silence; smell and taste are their dominant senses; flowers have properties of colour, movement and perfume for them, but shape is relatively unimportant; red is not distinguished as a colour, in fact the honey bee can probably only distinguish yellow, blue-green, blue and ultra-violet. Yet with only this strange and limited sensory equipment, and a tiny nervous system, they achieve a high degree of social organisation and an amazingly varied adaptability to changing circumstances: swarming, the production of new queens, the gathering of the correct food substances, are regulated in accordance with the needs of the colony for maintenance and reproduction.

A colony of bees thus poses innumerable problems that are important both to apiarist and biologist. In suggesting answers to some of them Dr Butler has provided a fascinating volume in the "New Naturalist" series. Writing clearly but authoritatively on such diverse aspects as evolution, colony organisation, behaviour of individual and colony, distribution and taxonomy, he takes his reader through a maze of problems, demonstrating with satisfaction the little bits of knowledge gained so far, but relishing even more the work to be done.

The most challenging and difficult problem presented by the social insects is their method of communication—the biologically adaptive organisation of the colony must depend on the integration of the behaviour of individuals. Von Frisch's discovery of the part played by the dances of bees in passing on information about the whereabouts of food marked a signal advance in this field. Dr Butler's theory of the "queen substance" may prove to be of equal importance. He suggests that those workers near the queen obtain from her a special substance that is then passed from bee to bee round a large part of the colony. As long as a sufficient supply of this substance is circulating, the workers "know" that the queen is all right. If the supply falls off, however, preparations are started for the rearing of a new queen. This theory, which is well supported by experimental evidence, clarifies many hitherto inexplicable aspects of colony organisation.

The book is well illustrated and clearly written. It can be thoroughly recommended to all who are interested in the behaviour of animals in general as well as in that of bees themselves.

Shorter Notices

BRITAIN—AN OFFICIAL HANDBOOK.
Prepared by the Central Office of Information.
Her Majesty's Stationery Office. 341 pages. Cloth covers: 10s. Paper covers: 6s.

Designed to answer the sort of questions about Britain which are frequently asked overseas, previous editions of this official handbook have had a free distribution overseas: this new edition is the first to be made available on general sale at home. It is still intended primarily to serve the needs of the overseas reader, but, in giving a world's picture of Britain, it forms a valuable reference book for home users as well.

This is not a tourists' guide to Britain, telling visitors where to stay and what to see, but it provides a wealth of factual and statistical information about most aspects of British life. Climate, households, the use of the land, government, industry, the welfare state, transport, defence, press, religion—these are some of the subjects covered. Naturally this is not a book intended to be read from cover to cover in one sitting, but some of the background information such as the brief history of monarchy and parliament and of Britain's industrial development is easily readable.

All readers of a book of this type will feel there are some omissions. Some will be surprised not to be able to look up the heights of any mountains in the British Isles, the population of any town other than London, the standard rate of income tax, or the size of the national income. One small slip which this journal cannot overlook concerns its ownership. Lord Layton is incorrectly designated as chairman of Financial News, Ltd., instead of The Economist Newspaper, Ltd. But, all in all, this is a very good ten shillingsworth.

★

CALIFORNIA FARM ORGANISATIONS.
By Clarke A. Chambers.
University of California Press. (*Cambridge University Press*). 292 pages. 28s.

This is a study of the three major agricultural organisations of California—the State

Grange, the Farm Bureau Federation and the *Associated Farmers*—during the twelve years from economic depression to recovery. The author provides a detailed account of the membership, leadership, organisational structure and geographic location of the three agricultural groups; he emphasises their different and often contradictory attitudes and policies on such matters as labour relations, unemployment relief, taxation, water and power, and partisan politics. In California, as in most of the other states, where pressure politics is often a substitute for party politics, the political activities of such powerful groups as the organised farmers are of considerable interest and significance.

Books Received

POLITICAL HANDBOOK OF THE WORLD 1954. Edited by W. H. Mallory. New York: *Council on Foreign Relations*. London: *Royal Institute of International Affairs*. 231 pages. 30s.

Great efforts are made to keep this very useful handbook up to date, and if it has been overtaken by events in one or two respects, that is no fault of the compilers. It seeks to set out, clearly and briefly, the political structure, the party programmes and personalities, and the orientation of newspapers in each country. A few minor errors are to be expected in a work ranging from Argentina to Yemen, but a British reader may be pardoned if he blinks at "Mr Atlee" and "Mr Gaitskill."

PEARS CYCLOPAEDIA 1953/54. 992 pages. 12s. 6d.

A strong light or very good eyes are the necessary equipment for 1,000 pages of minute print. Otherwise the book is a valuable, but cheap, mine of information on every imaginable subject, ranging from a Who's Who, an atlas of the world, a dictionary, the principal part of Latin verbs, rules for conducting a meeting, advice on gardening, make-up and cookery.

WILLING'S PRESS GUIDE, 1954. *Willing's Press Service*. 650 pages. 1 guinea.

THE ISRAEL ECONOMIST ANNUAL, 1953. *A Survey of Israel's Economy*. 272 pages. £3.

THE USE OF THE REVENUE BUDGET AS A MEANS OF FINANCIAL CONTROL. *Institute of Municipal Treasurers and Accountants*. 80 pages. 20s.

THE ANNUAL REGISTER: *A review of Public Events at Home and Abroad during the Year* 1953. Edited by Ivison S. Macadam, assisted by Hugh Latimer. *Longmans*. 488 pages. 63s.

STUDY OF THE PROSPECTS OF INTER-LATIN-AMERICAN TRADE (Southern Zone of the Region). *United Nations and HM Stationery Office*. 144 pages. 11s.

QUIN'S METAL HANDBOOK, 1953. *Metal Information Bureau*. 786 pages. £1 5s.

Letters to the Editor

Italy Between Left and Right

SIR—Your Rome correspondent's report on Italy in your issue of July 10th is indeed a woeful story. There are few bright spots in the dismal outlook, which is relieved only when your correspondent holds out the hope that American capital may strike oil in Sicily, and when he tells us that the present Scelba Cabinet is behaving better than he expected. Signor De Gasperi comes in for no better treatment. "Discouraged and sad," all that he can do now is to "write his memoirs." Your correspondent's tone obviously implies that these memoirs could not be on the lines of *The Economist*'s appraisal in August, 1953, of Italian recovery and De Gasperi's premiership. If I may quote: "His long premiership may be looked back to as something of a golden age, in which Italy enjoyed good government and freedom, both at the same time. . . . Real wages are 20 per cent higher and the production index stands around 150 compared with the nineteen thirties. . . . Land reform has been pushed to the limit of what is politically practicable . . . and by its import policies, the government has begun to succeed in making Italian industry more competitive. . . . Italy is one of the leading members of the Atlantic Pact. . . ."

Opinions on political trends can, of course, differ. But where there can be no question of opinion is in the realm of figures and facts. A survey of 1953 affords, if not a brilliant, certainly an encouraging picture of Italy's position today. National income (7 per cent increase on preceding year), agricultural production (9 per cent increase), and industrial production (9 per cent increase), have been steadily rising in the past years. Attention might then be drawn to the index numbers (housing, consumption of certain commodities—such as meat in the South—State Railway revenues, entertainments, etc.) that indicate improved "social" conditions, a better distribution of wealth, and a rising standard of living.

The charge of "immobilism" can hardly be levelled at a country that has started and is pursuing a land reform revolutionising thousand-year-old systems; and has at the same time introduced a new tax system involving a drastic change of custom and requiring an altogether different tax "conscience." To say that "land reform is marking time" is a half-truth liable to create a wrong impression. The apparent slowing down is due to the fact that all the land that could be reclaimed with comparative speed has already been distributed. The land now in distribution is the least hospitable, and requires greater reclamation efforts (deep ploughing, irrigation, pipelines, roads, etc.) before it can be handed to the farmer. Actually up to June 12, 1954, 66,979 families had received 351,522 hectares of land reclaimed. At that date 3,272 new houses had been assigned, 11,248 houses were building, 71 new villages and farming centres were building or had been built.

Other points are: Italy's policy of trade liberalisation (up to 99 per cent) is in the opposite direction to both monopolies and "immobilism"; judgment is still premature on Signor Vanoni's plan for full-employment, as the details have not yet been announced; expenditure by the Cassa del Mezzogiorno has not been, as your correspondent states, one-tenth in 1954 of what it was in the corresponding electoral period of last year: this year's figures are higher than last year's, and they are, of course, available.

Perhaps it is well to recall—as *The Economist* so fittingly did last year—that the country that is tackling the unprecedented agenda of century-structural problems was, a decade still "lying in ruins."—Yours faithf

Rome PAOLO C

Spotlight on Defeat

SIR,—Sir Winston Churchill may said a number of things abou prospects of ultimate victory, bu certainly said [not in public] toward end of 1940 that he felt sure Germans would not beat us but tha order to beat them we should rel the assistance of the United States. opinion seemed at that time to c spond with the facts of the mil situation.—Yours faithfully,

Headley, Hants STEPHEN KING-H

Power Politics and Atoms

Washington, D.C.

AS if Washington was not inevitably over-hectic in the concluding weeks of a congressional session in an election year, an important and complex piece of legislation has now become entangled in an embittered and devious controversy which is only indirectly related to the Bill in question, but which has already seriously delayed the Senate's programme. The legislation is the proposed revision of the Atomic Energy Act of 1946, to permit the private development of atomic energy for peaceful industrial purposes and a freer exchange of information with allied countries; the controversy is over the Administration's *maladroit* order to the Atomic Energy Commission to negotiate a long-term contract with certain private utility interests, known as the Dixon-Yates group, for the delivery of electric power to the Tennessee Valley Authority's transmitting facilities in the vicinity of Memphis, Tennessee.

This power is intended to replace electricity sold by the TVA to the huge AEC installations at Paducah, Kentucky, and thus to make it unnecessary for the TVA to build a steam-generating plant at Fulton, Tennessee, to supply Memphis, something which the agency has long hoped to be allowed to do. Champions of the TVA idea argue that this substitution of electricity produced by private enterprise for electricity that would otherwise have [illegible] to be produced by the public agency is the President's [illegible]dabout way of attacking the "creeping socialism" of the [illegible], which is so embarrassingly popular in the area [illegible]h it covers. The TVA, left intact, but unhurt, [illegible] be forced to swallow unwholesome doses of private [illegible], instead of being allowed to expand its own facilities [illegible]eet new needs, while by contrast the Dixon-Yates [illegible]ne is to be given extraordinary advantages, such as [illegible] reimbursed by the government for its federal income

[illegible] this it is answered that the Fulton plant would have [illegible]ed the TVA beyond the original conception of a hydro-[illegible]ic development merely supplemented by steam [illegible]ation; that to call a halt to TVA empire building [illegible] not necessarily mean the "sabotaging" of the agency; [illegible] that some alternative to the Fulton plant was needed in any case, if the TVA was to fulfil its obligations both to the AEC installations and the Memphis consumers, since Congress has refused four times to authorise the Fulton project. The Administration also emphasises that, by not building the Fulton plant, it is saving the taxpayer an immediate capital outlay of some $100 million, which would have dashed the hope of balancing the budget; this, it is held, cancels out the fact that, in the long run, the costs to the government of the Dixon-Yates scheme will exceed those of the Fulton alternative, because the price to be paid for the actual electricity will be higher.

If this were the end of the matter, it might be written off as one more round, although an important one with wide political ramifications, in the struggle over whether power should be developed by public or private interests. But the peculiarities of the Dixon-Yates proposal have made it dominate the debate over the revision of the Atomic Energy Act. To begin with, although the electricity shortage at Memphis may be the result of contracts entered into between the TVA and the AEC at Paducah, it is an awkward way of solving this problem to ask the AEC to make contracts in its turn for the supply of 600,000 kilowatts of electricity a year to Memphis. To official assurances that this is simply a matter of replacement, and that one kilowatt looks pretty much like another, there remains the objection, voiced by two members of the AEC itself, Dr Smyth and Mr Zuckert:

> The creation of such a contractual relationship would place upon the commission a continuing responsibility during the 25-year life of the contract [with Dixon-Yates] for stewardship in respect to matters irrelevant to the mission of the commission. It has been our observation in government administration that arrangements which are obviously incongruous at the outset tend to become even less clearcut because no one can foresee what contingencies may arise over a long term of years.

Again, this anomalous arrangement was being pushed through by the White House and the Bureau of the Budget completely over the head of the supposedly independent TVA (which, incidentally, is actually without a head at the moment, pending the long-awaited appointment of a new

chairman), and against the expressed judgment of three of the five members of the AEC. Even the General Accounting Office has complained that there was no competitive bidding and that the only alternatives considered were the TVA's Fulton project and a single, belated offer, rather clearly unsound, from a group of New York financiers. Quite apart from doubts about the legality of the AEC's purchasing electricity for the housewives of Memphis, there still remains the ugly question of whether such interference with this most sensitive and crucial agency will not jeopardise the respect which it has generally enjoyed, in Congress and out, since its birth. If the Administration can go to such lengths on behalf of a private electrical group *today*, congressional critics ask, what can be expected when, in a few years' time, the AEC is deeply involved in much more complex questions concerning the use of atomic power by private industry?

The proposed new Atomic Energy Act deals extensively with these questions and, even without the doubts raised by the Dixon-Yates incident, there would be room for hot debate here. The non-military development of the atom promises to reproduce the public *versus* private power argument in new and possibly more intense forms. The report of the Joint Congressional Committee on Atomic Energy, which accompanies the Bill, strives hard for non-partisan compromise, but here and there the issues break through the surface. The chairman, Representative *Sterling Cole*, for example, dissents bitterly from the provisions in the Bill compelling the owners of atomic patents to grant licences for their use; this attempt to frustrate the formation of monopolies in the atomic field amounts, in Mr Cole's view, to "socialism run rampant" and would kill the incentives to individual technological advance. On the other side of the fence, Representatives Holifield and Price darkly predict the development of a new monopoly, licensed by the AEC, with far fewer safeguards for the public interest than are now imposed upon conventional utility companies.

*

These debates over the hypothetical economic future of the atom inevitably divert much-needed attention from the vexing problems of international atomic policy. Mr Holifield, the California Democrat whose record of hard work as an original member of the Joint Congressional Committee has made him the epitome of his party's approach to the atom, regrets that the two sides of the question have been included in one Bill for joint action. He feels that

> the Congress *should* put first things first and enact those amendments which might be necessary to implement the President's proposal . . . for an *atomic pool* of resources to encourage peacetime development of atomic energy among nations and to prepare the way for international accord on atomic armaments.

To the concern of many informed Americans who fear that the United States may alienate its friends abroad by failing to relax its security restrictions sufficiently to indicate trust in its allies has now been added a new note: anxiety lest the United States be caught hugging "secrets" to its breast which are genuine secrets no longer, and which the Soviet Union may begin to use for the benefit, or rather the seduction, of underdeveloped *countries*. Considering the degree of heartfelt interest in his proposal for an international atomic pool which the President showed at his news conference last week, the new Bill appears rather hesitant in its approach to the release of information to other nations. Admittedly the problems of security involved are as ticklish as is conceivable and such unfortunate side issues as demagogic nationalism or the jealousy and suspicion of many in Congress towards the Executive's control of foreign policy are all too likely to becloud discussions of these *matters*, if not to influence *final* decisions on them. Yet the foreboding persists that the United States could lose the race for atomic friendships with other nations, without necessarily falling behind in its own scientific and technological supremacy, and in spite of the serious and responsible concern over the broad range of atomic problems reflected in the Bill which is now being pushed through Congress.

So Far, So Good

SENATOR FLANDERS' reaction to the embittered departure of Mr Roy Cohn, the young chief counsel of Senator McCarthy's investigating subcommittee—"so far, so good"—was shared by almost everyone except Mr McCarthy himself. Many in the Republican party in fact feel that the resignation, which forestalled almost certain dismissal by the committee, goes far enough and is good enough to end the whole unhappy affair. In this view the "sacrifice" of the young man who appeared daily as Senator McCarthy's evil genius on the nation's television screens, during the hearings on the dispute with the Army, may take away from the Senator the stigma of his dictatorial methods and leave the voters with only the memory of his anti-Communist successes. This can only be achieved, however, if Mr McCarthy on his side behaves better now that Mr Cohn is gone, and the other members of the committee control the Senator more firmly; there was little sign of any improvement in either respect last week when his one-man investigation of Communist infiltration into defence plants was resumed.

Mr Flanders, however, is determined to make his Republican colleagues in the Senate stand up and be counted on McCarthyism. He has refused to be deterred even by the danger that he would delay the President's essential legislative programme by insisting on a debate, an argument of which the party's leaders have made much in their efforts to avoid a vote on this question. But Mr Flanders has now shifted to ground where he has more chance of obtaining a majority. Instead of demanding that Mr McCarthy be deprived of his committee chairmanships, something so contrary to Senate tradition that it seems as dangerous to Democrats as it does to Republicans, Mr Flanders is now asking only for a straight vote of censure on Mr McCarthy; even this has not been done for twenty-five years. The debate has also been postponed until the end of the month when the support of leading Democrats, including Senator McClellan, absent this week from Washington, is promised. But by then, unfortunately, the pressure for adjournment will be even more on the side of the Republican leaders and against the courageous Mr Flanders than it is at present.

Road Map for the Future

THE annual conference of State Governors would seem very suitable ground on which to map out the President's inspiring new road-building proposals, since any such programme must involve state governments. But in practice Mr Eisenhower was ill-advised to choose this occasion, for the present scheme is one of the chief sources of friction between Washington and the state capitals; under it, even though the federal highway grants, financed out of the federal tax on petrol, must be matched with state funds, the federal government decides how the money is to be spent. The Governors had just been discussing, not for the first time, a suggestion that the federal government should give up both its petrol tax and its highway grants and leave the states free to raise more money by their own petrol taxes and to build their roads in their own way. Against this background Mr Eisenhower's proposals looked to many of the Governors like gratuitous interference, doubly objectionable from a Republican President pledged to develop close co-operation with, and greater independence for, state governments.

Some states, however, such as Nevada and the Dakotas, with long roads and few motorists, get more in federal grants than they pay in petrol taxes, and their Governors were among those who, on taking a second look at the President's proposals, found to their relief that they were only a vague sketch with more immediate relevance to next November's election than to a federal highway system. Mr Eisenhower was in fact declaring his faith in an ever-expanding America and incidentally his readiness to embark on a public works programme should the economic pump need priming. Spending on the nation's roads has certainly lagged behind the country's growth and that growth is also being hampered to some extent by obsolete communications, traffic delays and accidents, and the legal disputes arising out of them. Even to begin to meet the needs of an estimated population of 200 million in 1970, the President believes, an extra $5 billion a year would have to be spent on the roads for the next ten years; this would more than double the present combined expenditures of federal, state and local governments, but charges of extravagance could be met by pointing to the inadequacy of the present system from a defence point of view. Most of the Governors decided in the end that they had no argument with the President's general thesis, in spite of its New Deal look, and he, for the present at least, is ready to leave the details and the financing to them to work out on their own lines.

Housing Frauds?

THE Senate and House conferees met to work out a compromise on the Housing Bill while officials of the Federal Housing Administration were still being dismissed before the Senate Banking Committee was still hearing how highly respected builders as Mr Levitt of Levittown had managed to make millions of dollars out of government programmes for encouraging home building. The main causes of these quick but apparently legitimate gains seem to have been allowances of 5 per cent each for architects', builders' and other fees, charges which were incurred at a much lower rate, if at all, in large-scale housing projects, and other over-estimates by housing promoters when applying for government-insured loans. In the circumstances it would not have been surprising if the compromise Bill had gone farther than the Senate version in curbing these "windfall" profits; the House dealt with the Bill before the scandals broke.

The conferees were, however, satisfied with the Senate's requirement that builders must now certify their costs when construction is completed, and reduce both their mortgages and their rentals if the final figures are lower than their original estimates, instead of putting the difference in their pockets; only a reasonable profit, probably about 10 per cent, is to be allowed in future. The compromise Bill also goes nearly as far as the President, and much farther than the Senate wanted in the direction of encouraging private housing activity, by making mortgages easier to obtain, by extending government insurance on loans to cover old as well as new houses, and by arranging for the gradual transference to private enterprise of the government agency which now provides a secondary market for mortgages.

Unfortunately when it came to the public housing programme, the compromise was again nearer to the House than to the Senate version of the Bill. Instead of the authorisation for 140,000 units to be built in the next four years, for which the President had asked, the Bill provides for only 35,000 units of public housing in the current year, and these units must be for the accommodation of people turned out as the result of slum clearance and redevelopment schemes. Since such schemes cannot begin until alternative homes are available for those displaced, there is a danger that there will be neither hen nor egg to start this new public housing cycle. To the five conferees, including the Republican Senator Ives of New York, who refused to approve the compromise, the public housing provision is a fraud which can hardly serve even to save the President's face. Mr Eisenhower himself has promised to renew his plea for public housing at the next session of Congress.

Unemployment Changes

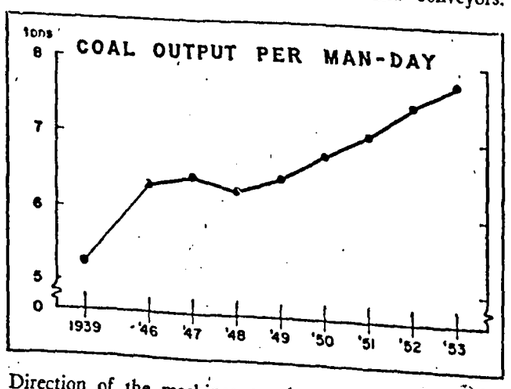
THE failure of the unemployment figures to meet seasonal expectations in June was for once a satisfactory sign: unemployment rose by only 42,000, much less than the usual increase at this time. The explanation was that the labour force also failed to rise as much as usual, apparently because many young people leaving school decided it was not worth looking for a job. The total number at work was still over a million less than a year ago, unemployment was higher than in any June since 1950 and employment in manufacturing continued to fall. But the average number of hours worked, a sensitive indicator, was going up, the number of those who had been out of work for 15 weeks or more dropped significantly, and the number of insured workers claiming unemployment benefits also fell.

This picture is not encouraging enough to distract attention from the need for improvement in the unemployment insurance system, something which Congress is considering seriously for the first time since 1935. The Bill which has passed the House and is well on its way through

the Senate makes employers with only four or more workers, instead of eight or more as at present, liable to the unemployment insurance tax of roughly 3 per cent of the annual wage bill. Many state systems already apply to such cases and some to employers of only one or more workers. The new federal law, if passed, will extend coverage to an additional 1.3 million workers and also to 2.5 million government employees. The Bill goes too far already for many businessmen but not as far as the President asked even as regards its extension of coverage, and it fails in more important ways to put as large a feather as he had hoped for in the cap of the Republican-style welfare state.

The Administration, like its Democratic predecessor, had wanted to set a national minimum of 26 weeks for the duration of unemployment benefits and of half the employee's weekly wage for the amount of benefits. At present the duration varies from 5 to 26 weeks and the amount from $5 to $50 a week, depending on state laws. The federal government merely collects the tax, retaining 10 per cent of receipts for its expenses, and sets basic requirements. After that the states are free to frame their laws as they like; federal interference is resented in this field as in every other, but the present wide variations in regulations and administration could have national repercussions if unemployment becomes more serious and more sustained. Nevertheless, Congress seems unable to bring itself to deal with the situation.

Mechanisation in Coal Mines



New York.

AN article last week pointed out that American coal producers are relying primarily on higher productivity to offset their heavy wage bills and to set the industry on a more competitive footing with its rivals. Progress in this direction since the war has been achieved mainly by emphasising opencast (strip) mining, in which output per man is three times as high as in underground mining. Large power shovels, excavators, bulldozers, and such new machines as the "walking dragline," for the swift removal of heavy overburdens, have extended the range of feasible opencast mines until they now account for nearly a quarter of the total output of the industry. Operations have been further extended by the use of giant augers—rotary bits three feet or more in diameter—which can bore horizontally for 200 feet, ejecting the coal automatically from the hole. But even with these devices, the deposits which can be mined economically by surface methods are essentially limited, and it is in underground mining that the application of new machinery will have long-term significance.

Mechanised production can be carried further in the United States than in Europe, owing to the prevalence of thick and horizontal coal seams and the relative absence of faulting in American mines. Over 95 per cent of all underground production is already cut by machine, and over 78 per cent was mechanically loaded in 1953. With new roof bolting devices to facilitate the installation and manoeuvring of machines, transport underground is speeded up by mobile off-track power loading equipment, larger shuttle cars, and better belt conveyors. Machines that can both cut and load coal in a single operation are becoming more frequent, and already nearly 300 of these complex mole-like "continuous miners" are in service or on trial.

In addition, new mining techniques, some based on European experience, are being introduced into American mines. The easily worked but wasteful traditional American system of "room and pillar" mining in thick seams is now being replaced by "longwall" mining on the German pattern; this makes possible the use of large coal planers and continuous mining machines along the whole length of the seam, which is mined laterally. "Longhole drilling and shooting," a form of remote mining which can be practised in steeply sloping seams, is also gaining acceptance. By these improved methods and by the introduction of nearly $1 billion worth of new machinery, output per man in underground mines was increased from 5.04 tons a day in 1945 to 6.39 tons in 1952; it has since risen further and the growing share of the more productive surface mines has pushed up output per man for all mines even more.

The next and more ambitious step is to eliminate the men at the coal face completely by the use of remotely controlled continuous mining machines and conveyors.

Direction of the machines can be controlled by electric sensing devices on the cutter—perhaps to be replaced soon by television "feelers"—which register on a screen in the control room. Both these remote miners and the augers have been developed for operation from the surface, and it is hoped they can be adapted for use underground. Thus, the ultimate goal—a fully automatic production from coal face to consumer—may soon be technically possible even if it is not yet feasible from an economic point of view.

★

The new technology will inevitably force its own pat on the organisation of the industry. Not only is co tration of output necessary to justify the heavy ove cost of the new machines but, if a proper balance of o is to be obtained between the cutting and lo machines, and if these machines are to operate continu at rated capacity, a company must organise a suitable layout and production pattern. It is now a questio adapting the mine to the machine, rather than the mac to the mine. Only large companies with adequate finar reserves can meet these conditions. At present, som per cent of the total output is provided by 300 of largest companies, with the remaining 20 per cent divi between some 6,700 smaller concerns.

Inevitably production will be concentrated in the more efficient mines—or in new ones—and the old high-cost pits will be closed. In periods of exceptionally slack demand, as at present, this trend is intensified in order to keep the more highly capitalised mines working at capacity. A solution to this problem of ensuring a steady demand is also being sought by closer integration with large consumers; intensive mechanisation is most rewarding in "captive" mines—mines either owned by, or with a close contractual relationship to, the steel companies, electric utilities, chemical companies and other large coal consumers. Integration, in turn, may mean the siting of new mines with a view to the large consumers of the future, especially those that can be persuaded to build new plants near the new mines.

This trend toward the greater concentration of production holds out little hope to small, marginal producers; these either cannot afford to mechanise, or can provide neither the physical conditions in which to get the best out of the machines nor the steady output needed to spread overhead costs effectively. Many of the small producers who specialise in low-cost strip mining, or who have the advantage of low-cost non-union labour, may be able to stay in production as long as these special advantages can be maintained, but the others will drop out. The industry can at least be thankful that the miners accept the consequences of their insistence on high wages and show commendably little opposition either to technological change or to the closure of high cost pits.

Pandora's Police State

EVEN though last January Congress was wildly enthusiastic about the President's proposal that anyone convicted of belonging to the Communist conspiracy should lose his American citizenship, neither house has yet given practical effect to that enthusiasm by passing the necessary legislation. Nor have many of the other measures in the Attorney General's large load of anti-subversive Bills got beyond the committee stage. The more the legislators look into this Pandora's box, the more they suspect that they are being asked to let loose a swarm of threats to America's civil liberties and constitutional rights—and Congress has not enough confidence in the Attorney General, Mr Brownell, to take his word for it that there is no danger of a police state hidden in his proposals.

The Administration will therefore have to wait until next year and the next Congress for most, if not all, of the additional legislative authority which it considers essential if the net against Communist infiltration is to be tightened. And if the example of the present Congress is followed, that authority, when it comes, will be in a more modified form than the Administration likes. Already the House Bill permitting the use in court of evidence obtained by tapping telephone wires has restricted this power to such an extent that the Administration regards the Bill as useless; the Senate version looks little more satisfactory and even Senator

McCarran, not usually accused of liberalism, seems to think Mr Brownell has gone too far this time. The House Judiciary Committee is proposing that an independent commission study the whole question of Communists in trade unions and defence plants, before legislation is considered, while the Senate committee has approved a Bill dealing with Communist-infiltrated unions and businesses by methods less drastic than the forced "dissolution" and "liquidation" suggested by Mr Brownell. The only Bill of this kind that has actually been sent to the White House is that requiring subversive organisations to give the government a list of their printing machinery. Another Bill that has a good chance of passage at this session, for it is through both the whole House and the Senate committee already, is that making espionage in peacetime punishable by death.

SHORTER NOTES

The United Hatters, Cap and Millinery Workers have provided a "very happy example of labour-management co-operation," according to the company concerned, by granting a loan of $250,000 to the country's largest millinery manufacturers, in order to keep the firm in business and to protect the jobs of the people engaged in the trade. In spite of its own financial difficulties, as a result of a costly strike earlier this year, the trade union has agreed to contribute $50,000 from its treasury and another $200,000 from the workers themselves, at a rate of $200 each, as an investment in the security of their jobs. Without the union loan, the company, which has experienced a sharp drop in hat sales and has had to make heavy investments in new productive facilities, would have been obliged to shut down two of its plants and discharge 700 of its workers.

★

The Interstate Commerce Commission has revoked its earlier ban on the extension of "piggy-back" operations, thus permitting six Eastern railways to begin carrying lorry trailers on railway flatcars. The commission's previous objection to the new service, designed by the railways to make up for the decline in freight traffic, was based upon its desire to protect the trucking industry against unfair competition from artificially low rates; however, the ICC will have full opportunity—at the forthcoming hearings on the question—to consider ways of regulating "piggy-back" services.

★

President Eisenhower has given his support to legislation prohibiting the payment of a civil service retirement pension to Mr Alger Hiss, who was convicted of perjury in 1949, after his resignation from fourteen years of government service. Congress was "shocked, aghast, enraged, and boiling mad" at the possibility of Mr Hiss receiving his $708 annually, beginning in 1966, and this mood was intensified when the Civil Service Commission and the Bureau of the Budget opposed Bills that had been introduced to remedy this situation. It turned out, however, that the agencies objected only to those Bills which interfered with the contractual agreement between the government and an employee involved in a pension; they are prepared to support a Bill which takes pensions away from any civil servant convicted of a felony.

★

Smaller taxicabs will be operating in New York as a result of the Mayor's approval of a new law permitting the use of stock automobiles as taxis, in competition with the special "jumbo" cabs. Over a hundred taxicab owners have already indicated their preference for the smaller type of cab, in general use in other American cities.

★

A Robert A. Taft Memorial Foundation has been established, as a non-profit and non-political educational organisation, to perpetuate the ideals of the late Senator. The organisation, which has already announced its readiness to accept contributions from "the Senator's many friends and citizens through the country who have wanted to make a contribution in his memory," will use its funds to aid schools, libraries and individuals "to promote the advancement and diffusion of knowledge and understanding." The new foundation—unlike its older and wealthier competitors, such as Ford, Rockefeller, or Carnegie—should be fre from any fear of investigation for subversive activities Congressman Reece's Committee, for Mr Reece has l been an admirer of the late Senator.

★

The influence of the Eisenhower Administration has praised by the International Temperance Associatio reducing by one-third the expense account charge alcoholic beverages for state and diplomatic functions d the past year, compared with the 122 million cocktails s by State Department officials during the nine years be 1942 and 1951. The Association regards heavy alco consumption as "the single most influential factor lowered United States prestige abroad"; but this h explains why a decline in American prestige has in the year accompanied the decrease in alcoholic consumptior

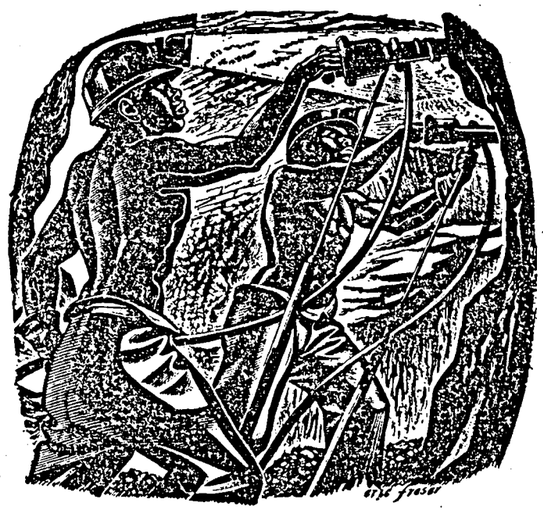
OLWOBULUUNGI BWABANTU!

FOR OVER FOUR YEARS Mukasa has watched the great dam being built at Owen Falls, to make more electricity for Uganda.

Mukasa has seen much good come from electric power.

In this new hydro-electric scheme he sees a brighter future for his people. "Electricity," says Mukasa, "is *olwobuluungi bwabantu*—for the benefit of Man."

Her Majesty the Queen, homeward bound on her world tour, recently opened the Owen Falls dam. The six 16,770-kVA waterwheel alternators, which make the electricity, are being supplied by The British Thomson-Houston Co. Ltd., one of the nine famous British companies that together make up A.E.I.



A.E.I. (Associated Electrical Industries) make everything electrical from a turbine to a torch bulb.

The World Overseas

Creeping Convertibility

WESTERN EUROPE and the sterling area inched a little closer to their convertibility goals last week. Mr Butler and his fellow finance ministers are in general agreement on how convertibility is to be approached and on the problems which must be solved before it becomes a reality. Before C-day (the day when non-resident sterling acquired by current trade can be freely turned into dollars) a number of decisions must still be taken and a number of things must have happened; after C-day more steps must follow before full convertibility is a reality. C-day will not be, in itself, a day of drastic decision but simply one point (and it is still a movable point) along a line. The sequence of events leading from where we are now to full convertibility is not a rigid one. But the road is a long one and there are many tempting resting places on the way. Although the two-day meeting in Church House last week charted the course, it did not set the time-table and any early announcement that the pound is now freely interchangeable with the dollar is ruled out by the course set. Talk about convertibility will be with us for months, and perhaps for years, to come. It is talk with a language of its own and much of it is pure jargon, but it is not yet altogether past translating.

Three big and interlocking problems and a cartload of lesser problems confronted the OEEC ministers. The first was the problem of trade, the second the problem of credit, and the third the problem of organisation. On each of these a large measure of agreement has been reached, the area of disagreement identified, and decisions taken on how to proceed, or how to put on ice. The result is a programme which is clear in outline but fuzzy, frequently intentionally so, in detail. It is a programme which divides into phases: first, a pre-convertibility phase; second, a transitional period of about a year which will begin when pound sterling becomes convertible for non-residents a number of European currencies also become convertible; and third, the future which is forseeable at the end of a decent, but not too long, transitional period. It is a programme which has the great merit of concentrating principles. The temptation to legislate in detail too far in advance is one of which Bretton Woods has taught the lers.

The principle which has rightly dominated all the discussions on convertibility at the meetings of the OEEC is that currency convertibility and trade liberalisation are—or at least should be—two sides of the same coin. Accordingly, there has been general agreement on three important trade objectives. First, at C-day no OEEC country, whether or not it is itself ready to make its currency either partially or fully convertible, should retreat from the level of liberalisation of its trade with other European countries then prevailing. Second, between now and C-day fresh efforts should be made to eliminate the remaining quantitative restrictions on intra-European trade. And third, during the transitional period the OEEC countries should not only continue with their programme of intra-European trade liberalisation but should progressively remove restrictions against dollar goods. These are important and difficult decisions. Further progress on removing trade restrictions even within Europe will not be easy. Except for France, most countries are already down to a hard core of quotas which are unimportant from the standpoint of the country's balance of payments but considered vital as protective devices. Those with low tariffs, such as the Scandinavian and Benelux countries, will naturally feel that the problem of eliminating the remaining quotas cannot be looked at apart from the question of tariffs. But the linking of these two problems raises knotty questions of principle and procedure which will be time-consuming and difficult to solve.

The decision that there should be no backsliding on C-day and that restrictions against dollar goods should be removed as well is even more difficult and leads directly to the question of credits and organisational arrangements. It is generally assumed that not all the European countries will be able to make their currencies convertible at the same time. But it is clearly to the interest of the countries which can become convertible, as well as of advantage to those that cannot, that trade liberalisation among the entire group be maintained. In the absence of a prior agreement to do so, the almost inevitable development would be discrimination by countries with weaker currencies against imports from countries with stronger currencies and a return to bilateral trading. It will be hard for a country which does not believe its currency is strong enough to become convertible to agree to maintain a liberal trade policy in Europe, and to go further and join with the "convertible" OEEC countries in removing restrictions against dollar goods. Accordingly, the plan is that when C-day comes the European Payments Union, which in its present form would cease to exist, should be succeeded by a new European Fund.

Although little has yet been said about the new fund, its general purpose would be to enable a country in difficulties to obtain funds on a short-term basis and thus to avoid reimposing trade restrictions. Presumably the normal

recourse of a country which had become "convertible" but was facing temporary balance-of-payments difficulties would be to the International Monetary Fund, and the European Fund would be drawn on principally by the "inconvertibles." But just as the IMF will only "work" if, in fact, the basic conditions of convertibility are present, so the European fund will only "work" if there is some real prospect that after a reasonable length of time the inconvertible European currencies can become as convertible as their stronger neighbours. As a direct descendant of the EPU, it should be easy for the proposed fund to inherit the freedom of discussion and mutual criticism that has been characteristic of the EPU. But unless the temptation to regard the European fund as a source of easy credit is resisted, and the price of assistance is both an examination of the reasons which have led a country to require funds and some assurance that the situation will be corrected, it is difficult to see how the new fund, like so many old funds, will be able to do more than buy time.

Ministerial decisions appear to have been easier on imminent problems than on hypothetical future developments. In international gatherings it is frequently easier to be more positive about tomorrow than about today, and in so far as the decision to concentrate on immediate questions reflected hard-headedness it is all to the good. But, at least in part, the unwillingness of ministers to look for long or too hard at the crystal ball was not caution or realism but wishful thinking. Although considerable progress has been made in agreeing both on immediate next steps and on the ground rules for a convertible world, the question of the interrelated roles of the IMF, Gatt and the OEEC in assisting countries to respect these rules and in disciplining violators was left completely unresolved.

Future of OEEC

The difference of view centres on the role of the OEEC, and, paradoxically, the difficulty arises because that organisation has been surprisingly successful, as well as somewhat unorthodox. One view, and a logically impregnable one, is that once the principal European currencies are convertible and trade discriminations against the dollar have been largely eliminated, there will no longer be an identifiable regional problem, and that the appropriate places for trade and payments discussions are Gatt and the IMF, somewhat modified and linked more closely together than at present. The other view is that the OEEC trade and payments system has worked, and therefore it would be sense to expand it rather than to jettison it. The British (and Commonwealth) Governments tend to favour the first approach, the Continental countries the second. The Americans appear to favour the first, but raise sceptical eyebrows when new organisational links between Gatt and the Fund are mentioned.

The reasons why the OEEC approach has worked well are essentially three, and the three are closely interrelated. First, trade and payments questions have been considerd together; secondly, technical discussions have had close ministerial direction; and thirdly, and by far the most important, countries have abandoned the sharp line between matters of internal and external economic policy that has traditionally marked international discussions. It should not exceed the power of man's devising to reproduce these constituents of success in the world-wide organisations by some adapting and reorganising. And if that can be done, it should be done. For it is difficult to see how the alternative of building on the OEEC can ever be a full alternative. It is unlikely that Japan, or for that matter a number of the Dominions, would see the point of joining a European club in order to talk about world trade. The problem of how to make the IMF and Gatt more effective would therefore remain even if the OEEC were to continue to discuss trade and payments questions. Furthermore, the key country in a system which is premised on convertibility is the United States. Although the United States is an associate member of the OEEC and an observer on the managing board of the EPU, the discussions in those organisations have never involved American undertakings on trade and monetary policy. There is at least some American commitment on which to build in Gatt and the IMF. Sentiment for the familiar should not be allowed to count in the final decision.

There is always the chance that the move toward convertibility will get stuck along the way, and that a multilateral non-discriminatory trading system will continue to be a pleasant dream. Achievement is, in any case, not imminent, the immediate tasks of the OEEC are obvious, and the transitional period will call on all its reserves of ingenuity. These are strong temptations to continue to wait and see. But the IMF holds its annual meeting in September and the contracting parties to Gatt meet to re-examine the General Agreement in November. Continued agreement to disagree among the member countries of the OEEC will only serve to make vigorous action by these organisations more difficult.

The Cypriot's Dilemma

FROM A SPECIAL CORRESPONDENT

IMAGINE a small British colony in a Channel island under the most benevolent French administration known. Its members would admit the economic advantages of their way of life—generous subsidies, French defence expenditure, cafés, good wine, French cooking—but, if pushed to a testing point, something in them would always vote for beer, gloom, darts, pools and sodden playing fields. They would not waver even if England were poor and shabby. That is roughly the position in Cyprus.

The Cypriots do not dislike Britain; they merely long for Greece, and the chief factor in this longing is a feeling that they can never "belong" among Anglo-Saxons; f years Britishers in the island have made Cypriots feel t by their display of unselfconscious superiority. Cypr feel that the British think them fit only for jobs in the office, whereas poor lean-wolf Greece offers them a equality of citizenship with opportunities to supply gen heads of the foreign office, and even prime ministers. deep sense of frustration deserves sympathy. Force the polls for one or other extreme solution—for unal Greekness with no material British link or unall Britishness with no emotional Greek link—they would a nervous breakdown as they voted, but they would n all vote for Greece for this reason alone. In their h of hearts they would prefer never to be put to this ag ing test.

Lately, therefore, they have brought off a *coup*. They now able to relax at the centre of stillness in the hea

a tropical storm, because they have succeeded in shifting the real flashpoint of the matter to Athens. In a sense they feel that in persuading the Greek government to espouse the cause of union the first step in the *enosis* campaign has been successfully completed. "Mother Greece," after a long period of embarrassed thought, and after several attempts to initiate private discussions with Britain, has been reluctantly forced to take up a question which, however one regards it, must be a most distasteful and awkward one for Greek diplomacy to deal with.

The bluntness of the British refusal to discuss the matter has had a sobering effect both in Greece and in Cyprus; the initial fury of the public has given place to a more subdued attitude, and in the island people are for the first time beginning to consider a constitution as a serious possibility. Field Marshal Papagos has also mentioned it, but only as a short-term gambit. While the Cypriot press maintains an uncompromising attitude to any suggestion of weakening over *enosis*, the Cypriots appear to have begun to appreciate how distasteful the whole problem is to Athens—if not to realise that the Greeks of Greece would lose more by Anglo-Greek discord than the Cypriots could gain by union.

The present deadlock has been greeted in Cyprus with certain subdued relief; for it is one of the paradoxes of the situation that, genuine and imperative as the psychological need for union is, the Cypriot is far from blind to the grave material hardships which would follow it, and fall on a people completely unused to them. The substitution of the drachma for the pound, and of the Greek judicial system for the present relatively honest if leaden-footed one, not to mention the intrusion of commercial rivals from Greece, could have grave effects on business no less than on pleasure. If Cyprus were to sink back into the anonymous neglect in which Crete or Xante smoulder today it would be a poor look-out for the rich middle-class which lives a comfortable English suburban life in which cars, radios and gold wrist-watches are within reach of the *many* rather than the few. The standard of living is fantastically high compared with that of Greece; and while it is true that the apparent health of the economy of the island is really artificial—that is, not based upon its real resources—nevertheless trade is booming and money pouring in.

The Attractions of Austerity

In justice to the *enotists*, it must be said that they have r tried to disguise the material hardships that would t them after union. Rather have they taken them for le-cry. The responsible intellectuals repeat that these tal benefits in the long run only serve to emphasise epen the Cypriot Greek's feeling of dissatisfaction, dimly senses that the Mediterranean way of life with alities has something less artificial to offer him than isant padded suburban existence; and he even goes s to say that distasteful obligations, such as military in the Greek army, would do Cypriots a lot of good nsolidate their feeling of belonging to their own

problem, then, whose mainspring is purely psycho- has been blown up to an intimidating size by British to think it important, and has assumed a purely l aspect which threatens to strain the good relations g not only between Britain and Greece, but also n Greece and Turkey. For it goes without saying that the large Cypriot Turkish minority, about 100,000 strong, has been alarmed by the possibility that the island might be returned to Greece. While the claims of the Turks were originally based only on the fear that material conditions would suffer under a Greek administration, there are distinct signs that the Turkish claim has now grown into something positive since Ankara has shown itself disposed to lend an ear to the complaints of the Turkish minority of Cyprus. It will be remembered that when Ataturk's grave was filled with soil taken from the various provinces of Turkey it was not forgotten to add a handful of the soil of Cyprus to it—official recognition of the validity of the Turkish claims which much encouraged the Turks of Cyprus. Many Turkish minds would be set at rest if faith could be placed in British consistency and fairness.

Moral conflict is everywhere, and responsibility for solving it now lies with Athens, for the Cypriot Right could easily be prevailed upon to follow any directive given by the Greek government. The Cypriot Left, which is *enotist* but has no other views in common with the Papagos government since it follows the advice of Moscow, would be less tractable. Indeed the whole question of change and compromise raises problems not the least of which would be that of imposing the constitution and elections that are the core of present British policy on an island where, on a straight vote, the Communists would dominate the political scene. A great gap in the case for *enosis* and self-determination is created by the political strength and organisation of the Cypriot Communists, whose appeal the Cypriot Right has good reason to fear. This weakness in the *enotist* case will be described in a later article.

Guatemalans Take Stock

FROM A CORRESPONDENT IN GUATEMALA CITY

THERE was a great gasp of relief in Guatemala when the revolution finally ended and practically all the Communists were swept together into ineffective piles—the important ones huddling together for asylum in the foreign embassies, and the small fry jammed into the jails. But no one, neither the market women, nor the taxi drivers, nor least of all the new government, imagined that the long crisis had reached a full stop. Even though the war was, militarily, on the tiniest possible scale, politically it had disorganised the country as completely as if there had been grandiose battles and total surrender. The government, the political parties, the labour unions, and the independent agencies dealing with such matters as social security and land reform, had all been so thoroughly infiltrated by Communists that there was no alternative to starting all over again. Even the army will eventually be reorganised, after a purge.

The most nerve-racking question, in fact, the one really important question that stirs all Guatemala, is how the new start will be made. Most people had no particularly strong feelings one way or another about the regime of President Jacobo Arbenz until its last few days in power, when it went semi-hysterical in a paroxysm of revenge for the impending defeat. There were some things people liked about the Arbenz government—the intensely protective labour laws, the social health schemes in the cities, and the redistribution of land in the country in so far as they received rather than

gave up plots. There were also things they did not like—the arrests, the dull fears, and most of all, the international hullaballoo that nearly ruined all business except coffee, and unnerved the normally placid Guatemalans.

For four years, the Arbenz regime proclaimed in shriller and shriller tones that the whole fuss was nothing but the greed of the United Fruit Company backed by old-fashioned United States imperialism. By the time the end came, there were few, if any, Guatemalans who had not absorbed enough of the din to suspect there might be something in it. They are now waiting to see if their suspicions are correct.

The United Fruit Company's contract with its 12,000 banana workers will be renegotiated. How? What will finally be done with the company's expropriated but still undistributed land? How much more than the $1,500,000 offered in compensation, and rejected as ridiculously inadequate, will be paid if expropriation is confirmed? The land reform law was suspended long before any important change could be effected in the old proportion of ownership—70 per cent of the cultivated land held by 2 per cent of the people. The Guatemalan Indian, naturally peaceable, sombre and resigned, has had enough of a taste of the greatest treasure he knows, land, to feel a tantalizing craving for a real feast.

The Indians have always been excruciatingly poor, backward, illiterate and half-pagan, but they are not stupid. To the surprise of President Arbenz and his followers, they could not be incited to rise violently in support of slogans and a group of earnest men in the capital. They took practically no part in the revolution. But they know what they expect, and they still have the arms hastily and hopefully distributed to them. The new regime has promised that land distribution will start again when a new constitution has been written and a new, improved law passed. Only 10 per cent of Guatemala's land is cultivated. With money, a good deal of the land hunger could be peacefully satisfied.

Landowners see the Light

Until a very short time ago, Guatemala's big *finqueros* could see no reason for any of this. They were more than content with their near feudal status, they were adamant about it. At least some of them seem, under Communist pressure, to have seen the light. Just after the Arbenz regime was overthrown, the ultra-conservative Association of Guatemalan Agriculturists placed large advertisements in the newspapers urging their members to make no change in their relationships with their workers, and to take nothing away from them now that the pressure is off. The peasants are waiting to see.

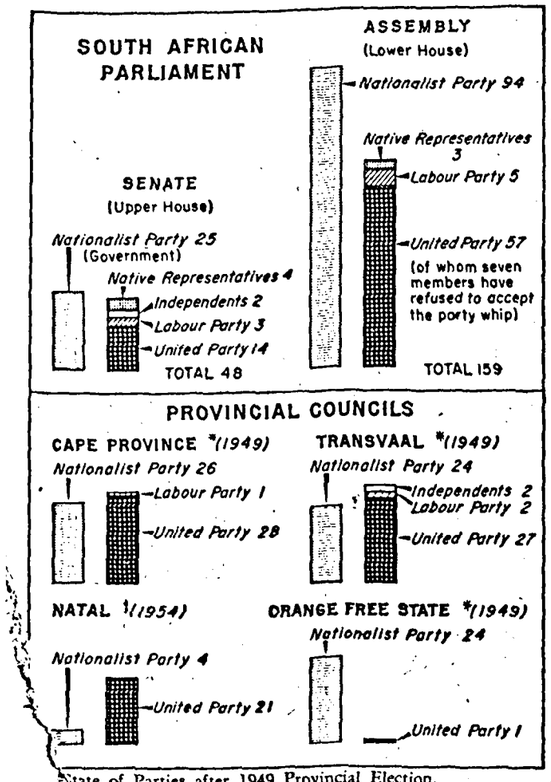
The intellectuals are waiting, too. They have been through a painful spiritual struggle. One man, held a prisoner by the Arbenz regime for fifteen months, tortured until death seemed preferable, and then sent before a firing squad which waited thirteen hours for the order to execute, escaped only because the regime fell that very day and the order never came. On his hospital bed the day he was released, he voiced his most bitter complaint against the Communists: "They made me join with the reactionaries. There was no other way to fight them." But he said that he would not consider entering the new government either. "It is better that I stay outside, where I can fight again, if this one goes sour the other way." Many others, faced with the same choice under Arbenz, preferred linking hands with the Communists to joining up with reactionaries. They are suspect now. They would probably be willing to put their energies to work in a new atmosphere, but as yet they are unacceptable. They, too, are waiting to see.

Guatemala has one great asset to tide it over this period of expectant tension. That is money, or rather, coffee, which comes to the same thing. National reserves are high, since most of the gold and cash was on deposit in the United States. Arbenz left a $35 million public debt, which shocked Guatemalans deeply, but a couple of good coffee crops will take care of that.

NOTES FROM SOUTH AFRICA

(These notes are contributed by or based on messages from our correspondents in South Africa)

Alternatives Before Malan



DR MALAN and his followers are unperturbed by parliament's rejection of the Bill to remove the Cape Coloured voters from the common electoral roll. In their minds it is not a defeat but simply a technical hitch that must be circumvented by one means or another. But the Nationalists, for fear of unfavourable repercussions in the country, are now opposed to unconstitutional action. They are anxious to clothe their manoeuvres with a cloak of respectability. That is why the provincial elections, which took place in Natal last month and are due to be held in the other three provinces on August 19th, have been elevated to a place of such importance. Normally they pass off unnoticed and scarcely anyone knows or cares who is his provincial councillor. But on this occasion the Nationalist cabinet is seeking a vote of confidence in its policies. Overwhelming victory, even if it is secured, cannot, however, release them from the constitutional deadlock in which they are gripped.

Assuming outright success for the Nationalists at the provincial elections—and it is by no means assured—Dr Malan has open to him two possible, though questionable, expedients by which he can improve the numerical standing of his party in the central legislature. He may take power to dissolve the upper house (Senate) and reconstitute it through the electoral colleges, which are formed by members of parliament and provincial councillors. With increased representation in the councils he can hope for larger Senate representation for the Nationalists. Alternatively, if his majorities in the coming elections are not big enough, he may seek to amend the South Africa Act so as to enable election of Senators by simple majorities instead of by proportional representation. By this device it has been calculated that he could increase the numbers of government Senators from 29 to 36. But the irony of the situation is that, no matter which expedient he is tempted to adopt, he will still be short of the number required to pass the contentious Coloured Voters Act, unless there are further desertions from the Opposition ranks.

* * *

Reviving Opposition

THE United Party (UP), the main opposition party, appears at last to be achieving stability after the severe rupture earlier this year. It is, indeed, showing signs of spiritual revival. The party leaders must be well satisfied with the results in Natal, for they showed unmistakably that the UP is capable of dealing with its rivals within the opposition ranks. The Federal Party, for instance, which stands principally for the maintenance of the Commonwealth tie and was expected to win several seats, failed to win a single seat, though it polled over 20,000 votes. In consequence the party leader, Senator Heaton Nicholls, committed hara-kiri by promptly resigning his seat in the Senate. But the United Party has less cause for satisfaction in the loss to the Nationalists of the Weenen seat in northern Natal. As for the coming contests it is to be expected that in the Cape, where the seats are at present almost equally divided, the Nationalists will gain control of the Council. In the Transvaal they are likely to increase their numbers, though it is doubtful whether they will secure a majority of the seats.

tate of Parties after 1949 Provincial Election, fter 1954 Election.

e Free State the UP is resigned to losing its single d.

e main objective of the Nationalist Party will be to many votes as possible so as to wipe out the Opposiinceer that it is a minority party. In the last general n a year ago the Nationalists polled 600,516 votes t the 615,973 of the combined opposition parties. If osed seats are taken into account the Government's ity of votes is over 110,000. Against this, however, ationalists can argue that it makes no sense to lump opposition votes together since the various parties ctions are at sixes and sevens with one another. There stance in this contention as is shown by the tendency splits in the once united fronts to become permanent.

Apartheid in Education

WHEN parliament seven months ago approved Dr. Verwoerd's Bantu Education Act, all African education up to matriculation standard, which formerly fell under the provincial councils or was provided by church and mission societies, was transferred to the Native Affairs Department. The Minitesr has said that the transfer will be gradual; but so far little has been done to clear away the confusion that the Act created. Here and there action has been taken. Without consultation double sessions have been introduced in schools in the Johannesburg area; by this device the Government provides additional schooling for African children simply by cutting in half the school hours. This expedient brought a vigorous complaint from the Bishop of Johannesburg, who described it as "a travesty of education."

With the exception of the powerful Dutch Reformed Church every religious denomination concerned in African education has protested against the Government's plan. And well they might, for they are going to lose half their teachers' subsidy from the Government, and thus are threatened with imminent extinction. The Native Affairs Department has explained that in fact the mission schools have been given a choice: either sell or rent their school buildings to the Department, or accept the cut in the teachers' subsidy. But the practical effect of this "choice" is to leave only one alternative—sell to the Government. It would, for instance, cost the Anglican diocese of Johannesburg about £44,000 a year out of a total budget of £72,000 to carry on under the Government's alternative.

Dr Verwoerd is unlikely to be moved by the Churches' protests. Recently, however, the influential Christian Council of South Africa, which embraces all the Christian Churches except the Dutch Reformed and the Roman Catholic Churches, decided to call a national conference to consider the implications of the Government's plans. Many people are, indeed, willing to concede that there are advantages in putting African education under the central government; but it is Dr Verwoerd's manner of tackling the problem, and the suspect motives behind his policies, which have infuriated and dismayed churchmen and others. It is obvious to everyone that his main object is to force through the policy of "apartheid" in the field of education, even if it means using to the full the dictatorial powers granted to him under the Act.

* * *

Fear and Verwoerd

As Minister of Native Affairs Dr Verwoerd occupies the most important post in a government more and more of whose energies are devoted to the determined and, in many aspects, ruthless application of *apartheid*. During this year's parliamentary session he has towered above all his colleagues and has been more often in the public mind and eye than Dr Malan himself. Illness among cabinet colleagues has left him in possession of the parliamentary stage for a large part of the time. He has stamped about on it threatening the English press with muzzling for daring to criticise him, and bawling at the Johannesburg City Council for not complying promptly with his wishes.

His explanations of the place of the Natives under *apartheid* become steadily less like those put forward by the serious-minded theorists of Stellenbosch University and the Dutch Reformed Church. "We have lots of tractors and

trek-oxen, but we don't give tractors and trek-oxen the vote"; this is a fair sample. In short, Dr Verwoerd seems to be strenuously grooming himself for the job of *volksleier* in a political setting where the past few years' events have amply demonstrated that nothing succeeds like success. And the reason for such success? A political observer who has been right fairly often explains: "We South Africans are afraid—afraid of the 'Natives,' afraid of the Indians, afraid of Mau Mau-ism and 'Gold Coast-ism,' and of course afraid of one another—Afrikaners fear Englishmen, Englishmen fear Afrikaners. Dr Verwoerd fully embodies those fears. He is not just playing politics, he really means what he says; that's why everyone testifies to his sincerity. He boldly admits his fears, and in the same breath announces that he, and he alone, holds the key that will turn the lock on fear—which he calls *apartheid*. More and more people are drugging themselves into a belief in *apartheid* simply because they share Verwoerd's fears."

★ ★ ★

Sick Nationalists

"MR STRIJDOM and I," said Dr Verwoerd the other week, "enjoy many a hearty laugh together at this wild story." He was referring to the popular theory that he has now supplanted Mr J. G. Strijdom as Dr Malan's probable successor. If Mr Strijdom is doing any hearty laughing, it is in private. The "Lion of the Waterberg" is in fact a much subdued man. Dr Verwoerd used to be a follower of his; now he seems to have become a follower of Dr Verwoerd. Possibly he is just waiting to see how much of the Verwoerd doctrine the country is really ready to swallow. But it is not like Mr Strijdom to wait, and friends are whispering that he has lost the "will to win."

The truth appears to be that illness and approaching old age have conspired together to quench several Nationalist fires. Dr Malan was already an old man in 1948, and some of the very active volcanoes of that year have also not been getting any younger. Mr Strijdom has been in parliament for 25 years and his health is not good. The same applies to the Minister of Justice, Mr Swart. Mr Eric Louw has been suffering from a very troublesome throat infection. It is generally accepted that when Dr Malan steps down he will be succeeded, for a short interim period, by Mr Havenga. But Mr Havenga's own health is indifferent, and Mr Strijdom's own supporters are no longer as confident as they were that when Mr Havenga in turn steps down, he will be followed by Strijdom.

The way might thus be opened for Mr Donges—who would probably be Dr Malan's own personal choice—or even for the good-humoured Mr Paul Sauer, in view of his probable ability to keep more strenuous-minded rivals from flying at each other's throat in a struggle for power that might split the Nationalist Party. But the emergence of Dr Verwoerd is a new factor in the situation. Last year, few would have tipped this fanatical-minded ex-professor for the premiership; this year, no calculations about Malan's successor can be made without taking him into account.

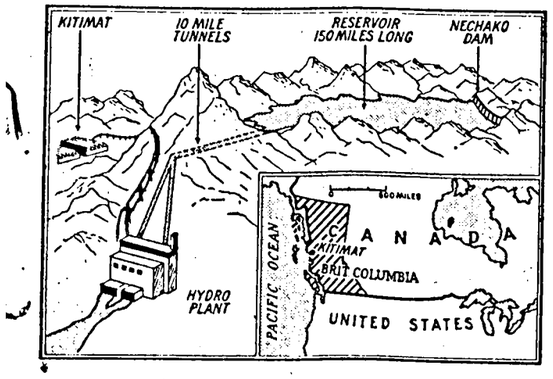
White Plumbers and Coloured Carpenters

As part of his policy of "protecting" the workers against the "Reds," Mr Schoeman, the Minister of Labour, has proposed to make a strike illegal unless a trade union has secured a two-thirds majority for a strike in a secret ballot. The insistence on a two-thirds majority is curious, in view of the Nationalists' violent disparagement of this obsolete and unnecessary provision, in another sphere, where they hold that the *volkswil* cannot be assessed and should not be restricted by a vulgar counting of heads.

But Mr Schoeman intends to go further. Natives, not being "employees" in terms of the Industrial Conciliation Act, are not recognised as members of trade unions; but many Coloured and Indian workers are members of unions along with whites in the same trades and industries. Now the Government will refuse to register such "mixed" unions, and will encourage both whites and non-whites to form separate, breakaway unions in place of the existing "mixed" unions. A special tribunal will also have the power to reserve whole grades of jobs exclusively for racial groups (thus taking an old leaf out of the caste-book which India is trying to discard). In Mr Schoeman's future South Africa, all plumbers for example will be white men, all carpenters will be Coloured.

These provisions have encountered the almost unanimous condemnation of both the trade unions, who foresee with alarm the end of all genuine trade unionism, and also of the employers who foresee with dismay having to work out separate wage agreements with a multiplicity of splinter "unions" organised on a racial basis. (It has been argued that under the new order, the employers will have an easy time beating down wages, but they apparently would prefer to continue to enjoy industrial, and racial, peace). Mr Schoeman appears to be undeterred by this massive opposition from both Labour and Capital.

Pioneering at Kitimat



FROM A CORRESPONDENT

MAKERS of aluminium must have a large, dependable and economic supply of electric power. For this reason the Aluminum Company of Canada, Ltd. (Alcan) has started operations in a remote part of northern British Columbia, 500 miles north of Vancouver. Near the Indian village of Kitimat it has just put into partial operation a smelter with an annual capacity of 83,000 metric tons and the largest privately-financed hydro-electric development project in the world. Ultimately the smelter will produce 500,000 metric tons annually and the hydro-electric station 250 million horse-power. To create this industrial foothold Alcan transported 50,000 men and 500,000 tons of supplies into the isolated valleys of northern British Columbia and spent a total of $275 million. When completed, the project will represent an investment of approximately $500 million.

The coast of British Columbia, like that of Norway, is deeply indented with long fjords reaching inland between towering peaks. The heavy precipitation of the region's heavy precipitation, however, drains mainly inland and upward over a rugged plateau. To take advantage both of this fact and of the hydro-electric potential and of the ocean transport, Alcan dammed the east-flowing Nechako river, creating a 150-mile long reservoir, and drilled a ten-mile tunnel through a coastal peak. There, the water is dropped 1,600 feet half-mile downward to the turbines in a powerhouse the size of a cavern carved inside the mountain. Thence, transmission lines take the power 50 miles over a mountain range to Kitimat, where there is room for a smelter and a town whose population may some day reach 50,000.

To plug the Nechako river and create the reservoir, Alcan fashioned the most massive rock-fill dam in the world. At the other end of the reservoir, 3.5 million cubic feet of granite had to be blasted out of the mountain for the tunnels and powerhouse. Placed there so that the surrounding rock could help to contain the enormous water pressures (and provide protection from weather, rockslides and possibly bombs) the tunnels had themselves to be protected; half their total length is lined with concrete, and the powerhouse itself has been placed 1,000 feet farther underground because of unexpected rock faults encountered during the blasting.

To complete the work on the tunnels and powerhouse as soon as possible, blasting crews bored into the mountain from six different points. The powerhouse and lower half

of the sharply-dropping penstocks were attacked from two tunnels from the valley floor. The upper penstocks and western end of the main tunnel were reached from camps perched 1,600 and 2,600 feet up on the face of the mountain and maintained by helicopter and a dangling telpherage system, one of the largest in the world.

On one side of the peak, a road was scraped up the face of a canyon to reach the mid-point of the ten-mile tunnel, a quarter-mile inside the mountain. Rising half a mile in its twisting eight mile length, the road was often blocked by snowslides. From this point, although it is only five surface miles farther to the lake where the water starts through the mountain, the terrain is so steep that the camp at the intake could not be reached from the powerhouse side at all. Of the most difficult camps to maintain, it had to be reached from the reservoir side of the project, over a mile road from central British Columbia to the eastern end of a 20-mile lake. There, men and supplies were put in barges, which were welded together at the site and driven by huge diesel outboard motors. In winter, only helicopters and ski-equipped aircraft could reach the camp. From the powerhouse, the route of the transmission lines from Kitimat crosses a mile-high mountain pass. To reach the pass, a zigzag road rising 1,000 feet per mile was hacked out of the mountain. Even so, some transmission towers sites on outcropping ledges of rock were supplied only by helicopter or cable-lines. The towers over the pass are in two sets—one of conventional steel, the other of specially new all-aluminium design; they carry the largest aluminium and steel cable in the world.

For the smelter at Kitimat, 5.5 million cubic yards of fill were dumped on swampy tideflats, and a 750-foot concrete wharf laid down by building and then capsizing three concrete boxes, each large enough to contain a six-storey building. Ships of Alcan's subsidiary, Saguenay Terminals, Ltd., bring powdery white alumina from the company's new $30 million reduction plant at the bauxite source in Jamaica. Shipping alumina instead of bauxite effects a 50 per cent freight saving on the 4,500 mile voyage.

Sucked out of the ships at the rate of 200 tons an hour by a specially-adapted pneumatic grain unloader, the alumina commences a completely mechanised ride on conveyors, first to a vast storehouse, thence on to the potrooms. The smelter incorporates technical innovations which lead Alcan to forbid photographs inside the potrooms. But their size alone is impressive—the two potlines are each a mile long, consisting of 171 thirty-eight foot pots into which fifteen miles of aluminium conductors carry 1,000 amperes of electricity.

Looking to the Future

Six miles away, an embryonic township now contains fifty modern houses for the smelter workers, and another 300 to 400 will be completed this autumn. Although Alcan and planning consultants are laying out the future arrangement of the town, all property will be privately owned. At the moment, many millworkers are still occupying the construction camp's housing facilities—including the *Delta King*, an old California sidewheel steamer towed to Kitimat for emergency housing.

Alcan has not said when it intends to undertake the expansion of the Kitimat plant, but preparations already made will hasten the task. At the powerhouse, only three turbines and generators are installed, but there is space (and water tunnels) for five more. The transmission lines are ready to take all the power the site will ever generate. To expand the project to its second phase of 275,000 metric tons, only more generators and potlines are required. To reach the 500,000 ton level, however, the present tunnel system in the mountain must be duplicated and the 700-foot powerhouse extended another 400 feet, to accommodate eight more generators.

Although in the three years since it was begun, in the midst of the Korean war, the cost of Kitimat has surpassed the original estimates by 60 per cent, and the edge has been taken off the vital American aluminium market, Alcan is confident that long-range aluminium consumption will justify the project. With further expansion in the United States made unattractive by high power costs, Kitimat gives Alcan and Aluminium Ltd. a strategic position on the aluminium frontier.

The Finns Flirt with Moscow

BY A CORRESPONDENT

THE new Five Year Trade Agreement between Finland and Russia which has just been signed in Moscow only confirms the pattern of trade between the two countries. Trade is at present based on the five year agree-

ment of 1950 and on two later supplementary agreements. The new pact does, however, amplify the arrangements made earlier this year by which the Soviet Union will pay half of its trade deficit with Finland in western currency; and it also guarantees for the next five years a market for the products of the shipbuilding and the metal industries whose postwar expansion has caused considerable uneasiness. Nevertheless there are certain features of the Russo-Finnish economic arrangements that are disconcerting. For instance, the meaning of the Soviet loan to Finland—despite its heavy commercial debt—has never been made clear.

What is remarkable is the political agreement which was announced in the same communiqué as the trade pact: the decision to raise the status of the Soviet Legation to that of Embassy: and the unusually fulsome tribute which Dr Kekkonen paid to Mr Molotov in Moscow. The joint political declaration says that the two governments are convinced that it is imperative at the present time to join the efforts of all countries to safeguard peace and security. It goes on to say that the two governments, acting in the spirit of the 1948 Treaty of Friendship and Mutual Assistance, "declare their desire to promote in every possible way the maintenance of international peace and security in conformity with the principles of the United Nations"—of which Finland is not in fact a member. No radical departure from Finland's right to remain outside international conflicts, which is clearly stated in the 1948 friendship treaty, is probably envisaged; but the linking of a new statement of political policy to a routine trade agreement is for the Finns an entirely new departure. Perhaps Mr Molotov intends to make Finland the first western member of his proposed European system.

The new agreement has been reached several months earlier than was expected and is the outcome of talks started by the previous government of Mr Tuomioja, and now concluded by the Foreign Minister, Dr Kekkonen, who is clearly the dominant figure in the new government. One subject of particular interest to Finland was not mentioned in the communiqué. After his resignation as Prime Minister last November, Dr Kekkonen revealed for the first time, in an exclusive interview published in the leading Agrarian newspaper, that he had been negotiating with Russia on the use of the Saimaa Canal, half of which is now in Soviet territory. The Soviet terms were not given in detail, but they involve a "practical policy in accordance with the 1948 agreement." When he was asked on his return from Moscow last month whether the Saimaa Canal had been discussed Dr Kekkonen was reluctant to answer, and it is uncertain whether the new agreement, the full text of which has not been published, includes any reference to this subject.

The form and substance of the communiqué also suggests that this may be the first step towards a proposal for the admission of Finland to the United Nations, and an abandonment by Russia of its insistence on block admission. But the chief question is the trend of Dr Kekkonen's foreign policy. Although the leader of a right wing party which has always been strongly anti-Communist in its policy he is convinced that he is the one man who can further Finland's interests in Moscow, and the new agreement will help to strengthen this conviction. But there are Finns who wonder whether this may not in the long run commit their country to greater dependence on Russia in the political as well as in the economic sphere.

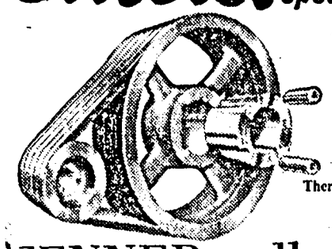
Journal of Geneva—XI

JULY 15th to 20th. A long series of high-level private talks. At the only full restricted session of the conference on July 18th, Mr Bedell Smith, who had returned to Geneva the previous day, made a conciliatory statement on the American attitude to any settlement that might be reached.

July 21st. During the night of the 20th-21st three cease-fire agreements between the Viet Minh and Vietnam, Laos and Cambodia were finally agreed and later signed. The texts of the agreements, which will come into force gradually, have not been published but together with a published political declaration they are believed to provide for the following settlement:

Vietnam. (a) There will be an armistice line about 12 miles north of Highway 9 and roughly along the line of the 17th parallel. About 12,750,000 people will be left under the Viet Minh and about 9,300,000 under Vietnam. (b) The French forces in the Red River delta will withdraw to the coastal strip round Haiphong and will withdraw altogether within ten months. Viet Minh troops in South Vietnam will be concentrated in several enclaves and evacuated within eight months. (c) Elections throughout Vietnam will be held by July 20, 1956. By July 20, 1955, Vietnam and Viet Minh representatives will start talks on the organisation of the elections. The elections will be supervised by an international commission composed of representatives of the armistice commission (see below).

Laos and Cambodia. All Viet Minh troops will be withdrawn. There will be one regroupment area for Laotian dissidents in north-east Laos; provision is made for their eventual reintegration under the Laotian government after the elections in August, 1955.



Supervision of Armistices. India (chairman), Canada and Poland will provide international armistice commissions, one for each Associated State. Most decisions will be taken by majority vote, but the most important will be referred, in case of disagreement, to the nine conference powers; the members will have the right to make majority and minority reports. The more detailed supervisory work will be mainly left to mixed commissions of representatives of the two sides.

External Relations of the Associated States. All parties will respect the independence, sovereignty and territorial integrity of the three Associated States. French troops will remain only by agreement with the governments concerned in specified numbers for a specified time. Laos and Cambodia will not join any military alliance not in conformity with the principles of the United Nations and no "foreign" troops or military supplies will be introduced into Vietnam, or requested (except for defence) by Laos or Cambodia.

No formal guarantee of the agreements was given at a plenary session which ended the conference; members, in effect, gave their backing (with American and Vietnam reservations) to the settlement. In a unilateral declaration issued at Geneva the United States government declared that it would refrain from disturbing the cease-fire agreements by force or the threat of force and would view any forcible violation of them with grave concern.

The filthy air

No. 4 IN A SERIES ON RESEARCH & DEVELOPMENT

Power stations are far from the worst offenders in polluting the atmosphere, but they can add to the nuisance unless strictly disciplined, and as large public plants they are sitting targets for public criticism. The fine flue dust produced by modern pulverised fuel fired boilers is removed by electro-precipitators, often with efficiencies so near to 100 per cent. that even decimal increases are significant. Simon-Carves are building dust precipitators for several new British power stations, and are devoting much research to the important fractions which separate performance from perfection. A recent official test on a post-war plant gave an efficiency of 99.4 per cent—a figure 0.6 per cent. too low to justify any resting on laurels.

'ENGLISH ELECTRIC'

Stories should start at the beginning. Before we buy a shoe, it has a history. This, nowadays, is an electrically-minded history, and it goes back further than the machines that helped stitch and finish the shoe . . . further even than those that split the hide, dressed the fine leather.

The ENGLISH ELECTRIC Company makes the motors for many of these efficient machines. But its contributions to better living do not begin there . . .

bringing you

Behind the grace of a woman's shoe . . . behind so much that is good in life . . . imagine the purr of great machines, the pulse of electric power. ENGLISH ELECTRIC makes many of the generators that produce it; the transformers and switchgear that control and distribute it to towns and factories and homes.

You may see the name ENGLISH ELECTRIC, too, on your refrigerator, your cooker, your washing machine, your television set . . . but that is another story.

better  living

The ENGLISH ELECTRIC Company Limited, Queens House, Kingsway, London, W.C.2

THE BUSINESS WORLD

Oil on the Margin

AN ordinary industrial customer buying heavy fuel oil in the Southampton area today pays 9¾d. a gallon for it—more than £9 a ton. At this price he gets a fuel that has about 1½ times the calorific value of coal, though for many specific uses in industry it possesses far greater comparative advantages over coal, because it is easier to handle, control and burn. But as a fuel for a power station boiler, oil has no special technical advantages whatever and some disadvantages, particularly in a station not primarily designed for it; and it is certainly worth no more than its equivalent thermal value of low-grade coal, which a power station can burn better than any other furnace.

The power station now being built at Marchwood on Southampton Water is expected to come into partial operation in the spring of 1956; during that year three or four of the five 60,000 kilowatt generating sets it is eventually to house will probably be brought into commission. In full operation Marchwood would probably take 600,000 tons to a million tons of coal a year. This coal would have to come quite a long way, perhaps from South Wales, but it could be delivered by sea in large colliers, the cheapest way of transporting coal. The average delivered price that the British Electricity Authority paid for coal in 1953 was 61s. 10d. a ton. Since then the prices of coal and transport have risen, and by the spring of 1956 they are fairly certain to have risen more. Even so, Marchwood might reasonably be expected to obtain coal then for something of the order of £4 a ton.

No prices were quoted, however, by the Minister of Fuel and Power when he announced two weeks ago that the Esso Petroleum Company had undertaken to supply Marchwood with oil, if BEA wants it, at a price that would "make the cost of generation of electricity the same as if coal were used." This implies that the comparison might cover the extra capital charges for dual-firing, which add about 1 per cent to the cost of a new power station—and Marchwood will cost some £30 million. Transport costs of fuel oil from Fawley to Marchwood will obviously be negligible, against the lengthy haul in coal. But the undertaking would seem likely to involve Esso in supplying this fuel (apparently a normal grade of heavy fuel oil) at a price of £6 or so, compared with the present ruling price of over £9. Some 400,000 to 650,000 tons of oil a year might be used; but it is not yet clear that this will be a firm contract, as the Minister and BEA both emphasise that dual-firing would enable Marchwood, and later other stations, to "burn oil at short notice should it prove desirable."

This raises some fascinating questions. Is fuel oil becoming so abundant that the industry's ruling prices, which characteristically respond gradually rather than quickly to changes in demand, can now easily be punched through by a consumer with some countervailing power? Can BEA hope to get the fuel oil that it already buys for Bankside and other power stations at similar cut rates after 1956? Is the relationship between coal and oil prices, upon which the traditional choices between these fuels for different types of combustion have been based, now due for some radical upset, which in its turn might transform the balance of fuel demand?

With the Aden refinery coming in, and Abadan coming back, refineries in Britain may well have to sacrifice some of the export markets that they have recently been supplying with fuel oil. This residual product, which is at present rather less abundant than some of the more highly refined products, may certainly present some problems of disposal in a year or two. Beyond that period, it is a matter of judging

the market. Today, the products of which the industry has a somewhat burdensome surplus are certain light oils; and over the next year or two it may be more apprehensive about the future prospects of demand for these than of the outlook for the heavy petroleum products. Western Europe has since the war developed its own pattern of oil consumption, using a larger proportion of heavy oils than does the United States and a much smaller proportion of motor spirit. It is hard to relate fuel oil prices to any specific "costs of production," since it is only one of the many products of the refining process. Oil prices depend on relative demands; and if present levels of motor taxation remain, and demand for the heavy oils goes on rising more rapidly than demand for the light oils, the oil industry might have to make these black oils bear more of the burden of cost than they do today. In such circumstances, the trend of heavy oil prices might be upward rather than downward. Any major extension of private motoring down to a new level of consumer—such as might result in Britain from a combination of Mr Harry Ferguson and an adequate road programme—could restore the balance of consumption, and make residual oil prices more flexible. But such desirable changes hardly seem imminent.

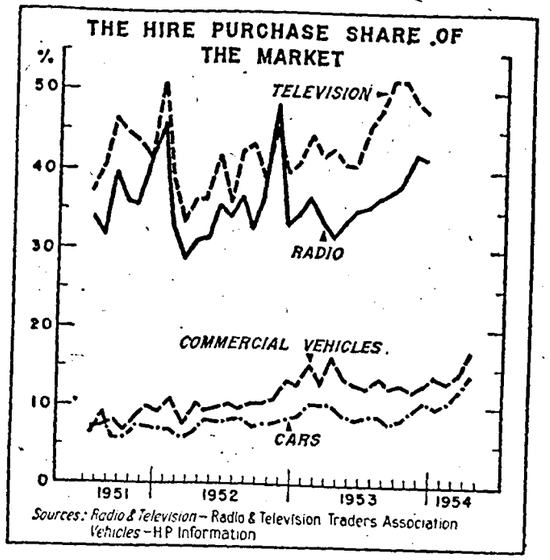
*

So it would seem prudent for the moment to count the Marchwood arrangement—a promise of a sharply cut price to a single consumer who may not even be committed to a firm and continuing demand—simply as a generous contribution by a single oil company, in its own special circumstances, to the safeguarding of Britain's energy supplies. It would be encouraging, but too optimistic, to think of this price as a basis upon which the electricity supply industry in this country could reconsider its long-term choices of primary fuels for conversion into power. The electricity industry, it may be said, does not like oil much as a fuel, or indeed any conversion of power stations to burn widely differing fuels. A boiler, ideally, is most efficient when it is designed to burn one grade of fuel, or a narrow range of grades, for the whole of its 20-year working life. It has been said unkindly that power supply engineers have pulverised coal running in their veins. They would doubtless reconsider many of their misgivings about sulphur content and vanadium deposits if the price of oil were "right"; a comparably priced alternative fuel would strengthen BEA's hand immensely in dealing with the coal monopoly. Unfortunately, Marchwood cannot be taken as proving that the price of oil, on a large scale and in the long run, will be right for BEA. The possible conversion to dual-firing of another 16 coastal and estuarial stations, or those near refineries, is best considered as a rather costly insurance premium against failure by the coal industry to supply all of the extra 14 million tons of coal a year that BEA will need by 1960.

If the permanent contribution that oil can make to electricity supply in Britain is likely to be a small and supplementary one, its contribution to another customer of the National Coal Board, the gas industry, may be much more significant. This industry at present uses gas oil mainly to enrich the carburetted water gas that it makes rather expensively from coke, to assist coal carbonisation plants to meet peak demands. It has now developed two catalytic processes for making gas directly from heavy oil, and 13 plants embodying these systems are now being put up throughout the country. These processes may be more economic than the production of water gas, partly because they will release coke; and in two years' time the plants now being constructed will be saving nearly half a million tons of good carbonisation coals. This seems a more obviously economic field for replacement of coal by oil than the electricity industry. The gas industry also has bounding hopes of natural gas, in which it has the technical assistance of the oil industry; and it is a significant buyer of certain refinery gases for blending into its own town's gas supply. It is true that the most promising technical developments in gas-making may still lie with coal, in the total gasification of the inferior coals that the industry will soon have to consider using. But this diversity of possible raw materials does give the gas industry a freer choice of techniques than the electricity industry can expect from conventional fuels.

Electricity may not have too long to wait for a non-conventional alternative. The Minister of Fuel and Power was more circumspect about the prospects of nuclear energy than those atomic knights who average about one dramatic new statement (or one rehash of the dramatic old statement) every month. But he said that before 1960 "design and, it may be, construction of nuclear power stations of an advanced type will be undertaken before 1960"; and he spoke of "the t… when massive contributions are made by nucl… power"—stations that because of their very high capit… costs and comparatively low fuel costs would be run full… out day and night as base-load plant. The British Electricity Authority has appointed a nuclear power enginee… and is now studying more carefully the arrays of guesse… that the atomic scientists can so far provide about t… possible economics of nuclear power generation.

Indeed, the one conventional feature of the fuel p… that BEA has been fortunate enough to obtain… Marchwood is that it does not seem to bear… obvious relation to the real costs of supply. It … almost spoil the Minister of Fuel and Power's a… if it did. Forward planning is inevitable in… energy industries of today, and the Minister is … mitted to some measure of co-ordination of the … nationalised fuel industries that claim public fun… Treasury guarantees. The only practicable w… co-ordinating such demands, as was said by a m… of the Ridley Committee long ago, is "to gather … independent technical advice you can and then a… a rate of interest." But today such modest co-o… tion and allocation of resources is made impo… because the prices of the fuels being compared



hence the demand that can be envisaged for them at such prices, are not based upon the relative costs of supply. Coal is too cheap; electricity prices do not reflect the pattern of system demand; gas and coke—and oil if it came within the Minister's purview—are joint products of which the price may depend upon idiosyncracies in accountancy; atomic power prices are an informed guess. In the circumstances, the least bad fuel policy that a Minister can adopt is perhaps to insure against absolute failures of fuel supply for a few years ahead—as Mr Lloyd has done—and to apply pressure, at the many points where such pressure is needed, towards more realism in pricing policy.

One Instalment for HP

LAST week the Board of Trade abandoned control of hire purchase trading. It might have been expected that in logic the Treasury would, for its part, withdraw its requests to the banks and its instructions to the Capital Issues Committee that have sought to thin down the flow of hire purchase finance. Whether it be weed or flower, hire purchase has remained a flourishing growth and has easily survived two and a half years of half-hearted dosing with weed killer by the Treasury and the Board of Trade. The difficulty is to measure the extent of the hire purchase and instalment finance business. It is one of the serious gaps in British economic intelligence. There are indeed some good figures relating to hire purchase business in motor-cars, motor-cycles, commercial vehicles and caravans; one can get a reasonable trend line for the instalment sales of gas and electrical appliances; there are some figures relating to farm and industrial machinery and a sample that gives some indication of what hire purchase means to the wireless and television trades. From the rest of the hire purchase field, which includes domestic furniture, there is nothing better than guesses implying that up to 70 per cent of the trade with individuals may be done on easy payments. For the clothing trades the statistical cupboard is bare; hire purchase proper has a footing there, but other forms of extended credit sale* have a stronger influence.

Hire purchase proper is an organised business with a trade association and journal and an information company that keeps traders and finance houses informed about the movement of some of the goods they have financed. Within a few seconds of a car being offered for sale to a dealer, H.P. Information can tell him whether the title is free. This same body issues some valuable statistics on motor-cars and motor-cycles. Hire purchase is now financing a larger share of the car market; the graph shows the proportion of new cars, commercial vehicles and motor-cycles registered that are carried on hire purchase. In new private cars, the hire purchase ratio rose last year from 7.9 per cent to 9.1 per cent; in commercial vehicles, the proportion rose from 11.1 per cent to 13.5 per cent. The figures from the radio and television trades suggest that perhaps 40 per cent of all radio and television sets are now sold on hire purchase agreements; if all extended payment agreements, formal and informal, were included, it might be 50 per cent.

Hire purchase contracts fall into two classes. First, there is hire trading without recourse, where the trader in effect sells the goods to the finance house, which hires them to the customer and collects the instalments.

Secondly, there is hire trading with recourse—or block discounting—where the trader makes the arrangement with the customer and then puts himself in funds by selling the customer's obligations to a finance house. But between those two categories there is a large number of variants. Sometimes the finance house will undertake the collection of instalments, though the trader remains a party to the transaction. Sometimes, the hire purchase bargain may be backed by an insurance against the customer's ill-health or unemployment.

No figures exist of the amount of money which is

* main clothing schemes are: the "budget" plan, which …ding rapidly; and the system of check or ticket trading …ell entrenched in certain northern areas. used in financing hire purchase. Some £50 million of resources are employed by the Finance Houses Association, but this consists of the big houses interested largely in capital goods, not in consumers' goods. Much hire purchase business is financed by traders themselves. Last year's accounts of Great Universal Stores, which does an active hire purchase trade in furniture, showed that at March, 1953, some £33.5 million was tied up in hire purchase accounts and the total must now be much higher. The gas and electricity area boards, using government guaranteed capital, have over £40 million tied up in hire purchase accounts, though in the latest year they seem to have kept the totals down. Great sums in the aggregate must be employed by the smaller traders and by the host of small finance companies with capitals of less than £50,000 each that have been slipping through the needle's eye of Treasury control.

