- Bristol: Examination results, 1108
- Cambridge: Appointments, 103, 163, 466, 1272, 1388
- Chair of physiology of reproduction, 62
- Degrees conferred, 49, 163, 466, 1272, 1888
- Examination results, 1272
- Medical School, 1199
- Prizes awarded, 163
- Research studentships, 844
- Dublin: School of Physic, Trinity College: Degrees conferred, 218
- W. Doolin appointed Professor of History of Medicine, 408
- Durham: Degrees conferred, 466
- N. Hodgson appointed professor of surgery, 460
- D. J. Tibbs appointed reader in surgery, 1448
- Edinburgh: Degrees conferred, 991
- Diplomas conferred, 991
- G. L. Montgomery appointed professor of pathology, 1220
- G. J. Romanes appointed professor of anatomy, 1220
- Glasgow: Degrees conferred, 1108
- Honorary degrees conferred, 1806
- during B.M.A. Meeting, 1219
- Ireland: National University: Honorary degrees, 994
- Leeds: Appointments, 49
- J. C. Goligher appointed professor of surgery, 529
- Honorary degrees conferred, 1219
- D. R. MacCallman appointed to part-time chair of psychiatry, 1506
- The University of Leeds: The First Half-century (A. N. Shimmis), 1477
- Liverpool: Degrees conferred, 1278
- Diplomas awarded, 1278
- Examination results, 467
- London: Appointments, 49, 108, 991, 1108, 1220, 1278
- Degrees conferred, 49, 163, 1888, 1884
- Diplomas awarded, 163, 1888, 1884
- Examination results, 108, 991
- P. C. Koller designated Professor of Cytogenetics, 828
- R. B. Lucas appointed professor of oral pathology, 1220
- Queen Elizabeth College: J. Yudkin appointed to Chair of Nutrition, 407
- Royal Free Hospital: readership appointments, 770
- St. Mary's Hospital Medical School: D. M. Price appointed professor of morbid anatomy, 658
- St. Thomas's Hospital Medical School: F. T. G. Prunty appointed professor of chemical pathology, 1220
- Scholarships, 49
- Teachers recognized, 49, 103, 991
- Manchester: Appointments, 1278
- Diplomas granted, 1273
- Examination results, 168
- Nottingham: Benefaction from Boots Pure Drug Company, 656
- Ontario: Queen's University, centenary of, 769
- Oxford: P. Allison appointed to Nuffield professorship of surgery, 1506
- Appointments, 1108, 1217, 1888
- Degrees conferred, 49, 163, 466, 1108, 1217, 1888
- Graduates' Medical Club 1275
- Prizes awarded, 108
- Radcliffe Travelling Fellowship, 1217
- Report of Regius Professor of Medicine, 675
- Retirement of Sir Rudolph Peters, 656
- Scholarships and exhibitions, 168, 991
- Honor V. Smith elected May Reader in Medicine, 714
- St. Andrews: Degrees conferred, 1103
- Examination results, 1103
- Sheffield: Appointments and retirements, 49, 104, 467, 1103, 1384
- Chair of medicine endowed, 827
- D. H. Collins appointed to chair of pathology, 769
- Degrees conferred, 104
- R. P. Jepson appointed to chair of surgery, 1275
- Resignations, 1884
- G. M. Wilson appointed to chair of pharmacology and therapeutics, 769
- Wales: Degrees conferred, 1217
- W. W. Mushin appointed Professor of Anaesthetics, 769
- Welsh National School of Medicine Examination results, 49, 466
- Yale: Silliman Lectures, 770
- University Grants Committee, 221

GENERAL MEDICAL SERVICES COMMITTEE REMUNERATION QUESTIONS

A meeting of the General Medical Services Committee was held on December 17, with Dr. A. TALBOT ROGERS in the chair. The business occupied the whole day, from 10.30 a.m. to 5.15 p.m.

A communication from the Ministry of Health was placed before the Committee relating to the precise calculation of the central pool 1952-3. One of the matters at issue was the ascertainment of receipts from private practice. The Ministry expressed disappointment that the Committee had not found it possible to agree to the forthcoming Inland Revenue inquiry being used to ascertain private-practice income, but was willing to discuss alternative methods; in the meantime it agreed to the provisional figure of £2m. (the figure taken by Mr. Justice Danckwerts) in the calculation of the central pool, subject to adjustment for under- or over-payment in the following year.

The CHAIRMAN said that it had been pointed out to the Ministry that income from private practice was a diminishing and not an increasing amount. They had been willing to accept the figure mentioned, which was agreed at the time of the Danckwerts award, and if it should be subsequently shown that the figure should have been higher or lower they would consent to adjustment.

The question of monthly payments of capitation-fee remuneration to general practitioners (which was provided for in certain circumstances in the distribution scheme) was another matter which had been discussed with the Ministry. It was stated that in Middlesex, if a monthly payment system were adopted, it would entail, with 1,600 doctors on the list, the permanent employment of two extra clerks by the executive council. On the other hand, Sheffield has been following the system for some time.

The DEPUTY SECRETARY said that the Ministry had carried out its undertaking and in a letter to executive councils had suggested that requests for monthly payment should be interpreted in a reasonable way without insistence on detailed proof of the nature of a practitioner's difficulty. He thought that the Ministry had gone a long way to meet the Committee's view.

Responsibility of Partners

A matter to which the Committee had drawn the Minister's attention was the anomalous position which arose under the terms of service whereby a general practitioner was responsible for all acts or omissions of his deputy or assistant. Whilst this provision was equitable in the cases of assistants and locumtenents, in the case of members of a firm each partner should be held responsible for his own acts. A suggestion from the Ministry was that partners should be held jointly responsible, and that where both

agreed that the deputy should accept responsibility then the practitioner on whose list the patient's name appeared would take no further part in any proceedings.

It was pointed out that under the Ministry's scheme it would be possible for a medical services committee, having had one of the partners before it and finding no case against him, to call upon the other. Dr. GORSKY said that it was possible for the partnership agreement to contain certain clauses respecting indemnity which would be rendered null and void in these circumstances. There were certain dangerous implications in all this, and he suggested that it would be well to consult with the secretaries of the defence societies.

Dr. DAIN said that not only should a partner be covered, but any deputy should take his responsibility for what he did. It ought to be ensured that a doctor should not be proceeded against when either a partner or a deputy had acted for him.

It was agreed that the Chairman, with Dr. Dain, Dr. GORSKY, and Dr. J. T. Baldwin (representing Scotland), should discuss this matter with the defence societies.

General Practitioners on Regional Hospital Boards

The CHAIRMAN said that it had been pointed out by the Ministry that in composing the regional hospital boards it was necessary to have regard not only to the type of persons nominated and their experience but also to certain geographical conditions so as to ensure an appropriate distribution of representatives. Therefore it was suggested that when submitting nominations more than one name should be put forward, to avoid the possibility of the rejection of the single nominee purely on geographical grounds. This was agreed to as a general procedure, but it was felt that it would be inappropriate to put forward additional names when a representative who had served already and was eligible was prepared for re-nomination.

Clinical Research in Relation to the N.H.S.

The White Paper on clinical research in relation to the N.H.S., issued by the Medical Research Council, was the subject of some comment. Dr. B. CARDEW strongly impressed on the Committee that, in co-operation with the College of General Practitioners, it should urge at once that general-practitioner research should be undertaken. This should be done before the new Clinical Research Board had laid down its plans, which otherwise might not adequately cover general-practitioner aspects. Dr. F. M. ROSE thought that the Committee and the College would be in a stronger position if it had actual representation on the Board. It was also urged that some part of the fund of £250,000 should be allocated directly to general-practitioner research, otherwise it might be devoted entirely to hospital research projects. It was agreed that the College should be invited to make joint representations to the Research Board.

Student Entry and General Practice

A report was presented by a subcommittee which has been studying how medical manpower is related to the present intake of students into medical schools. The subcommittee had arrived at the conclusion that the Council should be asked to invite the Ministry to co-operate in the setting up of a working party to examine on a long-term basis and with the widest possible terms of reference the future number of general practitioners likely to be required in all branches of the profession and to relate these needs to the intake of students (see leading article at p. 83).

The CHAIRMAN said that many aspects had to be considered, including the diversion of medical manpower to the colonial services, the armed Forces, public health, and industrial medicine. Some figures had been worked out and were presented to the Committee in the form of tables and graphs, showing that as the years went on a certain number of qualified people would be looking for posts over and above those required to fill the vacancies which occurred through death or retirement in the different sections of the profession. With a more or less fixed establishment in the hospital and other services, the only big field open to absorb those who were otherwise redundant was general practice, into which more and more students would go.

Dr. P. J. GIBBONS suggested that a factor on the other side might be the growing disinclination of parents to encourage their children to enter medicine. The number of posts in the higher ranks was more or less fixed, and this alone prevented many able people from entering the profession. The DEPUTY SECRETARY pointed out that there had been a consistent rise (except for the immediate post-war years) in the numbers on the *Medical Register* over the last quarter of a century. The conclusion was inescapable that more and more doctors would be coming into the field of general practice every year.

The recommendation for the setting up of a Working Party was agreed to unanimously.

Geriatric Units

The Liaison Committee (of consultants and specialists and general practitioners) recommended that a joint subcommittee should be appointed forthwith to give further study to the establishment of an integrated service for the treatment and rehabilitation of those chronically disabled by age or illness. Several members gave their experience of the work of geriatric units and of the conditions for the treatment and accommodation of the elderly. Dr. C. F. R. KILLICK referred to the tendency to look upon old age itself as a disease, and to deny the use of general hospitals to old persons suffering from some disease and to consign them to special hospitals for the aged. Other members also deplored the modern tendency on the part of many young people to waive their responsibilities to aged relatives. Dr. SORSBY considered that the teaching hospitals and their schools should take over some of the responsibility for looking after ageing people. It would be useful for students who intended entering general practice to learn something in hospital about the treatment of the aged, and this was one of the ends to which also nursing training should be directed.

After some further discussion it was agreed that the suggestion of a special subcommittee should be supported and that there should be four representatives of each of the committees concerned—General Medical Services, Consultants and Specialists, and Public Health.

Guillebaud Evidence

The Committee devoted considerable time to a draft memorandum on aspects of the National Health Service from the point of view of general practice to which it considered that reference should be made in the Association's evidence to the Guillebaud Committee. The memorandum dealt with general administration, finance, pharmaceutical services, and other matters of important policy.

The views submitted by local medical committees were carefully considered and a number of them were incorporated in the memorandum of evidence.

Vacant Practice: Acceptance of Patients

Dr. ROBERT FORBES and Dr. ANNIS GILLIE attended as representatives of the Central Ethical Committee to discuss further the fixing of a time limit after which an acting practitioner in the case of death or retirement of a doctor would be freed from any obligation not to accept as his patient anyone to whom he had been introduced or with whom he had been in professional relationship while acting as locumtenent until the successor in the practice was appointed.

Dr. FORBES said that this arose out of a previous discussion between the two committees, which had appeared to be in agreement except for the time limit attaching to the bar they were seeking to impose. The Central Ethical Committee had suggested that a local practitioner who acted in the interval between the vacation of a practice through death or retirement and the appointment of a successor should refrain during that period and for 12 months thereafter from accepting as his patient any patient of the practice with whom he had been in professional relationship, except, of course, with the consent of the successor. Further, that a whole-time locumtenent specially engaged for the purpose of keeping the practice in being should similarly refrain for five years from setting up in the area. It was pointed out that the practitioner in possession during the interval was in a position of peculiar advantage in his access to patients.

The difficulties of the situation were discussed at length and various possibilities were envisaged. The feeling of the Committee was that it would be impossible to lay down any rule to satisfy all parties. One member said that the Ethical Committee was trying to maintain a ruling made for entirely different circumstances that is to say, for the pre-N.H.S. period when goodwill in a practice still existed.

A form of words was suggested by the Secretary of the Association and approved for the consideration of the Ethical Committee at its next meeting.

Other Business

Dr. CATHERINE HARROWER presented a report from a joint subcommittee which, with representatives of the Public Health Committee, had been considering ways and means of effecting better co-operation between the general practitioner and the health visitor. A short statement on the subject was agreed to for submission to the Council, and subsequently with the Council's approval for issue to divisional secretaries, secretaries of local medical committees, and medical officers of health, and for publication in the *Supplement*.

Some criticism was expressed concerning a draft leaflet on whooping-cough prepared by the Central Council for Health Education. The criticism was on the ground that it was likely to cause unnecessary worry for the doctor. It was agreed to ask the representative of the Committee on the Central Council to draw attention to the points of objection.

A brief report was made on a meeting of representatives of the pharmaceutical industry and the National Pharmaceutical Union to discuss the differential rate of discount allowed by manufacturers to dispensing doctors and to retail pharmacists. The matter was referred to the Rural Practices Subcommittee.

An alleged increase of suicides due to the ingestion of barbiturates and other sedatives was brought forward in a letter from the East Sussex Local Medical Committee, which suggested the advisability of urging the Minister to make regulations restricting the quantity of drugs and preparations ordered by doctors on N.H.S. prescriptions. The proposal, however, was not considered acceptable.

Several matters on the agenda were deferred until the next meeting.

EXCHANGE VISITS WITH CANADA AND THE U.S.A.

The scheme for exchange visits between members of the American, British, and Canadian Medical Associations, which has the approval of the Bank of England, will be continued this year.

Procedure

Three doctors from Britain may visit Canada in exchange for three doctors from Canada. Each doctor from Britain will be required to make all his own travel arrangements, and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in Canada he will receive the equivalent in Canadian dollars. Similarly, each Canadian doctor on arrival in Britain will receive the sum deposited in sterling.

Three doctors from Britain may visit the U.S.A. in exchange for three doctors from the U.S.A. Each doctor from Britain will be required to make all his own travel arrangements, and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in the U.S.A. he will receive the equivalent in U.S. dollars. Similarly, each U.S. doctor on arrival in Britain will receive the sum deposited in sterling.

Duration of Visits

The duration of the visits is left to the discretion of the doctors concerned. The American, British, and Canadian Medical Associations cannot accept any responsibility for a doctor who allows his visit to outlast the money placed at his disposal.

Applications are invited from members of the B.M.A. to take part in such exchanges during the next financial year—i.e., April 1, 1954, to March 31, 1955. Each applicant must state the object of his visit. Medical practitioners in all branches of the profession, including general practice and public health, are eligible. Applicants should also give approximate dates of the visit desired. (Successful applicants will in due course be required to furnish exact dates and details of travel.) Applications must be received by the Secretary of the Association by March 1, 1954.

**RECIPROCITY OF PRACTICE
AUSTRALIAN STATE'S LEGISLATION**

The Victorian Legislative Assembly has passed a Bill which will allow graduates of medical schools from Britain and in other countries of the British Commonwealth to practise in the State of Victoria. The New South Wales Parliament introduced similar legislation several months ago.

A Legal Difficulty

Introducing the Bill, the Minister for Health explained that the British Government had amended its own medical legislation to allow Commonwealth graduates to practise in England without doing a postgraduate course there. The Victorian Bill was a reciprocal arrangement with the British Act. It was not contemplated at present, he said, to make any change in the requirements for the registration of medical graduates from countries outside the British Commonwealth. They would still have to pass a medical course at an Australian university.

The difficulty, a purely legal one, about reciprocal recognition of registration first arose when Britain introduced the compulsory pre-registration year into the medical curriculum.

U.S. COMMITTEE'S STUDY OF MEDICAL SERVICES

Mr. Charles A. Wolberton, chairman of the U.S. Congress Committee on Interstate and Foreign Commerce, during his visit to Australia in the course of a world tour of inspection, said that he and other members of his committee had

recently examined the British health services. He had been surprised to find that "the opposition to the British scheme, evident at its introduction four years ago, had now disappeared. There was splendid co-operation between the doctors and the public health authorities, and many early problems had been overcome."

Mr. Wolberton's committee deals with legislation on such matters as public health and medical and scientific research. It examined health schemes in France, Sweden, and Spain as well as Britain.

OCCUPATIONAL HEALTH**FITNESS OF TRANSPORT DRIVERS**

The Occupational Health Committee of the Association held an all-day meeting on December 16, with Dr. J. A. L. Vaughan Jones in the chair. It was announced that Drs. G. E. Graves Peirce, J. M. Rogan, and J. S. Spickett had accepted co-option.

The Future of the Services

A report was made on the Council's reception of the Committee's memorandum on "The Future of Occupational Health Services"—a report to which more than one meeting of the Committee has been devoted. The Council had found itself unable to accept the wording of two paragraphs, and amendments of these had been agreed to by the Chairman of the Committee with the Chairmen of the Council and the Representative Body, and the amended memorandum submitted to the Ministry of Labour and National Service.

List of Industrial Medical Officers

The Committee again considered the practicability of compiling a list of all industrial medical officers. The Association maintains a list of whole-time officers, but no list of part-time officers at present exists. The difficulties of obtaining a complete list were explained. A suggestion was made that the help of local medical committees might be enlisted for this purpose, also that information might be available through divisional secretaries.

It was agreed to ask the General Medical Services Committee whether in its view the information would be available through local medical committees, perhaps in collaboration with executive councils.

Medical Standards for Road Transport

The Committee devoted more than two hours to a memorandum prepared by a subcommittee under the chairmanship of Dr. L. G. Norman on medical standards for road transport. The original terms of reference of the subcommittee included rail and air transport, but Dr. Norman said that as yet only brief consideration had been given to these two groups, and both railways and airlines had their own medical services. Moreover, so far as airlines were concerned the medical standards for aircrew were laid down by international agreement and were constantly under review. The subcommittee therefore felt it desirable without delaying to complete its reference to put forward at once the conclusions reached with regard to road transport.

The report, which will be published in due course, presents information concerning present visual and hearing standards, physique, general medical condition, including emotional stability, and frequency of examinations, and includes a long series of recommendations (which were accepted) for the examination of public service and heavy goods vehicle drivers and private car drivers, and also a revised draft form of medical report.

Remuneration of Industrial Medical Officers

A report from the Remuneration Subcommittee expressed the view on a preliminary consideration that the existing recommendations for the remuneration of industrial medical

officers were too rigid. Many large industries did not wish to be tied to an incremental scale of 6% per annum. In some instances they preferred to give an industrial medical officer with two to three years' experience an increase amounting perhaps to the total of his probable increments for the ensuing five years and then to keep him at that higher salary for several further years. But it was essential to ensure that there were reasonable increments leading to a maximum within the range laid down by the Association. A revised draft of the existing recommendations will be submitted to the Committee at its next meeting.

Occupational Dermatitis

A report was presented by Dr. H. Alexander on behalf of the Occupational Dermatitis Subcommittee. Two films on industrial dermatitis were seen, one by Imperial Chemical Industries for professional audiences and the other by the Ministry of Labour and National Service for lay audiences. The latter came in for some criticism in that it gave the impression that occupational dermatitis was normally cleared up in 10 days, that whilst the patient was on the sick list the treatment was given at the factory, and that insufficient emphasis was laid on the desirability of changing the man's job inside the factory to avoid absence from work altogether—in the words of one member of the Committee, "the film gave a general impression that industrial dermatitis was just the easiest thing in the world to deal with."

New Approach about Notification

It was also reported by the subcommittee that discussions on the possibility of making occupational dermatitis a notifiable disease and attempts to secure that employers were notified in all cases where an employee was receiving industrial injury benefit had so far proved unsuccessful. The subcommittee felt that a completely new approach should be made to the Ministry of Pensions and National Insurance on this subject and a memorandum was being prepared for the next meeting. It was realized that the problem was bristling with difficulties. Dr. A. Meiklejohn suggested that something should be done on the lines of the memorandum on medical standards for road transport which had just been considered—a memorandum which could go to the Ministry of Pensions and National Insurance.

A suggestion was made that the preparation of advisory notes on the treatment of acute skin inflammations in the initial stages might prove useful to a number of general practitioners in avoiding the use of substances likely to aggravate skin diseases. The Chairman suggested seeking the views of the Dermatologists Group Committee.

The draft proposals for legislation in connexion with the Gowers Committee report on health, welfare, and safety in non-industrial employment were deferred for consideration to a later meeting.

REMOVAL FROM THE MEDICAL REGISTER ADDRESS NOT KNOWN

In the course of discussion of a matter put before the General Medical Services Committee at its meeting on December 17 by Dr. Bruce Cardew it was mentioned by him that 1,692 names were removed from the *Medical Register* in 1952. This large number represented the periodical purge of the *Register*, which the G.M.C. is bound by statute to carry out, of the accumulation of names of doctors who cannot be traced.

Doctors who change their permanent address should always notify the G.M.C. Those who have changed their address and have not notified the G.M.C. should find out if they are still registered practitioners, because their legal status depends upon the fact that their name is included in the *Register*.

THE PRIVATE PATIENT

SECTIONS OF HEALTH SERVICE AVAILABLE

Some patients believe that they are bound to obtain their family doctor service through the National Health Service to qualify for National Insurance benefit, or to have the use of other sections of the National Health Service.

There is no foundation in this belief, and, in view of inquiries received, the Private Practice Committee has considered it wise to set out the present position.

Open to Choice

The National Health Service is available voluntarily in full or in part to all the population of this country excluding the armed Forces. It is thus possible to obtain separately the benefits of any of the following sections of the Service:

(1) Family Doctor Service; (2) Specialist and Hospital Service; (3) Dental Service; (4) Supplementary Ophthalmic Service; and (5) certain services provided by the local authority, as, for example, ambulances, school clinics, and home helps.

At present selection within a section of the Service is not permitted. For example, despite repeated representations to the Ministry, a patient receiving attention from his family doctor under private arrangements cannot obtain his medicines under the National Health Service. He can, however, take advantage of any other part of the Service.

National Insurance Separate

National Insurance is obligatory for very many of the population, and the benefits are not contingent in any way on participation in the arrangements of the National Health Service. These benefits of National Insurance, where applicable, include unemployment benefit, sickness benefit, retirement pension, widow's benefit, guardian's allowance, maternity benefit, death grant, and industrial injury benefit.

JOINT COMMITTEE ON PRESCRIBING MINISTRY'S REASSURANCE ABOUT COSTS INVESTIGATIONS

The publication of lists of preparations classified in categories 5 and 6 by the Joint Committee on Prescribing has raised doubts in the minds of some practitioners about their liability to surcharge in the event of preparations in these categories being ordered for National Health Service patients. The letter from the Chief Medical Officer to the Ministry of Health, which was enclosed with the copy of the Joint Committee's classifications sent to every medical practitioner, stated that, while doctors were asked not to prescribe articles in categories 5 and 6, this request was without prejudice to the individual practitioner's right to prescribe whatever drugs he considered necessary for any particular patient, though he might subsequently be called upon to justify his action before his colleagues on the local medical committee.

The General Medical Services Committee has now taken this point up with the Ministry of Health. As a result of the Committee's intervention, and to remove any possible misunderstanding, the Ministry has given a categorical assurance that those drugs listed in categories 5 and 6 will not be referred by the Pricing Bureau for investigation merely because they come within these categories. Indeed, the Regulations themselves do not permit of investigations on this count. Only where the individual practitioner's prescribing costs are substantially above the average for his area and are the subject of an inquiry on those grounds will the prescribing of drugs in categories 5 and 6 be one of the factors which may be taken into account. In such circumstances the frequency of prescriptions for substances in the two categories will also be considered.

B.M.A. LIAISON MACHINERY

PUBLIC HEALTH REPRESENTATION

The Consultants and General Practitioners Liaison Committee was originally appointed, as its name suggests, to discuss matters of common interest to consultants and general practitioners. At its last meeting on November 11 the chairman suggested, and the Committee agreed, that it would be advantageous to include in its membership representatives of the Public Health Committee. The Committee therefore recommended the proposal to its parent committees, the Central Consultants and Specialists Committee and the General Medical Services Committee, both of which approved the recommendation.

The Public Health Committee has accepted the invitation and has appointed the following to the Liaison Committee: Dr. K. Cowan (chairman of the Public Health Committee), Drs. H. D. Chalke, S. C. Gawne, J. Kelman, Lilywelyn Roberts, and J. B. Tilley.

OPHTHALMIC GROUP COMMITTEE

The meeting of the Ophthalmic Group Committee, held at the Association Headquarters on December 11, was mostly occupied with two matters still largely in the confidential stage. One of these was the statutory registration of opticians following the recommendations of the Crook Committee, and the other the preparation of evidence for the Guillebaud Committee. Mr. O. Gayer Morgan occupied the chair.

Statutory Registration of Opticians

It was reported to the Committee that a joint deputation appointed by the Faculty of Ophthalmologists and the Group Committee had attended at the Ministry to discuss the action to be taken following the report of the Crook Committee. It is hoped to have further discussions with the Ministry at a later stage, after which the Group Committee's representatives will report again.

The Guillebaud Committee

The Group Committee then considered the draft memorandum of evidence prepared for presentation to the Guillebaud Committee by the joint subcommittee with the Faculty of Ophthalmologists. The problem was considered under two of Ophthalmologists. The problem was considered under two main headings: (1) "Would the replacement of the present per capita Supplementary Eye Service by a sessional clinic service under hospital authorities lead to a more economical use of public funds, as well as allow for the integration of the work of ophthalmologists, opticians, and orthoptists?" and, if such should be the case, (2) "What steps can be taken to provide more eye clinics with suitable staff?"

The DEPUTY SECRETARY pointed out that some members wished to see an extension of the hospital service whereas others desired an extension of the supplementary ophthalmic service. Was there not scope for a middle course? He thought the draft memorandum of evidence took the middle line. It hinged on one recommendation, that the financial control and administration of all ophthalmic services should be brought under the hospital and specialist service. Perhaps it had not been sufficiently stressed that if the ophthalmic medical practitioner was working in the clinic he would enjoy an enhanced status, would be permitted to undertake treatment, and have opportunities for promotion and advancement in the hospital service. The supplementary ophthalmic service would, however, continue side by side with the hospital service.

Dr. J. N. TENNENT was asked briefly to present certain points he had suggested on the ground of economy. These suggestions were mainly concerned with improvements in the supplementary ophthalmic service, and a number of them were agreed for inclusion in the memorandum of evidence.

Eventually it was agreed that the report be revised by the Deputy Secretary in the light of the views expressed in the discussion, that any figures of cost, etc., given as examples, should be the result of expert scrutiny, and that the revised memorandum should be submitted to the chairman of the Group Committee (Mr. Gayer Morgan) and the chairman of the Faculty of Ophthalmologists (Mr. J. H. Daggart), after which it could go forward to the Council of the Association as an agreed document.

Spectacle Frames for Schoolchildren

Dr. I. LLOYD JOHNSTONE brought forward the matter of the free range of spectacles for schoolchildren. He said that Worcester Ophthalmic Services Committee had resolved to urge upon the Minister that a serviceable frame strong enough and suitable for children could not be manufactured from the white metal material at present in use for frames C.221 and C.223, and that rolled gold frames should preferably be made available in the free range for children, or, alternatively, that frames of basic material similar to the hospital steel frame in use before the war, but suitably covered, should be substituted. The Ministry, however, felt that there was no evidence that nickel frames were not strong enough for children, nor that gold-filled frames were more serviceable than nickel.

Dr. Lloyd Johnstone demonstrated to the Committee a pair of child spectacles with cylinders in the region of +4.00 D, in which the frames were very easily bent and the child was wearing the glasses with the axes of each cylinder roughly 20° out of position. Even when straightened they could not be expected to stay in the position for long.

The Committee agreed to look into the problem.

"Reminders" by Opticians

A letter from the Guild of Dispensing Opticians concerning the sending out of "reminders" was read. The Group Committee's view was that "reminders" were unethical and unprofessional. Some ophthalmic opticians had alleged that "reminders" were sent out by dispensing opticians which indirectly resulted in sight-testing appointments being made for ophthalmic medical practitioners, and the Guild of Dispensing Opticians had been asked to recommend their members not to solicit their clients in any way for sight-testing appointments. The Guild had replied that it was emphatically against the issue of any communications by dispensing opticians which related to sight-testing. This was the exclusive province of the ophthalmologist; but there was nothing unethical, improper, or provocative in the issue of communications offering adjustments to the spectacles of former patients. By this means dispensers provided a useful after-service, and would much resent being asked to discontinue such a long-standing practice.

Mr. G. W. BLACK said that he was gravely perturbed about this question, and thought the Group Committee should reaffirm its opinion that the sending out of circulars of any kind should be discouraged.

This was the general feeling of the Committee, and the matter is to be reopened with the Guild.

Service Opticians

It was reported that after a meeting with representatives of the Service departments and the Ministry of Health which was attended by the chairman of the Group Committee and other members the proposals made by the Committee concerning sight-testing of dependants of Service personnel appeared to be favourably received—namely, that Service ophthalmologists should have complete responsibility for the work of the Service eye centres, including responsibility for scrutinizing and signing prescription forms for glasses. In reply to a recommendation on these lines the War Office now stated that the recommendations of the Group Committee were already in operation in the Army, opticians carrying out refraction work only under supervision, and the

SCOTTISH MEDICAL PRACTICES
COMMITTEE
FIFTH REPORT

In its report for the year ending June 30, 1953, the Scottish Medical Practices Committee states that its aim has been to secure as far as practicable a distribution of doctors in accordance with the needs of the people. The Committee is aware that, even in districts where the numbers on established doctors' lists are unduly high, the introduction of a new doctor does not always bring about any rapid reduction of these lists: but it anticipates that in course of time a more rational distribution may thus be achieved.

Size of Lists

Generally speaking, the report says, the slight tendency previously observed towards a more balanced ratio of patients to doctors throughout the country has been maintained, although in the cities, large towns, and industrial areas notable variations remain. The average number of patients on doctors' lists throughout the country is slightly over 2,000. In the district of areas listed as needing additional doctors (see below) the figure is approximately 2,900.

At June 30, 1953, there were 2,505 practitioners undertaking to provide general medical services in Scotland, compared with 2,424 at the corresponding date in 1952 and 2,339 at the inception of the National Health Service, since when the number of persons on the lists of doctors has increased by approximately 244,000. At October 1, 1952, there were 138 single-handed doctors with fewer than 500 patients on their list and there were 72 with over 4,000.

Number of Principals

At October 1, 1952, the number of practitioners practising as principals providing general medical services and maternity medical services was 2,137. The number providing general medical services, excluding maternity medical services, was 245—a grand total of 2,382 principals. The number of assistants was 305, and trainee assistants 98. There were 1,269 principals in partnership and 1,100 were single-handed, and of these single-handed practitioners 896 had no assistant.

It is the Committee's view that entry into practice by way of partnership will continue to be favoured by young doctors and others anxious to become principals. It appears to it doubtful whether there will be any considerable

immediate redistribution of patients as a result of the reduction of maximum numbers on lists from 4,000 to 3,500, and that entry into an existing partnership, with the use of partnership premises and a guaranteed share of the profits, will prove more attractive to many doctors than an attempt to build up a single-handed practice.

The New Distribution Scheme

During the year, the report states, the tendency towards a more even distribution received an impetus from the effects of the new arrangements for the distribution of doctors' remuneration which came into operation on April 1, 1953. The most significant feature has been the increase in the number of partners, encouraged by the "notional list" payments to partnerships. In many cases existing partnerships have assumed an additional partner; in an even greater number of cases, however, new partnerships have been formed, frequently by taking an assistant into partnership. There were 61 new partnerships in March and April of 1953 as compared with 19 in the same period of 1952.

New Applicants

The Committee has maintained a record of the number of applicants for the various types of vacancies advertised and of the respective ages of applicants and of the doctors selected as successors. It has again been impressed by the consistently high average number of applicants. During the year over 500 applications were received by executive councils for the 22 advertised vacancies. This does not, of course, accurately reflect the number of doctors seeking to be established, since many doctors were applicants for more than one vacancy.

The Committee has noted that it is becoming increasingly difficult for a doctor already established in one practice to move to another, should he so wish. One possible method, which has been little used, is by arranging an exchange with another established doctor. Provided that the executive council in each area was satisfied with the proposed arrangements, the Committee would normally raise no objection and would grant the applications by the two doctors for inclusion in the respective medical lists.

Comparatively few applications for the Initial Practice Allowances have yet been made, and it would appear to the Committee that even with the encouragement of an Initial Practice Allowance there is still reluctance on the part of many to face the hazards involved in setting up in single-handed practice.

SIR,—May I congratulate your correspondent Dr. E. Snell on his excellent suggestion (*Supplement*, December 19, 1953, p. 237) of the B.M.A. taking up the question of remuneration of hospital medical staff?

C. C. COOKSON.

Surgeon Captain J. G. Holmes, O.B.E., has retired.
Surgeon Commanders H. H. Fisher, G. S. Rutherford, and
T. McCarty have retired.
Acting Interim Surgeon Lieutenant-Commanders G. R.
Wheldon and J. S. Ritchie to be Surgeon Lieutenant-Commanders.
Surgeon Lieutenants P. D. A. Durham and H. R. Mallows to
be Surgeon Lieutenant-Commanders.

Majors R. M. Hector, D. W. Bell, T. G. A. L. Warrington, and A. Crook, M.C., to be Lieutenant-Colonels.
Captains M. A. C. Dowling and I. McC. Carmichael to be Majors.

REGULAR ARMY RESERVE OF OFFICERS

Colonel T. H. Twigg, late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

ROYAL ARMY MEDICAL CORPS

Captain (War Substantive Major) N. R. Murdoch has ceased to belong to the R.A.R.O.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonels R. W. Raven, O.B.E., J. D. Finlayson, T.D., J. H. Prain, J. Smith, O.B.E., T.D., R. J. S. Doherty, T.D., and R. Passmore to be Colonels.

Majors C. K. D. Edwards and F. H. Blackburn, T.D., to be Colonels.

Majors R. R. Davies, T.D., J. Baxter, H. B. Lee, T.D., A. C. Houghton, J. G. Waugh, R. C. Webster, and H. A. Mullen to be Lieutenant-Colonels.

Major R. W. Biagi, M.B.E., has been granted the acting rank of Lieutenant-Colonel.

Captains G. Gregg and J. Petrie to be Lieutenant-Colonels. Captains J. Attenborough, A. T. H. Glanville, and H. Walker to be Majors.

Major R. McL. Archibald has ceased to hold a commission. Captains J. H. H. Oliver and H. I. Jory have been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel F. Heywood-Jones, O.B.E., T.D., from Active List, to be Colonel.

Lieutenant-Colonel R. R. Davies, T.D., from Active List, to be Lieutenant-Colonel.

Majors G. K. Thornton, T.D., and H. McE. Morris, T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O.

REGULAR ARMY: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

Lieutenants (War Substantive Majors) A. W. Johnson and N. L. Corkill have relinquished their commissions and have been granted the honorary rank of Lieutenant-Colonel.

Lieutenants (War Substantive Captains) R. D. K. Levy, R. H. Bowie, C. Kirk, and P. Shubik have relinquished their commissions and have been granted the honorary rank of Major.

COLONIAL MEDICAL SERVICE

The following appointments have been announced: E. Akwei, M.B., Ch.B., D.P.H., and C. H. Bannerman, M.B., Ch.B., D.T.M.&H., Principal Medical Officers, Gold Coast; S. M. Adu-Appiah, L.R.C.P.&S.I., R. Y. Taylor, M.R.C.S., L.R.C.P., and F. D. Burgess, M.R.C.S., L.R.C.P., Medical Officers, Kenya; B. C. Fisher, M.B., B.S., Medical Officer (Leprosy), Nigeria; J. G. Hayes, M.B., B.Ch., Medical Officer, Northern Rhodesia; L. R. Taylor, F.R.C.S., Senior Assistant Surgeon, Singapore; Mavis E. Eva, M.B., B.S., Lady Medical Officer, Aden; G. Lynch, M.B., B.Ch., Radiologist, Federation of Malaya; J. R. Naudi, M.D., Medical Officer, Federation of Malaya; C. L. Schormar, M.B., Ch.B., Superintending Medical Officer, Windward Islands; L. T. Scott, B.M., B.Ch., Specialist Anaesthetist, Federation of Malaya; G. J. A. Searson, M.B., Ch.B., Medical Officer, Barbados; R. L. Huckstep, M.B., B.Ch., Resident Medical Officer (Intense), Kenya; J. Kolcan, M.B., Ch.B., District Medical Officer, Windward Islands.

British Medical Association

ANNUAL MEETING—GLASGOW, JULY 1-9, 1954

President-Elect: EMERITUS PROFESSOR SIR JOHN MCNEE, D.S.O., M.D., D.Sc., F.R.C.P., F.R.F.P.S.

PROVISIONAL PROGRAMME

The 122nd Annual Meeting of the British Medical Association will be held in Glasgow from Thursday, July 1, to Friday, July 9, 1954, inclusive.

On the evening of Wednesday, June 30, there will be a Cocktail Party for Representatives and their Ladies, arranged by the Glasgow Division.

The Annual Representative Meeting will begin on Thursday, July 1, and continue on Friday, Saturday, and Monday, July 2, 3, and 5.

The Representatives' Dinner and Ladies' Dinner will take place on Thursday, July 1, followed by a dance.

The Overseas Luncheon has been arranged for Friday, July 2.

On Sunday, July 4, an all-day sail on the Firth of Clyde has been arranged, and this will be followed by a concert in the evening.

The Adjourned Annual General Meeting and President's Address will take place in the Kelvin Hall on the evening of Monday, July 5, and the President's Reception, which follows, will be held in the Bute Hall, at the University.

The Annual Scientific Meeting and associated functions will occupy the period from Tuesday morning, July 6, to the evening of Friday, July 9.

The Official Religious Service will be held in Glasgow Cathedral on the afternoon of Tuesday, July 6, and arrangements for a Roman Catholic Service, on the same day, are also being made.

The Annual Dinner of the Association will be held in the Central Hotel on Thursday, July 8.

A full social programme is being arranged, including a Civic Reception on Tuesday evening, July 6, and a University Reception on Wednesday evening, July 7. There will also be a dance on Friday evening, July 9.

Several special functions have been arranged for ladies accompanying the members, including visits to Loch Lomond, Lake of Menteith and Stirling, the Burns Country, and Edinburgh. Also included among these is an all-day excursion to Loch Katrine and the Trossachs—the area of the water supply of the City of Glasgow.

The usual golf competitions will take place. The Overseas Conference will be held on the afternoon of Wednesday, July 7, and there will also be an "At Home" for Overseas Visitors given by the Empire Medical Advisory Bureau on a day yet to be fixed.

The Reception Room for Registration will be open in the Kelvin Hall on Monday, July 5, at 9 a.m.

Three Plenary Scientific Sessions have been arranged as follows: Tuesday, July 6, at 9.30 a.m., subject "The Problem

of Sleep"; Wednesday, July 7, at 3 p.m., subject "Food and Disease"; Thursday, July 8, at 9.30 a.m., subject "The Problem of Pulmonary Tuberculosis To-day."

Seventeen Scientific Sections have been arranged, the meetings to take place on Wednesday morning, July 7, Thursday afternoon, July 8, and Friday morning and afternoon, July 9. The arrangements, so far, are as follows:

Medicine	July 7 (a.m.), July 8 (p.m.)
Surgery	July 7 (a.m.), July 8 (p.m.)
Obstetrics and Gynaecology	July 7 (a.m.), July 8 (p.m.)
Pathology and Microbiology	July 7 (a.m.), July 8 (p.m.)
Child Health	July 7 (a.m.), July 8 (p.m.)
Preventive Medicine and Infectious Diseases	July 8 (p.m.), July 9 (a.m.)
Occupational Health	July 9 (a.m.)
Orthopaedics	July 9 (a.m.)
Psychiatry	July 9 (a.m.)
Dermatology	July 9 (a.m.)
Cardiology	July 9 (p.m.)
Radiology	July 9 (p.m.)
Neurology	July 9 (p.m.)
Forensic Medicine	July 9 (p.m.)
Anaesthetics	July 9 (p.m.)
Ophthalmology	July 9 (p.m.)
Physical Medicine	July 9 (p.m.)

Individual programmes for these Sections will be published in a later issue of the *Journal*.

The Scientific Exhibition will be held in the Kelvin Hall, and will be open daily from July 5 to 9. Demonstrations will be given at fixed advertised times and a wide field of medical interests will be covered. Further details will be published in a later issue of the *Journal*.

The Annual Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications will also be housed in the Kelvin Hall. The Exhibition will be open from 9 a.m. to 6 p.m. from July 5 to 9 inclusive.

The Ladies' Club will be situated in the College Club, University, and will be open throughout the Meeting.

HOTEL ACCOMMODATION

The following hotel accommodation will be available in Glasgow and adjoining districts. Members wishing to reserve accommodation are asked to write direct to the hotel, stating that they are attending the B.M.A. Meeting. The Association cannot accept responsibility for any of the prices stated below. These are the tariffs ruling at the moment and are subject to alteration without notice. Applicants should therefore verify the tariffs when making their reservations.