Government policy since the beginning of 1952 has tried to curb hire purchase by two devices. The first control was exercised by the Board of Trade and has recently been withdrawn—on the good ground that it had become impossible to administer. For a list of specified goods the Board of Trade fixed a minimum initial deposit of 33⅓ per cent, and a maximum period of 18 months over which payments could be spread; for bicycles the deposit was 25 per cent and the period 12 months. The recent decision in *Regina v. Proffitt* drove a coach and horses through the plan for it held that an extended hiring agreement with various options when it ended was not bound to the minimum deposit and maximum length. The other weapon in the Government's armoury—the Treasury request to the banks and its instruction to the Capital Issues Committee—has been a little more effective; certainly it is effective enough to keep the price of hire purchase money high. The banks were required to reduce their advances to the finance companies which discount hire purchase paper by 10 per cent, and the companies were prevented from raising additional capital. But the protests of the chairman of United Dominions Trust as each year his application for a capital increase has been turned down, does not mean that the instalment finance companies have been unable to do business or that they have starved of useful deposits. Money from public companies and from pension funds has come in freely and the finance companies have paid well for it; rates of 5 per cent and 6 per cent are frequently offered, and the marginal fringe may cost even more. These rates apply to deposits of from three to six months. Such a term may have been appropriate so long as the hire purchase agreements themselves were kept short; but with the removal of these restrictions, agreements are bound to become longer and the risk attached to using short-term money will increase.

Source: Motor Figures are estimates of *The Economist*. Other figures compiled by Hire Purchase Trade Association.

Hire purchase finance has been good paying business under these controls. The stream of new entrants into the field marks the fact that it has often been possible for the owners of a small finance company to earn 15 per cent on their investment; it would need a cynic deliberately to encourage an expropriated transport owner to use his compensation in setting up a hire purchase finance company to enable other people to buy his lorries back rather than buy them back himself. Yet that is the effect that the controls have produced. The loss ratio is low and the rates charged to the customer are high—often higher than he realises, since the charge is quoted as a percentage of the balance outstanding after payment of the initial instalment, whereas the average debt outstanding during the whole life of the contract is little more than half the initial amount. Table II shows typical rates quoted for various types of goods converted to percentages of the average debt assuming a year's agreement and monthly payments. If these rates appear usurious, it must be remembered that they are not pure interest; they include costs of collecting and administration. By comparison the charges in the two nationalised industries, gas and electricity, though not exactly uniform (for the area boards have their own ideas), are moderate—as they should be, since the boards have the advantage of Government guaranteed money for their instalment financing. The electricity boards charge about 7 per cent on the average debt outstanding, which breaks down into a pure interest figure of 4 per cent with 3 per cent for administration and maintenance. The gas boards range from 7 per cent to 8 per cent, including 4½ per cent to 5 per cent for pure interest and 2½ per cent to 3 per cent for maintenance and administration. The electricity boards in particular sell equipment in competition with private business which is apt to call the charges too low and the agreements too long.

The effects of full competition in hire purchase finance remain incalculable. If the Treasury were to withdraw the ban on the open raising of finance, some of the hundreds of new companies might well find it hard to hold their own against the established finance houses. Almost certainly, many hire purchase charges could then come down; indeed, the low loss ratio of less than one half of one per cent even on consumer goods already justifies a reduction of the ultra-cautious margin for bad debts that is now included in the price. It is difficult indeed to find any logic in the Treasury's attitude. People are officially encouraged to buy their houses on cheap financial terms; but ineffective barriers are put up to prevent their use of hire purchase to purchase what goes in the house—"ineffective" because any agile finance company can jump them, at the cost of higher rates for the buyer. It cannot seriously be contended that Treasury control of this kind does any good whatsoever; it makes hire purchase finance scarcer than it would be and therefore dearer than it need be.

Business Notes

Markets at a Pause

Both Throgmorton Street and Wall Street waited on the outcome of the Geneva conference. During the anxious period of waiting stock market prices on both sides of the Atlantic slipped back. On Wall Street aircraft shares, after a speculative rise, took the worst tumble. In the London market equity prices wilted before profit taking at the end of the "bull" account and small losses made their appearance in the long dated and irredeemable gilt-edged stocks. The signing of the cease-fire settlement had little appreciable effect on commodity prices (for only metals and rubber were weaker). But it was the signal for recovery in stock market values; and the recovery was cheered on its way by the success of the World Bank issue of a 3½ per cent stock maturing at 98, which opened at ⅜ premium.

With the holiday almost upon them, investors and dealers have an opportunity to re-assess the movements in the stock market prices. They can go on holiday with the comforting thought that the World Bank issue was over-subscribed, but with the less comforting proviso that the terms was for only a small amount of money. They can feel sure that there will be very few dividend announcements likely to disturb their cogitations; but they may wonder whether the authorities will soon give the green light for an electricity or gas issue—and on what terms. The more flighty supporters of gilt-edged have, apparently, already qualified their earlier notions that the authorities were planning a Daltonian assault on War Loan; they would probably be on a safer tack in supposing that the authorities

have more concern about the head of steam that is already pressing on the gilt-edged market than they have ambition to increase it. With equities the question is whether prices are high or too high. Can profits and dividends in the next few months possibly crown their performance of the last six months? The British economy and the markets look healthily ruddy; but that is just the moment for a cynical realist to start murmuring about the symptoms of blood pressure.

Bank Deposits and Conversion

NET deposits of the clearing banks rose by nearly £130 million in the six weeks to June 30th, to a new peak of £6,234 million for this season of the year, despite the fact that in early June the Treasury made its cash issue of £300 million of 2 per cent Conversion Stock, 1958-59 (simultaneously with its conversion offer to holders of Defence Threes). A substantial rise in deposits is normal in June, and this latest rise, though above average, is well below the exceptional movement of £158 million shown in June, 1953. Moreover, this year bank advances rose sharply, by £44 million, whereas in the similar period last year they fell by £9 million in consequence of heavy repayments by the electricity authority from the proceeds of its market borrowing. The fact that deposits rose less this year than last is therefore due to a reduction in the credit demands of the central government. If allowance is made for changes

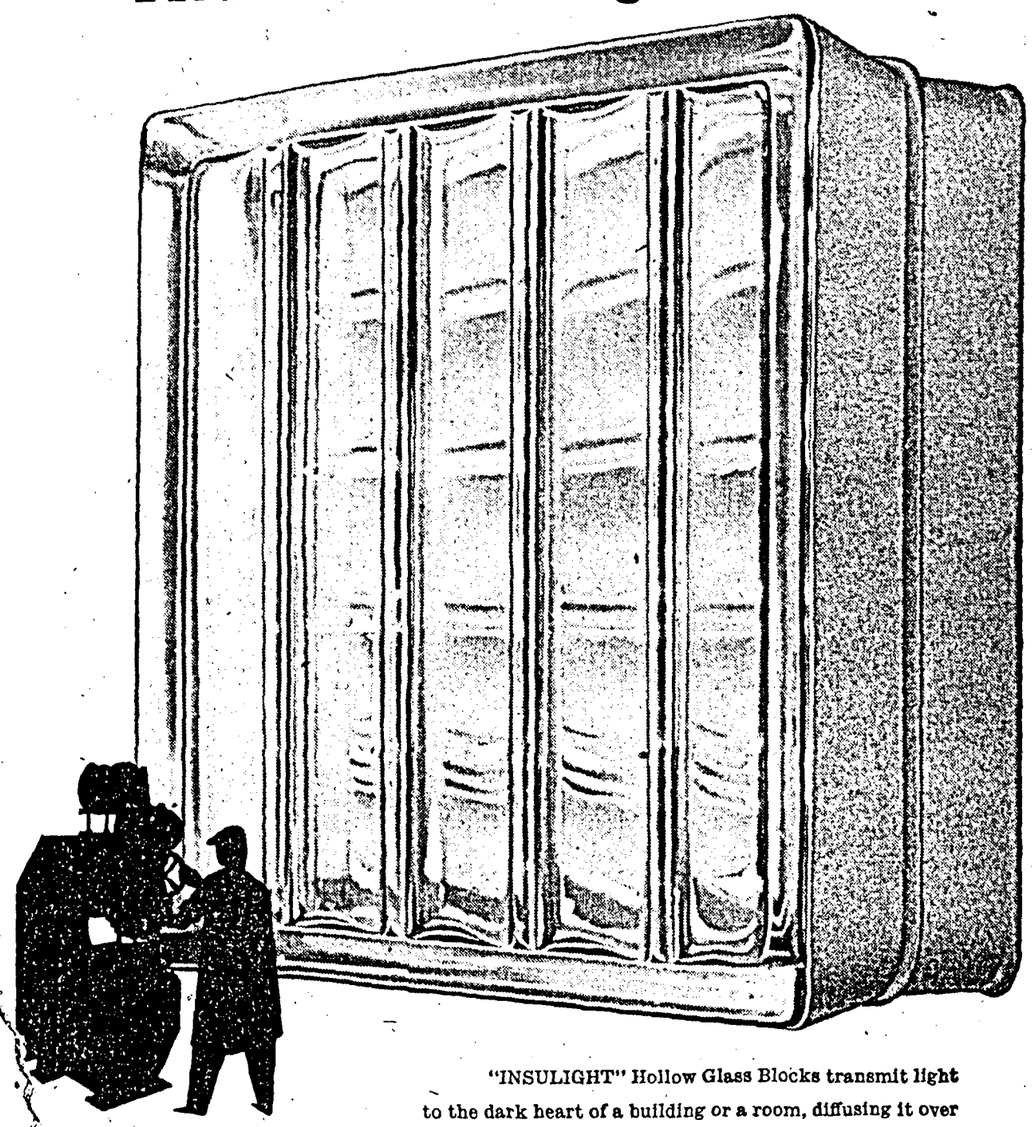
in portfolios of commercial bills (which of course represent finance for the private sector), the government's demands upon the banking system during this latest six weeks appear to have been around £80 million, compared with £170 million last year. This decline in the government's credit needs roughly corresponds to the reduction in the apparent cash deficit on its total domestic finances (excluding, however, its operations in gilt-edged), but the estimated amount of this deficit was appreciably smaller than the indicated borrowings from the banking system, and the difference is larger than could be explained solely by the financing of the surplus on Britain's external balance of payments.



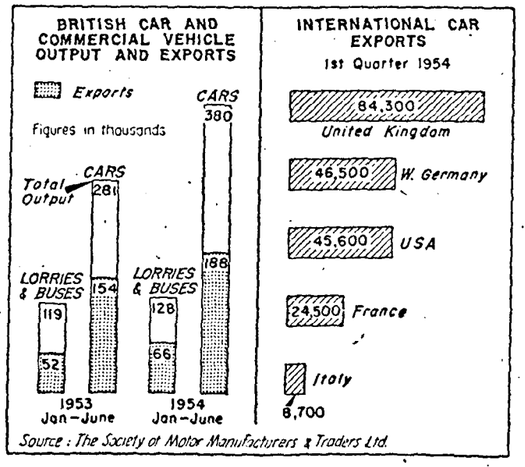
In other words, it appears that during this six-week period the central government (including the "departments") secured no net cash from its gilt-edged operations. The implication is that the amount of 2 per cent Conversion Stock issued or sold for cash to non-governmental purchasers was offset—and perhaps rather more than offset—by net "departmental" purchases of other securities during the fortnight before or the four weeks after the issue was announced. This is a rather surprising conclusion, for although the departments were known to have been actively absorbing the heavy offerings of the maturing stocks, it was equally clear that the conversion tactics had set up a strong institutional demand for certain other stocks—as well as the new 2 per cent stock. The banks, for their part, have taken the opportunity to switch, rather than to expand, their investment portfolios: these rose during the six weeks by only £7 million, whereas their actual take-up of the new stock must have been many times that amount. It should be emphasised that the gaps in the data from which these deductions are drawn involve a considerable margin for error; and it should be noted, too, that the net effect of the conversion tactics cannot be properly judged until the reverberations of the second operation, launched early this month, have ceased. The two operations were quite plainly conceived as a whole.

A Million Motors?

THE motor industry seems set fair to produce this year a million vehicles for the first time. Production of cars and commercial vehicles during the first six months passed the half-million mark, in spite of sporadic selling problems early in the year. This rate of production probably represents the limits of the new postwar capacity that has not, until this year, been fully used. Certainly the major factories are working to capacity—all of them have reported the attainment of highest-ever levels of output—and it is questionable whether they can increase it further without major plant extensions. Half this output of vehicles was exported, earnings from the sale of cars and lorries alone reaching £98 million during the half-year; b comparison with last year, the actual increase is some £1 million. To this must be added a further £24 million th the industry earned from the sale of tractors and an unspe fied but substantial sum for spare parts.

The buoyancy of the home market for cars was t expected, but the revival in exports needs examin First, the easing of Australian import quotas has ca jump in shipments there from 22,500 during the first h last year to nearly 44,000 this year. Sweden's b imports of German cars has caused a rise in sales t market from 11,000 to nearly 23,000. Other st markets like New Zealand and Eire show rising f while there has also been a solid but less spec improvement in exports to western Europe. Shipme North America have fallen. The United States, B third biggest customer, took 14,000 cars in place o 18,000 the year before. Canada took only 12,000 co with nearly 21,000 in the first half of 1953. The industry in North America is in the doldrums, and im cars are feeling the effects.

'INSULIGHT' lightens labour



"INSULIGHT" Hollow Glass Blocks transmit light to the dark heart of a building or a room, diffusing it over wide areas in places where ordinary glazing would be undesirable. They cut the racket of the machine shop, the roar of traffic, to a subdued murmur. They hold warmth in and cold out. They keep private places private. In fact "INSULIGHT" Hollow Glass Blocks do the work of walls—but walls of light.

The British industry's export market seems to have a sufficiently broad international base to enable it to ride out local fluctuations in individual markets ; but this raises the question of how to plan for the coincidence of the home and export peak demand. This summer's waiting lists, the last hangover of rationing, are the outcome of this timing.

The industry is already considering the unpalatable course of producing for stock during the winter. Such stocks that will almost certainly have to be carried by the manufacturers themselves. They may still persuade their home dealers to finance these stocks but will they ever get foreign agents to buy cars from them during the slack season ?

Second Thoughts for Rio Tinto

EFFECTIVELY Rio Tinto will receive £8 million from the sale of two-thirds of its Spanish assets to a group of Spanish financial interests, for in addition to the capital sum of £7,666,665 (the greater part of which will be paid in instalments in the next four years) it will also receive just over £333,000, representing profits accumulated up to January 1, 1954. These sums are payable in sterling as are the dividends on the "B" shares (through which Rio Tinto will retain a one-third interest in the new Spanish company) as long as these freely transferable shares remain in non-Spanish hands. Shareholders will welcome the price and these arrangements but they will be disappointed by the statement from the directors that their proposals for dealing with the proceeds from the sale are not yet ready. In explaining this delay, the statement says:

> The Board had hoped to be able to put forward proposals immediately, but legal and tax problems of considerable complexity arise in connection with the transaction and these require much study and will take some time to resolve.

A few shareholders no doubt have been hoping for a straightforward capital distribution. But there are practical difficulties in the way of such a distribution, however desirable it may appear in principle. About 40 per cent of Rio Tinto's ordinary shares (which have a strong merchant banking tinge to them) are owned in France and any distribution received by the French shareholders from the capital proceeds would be subject to a form of surtax. A capital distribution, which in any case would be possible only after the money had been remitted to this country and therefore at the best could be made only in instalments, would also reduce the cover on the preference shares, all of which possess votes. A reduction in capital might overcome the surtax difficulty, but with an ordinary capital of only £2,125,000 the company has not much room for manœuvre in this direction. A much more complicated scheme for rearranging the company's capital would appear more likely, but such a scheme would take time to prepare.

Beyond these problems, which in the end can be resolved with patience, is a question concerning the whole future of Rio Tinto. It will soon have a minority shareholding in Spain in addition to its investments in the Rhodesian copper companies ; but it also has a wide ranging interest in new exploration. The company may feel inclined (perhaps obliged if it wishes to retain control) to hold some of the proceeds back to finance the initial stages of development if the prospectors made a strike ; the costs of such developments are high and normally are not financed by direct public subscriptions for new capital. Perhaps some scheme can be worked out which leaves the shareholder with the option to stay in Rio Tinto, backing its new ventures, or to pull out, taking part of the capital proceeds with him. That is how it should be.

Terms of Trade Worsen

THE terms of trade, which rose by two points in April, moved a further point against this country last month to reach 100, the average for the whole of 1953. From a low point of 97 in March, the ratio of import to export prices has risen to the level of last July. The index of import prices rose by one point to 99, owing mainly to higher prices of raw cotton, wool and rubber, while the index of export prices was unchanged at 99 for the eighth successive month A further adverse movement—though not a sharp one—i probable, if only because of the delayed effect of higher com modity prices upon the import index. And while more pu chasing power among primary producing countries shou expand the opportunities for British exports, competiti from other manufacturing countries may make it difficult to raise export prices and the volume of exp Although the improvement in Britain's terms of trac been checked this year, the gross visible trade defic continued to fall, thanks to the recovery of exports. value of exports was seven per cent higher this yea in the first half of 1953—though it was only two pe above that of the second half—and the volume wa per cent higher. The value of imports was one p less than in the first half of last year, but as import fell by about four per cent, the volume was nearly per cent higher.

The reduction of £18 million to £46 million monthly average trade deficit reflects a closer bal trade with both the sterling and non-sterling areas. to the sterling area were 12 per cent, or £12 million a higher than in the first half of 1953, while impor

the sterling area rose by less than £1 million a month. Exports to the dollar area fell by little more than seven per cent, despite the fall of 12 per cent in shipments to North America ; imports from the dollar area fell more sharply, by £4.1 million to £45.3 million a month, and the trade deficit was reduced by £1.5 million a month. Exports to the OEEC area rose more than imports, reaching a higher level than in any previous half-year, and trade with this area was almost balanced. The gross visible deficit is of little use as a guide to the balance of payments on current account. To arrive at a figure an attempt has to be made to assess trade payments in and out, earnings from shipping and other invisible services and investments, and transactons on government account. These elements, particularly trade payments, can fluctuate sharply. But they are unlikely to have worsened radically this year, and with the known reduction of £100 million in the trade deficit between the first half of 1953 and 1954, it would be surprising if the Chancellor was not being unduly cautious in his "good hope" that the surplus on current account would "compare favourably" with that of the first half of last year. After all, it could hardly be any less than the negligible surplus of £13 million for that period.

Few Orders for Ships

BETTER supplies of suitable steel have enabled British shipyards to improve their rate of production and delivery over the last year. In the first half of this year, according to the quarterly shipbuilding returns compiled by Lloyd's Register of Shipping, shipyards in Great Britain and Northern Ireland completed 749,485 tons gross of merchant ships and started work on 757,585 tons, as against 667,609 and 655,666 tons respectively for the same period of 1953. Production at an annual rate of about 1,500,000 tons gross is more in line with the true capacity of the industry ; but this rate may not be maintained unless new orders are taken in to replace the tonnage delivered. So far this year, however, United Kingdom shipyards have ooked orders for no more than 232,000 tons, and against his must be set the cancellation of orders already placed r as much as 155,000 tons gross. In fact the net intake orders for new ships in the last twelve months has been more than about one-third the total output of the s during the period. At present the total order book nts to about 4,868,000 tons, but this does not neces- mean that there is still three years' work assured for yard. More than half the total consists of tankers, of them very large vessels, and some yards are begin- o feel anxious about their near future.

little consolation to know that the lack of orders is vide, and that for some of their competitors the t of empty berths is more immediate. American ds, for example, have not received a single order ocean-going merchant ship for more than 18 months ; ly 22,610 tons of new work replaced the 223,314 t were launched in the United States during the last With the threat of unemployment the spur, Con- shipyards in particular will be keen competitors few new orders that are likely to be available for me ahead. They are in a position to offer quick delivery, as well as fixed prices, and they have a flexible labour force which works long hours and on a shift basis. These are inestimable benefits when there is a dearth of orders ; and they represent a strong challenge to the British shipbuilding industry.

South Africa's Gold Sales

THE recently published annual report of the South African Reserve Bank defines and clarifies the arrangements that now obtain for the marketing of gold mined in the Union. The period covered by the report—the twelve months to March 31st last—witnessed the reopening of a free gold market in London and with it a fundamental revision of the arrangements made for the disposal of South African gold. The basic agreement between the Governments of the United Kingdom and of South Africa remain unchanged ; under this agreement South Africa undertakes to sell a minimum of 4 million ounces of gold a year to the United Kingdom while at the same time meeting the whole of the Union's own requirements for hard currency. The two fundamental changes were a withdrawal of the earlier permission given to the South African gold mines to sell part of their output in the premium market and a new arrangement whereby the whole of the South African gold sold in London by the Reserve Bank has, since March 22nd last, been disposed of through the free market that began to function in London on that day. Previously, the mines had been allowed to sell up to 40 per cent of their output in the premium markets in other centres. The other 60 per cent was sold to the Reserve Bank at its statutory price, and the Reserve Bank, in turn, sold not less than the agreed minimum of 4 million ounces direct to the Bank of England and disposed of the rest as best suited the exchange needs of the Union.

It is interesting to note from the Reserve Bank's report that during the year 1953-54 no less than £20,466,000 out of total sales of £112,085,000 was disposed of to the Bank for International Settlements against payment in US dollars. By using this channel, more favourable terms were obtained than if direct sales had been made to the US Assay Office. The withdrawal from the mines of their former freedom to sell part of their production "for industrial purposes" at a premium was not, in the event, of much significance

"Motor Business"

We have just circulated to a number of companies in the motor and allied industries a special bulletin showing how business research can help to solve their problems. If you, too, would like to have a free copy of this bulletin we shall gladly send you one, provided the supply has not been exhausted.

Please write or telephone, mentioning "Motor Business", to :

THE ECONOMIST INTELLIGENCE UNIT
22 Ryder Street, St. James's, London, S.W.1
Whitehall 1511. Extension 17

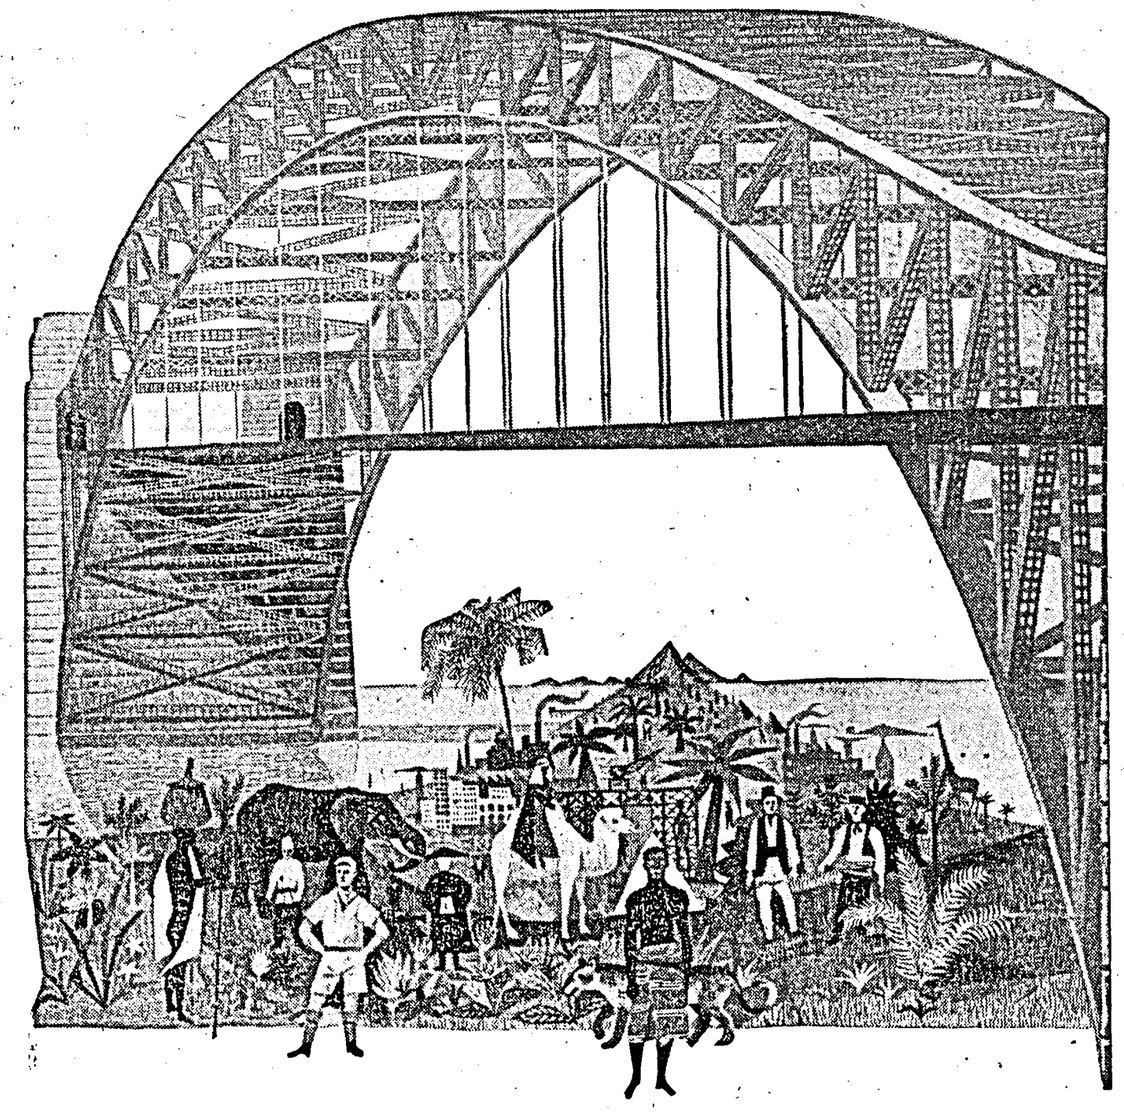
for them, because the large premium formerly quoted in the free market had disappeared last November. As from last March, the Reserve Bank buys all the gold produced in South Africa and bases its price on that quoted in the London market. In justifying this change, the Reserve Bank doffs its metaphorical hat to the reopened market: "having regard to the international nature and leading position of the London market, it appears unlikely that a better price would normally be obtained elsewhere."

A New Copper Contract

THE proposed revision of the standard contract for copper on the London Metal Exchange goes a long way to meet the criticisms of consumers and should help to minimise fluctuations in the cash price. At present, sellers can deliver copper either ex-ship London, ex-quay Liverpool or from a United Kingdom smelter or approved warehouse. Such consideration for the convenience of producers may have been justified when the market reopened last August, but the uncertainty of the delivery point has discouraged consumers from using the market. Moreover, fluctuations in the cash price can result solely from the mechanics of the contract, unrelated to the copper market itself. If, for example, a trader holding delivery orders from a smelter's works has not sold that copper before the orders expire, he will usually prefer to sell at some 15s. a ton below the prevailing market price to avoid the expense of putting metal into warehouse. The committee of the Exchange has now decided in principle that delivery will only be made ex-warehouse, as in the tin market. This has the further advantage that the buyer will be certain of obtaining delivery on the prompt day if he wishes, whereas delivery can take up to three weeks or so of the "prompt" day at present.

The new contract should be approved next month, and may be introduced by about the end of the year. Some traders consider that as long as there is no surplus of copper available to the market producers will avoid, whenever possible, the cost of putting metal into warehouse, and that the consequent smallness of stocks could lead to greater instability of price. This question, like many others associated with changes in the contract, can only be answered by experience. The committee has not been able to meet the request of some consumers for a contract that would reflect the world price of electrolytic wirebars. It considers that such a contract, cif UK or Continental ports, is desirable, but that it could not be introduced until the existing restrictions on imports of copper into the Continent have been eased, and that a contract based only on the United Kingdom alone might not produce a realistic world price.

Investing in Aviation Spirit



THE Shell refinery at Stanlow is becoming the main production centre of aviation spirit in this country. This is probably one of the few basic oil products that involves the erection of special-purpose plant and Shell has built first, a £3.5 million "platformer" and is now following this with a £500,000 "iso-pentane" unit. Behind this formidable terminology is an effort directed constantly towards accumulating and concentrating a high enough proportion of exceedingly light and volatile fractions of oil to make a fuel that will work effectively in the fastidious cylinders of a piston aero-engine. These need fuels with an octane rating of about 130 to prevent knocking, compared with 80 octane for premium grade motor spirit. The final product is a blend of petrol with a variety of high octane ingredients, most of which have hitherto been imported.

Behind Shell's decision to produce an increasing number of these products at Stanlow lies an appreciation of the expanding market for aviation spirit. In peacetime, aviation spirit probably represents not more than 3 per cent of the oil market, but in Europe capacity is not sufficient to meet demand. In spite of the increasing use of gas turbines in military and civil aircraft, which use a paraffin-petrol blend, the consumption of aviation spirit in Europe's piston-engined civil transports is expected to grow. American estimates suggest that it will reach its peak figure of about 33,000 barrels a day some time next year, but the subsequent levelling off is expected to be very slight during the next decade. Europe has been almost wholly dependent on imports of aviation spirit, and after the Abadan refinery was closed, imports had to be sought from the United States. The developments at Stanlow represent a move to remedy this deficiency that may find imitators at other of the big new refineries.

Bigger Board of Trade

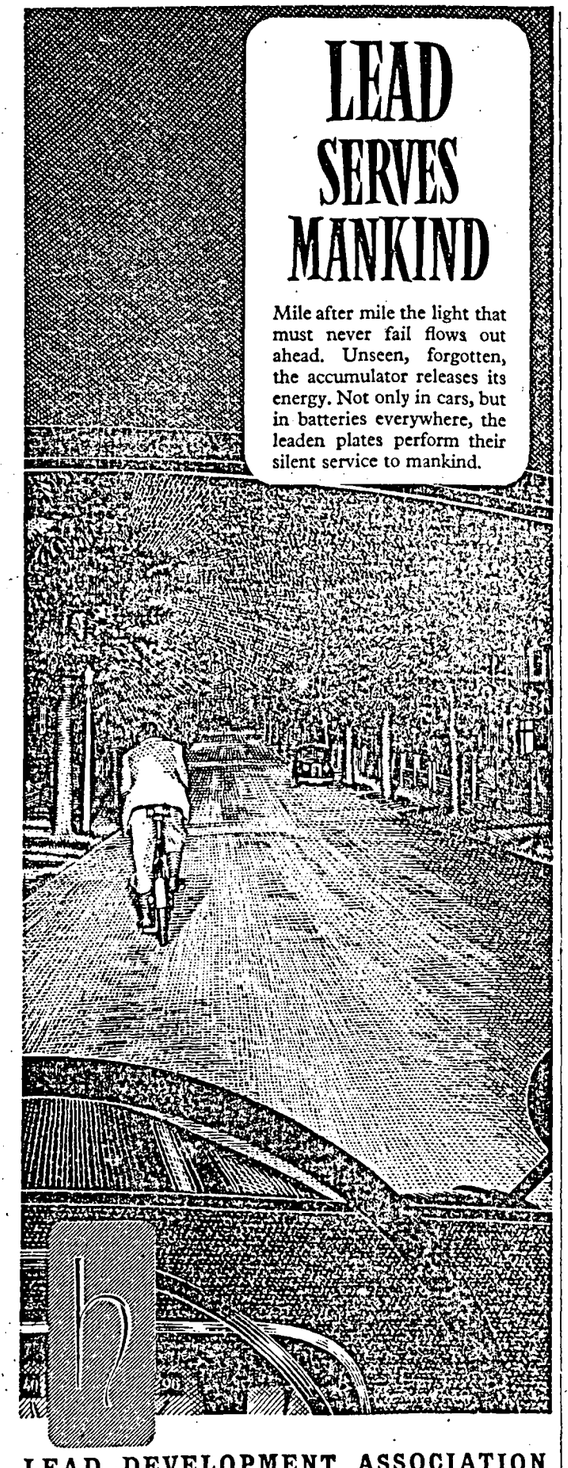
THE transfer of the functions of the Ministry of Materials to the Board of Trade on August 16th is a sensible, if belated, move. The largest part of the Ministry's administrative work ended in 1953, when private trading had been resumed in nearly all the importan materials under its wing. The question was simply whic department, or departments, should assume its prima responsibility of "ensuring adequate supplies of materi with which it is concerned" and its few residual functio including the management of the strategic stocks. Wh the Ministry was formed in June, 1951, it took over Board of Trade's responsibilities for some basic chem fertilisers, natural and synthetic rubber, textile fibres, paper and timber, and mainly light and non-ferrous from the Ministry of Supply. The Board of Tra now become a vertical organisation again, its respo for cotton, for example, extending from the raw r through the manufacturing industries. In cott several other raw materials, for which the Board n remained the licensing authority, the transfer will a good deal of duplicated effort. It will be e welcome to the affected industries, which will he deal with one government department instead of tv

The Board will no doubt create its own machi keeping supplies and stocks of raw materials unde review. Its problems in the event of anothe shortage should be eased by the experience gaine Ministry of Materials. There may be a danger, that the existence of the strategic stocks could lead

British steel spans the world

SYDNEY Harbour Bridge spans one of the great harbours of the world: spans it with steel.

Go where you will, you will find steel — British steel. In the factories of Durban and the tube trains of Toronto. In Arabian oil wells and African railways. During the first five months of this year over 18,000 tons of steel went to Kenya alone for new railways and tramways.



Wherever there is steel there is British steel.

British steel leads the world

THE BRITISH IRON AND STEEL FEDERATION S.79

LEAD SERVES MANKIND

Mile after mile the light that must never fail flows out ahead. Unseen, forgotten, the accumulator releases its energy. Not only in cars, but in batteries everywhere, the leaden plates perform their silent service to mankind.

LEAD DEVELOPMENT ASSOCIATION

—a non-profit-earning development organisation formed by the leading Commonwealth producers of lead and the manufacturers of lead sheet, lead pipe and other lead products.

the kind of life you want

It is an established fact that resistance wires of similar basic composition can have different lives under equivalent conditions of working temperature.

The production of a wire giving long life within its admitted range of working temperature can be achieved only by a specialised melting technique and by strict control in the subsequent processing.

These two essential manufacturing characteristics are fundamental, in conception and in practice, to our production of resistance wires for high temperatures. They are factors which can only come from long experience of this exacting work and constant development of technique.

complacency within both government and industry. But these stocks could hardly be drawn upon in an emergency similar to Korea; they are a source of last resort. The decision not to return light and non-ferrous metals to the Ministry of Supply presumably reflects the government's view that this department should in future be more exclusively concerned with procurement for the defence programme. The next step may be the transfer to the Board of Trade of the Ministry's responsibilities for the general engineering industries.

VHF Approved

THE BBC has come out of seven months' hard negotiations with official approval for about half of its plan to provide Very High Frequency sound services. In January, the Television Advisory Committee reported to the Postmaster General that all but one of its members considered that the BBC's proposals were technically sound. They appeared to be the only way of overcoming the inadequate services provided over wide areas of the country by the over-crowded long and medium waves. Since then the BBC engineers have argued for seven months with the Committee, Post Office, and radio industry representatives over the actual details of the plan put forward. This was originally based on the erection of about 50 transmitters on 20 separate sites. The BBC has won its point, against opposition in some sections of the radio industry, to run the transmitters on frequency modulation in place of the amplitude modulation used on the other sound services; but the proposals approved by the Postmaster General represent only about half the original plan, that is, only nine stations as against the 20 suggested. This, Lord de la Warr told the House of Lords, will cover about 75 per cent of the population. Presumably, therefore, large areas of the country will still be outside the reach of the improved services. The long delay in getting approval has disappointed the engineers who have to bear the brunt of complaints about transmission. The BBC plan was first made public last October, and it will be at least 18 months before the amended scheme is completed.

Radio-active Economics

[T]he sale of radio-active materials is beginning to bring [in] an appreciable income to the Department of Atomic [E]nergy and this week's international conference on their [u]se being held at Oxford is likely to give sales a con[si]derable boost. The contribution that these materials [ca]n offer is their ability to behave in the same way as [ra]dioactive elements—to go through a chemical [pr]ocess, through the blood stream or through a pipe-line—[si]gnalling all the time their presence and their concentration clearly and unequivocally to the watching Geiger [co]unters outside. The evolution of techniques for tailoring [ra]dioactive elements into everyday compounds like [fo]od and sugar has opened up possibilities for manipu[la]ting radiation with infinitely greater precision. These possibilities were discussed by the 800 delegates at Oxford, nearly half of whom came from abroad, among them 44 Germans. A feature of the German visitors was that they seemed to have a far clearer appreciation of the industrial possibilities of these new materials than has been shown either inside or outside this country.

One atom centre in this country, the Radio-Chemical Centre at Amersham, is specialising entirely in the preparation and sale of these materials. In the past financial year, before production had been put on a fully commercial footing, sales amounted to about £400,000. The rising level of consignments suggests that this year's turnover will be about £600,000 and business will probably level out at an annual £1 million a year. Of this, about one-third is made up of export shipments. These are limited by the short life of some of the compounds. The most valuable medically are those that after a short radio-active heyday end up harmlessly in the body as ordinary stable elements. This is one reason why hospitals and laboratories take far more consignments than industry, where long-lived sources of radiation are more in demand. The special facilities for preparing elaborate compounds that are being developed at Amersham have been the basis for exports even to countries such as the United States. In the first six months after arrangements had been made there for their distribution, exports to America realised about $50,000; and this business will no doubt expand.

Another aspect of radioactive economics is contained in the announcement that the production of heavy water is to start in New Zealand. Heavy water is coming into increasing favour with scientists as a means of "moderating," or controlling the activity in an atomic pile, the standard material at present used being graphite. Heavy water is a special form of hydrogen with a nucleus twice the normal weight; it is costly to produce and what supplies are in Britain come from Norway. An earlier scheme to make heavy water was rejected on the grounds of cost; now that a means has been worked out of linking it with power generation from North Island's hot springs, the economics look better and the project is to go ahead.

Machines from Abroad

WHEN tariff protection was introduced in 1932, provision was made for the exemption from import duty of foreign machines that were officially accepted as being needed but "not for the time being procurable" in Britain. The Import Duties Advisory Committee administered this exemption; it intended originally to lay down specific classes of machinery for automatic exemption, but found this impossible in practice and had to deal with individual applications for particular machines or consignments. During the war import duties on machinery were suspended; when they were re-imposed after the war a similar system of exemption was put into force and operated by the Board of Trade, advised by the Ministry of Supply. The volume of machinery brought in free of duty grew considerably; by 1951 the number of applications dealt with had risen to 12,313, and during 1951-52 the value of free imports was £19.4 million, amounting to 27.2 per cent of all machinery imports. The Government decided that this volume was exceeding "the narrowest possible field"

of free imports, which had been the original intention; moreover, the administrative burden of handling the applications had become heavy. In the Budget speech of 1952 Mr Butler announced that duty-free imports of machinery would for the present be suspended, and that a committee would be set up to examine the whole question.

The committee reported this week. It favours a discretionary system for free import of machinery, but not upon such a wide scale as the earlier one. In particular, it would restrict the consignments of machinery for which applications for exemption would be considered to those with a value of £2,000 or more, on the grounds that the duty on machines of lower value would not be a significant consideration affecting import to the extent that justified the work of administration. It feels that Government departments should continue to carry out this work, advised by a consultative committee containing representatives of industry; and that the criteria used by the departments should remain broadly as before, though exemption from duty on foreign machines where British makers' deliveries are protracted might be administered rather more flexibly. It makes one logical addition to the scope of exemption, by recommending that plant—"static machinery which performs industrial processes without moving parts" was the definition the committee finally arrived at, after the FBI, the National Union of Manufacturers and the British Engineers' Association had failed to produce one—should also qualify for exemption on the same grounds as machinery.

The Bowater Concert

HAVING attracted "a cinema of shareholders" to its annual general meeting and works visit, the Bowater Paper Corporation held its extraordinary general meeting at the Royal Festival Hall. Nearly 1,000 shareholders turned up, to vote on two resolutions, to watch a film and to enjoy a cup of tea. The first resolution, authorising the free scrip issue of one new £1 ordinary share for every three held, was passed unanimously. Commenting on this issue, the chairman, Sir Eric Bowater, gave a strong hint that another free scrip issue is likely next year. He also explained that earnings so far this year warrant the payment of an interim dividend and the board hope to be able to make this payment in October. Looking further ahead, now that the Tennessee Mills are in operation, Sir Eric anticipated "a high level of production" in the corporation's plants both at home and overseas.

The second resolution, granting Sir Eric an option to buy in the next seven years 150,000 ordinary shares at not less than the market price ruling on the day the grant is made (which effectively means in the next few days), was passed with only one voice of dissent. A few proxy votes had been entered against the option, which the vice-chairman, Sir John Keeling, described as a "testimonial" to Sir Eric; but the only shareholder to dissent at the meeting based his objection on the grounds that similar options should have been given to all directors and higher executives as well. Before the resolution was put to the shareholders, Sir Eric reminded them that "legally there was no obligation to seek the consent of the shareholders to this proposal."

Demise of the Cotton Commission

THIS week the Government moved the Order dissolving the Raw Cotton Commission on August 31st. This has always been the date aimed at, and the Government has rightly refused to entertain the Opposition's pleas for postponement. The Commission's customers have been given ample time to arrange to obtain their requirements of raw cotton privately, and they are assured of supplies of certain growths from the liquidator of the Commission up to next May. During the debate in the House of Lords, Lord Woolton revealed that by August 31st the Commission will have some 230,000 bales of cotton sold forward to contracting-in spinners, and will have a similar quantity, valued at about £20 million, for disposal by the liquidator. The total quantity of some 450,000 bales is equivalent to about 12 weeks' consumption in Lancashire, apart from the considerable stocks held by spinners and the small quantity held by merchants. The Government have again stressed that if Nigeria, Aden and Nyasaland decide that their existing contracts for the sale of cotton should run for the full term, they will be taken over by the liquidator, who will be the present chairman of the Commission.

The Liverpool cotton futures market is progressing as well as was generally expected, if not better. Prices have risen further this month, mainly because the acreage planted to cotton in the United States proved to be appreciably below the maximum allowed, and because the Commission revealed that its unsold stocks of American-type cotton were much smaller than had been supposed. Prices would probably move still further towards parity with the New York market if the Commission would announce the volume of hedges now remaining in its cover scheme. Most estimates of the weight of hedge-selling that may still come on to the market are almost certainly too high, and spinners should gain, rather than suffer, if the figure was made known.

The Consumer's Whisper

COMMON anxiety over the trend of coal prices—but some rather different grounds for it—are expressed in the annual reports of the Industrial Coal Consumers' Council and the Domestic Coal Consumers' Council, published this week. Both record their objections to the last increase in coal prices, which appear to have brought about insignificant modifications in the National Coal Board's original plans. The Industrial Coal Consumers' Council adds

> It has been suggested in certain quarters that the increases to which we have referred have subsidised industry at the expense of the domestic market, but we are satisfied after investigation that this is not so.

The domestic council appears to have been one of these quarters. It records that it protested about the "discrimination against householders" that it felt was implied by raising house coal prices by more than the average increase in industrial coal. Slight alterations were made, but "the modification made only an infinitesimal difference and our fundamental objections remained."

These two reports are linked not only by the staples of the Stationery Office, which published them together, but by the common membership of Sir Walter Drummond, Deputy-Chairman of the National Coal Board, and Sir William McGilvray, its marketing director. But these two Coal Board representatives, whose presence on the two councils is in any case somewhat remarkable, are presumably not associated with the council's objections to price changes that Sir William may in the first instance have been responsible for drafting; so they can hardly be held responsible for the councils' divergent views. It may be added that the industrial council

> felt it necessary to contradict misleading Press statements which have been made to the effect that there was something wrong with industrial coal prices in so far as certain sections of industry were being favoured. This is not so.

The facts of this contention are not significant—though it might be observed that both the gas and electricity industries, which are represented on the council, have from time to time suggested that their own industries have been treated particularly badly. What is remarkable is that the council should imagine that its own flat contradiction, unsupported by any evidence, will carry any weight whatever.

SHORTER NOTE

The factory and equipment of Jowett Cars, which stopped the production of the Javelin and Bradford vehicles last year, is to be sold to the International Harvester Company of Great Britain. The price to be paid for this equipment, excluding that required for the services and spares department which will remain in operation for the time being, is some £140,000 above the book values of the property concerned. As shareholders have not yet seen the latest copy of the balance sheet (though they have been told that profits have slumped from £306,706 to £97,083) they do not, in fact, know the exact purchase price. It seems, however, that even on the best assumptions about the price and the possibility of a capital distribution the 4s. ordinary shares were over-valued at their price of 6s. 6d. on the eve of the announcement. After the announcement, they fell to 5s. 9d., after touching 5s. 6d.

*

Correction: The range of prices in the International Sugar Agreement given in *The Economist* last week should have read 3.25 to 4.35 US cents a lb.

Company Notes

DISTILLERS. The shareholder in Distillers has to assume—for the company's accounts do not give him all the facts—that the stable element in the group's earnings arises from the whisky and gin division and that it is the chemical and industrial division which is primarily responsible for the wide fluctuations in total earnings. The company's preliminary report for the year to March 31st shows a very sharp rebound in trading profits, from £13 million to over £19½ million. Without much hesitation the shareholder can assume that this increase sprang directly from the recovery in chemicals, plastics and petroleum chemicals.

	Years to Mar. 31, 1953	1954
Consolidated earnings:—	£	£
Trading profit	13,030,747	19,717,540
Total income	13,280,492	19,911,332
Depreciation	1,464,792	1,514,566
Taxation	6,641,394	9,805,472
Net profit	*4,101,072**	*7,316,544*
Ordinary dividends	2,792,949	3,214,167
Ordinary dividends (per cent)	22½	25
Retained by subsidiaries	516,176	1,745,891
General reserve	1,000,000	2,000,000
Carried to carry forward	67,136	233,375

**Ordinary stock at 22s. 3d. yields £4 12s. per cent.*
†After the transfer of £400,000 from stock [illegible] *reserves.*

[illegible]ation, at nearly £10 million (including £1,000,000 for EPL), has lopped away [illegible] half of the trading profit. Nevertheless, net profits have risen from £6,[illegible]072 to £7,316,549, and the directors could have had little hesitation in [illegible]ng upon (and certainly no justification for withholding) an increase in the [illegible] dividend from 22½ to 25 per [illegible]x. The investors had expected a little more, and a free scrip issue as well, so that the announcement was followed by a fall of 6d. in the price of the 4s. ordinary stock units to 22s. 3d. At this price the shares offer a yield of 4.6 per cent, about 6s. per cent below the average yield offered by the leading equities (of which Distillers itself is a notable example). Investors obviously have another dividend increase in their sights. They have steadied their aim by the demise of EPL, the fact that the full exercise of options to convert the loan stock into ordinary stock would leave net earnings covering the dividend more than twice, and the probability that gross profits are more likely to go up again this year than to slip back.

★

UNITED DOMINIONS TRUST. Of all the companies providing finance for hire purchase transactions the best known is United Dominions Trust. The giant continues to grow. In the year to March 31st the value of its total assets rose by over £8 million to £34.4 million. Much of this increase represented a growth in loans to its customers. "Loans against security" rose from £2.1 million to £2.3 million, "bills receivable and notes on hand" from £5.8 million to £7.2 million and "amounts receivable under customers' agreements" from £11.1 million to £15.4 million. These increases were largely financed by further loans and acceptances taken out by the trust itself; this item in the balance sheet (the short-term nature of which is indicated by its inclusion in current liabilities and provisions) went up from £16.9 million to £23.9 million.

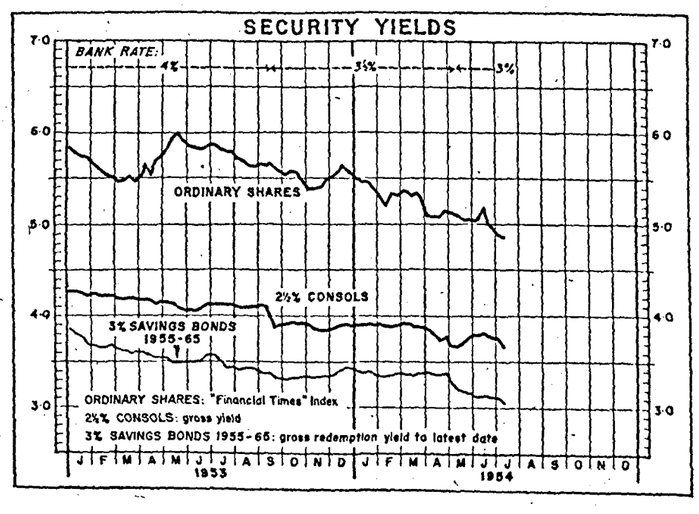
The provision of hire purchase credit may be risky, but it is evidently profitable. The group's profits advanced from £850,000 to just over £1 million. Taxation was about £120,000 higher at £560,000, but net profits increased from £337,000 to £433,000. This increase, coupled no doubt with the improvement in the group's cash balances from £3.8 million to £6.6 million, encouraged the directors to pay out a little more on the ordinary capital (which, because of the continual refusal of the Capital Issues Committee to permit any issue by the company, remains unchanged at £1 million). The ordinary dividend has been raised from 22½ to 25 per cent. This is only a moderate increase and investors are still looking for more, for the £1 ordinary stock units (which enjoyed a good rise after the lifting of the hire purchase restrictions) yield only 4 per cent at the current price of 125s. The hope in the minds of investors is that one day CIC will lift its ban on capital issues by the trust and that this will be followed by a free scrip issue and bigger dividend payments. That day may not be so far distant.

★

PYE. The directors of Pye, the radio and television manufacturers, followed the declaration of a dividend of 20 per cent on the deferred ordinary capital of £951,912 (as increased by a 50 per cent free scrip issue) with the announcement of a one for five "rights" issue of 761,529 5s. ordinary shares at 20s. each. The minimum assumption that investors could make, as the new money would first be used to pay off the £500,000 of 4½ per cent unsecured notes, was that the directors would be willing to maintain a rate of 20 per cent on the enlarged capital. On this basis, the 5s. shares at their "ex-rights" price of 26s. 6d. offer a yield of

only 3¾ per cent—a yield which openly suggests that investors are hoping for something more than a dividend of 20 per cent.

	Years to Mar. 31, 1953	1954
Consolidated earnings:—	£	£
Trading profit	955,992	1,416,405
Depreciation	135,018	202,915
Taxation	508,256	868,196
Net profit	*232,993*	*260,531*
Ordinary dividends	69,807	104,710
Ordinary dividends (per cent)	20	20
Added to group carry forward	173,286	73,443
Cons. balance sheet:—		
Fixed assets, *less* depreciation	957,010	978,610
Net current assets	2,339,736	2,714,210
Stocks	2,606,210	3,840,552
Cash	197,464	187,134
Bank overdraft	157,026	153,641
Reserves	1,218,502	1,042,637
Ordinary capital	602,862	951,912



5s. deferred ordinary stock at 26s. 6d. yields £3 15s. per cent.

To support this belief, the investor can call in evidence the profit and loss account for the year to March 31st. Trading profits advanced from £955,992 to £1,416,405, and the report gave a broad hint of fully employed factories, higher sales and, possibly, wider profit margins. Moreover, it showed that EPL took nearly £160,000 (compared with net dividend payments of about £105,000) from these profits; the death of this tax has obviously enhanced the value of the company's equity. Secondly, the investor will see in the decision to spend £100,000 of the new money in erecting new buildings a certain sign of expansion. Adding weight to that conclusion is the third factor, the directors' comments on the company's working capital commitments. Part of the new money will be needed for working capital —that need is evident in the growth in stocks (from £2,606,210 to £3,840,552), in debtors (from £1,864,799 to £1,958,285) and in "amounts due under hire purchase contracts" (from £198,735 to £224,332). The directors add that "it is probable that provision of still further working capital will be necessary in the course of the next few years, either from additional bank borrowings or by raising of additional permanent capital." Everything, in fact, points to expansion and investors appear to have discounted it accurately.

★

LEWIS BERGER. Another company in a trade closely in touch with consumers reports a recovery from the 1952 recession. Lewis Berger, the paint manufacturers, reports that in the year to March 31st profits made a sturdy recovery from £489,668 to £891,187. The increase in profits was due, the chairman explains, to "a new high level of sales" to which the development of the use of styrene made the most important single contribution. The improvement in sales and profits at home was overshadowed by similar improvements in overseas markets. Companies in Australia comprise the largest interest of the group overseas, and these companies have reported new records both in trading and profits.

The advance in net profits (from £212,152 to £377,066) had its almost inevitable sequel—an increase in the ordinary dividend from 12 to 15 per cent. This new dividend does not completely restore the cut in dividends made in 1952-53, for the dividend in the year to March 31, 1952, was equivalent to 18 per cent on the present ordinary capital of £1,581,825. Shareholders will doubtlessly look forward to the restoration of this rate in the current year, now that the chairman has expressed his conviction that "the improved results will be adequately maintained this year." In addition to the ordinary dividend, the company has again made a tax free distribution of 5 per cent from the capital profits accruing from the sale of fixed assets. In calculating the yield on the 4s. ordinary stock units it is better to ignore this distribution and on the basis of a 15 per cent dividend these stock units offer a yield of 4.9 per cent at the current price of 12s. 3d.

LONDON STOCK EXCHANGE

Next Account begins: August 11th
Next Contango Day: August 11th
Next Settlement Day: July 27th

UNCERTAINTY about the outcome of the Geneva conference and profit taking in equities at the end of the old account caused a few losses in the market at the beginning of this week. Once, however, the cease-fire settlement had been signed, a slight recovery in values was staged. In the gilt-edged market the long-dated and irredeemable stocks, which had recently enjoyed a speculative rise, lost a little ground. In the first two days of the week they closed with small losses, having dropped to rather lower levels in earlier dealings. On Wednesday, however, turnover in the gilt-edged market expanded and, though the longer-dated issues closed with only slight gains, quite sturdy advances were recorded in the medium-dated issues. In the foreign market, German stocks made some good gains on the strength of support from the Continent. Hungarian and Rumanian issues hardened.

In the industrial market, the fall in equity values brought the *Financial Times* ordinary share index down from its peak of 160.8 on Thursday of last week to 157.8 by the close on Tuesday; on Wednesday, however, the index recovered to 158.2. Declines were most pronounced in the store, textile, motor and paper groups. These groups, particularly the store and motor shares, later led the recovery. After a weak start, engineering shares remained firm, but on Wednesday shipbuilding shares turned distinctly dull. Bowater rose 3s. 6d. to 72s., on the strength of the chairman's indication of another scrip issue. The repetition of the Imperial Tobacco interim dividend at 8½ per cent led to a rise of 6d. to 53s. 1½d. In the oil market, Anglo-Iranian fell sharply on Monday by ½ to 12⅛, on the report from Persia (not confirmed, and certainly misinterpreted) that the compensation payment may be smaller than was expected; other leading oil shares lost ground as well. Part of these losses was recouped later in the week. Dealings in the Kaffir market were at a low ebb and prices tended to slip back.

es only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany ember, 1948=100. (3) Index numbers of unit value which compare the current average value of trade with its value in 1948; they are changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (4) Notes only for France and Holdings of the government and central bank at end of period: figures for Greece are gold reserves only. (5) Average for fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended July 17th there was an "above-line" deficit (after allowing for Sinking Funds) of £3,769,000 compared with a surplus of £5,701,000 in the previous ten days and a deficit of £29,558,000 in the corresponding period of last year. This brought the cumulative deficit to £146,450,000 (£184,771,000 in 1953-54). Net expenditure "below-line" absorbed £20,967,000 bringing the total cumulative deficit to £273,237,000 (£334,419,000 in 1953-54).

THE MONEY MARKET

CREDIT conditions became difficult in Lombard Street around last week-end, mainly on account of the lack of maturing Treasury bills caused by the incidence of Easter three months before. Small special purchases were made by the authorities (indirectly through the banks) on Friday and Saturday; and on Monday very large official help was needed and given, again mainly indirectly. Conditions eased slightly on the following day, although moderate official help was still necessary, and on Wednesday credit became plentiful and there was even a small balance of idle funds.

At last week's Treasury bill tender applications rose steeply by nearly £37 million to the near-record level of £433.1 million. The offer had been reduced by £30 million to £240 million and the market merely maintained its bid at £99 12s. 2d; the upshot was that the market's allotment fell sharply from 6s to 3s per cent. The offer at yesterday's tender was further reduced to £230 million.

The Bank return shows a sharp increase in the flow of notes into circulation, to £25.3 million. This brings the total outflow in the first three weeks of July to £53.9 million, compared with £41.5 million in the corresponding weeks of 1953. Government securities rose by only £13.7 million over the week, so that bankers' deposits fell by £10.2 million to £277.5 million.

COMPANY MEETINGS

THE BOWATER PAPER CORPORATION LIMITED

SIR ERIC VANSITTART BOWATER'S ADDRESS AT THE EXTRAORDINARY GENERAL MEETING OF ORDINARY STOCKHOLDERS

At the extraordinary general meeting held in London on Tuesday, July 20th, at which nearly one thousand ordinary stockholders were present, the chairman of the Bowater Paper Corporation, Sir Eric Vansittart Bowater, who presided, said:

It is indeed a delight to me again to welcome so very considerable a gathering of our stockholders, for it is only four months since I last had the pleasure of meeting you at our annual general meeting at Sittingbourne, and it is gratifying to me that so many of you should have again taken the trouble to come along, particularly so as the main purpose of our meeting today will doubtless rank in your minds as being largely a formality, for I cannot think that many if indeed any one of you would wish to do other than confirm the resolution relating to the proposed funding issue.

All too frequently, I fear, stockholders are inclined to treat these more or less formal company meetings as being of scant importance and without significance; to some extent anyway this may be the fault of directors in not seeking to make such meetings more interesting and to appear worth while. All this makes me doubly glad that you have seen fit to attend today.

We have a great number of stockholders resident in the north of our country or so far distant from London as to make it somewhat inconvenient or too expensive to attend meetings in London or the south; this being so we are considering holding our next annual general meeting in the north where not only have we several large plants but where also an important part of our business is centred and where we contemplate major developments in the near future.

At the end of the meeting I hope that as many of you as can afford the time will stay to see the film "A Newfoundland Enterprise" and join us in a cup of tea and, should you care to, perhaps take the opportunity this presents of talking over with us such aspects of our affairs as may be of particular interest to you.

FUNDING ISSUES

At our annual general meeting I informed you that it was our intention to recommend to you the distribution of £1,800,000 out of our capital reserves in the form of one new £1 ordinary share for every £3 of ordinary stock held, this of course being calculated on the basis of our now issued ordinary capital of £5,400,000 to which figure it was increased by the recent successful issue of ordinary shares under the terms of the option agreements that were still outstanding at the date of that meeting. Following on the funding issue now proposed our issued ordinary capital will amount to £7,200,000; but even then it still will not be wholly in line with the true value of our assets.

I also promised at the same meeting that some time after the final date for exercising the outstanding options, which was May 31st, but before the end of the year, I would call you together for the purpose of seeking your approval of this funding issue and in making good that promise I chose this the earliest convenient practicable date to do so.

With the consent of the Capital Issues Committee, which was readily granted, certain of our subsidiary companies in the United Kingdom have also capitalised some part of their reserves and undistributed profits to an aggregate amount of £1,300,000 and have distributed them in the form of additional ordinary shares to your Corporation, who are the owners of the whole of the equity capital in the companies concerned.

FURTHER DISTRIBUTION NEXT YEAR

I think it is reasonable to assume that later on our Canadian mill subsidiary will, probably by or before December 31st next, the date to which I would remind you our next accounts will be made up, also decide again to capitalise some part of its earned surplus, and if, as I anticipate, the board of that company decide upon the continuance of their policy in this regard it may, I think, be expected that during next year we might again be in a position to recommend to you a further capitalisation and distribution of reserves on some modest scale, for it seems to us to be appropriate—by means of such increases in the nominal value of the holdings of our ordinary stockholders—formally to recognise to some extent the very large sums that for so long now have annually been ploughed back into the businesses of our principal subsidiary companies and in this way also to bring the total of the issued capital of the Corporation still more nearly into line with the true value of its assets.

There was sent to you also notice of a second resolution upon which you will shortly be asked to vote, and as this is of a very personal nature relating to myself, I shall not of course participate in that part of these proceedings, and when the time comes I shall ask our vice-chairman, Sir John Keeling, to put that resolution to you, but I might perhaps be permitted to make a few comments in connection with this matter. The first is that the proposal before you was the spontaneous suggestion of my colleagues on the board, which I deeply appreciate. And the second is that I was informed that legally there was no obligation to seek the consent of our stockholders to this proposal, but having regard to its nature I preferred, as did my colleagues, that we should seek your approval before giving effect to it.

It may be of some small interest to those of you who are perhaps unfamiliar with our history, that when I first took charge of your Corporation's affairs, some thirty years ago now, the capital of the then private parent company was £125,000 and it had just decided upon the construction of our first manufacturing plant, now Bowater's Thames Paper Mills. Today our assets exceed £75 million and the productive capacity of our plants throughout the world is of the order of 1 million tons of paper annually, and each year we draw from our own resources some 800,000 tons of raw materials. I cannot and do not wish to claim anything approaching the sole credit for this, for my colleagues here and overseas, past as well as present, are in a large measure responsible for this achievement, my good fortune being the privilege of leading so magnificent a team of able and loyal men.

SATISFACTORY EARNINGS AND OPERATIONS

You will not, I am sure, either want or expect me to occupy a great deal of your time at this meeting, for those of you who are able to remain will, I know, be anxious to see the very interesting film depicting some of our activities in North America that we shall be showing to you after the termination of the formal proceedings. However, you will, I believe, like to hear from me something of the progress of your organisation since we last met, and I am very gratified to be able to report to you that your business, in common with others engaged in our industry, continues to enjoy a substantial measure of prosperity. From figures so far available I am able to tell you that to date our earnings are running at least at the same satisfactory level as those for our previous year's trading, and prospects, for anyway the immediate future, are by no means unfavourable. All our plants in this country and overseas continue to operate to capacity and, indeed, we are experiencing some difficulty in fulfilling all our obligations to our many customers, particularly in the fields of newsprint and magazine paper, but we are doing our utmost to press forward with the developments we have in hand designed further to increase our productive capacity, with the object of course of ameliorating, if not wholly relieving, this situation.

TENNESSEE MILLS NOW IN OPERATION

In this connection I know you will be pleased to learn that since we last met the new mills of Bowater's Southern Paper Corporation in Tennessee have come into operation both for newsprint and pulp and will, I hope and expect, quickly achieve a reasonably high level of production of both. It will be of interest to you to know that the first cargo of pulp is now on its way to this country and that the production of the pulp mill has in fact already exceeded its rated capacity. Publishers in the United States who have used it speak well of our first deliveries of newsprint from the new mills, and the coming into operation of this important addition to our productive capacity will help materially to relieve the great pressure on our Canadian mills, which, during recent times, have been hard pressed to supply all the needs of our many customers on the North American continent.

It had been, as you know, my hope an expectation that I would be present Tennessee when the mills there first star up, but unfortunately some slight delay occasioned by unexpected hold-ups occurred in connection with the install of piping and of electrical cabling, and unable to prolong my stay for a suffi time to be present on that exciting occa Despite this delay, however, operations commenced within two years of groun ing first broken on the site, an achieve that is not without its satisfaction in times.

Perhaps I should remind stockholder the initial productive capacity of these is 130,000 tons of newsprint and 55,00 of sulphate pulp annually. This pulp course surplus to the mills' own re ments of this material and is therefore able for shipment to and use in other mills, including our own mills in the Kingdom. This additional producti newsprint and pulp constitutes a va contribution to the requirement Southern United States newspaper lishers and to our own requirements o

type of pulp; moreover, it is, of course, another step in furtherance of our policy of controlling some part of our requirements of the many varieties of raw materials that we consume.

An important, and I think unique, feature is that at the start-up of this great new project its entire production has from the outset been sold under contracts for fifteen years ahead.

FREEDOM TO DEVELOP IN NORTH AMERICA

I recently caused to be sent to you the report of a meeting of our First Debenture stockholders held on June 3rd last, from which you will have observed that the resolution submitted to that meeting was carried by an overwhelming majority. This resolution released from the specific charge in favour of the trustees for our first debenture stock, the common stock of Bowater's Newfoundland Pulp and Paper Mills Limited, which stock is now owned by The Bowater Corporation of North America Limited, whose headquarters are in Montreal and the whole of whose capital is in turn owned by the parent Corporation. The release of this charge over this, one of its principal assets, has assured to the North American Corporation a much greater degree of financial freedom and flexibility. While, as I said at that meeting, I did not wish to give the impression that we had any major projects for further development on the North American continent under immediate contemplation, we felt that it was essential that we should be free to take advantage of any opportunities for the further development and expansion of our interests in Canada and the United States that might present themselves, as we feel confident that from time to time they will.

UK NEWSPRINT SUPPLIES

We are doing our utmost also to achieve a greater production of newsprint in the United Kingdom, for we recognise to the full the vital importance to the newspaper publishers of this country of increased supplies of newsprint from domestic sources, not only in their but in the national interests also, for many foreign currencies are still not yet in abundant supply. We have promised the British newspaper publishers that we will do what we can to increase our deliveries to them during next year, and we shall spare no effort to this end. They, like ourselves, have to plan their affairs ahead but for our part, under the continuance of Government control both of the consumption of newsprint and of Treasury allocations of the foreign currency necessary to acquire our full requirements of raw materials, it is not possible at this stage for us be precise in our undertakings as to quantities we shall be able to deliver a year more ahead. I would like it to be clear and understood, however, that in this important matter we regard the interests of our publisher friends and ourselves as being identical and indeed, I might say, identical. Our part we are anxious to increase our deliveries of newsprint to them, and for their they are anxious, as are we too, to see determination of continued vexatious government control over their use of that commodity.

Some of you may think that in what I am saying I am seeking to look rather a long way into the future but nevertheless, subject to unforeseen circumstances arising, it is my belief that we can look forward to a high level of production of our plants in the United Kingdom and overseas for some years to come and, I hope also, to continued reasonable stability in the level of prices both for our raw materials and for our many manufactured products.

INTERIM DIVIDEND INDICATED

Another thing I told you at our annual general meeting was that, having regard to the change of date to which our accounts would in future be made up, which entailed the current financial period being extended to fifteen months, it would be our intention on this occasion, assuming our earnings to justify it, to pay an interim dividend. It is my pleasure to inform you that in our belief our earnings to date are such as to warrant the payment of an interim dividend and our present intention is to do so in the month of October next. The additional ordinary shares now to be distributed, assuming you pass the necessary resolution that I shall later put to you, will of course rank for that dividend *pari passu* with those in current issue.

As you are fully aware, we have always followed a conservative line in the conduct of all our affairs, whether they relate to our finances, including the basis of the allocation of our profits as between their distribution by way of dividends and their retention in the business for its further development, or the day-to-day conduct of our operations, and I want to assure you that it is my intention to continue this policy and from the remarks I have made today I do not want you to think that I intend in any way diverging from that policy. In conclusion, may I say that proxies have been received from a very considerable body of stockholders, and although the existence of these in effect assures the adoption of the resolutions, it will be necessary formally to demand a poll in each case which I or Sir John Keeling propose respectively to do after putting the resolutions to you.

The resolutions submitted to the meeting were carried by overwhelming majorities, the results of the polls being, Resolution No. 1 1,917,041 *votes for and* 1,905 against, and *Resolution No. 2* 1,789,767 *votes for and* 127,845 *votes against.*

THE TRUSTEES CORPORATION LIMITED

SIR EDWIN HERBERT'S REVIEW

The 66th annual general meeting was held on July 21st in London.

Sir Edwin S. Herbert, LLB, the chairman, in the course of his speech, said: Once again we are able to report that our revenue of £416,043 from interest and dividends shows a satisfactory increase. This year it is £15,231 over the previous year.

The market value of our investments at £7,164,615 shows a surplus of £3,446,438 over the book figure or an appreciation of 92.7 per cent as against 56.2 per cent last year. I would draw your attention to the position of our disclosed reserves which, for the first time, exceed one million pounds.

The year under review has been one of marked activity on the Stock Exchange, activity which appears still to continue.

The revival of inflationary tendencies becomes more serious than ever before as we move away from controls in the direction of freedom. This freeing process has without doubt acted as a tonic to our industrial and commercial system. But freedom in business as in every other activity of life carries with it responsibility. Putting it bluntly we cannot have more than we earn and what we earn is conditioned by the price and quality of the goods and services we have to offer in competition with those of others. We cannot hope to prosper unless everyone concerned, management and labour and finance alike, face the facts of life.

The report was adopted and a total dividend of 24 per cent approved.

SALTS (SALTAIRE)

SIR FRANK B. SANDERSON'S ABRIDGED REVIEW

The thirty-first annual general meeting of Salts (Saltaire) Limited was held on July 21st at Saltaire, Yorkshire.

Sir Frank B. Sanderson, Bart (chairman), in the course of his speech, said:

Profit on trading of the group for the year ended March 31, 1954, amounts to £1,208,261, compared with £756,697 for the previous year, showing an increase of £451,564. The group trading profit includes the results of the two new subsidiaries—W. M. Rennie and Company, Limited, and Josiah France, Limited—from the respective dates of acquisition, but as these subsidiaries have not contributed for a full year the amount involved is not material. After providing £625,832 for taxation, the net profit of the group amounts to £592,743.

£307,500 has been transferred to general reserve, and the expenses of the reorganisation of the capital amounting to £11,811 have been written off. The board recommend payment of the following dividends, subject to income tax: (a) A final dividend of 3½ per cent on the 7 per cent non-cumulative preference shares. (b) A dividend of 12½ per cent on the ordinary shares.

The 12½ per cent dividend on the ordinary shares of 5s. each is equivalent to 7½d. per share. This compares with the dividend of 6d. per share paid last year on the ordinary capital in its old form of 1s. shares.

All our subsidiaries have experienced a successful year's trading, and all have made profits which have contributed towards the results which are placed before you.

Wool values have been on a more level basis than for several years, but your directors continue to view with some misgivings the present high level of values.

Your board continue to use every effort to increase our turnover in export markets, and particularly in the dollar countries. Commonwealth countries, the United States and other foreign countries have been visited by directors and executives of the group, with gratifying results.

It is hoped our Government will use every endeavour to facilitate trading in markets which are now buying our products and to reopen markets where we are now debarred from trading owing to financial and import restrictions.

We are meeting today in many markets fierce competition from Japan, who sell yarn and cloth at prices which appear to be completely unremunerative.

The results for the current year are not easy to anticipate. It must be borne in mind that a large portion of our output is exported to many parts of the world, where the demand fluctuates due to causes beyond our control. Competition for business at home and overseas is keener, with the result that all profit margins are narrowed.

We are living in an unsettled world fraught with difficulties and change. It is not possible to forecast far into the future.

A high machinery activity has been maintained for the early months of our present financial year. The technical and mechanical improvements which are constantly being made place your company in a favourable position to grasp every opportunity that presents itself and to meet any reasonable competition.

As far as can be foreseen, it is anticipated your company will be able to give a satisfactory account of itself at the next annual meeting. The report was adopted.

PATONS AND BALDWINS LIMITED

The annual general meeting of Patons and Baldwins Limited will be held on August 25th at Darlington.

The following is the statement by the chairman, Mr Philip A. Wright, circulated with the report and accounts for the year ended May 1, 1954:

In my statement with the company's accounts for last year I emphasised the extent of the recovery which had been made from the low level to which trade had fallen in the autumn and winter of 1951-52, and I stated that during 1952-53 the sales of hand-knitting wools had in weight been an all-time record. During the trading year to May 1, 1954, for which the accounts are now presented, we have maintained and even consolidated our position. Our sales of hand-knitting wools have again been substantially increased and have established a new record in turnover. Your company's branded hand-knitting wools are so well known that it is often overlooked that we are also very large spinners of manufacturing yarns for hosiery and other purposes, and in this competitive market I am glad to say we have also substantially increased sales and established a new record in weight sold.

Your board is constantly aware of the need to keep the selling price of the company's products as reasonable as possible and with this in view maintained the prices of branded hand-knitting wools unchanged between December 1952, and June 1954, despite rising raw material and manufacturing costs. Since December, 1952, costs have risen as follows:

Raw materials	...	10 per cent
Productive wages	...	12 per cent
Coal	...	11 per cent
Electricity	...	18 per cent
Transport	...	15 per cent

Fortunately higher production and improved efficiency have enabled us to absorb part of these increases and they are, therefore, not fully reflected in the increased selling prices which we have reluctantly been compelled to institute as from June 15, 1954.

In the hosiery and machine knitting trade there is an increasing demand for improvement in such things as fastness of colours, shrink resistance, etc., and this has brought many problems in its train. Your Board is fully alive to the situation and our constant and increasing research into the many facets of these problems results in a continual improvement in our yarns.

The narrower profit margins due to increasing raw material and production costs and our policy of maintaining the selling price of branded yarns unchanged throughout the selling season have, despite the record turnover achieved, resulted in a fall in trading profits compared with 1952-53. It should however, be recalled that that year was one of continually advancing raw material prices and the company was able to realise to advantage the stocks which were carried at the lower market values ruling at the beginning of the year.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The surplus on trading brought into Section I of the consolidated profit and loss account is £2,727,492, compared with £3,185,940 for 1952-53, thus illustrating the comments I have already made.

During the year the company completed negotiations in connection with the disposal of the remaining portions of Clark Bridge Mills, Halifax, and of certain office premises in Leicester. These sales, together with the sale of the boiler and motive plant no longer required at the old Halifax premises have yielded a surplus over book values of £43,824. In complying with the sinking fund redemption obligations under the trust deed securing the company's issue of 4 per cent first mortgage debenture stock a total of £56,387 nominal of stock was purchased during the year at prices slightly below par and the credit involved of £1,958 is shown separately in the accounts.

On the debit side of Section I of the profit and loss account are given the items which the Companies Act and practice in these matters requires us to show and they call for no particular comment on my part. A total of £130,498 is charged for bonus to employees and the directors are glad that the results of the year justify recognition of the efforts of our workers both at home and abroad by this share in the profits of the year.

The balance carried from Section I to Section II of the profit and loss account is £1,909,628, compared with £2,474,710 last year.

In Section II is shown the continuing heavy share which various tax collectors exact of the trading profit. The total charges for taxation, including profits tax on the preference and ordinary distributions paid or now recommended, amounts to £1,240,866, or nearly 65 per cent of the surplus of £1,909,628 brought in. This is an intolerable burden for productive industry year after year, and it is to be hoped that the Chancellor of the Exchequer with the wholehearted support of the whole of the Government and its multifarious departments can initiate an economy of state expenditure in all directions, without which there seems little prospect of the substantial reduction in taxation both on industrial profits and personal rewards which is so long overdue. The recent Budget introduced new investment allowances for capital expenditure, and we shall in due course benefit as your board is constantly alive to the need for improvement in productive efficiency and this almost always involves capital expenditure.

Happily we have a relief this year from the full severity of the tax burden as £202,264 has been brought back to Section II from British and Dominion taxation provisions not required. The greater part of this release of provisions made in earlier years arises as a result of our having settled, upon a more favourable basis than was expected, the liabilities arising as a result of the sale of the fixed assets of the company's former branch in Australia to the subsidiary company, Patons and Baldwins (Australia) Limited formed in 1951. The balance of the credit arises as a result of reductions in taxation rates effected by the Australian Government last year, a lead which it is earnestly to be hoped can be followed in due course here at home.

Taking into account the items I have mentioned and after excluding £96,092 for the interest of outside minority stockholders in the profits of Patons and Baldwins (Australia) Limited, the net surplus for the year of £774,934 is carried to the appropriation section, compared with £1,628,616 last year. In comparing, however, these two figures it must not be forgotten that last year's balance contained over £600,000 of non-recurring credits, compared with only some £245,000 this year. Last year, too, the charges for taxation were reduced by reason of the loss sustained in 1951-52.

APPROPRIATION ACCOUNT

Patons and Baldwins (Australia) Limited has had a satisfactory trading year and has maintained the rate of distribution on its ordinary stock at 6 per cent, transferring in addition a substantial sum to reserve after having written off the balance of its formation and share issue expenses which amounted to £A.40,000. The parent company's proportion of the reserve appropriation of the Australian company amounts to £79,681, and this is the first item shown in the appropriation account.

I have already mentioned that during the year debenture stock to the nominal value of £56,387 was redeemed and, accordingly, this sum has been transferred from profits to capital reserve.

A preliminary announcement of your board's intention to recommend to stockholders the capitalisation of share premium account, which amounts to £2,482,876, and a balance of £155,953, from profit and loss account and the issue of 2,638,829 new fully paid ordinary shares on a one-for-one basis was made in May. A circular setting out full particulars of the directors' proposals is sent with these accounts to those stockholders concerned. For the sake of clarity, the board, in presenting the accounts this year, have transferred from the profit and loss account to capital reserve the amount of £155,953 required for the capitalisation proposals. After bringing in the amount brought forward on profit and loss account of £502,828 and deducting the preference dividends already paid and the interim ordinary dividend at the rate of 5 per cent paid in February, there is available for appropriation a sum of £798,573, and the directors recommend the disposal of this amount in the following manner:

£	
217,703	in payment of a final dividend on the ordinary stock of 15 per cent, making a total of 20 per cent for the year.
580,870	to be carried forward to next year.
£798,573	

The board is this year departing from the practice of recommending the final distribution on the ordinary stock as a dividend, plus a bonus in favour of a straight final dividend of 15 per cent.

You will notice that your board recommends that the amount carried forward on profit and loss account be increased from £502,828 to £580,870. At a cost of reducing the carry forward by some £20,000 it would have been possible to recommend an appropriation of £100,000 to contingencies reserve, but the directors have not done this as in present circumstances they are of the opinion that the reserve at its present level of £3,100,000 is adequate. It will, however, continue to be the policy of the board to build up the reserves of the company as opportunity arises.

CONSOLIDATED BALANCE SHEET

Taking the group as a whole, net assets after deducting the interest of minority stockholders, have risen from £15,316,733 to £15,718,733—an increase of £401,936. The net value of fixed assets has fallen over the year by £187,462 for, as I indicated last year, our capital expenditure has steadied down to a more normal level; we are, however, embarking on an extensive reorganisation of our older Scottish mills and this in addition to the continual modification and replacement of machinery, which an up-to-date approach to production problems necessitates, will involve considerable expenditure over the next few years.

Whilst on the subject of machinery I may add that the company has during the last two years been closely associated with Mr G. F. Raper in the development of the Raper Drawing System. This development was accounted a great success at the Manchester Textile Machinery Exhibition in October last year and is now in commercial production. We are glad to have been able to foster this new drawing system for the benefit of the textile industry as a whole.

The chief and very welcome change in the appearance of the group balance sheet is the disappearance of bank overdrafts which on May 2, 1953, stood at £1,821,838. Group stocks have fallen by only £373,208 between the two balance sheet dates. Taking into account the substantially increased turnover to which I referred earlier in my remarks these two changes are all the more remarkable. I am happy to say they are the result of an extensive reorganisation undertaken a while ago into the control and organisation of our stocks, our wool buying, and planning of production. The new plans made to cope with these problems have not only enabled us to improve the efficient service which our customers expect, but have enabled us to turn over our stocks more frequently with resultant economy. Whilst we must still expect to have recourse to our bankers for the finance of peak stocks we hope that requirements in this direction will be on a lower level than for the past two years or so. Your board records its gratitude for the helpful and co-operative approach to finance problems which has been shown by the company's chief bankers.

Despite the fall in bank overdrafts of £1,821,838, current liabilities as a whole have only fallen by £1,285,948, there being an increase in the amount required for current taxation, British and Dominion, of £282,853 and other increases in normal trade liabilities. The amount set aside for future taxation has increased from £715,239 to £844,836.

EXPORTS

Sales to the export markets during the year under review have been well maintained. The resurgence of the European textile industry since the war, particularly in Germany, has led to considerably increased competition in many of our markets. This has been accentuated by the subsidised exports of tops from Uruguay, which, though a duty of 10 per cent is payable on entry to the United Kingdom, enter some countries free of duty. Shortage of sterling exchange in other countries, such as Japan and France, has also made export sales more difficult. The recent further freeing of sterling is a step towards freedom of trade and it is to be hoped that the coming year will see the easing of currency and other restrictions in South America and elsewhere. The reputation of the company's products throughout the world is such that we should have no difficulty in strengthening our position once these artificial barriers to trade are removed.

PERSONNEL

I have already mentioned that a bonus to employees at home and abroad has again been paid out of the profits of the year and it is gratifying that the diligent and faithful service of our workers and staff can thus be rewarded. The board have recently introduced a scheme for the recognition of long service with the company which gives benefits of a material kind to those completing 15, 25 and 40 years' service. After 40 years' service an employee is also presented with a suitable memento of the occasion and it is worthy of note that at the inception of the scheme no less than 84 men and women were already qualified by their time with the company for recognition in this way.

FUTURE PROSPECTS

Since March of this year there has been a continual rise in the price of raw wools in the primary markets and the tendency is still upwards. Stocks in the wool growing areas are negligible except in South America where there is still a certain amount unsold. In the consuming centres, such as Bradford, stocks of wool and tops are below average, and those in the hands of manufacturers and distributors would not appear to be excessive. The increasing demand from Russia, China and the countries behind the Iron Curtain is also a factor likely to have quite an influence on world wool prices. On the other hand, the wool textile trade in the USA and Canada is still in the doldrums, though there are signs that the corner has been turned and an improvement is on the way. At home and on the Continent there is at the moment a lull while the trade adapts itself to the new price levels, and order books are not filled so far ahead as they were a year ago, but this, I expect, will only be temporary.

Taking all things into consideration, I see little sign of an easing in raw material price levels this year even when the full weight of the Australian and New Zealand clips again comes on the market. It would appear that the world demand for wool, in spite of the increasing output of man-made fibres, is likely to absorb easily the available raw material as it comes to hand.

As regards your company I look forward in the coming year to increased sales of hand-knitting wools, to at least holding our own in the manufacturing yarn trade and I shall be disappointed if the coming year does not also show improved figures in the export markets.

BRITISH BANK OF THE MIDDLE EAST

EXPANDED ACTIVITIES

The sixty-fifth ordinary general meeting of the British Bank of the Middle East was held on July 20th in London, The Rt Hon Lord Kennet of the Dene, PC, GBE, DSO, DSC, chairman, presiding.

The following is an extract from his circulated statement for the year to March 31, 1954:

This has been a year of much activity and many interesting events in the history of our business. Our accounts again show a strong position. Our deposits are up by £3 million to £43 million. Cash in hand and with bankers and money at call are over £16 million, £1 million less than a year ago, but investments in British Government and other securities stand at approximately £15 million, representing an increase of over £2 million on the figures of the previous year. The decline in the total of credits and guarantees by £1 million is offset by an increase of £1,000 in advances to customers and bills discounted. Our fixed assets remain in the balance sheet at £100,000 unchanged. You will recall that a year ago you passed a special resolution increasing our capital to £1,500,000. Your directors received a dividend of 10 per cent last year on the old capital of £1 million. A dividend on the same amount of profits this year would call for a dividend of 6⅔ per cent on the new capital.

THE DIVIDEND

Whether we consider the accounts show a degree of strength and consolidation of position as to justify the payment of a final dividend of 5½ per cent, making a total of 7½ per cent for the year. Your board plan to reduce next year the disparity between the interim and final dividends.

The passage of the years has now established the British Bank of the Middle East as an institution with a much wider and more active scope in its present form than it had in its original form as the Imperial Bank of Persia. We seek and find new fields of utility, opened to us by changing conditions in the Middle East, and appropriate to our special experience. Thus the most characteristic events in our past year were the opening of new branches in Bombay and Calcutta, and at Doha on the Qatar Peninsula, in the Persian Gulf. In Baghdad we opened a new sub-branch.

INDIA

We have had branches in India before, one in Bombay from 1891 to 1900 and again from 1919 to 1934, and one in Calcutta from 1892 to 1895. In 1895, 1900 and 1934 we closed the branches in Bombay and Calcutta. The trend of trade then between India and Persia was the reason. But now we have five branches in the Persian Gulf where the currency is the Indian Rupee. We have three branches in Saudi Arabia and one in Aden, where transactions with India are considerable, not to speak of the trade relations between India and this country, in which we can play a useful part; and we have branches in other countries which trade with India. It is this expansion in our scope which takes us back to India, now that opportunity serves.

The Nationale Handelsbank NV, better known here perhaps by their former title, Nederlandsch Indische Handelsbank, transferred their branches in Bombay and Calcutta to us on January 1st, the necessary licences having been obtained from the Indian Government. Both branches were taken over as going concerns, so that we have acquired a foundation on which we can enlarge the considerable business which of late years we have been building up with India. In the course of this transaction with the Nationale Handelsbank, we have developed a very happy relationship with them. We hope and believe that we shall be of use to the economy of India, in the development of her trade with the other countries where we are established. Already we have evidence that this will be so.

OTHER COUNTRIES

In Iraq the most important event of the year has been the Coronation of His Majesty King Faisal II, which took place in May, 1953. In Kuwait much progress has been made. During the last year we completed and occupied the extension to our Kuwait office and four new dwelling houses for our staff.

In Bahrain trade has been generally satisfactory. At Dubai our business continues to prosper. Our new premises, which include air-conditioned accommodation for our British staff, have been completed and are a good addition to the buildings we have already constructed in other Persian Gulf centres. At Muscat our business continues to serve His Highness the Sultan and his people.

Our three branches in Saudi Arabia are now well established and we have evidence that the facilities thus made available by a British bank are appreciated. In Syria we have branches at Damascus and Aleppo. In the Lebanon our branches continue to hold the ground they have won. At Aden our recently established branch continues to progress.

The report and accounts were adopted.

HEAD, WRIGHTSON AND COMPANY

RECORDS IN MANY DIRECTIONS

CASH POSITION REASONABLY GOOD

MR RICHARD MILES'S REVIEW OF ACTIVITIES

The sixty-fourth annual general meeting of Head, Wrightson and Company, Limited, Engineers, etc., was held on July 21st at the Registered Office, Teesdale Iron Works, Thornaby-on-Tees.