In view of the demands of the tourist traffic to the Western Highlands of Scotland, members who desire hotel accommodation are advised to make their wishes known to the hotel concerned as early as possible.

* Licensed hotels.

Members who desire private accommodation—that is, not in hotels or hostels—should communicate with the *Lodgings Officer, University of Glasgow, 4, University Gardens, Glasgow, W.2*, stating their requirements. The telephone number of this office is *Kelvin 2231*.

Accommodation in hostels may be either of single rooms or rooms with two beds.

PROVISIONAL TIME-TABLE

Wednesday, June 30

8.30 to 10.30 p.m.—Cocktail Party (by invitation of the Glasgow Division), Trades House, Glassford Street, Glasgow, C.1.

Thursday, July 1

9.00 a.m.—Annual Representative Meeting Inquiry Office opens at Bute Hall, University.
9.00 a.m.—Ladies' Club opens, the College Club, University.
9.30 a.m.—Annual Representative Meeting starts, Bute Hall, University.
11.00 a.m.—Welcome by the Lord Provost of Glasgow to A.R.M.
7.30 p.m.—Representatives' Dinner, Central Hotel.
8.00 p.m.—Representatives' Ladies' Dinner, Central Hotel.
9.30 p.m.—Representatives' Dance, Central Hotel.

Friday, July 2

9.00 a.m.—Annual Representative Meeting Inquiry Office open.
9.30 a.m.—Ladies' Club open.
9.30 a.m.—Annual Representative Meeting.
1.00 p.m.—Overseas Luncheon, Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, C.2.
5.00 p.m.—Cocktail Party for Women Representatives and medical women accompanying Representatives, Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, C.2 (by invitation of the Medical Women's Federation, Scottish Western Association).
8.00 p.m.—Reception and Demonstration by Director and Staff at Glasgow Art Gallery, Kelvingrove.

Saturday, July 3

8.00 a.m.—Annual Breakfast of the Christian Medical Fellowship, the Union, University Avenue.
9.00 a.m.—Annual Representative Meeting Inquiry Office open.
9.00 a.m.—Council Meeting, Forehall, University.
9.30 a.m.—Ladies' Club open.
10.00 a.m.—Annual Representative Meeting.

7.30 p.m.—Glasgow Graduates' Dinner, Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, C.2.

7.30 p.m.—Aberdeen Graduates' Dinner, North British Hotel, George Square, C.2.

7.30 p.m.—Welsh Graduates' Dinner (accommodation being arranged).
p.m.—Theatre "Party."

Sunday, July 4

a.m.—All-day sail on the Firth of Clyde with luncheon and afternoon tea.
p.m.—Concert, Kelvin Hall.

Monday, July 5

9.00 a.m.—Annual Representative Meeting Inquiry Office open.
9.00 a.m.—Scientific Exhibition opens at the Kelvin Hall.
9.00 a.m.—Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications opens at the Kelvin Hall.
9.00 a.m.—Reception Room for Registration opens at Kelvin Hall.
9.30 a.m.—Ladies' Club open.
10.00 a.m.—Annual Representative Meeting.
12.30 p.m.—Annual General Meeting, Bute Hall, University.
p.m.—Council Meeting, Forehall, University (on conclusion of A.R.M.).
8.15 p.m.—Adjourned Annual General Meeting and President's Address, Kelvin Hall.
9.30 p.m.—President's Reception, Bute Hall, University.

Tuesday, July 6

9.00 a.m.—Reception Room for Registration open.
9.00 a.m.—Scientific Exhibition open.
9.00 a.m.—Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications open.
9.30 a.m.—Ladies' Club open.
9.30 a.m. to 12 noon.—Scientific Plenary Session, Kelvin Hall—"The Problem of Sleep."
2.30 p.m.—Robing for Religious Service, Royal Infirmary.
3.00 p.m.—Official Religious Service, Glasgow Cathedral.
3.00 p.m.—Roman Catholic Service, St. Andrew's Cathedral.
8.00 p.m.—Reception by the Lord Provost of Glasgow and Magistrates, at City Chambers, George Square, C.2.

Wednesday, July 7

9.00 a.m.—Reception Room for Registration open.
9.00 a.m.—Scientific Exhibition open.
9.00 a.m.—Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications open.
9.30 a.m.—Ladies' Club open.
9.30 a.m. to 12.30 p.m.—Scientific Sections.
10.00 a.m.—Leinster and Childs Cup Golf Competition.
2.00 to 3.00 p.m.—President and Party, Official Tour of Scientific Exhibition.
3.00 p.m.—Overseas Conference, Forehall, University.
3.00 to 5.30 p.m.—Scientific Plenary Session, Kelvin Hall—"Food and Disease."
8.00 p.m.—Reception in the Bute Hall by invitation of the University of Glasgow.

Thursday, July 8

9.00 a.m.—Reception Room for Registration open.
9.00 a.m.—Scientific Exhibition open.
9.00 a.m.—Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications open.
9.30 a.m.—Ladies' Club open.
9.30 a.m. to 12 noon.—Scientific Plenary Session, Kelvin Hall—"The Problem of Pulmonary Tuberculosis To-day."
10.00 a.m.—Treasurers' Cup Golf Competition.
2.30 to 5.30 p.m.—Scientific Sections.
3.00 p.m.—Garden Party in the grounds of the Glasgow Royal Mental Hospital, Gartnavel, 1055, Great Western Road, W.2 (by invitation of the Medical Superintendent and the Board of Management).
7.30 p.m.—Annual Dinner, Central Hotel, Gordon Street, C.1.

Friday, July 9

9.00 a.m.—Reception Room for Registration open.
9.00 a.m.—Scientific Exhibition open.
9.00 a.m.—Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications open.
9.30 a.m.—Ladies' Club open.
9.30 a.m. to 12.30 p.m.—Scientific Sections.
2.00 to 5.00 p.m.—Scientific Sections.
p.m.—Dance, the Union, University Avenue, Glasgow.

LINES OF COMMUNICATION

DISCUSSIONS WITH G.P.O.

The telephone is indispensable to the vast majority of medical practitioners in this country, though on occasion the doctor and his household may seem to be tyrannized by the summons of the telephone bell. At B.M.A. Headquarters a steady flow of correspondence is received concerning problems experienced by doctors in connexion with their telephones. Hardly a Representative Meeting passes without at least one resolution on the agenda on this subject. Last year was no exception and the following was resolved:

"That even stronger pressure be brought to bear on the G.P.O. in order that a satisfactory solution may be found speedily for the problem of the unattended telephone."

Co-operation of G.P.O.

With the willing co-operation of the authorities of the G.P.O., who are sympathetic to the difficulties experienced by doctors, a great number of the problems have been happily resolved. In view, however, of the misunderstandings and difficulties which still exist, it seemed advisable to review the whole position, and as a result of a meeting with representatives of the Post Office the following statement, which has the agreement of the G.P.O. authorities, is offered as an explanation of some of the remaining difficulties though not necessarily a solution.

The Present Position

Owing to continued restrictions on capital expenditure the G.P.O. is still faced with a shortage mainly of lines and exchange equipment, and to a less extent of labour. The demand for telephones is 50% greater than before the war, and, despite the connexion of 350,000 new telephones a year, there are still nearly 400,000 applicants waiting for the telephone, many of whom have been on the list for a number of years. The situation varies from one place to another, but the general position is improving.

The Shared Line

In order to provide telephone lines for as many as possible it is now an obligation on all new and removing subscribers at the residence rate to share a line if necessary. Sharing is not always enforced at the outset except when it is necessary to connect another person in the same locality who is on the waiting-list.

The telephone needs of doctors are well appreciated by the authorities. A doctor is given top priority for his consulting room and is entitled to a single line which is paid for at the business rate, and he is not required to share. The home telephone of a doctor who does not practise from there comes under the rules for an ordinary residential line and may be shared if necessary to provide service for another subscriber. Sharing will not be enforced where a considerable number of telephone calls are made and received at the private address from which the practitioner transacts a substantial portion of the business of his practice, particularly those of an exceptionally urgent type; in this event the telephone authorities will not accept the confidential nature of calls as a bar to the sharing of a telephone line, as they are not prepared to accept that a telephone line is at any time a suitable medium for the transmission of truly confidential matter.

It is of interest that, though doctors have misgivings on the sharing of a line, of the several thousand doctors who have had this type of telephone service during the last few years only one has so far complained to the Association as a result of his experience. This is the general experience of the Post Office authorities, who get little complaint from the 700,000 people who are now sharing their lines.

The Unattended Telephone

The need always to have someone ready to answer the telephone in a doctor's house frequently becomes an intoler-

able burden on the doctor, his wife and family, and his staff, and many arrangements have been suggested to overcome this modern problem.

In a partnership where the members live reasonably close together it may be possible to use extension lines. Where the G.P.O. has the necessary equipment in its exchanges it will arrange at reasonable notice for the transfer of a doctor's call to another member of a partnership or rota for regular periods or on occasion. The G.P.O. points out that the demand for this facility is very high in many places and asks doctors to assist colleagues and the G.P.O. by making use of the service only when essential to fulfil professional obligations. It should also be made quite clear that the Post Office can only accept straightforward instructions for the transfer or reference of calls to another number and can at no time accept any outside responsibility. A very simple alternative is the publication in the telephone directory of an alternative number, and this may be all the G.P.O. can do in country districts.

In view of the increased demands on the services of the doctor since the inception of the National Health Service and the increased salaries of staff, this problem has prompted the invention of a number of devices. At the present moment there is only one recording and answering device which has the approval of the G.P.O. for attachment to its telephone lines; the G.P.O. does not supply such devices.

Answering Bureaux

In larger centres it has been possible to make special arrangements for calls to be handled by special organizations of this type. These may be organized on a commercial basis or a private co-operative basis amongst a number of doctors, and in certain large centres the regional hospital board or the ambulance service have put their facilities at the disposal of the local doctors. The G.P.O. is anxious to assist, as far as it can, where a number of doctors desire to establish such arrangements, and telephone managers are ready to give advice.

Radio Telephones

A modern development has been the use of portable radio-telephones for "mobile" communication (e.g., between a doctor's car and his house or surgery). A G.P.O. licence is necessary. The application of these is strictly limited, as there are very few radio frequencies available, and conversations can be overheard by anybody tuning in to the appropriate wavelength. It is, however, appreciated that in special types of practices, especially in the country, private radio-telephone services can be of great value.

Doctors who have individual telephone problems are advised to discuss them with the local telephone manager or his representative, who is ready to give advice on the best method according to local circumstances of meeting the problem of the unattended telephone. If there are difficulties which cannot be resolved in that way doctors are advised to bring them to the notice of B.M.A. Headquarters, who will seek the co-operation of the G.P.O. to find an acceptable solution wherever it is possible.

UNDERGRADUATE INSTRUCTION IN THE SOUTH-WEST

Bristol University has arranged with about 25 general practitioners to give a fortnight's training course to students. Each doctor has agreed to take two students, one in March and one in April. Students will stay with the G.P.s or lodge near by.

General-practitioner Research

The South-western Regional Faculty Board of the College of General Practitioners reports in a newsletter that some 20 members in the region have volunteered to partake in research. It is suggested that the subject might be "The Present Scope of General-practitioner Obstetric Practice, with Special Reference to Future Undergraduate Teaching."

AMERICAN MEDICAL ASSOCIATION AND ETHICS

REPORT OF JUDICIAL COUNCIL

The Judicial Council of the American Medical Association, in which is vested the "judicial power" of the association in ethical matters, was among the committees which reported to the House of Delegates of the A.M.A. at its meeting at St. Louis from December 1 to 4, 1953. The following is an extract from the report of the council (*Journal of the American Medical Association*, December 26, 1953).

"In closing this report to the House of Delegates, your Judicial Council solicits the most careful consideration by the members of the House and their constituency of 140,000 physicians to the loss of public confidence in the integrity of the medical profession that follows each publicized expression of personal opinion regarding unethical conduct alleged to be currently prevalent in considerable segments of the nation. We have the constitutional processes by which charges of unethical conduct may be tried in an atmosphere of equity and fair play. Why not invite formal charges of misconduct among members, and thereby ensure each alleged offender trial by his peers rather than by sources that lead no further than to sensationalism and loss to our profession of the precious good will of the public?"

FEWER FORMS IN 1954

NATIONAL INSURANCE BENEFITS CLAIMS

About 4½ million fewer forms will be filled up in 1954 by people claiming sickness and injury benefits under the national insurance schemes. According to a statement by the Ministry of Pensions and National Insurance, the procedure has been simplified and claimants without dependants, who represent nearly two-thirds of all those claiming, will not have to fill up an extra inquiry form. The back of the new type of first medical certificate has been redesigned and now includes questions which hitherto had to be asked on a separate form.

When the new type of first medical certificate is in use anyone not claiming for dependants as well as for himself will not receive the separate form. These claimants will not hear from the Ministry of Pensions and National Insurance, therefore, until they send in their second certificate.

"Weekly" Certificates

The Ministry circular goes on to say that all claimants should send in their second certificate as soon as they get it from the doctor, and, as there are time limits for claiming benefit, subsequent certificates should be sent in weekly. Delay may lead to loss of benefit.

The Ministry's instructions might be taken by patients to mean that intermediate certificates must be supplied by the doctor at precisely seven-day intervals, and the Secretary of the B.M.A. states that the reference to weekly certificates in the Ministry circular in no way modifies the present position. That is to say, the initial intermediate certificate should still be issued not later than seven days after the first certificate, but subsequent intermediate certificates can be given at any time during each following week, as distinct from strict weekly intervals.

TRAINING OF DISTRICT NURSES

WORKING PARTY APPOINTED

The Minister of Health and the Secretary of State for Scotland have appointed a working party on the training of district nurses. Its terms of reference are: "To consider what training it is desirable that registered nurses and enrolled assistant nurses, respectively, should undertake prior to their employment on home nursing duties, and the means by which such training should be provided."

The Chairman will be Mr. I. F. Armer, Deputy Secretary to the Ministry of Health, and the members: Alderman Major G. Canty

(Lincolnshire); Miss M. F. Carpenter (Royal College of Nursing); Miss E. Cockayne (Chief Nursing Officer, Ministry of Health); Miss M. H. Cook (Public Health Nursing Officer, Ministry of Health); Dr. T. M. Clayton (Medical Officer of Health, Coventry); Dr. A. R. Culley (Principal Medical Officer, Welsh Board of Health); Dr. G. Matthew Fyfe (Medical Officer of Health, Fife County Council); Miss E. J. Merry (General Superintendent, Queen's Institute of District Nursing); Miss M. O. Robinson (Chief Nursing Officer, Department of Health for Scotland); Dr. Dorothy Egan (Principal Medical Officer for Maternity and Child Welfare, London County Council); Councillor Mrs. W. Shutt (Leeds); Alderman T. O. Steventon (Shropshire); Dr. J. A. Struthers (Medical Officer of Health, Holborn and Westminster); Dr. J. Stanley Thomas (General Practitioner, East Ham); Miss J. E. Treleven (Senior Superintendent, Ranyard Nurses); and Dr. W. S. Walton (Medical Officer of Health, Newcastle-upon-Tyne). The secretary is Miss J. E. Chapple, of the Ministry of Health.

About half the district nurses now employed have received special domiciliary training, mainly under the auspices of the Queen's Institute of District Nursing (or, in certain parts of London, the Ranyard Nurses), after completing their general training in hospital. The task of the Working Party will be to consider whether some minimum measure of special domiciliary training should be generally recommended for adoption by the local health authorities responsible for the home nursing service. Between 8,000 and 9,000 nurses are engaged either full-time or part-time in district nursing in England and Wales, and about 1,300 nurses are so engaged in Scotland.

CONSULTANTS DINNER

The Central Consultants and Specialists Committee is holding a dinner in the Great Hall of B.M.A. House on Wednesday, February 3, to celebrate the fifth year of its establishment by the British Medical Association. The Minister of Health and the representatives of the Royal Colleges of England and Scotland and of the Royal Faculty of Physicians and Surgeons of Glasgow will be present as guests.

Consultants and senior hospital medical officers who would like to be present should apply for tickets to the Secretary, British Medical Association, price £2 10s. (including cocktails but exclusive of wine), and can apply for a ticket in addition for a medical guest if they so desire.

N.H.S. SUPERANNUATION SCHEME

In *The Times* of December 29 and 30, 1953, Professor R. Titmuss discussed pensions in relation to the medical and other professions. Mr. J. Pringle, Public Relations Officer of the B.M.A., accordingly addressed a letter to *The Times*, with the following passage relevant to the medical profession:

"I am concerned to point out one or two errors of fact in Professor Titmuss's references to the medical profession. He may be right in saying that the National Health Service superannuation schemes are 'probably the most generous yet provided.' They are certainly the latest and therefore presumably the most up-to-date. They apply similar principles to everyone in the Service, hospital nurses and clerks as well as hospital doctors, though Professor Titmuss omitted to say so. Allowances to cover expenses, including car mileage, do not, however, as Professor Titmuss supposes, rank for superannuation, any more than they would in any other business or profession. Contributions are based on all professional earnings from National Health Service sources. The 'part-time' fees referred to by Professor Titmuss are part of the doctor's remuneration under contract, and as such are very rightly included in his total remuneration as assessed for pension purposes.

"Again, Professor Titmuss is inaccurate in saying that the superannuation benefits for National Health Service doctors were left out of account when settling the 'betterment' in their income compared with that in other comparable callings. When the Government gave consultants a 20% 'betterment' over their estimated 1939 remuneration, it was recognized that consultants in the Health Service do not now have

to provide for their own old age, as was obligatory in 1939. Consequently, the 20% was regarded as the gross 'betterment,' and from it was deducted a sum equivalent to the Government's 8% of salary contribution to superannuation, as well as the consultant's own contribution of 6% of salary. Similar provisions were made in the general-practitioner field. In other words, the level of 'betterment' expressly took into account the benefits of State superannuation."

Correspondence

Assistant with a View

SIR,—There have been so many letters from young doctors complaining of inability to enter into partnership that a recent experience of ours may be worth relating as indicating a difficulty which we had not foreseen.

We are a three-handed practice in the country and this practice has had three partners for over 50 years. There is no doctor in between us and our hospital town 17 miles to the west. Our neighbours to the east are four doctors 13 miles away. There is one doctor four miles to the N.E., and a partnership of two is 10 miles to the N.W. To the south our practice peters out in fell country. Before the war there was a doctor seven miles to the west of us and another one nine miles to the east. These practices have now been discontinued and are absorbed by the neighbouring doctors. Since the Danckwerts award and the arrangements of the new distribution scheme we felt that we could afford to have a fourth doctor in with us, thereby giving ourselves some leisure and time for study and at the same time absorbing some of the work of the young doctors for whom we ultimately as a principal one of the young doctors for whom we felt sorry. We therefore decided to look for an assistant whom we could take into partnership in about 18 months' time and we found a suitable man. We wrote to the executive council to obtain its permission to employ him as assistant with a view to partnership, and then followed some correspondence, the relevant extracts from which are as follows:

From the Executive Council in Reply to Our Application.—"I have to inform you that your application for permission to employ an assistant was approved on Friday 4th instant. I shall be obliged if you will inform me when Dr. E. actually commences his duties. Regarding the fact that at some later date Dr. E. may be admitted to the partnership, I have to state that, in view of the fact that X, which is included in Y district, is classified by the Medical Practices Committee, London, as a restricted area, any application for admission to the medical list will be considered according to the circumstances obtaining at the time of the application."

Our Reply to the Above.—"We are concerned that Dr. E. may be refused permission to enter into partnership with us when he applies in 18 months' time. We understood that the idea behind the new distribution scheme was to encourage principals to take in new partners. The journals have frequent correspondence from young doctors complaining that established principals will not admit them to partnership and saying that they are dissatisfied with the prospect of remaining as assistants. If the committee has sanctioned the employment of an assistant, what is the difference to the medical personnel of the district and to the Medical Practices Committee, London, between continuing as an assistant and being admitted a partner in 18 months' time? Or are we right in assuming that, if his application for admission to partnership is refused, permission to employ him as an assistant will be automatically withdrawn? This makes our arrangement with Dr. E. very uncertain. Naturally the best of the young doctors will only come with a promise of partnership. . . . He may not want to come here as an assistant 'with a hope' and we cannot see that we can offer him any other terms."