Mr Richard Miles, the chairman and managing director, who presided, said:

This is our sixty-fourth annual general meeting, and it is my pleasant duty to report that your old established company continues to flourish. In the year under review records were achieved in many directions—amongst others, in turnover, profits, gross work in progress, orders, and value of contracts to complete. The three last items may provide pointers to the short term future, if world trade holds. Our taxation charge is the highest we have recorded. Our cash position is reasonably good, but considerable working capital is always required in our businesses due to the size of the contracts, and to increasing competition from Germany and the United States for export work.

ACCOUNTS

This year, the first full year for which we have had a common year-end for all the subsidiaries and the parent company as required by the last Companies Act, we show a trading profit of £912,469 against that for the previous year of, say, £778,500, if we gross up the parent company's nine months' trading period to twelve months. After provisions for depreciation, workmen's pensions and taxation, we are left, in the group, with £367,758. We recommend that there be distributed a final dividend of 20 per cent less tax, making, with the interim dividend of 5 per cent, a total of 25 per cent less tax for the year, against 17½ per cent less tax last year (parent company nine months). After charging the two preference dividends, and allowing for a slightly higher carry forward than last year, there remain £75,000 to be placed to the parent company's reserve for general purposes, and £175,000 similarly to the appropriate subsidiary companies. Having undertaken certain future commitments in providing pensions for our workmen, we have thought it prudent to set aside towards these commitments an amount of £25,000, which is added to previous provisions for pensions in the balance sheet. We believe that our workmen are appreciative of the benefits accruing from these additional and substantial outgoings.

DEVELOPMENT

By those methods which may be available to us, such as efficiency in designs and production, maintaining a low unit margin of profit and a high turnover, we are doing our utmost to encourage buyers; but it is a difficult task in view of the costs over which we have no control. We, and our markets, would welcome conditions where stable prices could be extended over a reasonable term.

Nearly all our products are made to special designs. Hence periodic very large sums for re-tooling, as in the automobile industry, are not required. On the other hand, improved equipment in detail, improved buildings and lay-out are continuously necessary. You will observe that our authorisations for capital expenditure, spread over a period of years in accordance with our programme, amount to some £655,000, though the official orders placed to date total approximately £340,000.

New buildings and much new equipment have been installed at our steel foundries. All works have been well maintained. The new "investment allowances" should be encouraging, not only to us, but also to our customers.

We are acquiring the old Richardson Duck dismantled shipyard site adjoining the works of our engineering division at Thornaby. With the Craig Taylor site, purchased some years ago, where we produce aluminium alloy structures, we shall own most of the land included in the large bend in the River Tees at Thornaby.

ACTIVITIES

In the statement accompanying our annual accounts, I usually describe some of the work we are doing. You will remember that we can conveniently consider our activities as falling into four groups:

(1) A consulting group consisting of three companies and/or divisions: Our Head Wrightson Processes, Limited, in London is very busy on large projects for the oil and chemical industries, on atomic energy reactors and allied heat exchange problems. Our McKee Iron and Steel Division is building some of the largest ironworks, and important auxiliary equipment such as sintering and gas cleaning plant, at home and abroad. Our new Colliery Equipment Division is responsible for National Coal Board and other colliery work, and especially lately the new anthracite developments in West Wales, the subject of an important leading article in *The Times* recently. The first of these divisions is now very successfully marketing the efficient "Fluor" cooling towers, which are being installed at power stations and other industrial plants.

ENGINEERING GROUP

(2) An engineering group of four companies and/or divisions: we make at our engineering division at Thornaby: blast furnace plant, oil refinery equipment, dock and harbour equipment (we have an important number of large dock gates of both the mitre and flap types), railway wagons (concentrating more on the special types) and other heavy steel plate and mechanical work. Our Stockton forge division undertakes colliery, metalliferous mining and mechanical handling plants, and sub-contracts in the gas trade. They have a very full order book. Our Head Wrightson Machine Company, Limited at Middlesbrough had a record year, and is heavily booked for steel and non-ferrous tube plant, drawbenches, sheet and tinplate equipment and similar work, all to the most modern, and in many cases, unique designs. Our Head Wrightson Aluminium Limited had a reasonable year, but orders, especially for defence work, have tapered off considerably. Apart from the hangar doors for the London Airport, some 46 feet high and 300 feet long, and a large number of crane and dragline jibs up to 200 feet long, the highlight of the year was the completion of the Aberdeen aluminium alloy bascule bridge, opened by HM Queen Elizabeth the Queen Mother.

FOUNDRIES AND FORGES

(3) Our foundries and forges: our heavy iron foundries have had a fairly stable and successful year but we find, unfortunately, that some of the nationalised industries leave considerable gaps in their production programmes which entail variations in employment in our iron foundries. Our steel foundries, in common with others, experienced a considerable falling off in orders in the autumn, especially when the major oil refinery programmes were being completed; but there has been an upward turn lately, orders for raw material for the mechanical engineering industries being more buoyant. The customers of our drop-forges, particularly the automobile manufacturers, are extremely keen buyers.

OVERSEAS INTERESTS

(4) Our overseas interests: South African trade experienced a slight downward trend when the Orange Free State preliminary gold mine programme completed its stage of development in the autumn of last year, but our companies there had a good year, and the rate of orders received has improved lately. In Australia our plans are developing less quickly than we had hoped, and we are not yet able to implement our long term programme of increasing our manufacturing. Though importing is still on a reasonable scale, it is not at very profitable prices. The new branch office in Canada is having a difficult time: Canadian engineering works are not too well employed, and a number of our profitable American licences do not include Canada.

Elsewhere, our overseas trade is increasing. Mr Vaughan Pendred has been particularly successful in India where we now have a working arrangement with Messrs Balmer Lawrie and Company. In Spain our contract for the National Steel Works is exceeding to plan. Your senior officials have much time abroad on export enquiries and orders.

TRIBUTE TO STAFF AND WORKPEOPLE

General: Despite the fact that the capital goods industry fluctuates, the technique of modern production must demand increasingly up-to-date equipment. Many of the factors determining its installation, a high level of subsequent employment often dependent upon the course of trade.

In conclusion, it may be of interest to observe that we are finding a higher proportion over of our unskilled men than formerly. We are, however, traditionally fortunate in having a very sound backbone of senior technical staff and of responsible and loyal workmen, to whose loyal co-operation the continued success of our undertakings is largely due.

The report and accounts were adopted.

ALBERT E. REED & COMPANY, LIMITED

A YEAR OF FULL PRODUCTION

STRENGTHENED FINANCIAL POSITION

CURRENCY FOR WOODPULP PURCHASE: CONTROL NO LONGER JUSTIFIED

LORD CORNWALLIS REVIEWS THE GROUP'S ACTIVITIES

The fifty-first annual general meeting of Albert E. Reed & Company, Limited, paper manufacturers and converters, was held in London on July 19, 1954, the Rt Hon Lord Cornwallis of Linton, KBE, MC, the chairman, presiding.

The following is the statement by the Chairman, which had been circulated with the report and accounts for the year ended March 31, 1954.

As will be known to all shareholders, Sir Ralph Reed, our Chairman, tendered his resignation from that office and from our board of directors on March 31st. His health has not been good in recent years and he felt that he should not continue the responsibility and strain necessitated in the guiding of such an active and expanding group of companies as that which we now control.

So ends a great career in the paper-making industry.

Sixty years ago Albert Reed showed his courage and pioneering spirit in the foundation of the concern that still bears his name.

His son, for thirty-four years our Chairman, was chosen to hold the high office of Paper Controller, in war and aftermath of war, for eleven years.

We, who have served under Sir Ralph Reed and have watched the growth of our great enterprise under his leadership, tender to him a heartfelt "Thank You" and wish him every happiness and rest in his retirement.

My colleagues on the board have asked me to accept the Chairmanship of the board in the place of Sir Ralph Reed.

I can assure you all I am fully conscious of the honour thus accorded to me and the great responsibilities that the position of Chairman entails. I shall endeavour to maintain the wonderfully happy relations that exist between management, executive and all employed in our Group, and I firmly believe that with the enthusiasm and loyalty of all who belong to our "family" we can maintain the progress that has been achieved in the years we have undertaken.

At our last annual general meeting, two directors have joined the board. They were Hector G. Paul and Mr W. R. Tomlinson.

Hector Paul has been with Reed's for many years. He was deputy to Sir Albert Reed in the Paper Control and we have the benefit of his knowledge and experience will be of great value to the board.

Mr Tomlinson is managing director of Thompson & Norris Manufacturing Company Limited—which company has recently brought into the Group—and I am sure that his assistance to us on the board will be of great value.

In accordance with the Articles of Association these two gentlemen offer themselves for re-election at the annual general meeting.

TRADING CONDITIONS

The year covered by the accounts has been largely a period of full production following relatively quickly upon a recession, to which reference was made by Sir Ralph Reed in his statement to you last year. As he told you, the rate of production of paper and board in this country fell in the late summer of 1952 to 45 per cent of that for the last quarter of 1951. By the spring of 1953, however, there had been a substantial recovery and this developed rapidly due partly to the general recovery from the recession to which, to a greater or lesser degree, most industries had been subject, and partly to the fact that a great many consumers had allowed their stock to fall to exceptionally low levels and were taken by surprise by the speed of the recovery. Full production in our mills and factories was made possible, therefore, by the recovery in trade as I have indicated. In addition our exports, especially to Australia, have continued at a satisfactory level.

We have been able to maintain our programme of full production, however, only at the price of reducing our stocks of raw materials, as the currency allowed by the Government for the purchase of woodpulp was not sufficient to enable us to run fully and at the same time maintain our stocks.

The cost of our raw materials was relatively stable for the whole year, especially when compared with the very violent fluctuations which occurred in the previous years. During the second quarter of 1954, however, prices have tended to harden and are now, in the case of chemical pulps, approximately £4 per ton higher than the average price ruling for the year ended March 31, 1954.

PROFIT AND LOSS ACCOUNT

The profit for the year, before charging taxation, amounts to £4,261,000 compared with £2,134,000 for the previous year.

The taxation charge, based on the profits for the year, amounts to £2,990,000, but this figure is reduced to £2,504,000 by a credit in respect of amounts overprovided in earlier years, leaving available for reserves and distribution the sum of £1,757,000.

You will recall that your directors, in their letter of December 17, 1953, stated their intention to recommend a final dividend of 12½ per cent on the ordinary capital as increased by the bonus issue and by the issue of "A" ordinary shares. I think you will feel that our expression of confidence was justified by the results disclosed. Your board are now able therefore to carry out their intention to recommend payment of a final dividend at the rate anticipated which, with the interim dividend already paid, is equivalent to an annual distribution at the rate of 17½ per cent on the present capital. Out of the remaining balance of profits, including the balance brought forward from the previous year, your board have considered it desirable to appropriate £1 million to general reserve and £500,000 to pensions reserve.

BALANCE SHEET

The Group balance sheet once again discloses a considerably strengthened financial position. Some £750,000 has been spent on developing and maintaining at high efficiency the fixed assets of the Group. You will observe that the current assets have risen from £12 million to £14,500,000, of which cash and tax reserve certificates amount to £6,250,000. The excess of current assets over current liabilities has increased from £7,300,000 to nearly £10 million, thus disclosing an extremely liquid position.

The fall in stocks of woodpulp is more substantial than we should have wished and reflects not only the shortage of currency to which I have previously referred, but also the inability of some of our foreign suppliers to maintain their scheduled deliveries.

CAPITAL REORGANISATION

I need not dwell on the reorganisation of capital which took place during the year as you were kept well informed of the proposals and the reasons for the change. The suggestions put forward by your directors were duly approved at appropriate meetings of shareholders and received the sanction of the Court.

NEW ACQUISITIONS

You were informed at the time of the proposal to acquire the shares of The Thompson and Norris Manufacturing Company Limited, makers of corrugated fibreboard packing cases, and you will be gratified to know that holders of over 98 per cent of the capital stock of that company accepted our offer. The acquisition of this company adds very substantially to the interests which we already have in the packaging industry and I am glad to be able to report that the integration of that company's affairs into the Group is proceeding satisfactorily and harmoniously.

Following the acquisition of The Thompson and Norris Group, it seemed appropriate to us to acquire the shares of The Sun Paper Mill Company Limited. This company was already delivering approximately two-thirds of its output of paper to The Thompson and Norris Group and we thought it very desirable to ensure the permanency of this arrangement. I am glad to be able to report that the holders of over 90 per cent of the share capital of The Sun Paper Mill Company Limited have accepted our offer and it has now become a member of the Reed Group.

PROSPECTS

The past year has been one of greater stability in our industry and although there is a tendency for raw material prices to harden, we are hopeful that the stable situation will continue, and present indications tend to justify this hope.

I have previously referred to the fact that the amount of foreign currency which we are permitted to spend on the purchase of woodpulp is subject to Government control.

Although the amount of currency allocated for this purpose for the second half of this year will enable us to run at a reasonably high rate of production, we are not satisfied that it will permit us to attain the outputs which we had planned and, at the same time, keep our stocks of woodpulp at a proper level. We are making representations to the appropriate department dealing with this situation and have hopes that some improvement will be effected. We feel very strongly that this remaining form of control has now ceased to have any justification, and the sooner it is removed the better it will be for the development of our industry.

However, we are satisfied that our Organisation is in such a healthy condition, both from the point of view of plant and also the quality and spirit of the staff and employees that we are as well prepared as anybody to face the present situation and any vicissitudes which may arise in the future and, although we have not the slightest doubt that trading conditions will be competitive, we feel we are well equipped to meet this challenge.

TRIBUTE TO STAFF

In my earlier remarks I pointed out that the year had been one of full production. This happy state of affairs could not have been possible without the splendid efforts of all, the managing director, the executive officers and each and every one of our employees. They, one and all, take pride in Reed's products.

The management endeavour to ensure that the health, welfare and happiness of all our employees are their special care and responsibility. This partnership has produced the results you now have before you and I know all shareholders would like to join with your board in a very sincere expression of our gratitude to all concerned.

TRUMAN HANBURY BUXTON & CO., LIMITED

INCREASED PROFIT

The sixty-sixth annual general meeting of this company was held on July 22nd, in London, Mr G. Dent, chairman, presiding.

The following is an extract from his circulated statement for the year ended March 31, 1954 : I am pleased to be able to report a satisfactory year's result. Trading profit for the group has increased by £175,508 to £1,085,523. There are two main factors responsible for this increase: firstly, the reduction in the cost of brewing materials, especially malt; secondly, economies in expenses. The directors recommend a final dividend of 11 per cent making 14 per cent for the year, leaving a carry forward of £326,226, as against £320,381.

Up to Christmas our trade showed quite a satisfactory increase but during the last quarter of the year with bad weather conditions, there was some falling off which left our total output for the year at nearly the same figure as the year before. There was a further decline in draught beer sales although this has not applied to the sales of our Burton pale ale in London which retains its popularity.

Addressing the meeting the chairman said: With regard to the future I do not anticipate that the current year's results will be as successful as those of the year under review which was a fortunate one for many reasons. Since January the weather could hardly have been more unfavourable for the consumption of beer, and the beer trade of the country as a whole has shown a considerable decline over the period. It is to be hoped that the remainder of the year will prove more favourable to our trade and enable us to make up some of the leeway.

The report was adopted.

FERRANTI, LIMITED

CONTINUED EXPANSION

SIR VINCENT DE FERRANTI'S SURVEY

The annual general meeting of Ferranti, Limited, was held on July 15th in London, Sir Vincent de Ferranti, MC, MIEE, chairman and managing director, presiding.

The following are extracts from the chairman's circulated statement for the nine months to March 31, 1954:

The accounts show continued expansion in the activities of the company and its subsidiaries and further extension of manufacturing capacity.

CANADIAN INTERESTS

Subsidiary company (not consolidated) £1,022,474: The interests of the Group in Canada have been considerably extended by the purchase by Ferranti Electric Limited on March 11, 1954, of a controlling interest in another Canadian Company in which for nearly twenty years a minority shareholding has been held on this side.

The consolidated profit for the nine months, including dividends on investments, amounts to £1,446,649 as compared with £1,284,033 for the year ended June 30, 1953. After provision for tax (including £165,000 for excess profits levy) on all profits earned to date, the net profit is £546,863 against £436,248 last year. The capital issue expenses amounting to £6,982 have been written off.

After providing for the preference dividends, £330,765 has been transferred to general reserve account and a dividend on the ordinary stock of 6 per cent (£33,000 after deduction of tax at 9s.) is recommended, leaving £31,063 to be added to the undistributed profits carried forward which will then amount to £345,813.

INCREASED OUTPUT

The output of the Group, which is now employing over 11,000 people, has risen by 14 per cent, and has exceeded the input by £2 million, leaving unexecuted orders to the value of £15 million. The rate of output of armament work has increased by 7 per cent, and of civil work by 27 per cent, thus reversing the trend during the last financial year, when the figures were 40 per cent and 10 per cent respectively.

The output of power transformers has increased by 32 per cent in value over the figure for the corresponding period of 1952-53. Distribution transformer business has increased by some 25 per cent, but the total sales input for transformers of all types has shown a fall. No less than eighty-two major units have been delivered during the past nine months, of which fifty-two were for export. The latter include five 300 kV. class transformers for the Aluminum Company of Canada, and thirteen in the 230 kV. class for New Zealand. Other notable equipment supplied includes a 3.2 million volt, 77kW. sec. impulse generator for the National Physical Laboratory.

In overseas markets for electricity meters, restrictive buying policies have now eased, and sales to countries such as India, Argentina, Malaya, Colombia and Australia show a corresponding recovery. Business in the home market, however, has shown a slight fall; nevertheless the total sales input for meters of all types has shown a proportionate increase of 55 per cent over the rate for the last financial year. Technically, the accent has once again been concentrated on the problem of reducing manufacturing costs. A number of new special-purpose machines for producing the FM meter are now in operation, and delivery of several others is still being awaited.

Further intensification of the competitive conditions prevailing in the industry has again led to a fall in the output of the foundry. Recently, however, the sales input for castings has shown an encouraging upward trend. The demand for non-magnetic iron continues, whilst that for spheroidal graphite cast-iron, a new ductile material, is increasing.

GOVERNMENT EQUIPMENT

In the field of government equipment, development work on guided weapons continues to proceed satisfactorily. Anti-aircraft fire control equipment is being fitted in many of HM ships, and an artificial horizon, believed to be one of the most advanced gyroscopic instruments of its type, in both UK and Canadian aircraft. The rate of output of both government and commercial instruments has again increased.

The demand for radio and television receivers continues to rise. In order to meet the advent of commercial television, all current receivers have been made tuneable to cover these transmissions when they commence, as well as to receive the existing BBC service. New and larger types of cathode ray tubes for television and other purposes have also been introduced.

As predicted, the demand for domestic electrical appliances has increased, and the rate of output of radiant fires has been trebled. Research and development have kept well ahead in the field of electronic digital computers. Amongst other substantial orders received is one from A. V. Roe Limited for the first large computer to be supplied to a British aircraft firm. The new research laboratories at Wythenshawe are now in full operation.

ACTIVITIES IN SCOTLAND

At Edinburgh factory there has been a fall in the production of older types of equipment, which is expected to be offset by an increase in the output of certain newer device towards the end of 1954. A contract has been received for over two million dollars' worth of electronic equipment under the US Na department's offshore procurement pl The output of the valve factory at Dund building up steadily and has reached a one-third of its ultimate planned value

In Scotland, the scale of development on key equipment for the Services increasing. Various forms of technical ledge are being combined in the des complete aircraft systems. This wo addition to some real progress in co-op with aircraft manufacturers, is an imp contribution to the complex problem of ing efficient fighting machines for t Force and Navy.

The Canadian Company is exper increased competition in the market fo formers. This is being met both by i ments in design, and by plans for ex the range manufactured. Plans are al way for producing a thermal deman which has now been given tentative by the Canadian Government. The division has extended the scope of it ties so that it is no longer exclusively on work for the Department of production.

The report and accounts were adopt

THE BRITISH PLASTER BOARD (HOLDINGS) LIMITED

AN EVENTFUL YEAR

ACQUISITION OF SUBSTANTIAL CANADIAN COMPANY

LORD BELPER ON THE RECORD TRADING RESULTS

The thirty-seventh annual general meeting of The British Plaster Board (Holdings) Limited was held on July 22nd at 20 St. James's Square, London, S.W.1, The Rt Hon Lord Belper, DL (the chairman), presiding.

The following is the chairman's statement which had been circulated with the report and accounts for the year ended March 31, 1954:

The past year has been an eventful one for the company. Since my last statement, a substantial Canadian company has been brought into the group; our authorised and issued share capital have been materially increased, and the figures in the accounts now presented disclose record results which have been achieved by hard and efficient work at all levels, coupled with considerable expenditures on plant, machinery and other assets.

BOARD OF DIRECTORS

There have been several changes where the directors are concerned. Mr W. Steuart Trimble, who first joined the group thirty-three years ago and was appointed a joint managing director in 1947, recently expressed the wish to relinquish his position as joint managing director and the board have agreed to this with regret. He will, however, continue as deputy chairman and as a director of the parent company and of the more important of the subsidiary companies, so that the group will continue to have the benefit of his knowledge and experience. I take this opportunity to express our appreciation of all that he has done for the company.

Mr R. S. Jukes has been appointed managing director and carries the good wishes of the board in this important post. He will be supported by a management committee.

Mr J. F. Harvey resigns from the board as he has now attained the age of seventy. He has the longest record of service of any as a director, having served in that capacity since 927, so that he has been an important factor the parent company's growth from the time hen it owned but one small factory in allasey. All his colleagues join me in wish- him every happiness in his retirement.

Mr R. G. Forsyth will relinquish his ointment as secretary after the annual ral meeting, and Mr N. M. Barrow will d him in this position. Mr Forsyth, vill continue to serve as a full-time r of the company, has been secretary 35, and I wish to pay a special tribute on this occasion. His work through- een of the highest order and his tact rtesy never failing.

. V. Damerell was appointed to our January last, and Mr J. C. Duffus D. P. Davidson were appointed in These appointments are being sub- your confirmation. Mr Damerell is or in charge of The Gotham Com- ited, Thomas McGhie and Sons, and The Long Meg Plaster and ompany. Mr Duffus continues as f C. Davidson and Sons, Limited, our acquisition of that company's al last year, and Mr Davidson con- ts chief executive director. The be much strengthened by the these three directors.

e it will be your wish that I should congratulations to Sir Graham n the Knighthood he received in Year's Honours List, an event which gave me and my colleagues on the board the greatest possible pleasure.

CHANGE OF NAME

As authorised at the extraordinary general meeting, held on March 31, 1954, the name of the parent company now includes the word "(Holdings)" and you know that it is one of our objectives to create a separate operating company: "The British Plaster Board (Manufacturing) Limited." There has been some delay in bringing this about, as we needed first to be sure of the precise provisions of the latest Finance Bill in reference to taxation and changes of ownership. We are now clear that we can proceed with our plans without incurring any additional taxation liability and the change will take place in a few months' time. In the meantime, you will note that the balance sheet of The British Plaster Board (Holdings) Limited still incorporates certain manufacturing assets and liabilities.

THE BALANCE SHEETS

The issued ordinary and preference capital were increased in the early part of the year under review, to provide for the acquisition of C. Davidson and Sons, Limited. The authorised and issued capital have also been greatly increased and capital reserves have been reduced in accordance with the decisions taken in March last, and thus, whilst still not representative of the real value of your company, the issued capital does tend to be more appropriate to the capital employed in the group.

In addition to the changes brought about by the increases in share capital, the consolidated balance sheet figures have been considerably enlarged since the previous year by the inclusion of the assets and liabilities of C. Davidson and Sons, Limited, and our new Canadian subsidiary, Western Gypsum Products, Limited. The latter acquisition has been made in pursuance of the company's policy to broaden our interests throughout the world. Canada is unquestionably one of the expanding industrial countries and your board has been considering for some time the possibilities of acquiring an interest there. Western Gypsum Products, Limited, with its plaster and plaster board plants at Winnipeg and Calgary and a gypsum mine near Winnipeg, has been established for a good many years and has gained a considerable reputation for the quality of its products.

Some of the items in the consolidated balance sheet are not self-explanatory. In particular, "Redeemable preference capital," amounting to £92,138, was part of the capital structure of the Canadian company, but this has been liquidated since the close of our financial year out of the funds held by that company and the whole of the ordinary shares have now been acquired by us.

Of the purchase price of the ordinary shares of Western Gypsum Products, Limited, totalling £1,076,144, 40 per cent has been provided out of our liquid resources, whilst the balance of 60 per cent has been loaned by a Canadian bank which accounts for the greater part of the bank loans of £668,507, the balance being advances to the Rhodesian company in which we are interested.

The £150,000 of 4½ per cent mortgage debenture stock forms part of the capital structure of C. Davidson and Sons, Limited.

Apart from the items which have been brought in by the new subsidiaries, "Fixed Assets" have been increased during the year by substantial expenditures throughout the group amounting, before depreciation, to over £600,000, and also by the inclusion of the assets of the Rhodesian company, which became a subsidiary through the acquisition of C. Davidson and Sons, Limited, and that company's Rhodesian holding.

The slight increase in the amount of shares in associated companies is the net result of the purchase of an interest in a small Italian company, Perlite S.p.A., less the cost of our last year's holding in the Rhodesian company. The Italian company quarries perlite, which we are now importing into this country for use as a lightweight aggregate.

PROFIT AND LOSS ACCOUNT

Turning to the consolidated profit and loss account, you will see that the trading profits, together with income from associated companies, trade and other investments, total over £2 million. A full year of profits from C. Davidson and Sons, Limited, is, of course, included and I would like to mention here that the results achieved by that company have been most gratifying. No profit has been brought in for Western Gypsum Products, Limited, as the consolidated figures include the balance sheet items of that company as at November 30, 1953, which was prior to the shares being acquired by us.

Various forms of direct taxation, totalling £1,364,724, again take the greater part of the profits and, although the excess profits levy, for which £110,000 has been provided in the year under review, now disappears, taxation continues to absorb a disproportionate amount of our group's profits and thus militates against our ability to do our share in increasing industrial investment from our own cash resources which, as the Chancellor of the Exchequer has recently pointed out, is still far too low in this country.

Apart from the additional profits brought in by C. Davidson and Sons, Limited, almost all our subsidiary companies and associate companies in this country and abroad have contributed towards the increase in profits, and I would again stress that these results are not only the product of hard and efficient work amongst our personnel at all levels, but are also the fruits of the additional investment which this group has made over a number of years.

RESERVES

You will observe from the consolidated profit and loss appropriation account that there has been transferred to capital reserve £103,471 by subsidiary companies and £60,082 by the parent company. These are necessary adjustments arising from the acquisition of C. Davidson and Sons, Limited, and the revaluation of shares in subsidiary companies.

Your board has transferred to general reserve the item of £130,764, formerly shown in the balance sheet under "Central obsolescence and replacement reserve" and, out of this year's profits, the sum of £219,236 has been appropriated, which brings the parent company's general reserve up to £1 million.

DIVIDENDS

You know, of course, that the dividend for the year ended March 31, 1953, was 20 per cent, less tax. This is equivalent to 10 per cent on the enlarged capital, as authorised at the extraordinary general meeting held in March last. In view of the increase in net profits, your board now recommends a final dividend of 7½ per cent, less tax, which, with the interim already paid, makes a total for the year equal to 11¼ per cent on the enlarged capital.

GENERAL

I would like to emphasise that sales prices throughout the group have largely been held steady during the year under review, in spite of another increase in wages in May, 1953, and rising costs of raw materials and services —particularly those produced by the basic industries. There is no doubt that it becomes more and more important for prices to be held steady or reduced wherever possible for all goods and services if standards of living are to be improved and if international competition is to be met successfully. It seems to me to be most important that a lead in this direction should be given by the basic industries, notably the coal industry, and by the transport industry, so that the never ending cycle of increased prices can be stemmed. In this connection it is particularly important that labour should play its part and whilst no one, I am sure, would deny the justice of extra rewards for extra productive effort, the time has surely come when negotiations on further increases in earnings should have due regard to productivity and, what is also important, to quality. The continued relaxation of controls and the greater freedom to purchase raw materials abroad has been most encouraging, but we are still suffering the handicap of currency control in some directions and this group is finding that certain of its productions continue to be considerably hampered by inability to secure sufficient currency licences. I trust that the improving currency situation will permit a greater measure of freedom to be given in this direction, too, in the near future.

NEW HEADQUARTERS

Due to the expansion of the company's activities, we have for some time been finding our London headquarters very cramped for space and, consequently, we have arranged to occupy larger premises. A lease has been taken of Bath House, 82 Piccadilly, and the move will take place shortly.

PERSONNEL

In the course of this statement, I have made reference to the excellent work of all members of the organisation and I am sure you would wish me, at this point, to express our thanks to them for their services.

THE FUTURE

The activities of our group of companies is now widespread to a point where our prospects can be said to be a direct reflection of the national economy. So far our results for the current year have been satisfactory and if trade generally continues to be good the prospects for the current year appear favourable. The report and accounts were adopted and the final dividend of 7½ per cent less tax, making a total equal to 11¼ per cent, less tax, for the year, on the enlarged capital, was approved.

The retiring directors were re-elected and the remuneration of the auditors having been fixed, the proceedings terminated.

At a subsequent extraordinary general meeting the alteration to the Articles of Association was approved.

JACKSON THE TAILOR

A SUCCESSFUL TRADING PERIOD

EFFECTS OF THE MERGER

MR LIONEL JACOBSON'S STATEMENT

The twenty-second annual general meeting of members of Jackson The Tailor Limited was held on July 21st at the Royal Station Hotel, Newcastle-upon-Tyne, Mr Lionel Jacobson (chairman and joint managing director) presiding.

The secretary (Mr T. T. Scott) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated to the members with the report and accounts for the fourteen months ending March 31, 1954, and was taken as read:

In July, 1953, as a result of an offer made by the directors of Montague Burton Limited, which offer your directors recommended for acceptance, the overwhelming majority of the ordinary shares of Jackson The Tailor were acquired by Montague Burton Limited. As a consequence of the merger, three of your directors were elected to the board of Montague Burton Limited, I should like to take this opportunity of welcoming the three directors elected to the board of Jackson The Tailor at the same time: Mr Stanley H. Burton, Mr Raymond M. Burton and Mr Arnold J. Burton.

CONTINUANCE OF INDEPENDENT POLICY

At the time it was agreed by all concerned that Jackson The Tailor and Montague Burton should remain in friendly competition and that the growth and development of your company should in no way be affected or impaired. There has been a constant interchange of information and pooling of ideas but Jackson The Tailor has continued the development initiated in previous years. I should like to take this opportunity to emphasise that it will pursue its own independent policy of merchandising and manufacturing. It will continue to purchase from the suppliers with whom the group has dealt for so many years and to tailor in its own works the suits, overcoats and other garments that have attracted such a wide range of customers and which have produced such successful results.

The past year has seen a continuous intensification of the competitive market which had already developed in the tailoring trade. We welcome such developments. It is to the advantage of the customer. It gives me much pleasure to state that during the trading period covered by the accounts the turnover of the group has once more materially increased and moreover an improvement in sales figures has again been achieved since the end of the last financial year.

"A PERIOD OF MODERNISATION"

The period under review could be described as a period of modernisation rather than expansion. The results of the two new branches opened in Birmingham and Brixton during the period have fully confirmed your board's expectations. Other branches that have been opened in recent years have continued to progress favourably. In pursuance of declared policy, during the past year a considerable proportion of the branches have been modernised and when opportunity provided others substantially extended, with beneficial results in increased turnover.

You will observe that the financial accounts now before you cover a period of fourteen months to March 31, 1954. This is to meet the requirements of the Companies Act, 1948, in which it is required that an associated company's accounts should co-terminate with those of the parent company. Due to the variations in the periods, it is not as easy as in former years to make comparisons, but it will be evident to you that we have enjoyed a successful trading period and that we can face the future with reasonable optimism.

INCREASE IN GROUP STOCKS

There is one point in the financial accounts to which I would draw your attention and that is the substantial increase in group stocks held at March 31, 1954, as compared with those at January 31, 1953. Obviously with the growth of the business and expansion of turnover, larger stocks must be carried, but the main reason for the increase is that at the end of March we are nearing the peak of retail sales and it is essential that both warehouses and branches should carry adequate stocks to meet the demand for both spring and summer. I should also like to add that both February and March are substantial trading months and thus they have exercised more than average influence on the financial results.

The directors of Montague Burton Limited and of your company have given serious consideration to the advisability of amending the date of the group's financial year end to coincide with the period when seasonal stocks are at their lowest.

As a result it has now been decided that the next financial accounts of the company will cover a period of 17 months, ending August 31, 1955.

IMPROVED SUPPLY POSITION

During the period of shortage it was esse tial to safeguard supplies of cloth, but duri recent years there has been a considerab improvement in the supply position a consequently your directors took advant of a favourable opportunity which occu during the year of disposing of your pany's holdings in the Goulbourne facturing Company, Limited, and th now free to take advantage of th variety of cloth being offered at ex competitive prices. Our relation our suppliers have continued to b amicable and their enthusiastic co-o in the development and improven designs and cloths has been most aging. It is widely known that the Great Britain manufacture the fine in the world and they supply us which enable us to provide our cust a very reasonable price with a suit first quality materials.

I should like to express once appreciation of the support I have particularly from the manufacturin of the group. Their aim first and was to produce a good quality suit petitive price. This they have su achieved and in addition they have to expand their production to demands placed upon them by t section. To all others too numerous tion individually, may I express my grateful thanks for their assistance and support.

EXPANSION OF TURNOVER

We have not been unmindful of our customers and future trade. Once again due to increased production and sales we have been placed in a position where we could reduce our retail selling prices. One of the corner stones of our sales policy is to ensure a satisfactory standard of living for our employees and, as increased turnover accrues, to pass on to our customers any savings that result in order to achieve the expansion of turnover that is so essential for the economical running of the group.

The report and accounts were unanimously adopted.

The retiring directors, Mr S. H. Burton, Mr R. M. Burton, Mr A. J. Burton, Mr James Whitehouse, FACCA, Mr Wilfred Sandie and Lieut.-Colonel J. H. Levey, DSO, OBE, were re-elected: and the remuneration of the auditors, Messrs Price, Waterhouse and Company, having been fixed, the proceedings terminated.

THE BRITISH SHAREHOLDERS TRUST

STRENGTH OF FINANCIAL POSITION

SIR BERNHARD BINDER ON IMPROVED RESULTS

The thirty-second annual general meeting of The British Shareholders Trust Limited was held on July 21st in London.

Sir Bernhard Binder, FCA (the chairman), who presided, said:

It is pleasing to report results which are an improvement upon those of the previous year, the gross revenue of £122,028 being the highest since 1936. After deduction of all expenses (including £38,869 for taxation against £38,793 last year) the net profit at £5,125 is £17,422 more than that for the year to March 31, 1953.

This increase is in part due to increased vidends and interest received, but, in the ain, results from increased profits on acings and on realisation of securities. With e addition of the balance of £81,213 ught forward from the previous year and amount of £6,614 in respect of taxation stments, there remains for consideration of £138,952.

have again allocated £5,000 to the perannuation fund, and the directors that a final dividend of 5 per cent, with a bonus of 4 per cent, both less ax, be paid on the ordinary capital; gether with the interim dividend of nt already paid, make a total distribu- the year of 12 per cent compared per cent which has been maintained past seven years.

e proposals are approved, the amount rward will be increased to £98,431 18, which is the margin over the bution for the year.

ccounts show total reserves of which, together with the issued es a total amount employed in the £1,029,401; but in addition, the d estimated value of our invest- he date of the balance sheet shows ation of £171,329 or over 20 per ared with £75,712 or about 9 per he previous year, whilst the book only increased by the small amount £8,000.

SUBSIDIARY'S WIDENED SCOPE OF OPERATIONS

Our subsidiary, the Record Electrical Company Limited, has widened its scope, although its trading profit for the year under review was £2,715 lower than in the previous year and the net profit, before tax, was £4,970 lower at £77,461. You will see that our accounts show an amount of £13,411 for dividends and interest received from this subsidiary. This is an increase of £3,701 compared with the amount we received in the previous year and represents the increased dividend payment for 1953. As I have explained on a previous occasion, there is a year's lag in bringing this dividend into our accounts.

COUNTRY'S ECONOMIC PROGRESS

Looking back over the twelve months which have elapsed since we last met, a great improvement in the nation's economic and financial position is discernible. We are experiencing feelings of relief resulting from the policy of freeing controls. The re-establishment of the London Bullion Market and the extension of the system of "transferable" sterling accounts are two of the measures adopted to clear the way for financial and economic improvement. The attainment of the ultimate goal of convertibility of sterling and the abolition of Exchange Control depends on continued improvement in our national production and exports. The former is essential to maintain our position in competitive export markets.

As investors and sponsors of investments, the sustained rise in market prices is not unwelcomed, but in this period of rising prices discrimination is more than ever important. A number of rises in prices represents a belated adjustment of values reflecting more generous dividend distributions and an appreciation that they represent some offset to inflation. In considering the purchase of investments at present high prices, attention should be given not only to increased dividends but to the margin of profits ploughed back by undertakings to provide not only for the increase in replacement values when incurring capital expenditure, but also to provide reserves for possible setbacks in earnings.

For thirty odd years the BST has actively sponsored industrial investments and helped in converting private undertakings into public companies. The subsequent improvement in so many of such investments reflects the care with which our preliminary investigations are made, in regard to which the attention given to management is an important factor. This service to the public we confidently expect to continue, with, we hope, satisfaction to investors generally and to our own stockholders. As I have already indicated, we have over £1 million employed in our business so that the question of finance in no way hampers our ability to deal with substantial propositions.

The division of the distribution we make to our stockholders between dividend and bonus indicates that the proportion distributed as bonus is a fluctuating revenue dependent on the issues, placings and dealings we are able to make in a particular period.

The increased distribution we are able to recommend to you this year is the outcome of the energy and ability of our managing director, Mr E. Ronald Crammond, aided by his loyal and hardworking staff, all of whom deserve your hearty thanks.

The report and accounts were adopted.

The other formal business having been duly transacted, the proceedings terminated with a vote of thanks to the chairman, the managing director, the other directors and staff

WILSON BROS., LIMITED

(Greeting Card Publishers)

RECORD VOLUME OF SALES

The seventh annual general meeting of Wilson Bros., Limited, was held on July 20th in London, Mr H. Wilson (chairman and joint managing director) presiding.

The following is an extract from his circulated statement:

The profit for the year, before providing for taxation, has risen from £124,660 to £176,933, an increase of £52,273. Your directors recommend a final dividend of 32½ per cent, which, with the interim dividend of 17½ per cent already paid, will absorb £33,351.

It is gratifying for me to report that the volume of sales in the past year covering both the home and overseas markets has been the greatest in the company's history.

From the results of the past year, it becomes apparent that your board's policy of marketing high-grade popular-priced greeting cards is undoubtedly stimulating an increasing demand for your company's publications.

Trading for the first few months of the current year has been satisfactory and your board again looks forward with confidence to another successful year.

Your directors are recommending that a sum of £12,225 be capitalised and applied in paying up in full 244,500 shares of 1s. each which will be issued to shareholders by way of bonus in the proportion of one new share for every ten shares held.

The report was adopted and the board's capitalisation and bonus issue proposals were sanctioned.

KEPONG (MALAY) RUBBER ESTATES

EFFECT OF LOWER PRICE

The forty-ninth annual general meeting of this company was held on July 22nd, in London, Mr T. J. Cumming (the chairman) presiding.

The following is an extract from his circulated statement for 1953:

The accounts now presented show the effect of the lower price of rubber experienced during the year. While the crop at 9,926,265 lb was 408,455 lb less than that for 1952, the proceeds of sale show a drop of £242,202. On the other hand, there has been a considerable reduction in the Estate expenditure consequent on the adjustment of the wages structure and also in the application of export duty, as both are based on the market price of rubber.

Fortunately, refunds of the Cess previously collected for replanting have been received, and these, with the trading profit of £156,590, enabled the board to recommend the payment of a dividend at the same rate as last year, namely 7½ per cent, less tax.

The estimated crop for the 1954 season is placed at 10,272,750 lb and, although the quantity harvested up to the end of May is only 3,813,990 lb, it is expected that the full estimate will be procured as the best cropping months are still to come. Concentrated latex accounted for approximately 75 per cent of the crop and most of this latex was used in the manufacture of foam rubber.

With regard to our interest in the Oban (Nigeria) Rubber Estates Limited, I am glad to be able to report continued progress in the development and planting of this property.

The report and accounts were adopted.

AMALGAMATED ROADSTONE CORPORATION

EXCELLENT CURRENT PROSPECTS

WELL-EQUIPPED ORGANISATION

MR W. H. GATTY SAUNT'S REVIEW OF ACTIVITIES

The eighteenth annual general meeting of Amalgamated Roadstone Corporation Limited was held on July 15th, Mr W. H. Gatty Saunt (chairman and joint managing director) presiding.

The following is his circulated statement:

Last year's statement indicated that the results for the five months from November 1, 1952, to March 31, 1953, had been disappointing due to the exceptionally unfavourable weather conditions and the withholding by the Government of normal additional winter grants to local authorities. The summer seven months from April 1, 1953, to October 31, 1953, were then adversely affected by the serious reduction, almost without notice, of Government grants to local authorities for the fiscal year April, 1953, to March, 1954. The result of this reduction was that we were unable to make up the leeway of the winter set-back, and ended the financial year to October, 1953, with trading profits some £100,000 down on the previous year's results.

THE CURRENT YEAR

As regards the current year ending October 31, 1954, the five months November, 1953, to March, 1954, while still adversely affected by Government policy, had the advantage of far better weather conditions, and then for the fiscal year commencing April, 1954, the Government authorised an increase of expenditure on road maintenance of 13 per cent. This, coupled with the better winter weather, has enabled us during this current financial year, now nearly eight months spent, to achieve results not only far better than last year, but better even than the year before that, which, you will remember, was a record in the history of the company. Subject, of course, to any unforeseeable adversity, the prospects for the rest of the financial year are such that your directors feel justified in expressing their confidence that this year's financial results will be excellent.

I should like to draw your attention to the fact that reserves shown in the balance sheet under the heading of "capital, revenue and future taxation reserves" now total more than £800,000, which is within £100,000 of the amount of our issued ordinary share capital.

During the seven years ended October 31, 1953, capital expenditure on plant and equipment has amounted to £2,042,000, of which more than three-quarters has been met out of profit by way of initial allowances, depreciation and undivided profit, with the result that intrinsic values are very considerably in excess of book values.

A great deal is now being said, but little yet done, about the increasingly urgent necessity for far greater expenditure on roads than the Government has hitherto permitted and we are now well equipped to cope with substantially increased demands for all our products.

It should, of course, be noted that had the profits for the year been any higher than they were, nearly 80 per cent of any increase would have gone in taxation. It is fortunate that this current year's substantially increased profit earning should coincide with the termination of excess profits levy.

WILLIAMSTOWN SHIPPING COMPANY

The foregoing remarks do not, of course, apply to Williamstown Shipping Company whose accounts are not consolidated in our group accounts. This company, in which we are interested to the extent of 62 per cent, earned profits, subject to tax, £40,000 higher than the previous year

You will note in the consolidated balance sheet that the investment in this company was increased by £67,000 to nearly £400,000. This results from a reorganisation of that company's capital envisaged at the time we made our original investment, whereby its share capital of £178,000 has been divided into £160,000 12½ per cent preference shares and £18,000 in 360,000 ordinary shares of 1s. each, of which we now own the whole of the preference shares and 62½ per cent of the ordinary shares.

We are actually engaged in negotiating the sale of the preference shares on terms which should reduce to approximately £80,000 the book cost of our holding of ordinary shares and restore our liquidity which this investment had temporarily reduced.

From the directors' report you will note that its profits, subject only to income tax, were over £127,000 so that after allowing for the preference dividend of £20,000 (gross), more than £100,000 (gross) was applicable to the ordinary shares.

Trading profits of the current financial year to date are at least as good as last year's.

VALUATION OF FLEET

The fleet now comprises nine ships of which eight have been built for the company since 1946, the latest having been delivered in February of this year, and the company has building a new ship due for delivery at the end of April, 1955. A professional valuation of the existing fleet made in May this year shows the fleet to be worth over a million pounds and the valuation exceeds the book values by more than £230,000.

You will, of course, not forget that we hold just over half of the share capital of Amalgamated Limestone Corporation Limited whose fortunes and prospects are fully dealt with in Colonel Cleaver's statement.

As usual, we have had throughout the year under review, the loyal and helpful service of the staff of the company. For their assistance, I tender to them, not only on your behalf but for the board as well, our most sincere thanks.

CHAIRMAN'S ADDITIONAL REMARKS

Supplementing the remarks in his circulated statement, the chairman said:

In my statement circulated with the accounts, I referred to negotiations for the sale of the preference shares in the Williamstown Shipping Company, with a view to restoring our liquidity. In the subsequent course of negotiations and after consulting certain large institutions owning substantial holdings of both our preference and ordinary shares, we decided that it would be better to make a rights issue of additional ordinary shares in Amalgamated Roadstone Corporation.

An extraordinary general meeting will therefore be convened at an early date with the object of increasing our authorised ordinary share capital from £1 million (of which £900,000 is issued) to £1,500,000.

Thereafter, subject to the requisite Treasury consent being obtained, it is intended to offer to ordinary shareholders by way of rights one new share for every three shares held.

The report and accounts were adopted.

HENRY HOPE & SONS

RECORD TURNOVER

The fifty-sixth annual general meeting of Henry Hope & Sons, Limited, was held on July 21st at Smethwick, Mr Michael Hope (chairman and joint managing director) presiding.

The following is an extract from his circulated statement: The parent company's turnover for the year 1953-54 just exceeded last year's record both in volume and in value. Unfortunately the bulk of the increase in turnover was achieved in our standard window department, which operates on a very small profit margin, and most of the other departments suffered a relative setback. The result of this, combined with increases in the cost of wages, raw materials and services during the year, was a sharp fall in our trading profits, from £475,222 to £366,412.

Taxation is £280,000 lower than last year, and our subsidiaries have retained £40,000 less of their profits. We therefore reach the rather odd position that although our consolidated gross profit before tax is £300,000 down, the parent company's net profit is slightly higher at £257,195. Your directors feel justified under the circumstances in recommending an ordinary dividend of 27½ per cent.

We have always prided ourselves on the high level of our designing and engineering staff. Among the items which they have developed during the year is a new system of glazed curtain walling, which we are marketing under the name of "Windogrid" and which we believe will be widely used in the schools building programme, especially fo multi-storey buildings.

It was with mixed feelings that we learne in February of this year that the Governme had referred the standard metal windo industry to the Monopolies Commission. are not afraid of any investigation into methods of manufacture or trading, an report of the Commission, when it ap will we hope remove a number of misc tions. The standard metal window o as made here at Smethwick, hot-dip nised in our own plant and fitted wit bronze fittings of decent design, is standing example of value for mon will bear comparison with any material produced anywhere in the w

At the same time these inquiri money and take up valuable time; that of the Commission and of their but also that of the directors and staf metal window manufacturers, toget their legal and accounting advisers, to assemble the mass of historical an cal information, going back over twenty years and more, which the sion apparently require in order t balanced judgment on the matter to them. We can only hope that be able to prosecute their investig the standard metal window indu greater despatch than has apparen possible with some other inquiries.

The report and accounts were ado

AMALGAMATED LIMESTONE CORPORATION

SUCCESSFUL DEVELOPMENT OF UNDERTAKINGS

MR D. W. CLEAVER ON THE YEAR'S ACHIEVEMENTS

The third annual general meeting of Amalgamated Limestone Corporation Limited was held on July 15th, Mr D. W. Cleaver, DSO (the chairman), presiding.

The following is his circulated statement:

The prospectus issued on June 9, 1950, envisaged no early dividends, but a long-term policy of development out of profits. We are now able to present a picture which I am sure you will find both interesting and satisfactory.

You will see from the accounts that capital expenditure has been £343,175 on properties and plant, and £75,978 investments in associated companies. Approximately £125,000 has been incurred in quarries, plant and buildings for the production and sale of agricultural and industrial lime, which has been the bread-and-butter business of the Corporation since its inception and, in fact, the sole source of revenue to date.

Starting practically from scratch in this highly competitive industry the Corporation, in three and a half years, has earned a gross profit of nearly 100 per cent on capital employed therein, viz., £116,474, which has been applied as to £59,978 to depreciation, £27,653 to current and future taxation reserve and £28,793 to net undistributed profits carried forward.

NEW ACQUISITION

We have, during the last few months, acquired options on further limestone lands in the United Kingdom and in this connection have bought at Saltoun, near Edinburgh, at a very favourable price, a small agricultural limestone quarry with an assured profitable trade attached thereto. This quarry will, I feel sure, contribute a useful quota to what I may call the routine revenues of the Corporation from the sale of agricultural lime.

At our quarries at Plymouth, which were riginally developed and equipped for the roduction of agricultural lime, we have con-ructed a small cement works, at a capital st, to October 31, 1953, of approximately 20,000 and a present capacity of approxi-ly 40,000 tons per annum.

oduction was commenced in the early hs of this year and has now got through of the early teething troubles insepar-om such a project, and although little dition to our trading results is expected his initial training year, the prospects future are excellent. Costs are good ling prices are those laid down by the t Makers' Federation, of which we en accepted as members. The profit is substantial and promises still improvement. It has already been by your board to enlarge this plant necessary work to effect this has ed.

GRESS OF ULSTER LIMESTONE CORPORATION

amount of £75,978 shown as ents in Associated Companies," a r one half is invested in £37,000 nt stock (out of a total issue of and 47,500 out of 100,000 1s. shares, Ulster Limestone Corporation Limited, reference to which was made in last year's statement. It includes also just over £7,000 owing to us at that date on current account, since paid.

This undertaking earned in the year to October 31, 1953, £55,259, subject only to taxation. Here also the policy is conservation of resources. No dividend having been paid, your Corporation's share of these profits is not reflected in the accounts now before you. The progress of this Ulster company during the seven months of the present financial year is such as to indicate that this result will again be attained, if not exceeded.

The balance of £29,500, plus £15,000 transmitted since the date of the balance sheet, comprises an interest of approximately 40 per cent of the equity share capital (subject to £500,000 6 per cent stock which, as mentioned in last year's statement, was placed for cash) in the British Standard Portland Cement Company Limited registered in Kenya.

OVERSEAS

This company has recently completed construction of cement works at Mombasa, in the protectorate area of Kenya, which commenced production a few months ago with two kilns capable of producing 75,000 tons a year and, as envisaged in the directors' report last year, the erection of the third kiln then contemplated is now actually in hand. This will raise the capacity of the plant to approximately 110,000 tons a year. It is possible that at an early date decisions will be made to duplicate out of profit the whole installation at Mombasa, to increase capacity to over 200,000 tons a year.

Here, also, the cement made is of first-class quality; the costs are good and the margin of profit is considerable. Situate on the coast, the works are well placed for effecting delivery not only by rail to Nairobi and beyond, but also by shipment to, for example, Dar es Salam, Aden and the East Coast of the African Continent.

I, personally, was out there in February this year in time to see the first kiln lit up and was very greatly impressed by the excellence of the works in every way.

In view of this company's intention to duplicate out of profit and to redeem the £500,000 stock before making any cash distribution to shareholders, no early return is expected on this investment which should, however, attain within a comparatively short time, a capital value far in excess of its modest cost.

Generally, therefore, the picture has developed according to plan and although perhaps another year or two may be added to the incubation period referred to in our prospectus, this survey of the Corporation's achievements and acquisitions to date should amply satisfy both board and shareholders alike.

SEARCH FOR NEW OPPORTUNITIES *CONTINUED*

We continue to search for new opportunities for profitable investment and exploitation both at home and abroad—some have been actively investigated and rejected, others are still under consideration—and I do assure you that no opportunity will be lost of any advancement of your Corporation's interests which may become available.

I am sure you will join with me and the board in thanking the staff for their wholehearted keenness and enthusiasm which has contributed so much to the successful development of our several undertakings.

The report and accounts were adopted.

VENT-AXIA LIMITED

TRADING BASIS BROADENED

The eighteenth annual general meeting of Vent-Axia Limited was held on July 20th in London, Mr J. C. Akester, chairman and managing director, presiding.

The following is an extract from his circulated statement:

During the financial year which ended on March 31, 1954, the company acquired the entire issued capital of Axia Fans Limited. This year, therefore, we present for the first time, in addition to the normal accounts of Vent-Axia Limited, a consolidated balance sheet and profit and loss account of the group which incorporates the trading results of the subsidiary company for the eight months ended March 31, 1954.

I will deal first with the accounts of Vent-Axia Limited. The authorised capital is now £240,000, and during the year 60,000 £1 preference shares and £5,600 ordinary stock were added to the issued capital in connection with the acquisition of Axia Fans Limited. The trading profit for the year ended March 31, 1954, was £102,895, an increase of £17,172 over last year. Your directors recommend payment of a final dividend on the ordinary stock of 45 per cent, less tax, making 70 per cent, less tax, for the year, as against 62½ per cent last year.

Dealing now with the consolidated accounts, the group profit before taxation was £115,317. After providing taxation, £65,893, and costs relating to increased capital, etc., £5,309, there remains a net group profit of £44,115. Net assets of the group are £245,750 and current assets exceed current liabilities by £218,272.

During the last twelve months we have expanded our sales organisation, and a new branch was opened at Bristol in October to extend our activities in the West Country. The value of both home and export orders booked was higher than last year, and current orders continue to show an upward trend. The demand for the new Vent-Axia Reversible which we put on the market some fifteen months ago has steadily increased, and we have now superseded our original Extract and Intake models with a new range which incorporates the improvements in design of the Reversible Unit. As a result of this, standardisation of the components has been achieved, which in itself will lead to simplification of production. The acquisition of Axia Fans Limited during the past year has broadened the trading basis of your company and should add to its goodwill and standing generally. This company, which was founded a few years earlier than Vent-Axia Limited, manufactures high-efficiency fans for general ventilation purposes, in particular for the machinery spaces of ships and the refrigerated holds. It also carries out the complete heating and ventilating installations of the crew and passenger accommodation. The number and type of orders the company has in hand gives us every confidence in the future.

The report and accounts were adopted.

AUSTRALIAN ESTATES COMPANY LIMITED

SIR DENYS LOWSON'S ADDRESS

ANOTHER YEAR OF SOUND PROGRESS

The annual general meeting of The Australian Estates Company Limited was held on July 14th in London.

Sir Denys Lowson, Bt. (Chairman and managing director), presided, and, in the course of his speech, said:

I feel sure that you would wish me straight away to give a very warm welcome to our Australian director and general manager, Mr George S. Colman, CBE, whom we are very happy indeed to see amongst us today. He has come over from Australia and we are having great advantage from his present visit to this country, which does allow us to discuss at first hand a number of the problems which he has to face continuously out there.

ACCOUNTS

The consolidated profit and loss account for the year ended December 31, 1953, shows a gross trading profit of £1,145,033, as compared with a corresponding figure of £1,010,151 for the previous year.

After deducting Australian and United Kingdom tax of £565,363, also depreciation and other charges, there is a net profit left of £220,169, which represents another successful year's trading. The board recommends a dividend of 15 per cent and also a bonus of 5 per cent out of the profits distributed by the Joint Organisation for the Disposal of Wartime Wool Stocks. After providing for this distribution and the appropriations shown in the profit and loss account, the amount to be carried forward to 1954 is £145,795.

The fourth interim distribution of the Joint Organisation Wartime Wool Profits, amounting to £A14,700,000, was made by the Commonwealth Government in April, 1954.

It is expected that a further sum of approximately £A12 million will be paid to growers before June, 1955, which will conclude the Wool Realisation (Distribution of Profits) Act of 1948.

The 1953 season was generally satisfactory in Northern Queensland, but the rainfall in the Central and Southern districts was mostly below average, although our properties had a fairly satisfactory year, with the exception of Terrick stud and Terrick Flock where sheep had to be fed. Lambings were slightly higher and the wool clip better.

The season in Victoria was generally satisfactory, though dry towards the end of the year.

Our agency business in Queensland and Victoria maintained a high turnover in livestock, and most branches showed satisfactory results. Expenses rose slightly as compared with 1952, and, although still very high, there was more stability during the year than for some time past.

Both Kalamia and Pleystowe sugar mills treated record tonnages of cane, and the cane grown at our Kalamia plantation was the highest in its history.

I have referred on several occasions to the extremely high capital cost of machinery, plant and buildings, which has imposed a considerable burden on the Company in the developments at their sugar mills. Repairs and maintenance on all stations and mills are also on a very much higher level than pre-war, and little relief is obtained for depreciation in taxation, which adversely affects the liquid funds of all companies.

PASTORAL

Our cattle properties had a good season, with record brandings on three stations and a slightly higher number of cattle sold than in 1952.

Although the rainfall was below average at our Queensland sheep properties, it was still a fairly good year; sheep numbers rose, more lambs were marked, and our total wool clip for Queensland and New South Wales was 9,451 bales, compared with 8,245 bales the year before. The average price realised for wool was slightly higher than in 1952.

Poor rainfall affected our New South Wales properties, and grasshoppers destroyed most of the pastures on several stations; hand-feeding had to be carried out for some months to maintain our breeding flocks. Jemalong, in particular, suffered from drought and grasshoppers, which combined to damage both the pastures and a large area under wheat. Last year Jemalong suffered from very severe flooding from the Lachlan river.

Our stud properties were successful at country shows and sheep sales.

SUGAR

The 1953 sugar production in Queensland was a record, yielding 1,223,000 tons, as compared with 934,226 tons in 1952, an increase of some 31 per cent.

Record cane crops were harvested for all but 8 out of 31 mills in Queensland, and each of these was only slightly below its record performance.

The seasonal prospects are favourable for another year of high tonnages in 1954, and there will also be an increase in the acreage under cane.

It is estimated that the value of export sugar from Australia from the 1953 season will be nearly £30 million, which is an important contribution to the country's overseas earnings.

The Annual Conference under the British Commonwealth Sugar Agreement was held in London in November, 1953. This Agreement will continue to operate until December, 1961—that is, for another seven years—and is also subject to the possibility of extension.

An International Sugar Agreement was negotiated in July/August, 1953, and took effect from January 1, 1954, to operate for five years. This Agreement does not affect the Australian quota of 600,000 tons under the British Commonwealth Sugar Agreement. You will appreciate that we only get a fixed price for our quota under the British Commonwealth Sugar Agreement and our quota for internal consumption in Australia, and in so far as there is any excess, that is sold on the world market at whatever the world market price might be.

Our Kalamia mill treated 360,483 tons of cane for the season, compared with 315,441 tons in 1952. Pleystowe mill crushed 361,932 tons as compared with 256,180 tons in the previous year—easily a record for both mills. Our total sugar production from the two mills came out at no less than 107,000 tons of sugar, which represents somewhere about a twelfth, of the total Queensland production of sugar.

The rainfall during the last two seasons was well distributed, and made for maximum production.

Sugar mills in Queensland have spent several millions of pounds in the last three years, to enlarge and modernise their plants, to cope with the increased tonnages from additional assignments of cane lands and higher yielding varieties of cane.

This Company's expenditure has been high, but was necessary to treat the heavy tonnage tendered to the mills, and these quantities may even be exceeded in the future.

The prewar record at Kalamia was 254,650 tons, and at Pleystowe 245,958 tons, so the 1953 crushings are an increase of 41 per cent at Kalamia and 47 per cent at Pleystowe, which illustrates the need for the enlargement of the mills.

In order to compare our engineering and chemical practices with those of other countries, we have been in the habit for some years of sending technical officers to Hawaii, Cuba, USA and the Philippines, and, at the beginning of 1954, two of our chief engineers paid a visit to the West Indies. We acknowledge with thanks the cordial assistance afforded to our officers by the management and staffs of the mills in the West Indies, particularly those of Messrs Tate & Lyle.

AGENCY

During the year, we added to our Victorian organisation by purchasing the stock business of Mr Leo Kearney at Murchison and Nagambie, and also the business of John McNamara & Compar (Echuca) Pty. Limited.

In Queensland, we purchased the s businesses of M. J. Ward & Company McWhinney & Company at Milmerr Southern Queensland. We also oper sub-branch at Dulacca in Southern Q land.

We now have altogether some 59 branches, compared with 17 ten years and our turnover of sheep, lambs, catt pigs has greatly increased.

Shareholders will appreciate that wi two big wool stores in Melbourne an bane, it is essential to have a wide c connection, which ensures that these used to the maximum advantage; t this policy of acquiring sub-branch turnover of wool at our sales and the handled in our wool stores would h bound to show a considerable reduc

IMPROVEMENTS

The policy mentioned in my las of bringing all our stations, mil

branches up to a high standard has continued, which is in keeping with the trend to modernise all primary and secondary industries in Australia, to raise production and efficiency, our aims being to use the opportunity afforded by the recent good seasons, not only to improve our water facilities and our sub-divisional fencing (thereby allowing better control of herds and reducing losses from rabbits), but also to improve all our working quarters and houses for station staff and shearers. In every case, the maintenance of our premises is fully up to the maximum standard required under the local Wage Board Awards, and we have received many favourable commendations for the work which we have done, from official and other authorities.

In that connection, I have previously spoken of the great hardship from which we suffer as regards taxation. In company with many other companies operating overseas, we find that the local governments will frequently give allowances in full against taxation for improvements carried out. For instance, in Australia today expenditure on water improvements or sub-divisional fencing will probably be allowed in full against local earnings there, but when it comes to a question of British taxation that expenditure is disallowed and then a mere pittance in comparison is granted by way of the usual depreciation allowances, which are spread over a long period of time. Therefore, we do operate with a great handicap as, for instance, many of the mining companies have also found.

RESEARCH

I should like to record my appreciation of the valuable assistance the company has received from the Department of Agriculture and Stock in Queensland, who have helped us from time to time on disease and animal nutrition problems on our sheep and cattle properties.

The Department of Agriculture in New South Wales has also been of great assistance in advising us on pasture improvement and agricultural operations, particularly at Jemalong, and we tender them our thanks.

We are now commencing, on our Queensland sheep properties, a special study of soils, grasses, and animal husbandry, designed o increase numbers and reduce mortality. In his work, the agricultural and veterinary chools of the Queensland University have en good enough to co-operate with us, and sist in the design and supervision of the ogrammes of work, which will be spread r several years. As you know, our two big bles in Queensland are the high rate of lity of both sheep and cattle, frequently ing not less than 10 per cent of the each year; and, on the other hand, the very disappointing fertility rate as sheep—and, to a lesser extent, as cattle. Very often we only get an of 50 per cent of lambs from our hich have been joined to the rams, and ble average is certainly not more than per cent.

Commonwealth Scientific & Industrial Organisation in Australia is doing work in assisting primary produc- has shown how poor lands can be nductive by the addition of trace and fertiliser; made important ex- in the drought feeding of sheep, e of improved pastures rotated with gned to increase wheat and other

roduction of the disease known natosis by the Commonwealth & Industrial Research Organisation s ago has resulted in an enormous n the number of rabbits, particularly in New South Wales and Victoria, with consequent benefit to the carrying capacity of the land.

Four main features affecting rural food production in many parts of Australia are scarcity of water, and droughts; poverty of soils; losses from plant and animal diseases; and rabbits.

Irrigation works now in progress will help millions of acres, but only a small proportion of the total area of Australia.

In the pastoral districts of Queensland and New South Wales, our company has spent large sums on the conservation of water, to save stock in drought periods. Although this is allowed in Australia in full as a charge against profits, it is disallowed in this country—which places a heavy burden on us.

WOOL

The Australian wool selling season for 1953/54 was again a satisfactory one, free from industrial trouble and without any severe fluctuations in price levels.

Competition was good throughout the year. The United Kingdom was a little less active than in the previous season, but their buying is still the main support of the Australian wool market. France and Italy occupied second and third places respectively. Belgium, Japan and Russia followed in that order, Japan purchasing less than last year, probably due to an adverse sterling balance. Buying by the United States of America was disappointing.

FIGURES FOR THE AUSTRALIAN CLIP, SOLD IN AUSTRALIA, ARE:—

	Bales	Gross value £	Price per lb. d
1949-50	3,597,940	286,919,294	63·77
1950-51	3,549,998	636,156,430	144·97
1951-52	3,413,805	308,107,658	72·86
1952-53	3,893,249	405,195,581	82·32
1953-54 (est.)	3,821,900	394,000,000	83·0

When auctions were resumed in 1946/7 after the war, 2,955,972 bales were sold for a gross return of £92,601,206 and an average price of 25.20d. per pound.

Now, as you know, we are very mindful of the possible impact of synthetic textiles and competitive textiles. It is a fact, however, that wool is regarded as a rather dear textile fibre on its present basis, and the past season has borne witness to strong consumer-resistance to high prices. There is an increasing disposition for the large wholesale clothiers and hosiery producers to keep the prices of their products broadly stable.

Competition from man-made fibres is a factor in some directions (notably in the United States), but at the moment these fibres are being used rather as complementary than as competitive raw materials. In fact, in many cases they are not used to cheapen the ultimate product, but to give it special properties, and may thus help to stimulate the demand for wool. This applies particularly to such fibres as nylon and terylene.

Whilst there has been some falling-off in the rate of wool consumption and machinery activity in the United Kingdom compared with the best points of last year, when pipelines were being filled, the industry continues to be well employed, with a shortage of work people and stocks not more than adequate.

In my last report, I mentioned the opening of a Wool Futures Market for the first time in London. So far, it would appear that Australian producers have operated only to a small extent on this market.

OUTLOOK

In Queensland, rains over most parts of the State during the first three months gave the 1954 season a good start, and most districts will enter the Australian winter with satisfactory feed and water supplies. Some parts of the South Western Darling Downs and portions of the far South West and North West need more rain.

Good rains on the coast of Queensland should ensure another very high output of sugar.

In New South Wales, only light rains have come and good falls are badly needed in many districts.

In Victoria, the summer was dry, but satisfactory rain came in April. However, many areas still need more to carry them through until the spring.

STAFF

A number of our station managers and staffs had an anxious year owing to an indifferent season in some areas. The sugar mill staffs had a particularly busy year, with record crushings and the installation of new plant. The agency branch staffs worked hard to keep up their turnover.

We acknowledge the efforts and loyalty of the whole service.

We also appreciate the good work of our subsidiary organisations—Trenchard's and McNamara's—and our partners at Bendigo, Messrs F. A. Hill & Company, all of whom have given us good co-operation in our growing Victorian Agency business.

As I have indicated on more than one occasion in the past, the great strength of our business lies in the fact that we are not dependent on any single activity. We have four main branches—sheep, cattle, agency and sugar. The agency side is naturally considerably bound up with the prices of wool and sheep. Results from these various activities frequently fluctuate; and a poor season in, say, sugar, will often be made good by substantial earnings from the pastoral side. This policy owes much to the foresight of Mr G. S. Colman, our Australian director and general manager, whom we are so delighted to have with us. His sound judgment, enthusiasm and hard work have brought the company over the last few years to the fine position which it now occupies. Once more, Mr Colman, we express to you our warmest thanks and grateful appreciation for a very fine year's results. We also welcome in this country at the present time Mr Kieran McNamara, director and Melbourne manager of our subsidiary, John McNamara and Co. Pty. Ltd., and associated companies.

The report and accounts were unanimously adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

The Company Meetings Department,
The Economist,
22 Ryder Street, S.W.1.

de WENDEL & CIE., SA (PARIS)

IRON AND STEEL PRODUCTION

The annual general meeting of de Wendel & Cie., SA, was held in Paris on June 23rd with Count Emmanuel de Mitry in the chair, and the following is a summary of the report presented by the board:

The work of the European iron and steel industry last year was marked by the opening, on May 1st, of the common steel market. The old system of agreements and protective tariffs was superseded by unfettered competition, not only among the industries of the six countries constituting the European Coal and Steel Community but also within those countries themselves. In France, the impact of the opening of the common market at a time of economic depression at home and falling sales abroad was severe, and resulted in violent price fluctuations which badly affected both producers and manufacturers. It was not until the first three months of this year that more settled conditions could be re-established.

The company's steel production, although 3.5 per cent. short of the 1952 figure, yet reached 1,431,000 tons, thanks to a well-filled order book on January 1, 1953. Turnover rose to Frs. 49,340 million.

MODERNISATION PROGRESS

The company's modernisation programme made good progress, and capital expenditure in 1953 totalled Frs. 7,216 million. Mechanisation in the iron mines continued to develop, and it is already beginning to show results in the form of a rising output.

A modern blast furnace, completed in 1953, was fired in March this year. Progress was also made on several other projects, such as the erection of a new continuous wire-rolling mill, the extension of a tin-plate mill, the construction of coke-oven batteries, and a housing scheme for the company's personnel.

"Sollac," a company in which de Wendel & Cie. has an important holding, successfully put its new continuous strip mill into operation during 1953. This has facilitated the production of black iron and sheeting of steadily improving quality.

PROFIT AND DIVIDEND

The balance sheet at December 31, 1953, showed current assets of Frs. 21,929,173,117, as against short-term liabilities amounting to Frs. 15,138,848,971. Fixed assets totalled Frs. 28,005,526,454.

Profits for the year, after allowing Frs. 3,384,121,077 for amortisation, totalled Frs. 509,757,971.

It was proposed to distribute a dividend of Frs. 400 gross for Frs. 5,000 shares fully paid up, and Frs. 275 gross for Frs. 5,000 shares paid up by half on December 31, 1953.

The report and the resolutions proposed by the board were adopted.

ALLIED IRONFOUNDERS LIMITED

A QUARTER-CENTURY OF PROGRESS

POSITION OF FINANCIAL STRENGTH

The twenty-fifth annual general meeting of Allied Ironfounders Limited was held on July 22nd, in London. The Chairman, Mr James Shaw, presided. The following is an extract from his circulated statement:

Allied Ironfounders had its 25th anniversary earlier this year. During this quarter-century the company has grown and prospered and now occupies a leading position in the light castings industry.

The trading profit this year is £2,097,551, over £320,000 higher than in 1953. After allowing for taxation of £991,420 and bringing in certain expenses and credits we have a balance of profit of £778,138. With the amount of £668,569 brought forward the balance available is £1,446,707. Your directors have decided to withdraw the £250,000 we had previously placed to a stocks reserve as we are satisfied that the stocks we hold have been *conservatively valued and are in* good condition with no serious risk of obsolescence. We have then appropriated £838,878 to the general reserve, bringing the figure on the consolidated balance sheet to £1 million. We now propose to increase the final dividend on the ordinary shares to 15 per cent, making a total of 22½ per cent. Your company's financial position is exceedingly strong and the improvement in the earnings for the year in our opinion justifies this increased distribution.

I mentioned two years ago that we were giving careful consideration to the basis of calculating the charge for depreciation and we have revalued both buildings and plant on the basis of their replacement cost at March 31, 1953. From this you will see that assets which originally cost us some £4,066,000 would, if replaced now, call for a total expenditure of over £7,197,000, and the excess of more than £3 million over the original cost will give you an indication of the additional funds which we shall have to invest in our fixed assets as and when we replace them.

The depreciation charge this year is calculated on these replacement costs, and to cover fully past depreciation on the same basis we have set aside out of our revenue reserves the sum of £2,343,977. The strength of our financial position has enabled us to do this out of taxed profits whilst leaving a substantial balance of revenue reserves and unappropriated profits.

The increase in our stocks and debtors over recent years has been very considerable, and the revaluation of our fixed assets further emphasises the increase in the amount of capital which is now permanently required in the business. Your directors feel that this change should be recognised by capitalising part of the revenue reserves and increasing the ordinary share capital by a bonus issue on a one-for-one basis.

As shown by the table given with the accounts, the growth in the capital employed from £3,062,389 to £8,707,433 over the past ten years is impressive, and it is even more satisfactory that the profits have increased in even greater proportion. The gross ordinary dividend which we are paying for the past year represents no more than 7.6 per cent on the ordinary shareholders' proportion of the capital employed in the business.

ENCOURAGING PROSPECTS

Last year I was cautious when speaking of our trading prospects, but over the past year conditions have improved and have offered us opportunities of which we have taken advantage. An expanding housing programme has absorbed a large proportion of our output, and this, along with the marketing of new speciality products, has kept most of our plants busy. We have maintained and improved both plants and production methods, and this, with our excellent labour force, has all contributed to the very satisfactory results shown by this latest page in your company's history. The forward prospects as your directors view them at this time are encouraging and we look ahead in a spirit of confidence.

The report was adopted and the capitalisation proposals approved.

UNIVERSITY OF SYDNEY, AUSTRALIA

Applications are invited for the position of ASSISTANT LIBRARIAN in the Fisher Library. Applicants must be graduates of a recognised University, must have Professional Membership of an approved Library Association or an equivalent qualification, and experience in a large library.

The salary is within the range of £A1,500-£A1,750 per annum, with annual increments of £A50, and is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful applicant.

Finance available for home purchase under Staff Members' Housing Scheme

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is August 31, 1954.

DO YOU WANT MORE BUSINESS? Then cover more territory and make more regular calls with a 1954 self-drive car. No more waiting for public transport. AUTOHALL have a fleet of over 100 1954 cars, all expertly maintained and serviced to meet your requirements. Will you ask your secretary to drop us a line for our new, informative brochure ?—Autohall, Dept. 2-B, 302-306 King Street, London, W.6. Tel.: RIVerside 2881.

NEWLY qualified Accountant required by manufacturing company for Kingston-on-Thames offices. The initial duties, which will be on internal audit, afford opportunities for gaining experience of industrial accounting.—Write, with full details, to Box 647.

WYE COLLEGE
(University of London)

The Governing Body of Wye College invites applications for post of Assistant Agricultural Economist in the Agricultural Economics Department. Applicants must be graduates, preferably qualifications in Economics or *Horticulture or Agriculture*. The appointment will be made in the A.A.E. scale (£390-£670 consolidated with superannuation under F.S.S.U.

Further particulars may be obtained from the Registrar, Wye College, Nr. Ashford, Kent to whom applications should be forwarded as soon as possible.

HER MAJESTY'S COLONIAL SERVICE

Applications are invited for the following posts:

Vacancies are occurring in the Colonial Service for Statistician (CDE.59/88/02), on permanent and pensionable or contract terms. For present vacancies in the East African Statistical Department practical experience is essential; applications for Statistician generally can, however, be entertained from young graduates who have such experience provided they possess the normal basic qualification of a good Honours Degree in Statistics or in Mathematics, Economics or other appropriate main subjects combined with Statistics.

Application forms and further particulars of present vacancies and of conditions of service can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1.

BUSINESS-BUILDING opportunity sought by energetic marketing manager with proven success in advertising promotion, economic/market research.—Box 648.

BANKING BUSINESS OF EVERY KIND TRANSACTED
A comprehensive service as Trustees and Executors is also undertaken by the Bank's Trustee Companies in
HONG KONG LONDON SINGAPORE

AN Industrial Company, outstanding in its own field, requires an experienced ACCOUNTANT to undertake the initiation and development of modern accountancy methods to a wide range of products. *The highest* professional qualifications and industrial experience are essential. A University Degree would be an added advantage but not essential. A substantial commencing salary is offered, which should increase to £3,000 per annum in five years if progress is satisfactory.—Applicants, aged 30-35, should send full details of qualifications and experience to Box 645.

AMERICAN private organisation located on Continent requires Chief Analyst to *specialise* in audience research techniques concerning effectiveness of broadcasts to Iron Curtain countries. Applicant should have *some* knowledge of political problems of East European countries and experience in using social science research techniques; also ability to evaluate and write reports. No language requirements. Salary for appropriate person would exceed £1,000 plus furnished housing for self and family and *transportation*.—Full particulars, including picture, should be furnished in first letter to Box 643.

A LONDON manufacturing company, shortly moving to Kingston-on-Thames, has a vacancy for a qualified Accountant to take charge of all costing and inventory control. Experience in a process industry desirable. Good salary and prospects.—Detailed applications to *Box 646*.

ECONOMIC RESEARCH ASSISTANT *required by International* Wool Secretariat. Applicants should have a First or Upper Second Honours Degree in Economics and *some knowledge of* Mathematics. Starting salary £475-£600, with superannuation benefits. —Apply in writing, giving references and full particulars of qualifications, experience, etc., to the Secretary, International Wool Secretariat, Dorland *House*, 18-20 Regent Street, London, S.W.1, marking cover "Confidential E."

THE British Institute of *Management* invites applications for replacement vacancy of Information Officer in the field of financial and office management. University degree and/or a technical qualification, and experience in finance, industry or commerce are required, together with the ability to write accurately and fluently. Age 25-35. Commencing salary between £550 and £650 p.a.—Further details from the Director, Management House, 8 Hill Street, W.1. (Envelope to be marked "IOF.")

EXPERIENCED Cost Accountant required. Preferably with knowledge of B.F.M.P. costing system but keen interest in costing method essential. Good salary to right man.—Apply in first instance for application form to Personnel Officer, Jarrold's Printing Works, Norwich.

WANTED for cash, Review of Economic Studies and Economic History Review, preferably complete *sets* but odd *runs volumes* welcomed.—Box 637.

EXPORT SALES. *Applications are* invited for an appointment as Assistant to the Export Manager of a large manufacturing organisation. The *duties will include* the general supervision of the Export Office, responsibility for the presentation of statistics and the entertainment of overseas visitors. A good education is essential preference may be given to University graduates, but, in addition, candidates must have a thorough knowledge of export procedure gained through previous administrative experience in an export organisation. The appointment offers good opportunities and will carry an attractive starting salary. All applications will be acknowledged and will be treated in strict confidence.—Box 640. This vacancy has been notified in accordance with the Notification of Vacancies *Order*, 1952.

ACCOUNTANT with experience of industrial management accountancy and preferably C.A. and C.W.A. for post of CONTROLLER in rapidly expanding well-founded concern in country town in South. Reply unless you can show by reference from leading member of leading profession or from leading industrialist that you have outstanding capacity for clear exposition and ability to work with others of different outlook beyond the extent to which such ability is required by an ordinary good accountant.—Reply to Box 631.

If Economists' Bookshop, 11-12 Clement's Inn Passage, London, WC2, invites you to *submit lists* of books on Economics, History and Public Services, you may wish to sell (*periodicals excluded*).

EXPERIENCED FOREIGN SALES *MANAGER*, wide international experience in commerce and industry, fluent French, German, Spanish, required for appointment.—Please reply Box 625.

BEDFORD COLLEGE (University of London)
REGENT'S PARK, N.W.1

The Council of Bedford College invites applications for Research Assistant (man or woman) in Social History, in the Department of Sociology, from October 1st for one or two years; salary £350 or £400. Good Honours degree in History, or in Economics with Economic History as *special subject, essential; historical or* social research experience desirable.—Applications, with names of three referees, to the Secretary by August 20th.

HER MAJESTY'S COLONIAL SERVICE

Applications are invited for the following post.

A vacancy exists for a Statistician (BCD.69/30/01) to undertake work in British Guiana similar to the function of the Central Statistical Office in the United Kingdom. A good academic background and wide practical experience are essential qualifications.

The appointment is on contract terms for two or three years. Salary at the rate of $7,200 (£1,500) per annum. A gratuity is payable on satisfactory completion of contract. Generous home leave on full salary; free passages provided for the officer, his wife and children not exceeding five persons in all.—Intending candidates should write for application forms to the Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1, from whom further particulars may be obtained.

OVERSEAS BANKING

Important managerial vacancy in British Colonial Territory arising shortly. Applications invited from fully competent banker having previous experience similar territory, of appropriate age and with attributes of character and personality required to assume control under Head Office of existing branches and staff.—Write with particulars experience and *qualifications* to Box R. 181, c/o Streets, 110 Old Broad Street, E.C.2.

COMMERCIAL MANAGER

An *old-established* Scottish firm of biscuit *makers require* a Commercial Manager of considerable experience. The post involves control of the financial and sales functions of the company, which has an annual turnover of about £1 million. The salary is in *accordance* with the responsibilities of this important appointment.—Please send full details, which will be treated as strictly confidential, to Box 1869, Robertson and Scott, 42 Charlotte Square, Edinburgh, 2.

GERMANY

British subject, former German banker, going to Germany, would like to act as link between industrial concerns, banks, exporters, etc.—Box 644.

WORKS Magazine Editor required by manufacturing organisation in West London. Should be well educated, preferably Arts Graduate with *some* industrial experience in personnel management or similar sphere.—Write age, qualifications, experience and salary required, to Box 639.

ASSISTANT SALES MANAGER required by old-established company near London starting new division to sell domestic products through ironmongers and hardware trade. Must have suitable practical *selling* experience, be *competent to train* salesmen and supervise office organisation. Excellent opportunity for energetic *young man* with ideas.—Write, giving age, experience and salary required to Box 638. This vacancy has been notified in accordance with *the Notification of Vacancies* Order, 1952.

BEECHAM GROUP LIMITED require a Deputy Accountant aged 30 to 40 years for a factory in the Greater London area. Applicant must be fully qualified in financial and cost accounting. Experience in budgetary control and standard *costing essential*. Post is superannuated and offers excellent opportunity. Four-figure salary dependent upon experience and qualifications.—Write in confidence to Personnel Controller, *Beecham Group* Limited, 68 Pall Mall, London, S.W.1.

PERSONAL SECRETARY to Managing Director. Polytechnic Touring Association, Ltd., 73/77 Oxford Street, W.1. Business experience essential. Commence early September.—Written applications to Personnel Officer. *This* vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

DOES YOUR COMPANY require a young experienced *Production* Controller? Age 34. *If so*, let me send you details of my successful record and *experience* in *all aspects of Production Control* Management.—Box 641.

ENGLISHMAN at present in England and returning to Australia early August, seeks Agencies for Queensland and New South Wales.—Box 642.

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the *General Certificate of Education* examinations: B.Sc. Econ., LL.B., and other external London University Degrees. Civil Service, Local Government and Commercial Examinations, &c.

Also expert postal *tuition for Prelim. Exams.*, and *for the professional exams.*, in Accountancy, Secretaryship, Law, Sales Management, &c., and many intensely practical (non-exam.) courses in commercial subjects.

More than 70,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book lending library. Moderate fees, payable by instalments.

The wise man who knows about

Nothing

A CONTRADICTION in terms? No—because he knows how to create a complete void. In other words, he is an expert on vacuum techniques—a member of Philips staff of scientists specialising in this subject.

In order to produce high quality X-ray tubes, electron microscopes and other instruments, Philips were compelled to carry out extensive research in this particular branch of science. Not only did they contribute to the art of producing very high vacuums but they also had to design simple and reliable apparatus for measuring pressures of one millionth of an inch of mercury or even less.

Knowledge of vacuum techniques is important not only for the manufacture of all kinds of lamps, but also for the various other types of industrial and scientific equipment manufactured by Philips.

THOUGHTS ON THERMAL INSULATION

No. 1

No, sir, you can't really measure it

ONE OF THE MORE disconcerting things about heat loss is that you don't really know how much money is being wasted because of it. What we *do* know is that you are a very lonely exception if you are not spending much more on factory fuel bills than you need — fuel consumed but not doing its job properly in space heating or in heat processing. Heat which leaves the plant without paying costs the country, according to the Productivity Report on Fuel Conservation, 5 million tons of coal per annum. This is amazing when you realise that the prevention of heat losses by effective thermal insulation could substantially cut that figure at a fraction of the cost of the wastage.

In more specific terms, there is hardly a factory in the country which could not financially benefit from improved thermal insulation. In high temperature installations, steam processing, and in buildings, efficient heat insulation is the biggest single factor in the conservation of fuel. Thermal insulation is now a specialised field, calling for high efficiencies in a multitude of industrial applications. Insulation of various kinds is manufactured for temperatures up to the order of 1900°F, but good thermal insulation demands much more than just efficient materials. So diverse are the requirements that a wide experience is needed to ensure the best possible use of insulation materials to achieve an efficient and economical installation.

As contractors, as well as manufacturers, we can bring more than 50 years experience to any problem of heat insulation. That good insulation is also sound business is a starting point on which we would like to base detailed proposals. Consultation and preliminary investigation by us will be gladly offered and will cost you nothing. Get your Plant Engineer to drop us a line.

ABC of Peace and Security

MOLOTOV has lost no time in issuing an invitation to another conference on the subject of European security and of Germany's place in it. The invitation will without doubt be refused. There is nothing new in it; the American and British Governments have, within the last few weeks, emphatically reaffirmed the principles of their European policy; and M. Mendès-France, even if he wished to accept (of which there is no sign, whatever some of his supporters may say), would not so openly break with France's principal allies.

Indeed, Molotov must have known that his invitation would be refused. He issued it, not in any expectation of getting it accepted, but for propaganda reasons. His aim, his unvarying aim, is to weaken and divide the non-Communist world. At the moment his chief preoccupation is to halt the process of embodying Germany in the western world and to prevent either the ratification of the European Defence Community or an invitation to Germany to join the North Atlantic Treaty Organisation (which is not an alternative to EDC but an inferior variant of it). This is the target for 1954; behind it is the wider objective of isolating the United States from its friends and thus disrupting Nato itself.

This has been the aim of Soviet policy ever since the end of the war; there is nothing either new or doubtful about it. The only thing that has changed is the method employed for pursuing the aim. Stalin's brutal tactics obviously failed; he succeeded only in compacting the western world. Indeed, the precision of the timing whereby, whenever the western nations were showing signs of drifting apart, he did something to drive them into each other's arms again, was so great that one might almost have thought that was his object. Now Molotov is trying the soft treatment. He is trying to drive a wedge between the western governments and their public opinions by feeding the illusions of politicians, of journalists and of ordinary men and women who long for peace and security. He hopes by these means to win over the French government, to put the British and German governments on the defensive in their own countries and thus make them incapable of any firmness, and by this means, since he cannot convert the Americans, to leave them bombinating *in vacuo*.

Thus a new phase of the cold war is on, fought not with threats but with promises, playing not upon the fears of free men but upon their hopes. It is a much more dangerous method of cold warfare than any that Stalin ever pursued. And unfortunately events have provided the new campaign with a magnificent exhibit in the conference at Geneva. "Look," the western peoples will be told over and over again in the coming months, "what progress can be made if only you will turn your backs on those stupid Americans. See how reasonable we can be in negotiation if you will only leave your guns outside the door; if we have appeared to be unyielding in the past it is only because we were afraid for our own security. If only you will abandon your

arrangements for mutual defence, there is nothing that cannot be solved. As a first step we can surely all promise to ban that terrifying bomb." Thus will the example of Geneva be tirelessly paraded in Communist propaganda. Every care will be taken to prevent anything from spoiling the picture—which explains the strange phenomenon of the Chinese Government apologising so promptly for the Hainan incident. It would be idle to deny that this line of propaganda is achieving a certain success. It has not yet reached anywhere near the strength that would make the western governments hesitate in rejecting Molotov's invitation to a European Geneva. But it ought to lead them into taking special care to see that their peoples understand and accept the reasons for rejection.

★

This, therefore, is a time for going back to the simple fundamentals of foreign policy and for repeating them as clearly and as often as the Communists repeat their slogans. The danger now is not with the sophisticates, the experts, the chancelleries who understand the facts of international life. The danger is with the simple folk who can be misled. And since Geneva is evidently to be the shining example, it is as well to start with a few simple facts about Geneva.

1. *The agreements reached last week were not a victory either for the West, or for the spirit of reason, or for M. Mendès-France and Mr Eden. They were the acknowledgement of a defeat.* Even if the demarcation line drawn across the waist of Vietnam can be maintained and defended, it would still be true that millions of people and a whole area of strategic importance, which up to a few months ago the West was resolved to defend, have been handed over to the Communists. If, as is by no means impossible, the rest of Laos, Cambodia and Vietnam go the same way before long, then it will be a much worse defeat. The cork in the bottleneck has been at least loosened, and the security of everything that lies further down the line of thrust—of Siam, of Malaya, of Indonesia, of Australia—has been endangered. To say this is not to say that the agreements should not have been reached. There had been a long story of French bungling and the position was past redemption. No one had an alternative course to suggest—not even the Americans, unless they were willing to send a large army. M. Mendès-France and Mr Eden were right to make the best they could of a bad job, and they did it skilfully. But no one should be under any delusion that it was anything but a very bad job. Geneva was about as much a victory in the diplomatic field as Dunkirk in the military.

2. *Geneva does not prove that anything significant can be secured from the Communists by negotiation.* It was clear from study of the Communist press that the Russians certainly, and the Chinese probably, were ready to do a deal when the conference opened (see *The Economist*, May 1, 1954, page 352). Whenever they think the West is ready to give them something, they will always be ready to accept it across the conference table, giving fair words in return. To have this demonstrated does not prove anything about their willingness to make any real concessions for the sake of peace. It shows only that they prefer not to fight if they can get what they want without.

3. *What has happened in Indo-China does not prove that the neutralists in London, Paris and Delhi are right, or that the Americans are wrong. On the whole, it proves the opposite.* If the Communists, having got the French on the run, forbore from pressing their advantage home and swallowing the whole of Indo-China at once, one must ask why. Almost certainly there were two reasons. The first is that they were thinking of Europe; they are more interested in splitting the French off from Nato than in running them out of Asia. The second is that they were afraid the Americans might come into the fight and turn it into a real war—at best Korean, at worst thermo-nuclear. The first reason is a desire to exploit western political weakness; the second is respect for western military strength. In neither case has moderation, tolerance or willingness to compromise anything to do with the motives of the Communists. They reason in terms of power, and can be met only in terms of power. The Americans are not wrong; they are much more than half right.

★

These are the lessons, to be deduced from what has happened to Geneva, that somebody ought to be hammering home daily to the peoples of Western Europe. There are several equally obvious truisms about the situation in Europe that people will forget unless they are constantly repeated.

4. *The argument is not whether Germany shall be rearmed, but on which side of the iron curtain a rearmed Germany shall stand.* The fact that the argument is currently labelled "German rearmament," is, as Mr Attlee pointed out, itself evidence of a Communist propaganda victory. Nothing can now prevent the Germans from regaining their full sovereignty—which inevitably includes the right to bear arms—if not once, then within a few months. What western pol is aiming at is to ensure that the inevitably-to sovereign Germany shall, so far as possible, be mitted to the western and democratic side of the world struggle. That the Russians do not like understandable; what passes comprehension is anybody in the West can fail to want it. The Ge may or may not be sincere democrats; they may not be trustworthy. But in any event it is bett they be with us than against us.

5. *Germany cannot be neutralised.* The two reasons for this. The first is that nature a vacuum. The second is that if a "neutral" G were left free to play East and West off agair other, the Russians have so many colossal b their sleeves, such as the promise of unity,

restoration of the lost eastern territories, that they would probably win the auction.

6. *The mutual withdrawal of occupation forces from Germany sounds fine; but it is a trap.* It is highly unlikely that the Americans would withdraw from Germany without going home across the Atlantic. And it is highly unlikely that they would go home across the Atlantic and still remain ready to come back again when they were needed. The result would be to leave the Russians undisputed masters of Europe.

7. *Non-aggression pacts are also a trap,* since the only ones in which the Russians are interested (as they always carefully explain) are those that rule out "aggressive alliances"—a term which, on Russian lips, means Nato. A European non-aggression pact (which they are quite ready to call a "Locarno" if that would please Sir Winston Churchill and Mr Eden) is a proposal that the western alliance be dissolved while the Soviet empire—which could dispense with public treaties of alliance since it is held together by the iron bands of party and police—would remain as strong as ever.

8. *Whenever you depart from a policy of strength and firmness, you are, to that extent, trusting yourself to the other fellow's good intentions. And how can you trust the good intentions of a secretive police state?* This is really the hub of the whole matter. When a free country gives a promise, whether it be one of disarmament or of non-aggression, its own public opinion watches over the observance and gives warning of any intention to break it. But nobody can tell what a Communist government is up to or what it intends. This is the real answer to those who plead for a policy of mutual trust and friendship. There cannot be mutual trust without knowledge; and only the Communists themselves can open the way to knowledge, by unsealing their frontiers and allowing their peoples to move and speak freely. Until they do, there is no security for the West save in vigilance. The only co-existence that is likely to remain peaceful is one that is based on strength and unity.

This is the simple alphabet of security that Ministers, if they believe in the policy they are pursuing and do not want to see it broken down by the wanton and the wishful, should be preaching up and down the country. It is their duty to keep the country's head clear.

Agreement on Suez

THE Middle East this week is full of reasonableness. The British and Egyptian governments have initialled an agreement on British evacuation of the Suez Canal Zone and on new arrangements for Middle East defence. Almost simultaneously, the British and Saudi Arabian governments have agreed to arbitration about the oasis of Buraimi, title to which has been disputed between the Saudis and the British-protected sheikhdoms on the Persian Gulf coast. The second arrangement gives almost unqualified ground for satisfaction; it is described in more detail on page 355. The first, and much the more important, of the two, calls for more qualified approval. It must be welcomed because after eight years of abortive struggle it releases energies which both countries badly need for other purposes; on the other hand, even its warmest advocates must admit that it rests on untested foundations—notably, on the stability of Colonel Nasser's regime and on its capacity to make its servants do what it has undertaken to

•

The new Anglo-Egyptian agreement is of expected because, for months, only narrow differences have ated the two negotiating parties. Britain's under- that its troops will totally evacuate the zone twenty months is offset by Egypt's undertaking least seven years to help to maintain, and enable technicians employed by civilian contractors to n, installations that will be instantly reactivated vent of attack on any Arab state or on Turkey— on Iran. In a word, there has been concession points for which the British were holding out a ten-year treaty, a two-year evacuation term, the continued maintenance of certain highly technical military installations by British soldiers, and the inclusion of Iran in the terms for reactivation—and concession on only two points to which the Egyptians attached importance: they had sought fifteen months and not twenty as the evacuation period, and had been reluctant to commit themselves about an attack on Turkey. Yet the British negotiators thought this unbalance of sacrifice worth while; what were their grounds for thinking so?

Weighed in isolation, they may seem thin. Properly to assess their merits, they must be set against the alternative policies available. So long as there was no agreement, 80,000 British troops were pinned down in a base so tiny as to be by modern standards an anachronism. These troops were spending considerably more than half their energies on preserving their own security against the harassing tactics of an unwilling host country; and the site on which they were doing so was thought in terms of modern warfare and of the only likely attack upon the Middle East to be situated too far to the south. Thanks to the agreement, these effectives can provide the mobile strategic reserve which it is the present target of the British general staff both to build and to keep dispersed and in fighting trim.

Without the agreement, Egypt was virtually doomed to a social instability that suits only the Communists, since social stability is unattainable without large western investment, and no investor, and notably no important American investor, would enter into major commitments without first seeing a settlement on the Canal. Moreover, in the absence of an agreement, the

year 1956 would have been the end of the term of twenty years for which Britain's 1936 treaty of alliance with Egypt was to run unchanged. That treaty was self-renewable and therefore in the "permanent" class, but it was permanent only as regards Anglo-Egyptian alliance. A permanent alliance is not a synonym for a permanent base on foreign soil, and, after 1956, Egyptian appeals to the United Nations on the score of British trespass on Egyptian territory would have been inevitable, and almost inevitably successful. By the new agreement, which if completed this year will last at least until 1961, not only is this dispute avoided, but Egypt is also vested with proper responsibility for defending its own assets; and, once vested with self-respect, it is likely to become interested in wider defence plans.

From Colonel Nasser's point of view, the advantages of agreement are easy to enumerate. He brings to an end a 72-year occupation of Egypt's soil which educated Egyptians have for decades regarded as an intolerable slight on their capacity. He secures a promise of help in the event of attack; he opens the door to western investment; and by becoming a contributor, on conditions, to a western defence arrangement he opens up a prospect of better armament. While westerners tend to see this last point only in terms of regional defence, many Egyptians are bound to think primarily of its advantages in the struggle that really interests them—the struggle against Israel.

The agreement is only in outline and only initialled. Many weeks must pass before the lawyers finish drafting and negotiating its details, and during that time it will be manhandled by adversaries in both countries. Although Egypt derives such long-sought and patent advantages from it, Colonel Nasser's many personal adversaries both to left and to right are capable of shouting it down in order to promote his downfall. His main supporters, who are to be found in the officer corps of the army, will need to stand firm behind him if he is to see it through.

In Britain too the applecart could yet be upset. The volume of Conservative opposition to retreat from an old stand has been measured and is not decisive; but it could become so if reinforced by some Labour support on the ground that the agreement will create new dangers unless it is accompanied by Egyptian undertakings not to use against Israel weapons furnished for purposes of area defence. During a debate that is taking place as *The Economist* goes to press, the Tory "Suez Group" must decide whether a vote against the agreement can be given without falling victim to a Labour manœuvre to defeat the Government.

Settlement is not a foregone conclusion; but, if it fails, only confusion and new animosities can ensue. The main result to hope for is one in which an anti-Communist Egyptian government ceases to hamper, and begins to work with, the peoples who oppose Communist expansion.

Prickly Thistle

FOR the last two years a Royal Commission, with predominantly Scottish membership, has been reviewing "with reference to the financial, economic, administrative and other considerations involved, the arrangements for exercising the functions of Her Majesty's Government in relation to Scotland." Its report, for which Scottish nationalists have been sharpening their axes long in advance, was published this week (Cmd 9212. 4s.). It contains proposals for some mild administrative reforms, reminiscent of those that Liberal governments used to propose for Ireland in the nineteenth century—before the Liberal party began to support Home Rule and in between periods of Tory coercion. But it is not a report that is designed to prevent nationalist axes from swinging.

The commission does not deny that many grievances exist in Scotland, and that some at least are justified. It traces their primary source to the general growth of state control which, coupled with the decline of local government, has buried local initiative beneath the weight of a bureaucratic colossus centred on London. But the commission roundly and rightly attacks the myth of English economic exploitation. The Catto report had already demonstrated that Scotland takes more out of the national kitty for purely local expenditure than it pays into it. The present report shows that in most fields of Government activity, such as housing and health, Scotland has had at least its fair share of public expenditure in the last nine years. Clydeside has had since the war more financial aid from the Exchequer than any other development are Only in road transport does the commission think t a British Ministry has treated Scotland unfairly; even here it finds that the Ministry of Transport's is less fiscal iniquity (which is suspected but not pr than ignorance of Scotland's peculiar geography.

The report does not therefore recommend any r changes in Scotland's administrative arrangements the moment Scotland has separate departmen Agriculture, Education, Health, and Home Affairs, which come under the direct control of its Secret State; other Government business there is tran through regional offices of the British depart The commission believes that this division of re bility is sound. Scotland has its own distinctive of local government, education, and law; while

other fields, notably agriculture, conditions differ markedly north and south of the border. All these matters can reasonably be treated as Scotland's private concern. But departments dealing with economic matters, such as the Board of Trade and the Ministry of Labour, come in a different category. Administrative separation in these cases would fly in the face of the economic unity of Britain, and that would not be of advantage to Scottish industrial development. The principal changes that the commission recommends are that responsibility for roads, for the appointment of JPs, and a few minor matters should be transferred to the Scottish Secretary. In addition, the heads of regional offices of British departments should be given a more senior status and renamed Scottish Controllers—a description which (the report *insists*) should not debar Englishmen from these posts.

★

These proposed palliatives are not reinforced when the commission turns to examine the present political machinery of Scotland, which it believes should be retained in its entirety. There are two real difficulties here, but they are not difficulties to which the commission could easily draw attention. In the first place, the present system turns on the position and personality of the Secretary of State, who administers the Scottish departments and acts as Scotland's spokesman in the Cabinet. Shuttling to and fro between London and Edinburgh, and handling an outsize administrative job, postwar Secretaries have not always been equal to the demands of their office. The Secretary's load is now lightened by the existence of an additional Minister of State for Scotland, but the commission rightly insists that the Secretary should retain his supremacy and exclusive right to speak for Scotland.

The second difficulty is that Scottish affairs do not at present get sufficient attention in Parliament. This is not primarily a defect of Parliamentary procedure. Scottish MPs, meeting in Scottish standing committee, are capable of sifting all the legislation that is put before them. But the Government has not the incentive (or perhaps the energy) to sponsor much special legislation r Scotland; and the ability of the Secretary of State interest his colleagues is inevitably limited.

hese problems are a burning issue in Scotland ; and it is therefore not surprising that the com- n itself apparently felt that its terms of reference, were not intended to include discussion of er Scotland should have a separate Parliament, equivalent to a charge to write about Hamlet t discussing the prince. Since many of the ses who came before them seemed unwilling to anything else, the members of the commission able to resist the temptation to visit Belfast and their own conclusions. They decided that no ity for progress lies down this road. The and administrative arrangements in Northern hey declare, have come into being "as a result of historical causes peculiar to that country." "However well adapted to conditions there" (and there seems at least a suggestion that the commissioners do not really believe that they are well adapted at all), these arrangements "would not further the special interests and needs of Scotland." Moreover, a substantial majority of the witnesses who appeared before the commission, representing a "broad cross-section of responsible Scottish opinion," agreed with this judgment; but the report recognises that it was not within the commission's duty to estimate the amount of popular support accorded to the conflicting views.

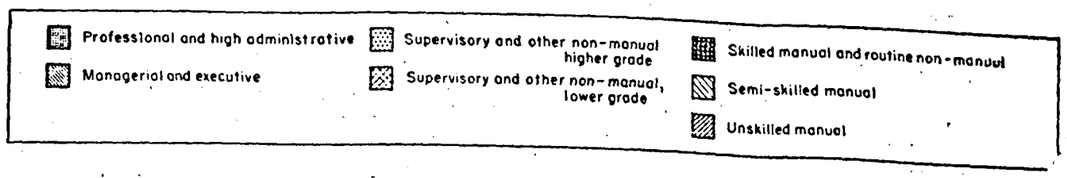
This, of course, is the kernel of the problem. It has not yet been within anybody's duty to measure the strength of this support; and the outside observer is left with the apparently conflicting facts that a very large segment of the Scottish adult population has signed various petitions in favour of Parliamentary devolution, but that most of those signatories themselves continue to vote for candidates who are opposed to it. At the last general election Scotland returned 35 members of the Labour Party, which is specifically opposed to Parliamentary devolution, and 35 members of the Conservative Party, which is instinctively opposed to it. It also returned one member of the Liberal Party, which supports devolution, but it has not sent a single Scottish Nationalist down to Westminster. This is a sign that the desire for devolution is not yet a dominating emotion in Scotland, in the sense that the ordinary Scot's involvement in the ordinary party battle is not overridden by his susceptibilities in this matter. But it is not a sign that the majority of Scots do not want more devolution than is recommended in this report; for what it is worth, the reactions of most shades of Scottish opinion to date suggest that they probably do.

★

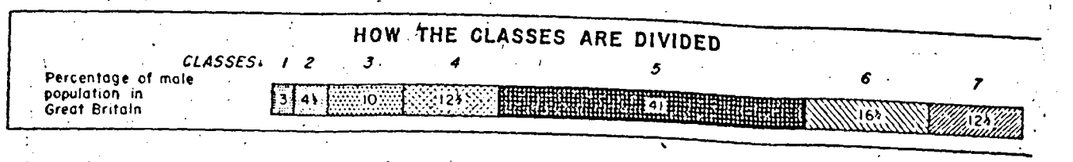
If they do want this, then it will be a pity if English politicians play any part in refusing to let them have it. Let it be granted that the Scots would almost certainly lose economically by a devolution that was pushed to the point of a separate Parliament; that all the traditional complaints that Scotland has a higher unemployment ratio, a greater backlog of housing needs, and a lower accumulation of productive capital equipment are really arguments in favour of the present system, which necessarily gives Scotland easier access than Ulster has to subventions or investment from England. Let it be granted that the covenanters' campaign is almost wholly based on emotion. But emotion is a factor that counts in politics, and it has always been surprising that Englishmen should conceive that they might have any material interest in running counter to any such tide. It should be left to the Scots to strike their own balance between their feeling and their thinking; meanwhile the Government should accept the recommendations in this report, but it will be very surprising indeed if it has yet heard Scotland's last shriek on this subject.

In Father's Footsteps?

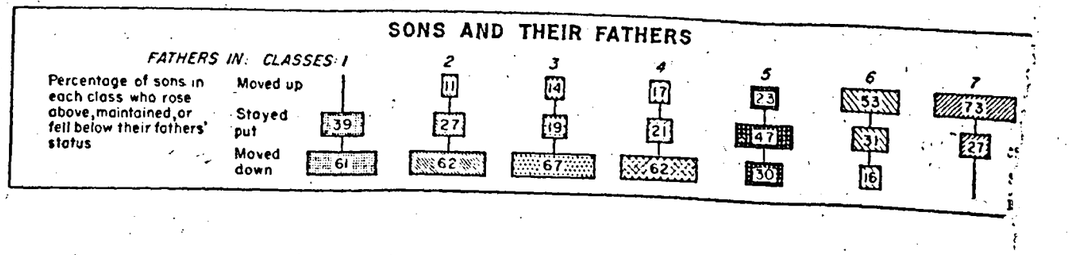
DO children better themselves? There was a time when the question would have meant: does the dustman's daughter marry a duke? Today it means: can the dustman's son become a higher civil servant? For a person's social standing in the community is judged more and more by his occupation. It is on this assumption that Dr D. V. Glass and his colleagues in the London School of Economics have based a pioneer study of social mobility in Britain, which was published recently.



During a preliminary survey they found a wide measure of agreement in the public mind about the social importance of different jobs. They were, of course, fully aware that social status cannot be measured on a scale so simply as can, say, intelligence. Any attempt to measure it must be to some extent arbitrary, for it involves subjective as well as objective criteria. Nevertheless, they found themselves able to arrange occupations in a "hierarchy of social prestige" and split them into seven broad groups. In the middle of the scale, 41 per cent of adult men in Britain were allocated to a large upper working class group, comprising skilled manual workers and routine non-manual workers. The remainder were divided into almost equal parts, with four middle or upper classes above the centre group and two working classes below it. The first chart below shows the comparative size of these groups.



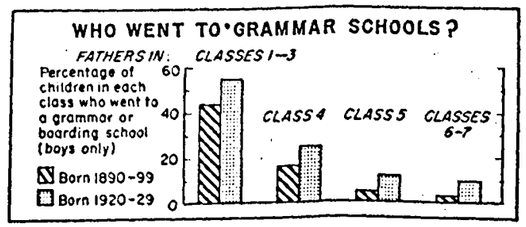
This social classification was based on the findings of a sample inquiry undertaken by the Government's Social Survey. But the purpose of the study was not to determine how many men should be put into each social group. It was to estimate how much movement takes place up and down the scale and from one generation to another. The results can be summarised with rough tidiness. In the sample as a whole approximately one third of all sons stayed in the same class as their fathers, approximately one third moved down, and just under one third moved up. This suggests that there is a greater degree of social flexibility in Britain than in some other European countries—for example, France and Italy.



These approximations necessarily mask considerable variations between the groups. As the chart shows, in each of the four middle or upper classes between 61 and 67 per cent of all sons failed to do as well for themselves as their fathers had done; while among unskilled and semi-skilled manual workers respectively 73 and 53 per cent of all sons did better than their fathers. The higher one starts, the harder it is to rise and the easier to fall—which is not very surprising. One of the most significant findings of the study, however, is that 39 per cent of the sons of "professional and high administrative" men (Class I) managed to follow their fathers to the top of the ladder; the direct influence of a father's position on his son's career seems greater in this class than in any other. But the even higher proportion of upper working class (Class 5) sons who followed in their father's footsteps is not so significant as it looks, for the huge size of this group makes the bare figures misleading. It is, in fact, easier to climb or drop into this class than into any of the others. Dr Glass describes it as a valley, with more rigid classes on either side—especially the classes above it.

Perhaps the most interesting chapters in the book

The Seven Classes



discuss the relation between education and social status. They are interesting not only because education is one of the main factors determining social status, but also because of the present controversies about the future of the independent schools, the tripartite system of education in the national schools and the method of selecting children for each type. The study found that, before the 1944 Education Act, social origins and education tended to reinforce each other, producing a close connection between the social status of father and son—especially for the higher groups. But although education was found to be a powerful factor in the achievement of higher social standing, it was certainly not the only one; the survey found that men with a university education and high social origins were more likely to go up the ladder than others with a comparable education born in a lower group. Perhaps this means that manners—or rather the manner—made man; or perhaps it means that nepotism still counts.

Children born in 1920-29 had a much greater chance of a grammar school education than those born in 1890-99; for the children of unskilled workers the

chances increased fourfold, but for the middle classes (Classes 1-3) chances had improved by only one-fifth. The chart on this page shows the improvement in chances for all classes in this period. Since then, the 1944 Act has given all children a much better chance of grammar school education; but a local investigation made in Hertfordshire in 1952, whose findings are included in this study, confirms what is already well known: that the number of parents who would prefer their children to go to a grammar school is still far greater than the existing number of grammar school places. Parents know, and so do their children, that it is grammar school education that gives a child the best chance of moving up the social ladder. Conversely, when children of parents in the higher social classes are refused a grammar school place, it does not necessarily mean that they are being refused an education for which they are unsuited and given one to match their abilities; it also means that they are being forced down the social scale.

This is really the crux of the matter. If society in general is to be really fluid, there has to be movement down the scale as well as up it. It is anxiety to prevent this happening to his own children that prompts so many a middle-class father to buy for them, at considerable personal sacrifice, the education that they hope to obtain from the state. But need it happen? Let it be granted that all children cannot better themselves. Need they worsen themselves in the eyes of the community simply because they have not the abilities, or the opportunities, their fathers had? Moreover, are we quite sure that perfect mobility is wholly desirable? It is one thing to ensure that brilliance gets its chance. But it may not be in the best interests of society if certain characteristics—ruthlessness and love of power—that often accompany a quick moving up the scale were to become too prominent among the new elite.

Some of these questions are asked, but only briefly answered, by Dr Glass. What is clear is that the rigidity in the social structure that is shown by this survey, with social origins conditioning the type of education received and with both affecting the social level reached, is sagging. Thanks to the 1944 Education Act, natural ability, or measured intelligence, will play an increasingly more important part than social origin. The problem is how to prevent this from creating an anxiety neurosis among those who fail to reach the upper rungs of the new educational ladder—a neurosis that could be as damaging to society as the frustrated ambitions of those whose path was blocked in the past.

*The book discussed in this article is "Social Mobility in Britain." Edited by D. V. Glass. *Routledge and Kegan Paul.* 412 pages. 36s.

Beer and Crime

Before beer shops were allowed, the public houses were the exclusive resorts of [the] loose classes. Since beer shops were authorised, these have chiefly become the home of the depraved. Now beer shops receive much of the vituperation formerly heaped on public houses. Only a few years ago, the beer shop system was much praised. The law establishing it was the only great measure . . . passed in one session, and now the Committee say this system is a failure. . . . Thus the good intentions of the Legislature to serve the people, and provide them with wholesome drink and prevent drunkenness, have not been realised. As much ardent spirits are consumed as ever; as much as ever is drunkenness the cause of crimes; as much as ever are places of resort for drink places of disorder, places where criminals meet and concoct their plans, and places where those must live who have no other homes. It is stated on high authority, there always shall be poor in the land. It seems highly probable, too, that there always will be criminals in the land, and it is rather a good thing than otherwise that the rest of society knows their haunts. It is better that they should have some places of common resort than be dispersed through the whole society. Public houses are by their very name and nature open to the police as to other persons; and to have inspectors of them . . . is one step probably to acquire a knowledge of what legislation actually can do to prevent moral disorders in them. Certainly there is no generally prevalent opinion more wholly unfounded, or which causes more labour in vain, than the opinion that legislation can by its fiats charm evil out of society. . . . Certainly crime, like poverty, though we are impelled to try and lessen both, is for ever rife as if it were an essential part of society in its present condition.

The Economist

July 29, 1854

Notes of the Week

No New Order

To a government needing a blood transfusion, Sir Winston Churchill has given a liver pill. His new appointments are unexceptionable in themselves, but they do no more than fill the gaps created by the resignations of Sir Thomas Dugdale and Mr Oliver Lyttelton. As had been expected, Mr Lennox Boyd returns to take charge of the Colonial Office, where he had earlier made his mark as a junior minister; it is a strange commentary on the squabbles of nine months ago to be able to say that one of his main tasks will be to gain the confidence of African leaders as fully as his predecessor has recently done. Mr Heathcoat Amory takes over at the Ministry of Agriculture; promotion to this hot seat is his penalty for proved charm and departmental ability. The other changes raise men of clear promise or achievement to posts of minor responsibility, even though some surprise has been expressed at the choice of the ex-soldier, Mr Low, for the role of trade crusader in a businessman's government. Even as the new names were announced, Sir Lionel Heald announced his impending resignation as Attorney-General, other departures are expected soon, and Sir Winston Churchill's supporters are already looking impatiently towards another reshuffle.

These changes, however, do nothing to overcome the basic faults in the structure of the Government; once again Sir Winston has been led up to the fence only to shy from it at the last moment. Effective leadership in domestic policy and in the Commons cannot be provided if every new point has to be referred to a Cabinet presided over by a man preoccupied with world problems. Sir Winston should appoint a leader with power to act on his own initiative, and with the prestige and authority to command the respect of the Opposition and the support of his own side. Only three men could do this—Mr Eden, Mr Butler and Mr Macmillan. Mr Eden, in view of his eventual destiny, would obviously be the best of all; but if he does not wish to leave the Foreign Office, and Mr Butler cannot be spared from the Treasury, then Mr Macmillan could now surely be set free from building all those houses.

Bull by the Horns

MR EDEN has grasped his bull by the horns; but Mr Attlee is still going with his to China. That seems to be the main import of the confusing happenings of Parliament's last week before the recess. Mr Eden's grasp may be nervous and insecure, but there can be little doubt that he was wise to hurry forward the initialling of the Suez agreement before Parliament broke up. The Tory rebels have seemed discomfited by the need to blow off some of their steam in a hurry; if they had bottled it up all through the summer, the pressures on general Tory policy—and speculation about what would happen when Parliament returns—would have been even greater than they are now. The debate on Suez is in progress as this issue of *The Economist* goes to press, and it is still not known whether there will be a vote or who may participate in it; the Government may emerge looking slightly bloody, but at least it has shown its backbenchers that on important issues it will not be bowed.

Meanwhile the Labour party has reacted to the end-of-term atmosphere by another show of eagerness to avoid a clash of personalities, although the clash of policies still resounds. At Wednesday's meeting of the National Executive there was some discussion of the propriety of Mr Bevan's recent pamphlet on the "alternative to German rearmament"; some members were particularly indignant at his revelation that some of his faction had previously voted for the "Attlee conditions" (which they now claim have not been fulfilled) merely out of a hypocritical desire to delay something that they did not want. The party leaders, however, apparently did their successful best to damp down recriminations and embarrassment, and no action has been taken. While this meeting was in progress, the general council of the Trade Union Congress were voting by 23 to 6 to support a German defence contribution within EDC or some other effective system of collective security. They seem likely to be able to carry this policy at the forthcoming annual congress at Brighton; but the prospects of a similar success at the Labour party's conference at Scarborough have, if anything, grown slightly less hopeful in the last few weeks.

Co-existing with Migs

THE language of Communist governments bears relation to reality. The irresponsible killing of women and children in a clearly marked British ai on its regular mail route over the open sea is desc by Peking as a "regrettable accident." When Am aircraft were ordered to the area to search for sur this was a "shameless act of aggression against the C people." Even in London, some people seem t bifocals through which unprovoked and inexcusable appear the most natural thing in the world if car by Chinese, and self-defence highly sinister if car by Americans. In the House of Commons on a wave of anti-American criticism was on the breaking when Mr Eden stilled it with a dramat

tion. The Foreign Secretary said that, after the British airliner was attacked, Hongkong notified the Chinese authorities that search aircraft would be sent out, and got the curt reply that they would be fired on without warning if they approached land.

Against that background, it is difficult to see on what grounds the American action can be criticised. Wild and foolish words were certainly uttered in Washington when the news arrived that six Americans who had been in the British airliner were missing, killed or wounded; but words are one thing and action another. The same principle applies to the Chinese. It is a pleasant surprise nowadays to get any apology at all from a totalitarian government; but it would be pleasanter still if there were not such obvious political motives for Peking's politeness to Britain at this particular moment.

Only a few weeks ago, a Belgian aircraft crossing Austria with the singularly unprovocative mission of delivering British pigs to Jugoslavia was fired on by Soviet fighters and its pilot was killed. No satisfaction was offered to the Belgians; was that simply because they were not important enough, in Russian eyes, to be worth placating, or because Mr Molotov was not then engaged in mounting a skilful *détente*? It would be naïve to imagine that this week's apology from Peking, wrapped up as it was in familiar anti-American propaganda, was anything but a tactic of the immediate moment. "Peaceful coexistence" will remain a mockery until civilian aircraft are able to go safely about their peaceful business near the frontiers of the Communist world. Until then, one may be excused for looking askance at anyone in this country who, while finding excuses for those who shoot down British airliners, hastens to attack those who come swiftly and gallantly to the rescue of the survivors.

Mr Rhee Runs Amuck

MR SYNGMAN RHEE is a sincere patriot, a legendary figure in the grim tale of his country's struggle for freedom, a veteran politician and a man of great courage. He is also, to put it bluntly, a menace; a menace to peace, to Korea's allies, and to Korea itself. Nothing less strong can be said of a man who, when speaking as a distinguished guest of the United States Congress, judges the occasion right to call for a war to restore Chiang Kai-shek to power in China.

It is possible to sympathise with the South Korean esident's anguish over the continued division of his own untry. It is impossible to condone his gross abuse of erican hospitality. His kind of talk doubtless delights, ugh for different reasons, both the China lobbies—the in Washington, and the Bevanite one in this country, r anxious to find new evidence of American jingoism. such words, spoken from such a platform, must do ld damage to the cause of the free world. It is a main is of Communist propaganda that the United States other nations fought in Korea not to save a small from aggression, but as a first step towards an on of China. Mr Rhee implicitly endorses this Com- distortion; and by so doing he not only gravely sses Korea's truest friends, but also makes it ely difficult to preserve the unity among free nations to which his people owe their survival in freedom, and on which they may need to rely again.

Unfinished Business

PARLIAMENT is adjourning for the eleven-week summer recess with an unusually large load of unfinished business on its hands. Normally Ministers aim to leave themselves a fortnight at the end of October in which to clear up the odds and ends left over after the recess, and then to start the new session on the first Tuesday in November. This year, however, the timetable has got out of hand; when Parliament reassembles on October 19th there will still be another five or six weeks' work ahead before the present session can be ended. This means that the next session cannot start until the end of November at the earliest.

The Government cannot, as in previous years, claim that special factors such as the Coronation or the late King's death have upset its plans. In most respects this has been one of the most normal sessions since the war. The sole reason for the present clutter is that the Government has tried to cram into the legislative machine more than it can digest in a session of normal length. Although the Rents and Television Bills have been the only measures to attract much public attention, Parliament has also had to deal with Bills covering such complicated subjects as mining law, town and country planning and leasehold reform, with Scottish counterparts in the last two cases. In addition, there have been Bills to set up the new Atomic Energy Authority and to revive the Liverpool Cotton Exchange, together with the usual flock of minor measures. In all, 63 Government Bills have been introduced, of which two have been withdrawn and one (Teachers' Superannuation) has been shelved.

At the end of this week twelve of the Government's Bills are still left in the pipeline. As should have been foreseen months ago, the main jam has developed in the House of Lords; despite an unprecedented number of sittings after dinner, the peers have still to deal with the Mines and Quarries Bill and the two Town and Country Planning Bills. The Commons has eight Bills on its plate, most of them fairly modest. But the Food and Drugs Bill and its Scottish counterpart will both need some time in Committee, while the Overseas Resources Development Bill (which is to write the final act in the farce of the groundnut scheme) has not even been given a second reading. To this legislative business left for the autumn will have to be added the two annual debates on nationalised industries, at least one debate on the railway reorganisation plan and presumably at least one debate on foreign affairs.

Next Year's Programme

THE extension of the present session by three or four weeks would not be of much importance were it not bound to influence the length and timing of the next one. There is nothing sacrosanct about the length of

a session; ordinary annual sessions since the war have varied in length from 155 days to 212. But the elasticity of Parliament's work is limited by certain immutable factors—the debate on the Queen's Speech, the Budget and Finance Bill, the Appropriation and Consolidated Fund Bills, the 26 Supply Days and Private Members' time. In addition, a government must periodically find time for special debates on such subjects as defence, foreign affairs, Welsh and Scottish affairs, the nationalised industries, colonial problems, reports of select committees and Crichel Downs. So far in the present session these special debates have taken up 18 days, the fixed items 73 and Government legislation 68.

Such flexibility as exists in a session, therefore, exists largely in the time available for government legislation. If the Government, while starting the next session three weeks late, wants to end it at the usual time—as it will do if it is aiming at an election in the autumn of 1955—then the three weeks cut must come from the time available for its own Bills. Such a loss would leave the Government's supporters dry-eyed; Tory backbenchers now take the disillusioned view that most Bills lose more friends than they gain, and they are not at all enthusiastic about tackling such complicated matters as local government reform so late in this Parliament.

The most immediate problem for the Government's timetable seems to be when it can introduce its legislation to increase pensions. With the reports of the Government Actuary and the Phillips Committee not due until November, the Government will probably be able to do no more before Christmas than announce its plans. But pledges have been thrown around the constituencies like confetti and the Government may want to bring forward the necessary legislation before Christmas, too. One way to fit this in would be to allow the present session to run on until Christmas. When Mr Attlee did this in 1949 he declared an election in the recess. Some members are already speculating nervously about the chances of history being repeated, but the Government seems in no hurry; before it goes to the country it wants the pensioners to feel the increase in their pockets, and that cannot be until well into next year.

Civil Defence at a Price

THE commission of three appointed by the Home Secretary to take over Coventry's civil defence seems to have found itself metaphorically as well as literally in that city. Apart from a hostile reception from the Labour councillors who have abrogated their responsibilities, the commission can expect a none too cordial welcome from the local population. The Labour councillors who abrogated their responsibilities now refuse to co-operate with the commission by making available their officers, premises and equipment. This is a retaliation because the new system—or rather the councillors' H-bomb arrogance that has made it necessary—is likely to cost ratepayers dear.

Under the terms of the Civil Defence Act the Home Office makes a grant equal to three-quarters of the cost of civil defence organised by local authorities; but if it has to take over the job itself it can present the local authority with the whole bill. It is estimated in Coventry that the extra cost will be about £15,000, or the equivalent of a rate increase of about 2d. in the pound. The council has refused any co-operation until it is given this grant. But despite this, and whether or not any effective civil defence can now be carried on in the city, the Home Secretary's action has certainly been the right one—and he should not yield meekly to this unpleasantness. A firm stand now may deter other authorities who have been tempted to follow the same path.

No Help from Molotov

MOLOTOV'S latest diplomatic effort was clearly aimed at France; but if his intention was to delay or influence the forthcoming parliamentary battle over EDC, the shot was not very well directed. M. Mendès-France might well have welcomed a Soviet opening which would have allowed him to by-pass the stiffest obstacles that face his governmental coalition; but the opening would have had to be attractive enough to enable him to persuade all France's allies to keep him company. The Soviet invitation, however, did not visibly differ from its unsuccessful predecessor, and it disappointed even some of the most convinced partisans of a Four-Power meeting. Hence the Soviet Note evoked little echo in Paris. The opponents of yet another conference have merely found in it a confirmation of their feeling that Geneva has changed nothing in the European situation; while those who favour new international talks over Germany before the French parliament is asked to pronounce on the matter could find no new weapon in Molotov's arsenal.

M. Mendès-France, having inherited the seemingly insoluble EDC problem which has puzzled so many preceding governments, apparently still intends to solve it during August. Nobody knows in what manner he expects to cut the Gordian knot that grips French politics; busy with his economic programme and with Tunisia, M. Mendès-France has not judged it opportune to show his hand in advance. There are, however, indications that he no longer puts much hope in the search for a compromise. The negotiations between followers and opponents of the treaty show no sign of producing any concrete results. Thus the French premier is unlikely to present the other signatories of the treaty with any magic formula for which he could seek their approval.

He may, therefore, be left with no alternative but to face the National Assembly with the treaty in roughly its present form and ask it to give its verdict. Yet it is to be wondered whether even the premier's strict neutrality i the debate would be enough to prevent his governme from bursting asunder; the "Europeans" will press hi to back the ratification, while the Gaullists pull in t opposite direction. Already the European question is pr venting M. Mendès-France from widening his coalitic He wants the Socialists in and has consulted them ab his economic programme, but while the Socialist "rebe welcome him as a "neutral" over EDC, the ortho secretary of the party, M. Guy Mollet, mistrusts premier's European intentions. When the problen Germany is raised in the cabinet, M. Mendès-Franc think nostalgically of the relatively mild wrangles Geneva conference table.

Cuts in Strategic Controls

IT was with relief as well as satisfaction that the President of the Board of Trade was able to announce to the House of Commons on Monday a relaxation of the controls on exports of strategic goods to the Soviet bloc, for he was thus able to redeem, although somewhat tardily, his rash promise of last March. The cuts appear far-reaching: the embargo list will from August 16th be reduced from 250 to 170 items, and the quantitative control list slashed from 90 to 20 items, while a further 60 items will be kept under surveillance on the "watch" list. Simultaneously steps will be taken to improve the machinery of control. Trans-shipment controls formerly operated by only a few countries will be extended to all sixteen countries participating in the system, and Britain has agreed to introduce shortly some form of merchandising control, the exact nature of which has not yet been disclosed.

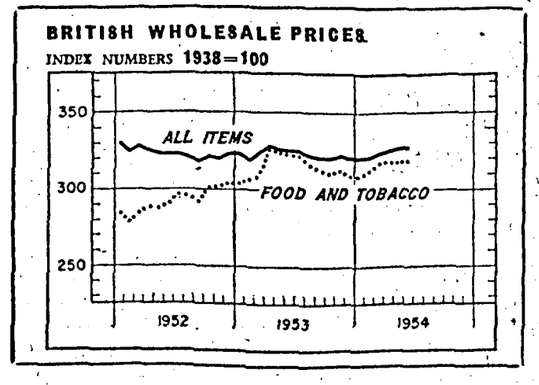
Until the full details of the items taken off the lists are known it is impossible to say with certainty whether the relaxation matches the Prime Minister's call for sweeping changes; but on the evidence available it looks as though the British point of view has prevailed. It remains now to be seen whether in fact much commercial gain will follow; but it is improbable that it will measure up to the optimistic estimates of the Board of Trade. Nor should anyone cherish the illusion that the Russian propagandists and those who sing their tune in this country have had their fill; they will go on niggling away until—if they have their way—there are no controls left whatsoever. Having taken such a large bite out of the system, and having done some useful tidying up, the Government should now resolve to move extremely cautiously in any future changes, for the point where security is directly endangered is close at hand.

A great opportunity has been cast aside by the hesitating and piecemeal approach to this operation, for the West's concessions might well have been used to extract concessions in other directions from the Soviet bloc. But even though the chance has been missed, it is not too late for some people in Britain to readjust some of their uncharitable judgments on the Americans. As usual, Mr Stassen has proved accommodating and amenable to persuasion. No one will envy him the job of defending these proposals with Congress in its present mood.

The Unfortunate Case of Dr John

THE defection of Dr Otto John to East Berlin is a blow, even if he divulges no secrets to the Communists. It also symptomatic of the confusion of mind in which anti-zis in a divided Germany are increasingly finding themves. Dr John was probably influenced by the fear that personally was sure to lose his post as head of the Office Protection of the Constitution when Germany regained rmy and independence. He had helped the British duri g ar, after taking part in the plot against Hitler, and he ot been noted for efficiency. The last occasion among on which his office had been under fire was an anti-unist drive, in which a number of men were arrested founded suspicion.

Dr John may therefore have had personal reasons for his action. But his fears are shared by most convinced anti-Nazis and cannot be dismissed. The danger does not lie in a restoration of pure Hitlerism. It is significant of the weakness of the diehard politicians that only 6 votes out of more than 900 were cast for Admiral Dönitz in the recent presidential election which overwhelmingly returned the liberal Professor Heuss. But Dr John and those who think like him were more justly fearful of the result, in a state where so many posts have had to be filled by former Nazi party members, if a national army is set up and nationalist politicians come to the fore.



Many anti-Nazis will in future be confused by the fact that Communists are voicing the same fears and that Mr Molotov is proposing a way out which would neutralise and unite Germany. After all, for a German to go to East Berlin means, unless he realises that he is passing from one world to another, only driving into the next street; and the Russians, as an article on page 369 shows, are increasingly smoothing out the superficial signs of division.

It is ironic that Dr John's move, intended as a blow to the nationalists and neo-Nazis, will probably have the opposite effect. It will help the extreme right to discredit the British and those who helped them. It will encourage those who would like to start a McCarthyite campaign in which anti-Nazis would be denounced as "Reds." And it is one more blow to Dr Adenauer's foreign policy.

Schools Below the Minimum?

IN the report stage of the debate on the education estimates this week the Minister of Education was attacked on lines with which she is already familiar through the complaints of the Association of Education Committees. Her Labour critics claimed that the volume of school building is not sufficient even to carry out the meagre policy laid down in Circular 245. This circular limited school building to what is needed to accommodate the extra children who are flooding into the schools as a result of past bulges in the birth race—with nothing to spare to replace slum schools, to relieve overcrowding, or to reorganise all-age schools (in which secondary education is sometimes little more than nominal).

The case against the Minister rested on evidence that she has drastically scaled down the programmes that have

so far been presented to her by local authorities. Seventy-five authorities, which together had asked for £42 million for building during the coming year, have been allowed only £24 million. Miss Horsbrugh was accused of arbitrarily keeping total expenditure on school building to a predetermined figure of £45 million, regardless of local authorities' own views of their minimum needs. The Minister answered these criticisms by saying that it would be wrong to add together the separate local programmes and to assume that this was the minimum necessary to carry out her policy; it is common practice for local authorities, who have now grown used to expecting cuts, to ask for more than they strictly need. Miss Horsbrugh said that 85,000 places were now under construction to cope with the 80,000 extra children who will enter primary schools by the end of 1957. But, as the bulge in age groups moves on, the main problem will be to find enough places in the secondary schools; and, surprisingly, Miss Horsbrugh gave no figures here. The number of secondary school places now under construction is 214,000, but as many more again will have to be started between now and the spring of 1956 if the increase of 364,000 children in the secondary schools is to be accommodated by the end of 1957. The crucial question is therefore, how many places has the Minister "programmed"? This she did not reveal. The case against her is by no means proved, but she has not established her innocence.

Copper Workers' Colour Bar

THE breakdown of negotiations for giving Africans a better deal on the Rhodesian copperbelt is a serious matter, and not least for the European union which has largely caused it. In the negotiations, which have been dragging on for over a year, the mining companies had proposed that a limited number of Africans should be given a chance to prove their worth in jobs previously reserved for Europeans. Although the European workers were to be given a firm guarantee that their present rights and conditions of work would be respected, their union has rejected the scheme—by standing pat on its formula of equal pay for equal work.

This formula, though an axiom of British trade union practice, is a euphemism for an industrial colour bar on the copperbelt. The Europeans who first went to Northern Rhodesia to set the mines in motion expected, and received, expatriate standards of pay. They are among the most highly remunerated workers in the world, and the best paid African gets only a small fraction of their wages. It would upset the whole structure of African society if African miners were to leap suddenly on to European scales; and in practice the Europeans would not tolerate it. The European case is further undermined by the fact that, only a few miles across the border of the Belgian Congo, Africans are getting good pay for jobs which Africans in Rhodesia are still considered incapable of holding.

This breakdown may have had one good result. At long last the Northern Rhodesian government is being involved, after years of timidly sitting in the wings. A board of inquiry has been set up to investigate the reasons that prevent African advancement, and to make recommendations that will take "the well-being of the federation and Northern Rhodesia" into account. The well-being of the federation—and of the doctrine of partnership—should allow it to return only one answer.

Luxemburg Frees Special Steels

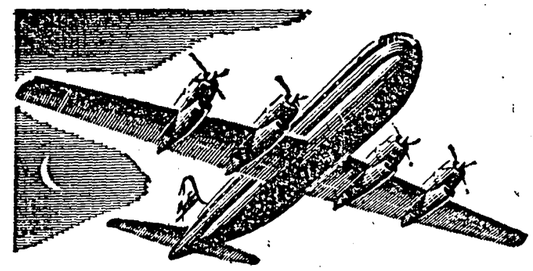
THE High Authority of the European Coal and Steel Community has set tomorrow, August 1st, as the date for the coming into force of the common market for special steels. With the elimination of national barriers to the interchange of these, which are mostly alloy steels, action has now been taken on all the commodities (coal, coke, iron ore, scrap and common steel are the others) covered by the treaty establishing the Community. There is still much to be done in harmonizing freight rates, in eliminating distortions in transportation charges, and in freeing the market from the artificial restraints of restrictive agreements before the Community will have a genuinely common market; and there is the additional need to raise productivity in the Belgian coalmines and in the Italian steel mills so that they will no longer require the special measures provided for them during the transitional period. But the important fact remains that, for all the commodities covered by the treaty, what were six national markets are now legally one; and any deviations from the basic rules of the common market will require express sanction.

Although the opening of the common market for special steels, originally planned for May, was twice put off, the delay will have been justified if, as seems virtually certain as *The Economist* goes to press, the common market can now be opened without recourse to special protection for the French industry. Section 29 of the transitional provisions appended to the treaty provides that the High Authority, after consulting the Consultative Committee and the Council of Ministers, may institute precautionary measures, such as fixing prices or setting quotas, to prevent extreme dislocations at the time of the opening of the common market. At the request of France the desirability of taking action under Section 29 was thoroughly considered. Happily, the Authority, the Committee and the Council, which met in Luxemburg earlier this week, were agreed that no action was required at present, although the situation will be kept under close review and future action is not ruled out.

The High Authority's practice of testing the ground carefully before stepping has also been rewarded by an important decision on the part of the French. Special steels, like a number of other products, have, for several months been subject to new French import taxes amounting to some 15 per cent by value. These import taxes are quite clearly contrary to the spirit of the OEEC trade liberalisation rules and they would also seem to violate the rules either of GATT or of the IMF, depending on whether they are viewed as an alternative to tariffs or to currency devaluation. Indeed, although M. Faure, who was called upon to explain this to the OEEC Council in May, was doubtless made to feel uncomfortable, the import taxes have remained. Now the French have agreed that, with the coming into force of the common market, the tax will no longer be collected on special steels imported from the other countries in

EXPORT QUESTIONS
NEED EXPERT ANSWERS

Will Latin America take Airliners?



WHETHER you are exporting airliners or T.V. equipment, dynamos or omnibuses, the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 53 branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to:—

Pressure Product

IN 1939 I.C.I. began the works-scale production of a new plastic that was to play a major role in defeating Hitler's air armada. The plastic was polythene, the white, tough, flexible material that provided the high-frequency insulation in almost every wartime radar set. Without polythene, the Allied land and sea radar systems could not have developed as they did — let alone airborne radar. No other material could supply the combination of insulating and mechanical properties that airborne radar needed. Polythene's discovery in 1933 was the result of research on the effect of extreme pressure on chemical reactions. It was pure research, inasmuch as it was aimed primarily at the acquisition of scientific knowledge. But it yielded polythene.

Making polythene in large quantities was a difficult task. Ethylene gas had to be heated at pressures similar to those produced in a 15-inch naval gun. Such pressures were greater than had ever been used in chemical plant before. The first experimental safety-valve blew the skylights out of the laboratory, while a gauge- or pipe-burst was not uncommon. But by September, 1939, the Research Team handed the world's first polythene plant over to the works in time to meet the wartime needs of radar. Today, this unusual plastic is doing its unique job as high-frequency insulator in many branches of the growing electronics industries — in radio and television; in radar and electronic control equipment; and in undersea cables — but it has also been found ideal for many other uses, from cold-water tubing to packaging film — of which hundreds of miles are produced each week.

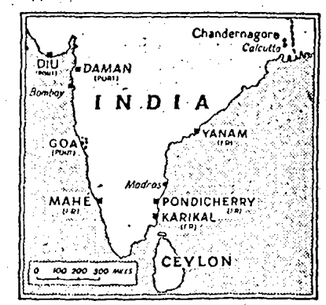
Community. Although the general problem of the import tax remains, it is of first importance to the future of the Community that the authority of the treaty has been recognised, and that it has prevailed without being openly challenged.

Overlords in Argentina

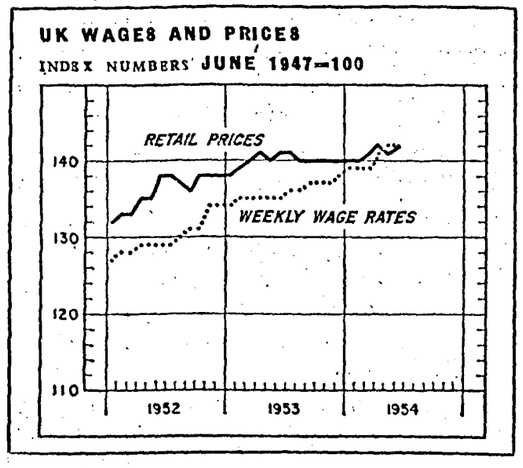
LAST May Day, General Perón drew applause from those of his followers who are increasingly anxious about public expenditure by promising a drastic cut in the size of his cabinet. But, like other heads of governments, he has found that ministerial salaries are not easily saved. The "cut," when finally announced last week, did reduce the nominal number of ministries from 21 to 16; but this was accompanied by the appointment of four "Secretaries of the Executive," in other words, "overlords" respectively concerned with defence, economic, technical, and political affairs. With the president, these now constitute an inner cabinet of only five men.



This reorganisation is easily interpreted as a move to the political right. Three of the new cabal of five are military men: the president himself; General Sosa Molina, the defence secretary; and Admiral Teisaire, the vice-president, who now becomes the political overlord. Dr Mende, the technical secretary, is best known for his skilful public relations work, including the production of whatever statistics best suit the occasion; and the economic secretary, Dr Gomez Morales, has already presided over many discreet but forceful shifts away from the régime's earlier policy of placating labour at all costs. Through him, the new officially blessed employers' federation is represented in the inner cabinet; the once all-powerful labour federation (CGT) is not. Indeed, the most notable absentee from the inner cabinet is the Minister of the Interior, Señor Borlenghi, a CGT stalwart who only a few months ago was widely regarded as a strong candidate for the presidential succession, and a dangerous one because of his left-wing views.

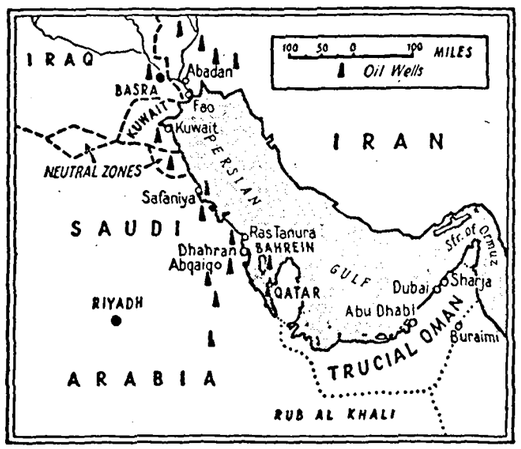
Pockets of Trouble

INDIA's dispute with Portugal has flared up, in marked contrast to Mr Nehru's statement last week-end to the ngress Committee that he hoped the question of the ch settlements would soon be amicably settled. iously more Indian irritation had been concentrated ist the French than against the Portuguese, and this ibuted to the misunderstandings between Delhi and over Indo-China. Lately, however, the anxiety of the French and Indian governments to reach a satisy agreement on the settlements has run parallel with tcellent impression created in India by M. Mendès-'s behaviour at Geneva.



question of these little European enclaves in the sub-continent has a power to fan the flames of racial ut of all proportion to its scale. In the case of h, both parties now agree in principle to the f the four remaining settlements to India, subject oncurrence of their inhabitants; Chandernagore was handed over after a plebiscite in 1949, but there is still much disagreement about the transition. Is there to be a direct referendum? How and in what order are administrative functions to be handed over? There is some difference between Pondicherry and the other three owing to their size; in each case, local Indian movements have occupied some of the French villages, rather on the lines of a sit-down strike, but in Pondicherry there is a more solid lump of French territory. All, however, are likely to be formally transferred before very long.

The case of the Portuguese territories, Goa, Diu and Daman, is more explosive. Portugal has again warned India this week that it will not yield up its ancient possessions, and that Delhi will be held responsible for any aggression against them, whether overt or disguised as a "spontaneous" local movement. In these circumstances, riling though it may be to have pockets of aliens in Indian territory, Delhi will have to move with discretion; as the keeper of the Asian conscience, it cannot profitably play too much power politics à la Kashmir.



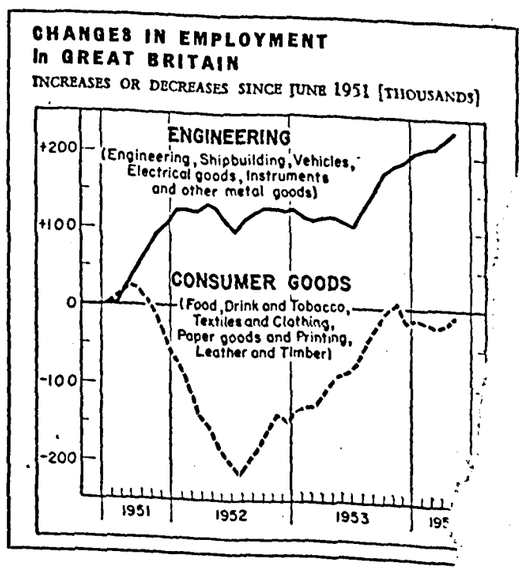
Compromise in Arabia

BY a coincidence, the House of Commons learnt of the settlement of two Middle Eastern quarrels on the same day this week—the Suez dispute, and the Anglo-Saudi difference over the oasis of Buraimi in Arabia. The second quarrel was potentially troublesome because of the suspected presence of oil in the region of undefined boundaries in which Buraimi lies. Claims to its eight villages and the empty area round about it are now to be settled through

arbitration by a panel consisting of a Briton, a Saudi and three neutral adjudicators. Two years of inflammatory stories about shootings, "blockade," and "requests for assistance against aggression" are over; although they affected only tiny handfuls of people on the spot, they served to rouse tempers and to queer international relations by the time they reached distant capitals.

The discord that reigned in the oasis was described in *The Economist* of March 28, 1953. Briefly, modern usage suggested that it belonged partly to the Sultan of Muscat and partly to the Sheikh of Abu Dhabi; for instance, in 1945, nobody questioned the holding of a conclave there between the local sheikhs and a representative of their British protector. But in August, 1951, a Saudi official arrived there with forty men, claimed that Buraimi had been Saudi in the nineteenth century, and started to distribute the food and money that are the quick way to win hearts

in such poor country. The British were affected because the Sultan of Muscat asked for their help and because the Sheikh of Abu Dhabi enjoys British protection in matters of foreign relations. They therefore supplied pickets of Trucial Oman levies with instructions to prevent supplies from reaching the newcomers in quantities greater than was normal for the oasis. News of free food and largesse travels fast, and beduin took to eddying in and out of Buraimi, gathering round the Saudis when bounty was flowing but tending to leave again whenever supplies ran low. Shots were exchanged at times.



Now, both the Saudis and the levies are to go away, and the rulers and oil companies with interests in the area undertake to observe a neutral zone pending the verdict of the arbitrators. The importance of the agreement is that it sets a precedent for peaceful boundary demarcation in an area that used to be unimportant and uncoveted but is now thought to be rich and worth scrambling for.

More Trouble for the Ministry

IT is unfortunate for the Ministry of Agriculture that the case of *Woollett v The Minister* should have come before the High Court in the same week that the House of Commons debated Crichel Down. The two cases are not parallel, save in one important respect; each has called into question the behaviour of this Ministry's officials towards the individuals with whose lives and fortunes they propose to interfere. Mrs. Woollett owned four acres of land in Essex, of which she was dispossessed by powers derived from the Agriculture Act, 1947. Under that Act, her sole protection against unfair treatment was the Agricultural Land Tribunal, which is a tribunal of both fact and law and whose decisions are not subject to review by any superior court.

The case for entrusting such extensive and exclusive powers to any single body such as a land tribunal is that these tribunals contain independent farmers and landowners who are meant to be carefully selected by the Minister from specially constituted panels. Mrs. Woollett's complaint was that members of the tribunal who heard her case were chosen either by the chairman of the tribunal (who holds a permanent appointment) or by its secretary (who was without any authority or competence to do so), a method of selection that Mr Justice Stable considered to be "utterly deplorable." The Court held that the tribunal was not properly constituted, that the certificate by which it purported to dispossess Mrs Woollett was not an effective certificate under the Act, and that Mrs Woollett was entitled to possession of her four acres.

Since some twenty-four other landowners were dispossessed by certificates granted by the same tribunal at the same sitting, the Ministry has now a rather confused situation to clear up; unless, of course, it decides to enter an appeal against Mr Justice Stable's judgment. In any event, the new Minister of Agriculture will clearly have to spend a nervous few days searching through his files for any other postscripts to Crichel Down. When an organisation has lost respect, not only for the concerns of private individuals, but also for the formalities it has itself laid down for their protection, it has ceased to retain any claim that it is working in the public interest.

Letters to the Editor

Diplomacy and Cyprus

SIR—All I could find in your article of July 24th was the addition to the old theme "Of course we are right" of a reservation "But let us see what these people have to say." But are you right after all? You recognise yourself how difficult it will be for Britain to convince the Assembly of her "impeccable" title over the island or even to draw an iron curtain around the field of her domestic jurisdiction. This would simply make nonsense of the promises contained in the Atlantic Charter and the principles embodied in the Charter of the UNO as recently reaffirmed during Sir Winston's visit to Washington. Bilateral negotiations are therefore advised, but all that is suggested in your article is that Greece should be asked to subscribe to or join in the enforcement of a permanent regime of dependency over a people which demands the right to determine its own future. "There cannot be any question of abandoning British sovereignty over the island." Why? Because the United Kingdom cannot rely on the continued goodwill of the Greek government. But then it may expect to foster the bitterness and indignation of the Hellenic people. I hope, Sir, that we are moving towards the abolition of an international stock exchange where titles are bought and sold on territories and the freedom of peoples inhabiting them.—Yours faithfully, DEMETRIOS ARGYRIADES

London, W.8

Anglo-Egyptian Relations

SIR—Egypt's removal of all restrictions on sterling imports reopens to British firms one of the easiest, safest and most profitable markets available. Import licences are still necessary, and for non-essential goods the sterling has to be purchased from the "import entitlement" account. But there is plenty of import Entitlement Sterling available, and there is every prospect that the British Export Credits Guarantee Department will abandon its present suspicious policy in regard to cover for Egyptian business and so provide the facilities which some manufacturers require and are at present lacking. It is our earnest hope that British manufacturers will now make a determined effort to recover their position in many branches of commerce which have been lost over the past two years to competitors, and notably to German manufacturers, who have not suffered from import restrictions.

There are also a large number of investment or Government sponsored civil engineering projects in which it is most desirable that British Civil Contracting Engineers should be interested. There have been no tenders by British firms for any major project in Egypt for a number of years. German firms have been more enterprising and successful. British civil engineers have had reason to complain of the conditions of tender and of administrative delays and injustices in the course of execution, but these are, by and large, matters which can be the subject of representations to the Egyptian Government, who will undoubtedly give them sympathetic consideration. Egypt would welcome a renewal of interest by British firms in engineering projects.

There are, of course, complications. Egypt's economic position is sound as far as the current payments position is concerned but the Egyptian Government has not the capital to finance the large number of developments which the country needs. Facilities for payment over a period are more attractive today than the lowest tendered price. The new attitude of ECGD may assist contractors in meeting the need for prolonged credits.

One instance may be quoted to show how much ground has been lost by British civil engineering firms. The Egyptian Government has prepared plans for a new dam south of Assuan. The cost of this work will be around £200 million, spread over 8-10 years. Last year a number of constructional experts were invited to Egypt to inspect the plans and the site and to submit their comments. One British expert was included in the invitation, but was unable to attend. As a result of the criticisms then made, the plans were revised and this year fresh invitations have been issued, but no British expert has been invited. The reason must lie in the recent disinterest by British firms in Egyptian contracts in general.

There are some prospects of an official trade delegation visiting Egypt at the end of 1954 or early in 1955. It can do a great deal of good and should bring back to the UK better reports of conditions in Egypt than, to judge from the attitude of many British exporters, are currently accepted in England. Plans for a British trade exhibition to be held in Cairo in the autumn of 1955 are under active consideration. This project can be a great success, provided it receives the full support of British manufacturers. This Chamber will be only too glad to assist exporters with advice or by any other means in our power.—Yours faithfully, E. A. H. GOODWIN

British Chamber of Commerce of Egypt

Practical Convertibility

SIR—In your issue of July 3, 1954, you publish a letter from Mr Ernest H. Meili in which he referred to difficulties he had experienced in paying for excess baggage charges at Hamburg, and commented on the apparent disregard by BEA of the improved position of both sterling and the Deutschemark.

Unfortunately BEA is not a free agent in this matter as we are bound by the currency regulations of both the UK and of Germany. In conformity with the ban imposed by the UK Treasury on the use of sterling notes abroad, BEA is not permitted to accept these notes at any of our stations outside the UK. Until very recently the German regulations restricted the facility to pay in Deutschemarks for fares and excess baggage to German nationals and others having a convertible Deutschemark account, and it has therefore been necessary for BEA to require payment in some currency other than sterling notes or coin or Deutschemarks. Furthermore, where the Corporation accepts foreign currency for such payments, any change due to the passenger has to be provided in Deutschemarks.

We in BEA have been very conscious of the sense of frustration caused to our passengers by these restrictions and, particularly for this reason, have continually pressed for some relaxation which would ease the problem. The German authorities are now gradually removing the more onerous of the restrictions and, by a recent amendment to the licence under which the Corporation operates in Germany, we are now permitted to accept Deutschemarks from non-German nationals for a maximum of 20 kilos of excess baggage for certain categories of passengers. In addition, a facility has been granted which enables passengers to pay charges for any additional excess baggage direct to a bank for credit to BEA's Deutschemark account, but this method is still extremely irksome to the passenger. We are continuing our efforts to induce the German authorities to permit unrestricted payment in Deutschemarks for excess baggage and are hopeful that this may be achieved shortly.—Yours faithfully, R. L. WEIR

Confusion in Kenya

SIR,—You talk of "the disarray into which European politics in Kenya have fallen," and describe this as "a deplorable state of affairs." Is it not fairer and truer to describe the present state of flux as a necessary and to some extent healthy prelude to the birth of two political parties? To talk of white supremacy as a myth is also misleading. Whether we like it or not, the European Kenyans are the only possible leaders in all practical, economic, social and ethical spheres, for the foreseeable future: this should be a matter for pride and not for shame.—Yours faithfully, R. A. RUSSELL-SMITH

Kiambu, Kenya

Books & Publications

Unfair to Beveridge

BEVERIDGE AND HIS PLAN.
By Janet Beveridge.
Hodder and Stoughton. 239 pages. 15s.

LOYALTY is a magnificent, terrifying, and sometimes rather comic virtue. It can inspire superhuman efforts and courageous self-abnegation; it is less favourable to cool objectivity and a sense of proportion. When to the loyalty first of a devoted lieutenant and then of a close colleague there is added that of a wife, very much a personality in her own right and fully endowed with Scots pugnacity, and when the whole force thus generated is let loose on its object's grievance, no one should be surprised if the result recalls an incident narrated in an early chapter of Lady Beveridge's book: the impact of little William Beveridge's mother, formidable in maternal wrath, on the school bully who had been knocking little William about. Figuratively speaking, the author is out to picket Whitehall with a placard bearing the legend "Unfair to Beveridge!"

Her book is neither precisely a biography of Lord Beveridge nor precisely an account of his Plan. It fills in some of the gaps in his own "Power and Influence"—notably by a lively and valuable account of his parentage, childhood and schooldays—but leaves others still yawning. The silence enshrouding, for instance, the years at the London School of Economics will be regretted, for a number of reasons, by many readers. Inclusions and omissions, however, follow a reasonably consistent pattern. It is the author of the Plan whose story is being told; whatever in his life, personal or professional, leads up to the Plan is relevant; other aspects, however interesting, can sink into the background. The discussion of the Plan itself assumes in the reader not only prior acquaintance with the Beveridge Report but ability to recall, without systematic reminder, every respect in which it differed from the 1944 White Papers and from the Labour Government's legislation. These passages cry aloud for an appendix, or at the very least for page references to the "sacred text." It is human and forgivable in Lady Beveridge to devote, instead, two full chapters to the success of the American tour on which she accompanied her husband—the apt rejoinders with which both regaled the press, the personal kindness of the President, the appreciative audiences, the fan mail—and a third chapter, of considerably greater intrinsic interest, to the reception of the report by the European resistance movements and the flatteringly anxious reaction of Goebbels's propaganda machine; but it is not really very enlightening. Indeed, the paradoxical effect of her account of the "launching amid cheers" of the Plan is to rouse lively sympathy for a War Cabinet who, facing hideous military peril and unknown but ominous economic prospects, were confronted with so formidable a popular enthusiasm for so vast a commitment. Of course Sir William Beveridge was right and the Cabinet were wrong—wrong and inconceivably clumsy. They should have gone nap on the report; used its author's services to the full in drafting legislation; and kept the principle of the welfare state—whatever particular amendments proved necessary—in fact as well as in name as far above party as the aim of victory itself. So it is easy to see now, jobbing backwards. Britain might have been spared much but for that misjudgment. Lady Beveridge's indignant pages will not, however, persuade every reader to impute it to jealousy, bad faith, or plain imbecility—expressions, it should hastily be added, which she never uses, though they glower unmistakably between the lines.

This book will neither help nor harm Lord Beveridge's reputation. He will not (as some surmised at the first breath of its appearance) have to take a long sea voyage; his stature, on the other hand, is independent of ex-parte championship. The book's quality lies in portraiture, in a detailed solidity lacking in his own larger-scale narrative, and in something of which the most irreverently critical must concede the value: transparent devotion to a good cause and a good man. Its main defect is one that often accompanies such devotion, a vicarious egotism, deadly to the power of seeing a complex sequence of human interactions steadily and whole. In the last analysis, it is as a human document rather than as a piece of contemporary history that "Beveridge and His Plan" should be read.

Secret Weapon

V.2.
By Major-General Walter Dornberger.

HAUPTMAN DORNBERGER, a young artillery officer, posted to a dangerously esoteric appointment concerning rocket development in 1932, would, in the British Army, have been moved on for the good of his career two or three years later. But in the German Army he was allowed to remain on this one task for twelve years. In that time he and his faithful team developed, produced and put into the field what was probably the technically most advanced weapon (nuclear fission apart) in the history of war.

The technical problems tackled and mastered by General Dornberger's team, forced for reasons of secrecy to work for most of the time without the help of industry or the universities, were formidable. Many of their solutions were brilliant, and not only worked but were taken almost straight from the laboratory and put into quantity production. The technical lead held by the Germans in this sphere was very apparent when the V2 threat was under consideration by the Allies during the war; the prognostications of our then technical experts probably did more to cloud than to clarify the picture pieced together by Intelligence.

On the military value of the long-range rocket opinions will vary until another war conveniently provides further evidence. In the latest volume of his war memoirs Sir Winston Churchill condemns the V2 on the ground that it required as much productive effort as a Mosquito aircraft to make, and only delivered one ton of high explosive during its life, as compared with the Mosquito's average of 125 tons. General Dornberger maintains that the production cost of a rocket was less than one-thirtieth of a twin-engine bomber, and that rocket production did not in fact interfere with German aircraft production. Bearing in mind the story disclosed by this book of over-early crystallisation of the specification (which resulted in the seemingly absurdly small warhead), the rushed development, the curtailed and inadequate trials, the chaotic manufacturing conditions and the extemporised operations, one cannot but wonder at the results actually achieved. It would be a tragedy if those responsible for defence were misled by too easy criticism of the V2 as an inaccurate and expensive toy.

It was a bitter blow for General Dornberger, who, besides playing a large part in developing and manufacturing this revolutionary weapon, had selected and trained and equipped the troops to operate it, to be at the last moment deprived of command in the field by the intervention of the SS. He may have been to some extent to blame for this by too readily accepting the help of the SS in getting priorities for his work at a critical stage, although after Himmler had gained control of the Home Army as a result of the plot of July 20th, S intervention was probably inevitab No doubt because of this ultim change of command, General Dor berger deals in a disappointingly p functory manner with the actual ope tions.

The book is not a literary masterpi and makes at times a rather he attempt to dramatise a story wh would, without any adornment, com favourably with the most luri "science fiction." While it wou unrealistic to expect from General berger any display of remorse invention of the V2, one migh hoped for some word of apology

concentration camp slave labour used for its production, an unpleasant subject on which he is discreetly silent.

Fight Against Crime

SCOTLAND YARD.
By Sir Harold Scott.
Andre Deutsch. 256 pages. 16s.

DURING the immediate postwar years, a great flock of thieves, confidence tricksters and other rogues, many of them violent, descended on London. The annual number of indictable crimes, which had been a little more than 90,000 in 1939, shot up suddenly and alarmingly to nearly 130,000 in 1945—or more than a quarter of the total number of indictable crimes in the whole of England and Wales. It was not until 1949 that the first significant fall in the number of crimes in London was recorded and the Metropolitan Police began to get the better of the criminals.

It was Sir Harold Scott's unenviable responsibility to lead the Metropolitan Police throughout this period. When he took up office as Commissioner in 1945, the force was some 6,000 men short of its normal prewar strength of 19,500. Recruiting was poor, and the policemen themselves were discontented with their pay and conditions of service. By the time he left office, in 1953, policemen's pay had been increased; promotion had been placed on a fair basis; the organisation of Scotland Yard, the Force's headquarters, and of the districts and divisions had been streamlined; and the back of the postwar crime wave had been broken.

With so much to his credit and so many exciting events to describe, Sir Harold Scott is singularly modest and unsensational. Not that the book is dry—far from it—but it lacks punch. After eight years of fighting London's criminals, of fighting, too, ignorance and apathy in Parliament and the press, one would expect pungent comments on the social problems of the age instead of the few platitudes which he offers. A policeman is even better placed than the doctor in general practice to notice the trends of modern life and to observe the effects of social legislation. His own enior officers, as Sir Harold Scott must now, are far from mealy-mouthed about ch matters, and the book would have d more value if the few criticisms and nments which he allows himself had n more outspoken.

For the rest, there are enthralling ounts of many of the big criminal es of the past few years—of the battle London Airport where bandits npted to snatch £750,000 worth of on and goods and were beaten off e Flying Squad in a pitched fight crowbars and truncheons; of the Haigh, Christie and Setty murder nd of the ruthless pursuits of happily few criminals who carry s. There are descriptions, too, olice organisation for the Coro- and, notably, Marshal Tito's visit. All in all, Sir Harold Scott gives an excellent account of his own work and the work of his policemen during these difficult postwar years.

Britain's Fifth Column

A GALAXY OF GOVERNESSES.
By Bea Howe.
Verschoyle. 206 pages. 15s.

THIS book presents the governess through the ages in a series of brief biographical sketches and shows how her prestige has fluctuated in public estimation. When learning for women is fashionable, as it was when Queen Elizabeth I set the standard, then the governess is respected. When all that she teaches is handicrafts and accomplishments she is a person of small importance. But it was not only because no intellectual standards were demanded of her that the Victorian governess was an object of contempt. The newly rich manufacturer wanted his crude offspring to be taught by gentlewomen. The daughters of the clergy were a convenient glut on the market, and he asserted his new place in society by treating these impoverished ladies very badly. Paid perhaps £20 a year, slighted by her employers and scorned by the servants, far from her friends and forbidden followers, the Victorian governess had an intolerably lonely and unhappy life.

Yet the profession has had its triumphs and rewards, however few. Some governesses commanded great affection and influence, as, for example, Selina Trimmer of Chatsworth, who was consulted by Lady Harriet Cavendish on whether it would be imprudent to marry the lover of her aunt, Lady Bessborough. The most successful character in Miss Howe's galaxy was Catherine Swynford, governess first to the children of Edward III and Queen Philippa, and later in the household of John of Gaunt, whose mistress she became. Not only did she become Duchess of Lancaster after his wife's death, but she also obtained legitimacy for the children she had borne him. The book contains nothing about the soberer rewards of being a royal governess today, but perhaps the less said about that the better.

In the nineteenth century governesses became one of Britain's most important exports, and were to be found in palaces and aristocratic houses all over the world. They were good propagandists for their country because, however exalted their employers, they remained convinced of the superiority of everything British. Readers who hope to find something sensational in the revelations of Miss Emmeline Lott, who lived in a harem (yashmak and all) as governess to a Pasha, may be disappointed. Others may occasionally blench at the somewhat inflated style; and few people, whatever they think of hockey-playing hoydens, will share Miss Howe's regrets at the passing of governess education. But this is certainly an entertaining book and clearly based on much patient research.

Scottish Symposium

THE SCOTTISH ECONOMY.
Edited by A. K. Cairncross.
Cambridge University Press. 335 pages. 30s.

THE renaissance north of the Border is gathering strength. Hard on the heels of the new *Scottish Journal of Political Economy* comes this symposium by twelve economists and social historians of Glasgow University. If addiction to aggregates has made some people south of the Border blind to the existence of such a thing as a Scottish economy, this book will serve as an eye-opener. Although the seat of power has long been in London, Scotland cherishes its own institutions and culture; and a liberal measure of administrative autonomy has done much to preserve the identity of the country within the statistical records of the United Kingdom. In his introduction, Professor Cairncross describes Scotland as "a distinct society with a unity and cohesion of its own," "an ancient kingdom in which the fire of nationalism still burns"; its economy functions "as a unit and with an independent momentum." The aim of the book is to give a twofold analysis—a comparison between the economy of Scotland and that of the United Kingdom at the present time, and a survey of long-run tendencies affecting Scotland's development. The Glasgow economists are in a great tradition: did not the father of political economy—the least parochial of men—include in his "Wealth of Nations" many penetrating comparisons between

economic conditions in Scotland and England in his day?

The survey covers population, trade, income and consumption, the main industries, housing, health, crime, education, trade unions and the churches. Skilful use has been made of a variety of sources, particularly the recent Censuses of Production and Population. While much of the story is inevitably unexciting, there are a number of facts to interest the social scientist. For example, in 1951 there were nearly as many people living more than two in a room in Scotland as there were in England and Wales, where the population is nine times as large; the English have now replaced the Irish as the largest group of immigrants to Scotland; one in four church members is now a Roman Catholic as against one in six fifty years ago; in the worst winter month it is usual for 6 per cent of all Scottish workers to be off work owing to sickness.

A chapter of special appeal to economists is the one on income by Mr A. D. Campbell. Real income per head in Scotland in the slump of the thirties was 14 per cent lower than in the United Kingdom, and in 1948 it was 10 per cent lower. It is a pity that the details of this computation have not been published, for this is a significant new departure in regional analysis. The reasons given for the difference, in order of importance, are the lower level of incomes from work (agriculture playing a big part), the lower proportions of occupied persons in the population, and the higher rate of unemployment. These factors, however, hardly go to the root of the matter and do not tell us why wage-earnings are 5-10 per cent lower in Scotland. Mr Cairncross thinks the real reason is the comparative indifference of Scottish industry to technical progress. When we recall that Adam Smith too found Scottish wages lower than English, are we to conclude that Scotland has always suffered from a dearth of enterprising entrepreneurs? Perhaps the best men emigrated.

The book succeeds admirably in its declared object of portraying the measurable aspects of Scotland's economic life, and incidentally indicates the limit to which regional statistics can now take us. It is not the fault of the authors that they leave unanswered some of the deeper problems posed by the facts of Scotland's secular growth.

Poetry's Fallen Estate

THE BROKEN CISTERN.
By Bonamy Dobrée.
Cohen & West. 167 pages. 12s. 6d.

PROFESSOR DOBRÉE'S theme in these, the Clark Lectures for 1952-53, is poetry's fallen estate in the modern world. Parnassus, he would seem to say, was once a true National Park, known to many in a wide and delightful freedom. But now it is frequented mainly by school children and undergraduates moving purposefully in crocodiles under the superintendence of evaluating and analysing dons. Not here, O Apollo, are haunts fit for thee!

A great deal of poetry is still written, but it no longer gets itself much read. What is the reason? Was Peacock justified in saying that man has outgrown poetry? Mr Dobrée is emphatic that he was not:

> I for one pin my faith to the doctrine that for a satisfactory civilisation to exist, imaginative writing must be widely read, noting the accepted fact that poetry is the most highly-geared and inclusive form of such writing; but adding that to be nourishing it must respond to and express general states of being.

It is always possible to argue that poetry must become less generally comprehensible as it evolves. As Mr Edwin Muir puts it:

> The more a writer tries to render his vision of the world in its completeness, the more irrevocably he turns it into his private world. The more carefully he connects everything with everything, the less is his reader able to connect anything with anything.

But this, Mr Dobrée implies, is to treat poetry in a somewhat irresponsible or at least unbalanced fashion; and there is an answering truth, which has been proclaimed by Mr C. S. Lewis:

> It may well be that the author who claims to write neither for patron nor public but for himself has done our art an incalculable harm . . . by teaching us to emphasise the public's duty of "recognition" instead of the artist's duty to teach and delight.

The crux of the matter indeed lies here. Poetry must in all ages preserve its bardic function or perish; we rightly require it to be "releasing, illuminating, reconciling, and to deal with the things that most matter to most men." Poets abandoning this labour and this claim go out into the Waste Land—and against them we must invoke Jeremiah: "They have forsaken. . . . the fountain of living waters, and hewed them out cisterns, broken cisterns that can hold no water." This is perhaps a little dismal; yet Mr Dobrée is not himself a Jeremiah in the popular sense. He traces, learnedly and delightfully, the history of certain great public themes in English poetry, shows how these necessarily in some respects exhaust themselves from the imagination, and makes some enquiry into the manner in which they may be reincorporated there. His book is both a challenge to poets and a vindication of poetry.

Opinion Surveyed

POLITICS AND OPINION IN THE NINETEENTH CENTURY.
By John Bowle.
Cape. 512 pages. 25s.

MODERN conditions, Mr Bowle remarks in his new book, make the engagement of intellectuals in current affairs a necessity, and as he has written about the nineteenth century the twentieth has never been far from his mind. He writes "in the hope of contributing to clarify and mobilise opinion upon questions which will determine the life or death of modern society." This is not, of course, a plan on which a sound account of the development of political theory can be drawn up; and such an account should be fortified with a stronger grasp of social and political history than Mr Bowle displays in this book.

He has stressed the middle-class origins of most nineteenth-century political thinkers, but has stuck to their opinions and, on the whole, left their politics alone. Only five of the writers he discusses ever held responsible public office: three of these, Maistre, Tocqueville and Acton, were aristocrats; One, Leo XIII, was Pope; and Mazzini (whose interesting conspiratorial techniques are left unanalysed) ruled for only a few months. Questions of real interest about the impact of middle-class thinkers on the politics of the century still await an answer: what role did they play, for example, in the creation and organisation of mass parties? To what extent were they the controllers, and to what extent the puppets, of government policy? What machinery was there to translate any of their opinions into action, in what the author calls "the age of Marx and Spencer"?

None of these points is raised; instead, we are offered a survey of ground on the whole familiar to those already interested in the subject, drawn up in a style that can hardly appeal to the uninitiated. The strength of this book lies in the summaries that it gives of some of the main writings of about forty important authors, British, French, German and Italian. These sketches, composed largely of quotations, are sparsely accompanied by comment; this, on Marxism, may stand for example:

> On the merest pragmatic considerations, a less barbarous political theory is better suited to the twentieth century, in particular since nuclear weapons have made theories of inevitable violence incompatible with the continuance of ordered society.

Biographical footnotes, often of a rather hectic kind, help to introduce each new writer; and other notes list the chapter headings of major works cited. The summaries may serve to send readers back to the originals, for which no substitute is to be found in Mr Bowle's careless prose.

FOREST CREATURES FLEE in terror from the holocaust of fire. A hundred miles away towns taste the burning; the sun is overcast, smoke constricts the throat. Fire, which brings blackened desolation, *could* starve the world of newsprint. Over the 7,000,000 acres of Bowaters' timber limits in the Canadian Province of Newfoundland such fire is guarded against by endless vigilance, war is constantly waged against pests and parasites, afforestation is carefully planned. This is the Bowater guarantee for never-ending supplies of pulpwood for their mills at Corner Brook, one of the largest integrated pulp and paper mills in the world.

From the mills of the Bowater Organisation in Europe and North America comes newsprint in a never-ending stream for the newspapers and journals of the world; other printing papers for magazines and reviews that carry colour and interest into countless lives; paper for the protection of food and for packages of almost infinite versatility.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Making the Best of Geneva

Washington, D.C.

THE Geneva settlement has on the whole been received in the United States with calmness and considerable resilience although bitter words have been spoken about "another Munich." For example, shortly after the news arrived, *Senator Knowland*, the majority leader, and Senator Symington, a former Democratic Secretary of the Air Force, agreed that those who followed the policy of "peaceful co-existence with ruthless Communism" would find themselves in the predicament of the "young lady from Riga who went for a walk with a tiger." And the air clashes off Hainan, although their impact has been less than might have been expected, could hardly have been better timed to provide extra arguments for those who believe in the incorrigibility of the Communists and the utter immorality of admitting the present Chinese government to the United Nations.

Until the Chinese apology arrived in London there was hope that the shooting down of a British aircraft would have a salutary effect on a Britain thought to be intoxicated by the heady effects of its own diplomacy; now there is quiet satisfaction that the air arm of the Pacific fleet was found to be ready and resolute. The absence of anything resembling war fever, and the polite silence that greeted President Rhee's suggestion to Congress that the South Korean and Chinese Nationalist armies be used to overthrow the Communist regime on the Chinese mainland with American air and naval support, speak much for the stronger nerves which Americans have acquired in the course of the cold war.

The bitterness of some of the reactions to the "abandonment of Indo-China," as the widely read Alsop brothers term it, ought not to be overlooked, for many Americans feel a deep sense of shame at the idea that twelve million more people should have disappeared behind the Iron Curtain. The reason is partly political embarrassment—Republican propaganda in opposition had habitually summed up Democratic foreign policy by the statement that when President Roosevelt went to Yalta there were 200 million people under Communist rule and when President Truman's term finished there were 800 million. It is partly strategic anxiety—Senator Symington, for example, and the Alsops argue that the Russians are rapidly overhauling the United States in modern weapons. But underlying this is a deeper feeling that American policy, in fumbling badly, has in some way displayed a failing of moral fibre, which will have the most serious effect on anti-Communist opinion on both sides of the Iron Curtain.

Nevertheless the general tone of American comment on the Geneva settlement is one of level-headedness and moderation. For this there are several reasons. Senatorial passions on foreign policy were for the time being exhausted by the flare-up over the rumours that Britain would try to force the entry of Communist China into the United Nations, while Senatorial bodies have been exhausted by a succession of all-night sessions on the atomic energy Bill. There is also wide sympathy with the President's observation at his press conference that, when he was put up against it, he could think of no better plan, so that he ought not to criticise what had been done.

Moreover, the propaganda drive by the Administration to convince the American people that the defence of Indo-China was essential for their safety got under way rather late in the day and had been put into reverse during the weeks of the conference. Also there was the discouraging factor, to which the President called attention as early as his press conference on February 4th, that many Indo-Chinese showed slight signs of wanting to be saved. Most Americans considered this must be entirely due to Indo-Chinese dislike of French colonialism, a feeling with which they of course greatly sympathised. Indeed it was the confusion of emotions—anti-colonialism mixing with anti-Communism—that kept American opinion aloof from the Indo-Chinese war until its penultimate phase, until, in fact, long after American money had started to pay a large share of its cost.

*

Finally, at least two of the accompanying features of the Geneva agreements gave some cause for relief. There was the ending of the French colonial regime and the emergence of Laos, Cambodia and, for the time being at least, southern Vietnam as independent states. Then there was the phenomenon of M. Mendès-France. Whoever is being blamed for the way the war ended, it is not the French Prime Minister. It is considered in the State Department that he obtained better terms than could have been expected in view of France's precarious military position; his meeting with Mr Dulles in Paris was a great personal success; and the highest hopes are being entertained that he will be able to turn the prestige gained at Geneva into good use in the National Assembly, persuading it to deal realistically with France's economic problems and ratify the European Defence Treaty. Thanks to the impact of this one fresh personality France's prestige is higher in the United States

at the moment of the laying down of arms than at any time for several months past.