From the Executive Council.—"With reference to your letter of September 10, I have to draw your attention to the fact that the admission of medical practitioners to the Medical List for the purpose of practising as principals, either in partnership or otherwise, is the function of the Medical Practices Committee in wise, is the function of the Medical Practices Committee in London, and for this purpose they classify the various areas throughout the country, and therefore throughout the county area, according to the number of medical practitioners at present in practice in the areas concerned. Each application for admission to the list has, therefore, of necessity, to be considered in relation to the conditions and circumstances applying at the time of the application. It is, therefore, not possible for a decision on such a matter to be given in advance. As you will readily appreciate, between the date of such a decision and the date of a doctor's

actual entry into partnership, further applications might be received for immediate admission, thus bringing about a radical change in circumstances and availability of practitioners. I regret, therefore, that the executive council is not able to give any decision on the point you raise regarding your proposed assistant, Dr. E."

We then wrote.—"Thank you for your last letter. We understand now that permission to employ Dr. E. as assistant will not be withdrawn if his application to enter into partnership is refused. We really do want to know the difference to medical personnel between three principals and one assistant on the one hand, and four principals on the other."

"You mention the possibility of some person making application for inclusion on the council's list between now and April, 1955. As you now have knowledge of our intentions we shall expect to be informed if anybody does make application to practise in this area, before their application is considered by the committee, so that we can safeguard Dr. E.'s position."

Throughout the whole of this correspondence the clerk of the executive council has been most helpful and patient, but there the situation is. Dr. E. has come and is installed as assistant with a promise from us that we shall take him into partnership, but there is no certainty from the executive council that he will be allowed to do so, and we still have not been able to get a satisfactory answer to our question asking the difference between three partners and one assistant, and four partners. In case there are others who are similarly placed, we publish this correspondence, with the permission of the clerk of the executive council, in order that they may be forewarned of the difficulties which might arise.—We are, etc.,

D. D. & W.

Remuneration of Hospital Medical Staff

SIR,—Your correspondents Dr. E. Snell (*Supplement*, December 19, 1953, p. 237) and Dr. Bernard Sugden (*Supplement*, January 2, p. 7) may be interested to know that about nine months ago the Member of Parliament for the area in which I was then living asked, after I had been in touch with him, in the Commons if the Minister of Health could explain why there was delay in settling negotiations. The reply was phrased in such a manner as to indicate that the cause of the delay was because the matter was being negotiated before the Whitley Council. A further approach to the Minister made some two months ago produced the same reply.—I am, etc.,

A. W. ANDERSON.

Hastings.

SIR,—I wholeheartedly endorse Dr. B. Sugden's letter (*Supplement*, January 2, p. 7). It is fantastic that the full-time consultant and many of the part-timers should find their incomes less than that of a recently qualified general practitioner who has a large N.H.S. list. One realizes the present sociological trend to reduce the higher incomes and raise the lower, but for the raw recruit to be able to earn more than the general is hardly calculated to produce the best army to fight disease.—I am, etc.,

PAUL F. B. GILLET.

Hove, 3.

Mildmay Memorial Hospital Maternity Unit

SIR,—For 30 years the Maternity Unit at the Mildmay Memorial Hospital has served a useful function in the Islington, Hackney, and Stoke Newington areas. Four weeks ago the unit was closed at 48 hours' notice and 230 bookings were informed that they would have to be transferred to other hospitals. During this 30 years general practitioners have been able to attend their own patients in this hospital, and closure removes the only opportunity for such liaison in this district.

On the appointed day the hospital was taken over by the Ministry of Health, and Nos. 2, 3, 4, 9, and 10, Newington Green—owned by the Mildmay Trust but occupied, No. 2 by the medical superintendent, 3 and 4 by the obstetrical unit, and 9 and 10 as a nurses' home—continued to be used by verbal licence of the directors of the Trust, and no rent was charged subsequent to the appointed day under the National Health Service Act. A dangerous-structure notice was served on the Trustees in

August, 1952, and notice thereof was given to the Ministry's solicitor on August 27, 1952. No reply to this communication was received. A copy of the notice was served on the Trustees in April, 1953, and notice thereof was given to the Archway Group Management Committee on April 22, 1953. To this communication also no reply was received. A summons was issued returnable at the Old Street Police Court on December 10, and on that same day a letter was received from the solicitor to the Ministry determining at two days' notice the licence under which the premises were held by the Ministry and refusing to accept any liability. The premises Nos. 2, 3, and 4, Newington Green were also, and since the appointed day had been, occupied by the Minister as a tenant at will, and as presumably no rent would be paid, nor liability accepted for repairs, the directors of the Midmay Trust Ltd., as trustees, had no option but to determine this licence.

The closing of Nos. 2, 3, and 4 as a maternity institution is a tragedy. It was opened some 30 years ago by the Trust, by whom all the furniture and equipment was provided, and it was found that the patients preferred accommodation where their husbands could visit them at any time, and their own doctors attend them. The Ministry gave instructions that no more patients were to be admitted after 48 hours. The hospital continues to operate—only the obstetrical unit being closed. Of the 230 patients booked, about one-third were to be attended by general practitioners.

A year ago the Ministry asked the Trust to meet the district valuer to agree on a price for Nos. 2, 3, and 4, Newington Green as the Ministry were desirous of purchasing them, Nos. 3 and 4 being the obstetrical unit. This was done, and an agreed price arrived at, but no further action was taken by the Ministry.

Surely this is the solution to the problem.—We are, etc.,

Care of the Aged Sick

SIR,—I was amazed to read in the "Medical Notes in Parliament—Care of the Aged Sick" (*Journal*, December 26, 1953, p. 1436) that the Minister felt that "it would be the final irony of the Welfare State if all they could find to solve this immensely difficult problem was to bring back the relieving officer and rebuild, in whatever form, the work-houses."

As a practitioner with 30 years' experience as district medical officer, and hospital medical officer under the Poor Law, and later the Public Assistance, I think that the most retrograde step in the N.H.S. was the discontinuance of the relieving officer. It does not always follow that because an old person is sick he is in need of hospital treatment—far from it. If better use were made of home helps, by "grants in aid," the aged sick would be dealt with in a far kinder fashion in their own homes, and their relations would be only too pleased to co-operate, if in these hard times they were not asked to undertake responsibilities they could ill afford.

The present N.H.S. presupposes that the whole community is of average intelligence, and is able to make use of the vast benefits at its disposal, but this is not the case. There may be many, although affluent, who are in reality in need. Many of them have not the energy, the desire, or the "savvy" to implement their pensions, grants, etc., to their advantage. It was for such as these, "the poor in spirit" from whatever cause, that the kindly relieving officer proved such a blessing when he relieved them in their several necessities "in kind." Who has the time to do that now?

In my humble opinion there is as great a necessity for the relieving officer, and the workhouse, as ever, and with due respect I prophesy they will return, but probably under another name. Apart from the fact that in the hierarchy of the Health Service the almoner must be based on a hospital, what is the actual difference in function between her and the relieving officer, except that the latter was so much closer to those in need?—I am, etc.,

Ruthin.

18 Mon.	Armed Forces Committee, 2 p.m.
19 Tues.	Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, London, W.C.), 2 p.m.
20 Wed.	Committee on the Rehabilitation of Disabled Persons, 10.15 a.m.
20 Wed.	Joint Health Visitors Subcommittee, Central Consultants and Specialists, G.M.S., and Public Health Committees, 2.30 p.m.
20 Wed.	Transport Medical Standards Subcommittee, Occupational Health Committee, 2.30 p.m.
21 Thurs.	G.M.S. Committee, 10.30 a.m.
22 Fri.	Meeting of Chairman and Speakers, Plenary Session—"Food and Disease," 11.30 a.m.
22 Fri.	Complaints Procedure Subcommittee, Central Consultants and Specialists Committee, 2.30 p.m. (Date changed from January 14.)
25 Mon.	Staff Side, General Whitley Council (at 14, Russell Square, London, W.C.), 10.30 a.m.
25 Mon.	Pharmacopoeia Subcommittee, Science Committee, 2 p.m.
25 Mon.	Full General Whitley Council (at 14, Russell Square, London, W.C.), 2.30 p.m.
26 Tues.	Medical Students and Newly Qualified Practitioners Subcommittee, Organization Committee, 2 p.m.
27 Wed.	Planning Subcommittee, Occupational Health Committee, 10.30 a.m.
27 Wed.	Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
27 Wed.	Psychological Medicine Group Committee, 2 p.m.
28 Thurs.	Meeting of Chairman and Speakers, Plenary Session—"Problem of Sleep" (at 234, St. Vincent Street, Glasgow), 2.30 p.m.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Farnham Hospital, Wednesday, January 20, 8.30 p.m., clinical meeting.

BIRKENHEAD AND WIRRAL DIVISION.—At Arrow Park Hotel, Woodchurch, Saturday, January 23, 7.30 for 8 p.m., dinner; 9 p.m., Sir Heneage Ogilvie: "Practice—Yesterday, To-day, and To-morrow."

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, January 19, 8.30 p.m., meeting. Address by Mr. Oliver T. Mansfield.

BROMLEY DIVISION.—At Royal Bell Hotel, Bromley, Tuesday, January 19, 8 p.m., business meeting. 8.30 p.m., symposium: "The Care of Old People." Speakers include Dr. E. G. Pringle, Dr. A. Elliott, Dr. G. S. Stamp, Mr. Tom Brown, Mrs. Busbridge, and Dr. H. L. Glyn Hughes.

ENFIELD AND POTTERS BAR DIVISION.—At Firs Hall Ballroom, Green Lanes, N., Saturday, January 16, 7 for 7.30 p.m., annual dinner and dance. Members of North Middlesex Division are invited.

FINCHLEY DIVISION.—At Finchley Memorial Hospital, Bow Lane, N., Friday, January 22, 8.45 p.m., meeting. Mr. A. J. Wrigley: "Changes in Obstetrics in the Last 25 Years, and the Lessons to be Learned Therefrom."

HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Tuesday, January 19, 8.30 p.m., clinical meeting. Dr. H. J. V. Morton: "Some Recent Advances in Anaesthetics" (with demonstrations and effects).

MARYLEBONE DIVISION.—At Medical Society of London, Thursday, February 4, 8.30 p.m., meeting. B.M.A. Lecture by Mr. J. E. A. O'Connell: "Surgical Treatment of Disk Lesions." Members of the St. Pancras Division are invited.

MID-HERTS DIVISION.—At Red Lion Hotel, St. Albans, Friday, January 22, 8.45 p.m., meeting.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, January 19, 8.45 p.m., meeting. Dr. C. A. Birch: "Air Embolism and Other Medical Hazards." A short discussion will follow.

OLDHAM DIVISION.—At Oldham Hotel, Rhodes Bank, Oldham, Monday, January 18, 9 p.m., meeting. Lecture by Dr. P. B. Mumford.

PADDINGTON DIVISION.—At St. Mary's Hospital, W., Thursday, January 21, 9 p.m., Mr. A. Dickson Wright: "Hypertension." Film: "The Surgical Treatment of Hypertension."

ROCHDALE DIVISION.—At Turner Hall, Birch Hill Hospital, Rochdale, Sunday, January 17, 11 a.m., clinical meeting.

SOUTHAMPTON DIVISION.—At Conference Room, Civic Centre, Southampton, Wednesday, January 20, 8 p.m., ordinary meeting. Lecture by Dr. O. Parkes: "Some Experience in M.I.S." A social meeting will follow. Members are invited to bring their ladies.

British Medical Association PROCEEDINGS OF COUNCIL

A meeting of the Council of the British Medical Association was held at B.M.A. House on Wednesday, January 13, at 10 a.m., with Dr. E. A. GREGG in the chair. The Chairman at the outset referred to the extremely heavy agenda, comprising reports from 24 committees and some 30 other items, as well as the draft interim memorandum of evidence proposed to be given by the Association to the Guillebaud Committee. He asked chairmen of committees to assume that members of Council had read the documents and to content themselves with moving recommendations without speaking unnecessarily on matters reported under the heading of "action taken."

Preliminary Business

The Chairman was authorized to convey the congratulations of the Council to the 39 members of the Association whose names appeared in the New Year Honours List.

It was reported that arrangements had been made for the President of the Association, Mr. Tudor Thomas, with Mrs. Tudor Thomas, to visit the Far Eastern Branches—namely, Borneo, Ceylon, Hong Kong, Malaya, and the Middle East—during March and April. The Council expressed its good wishes to them on their journey.

Arrangements for the three plenary sessions, the scientific sections, and the scientific exhibition at the Annual Meeting in Glasgow were completed. Concerning the Joint Annual Meeting at Toronto in 1955, it was stated that the Bank of England had agreed to allow an amount of Canadian dollars for a small dinner party in Toronto in honour of Dr. T. C. Routley on the occasion of his installation as President.

The CHAIRMAN reported that he had authorized the Secretary to express to Dr. Sen, Secretary of the Indian Medical Association, the regret of the Council that it had not been possible to find any suitable representative to attend the annual meeting of his Association at Hyderabad. Dr. Sen was also asked to convey the cordial greetings and congratulations of the British Medical Association on the twenty-fifth anniversary of his organization.

The Council considered nominations to the Central Health Services Council and its standing advisory committees. Representatives of the Association were also appointed or reappointed on certain other outside bodies.

It was reported that, on the President's suggestion, the Cardiff Division Executive Committee had decided unanimously to accept responsibility for the cost of the Welsh

concert held during the Annual Meeting in Cardiff, and for the flowers for the Annual Dinner, and a cheque for £229 had been received from the honorary secretary of the Division. The Chairman said that this was yet a further example of the continuing kindness of their hosts at Cardiff.

A letter was read from the honorary secretary of the Medical War Relief Fund expressing warm thanks on behalf of the committee of the Fund for the sum of about £330 transferred to the fund by the Council, being the amount earmarked for charitable purposes by subscribers to the War Memorial Fund.

Certain recommendations received from the World Medical Association General Assembly, 1953, were considered. One of these was that each member national medical association should appoint a committee to study the proceedings of the First World Conference on Medical Education, held in London in August last. The W.M.A. Council was of opinion that those best qualified to study the Conference were those who had been most concerned in arranging its programme—namely, Sir Lionel Whitby, the President, and Dr. Hugh Clegg, the Secretary—and had appointed them as a committee with power to co-opt other members as might be needed. It was pointed out that the national medical associations could not be given any material until the proceedings of the Conference were published, probably at some time in the spring of 1954.

The CHAIRMAN reminded the Council that at its meeting in November, 1952, it had resolved that a comprehensive report on general practice should be prepared and submitted at a later date for approval by the Representative Body and by the Conference of Local Medical Committees. He said that he was anxious that this work should proceed as soon as possible, but he thought the matter might be postponed to the next meeting of the Council, when definite proposals would be brought forward.

Coat of Arms for the Association

A letter was read from Dr. S. F. L. Dahne, member of the Council, urging the adoption of a coat of arms, properly blazoned, to symbolize the origin, foundation, work, and ideals of the Association. He said that this would entitle the Association to fly its own banner or standard on all appropriate occasions, and the arms could properly be used on the Association's seal and on the covers of its publications and the like. Dr. Dahne suggested that should the

principle be accepted each member of the Council should subscribe 2 guineas, and the coat of arms would then be the gift of the Council to the Association to mark Coronation year. He moved that a committee be set up with instructions to work out the details in time for the next Council meeting.

It was agreed to leave the matter in the hands of the Office Committee, to which Dr. Dahne and any other member having special knowledge should be co-opted.

The Office Committee was also instructed to plan the arrangements for the autumn Council Dinner.

Salaries of Civil Service Medical Officers

The SECRETARY (Dr. Macrae) gave an account of the latest discussions which had taken place with the Treasury on the salaries of Civil Service medical officers. After a good deal of negotiation the Treasury had put forward certain proposals, and there was now a prospect of an interim settlement (pending publication of the report of the Royal Commission on the Civil Service) acceptable to the Civil Service Medical Officers Joint Committee.

The Council agreed that, subject to acceptance by the Treasury of the conditions of the proposed settlement, as approved by the Joint Committee, it would afford the normal facilities for advertisement in the *British Medical Journal* of Civil Service medical officer posts.

Dr. R. P. LISTON asked whether the medical officers in the Civil Service understood what the B.M.A. had done in this matter.

The CHAIRMAN: They understand it up to the hilt. The rock of salvation in this whole matter has been the B.M.A.

The Constitution Committee

At its previous meeting the Council began to set up a new Constitution Committee in accordance with the resolution of the Representative Body. The Council then appointed 12 of its own members, and deferred the appointment of a further 13 non-Council members, providing for regional representation. The following were now appointed as the 13 additional members: Mr. J. L. Gilks, Dr. J. T. Baldwin, Dr. M. G. Williams, Dr. H. J. Cronhelm, Dr. A. B. Davies, Dr. P. Lyle, Dr. F. Lishman, Dr. J. H. E. Moore, Mr. J. R. Nicholson-Lailey, Dr. D. F. Whitaker, Dr. D. C. Gullick, Dr. Jean Chappell, and Dr. R. Cove-Smith. The Council also appointed Dr. Dain, feeling that he had an outstanding claim to go on to this committee in view of his great experience of the work of the Association. His inclusion as an additional member brought the total membership to 26, but still did not give the Council more than a 50% share of the total. Actually 13 members of the committee are members of the Council, and 13 non-members.

Some demur was made by Dr. ROSE that only three of the Committee members were from the North of England, and by Dr. CHALKE at the lack of public health representation. As regards the latter point, it was explained that it was not the intention that sectional interests should be represented on the Constitution Committee. It was agreed also that the terms of reference of the Committee should be "To examine and report on the present structure and constitution of the Association, with special reference to the reorganization of the Representative Body."

Medical Standards for Drivers of Vehicles

Dr. J. A. L. VAUGHAN JONES introduced the report of the Occupational Health Committee, to which was appended a memorandum on medical standards for road, rail, and air transport. He drew attention to one particular suggestion in the memorandum, that in a case where a driving licence had been suspended the court before its restoration was approved should have power to require a medical certificate to the effect that the applicant was medically fit to drive and that such certificate should normally be required as a routine. He said that he was bound to bring this proposal to the notice of the Council; he felt that it was a serious step to take, but it represented the feeling of the majority of the members of his committee.

The Council approved the memorandum for submission to the Ministry of Transport.

Association Finance

Mr. A. M. A. MOORE (Treasurer) said that the financial position of the Association on December 31, 1953, showed a surplus available for debt redemption considerably in excess of the sum anticipated. He moved a recommendation that the whole of the surplus available should be used for debt redemption, which was agreed to.

Mr. Moore also presented draft revenue and capital budgets for 1954. For certain reasons, which he gave, arising out of an overall increase in the anticipated expenditure, the total surplus for 1954 was estimated conservatively at £45,309.

Mr. D. CALLANDER presented a report from the Building Committee. He also announced that there had been received that morning certain long-awaited consent with regard to the property at the rear of B.M.A. House. This would enable the Association to proceed with its plan of development.

For the Journal Committee, Dr. O. C. CARTER, the chairman, mentioned some considerations which the Committee had had in mind in forming the budget for 1954. More copies of the *Journal* would have to be printed each week, there had to be faced the possibility of a rise in the cost of paper and printing, and the advertising position was difficult to predict. The Committee considered that there was a case for providing more text pages in the *Journal*, but that a cautious start should be made during the first six months of the year and the situation reviewed at the end of June.

A recommendation to this effect was agreed to. Dr. Carter also presented the budgets for the *Abstracts* and for the special journals, which were also approved.

War Memorial

Dr. H. G. DAIN presented a report of the War Memorial Committee. He said that in order that there should be no doubt that the memorial was erected in memory of all British medical men and women who lost their lives in the recent war—not members of the Association only—the Committee was of the opinion that a suitably inscribed bronze tablet which would form an integral part of the memorial should be prepared and placed at the entrance to the memorial, bearing these words:

"In honour of the medical men and women of the British Commonwealth of Nations who gave their lives in the Second World War."

He added that the incorporation of this tablet within the memorial itself would have the advantage that it would form the focus for the unveiling ceremony.

A member suggested that the words "In memory of" should be substituted for "In honour of," but it was pointed out that on the war memorial itself the words were inscribed: "In Memoriam; 1939-1945." The inscription was agreed to, except that the phrase "British Empire and Commonwealth of Nations" was preferred.

Central Consultants and Specialists

Dr. T. ROWLAND HILL introduced the report of the Central Consultants and Specialists Committee, which covered the business already set out in the report of the meeting of that Committee in the *Supplement* (December 18, 1953, p. 232).