As for the future, the division between optimists and pessimists does not run on party lines. The pessimists take it gloomily for granted that it will not be long before the three new states are undermined by Communist subversion and think that all Indo-China can now be written off as surely as the whole of Czechoslovakia could have been written off in 1938. The optimists see the uncommitted elements in Indo-China rallying round the governments of the states as soon as their independence of the French is seen to be authentic. They call for substantial economic and technical aid to enable Laos and Cambodia to withstand subversion and make Vietnam a shining example to the north in time for the elections in 1956.

It is clear that, doubtful as many people are about its chance of success, it is this second theory that will be tried. Mr Taber, Chairman of the House Appropriations Committee and reputedly the most economy-minded man in Congress, has just piloted through the House of Representatives a Bill placing at the President's disposal the $716 million intended to finance the Indo-Chinese war. He will be able to use it in South East Asia for any purpose, economic or military, covered by the mutual security Act. On the other hand the Administration is determined not to be caught a second time without a system of collective defence in being. Plans are going ahead for a conference next month or in September at the latest, probably in the Philippine Islands, of the powers who might be prepared to join a South East Asia defence organisation. Anzus, the alliance of the United States, Australia and New Zealand, is likely to be the model rather than Nato. There will, for example, be no unified command.

There seems to be no major Anglo-American difference over the question of this alliance, although there are still some American suspicions left over from the last misunderstanding and some marginal differences of emphasis. Despite the strength of feeling that there has at times been about Indian foreign policy, there is no disposition to oppose Britain's wish to associate India and the other Colombo Powers as closely as possible with the new *status quo* established at Geneva. In American, and particularly congressional, circles where, despite gestures of impatience, Indian criticisms of American actions and motives have caused much heartsearching, there is hope that with the dismantling of French colonialism the United States will yet be received back with open arms as the oldest alumnus of the anti-colonial school.

Fruits of the Filibuster

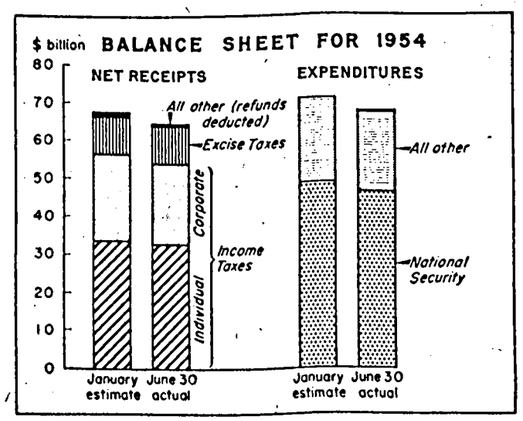
THE filibuster on the Bill to revise the atomic energy law conducted by liberal Democrats and Senator Morse of Oregon came to an end this week, only a few minutes before establishing a record for talking down a measure, when the majority leader, Senator Knowland, supported by the conservative Democrats, made it clear that he would keep Congress in session until all the remaining business backed up behind the Bill had been dealt with. The Administration has thus won its battle for the freer exchange with friendly nations of both peaceful and limited military information on atomic matters, despite the coupling of these purposes with the creation of a private domestic stake in the production of atomic power, about which there is so much stronger feeling.

The final vote in the Senate was 57 to 28, and in the House, which in a disciplined way voted down all Democratic amendments, 231 to 154. Both versions authorise private operation of atomic energy plants, which is now forbidden, and the granting of patents in this field to encourage private research. But in two respects the Senate Bill reflects the fears of the filibusterers that private monopolies on the part of a few large companies are about to be created out of a public investment of $12 billion in the development of atomic energy.

One of the filibuster's unexpected results was the adoption in the Senate of a provision authorising the Atomic Energy Commission to produce electric power at its own plants. This is a provision of which the present Administration is unlikely to take advantage, but which, if it is retained, might give some future Democratic Administration a yardstick for atomic power costs. The Senate also agreed to an amendment providing that for ten years, rather than for the five contemplated by the Administration, the Atomic Energy Commission might compel the holders of patents to share their secrets with others in the industry. The House version is much more favourable to private investment; it does not require any compulsory sharing of patents, and forbids the Atomic Energy Commission to engage in the production of electricity. Despite the promises of the Senate leaders, it may be doubted whether they will fight very hard for the Senate safeguards when Congress is so harassed and anxious to adjourn. But a fair criticism of the whole handling of the atomic energy legislation is that it deserved more than hurried consideration at the end of the session.

Escape for Watches

THE President's decision to approve the recommendation of the Tariff Commission that the duty on watches and watch movements should be raised is a sharp disappointment to those who hoped that, however recalcitrant Congress might be, the Administration would live up to its own belief in freer trade whenever it had the power to do so. The increase in duties will go as high as 50 per cent on some watches, though in no case above the levels prevailing in 1930. The Swiss have lost no time in protesting against the blow to the trade they have built up since the tariff was reduced in 1936. British bicycle manufacturers must regard, as another sign of ill-omen, the inquiry the Tariff Commission has instituted into the possible threat imports pose to the domestic bicycle industry. In the case of the watches, however, one of the arguments most persuasive to a reluctant President has been that the national defence requires the preservation of skills which in time of war are needed to turn out precision time fuses.



There is more hope in the President's postponement of a decision on lead and zinc duties, the second important test of the escape clause which was due to be decided in July. The Administration appears to be searching for some method of satisfying the influential mining states without penalising the trade of Mexico, Canada, and other exporters in the western hemisphere. The Tariff Commission ruled, by five to one, that the maximum permitted increases in

duties were necessary to revive ailing domestic mines and combat unemployment. The Administration, however, seems anxious to see first whether the increased purchases for the stockpile may not make it possible to avoid a substantial tariff rise and, if they fail, willing even to consider a direct subsidy to domestic miners.

These efforts are more in line with the President's recent refusal to raise the duty on imported fish fillets, which was so gratefully received by Canadian fishermen and by advocates of lower tariffs. In that case, however, the President could lean on the "fish stick," a pre-cooked frozen novelty, which has become so popular in the last year that it is difficult for supply to keep pace with demand. Soon, thanks to this convenient delicacy, the market should be large enough for all.

Deficit and Debt

WHATEVER the Democrats may say, President Eisenhower is making good progress toward the fulfilment of one of his election promises—to balance the federal Budget. Just in time to give a good start to the congressional election campaign the final figures for the 1954 fiscal year, which ended on June 30th, showed a cash deficit of only $1.5 billion, and an official deficit, after allowing for trust fund operations, of $3 billion. This was the first full financial year for which the Republicans had been responsible and the result compares with a cash deficit of $5 billion and an official deficit of $9.4 billion in the 1952-53 year, and an estimated deficit of nearly $7 billion for 1954 when Mr Truman left office. The 1954 balance sheet is even slightly more satisfactory than Mr Eisenhower himself expected in January and the new Administration is congratulating itself on this proof of the effectiveness of its continuing search for economies.

These economies have been most marked in the Defence Department and the reductions in spending there had at least something to do with the recession in the early part of this year, which in its turn brought 1954's tax receipts below the January estimates. But the fact that the deficit was lower than had been anticipated in January in spite of this short-fall in revenue is another source of Republican satisfaction, especially since there has been a reduction, allowed for in the January estimate, of $7.5 billion in tax liabilities as a result of cuts in excess profit, personal income and excise taxes.

The Secretary of the Treasury, Mr Humphrey, has been waiting until he knows exactly what the effect of the latest Tax Bill will be on revenue, and of the last Appropriations Bills on expenditure, before asking the Senate to swallow the pill which lies hidden in the sugar of the small deficit. For the Treasury ended the fiscal year with only $4.2 billion between it and the ceiling of $275 billion on the national debt; since then it has had to borrow another $3.5 billion by issuing tax anticipation certificates. Last July a gap of $9.5 billion was not considered a big enough margin to tide the government over the winter season of low tax collections and heavy spending, but when the Senate refused to follow the House's example and raise the ceiling to $290 billion, various stratagems enabled the Treasury to get by without going bankrupt. Senator Byrd is already telling Mr Humphrey that what has been done once can be done again, but it seems fairly certain that an exhausted and impatient Senate will be faced with another request for an increase in the debt ceiling before it is allowed to adjourn.

Rival Loyalties in Texas

IN recent primary elections (in which each party chooses the candidates who will carry its flag in the November contests) in states where the Democratic nomination means almost certain victory, and where the voters therefore make their real decisions in the primaries, incumbent Democratic Senators have been regularly nominated and are to all intents and purposes already re-elected. This week the two Democratic leaders in the Senate, Mr Lyndon Johnson and Mr McClellan, were both nominated, in Texas and Arkansas respectively, and Senator Ellender also won in Louisiana. In Oklahoma Senator Kerr failed to gain the necessary clear majority of the votes cast, and was threatened with having to fight a "run-off" election against a rival millionaire, Mr Roy Turner. But Mr Turner decided that even he was not rich enough to go on with a campaign that was already reputed to have cost over $1.5 million.

Senator Johnson, unlike Senator McClellan, had no difficulty in winning; nevertheless there seems almost certain to be a run-off in Texas, for the Governorship. This position usually brings with it control of the party machine in the state and can have great national importance, as was shown in 1952 by the present Governor of Texas, Mr Shivers, who is now seeking re-election. Then, mounted on the charger of states' rights, Mr Shivers over-rode loyal and liberal Texas Democrats and gave his support, and as a result the support of Texas, to Mr Eisenhower instead of Mr Stephenson.

It is difficult to tell how much the memory of this treachery has to do with Mr Shivers's present difficulties, or indeed how far it is regarded as treachery by the average Texan. The Governor did after all get a handful of silver which has benefited the whole state—the rights over undersea oil which Mr Stephenson insisted belonged not to Texas but to the United States. The near success of the rival

Democratic candidate for the gubernatorial nomination, Mr Yarborough, who in 1952 was easily beaten by Mr Shivers, is probably due mainly to distrust of letting any man succeed himself twice—Mr Shivers is running for a third term—and to the suggested connection between Mr Shivers and two financial scandals in the state. To Mr Yarborough's charge that Mr Shivers has been disloyal to the Democratic party, Mr Shivers replies that Mr Yarborough is disloyal to Texas and is bringing in outsiders, from trade unions, Negro organisations and the Americans for Democratic Action to work for him.

Certainly Mr Yarborough has the support of such groups, which have growing influence in Texas now that it is becoming industrialised. Outsiders are flocking into the state to live and they remain Americans even after they become Texans. This may explain why a loyal Democrat looks as if he might defeat a loyal Texan. The struggle between Mr Yarborough and Mr Shivers is also a microcosm of the struggle between liberals and conservatives in the Democratic party, which has never been joined so decisively in the nation at large as it has been on this occasion in Texas.

Tax Reliefs

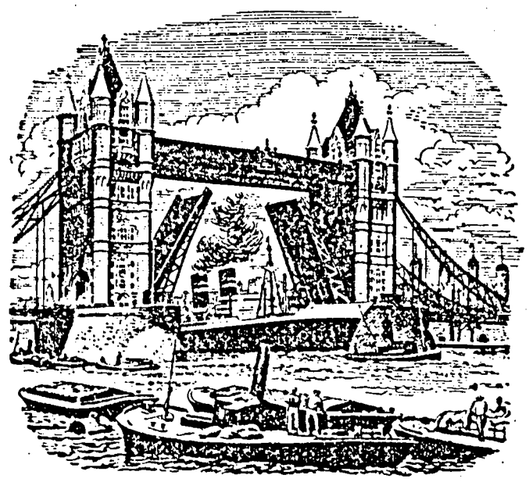
THE House of Representatives has already approved the compromise version of the Tax Bill, but trouble is feared in the Senate over the dividend provisions. These were designed to relieve double taxation, but were originally rejected by the Senate on the political grounds that they would benefit only the rich. The compromise does not go nearly as far as the Administration and the House wished, but it does provide for the exclusion of the first $50 of dividend income from tax calculations and for the deduction of 4 per cent of the remaining dividend income from the amount of taxes owed. Apart from this, the final version of the Bill—to reach it almost 600 disagreements had to be resolved—follows closely the lines approved by the Senate, including the elimination of the tax relief on income earned abroad which the Administration had wanted in order to encourage foreign investment. Senators favoured this relief in principle but could not agree on the details of the clause and so left it out altogether.

The Bill contains a great number of provisions affecting businesses, covering tax regulations on such things as partnerships, pension plans, operating losses, depletion allowances and so on. The most important relief for corporations allows them to write off for tax purposes two-thirds of the cost of new equipment during the first half of its life. This, which means an annual loss of over $300 million in revenue, is designed to encourage industry to keep up its spending on new plant and machinery, and the Bill is expected to stimulate business in other ways as well. Personal spending may also be spurred by the various reliefs for individual tax payers, particularly as regards allowances for child care and medical expenses and on pensions. The Bill, which will run to about 900 printed pages, the longest on record, is a complete redrafting, the first this century, of the tax code. Under it about $1.4 billion altogether will be lost in annual revenue, but it prevents the loss of an additional $1.2 billion by extending the present 52 per cent tax on corporations until next April.

Wheat in the Dark

ALTHOUGH this month's drought is not yet as serious as it was last year, five more states have asked to be placed upon the "disaster list" which carries the right to emergency federal aid, and the government is holding itself in readiness to resume the buying of beef if the burning up of pastures forces ranchers to liquidate their herds. But it is too late for much of the wheat crop to be affected; nearly a billion bushels are expected to be added to a surplus of 889 million bushels, which in itself is more than sufficient for the coming year. It is no wonder, therefore, that the wheat farmers voted last week to accept a further 13 per cent reduction in the acres devoted to wheat and drastic restrictions over the use they may make of their idled land.

The vote for controls this year, however, was noticeably less enthusiastic, at 73 per cent of those taking part, than it was last year when 89 per cent agreed. Mr Benson, the Secretary of Agriculture, attributes this to the growing impatience of farmers with the stringent controls which must accompany high rigid supports for farm prices. There is no question that the imposition of allocations and marketing quotas bears particularly hardly on the small farmer who has just enough land to make a living. But it is also true that, to some extent, farmers this year were asked to buy a pig in a poke for, until the farm Bill is voted upon, they cannot know exactly at what level their prices will be supported. Mr Benson has issued an assurance that this will not fall below 80 per cent of parity—an assumed just price—whatever Congress does or fails to do. This means a guaranteed price of about $1.99 a bushel, less than this year's $2.24 a bushel, but still preferable to the $1.25 guarantee which is all wheat farmers could have counted on if they had jettisoned controls.



Electricity in an Election

FROM A CORRESPONDENT IN OREGON

IN no part of the United States does the question of whether hydro-electric power should be developed by private interests or by the federal government assume so much importance, economic and political, as it does in the Pacific Northwest. It has been obvious for some time that this question would be the main issue in this year's election contests in Oregon, but the arguments have now crystallised around the two candidates for the senatorial seat. In November the voters will thus have an opportunity to give a clear-cut decision between the two methods of providing the additional hydro-electricity which is vital to the area. The Republican incumbent, Mr Guy Cordon, is the chief congressional exponent and part author of the Eisenhower Administration's policy of encouraging the private financing of river developments as the only swift and sure means of obtaining more electricity. The Democratic challenger is Mr Richard L. Neuberger, a State Senator and a well-known journalist, who is an all-out advocate of public power projects as the only answer to the Northwest's difficulties.

Mr Neuberger wants the full hydro-electric potential of the Columbia river and its tributaries—30 million kilowatts, more than five times that of the Tennessee valley

AT NO EXTRA COST!
FLY TO Bermuda
ON YOUR TRIP TO NEW YORK

Your first class fare to New York, via any international airline, can include a trip to Bermuda—*at no extra cost!*

So why not enjoy a holiday in Bermuda when business is over in New York! Bermuda is less than three hours away, daily flights are frequent, and you'll be in the sterling area so you can stay as long as you please. For complete rest, and enjoyment, there is nothing like Bermuda's pink sandy beaches, varied sports and peaceful, leisurely living!

system—to be developed by a continuation of the federally-financed programme that began with the construction of Bonneville and Grand Coulee dams in the first years of the Administration of President Roosevelt. This undertaking ground to a halt in 1950, when Congress sidetracked domestic public works in order to give a clear run to the stepped-up military and foreign aid programmes. Not since the outbreak of the Korean war has Congress authorised funds for a new dam on the Columbia river system. Dams now under construction are expected to satisfy the Northwest's growing need of energy until 1960. But after that year the region, which is expanding rapidly in population and industry, will be faced with a critical shortage of electricity unless new projects get under way soon, for these massive concrete dams take from six to ten years to build.

Senator Cordon agrees that new projects are urgently needed, but he believes that private utility firms should now be encouraged to undertake portions of what was intended to be an all-federal hydro-electric system like that in the Tennessee valley. Mr Cordon contends that, since Congress is unwilling to finance new projects on the Columbia, private capital should be permitted to contribute to the construction of dams and to make profits through the sale of electricity; enough federal funds should be provided in each case to pay for those navigation, flood control and irrigation aspects of the undertaking on which direct returns would be insufficient to cover costs. That is what has come to be known as the "partnership" policy of the Eisenhower Administration. Mr Neuberger argues that the Northwest's extremely low electricity charges, which have been responsible for the area's economic growth, are dependent on the continued development of hydro-electricity with public funds. He also objects to the partnership plan because private interests would provide funds for only part of each project but would reap all of the return from the electricity produced.

The partnership plan has already been given practical effect in the Northwest in a number of ways which will be argued over endlessly between now and next November. The most controversial example was the decision by the Secretary of the Interior, Mr Douglas McKay, a former Republican Governor of Oregon and a close political associate of Senator Cordon, to withdraw federal support from the much-publicised plan to build a high dam in Hells Canyon. Construction of the federal dam has been opposed by the Idaho Power Company, which sought permission to develop that stretch of the Snake river by building a series of low dams, and supported by many local groups interested in cheap electricity and plentiful water for irrigation. The engineering merits of these competing projects are now being considered by the Federal Power Commission, but no decision is expected until after the election.

A second example is offered by the long-term contracts which have been signed with private utility companies, assuring them of a share of the electricity produced in the Northwest by federal generators for twenty years, in spite of the law which gives public agencies first call on the output of all federal hydro-electric projects. A private power company has been given the privilege of completing the main Central Oregon transmission line to Klamath Falls, which means that this firm will have control over all electricity moving into the Klamath Falls area from the Columbia basin. The Bonneville Power Administration, the government agency responsible for marketing federally produced power in the area, had planned the line as an integral part of the unified federal grid system, which has made it possible to deliver electricity to any point in the Northwest at a uniform price. Furthermore, the Bonneville Power Administration itself has been reduced in authority. Finally, Senator Cordon has introduced in the Senate a Bill to effect a partnership between the federal government and the Portland General Electric Company for the erection of a dam at the important John Day site. This scheme is regarded by local government electricity undertakings, rural electricity co-operatives and farm and labour organisations as an attempt to undermine the integrated federal system of the Columbia basin.

Senator Cordon cannot be said to be an Eisenhower Republican even though he agrees with the President's power policy. He has opposed much of the foreign aid programme and was one of the comparatively few Senators who voted against the North Atlantic defence treaty. Mr Neuberger, on the other hand, is an advocate of foreign military and economic aid on the broadest scale. On domestic issues it is fair to say that Mr Cordon's record is more conservative than that of Mr Eisenhower; Mr Neuberger is far to the left of both.

★

This difference in ideology is, of course, at the base of the argument over power development, but views on the Northwest's hydro-electric problems do not divide on strictly party lines. It was a Democratic Congress which imposed the "no new starts" policy on the Columbia basin, drawing support from midwestern and eastern Congressmen of both parties who feared the economic competition offered by the West and the South as the result of cheap electric power. And, while in Oregon the Republican and Democratic candidates for the House of Representatives and the Governorship are following the respective leads of Mr Cordon and Mr Neuberger, in Washington, another state with a major stake in the development of the Columbia basin, there is no such partisan division on the issue. There both Republicans and Democrats generally favour continued federal development. It is, of course, hardly surprising that Oregon's junior Senator, Mr Wayne Morse, who bolted the Republican party two years ago and now calls himself an independent, is an energetic supporter of Mr Neuberger and a sharp opponent of partnership.

Correction:—On page 199 of *The Economist* of July 17th, the figure for the cut in the annual consumption of coal by the American railways should have read 100 million, not 100,000, tons.

The World Overseas

Co-existence in Germany

A TRAIN recently steamed into the little town of Wolfsburg on the western side of the interzonal frontier, and was greeted like the first transcontinental express to cross America. A band from the Volkswagen works blared at midnight on the festooned platform. Rejoicing was understandable because the train came from Leipzig, and was the first for ten years to make the trip to Cologne. It symbolised a new policy on the part of the East German government, working on Soviet orders. After weeks of negotiation between representatives of the east and west railway administrations, the interzonal train service is to be doubled.

With the new freedom in passport regulations and better transport, traffic has already greatly increased. West German professional men and groups of workers are accepting invitations to all-German gatherings in Central Germany (as it is called in the west) in larger numbers than before. There are other signs of a change. In Berlin, for instance, Russian officials are attending western parties with hail-fellow-well-met manners. But perhaps the most striking evidence of softer Soviet tactics is the relaxation of restrictions in the "forbidden zone" along the interzonal frontier. This zone dated from the summer of 1952, when the Bonn and EDC treaties were signed. At that time, Herr Ulbricht announced that the "German Democratic Republic" would go full steam ahead towards Socialism, and he made it clear that he would seal his state off from the west and strengthen the power of the secret police and East German army. As a start, the police, acting with a brutality that roused great bitterness, cleared a strip along the interzonal border of "unreliable" inhabitants and imposed restrictions on the rest. Many peasants from all Soviet Germany fled across the frontier leaving large tracts of land untilled.

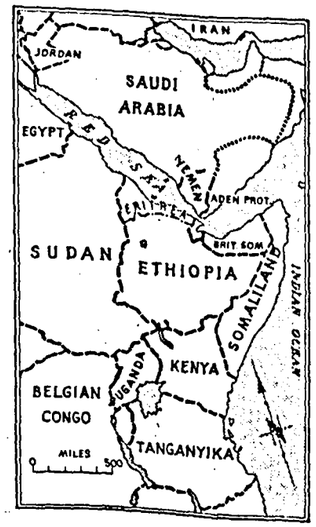
After July, 1952, the mailed fist was also applied to the Soviet Zone churches. The Protestant church did not escape, though it is by tradition obedient to the state. Now the velvet glove is on Communist hands, and the Protestant church has been allowed to hold a huge all-German rally at the Soviet exhibition pavilion in Leipzig. Here, anxious East Zone questioners, looking for guidance about the Communist régime, were spiritually fortified, but also commanded to obey the *Obrigkeit*. To impress the visitors with the new tolerance, Herr Nuschke—puppet non-Communist of the East German government—hobnobbed with churchmen-politicians from Bonn, and gave a public assurance that East German critics would not be prosecuted though they will be reformed by persuasion. In the effort to further the Soviet campaign for unity, "peace" and opposition to atomic weapons in Germany, the Metropolitan Nicolai of the Orthodox Church has been roped in. The dignitary invited neutralist Protestant church leaders from the west to Moscow and sent messages to Leipzig. This fraternisation between the heirs of Luther and of Byzantium in the stronghold of materialism is one of the queerest moves in the whole of Mr Molotov's game.

For the general public, the Communists offer better and better living. The "new course" introduced in May of last year has been continued with limited success, though the Russian authorities have helped by giving up the factories they had confiscated. The planners have run into trouble. They tried to secure more consumer goods by raising the working norms on which wages are based, and the result was the revolt of June 17, 1953. They cancelled the increases, but still try to find means of inducing greater productivity. Exports have also to be expanded, and whole factories are to be offered to China and the Near East. But in many vital fields of production, and in quality, the tale is of plans unfulfilled. Concessions have been made to the peasants, but food is still scarce. Some farmers were recently given savage sentences for allegedly fostering livestock disease on a state farm, but such terrorism is hardly likely to tempt emigrés to return. It is true that food and industrial consumer goods are more plentiful than before, but they still lag far behind the German "Golden West." In real purchasing power, the western D-mark is still worth about two and a half eastern marks, and the Communists remain at a disadvantage in interzonal trade on that account.

Attempts to catch up with the Federal Republic have been easier in the realm of "sovereignty" than in standards of living. After the Berlin conference, Mr Molotov granted an ostensible sovereignty to the German "Democratic Republic," and has tried to secure recognition of it from the Bonn government, the western allies and foreign states. He has not succeeded, though it becomes increasingly difficult not to deal with the East German authorities in practical affairs. Mr Molotov intimated, at the Berlin conference itself, that he would recognise the Federal Republic in return for Bonn's acknowledgment of the status of the East German state.

The picture from the Soviet side is therefore increasingly one of peaceful co-existence between two states. Though Mr Molotov has remained *fortiter in re*, he is certainly *suaviter in modo*. It was evidently decided in Moscow last year that the more Herr Ulbricht threatened and cut connections with the West Germans, the more they rallied

round Dr Adenauer and looked to America for protection. If Soviet terms for reuniting a neutralised Germany were ever to be accepted, it was essential to appeal to the German bourgeois and to brush up the puppet "National Front" as well as to improve eastern living conditions. Mr Molotov, it is evident, wants recognition of the eastern republic as a sovereign state, because its representatives might then in due course negotiate with a Bonn government on reunification without "interference" from the Allies. One day, it is evidently anticipated, West German intellectuals, churchmen, industrialists and trade unionists will be so used to conferring with Communists that they will start organising the kind of elections that Mr Molotov proposes. Before that event, the two German states would, according to Mr Molotov's Berlin plan, join his European Treaty Organisation, with limited forces pledged not to keep company with Americans. In the meantime, active opposition in the Soviet Zone is not likely to increase as conditions improve and the interzonal trains multiply. Resistance does not go with co-existence. It leads, according to a recent German Communist forecast, to collaboration.



Aggression by Locust

IN the old days, even prophets were glad to collect the locusts and eat them with wild honey. If the millions of insects that escaped went on to destroy the crops and blight the countryside with their slime, that was an Act of God about which little or nothing could be done. This same apathy persists today among most of the indigenous populations of East Africa and the Near East. Yet this year the locust menace is reaching a new peak; losses could easily run into many millions of pounds. There is no good reason why the pest should not be eliminated with the help of modern control methods and equipment; and partly as a result of a conference held this month at the Colonial Office, the three British territories in East Africa are planning an urgent drive to save themselves—and others—from a possibly ruinous situation.

It is the desert locust, not to be confused with the red locust, that is causing the fuss. The red locust makes a nuisance of itself further south. Its main breeding grounds are in the southern part of Tanganyika and it is being very successfully coped with by an international organisation to which all the governments with an interest in the affected areas—the British, the French, the Portuguese—subscribe. There is as yet no such international co-operation to settle accounts with the desert locust. The governments in question are less well assorted; most are poorer and all are more hopeful, in a philosophic way, that the locusts will blow over into their neighbour's fields and leave them in peace. And the locusts are making full use of this failure to take and concert measures.

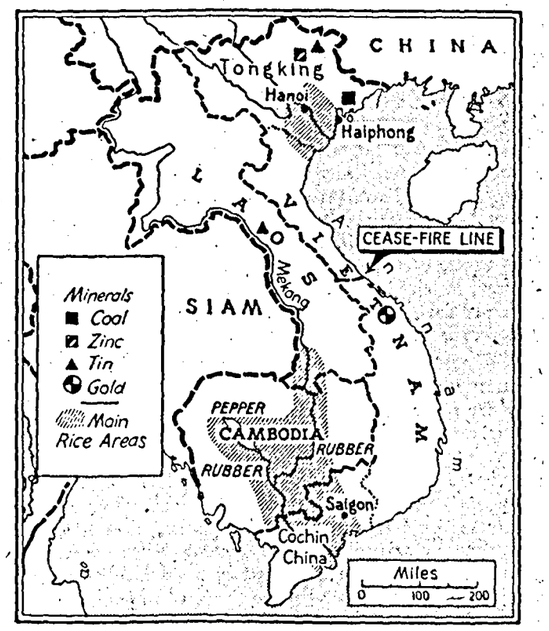
All the countries of the desert zone from India through Arabia and Syria to East Africa are periodically afflicted by invasions. The locusts coast down wind and can take hops of as much as 1,200 miles at a time. They travel with the monsoon from India to the Arabian peninsula; and from Arabia swarms fly north or cross into Africa. It is the luck of the draw whether they land in Egypt, Jordan, Ethiopia, Somalia, or East Africa. The last serious invasion of East Africa was in the early 1930s, when locusts reached as far south as Tanganyika. For no clearly explained reason, a relatively peaceful period followed. But in 1948 a fresh outbreak began. As a consequence a special locust control organisation was formed in East Africa to fight the swarms coming over from the breeding grounds in the Arabian peninsula. Teams were sent over into Arabia to deal with the pest at source. This campaign is being organised—and paid for—not by the three territorial governments direct, but by the East African High Commission, a body much maligned by black and white politicians alike, but which is none the less doing much unpublicised good work of this sort. Its resources are, however, limited, and as the pest began to get on top in Arabia the teams had to be withdrawn to administer first aid in East Africa itself.

This year, reports from the Arabian peninsula are more alarming than ever. Unless drastic action is taken there is a real risk of a devastating invasion during the next six months. The locusts could easily do £15 million of damage at a single sitting. Although they do not eat cotton or coffee, swarms (there could be hundreds of them, some as much as a hundred miles square) could destroy the plantation crops by sheer weight. It is possible to argue that these fears will prove alarmist, as in the past; and that the locusts will fly away into the Indian Ocean and not be heard of again for fifteen years. But there seems no good reason why the risks should be allowed to continue. The East Africans have consequently taken a lead in convening a working committee of the Food and Agriculture Organisation which will, at its September session, consider ways and means of internationalising their private campaign. Meanwhile, they have decided to send the extermination teams back into Arabia.

What is at present being done? The East African territories—with some slight assistance from the British taxpayer—are now spending £1 million a year on the campaign. They have a team of some sixty or seventy trained locust officers in the field; they also finance research, both pure (into the creatures' habits), and applied (into methods of destruction) to the tune of £200,000 a year. The efforts of the Arab states are less well knit. Most have contributed in kind and provided teams, but the bulk of the effective international work continues to come from the East African territories. There are only two known ways of destroying locusts, either by spreading poison bait while they are in the hopper stage (they take six weeks to grow wings); or by spraying them with insecticides when they are in the air. The former method is by far the more effective: not only are the flying swarms far too big to be sprayed efficiently, but there is a very real danger to the aircraft if they accidentally get in the insects' way.

To do this the East African High Commission estimates that an extra £250,000 is needed. It argues that the locusts, being no respecters of frontiers, should be fought on an international plane; that contributions to the campaign should be paid on the same basis; and that the United States might even be persuaded to cash in on the good will. The teams that have been sent up from East Africa seem so far to have been remarkably successful in crashing the barriers which otherwise cut across British relations with the Saudi Arabians and some of the other affected countries. It may not prove so easy to put co-operation on the more formal level of international conventions and responsibilities. But the danger is now so great that it should seem obvious even to the most ostrich-headed that the only long-term solution is to make a really concerted attack on the infested areas in Arabia.

Economics of Divided Vietnam



IN Vietnam the gunfire is dying down but the economic consequences of the division of the country cannot yet be fully grasped. Much will depend on the Viet Minh's attitude towards French and native firms as well as on its willingness to trade with southern Vietnam and with France. But it is already possible to sketch the background against which the relations between the parts of a once united country will have to be worked out.

The population of Vietnam is roughly equally divided by the demarcation line. After eight years of war there are obviously no accurate statistics and some estimates have tilted the population balance strongly in favour of the North. The most reliable figures, however, are probably those published in *Le Monde*, which has adjusted the data of the 1943 census. The total population of the Associated States is put at 27.5 million, of which 22.5 million live in Vietnam; and about 11 million people live north of the demarcation line. It is impossible to predict how many will take advantage of the opportunity to migrate south, but a large-scale exodus of peasants is unlikely.

The Viet Minh will find it more difficult to feed its half of the population than southern Vietnam. If a summary balance-sheet of economic resources were to be drawn up the southern section would show more foodstuffs and rubber, while the northern part would prove richer in mineral wealth. (For more details see *The Economist* of May 8th.) In the present division of the country the Communists do not take over any rubber plantations. Rubber cultivation is limited to the basaltic red soil of the south and is concentrated in Cochin-China. Rubber exports are once again approaching the prewar level of some 70,000 tons. The whole rice surplus (prewar exports averaged 1.5 million tons) is also to be found in the south, in the Mekong delta. Though output in the Tonking delta is estimated at some 1.7 million tons, the north is not self-sufficient in rice. Will it go on importing rice from Cochin-China?

With a rice deficit and no rubber surplus the area occupied by the Viet Minh will in the short run prove an economic liability to its Chinese and Russian allies. But potentially it offers great scope for industrial development. Coal, tin, zinc, wolfram, manganese, antimony and lead deposits are all to be found in the Tonking region and there is room for rapid expansion. Though anthracite extraction was only 750,000 tons last year, output had exceeded 2.5 million tons before the war and can be stepped up rapidly.

Moreover, not all the wealth is potential. The Communists now inherit several actual economic centres, particularly Hanoi, Haiphong and Nam-Dinh. The latter, in the south of the Red River delta, is a textile centre and, according to *Le Monde*, its mills employed 13,000 workers in 1940, though only 4,000 in recent months. Hanoi, in addition to being a transport and distribution centre, has also many branches of light industry; its population is in the neighbourhood of 275,000. Finally, Haiphong, with about 160,000 inhabitants, has textile and engineering establishments as well as important cement works; although its turnover has declined to about one-third of the prewar

volume, Haiphong is still an important harbour and the French are very grieved over its loss; they had hopes of keeping it and building it up as a competitor to Hongkong.

What will be the direction of Haiphong's traffic in the future? Will north Vietnam continue to import its textiles, chemicals, vehicles and other goods from France? This question still remains in suspense as also does the problem of the future treatment of French firms which decide not to be evacuated. The Viet Minh is clearly keen to keep the French specialists; it has already asked the textile experts to return to Nam-Dinh. Its attitude, however, to French as well as to native capital is not yet known. M. Mendès-France was given assurances that there will be no discrimination against French firms. This may mean merely equality before an anti-capitalist law. On the other hand, many French firms hope that the Communists genuinely want French collaboration in the transitional period, while few people now look beyond July, 1956.

The race is still against the clock, but the battle is to be fought for the moment with economic weapons. The Viet-

minh, confident that it will win in the electoral battlefield, may well harness French firms for its vital economic task. It will certainly appeal to its Communist allies for aid. Southern Vietnam has been promised a greater degree of independence and French economic assistance. American aid will certainly flow in as well. Yet will all this be poured down the drain through corruption or inefficiency? Having failed to win on the battlefield will the West prove capable of preventing an economic Dien Bien Phu in Indo-China?

Tito and the Peasants

FROM A SPECIAL CORRESPONDENT

DESPITE the considerable progress of industry, and the very rapid growth of the urban population, nearly two-thirds of all Jugoslavs still earn their living from agriculture. Before 1941 most Jugoslav peasants lived in great poverty. For this there were many reasons, but chief among them was rural overpopulation. Too many people were engaged in producing crops at too low an output per acre, there were too few jobs outside the villages, and every year the pressure was increasing. Poverty bred political discontent. When Tito's Partisans began their national and civil war, many peasants were attracted to them not only by the patriotic desire to fight the invaders but also by the hope of a social New Deal, which the Partisans proclaimed. Other peasants joined Tito's enemies; but it remains a fact that one of the main reasons for his victory was the support of a very large part of the peasantry.

In the first postwar years the new régime's agricultural policy was an imitation of Soviet policy. This lost it most of the peasant support which it had won in war. The aim was collectivisation of agriculture. The pressure on the peasants was in fact most severe during the two years which followed the Cominform's excommunication—1949 and 1950. This policy proved a failure, partly because it was resented by the peasants and possibly still more because it was uneconomic. Since 1952 peasants have been allowed to leave collectives, and collectives to dissolve themselves, with the result that about two thirds of them have disappeared. Compulsory deliveries to the state have been abolished, taxation reformed. The peasants' pleasure at these changes was diminished, it is true, by a new land reform carried out in the spring of 1953, which lowered the maximum limit for private holdings from 25 to 10 hectares, and placed the land thus acquired at the disposal of the authorities, who were to use it primarily for the benefit of poorer peasants who had been stranded in impecunious surviving collective farms. But on balance since these changes the lot of the peasants has been much less harsh. Nevertheless, several very serious problems remain.

Whereas before the war Jugoslavia had a large export surplus of foodstuffs, in recent years it has had to import grain. If it is ever to pay off its large foreign debt, to improve its balance of payments, and to pay for the materials needed for further industrialisation, it must increase its agricultural output. In some important areas this still lags behind the not very impressive prewar levels, and at present the peasant smallholder has few incentives to do better. He lives well, at least in the most fertile areas. He eats as much as he likes—far more wheat flour and far less maize than before the war. His children are better educated than ever before. But he sees little reason to work harder, produce and sell more. Though there are no more compulsory deliveries, heavy transport costs limit the opportunity to sell direct to the urban consumer, and the producer in fact has to accept the low prices dictated by the state authorities. Though taxes are now assessed, not on the crop but on the acreage of land, and thus are no longer an active disincentive to output, they are still considerably heavier than they were before the war.

The relationship between the prices of agricultural and industrial goods is a point on which experts disagree. All that can be said with certainty is that, of those articles which the peasants need to buy, some are cheaper but others are not. Rightly or wrongly, many peasants believe that the exchange of products between town and country is so unfavourable to them that it is not worth their while to make the extra effort.

But difficulties in foreign trade are not the only trouble. The spectre of rural overpopulation is looming up once more. The original five year plan of industrialisation had to be scrapped some time ago. Certain "key projects," of major importance to the future of the economy, were retained. Many of these have not yet been completed. Many of them, like electric power stations, though providing employment during their construction, will not require a large labour force when finished. Other outstanding industrial projects have been subjected to severe scrutiny, by strictly economic criteria. New industrial construction is for the time being forbidden, except for minor local enterprises sponsored by local authorities. In short, the prospect of a considerable outlet in industry for the growing rural surplus population, for the next few years at any rate, is extremely bleak.

Incentives to Grow More?

The abandonment of collectivisation does not mean that co-operatives are to be discouraged. On the contrary, Marxists and non-Marxists can agree that Jugoslav agriculture desperately needs more and better co-operatives, for the improvement of crops and livestock, for various forms of village industry and to raise technical standards. It is not difficult to list the things that can and should be done to improve Jugoslav agriculture. Most of them are to be found in the ambitious ten year plan approved by the Federal and Republican governments. But underlying these practical plans is the deeper problem of the régime's relations with the peasantry. The essence of the government's plans is that agriculture should be improved by investment from outside, by action planned from above, rather than by the initiative of the peasants themselves. The peasants could be given a direct incentive to produce more if the prices of their produce were allowed to rise, or if their taxes were appreciably reduced. But this the government does not wish. To keep prices low, it even imports large quantities of Turkish grain, of rather low quality and at a rather high price. The total estimated revenue for 1954 from peasants' taxes is 32 milliard dinars, while the average yearly investment on the agricultural ten year plan is 64 million. A substantial reduction of peasants' taxation would thus provide an incentive at rela-

future imperfect

Wild animals depend for their food on what they can find.
It is a hand-to-mouth existence. Man, having evolved the idea of
agriculture, sows to reap. He cozens nature, making her amenable,
to produce his food *when and where he wants it.*
He asks only health and strength to work his fields,
peace to enjoy the fruits of his labour and a stable economy
to ensure that he can sell and buy and exchange.
The main product of the Fisons business has for a hundred years
been chemical fertilizers, to enrich the soils of farms and gardens.
But they make chemicals for medicine and industry too.
Fisons contribute to Britain's harvests, health and wealth.

tively small cost. But for political and ideological reasons it is not considered desirable.

There is mutual distrust between government and peasants. The peasants will not quickly forget the experience of 1949-50. They resent the government's attitude to their religion. The Jugoslav Communists regard the peasants as unreliable petty bourgeois. Some of the wilder comrades have been known to describe them as "class enemies," but they have been told by no less an authority than Edvard Kardelj—the Marshal's right-hand man—that this is a serious error. There can be no doubt of the desire of the Communists to raise the standard of living of the peasants. Their anti-religious campaigns they regard as humanitarian action, to save the peasants from superstition and squalor. The peasants see it differently.

Jugoslavia has other serious social problems, among the recruits to the working class and the intelligentsia, but they are less serious than the peasant problem. Agricultural output and rural overpopulation are matters of life and death. Improvement can come only by a combination of government policy and peasant initiative, by the restoration of confidence between the peasants and their rulers, through the new types of co-operative or through any other channels that may be available. The task is not easy and progress cannot be very quick.

Reshuffle in Albania

WHAT goes on inside Albania is really anybody's guess. But the news that does trickle out from this most isolated and mysterious of all the Soviet satellites suggests that the regime conforms faithfully to the pattern laid down by Moscow. The latest development, announced last week, is a government reshuffle. The leading figure in the regime, Enver Hoxha, has resigned the premiership, and, as first secretary of the central committee of the party, is to devote all his energies to strengthening and developing the party. His rival, Mehmet Shehu, formerly deputy premier and minister of the interior, heads the new government.

In one sense, this is only another round in the interminable sparring of these two party bosses; it is almost exactly a year since the previous round in which the honours seem to have been fairly evenly divided. But it also conforms to the trend that has been carefully followed elsewhere in eastern Europe—the trend against collective leadership and towards a formal separation of party and government. It does not necessarily mean that Hoxha is on the way out; Rakosi, who performed the same manœuvre in Hungary a year ago, is very far from being a back number today. Moreover, there is clearly no intention of blowing softly upon the dominant role of the Albanian Communist party.

In Albania, as elsewhere in the Communist bloc, agriculture is the government's chief preoccupation; the minister of agriculture in the new cabinet is also the first vice-premier. Agricultural production is stagnating, if not declining, and collectivisation has been a signal failure; by the end of 1953 only 12.8 per cent of the arable land belonged to collective and state farms. Since last summer the government has dutifully followed the Soviet "new course" line towards the peasants; investment in agriculture is being stepped up, compulsory delivery quotas reduced, and attempts made to improve supplies of consumer goods. But incentives for the peasants do not go well with a fixed and proclaimed determination to go on with collectivisation; in any case, in Albania's primitive economy, more textiles and shoes are not easy to come by in a hurry. Enver Hoxha has just announced a "considerable credit" from the Soviet Union for agricultural machinery, fertilisers and equipment for consumer goods industries. For the regime, much will depend on the extent to which this credit materialises. The Albanian Communists may not, like some of their comrades further east, have the Red Army sitting on their coat-tails; but their dependence on Moscow is none the less compelling for that.

Divided Bengal

FROM A CORRESPONDENT

THE bitter flare-up in East Bengal which has recently compelled the Pakistan government to concede linguistic parity to Urdu and Bengali, is a sharp reminder that boundary commissions are not always able to control the human urges that lie deep beneath the surface. Bengal had long been the problem province of the former British India, and the creation by Lord Curzon of a separate East Bengal administration from 1905 to 1911 merely served to emphasise the distinctive ethnic unity of the Gangetic delta. The causes of the partition in 1947 were quite different from those of 1905; but in both cases the operation was carried through in recognition of the existence of a Moslem peasant majority in the eastern wing of undivided Bengal and against the wishes of a Hindu minority—financially powerful, educationally far ahead of their Moslem brethren and by no means insignificant numerically.

Men are as much the victims of their administrative past as of any of the other forces of history. The Permanent Settlement of Bengal (1793) produced *inter alia* two consequences: first district administration never developed in Bengal as in other Indian provinces and Eastern Bengal, remote and riverine, especially lagged behind. Secondly, Bengal acquired an unusually high proportion of *bhadralog* or educated middle-class recruited from Hindu joint families with some financial interest in the land. Over the years it developed a strong local territorial patriotism and the focus of *bhadralog* interest was, and is, Calcutta, rather than Delhi. Likewise, the Moslem landowners of East Bengal and the few successful Moslem businessmen and contractors once considered it necessary to maintain an establishment in Calcutta such as they now support in distant Karachi. But for the Hindus of East Bengal the sundered bonds which they once had with Calcutta have not been replaced by new ties with Karachi, with which they have even less natural affinity than the 33 million Moslems of East Bengal. In differing measure the two Bengals present both Delhi and Karachi with problems of considerable perplexity. In India all Bengalis know themselves to be Indian; in Pakistan it is less certain that 9 million Hindus of East Bengal regard themselves as Pakistanis. It might even be that they consider themselves Bengalis first and Pakistanis only by documentation.

The Bengalis are the Celts of the Indo-Pakistan subcontinent. They have excelled in the arts and professions, and sometimes in administration, rather than in commerce and industry. Not easily assimilable in the mass, individual Bengalis and small groups, who have migrated outside their native state, have frequently risen to positions of high responsibility in public life. Rabindranath Tagore, Bankim Chandra Chatterji, Keshab Chandra Sen and, later, the artist Jamini Roy, are among the intellectual *élite* of a world that has passed or is passing. Moreover, they imbibed western culture without losing their own. Bankim Chandra's novels are the literary heritage of a generation of stylistic and vigorous young Bengali writers who are loath to forsake their mother tongue for Hindi, though the latter represents an expanding publishers' market. Politics and disputation are second nature to the Bengali, whose capacity for political invective develops accordingly. Gifted, individualistic, with little liking for manual labour and a low emotional flash point, the Bengali is not without considerable personal courage. But he can neither be regimented nor "pushed around," and his strong aversion to the discipline of the barrack square has led to unmerited slurs upon the Bengali character. That he has never been classified amongst the martial races of India does not mean that he is a coward.

How do these volatile people—an easy prey to alternate moods of exuberance and morbid depression—fit into the new pattern of the subcontinent? The answer is not very easy. In these first formative years, policy in Delhi and Karachi follows two main trails: political consolidation and economic advancement by industrialisation. Neither is wholly congenial to the Bengali temperament. In his *Annals of Rural Bengal* Sir William Hunter wrote "the Bengali bears existence with a composure that neither accident nor chance can ruffle; he becomes silently rich or uncomplainingly poor. . . . his resentment is enduring, but unspoken." Accident and chance have done much to Bengal in the ninety years since these words were written. Resentment is no longer unspoken and Bengal has totted up a lengthy list of grievances, some real and some imaginary, against the powers that be. All of them press heavily upon the declining living standards of the Bengali middle-class. Neither peasants nor artisans, the Bengali middle-classes enjoyed hereditary rights in a *rentier*-white-collar order that is rapidly disappearing in a welter of planning. It remains to be seen whether, in addition to his other qualities, the Bengali is also adaptable enough to meet the changing times.

Cards on the Table in Rio

FROM A CORRESPONDENT

THE Brazilian scene shows three features common in Latin America at the present time. First, the commercial and industrial groups, which have increasingly asserted themselves over the older agricultural and exporting interests, are realising that they are all equally dependent on a buoyant foreign trade. Second, there is a mounting distaste for certain government controls reputed to be operated with favouritism or worse. Third, inflation—which was allowed at large rather as a good genie—is at last seen to be turning on its masters, and there is talk of putting it back in the bottle.

Although Latin America's terms of trade have greatly improved since before the war, it has been fashionable policy to keep most of the benefits out of the hands of the farming and mining interests. In some countries the increased earnings have been dissipated in government spending; in others they have been used to support deficit state trading. In Brazil, until the middle of last year, they were largely transferred to the industrial sector by progressive overvaluation of the cruzeiro, which kept earnings from exports down and at the same time cheapened imports. In the end this policy brought about its own failure. Exports were inhibited, and a massive flow of imports put the Brazilian trade balance some £100 million in the red.

Senhor Aranha, after his appointment last year to the Ministry of Finance, analysed this and other trends with an objectivity possible only to one called in to remedy a disorder in which he has had no previous part. He introduced virtual devaluation, on the one hand by the addition of "bonuses" to export prices, and on the other by the auction of foreign exchange to be spent on imports of low priority. This caused exports to rise and imports to fall far more sharply in the last quarter of 1953 than mere seasonal movements would have warranted. This effect has been enhanced by the sale of stocks held up in 1952—in 1953 cotton exports, for example, were five times the meagre volume of the previous year. In addition the ill wind that swept polar air up the valley of the Paraná in June of last year brought about such a providential reduction of the coffee crop that, with prices up by half on last year, a greater dollar return has been achieved with smaller exports. And in the case of cocoa Africa's loss has been Brazil's gain.

Profits for Whose Pocket?

The new arrangements for selling foreign exchange by auction serve to channel profits on rare imports into the state's pocket, to ensure that no enormous arrears in overseas payments accumulate, but also to make the distribution of available foreign exchange as automatic as possible. The successful campaign of certain newspapers against the former methods of the Import-Export Licensing Department (CEXIM) had been largely partisan; but the fact that some politicians had such manifold business connections had made some ill feeling about the old system inevitable among competing importers not holding public office. Similarly, if no account be taken of such factors, some of the past fluctuations of rediscounts by the Bank of Brazil are as inexplicable as the path of the planet Mercury without the aid of relativity.

Senhor Aranha and public opinion may, between them, have put some of this right; but inflation, the finance minister's third problem, is a harder nut to crack. The cost of living, which rose during and just after the war mainly because of the positive balance of trade, rose by 6 per cent in 1950, 11 per cent in 1951, 16 per cent in 1952, and 14 per cent in 1953. The main internal support to inflation in the last few years has been the continuous expansion of credit, based largely on the deficit spending of central government agencies and of the states and municipalities. The means of payment increased by 30 per cent in 1950, 20 per cent in 1951, 18 per cent in 1952, and by 20 per cent during 1953. Patriotic economists often present the idea that "Brazil is trying to do too much at once" as the prime cause for the credit expansion, and thus of the inflation. Senhor Aranha, however, himself pointed out that much of this enthusiastic over-investment was in fact devoted to luxury or speculative building undertaken to disguise or safeguard earnings which inflation created and would otherwise as instantly destroy.

At first Senhor Aranha tried valiantly to interpose his authority between the printing press and the itching fingers of the bankers, but to no avail. Another step initiated by

him has been to fund much of the public debt by a loan on which interest and repayments are in dollar drafts at a rate of exchange which makes the effective return about 10 per cent. But Congress turned down another suggested measure—a tax to drain away all profits over 12 per cent of working capital and reserves.

The Bank of Brazil has itself recently restrained its loans to the public, but not, unfortunately, its advances to the Treasury. Loans by the banking system to the public have continued to rise at the same annual rate—some 18 per cent—as before the Finance Ministry and the Bank of Brazil came under new management. Prices continue to increase. New steps have recently been taken at the technical level—the rediscount rate has been raised, and banks must keep 8 instead of 6 per cent of their sight deposits with the Bank of Brazil. But these measures were tabled only two days before the May Day speech in which President Vargas announced that the minimum wage throughout the Republic would be virtually doubled on July 1st.

It is, undoubtedly, the President's duty to safeguard the interests of those who earn a miserable £12 per month in the capital (and less elsewhere)—all the more so in a pre-election year and after the dismissal of Senhor Goulart from the Ministry of Labour in February. Yet the result of a wage increase of this order, and, to a lesser extent, of the higher pension contributions also announced, is certain to be another upsurge of all wage costs and of prices. The President has assured his people that profit margins are already generous enough to absorb much of the increase. But in Latin America (and elsewhere) inflation is very largely a state of affairs in which people know that prices will continue to rise. Senhor Aranha was brought in by President Vargas to change this atmosphere ; but in playing his highest political card of the present rubber, the President may turn out to have trumped his Finance Minister's ace.

China's New Constitution

THE draft constitution of the Chinese People's Republic which was unanimously adopted by the Central People's Government Council on June 14th, should not be studied in the abstract apart from the existing facts of power in China. Drafted originally by the central committee of the Communist party and then passed with slight amendments through a special committee to keep up the appearances of "coalition" government, the new constitution is plainly intended to perpetuate not only the leadership of the Communist party on a permanent basis, but also the personal leadership of Mao Tse-tung.

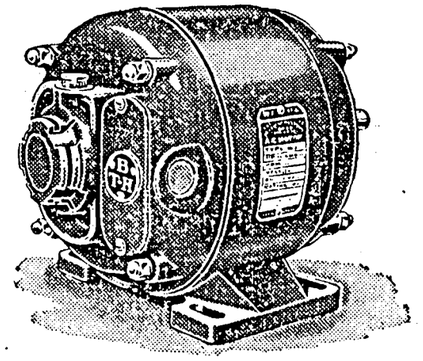
The constitution lays down that "all power in the Chinese People's Republic belongs to the people," and the people (except for "feudal landlords and bureaucratic capitalists") are supposed to exercise electoral rights through universal suffrage, but their freedom of choice between parties is drastically limited. One article declares China to be "a people's democratic state led by the working class and based on the alliance of workers and peasants," and another article makes the "building a socialist society through socialist industrialisation and socialist transformation" the state's objective. Since the working class which is to lead the state is in China a small minority of the total population, the majority in this "democracy" is constitutionally left with no function but to follow the leadership of the designated minority, whether it approves of it or not ; moreover, since in Communist theory the Communist party alone represents the working class, leadership by the working class is also leadership by the Communist party.

The writing of "socialist transformation" (which means the expropriation, as soon as is expedient, of all privately owned land and capital) into the text of the constitution means also that it will be unconstitutional to oppose the social and economic policies of the Communist party ; and to make sure that nobody will presume too far on the principle that all power belongs to the people, article 19 lays down that "the Chinese People's Republic . . . suppresses all kinds of treasonable and counter-revolutionary activity and punishes all traitors and counter-revolutionaries."

All this is very similar to the constitutional forms of other Communist-ruled states, but in the provisions for the exercise of supreme authority in the state the new Chinese system diverges considerably from the model set by the Soviet Union. In the early days of the Bolshevik revolution, when theory was still strongly adverse to any recognition of a concentrated personal authority, governing power was vested in a Council of People's Commissars. Lenin became chairman of this Council, a position equivalent to that of prime minister, but he was not head of the state. After Lenin's death, Stalin's power was for many years exercised merely as secretary-general of the Communist party without official position in the state ; finally he became formally head of the government, in which status he has been succeeded by Malenkov, but neither has been head of the state. The Soviet system which separates the head of the government from the head of the state, with the latter lacking effective power, may be attributed in origin to the example of the French Third Republic.

CHANGES OF NAME IN NEW CONSTITUTION

Existing institution	*Future institution*
1. Chinese People's Political Consultative Conference.	1. National People's Congress.
2. Central People's Government Council.	2. Standing Committee of National People's Congress.
3. Government Administration Council.	3. State Council.
4. Revolutionary Military Committee.	4. National Defence Council..



The Chinese, on the other hand, have been deeply influenced by the example of the United States presidency, and the new Communist constitution vests in the Chairman of the Chinese People's Republic far-reaching powers. He is, indeed, to be elected, not by direct popular vote, but by the National People's Congress ; he will, however, hold office for four years at a time, the duration of the Congress itself, and he will nominate the Premier of the State Council. He will be concurrently Chairman of the National Defence Council, and he can "whenever necessary" convene and preside over a "supreme state conference," which will apparently take the initiative on important matters of policy, overriding the authority of the State Council.

Thus, although the Chairman of the Republic will have to co-exist with a prime minister (the Premier of the State Council), his constitutional powers will resemble those of the American much more than those of the French president. It is clear that he is meant to hold supreme governing power, and not to be a mere ceremonial head of the state. For the masses of the Chinese people, conditioned by so many centuries of veneration for the "Son of Heaven," his position as head of the state will give him a unique prestige such as no mere minister could attain. Mao evidently means to stay where he is for the term of his natural life.

Fractional Horsepower MOTORS

BTH fractional horsepower motors are second to none in quality and proved performance. All types are available in sizes to meet every domestic, commercial, and industrial need. Precision-built of highest grade components, and fully tested, they will give long and trouble-free service.
No manufacturer can offer a wider choice in fractional horsepower motors. Whatever the conditions of service or type of drive, there is a BTH motor well suited to the job.

Whether a trip round the lighthouse or a voyage across the world—nickel helps

A trip on a motor boat—traditional part of a seaside holiday—and a voyage to the new world require vessels of a very different type. For the motor boat a 12 h.p. engine may be adequate, but the Queen Elizabeth can call on 160,000 h.p. to drive her 83,673 tons through the water, not to mention additional power to provide for the comfort of her passengers and the safety of the ship.
Nickel plays a part in both of them. It strengthens and toughens the steels and alloys used in their engines, and, in the case of the big ship, goes also into decorative metal work, galley equipment and navigational aids. Throughout industry nickel helps equipment to perform better and last longer.

THE BUSINESS WORLD

Atomic Energy and Industry

ON Sunday the Atomic Energy Authority becomes the new owner of the country's atom factories. Eight of the nine members to the board have already been appointed. In the House of Commons, the Minister of Fuel speaks confidently of "preparing the way for atomic power" and of advanced designs of nuclear reactors, of which construction will be undertaken within the next five years. The British Electricity Authority creates the new office of "nuclear power engineer." In the atomic plants, work continues much as before, but the three directors of the plants are now full-time members of the board of the Authority, and in future should have a vigorous sense of independence.

More is involved than a change of name and responsibilities. The powers and functions of the new Authority are not the same as those that were exercised by the Ministry of Supply under the Atomic Energy Act of 1946. The Atomic Energy Authority Act that received Royal assent on June 4th sets up a public corporation for atomic energy, but it does not create a nationalised atomic industry. The Authority takes over as a going concern from the Ministry of Supply all the atom plants in the country. These are shown on the map ; their payroll, excluding contractors' labour, amounts to nearly 20,000, with an annual wage bill of £12 million.

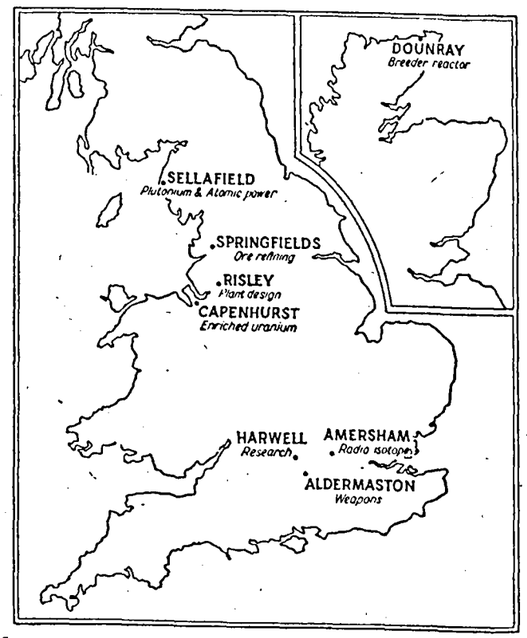
The Authority will indeed own these plants. The money to run them will continue to be provided by the Government but with this difference: it will not be concealed discreetly in the Ministry of Supply's Research and Development estimates, but will be voted annually by Parliament. The revised estimate for the current financial year is £53.7 million, including nearly £27 million for new plant and buildings. Capital costs must continue to bulk big in the Authority's expenditure for some time to come. These figures cover only its civil work. The cost of weapon research and production will continue to be borne by the Ministry of Supply.

There is no intention, however, that the Authority should necessarily be the sole owner of all atomic resources in the country and every intention that industry should be encouraged to play as big a part as possible in the new industry. This was a guiding principle in bringing the new Authority into being. The far-reaching powers given to the Ministry of Supply under the 1946 Act to control the production and use of atomic materials have devolved upon the Lord President of the Council, not upon the new body. In this it differs from public corporations such as the British Electricity Authority which has the exclusive right to sell electricity to the public in England and Wales. Nor does the Act assume that the Authority should have a *de facto* monopoly as the sole source of atomic knowledge. Three clauses give it important powers—

(a) to provide technical training;

(b) to sub-contract research to university or industrial laboratories;

(c) to give grants to assist the independent production or use of atomic energy and to aid atomic research.



This opens the way for what it is hoped will become an increasingly close co-operation with industry.

"Atomic energy" is not used in the Statute book in the narrow sense of power generation alone ; the Act uses broader words—"energy released from atomic nuclei as a result of any process, including the fission process." Thus it covers all nuclear processes, whether they be power generation for electricity or for transport ; the production of plutonium (of which electric power is an expected by-product) or chemical processes based on atomic reactions. It becomes for the first time legally possible for any one of these activities to be undertaken by private industry unless the Lord President expressly forbids it. In particular it paves the way for the

building of atomic power plants by the British Electricity Authority. The first power plants, such as the one now being built in Cumberland, are essentially experimental and they will be owned and operated by the Atomic Energy Authority which will sell the power produced direct to BEA. The generating costs of this first experimental installation are estimated to average a penny a unit, which compares with capital and works costs for new steam stations in Britain of some ¾d. a unit. By the time the scientists are ready to hand over the job of building or running such power plants to BEA, impending improvements in design should in all probability have brought costs down.

The success of the new organisation will need to be measured not only by the number of atomic power plants that go up over the country, but by the extent to which private industry begins to participate directly in atomic development. Co-operation between the Authority and industry is not something that can be worked out overnight. Industry starts with a nine-year handicap. Even though the caretaker Department of Atomic Energy has been paving the way during the past months for the greater sub-contracting of development work, especially on projects connected with atomic power generation, the burden of what might be described as nuclear engineering has fallen on the staff of the atomic plants, who alone possess the necessary combination of theoretical knowledge and practical experience. With one or two exceptions, industry's main contribution has been to modify conventional end-equipment to the unconventional requirements of scientists.

Atomic Energy on the Map

★

This phase should soon be nearing its end. The Authority takes over what might be described as a pilot-scale industry on the verge of a major expansion. Atomic scientists who have been wholly pre-occupied with the physical problems of making and handling fissile materials, the raw materials of their industry, are now able to raise their sights and explore the ways in which they can use what the Act describes as "the energy released from atomic nuclei." To do this successfully, the scientists will need the help, the co-operation and the technical know-how of industry, just as industry needs their assistance to adapt its processes to the new nuclear technology. The picture of an atomic Authority that would act as designer and originator of all nuclear developments, a source of blue-prints for the public service authorities here and overseas and for industries that will build plant to its tested designs seriously underestimates the eventual impact of nuclear technology on the industrial economy. The electricity authorities are not the only ones interested in atomic power, nor is the interest of other industries and countries confined to the building of power stations to supply their own factories and plants. There are the aircraft and shipbuilding industries; there is the chemical industry; there are the engineers whose skills need to be brought to bear on equipment that must work in conjunction with atomic piles. It seems hardly possible—for example—that research will fail to uncover a better method of harnessing the power of the atom than using it to boil water, to make steam, to drive electricity generators. The future of these industries is for better or worse linked up with the growth of nuclear physics. The atomic scientists are in a position to surmise how atomic energy can be applied in these different fields, but they lack the specialised knowledge of engineering design and operating technique just as industry itself lacks atomic knowledge. In the same way that liaison has been established between the caretaker Department of Atomic Energy and the British Electricity Authority, similar contracts will have to be made with selected companies in other industries.

The two tasks facing the newly formed board will be, first, the Authority's own capital plans and secondly, the best way of establishing this liaison with industry. There are many practical problems, and security is not the least of them; there may also be difficulties over finance and patent rights; there will, without question be problems of human relations. But these are minor difficulties compared with the importance to both sides of finding a satisfactory working association. It may at first be restricted to discussions between scientists and engineers about the best design approach to a specific task. But this must be expected to lead eventually to the design and construction of atomic-powered equipment by industry. It might be possible for the Authority to press ahead and invest its own

resources in every promising project, with the prospect of an exhilarating growth in the scale of its operations, but it seems more likely to make full use of its powers to delegate some atomic responsibilities to the appropriate industries at the earliest moment.

It depends on the initiative of industry whether co-operation will eventually evolve into competition. For some time to come designers will rely heavily on the Authority for technical advice. But companies closely involved in the application of nuclear techniques are not likely to remain indefinitely in a state of atomic tutelage. In the long run, industry may carry a considerable share of atomic research and development. Whether it does, and with what success, will depend on how soundly the new Authority lays the foundations for the "co-operation" that it was brought into being to promote.

Experiment at Wilton

No single industrial development in Britain since the war has continued to attract as much professional interest from top management in large-scale, multi-product industry throughout the world as a collection of diverse chemical plants set down together since 1946 on a greenfield site at Wilton on the south bank of the Tees estuary. The problems of expansion that faced the board of Imperial Chemical Industries towards the end of the last war were not unique. The Wilton experiment, ICI's answer to some of these problems, was unique when the decision was taken, and seems to be so still. If any potential imitators are awaiting a comprehensive verdict from ICI on whether the unorthodox organisation that it chose to employ at Wilton is the ideal one, they will have to wait some time. But the company has spent some £34 million on development at Wilton so far, and has another £25 million firmly in sight, to spend at some £9-£10 million a year; and "the order of £100 million," as the capital value of Wilton's installations in 10 to 15 years' time, crops up rather often in conversation there. That seems at any rate strong circumstantial evidence of ICI's confidence in its largest postwar experiment.

The problems which the Wilton complex of chemical industry was to answer can be stated simply. As a company, ICI is decentralised into twelve divisions, each operating with considerable independence in a separate field of chemical manufacture, and each with its own board and chairman appointed by the main board of ICI. By 1943 it was obvious that several of these needed to expand considerably after the war. Because they were already outgrowing their existing sites, or for other reasons, some of these divisions had to contemplate expansion on new sites. Suitable locations for modern chemical manufacture are not abundant in Britain, and the trend of amenity legislation was to make them rarer. Nor could separate new plants necessarily count on the integration of inter-dependent chemicals that the older plants possessed.

Economic and technical factors, therefore, pointed towards the concentration of much of this expansion on some large new site; but such a step might obviously have strained the functional organisation of the company. The solution was ingenious. It was decided to bring the plants together; but that each plant should remain a part of the existing manufacturing division, and under its complete control. Only the new site itself was to be managed centrally; it would offer common services—from process steam to accountancy—plus a plant construction organisation, to its manufacturing cousins that came to lodge there. It was to be governed not by a divisional board, but by a council upon which all these lodger divisions would be represented—the Wilton Council.

The site was perhaps a more obvious choice than the form of organisation. Tees-side had already been recommended tentatively as a site for any entirely new concentration of chemical plant for ICI. The emphasis at the beginning was upon a concentration of heavy organic chemical manufacture. It was becoming clear that in the future more of these hydrocarbons would be produced from oil instead of coal, and though these materials were produced by various of the existing manufacturing divisions, some companies might have chosen to establish a new division to manage all manufacture there. Was there a time when the Tees-side complex might have become a division—ICI Petroleum Chemicals? If so, that moment passed; the new concept of a common service site for all the divisions that chose to come was established.

Alternative sites were intensively studied, notably the Hull area. But Tees-side had most of what ICI needed. It had 2,000 level acres, but not too flat for good natural drainage; the subsoil was suitable to carry the plants envisaged; it was close to large supplies of good coal from Durham; there are large supplies of good water for cooling and processes, and enough drinkable water for the boilers and human beings that have more delicate palates. ICI has in fact put in a 1½ million gallon reservoir in the hilly ground above Wilton to give one day's supply in normal running (and pressure for 2 minutes' natural supply of water to all its fire services before the pumps take over). It is close to a highly-developed industrial area for the skilled labour that modern chemical industry requires, and in a scheduled development area where some labour should, in time (or in theory), be "released" from the declining Cleveland ironstone mines and the rationalisation of the steel industry. Local services are good. Wilton generates most of its own electricity (as a by-product of process steam), but it does some business at certain times, buying or selling power, with the grid, and it buys some town gas. Its transport services, by sea, rail, and road, are excellent. It is close to Billingham, the vast ICI

centre on the other side of Middlesbrough. It is hard to set these factors in any kind of order. The visitor may be mildly surprised to discover that the location of this chemical complex close to the deposits of Durham brine and anhydrite was by no means the predominant consideration. Such oddities are not unknown in the chemical industry. The original choice of Billingham, for example, as a site for synthetic nitrate production seems to have been clinched by the fact that a small local power station had electricity to spare.

The company took a year's option on the Wilton site in mid-1945. Early in 1946 it learned that Dorman Long had bought a 680-acre strip of land between Middlesbrough and Redcar separating the Wilton site from the Tees waterside, to build its Lackenby works. Some hurried negotiations followed by which ICI secured a ¼-mile-wide "corridor" across the Dorman Long land to the river frontage. Along this corridor it brings in oil from the Tees wharves and tank farm; exchanges intermediate products with Billingham through "the Link," a series of pipelines that dive in a tunnel under the Tees bed; and moves the solid and liquid effluents from its manufacturing plants out to a tipping area and river (the flow of effluent liquid being governed by a sidereal clock). Later ICI bought about another 2,000 acres of rough hill land adjoining the plant in order to secure "Wilton Castle," a late Victorian country house, as an administrative headquarters for planning the construction. Local and national authorities co-operated. The three local councils whose boundaries trisect Wilton have built houses for key workers, and there is a widely termed planning consent, even though this did require one major alteration in the layout originally intended.

Today there are more than a dozen of these manufacturing plants, belonging to six ICI divisions, at Wilton—though the interconnection and exchange of intermediate products among them make identification of "a separate plant" not wholly simple. They are fitted, as yet loosely, into the network of ring roads, the sidings that sweep in a curve from the Middlesbrough-Saltburn line of British Railways and the orderly tangle of pipelines, carried in vast concrete "duct" trenches below ground level, that have replaced the characteristic overhead pipelines of older chemical plants. The main item of manufacturing plant on the site is the Billingham Division's thermal oil cracker and olefines plant, from which ethylene is used for the plastics division's polythene plant and as one of the main ingredients for the "Terylene" plants now being built at Wilton. The other main products of the cracker, petrol refined to premium grade, propylene, and tail gases containing hydrogen and methane, are pumped to Billingham for further use or disposal. A paraxylene plant to provide the second main ingredient of "Terylene" depends partly on petroleum products from the cracker. Phenol and urea come from Billingham for the older plastics. The propylene from Wilton, converted into acetone at Billingham, finally returns as methyl methacrylate for Wilton's Perspex plant. The ethylene stream from the cracker also goes into Lissapol N, a synthetic detergent made at Wilton, into the glycol plant for ordinary sale and for "Terylene." It requires chlorine for conversion into ethylene oxide for these products, and one of the world's most modern chlorine plants has been set up on the site for this and other processes. The "Terylene" plant, not yet handed over to process management, is being doubled in capacity; a phthalic anhydride plant is under construction; and the synthetic "rubber-like materials" will come here, among other new ICI ventures.

To these plants, among others, the Wilton organisation offers engineering services, technical, accounting, personnel and clerical departments. It arranges for the transport of employees to and from the plants, feeds them there, supplies welfare and medical services. It will plan with divisional engineers and build to their requirements any item of plant; but the division is equally free to bring in outside consultants or contractors, and this seems likely to be done for the second oil-cracking unit. Only slightly over 300 acres have been covered on the 2,000-acre site. The manufacturing managements estimate their service requirements on the site as far in advance as possible and the Wilton managers plan to have them available in time; here the boiler plant, and the power-steam balance it involves, are among the main items in Wilton's own expansion plans. Of the 5,000 workers now employed at Wilton, more than half are still on construction, though the manufacturing labour force is growing—slowly, since much of the new plant put in is almost wholly automatic.

As an experiment in combining diversity and decentralised management with the advantages of concentration in chemicals manufacture, Wilton cannot but impress the outsider. To assess the eventual success of the common service organisation, in the long run, may be an extremely difficult task—in an industry where accountancy has inevitably to be arbitrary in its allocation of joint costs. Wilton transfers all services and materials at cost and therefore has no profit and loss account itself, proportionate shares of its overhead charges being allocated to each lodger division. As it continues to grow, some strains may be put upon the organisation formulated in 1946; its labour policy, for example, has to take careful account of possible conflicts between divisional and local loyalties. Wilton accounts for only about one-fifth of ICI's expenditure on new plant in Britain since the war, and there are various types of expansion for which it may never be chosen as a landlord. But the plants concentrated at Wilton today are operating most successfully, and for certain projects Wilton can offer room and services with greater convenience and lower costs than a manufacturing division could find anywhere else. The particular form of organisation chosen remains experimental; but ICI feels that Wilton could be successfully run in more than one way.

Business Notes

Rhodesian Loan Success

INVESTMENT markets have slipped back and then recovered. The surprising fact is not that they slipped back but that the check should have been so slight. If markets have lost some of their resilience they remain very strong. On Tuesday the *Financial Times* Index of Government securities was 116.15 compared with 116.30 a week earlier. The industrial index at 158.3 was actually a little above the figure of 157.8 a week earlier. Incidents in the Far East were occasions for pauses rather than for sharp breaks. In no section was this more evident than gilt-edged where good buying from the institutions was already making the beginnings of a further advance by Wednesday afternoon as soon as it became known that the first London loan of the Rhodesia-Nyasaland Federation had been a marked successs.

That issue of £10 million 4 per cent stock 1972-74 at £97 10s. was attractive to investors even in the relatively unfavourable atmosphere of Wednesday morning when the lists opened for a brief 5 minutes and were quickly subscribed approximately twice over, applicants for up to £1,000 receiving full allotment and larger applications about 48 per cent subject to a minimum of £1,000. It does not appear that the "stags" ventured out. The stock opened on Thursday at a small premium and quickly rose to ⅛ premium, a level from which the market would not be surprised to see it improve. In the more active markets of a week earlier the issue could easily have been an embarrassing success. As it was, it gave further evidence of the capacity of the gilt-edged market to handle the steady flow of gilt-edged issues which must be expected to continue, even if it slackens during the holiday months.

Among the prospective borrowers in that market is New Zealand which expects to make an issue for £10 million in London later in the year to provide part of the cost of a public works programme estimated to cost £71 million. The nationalised gas and electricity industries must also be expected to seek fresh capital soon.

Freer Commonwealth Markets

FURTHER plans for the dismantling of some of the import restrictions imposed by nearly all Commonwealth countries in the crisis of 1951-52 have been announced by New Zealand and South Africa. Mr Holland, New Zealand's Prime Minister and Finance Minister, announced last week in his budget speech that the dominion aims at abolishing its system of exchange allocations altogether at the end of the year, though imports are still to be restricted through the ordinary licensing procedure. This relaxation will put an end to the twin prongs of import control that New Zealand has operated since April, 1952. The total value of imports has been held to a percentage of imports in the base year of 1950 (for 1954 the percentage is 75) by allotting exchange to importers. In addition, certain goods have remained subject to specific licensing control. The list includes imports from the dollar area and Eastern Europe and imports of cars from all countries. The application of these restrictions has been substantially eased in recent months; imports of cars have risen substantially above the low level of a year ago, and in the spring specific relaxations were made in controls over imports from the dollar area.

The promise of further relaxations will certainly be welcome to British exporters. Despite the recent improvement in trade, exports to New Zealand at £58.7 million for the first half of this year, were still much below their level of £72.2 million in the first half of 1952. On a longer view, some fillip to sales of British goods in this market should be provided by the release of around £11 million of spending power through concessions in income tax and the sales tax announced by Mr. Holland in his budget speech.

The announcement of some further immediate relaxation of import control in South Africa is essentially a follow-up operation after the general increase of five per cent in import quotas made early this month. The present liberalisation is designed to relieve specific shortages of consumer goods. It will nevertheless prove useful to British manufacturers of mustard powder, infants' knitted cloths, watches and clocks, cutlery, lawnmowers, sewing machines, and fountain pens. Additional import permits are to be issued for these and a few other items; but total imports remain restricted by quota to less than half of imports in 1948, when import control was first imposed. The Governor of the Reserve Bank of South Africa, Dr de Kock, has however intimated that a substantial easing of import control may be expected next year—and perhaps also its total abolition in the not too distant future.

Wider Use of Sterling

AS usual the only important new material in the annual report of the Bank of England is that relating to the use of sterling in international trade. This year the figures are great news. They show an extraordinary expansion in the dimensions of sterling transfers between bankers and

traders outside the sterling area. These transfers, excluding those to and from American account countries and excluding also transfers between countries in the same monetary areas, amounted to £802 million in 1953 compared with £379 million in 1952, £463 million in 1951 and £298 million in 1950. The increase springs from three causes.

The first was the extension of arbitrage transactions between a number of European currencies in May, 1953. The arrangements at first applied only to spot transactions, but in October, 1953, they were extended to forward operations, normally for periods not exceeding three months. The compilers of the Bank of England report, speaking from first-hand knowledge, say: "The London Foreign Exchange market was quick to make use of the increased opportunities afforded by the introduction of European arbitrage." The second reason for the exceptional increase in the amount of sterling transferred between non-resident accounts was the extension, also in 1953, of the freedom by which sterling could be transferred between the accounts of authorised banks in all countries participating in the arbitrage scheme. Thirdly, the wide use of sterling in international trade was due to the further reopening of commodity markets, allowing merchanting transactions between non-sterling countries on a sterling basis. Such transactions, including those allowed under commodity market schemes, amounted to £142 million in 1953. That figure actually showed a small drop on the revised figure of £150 million for 1952. But the 1952 total was abnormally swollen by the hectic August fortnight of that year when for a brief and unrepeatable spell general sanction was given to resell to countries in the European Payments Union commodities bought with dollars. At the beginning of the twelve months to February, 1954, covered by the report, commodity market schemes had been introduced for cocoa, coffee, lead, raw sugar, rubber, tin and zinc. During the ensuing twelve months further schemes were inaugurated to cover dealings in copper and grain, and terminal transactions in wool.

The Bank's report provides a useful description of the place of the commodity markets in Britain's shop window. Before the war, the commodity markets in the United Kingdom formed an essential part of the sterling system. Although their direct contribution to the external income of the sterling area was by no means negligible, their chief significance was that they offered to holders of sterling in any part of the world a comprehensive range of basic products and that, together with the other main constituents of the system (the banks, shipping lines and the markets for money, freight, insurance, etc.), they provided the necessary services for the finance and movement of such products. Thus, these markets assisted in making sterling a currency for which its holders found constant and ready use.

"No" Again to Option Dealings

Is speculation an evil? The Council of the London Stock Exchange, by its renewed refusal to allow option dealings, implies that it is. On the Johannesburg Stock Exchange, where option dealings flourish, the contrary view seems to prevail. In the prewar London market there were no qualms; option dealing was well developed, specialised, and at times active. Option dealers used to meet the investor's hunch that such and such a share was likely to rise or fall by selling the "put" or the "call" or the "put and call" of the shares for a three months' run. Some jobbers used the facility to cover their short sales or to avoid taking too much stock on their books. Normally the option dealer would cover himself in part against his risk by buying or selling half the stock represented by his option transactions.

Clearly there is a strong speculative element in all option dealing by the public. The operator who buys the "put"—the right to sell at an agreed price—or the "call"—the right to buy at that price—is always hoping to make money on the rise or fall of the market. He is never investing for a dividend income. Equally clearly markets which include option facilities tend to be more active; the operator can deal with larger numbers of shares, for a smaller commitment. When, as at present, the market is active and brokers well employed, the demand for a resumption of option dealings is of interest mainly to the small group of prewar option specialists, such as the four jobbing firms and seven Stock Exchange members whose petition has now been refused. Indeed, a forceful argument could be adduced that a time of active markets and rising prices is not the best moment to widen the facilities for speculators.

But the Council has not used that argument; it has not used any argument at all. It says, with more emphasis than on previous occasions, that the application had been considered "from every point of view" and that the restoration of option dealing would not be in the best interests of the Stock Exchange. The public is left to guess whether the Council has independently decided to wash its hands of options, or whether it has tested the views of higher authority on what it may regard as an issue of public policy. Whether the Council has refused because it thinks that the timing of the request was wrong or whether at all times it would oppose options with their implied opportunity of making money on a falling, as well as on a rising, market, it is certain that the issue has not been settled for ever. These requests will continue to come forward from time to time. And sooner or later the occasion will arise when it will be beyond argument that a broader market, including a few more speculators, would help the City.

Squabbles in Wardour Street

The disputes in the British film industry that the Board of Trade last week suggested should go to arbitration are ultimately concerned with the division between exhibitors, renters and producers of the extra £3½ million of box-office proceeds that should accrue this year from the reduction in Entertainments Duty. The immediate deadlock has resulted from the preliminary positions for that bargaining that certain sections of the trade have adopted. In the normal commercial division of box-office revenues within the industry, the exhibitors would pay about 35 per cent in film rentals, leaving themselves some £2½ million of the extra net takings; from these extra rentals, the film renters would retain about £400,000, and pass on some £800,000 to film producers. On last year's form, perhaps £575,000 of this sum would go to foreign producers and

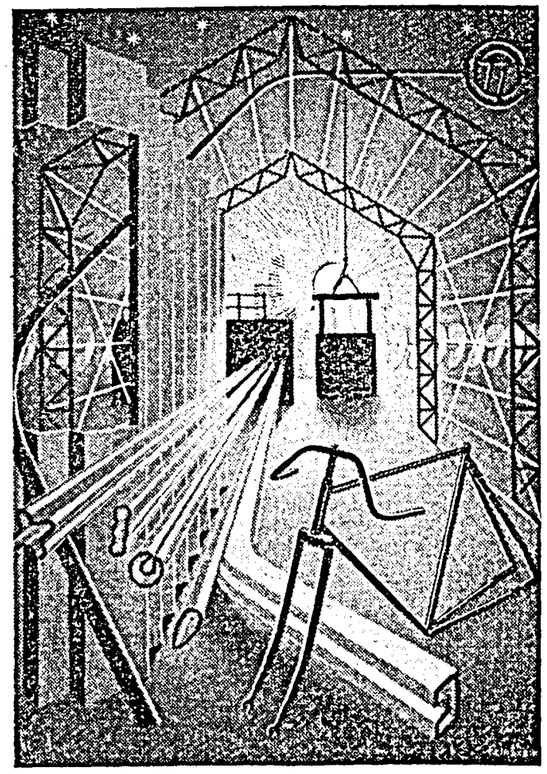
£225,000 to British. Any major adjustments to these shares would come primarily from alteration in the scale of the "Eady levy"—the payments that are made by exhibitors into a fund for distribution direct to producers of British films.

The present scale of levy has been running at some £2.8 million a year, and providing producers of British features with additional revenue equivalent to about 40 per cent of the total rentals paid on their films—perhaps 60 per cent of the amount that the producers themselves normally get from these rentals after distribution is paid for. The levy gives producers of short films additional revenues equivalent to about twice what they earn in the normal commercial way. This levy is still formally "voluntary"; it was renewed last autumn under the threat that if exhibitors would not consent to pay the Board of Trade would make it statutory. But the agreement reached in November stipulated that "failing any reduction in Entertainments Duty," the levy should be reduced from August this year to a scale that would yield only about £2.3 million a year to supplement the producers' earnings. The Cinema Exhibitors' Association chooses to interpret "failing" as "regardless of" the reduction in duty actually granted since; for this reason, and because certain conditional negotiations with the renters over scales of rental have not been completed, it has instructed its members, from next week, to pay levy only at the reduced scale—pending any agreement over adjustment of levy to share out the duty now remitted. The British Film Producers' Association argue that this is a breach of the November agreement, and have been supported by the two main cinema circuits with production interests, Associated British and the Rank Organisation; the Rank circuits, indeed, have resigned from the exhibitors' association. Several hundred cinemas, already, do not pay the levy at all, arguing that they cannot afford to; the cinema employees' union is demanding that before any other sections of the industry get any of the amount remitted in duty, their wages should go up; and the film technicians' union, emboldened perhaps by an extremely generous award on laboratory wages, is once again suggesting that one film circuit should be nationalised to favour British films. The situation in the British film industry, in other words, has returned to normal.

Hire Purchase Faces Competition

After the removal of the Board of Trade restrictions on hire purchase, traders are taking advantage of their new freedom to accept less than 33⅓ per cent as an initial payment and to spread the instalments over longer periods than 18 months on goods which were previously controlled. Terms have not yet settled down, but a rough pattern is emerging. The figures give an approximation of the current terms. There remains a fringe of easier terms offered by a minority of traders. There is also a substantial range of commodities that were not under control at the time when the Board of Trade order was withdrawn: furniture is still offered for a 10 per cent down payment with payments spread over one to two years according to the value bought. Pedal cycles were controlled on the basis of a maximum contract of one year and a minimum deposit of 25 per cent.

Trade associations have generally been diffident about offering advice to their members, not least because hire purchase terms depend both on the value of the goods bought and their durability. The Hire Purchase Trade Association has felt unable to give formal advice, though it maintains its traditional view that a substantial down payment is essential to satisfactory hire purchase trading; the Radio and Television Retailers Association has given unofficial support to the idea of a minimum deposit of 10 per cent and a maximum contract of 2 years. The most useful contribution so far comes from the representatives of the big stores, though not as the official policy of the Retail Distributors' Association. It is suggested that the department stores should make a principle of stating clearly the price charged. That implies a clear statement both of the cash price and what the customer has to pay on hire purchase—not merely



Article	Down Payment	Spread of Instalments
Motors (new)	25 per cent	2 years
Motors (second hand)	20 per cent	18 months
Radio	10 per cent	2 years
Refrigerators	10/15 per cent	3 years
Pedal cycles	£1	9/12 months

the down payment and the amount of each instalment but also the number and frequency of instalments, or a statement of the balance to be spread over the instalments. As a general rule it is suggested that the initial down payments should not be less than 10 per cent of the cash price and that the spread of the instalments should not be greater than two years, with the provisoes that for many types of goods higher down payments and shorter contracts are desirable and that department stores generally feel that single instalments of less than about £1 are not economic.

This is useful and careful thinking with which the other interests will not disagree. Much can be done by applying it to shop window displays and brochures by traders themselves. There may also be a further sequel. The newspapers have in recent years tried to exclude misleading merchandise descriptions from advertising copy. The idea is being mooted of enlisting their help on misleading hire purchase terms. Discussions between the Newspaper Proprietors Association, the Retail Trading Standards Association and the Retail Distributors' Association seem to be indicated.