He moved on behalf of the Psychological Medicine Group and Deficiency be asked to give the Association an opportunity to submit evidence and that the preparation of the evidence be referred to the Group Committee with power to co-opt for the purpose representatives of other interested committees and, if necessary, additional members with special experience.

This recommendation was agreed. Dr. Rowland Hill also presented a draft memorandum on the procedure for dealing with legal actions involving hospital authorities and members of their medical staffs, and this was approved.

General Medical Services

Dr. TALBOT ROGERS presented the report of the General Medical Services Committee, which covered the two last meetings of that Committee, reported in the *Supplement* of December 5, 1953, p. 218, and of January 2, 1954, p. 1.

The report included a memorandum by a subcommittee which had inquired into the number of students entering medical schools, the number qualifying, and the number of newly qualified practitioners likely to be absorbed into the various branches of the medical profession during the next few years.

The Council accepted a recommendation to invite the Ministry of Health to co-operate in the establishment of a Working Party to examine on a long-term basis and with the widest possible terms of reference the future number of medical practitioners likely to be required in all branches of the profession and to relate the intake of students at the teaching schools to these needs.

On the question of general-practitioner representation on regional hospital boards the Committee reported that there was now at least one such practitioner on every board, but in several instances these practitioners were not the nominees of general practitioners in the area. It transpired that nominations had been rejected by the Ministry for geographical reasons and in order to preserve the balanced representation of different localities. The Committee recommended that to overcome this difficulty the Association, taking up the suggestion of the Ministry, should make more than one nomination for any particular vacancy, so that if the first was unacceptable for geographical reasons the second would be available.

The recommendation was agreed to.

Public Health

Dr. H. D. CHALKE, for the Public Health Committee, introduced the report of a joint subcommittee set up to consider a resolution of the last Annual Representative Meeting to the effect that ways should be considered whereby the help given by health visitors to general practitioners might be increased. This report took the form of a general statement on the position, followed by a number of suggestions whereby greater co-operation between general practitioners and health visitors could be achieved. It was agreed that this report should be sent out with a covering letter to all Branch and Divisional secretaries, secretaries of local medical committees, and medical officers of health; also that the document should first be submitted to the Council of the Society of Medical Officers of Health with a view to obtaining approval in order that when published it might represent the views of both bodies, and that the document be published at the appropriate time in the *Journal*.

Private Practice

Dr. IAN GRANT presented the report of the Private Practice Committee. He said that the methods whereby private practice might be encouraged had been considered. On the question of the issue of Form E.C.10 to private patients it was noted that this had been approved both by the Representative Body and by the Conference of Local Medical Committees. It was felt that representations should now be made to the Ministry of Health. The General Medical Services Committee had been informed accordingly and it had been suggested that, as this was a matter of special interest to private practitioners, two representatives of the Private Practice Committee should attend any discussions with the Ministry.

Dr. HALE-WHITE said that it was important that the representatives chosen should be people engaged almost entirely in private practice and in contact with patients, not merely concerned with life assurance work or something like that.

Radio and Television

Dr. R. FORBES, chairman of the Central Ethical Committee, brought forward a brief report on the policy of the Association regarding sound radio and television. The B.B.C.

for many years did not disclose the names of medical practitioners who broadcast, but recently this policy appeared to have been abandoned and practitioners who appeared in the programmes, both sound and vision, were frequently announced by name and their names and qualifications, and sometimes their photographs, were published in the *Radio Times*. It was agreed that the B.B.C. be invited to receive representatives of the Association to discuss sound and television programmes on medical matters involving the participation or personal appearance of practitioners, and that if the invitation was accepted the following be included in the deputation: Dr. E. A. Gregg, Dr. R. Forbes, Dr. S. Noy Scott, and Dr. Annis Gillie.

The Tynwald Commission

It was reported to the Council that the representations made by the Association and other professional organizations to the Tynwald Commission on salaries and emoluments in the Isle of Man had been successful. The Commission was convinced of the rightness of the principle whereby the remuneration of persons employed by the Government should be reduced to take account of the difference in income tax between the island and the mainland, but, as such a measure would be resented by important sections of the community and would possibly involve a serious administrative deadlock, it did not appear to the Commission that the amount likely to be saved was sufficient to outweigh the disadvantages of the suggested method of saving. The Commission recommended, however, that all boards, etc., in dealing with questions of salaries and emoluments, should bear in mind the difference between the Manx and English conditions and endeavour by negotiation and agreement to arrive at scales which would recognize these differences.

The CHAIRMAN said that a great debt of gratitude was due from practitioners in the Isle of Man to the Association's Secretary, Dr. Macrae, for the fine work he had done in this connexion. He paid a high tribute to him for the promptness and persistence with which he had dealt with this matter. They were also grateful to Dr. Talbot Rogers, who, at the shortest notice, had accompanied Dr. Macrae and supported the Association case.

Compensation and Superannuation

Dr. WAND, for the Compensation and Superannuation Committee, reported that representatives of the Committee had met the Ministry of Health to discuss certain points which had been the subject of various resolutions of the Representative Body. The Ministry had stated that any general compensation could be obtained only on retirement or in the case of hardship arising out of the purchase of a practice before the Appointed Day, but it recognized that there would be individual cases of hardship where an elderly doctor or one whose health was failing found it necessary to take a partner in order to prevent the complete disintegration of his practice, and the Ministry would look sympathetically at cases of that nature. The Committee felt that this new principle should be established in full, and was pressing at once for its extension to include advance payment of compensation where an elderly doctor continued to work because he was unable to retire on economic grounds.

The Council sent a message of sympathy and best wishes to Dr. A. N. Mathias, Chairman of the Compensation and Superannuation Committee, in his illness.

World Medical Association

The Council authorized the payment of the 1954 subscription to the World Medical Association at the new rate, and also appointed two delegates and two alternates to attend the General Assembly in Rome in October, 1954.

A letter with some well-known signatories was read proposing a "United Kingdom Committee for the World Health Organization of the United Nations." This would be a specialized body to study closely the work and plans of W.H.O., organizing meetings and giving assistance to

the Organization in a number of ways which were set out. The CHAIRMAN OF COUNCIL said that he thought inquiries should be made of the sponsors of the new organization as to any ways in which the B.M.A. could be of service, but, of course, the interests of the B.M.A. in W.H.O. were in charge of the World Medical Association.

Guillebaud Committee Evidence

The Council spent three hours on the discussion of the draft interim memorandum of evidence, prepared on the basis of memoranda received from the standing committees concerned, for submission to the Guillebaud Committee. The memorandum covered questions concerning the general administration of the National Health Service, the hospital services, the local authority services, and the general medical services. It extended to 133 paragraphs, which were considered one by one by the Council.

On the section relating to ophthalmic services Mr. O. GAYER MORGAN, chairman of the Ophthalmic Group Committee, attended the Council by invitation to clarify certain points.

Warm thanks were expressed to Dr. Stevenson, the Deputy Secretary, for his work on the memorandum.

Various emendations, mostly of an unimportant character, were made in the evidence, which was finally approved for submission to the Guillebaud Committee.

Society of Medical Officers of Health Evidence

It was reported that the Society of Medical Officers of Health had not yet completed the preparation of its evidence for the Guillebaud Committee. Three of its members—Dr. C. Metcalfe Brown, Dr. H. K. Cowan, and Sir Allen Daley—had been appointed to confer with the Association on the subject. Their observations on certain paragraphs were considered by the Council.

Dr. FRANK GRAY said that he hoped that in the presentation of the evidence there would be the closest co-operation between the Association and the Society of Medical Officers of Health. He presumed that the revised draft would be placed before the Council of the Society and also that the Society's evidence when ready would be submitted to the Association. The fullest consideration should be given on each side to the evidence tendered by the other.

Dr. CHALKE, on behalf of the Council of the Society, said that he entirely associated himself with Dr. Gray's remarks.

On the question of witnesses to give oral evidence before the Guillebaud Committee, Dr. HUTCHINSON suggested that, as the Steering Committee had done so much already in the preparation of the evidence, it should be asked to choose the witnesses, and this was agreed to.

Other Business

Dr. D. F. HUTCHINSON, for the Waverley Evidence Committee, reported that it had prepared a basis for its deliberations and had invited the Armed Forces and the Overseas Committees to submit memoranda.

Dr. H. H. D. SUTHERLAND, for the Amending Acts Committee, reported that it was considering, as instructed by the Council, a draft scheme for the restoration of the right to buy and sell goodwill, and hoped to submit final proposals to the March meeting of Council.

An application for legal assistance was brought forward by the Legal Actions Committee on behalf of a doctor who was contesting an appeal made by H.M. Inspector of Taxes against the decision of the Commissioners of Inland Revenue with regard to certain allowances. It was agreed to authorize financial assistance not exceeding £200.

The Joint Committee of the B.M.A. and the Magistrates Association reported that it was continuing its task of preparing a memorandum on the subject of cruelty to and neglect of children.

Dr. F. GRAY again brought forward his motion to instruct the Finance Committee to consider and report what remuneration should be paid to the officers of the Association for their services. The Council agreed to the instruction being given.

Dr. J. G. M. HAMILTON presented the report of the Scottish Committee. In view of the very successful visit of a party of Scottish doctors to Denmark in September, 1953, the Committee had asked that the prospects of arranging a similar tour of Scotland for Danish doctors in the summer of 1954 be investigated.

An invitation from the Royal College of Nursing to meet members of other interested bodies at a conference on the legal position of the nurse undertaking procedures outside her professional scope was accepted, and the Chairmen of the General Medical Services, Central Consultants and Specialists, and Public Health Committees, or their nominees, were asked to attend.

An invitation had been received to a celebration in Frankfurt on the occasion of the 100th anniversary of the birth of Paul Ehrlich and Emil von Behring, founders of chemotherapy and immunotherapy, on March 14 and 15. It was agreed that the Editor of the *British Medical Journal* should represent the Association.

A congratulatory letter had been sent by the Chairman of Council to Professor Raffaele Bastianelli, of Rome, a Foreign Corresponding Member of the Association, on his forthcoming 90th birthday, and a very charming letter was read from him in reply.

The Public Relations Committee reported that it had considered the resolution from the Annual Representative Meeting deploring the publication in the popular press of extracts from medical articles and of articles of an irresponsible character praising new drugs without illustrating any potential dangers. The Committee was fully in sympathy with the resolution but considered that no action could be taken in the matter.

Owing to the manner in which chairmen of committees and members of Council generally had acted on the Chairman's instruction given at the beginning of the meeting, the heavy programme of business was completed at 5.45 p.m., a much earlier hour than had been expected.

G.P. OBSTETRIC BEDS IN BLACKBURN

H.M.C. CLOSES MATERNITY HOME

The Springfield Maternity Home, Blackburn, a home with 20 G.P. obstetric beds, was closed on the instruction of the hospital management committee on January 8. The patients were transferred to the Bull Hill Maternity Home, Darwen. It is understood that the doctors concerned were not notified of the date of closure and that the patients themselves had barely 24 hours' warning.

Lack of Consultation

As already reported in the *Supplement* (December 19, 1953, p. 234), the hospital management committee's decision to close Springfield on the grounds of redundancy, and without first obtaining the view of those most affected, aroused the resentment of the local G.P.s and the people of Blackburn. The local executive council passed a resolution of protest because it had not been consulted and asked that no further action be taken in the matter until there had been an opportunity for discussion. It was said that the closing of the beds would seriously affect the general practitioners' facilities to practise obstetrics and that the alternative accommodation was inconvenient because of distance.

Letter to the Minister

The Lancashire Local Medical Committee has now sent a letter of protest to the Minister of Health. It calls attention, among other things, to the manner in which lay officials of the hospital management committee finally ordered the evacuation of the patients without first informing the doctors in charge of them and without, it is understood, any medical examination. The letter requests the Minister to institute a public inquiry into the whole matter.

ADVANCE PAYMENTS BY EXECUTIVE COUNCIL

SPECIAL PROVISION

On one or two occasions recently the General Medical Services Committee has learnt of difficulties experienced by general practitioners in securing advance payments on account of the usual quarterly cheque from the executive council. Special provision is made in the model distribution scheme for a general practitioner to apply for payment on account, and executive councils are required to make such a payment if the practitioner satisfies the council that it would involve him in difficulties if he had to wait until the end of the quarter.

Ministry's Letter

The G.M.S. Committee has made representations to the Ministry of Health that no undue burden of proof should be placed upon the doctor when he is making an application of this nature, and as a result of the Committee's intervention the Ministry has written the following letter to the Honorary Secretary of the Society of Clerks of Executive Councils:

"Paragraph 19 of the Model Distribution Scheme does, as you know, make provision for a medical practitioner to apply for payment on account, to be made in advance of the payment due at the end of a quarter. The paragraph says that an executive council should make such payment if the practitioner 'can satisfy the council that it would involve difficulty or hardship to wait until the end of the quarter.'

"The representatives of the profession have stated that in their experience councils are applying divergent criteria in deciding what satisfied them that it will create hardship for a practitioner to wait until the end of the quarter, and they have urged that to executive councils should normally exercise their discretion to make an advance payment where a doctor has asked for such payment because of financial difficulty. We appreciate that any undue extension of these arrangements might involve executive councils in more additional work than they could at present undertake. We would like to suggest, however, that where possible councils should normally comply with such requests without insisting upon a detailed proof of the nature of the difficulty or hardship."

This letter has been published in *The Executive Council*—the society's journal—and the G.M.S. Committee hopes that as a result no further difficulties will arise.

PRESIDENT SUBMITS HEALTH MESSAGE TO U.S. CONGRESS

On January 18 President Eisenhower submitted to Congress a special message containing recommendations "to improve the health of the American people." One of the message's main features is the proposal to strengthen private hospitalization and health insurance by establishing a "limited Federal reinsurance service."

The Message

After reviewing what he called the "rapid progress toward better health" of the American people, the message said that much remains to be done. Medical knowledge and skill were not always available to old people where and when needed. Two of the key problems are the distribution of medical facilities and the costs of medical care. Further action must be taken on these problems, but freedom, consent, and individual responsibility were fundamental to the American system. In adhering to the principles of the doctor-patient relationship and the freedom of the patient to choose freely the manner of his care in illness, and rejecting the socialization of medicine, the President said that certain national health goals could still be attained.

The Proposals

The message proposes a voluntary health insurance plan. The Government should work with private non-profit health

insurance organizations and study and devise better insurance protection. A limited Federal reinsurance service to offer broader health protection to more families is recommended. A capital Government fund of \$25,000,000 for this purpose is proposed.

Grant-in-aid Approach

Federal support to a simplified formula of all the various and complex existing grant-in-aid schemes is recommended. The States should be aided in inverse proportion to their financial capacity.

Referring to the 2,000,000 disabled persons who could be rehabilitated, the message says that there should be Federal grants to the States to train medical personnel and foster research in this subject.

Hospital Needs

It is estimated that there is need for 500,000 hospital beds in addition to the present 1,060,000. It is recommended that Federal funds should be given to develop the hospital service, particularly for the chronic sick and the aged. Four proposals for expansion are put forward: (1) Added assistance in the construction of non-profit hospitals for the care of the chronically ill. These would be of a type more economical to build and operate than general hospitals. (2) Assistance in the construction of non-profit medically supervised nursing and convalescent homes. (3) Assistance in the construction of non-profit rehabilitation facilities for the disabled. (4) Assistance in the construction of non-profit diagnostic or treatment centres for ambulatory patients.

It is reported that on the whole the recommendations have been received favourably by Congress. The Speaker of the House of Representatives said the House would give them "sympathetic consideration."

ANNUAL MEETING, GLASGOW, 1954

SLEEPER ACCOMMODATION

The attention of members is drawn to the fact that sleeping accommodation on trains both to and from Glasgow is limited and in July is generally booked up many weeks ahead. Those wishing to travel by sleeper to or from the Annual Meeting are advised to make their arrangements at the earliest possible moment. It is understood that some trains are already booked up.

ALL-DAY EXCURSION DOWN THE CLYDE

An all-day excursion has been arranged for Sunday, July 4. One of the large Clyde steamers has been booked for the occasion and will start from the Glasgow Docks (Broomielaw) on Sunday morning and proceed down the river estuary as far as Rothesay and the Kyles of Bute, thus giving members an opportunity of enjoying some of the most beautiful scenery in the West of Scotland, as well as seeing many famous Clyde shipyards. The steamer will accommodate without crowding 400 or 500 people and there will be adequate catering arrangements. The return journey from Wemyss Bay or Greenock to Glasgow will be by train.

Particulars as to booking will be published later, but members wishing to avail themselves of this opportunity should make their arrangements so as to be in Glasgow early on Sunday morning, July 4.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE DINNER

It has now been found possible to include wines in the price of the ticket for the Central Consultants and Specialists Committee Dinner, which will be held at B.M.A. House on February 3, and at which the chief guest will be the Minister of Health. Consultants may apply to the secretary for tickets for themselves and medical colleagues. Price £2 10s. inclusive of cocktails and wines.

Correspondence

Remuneration of Hospital Medical Staff

SIR,—May I congratulate Dr. E. Snell on his forthright letter on the subject of remuneration of hospital medical staff (*Supplement*, December 19, 1953, p. 237)? It is a wonder your columns do not contain more such letters.

Clearly the Government has not kept the bargain made when the Spens Report was accepted, and now appears unwilling to face and act upon this unpleasant fact. One wonders why our representatives have been so slow to force a decision and obtain for us a settlement to match the Danckwerts award. Surely it is not for lack of a strong case. Let us hope that the matter will be resolutely dealt with in 1954.—I am, etc.,

Surbiton, Surrey.

J. R. DICKSON.

SIR,—The subject of hospital staff remuneration for some months did not appear in the columns of the *Supplement*. One assumed that this silence was maintained by tacit agreement to avoid embarrassing delicate negotiations of Whitley Committee "B." It is apparent that there was no foundation for hope that a satisfactory outcome might be imminent. Resumption of relevant correspondence by Dr. E. Snell (*Supplement*, December 19, 1953, p. 237), Dr. Bernard Sugden (*Supplement*, January 2, p. 7), and Dr. C. C. Cookson (*Supplement*, January 9, p. 11) is timely, lest it be thought that interest is waning. It is useless to speculate upon reasons for the absence of any profitable outcome to deliberations of Whitley Committee "B." This committee stands as a failure, and its minutes as a monument to bureaucratic ineptitude. Let it redeem itself, and this can only be if the watchword of the Staff Side, and of consultants and specialists, be "Spens now, or immediate arbitration."—I am, etc.,

Worcester.

ANTHONY A. VICKERS.

SIR,—May I draw the attention of members of the profession to the quandary facing many young doctors at the end of their national service? They feel that before entering practice a further period of postgraduate hospital experience is desirable—e.g., in obstetrics, paediatrics, or otolaryngology. A married man is, however, faced with a fall in his income from approximately £900 per annum (Service pay and marriage allowance and ration allowance) to £450 per annum, a salary that many of us were earning before joining the Services. From this, £100 is deducted for our keep, whilst we have to provide separate accommodation for wife and family. One is accordingly compelled to fall back on one's savings.

Surely, after six years' study and three and a half years' postgraduate work, a man doing house appointments should be paid at the rate of a senior house officer? This is, in fact, the custom in certain more highly specialized posts.—I am, etc.,

N.S.M.O.

Rural and Urban Mileage Payments

SIR,—As rural practitioners do not receive mileage for patients who reside within two miles of their surgeries or their partners' surgeries, or for patients living in urban areas, what honest argument is there for paying mileage to urban doctors whose patients live within two miles of a rural doctor's surgery?

When patients move from an urban area to a rural one the urban practitioner, owing to mileage payments, is prepared to retain them on his list. The rural practitioner does not have the same economic inducement when his patients move into an urban area. What is the reason for this apparently unfair and peculiar arrangement?—I am, etc.,

Harold, Beds.

R. STUART.

 - 30 Sat. Hypnotism Subcommittee, Psychological Medicine Group Committee, 10 a.m.

Branch and Division Meetings to be Held

CHELSEA AND FULHAM DIVISION.—At St. Stephen's Hospital, 369, Fulham Road, Chelsea, S.W., Friday, January 29, 8.30 p.m., general meeting. Lecture by Dr. F. Dudley Hart: "Some Therapeutic Advances." Members of Kensington and Hammer-smith Division are invited.

CITY DIVISION.—(1) At Hackney Hospital, Homerton High Street, E., Wednesday, January 27, 2 p.m.; films: (a) "Senile Obliterative Arteritis of the Legs"; (b) "Movements of the Tongue in Speech." (2) At Institute of Laryngology and Otolaryngology, Gray's Inn Road, W.C., Friday, January 29, 3.30 p.m., clinical meeting. Mr. A. R. Dingley: "Hoarseness: Differential Diagnosis and Treatment."

COVENTRY DIVISION.—At Gymnasium, Coventry and Warwickshire Hospital, Tuesday, January 26, 8.30 p.m., ordinary general meeting. Dr. S. J. Hadfield (Assistant Secretary, B.M.A.): "The Hadfield Report—A Field Survey of General Practice, 1951-2." A discussion and questions will follow.

DUDLEY DIVISION.—At Guest Hospital, Dudley, Tuesday, January 26, 8.15 p.m., clinical meeting. Mr. L. H. G. Moore: "Fundus Conditions" (illustrated by slides).

GRIMSBY DIVISION.—At Scartho Road Infirmary, Grimsby, Thursday, January 28, 8.30 p.m., meeting. Professor A. M. Boyd: "Management of Obliterative Arterial Diseases of the Lower Extremities." All medical practitioners in the area of the Division are invited.

HYDE DIVISION.—At "Pack Horse Inn," Mottram, Wednesday, January 27, 8.45 p.m., meeting. Mr. C. E. B. Richards: "Multiple Pregnancy." Members of the Glossop Division are invited.

KINGSTON-ON-THAMES DIVISION.—At Kingston Hospital, Wolverton Avenue, Kingston-on-Thames, Tuesday, January 26, 8 for 8.30 p.m., Mr. J. V. O'Sullivan: "Some Problems in Obstetrics and Gynaecology Common in General Practice."

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Macclesfield Arms Hotel, Macclesfield, Thursday, January 28, 8.30 p.m., meeting. Dr. R. Forbes (Medical Defence Union): "Recent Developments in Medical Litigation."

MID-ESSEX DIVISION.—At Out-patients Department, Chelmsford and Essex Hospital, London Road, Chelmsford, Wednesday, January 27, 8.15 p.m., meeting. Sir Heneage Ogilvie: "The Pit-discussion will follow."

SOUTH BEDFORDSHIRE DIVISION.—At Warden Tavern, Wednesday, January 27, 8.30 p.m., annual general meeting.

SOUTH STAFFS DIVISION.—At Bell Library, Royal Hospital, Wolverhampton, Tuesday, January 26, 8.30 p.m., meeting.

STRATFORD DIVISION.—At Minor Hall, East Ham Town Hall, E., Friday, January 22, 9 p.m., meeting at invitation of East Ham Local Medical Committee. Dr. Robert Forgan: "The Experimentally Minded General Practitioner."

SWANSEA DIVISION.—At Swansea Hospital, Thursday, January 28, clinical meeting.

WANDSWORTH DIVISION.—At Putney Hospital, Lower Common, S.W., Thursday, January 28, 8.30 p.m., clinical meeting.

WEMBLEY DIVISION.—At Lecture Theatre, Wembley Hospital (near the Pathological Laboratory), Tuesday, January 26, 9 p.m., meeting. Discussion: "Current Anaesthetic Methods, with Special Reference to Hibernation Technique." Speakers, Dr. J. Kennedy Harper and Mr. J. S. Callcutt. All medical practitioners in the area of the Division are invited.

WOOLWICH DIVISION.—At Eltham and Mottingham Hospital, London, S.E., Tuesday, January 26, 8.15 p.m., meeting. Sherry Party, followed by demonstration of clinical cases, and film: "Senile Obliterative Arteritis of the Legs." Members of Greenwich and Deptford Division are invited.

THE BROTHERHOOD OF MEDICINE*

BY

ANGUS MACRAE, M.A., M.D.
Secretary of the British Medical Association

Referring to the relations between members of the Bar in a speech delivered many years ago, the late Lord Macmillan said: "I am convinced that there is no profession which binds its members in a closer fraternity. It is not for nothing that in the law we call each other brethren. . . . If I were to seek for the explanation of the bond which binds in brotherhood the servants of the law throughout the world, I venture to think that I should find it in our common devotion to a great ideal, the promotion of the orderly progress of civilization."

We, too, in medicine ought surely to be united in the pursuit of a common ideal; and, happily, there is much good feeling among us. When I hear old doctors with long memories talking about the conditions of certain forms of practice 50 or 60 years ago, I feel that we have advanced far towards fraternal harmony. Certainly great progress in this direction has been made since the first half of the nineteenth century, when our Association was founded. Yet one has only to glance at the correspondence columns of the medical press to-day—and, unfortunately, of the public press as well—to realize that complete professional brotherhood is still an unattained ideal.

Ethical Disputes

What, then, are some of the causes of friction and unhappiness in our professional relations at the present time, and what can we do—what are we doing—as an Association and as individuals, to remove them?

In the first place, there are the occasional disputes that occur between one doctor and another because of difficulties of personality—the hasty temper, for example, that causes a man to bring angry accusations against a colleague merely because of an uncorroborated and possibly inaccurate account given by a patient of the colleague's words or actions. Human nature being what it is, such difficulties are perhaps to be expected, though our Association can and does help to prevent them by providing oppor-

*An abridged version of a talk to the Ayrshire Division of the British Medical Association on January 10.

tunities in the Divisions for neighbouring doctors to cultivate friendly relations and acquire mutual understanding. And when a serious breach has occurred, we can sometimes help to close it through our procedure for investigating complaints of unprofessional conduct. This procedure should not be thought of solely as a means of bringing the guilty to trial and conviction. It is intended to serve also as a ministry of reconciliation, and I am glad to say that I can recall occasions on which, as a result of an impartial adjudication by the Ethical Committee, an atmosphere of bitterness and distrust has been dispelled and harmony restored.

The Bitter Memory

It is inevitable that there should be divisions among us from time to time because of differences of opinion on matters of policy in the medico-political field. As has been shown twice in this century, it is not easy to maintain cohesion in our ranks when we are confronted with new and revolutionary projects for the organization of medical services by the State. Yet I wonder if it is necessary that such differences should result in continuing bitterness and rancour. When I joined the staff of the Association in the year 1935, one of the things that surprised me was to find that there were doctors who rejected all appeals to rejoin our membership because they could not forget the year 1911. They had withdrawn permanently from our company solely because they believed that, at one particular point in time, we had taken a wrong turning. Fortunately, there are many to-day who, although they took a similar view of the events of 1948, have nevertheless remained with us and are helping us in our efforts to remedy the faults that have been disclosed in our National Health Service.

I can understand bitter feelings among those who sincerely believe that measures promoted or accepted by the profession are not merely unwise but are also unjust to them as individuals by denying them a fair financial reward for their labours. An example which comes readily to mind is the revolt of the "small-list" general practitioners against what they consider to be the injustice of the new distribution scheme associated with the Danckwerts award. My theme being brotherhood, I have no wish to introduce controversy here and now. Let me just say that when a discontented minority, however loud in complaint, has little voice in decision, it behoves those responsible for the decision, particularly if they themselves should be interested parties, to be specially heedful of the claims of brotherhood

in their approach to the problem. I believe that, whatever the outcome in the case to which I have alluded, that spirit will not be absent from the forthcoming discussions.

The Rules for Consultation

It very often happens that two or more doctors engaged in different forms of practice are concerned with one and the same patient, and in this circumstance is perhaps to be found the main source of strife, not merely between individuals but also between whole sections of the profession. On many occasions our Association has found it necessary to regulate the professional relationships in such cases in order to minimize the dangers of friction.

For example, 20 years ago there was some dissatisfaction among general practitioners about their patients being seen by other doctors in private practice, including consultants, without their consent or knowledge. The Central Ethical Committee drew up a series of rules concerning the intra-professional obligations in these circumstances. The rules were designed to protect the freedom of the patient to seek medical advice from any source which he considered suitable; and to protect also the right of every registered medical practitioner in private practice, whether general or special practice, to see any patient who sought his professional assistance, subject to the observance of certain generally recognized courtesies.

Consultant and G.P.

At the present time frequent complaints are made by the general practitioner about delay in obtaining out-patient appointments at the hospital, delay on the part of the consultant in reporting on out-patients, and delay—particularly embarrassing to the patient's doctor—in notifying the discharge or the death of in-patients. When bad feeling is aroused in connexion with these matters it may sometimes be due to a too hasty assumption by the general practitioner that his consultant colleague is neglectful and is not attempting to pull his full weight in the professional team.

When general practitioners and consultants come together for friendly discussion of such problems, as they do in a liaison committee which we have established at the Association's headquarters in London, it becomes clear that the difficulties are by no means all on the one side. The truth appears to be that the hospital facilities at present, including the supply of junior medical staff and of clerical staff, are unequal to the heavy demands that are being made upon them. However, it has been agreed in the liaison committee that no difficulty should be allowed to stand in the way of immediate notification of the death or discharge of a patient, even if the general practitioner may have to be kept waiting for a full report; and it is proposed to emphasize the importance of this in a letter to be addressed to hospital medical committees.

More detrimental in its effect on professional relations, if all reports on the subject be true, is the growing gulf between the general practitioner and the consultant resulting from the diminished opportunities for the general practitioner in hospital work on the one hand, and on the other from the rigid training scheme which makes it virtually impossible for the would-be consultant to gain experience of general practice without endangering his prospects of promotion in the hospital hierarchy. It is said by some that, as one unhappy consequence of the separation of the two professional groups, there is a tendency among consultants to adopt an arrogant attitude towards their general-practitioner colleagues and to regard them as belonging to a vastly inferior order of being.

I am told, however, that in some areas the recent shortage of hospital medical staff has resulted in those general practitioners who were ousted from the hospitals at the beginning of the National Health Service being reinstated as members of the hospital medical teams. This is good news. A large extension of part-time hospital appointments for general practitioners is now generally regarded as necessary from the point of view of the needs of the hospitals for

"pairs of hands." It will not only be good for the hospitals, it will be good also for general practice. And, incidentally, it should help to promote good fellowship between general practitioners and consultants. Meantime we may rejoice in the fact that there are very many members of these two sections of the profession who regard one another with mutual respect and friendliness and whose relations are so pleasant that thoughts of relative status never enter their heads.

Local Authority Clinics

Although our Association was active in promoting, in the public interest, the development of the local authority clinical services, there is a long history of suspicion among general practitioners about the activities of the public health medical officers. Twenty-five years ago there were complaints about encroachment on private practice by the local authority clinics, and Dr. Alfred Cox, then Medical Secretary of the Association, was sent out to make a field investigation of the position. The following words are taken from his illuminating and frank report:

"I suggest that active Divisions cannot do better work than by organizing, in collaboration with the medical officer of health, visits of their members, a few at a time, to the local clinics. There I think they would find that some of their ideas about encroachments on their field of work are wrong or exaggerated. They would find that the work done is highly necessary and that most of it is work that has never come their way; and, noting the character of the people who attend, they would, I think, agree that the vast majority are not people who would have sought (or indeed could afford to seek) the services of any doctor privately; that if the work was not being done at the centres (whether by whole- or part-time practitioners) it would mostly not be done at all, or done at the hospitals. . . . I submit that we would be doing a great service to the profession if we educated them to claim and to take their part in the present scheme, instead of bemoaning the encroachments on private practice."

Better Relationships

Since that time difficulties have continued to arise between the general practitioners and the public health medical officers. Three years ago our Association, in conjunction with the Society of Medical Officers of Health, found it necessary to offer guidance in the form of rules of procedure to be observed when a medical officer of a local authority contemplates that the condition of a schoolchild needs special investigation or treatment. The rules require the medical officer to approach the general practitioner, so that he, if he so wishes, may arrange the consultation; and they require the medical officer to send to the general practitioner a copy of any report on the child received by him when he, with the concurrence of the general practitioner, has made the arrangements. This procedure has been put into force in many areas and is reported to be working smoothly and to have led to an improvement in personal relations.

At the Annual Representative Meeting in Cardiff last July there were complaints, by no means the first of their kind, about some of the activities of health visitors. Once again our Association has assumed the role of mediator and has produced a memorandum of proposals—to be sent shortly to the Divisions—designed to promote closer co-operation between the general practitioner and the health visitor in the interests of the patient.

In the report of his Field Survey of General Practice, published in the *Journal* last September, my colleague Dr. Stephen Hadfield writes as follows: "During my investigation I found almost no evidence to suggest an enlightened attempt, either by the public health medical officers or by the general practitioners, to co-ordinate the public health service and the general-practitioner service." Compare these words with those used by Dr. Alfred Cox in his report a quarter of a century ago: "Not half enough trouble has been taken in most areas either by the general practitioners

¹British Medical Journal, 1953, 2, 683.

or by the medical officer of health to prove to each other that they are men and brothers, and each interested in the other man's side of the question." Truly in this field the advance towards brotherhood, if steady, is painfully gradual.

Towards a Better Organization

There is an important question which I cannot attempt to discuss in detail this evening—the question whether the constitution of our Association is the one best suited to our present circumstances and most conducive to unity in our ranks. We have an elaborate system of cross-representation of committees, and it is usual for one committee to invite the views of another before deciding on proposals of mutual interest. Such proposals are then subjected to the test of a wider professional opinion in the Council, and later—if they are concerned with major matters of policy—in the Representative Body. The Representative Body has been admired as a thoroughly democratic assembly, composed as it is in the main of persons elected by their local colleagues in the Divisions, the membership of which embraces all sections of the profession. In the past it has been our proud claim that the voice of the Representative Body was the authentic voice of the medical profession of this country.

It may be doubted—indeed, it has been doubted—whether this claim is fully justified at the present time. For the Representative Body is predominantly composed of general practitioners, and is liable to adopt resolutions relating to practitioners, and is liable to adopt resolutions relating to the hospital services which the Council is unable to carry into effect because they are not acceptable to those in the Association and in the Colleges who negotiate such matters with the Ministry of Health and the Department of Health for Scotland. This is a state of affairs which not only detracts from the authority of the Representative Body but also tends to cause dissension between sections of our membership. A special committee is now about to begin a review of the Association's constitution, with special reference to the question of reorganization of the Representative Body. Much hard thinking and wise judgment will be necessary in the fashioning of a new instrument which may better serve the purposes of our Association as an organization representative of the entire medical profession.

It may be that the time has come to reconsider not only our domestic machinery for the formulation of policy but also the methods of negotiating terms and conditions of service with the authorities concerned. From time to time, as I witness a brilliant exhibition of the arts of evasion, of negation, and procrastination by the Management Side of a Whitley Council Committee I feel that we may find ourselves forced to conclude that a procedure designed for the settlement of claims by friendly discussion has proved a miserable failure.

If, in matters affecting the Treasury, we can achieve acceptance of reasonable claims only by a *sais fecht*, I wonder whether we are wise in conducting separate actions by isolated bands of warriors. May not the very success of the Danckwerts battle make the struggle harder on other sectors of the front? Is it too much to hope that our approach to brotherhood is such as to enable us to devise a means of joining our forces in a single concerted attack when the occasion calls for a combined operation?

The Ideal of Brotherhood

Much as I admire the comradeship of the Bar, I believe that the nature of medical practice, and the conditions in which it is carried on in this country to-day, are such as to make the consistent exercise of brotherly love much more difficult for us than it is for our friends of the law. Nevertheless, the ideal of brotherhood is one that we must always pursue, and I have no doubt that our Association will continue to play a prominent part in promoting what was one of the objects of our pious founder—the object, as Charles Hastings expressed it, of "establishing the harmony and good feeling which ought ever to characterize a liberal profession."

But the thought that I should like to leave with you, in conclusion, is this. The efforts of our Association to improve intraprofessional relations cannot be fully effective unless there is good will on the part of the individual doctor. If good will is absent, rules and regulations and memoranda of guidance drawn up by our committees can avail little; and if more good will were present, many of the deliberations on these matters in the committees would be unnecessary. I cannot express the matter better than in words written by the late Dr. C. O. Hawthorne, who was one of the giants of our Association 20 years ago: "In the relations of the practitioner to his fellows, while certain established customs and even rules are written and must be written, the principal influence to be cultivated is that of good fellowship. Most men know what is meant by 'cricket' and the spirit of the game. Difficulties and differences will arise, but most of them can be successfully met by mutual good will and recognition of the other fellow's point of view."

Five years ago, the World Medical Association, founded on the initiative of our own Association with the object of promoting a larger brotherhood of medicine among the doctors of the world, gave its approval at a meeting in Geneva to a document known as the Declaration of Geneva. This is a revised and modernized version of the ancient Hippocratic Oath. It was hoped that it might be adopted widely for use at medical graduation ceremonies. The declaration includes these words: "I will maintain by all the means in my power the honour and the noble traditions of the medical profession; my colleagues will be my brothers."

I hope that it may not be out of place if, on a Sunday night in this country of Robert Burns, I suggest that it would be well if all of us at the beginning of a new year were to search our consciences and ask ourselves how far, both in our personal dealings with other members of our profession and in our contributions in councils and committees to discussions of professional affairs—how far we are faithful to the ideal embodied in these words, "my colleagues will be my brothers."

ENCOURAGEMENT OF GROUP PRACTICES IMPLEMENTATION OF WORKING PARTY'S REPORT

The Ministry of Health has sent a letter (E.C.L.3/54) to all executive councils setting out the arrangements that have been made to implement the recommendation in paragraph 29 of the Report of the Working Party on the Distribution of Remuneration among General Practitioners (*Supplement*, June 7, 1952, p. 283) that an annual sum, provisionally fixed at £100,000, should be set aside for the purpose of stimulating the formation of group practices.

Definition of Group Practice

A group practice is defined as follows: "Group practice applied to general medical practice means that the medical practice is carried on by several general practitioners working together in close association, consulting one another about their patients, and doing their 'surgery work' in whole or in part in a common building controlled by the doctors. All members of a 'group' should work in the common surgery premises even if on occasions they also work at separate branch surgeries. A group practice should employ ancillary help to the extent of one or more persons who can provide services of the secretarial, nursing, receptionist, or almoner type. Normally, a group should consist of three, four, five, or six principals. Larger numbers tend to diminish the value of group association. The group may or may not be a partnership, but, if not, there must be a proper understanding between the members of a group on the sharing of the earnings of the group and particularly as to the sharing of expenses. Patients must continue to be

the responsibility of the doctor of their choice in the group. The group should provide a 24-hours service to patients and also proper off-duty and holiday relief for its members."

The Ministry Committee on General Practice which drew up this definition recognized that in some rural areas the potential number of patients could not support more than two practitioners and did not consider that such a case should be ruled out. The Minister has also accepted this view.

Outline of Proposals

The Ministry has decided, in consultation with the G.M.S. Committee, that assistance should take the form of interest-free loans which will normally be recoverable by quarterly deductions from the remuneration payable by executive councils to individual members of the group. The sum to be set aside annually for the purpose, together with the sums repaid on the loans, will be known as the Group Practice Loans Fund.

An application for a loan will, in the first place, be made to the executive council, who, in consultation with the local medical committee, should forward it to the Ministry with their comments. It will then be referred to a committee to be called the Group Practice Loans Committee, composed of representatives of the medical profession and the Ministry, for a decision. The committee will advise the council in each case whether a loan should be made, and, if so, the amount to be lent. It has been decided not to prescribe a standard term of years for these loans, but that the period of repayment should depend so far as possible on the circumstances of a particular application. It is thought that the normal period should be 10 years and should not in any case exceed 20 years.

The council will then enter into a contract with the members comprising the group. It will be essential for the group to draw up an agreement among themselves which may or may not form part of their partnership agreement (if any). Details of the nature of the loan agreement between the executive council and the group may be obtained from the executive council concerned. All expenses, including those of the council, incurred in drawing up and executing the necessary legal documents will be borne by the group and will not be included in the loan.

Uses of the Loan

Assistance by means of these loans will be available for the following purposes: (a) the erection of a new building, either on land already owned by one or more of the members or on land which may have to be acquired for the purpose and for the acquisition of such land; (b) the acquisition of an existing building and its conversion into surgery premises; (c) the conversion of a building already owned by a member of the group.

It is essential that the premises should be used for the purposes for which the loan is made for a period of years substantially longer than the duration of the loan, and as a minimum the period should be 21 years. Applicants must be willing to accept this condition. Application for a loan may be made by general practitioners taking part in general medical service who propose to form a group practice or who, having formed a group, propose to provide new practice premises or substantially to improve the existing premises.

Additions to the Group

Where a group wish to admit a new member either as an addition to the existing group or to fill a vacancy, whether in formal partnership or not, admission to the medical list will be subject to the same conditions as if the members of the group were in formal partnership—that is, the right to replace a member can be assumed, though additional members, whose names are not already included in the medical list in the locality, will not normally be admitted in a restricted area. Agreement should be reached between the members in the first place as to the new member's share of liability for the outstanding or continuing loan.