Peak Output of Paper

Production of paper and board, which tends to move with business prosperity, rose to new postwar peaks in the first quarter of this year. Total output of paper was five per cent higher at 43,400 tons a week, which was 10 per cent above the prewar average. All the main types of paper shared in the increase except newsprint, output of which was almost unchanged at 12,200 tons a week, compared with a prewar average of 15,400 tons. The newsprint industry has been working at the limit of existing capacity, but has not yet replaced all the facilities destroyed during the war. Total output of board rose by about 4 per cent in the first quarter to 17,200 tons a week, which was 53 per cent above the prewar average. Supplies of paper generally are still somewhat

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1. Also at Manchester, Glasgow and London. Works at Birmingham, Wakefield and Birkenhead.

below demand. For packaging paper, demand has been stimulated not only by the rise in industrial production and exports but also by the return to competitive markets in foodstuffs and the introduction of self-service stores. The growth of paper production was partly at the expense of stocks. Stocks of woodpulp for paper-making suffered more than the usual seasonal decline, dropping by nearly 20 per cent to 270,000 tons at the end of the first quarter and in April to 250,000 tons, equivalent to about 8 weeks' consumption. In May and June, however, stocks are believed to have risen by about 30,000 tons. Stocks of waste paper fell by 12 per cent in the first quarter to 80,000 tons, the lowest level since January, 1951.

The paper makers' profits have recovered sharply from the recession of 1952. Moreover the rise this time owes little to the artificial element of price inflation of stocks and their turnover on a rising market. Prices of Scandinavian woodpulp have risen only moderately in the last nine months, and prices for shipments made in the third quarter are the same as in the second. Paper-making activity appears to be limited only by the restrictions on imports of woodpulp. In the second half of this year, however, supplies should be rather larger than in the first half, assuming that prices remain unchanged. Imports of woodpulp from Scandinavia and North America have been set at more than £35 million cif, compared with a revised total of £30¾ million in the first half. Import quotas for all types of paper (excluding newsprint) and board have been raised from just under £15 million to about £15¾ million fob. Imports of newsprint, which are also controlled, are expected to rise by about 100,000 tons to 375,000 tons in the year ending next June. Together with about 400,000 tons from the home mills, the total supply of newsprint would be 775,000 tons, compared with a consumption of some 1.1 million tons before the war.

"Gussies" Bounding Profits

THE speculative type of investor who chose Great Universal Stores for his stake in the 1954 Stock Exchange boom can have nothing to complain about. All reasonable hopes have been fulfilled though not all the wilder market guesses: trading profits have jumped from £11.4 million to £15.5 million; the final dividend of 45 per cent on the Ordinary and "A" Ordinary shares makes a total of 60 per cent. Allowing for the 50 per cent scrip issue of last October this is equivalent to a rise from 33⅓ per cent to 60 per cent on the present capital. A further free scrip-issue, this time of 100 per cent, makes up the total of the investor's reward. The "A" ordinary 5s. units which stood at 51s. 9d. at the beginning of the year reached 85s. on Thursday, after the results were out.

"Gussies" have swum to prosperity with the help of two favourable currents: the rise in retail sales, and the growth of hire purchase trading. The second has been particularly marked in the furniture business and no doubt owes much to the housing drive. The preliminary figures do not show the volume of hire purchase debtors (last year £33.5 million) nor the volume of instalment credit sales (last year £7.5 million) but bounding profits suggest that instalment trading has continued to flourish. Even now shareholders see one more good hope in front of them. A sum of £1.5 million was again charged in the year ended March 31st for the now defunct Excess Profits Levy. That sum was greater than the net cost of the last year's ordinary and "A" ordinary dividends. So if the maintenance of profits can be assumed a larger sum should be avail-

	Year ended March 31, 1953	Year ended March 31, 1954
	£	£
Consolidated trading profit	11,386,271	15,487,741
Depreciation	748,486	781,312
Tax	6,746,550	9,197,490
Net consolidated profit—after tax	3,183,385	4,760,768
Ordinary dividend	732,982	1,346,907
Ordinary dividend (per cent)*	50	60
General reserve	1,542,203	2,292,797
Added to group carry forward	792,501	986,722

* 50 per cent scrip issue in October, 1953, ranks for dividend this year.

able next year—and even after the past year's heavy tax charges equity dividends were more than three times covered. Investors still recognise those prospects by buying "Gussies" to yield a shade over 3½ per cent, but after the great rise of recent months, the shares are bound to become more sensitive. One sign of that nervousness was the sudden dip of 2s. 7½d. in the price of the "A" ordinary units on Wednesday just before the results were announced. It suggests that the sellers were hardly steady-going long term investors and perhaps that a few of them had more stock than they felt certain of holding.

Productivity in Gas

THE new "Rochdale" process for making gas, which is now in commercial operation at the Partington works of the North Western Gas Board, has never been tried by the gas industry before, though it was first chanced upon as far back as 1917. That was in the course of work on the production of the explosive toluene (the second "T" in

Are you

PLOUGHING BACK ENOUGH

TNT); the process was put forward again in 1928 during experiments in steam economy. The "Rochdale" system is simple enough; it consists of injecting gas at the base of vertical gasmaking retorts in order to speed up the heating process and thus the rate of gas making and coal throughput. Ordinarily steam is injected to cool the coke before it is discharged from the bottom of the retort; the carburetted water gas used in the new system not only acts as a cooler it also carries most of the heat back up the retort for re-use. As a result, the time required for carbonisation is approximately halved and twice as much work can be got out of substantially the same plant—the few alterations needed add only about 5 per cent to its original cost. But coal accounts for a good three-quarters of gas-making costs. Preliminary estimates of costs based upon three years' development work and less than two months' production experience suggest that the extra gas obtained from Rochdale retorts will cost about a quarter to a third less than a similar quantity of extra gas obtained from orthodox retorts, but these are highly tentative figures. Any benefit gas users in the North West can expect to obtain from this economy will depend upon the rate and extent to which gas making plant is converted.

This process is also one of the ways in which the gas industry may be able to use lower grade coals for carbonisation. A Rochdale retort carbonises blended coals at almost the same rate that conventional vertical retorts carbonise good quality coals. The gas industry, which has been finding it increasingly difficult in recent years to obtain the grades of coal it has been accustomed to using in the past, has lately been experimenting with various ways of using lower grade coals, as well as other raw materials for gas.

No Industrial Code

THE report on human relations in industry, published last week by a sub-committee of the National Joint Advisory Committee to the Minister of Labour, contains nothing new, but it is nevertheless the first statement on this specific subject that has been issued jointly by employers, trade unionists, and the Government. The report repeats the call for greater efforts throughout all industry to maintain and improve relations between individuals, and it goes on to suggest that the Government and the press could be much more concise and consistent in their pronouncements, and that firms, employers' organisations, and trade unions should become more acquainted with the activities of professional and other bodies at work in the industrial relations field. Relations between employers' and workers' organisations in this country have improved considerably in recent years; what is now needed is similar improved relations at the factory level. The sub-committee rightly places the primary responsibility for this task with employers and management, who can do most to foster mutual respect and confidence by the way in which day-to-day problems are handled over a long period. Apart from exhortation, setting up suitable machinery where private arrangements have fallen down, and generally giving help where help is needed, there is little else that the Government can do.

This statement seems, incidentally, to be the last relic of the code of industrial relations that was drafted by the Conservative party in its Industrial Charter seven years ago. Early in the life of the present Government the Charter was examined by all government departments concerned and an industrial code was prepared. But the National Joint Advisory Committee, to whom the code was submitted, holds the view that codes of conduct for industry are not the best way of making further progress.

Coal for the Grate

UP to the middle of July, the recorded consumption of coal in Britain this year was nearly 4 million tons more than last year. Temperatures have been markedly lower—1.7 degrees down on the average of the first 28 weeks—while industrial activity has been booming. Production is now about 1¼ million tons higher than at this time last year, primarily on account of the normal day's work that replaced the Coronation holiday of 1953. The result has been a lower level of stocks, which at present total about 16½ million tons, two million tons down on the year.

Coal supplies have not yet limited the rise in industrial output; with a surplus of coal available on the Continent and tonnage easily available, there seems no reason why they need do so this winter, even if the National Coal Board has to import more coal than it originally planned. But if the present level of coal exports is to be maintained over the next year or two, and European coal consumption rises again, economy in fuel will become imperative. The National Industrial Fuel Efficiency Service, which was set up by the Government this year to carry out on a private basis the advisory work formerly done by the Ministry of Fuel and Power, should not be short of work.

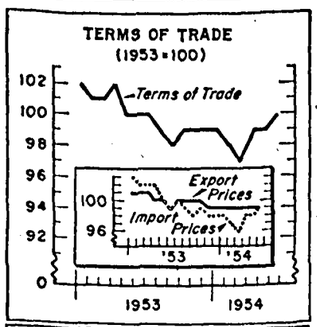
The National Coal Board mentioned in its report this year that it had been replanning its marketing system against the day when rationing of domestic coal comes to an end. It does not believe that the lifting of restrictions would in itself increase domestic demand by more than about a million tons a year, as against estimates of 5 million tons that have been made fairly often by coal merchants. Householders have always had free recourse to electricity and gas to supplement their limited coal supplies; moreover, there are certain indications that rises in price are having an effect. In a recent study by the Department of Scientific and Industrial Research of numbers of houses where coal was burned in old grates and in the new "efficient" grates, little evidence was found that in practice householders either used less fuel or obtained more warmth; but there was some indication that consumption of all fuels had declined over the last few years.

Light Metals for Aircraft

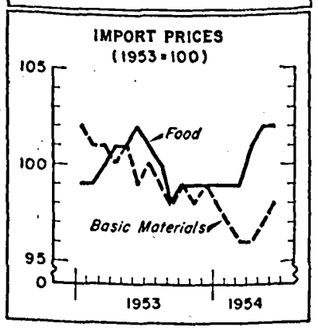
THE titanium melting furnaces and handling plant that are to be installed by William Jessop and Sons at Sheffield will considerably increase capacity in this country for the forming of this expensive medium-weight metal, which can be rolled on mills that handle alloy steels. Opinion in this country does not seem to have reached final agreement upon the extent to which titanium will be required for high-speed aircraft in the ranges of speed now envisaged, in spite of the confident estimates in the United States that vastly increased amounts will be needed for military aircraft there in a few years' time.

The question whether titanium can be used in the early stages of axial compressors for aircraft gas turbines, where considerable strength is required at medium to high temperatures, may have repercussions upon demand for other metals elsewhere in the aircraft. As turbines become more powerful, the use of titanium might hold down weight without demanding drastic economies elsewhere in the airframe. But if stainless steel has still to be used, the extra power may be obtained only at the cost of considerable increases in weight, which will have to be offset elsewhere. This, in its turn, might require some replacement of aluminium alloy sections by magnesium alloys, which are about 30 per cent lighter.

Mining Finance Deal



LARGE interlocking share transactions between the mining finance houses are a rarity. One occurred this week when Anglo-American Corporation of South Africa agreed to subscribe for a block of 199,108 £1 Ordinary shares in General Mining and Finance Corporation for £822,500—approximately £4 2s. 7½d. per share compared with a current market price of the General Mining shares of £3 19s. 4½d. per share. Moreover the new shares to be issued to Anglo-American will not participate in the dividend which General Mining expects to declare for this current year. The holding of Anglo-American in the General Mining equity will thus amount to about 9¼ per cent. Sir Ernest Oppenheimer, the chairman of Anglo-American, joins the General Mining Board and Sir George Albu, the chairman of General Mining, the Anglo-American board.

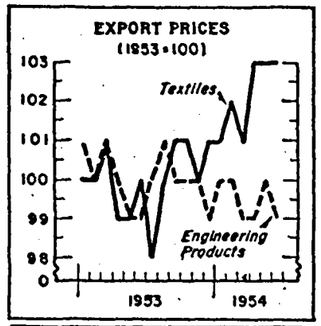


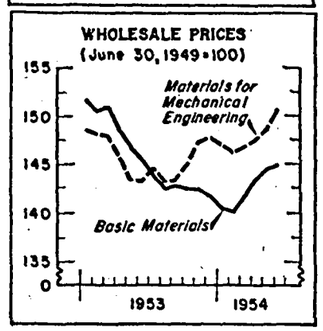
No general policy of mergers between the mining finance houses is to be foreseen from this development. It simply rounds off an operation on which General Mining was already engaged—the merger between General Mining and Strathmore Consolidated Investments. Strathmore is interested in mines—Stilfontein and Ellaton—of which part of the development has also been financed by Anglo-American. The proceeds of the share issue to Anglo-American will be used to buy a portfolio of securities from Anglo-American at current market prices.

Bristol and Shorts

THE Bristol Aeroplane Company's acquisition this week of a 15¼ per cent shareholding in Short Brothers and Harland prompts the question whether it is the first step towards a disposal of the government's substantial holding in Shorts. This holding is not affected by the Bristol acquisition, which is of 360,000 newly created £1 shares, for which Bristol have subscribed at a premium. Bristol also gets two new seats on Shorts' eight-man board. The other shareholders are Harland and Woolf, also with a 15¼ per cent holding, and the government whose holding shrinks from 82 per cent to 69¼ per cent.

The principal shareholders in Shorts were bought out by the Government during the war after complaints about the factories' rate of production. It has sometimes been difficult since the war to keep the company's 1.5 million square feet of factory space on a profitable footing, and since rearmament began in 1951 it has been largely occupied on sub-contracting for other manufacturers. Sections of Swifts are built there for Vickers; work has been done for de Havilland; complete production lines have been laid down successively for Canberra bombers, Comet IIs (at present suspended);





Price Puzzle

It is impossible to trace how the rise in world commodity prices has affected British industry. The charts can sketch only the broad movements. Import prices have risen 3 per cent since March while export prices have remained unchanged; hence the terms of trade have worsened (risen) slightly this year. The import and export indices, which are based on the declared value of goods at the port of loading, measure the effect at each end of the process (though higher domestic costs are not always passed on in export prices). The vital middle part—showing the change in producers' prices throughout the chain of manufacture—is something of a statistical no man's land.

The wholesale price index of basic industrial materials, excluding fuel, has risen 3.3 per cent since February. The wholesale price indices also record changes in prices of materials used by broad sectors of industry, such as mechanical engineering, together with changes in a rather motley collection of individual products. They do not record the movement of prices of composite products going into, or coming out of, the important engineering and capital goods industries. The government is trying to make available price indices to illuminate this crucial factor in Britain's export prospects. It is in industry's interest to support this venture.

and more recently preparations have been made for tooling on Bristol's behalf for a Britannia line. Short's own designers, however, recently won a production order for an unusually light and simple anti-submarine aircraft, the Seamew, and operations have shown a profit during the last two years.

Bristol Aeroplane's expansion at Bristol may be limited by the inelastic supply of labour in the district. The company's products are in the heavy class and take up a prodigious amount of assembly space. Meanwhile the number of different projects at Bristol is multiplying. This week's purchase of a shareholding in Shorts suggests that Bristol may have hopes of using some of the assembly space in Belfast as a overflow for work at Filton. Whether this is followed by closer integration between the two concerns will depend in part on the attitude of the government.

Standards Puzzle for Exports

AN unexpected hazard is being created for British exports by the fact that in some of their best markets, Governments are laying down national engineering standards. In some countries, such as South Africa, the standards that they draft are backed by mandatory powers, and one consequence of their enthusiasm for their work is that engineering exporters are faced with the need to adapt their products like chameleons to the different requirements of different markets. This is a direct contradiction of the avowed object of standardisation. It not only involves irritating minor modifications of engineering designs but when, as sometimes happens, the standard incorporates one of two competing methods of construction, an entire industry can sometimes be debarred from selling to that market.

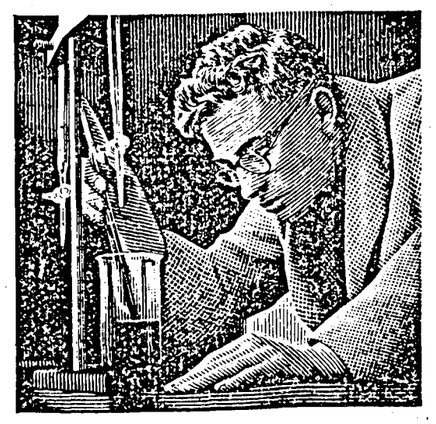
There is international machinery for dealing with this situation; there are more than 30 national standards bodies and they are all members of the International Organisation for Standards at Geneva. Fairly successful efforts are made at Geneva to co-ordinate the standards of different countries, but these still seem to depend on initiating discussions while those standards are still in draft form. Since the new standards have a tendency to appear in some of the best British export markets, the British Standards Institution has set up a new export panel consisting of representatives from the main exporting industries. It is hoped that through their sales organisations, companies in these industries will be able to give the panel advance information of the likely commercial effects of draft local standards, so that the BSI can either discuss them direct with its local counterpart, or set the Geneva machine in motion. The BSI's two main objects in this are to prevent the appearance of standards that favour the engineering practices of one of Britain's competitors over British methods, or of standards that will, consciously or unconsciously, protect local industries against imported goods by making the requirements impossibly complicated.

Mercury in Atomic Power Plants?

MERCURY, that little silvery blob at the end of a thermometer, appears to have met a new need of man in the production of atomic energy. That is believed to be the reason why the United States government has been buying all the mercury it can lay hands on, and why it is seeking to expand production of the metal at home and abroad. As a result, the price has risen spectacularly, even for this most volatile commodity. In the last seven months it has soared from just over £60 to a record £100 a flask of 76 lbs. In comparison, production costs in the two largest producing countries, Italy and Spain, are probably less than £25 a flask. Towards the end of last year the American government, which hitherto had bought fairly large quantities at irregular intervals, placed forward contracts with Italy and Spain, and with Yugoslavia. The total quantity was some 80,000 flasks, equal to roughly half the world output, for delivery by about the end of May. The United States has also helped to finance the re-equipment of the mines in Spain, where output is expected to double and reach about 80,000 flasks a year in 1955. The American authorities are now trying to expand production in Italy. And this month they announced that until the end of 1957 they would buy up to 200,000 flasks at a guaranteed price of $225 (£80) a flask from domestic producers and from Mexico.

The urgent need of the United States for mercury is illustrated both by this high guaranteed price and by the fact that until now it has appeared to be reluctant to draw upon its limited domestic resources. A possible use of mercury in atomic energy would be as a heat transfer medium from the pile to the generating plant. There is already a technique for using mercury vapour instead of steam to drive turbines. Even one experimental plant using mercury as a heat exchanger would require very large quantities. In this country, gas will be used to transfer heat from the atomic pile to the generating equipment, and liquid sodium may be tried later. However distressing the present price may be for the major commercial users of mercury, such as the makers of chlorine and of mercurial salts for pharmaceutical preparations, a period of high prices seems assured for some years. In time the expansion of production may bring about some decline in the price, or another element may be substituted for its use in atomic processes.

SHORTER NOTES



In an attempt to settle disputes over miners' pay in Yorkshire that have caused a large number of unofficial strikes in recent months, the National Coal Board and the National Union of Mineworkers have agreed to experiment at two or three pits in the area with alternative methods of increasing pay—a higher basic rate per ton with allowances for individual conditions of working, and a "consolidated rate" per ton that will cover the special conditions for which allowances are normally paid.

In reply to a question in the House of Commons last week, the Minister of Transport announced that he was proposing to consult representatives of industry about the increasing number of large indivisible loads carried by

Prospecting for Ideas

The United Steel company is not only a complex industrial enterprise, but also a community of human interests, experience and skills. A long-term plan of staff replacement ensures not only that these experiences and skills are handed on, but gives opportunity to young men.
Imagination and ideas originate in individuals and fructify more readily in an atmosphere of experienced organisation which puts at their disposal the counsel of older men and the resources of a large organisation. Recruits are selected for their potentialities, and as those of the required character and capabilities succeed in their first work, new responsibilities and opportunities open before them with the possibility of rapid advancement for men of energy and ideas.
With a far-sighted, long-term staffing policy the Company assures that its future will strike and develop rich fields of ability and enterprise.

*FOR NEW IDEAS**

ON LOW-COST ACCOUNTING

The Man from Remington Rand has a ready answer for all accounting problems. If business figurework is taking up too much time and money in your organisation, it's time you asked him to call. He'll gladly make a free analysis of your needs; prescribe the equipment to meet them; give you and your staff new ideas altogether on speed and accuracy in the accounts department.

THIS IS REMTIMATIC It is the modern method of manual book-keeping—based on proved mechanized-accounting principles. It cuts the manual labour of book-keeping—often by two-thirds. It is as near fool-proof as an accounts system can be. It can provide daily balances and speed your routine on payroll, ledgers, analysis, and statements. And it costs about the same as a standard typewriter. Does Remtimatic sound your kind of accounting system? Then let us show you that it is.

Send for the Man from

Remington Rand

COUPON: I would like to know more about Remtimatic.

Everything points to

LIVERPOOL

for

industrial development

The three great Liverpool Corporation industrial estates provide manufacturers with ideal conditions for efficient production. The Liverpool civic authority is eager to co-operate and is companionably allergic to red tape.

Adequate labour supply.

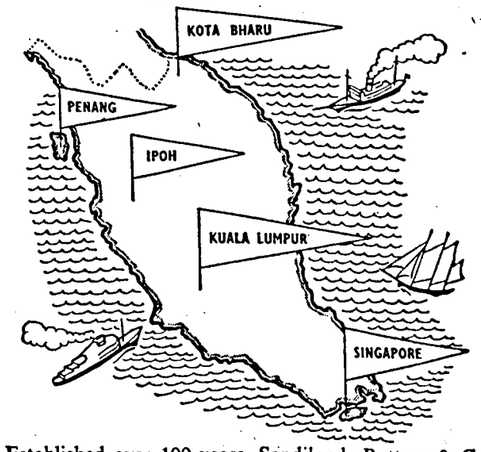
All public services.

Sites on main lines and trunk roads.

Near the docks for exports.

Adjoining workers' houses.

Mortgage facilities readily available for factory building or purchase of sites.



One of the most satisfactory features of siting plants on a Liverpool industrial estate is the large labour force available, particularly of young men keen to train as skilled technicians.

THE BRICKS OF PROSPERITY

Refractories are a vital part of the economy of any industry using furnaces—but how often do they appear in the accounts—in their own right we mean, not hidden in Capital Cost, Furnace Maintenance or Overheads? Not often? Never?
It's worth any accountant's while to dig them out of this obscurity and look at them carefully—with the technical help of a furnace engineer if possible. For refractories can have a profound effect on an industry's prosperity.
Take Morgan M.I. refractories*. They have stepped up the output of batch furnaces in many industries by 50 per cent and more and could perhaps do the same for yours. Furnaces which once took an hour and a half to reach working temperature now heat up in fifteen minutes. Two furnaces lined with M.I. do the work of three lined with ordinary firebricks. Think for a moment of the effect of that on overheads and on the profit/capital ratio. Anyway give refractories a thought; they are worth it.

* M.I. bricks are low heat-storage refractories which can be used as a direct furnace lining up to 1510°C (2800°F). They are made on modern continuous plant under stringent quality control and every brick is ground to size. Full technical details are available on request and our furnace engineers are always pleased to have the opportunity of discussing special problems in the use of these, or any other, Morgan refractories.

vehicles. Complaints about the congestion that these road- and often slow-moving loads cause have been growing bulk- in recent years.

★

The composite rate of income tax paid by the building societies in respect of share and deposit interest is to go up for the current financial year by 3d. to 5s. 1d. in the £.

Mr Heathcoat-Amory, speaking for the last time as Minister of State, Board of Trade, told the American Chamber of Commerce in London that about half Britain's imports in 1953 from North America are now free from licensing restrictions. Of equal significance, about a third of the imports from the United States in 1953 were manufactured goods. He again expressed the Government's disappointment at the slow progress of the American policy for freeing trade.

Company Notes

NCHANGA. Last year was most eventful for Nchanga Consolidated Copper Mines, perhaps even more eventful than for the other Rhodesian copper producers. The company was formally incorporated as a Northern Rhodesian company. It had to adjust its operations to the re-opening of the London Metal Exchange for dealings in copper. It attained a production rate of 120,000 long tons a year, even more than the rate that the third stage capital extensions were designed to permit. Finally, it decided to embark on the fourth stage of its development programme.

The reversion to normal trading through the market meant that part of the company's production of copper was absorbed in re-filling the "pipeline" to consumers. Even so sales went up from 90,150 to 101,238 long tons, income from sales from £23.7 million to £26.6 million, and the company's gross profit from £14 million to £14.2 million. Nchanga already had £750,000 in reserves, appropriated against the eventuality of free dealings in copper, and this sum has now been written back into the profit and loss account. This sum, together with £500,000 from tax provisions no longer required, brought the year's disposable net profit up to about £10 million. Of this sum, £7 million was paid out in ordinary dividends (which were 100 per cent, compared with 75 per cent in 1952-53).

Looking to the future, the chairman, Sir Ernest Oppenheimer, suggests that "there appears to be no immediate prospect of a weakening of the market." Nchanga, like the other producers, has sold most of its copper forward and Sir Ernest does not expect much difficulty in selling the uncommitted balance. But the company has made one important administrative change. It has arranged with its "progenitor," Rhokana, to pool the entire output of the two companies; sales will then be made jointly from that pool. The maintenance of stocks of the different sizes and qualities will thus be simplified and, since duplication will be eliminated, total stock requirements will be reduced.

Another pointer to the future is that the company has decided to go ahead with the fourth stage of its development programme. These developments will cost about £2½ million but they are not designed to increase the rate of copper production and must apparently increase costs. It is intended to maintain the current rate of production but to spread mining operations more evenly across the high and lower grade bodies of ore. All these arrangements strengthen Sir Ernest's conclusion that Nchanga has now reached "maturity" and that the next few years will be a period of consolidation rather than expansion.

★

GENERAL ELECTRIC. The unexpected increase in the ordinary dividend of General Electric Company from 11¼ to 12½ per cent and the announcement that net profits had almost doubled (rising from £1,266,054 to £2,364,345) in the year to March 31st added 3s. 6d. to the price of the £1 ordinary stock units, putting them on a yield basis of 5 per cent at the current price of 50s. The announcement also gave a fillip to other electrical equipment shares.

	Years to Mar 31, £ 1953	£ 1954

£1 ordinary stock at 50s.	*yields £5 per cent.*	

The full accounts of GEC show that the increase in net profits and in the ordinary dividend was based upon a marked expansion in trading profits (from £6½ million to £8½ million). This advance in profits was due to a rise in turnover both in capital and consumer goods. Indeed, many of the company's profit margins were lower, for both at home and abroad the group found it impossible to recover in its selling prices the wage increases granted in the engineering industry. In spite of the increase in sales, the group reduced its stocks by about £4 million to £34½ million, which made possible a reduction in bank overdrafts from £4.3 million to just under £1 million. Steadier prices and easier raw material supplies have thus made it possible to economise both in working stocks and in finance.

This is a story of the past and the remarks that Sir Harry Railing has to make about the future suggest that some slight qualification may have to be added to the initial reaction of investors. The group's order book is "still satisfactory," but Sir Harry again draws attention to the dangers of competition overseas, particularly in the market for electrical capital goods. He hopes that the improvement in the sales of consumer goods may help to counterbalance this threat, but he adds that an expansion in production will be needed if the further wage increases recently granted are to be absorbed.

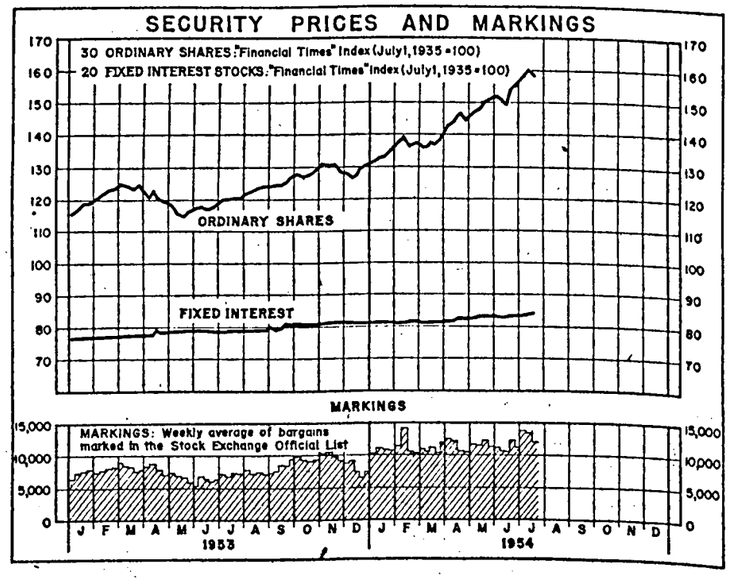
★

JOHN BROWN. The preliminary results of the shipbuilders and marine engineers, John Brown and Company, disappointed investors. The ordinary dividend, which, as usual, was declared tax-free, was left unchanged at 7½ per cent, though the group's net earnings had risen from £630,315 to £707,294. After the announcement the £1 ordinary shares were marked down by 9d. to 37s. 6d., to offer a yield of 7.2 per cent. The yield is high, for order books in the shipbuilding industry are thinning out even though good profits from old contracts are still being earned. Not too much should be made of the latest increase in profits because contracts are completed at irregular intervals and the earnings accruing from them also come into the profit and loss account irregularly.

Beyond its major interests in shipbuilding and marine engineering, John Brown has long had an interest in the manufacture of machine tools and in high grade steels. It is now adding to these interests by acquiring from A. C. Wickman (Canada) its "business and assets relating to the manufacture of tungsten carbide equipment, and its business as agent and factor for machine tools." This acquisition appears to be a natural development of the interests that John Brown already has in Canadian industry,

through Firth Brown Steels and Firth Brown Tools (Canada). But it is the prospect for the shipbuilding industry on which shareholders must chiefly assess the value of the shares.

★



AMALGAMATED ANTHRACITE. Before coal nationalisation about 80 per cent of the Welsh anthracite output was raised and sold by Amalgamated Anthracite Collieries whose profit record, even in free enterprise days, was a bed of thorns rather than of roses. After nationalisation the company decided to lick its wounds and carry on as coal distributors, builders' merchants, wagon repairers and carbon black manufacturers. Gradually it has been pulling round and the capital reorganisation scheme of this spring was designed to put it on a new footing. The 4s. ordinary stock units were to be written down, so that each four of them would become 5 1s. ordinary stock units and the £1 3½ per cent participating preference units to 16s. 8d., of which 15s. was to become 6 per cent non-participating preference stock and 1s. 8d. ordinary stock. This was based on the assumption that the profits before tax for 1953 would be not much less than the 1952 figure of £365,000 (excluding special non-recurring items of about £114,000).

The figures now announced subject to audit show that that hope has been more than fulfilled. The net profit before tax for 1953 was £382,243; there was a non-recurring credit from previous years of £72,600 and including that a net profit after tax £265,956. This enables the group to make the payments to shareholders that were promised if profits were up to expectations. Preference shareholders receive an additional one per cent before reorganisation of their capital; this starts them off on a basis equal to the full 6 per cent on the reorganised capital. A dividend of 3 per cent on the ordinary stock, after reorganisation, is also declared in respect of 1953 and the first half yearly dividend of 3 per cent on the preference capital after reorganisation in respect of the first half of this year is also announced.

★

CABLES INVESTMENT TRUST. The interlocking group of investment trusts under the chairmanship of Sir Edward Wilshaw has seen in the lifting of the ban on new issues by investment trusts an opportunity for expanding its portfolios and activities. The prologue to the new issue is the announcement that in the year to June 30th the net income of both Globe Telegraph and Trust Company and Cables Investment Trust—controlled jointly by Cable and Wireless (Holdings) and Globe Telegraph—have risen and both trusts have decided to increase their ordinary dividends from 8 to 9 per cent. The new issue arrangements are that Cables Investment Trust will place privately £1 million of 4 per cent unsecured loan stock and will increase its equity capital of £2 million by a £500,000 issue to Cable and Wireless (Holdings) and Globe Telegraph. In turn, the directors of Globe Telegraph are contemplating a new issue of shares to stockholders and they hope to make a further announcement before the end of the year.

The effect of this arrangement is that the subsidiary by raising prior charge capital on comparatively cheap terms provides a cushion for the equity earnings of its parents. The investment of the new funds should naturally increase the earnings cover on the ordinary dividend of Cables Investment Trust. Therefore it should enable the parent company, Cable and Wireless (Holdings), to distribute its own earnings almost up to the hilt. In all it is a sensible scheme.

LONDON STOCK EXCHA

Next Account begins / August 1.
Next Contango Day: August 11
Next Settlement Day: August 17t

THE stock market began the week on a dull note, but on Wednesday the Suez agreement and the better tone on Wall Street brought a rally. In the gilt-edged market, the biggest losses were reported in the undated issues which lost as much as ¾ of a point in dealings in the first two days of the week. On Wednesday, however, the prompt over-subscription of the Rhodesia and Nyasaland lists gave the market a fillip and produced gains of up to ⅞ of a point among the undated and long dated stocks. The chief feature of the banking sector was the abrupt movement in the price of the shares of the Mercantile Bank of India. After the announcement that the bank's shares were to be sub-divided and that a free scrip issue was to be made the "A" shares rose by 11 to 40; but on Wednesday profits were taken and the "A" shares came down to 37½. Little interest was taken in foreign bonds and the price of the German and Japanese issues tended to fall; by contrast the 7 per cent Polish stock appreciated (a reflection, it was reported, of buying in a market short of stock).

In the industrial market the biggest losses were reported on Tuesday. Price movements on Wednesday were usually small, but the undertone was firm. Store shares rallied well, and textiles, tobacco, electrical equipment, while building material issues were also firmer. Dealers reported a good demand for Stewarts and Lloyds, which advanced on Wednesday by 1s. 3d. to 2s. 6d. premium. In the brewery market, Watney's shares rose by 1s. 6d. to 65s. 9d. after the announcement of the possible sale of the site in Pimlico. Oil shares were dull at first, but rallied later. Tea shares advanced all along the line in response to the continued firmness in the price of tea. Turnover in the Kaffir market was higher than it has been for some weeks. Continental and professional support contributed to the rise in the prices of the OFS and Far West Rand issues.

Financial Statistics

EXCHEQUER RETURNS

For the week ended July 24th there was an "above-line" surplus (after allowing for Sinking Funds) of £9,864,000 compared with a deficit of £3,769,000 in the previous week and a surplus of £248,000 in the corresponding period of last year. This brought the cumulative deficit to £136,586,000 (£192,524,000 in 1953-54). Net expenditure "below-line" absorbed £12,465,000 bringing the total cumulative deficit to £275,838,000 (£353,399,000 in 1953-54).

THE MONEY MARKET

At last week's Treasury Bill tender total applications fell by only £10 million from their high level of £433.1 million in the previous week. The offer was again reduced by £10 million, to £230 million, and the market maintained its bid at £99 12s. 2d per cent. The upshot was that its allotment remained at only 34 per cent. At yesterday's tender the offer was raised to £240 million.

Largely on account of the market's small take-up of bills, Lombard Street has had a quiet week. On Thursday before the week-end market supplies of credit were adequate, but on Friday conditions became tighter and the authorities made small special purchases, indirectly through the banks. On the remaining days of the week covered by the Bank return conditions turned comfortable, and small balances were left unlent.

Business in the gold market has been more active in the week covered by the Bank return. The price at the fixing remained at 249s. 0½d. per ounce until Wednesday of this week, when strong demand raised it to 249s. 1d. This was equal to the previous peak price since the reopening of the market in March, reached in the middle of May.

The fiduciary issue has been raised by a further £25 million from its record level of £1,725 million; this brings the total increase in the issue since the end-January low-point to £175 million, compared with £125 million in the corresponding period of 1953.

At the 52nd Annual General Meeting on the 26th July, 1954, the speech by the Chairman, Mr. E. Ronald Crammond, included the following:—

Appreciation on investments at 30th April, 1954, was £541,345, being more than double the excess at the close of the previous year.

Of the total investments and loans of the Group 48% are in Canada.

The dividend on the Preferred Ordinary Stock raised to 9% last year, has been raised to 10% this year.

A subsidiary Company, GENERAL SECURITIES REGISTER, LIMITED, is being increasingly used as a "recognised marking name" for Canadian and American stock and share certificates.

BETRUST INVESTMENT CORPORATION LTD. has been formed as a subsidiary in Canada with a capital of $1,000,000.

Copies of the Annual Report and full speech may be had on application to the Secretary, 52-60, Bishopsgate, London, E.C.2, who will be pleased to receive enquiries from companies requiring the Companies' services.

COMPANY MEETINGS

THE STANDARD BANK OF SOUTH AFRICA

CONTINUED STEADY EXPANSION

SIR FREDERICK LEITH-ROSS ON YEAR OF MARKED PROSPERITY

The one hundred and forty-first ordinary meeting (being the annual general meeting for the year 1954) of The Standard Bank of South Africa, Limited, was held on July 28th in London, Sir Frederick Leith-Ross, GCMG, KCB (the chairman), presiding.

The following is an extract from his circulated statement:

As would be expected of an institution such as ours, which has to develop with the development of Africa, the total of our assets continues steadily to grow. This year the balance sheet has increased by something over £25 million to a total of £363 million. You will recall that in 1953 we decided to increase our capital by £2 million and, although there were special reasons connected with the banking law in the Union of South Africa which made this desirable, it is clear than an increase was more than justified by the continued expansion in our business. I may remind you that in 1939 the total of our balance sheet amounted to £86 million. In the fifteen years that have passed since then our figures have multiplied more than four times and, although the value of money has fallen considerably in the intervening period, there is no doubt that the business of the bank has made real progress.

The balance of profit for the year after providing for taxation and after making transfers to the pension fund and to the reserve for contingencies amounts to £635,811. An interim dividend of 1s. per share was paid on January 30th last.

The board recommend that a final dividend for the year of 1s. 3d. per share be paid.

UNION OF SOUTH AFRICA

Despite recurrent apprehensions of political trouble, both international and domestic, the year under review has again been one of marked prosperity in the Union. It has been described as a year of consolidation rather than of expansion: but this does not mean that it has been a period of stagnation. On the contrary, there has been a steady and substantial advance in almost every field of economic activity. Agriculture, which still remains the basic industry of the country, has had a particularly good year, new records of production having been attained in many sectors. The development of industry has continued and the output of private manufacturing undertakings increased in value by about 10 per cent. The new goldmines, in which some £150 million have been invested since the war, are now beginning to produce substantial results, over £5 million worth of gold having been obtained from the few mines in the Orange Free State field as yet in active production. A number of others are commencing operations and receipts from uranium are beginning to supplement the income from gold. Altogether, there is every justification for confidence in the economic prospects of the country.

As a result of the expansion in production, the national income showed a further considerable increase over the record figures of 1952. The increase over the past five years has amounted to no less than 50 per cent—a remarkable rate of progress. In the circumstances it is not surprising that the advances made by the commercial banks last year also reached record levels, due in part to the substantial assistance required for financing crops. Under the South African banking law, the advances that can be accorded by the commercial banks depend upon the amount of their capital and unimpaired reserves held in the Union and the increase in the capital of our bank which took place last year has given us greater resources for meeting the increased demands of business. The expansion of credit that has taken place is not excessive, as the commercial banks have continued to apply a conservative lending policy. The main problem has been the financing of the capital needs of the government and of public or semi-public authorities. The strain was relieved by the measures taken by the finance minister last year to secure a substantial budget surplus, as well as to impose a special loan levy on the taxpayer.

As a result, inflationary pressures have been kept in check and although internal prices have continued to rise, the rate of increase has diminished in comparison with previous years and prices, on the whole, have been more stable than for some time past. There has been keener trading competition but turnover has been well maintained and the volume of business, as recorded in the retail indices, has been slightly higher, in terms of money, than in the two previous years. The wholesale price index of imported goods has shown a downward tendency but this has had little effect on internal prices owing to the continuance of import and exchange controls. The government are hopeful that, provided no unforeseen difficulties arise, these controls may be relaxed in the comparatively near future, as a first step to their eventual abolition.

SOUTH-WEST AFRICA

General trading conditions were quieter than in 1952, as shopping demand, which is markedly sensitive to seasonal factors, was somewhat hesitant owing to the after effects of the 1952 drought and to lower prices received for karakul pelts. Total turnover was, however, fairly satisfactory owing to continued expansion in the fishing industry and to the maintenance of activity in the mining industry. The territory continues to achieve a substantial favourable external balance of payments. Farming is still the mainstay of the territory. Conditions improved in 1953 owing to timely rains, and this should ensure maintenance of general business activity in the current year.

THE FEDERATION OF RHODESIA AND NYASALAND

On September 3, 1953, the Federation of Rhodesia and Nyasaland came into being. This marks a great step in the history of these territories. Although the general economy of the country is, at present, relatively undeveloped, its economic potential is high and there is every reason to hope that with its combination of agricultural and mineral wealth, and growing industrialisation, the Federation will develop into a strong and well balanced economic unit.

As statistics for the Federation as a whole will only become available during the course of the current year, our review of the economic activity for the past year of the three territories comprising the new state is based, as in previous years, on the former territorial pattern.

SOUTHERN RHODESIA

The volume of general business during the past year showed a moderate decline, and turnover in the wholesale and retail trades was lower than that of the preceding year. Staple goods continue to command a sustained turnover but purchases of non-essential items have become more and more selective. Wholesalers and retailers are, nevertheless, looking forward with confidence to more prosperous trading conditions as it is expected that the volume of general business will expand under the impetus of the new arrangements enabling goods to move more freely between the federated territories.

The development of secondary industries in Southern Rhodesia has been a notable postwar achievement. The number of industrial establishments has more than doubled in recent years and the value of their output has risen from some £18 million in 1945 to an estimated £107 million in 1953. The range of goods manufactured has greatly expanded, and their quality is said to be comparable with imported articles; there is now a substantial export of certain products.

NORTHERN RHODESIA

Business conditions were generally satisfactory both in the wholesale and in the retail sections, though reports have also spoken of a quieter tone. Commercial turnover was relatively steady, but it was apparent that a shortage of ready money was felt, particularly among the smaller traders. Most branches of the economy of Northern Rhodesia made progress and business conditions are expected to continue on a satisfactory level. There was considerable new building construction during the year.

The provisional figures for the value of the mineral production for 1953 show a substantial increase on the previous year's record. The expansion in the receipts of the mining industry was due mainly to the higher output of the copper mines whose prosperity is of paramount importance to the economy of Northern Rhodesia. 362,581 tons of copper worth £90 million were produced in 1953; this compares with 312,363 tons worth £72 million in 1952.

NYASALAND

Trading conditions in the European sector of business recovered to a large extent from the setbacks of the previous year, due principally to the satisfactory prices obtained for tea. In addition, the tobacco crop was on

the whole a good one, realising satisfactory prices, and there was an increased production of food crops. The external trade of the territory continues to develop and, with a sharp fall in the value of imports, the adverse trade balance was considerably reduced.

EAST AFRICAN TERRITORIES

In Kenya the commercial community has withstood very well the setback caused by the state of emergency which arose from the activities of Mau Mau elements.

Development is still taking place, but the influx of capital from overseas has been on a considerably reduced scale and there have been few *new settlers. Farming in the* colony as a whole has again suffered from lack of rain, but farmlands generally have retained their values. Last season's coffee crop showed a substantial increase over that of the previous year with very favourable prices and an equally successful year is forecast. The production of sisal has been maintained.

In the troubled areas business has been restricted but commitments continue to be met and the effect on wholesale business has not been as serious as might have been expected. The colony's adverse trade balance is slightly less than a year ago but the cost of operations to deal with Mau Mau troubles is putting an excessive strain on the finances of the colony.

The reports and accounts were adopted.

FODENS LIMITED

The fifty-second annual general meeting of Fodens Limited was held on July 28th at Elworth Works, Sandbach. Mr James Wild, the chairman, said in his report:

The accounts presented are for a trading period of ten months only.

The demand for our vehicles and engines has continued to increase, and in spite of the many difficulties which are inseparable from present-day trading we have been successful in increasing our output to meet this demand.

The trading activities of our South African subsidiary continue to be very satisfactory and the board is now negotiating for larger premises to meet the increasing demand which we expect for our products in the Union.

The following analysis shows how each £1 of the gross trading income was used during the year:

	s.	d.
Wages and salaries ...	4	0¼
Materials and services	13	11¼
Servicing of buildings, plant and equipment		3¼
Taxation	1	0¼
Retained in the business		5
Dividend (net)		2¼
Total	£1	0 0

Our order book is in a satisfactory condition and we shall use all our endeavours to keep production costs to their minimum and output at its maximum, consistent with our well-known high quality of manufacture.

With the loyal support of all our workers I have no doubt whatever that Fodens will continue to merit the good name they have always had for reliability since the pioneering days of the nineteenth century.

I am sure you will join with me in expressing to all employees our appreciation of their loyal co-operation and good work during the past year.

The report was adopted.

BRITISH SUGAR CORPORATION, LIMITED

RECORDS BROKEN

SIR ALAN SAUNDERS'S ADDRESS

The eighteenth annual ordinary general meeting of the British Sugar Corporation, Limited, was held on July 27th, in London, Sir Alan Saunders, OBE, chairman, presiding.

The following is an extract from the chairman's circulated address for the year to March 31, 1954:

In 1953 the weather was almost ideal for this industry. Sugar beet growers and the home-grown sugar factories broke one record after another. The quantities of beet delivered to the factories and of sugar produced were the highest in the history of the industry. The average yield per acre was also a record.

Freedom from disease and continuously favourable harvesting weather were probably the most significant factors in the record results, but full credit must also be given to growers for the higher standard of cultivation now attained.

CROP DETAILS

Last season the total crop was 402,477 acres, grown by 38,191 growers, giving an average of 10.54 acres per grower. The yield of sugar beet per crop acre—13.11 tons—surpassed the previous highest, 1950, by 0.3 ton. The total tonnage delivered to the factories was 5,275,159. This was 1,039,251 tons more than in the preceding year and 58,877 tons higher than the previous record in 1950. The average sugar content, at 16.31 per cent, was slightly lower than in the previous season, but the average sugar per root (110 grammes) was a record. The production of sugar beet pulp, an attractive stock feed, was 321,018 tons. Molasses production was 211,638 tons.

Approximately 4½ million tons of crowns and leaves were available on the farms and our records show that a higher proportion than ever before was fed to stock.

Our six heaviest crops to date have been produced in the last eight years, and a comparison of the yield per acre for the past five seasons (11.55 tons) with that of the immediately preceding five years (9.47 tons) shows an increase of nearly 22 per cent.

I have referred on previous occasions to the progress that has been made with the mechanisation of the sugar beet harvest, and the percentage of the crop harvested in this manner last season reached the record figure of 30 per cent.

We are now tackling the spring labour peak comprehensively. In 1953 we supplied farmers with more specially processed seed than previously, and considerable progress has also been made with the technique of mechanical thinning.

RE-EQUIPMENT OF FACTORIES

Since I announced in 1950 the long-term proposals for re-equipment and modernisation of the Corporation's 18 factories, involving an expenditure of between £9 million and £10 million, the work has gone forward satisfactorily in accordance with the plans laid down; and, in fact, is expected to be completed during the present financial year. In the year under review, capital expenditure amounted to £1,748,000, making a total expenditure since April 1, 1949, of £7,874,000.

By the second week in February the whole crop had been safely worked at a record average slice of 42,578 tons a day. This is the more commendable as the former record of 41,115 tons, achieved in the previous year, was for a much smaller crop which was processed by mid-January.

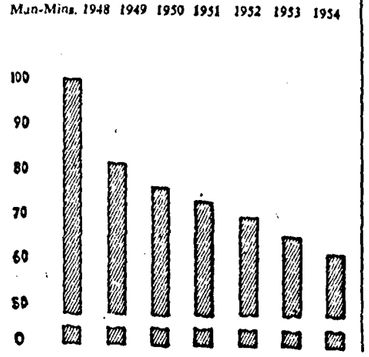
Despite the considerable increase in speed, the sugar losses in process were reduced by 5 per cent. Our labour productivity has again been increased by almost 5 per cent, and our campaign casual labour has again been reduced.

The record tonnage of sugar produced during the beet campaign was 748,935 tons, 464,730 tons of which was white sugar and 284,205 tons raw sugar.

The conversion of Allscott factory from raw to white sugar has been completed, and this accounts for the increase in the proportion of white sugar produced. Thirteen factories now produce white, and five, raw sugar.

Although the need for reconstruction funds is still great, my colleagues and I have reached the conclusion that there should be a modest increase in the members' dividend. Accordingly, we are recommending that the dividend which has been maintained for the past fourteen years at 4½ per cent should this year be increased to 5 per cent.

CHART I.—Factory Labour
(man-minutes per ton of beet worked)



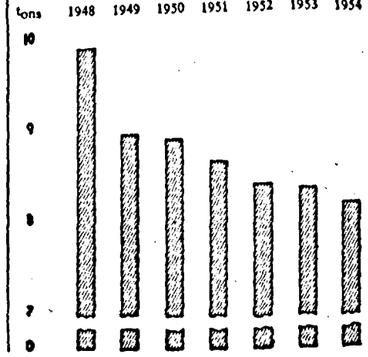


CHART II.—Coal Saving
(coal used per 100 tons of beet worked)

GEORGE NEWNES LIMITED

RECORD RESULTS

STATEMENT BY THE CHAIRMAN, MR H. C. TINGAY

The fifty-seventh annual general meeting of the company was held on July 29th at the company's offices, Mr H. C. Tingay, chairman, presiding. The following is an extract from his statement:

Sir Frank Newnes, Bt, who has filled the position of chairman for very many years, has at his own wish recently decided to retire from that position through advancing years. It is a matter of gratification to his colleagues to know that he will continue as a member of the board, thus making available the benefit of a long business experience acquired over a lifetime with the company. In recognition of his long association with the business—founded by his father over 60 years ago—it is the earnest wish of the other members of the board that Sir Frank should fill the newly created, indeed specially created, position of president of the company, and shareholders will be happy to know that Sir Frank has accepted that position in addition to remaining a member of the board.

RECORD FIGURES

Last year the company was able to announce that the results at that time constituted a record in its history. This year the figures make an even better showing. The combined earnings of the Group amount to £1,518,649 as compared with £1,111,003 for the previous year. After deducting taxation of £794,896 as against £476,842 there remains a net profit of £723,753—an increase of approximately £90,000 over that of last year.

The figures of the parent company, George Newnes, Limited, show a corresponding advance. The net profits, after deducting taxation and all other charges, amount to £468,050 as compared with £409,153. With the amount brought forward from last year, and after deducting dividends on preference shares and interim dividend on ordinary shares, there remains a disposable balance of £476,183. The directors recommend a final dividend of 13 per cent, making 16 per cent for the year, on the ordinary shares. Of the balance remaining they propose that £10,000 be placed to sick and pension fund, £10,250 to supplementary pensions account, £188,758 to general reserves, and £20,000 to reserves for contingencies, leaving £94,000 to be carried forward. The arrangements carried out at the end of last year to increase the 10s. ordinary shares to 20s. by capitalising reserves reduced the general reserves to £311,242. The sum of £188,758 now being allocated brings that item back to the round sum of £500,000.

The consolidated accounts setting out the affairs of the Group present a strong and healthy position. Various reserves total £2,271,879, including development reserves of £779,143. Balances on profit and loss accounts of the various companies, i.e., undistributed profits, amount in all to £346,437. Cash and tax reserve certificates total £2,058,717 as compared with £1,486,849 last year.

WIDELY SPREAD INTERESTS

The trading of the Group continues on a high level. Circulations and advertisement revenues, in many directions, constitute new records. Of the fifty-six publications comprised in the group about one-half are in the general and specialised field, the other half being in the trade and technical field. Our publishing interests are thus widely spread—a policy laid down by the company many years ago as providing the best security against unforeseeable happenings.

The number and variety of publications preclude separate mention, but some of the more important properties might be referred to individually. *Woman's Own*, our colourgravure weekly, fully maintains the powerful position it has reached both with readers and advertisers. Its present sale of nearly two and a quarter millions is restricted to that figure only by reason of additional paper supplies not being available. The same applies in the matter of pages, and under present conditions advertisers are unable to obtain in full the amount of space they would like to have. We are hopeful that these hampering restrictions will shortly be removed or at least modified.

Tit-Bits—that lively septuagenarian weekly—not only adds to its years but also continues to add to its circulation. Since speaking of its remarkable vitality and progress at this time last year, the weekly sale has now well passed the million mark.

Our group of "Practical" periodicals—*Practical Mechanics, Practical Wireless, Practical Television* and *Practical Engineering*—has recently been extended by a newcomer, *Practical Motorist and Motor Cyclist*. Although only in its third issue, the demand has been overwhelming, and it would appear that another successful member has been added to this very popular "Practical" family.

Homes and Gardens, our popular monthly magazine, continues to advance both in sales and advertisement revenue. The figures, now at record levels, still show the same upward trend.

C. Arthur Pearson Limited, our principal subsidiary in the general publishing field, shows excellent results from a well-varied group of publications. *The Smallholder*, the accepted weekly journal for all small food producers including the home gardener, stands out prominently. During the year its scope was expanded and the selling price raised from 3d. to 4d. At no time in its long and successful history has its appeal both to reader and advertiser stood at a higher level.

The latter may also be said of *Aeronautics*, our high-class aviation monthly, which holds the respect and attention of British and overseas aircraft and aero-engine constructors. It also plays an important part in the national economy in making known abroad the high quality and technical excellence of our aeronautical products.

Amateur Gardening has had another excellent year, the circulation reaching the highest figure in its long history. The editorial policy has moved still further towards widening the paper's appeal, without in any way lowering its high standard, so as to attract an ever-growing gardening public. An attractive new photographic cover with coloured border has been warmly welcomed by readers.

DICTIONARY OF ENGLISH FURNITURE

On the *Country Life* side of the business the event of the year has been the publication of a new edition of the *Dictionary of English Furniture*. This monumental work, consisting of three volumes, half a million words and nearly 2,800 illustrations, has been out of print since the beginning of the war, and the demand for it was such that it was not uncommon for odd volumes, originally sold at 5 guineas each, to fetch £30 or £40. The new edition, completely revised and enlarged by Mr Ralph Edwards, has had a reception far exceeding our expectations, in spite of the necessarily high cost of 30 guineas a set.

Country Life itself maintains its unquestioned pre-eminence in its own field.

Our associated company, Temple Press, has also done well. In addition to its extensive publishing interests in technical and specialised fields, it has one of the most modern printing works in London. Since the war a considerable amount of new plant has been installed, and this year, in order to meet the steadily increasing demand for their weekly journals, such as *The Motor, The Commercial Motor* and *Motor Cycling*, an order for new high-speed magazine rotary presses has been placed. Temple Press is justifiably proud of its reputation for high quality printing, particularly colour work. More colour than ever is now required by advertisers, especially in their monthly journals, *The Motor Ship, The Oil Engine and Gas Turbine, Plastics*, and the export journal, *The Overseas Engineer*, and to meet this demand the most modern colour presses available are now being installed.

The National Trade Press similarly records a successful year. The company has benefited from the revived prosperity of the textile and footwear industries which are served by several of its publications and Trade Fairs. During the year the number and range of its Trade Fairs was extended, and at the present time seven exhibitions are being sponsored through its journals. The Trade Fairs have been welcomed by exhibitors, also by tens of thousands of buyers from all parts of the British Isles, as well as many from overseas. A collection of the models exhibited at the National Fabric Fair (now in its fourth year) has on each occasion afterwards been flown by BOAC to South Africa, Australia, New Zealand and USA, where they have been shown to audiences of women in large towns. It is estimated that more than 250,000 fashion-loving women overseas have been able to see the models.

BOOK INTERESTS

Our book publishing interests, largely devoted to subscription selling, record a high level of trading both in this country and in other English-speaking countries. From time to time reference has been made to the great publishing enterprise in which, the company engaged a few years ago in producing an entirely new edition of the world-famous *Chambers's Encyclopædia*, by arrangement with W. and R. Chambers, Limited, of Edinburgh. As the only completely new postwar British encyclopædia it ranks as a work of the first order of importance in authority and scholarship. The very large expenditure involved in the initial preparation has been amply justified by results, and another edition is now in course of production to meet the continuous and considerable demand.

The report and accounts were adopted.

THE AMALGAMATED PRESS LIMITED

CHAIRMAN'S STATEMENT

The following is the statement of the chairman, the Hon Michael Berry, MBE, on the report and accounts for the year ended February 28, 1954, submitted to the annual meeting on July 29th.

Before reviewing the progress of the year, I must dwell again on the grievous loss to the company, already recorded in the directors' report, of the late Viscount Camrose. Lord Camrose became chairman of The Amalgamated Press Limited in 1926 and continued in that position until the day of his sudden death on June 15th.

You will not expect me, his son, to attempt his obituary. Rarely, in any case, has the press of so many countries poured out such splendid tributes in memory of a man who, throughout a many-sided life, had preferred to be known publicly only through what he created. One recalls particularly the emphasis on his humanity, his integrity and his courage. What has been said of him is best summed up in the words of a distinguished Danish journalist, Jorgen Bast, in *Berlingske Tidende* who wrote "One of the great trees in the forest of the world press has fallen."

For more than a quarter of a century Lord Camrose guided the fortunes of The Amalgamated Press. During that time the company has continually expanded and augmented its position as the largest periodical publishing house in the country.

From the age of 14 to his death, Lord Camrose was primarily a working journalist. His first independent enterprise was a periodical; but whether he was concerned with periodicals or newspapers—and in the course of his life those with which he was connected catered for many differing types of readership—he always maintained fixed principles. He would never pander to the meaner tastes. He scorned, and I am sure you too scorn, the easy money to be garnered by lowered standards. It is the more a crowning tribute to his 27 years as chairman, that deriving so much from his inspiration and wisdom, the accounts which I now present to you are a record in the company's history.

THE ACCOUNTS

The gross profits of The Amalgamated Press group amount to £4,784,000 after charging debenture interest. This compares with £4,240,000 last year and betters even the £4,773,000 of the preceding year during which abnormal profits were made by our paper-making subsidiary.

To a large extent, of course, we have laboured in vain. The increase on last year's profits is £544,000 but on this the taxation charge is £422,000, so that we have left only £122,000 more to deal with. On the other hand there is included in the charge £95,000 for excess profits levy, a tax which has now been repealed.

The net profit, after taxation and after allowing for profit attributable to outside shareholding, is £2,005,000. We are leaving £586,000 in the accounts of subsidiaries, which is £14,000 less than last year, and after £36,000 added back for provisions no longer required, there is a balance of £1,455,000.

We propose a final dividend of 17½ per cent on the ordinary shares, making a total of 27½ per cent against 22½ per cent last year. After allowing for the preference and interim ordinary dividends already paid, and adding in £409,000 brought forward from last year, we are left with £1,328,000 to allocate.

Of this we have transferred £750,000 against £600,000 last year, to general reserve. We have also transferred to general reserve the £450,000 standing to the credit of contingencies and development reserve. Your directors consider that there is no longer any useful distinction between the two reserves and that a clearer picture is shown by their amalgamation. The total of the general reserve therefore becomes £4,800,000. We have in addition applied a further £250,000 in writing down copyrights and goodwill to a round sum of £3 million. These very large allocations require a total of £1 million, leaving £328,000 to be carried forward.

Finally, it is proposed to create 2,400,000 "A" ordinary shares of 10s. each, ranking with the existing ordinary shares, but carrying no voting rights, and to issue them as a bonus of one share for every two ordinary shares held. This recommendation, for which we have received the consent of the Capital Issues Committee, will be the subject of an extraordinary general meeting following the annual general meeting.

There are not many items in the balance sheet to which I need specially draw your attention. Current assets are £5,534,000 against £4,871,000 last year. On the opposite side current liabilities are £1,100,000 against £812,000. This leaves a surplus of current assets over current liabilities of £4,434,000, an increase during the year of £475,000.

In the consolidated balance sheet current assets are up by £1,345,000, while liabilities are down by £164,000.

TRADING OF THE YEAR

These satisfactory results have not been easily achieved. Production costs, despite economies wherever possible without loss of goodwill, have continued to rise. The relief which came from a decrease in the price of paper was completely swallowed up by increased printing charges. All other costs have advanced—wages and salaries have risen and we have had to pay more for editorial material, engraving and carriage.

WOMEN'S MAGAZINES

Our women's magazines and periodicals have increased their readership. With their big sales, together with the high purchasing power which readers have for both personal and domestic spending, our publications have proved themselves better-than-ever value for the advertisers. Homemaking, housekeeping, cookery, mothercraft, fashion, health, beauty—all these are our readers' everyday interests. On each of these subjects they seek help and guidance both from the editorial features and from the advertisements.

Despite the constant growth of television and other counter-attractions a number of our periodicals reached all-time peak circulations during the year. In the last week of February, 1954, we sold more than 10,600,000 copies of our weekly publications, and in the same month the public bought over 2,650,000 copies of our monthly magazines. I am sure you will agree that these are remarkable figures.

Our publications are so numerous that I must omit mention of a large number of them in this review of the year's operations. Once again, *Woman's Weekly* has been in the limelight. During the 12 months it achieved the largest average weekly sale it has ever recorded—and this in the teeth of intense competition. Its continual expansion, with a weekly sale now over 1,825,000, has been one of the outstanding features of our company.

Among our monthly magazines, *Woman and Home* has once again reached a higher circulation. With a figure of well over 900,000, it enjoys, as it has done for many years past, a sale far in excess of any other competitor in the same field.

Woman's Journal, pre-eminent among quality magazines for women, has had an equally successful year. Sales have remained steady and advertisement revenue continues to increase. The Coronation Issue with 170 pages was a tour-de-force of editing and production and received high praise from readers and advertisers alike.

KELLY'S DIRECTORIES LIMITED

Kelly's Directories, Limited, and its subsidiaries have again had a most satisfactory year. Group profits, after all charges, have further advanced from £1,295,000 to £1,393,000 this year. After taxation and profit attributable to outside shareholdings, there is a balance of £668,000 compared with £526,000 last year. Of this sum £335,000 against £299,000 has been retained in subsidiaries, leaving a net profit of £332,000. The dividend on the ordinary stock has been increased from 20 per cent to 22½ per cent, £175,000 is again placed to revenue reserve, and the carry forward is slightly raised to £183,000.

THE ASSOCIATED ILIFFE PRESS LIMITED

The year has been a most satisfactory one for the Associated Iliffe Press whose 35 journals cover such a wide range of special subjects.

A number of new circulation records have been set up. Particularly good figures have been achieved in the motoring and aviation fields where *The Autocar*, *The Motor Cycle* and *Flight* have forged ahead.

Farmer & Stock-Breeder has once more exceeded its previous highest total of advertising. For the whole Iliffe group the year's advertising revenue amounted to £3,500,000, an increase of 8 per cent.

FUTURE PROSPECTS

In regard to the current year I should not feel confident in making any exact predictions. In publishing, the major part of our business, results have so far been not unsatisfactory, though production costs still tend to rise and may prevent us from enlarging our activities to the extent we would wish. Moreover, competition will undoubtedly remain very keen. Since the war, the paper-making industry has been accustomed to so many sudden shifts of Government policy that an estimate of its profitability a year hence would entail a large measure of crystal gazing. Taking all our operations together, and you appreciate how widely based they are, there seems no reason why next year's results should be less acceptable than those now before you.

Whatever the future may hold I am certain that the specialised knowledge, experience and skill of our staffs in all sections of our business will be equal to the changes and difficulties which are inevitable in the running of this vast company.

I know that all shareholders will wish to join me in paying a tribute to the enthusiasm, loyalty and hard work of all those who served the parent company and its subsidiaries during the past year.

TRUST HOUSES LIMITED

MERITS OF CONSERVATIVE DISTRIBUTION POLICY

The fifty-first annual general meeting of Trust Houses Limited was held on July 23rd in London.

Captain A. R. S. Nutting, OBE, MC, the chairman, who presided, in the course of his speech, said: Our trading profit of £469,711 for the year under review shows a small increase of approximately £2,000, but after taxation and a non-recurring item (for which we obtained credit last year—namely, interest on our war damage claims), and adding thereto the balance brought forward from the previous year, we have an amount available for appropriation of £252,330 which is £639 more than last year.

We propose to place to reserve for improvement and development of properties, the sum of £80,000. We are not this year making a transfer to the staff benefit fund, and I shall refer to this later.

We propose to pay the same dividend as last year—namely, 8 per cent and to increase our carry forward by £7,000.

On the merits of a conservative distribution policy, I would like to give you an extract from a speech made in January this year by Sir Harry Pilkington, president of the Federation of British Industries. He said "we must persuade our own shareholders, the general investing public, to take a long view. Of any two companies in identical circumstances, making a thousand pounds profit, the one that pays out £700 and invests £300 in the future is worth less, not more, than the one that pays out £300 and invests £700 in the future. There was a parable about the wise and foolish virgins; so often the open market for shares applies false values and pays attention to what was paid out and not what was retained."

As far as your company is concerned, with taxation as high as it is and purchase tax payable on so many items which are tools of our trade, our problem is to retain enough for the future.

ACQUISITIONS AND IMPROVEMENTS

If you will turn to the balance sheet, you will see that our fixed assets have increased by £97,000 and our furniture and equipment by £80,000. We have acquired the Imperial Hotel, Exmouth, the Pendragon Hotel, Southsea, and the George Hotel, Battle. We have also made extensions and improvements to several of our houses, notably to the Angel Hotel, Guildford, Francis Hotel, Bath, Dolphin Hotel, Southampton, Cricketers Hotel, Bagshot, and the Abinger Hatch Hotel, Abinger.

If it were not for the money we plough back into the business each year, and the substantial part of our profits that we spend on keeping our houses up to date, I fear we should not be in the position to maintain our earnings.

We run our business on a small profit margin, our expenses are always increasing under nearly every item, but I think I can claim, and I hope and believe you will agree that we give our customers the best possible value for money.

I have already mentioned that we are not making a transfer to the staff benefit fund, and I would like to tell you what we are proposing to do. We have, as I think our shareholders know, at present in being a superannuation fund for our head office staff; we now propose to inaugurate a pension fund for our managers at our houses. We feel that this is most desirable.

The report and accounts were adopted.

RICHARD COSTAIN LIMITED

ORGANISATION'S STEADY PROGRESS

SUBSTANTIAL CONTRACTS IN HAND

SIR RICHARD COSTAIN ON BOARD'S CONSERVATIVE POLICY

The twenty-first annual general meeting of Richard Costain Limited was held on July 23rd at Rodney House, Chichester Street, Dolphin Square, S.W.1, Sir Richard Costain, CBE (chairman and joint managing director) presiding.

The secretary read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1953:

The group's trading profits in the consolidated profit and loss account amount to £354,017 for 1953 and show an increase over the previous year. After provision for depreciation, interest, taxation and outside shareholders' interests, the net balance of profit applicable to the group is £105,094 compared with £96,543 for the previous year and the amount available in the parent company's accounts is £104,886. Further capital profits on the sale of fixed assets have been realised during the current year and added to general capital reserve account. It will also be noted that there is a considerable reduction in bank borrowings compared with the previous accounts.

The board have given careful consideration to the advisability of recommending an increase in the rate of ordinary dividend which has been maintained at 10 per cent for a number of years. The policy of the board in restricting dividends to the moderate level of 10 per cent has been dictated by the necessity of conserving resources for the development of trading activities. Having regard to the large commitments normally undertaken in connection with our civil engineering work a conservative policy must be continued. However, the board feel that shareholders should participate in the substantial capital profits which have been realised in recent years. They propose, therefore, to recommend a capital (tax free) bonus payment of 3 per cent out of the general capital reserve account. It is hoped that circumstances will permit this capital bonus of 3 per cent to be continued for at least a limited number of years, and it will in future not necessarily be paid at the same time of the year as any proposed ordinary dividend.

AT HOME

The company has a number of substantial civil engineering contracts in hand which it is carrying out with the efficiency which is the constant interest of your board.

Considerable progress is being made with the large hydro electric scheme at Garry in Northern Scotland. Further new work was obtained during the year including a large contract for the LCC at Beckton Sewage Works and in spite of hardening prices it is hoped that satisfactory results will be obtained from these contracts.

Construction of the new Silver City Airfield at Ferryfield, Lydd, was entrusted to the company comprising two runways, terminal buildings, restaurant, Customs buildings, and petrol installations. It is anticipated that the airfield will be in operation at the end of June, and sets a new standard for rapid construction.

We have also obtained further contracts for opencast coal mining during the year.

The policy of de-centralisation has been further extended during the year and branches are now in existence at Plymouth, Bristol, Newcastle and Canterbury.

Further large building projects are being carried out, and we are erecting our own new offices in Westminster Bridge Road, which we hope will be completed in the autumn. These should increase considerably the efficiency and economic running of the head office organisation of your company.

Your subsidiary company, Costain Concrete Company Limited is continuing to take the lead in the production of pre-stressed concrete sleepers for British Railways and have produced their millionth sleeper during the year. Other forms of concrete products are being developed and expanded.

Our associated firm, Costain—John Brown, continues to develop, and is now well established as a chemical construction engineering firm. During the year it purchased the technical assets of Bamag, a chemical engineering firm which specialises in edible oil plants among other things. The oil refinery construction for the Anglo-Iranian Oil Company on which Costain—John Brown is engaged together with British and American associates at Kwinana, Western Australia, is proceeding very satisfactorily.

During the year, the property side has continued to suffer from the Rent Restriction Act and while one appreciates the efforts that are being made by the Government, I am afraid these will only result in a very limited improved return to your company which will not in fact off-set the increased costs of the last fifteen years.

WORK ABROAD

CANADA.—In view of the potential development in Canada, your company has had under consideration for some years extending its operations in this area. After surveying the situation, we have purchased a controlling interest in a company, the Leeds Construction Limited, which is at present operating in Montreal.

KUWAIT.—Our associated company, the Gulf Engineering Company (Kuwait) Limited, in which we are in partnership with Abdulla Mulla Saleh, has continued operations in Kuwait. The work which the company is carrying out includes the erection of a new power station and the construction of reservoirs and water towers. All work, I am glad to report, is well up to schedule. No profits from this side of our activities have so far been brought into the group profit and loss account.

RHODESIAS.—With the advent of Federation, it is felt desirable to establish a permanent organisation in these countries and the board, therefore, is engaged upon forming subsidiary companies in both Northern and Southern Rhodesia. It is hoped this step will lead to greater efficiency. The experience which the company has gained during the past seven years is now proving of real value and the volume of work continues at a satisfactory level.

WEST AFRICA.—The main sea wall of the Apapa Wharf Extension was completed this year 100 days ahead of the original programme. The Ijora and Oji power stations

are both making good progress, and the Costain (West Africa) Company has still continued to make good headway.

It is hoped to maintain and improve upon the present satisfactory progress of our organisation in its various spheres of activity and the board is deeply appreciative of the continued support and co-operation of the staff everywhere.

The report and accounts were adopted and the dividend of 10 per cent, less tax, and capital bonus of 3 per cent (tax free), were approved.

The retiring directors, Brigadier A. G. Bonn, CBE, MC, MICE, and Mr R. M. Wynne-Edwards, DSO, MICE, were re-elected and the remuneration of the joint auditors, Messrs James Worley and Sons and Messrs Peat, Marwick, Mitchell and Company, having been fixed, the proceedings terminated.

G.R.A. TRUST

APPROVAL OF PREFERENCE STOCK REPAYMENT

The twenty-sixth annual general meeting of The Greyhound Racing Association Trust Limited was held on July 22nd in London.

Mr Francis S. Gentle, chairman, in the course of his speech, stated that attendances and totalisator turnover had continued to fall because of the discriminatory 10 per cent pool betting duty: against the £62,000 recommended in dividends, there was a "staggering tax bill" of £1,759,000.

The group's trading profit had nevertheless risen from £213,000 to £234,000, mainly due to careful economies, but patrons' interests were given first consideration and there had been no lowering of "G.R.A. standards."

The accounts and the directors' report thereon were adopted, the 10 per cent dividend on the ordinary stock was confirmed and the retiring directors were re-elected.

Special resolutions for the repayment, pro rata and at par, of 50 per cent of the company's £800,000 8 per cent cumulative preference stock were adopted, subject to confirmation by the court: in the board's opinion the repayment would benefit (a) the holders of the 8 per cent cumulative preference stock, in so far as concerned their remaining £400,000 of 8 per cent preference capital, by increasing the ratio of preferential "cover" available for both income and capital, and (b) the holders of the ordinary stock by reducing a prior charge as regards both income and capital, while leaving the company still adequately supplied with working capital.

Bayerische Hypotheken- und Wechsel-Bank

HEAD OFFICE MUNICH

Foreign Commercial Bank

At the General Meeting on 30th June, 1954, the Capital Stock of RM. 34,012,500 was converted in a proportion of 10:8 into DM. 26,995,000, a Dividend of 8½ per cent as well as a Bonus of 6½ per cent was declared for the year 1953 and the Capital Stock was increased to

DM. 40,010,000.—

Total of the Balance Sheet:

on 31st December, 1953	about	DM. 1,572,414,000
on 30th April, 1954	about	DM. 1,678,875.000

Principal items of the Annual Balance Sheet per 31st December, 1953:

Capital Stock	DM.	26,995,000.—
Reserve Fund	DM.	9,300,000.—
Pension Fund	DM.	44,000,000.—
Deposits	DM.	919,426,206.30
including Savings Bank Deposits	DM.	196,981,076.64
Accounts Receivable	DM.	560,670,214.60
Longterm Loans of Mortgage Department	DM.	321,185,064.85
Bonds in Circulation	DM.	391,101,381.50

Besides the **Head Office Munich** following Branches are licensed as **Foreign Commercial Banks:**

Augsburg, Nürnberg, Ludwigshafen/Rh., Aschaffenburg, Bamberg, Grünstadt, Hof, Kaiserslautern, Kaufbeuren, Kempten, Kitzingen, Kusel, Lindau, Lindenberg, Mannheim, Neustadt (Weinstr.), Neu-Ulm, Regensburg, Schweinfurt, Selb, Weiden and Würzburg, moreover the Branch Grossmarkthalle at Munich.

Munich, July 1954

CONSOLIDATED TIN SMELTERS, LIMITED

HIGHER TONNAGE TREATED

The annual general meeting of Consolidated Tin Smelters, Limited, will be held on August 19th in London.

The following is an extract from the circulated review by the chairman, Mr Clifford Waite, for the year ended March 31, 1954:

The net revenue of the parent company for the year is £335,672, out of which your directors have made appropriations similar to those of last year—£50,000 to general reserve and £50,000 to write down the investment in subsidiary companies. They recommend for your approval a dividend of 2s. 6d., together with a bonus dividend of 6d., making a total of 3s. per £1 ordinary stock, less tax, payable on August 28, 1954. This dividend, together with the dividends on the preference stock, will absorb a net amount of £213,363, and after bringing in the amount of £136,994 brought forward from the last accounts and £736 for taxation provisions no longer required, the balance carried forward on revenue account is increased to £160,039.

EASTERN SMELTING COMPANY

No further payment was received during the year under review by Eastern Smelting Company Limited in respect of its "seizure" claim. Since the close of its financial year, however, advice has been received that a final dividend of 20.4 per cent—making 90.4 per cent in all—has been declared. Eastern Smelting Company Limited has also been advised of the details of an assessment in respect of its claim for damage to property and loss of stocks (other than tin and tin-bearing material).

The aggregate tonnage of concentrates treated in our works during the year was approximately 5 per cent higher than that treated in the preceding year, due in some measure to the shipment of Bolivian concentrates which had accumulated at port as a result of the nationalisation of the large mines in October, 1952.

Apparent world surplus of tin production in 1953 was therefore 45,500 tons. Due to the stockpiling programme in the United States of America and the "insulation" of stocks which that country had accumulated through its official purchases of tin and tin in concentrates, very little, if any, of this surplus production found its way to consumers through the normal channels. The same will probably be true of the year 1954 in view of the prolongation of the operations of the Texas City Smelter and the USA government purchases of tin and tin concentrates from Indonesia, Bolivia, Thailand and Portugal.

LACK OF PROSPECTING

Ever since the Malayan Emergency commenced in 1948, we have been accustomed to attribute the lack of prospecting to that factor. This was, and to a lesser degree still is, correct, but with the decreasing tension in Malaya and the declaration of larger areas as being free of banditry, one would imagine that prospecting would have increased, but such does not appear to be the case to any great extent. In the period prior to the war, prospecting was not encouraged under the Tin Restriction Scheme for reasons which are obvious, but even in those days the granting of a prospecting licence was automatically followed by the granting of a mining lease where results warranted an application to the appropriate authority.

Today there is no certainty that a mining lease will be granted to the successful prospector. This is a deterrent as prospecting necessitates considerable capital outlay which miners are unlikely to incur unless they can be assured with reasonable certainty that they will be granted the necessary lease to work and mine the area that they have proved.

CHARRINGTON, GARDNER, LOCKET & CO.

INCREASING DEMAND FOR SMOKELESS FUELS

The 51st annual general meeting of Charrington, Gardner, Locket & Company, Limited, was held on July 29th in London, Sir John Charrington (the chairman), presiding.

The following is an extract from his circulated statement:

The group profit on trading for the year, after providing for all charges except taxation, amounts to £208,816, which is slightly less than last year.

The company's policy in past years of placing to reserve for deferred taxation on initial allowances the temporary tax saving arising from initial allowances on plant and machinery has been continued. The net amount placed to this reserve is £12,500. With this sum the charge for taxation for the year is £134,721, leaving a profit after tax of £74,095, which is £13,499 higher than last year's figure.

In addition the surplus on sale of assets is higher at £21,217, and tax reserves of earlier years, which have proved surplus and may safely be brought back, amount to £22,184, so that the profit available for distribution or allocation amounts to £117,496, against £86,287 a year ago.

We recommend a final dividend of 12 per cent, which makes a total of 22 per cent, the same as for last year. Of the balance of profit available we have placed £50,000 to general reserves and added £23,771 to the balance of profit carried forward.

TRADING ACTIVITIES

The house coal trade in London has for some years been especially susceptible to weather conditions, and it is not surprising that the results of our London depots, a large and important part of the company's activities, were disappointing when it is remembered that the winter was exceptionally mild right through to late January.

The volume of business in all other departments was well maintained and, indeed, increased on the industrial side.

In the eastern counties, demand for domestic fuel is less dependent on the vagaries of the weather, and our subsidiary companies have operated satisfactorily.

There is throughout our domestic trade a considerable increase in the demand for smokeless fuels, which we are doing all we can to encourage.

In my statement to you last year, I told you of the happy arrangement we had come to with the Vacuum Oil Company. I am glad now to be able to report that our sales of their fuel oils have developed most satisfactorily. Moreover, I am optimistic that the development this year will be even better.

There has been a welcome recovery in the trading of our lighterage department. I mentioned to you last year the launching of our new collier, the *Lady Charrington*, and she has had a very successful year's trading.

The report was adopted.

F. H. LLOYD & COMPANY LIMITED

FURTHER SATISFACTORY PROGRESS

MR F. N. LLOYD ON COSTS AND MANPOWER

The sixty-seventh annual general meeting of F. H. Lloyd & Company Limited was held on July 23rd at the registered office of the company, James Bridge Steel Works, near Wednesbury, Mr F. N. Lloyd, chairman and managing director, presiding.

The secretary, Mr E. Allison, read the notice convening the meeting and the report of the auditors.

The following are the chairman's comments on the report and accounts for the year ended March 27, 1954, which were circulated to the shareholders:

Ladies and gentlemen—The company has continued to make satisfactory progress, as reflected in the higher figure of profit shown in these accounts. After providing for depreciation, £164,556, and taxation, £547,472, the net profit for the group for the twelve months as shown in the consolidated profit and loss account is £332,372. This constitutes a record, the previous best being £316,000 in 1952. The depreciation charge this year is on a more generous scale than hitherto, and this is because of the substantial capital expenditure which has taken place, the total amount affecting F. H. Lloyd & Company, Limited and its two subsidiaries being £367,228.

DIVIDENDS AND RESERVES

During the year, interim dividends were paid of 2½ per cent, less tax, on the 5 per cent cumulative preference shares, and 5 per cent, less tax, on the ordinary shares. The general reserves of the group are increased by an allocation of £235,000 from £550,000 to £785,000. We now recommend the payment of final dividends on the share capital of 2½ per cent, less tax, on the cumulative preference shares, and 15 per cent, less tax, on the ordinary shares, which, in total, will absorb £65,450.

The balance on the appropriation account of the parent company to be carried forward to next year is £101,466, which, with the amount of £19,677 carried forward in the subsidiary companies, makes a total carried forward for the group of £121,143, compared with £98,730 last year. You will notice that, this year, we have adopted the practice of combining the consolidated profit and loss and appropriation account, as it is felt that this method gives a clearer picture of the way the profits are being dealt with.

FACTORS IN THE OUTLOOK

These results are better than seemed to be likely a year ago, but our trading results for the current year have not started off as well. I do not think we can continue as well as this indefinitely, as costs are rising and there are limits to the extent to which we can raise our prices, owing to increasing competition. 25 per cent of our consumable purchases comprises coal, gas and electricity in respect of which we have to face a probability of further price increases. Wages constitute 33 per cent of our total costs, and we are now experiencing the full effect of the increases which have been conceded. With market conditions hardening against us, our earning ability is more than ever dependent on raising the technical efficiency of our manufacturing processes.

The accounts this year reflect for the first time the financial results of the capital issue which was in progress at the time of our last report. Our financial position has thereby been strengthened considerably, and your

board has decided to put in hand further expenditure, which will maintain the rate of our development during the current year. Our objective is not to increase our total manufacturing capacity for steel castings, but rather to improve the quality of our product, and to enable our works to make a wider diversity of castings in quantities which can be more readily varied to suit the changing conditions of the demand for castings in this country.

FULL EMPLOYMENT FOR CURRENT YEAR

It is satisfactory to report that our order book at all three companies is such as to ensure full employment for us during the remainder of the current year. On the general future outlook, we are dependent on the trading conditions in heavy industry generally, but we are confident that we can at any rate hold our share of whatever business is available. The supply of skilled manpower remains a problem, and in two directions, viz., the manufacture of intricate heavy steel castings and of machining work, is likely to prove the limiting factor on what we shall be able to turn out this year. The problem is becoming so severe that our best efforts in the direction of recruitment, training, and the supply of improved equipment have not entirely been able to offset it.

At the beginning of this year, Mr M. C. Lloyd, who joined our board of directors in April, 1951, became a full-time working director with the company, and he now holds the appointment of works director of F. H. Lloyd & Company, Limited.

In conclusion, I think it would be your wish that we should pass a vote of thanks for the efforts of all our employees, both staff and works, for the contribution which they have made to the excellent results now shown.

The report and accounts were adopted, the proposed dividends were approved; the retiring director, Mr C. E. Lloyd, was re-elected and the directors were authorised to fix the remuneration of the auditors, Messrs Agar, Bates, Neal and Company.

HICK, HARGREAVES AND COMPANY

RECORD NET PROFIT

WORKS IN FULL PRODUCTION

MR W. D'ARCY MADDEN'S SPEECH

The sixty-third annual ordinary general meeting of Hick, Hargreaves and Company, Limited, was held on July 28th at Bolton.

Mr W. D'Arcy Madden, CBE, JP, chairman and managing director, who presided, said: The company has again had a successful year and both the profits earned and the financial position are very satisfactory. The net profit before taxation and after deducting the normal depreciation is £453,741, a record for the company and an increase of 13 per cent over the previous year. Tax requirements amount to £245,634, and with £31,355 brought in from last year, the balance available is £239,462.

From this sum, your directors have set aside £65,000 to be added to the plant replacement and extension reserve. This provision has the effect of increasing the normal amount reserved through depreciation to an amount which would have been needed to provide for replacement if the fixed assets were taken at something like their true value today. You will remember that £50,000 was reserved for this purpose last year.

Your directors have also decided to write down the "goodwill" from £40,000 to the nominal figure of £1, thereby strengthening the balance sheet and achieving an aim they have long had in mind.

A sum of £20,246 has been allocated to the general reserve fund, bringing that reserve up to £420,000. No addition has been made to the stock depreciation reserve which remains at £30,000 and which is considered to be sufficient provision.

LARGER DISTRIBUTION

The final dividend recommended is again 15 per cent, but on the increased capital. With the interim dividend paid in December last of 5 per cent on the then capital, the dividend distribution is increased this year by £19,500 after tax.

We are continuing our established policy of setting aside a portion of the profits for a bonus to the employees of the company, and in view of the larger profits this has been increased and amounts to £20,000. This is the seventh successive year in which a bonus has been provided and the sum so distributed is now £100,000.

The pension supplementary reserve, which was inaugurated two years ago, receives £7,160, which brings up this reserve to £25,000 after some expenditure on the purchase of annuities during the year. There is no allocation this year to the benevolent and welfare trust fund and the capital of this fund, in the hands of the trustees, remains at £30,000.

BALANCE SHEET ITEMS

Turning now to the balance sheet, you will notice some important changes since last year. At an extraordinary general meeting held on January 27th, it was decided to capitalise £168,000 standing to the credit of reserve funds of the company by the issue of one bonus share for every two shares held, thereby raising the issued share capital to £504,000. This transaction required the whole of the capital reserves which consequently no longer appear in the balance sheet.

You will also notice with satisfaction that the mortgage debenture of £50,000 held by the bank has been redeemd during the year from our cash resources, which notwithstanding remain substantial and satisfactory.

VALUE OF ASSETS

I have already referred to the writing down of the goodwill item on the assets side of the balance sheet. The fixed assets stand at £180,180, but their true value today is probably around £800,000. Your directors are of the opinion that a revaluation of the fixed assets should be available and Messrs Airey Entwistle and Company have been instructed to carry out this work for us during the coming autumn.

The net current assets after deducting all liabilities and appropriations amount to the satisfactory total of £1,236,405, an increase of £70,093 over last year notwithstanding the redemption of the mortgage debenture.

I have already referred to the cash position, which you will see from the balance sheet stands at the considerable figure of £317,977—you will also notice that this sum is nearly equal to the cash payments received on account of work-in-progress. As I have remarked on a previous occasion, we are fortunate in being able to secure progress payments with our major contracts and should these conditions alter it would be necessary to find means of financing our long date commitments.