EXCHANGE VISITS WITH CANADA AND THE U.S.A.

The scheme for exchange visits between members of the American, British, and Canadian Medical Associations, which has the approval of the Bank of England, will be continued this year.

Procedure

Three doctors from Britain may visit Canada in exchange for three doctors from Canada. Each doctor from Britain will be required to make all his own travel arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in Canada he will receive the equivalent in Canadian dollars. Similarly, each Canadian doctor on arrival in Britain will receive the sum deposited in sterling.

Three doctors from Britain may visit the U.S.A. in exchange for three doctors from the U.S.A. Each doctor from Britain will be required to make all his own travel arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in the U.S.A. he will receive the equivalent in U.S. dollars. Similarly, each U.S. doctor on arrival in Britain will receive the sum deposited in sterling.

Duration of Visits

The duration of the visits is left to the discretion of the doctors concerned. The American, British, and Canadian Medical Associations cannot accept any responsibility for a doctor who allows his visit to outlast the money placed at his disposal.

Applications are invited from members of the B.M.A. to take part in such exchanges during the next financial year—i.e., April 1, 1954, to March 31, 1955. Each applicant must state the object of his visit. (This is not a scheme for the exchange of appointments or practices.) Medical practitioners in all branches of the profession, including general practice and public health, are eligible. Applicants should also give approximate dates of the visit desired. (Successful applicants will in due course be required to furnish exact dates and details of travel.) Applications must be received by the Secretary of the Association by March 1, 1954.

WAVERLEY EVIDENCE COMMITTEE

The following have been co-opted to the special committee set up by the Council (see *Supplement*, December 12, 1953, p. 229) to prepare the Association's evidence to the Waverley Committee on the Provision of Medical and Dental Services for the Armed Forces: Dr. E. R. Boland, Brigadier D. C. Bowie, Mr. H. Parker Buchanan, Sir Zachary Cope, Sir George McRobert, Dame Louisa Wilkinson, Dr. Lena Williams.

SPRINGFIELD MATERNITY HOME, BLACKBURN

A report of the questions asked of the Minister of Health in Parliament about this matter and his replies will be found under "Medical Notes in Parliament" in this issue of the *Journal* (p. 281). The matter is to be raised again by Mr. H. Hynd (Member for Accrington) on the adjournment.

Correction.—In the report of the proceedings of Council (*Supplement*, January 23, p. 19) it was stated that Dr. Jean Chappell had been appointed to the Association's Constitution Committee. It should have been Dr. Joan Chappell.

Notes and News

Medical Aid Scheme for Africans.—Southern Rhodesia may soon have a medical aid society for the benefit of Africans—a scheme which has never been attempted in Rhodesia before. It is being planned with the co-operation of the Salisbury Rotary Club and the Salisbury Chamber of Industries. It is the idea of the new scheme that clinics should be established in the industrial area of Salisbury and supported entirely by industrialists. Employers would be asked to pay for the establishment of the clinics, but in time Africans would be invited to subscribe.

Exchange of Hospitality.—A medical family with three children, who live in a small village in Denmark and also have a summer cottage by the sea, offers hospitality to an English medical family with children, during July or August. In return the Danish family would like to receive hospitality in Britain in 1955. They would like to find an English family living near the sea. Would anyone interested please communicate with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1?

Questions Answered

Unclaimed Capital Allowance

Q. I bought a new car in January, 1951, and paid by 36 monthly instalments, which are now finished. I receive a monthly car allowance from my principal. I have been informed that I can claim depreciation allowance from the income-tax authorities, and that I could have been claiming this during the past three years. Can I claim the allowance now, and also for the past three years? I presume I have not been granted this automatically, as I did not claim at the time.

A.—An omission to claim a capital allowance can be rectified by a claim made during the six years following the year concerned, provided that declarations of income have been made for the years of claim. The statutory provision is commonly known as the "Errors and Omissions Section." The basis of calculation of the claim would be 25% per annum wear and tear allowance, on the total cost for the first year—that is, for the three months to April, 1952—and thereafter on the written-down value. The questioner does not state the amount of the "monthly car allowance" received by him from his principal. If, as may be the case, that allowance is sufficient to cover all the necessary expense of the car when being used for practice purposes (including a reasonable amount for wear and tear of the car) the revenue authorities will probably take the view that there is no claim to the capital allowance. That allowance forms part of the total cost of running the car and cannot be claimed on as a separate item of expenditure.

A Guide to Income Tax

Q.—Could you recommend a really sound book dealing with the details of income tax?

A.—Presumably the questioner wants a book which will supply guidance on (a) the calculation for income-tax purposes of the gross amount assessable in the case of professional profits, and (b) the allowances, etc., deductible in determining the amount of tax payable. Unfortunately there is a dearth of books of that type. The trouble is that there are almost yearly changes in some elements in the income-tax code, with the result that books become out of date, and therefore misleading, so quickly that publication is apt to be unprofitable. A useful handbook was published by Stone and Cox., Ltd., 44, Fleet Street, London, E.C.4, in 1946, price 6s. 6d., which may meet the questioner's requirements, provided he remembers that in some points

of detail there have been changes since 1946. If a more comprehensive textbook is required, there are publications available at 35s. upwards, but they deal with questions that do not arise in the calculation of tax on professional profits, and, of course, are also liable to become out of date.

Balancing Charge

Q.—My car was purchased just over two years ago and I was permitted the initial 40% allowance for income-tax purposes. The written-down value is now about £160. I propose to sell this car and buy another for the price I shall receive from the sale (about £350). Shall I be obliged to pay tax on the difference between this sum and the written-down value, despite the fact that the vehicle I subsequently obtain will be of exactly equal value to my present car? What would the position be if I exchanged my present car for another without any money transaction?

A.—If the present car, now written down by income-tax allowances to £160, is sold for £350 the effect will be that an excessive allowance will have been given in the sum of £350 - £160 = £190, and that will be the amount of the "balancing charge" on which income tax will be payable. The allowance for the car bought for £350 will be:

Initial allowance 20% of £350	..	..	..	£
Wear and tear allowance @ 25%	..	..	..	70
				88
				£158

Written-down value to be carried forward .. £192

If the questioner desires, he can elect for the calculation to be made as follows (in which case, of course, he will not be liable to pay tax on the £190 as a balancing charge):

Cost of new car	..	..	..	£
Deduct amount of balancing allowance	..	..	..	350
				190
				£160

Initial allowance	..	..	..	£32
Wear and tear allowance	..	..	..	40
				72

Written-down value to be carried forward .. £88

This alternative gives a short-term advantage as compared with the more usual one, but results in small allowances in future years.

The allowances would remain the same if a simple exchange of cars were made, provided that the car acquired was of a value of £350—that is, an exchange would be regarded as a double transaction of sale and purchase.

Part-time Locum

Q.—Between hospital appointments I am doing part-time locum work as a refractionist. Can I claim tax relief for (1) examination fees for the D.O., (2) replacement of an ophthalmoscope which was necessary for the work and was not provided, and (3) travelling expenses to various hospitals?

A.—(1) Examination fees cannot be claimed as expenses incurred in doing the work for which payment is received. (2) It is considered that there are grounds for the claim on replacement of an instrument which is "necessary for the work and was not provided," so long as any element of improvement is eliminated from the cost as being capital expenditure. (3) Travelling expenses to various hospitals should be allowable. It is assumed that the questioner is, or will be, assessed under Schedule D, as carrying on his profession as a locum tenens, and not under Schedule E as for a series of separate employments.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

The Obstetric List

SIR.—Your correspondent Dr. D. Saklatvala in his letter (*Supplement*, January 2, p. 6) refers very ably but all too superficially to the compilation of the Obstetric List. When applications were invited by the executive councils in 1948 for inclusion in the list, each general practitioner had to decide for himself whether he would apply to be paid perhaps £7 7s. per confinement or to limit his services to the maximum of £5 5s. A young and inexperienced man would naturally be anxious to increase his practice and his income and would apply for inclusion. An old man whose activity, practice, and income were falling would also apply, and between these age groups the man who, perhaps through no fault of his own, had not built up a busy practice might also apply.

But what of the man in the middle-age group who is possibly at the peak of his experience and activity and is responsible for as big a practice as is considered reasonable? Surely he is perhaps the most desirable candidate? But he is already fully occupied in giving attention to his own patients, maternity and otherwise, and he must reflect on whether it would be wise for him to chance breaking the camel's back by making himself liable to be called upon to attend patients to whom he is not, and never will be, the family doctor. He must, if asked by the maternity nurse—and presumably he is already well known and therefore springs to mind easily—travel beyond the normal limits of his practice; and, the more efficient and useful he proves, the fewer nights he will have in bed and the more surgeries he will have to curtail. In a seaside area the population is vastly increased in the summer, and the incidence of premature labours with attendant complications rises steeply. Is it surprising that this man may, in the interests of service to his own patients, decline to apply for the doubtful privilege of earning increased fees?

Dr. Saklatvala has brought an unsatisfactory state of affairs to notice, but he has surely assumed too readily that every general practitioner of 20 years' standing is already on the Obstetric List; that it may right itself in 20 years is small contribution to the present service.—I am, etc.,

Bosmor Regis.

DAVID HAY.

Specialists' Remuneration

SIR.—I should like to support the comments of Dr. E. Snell (*Supplement*, December 19, 1953, p. 237) and Dr. Bernard Sugden (*Supplement*, January 2, p. 7), with which I am in whole-hearted agreement.

The failure to press for simultaneous implementation of both Spens Reports has resulted in a disturbance of balance within the profession, and, while the general practitioners are receiving no more than their due, the skill of hospital staff and the responsibility, both moral and legal, which they bear are not being adequately recompensed. The long and arduous training of the specialist and his large financial outlay as he gains experience in various centres are factors which cannot be over-emphasized in the assessment of a revised salary scale.

It is now over fourteen months since a claim for this was entered on our behalf by the Staff Side of Whitley Committee "B." One must recognize that speed of settlement is an essential factor in such negotiations, otherwise certain points may lose their relevance. If, after all these months, the Management Side are unable or unwilling to make even an offer, surely the time has come to abandon salary claims and press only for arbitration, which is the right of almost every State (or other) employee whatever

his level in modern society. In such a demand for simple justice, we should have the full support of public opinion. And that is important, because it must be borne in mind that, while public opinion was on the side of the practitioners in their fight for Spens, specialists have no such fund of good will in their favour. The majority of even well-informed laymen believe that the Danckwerts award and the Spens scales applied to all members of the profession. I was amazed recently to find that in a group representing the legal, banking, teaching, and engineering professions, all those individuals to whom I spoke on the subject held this mistaken view. The importance of our public relations in eliminating such erroneous ideas, at the same time as any announcement is made regarding salary adjustments or arbitration demands, cannot be over-stressed.—I am, etc.,

Worcester.

E. N. MOYES.

Whitley Arbitration Machinery

SIR.—At the A.R.M., July, 1953, the following resolution was passed: "That this meeting deplores the lack of a Whitley Court of Arbitration to which there should be a right of appeal by unilateral reference and where the ruling should be binding on both parties, and instructs Council to take immediate and urgent action . . ." (*Supplement*, July 18, 1953, p. 24).

After a silence of six months may I ask what have been the results of this urgent action? When the general practitioners were unable to obtain arbitration the Association named a date for withdrawal from the N.H. Service unless arbitration had been agreed. We know the result. The only effective action which the Council can take is to state by July 10, 1954, one year after the mandate given at the last A.R.M., all public health medical officers shall be withdrawn from service. Is there any other body of men and women who would tolerate the conditions whereby they are unable to go to arbitration without their employers' consent, and when an award has been made the employers are not bound to implement it?—I am, etc.,

Darlington.

MAURICE B. GRIFFITH.

Quality and General Practice

SIR.—Your correspondent Mr. B. J. Shaw (*Supplement*, January 9, p. 11) asks whether a stimulus and incentive for could be provided by a system of merit awards and grading of general practitioners. Many of us think that this is not of a doctor's qualities and are happiest when able to pay him directly for his services. Let the doctors be "set free" and given back the right to ask the fees which they deserve. If a patient considers he has not had his "money's worth" the doctor will soon lose that patient to a colleague. The G.P. who gives his patient a "good deal" will be able to secure a just reward. The registrar who fails to obtain a consultant's post will once again be pleased to become a G.P. in that he will feel he will be able to secure fees which are related to the type of service which he is able to give his patient.

Fewer of the millions now spent on the N.H.S. would be needed for the hospitals, and more would be available for the general practitioners, who should be paid for their services by the patient, and he in turn should receive fixed sums per item-of-service from the State in exchange for the money he has been compelled to pay for a National Health Service in taxes and insurance contributions.

This proposition is not reactionary. Look at Australia—a progressive country where the Government believes that a partnership of the medical profession, the community, insurance organizations, and the Government can evolve a method of retaining all the existing traditions and advances on the medical side and still bring the cost of a first-rate medical service within the means of the people. Look at New

Six new members of the Scottish Health Services Council have been appointed by the Secretary of State for Scotland in place of those who retired on December 31, and other members whose term of office expired on that date have been reappointed. Mr. J. Dunlop, Mr. W. Russell Logan, Colonel J. M. Miller, Miss E. Renwick, Dr. J. Riddell, and Councillor J. Thomson have been appointed members until December 31, 1956; Mr. J. M. Graham, Dr. G. W. Ireland, Colonel W. Mackie, Professor G. L. Montgomery, Dr. C. J. Swanson, and Captain J. P. Younger have been reappointed to the Council until December 31, 1956.

Zealand. No less a man than Dr. Ian Grant, the Deputy Chairman of the Representative Body, tells us that if we go to New Zealand we will work in a health service where individual effort and merit are still rewarded and where quality is given pride of place over quantity. Haven't we got the answer? Why not let us seriously consider such a scheme, and not cast it aside as either financially or administratively impossible?—I am, etc.,

Dorling.

CYRIL E. BEARE.

Economy in Prescribing

SIR.—The letter by Dr. B. MacKenzie Hegarty and others (*Supplement*, December 19, 1953, p. 237) contains much food for thought. There are, however, other aspects of the problems they discuss.

Most medical journals are well besprinkled with advertisements of proprietary medicines, and the way to learn about them is from the literature sent by the pharmaceutical firms. Consultants and specialists are prodigal users of proprietaries and advise G.P.s accordingly; and patients frequently know this. The public are not given sufficient direction by propaganda to ease their demands on G.P.s, and are not told that they too have to take part in the economy drive. Much literature has been circulated to the G.P.s by official bodies; and articles in medical journals, usually by consultants and specialists, seem to put the G.P. "on the spot" by stating or implying he over-prescribes or chooses expensive drugs; or the G.P. panders to the demands and whims of patients. A few newspapers, some M.P.s, and other public personalities indicate that the high cost of the drug bill is due to the G.P.s. G.P.s who are on call round the clock have little or no redress against complaints of excessive demands by patients. The status of the G.P. is not what it was. The 1952 N.F. in "Notes For Prescribers," which appears to contain the style and ideas of several authors, seems to imply that the prescriber (usually a G.P.) is a "tyro" at the job. The N.F. is neither national nor reasonably comprehensive. Neither is it up to date, nor does it bear the imprint of down-to-earth prescribing. If we consider the whole range of useful drugs available, desirable, essential, and necessary for treatment we find the N.F. is "negligently deficient." Moreover, the N.F. is biased against proprietary drugs. The committee which formulates it seems over-balanced by a plethora of professors and people who may know pharmacology in abstract but do not give the impression that they understand prescribing for patients. For these reasons G.P.s are on the losing side before they begin to justify their action if accused of over-prescribing. Here is a case to consider. One of my patients, a professional man in the middle fifties, is an asthmatic. He has been given and has tried most remedies but finds that a proprietary listed in a proscribed category is the only thing to relieve him and to keep him at work. Has he to buy the drug himself?—I am, etc.,

Luton.

DOUGLAS R. SNELGROVE.

Aureomycin in General Practice

SIR.—I wonder whether you or any of your readers can tell me why general practitioners are not permitted to prescribe aureomycin, although they are allowed to prescribe chloramphenicol, a more expensive and more dangerous substance. I have recently had two cases of pneumonia in practice which failed to respond to penicillin and sulpha drugs, and for which aureomycin seemed indicated. The only way I was able to obtain this was by getting a consultant to do domiciliary visits.

Aureomycin, I understand, has now been out for at least five years and it seems difficult to understand why better supplies are not forthcoming. One final point: Would it not be possible for general practitioners to be allowed a quota per month, obtainable through their local hospitals?

—I am, etc.,

Winchester.

H. J. BLISS.

ANNUAL MEETING, GLASGOW, 1954

HOSTEL ACCOMMODATION

Members who wish to reserve hostel accommodation in Glasgow during the Annual Meeting in July are asked to write direct to the Executive Officer, B.M.A. House, Tavistock Square, London, W.C.1, stating their requirements. A list of hostel accommodation was published in the *Supplement* of January 16 at page 14.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Commanders J. B. Patrick, P. B. Jackson, and A. D. Sinclair to be Surgeon Captains.
Surgeon Lieutenant-Commanders (Acting Interim Surgeon Commanders) The Hon. A. G. Gathorne-Hardy, F. B. B. Weston, L. G. Topham, L. D. Arden, D. J. O'Donoghue, and W. J. Cranley to be Surgeon Commanders.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant-Commanders A. Ruffman and R. Vaughan-Jones to be Surgeon Commanders.
Surgeon Lieutenant-Commander (Emergency) S. D. Moss, R.N., has re-entered the Permanent R.N.V.R., in the rank of Surgeon Lieutenant-Commander.
Surgeon Lieutenant E. M. Stirk to be Surgeon Lieutenant-Commander.
Surgeon Lieutenant (D) F. G. Hardman, M.B., Ch.B., B.D.S., F.D.S., to be Surgeon Lieutenant-Commander.

ARMY

Major-General A. G. Harsant, C.B., O.B.E., Q.H.S., late R.A.M.C., has retired on retired pay.
Colonel (Temporary Brigadier) J. Huston, late R.A.M.C., to be Brigadier.
Colonel J. N. Atkinson, late R.A.M.C., having attained the age for retirement, is retained on the Active List.
Lieutenant-Colonel L. T. Furnivall, D.S.O., from R.A.M.C., to be Colonel.

Association Notices

ELECTION OF MEMBER OF THE COUNCIL BY
THE FAR EASTERN BRANCHES

Notice is hereby given that, owing to the resignation of Professor Kenelm H. Digby, there is a vacancy in the Council of the Association. Nominations of candidates for election as a member of Council by the Far Eastern Branches for the remainder of the period ending with the conclusion of the Annual Representative Meeting, 1955, must be forwarded in writing so as to reach the Secretary not later than March 25, 1954.

The Branches in the Group are: Borneo, Ceylon, Hong Kong and China, Malaya.

Nominations must be signed by not fewer than three members of any branch in the Group, and should be in the following form:

We, the undersigned, hereby nominate.....

of..... (full name and address to be given) for election by the Borneo, Ceylon, Hong Kong and China, and Malaya Branches as a member of the Council of the Association for the period ending July 23, 1955.

Signatures and addresses of three nominators.....

Branch.....