HEAVY ORDER BOOK

The works have continued in full production throughout the year and are fully occupied with a heavy order book which exceeds £4 million sterling, including condensing plant and feed heating contracts for the British Electricity Authority for commissioning up to the end of 1958.

The heavy-bay extension to the engineers' shop will be in commission by the end of this year and will enable the handling of contracts for the large condensing plants of 120 mw and 200 mw which will be required by the BEA in the near future.

We have recently received orders for auxiliary equipment in connection with the first atomic power station for this country and we attach great importance to having entered this field right at the beginning.

Our deaerating and high vacuum plants have maintained their high reputation in many industries, a reputation secured through continual research and development. To forward this important side of our business, plans are being prepared for the construction of new and improved testing and research equipment, which will greatly facilitate this important work.

Our rotary compressor department continues to expand in a satisfactory manner. The special work we are doing for the Admiralty and for the Ministry of Supply continues to occupy an important section of the works.

The shortage of technicians and of skilled engineers in the engineering industry continues to be a major difficulty—limiting output and the quicker deliveries now demanded.

With a view to further improving our efficiency, your directors have engaged the services of an eminent firm of industrial consultants to examine and report on all aspects of our organisation and methods.

CHANGE IN DIRECTORATE

Since our meeting a year ago, Mrs C. L. Wright has retired after twenty one years' valuable service on the board of directors. Group Captain E. C. Lewis was appointed to the vacancy and in accordance with the Articles of Association now retires and presents himself for re-election.

Mr C. Metcalfe retired last month after twenty six years as secretary to the company. The directors desire to place on record their appreciation of his services. Mr J. L. Leyland, the assistant secretary, has been appointed secretary to the company in succession to Mr Metcalfe.

The relations between the management and the employees of the company continue to be happy and satisfactory, and I take this opportunity to thank them all for their good work and loyal service during the past year which has made possible the excellent results we have achieved.

The report and accounts were adopted.

THOMAS DE LA RUE AND COMPANY

MARKED IMPROVEMENT IN FORMICA SALES

The fifty-seventh annual general meeting of Thomas De La Rue and Company, Limited, was held on July 28th in London.

Mr Bernard Clement Westall, CBE, MA (the chairman), in the course of his speech said: Stockholders will observe that the financial position shows a considerable improvement compared with the position a year ago. The principal feature is the repayment of the bank loan of £900,000 and the increase in the cash at bank and on hand from £70,674 to £176,049.

Current assets of £2,814,745 exceed current liabilities by £1,343,325—an improvement of £631,402 over last year's figure. The reasons for this big change in the liquid resources of the company are, first, the absence of any considerable capital expenditure coupled by the sharp improvement in the trading profit; secondly, the more rapid turn round and reduction of stocks. Thirdly, the general tightening of financial control.

Profit on trading has risen from £497,561 to £847,883, and after deduction for depreciation, bank interest, etc., from a loss of £71,020 to a profit of £517,040.

There is a profit for the year after taxation provisions, which require £360,333, of £156,707 against a loss last year of £122,902.

After various adjustments and allocations, including the payment of a dividend of 20 per cent less tax, the balance to be carried forward will be £309,006 compared with £210,535.

The Security Printing Division: It is a matter of some satisfaction that the profits of this important section of the company's interests have been maintained at such a satisfactory level in spite of the loss of so much turnover when China ceased to be a customer.

The main reason for the improvement in the profit and loss account has been the marked increase in the sales of our decorative laminates. These are known by the trade names of "Formica" and "Traffolyte." While export sales had a much better year and, in particular, there was some recovery in our Australasian trade, the main improvement lay in the increase in the home market. This increased demand has enabled the factory to revert to full-time operation. The use of "Formica" has expanded very considerably. The sale of "Delaron," our industrial and di-electric laminate, has steadily improved. During this current year a further improvement in the results of the Plastics Division may be expected.

The results of the gas division were somewhat disappointing. New plans, however, for the development of our gas cookers and other appliances are in hand. The sale of "Potterton" boilers has been well maintained during the period under review. We are hopeful that the new types, coupled with the reorganisation of the division that has been carried out, will bring about an improvement in the results for the current year. The full benefit, however, must of necessity be felt gradually.

In the stationers division the sale of playing cards has dropped slightly during the year, the sale of "Onoto" diaries has remained steady, while there has been a small improvement in the sale of "Onoto" pens. The board have long-term plans which we hope will, ultimately, bring this division into a more satisfactory condition.

The report and accounts were adopted.

GROSVENOR HOUSE (PARK LANE)

EMINENTLY SATISFACTORY RESULTS

ATTRACTIONS FOR HOME AND OVERSEAS VISITORS

The twenty-sixth annual general meeting of Grosvenor House (Park Lane) Limited, was held on July 29th at Grosvenor House, Park Lane, London, W.1, Sir Charles S. Taylor, MA, DL, MP (the chairman) presiding. The following is an extract from his circulated statement:

Last year I was able to report the highest profits in the Company's history. This year we have again broken all records by showing a further increase of £78,000. I think you will agree that these results are excellent.

While I am satisfied that the results are due in part to the cumulative effect of the company's publicity campaigns, both at home and overseas, and to the continuation of the "Come to Britain" drive of the British Travel and Holidays Association, I must remind you that the Coronation which took place during the year under review certainly produced an increase in turnover and profits and also had the effect of extending the London Season.

Taking these factors into account your directors recommend that the dividend should be raised to 10 per cent and an additional 5 per cent Coronation bonus be paid, making 15 per cent in all.

APPEAL OF GROSVENOR SERVICE

Grosvenor House has benefited during the last few years by the increase in the number of visitors from overseas, but it is not possible to run a hotel profitably without a steady cushion of regular customers from Britain. Because of high taxation, there are now fewer British people spending money in restaurants. In spite of this Grosvenor House is more than holding its own and, because of the excellence of the service and the high quality of the food and cooking, attracts a very fair proportion of regular "diners out."

To cater for tourists from abroad certain restaurants are permitted to remain open until 2.30 a.m. excluding Saturdays and the restaurant at Grosvenor House does in fact serve a large number of these visitors who do not all want to go to bed at eleven o'clock.

Maintenance continues to occupy our close attention, and this really includes not only normal repairs but also, because of the nature of our business, re-decoration, re-furnishing, modernisation and improvements.

A good deal of what we consider to be proper and ordinary maintenance is regarded by the tax authorities as capital expenditure. We have always regarded this taxation as inequitable and, from the Treasury's point of view, unwise. It is helping to starve the goose that lays the dollar eggs.

The end of rationing will undoubtedly cause keener competition in the catering trade. This is a good thing and we welcome it. I was delighted when a few weeks ago at the International Competition held at Berne, Switzerland, a team of six British cooks entered, and won twenty-one gold and six silver medals. The National Apprenticeship Scheme for cooks is now running satisfactorily and will help further to improve the standards of British cooking.

Finally, I am indeed glad to tell you that thousands of visitors have gone out of their way to compliment the directors and management on the courtesy and efficiency of our staff.

The report was adopted.

THE A.P.V. COMPANY LIMITED

RECORD VOLUME OF ORDERS IN HAND

The forty-fourth ordinary general meeting of The A.P.V. Company Limited was held on July 28th, in London, Dr Richard J. S. Seligman, PhNatD, FCGI, FInstMet, FIM (the chairman), presiding.

The following is an extract from his circulated statement:

In addressing you last year I drew attention to the adverse conditions which then faced your company and their effect on its trading results. At the same time I pointed out that in the opinion of your directors those adverse factors would not all persist and that there was evidence that large demands existed for plant and equipment made by your company which would result in improved trading if certain obstacles and restrictions could be removed. The months which followed this statement brought ample evidence that it was fully justified.

Indeed, in the second half of 1953 the orders received by your company were some 50 per cent greater than in the first half of 1954 and at an increased rate so that, at the moment, the orders in hand of your company stand at a higher figure than they have ever reached before.

It is clear, as it was clear at the time when I addressed you last year, that this improvement could not come in time to affect the 1953 results, but it does give us considerable encouragement when looking to the future.

FUTURE PROSPECTS

Now I will turn for a few minutes to the hazardous task of looking into the future and let me say at the outset that the picture, as I see it, is far from being discouraging.

I think it reasonable to assume that in so far as the dairy industry is concerned, your directors are justified in anticipating not only a maintenance of the present high rate of demand for your company's products but a gradual manageable increase, an increase which the relaxation of control over credits should facilitate.

Your directors feel that they can count on not only maintaining your company's sales to the brewing industry at their present level but that a gradual increase is to be expected over the next few years.

In the food industries your directors look forward to continued and expanding sales in many parts of the world.

In general, your directors feel that they can look forward to a steady growth of the sales of your chemical engineering department and that this will be facilitated by the promising entry which has been effected into the coal carbonisation by-products and similar fields.

The orders received in 1954 to date for bulk transport tanks are at a higher rate than in either of the previous years.

The general engineering department is almost exclusively concerned with meeting the needs of the defence departments. I believe I am justified in saying that the departments in question have not been disappointed in the quality of the equipment produced. It is obviously impossible to foretell for how long this department will be engaged on work of the kind in question, but it can be said without hesitation that the contracts already allotted to it will carry it well beyond the end of the current year.

The report was adopted and the dividend of 10 per cent approved.

THE LONDON COUNTY FREEHOLD AND LEASEHOLD PROPERTIES

PROGRESSIVE RELAXATION OF CONTROL URGED

The forty-fourth annual general meeting of The London County Freehold and Leasehold Properties, Limited, was held on July 26th in London.

Mr Thomas J. Cullen (chairman and managing director) in the course of his speech said:

Our gross rental income for the year was £2,294,026, being £76,779 more than last year. The net revenue was £295,294.

All property outgoings continue to rise. The new Housing Repairs and Rents Act will help towards recovering the increased cost of repairs, and the increased cost of services up to the date of commencement of the Act. Its provisions must surely be looked upon as a "first step" only.

Only by progressive relaxation of control can the anomalies that have been created by the Rent Acts be satisfactorily removed.

Tenants of rent restricted property have, in fact, been subsidised by their landlords, in our case out of the earnings of our commercial properties.

Beginning with a portion of the current year to March, 1955, we should be able to start giving stockholders the benefit accruing from our investments, principally commercial, made since 1939.

It is abundantly clear that under the terms of the Act a landlord will only recover a limited increase for his increased expenditure on repairs and the increased cost of services.

Rents that are increased up to the limits of the Act will still be far below those which it would be economic to charge if based on the present-day cost of building, but a valuation for the purpose of sinking fund provisions will now be possible on the basis of the new rents recoverable. We shall, when the new rents have become effective, recalculate the sinking funds for the whole of our properties for the purpose of providing for a continuation of the income when leases fall in or freeholds require to be rebuilt.

I maintain that asset values and sinking fund provisions should be related to each other. For this purpose, then, it is essential to see that the properties are valued on an income basis, and the sinking fund provisions are adjusted to be in line with this.

This revaluation might possibly give rise to the suggestion that property assets should be valued at their market value. I should immediately join issue with such a proposal, insisting that the value of the assets of a property investment company (as distinct from a finance company) must be calculated on their value to that company on the basis of what they can earn after making due provision for amortisation according to the length of the lease. I have no doubt that your board, ignoring fluctuations in market value, will secure that the properties of this company are valued on the basis of maintainable income.

Our property investments and capital improvements still make steady progress.

It is unfortunate that a good landlord, who is also a capable property manager, is frequently misunderstood. We do, in fact, obtain our results from careful finance and borrowing at advantageous rates—certainly not from high rents.

The report was adopted and the total dividend of 1s. 1½d. per 10s. unit of ordinary stock was approved.

WALSALL CONDUITS

RANGE OF PRODUCTS FURTHER EXTENDED

MR A. E. READ ON THE STOCK POSITION

The eighteenth annual general meeting of Walsall Conduits Limited was held on July 23rd in Birmingham, Mr Albert E. Read (the chairman) presiding.

The following are extracts from his circulated statement:

The group trading profit for the year ended December 31, 1953, before providing for taxation, was £405,561 compared with £360,217 for the year 1952. The provision for taxation in this year's accounts of both parent and subsidiary companies includes the whole amount of income tax liability for the year to April 5, 1954, payable January 1, 1954, whereas in past years the amount provided was limited to the liability accrued to December 31st.

After making provision for all taxation amounting to £259,430 as compared with £201,025 for 1952, the final net profit of the group was £146,131 as against £159,192 for 1952. The increase of £45,000 in the trading profit was thus exceeded by the larger provision for taxation.

The subsidiary company, A. G. Hackney and Company Limited, has incurred a loss for the year 1953 after providing for taxation of £6,879 compared with a loss of £15,020 for the previous year. The figures for the first five months of 1954 show some improvement over those of the corresponding period of last year.

ADDITIONAL COSTS ABSORBED

The year 1953 might be called a year of change, the decline in demand which occurred in 1952 continued until September, 1953, when an abrupt change took place; demand suddenly increased and we were again in full production.

During the year under review competition was keen whilst costs continued to rise, but I am pleased to say that reorganisation in methods of production has enabled us to absorb all additional costs and even to reduce many of our selling prices. We have continued to extend our range of products, and also the area of sales. Exports for the year under review reached record figures, and much more could be done in this field if it were not for import restrictions, but this is a matter beyond our control and requires to be dealt with at governmental level.

Sales for the first five months of 1954 exceed those of the same period of last year. At the present time we have a full order book and I feel we can look forward to the future with confidence.

STOCK POSITION

The group balance sheet shows a decrease in the value of stocks held at December 31, 1953, of £81,000 and this partly accounts for the increase of £187,000 in the cash at bankers. It is indeed a difficult matter to build up and maintain a well balanced stock adequate to meet customers' requirements. The directors have given careful consideration to this question and have succeeded in reducing to reasonable dimensions the amount of stocks on hand without in any way impairing delivery efficiency and efforts will continue in this direction to enable stocks to be reduced to an absolute minimum, consistent with the maintenance of an efficient sales service. I am convinced that much saving of space and money can be effected in this way. The report was adopted.

OHLSSON'S CAPE BREWERIES

A SATISFACTORY RESULT

The sixty-fifth annual general meeting of Ohlsson's Cape Breweries, Limited, was held on July 28th in London.

Mr Geoffrey Dent (the chairman) presided and in the course of his speech said: The profit from trading and rentals increased by £71,826, which I hope you will agree is a reasonably satisfactory result. Although there appeared to be a greater feeling of confidence, spending power remained low, and up till November profit margins continued to decline. Expenses, and in particular carriage rates, rose sharply.

Our total barrelage over the period showed a slight reduction. There was a decline in sales at the Cape, and to a lesser extent in the Transvaal, but these falls were largely offset by increases in Natal and Rhodesia.

At the end of November the government suspended price control on all beers. Following this suspension the price of Lager, Pilsener, Ale and Special was raised by 9d. wholesale and 1s. retail per gallon. The price to the public was thus raised by 1d. per pint. While this increase has restored a reasonable profit margin, it was bound to have some effect on consumption. It is too early as yet to say what the final extent of that effect will be.

With regard to the future, sales so far this year have been at about the same level as those of the previous year. The better profit margin obtained by the increase in price should benefit the earning capacity of the business if the level of trade can be maintained.

The report was adopted.

GEO. BASSETT & CO.

ALL PREVIOUS RECORDS SURPASSED

The twenty-eighth annual general meeting of Geo. Bassett & Company, Limited, was held on July 29th in London, Mr E. M. Mott (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The year was a record-breaking one in every respect, profits, output and turnover all attaining new levels far in excess of any previously achieved in the company's history. For fourteen years we had been confined within a close network of controls which afforded little or no scope for enterprise and initiative. During this long period, however, we never relaxed our preparations for the eventual dawn of the day of freedom. The accounts represent the first, though by no means I think the final, fruits of those preparations.

The demand for all our leading lines—and particularly for liquorice allsorts—remains so heavy that we are still compelled to allocate supplies to our customers.

In my statement a year ago I told you that I did not anticipate any expansion in our export trade during the ensuing year. Actually there was a small increase of 10 per cent. In view of the increasingly keen competition we have to meet in all markets I think this is adequate testimony to the growing popularity of Bassett products overseas.

Profits for the current year so far are running ahead of last year's record level. Although we are sparing no effort to increase production still further by every possible means, it may well be some time before we are able to catch up with demand.

The report was adopted and a total dividend of 25 per cent was approved.

HACKBRIDGE AND HEWITTIC ELECTRIC COMPANY

CONSIDERABLY INCREASED OUTPUT AND DELIVERIES

The forty-eighth annual general meeting of Hackbridge and Hewittic Electric Company, Limited, was held on July 26th at the office of the Registrars, Anglo-Scottish Amalgamated Corporation, Limited, Hasilwood House, 68 Bishopsgate, London, E.C.2. Mr Douglass Hewitt presided.

Before proceeding with the business of the meeting, Mr Douglass Hewitt referred to the great loss sustained by the board, shareholders and employees in the death on July 13th of the chairman, Mr T. F. Lister, who had been associated with the company for 29 years. The present strength and success of the company was due, in no small measure, to the untiring and devoted efforts of Mr Lister.

LATE CHAIRMAN'S STATEMENT

The following is an extract from the statement by the late chairman, which had been circulated with the report and accounts for the year ended March 31, 1954. The trading profits of the group amount to £504,000, an increase of £44,000 over the previous year, which reflects a considerable increase in output and deliveries during the year.

In order to meet the demands for higher voltage transformers and to facilitate and improve the methods and conditions of manufacture, it was decided to extend the main transformer assembly bays and test equipment which it was hoped to have available for use within a few months. During the past twelve months the two largest rectifier installations made by this company were commissioned in the USA. These are the largest glass bulb unit installations in the world. Other large rectifier installations put into service during this period were eight sub-stations for the British Railways Southern Region (out of a total of 28 on order) and a particularly interesting change-over scheme at Bond Street for London Transport which is to be followed by a similar but larger installation at Charing Cross.

The order book of the company is satisfactory and ensures full output in all divisions during the coming year. Incoming orders, however, show a decline over previous years which may well affect output during the following year unless there is a change for the better in this respect in the near future.

After providing for all outgoings and taxation, the net profit of the group for last year amounts to £167,700. The directors have transferred to general reserve the sum of £75,000, and they recommend the payment of a final ordinary dividend of 20 per cent making a total of 25 per cent, less tax, for the year, compared with 20 per cent paid for the previous year. The dividend expressed as 25 per cent on the ordinary stock is, in effect, actually only 10.7 per cent on the real capital employed, and it is in this light that the rate of dividend should be considered. We are pleased to record, too, that our employees have benefited by the increased output and profits to the extent of a sum totalling £120,000, which represents an increase of 24 per cent over normal wages and salaries. This payment to employees has been made in the form of output bonus, long service bonus, provisions for pensions, canteen services and holidays-with-pay.

The consolidated balance sheet shows that the capital, reserves and undistributed profits of the group amount to £1,518,000, an increase of £90,000. The report was adopted.

RUSTON & HORNSBY

WAGES, COSTS AND PRICES

The sixty-fifth annual general meeting of Ruston & Hornsby Limited was held on July 29th in London, Mr W. J. Ruston, chairman, presiding.

The following are extracts from his circulated comments on the report and accounts for the year ended March 31, 1954:

Total despatches of the group show a slight decline on the previous year. This fall in itself would have affected earnings very little but there has been a rapid and general increase in costs with the result that trading profits of the group at £2,006,021 show a fall of £322,918. Group net profit is £1,062,703, a fall of £63,819.

After deducting £323,426, retained in the accounts of subsidiaries, the net profit dealt with in the accounts of the holding company is £739,277. Of this £440,488 has been appropriated to general reserve, whilst the balance on profit and loss account has been increased by £3,989. The difference represents distribution to shareholders, i.e., dividend on the preference stocks and the proposed payment of 12½ per cent on the ordinary stock.

These distributions should be considered in relation to earnings as well as in terms of the return made to those whose funds are invested in the business. The total distributed is £294,800, which is only 28 per cent of the net earnings of the group. Expressing this as a percentage on the capital employed, which is more truly representative of what has been invested in the business, shows a quite modest net return of 2.2 per cent.

I feel I must again emphasise that the amount of £1,164,000 taken by the Treasury is nearly four times that distributed to shareholders. Further comment is superfluous.

OPERATING REVIEW

There has been a rapid increase in the costs of most of our products, despite the most careful scrutiny of costs. This is hardly surprising when one considers that claims for increased wages have become almost a yearly event. I refer to the November, 1952, and the April, 1954, wage increases. In view of the much more intensive competition we are facing in world markets in what is predominantly an export trade, the difficulties of licensing regulations and lack of sterling in many of our most important markets, we felt that we could not hope to maintain our position and turnover as exporters if we were to raise our prices in accordance with increased wages and consequently increased costs. We have therefore felt it absolutely essential, in the national interest as well as our own, to try to maintain and in some cases even to reduce our present prices, rather than pass on the increased costs to our customers.

As I see it, if we are to have these constantly recurring demands from labour for increased remuneration, the only foreseeable end is a general reduction in sales due to our being priced out of world markets, leading in turn to decreased profits and consequent inability to spend the necessary capital on replacements and the maintenance of our plant in an up-to-date and efficient condition. Moreover, this state of affairs, if persisted in, can only in the end lead to unemployment.

The demand for our products in the Commonwealth remains good. I feel that the current year's trading should be on a reasonable scale commensurate with our production capacity, although, because of increasing costs, the rate of profit may be further reduced. The report was adopted.

NCHANGA CONSOLIDATED COPPER MINES LIMITED

(Incorporated in Northern Rhodesia)

RECORD PRODUCTION AND PROFITS

SIR ERNEST OPPENHEIMER'S STATEMENT

The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, circulated with the annual report and accounts for the year ended March 31, 1954:

The results for the year to March 31, 1954, include four months' sales to the United Kingdom Ministry of Materials at negotiated prices related to the United States export price and eight months' sales at rather lower prices based on the London Metal Exchange quotations. The latter, after an initial sharp drop from the last United Kingdom controlled price of £252 a ton, rose gradually but almost uninterruptedly from an average price of £227 in August last year—for prompt copper—to an average price in June this year of £239 per ton.

There has, moreover, been a notable narrowing in recent months in the discount of the price of copper for delivery three months forward as against the prompt price; this discount, or backwardation, has come down from £15 15s. per ton at the beginning of March to £2 7s. 6d. per ton at the end of June, a trend which provides satisfactory confirmation of the underlying strength of the market for at least the immediate future.

NEW RECORD COPPER PRODUCTION

Production of finished copper, at over 115,000 long tons, set a new record, but included 5,000 tons from treatment of excess stocks of process copper at the refinery at the previous year-end. New production for the year was almost 110,000 long tons, and exceeded the target rate of production under the Third Stage Extensions programme—which had been set at 108,000 long tons per annum—even though all the additional plant under the programme was not available for the whole of the year.

FOURTH STAGE EXTENSIONS PROGRAMME

The fourth stage extensions programme now authorised is expected to cost about £2,500,000. It is intended to ensure the continuance for many years of the present rate of production, although it will also provide a practicable basis from which to initiate future expansion if such should appear warranted.

The desirability of spreading mining operations more evenly over the ore reserves has been very much in mind for many years, and the intention now is to mine simultaneously from the Nchanga West and Nchanga Orebodies—a reduction in the rate of mining at Nchanga West being offset by mining a much greater tonnage of Nchanga ore, so that despite the latter's lower grade, overall production of copper will not be affected.

After full investigation the consulting engineers put forward recommendations for extracting Nchanga ore by open-pit methods, and your board accepted these recommendations. Production from the pit should begin in 1957.

In 1951 I informed members that a further drilling programme was in progress; results to date indicate an addition of about 14,500,000 tons of ore, at the very satisfactory grade of 6.48 per cent copper, to the existing reserves in the Nchanga West Ore-

body which, in round figures, amount to 37 million tons at 7 per cent. copper.

FINANCIAL RESULTS

It is very gratifying to be able once again to report a record profit. A reduction in average selling price as against the preceding year was more than made good by increased sales—even though sales were restricted by the absorption of a substantial slice of the year's production in the lengthy "pipeline" to overseas consumers which had to be filled when the free market in copper was re-established.

A reserve of three-quarter million pounds existed against this eventuality, and has therefore been added to the year's profit, together with over half a million pounds from tax liabilities previously overestimated, to give a disposable profit for the year of just over £10 million. Of this sum it is proposed that £7 million shall be paid as dividend, at the rate of 20s. (net) per unit of stock, and that £3 million shall be transferred to general reserve.

FUTURE TRADING OUTLOOK

Although I can give no opinion on the long-term trend of prices, I feel justified in saying that there appears to be no immediate prospect of a weakening of the market. The bulk of the company's output is under contract for delivery over varying periods ahead on satisfactory terms and we do not anticipate much difficulty in disposing of the balance.

PERIOD OF RELATIVE CONSOLIDATION ENVISAGED

Although only 17 years old, your company may now be said to have reached maturity. Its physical expansion is for the time being almost complete and it is entering on a spell of relative consolidation. In terms of output, it ranks as one of the largest copper mines in the world and, if the measure be ore reserves, it is among the richest; I am confident that your company has before it a long and prosperous trading career.

Copies of the annual report and accounts are obtainable from the Head Office, Kitwe, or from the Transfer Offices at 44 Main Street, Johannesburg, or at 11 Old Jewry, London, E.C.2.

WILLIAM HANCOCK AND COMPANY

HIGH QUALITY OF PRODUCTS

The sixty-seventh annual general meeting of William Hancock and Company, Limited, was held on July 29th in Cardiff, Colonel J. Gerald Gaskell, CB, TD, DL (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The net profit for the year ended March 31, 1954, amounted to £93,172, an increase over last year's figure of £5,373. Your directors have pleasure in recommending an increase in the total distribution on the ordinary stock from 15 per cent paid last year to 16¼ per cent to be paid this year.

The trade has remained very stable and this, I think, can be attributed to the high quality of our beers which has enabled us to stand up to the severe competition that we have had to meet during the last few years.

As you will see from the directors' report they are recommending an increase in the authorised share capital of the company and the issue to ordinary stockholders of 143,000 ordinary shares of £1 each, credited as fully paid up, by way of capitalisation of reserves. I should like to make it clear that the primary object of the issue is to improve the financial structure of the company and to bring its issued capital more into line with the present day value of the assets. It does not, of itself, indicate an increase in the total amount to be distributed by way of dividend on the ordinary stock.

The report was adopted and the capitalisation and bonus issue proposals sanctioned.

MILLARS' TIMBER AND TRADING COMPANY, LIMITED

PROPOSED CAPITAL REORGANISATION

The annual general meeting of Millars' Timber and Trading Company, Limited, was held on July 23rd in London.

Colonel Clive E. Temperley, OBE, MC, BSc, presiding, in the course of his speech, said: For some time your directors have been considering the capital structure of the compahy. In 1936 the capital of the company was reorganised. Substantial arrears of preference dividends were wiped out and the nominal value of the issued ordinary shares was written down from 20s. to 4s. Since then your company has consistently earned profits and has ploughed back a large part of them into the business. In this way it has accumulated substantial reserves and has replaced as least some, if not all, of the capital previously lost. Your directors therefore think the time has come to replace some of the amount written off the ordinary shares 18 years ago. One of the overall effects of the scheme is that the nominal value of the ordinary shares will be written up from 4s. per share to 10s. per share.

The total charge ahead of the ordinary shares is £55,250 per annum, which compares with an ordinary dividend of £68,000 on the 30 per cent basis we recommend this year. The capital is therefore particularly high-geared in that the prior charges amount at present to nearly as much as the ordinary dividend and, secondly, the capital includes non-cumulative preferred ordinary shares which are, in fact, non-cumulative preference shares—not a very attractive form of security.

CAPITAL STRUCTURE SIMPLIFIED

Your directors think that all members of the company would benefit if its capital structure were simplified and the preferred ordinary shares done away with. This would reduce the prior charge standing in front of ordinary dividends and would improve the general marketability of the company's issued capital. They accordingly propose to seek the approval of shareholders for the conversion of five preferred ordinary shares of 10s. each into three ordinary shares of 10s. each.

The consent of the Capital Issues Committee has been obtained, and it is proposed that the scheme shall take effect as from January 1, 1954. Thus the preferred ordinary dividend of 6 per cent, recommended in the accounts, will be the last preferred ordinary dividend paid and the new ordinary shares which holders of preferred ordinary shares will receive will rank for ordinary dividend in respect of the profits earned in this year of 1954. You will have full particulars early next month. The directors strongly recommend the scheme to you for your acceptance, and they hope that, if you agree, you will not fail to send in your proxies in favour of the proposals as soon as you receive them.

The report was adopted.

WALKER CAIN LIMITED

CONTINUED UPWARD DEMAND FOR BOTTLED BEER

The thirty-second ordinary annual general meeting of Walker Cain Limited was held on July 29th in London.

The Rt Hon Lord Brocket (the chairman) presided, and in the course of his speech said: I feel sure the results of the year's trading will meet with your approval. Output was maintained and, bearing in mind a recession in the country's output during the latter part of the period, this can be regarded as satisfactory. In the face of a continuing upward demand for beer in bottle we note with some pleasure that our sales of draught beer have suffered only a small decline. In spite of all our efforts we are still carrying too heavy a burden of taxation when comparison is made with that levied on other consumer goods.

Another branch of our business which has progressively increased its home sales is our wine and spirit department. In the export market we are hopeful of extending our activities particularly in the hard currency areas.

Our profit from trading shows an increase of £72,739. The provision for taxation on the profits of the year (profits tax and income tax) requires £34,817 more and after deducting other items detailed with relatively small differences our net profit of £598,555 shows an increase of £35,021. In view of the improved results your board recommend an increase of 2 per cent in the final dividend on the ordinary stock.

The report was adopted.

UNIVERSITY OF CAMBRIDGE

Applications are invited for three posts of Assistant Agricultural Economist in the School of Agriculture. Qualifications should include a University degree in Economics or in Agriculture. Consideration will be given to candidates graduating this autumn. Salary scale, £396 rising to £676 (men) and £571 (women). Starting salary will depend on qualifications.—Further particulars are obtainable from the Secretary, School of Agriculture, to whom applications should be sent before September 1, 1954.

B. COM. (Accountancy), single, 30, fully mobile, seeks industrial appointment—medium or large firms. Four years of audit experience of the large manufacturing companies—machine accounts, punch cards, etc. Willing to undergo period of training.—Box 653.

ASHRIDGE

Course 49. Progress in Science. August 13th/16th. Research in Agriculture, Sir James A. Scott Watson: The Power of the Atom, Professor P. M. S. Blackett, M.A., F.R.S.: Science and Industry, Sir Charles Goodeve, O.B.E., D.Sc., F.R.S.: The Nature of the Universe, Mr. Fred Hoyle, M.A.: Developments in Medical Research, Mr. Kenneth Walker, M.A., F.R.C.S.
Inclusive Fee: £3 15s.
Applications to The Secretary, Ashridge, Berkhamsted, Herts. Tel.: Little Gaddesden 3191.

EX-I.C.S. OFFICER, Indian, 49, Anglophile, customs, finance and commerce experience seeks executive position with English organisation in India.—Please reply, Box 654.

The Bank of Adelaide

invites all who have or would like to have relationships — business or personal — with Australia, to use its complete banking service.

Principal Offices in Australia:
Adelaide (Head Office), Brisbane, Melbourne, Perth & Sydney.

LONDON OFFICE:
11, LEADENHALL STREET, E.C.3

Incorporated in 1865 in South Australia with limited liability

CITY OF LONDON COLLEGE

Applications are invited from LECTURERS prepared to undertake part-time evening lecturing in Economics (Principles and Allied) to students preparing for Part I Final examination London B.Sc.(Econ). Classes commence September 27, 1954; attendance required on two evenings per week.—Application forms from the Secretary, City of London College, Moorgate, E.C.2.

RHODESIA UNIVERSITY COLLEGE

Applications are invited for:—
Chair of English
Chair of Education
Chair of African Studies
Salary scale £2,000 x £50—£2,300 p.a. Superannuation scheme. Passages to Salisbury paid for appointee, wife and dependent children on first appointment with allowance for transport of effects. Unfurnished accommodation provided at rent of not more than 15 per cent. of salary.—Application (6 copies) stating full qualifications and experience, and naming three referees, to be received by October 18, 1954, by Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained.

J. WHITTINGHAM & SONS LIMITED

It is announced by the directors of both Companies that an interest in the business of W. P. Martin & Co. Pty. Ltd., of Sydney and Melbourne, has been acquired by J. Whittingham & Sons Ltd., of Bradford, and that, in future, the business will be styled W. P. Martin, Whittingham Pty. Ltd.
The policy and management of the Australian business will continue unchanged and customers and other business associates are assured that there will be no interference with existing valued relationships. (Messrs. W. P. Martin Pty. Ltd., were established in Sydney in 1888).

BRAZIL

Commercial, manufacturing and financial information. Enquiries invited.—Littlejohn and Company, Limited, Caixa Postal 7352, Sao Paulo, Brazil.

MONSANTO CHEMICALS LIMITED have a junior vacancy in their sales organisation for a Qualified Agricultural Chemist interested in a commercial career. University degree essential with some experience of agricultural chemistry. Good salary, commensurate with qualifications and experience, is offered, and the post is permanent and pensionable.—Applications, giving full details of age, education, training and experience, should be sent, in writing, to the Chief Personnel Officer, Monsanto Chemicals Limited, 8 Waterloo Place, London, S.W.1.

EXPORT SALES. Applications are invited for an appointment as Assistant to the Export Manager of a large manufacturing organisation. The duties will include the general supervision of the Export Office, responsibility for the presentation of statistics and the entertainment of overseas visitors. A good education is essential and preference may be given to University graduates, but, in addition, candidates must have a thorough knowledge of export procedure gained through previous administrative experience in an export organisation. The appointment offers good opportunities and will carry an attractive starting salary. All applications will be acknowledged and will be treated in strict confidence.—Box 640. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

PUBLIC Company in South Bucks require Solicitor with at least five years' wide general experience and preferably with knowledge of commercial and company law. Salary according to qualifications. Age limits 28-35. Membership of pension scheme (partly contributory) compulsory. First-class sport amenities. Applications, giving full particulars of education, age, experience and present remuneration, should be sent to Box AC.91373, Samson Clarks, 57/61 Mortimer Street, W.1.

SENIOR FOREIGN SALES MANAGER, wide international experience commerce and industry, fluent French, German, Spanish, seeks appointment.—Please reply Box 625.

JUNIOR MARKETING EXECUTIVE required by large West End Advertising Agency. At least two years' Market Research experience and some knowledge of economics and statistical methods.—Box 652.

Your enquiries will receive prompt and courteous attention.

THE BANK OF NOVA SCOTIA
108, Old Broad Street, London, E.C.2

Established in Canada in 1832 with limited liability.

THE UNIVERSITY COLLEGE OF THE GOLD COAST

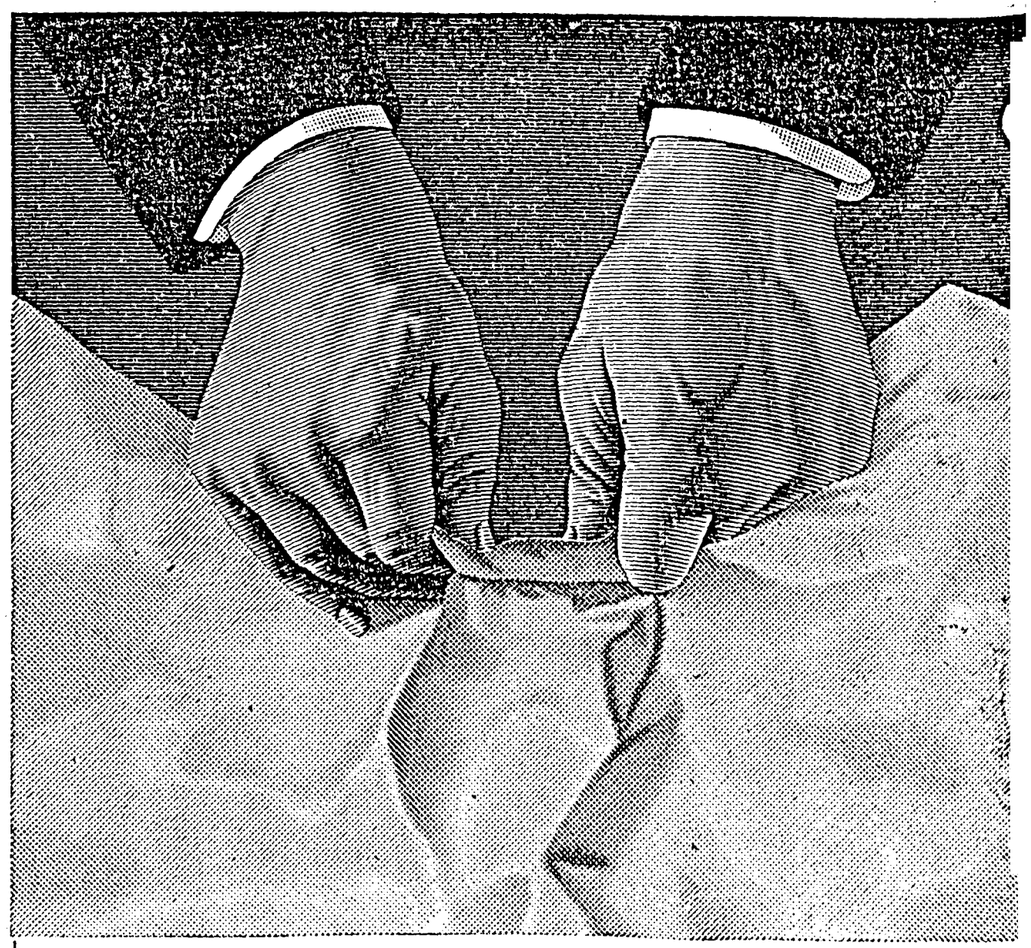
Applications are invited from graduates for the following appointments:—
(1) Resident Tutor to specialise in Trade Union Studies, including Industrial Relations.
(2) Resident Tutor to specialise in either Economics or Political Institutions.
Salaries on Scale £750 x £50—£1,400 p.a., according to qualifications and experience. Family allowance £100 p.a. per child (maximum £300 p.a.). Outfit allowance £60 on first appointment. F.S.S.U. Free passages for appointee, wife and maximum of three children. Part-furnished accommodation at rent not exceeding 10 per cent of salary.
Applications (six copies), naming three referees and stating full qualifications and experience, to be received by August 23 by Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further information may be obtained.

AMERICAN private organisation located on Continent requires Chief Analyst to specialise in audience research techniques concerning effectiveness of broadcasts to Iron Curtain countries. Applicant should have some knowledge of political problems of East European countries and experience in using social science research techniques; also ability to evaluate and write reports. No language requirements. Salary for appropriate person would exceed £1,000 plus furnished housing for self and family and transportation.—Full particulars including picture, should be furnished in first letter to Box 643.

AMERICAN SALES EXECUTIVE (44), married, two children, must return U.S. after four years British Colony and two years England, where he learned to love and understand all things British, would welcome opportunity to represent company in the dollar market. Best education, widely travelled, stock broker, aircraft manufacturing executive, seven years' travel, sales and management, international civil aviation. Thorough knowledge aircraft, motor-cars, boats and hobby agriculture. High level U.S. contacts; ex-officer U.S. Army; trained public speaker.—Box 651.

A STATISTICIAN is required to organise the collation, analysis and presentation of statistical information to the management of a substantial engineering company in the east London area. The successful applicant will have a first or second-class honours degree with statistics as a special subject and must be keen to apply his knowledge vigorously to industrial data. Experience in the application of statistical analysis to financial data would be of value. Salary will be appropriate to qualifications and experience.—Applications, which will be treated in confidence, should be addressed to Box 650.

STUDY AT HOME
B.Sc. ECON.



This London University degree, open to all, is a valuable qualification for statistical, research, educational and welfare work. It is necessary only to pass three examinations. Wolsey Hall (founded in 1894) can prepare you for these at home. Reasonable fees, instalments. 952 B.Sc. Econ. (Final) Successes, 1925-53. Prospectus from C. D. Parker, M.A., LL.D. Director of Studies, Dept. P15.

The proof of the paper . . .

Try your strength against a piece of Aylesford Kraft paper. You will soon find how strong it is.

Why is it that this tough yet tractable paper—unrivalled for bags, wrappings and multi-wall sacks—has won so fine a reputation? Because Aylesford Kraft is pure kraft. The pulp from which Aylesford Kraft is made is the best that the forests of the earth can offer. Its quality and moisture-content are carefully controlled so that it can be restored to the ideal condition before it is beaten and passed to the giant machines up to twenty feet wide, which today make possible the largest output in Europe. Nothing but this pure material and British craftsmanship goes into the making of Aylesford Kraft. It is a pedigree paper unsurpassed in quality.

There is no better Kraft than AYLESFORD KRAFT—made in Kent by British craftsmen

Steel windows . . .

. . . and no rust

Rust and corrosion need never again mar the good looks of a building's windows—if the windows are Crittall's positively rustproofed.

The Crittall galvanized surface is a tough, deep and lasting amalgamation of zinc with steel—a surface which, because it gives paint itself a firmer, surer grip, reduces the cost of upkeep, while rust and corrosion never even get a look in.

What to See in China

"I HAVE been exposed to lots of eyewash in my time, and I know it when I see it," remarked the Leader of the Opposition last week, when asked about the visit to China on which he and other Labour Party delegates are about to embark. In his time Mr Attlee has undoubtedly shown that he can recognise eyewash. But in the past it has not been his custom to submit meekly to serving the purposes of a propaganda machine that is hostile to him, his party, and all that he stands for. The Labour delegates have presumably reconciled themselves in advance to the fact that during their tour they will be photographed, filmed, recorded for radio, and exhaustively written up by the worldwide Communist "disinformation" network; that their simplest expressions of thanks to their hosts will be represented as prostrations before the might and glory of Mao Tse-tung's regime; and that if they venture to comment unfavourably on anything they see, no breath of that criticism will reach the millions behind the iron curtain. They presumably think this a price worth paying in order to see Peking's peepshow.

It is easy to guess what their hosts will be anxious to show them; the conducted tour through the new China is already as standardised as the uniforms and thoughts of its rulers. Mr Attlee, Mr Bevan and their companions will visit "model villages" and "mutual aid" farms, water conservancy works and state-operated factories; they will admire the Gate of Heavenly Peace and the Nine-Dragon Wall; they will relax beside peaceful lakes, and they will be shown films depicting the regime's progress and its peaceful intentions. And why not? The Communist government has unquestionably much to show; it is, indeed, oddly coy about letting impartial foreign visitors see how it has improved on the state of affairs to which the Kuomintang and years of war had reduced the country.

Yet, if the Labour delegates confine themselves to viewing these exhibits and debating Marxist principles with their indefatigable guides, their passage money will be wasted. The achievements, and the theories, of Mao's government can be seen and studied in glossy publications generously distributed in Britain and other free countries. There are other facets of the regime that are not so widely publicised; and if the delegates are to learn in Peking anything that they could not have learnt in Bloomsbury or Westminster, it is to these that their attention should be particularly directed.

As a start, they might well propose a call at the office of the Supreme People's Procurator, a functionary who, with his deputy procurators-general, controls an extensive apparatus concerned with the punishment of those who neglect their work or "sabotage" production or construction. They might try to attend one of the trials of workers conducted by the "comrade tribunals"; the duties of these bodies, intended to "combat violations of labour discipline," were described at length in a recent issue of the *Jen Min Jih Pao* or *People's Daily*, the *Pravda* of Peking.

When they are shown over state factories, the trade union delegates might well ask their interpreters to construe the new code of labour discipline which, according to government orders issued in mid-July, ought now to be prominently posted on the walls. It forbids workers to talk or otherwise waste time in working hours, to arrive late or "stroll around"; it requires them to try to overfulfil their norms, and in any case to fulfil them; and the last eight of its 22 sections are devoted to punishments, which are to be given promptly for any lateness or idleness. Workers, says this code, should be made to apologise for their mistakes publicly; if their products are defective, up to one-third of their wages will be deducted to make good the state's loss; and, while appeal may be made to a higher level, any punishment awarded must be imposed without awaiting the higher organ's ruling. There is, of course, no right to strike in China now.

Factory work is, indeed, so attractive in People's China that it is sad to read in the *People's Daily* of July 11th that many parents still think it better for their children to get secondary education than to pass directly from primary school to workbench. Castigating these outworn ideas, the official Communist newspaper warns parents that only a few children can go to secondary schools, and that the party and government will show them that juvenile labour is "equally glorious." One can imagine Miss Horsbrugh's relief if the *Daily Herald* and *Tribune* are converted to these progressive views in the next few weeks.

*

The Labour delegates will, unfortunately, reach Peking too late to enjoy the pageantry of the annual Army Day and to gaze up at the fly-past of fighters and bombers, some of whose ardent young pilots are doubtless eager to get back to defending the Hongkong-Bangkok air route against aggressive British mail planes. But the new Finance Minister may be happy to explain to them the budget published in mid-June, in which all forms of social, cultural, educational and health service work were allotted only two-thirds as much as is to be openly spent on armaments—in a country where soldiers come cheap. In the atmosphere of a Peking festooned with "peace" slogans the delegates may see no discrepancy in these figures. But they will, one hopes, meet Kuo Mo-jo, the head of the China Peace Committee, a body whose chief claim to fame has been its success in collecting funds to pay for Migs and other Soviet weapons.

Mr Attlee and Mr Bevan are not likely to get a close look at Mao's now enormous army. But while they are contemplating China's industrial progress, they might find time to glance at the *People's Daily* leading article of July 24th, which emphasised that modern armed forces could not be built up without heavy industries, and to reflect on the wisdom of meeting all Peking's demands for British heavy machinery. They will doubtless hear much of the claim, advanced a few weeks ago by the Chinese trade mission to Britain, that £100 million worth of trade could be done between the two countries in the coming year if strategic controls were abolished; and it will be interesting if they are given a convincing account of what China could sell to this country to balance so large a trade. The impression left by Mr Tsao in London last month was that Britain would have to accept remarkable quantities of preserved eggs, bristles and feathers, at doubtfully attractive prices.

How does this "peaceful" government mean to use "the second largest army in the world," which it says it will aim to build? Commander-in-Chief Chu Teh, in his Army Day speech this week, promised that Formosa will soon be liberated. The *People's Daily* of July 23rd had already declared that "the powerful Chinese people . . . will never pause until this aim is achieved." The same leading article seemed less than kind to China's principal guest when it dismissed Mr Attlee's suggestion of United Nations trusteeship for Formosa as "putrid." The Labour leaders can read for themselves, in the July issue of the English-language *People's China*, that under the new Peking constitution the millions of Chinese in Siam, Burma, Indonesia and Malaya, "neglected" by earlier governments, will now be "protected" by Mao Tse-tung's regime. This hardly squares with Chou En-lai's simultaneous protestations to the Burmese and Indian prime ministers about peaceful co-existence and non-interference.

There are many other matters to which the Labour leaders might direct their curiosity. They might—if they can—seek out Kao Kang, who was the much-lauded ruler of Manchuria until this year he committed the unpardonable sin of "standing up against the party." Mr Bevan should find this an enlightening interview. They might contrast the official announcement at the end of June that, "for the first time in many centuries," the peasants along the Huai river could now live without fear of floods, with the devastation that has since struck the area, despite the fact that two million of these same peasants had been harnessed to a much publicised programme of dam building for the past four years. They might ask why British traders, however useful their wares, have found it so difficult to get into, move around in, and indeed to get out of China in recent years. They might raise the question of the brutal treatment and forcible indoctrination (under the nicely named "lenient policy") of British prisoners taken in Korea. But perhaps their most interesting quest would be to seek out their own opposite numbers in China—the leaders of the "democratic parties," which are still allowed a tenuous existence owing to their propaganda value—and, without asking such foolish questions as how these parties viewed their chances of coming to power during this year's "elections," to inquire precisely how their party platforms differ from that of their Communist rulers. This should be an instructive glimpse of the "new democracy" at work.

Tory Terriers

THE revolt of the twenty-eight Conservative backbenchers in the Suez debate proved to be a very bourgeois affair. There was never any smell of blood. Mr. Julian Amery, the most eloquent of the rebels, proclaimed that he was voting against the Government because he could "do no other"; but if Labour had decided to join the dissidents *in order to vote the Government down, the rest of his group was plainly prepared to do* "something other" very fast. Lord Hinchingbrooke, the only member of the group who managed to look at all angry, was careful to explain that his revolt would extend "to the division lobby and not beyond it"; he had no intention of going down to his "constituency during the recess, perhaps finding some troops who have flown back from the Middle East as a result of this agreement, and telling them that they must go back to where they were before." The other backbenchers all had the air of men making a routine protest rather than presenting a serious challenge. Some of them were protesting against what they considered to be the cession of the main responsibility for defence of the Middle East to the Americans; some were Empire crusaders, mournfully but not very vigorously clanking their chains on the way to the division lobby; and a surprisingly large number were voting against the Government merely in order to prove to themselves and to their party what good Conservatives they were.

Nevertheless, this split among the Tories needs to be taken seriously, for the dissidence that it has dramatised has been the most remarkable feature of the third session of this Parliament. By all the laws of luck and politics, this third session should have been an even greater political triumph for the Government than the second session had been. It has been a period of continuing full employment, reasonably stable prices, peaceful co-existence and good red meat; it has cleared the way for a fourth session in which there will be a political need to increase old age pensions, but no urgent electoral incentive to do much else. When that fourth session ends in the autumn of next year the Government —on its record to date, and but for these recurring rumpuses on the benches behind them—should feel confident that it would be able to call an election, to portray itself as fighting against a Labour party that has been the exponent of austerity at home and is becoming the proponent of Bevanism abroad, and to win power for another five years by a thumping majority. *This is* probably still the Tories' strategy and their hope, but there is now a serious impediment in their way. After the events of the last few months, the Labour leaders will be able to claim that they are campaigning, not against a successful Government, but against a sinister shadow called the 1922 Committee; and this is a slogan that may still bring them success.

The Tory backbenchers themselves are indignant at —indeed openly contemptuous of—this defeatist suggestion. They do not feel that they have done anything that need cause the Government to lose votes. What, they ask, has been the nature of their so-called "unpopular" revolts? They have opposed a scheme for increasing parliamentary salaries, and have felt confident that a majority in Britain opposed it too. They agitated noisily for action in the Crichel Down dispute, action that the country wanted and that the Government may or may not have been ready to take in any event. They have secured the abandonment of a bill about development councils of which not one elector in ten has ever heard, and the postponement of a teachers' pension bill against which teachers had violently protested; and they have aroused the irritation of Egyptians and Arabs who fortunately do not participate in British elections. In each dispute they have struck the attitude that would have been struck by a united Conservative party if it had been in opposition, and they believe that they have been both electorally wise and politically high-principled in doing so.

*

*

These two claims—to electoral wisdom and political principle—are separate arguments. The only connection between them is that they are both quite wrong. The flaw in the first claim is obvious. The Tory rebels might be able to argue convincingly and at great length that each of their campaigns has been one that the public should support; but if they enter into convincing and lengthy arguments against their own Government they will be playing into Labour's hands. They will either arouse suspicion of their own motives, or else they will start to chip away the reputation for business-like efficiency which is their party's principal gloss.

The Tory dissidents can therefore defend themselves before their supporters only by saying that they have been fighting for important principles in which they believe. It is unfortunate, however, that very few of them —and fewer still in the country at large—seem to have any clear idea of what these principles are. The Tory rebels of the last few months have not considered themselves to be an extreme right-wing group, in the way that the Bevanites have considered themselves to be men of the extreme left. On the contrary, if there has been a single current behind their campaigns it has been a strangely unconservative current of anarchy. The only common denominator in the various rebellions has been a suspicion of decisions or proposals handed down from authority—whether that authority be a select committee, or the civil service, or defence experts or any other body over whom Tories feel that they may lack effective control.

There are some healthy elements in this suspicion; it is a good thing that a political party should be keeping a careful eye on the influence of the salaried experts—in the Treasury, the defence services, the Foreign Office and other departments—by whom so many important decisions tend to be taken in the complicated modern state. But if the Conservative backbenchers are to take up this role of terriers, they should resolutely pick out the holes from which they expect trouble to emerge, and stand over them on guard. In the last few months they have not been doing so; they have been barking wildly in the public yard.

There are three general dangers against which a terrier campaign by backbench Tories might excusably be directed. First, they have reason to fear that the present British administrative machine still tends to handle problems only as they arise; it should be the task of party politicians to ensure that government is not merely an expert reaction to the contingencies of the present, but is also driven forward by an idea—or set of principles—about where the country wants to go in the future. It is difficult to argue that any of the Tory revolts in this session have had this object in view; indeed the current slogan of the dissidents seems to be that the less legislation there is, the happier they will be.

Secondly, civil servants and other administrative experts may often tend to wriggle away from awkward situations, to avoid embarrassment by particular sectional interests. The Tory backbenchers thought they were protesting against such a retreat in the Suez debate; but the balance of argument in that debate clearly showed that expert military opinion here was not weak-kneed but right. In domestic policy, of course, Tory backbench revolts have more often acted in support of pressure groups than against them; and in one of the few cases in which the rebels thought they were doing the opposite—in the battle over MPs' pay—they were quite satisfied when they secured a change from an open and defensible scheme to a hole-in-the-corner and indefensible one.

Thirdly, government by civil servants may lead directly to subordination of the interests of the individual to the interests of the administrative machine; party politicians should act as bulwarks against this tendency to despotism or excessive state control. The Tory backbenchers believe that they did this over Crichel Down; but it is not clear how far the action that the Government took in this matter was really forced from it at pistol point. The weight of evidence suggests that the backbenchers' campaign merely made a necessary and pre-determined rectification of Government policy look like a scared sacrifice and retreat.

In nearly all these interventions, therefore, the rebels seem to have been clumsy in either manner, intent or effect. Their errors of manner may not be their fault; the administrative muddle into which British government has fallen—largely as a result of problems of personality that are now widely recognised—makes it very difficult for them to exert what pressure they want at the right time and in the right way. But for the errors of intent and effect the rebels themselves are entirely to blame. It may be proper that there should now be some reaction against Disraeli's dictum that a Conservative government should be an organised hypocrisy; but if the backbenchers want to swing conservatism right over to the status of a disorganised ideology, they have chosen an odd moment to do so. If they continue their irridentism when Parliament returns in October, they may still throw away their glistening opportunity for another five years of Conservative rule.

France on the Mend

ONLY six weeks have passed since France and the French Union began their treatment at the hands of a new prime minister. Already the patients feel and look much better, and they show a confidence in M. Mendès-France and his drastic methods that no one else has inspired for many a long day. There was always much to be said for the clarity and insight of his diagnoses; what was in doubt was his ability to carry out his prescriptions. But he has shown flair, vigour and determination as the manipulative surgeon of French politics, applying skill and strength suddenly at the points of congestion, trusting that the pain he caused would be followed by relief and healing. So far he has been successful. Can he continue with these methods and will he be given the time and the backing to try?

His spectacular time-table, first to Geneva, then to Tunisia, brings him this month to Paris and the economic problems of France, and perhaps to Brussels and the problems of French policy towards Germany and Europe. He starts with certain assets—notably prestige and popularity—that he has created for himself. He has brought a sense of purpose back into French political life and shattered the growing belief that *immobilisme* was an inevitable feature of its democratic practice. National pride is flattered by the attention now being paid to French views by other governments and by the spectacle of a premier who gets results, who takes the public into his confidence in the Rooseveltian manner and does not hide unpleasant truths. His impact on the mood of his countrymen is of no small importance in a nation that had begun to despair of its institutions and its statesmen.

But this very popularity is a dangerous asset in France, for it breeds suspicion in parliament; and the chief weakness of M. Mendès-France is precisely the uncertain backing that he has in the National Assembly and the motley character of his coalition government. The conservatives mistrust him, while the Christian Democrats feel strange out of office, sulking and thirsting for revenge. Because he rejected Communist votes and has been unable to coax the Socialists into his government, there is no popular front behind this "progressive" premier. Many of his Gaullist supporters, as well as many fellow-Radicals, dislike his zeal for a new deal in North Africa and would stab him in the back at the first opportunity. Above all, his majority is as deeply divided about German rearmament and the ratification of the treaty for a European Defence Community as were previous majorities. So far his coalition has been held together only by success.

*

With these assets and handicaps, M. Mendès-France goes on with his triple task of saving what can still be saved of the French Union, of restoring health to the economy and of shaping a coherent and steadfast foreign policy. For the moment he has moved decisively only in the first direction, and he may find the going more difficult as he gets further. In Indo-China much of the power of decision lay in the hands of foreigners; M. Mendès-France's merit was to make a brilliant judgment of his chances when even his critics had given up hope of winning through by force. That is not true of North Africa. He has to face powerful colonial lobbies in parliament who will not listen to the argument that it is better to give power to moderate national leaders than to wait until insurgents take it by force. So far M. Mendès-France has shown both courage and skill against them but they may yet bring him down.

At the base of this new policy is the calculation that political and commercial ties with Paris will prove more profitable and more efficient in North Africa than methods of suppression. But this calculation will largely depend for its success on such a recovery in France as will exercise a powerful attraction on its partners overseas. If the new premier were asked to single out one cause of his country's decline in prestige and power, he would probably point to the fact that its industrial production is now only a fraction greater than it was in 1929, and that it has failed to keep pace with its competitors. Economic expansion, therefore, lies at the heart of his programme. In opposition he advocated cuts in unproductive—that is to say military—investment and deplored the rentier mentality that Frenchmen have developed under the influence of American aid. The end of the Indo-China war should, in the long run, give France some relief; but at first a reduction in dollar aid could hinder the readjustments of the French economy—towards freer trade abroad and more competition at home—by which the premier hopes to transform the paradise of the unfit into a striving economy.

The government has now laid a vague economic programme before the Assembly and will soon ask for permission to act by decree over a wide field of fiscal and other matters. Its authors seem to be in a rather optimistic mood, perhaps a little intoxicated by the technique of setting time-limits. There is in fact little scope in economic affairs for four week *coups*. Indeed, the only speedy method of adjusting French internal prices to the world level would be to devalue the franc; and even to hint at any such idea at the moment would be tantamount to political suicide. There remains the alternative of reducing trade barriers and patiently cutting costs by increasing productivity. Such a policy will provoke loud protests from all kinds of vested interests, and it is far from certain that the French workers will agree to pin their hopes of better times to a lower price level or to have their wage increases linked to rising productivity. The present government, like any other that tries to foster economic expansion without inflation, must rely on the co-operation of the trade union movement, and in France that is dominated by the Communist-controlled CGT.

At this point the prospects for economic reform become entangled with the government's intentions in foreign policy. It has been argued that M. Mendès-France will be more kindly treated by the CGT than were his predecessors. It is pointed out that the Communists voted for him, and Mr Molotov followed his time-table, at Geneva. But any claims of M. Mendès-France on Communist indulgence can spring only from the assumption that he is less "European," less committed to EDC—Mr Molotov's *bête noire*—than his predecessors. Were he to disappoint such hopes, he could expect no mercy from M. Duclos and his comrades.

*

How the EDC treaty is to be dealt with is still M. Mendès-France's secret. The difficulty of either rejecting or ratifying it has inspired such fear and embarrassment in previous ministers that they have turned their back on it. M. Mendès-France originally intended to find some compromise formula that would rally a large parliamentary majority; but that proposal has been rejected by other governments who have signed the treaty and it has not even brought together partisans and opponents in France. He is expected to stage a debate on EDC very soon, but not as an issue of confidence. To do that would split his cabinet into two irreconcilable factions.

This long-delayed battle is bound to be close. Both camps might in an emergency muster about 290 votes, leaving about 50 deputies abstaining or uncertain. M. Mendès-France has already said that he is reluctant to bind his country to such a fateful decision by a handful of votes. Even if he were to overcome this reluctance, the treaty would probably be rejected by the *Conseil de la République*, thus forcing the Assembly to pass it a second time by an absolute majority—and even the most sanguine partisan of EDC can scarcely hope

for this. No government, whatever its intentions, seems capable of breaking this deadlock and herein lies the root of all delays. This may be an unpalatable fact, but it has to be faced.

Bold *coups* and spectacular achievements are no longer open to the French government. In the economic field it must prepare itself for a lengthy convalescence and on the European front for bitter argument. Scores of deputies are waiting eagerly for a tactical blunder, to pounce on the successful premier. There are the open enemies who would not hesitate to hit below the belt and exploit latent anti-Jewish feeling; there are the "friends" who may suddenly stab him in the back, and all those who are attracted by the glitter of success but will desert as soon as the shadow of failure appears. Indeed, the new healer surgeon may be dismissed before he has time to proceed much further with his treatment, but by operating boldly he has already left his mark on the body of the Fourth Republic. Even if the deputies give him notice, Frenchmen may well remember his services when they next go to the polls.

Housing — Illusion and Reality

IN the narrowest political terms the Government's housing policy has been an unqualified success. For some time Mr Macmillan has been experiencing the happy sensations of a Minister who has outplanned the planners and produced the cascade of houses that Labour critics had claimed to be impossible. The 320,000 new permanent houses that were completed in Britain in 1953 seem likely to be slightly exceeded in 1954; nearly 168,000 houses and flats have been completed in the first six months of the year. The voters are being told that some parties keep their pledges.

Unfortunately for the Conservatives, this statistical sunshine is darkened by a cloud that has already grown a lot larger than a man's hand. The houses proliferate; but who gets them and who pays for them? Any fair analysis of these questions is bound to reveal that it is no Conservative policy that the Government is following. Conservatism at its best implies respect for individual initiative plus solicitude for the genuinely needy. Socialism at its worst runs to a woolly-headed egalitarianism which supposes that public expenditure (unless it be on armaments) is *ipso facto* beneficial. There is little doubt which boot present housing policy fits.

The people who pay for most of the new houses are the taxpayers and ratepayers. More than three out of every four houses completed in the last twelve months was built with public subsidy. Every council house now built attracts the equivalent of a capital grant of £845, and the average tenant gets a rebate of about 40 per cent of his true rent. Both figures are a great deal higher in the case of flats. These are the statutory subsidies, paid as of right under Act of Parliament and accepted by tenants in precisely the same spirit; in addition, the ratepayers of some districts make a further payment in aid of council rents. Moreover, the success of the Government's drive to build more houses means that the burden is constantly rising. Last year's increase in housing subsidies (over £10 million) was the biggest on record; if present policy were continued for another ten years, its annual charge on public funds would approach £200 million.

The lucky people who get the new houses, and the bounties that go with them, are not those who are worst-housed at present or those who are most in need. They are a heterogeneous collection, mostly in the middling income groups, whose one point in common is that they have been for a long time on the lists of some housing authority. This means that young couples who have just been married hardly ever qualify for these new houses; they also have little chance to find rent-restricted accommodation, for that is monopolised by older people with squatters' rights. They—and others who have been unlucky—are driven back to live with their "in-laws," or to pay fancy rents for furnished accommodation, or to buy houses of their own at prices which they cannot really afford. Once there, they pay high rates to subsidise those who are better off, and who have got the council houses that they wanted themselves.

*

These are glaring and familiar anomalies. The wonder is that they do not shock more; and the reason seems to be that public housing is still viewed as a sort of state bonanza, which may be extravagant but which hurts no more than a general tax on cigarettes. The idea that the housing problems of one family can be directly traced to the good fortune of another family in getting a council house has been slow to take root. It is now generally realised that many council tenants are better off than many of their ratepaying benefactors. But the broader connection—between the absorption of housing resources and inflation of housing costs by state action on the one hand, and the difficulty and high price of renting or buying accommodation on the free market on the other—still escapes the public's comprehension. If one family is lucky enough to get a new council house for a rent of twenty shillings a week, although in an unsubsidised market it would choose to stay in its present not uncomfortable home; if a second family would actively prefer to move from a house to a flat but does not do so—and therefore does not make room for other people — because this would involve it in paying an

economic instead of a subsidised rent; and if a third family has to pay £4 a week for a couple of badly furnished rooms—then these are regarded as three separate cases. It is not realised that the third case follows from the first two as night follows day.

The Government, of course, does dimly recognise this; and that is one reason—together with its concern about the cost of subsidies—why it does not wish to continue housing policy in quite its present form. Political kudos having been won, economic discretion has become the better part of valour. The Housing Repairs and Rents Act, which received the Royal Assent last Friday, is intended to set the scene for a subtle shift in housing emphasis. It is not a major shift; the small rise in rents under the Act may have only a marginal effect. But it is as far as the Government is willing to go during this Parliament in its policy for the renting of private property. The main hope now must be that it can be induced to make a similar small shift in its policy for council housing as well.

*

Mr Macmillan has gently indicated on several occasions what he is after in this field. He wants local authorities to build rather fewer new houses and private enterprise to build rather more. Solicitous in this one matter of local rights, the Minister has hesitated to control the policy of local authorities, although he has put some limit on the numbers of houses which will qualify for subsidy. But by tactfully emphasising the importance of slum clearance, he doubtless hopes to modify as well as to divert the energies of local government.

As yet this policy has had very little success. The number of council houses under construction is fractionally smaller than a year ago, and the figure for private enterprise houses is larger. But the switch is very slight and the ratio of public to private housing is still more than 3 to 1. There are reasons for expecting that this state of affairs will continue; they were emphasised in two papers recently delivered to the annual conference of the Housing Centre. In one of these Mr D. W. Riley, the county planning officer for Stafford, indicated that most local authorities still regard slum clearance as something of a residual activity. They expect to be busy for a long time in catering for families now sharing accommodation and for the natural increase of the population; in other words they continue to interpret their housing responsibilities in the broadest terms. In the other paper Mr Norman Wates, a building contractor, explained why the private demand for houses is so small. Why should people buy their own houses if the local authority is willing to house them at half price? Admittedly, there is a wait to get the council house, but in many areas the delay is rapidly being reduced. Admittedly, there is still a certain social stigma (for some people) in living on a council estate; but such objections commonly count for less than hard economic facts. The hard fact in this case is that a small private house which could be bought for £650 before the war now costs about £2,000. The prospective purchaser in a professional or clerical occupation has not had anything like an equivalent rise in his net income.

*

Thus Mr Macmillan should cherish no hope that the housing market will right itself automatically in time. The private builder cannot recover a mass market until building costs are reduced and the pressure of public demand is abated. No progress can be made in this direction so long as the housing subsidies remain at their present level. The subsidies are not only sustaining a rate of building that is eating up an excessive share of national resources; they are also instrumental in causing the steady inflation of building costs by 5 per cent each year. If any other industry was favoured with such public bounties there would be someone at least to protest; but so great is the political magic of housing statistics that not even a Stanley Evans has come forward to emphasise the close connection between high subsidies and high costs.

The Government is not going to make a drastic overhaul of this pernicious system during the present parliament; it has committed itself, for another year, to continue the subsidies that it pays to local authorities for each new house at roughly the present level. But some action could be taken now to ensure that fewer subsidies go to tenants who do not genuinely need them. Attempts to raise the rents of richer tenants are apt to run foul of opposition to a means test. There is a simple and just way to meet this objection. Every tenant should be required to show why he cannot pay the full economic rent for his particular dwelling. In most cases rebates would be necessary—anyhow in the case of post-war houses; but they should be paid as concessions, not expected as automatic rights.

The Government might hesitate to make all local authorities conform to the same system. But it has the means to hand for ensuring that all councils at any rate proceed in the same general direction. It could reduce drastically the annual number of houses on which the Exchequer subsidy is payable. Each local authority would then be forced either to curtail its rate of building or else to spread its available subsidies more thinly. Both these pressures would be beneficial. They would be a sign to ratepayers that the Government would not foot the bill for subsidies that were socially unjust and unnecessary. At the same time, the slackening in local authority building might set the trigger for a fall in costs and a new impetus to private enterprise housing. This should be the Government's next step after the passing of the Rents Act; it would help to restore some balance to the nation's housing policy, which is at present roaring triumphantly off the rails.

Notes of the Week

Mr Attlee's Success

ONE of the by-products of the debate on the Suez agreement was that it enabled Mr Attlee to pay off a long-standing political score and to give one of his most effective parliamentary performances for a long time. The congratulations that his supporters showered on him afterwards should remove all doubts about his capacity to hold on to personal leadership of the Labour party for as long as he wishes. Just as Sir Winston Churchill has always felt special resentment about the "warmonger" campaign of 1951, so Mr Attlee has always been particularly offended by Tory charges of "scuttle" during his years in office; and in the debate on the Suez evacuation he took ferocious pleasure in ramming the offending word down Sir Winston's throat. As Sir Winston has all too effectively wiped out the "warmonger" charge by rushing in the opposite direction, the two men have now wiped their personal slates clean. Both stand equally tarred by the same pinkish brush, and only Captain Waterhouse remains swathed in imperial purple.

Mr Attlee has had to wait for his moment of revenge; but at least, when the chance came, it could not have been more timely. The Suez debate was the last big occasion before Parliament rose for the summer recess, and Mr Attlee's taunts will continue to ring musically in the ears of his followers until the time comes for them to foregather for the annual party conference at the end of next month. And, just to be sure that no discords can be introduced in the meantime, Mr Attlee will this week-end be whisking Mr Bevan off to China.

But at the conference Mr Attlee will need all the credit he can get if he is to avoid defeat on "German rearmament." The agenda for the annual Trades Union Congress next month offers not a word of support for his policy; those resolutions on foreign affairs that avoid the subject do so only in order to concentrate on airing familiar left wing themes about the H-bomb. Some of the biggest unions, of course, are pledged to support the official policy; and the TUC's agenda, like that for Labour's own conference, is mainly intended as a safety valve for the irresponsible. But the unions can put up sensible resolutions if they want to—there are, for instance, two or three that promise a serious and responsible debate on the future of collective bargaining. As with the agenda for the Labour conference, those organisations that recognise the facts about German sovereignty have flinched from putting them down on paper; they will no doubt come out fighting when the bell rings, but their present discomfiture indicates again that resistance to this emotional urge from the left will be the most crucial political issue of this summer.

Custodians Against What?

THE Independent Television Authority hopes to have its programmes on the screen in about a year's time. Nine of the ten members of the authority have now been appointed; none of them knows very much about television, but they have been chosen as unimpeachable custodians of public taste. The chairman is Sir Kenneth Clark, from the Arts Council. Education has a distinguished representative on the authority in Miss Popham, the former headmistress of Cheltenham Ladies' College; if Cheltenham cannot keep an eye on Birmingham, who can? The other members bring the expected representation of the different regions of the United Kingdom, of youth clubs and of university life. Because, presumably, of the Labour party's opposition to commercial television, there is a certain shortage of horny hands; but the former general secretary of the Transport Salaried Staff's Association brings the necessary trade union touch.

The first task of these nine distinguished people will be to appoint a Director General to administer the scheme for them; then they will have to grant contracts to, initially, two or three programme companies to fill the screens in a way that they feel they can trust. Sir Kenneth Clark agrees that these contractors will probably have to carry on their programmes through "one very lean year" (when advertisers may well feel that they are having to pay a lot of money to reach a relatively small audience); after that, he thinks, prosperity will start. This is the crucial question. The members of the authority should not regard their new job as one of acting as nursemaids to a monster that is liable to corrupt the uneducated and the young; that bogey should have been laid as soon as the Television Bill was published last winter. Instead they should realise that they are taking over control of a risky experiment that—because of the ramshackle controls with which the Act has encumbered it—will have to be operated with fire and faith and the most resolute management if it is to attract advertisements, presumably at an average cost of about £300 a minute, in sufficient volume to make the scheme pay.

Disquiet Over Defence

JUST under six months ago the service authorities completed a comprehensive review of the defence structure, and published the broad results in the annual White Paper on Defence. On the same day, Sir Winston Churchill read about the H-bomb tests in a newspaper, and decided that this review was already out of date. As the H-bomb is one thousand times more powerful than the original A-bomb, Sir Winston may well be right. But by making the bare statement that all previous strategic conceptions are obsolete—without discussing the implications—he has given a green light to the irresponsible. The Labour Party, for instance, may be about to decide that Sir Winston's words, coupled with the Suez agreement, gives it a sufficiently plausible case for coming out openly in favour of a cut in national service. Such a campaign would make the worst possible background for the difficult calculations now facing the military planners.

This week the army lifted a corner of its nuclear curtain. Its enterprise was commendable—although it seems to have been partly a move in its private battle with the RAF about the future control of the army's helicopters. These helicopters are to play a vital role; they will take the supply lines off the vulnerable roads and will help to make the infantry soldier, armed with his new rifle and supported by tanks, much more mobile and self-contained. Maintenance, the other bugbear of modern armies, will be simplified by drastically pruning the variety of weapons in use.

As answers to the army's own tactical problems, these measures are probably the best available. But there is no indication of how they are supposed to fit into the general strategic pattern, nor is there any sign that the new streamlined army will be a reality for another year or two at least. The new supply system is not to be tested at divisional level until next year; the new rifle is still in the trial stage, and the production lines are not to be tooled up before next year; the new helicopters cannot even be ordered until the War Office and the Air Ministry decide which of them should do it. In fairness to the Army, it should be said that if the Air Ministry and the Admiralty were to give an equal amount of information about their plans, their pictures would probably be still more disquieting. This is all the more reason why they should now follow the War Office's lead. A democracy that has been told that all previous strategic ideas are obsolete needs to be given some idea of what is to replace them. If clumsy public relations provide any opening for those who would like to send military as well as civil defence to Coventry, the consequences could be disastrous and immense.

Siam Next on the List?

IT is good news that the five Colombo powers have formally pledged their "firm support" to the Geneva agreement. But those who expected the agreement to inaugurate a period of relative tranquillity in South East Asia have received an unpleasant shock in the past week from evidence of Communist China's intention to support a subversive agitation against the present government of Siam. Even while the Geneva conference was in progress, Chinese radio propaganda was fiercely denouncing Siam for "serving American aggression" and "smoothing the path for American war preparations," but there was no official confirmation of the rumours that China was harbouring the exiled former prime minister of Siam, Pridi Phanomyang, for use in its political attack on that country. But two days after the signature of the Geneva agreement it was announced in Peking that the China Peace Committee had given a banquet in honour of Pridi, attended by important members of the Chinese Communist party; a few days later a manifesto by Pridi was published, appealing to the Siamese people in terms almost identical with those already used in propaganda from Peking. It is a fair presumption that Pridi, the old rival of the present Siamese prime minister, Pibul Songgram, has struck a bargain with the Peking government, and hopes to return to power in Bangkok with Chinese help.

From the abuse that the Chinese Communist radio is now showering on the present American ambassador in Bangkok, it may be assumed that he is having some success in persuading the Siamese government to rely on American support and not be intimidated by the war of nerves waged from Peking. Songgram, who sent a Siamese contingent to take part in the war in Korea under the United Nations command, is probably in any case too deeply committed to the anti-Communist cause to be able to change sides at this hour; but many of his followers may well think it wise to intrigue with Peking if Siam has no definite guarantee of protection from the western powers—as it has none at present—against its powerful neighbour. While the western governments proceed with leisurely contemplation of measures which might be taken to defend South East Asia at some future date, they may suddenly find that yet another territory is being nibbled away.

Shock Treatment in Tunis

M. MENDES-FRANCE'S startling dash to Tunis, carrying a proclamation of home rule, belongs to the same category of policy for the Mediterranean as Mr Eden's handling of the Suez question. The long coast of North Africa lies close to Europe's underbelly; by vesting moderate North African nationalism with responsibility for its own good management, both politicians hope to cause it to see, and to go on seeing, that its interests are bound up with those of western Europe.

The contrast between this broad view and the parochialism of previous French cabinets is best grasped when it is remembered that M. Mendès-France was the first foreign minister to visit Tunisia since the war. No predecessor had ventured so far, because each of them was too conscious of the lobbies pulling at his coat-tails with injunctions not to forget the claims of the French settlers, or else not to wreck the coalition of the day. The same warnings would have dogged M. Mendès-France had he given people time to utter them. The skill of his technique lay in its speed and singleness of purpose; for the first time, he forced a French cabinet to give undivided attention to the mounting problem of Tunisian nationalism.

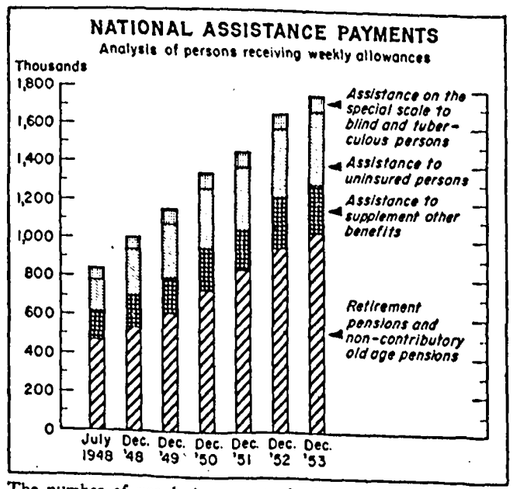
The exercise cost it grief and pain. It was at first unanimous only on one point—that terrorism must be quashed, if necessary by force. It therefore decided to drop its civilian Resident General and to appoint in his place the General who is commander of the French forces in Tunisia. This step reassured several doubters; but they had other misgivings. Ought not terrorism to be stamped out before concessions were mooted? What guarantee was there that

an autonomous Tunisia would respect new conventions affording some rights to French settlers? Or that an elected parliament would not alter the Tunisian constitution? At least one minister wanted to resign, and was only prevailed upon to trust the Tunisians because M. Mendès-France said that if General Koenig went he would go too. In the end, he secured unanimous support by setting out the stark alternatives to his policy; these, he argued, were mounting tension, little security for the settlers and their vested interests—even at the cost of expensive campaigning—and, above all, the driving of moderate nationalists who see a need to work with France into the obstinate, non-co-operative frame of mind so familiar in Egypt and Asia.

His final touch of genius was to take the iron-clad Marshal Juin with him. The curious sight of this confirmed diehard nodding acquiescence to a proclamation of Arab home rule was rightly calculated to reassure the settlers; presumably the Marshal agreed to go because he is vain enough to reason that his very presence would show terrorists that France means business. So off he went in the cortège that sought, and required, no Parliamentary approval in Paris, because all that it was doing was to carry out the treaty of 1881, which all previous French governments have endorsed but which none has till now fully applied.

Doubtful Prospect in Morocco

Now that M. Mendès-France's opponents have had time to draw breath, their criticisms of his Tunisian move are gathering volume. They are voicing all the arguments advanced by the waverers in the cabinet, and are claiming in addition that generosity gets France nowhere, because the immediate result of his gesture to Tunis has been to increase unrest in Morocco. But this contention, though superficially so plausible, is illogical. It ignores the immense difference in mentality between Tunisia and Morocco and between the problems they now present for Paris.



Heredity has given the Tunisians a quick Phœnician receptiveness; throughout centuries of invasion from Europe as well as from the East they have absorbed new influences through open pores. In seventy-five years of French protection and education, the educated class has learnt as much from French as from Islamic culture and forms of thought. The nationalist movement, the Néo-Destour, has remained xenophobe, Muslim and Arab, and has therefore out-distanced and swamped all factions of the "Back-to-Islam" type; it is thus homogeneous and commands nationwide approval. At the same time it differs from such parties elsewhere in the Arab world, because Tunisia's educated bourgeoisie is sufficiently stable and well founded to think realistically and to see that all it has gained from contact with France will be lost if it cuts the painter right through. A sketch of the gamut of personalities and social classes that hold this view is given on page 453. In other words, the cabinet now formed to negotiate details with France is fairly unlikely to be superseded by men hell-bent on easternisation.

★

Morocco presents a different picture. It remained wild and largely unexplored as late as the 1920s. It is homogeneous neither racially nor socially, being much more than half-Berber. The Moroccan is standoffish and far from receptive, and the gap between Morocco's feudal leaders and its semi-educated townsmen is as yet virtually unbridged by a mature professional class of educated men. Its nationalist groups are torn by faction; its Berber chiefs despise its Arab townsmen. Last but not least, its educated inhabitants have been thrown into dissension by the recent French policy of making and unmaking Sultans. Even M. Mendès-France could not devise a single stroke of policy to meet such a variety of views and requirements; probably the most he can do is to tell the Moroccans that he must first carry out his Tunisian experiment, and meanwhile will use force—French if necessary—to curb terrorist activities. For success, he will need to devise some proof of good intentions, and to think of one sufficiently dramatic to serve his purpose will not be easy.

People on Assistance

THE annual report of the National Assistance Board [Cmd. 9210] provides a useful appendix to the recent debate on old age pensions, and to the promises to increase national insurance benefits that were made by both political parties during it. As there was no increase in national assistance scales last year (and thus no change in the number of income groups that became eligible for allowances) some check was put on the steady rise in the number of applicants that has gone on ever since the national assistance scheme started in 1948. Nevertheless, about the same number of new allowances were granted in 1953 as in 1952, presumably because the army of old age pensioners becomes bigger each year and because people's reluctance to apply for assistance is gradually being overcome.

The number of people in respect of whom assistance is paid is much greater than the number of people receiving allowances, because dependants, of whom there are about 750,000, are not treated separately.

The diagram shows how the number of allowances was distributed among the different classes last year. By far the largest number of allowances is paid to supplement pensions (including 146,000 non-contributory old age pensions which are outside the national insurance scheme). But, the most important new material for the debate on pensions is that, according to a sample taken in November, 1953, only 66,000 of pensioners on assistance were drawing 5s. a week or less. A further 264,000 were drawing between 5s. and 10s.; but as many as 482,000 retirement pensioners and 68,000 non-contributory pensioners were receiving between 10s. and 20s., and the remainder were receiving sums up to £3. Thus, to make any substantial reduction in the number of pensioners on assistance, and make some better off, retirement pensions would have to be increased by at least 10s. a week. Any smaller increase would merely leave these people—the neediest of pensioners—to face a corresponding cut in their assistance; and they would not even have the consolation of being able to dispense with the means test altogether.

Legislating for Cleanliness

THE Labour party has been alleging for some time that the Food and Drugs Bill is being wrecked by vested interests. These suspicions were aired at length when the Bill was eventually given its second reading in the House of Commons on July 23rd. (The fact that it took place on a Friday—when most members are away—fanned Labour's wrath).

The basis for its suspicions of wrecking is the withdrawal of the draft regulations on food hygiene issued to the interests concerned for their comments. These regulations will be the heart of the measure when it becomes law. Other clauses give the Ministers of Food and Health powers to determine the composition of various foods and, if necessary, to prohibit the inclusion of certain substances found to be harmful, a precaution that has become necessary by the growth of the food processing industry. In addition, the Bill will strengthen the provision under the principal Act (of 1938) which prohibits the use of misleading labels and advertisements to describe any food or drug. But to the public the Bill is known as the Clean Food Bill. Has it been wrecked, as Dr Summerskill alleged, by caterers thinking more of their profits than of the public safety?

She cited instance after instance of the original draft regulations being dropped or greatly modified by the Ministry of Food, as a result of the representations made by the catering industry. But, as Dr Hill made quite clear when winding up for the Government at the end of the debate, the Ministry never expected these regulations to be accepted in their entirety. They contained an ideal code of hygiene, embodying almost every recommendation—but with one or two surprising omissions—made by all the experts interested in the subject. The result was some extraordinary anomalies; nor was any attempt made to differentiate between what was enforceable and what unenforceable but desirable. That was left to be sorted out after the Ministry had received the first comments of the trade. The Ministry then prepared some new draft regulations, based on the original ones, embodied others in a suggested code of practice, and has now sent the whole lot to the catering industry for further comment. Dr Summerskill—together with the Labour members who have seized on this "surrender" as a happy talking point for holiday speeches—must know that a great deal of the original draft was quite unenforceable and impracticable. It is one thing to say that everyone handling food ought to wash their hands after using the WC; but it is quite another to fine or imprison them for failing to do so.

Attracting Science Teachers

AN independent committee set up by the Federation of British Industries has produced a constructive report on the shortage of teachers of science and mathematics. This shortage will get worse in the next five years as the secondary school population grows; even if no allowance is made for the tendency for pupils to stay longer at the grammar schools, or for any improvement in the present staffing ratio, the schools are threatened with a deficiency of 2,300 teachers of these subjects by 1960. If these missing 2,300 are to be supplied, the committee believes that university science departments will have to be expanded; more questionably, it also recommends that science teachers should do only a shortened national service—although enough to give them basic training and to absolve them from complaints of shirking.

The committee's most important conclusion, however, is that the schools will have to pay salaries nearer to those that scientists can earn in industry. It does not recommend an increase in the starting salary, but, very wisely, prefers to concentrate the larger fruit at the top of the tree. It suggests there should be four grades of assistant master, with promotion by merit from one grade to another. In the top grade the maximum salary should be £1,500, compared with the present maximum of £941 with special allowances. If this plan were confined to scientists it would cost about £1½ million a year; if civil war in the common room made it necessary to extend it to all teachers it would probably cost about £4 or £5 million a year. This, however, would still be a small proportion of the total salary bill of £150 million, and far less than the cost of equal pay. On this reckoning the country can—and should—avert a very real threat to industrial progress at a surprisingly low price.

New Relationship for Iran

THOSE who like reading between lines can discern, as they digest the new oil agreement with Iran that is described on page 461, some interesting lessons for foreign investors in touchy countries, as well as for the touchy countries themselves.

What the published statements show is, on the one hand, that the Iranians had to get agreement for their Treasury's sake but that, to get it, they had to waive many prejudices in order to make their offers sufficiently attractive to tempt the foreign investor back into Iran. The statements also

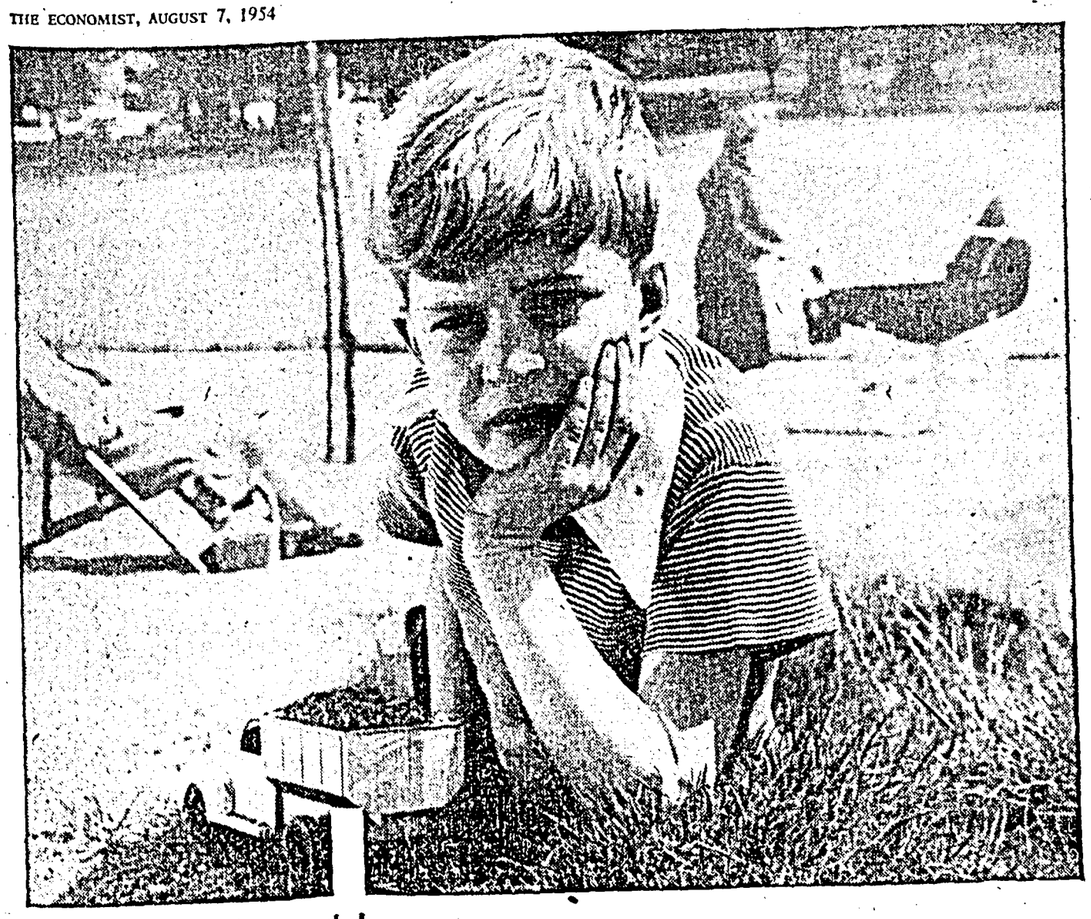
show that the consortium of oil companies, though not specially anxious to take risks because Iranian oil was no longer essential to them, were being egged on by their respective governments to do so because a stable, industrialised Iran is a political asset to the western world.

Both sides suffered from an additional handicap as they strove to find their formulæ; the Iranians had to strike a difficult balance between offering the foreigners some bait and producing a settlement that would look triumphal to a nation that has for years been stuffed with warped stories of what foreigners want to do to Iran. The handicap for the consortium companies was their heavy investment in neighbouring Middle East states. If they were over-generous to a nation that had interpreted nationalisation as the right to maltreat a foreign investor, were they not putting a premium on tantrums? The Arab states next door are all watching, lynx-eyed, to see if and where Iran is to get more favourable treatment than they. In fact, their scrutiny will reveal that though it is getting benefits, these will not be greater than any Arab state has got already, and that nothing Iranians can do will recover for them the losses incurred during three disastrous years of trying to run oil without partners. One of the best points about the agreement is that it brings to an end a supposed relationship between western exploiter and Middle Eastern victim. Its basis is a common or garden business partnership bringing advantages to both parties.

Achievement of this result in spite of the obstacles is a triumph of reasonableness. Notable contributions to it were the demeanour whereby the western negotiators suggested even to ardent nationalists that the bad old days were over, and the acumen and tolerance whereby the chief Iranian negotiator, Dr Amini, brought his compatriots in office to see that certain Asian prejudices are out of date. Whether the Majlis can be brought to think likewise when the agreement comes up for ratification depends greatly on the Shah, who wields more personal influence than any other individual in Iran.

On Co-existing Peacefully

SIR Winston Churchill and Mr Eden have adopted Stalin's slogan of "peaceful co-existence" after it has become old-fashioned in Moscow. It is true that Soviet and Chinese propaganda has had a great deal to say in favour of peaceful co-existence since the phrase came so unexpectedly from the lips of the British Foreign Secretary. But Communist policy has in fact moved ahead from the conception of two camps which was its basis in the days of Stalin. Now Mr Molotov propounds a different idea, that there is no need for two camps at all. They might, according to the Soviet plan, be united in the mutual defence systems which the Soviet and Chinese leaders have proposed for Europe and Asia. The Communists have not yet gone so far as to adopt the slogan of "one world," but they are approaching that point. They already propose Europe for the Europeans and Asia for the Asians, that is to say, two worlds, both without America.



"Without America" are, of course, the operative words. "Peaceful co-existence" as generally understood in Britain means that the western camp is grouped around the United States, and it is here that the fundamental difference lies between Stalin's idea and the advance on it made by his successors. The Soviet slogan in the latest stage of Communist strategy is that America's policy of strength has proved to be a failure. The main exposition of this argument against "positions of strength" (for America) and for the Communists' mutual defence systems (without America) came first from Mr Molotov, in his survey last March of the conference in Berlin. It has since been repeated by the Chinese, East Germans, including Field-Marshal Paulus, and various innocent Socialists. Mr Chou's pact of peaceful co-existence with Mr Nehru, for example, is evidently intended by the Chinese Communist leaders to be merely the preliminary to his Asian system of alliances, designed to eliminate American positions of strength and financial aid to Asia. Indeed, one Chinese Communist journal has jumped well ahead of the facts by declaring that the pact means that "the peoples of Asia" have now realised the need for this system.

The Communists and the British are, therefore, talking about two contrary propositions when they speak of "peaceful co-existence"—one meaning two camps, with America, and the other one camp, without America. It is just as well that this should be understood. It is of more practical importance than the well-known fact that the Communists have never thought of peaceful co-existence for ever. Ideological lectures still point this out to the Russian public. After national states have first all become Communist, said a recent lecture, they will be merged into one world-wide "people's empire." But, before this earthly paradise comes to pass, the Communist politicians must succeed in befuddling a great number of people in the West and East about their intentions.

Muzzles for Cyprus

WHAT has been said and done about the Cyprus question in the last fortnight makes it look as if the Foreign Secretary and his colleague at the Colonial Office have said to their officials: "Swat that fly; it worries me." To the handling of this complex and embarrassing matter they appear to have brought none of the patience and ingenuity that they have displayed recently, the one in Geneva and the other in Nigeria and the Gold Coast. It is one thing to say Britain must remain sovereign in Cyprus for purposes of sure defence of the Eastern Mediterranean. It is another and less defensible one to say this without even trying to discover a way of reconciling British rights and needs, Greek sympathies for the Cypriots, Cypriot yearning to be Greek, and Turkish unwillingness to see Greeks displace British. But it is yet a third, and one wholly without justification, to offer a new constitution as a first step towards self-government, and almost in the same breath to revive severe anti-sedition laws.

Henceforth it appears that to write and talk about a change of sovereignty in the island will be seditious. It may be punished by up to five years in prison; offending editors and publishers may be driven out of business; captious citizens may be deprived of British nationality

"Daddy, what is earth made of?"

That's mostly powdered rock he's playing with, you tell him—mixed with mould. It's the top of the earth called soil; in it are mineral salts, which help to feed the plants which in turn feed us.

Earth—the basic raw material. Sometimes scratched, even to-day, with Bronze Age tools, yielding a pitiable crop. Yet fertile, brimming over, where it is channelled for irrigation, ploughed, reaped, *husbanded* by power: diesel and electrical power, supplied all over the world by THE BRUSH GROUP LIMITED.

Supplied to the Sudan Gezira Board, for example, by J. & H. McLaren Ltd., a member company. Here 108 McLaren diesel engines have been cable-ploughing the land since 1927, the soil being too light for tractors. Over 600,000 acres now yield their crop of cotton and linseed; soon this same number of engines will extend the limits of fertility further still, to a total area of one million acres.

When the Kiwi cables to the Caribou

Between the land of the Kiwi and the land of the Caribou urgent messages must travel speedily and safely. Cabinet decisions, business quotations, Press despatches, family news—they are all part of the daily interchange of opinion and information between New Zealand and Canada. In New Zealand these messages are sent and received by the New Zealand Post Office; in Canada by the Canadian Overseas Telecommunications Commission. Between New Zealand and Canada they travel for 6,000 miles on the bed of the Pacific Ocean along cables owned and maintained by Cable & Wireless Ltd. Cable & Wireless Ltd. is a trading organisation; but it stands at the centre of Commonwealth communications. It owns the Commonwealth's 150,000 mile submarine cable network and operates the wireless relay stations on most of the Commonwealth's trunk wireless routes. From 62 telegraph stations within the Commonwealth and 70 in foreign countries, Cable & Wireless Ltd. operates the overseas telegraph service of most of the Colonial territories and the cable services of foreign countries in which concessions are held. Linking the Commonwealth is a vital part of the business of Cable & Wireless Ltd.—part of Britain's business.

How these services are carried out is explained in a 40-page illustrated booklet "World Wide Communication", which gives many interesting details about the Company's equipment, operations and administration. A copy will be sent to you without charge if you will write, mentioning this paper, to: The Public Relations Officer, Cable & Wireless Ltd., Electra House, Victoria Embankment, London, W.C.2.

and aliens—presumably Greeks included—may be deported. The only excuse for making such threats at this moment would be convincing evidence that the numerous and well-organised Communists of Cyprus were planning big mischief. But nothing of the kind has been claimed, and three months must now pass before the House of Commons can inquire whether the danger exists. Admittedly *enotists* write and talk in an emotional and provocative way. It is true, too, that Cypriots and Greeks seldom hear the political and economic consequences of a change of regime objectively reported and discussed. But the British surely have sufficient reserves of skill and political art to avoid confronting excited nationalists with the gag.

Saving the Stowaway

It was ironical that the Polish ship, *Jaroslaw Dabrowski*, which was taking the Americans Dr Joseph Cort and his wife to their chosen home behind the iron curtain, should also be taking the stowaway Antoni Klimowicz back to the country from which he was trying to escape. Klimowicz had been discovered in the hold by dockworkers, and —learning that he wished to see the English police—they tried to smuggle him ashore. They were discovered, and Klimowicz was seized and locked up by the Communist crew. He was still on board when the ship weighed anchor and began to move down the Thames.

Meanwhile, the dockers had got in touch with the Polish Ex-Combatants Association, which had informed the Home Office. The Lord Chief Justice then gave leave to issue a writ of *habeas corpus*, requiring the master to produce Klimowicz in court on August 3. This was served at the last desperate moment—on July 31st, with the impressive accompaniment of 80 river police, in a flotilla of launches, and a destroyer standing by. When the master refused to co-operate the police searched the ship and took the stowaway ashore. His appearance in court on Tuesday was a formality, merely part of the procedure that was used to get him ashore. His application for asylum is now being considered by the Home Secretary.

There was nothing unusual, in order to set free a person thought to be detained against his will, in the issue of a writ of *habeas corpus*; and this writ, of course, runs in British territorial waters. The action taken follows in a line from the judgment of Lord Mansfield in the Somerset case in 1772, when a slave owner was travelling in a ship that called into the Port of London—and had his slave wrested from him and set free. No man, said Lord Mansfield, can be a slave on British soil. That dictum has rightly been re-echoed. But, amid the excitement, one lesson of this affair is apt to be forgotten: the machinery of British justice is meant to be swift and silent; in this case it was nearly too slow, and—partly because of Communist resistance, but perhaps partly for reasons of political show—it was certainly noisy to a degree.

Returning to Work

A case recently heard in the High Court underlines the financial difficulties sometimes placed in the way of disabled persons wishing to return to work. The appellant, who was severely paralysed as a result of poliomyelitis, contested the decision of the Minister of National Insurance that he was "gainfully occupied"; he complained that his necessary expenses in getting to and from work exceeded his earnings. His appeal was dismissed, and the refusal to allow him sickness benefit of 32s. 6d. a week was upheld.

The case is interesting for more than one reason. First, it emphasises again the sharp distinction between the treatment of persons under the national insurance scheme and under the industrial injuries scheme. Anyone disabled as a result of his employment—or war service—is allowed to retain his disablement pension even when he has returned to full-time work and even though his disability involves him in no extra expenditure. Obviously people on sickness benefit under the main scheme cannot be treated so generously as this. But the National Insurance Advisory Committee might consider whether some provision should be made to allow a temporary overlapping of benefit and earnings, especially in cases where a return to work is encouraged as part of the process of rehabilitation.

At present, from the national insurance point of view, a person is considered as either completely well or completely incapable of work. That is, he is regarded as entitled to his 32s. 6d. a week, with dependants' allowances, or to what he can earn. There are only two exceptions to this rule: first, hospital patients who are prescribed occupational therapy are allowed to earn up to £1 a week from the work thereby performed; secondly, people unfit for any real work are allowed to earn up to £1 a week by homework, but they forfeit the whole of their sickness benefit if their earnings exceed that amount. In 1948 the advisory committee recommended that the possibility of extending the provision for hospital patients to other patients should be considered after experience had been gained of its working. But that would not meet the whole need. People who have had a long or severe illness are often reluctant to test their recovery by a partial return to work, because it means the complete withdrawal of their sickness benefit. It is possible that this lack of a half-way house sometimes postpones indefinitely a full return to work; and the advisory committee might consider whether the disadvantages of the present system do not outweigh the dangers of sickness benefit being used to subsidise low earnings.

Co-operation in East Africa

The annual report* of the East Africa High Commission, which was published at the beginning of last week, testifies to a long list of good works and necessary services; it says nothing of the storms that have lately blown around the idea of still closer links between Kenya, Uganda and Tanganyika. That is an instructive commentary on the way in which the High Commission has developed. At first, federation was advocated by Europeans who saw, or thought they saw, a chance of throwing a chain of white settlement down the backbone of Africa. They soon came to see the obvious snags; and the black races—particularly in Uganda —saw them sooner still. The present High Commission did not stem from this debate, nor from the reports of the many committees that investigated East Africa between the wars. It was confirmed in its present form by the Labour

*HMSO. Colonial Number 305. 3s. 6d.

government in 1947, and it grew out of the common administrative machinery set up during the second world war.

The commission's activities include the administration of the railways, harbours and postal services of East Africa. In addition, customs rates are tied to each other; there is a common income tax service; and the commission is responsible for a variety of research and control organisations, such as locust control, agriculture and forestry research, and a common statistical service. Africans in Uganda tend to be suspicious of it—partly because its headquarters are in Nairobi and its ex-officio chairman is the Governor of Kenya, and partly because they are not satisfied with the inter-racial character of its assembly. The unofficial element in this assembly is drawn mainly from the members of the three territorial legislatures, and through them responsibility for the activities of the commission is sifted back to the territorial units. No doubt the originators of the scheme hoped to see a common political consciousness grow out of this functional approach. But this has not been the result. The commission's present scope will come up for review before the end of 1955. At that review its existence should be recognised as a useful economic and administrative, not as a sinister political, fact.

Rome and EDC

THE bill for ratification of the European Defence Community Treaty has been approved by the foreign affairs commission of the Italian Chamber of Deputies. The sixteen members of the government coalition voted for it and the eleven Communists and Nenni Socialists against it. Two Monarchists and one MSI member abstained, but the Monarchists were careful to point out that this abstention did not represent their party's final view. The finance, defence and justice committees of the Chamber have already approved the bill and the way is now cleared for a debate in the lower house. This is expected to take place when the Chamber reassembles in early autumn. After the lower house has voted, the EDC issue will go before the Senate, and a final decision can be looked for in December.

If the Scelba government is allowing so much time, it is precisely because the chances for a final ratification by Italy have been improving steadily. The government does not want to force it through by the narrow margin of votes already available. The Monarchists and the neo-Fascist MSI, both of whom started out as strong opponents, are gradually coming round. At present they are abstaining, but in December they may very well vote with the government. Two external factors have been preparing the way: the Trieste problem appears near a solution and the *rapprochement* between Belgrade, Athens and Ankara has made Italy more conscious of the need for integration within the Atlantic camp.

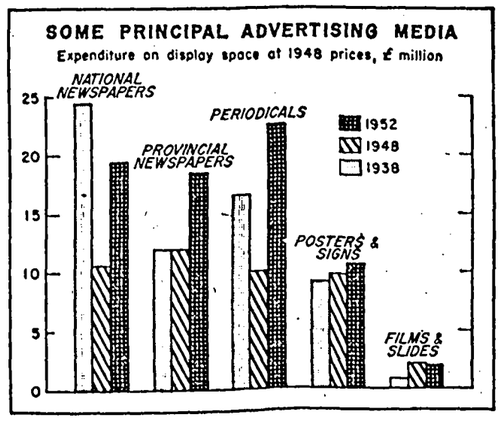
There are cynical observers, however, who give a different explanation. The Italians are increasingly convinced that Paris will not ratify EDC in its present form. An Italian ratification, therefore, would bring handsome dividends in American goodwill without really affecting fundamental issues. Seen in a European context, one thing is certain: the growing support of Italian right-wing extremists for the treaty is likely to intensify French opposition to it. A growing majority in Rome may mean a dwindling one in Paris.

To Encourage Montenegrins?

LAST week the Orthodox Metropolitan of Montenegro, Bishop Arsenije Bradvarevic, was sentenced to eleven and a half years' imprisonment with hard labour, on a charge of plotting to overthrow the present government. On the evidence available, such drastic treatment for an old man of over seventy hardly seems to be justified. He appears to have indulged in careless talk and wishful thinking about the possible downfall of the Communist regime, but of positive and practical scheming to overthrow it the evidence published is flimsy. The Jugoslav government's action is all the more surprising since for nearly a year it has appeared anxious not to sharpen its differences with the churches; and when the Jugoslav leaders have discussed religious affairs it is the Catholic bishops, not the usually more amenable Orthodox ones, against whom they have fulminated.

The trial of Bishop Bradvarevic is not an attack on religion as such, but it is evidence of Belgrade's determination to make the churches completely subservient to the state; for the Bishop's real crime, in the eyes of the Jugoslav Communists, was his consistent opposition to measures designed to bring the clergy under state control, and in particular to the state-sponsored association of Orthodox priests. But why was he treated with such severity, instead of being allowed to retire to a monastery, as was the aged Metropolitan of Skoplje four years ago? The authorities clearly do not want to use the trial to stir up feeling against the clergy; on the contrary, the Jugoslav press, which usually makes the most of any alleged clerical misdeeds has almost ignored the whole affair. Perhaps the truth is that Belgrade is glad of an occasional opportunity, however ill-chosen, to display its strength and resolution in the isolated fastnesses of Montenegro.

A Gift for Russia?



The cause of sound principles of government, of constitutional action, and of individual liberty, has this week gained an important and significant victory in the rejection of Lord Palmerston's proposal to continue the existing Board of Health. The Home Secretary was desirous of persuading the House of Commons to pass his Bill, preserving to that Board its present constitution for at least another year; and the House, aware that this proposal was simply one for empowering Lord Shaftesbury, Mr Chadwick, and Dr Southward Smith to continue to manage the sanitary affairs of the country henceforth as they have done hitherto, intimated unmistakeably that on no terms and under no circumstances would it grant to those gentlemen any longer lease of power. Three more benevolent or meritorious men it would be difficult to find anywhere:—three malefactors on whose proceedings it was more necessary to put a peremptory check, it would be still more difficult to find at large. . . . Lord Palmerston recently gave a most happy definition of dirt. "Muck (he said) is only wealth *in the wrong place*." In the town it is pestilential filth: in the country it is fertilising manure. Nearly the same may be said of Mr Chadwick. He is a jewel—in the wrong place. He is a gem—spoilt from bad setting. In Austria, in France, in Prussia—in any country where people were to do nothing for themselves, but to have everything done for them; where they were to be governed honestly, justly, kindly, but to have no self-government whatever—Mr Chadwick would be invaluable He would be worth fifty ordinary bureaucrats. But there is one nation in Europe where he would be beyond price; . . . where nearly everything requires changing; where men are slaves and willing slaves already; and where, therefore, Mr Chadwick's peculiar faults would be unfelt and his peculiar merits would have ample scope. . . . We honestly believe that we shall give Russia an ample equivalent for all that we shall have taken from her, if at the conclusion of peace we make her a present of Mr Edwin Chadwick, to preside over and reform her corrupt but far stretching bureaucracy.

August 5, 1854

The Cost of Advertising

AN interesting survey of advertising in the United Kingdom has been prepared for the Advertising Association by Mr Rodney Silverman. He estimates that total expenditure on advertising was £199 million in 1952, compared with £121 million in 1948 and £98 million in 1938. Throughout this period advertising in the press remained consistently at just over half of all advertising expenditure, but there have been wide variations between different types of newspaper. As the chart shows, the national newspapers (owing primarily to newsprint rationing) lost ground to the provincial newspapers, magazines and periodicals—as well as to posters, films and transport space.

In 1953, according to Mr Silverman's preliminary estimates, total advertising expenditure reached £230 million; and to some extent the prewar pattern is now being restored. In national and London evening newspapers Mr Silverman estimates that the volume of display advertising had regained the prewar level in 1953, but in the meantime there had been a 60 per cent increase in circulation. Provincial papers did still better, with a volume of advertising almost double what it had been before the war; while magazines and periodicals, whose circulation has increased enormously, gained about 65 per cent more advertising in the same period. The greatest loss, in proportion to all advertising expenditure, has been suffered by radio advertising. Radio Luxemburg is now virtually the only station for English language broadcasts, whereas before the war there were several French commercial stations. It is still a very open question whether commercial television will find it easy to tap from this pool the £3 or £4 million a year that will presumably be needed to keep the Independent Television Authority alive.

Economic Advice for Mr Costello

OUR correspondent in Dublin writes: The annual report of the Central Bank of Ireland is able to point to a recovery of both production and employment in Irish transportable goods industries in 1953-54, together with a moderate improvement in farm output. Exports rose in volume and value; and—although there was probably still a small deficit in the current balance of payments—the external assets of the commercial banks again increased appreciably in 1953. It is possible, however, that the new Government has had the bad luck to take over at a time when conditions are about to turn more sour. Imports are rising again in volume and in cost, and it cannot be expected that export prices will be maintained at recent levels indefinitely. The Central Bank stresses the peril of "pricing ourselves out of our export markets"; and adds that the course of prices in Ireland during 1953 was much less favourable than in other countries of western Europe. The result of the general election was one reflection of that.

Like most other economic commentators in Ireland, the bank discusses how far the Republic's problems of unemployment and emigration can be solved by programmes of capital expenditure. It says that much recent investment has, perhaps necessarily, been in projects of social rather than economic importance, with a heavy increase in the burden of debt. "There is an evident reluctance to face economic realities, and the whole edifice of government, central and local, is planned on a scale befitting a highly industrialised economy but less suitable for an agricultural economy with limited resources apart from the land." The remarks of central banks on investment policy are not often well received by governments. But insistence on the importance of agriculture may find a hearing in the new cabinet; it is unlikely that the rate of capital investment will be appreciably reduced, but it may be more fruitfully directed. In this respect the Central Bank's views may be aided by the long-awaited report of the Commission on Emigration, which emphasises the importance of investment but is not unmindful of the other and more imponderable issues—such as problems of organisation and technique—around which a great deal of Irish economics turn.

SHORTER NOTE

Correction.—In a Note on page 351 of last week's issue, it was stated that 85,000 primary school places were under construction to cope with the 80,000 extra children who would enter these schools before the end of 1957. The figure of 85,000 was a misprint; in fact, 185,000 places are under construction.

from China to Peru

You sharpen your pencil. Then, as you close your pen-knife, you glance at one of the blades. You see engraved on it the word 'Sheffield' and it comes as no surprise. Nor should it wherever you are. Last year over 300,000 *dozen* British steel pen-knives were exported: to practically every country in the world. Pen-knives or pipelines, razors or railways, the story is the same. Wherever there is steel there is British steel.

British steel leads the world

Books & Publications

Servant of Bengal

WARREN HASTINGS.
By Keith Feiling.
Macmillan. 431 pages. 30s.

THE star-crossed career of Warren Hastings presents superb vistas for a biographer; it embraces the restless Indian scene, coloured by corruption and malevolence, the stock-jobbing politics of the East India Company, and the cynical manœuvrings in Parliament where impassioned invocation of principle concealed a scramble for power and profits. All these strands are combined in the long agony of Hastings's impeachment, based upon evidence tainted by prejudice and reinforced by the diatribes of Burke and the histrionics of Sheridan. After Hastings's death his reputation was subjected to a further Whig scrutiny by Macaulay, who, while insisting upon the achievements and abilities of Hastings, let the hard light of his intelligence play upon the ambiguities in Hastings's career, and dismissed brusquely "the idle story that Burke had some private slight to revenge." Now Hastings can be considered more sympathetically. Burke's dubious Indian connections have been exposed; and Hastings's present biographer is also the historian of the Tory party. Using the three hundred volumes of Hastings's papers Professor Feiling has aimed at setting his subject in the full context of the political and commercial morality of his own age.

Macaulay wrote of Hastings that "his internal administration, with all its blemishes, gives him a title to be considered as one of the most remarkable men in our history." Hastings's achievements are the more impressive since he never enjoyed unquestioned power. The East India Company did not have full sovereignty in Bengal, and Hastings as governor was for a long period outvoted by the majority on his council. Moreover, he had to create new traditions of service among the company's servants, many of whom had come to India to mend their fortunes. "Wild as the chaos itself" was Hastings's phrase for Bengal. Mr Feiling has chosen not to dispel the chaos but to emphasise it by painting an impressionistic picture of Hastings at his daily task, faced by the complications of Indian land-tenure, eastern corruption, frontier wars and French intrigue, with his nerves frayed by the endless conflict with Philip Francis. But from this confused and crowded detail Mr Feiling has detached the principles which informed Hastings's actions. He loved India and had no colour prejudice. His avowed aim was "to found the authority of the British government in Bengal on its ancient laws." By centralising authority in Calcutta he hoped to reduce corruption, and, by revising the system of land tenure, to improve the lot of the peasant, thus ensuring the prosperity of Bengal and the profits of the East India Company.

The tragedy and ambiguities of Hastings's career can be ascribed largely to the double allegiance he owed to the British Government and to the company. He was required to be an opportunist and had in addition realism and even ruthlessness. Like Macaulay, Mr Feiling sees some blemishes. Hastings was not rapacious, but some of those he sheltered undoubtedly were. He could misjudge people and he could mishandle a situation. Of his high-handed treatment of the Begums of Oudh Professor Feiling writes, "Unhappily, such beams of light as we can discover have a murky air, like coarse tallow in a tomb." He defends Hastings against the charge of conniving at the judicial murder of Nuncomar; yet here Hastings's realism led to the strict application of English law while his general principle was that to subject Indians to an alien code was "wanton tyranny."

Mr Feiling's interest is in men rather than measures. But if he has not given us an analytic assessment of Hastings's reforms and a judicial sifting of the impeachment charges, he has used his gifts for vivid characterisation and apt quotation to the full. Philip Francis "always loved a cosy home, had distinction of speech, an agreeable irony, and soft hands." Francis suffered from the heat, and his venom against Hastings breaks out like the jerk of a cobra in the remark that "he is more tough than any of us and will never die a natural death." A multitude of people live again with Hastings in these pages, and even if those without previous knowledge of the period may find the book difficult, they will be recompensed by Mr Feiling's warm humanity and patient scholarship.

Great Deterrent?

STRATEGY FOR THE WEST.
By Sir John Slessor.
Cassell. 177 pages. 9s. 6d.

FEW will quarrel with Sir John Slessor's description of the problem posed by militant Communism, or with his politico-military object of driving Communism back behind its frontiers and keeping it there. Ethical and political considerations, however, surely demand the qualification that this task be executed with the minimum suffering and destruction in the long run.

The omission of this qualification is perhaps partly responsible for his questionable solution to the crucial military problem of our time—how to match the numerically superior Russian armies. Sir John's answer to that, and the main theme of his book, is to threaten Russian cities with annihilation by atomic/hydrogen air power. This "Great Deterrent," he maintains, will abolish world wars, provided the Western Allies are prepared to implement their threat without hesitation. But would they be so prepared when, as he admits, the resultant retaliation on their cities would make their action suicidal? Moreover, would their action conform with the moral standards they are at pains to defend against Communism? Might it not ultimately create more problems than it would solve?

Sir John holds that the Western powers cannot match the Red armies directly—even with atomic weapons on the battlefields—without ruining themselves economically. But, surely, the crucial question is whether the utmost resources of the West can be brought to match the Red armies at the decisive points if its superior atomic and other techniques are concentrated, not only on the key battlefields, but also on the air and naval operations supporting them directly and indirectly. If this could ever be achieved, could not the "Great Deterrent" of destroying cities then be reserved to deter the Communists from destroying ours—a purpose for which it would be both effective and justified?

Is it good enough to argue, as Sir John seems to, that atomic and hydrogen weapons are bound to be used ultimately, so the West ought to initiate their use in the biggest way from the start? Indeed, if it did, might not the smaller and more exposed Allies be knocked out by attacks on their cities so quickly as to render useless all their arduous preparations for holding the Russian armies?

One has similar doubts about the author's proposal for an atomic/hydrogen air "Locarno" to guarantee a Germany unified on Western initiative, and, again, one wonders whether a less drastic guarantee is possible.

Small wars, Sir John rightly admits, can be prevented or won only by readiness to apply "conventional" forces locally, and he correctly stresses the need to do this vigorously and without fear, using atomic weapons tactically and locally if really essential. But would not we, ourselves, sometimes be deterred from this if the "Great Deterrent" were the only further card to play should the Red army unexpectedly make a threatening move in a vital quarter as a result of the vigorous local action?

In arguing that British participation in the West's strategic bomber force should be achieved at the expense of aircraft carriers, Sir John does not do justice to the latter's roles and unique attributes,

and in stressing their expense and vulnerability provides few convincing arguments why, in these respects, they compare so unfavourably with shore-based aircraft and shore bases.

Nevertheless, this thought-provoking book should be widely read, and if approached with an analytical and critical mind should do much good.

The Wealth of Families

THE FAMILY IN THE AMERICAN ECONOMY.
By Hazel Kyrk.
University of Chicago Press. (*Cambridge University Press.*) 424 pages. 45s.

IF only human beings were more like herrings and less like rabbits, economic policy—and particularly the economic policies of welfare and social justice—would be wonderfully simplified. Herrings have no family life. Once hatched, they are on their own, atomistic individuals having no relationship to any group smaller than the shoal, for all the world like Economic Man. Rabbits are born blind, hairless, helplessly dependent on the family circle; the economic unit among them is neither the individual nor the warren, but—as among the real-life citizens of the human economy—the burrow-full or household. Herring-economics is complicated enough in all conscience; rabbit-economics, particularly given the fact that the human burrow is not tenanted throughout the life-cycle and contains such very variable numbers, is much worse.

"The Family in the American Economy" is a valiant attempt, more ambitious perhaps than its author realises, to provide a primer of rabbit-economics and to relate it to the more familiar economics of the shoal. It is excellent on facts and figures, sociology, statistics of family structure, income distribution, the balance of earners and dependants; it is suggestive and sensible on what the author aptly calls "consumer production"—the housewife's economic domain with its shifting and optional frontiers—on married women's earnings, on intra-family economics in general; it is shrewd and well balanced on standards of living and their social determination; it is compendiously informative on relevant legal points; in fact it is full of good stuff, even fuller than Miss Eleanor Rathbone's "Disinherited Family."

Unfortunately it is loaded down and padded out with a mass of general descriptive and theoretical economics of a very different order of merit. It must, of course, have been very difficult to judge where to draw the line—everything that happens in the economic sphere, after all, impinges on family incomes, security and welfare—but Professor Kyrk has drawn it so widely as to impose on herself the duty of writing about collective bargaining, the securities market, patent law, banking policy, monopolies and the trade cycle. It is exasperating to see what might have been a shapely, original, reasonably brief and not too horribly expensive work thus inflated to the dropsical dimensions and forbidding cost of the standard American textbook; for the chapters concerned have neither the stimulating power which can redeem a sketchy first approximation nor the solidity which can compensate for dullness. But if Professor Kyrk is weak on shoals she is very strong indeed on burrows; and that is a much rarer kind of strength than goes to the compiling of conventional economic courses.

Europe at War

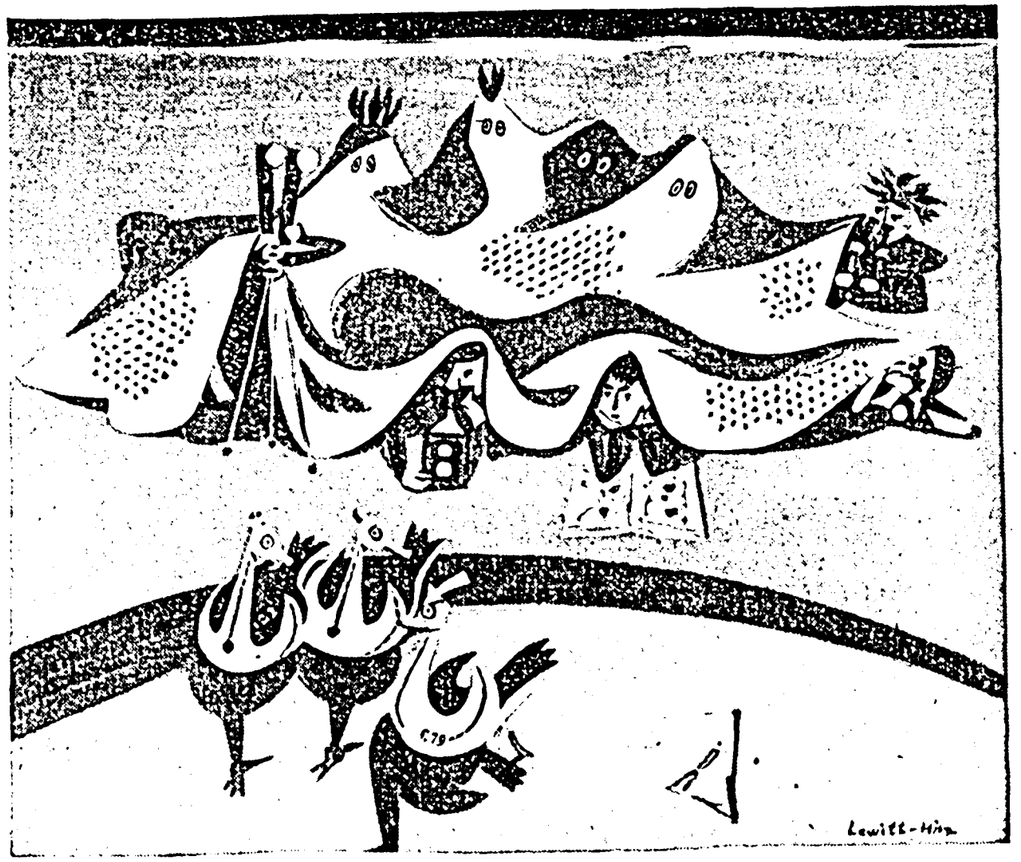
HITLER'S EUROPE. *Survey of International Affairs*, 1939-1946.
Edited by Arnold Toynbee and Veronica M. Toynbee.
Oxford University Press for the Royal Institute of International Affairs. 746 pages. 63s.

DOCUMENTS ON INTERNATIONAL AFFAIRS, 1939-1946.
Selected and Edited by Margaret Carlyle.
Vol. II: *Hitler's Europe.*
Oxford University Press for the Royal Institute of International Affairs. 382 pages. 38s.

A "SURVEY," to be both adequate and useful, should presumably meet certain simple tests. It must rest on a reliable compilation of data without becoming a merely encyclopædic collection; it must gauge the relative importance of different sectors of its subject according to some constant and clear standards of significance; and it should not assume, in the end, proportions so massive that its average user cannot get a general picture of the whole field surveyed.

These basic tests have not been ever-present to the planners and editors of these two volumes, so that despite the vast amount of careful work that has gone into them, and the considerable interest of some parts of them, they fail in their primary purpose. They offer, instead of one integrated survey of Hitler's Europe, a medley of chapters, some primly narrative and painfully encyclopædic like Professor Cobban's on Vichy France, others more impressionistic like Mr James Parkes's on the treatment of the Jews; some concisely informative like Mr W. Klatt's admirable section on food and farming, others overloaded with technicalities like Mr Clifton Child's on Nazi law. And no general impression emerges from the 700 pages of the first volume; still less from the 350 pages of uncritically selected documents in the second volume.

The best and most useful part of the work is the sections on the political structure of Hitler's Europe by Mr Child and on its economic structure, mainly by Miss Patricia Harvey. Here the writers are dealing with the basic aims and techniques of Nazi power, and they do much to show the conflicts of purposes and even of methods into which Germany drifted in its "New Order." Even here, as in the chapters on Italy and France, value is lost by the attempt to separate political data from economic; and the writers fail to emphasise enough the ways in which political and ideological considerations constantly impeded and even frustrated sensible economic policies, and how economic necessities at times dictated unwelcome political moves. Occasionally one has the strange impression that the simple fact that Hitler's Europe was constantly at war has been lost from sight. Sheer military necessities often dictated what happened, however much Hitler may have tried to cling to dogmas. Because of this structural arrangement of the survey, some of the most interesting questions about its subject are left unanswered.



The scale on which the occupied countries of Europe are studied seems somewhat arbitrary, so that Luxemburg gets almost as much attention as Greece and Italy little more than a third as much as France. No effort is made to examine the really exciting question of contrasts between the western nations and the Balkan countries in the social bases and impulses of their resistance movements. This subject, requiring the pooled knowledge of a team of specialists, might have lent itself particularly well to treatment in such a book. But that opportunity has been lost. The sources have been oddly partitioned between the writers, so that the diaries of Goebbels are used for Germany and of Ciano for Italy; but neither is used (where they might appropriately and usefully have been used) by Professor Cobban when he writes about Vichy France, although he uses French sources very exhaustively. A flutter of cross-references in footnotes and a brief general introduction by Professor Toynbee are no compensation for this reciprocal unawareness of the contributors. The inconsequential little miscellany of maps adds nothing to the book except confusion. The volume of documents would have gained immensely from a more austere selectivity, and from the addition, in the space so saved, of critical commentaries on their circumstances and relative importance.

The work, then, is in no real sense a "survey." It is a quarry, from which the student of the war is left to hew what he wants. Perhaps its immediate service is to remind British and Americans alike, when they are inclined to look to Germany in the 1950s as the new saviour of Europe, that its record in the 1940s was such that the nations of Europe are unlikely to welcome this new role with much enthusiasm.

Man Against the Antarctic

THE WHITE DESERT.
By John Giaever.
Chatto & Windus. 304 pages. 25s.

FOR the space of many months the members of the Norwegian-British-Swedish Antarctic Expedition of 1949-1952 lived in perfect amity in that white waste which most of mankind knows only by conjecture. At their base camp they lived together in as great a degree of congestion as any city dwellers live. They never quarrelled. They were

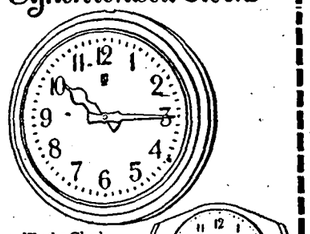
The Schweppshire Way of Life

6. GUARANTEED BIRD-WATCHING

The naturalists of Schweppshire have long led the world in bird-watching, spider-watching, dandelion-watching and in fact watching. The time came, of course, when there were more watchers than watched; more naturalists than nature. Since what we have to do simply is really watch, Schweppshire did not allow etiquette or the old-fashioned shibboleths of the game to prevent them from providing an easy answer to this difficult question.

Because the watching of birds is, if possible, more O.K. than anything else, we provide the birds. But as live birds are usually difficult brown smudges which dart across the eyes before they can be seen, and since all look almost exactly alike anyhow, our birds are (a) dummy and (b) impossible not to tell apart. See above three decoy ducks floating alone on a Trust Pond in a Schweppshire Ornithological Union Sanctuary. Look again at the rolling sand dune which now you will see, perhaps, is a large piece of ordinary undercarpet cleverly camouflaged. Beneath it, how many watchers can you see? On the left, is Max Nicholschweppes making notes on the lack of movement observable through a periscope. Next is Eric Schwosking, capturing an unforgettable moment of unwild life. Peter Schwott, of Schwevern Wildfowl Trust fame, identifies with the help of his own identification book, the identity of the bird marked with an arrow, which is, of course, the bird marked with an arrow. Observing through binoculars are observers.

In the inset, Ludwig Henn records on the spot, after an eighteen-hour vigil, the typical squeaks of an actual weathercock.



Written by Stephen Potter, designed by Lewitt-Him.

bound together by the hard discipline of science, a common purpose and a common interest in survival. Nationality disappeared. They were all of one race; men against the Antarctic.

The tale is told by their leader, John Giaever from Norway. He tells it with a pleasant humour and suggests that he and his brilliant and distinguished companions were really just a lot of amateurs. Older than the others, he describes himself as "an experienced old crow among wise young owls." That he knew how to lead is manifest. He knows how to write as well.

> The Antarctic he describes as a desert still untamed, treacherous and menacing. . . One long summer day follows the one long night of winter in ceaseless alternation through ice-ages in thousands of years; yet neither summer nor winter is ever present there. It stands like a glacier realm of death, its pressure ramming in the pole of the earth, a provocative enigma. To the gazing eye it offers a vague, barren vision, but to the resolute spirit strong and ample nourishment. Here is a land of legend, yet without myth.

Many years have passed since Captain Scott and his companions perished in this same white desert. After several more decades of the machine age, men are no more invincible than they were. In a trice, three of Giaever's companions, from Melbourne, Sweden and Croydon, were snatched to their death. The expedition reached its destination in the same way and by the same route through the Weddell Sea that had been pioneered by Sir James Ross well over a hundred years before. Where Scott had used motor sledges and Siberian ponies, they used petrol-driven "weasels" and husky dogs. Mid-twentieth century man has not so many more advantages against the elements.

This book reads like a saga from the landing of the expedition in Queen Maud Land. The nature of Queen Maud Land alone requires careful explanation, for it is not land at all, but "floating ice and firm, solid, compressed snow." From the ship they transported between 300 and 400 tons of stores to set up their headquarters at Maudheim, which became a little metropolis, always in motion with the three foot rise and fall of the ice. Sometimes in the night they would wake up and ponder on the fact that this was not land, but that they were perched on many feet of ice, balanced on many fathoms of icy water.

At the other end of the world, in the Arctic, the sun glows in the summer and there are great wastes of granite rock and rank growth in the valleys; and the air is full of the sound of running streams and the cry of birds. But here there were no streams except melted snow trickling off the roof, and no birds and beasts but the seals, and the penguins, and the occasional skuas.

This attractive and unpretentious narrative covers more than two years. The interest never diminishes. There is death, there is discovery, there is disappointment and there is triumph. And the story is told by a pen such as few Polar explorers have ever possessed.

Destroyer

THE *KELLY*.
By Kenneth Poolman.
Kimber. 219 pages. 15s.

SOME future Sir Arthur Bryant, setting out in 2054 to add a touch of contemporary local colour to his chapter on the Royal Navy during "The Years of Endurance, 1939-41," may come across this book in the mountain of available material and find in it just what he seeks.

HMS Kelly was commissioned in August, 1939, and was sunk by dive bombers off Crete in May, 1941. Her Commanding Officer throughout her short but immensely busy life was Captain Lord Louis Mountbatten; now, as Admiral the Earl Mountbatten of Burma, C-in-C Mediterranean Fleet, he has written a brief foreword to this book about what was, in a quite unique way, *his* ship. The story of the *Kelly*, he observes—with a modesty more becoming than strictly accurate—is "merely typical of the tale of any of our destroyers during the first two gruelling years of war." The *Kelly* was unquestionably an outstanding ship with a quite outstanding Captain; yet, in what she did, she was perhaps typical. Commissioning with a raw crew in a tearing hurry, belting hither and thither around the coasts of Britain at everyone's beck and call, attacking (and sinking) submarines in the Atlantic and E-boats in the Channel, escorting the Fleet, being mined, torpedoed and bombed, fighting in the thick of the Norwegian campaign and in the early battles of the Mediterranean—any or all these are reasonably typical of the continuous performances given by destroyers belonging to the under-manned, under-shipped navy of the early war years.

Mr Poolman has painted with rapid, impressionistic strokes a small but fascinating picture of a British destroyer and those who manned her. Some passages may seem oddly familiar, particularly to cinema-goers; this is because the film *In Which We Serve* was largely based on the story of the *Kelly*—a fact which also accounts for the curious tendency on the part of the figure of Lord Louis Mountbatten to turn itself, every so often, into the likeness of Mr Noel Coward. Perhaps Mr Poolman's finished picture is just a shade too rosy in tone, but it is authentic for all that. Whether or not its freshness and vitality catch the eye of some future historian, they will certainly appeal to a wide public today; and many a wartime sailor may be led to reflect, as he swings round an office desk, that perhaps the Navy was not such a bad place after all—at any rate in retrospect.

Shorter Notices

ADVENTURE OF THE WORLD.
By James Fisher.
Rathbone Books. 67 pages. 10s. 6d.

This book is a triumph of collaboration—between the author, the art director, the illustrators and the map drawers. With a simple text and an abundance of colour illustrations, small and large, it tells the story of the world: how it began; the various ages of life; nature's work; man's work.

The book will fascinate people of all ages, but educationally appears to be intended for ten to thirteen year-olds. They will not always be able to follow the story without expert adult help. But they will be bound to find it an immensely stimulating supplement to the first years of geography. Prehistory, moreover, which is such a remote subject for young minds, is made to come alive by the exciting pictures of prehistoric animals.

From man's world and how he lives—in deserts, plains, mountains, cold countries and at sea and by rivers—the story ends with the ascent of Everest and the last secrets: the deep sea and space, illustrated by an imaginary space ship being inspected by its crew near the moon. The publishers deserve thanks not only for sponsoring such a beautiful production, but also for putting it on sale at such a remarkably low price.

AN APPROACH TO MONEY AND BANKING.
By James Dandy.
Staples Press. 190 pages. 12s. 6d.

There is little scope for addition to the wealth of good elementary textbooks on money and banking, and any new work can be justified only by exceptional clarity of exposition and full coverage of the latest developments. Mr Dandy's book does attempt to describe the financial mechanism as it exists today and not at some date in the distant past; but that, unfortunately, is its single merit. Not only is the exposition throughout naïve in the extreme ("The starting point of inflation in modern times may with some justice be set in 1694 when the Bank of England made its first loan to the Government"); it also contains errors of fact. The most serious are contained in Mr Dandy's discussion of the rate of interest ("What Money Costs"). For example, he makes the statement that "in the case of Government securities the investor normally assumes that his investments will not fall in value," and then goes on to cite the example of a purchaser of Defence Bonds. The chapter on the creation of credit is also full of errors and half-truths. The reader is forced to the reluctant conclusion that Mr Dandy has not fully understood the subject he is writing about.

Letters to the Editor

Diplomacy and Cyprus

SIR—In your article of July 24th, it is stated that the Greek Government took up the question of Cyprus in order to deflect public opinion from differences at home. May I point out that the present stable Greek Government with a majority of 240 deputies in a Chamber of 300 seats is not in need of any such methods. In fact the claim on Cyprus was officially raised by the previous Greek Government in the Chamber on February 15, 1951, and was followed by a demarche in London; it could not, however, be further pursued then, owing to that Government's unstable position and slender majority in the Chamber.

The doubts expressed in the article as to the security of military bases on Greek territory in view of the treaty with Egypt on the Suez, are hardly justifiable; no analogy exists with Egypt, which is not a member of Nato and whose general attitude towards Britain and her allies has all along been entirely different from that of Greece. Furthermore, in the strategic use of any base the feelings of the local population have to be considered no less than the legal sovereignty of the territory.

As to the suggestion that by abandoning sovereignty in Cyprus Britain will get nothing in exchange but the good will of the Greek Government so long as that Government is in office, may I say that far more is involved; the permanent good will and friendship of the whole Greek people, now in danger of being irreparably impaired, will be won. The merit of that friendship stood its test during the last war when at its most crucial moment Britain found by her side only Greece fighting to the bitter end.

But more still, the moral gain from showing to the world that Britain places her conception of right and wrong first in her policy is immeasurable; on such imaginative statemanship depends her right to the moral leadership of the world.—Yours faithfully,

ZENON ROSSIDES,
Delegate of the Ethnarchy of Cyprus
London, W.1

After Crichel Down

SIR—In your issue of July 24th you rightly demand that "no Minister and no department shall take any decision affecting the rights or property of any individual without the papers being referred—not necessarily for decision, but at least for report—to some wholly independent scrutiny." I submit that the most suitable method would be a "supreme administrative court."

Such supreme administrative courts exist in most countries whose legal systems distinguish between public (administrative) and private law. Owing largely to Dicey's influence the existence of "administrative law" has been hotly contested by English lawyers, and the existence of the prerogative writs has been used as an argument to maintain the illusion that no "administrative" law exists in England. But it is obvious by now that the existing machinery of justice is not able to deal adequately with the new problems of delegated legislation.

To have in each case "recourse to some form of independent referee," if this meant *ad hoc* committees and *ad hoc* referees, would not, I submit, lead to the desired result, which is the creation of absolute certainty in each individual's mind that he is always able to defend his rights against any public authority as effectively as against any private individual. A referee appointed in each case by the Minister can never command such confidence as a High Court Judge who cannot be dismissed by the Executive.—Yours faithfully,

London, W.C.2 ALFRED DRUCKER

Borrowed from Stalin

SIR—A letter in your issue of July 10th from T. Zavalani gives shocking misinformation about the leading article in the Moscow *Kommunist* (No. 6, April, 1954). He states that "in this long article there is no mention of peaceful co-existence." On the contrary, on page 9 is this specific paragraph:—

> The Soviet Union does not impose its social system on anyone. The builders of socialism and communism in their relations with the capitalist countries start from the possibility of the prolonged peaceful co-existence of two systems—the capitalist and the socialist—from the possibility of peaceful economic emulation and business relationships between countries with different social systems. Co-existence and co-operation between them are quite possible, given mutual desire to co-operate, readiness to fulfil obligations undertaken, observance of the principle of equality and non-interference in the internal affairs of other states.

There is much else in the article bearing on the same question. Your correspondent did not even get the title correctly, making it refer to the march of humanity towards "communism," when it speaks of the march towards socialism. The distinction may not mean much to your correspondent, but it means a great deal in a Soviet journal.—Yours faithfully,

ANDREW ROTHSTEIN.
British Soviet Friendship Society, E.C.1

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The McCarthy Dilemma

Washington, D.C.

THE upper house of the United States Congress has seldom contained a more uncomfortable group of people than it did last Friday evening when Senator Flanders, Republican of Vermont, finally presented his motion:

> Resolved, that the conduct of the Senator from Wisconsin, Mr McCarthy, is unbecoming a Member of the United States Senate, is contrary to senatorial traditions, and tends to bring the Senate into disrepute, and such conduct is hereby condemned.

The malaise of the Senators had been expected. The political ghosts of ex-Senators Benton of Connecticut and Tydings of Maryland—men who once dared to provoke Senator McCarthy's wrath—undoubtedly still walk in Congress in spite of various documented attempts to prove that it was not these acts of courage that brought about their electoral defeats. Every Senator knows that McCarthyism retains a unique hold over a considerable bloc of voters who are united solely by admiration of the Senator from Wisconsin and are likely to ignore all other criteria in deciding for whom to vote. There is also an opposing group, only relatively less single-minded in its determination to destroy supporters of McCarthyism at the polls. Between these two reefs many a Senator could discern no navigable passage.

But to this predictable discomfort were added other factors. The Democrats, although smarting under Senator McCarthy's attacks upon the "twenty years of treason" under their Administration, have clung to the view that McCarthyism is a Republican family problem for which the Democrats bear no responsibility. At the time of the Army-McCarthy hearings, when millions of citizens spent dozens of days watching Republicans vilifying other Republicans, this policy appeared profitable to the Democrats. It was defended by some of the strongest opponents of Senator McCarthy on the grounds that for the Democrats to take the lead against him would only rally the Republicans in a partisan struggle which would be fought without regard to the broader moral and constitutional aspects of McCarthyism. A reflection of this view was seen on the day before the motion of censure came up, in the decision of the Democratic policy committee in the Senate to call the question "a matter of conscience upon which each individual Senator should vote his convictions without regard to party affiliation."

Some Democrats, moreover, felt that Senator Flanders had not chosen the best way to attack the problem. They recalled that he had been a very recent convert, in public at least, to anti-McCarthyism; as late as March, they argued, he had seemed to be concerned for little beyond the damage that the Wisconsin Senator might do to Republican party unity. Once converted to the need for a general attack, Mr Flanders had made an unsuccessful attempt to persuade the Senate to deprive Senator McCarthy of his committee chairmanships; when this was unanimously rejected by the Republican policy committee in the Senate, Mr Flanders turned to the device of a resolution of censure. Many Democrats doubted the efficacy, and even the fairness, of such a resolution, phrased in completely general terms, lacking a bill of particulars other than that supplied by Senator Flanders's speeches in its defence, and stemming not from the investigations and deliberations of a Senate committee, but from the conscience of an individual Senator, independent and respected though he is.

★

To this it could be replied that Senator McCarthy has either ignored or managed to confuse and frustrate the work of all the previous committees which have delved into aspects of his career, and that to advance a complex bill of particulars would be to invite defeat through differences of opinion over details. The dilemma of dealing with McCarthyism was thus encountered: if specific charges against the Senator are investigated, they can easily be obscured by him in the course of their formulation and, even when forcefully and clearly presented, they tend to give only a pale reflection of the total evil involved. On the other hand, to subject Senator McCarthy to any vague, general accusation—even one as obviously justified, to most thinking people, as Senator Flanders's—is to open the way to complaints that insufficient attention is being given to those very considerations of impartial justice for which the battle is being fought.

Finally, those Democrats and liberal Republicans who most desire to deal with McCarthyism doubted whether a vote of censure would have much effect. No matter how enormous and palpable the evil, something like a third of all Americans apparently remain under its spell. Would a vote of censure by the Senate awaken them to reality? To the minds of those who are convinced that the United States has been saved from Red revolution solely by the efforts of the valiant champion from Wisconsin, a successful vote of censure might simply have demonstrated that even the Senate is now heavily infiltrated by subversives.

The Republicans entered the fray with many of these factors present in their minds, and some others as well. The divisions in their ranks were bound to be accentuated and publicised by any debate over the issue, even without a decision. Their agony was well reflected, as was the direction in which they were looking for a way of escape, in the proposal of Senator H. Alexander Smith, of New Jersey, that a committee be set up to consist of three Republican and three Democratic Senators, with the Vice-President, Mr Nixon, as chairman, to investigate in general "the alleged good or evil of so-called McCarthyism," and to report to the Senate by February 1st—conveniently after the autumn elections.

No sooner had the debate begun, however, than the doubts and fears of both parties were expressed by demands from such disparate quarters as the two Senators from Oregon—the liberal Mr Wayne Morse and the conservative Mr Guy Cordon—for a more cautious procedure than a general debate, under the very lax Senate rules, upon a general resolution. The danger in such demands, of course, is that they lend themselves too easily to the kind of evasive action that Senator Smith only too clearly had in mind. However, as the debate developed over three dramatic days, the objection to a general censure without specific charges was met by amendments proposed by Senators Fulbright and Morse. The Democratic Mr Fulbright argued that his amendments needed no reference to committee since they contained nothing that could not be found either in reports from the previous committees which have struggled with various aspects of McCarthyism or in the official records of the Senate itself.

★

Such arguments were in the end of no avail against Senator George, the patriarch of the conservative Democrats and a veteran of the last censure debates in 1929, and Senator McClellan, the leader of the Democrats on Mr McCarthy's permanent investigating sub-committee, which also investigated Mr McCarthy himself. Both favoured submission of the Flanders resolution and the amendments to it to a new bipartisan select committee as proposed by the Republican majority leader, Senator Knowland. There can be no guarantee that the Senate will in fact act on the committee's report, even if it comes before adjournment, but the debates showed that Senators were very sensitive to the charge that they dare not face the issue squarely.

One of the problems before Mr McCarthy's opponents during the next few weeks is how to make the fear of failing to deal with McCarthyism equal to the fear of dealing with it. Perhaps if the Wisconsin Senator treats this new committee as he has all other attempts to study his record, he will at last convince a majority of Senators that he is beyond redemption or appeasement. His intervention towards the close of the debate, when he attacked his accusers as "consummate liars," bullied them by implying that they would not dare testify against him under oath before the new committee, threatened Senator Fulbright with a libel suit and referred to him as "halfbright," indicates that Mr McCarthy plans no change in the strategy that Mr Morse describes as "political thuggery." But most Senators have been very patient with this sort of thing so far, and there are distressingly few signs that their patience is near its end today.

Advice of the Senate

CONGRESS is rapidly clearing its few remaining hurdles, in a determination not to be kept in Washington —and away from the hustings—beyond next week. It will have dispersed, in all probability, before it knows the decision of the French Parliament about the European Defence Treaty, to which the restoration of German sovereignty and the Germans' right to rearm are tied. The Senate felt, however, no enthusiasm for the Administration's scheme to call a special session in the autumn to ratify a new arrangement, should that be necessary. And it was not convinced that, if the Treaty is not ratified, Mr Dulles's plan for securing French consent to a limited restoration of German sovereignty was realistic, for this would not carry with it the right to rearm.

For these reasons the Senate, usually so jealous of the executive, has, in effect, offered advice and consent in advance; it has unanimously passed a resolution urging the President, if necessary, to take such steps as he sees fit to restore Germany's sovereignty and enable it to contribute to the military security of western Europe. This is expected to be accomplished by the simple exercise of the President's right—and that of the Prime Minister—to recognise a sovereign power which would imply the right to rearm. One more broad hint is thus dropped to the French by a Congress which would prefer to see the rearmament of Germany carried on inside the European Defence Community, but is becoming increasingly fearful that the delays in restoring Germany sovereignty may drive the Germans into the Russians' arms.

Debate on the foreign aid Bill was interrupted to pass the German resolution. The Bill itself contains another expression of senatorial opinion which, however, shows that Senators have taken the advice of the Administration. It conveys the unanimous opposition of the Senate to the admission of Communist China to the United Nations, and carries a request that, should this take place, the Administration should submit a report to Congress on the implications for American policy. This 90 to 0 stand is all that remains of Senator Knowland's original demand that the United States should walk out of the United Nations if Communist China walked in. And at his press conference the President hinted that he agreed with the American Assembly, a private organisation with many influential members, that future developments might make undue rigidity on this score undesirable.

A Nudge in Time

THE Secretary of Commerce, Mr Weeks, maintains that the policy of speeding up government procurement, announced last week, was decided upon when the Korean war ended, in order to fill the economic gap left by the decline in defence spending. It is, however, fortunate, to say the least, that this "relatively substantial nudge" is being given to prosperity just in time to save the Republicans from being charged during the election campaign with neglect of the country's economic difficulties. The nudge will give a little extra boost to the economic indicators as they begin their autumn climb and may shake them out of the depressingly dead level that they have followed in recent months.

The nudge is being applied, or will be applied when Congress has finished supplying the necessary funds, just where it is most needed, to America's most concentrated depressed areas, the shipbuilding and textile industries. The Navy and the Maritime Administration have already allocated their shipbuilding expenditures for next year and the Army has conveniently decided that it is time to spend $60 million on new green uniforms. It has also been placing contracts for tanks and combat vehicles, while the Air Force has announced that it will soon buy aircraft worth $1 billion; both the automobile and the aviation industries have been feeling the lack of government purchases. The Department of Commerce is allocating funds for new highways to state authorities six months earlier than is usual and federal aid is also being given to airports; together these two nudges should ensure that construction activity continues to support the national economy as buoyantly as ever.

All this proves that Republican economic policy is flexible and that the Administration is ready to counteract immediate recessive tendencies. But it does not provide any concrete evidence that the Administration is ready to encourage long-term economic growth actively. Mr Weeks's nudges do not involve any increase in total government expenditure, only an acceleration, while there is a growing feeling, expressed recently not only by the new left-wing Conference on Economic Progress, headed by Mr Leon Keyserling, but also by the respected National Planning Association, that a steady increase in government spending is essential if the ever-expanding labour force is to be fully employed.

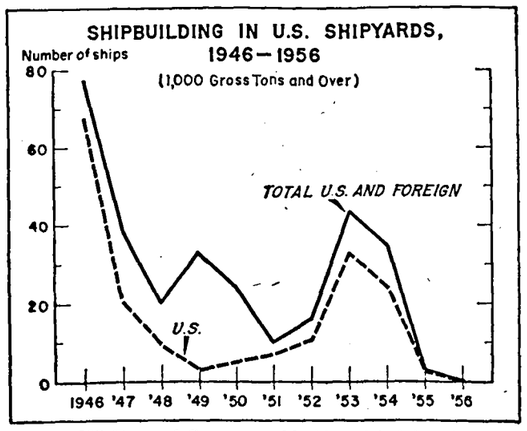
Reinforcing the Reserves

THE main interest of the latest official scheme for replacing the Selective Service Act, which expires next June, lies not in the proposals for conscription—Congress is apparently to be asked to continue the present two years of compulsory military service—but in the proposals for strengthening the reserves. At present men, whether conscripts or volunteers, are supposed, on leaving the active forces, to join the reserves for long enough to make up a total of eight years of service, but this law has never been effectively applied, and the present state of the reserves is said to be "a scandal." Under the new plan men would be compelled to do their reserve, as well as their active, duty.

In discussing the scheme, Mr Hannah, the retiring Assistant Secretary of Defence, revealed that the Defence Department now expected to have a total of 3,047,000 men in the regular forces in mid-1955. This figure, to be maintained indefinitely, is 232,000 more than was estimated last year, although rather less than the number serving at present; it reflects upward adjustments following the deterioration in the Far Eastern military situation. In addition the new reserve proposals would provide another 3,055,894 men, organised and ready to be called up immediately, over half of them for the Army, should a national emergency arise.

To call up the National Guard, which at present constitutes the bulk of the Army reserves, would now take at least a year, according to Mr Hannah. The Guard is now composed of state units controlled by State Governors and the plan is apparently to give it full responsibility for training Army and Air Force reserves and in the process to bring it under federal control. But the "States' righters" in Congress will certainly have a great deal to say against this, just as the economisers will have a great deal to say against the estimated cost of the consolidated programme; it is put at $1.5 billion a year, about twice the current expenditure on the existing programmes administered separately by the various services.

In an attempt to recommend to Congress a scheme closely resembling the "universal military training" which has so often been rejected, Mr Hannah claimed that it was "geared to the day of active war with the Soviet Union." This belligerency went too far for his superior, Mr Wilson, the Secretary of Defence, who toned it down to a plan for "a strong deterrent force" available in case of attack. But Mr Wilson backed up Mr Hannah's insistence that the scheme had been accepted, in its broad outlines at least, at the highest levels of the Administration, although the White House, thinking more of political prejudices than of military necessities, is still insisting on the tentative nature of the plan, and will presumably continue to do so until the election is safely over.



Sinking Shipyards

THE problem of keeping the shipbuilding industry afloat is an awkward one for an Administration which believes in economy and the least possible government intervention in private business. On the one hand, the retention of a core of shipyard workers is a vital defence consideration; as the chart shows, if no new orders for merchant ships were forthcoming, only three would remain to be completed next year; employment would drop to just over a thousand, compared with the 36,000 which the Department of Commerce believes is needed as a possible mobilisation base. No new orders have been received since November, 1952. On the other hand, Congress is if anything more grudging than the Administration in sending new money down the ship ways, and demand from the private shipping lines is certain to be at a low ebb for another six years at least.

This is because the bulk of the present merchant marine was built during the war years; even the lines which, as a condition of government subsidies, must replace their ships when they are twenty years old, will not be in the market for new ships until 1961 or later. Unless there is a sharp upturn in the American share of international trade, shipping companies will be anxious to hang on to their existing vessels instead of buying costly new ones. In the view of the Department of Commerce, which was asked to survey the problem when aid to shipbuilding was suspended last year, some 60 merchant ships should be built each year to maintain employment in the yards and avoid the simultaneous obsolescence of four out of five American merchant ships in ten years' time. But none of the inducements which the department is prepared to sponsor, in the way of guarantees of shipbuilding loans, or more advantageous tax and trade-in arrangements, seem likely to pursuade the shipping

companies, who are having trouble in keeping their own heads above water, to come to the aid of the yards.

The House, by passing a Bill authorising the Secretary of Commerce to guarantee mortgages on new vessels up to 90 and, in some cases, 100 per cent of their cost, showed that it does not wholly despair of stimulating private demand. But the hopes for survival of the private shipbuilding yards will depend in the immediate future on federal aid: on the $82.6 million for construction sub-

Source: US Dept. of Commerce, Maritime Administration.

sidies on new liners and various other minor programmes wrung out of a grudging House by Administration pressure; on the building of five high-speed tankers for the Navy and of fifteen others for private owners who are promised government chartering, and on the Navy's own building programme, which is being distributed so as to keep the largest number of yards afloat.

A Penny for Your Uranium

New York.

THE uranium boom on the Colorado Plateau, the 130,000 desolate square miles around the junction of the states of Utah, Colorado, Arizona and New Mexico, which in 1952 turned dusty little Mormon towns overnight into thriving mining camps, brought with it not only a rush of independent prospectors with Geiger counters, but also a rush of independent speculators in penny (one cent) shares in uranium prospects. In Salt Lake City these shares are being dealt in at a rate which has sometimes exceeded 7 million shares a day, twice the volume, although not the value, of a busy day's trading on the New York Stock Exchange.

The great bulk of these penny stocks, many of which have risen to 20 or 30 cents or even higher, are not listed but are traded over the counter to speculators and investors who as often as not know little or nothing about the company or the broker concerned, which is sometimes just as well for both of them. Even where the shares are related to a promising property, the title may be dubious and large sums are still being raised on the strength of little more than a parcel of barren land on the Plateau, and spent, not on the development of proven reserves, but merely on prospecting and drilling in the hope of finding uranium ore. If ore is found, the promoters' pickings are sweet, as in one extreme case where two million shares, bought by insiders for a cent a share, were subsequently offered to the public at $1.25 a share, bid up to $2.60, and finally settled at about $1.75.

★

The Utah Securities Commission has challenged a few of the more dubious promotions, and shares issued or traded in more than one state are subject to registration with the Securities and Exchange Commission, which has already voiced its concern at the flood of new uranium stock offerings. It has now set up a branch office in Salt Lake City and can be expected to raise more frequent objections to these offerings in future. A detailed description of a company's operations is required for registration but, while the Atomic Energy Commission forbids the disclosure of information on large-scale uranium operations, security requirements, often used as an excuse, do not in fact justify small companies in keeping the public in the dark.

The uranium boom, in speculating as in prospecting, is based upon the market and prices guaranteed for uranium ore until 1962 by the AEC. Over 500 mines are now producing on the Plateau; most of them are "man and a boy" operations, but there are a dozen or so with reserves of over 100,000 tons of ore, and output is reported to be doubling every eighteen months. This government subsidised uranium fever has been caught by the large mining companies, which can afford large-scale and systematic exploration and development and have the diversified interests that the prudent investor in uranium development should take into account. For techniques, both of atomic weapon and nuclear power production, are changing too rapidly for anyone to be able to predict whether the demand for uranium will be as great as the supply once the AEC's guarantees expire. Meanwhile there is little doubt that many of the upstart uranium companies will never declare a dividend—or even find uranium.

New York's New Governor

ALTHOUGH the nominating conventions are still six weeks off, the political air in New York already has a nip of autumn keenness, at least on the Democratic side. The Republicans are still waiting for Mr Dewey to make up his mind about a fourth term as Governor. He has been letting it be known for months that he is cured of presidential ambitions and only anxious to retire to build up his own law practice, but so far he has made no public renunciation. The Republican strategists are naturally most unwilling to let Mr Dewey go. The Governorship of New York, besides being a favourite stepping stone to the Presidency which they would be reluctant to see go to a Democrat, controls great political resources which Mr Dewey used to secure President Eisenhower the Republican nomination in 1952.

But the successor whom Mr Dewey favours, Senator Ives, though less experienced, belongs to the liberal wing of the party and is also a proved vote-getter; he ran a million votes ahead of the President in New York in 1952. It may well be that Mr Dewey is holding up his own abdication in order to discourage other candidates and keep the field clear for the only other Republican he believes can win this autumn.

Senator Ives's liberal record would be an asset, for it is clear that the Democratic candidate will be of the New Deal persuasion. This is because the Democrats, to win, must roll up a big majority in New York City to cancel out the Republican lead in the rural areas and to do this they must secure the support of the Liberal party, the third group in New York politics. All the three candidates now in the running are Fair Dealers: Mr Franklin D. Roosevelt, Jr, who was first in the field; Mr Averell Harriman, who has just announced that he is available; and Mr Wagner, the Mayor of New York City, who has done no more than refrain from saying he would refuse to be drafted, but who is given an excellent chance. Mr Roosevelt has the magic of his father's name as well as great personal political charm; and he has already efficiently rounded-up 317 up-state delegates of the 510 needed to secure the nomination. But it is not only Mr Dewey, who has an understandable distaste for any Roosevelt, who feels that the son of the great President has yet to prove that he has earned the right to govern the most important state in the Union. The Democratic leaders in New York City, who really choose the candidate, are waiting for the results of a post-card poll of Democratic voters before they decide to climb on the band-wagon which Mr Roosevelt is parading so invitingly before them.

Ultra or Only Very High?

RECENT hearings before a Senate subcommittee have drawn attention to a vicious circle which is circumscribing television broadcasting. When the Federal Communications Commission resumed the licensing of television stations two years ago, after clearing up its initial confusions, it allocated to television twelve channels, with room for 617 stations, in the very high frequency (VHF) waveband and seventy channels, with room for 1,436 stations, in the ultra high frequency (UHF) band. But the hundred odd stations which had been licensed before the FCC's "freeze," and which had become well-established during it, were all in the VHF range. As a result, manufacturers were only making VHF sets; an adapter costing about $30 was needed to enable such sets to receive UHF telecasts. In addition to this, UHF reception is not very reliable and the area it covers is smaller. It is not therefore surprising that the first overwhelming demand was for the new VHF channels.

This, however, led to long delays in the granting of VHF licences, and competitors decided that the prospect of getting on the air quickly made the ultra high channels attractive. But once on the air, they found in many cases that they had no audience worth mentioning, since UHF receivers were not being bought; less than one-tenth of the 30 million television sets in use today are equipped to receive ultra high frequency signals. Since they could not guarantee an audience, the UHF stations did not appeal to the advertisers who provide the good programmes which in their turn would make UHF adapters worth buying. In particular the UHF stations had difficulty in affiliating with either of the two national networks, the Columbia Broadcasting System and the National Broadcasting Company, which distribute the most popular programmes all across the country. These networks, which accept only one affiliate each in any one place, naturally preferred very high frequency stations, which could promise both an audience and good reception.

Now that VHF stations are becoming established in all the large centres, the UHF stations are having increasing difficulty in keeping their antennae above the air waves; of the 130-odd stations which have been set up nearly half have closed down again. The survivors are appealing to Congress for help, asking for at least the removal of the excise tax on UHF sets, and at most another freeze, on VHF stations only, until UHF telecasting is equally firmly established. The ultra high frequency advocates have enlisted the god of free competition on their side, arguing that the present system is strengthening the already powerful duopoly of CBS and NBC in the television field and leaving televiewers with little or no choice of programme.

Air Conditioned America

New York.

IN the most comfortable country in the world, a new form of luxury is rapidly becoming a necessity. Air conditioning, which before the war supplied a $200 million market largely confined to factories and commercial buildings, had by 1953 become an industry with a total sales volume of $1.7 billion, nearly 25 per cent of which was for residential use. The ugly rump of a "packaged" air cooler protruding from a window sill of a block of middle class flats has become a social symbol as significant as a television aerial. One result is that the peak of electricity consumption no longer comes in January, but in July, when the air conditioners are switched on. Another is the creation of a market for warm clothes for air-conditioned occasions; experience has taught some temperance in the lowering of temperatures, but restaurants and cinemas are still sometimes too cool for the light clothing suitable for the sweltering out of doors.

There are basically five distinct types of air conditioning: the small, under two horsepower, room cooler—the window box—which sells for $200 to $400 and air conditions a single room; the larger commercial one, looking rather like a giant refrigerator, of two to fifteen horsepower, which is used in shops, restaurants, and small hotels and office buildings; the year-round residential central air conditioning system which cools a private house in summer and warms it in winter; the large tailor-made central installations for factories, large office buildings and department stores; and finally the specialised heavy duty types of air conditioning for motor cars, railway coaches, and aircraft.

Last year over a million room air conditioners were made. Since there are nearly 44 million American homes wired for electricity, and another 8 million flats, this market is clearly far from saturated. With many more firms in the market, all engaging in intensive promotional campaigns, sales of room air conditioners are expected to reach 1.5 million units a year within the next five years. Thereafter, its missionary work completed, the room cooler is expected to give way to the more comprehensive year-round central air conditioning systems, regarded by all manufacturers as the key to the greatest potential residential demand. Last

Up and up went the demand for their bottled beer. More orders to be analysed, more ledgers to be posted. In the offices of the famous brewers it was a case of "time, gentlemen, please."

Father William wanted them "cleared" fast

CHEERFUL SYMBOL of the great brewers, William Younger & Co. Ltd., Edinburgh, Father William had a problem. The country was drinking far more *bottled* beers. Orders from Customers and from their own houses poured in for the fifteen different lines of bottled ales and stouts they brew. With so many invoices to deal with, each with several lines to be posted and analysed, over and above the normal volume of Bulk Ale sales, the office departments were hard pressed to produce the up-to-the-minute sales figures the company needed.

Younger's asked Burroughs for suggestions, and after considering various other methods of handling this detailed analysis, they decided to install Burroughs Electric Duplex Calculators for the "analysis of ales and stouts" operation.

Then, seeking to speed their already mechanized Sales Ledger posting, they went to Burroughs again, and installed Burroughs High Speed Accounting Machines for *that* work also.

Result: Invoice checking, extension and analysis with the Burroughs Calculators now goes so smoothly that Younger's management can rely on comprehensive sales-figures in plenty of time to relate production to public demand. They find, too, that flexible Burroughs Accounting Machines can cope with a greatly increased volume of daily posting to "Bulk" Ledger or "Bottled" Ledger. Father William is a happy man! **What about you?** If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service *guarantees* its efficiency in operation.

Seen demonstrating a Burroughs Duplex Calculator in the offices of William Younger & Co. Ltd. is Burroughs representative Mr. M. Jolly. This fast, two-answer-dials calculator is one of the machines that helped to solve the Case of the 15 Bottlenecks.

Call Burroughs *today*. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

FOR EXPERT ADVICE ON BUSINESS FIGURING CALL IN **Burroughs**

year only some 50,000 of these systems were installed, but new houses, the best market for air conditioning since installation costs are lower if the system is built with the house, are still going up at the rate of over a million a year. Furthermore, of 25 million homes in the United States already equipped with central heating, over 13 million can easily be converted to central air conditioning, using the air ducts already in place.

One important reason for the slow start of the central residential systems has been the relatively high initial cost of the equipment and its installation. This may well amount to nearly 10 per cent of the cost of a $20,000 house. For this reason sales of these units have so far been largely concentrated in houses which cost at least $25,000 to build. But already, by planning in conjunction with the builders of mass-produced pre-fabricated houses, the major air conditioning manufacturers claim that central systems can be feasibly installed in houses built to sell for less than $10,000—partly because of the elimination of ventilation requirements, which air conditioning makes possible. Another problem is the relatively high operating cost of a central air conditioning system, especially the cost of water, which is used in large quantities in most systems for cooling the condenser.

But in spite of the cost, it is confidently predicted that customers will demand a central air conditioning system just as they now demand central heating. Within five years at least half of all new houses built will have these systems and the new house without air conditioning will rapidly become unsaleable. By 1963, if these hopes are fulfilled, a million residential air conditioning units a year, worth $1.5 billion or more, may be sold, in addition to room coolers. But although these residential units are expected to run a very close second, the biggest air conditioning market of all will probably remain, as at present that for the large expensive "tailor-made" central installations for factories, offices and other commercial buildings.

★

In many industries, such as textiles, tobacco and printing, temperature and humidity control and the elimination of dust are essential, and air conditioning is already a commonplace. But the range of applications is widening rapidly, as the health and comfort of the worker receive greater attention in the search for high productivity. Virtually all major office buildings constructed since the war have complete air conditioning, but the market is by no means confined to new building. It is now possible, at a cost which is high but not prohibitive, to instal central systems in existing buildings. Property experts say that once the amount of air conditioned office space in any city reaches about 15 per cent of the total, as it has in New York's business district, the owners of the remaining buildings will be forced to instal air conditioning in order to maintain their rents and keep their tenants.

Because of its rapid and seemingly inexorable growth the market for air conditioning has been called "recession-proof." But even if this is so—a matter for debate—it is by no means weather proof. This year is a case in point. Manufacturers, who started the year with some 150,000 room coolers in their own and dealers' stocks (owing chiefly to difficulties in matching last year's production to the highly seasonal demand), expected 1954 to be another record breaking year and boosted their production schedules accordingly.

But in May and June sales lagged. With many more manufacturers, distributors and dealers in air conditioners in the market this year, heavy discounting and other forms of price cutting became widespread. The long-awaited heatwave arrived at last, and sales of air conditioners kept pace with the thermometer, but the relief may have arrived too late in the season to compensate fully for the disappointingly slow sales in the earlier months.

This extreme dependence of room air conditioner sales on the weather is not paralleled, either in the residential central air conditioning market, or in the large commercial and industrial installations. For the controlling factor here, at least in the case of installations in new buildings, is the pace of new housing starts and new construction, both of which have been surprisingly well maintained this year, in spite of the decline in industrial production. But if the business readjustment had been accelerated by a decline in construction—instead of offset by an increase—the sales of the entire air conditioning industry over the year might have been found to be less recession-proof than is commonly supposed. Nevertheless, the secular growth of the air conditioning industry is not in question. Americans born in 1960 will go from womb to tomb in an air conditioned room.

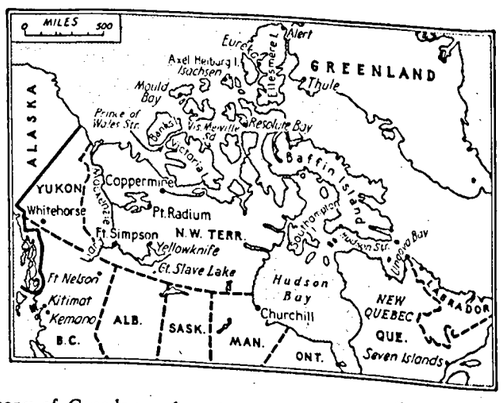
SHORTER NOTES

A plea from the President has induced the House and Senate conferees on the foreign aid authorisation Bill to restore half the cut made by the Senate which, contrary to custom, has this year been in a more niggardly mood than the House of Representatives. The authorisation for the current fiscal year now stands at $3,055 million, nearly $400 million less than the President first requested. As *The Economist* goes to press, the conference Bill has still to be approved and the Senate has still to appropriate funds; the House has already appropriated only $2,896 million in new money for this year.

★

In the rush to adjourn, neither House nor Senate is in any mood to reject the compromises reached by their conferees on the important bills which have been passed in different forms by the two chambers. There was argument over the final versions of both the Tax and the Housing Bills, over the tax reliefs on dividend income in the one, and over the public housing provisions, or rather over their virtual absence, in the other, but both have now been sent to the President in a form that he is prepared to accept even though he has not got all he asked for.

★



In spite of the Federal Trade Commission's report that speculation, restrictions and irregularities in the coffee market, rather than an actual shortage of coffee, caused the sharp price rises last winter, it is unlikely that Congress will find time this session to impose federal regulations on coffee trading on the New York Coffee and Sugar Exchange.

The World Overseas

Royal Tour of the Canadian North

FROM OUR OTTAWA CORRESPONDENT

THE Duke of Edinburgh's tour of Canada not only sets a new pattern in royal journeys; it also draws fresh attention to the problems and the possibilities of that vast area known vaguely as the Canadian North. The greater part of the Duke's 8,000 miles of flying actually takes him over a rather uniform kind of country. Most of the way he is following the huge V of the Canadian Shield which stretches up both sides of Hudson Bay with its angle just touching the St. Lawrence River south of Ottawa. The Canadian Shield presents from the air a characteristic panorama of bare, eroded rock interspersed with swamps (muskeg). In some areas it is heavily wooded, but not with big trees. In the Northwest Territories, between Port Radium, Yellowknife and Churchill, the Duke will be getting near the tree-line which marks the edge of the true barrenlands; and there he will see nothing but scruffy and occasional tree growth. But if the Canadian Shield lacks scenic variety, it is the formation most favourable to mineral deposits; and new mining holds the immediate key to northern development.

At the two ends of Canada the Duke of Edinburgh will visit the latest and most important of the new developments in the Canadian North. In northern British Columbia he is visiting the Kitimat-Kemano aluminium plant of the Aluminium Company of Canada; and at the end of his trip he will see the iron-ore pits and new railway and loading facilities in New Quebec, from which the first ore shipment has just been dispatched. Both these developments have cost hundreds of millions of private capital to construct. Everything is expensive in the North. All man's requirements from razor blades to bulldozers have to be brought in. In New Quebec and Labrador the railway to the ore deposits was virtually built by air; air strips were established along its length, through which a private fleet of aircraft poured in the men and equipment needed for the ground work. In the aluminium development in British Columbia, the power line from Kemano to Kitimat could be built only by a fleet of helicopters.

Once having got into the north an important factor in deciding for or against development is the cost of transportation out again. Kitimat is only possible because bauxite ore or alumina can be brought in by cheap ocean steamers and the aluminium ingot can be shipped out the same way. The Quebec-Labrador iron-ore exploitation is possible only because cheap water transportation is available from the terminus of the new railway at Seven Islands; and it has always been a condition of this development that production cannot reach anything like full capacity until the St. Lawrence Seaway provides an adequate through water route to the inland steel empire with its ports on Lake Erie.

Economic transportation always and everywhere depends on the markets to be served. The Quebec-Labrador ore is assured of continuing and growing markets in the American steel industry, which is a partner in the development. The full development of the Kitimat aluminium plant remains less certain, and the full potential of which it is capable will not be reached until it is known whether the United States will limit the relatively high-cost expansion of its own industry in favour of cheaper Canadian supplies.

The course of the world's metal market is, therefore, probably the greatest single determinant of the pace of development in the Canadian North. At the northern end of the Labrador Trough, for example, just a few hundred miles north of the present iron-ore workings, promising metal finds are being examined; and they could be shipped out from Ungava Bay, to the south of Hudson Strait. On the south shore of Great Slave Lake, just across from the gold-mining town of Yellowknife which the Duke will visit, are deposits of lead and zinc ores now believed to be so large and so easily mined that it is probably only a matter of time before it is worthwhile to build a railway in order to bring them out. But in the present state of the market for lead and zinc, who would dream of trying to tap such remote supplies?

Many people have been unwilling to think that the future of the North must depend mainly on activities as local and as temporary (on a long view) as mines. But over the greatest part of this territory agriculture is not feasible. At Fort Simpson, where the Liard River joins the Mackenzie River, the Duke of Edinburgh will see what is probably the best agricultural land in the Northwest Territories. Here the soil is reasonably good and the long hours of daylight tend to make up for the very short season. Some crops produce abundantly because of very quick growth. Wherever such conditions allow even a limited scale of market gardening, it can be a great boon to a northern community. But there is no basis for land settlement. In the near future it is the search for minerals which offers the major hope of settlement, and that on a limited, local scale.

The attempt to improve the status of the indigenous population is now beginning. At Coppermine, a tiny settlement on the shores of Coronation Gulf, the Duke of Edinburgh will visit an Eskimo home. Leading local residents, including Eskimos, will be presented to him, and he will see an exhibition of Eskimo handicrafts at the little government school. Until lately the education of Eskimos has been largely in the hands of the missions (chiefly Anglican and Roman Catholic) who have operated with government assistance. Now the Government is taking a rather more positive part. Gradually, and as local conditions permit, attempts are being made to improve the education of the Eskimo, particularly on the technical side, and to find more satisfactory and permanent pursuits for those who are now finding hunting and trapping increasingly unsatisfactory. In northern Ungava, for example, consideration is being given to the possibility of establishing farms—with yaks to replace the diminishing caribou, possibly with eider-duck, on the pattern of Iceland's successful industry.

The new concern of both Canada and the United States with the defence of the transarctic bomber routes is tending to force the pace throughout the North. At present the early warning network is being extended one stage further north, with the adoption of the Canadian device known as the McGill Fence. When that is finished there will certainly be pressure for a further step outwards towards the Arctic Coast. But it is still by no means certain that a string of northern bases must follow the radar networks. The protection of emptiness—what Mr Pearson once called the "scorched ice" policy—still has influential supporters. It is however not defence but weather that has taken white settlement furthest north.

To Alert and Eureka

The four joint weather stations—and that is all they are—established by Canada and the United States in the Arctic Islands are served principally from Resolute Bay on Cornwallis Island, which is the central station and the most accessible. The Royal Canadian Air Force keeps a detachment there to maintain the airfield and look after incoming aircraft. Once a year a convoy of ships goes in with heavy supplies. Until this year the annual sea supply mission was conducted by the United States because Canada did not have enough ships. This year Canada is carrying it out for the first time. With two new icebreakers—one of them, the *d'Iberville*, which attended the Coronation Review at Spithead last year—two chartered merchant ships are now heading north. One of them is a tanker; the other carries heavy dry cargo for the weather stations and other northern posts. From Resolute the *d'Iberville* will go on alone to try to reach Eureka, another of the weather stations. The most northerly of all, Alert, on the farthest tip of Ellesmere Island, will be supplied, if conditions permit, from the big American base at Thule in Greenland. The other two—Isachsen and Mould Bay—have to depend entirely on supplies delivered by air.