If a contest occurs voting papers will be issued from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Bournemouth, Friday, January 29, 8.15 p.m., meeting. Address by Surgeon Lieutenant-Commander W. E. Crocker, R.N.: "Medical Problems Associated with Deep Diving."
CARDIFF DIVISION.—At Park Hotel, Cardiff, Wednesday, February 3, 7.45 for 8 p.m., supper-meeting. Address by Dr. W. R. Harrison, M.Sc., Ph.D.: "Forged, Anonymous, and Suspect Documents."
DONCASTER DIVISION AND DONCASTER MEDICAL SOCIETY.—At Parkinson's Café, High Street, Doncaster, Tuesday, February 2, 7.30 p.m., joint meeting. Address by Mr. L. B. Patrick: "The Cause and Prevention of Genital Prolapse."
DUNDEE AND ANGUS DIVISIONS.—At Medical School, Dundee, Friday, February 5, 8.30 p.m., general meeting. Professor D. M. Douglas and Professor Ian G. W. Hill: Mitral Stenosis and the Selection of Cases for Valvotomy, followed by colour film of valvotomy operation.
LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, S.E., Friday, February 5, 8.30 p.m., meeting. Dr. Horace Joules: "Smoking and Cancer of the Lung" (lantern).
METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C.1, Tuesday, February 9, 5 p.m., meeting. Address for senior students by Dr. Charles Hill, M.P.: "Medicine from the Outside." All recently qualified practitioners are invited.
MONMOUTHSHIRE DIVISION.—At St. Mellons County Club, Thursday, February 4, 7.30 for 8 p.m., dinner. Address by Dr. Griffith Pugh: "The Ascent of Everest" (illustrated). Wives and friends of members are invited.
NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, February 2, 8 for 8.45 p.m., B.M.A. Lecture by Dr. Vaughan Jones: "Occupational Health and the Hazards of the Housewife."
REIGATE DIVISION.—At Redhill County Hospital, Tuesday, February 2, 7.30 p.m., clinical meeting.
ST. PANCRAS DIVISION.—At B.M.A. House, Tavistock Square, London, W.C.1, Friday, February 5, 8.30 p.m., meeting. Lecture by Professor M. L. Rosenheim: "Hypertension."
TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devon Road, Bow, E., Friday, January 29, 3 p.m., clinical meeting. Dr. P. B. Woodruff: Cancer Campaign.
WEST DENBIGH AND FLINT DIVISION.—At Marine Hydro Hotel, Rhyl, Thursday, February 4, 8 p.m., dinner. 9 p.m., Annual B.M.A. Lecture by Dr. Marjory W. Warren: "Medical Problems and Management of Elderly Sick."

PUBLIC RELATIONS

A few years ago the term "public relations" had hardly come into currency; where it had done so it was scarcely understood, and where it was understood it was mostly disliked. It was disliked especially by the medical profession, whose relations with the press had been like those of the Jews with the Samaritans. The dislike was largely founded on a traditional aloofness on the part of the profession, continually reinforced by instances in which at any rate the popular press had headlined the doings of an errant doctor or had made the whole profession or a section of it the target for mischievous criticism. Much that had appeared in the press about medicine and doctors was false, if not in fact at least in emphasis, but the doctor was a good body, for the members of no other profession come into such close relation with the public in their homes, and therefore on occasion make such good "copy." The doctors themselves in their contacts with the press often adopted a lofty and patronizing "I am telling you" attitude. All this had its repercussions when medicine ceased to be a private affair between doctor and patient and, first, National Health Insurance and then, a generation later, the National Health Service were cradled in party politics.

Early Efforts

In the British Medical Association itself the idea of public relations was not at first favoured. In 1937 a propaganda committee was set up, consisting of the principal officers of the Association and the chairman of the National Insurance Defence Trust. This committee was to consult with the chairman of the appropriate standing committee when it was proposed to issue any information on the work of the Association or its attitude on any public question. On the outbreak of war this kind of propaganda, like so many other things, ceased to exist. The idea, however, was revived before the war ended, and the functions of the reconstituted body were described as the collection and correlation of medical intelligence.

The Public Relations Committee to-day consists of the officers of the Association, two members appointed by the Council, four by the General Medical Services Committee, two by the Central Consultants and Specialists Committee, two by the Public Health Committee, one by the Journal Committee, and a member of the Occupational Health Committee, and there is power to co-opt two other members. Its reference is in the widest terms: "To

consider matters involving the relations of the profession to the public." The Public Relations Department, which is run at an expenditure of about £6,000 a year, is financed half by the Association and half by the National Insurance Defence Trust, but the Public Relations Officer is an officer of the Association, which is responsible for his salary. The special problems of Scotland with its separate National Health Service Act, are catered for by the maintenance of a part-time press officer in Edinburgh to advise and assist the Scottish Committee and Secretary.

Creating a Climate of Opinion

The chairman of the Committee is Dr. H. Guy Dain, who has already given such immense service to the Association over so many years. He has brought to this latest task a practical outlook and a shrewd judgment. It was largely due to his insistence that some organization along these lines was felt to be necessary, and the Public Relations Department was accordingly set up. It was at his instance that in 1943 Mr. Colin Hurry was appointed in a consultative capacity. Dr. Dain impressed upon the Council many years ago that by reason of political developments the medical profession would become more or less vulnerable to public opinion. The greatly improved attitude of public opinion to-day on matters affecting the medical profession is largely due to his inspiration and ideas.

On many occasions in the past, when the profession has been passing through times of crisis, it has had what has been described as a "bad press." The British Medical Association used to be called—one hears the reference less frequently now—the most exclusive of all trade unions. The old picture, "The Doctor," by Sir Luke Fildes, popular in Victorian dining-rooms, faded out of recognition and gave place in many quarters to the figure of a mercenary individual concerned above all things about his fees, the unreasonable demands made upon his time by trivial calls, and complaints about this, that, and the other. The term "panel doctor" was often used disparagingly. In the National Health Insurance struggle in 1911 the profession for the first time in its history was brought up against an acute political issue in which it was directly involved, and its case, however good, found very little support in the organs of public opinion.

For many years Fleet Street continued to be 1,000 miles from Tavistock Square. Many journalists did not really know what the B.M.A. was. It was confused repeatedly with the General Medical Council, so that such a hybrid term as "British Medical Council" appeared with extraordinary frequency. By the way, in a television play, in December, 1953, a doctor was erased from the *Register* by

the General Medical Council, or rather by its President, apparently acting in his individual capacity, and the decision was referred to later in the play as that of the British Medical Association! For many years the B.M.A. was the last source to which the journalist would have turned for medical information.

The Public Relations Officer

The Public Relations Department is now a solid piece of Association machinery. In 1947 the Council appointed a Public Relations Officer admirably suited for his task by his journalistic experience on the *Manchester Guardian* and the B.B.C. Mr. John Pringle has a job which calls for skill and tact. The function of the Public Relations Department is not to dispense refreshment on occasion for members of the press nor simply to give them what are called "hand-outs." It is to interpret to the public the views and attitude of the Association itself—in other words, to put medical affairs in journalistic language without doing violence to their meaning. What, for example, can the term "Implementing Spens" mean to the average member of the public? What would such a term convey at the top of a newspaper column?

The Public Relations Officer must be familiar with two worlds—the world of the press and the world of medicine, each revolving in separate orbits and sometimes sneering at one another as they come into juxtaposition. When Mr. Pringle joined the Association, in the year before the National Health Service came into operation (though the Act was already on the Statute Book), the quarrel with Mr. Aneurin Bevan was at its height. Left-wing newspapers were, of course, denouncing the Association and all its works, but anti-doctor cartoons and leading articles were by no means confined to that section of the press. Whatever may have been thought of Bevan, Beveridge was highly popular, and there was a widespread belief that the B.M.A. was setting itself to sabotage the Beveridge Social Security plan in so far as it affected the interests of a "selfish profession." One little incident among a hundred may be recalled. The Representative Body was in session in London when the results of the 1945 General Election were announced, and on the announcement of the defeat of Sir William Beveridge (as he then was) there was a slight murmur of applause from a back bench. This was magnified at once into the headline: "Doctors cheer Beveridge defeat."

An Information Service

That sort of thing, expressed in innumerable ways, had to be overcome. A comprehensive service of information, particularly in the field of social medicine, was set up to answer press inquiries, and this has now become well established and is made use of daily by practically the entire national press. The telephones of the Public Relations Department are almost constantly ringing with inquiries on all sorts of medical and medico-political subjects, from medical education to geriatrics, from the Association's policy on spiritual healing to a dispute over a local authority appointment. Swift and accurate information is distributed. The Association's Public Relations Officer, like the doctors whom he serves, has no fixed hours. His private telephone number is known in Fleet Street, and calls may reach him at midnight concerning the accuracy of some statement (perhaps a statement just made in the House of Commons), or the likely attitude of the Association on some question which has arisen as a newspaper goes to press, or the verification of some fact affecting the profession or a member of it. It is not only the press which is served, but also the B.B.C., and many other institutions, including Government departments, which in their special ways require information. It is not simply a question of correcting some fantastic statement in a popular Sunday paper, but, maybe, of devising the best reply to some more eminent and dangerous critic. An example of prompt refutation was afforded during the critical plebiscite just before the

National Health Service came into operation. Mr. Bevan in the House of Commons had attacked the method by which the plebiscite was taken, declaring that it was a long way removed from the secret ballot and the workings of democracy. The immediate response of the Public Relations Department was to invite the press—who came in large numbers—to witness the counting of the votes and the precautions to ensure that the real unembarrassed voice of the profession had been heard. This demonstration disposed of Mr. Bevan's insinuations once and for all.

The Press at the Annual Meeting

It is curious to reflect that at the very first Annual Representative Meeting 50 years ago the press—and only the local press at that—timidly knocked at the door and were refused admission. Since then the press have been not only admitted but welcomed, and special facilities provided for them. On rare occasions the meeting has gone into secret session, but more often when matters not ripe for publication have been discussed the press has been asked not to report the proceedings, and the request has been punctiliously respected.

At the Annual Meeting of the Association the Public Relations Department is concerned with arrangements whereby any number up to 40 journalists require not only accommodation in the meeting-places but telephone facilities, hand-outs, synopses of papers, and so on. They have to be "fed" as in fact the modern journalist expects to be. The journalist is no longer the "chiel amang you takin' notes"; he is a pampered recipient of more ready-made matter than he knows what to do with, with the result that going news-gathering are no longer necessary. Everything comes to him who waits, and he has not to wait long. But the net result is more accurate and well-informed reporting, and that is all to the good. Press conferences are held whenever anything important has to be announced. Publicity is arranged for major decisions of the Representative Association or its committees are also publicized by every appropriate means. The Department is responsible for organizing various lectures, such as the Sir Charles Hastings lecture, on medicine and health for the general public.

All the principal newspapers and periodicals are read by members of the Department, and passages marked for circulation to other Association officers. An extensive filing system is maintained. A duty of the Department is a close scrutiny of *Hansard*. Correspondence from the general public is dealt with, many of the replies involving considerable research. One curious question often asked, for example, is how to proceed to bequeath one's body for research purposes. So numerous have been such inquiries that the Department has had to have the complicated procedure set out on a printed sheet. Many letters and telephone calls often reveal a simple misunderstanding with regard to medical practice or the regulations of the National Health Service. The explanation often dispels any resentment. The Public Relations Officer attends all the important committees of the Association, and is frequently called upon to give his advice as to the likely public reactions on any contemplated action. In all its work the Department is in closest touch with the medical secretariat, the staff of the *British Medical Journal*, and the library.

Other work includes the preparation of a list of forthcoming medical conferences, copies being circulated to the press and to inquirers. This list is now by far the most complete in existence and is of assistance to organizers such work as the preparation of a popular illustrated edition of the Association's Report on "The Care and Treatment of the Elderly and Infirm." The preparation of a "B.M.A. Book of Medical Scholarships," containing a list of all such awards available in Great Britain and Northern Ireland, developed out of the work of the Department in answering questions on careers in medicine.

Local Public Relations

Finally it should be said that public relations is not the affair of Headquarters alone. The importance of the local newspaper has often been overlooked, yet its influence in a particular community may surpass that of any national daily. Over 200 of the Divisions in Great Britain and Northern Ireland now have a Public Relations Secretary, and in not far short of half of these he is a different individual from the Honorary Secretary of the Division. Guidance is given to the local press, speakers are provided for meetings, and Headquarters is kept in touch with local events and opinion. Many of these Public Relations Officers are keen and enthusiastic workers, well abreast of the events and feelings in their own areas.

It must be borne in mind that public relations is not just a "crisis" activity. If it was mobilized only in a crisis it would fail. It goes on all the time. Every day at Headquarters and at the periphery there is a steady build-up of favourable public opinion which will act as a defence should a crisis arise. The really big achievement of the Department has been to demonstrate that the public interest and the interest of the profession are not antagonistic, are not indeed separate, but over a great part of the field, perhaps over the whole field, are identical.

WHITLEY COUNCILS FOR THE HEALTH SERVICES (GREAT BRITAIN)

MEDICAL COUNCIL: COMMITTEE "C"

The following M.D.C. circulars (Nos. 19 and 20) signed by the joint secretaries, Dr. A. V. Kelynack and Mr. T. B. Williamson, and dated January 22, 1954, have been issued to all local authorities in England, Wales, and Scotland.

PUBLIC HEALTH MEDICAL OFFICERS: INCREMENTALS FOR PART-TIME OFFICERS (No. 19)

"Committee 'C' of the Medical Whitley Council have agreed that part-time public health medical officers who are paid an annual salary related to full-time pay should be paid not as a 'flat rate' but in accordance with the appropriate salary scale; i.e., they should be entitled to annual increments in the same way as whole-time officers. "Committee 'C' accordingly recommend: (1) that such part-time officers should be paid the appropriate proportion of the salary which would be payable if the employment were whole-time, so that in each year of employment the salary will be related to the appropriate incremental point of the whole-time salary scale; and (2) that where such an arrangement is not already in operation, it should come into effect from April 1, 1954, at the incremental point which the officer would have reached on that day if this arrangement had been in operation from the date on which the officer took up his present post with his present employing authority."

PUBLIC HEALTH MEDICAL OFFICERS MATERNITY LEAVE SCHEME (No. 20)

"Following the introduction by the Ministry of National Insurance of a revised scheme of maternity benefits, Committee 'C' of the Medical Whitley Council have reconsidered the Maternity Leave Scheme applicable to women public health medical officers, and have agreed on the following amendments to the scheme set out in Appendix I to M.D.C. Circular No. 11:

"(1) In respect of the period October 26, 1953, to January 23, 1955, (a) the scheme set out in Appendix I to M.D.C. Circular No. 11 shall apply to women officers not paying National Insurance contributions; (b) women officers paying contributions and electing to take the new benefits shall be granted leave for 18 weeks, with full pay for the first four weeks with deduction of maternity allowance, and half pay for the remaining 14 weeks without deduction of the

allowance. Account shall not be taken of any additional benefit which may accrue in certain circumstances.

"(2) In respect of confinements after January 23, 1955, (a) the present period of maternity leave shall be extended from 13 weeks to 18 weeks, absence from duty to commence 11 weeks before the expected week of confinement; (b) full pay shall be granted for the first four weeks of absence, with reduction of maternity allowance and of any other additions which may accrue; and, for the remaining 14 weeks, half pay shall be granted, without deduction of allowances except to the extent to which the combined pay and allowances may exceed full pay; (c) women officers who do not pay National Insurance contributions shall be deemed to be insured and the appropriate weekly allowances shall be deducted from their full pay.

"(3) In respect of the understanding in regard to return to work (paragraph (f) of Appendix I to M.D.C. Circular No. 11): the return to duty shall be for a period of at least three months. This requirement may, however, be varied at the discretion of the employing authority, on good cause being shown."

MEDICAL SERVICE COMMITTEE CASE

HOSPITAL DOCTOR'S STATEMENT

In a case which came before the Medical Service Committee of the London Executive Council recently the complainant alleged that the practitioner had been negligent in the treatment of his late wife and failed to diagnose her illness as quickly as he might have done. The committee decided in favour of the doctor, and in doing so added the following opinion:

"It appeared to us from the correspondence and the oral statement made to us by Mr. A that there might have been no complaint made in this case had it not been for a statement alleged to have been made to Mr. A by a doctor at the hospital. That statement was that 'it would have made all the difference if the patient had been admitted to hospital some weeks previously.' In this connexion we had before us a letter written by the house-physician at the hospital, in which he said that he . . . was sure he did not tell Mr. A that earlier admission to hospital would have made 'all the difference,' and he suggested that Mr. A, who was extremely distraught at the time, must have misunderstood what was said to him. We have pointed out in previous reports how unfortunate it is that statements are made to patients' relatives at hospitals that if something different had been done it would have made all the difference, particularly when these statements are made by unauthorized persons—e.g., nurses, etc."

METROPOLITAN COUNTIES BRANCH

The Annual Charities Ball of the Metropolitan Counties Branch will be held in B.M.A. House on Thursday, May 6, 1954. It is hoped that as many members of the profession as possible, including those outside the Branch area, will attend and thus enable the Branch to make a handsome contribution to the medical charities. Dancing to the music of the Sydney Lipton Ballroom Orchestra; buffet and bars. Tickets £2 2s. each, or six for £11 11s. Further particulars will be issued in due course.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

GROUP PRACTICE LOANS

BROADCAST BY ASSOCIATION'S P.R.O.

Mr. John Pringle, Public Relations Officer of the B.M.A., was invited by the B.B.C. to take part in its "At Home and Abroad" programme in the Home Service on January 29. Mr. Pringle talked about the new proposals for stimulating group practice (see *Supplement*, January 30, p. 27), and the following is a slightly abridged version of what he said.

"There is, of course, nothing new about group practice itself. Group practice existed in this country long before the magic words 'Health Centre' were ever invented. Medicine is, and always will be, a highly individual profession, and some doctors—and first-rate ones, too—prefer to work single-handed or independently. Other doctors feel that practice in a large partnership enables them to do their best work, to pool knowledge and skill, and to work out a rota system for night and emergency calls. So more and more the tendency has been towards the development of partnerships, and when you have several doctors working together, sharing the services of secretary, nurse, receptionist, and so on, then you have a group practice.

Spontaneous Development

"Group practice is a voluntary, spontaneous development called forth by the needs of the public in a particular district and by the fact that a number of doctors find they can work well and get on happily together. It is not created by external authority; the doctors arrange their own work, as they themselves think best. If the public do not like the medical treatment they get there, they can go elsewhere.

"The fully-blown health centre is a rather different thing. It usually means a building specially erected, maintained by the local health authority—and in connexion with it there are usually different kinds of local authority services, ante-natal or child welfare clinics, for example. They tend to be expensive to build and maintain, and the full capital cost, of course, falls on you as ratepayers or taxpayers.

A Cheaper Way

"The medical profession have always been slightly cautious about the wholesale setting up of health centres, especially in view of the enormous cost to the nation, and they have rightly insisted on experiments first. Meanwhile, so doctors have argued, why should their own existing premises not be converted or enlarged cheaply to make group practice easier? The trouble, of course, has been finding the money. This is where this new £100,000 loan comes in. And I want to correct a misunderstanding. This is not a Government loan to doctors. Most doctors, as you know, are paid out of a central pool, which is calculated on a national basis and arranged to meet not only their remuneration but all practice expenses. At the last agreement on the distribution of this money it was agreed that a sum of £100,000 should be set aside annually. In effect, therefore, every family doctor is voluntarily forgoing a part of his proper remuneration every year in order to assist something which the profession believes to be a good thing.

A Step in the Right Direction

"One hundred thousand pounds annually for the whole country may strike you as a very modest sum. So it is, but this is a start, and as the years go by the loans will be repaid and become available for further loans. It will strike many people as a step in the right direction—a little healthy encouragement to a natural organic development—something not imposed on the public and the profession from the outside, but springing directly from the needs of patients and the experience of doctors working together to serve them."

MEDICAL PRACTICES COMMITTEE

AMENDMENT OF CLASSIFICATION OF AREAS
On the admission of an additional doctor or doctors the following areas in England and Wales have been reclassified.

"Intermediate" from "Designated"

Berkshire.—Urban District and Rural District of Abingdon.
Buckinghamshire.—Aylesbury; Newport Pagnell.
Cambridgeshire.—City of Cambridge.
Durham.—Urban District of Chester-le-Street.
Essex.—Harlow New Town Development Area; Borough of Walthamstow; Urban District of Rayleigh.
Hampshire.—Borough of Gosport.
Kent and Canterbury.—Borough of Chatham.
Lancashire.—Urban District of Urmston; Rural District of Preston; Irlam District.
London.—Borough of Greenwich: North 1, 2, 3, and Marsh Wards. Borough of Islington: Tollington and Upper Holloway Wards. Borough of Lewisham: Rushey Green and Lewisham Park Wards. Borough of Westminster: Victoria Ward.
Middlesex.—Borough of Heston and Isleworth. Borough of Willesden: Roundwood Ward. Urban District of Hayes and Harlington.
Nottingham County and City.—Kirkby-in-Ashfield.
Somerset.—Rural District of Clutton.
Wiltshire.—Salisbury.
Yorks (North Riding).—Urban District of Eton.
Yorks (West Riding).—Urban District of Worsborough.
Northampton.—Whole of County Borough.
Monmouthshire and Newport.—Urban District of Ebbw Vale.

"Restricted" from "Intermediate"

Dorsetshire.—Winfrith, Wool and District.
Gloucester County and City.—Corse and Newent.
Northamptonshire.—Kingscliffe.
Somerset.—Rural District of Dulverton.

"Intermediate" from "Restricted"

London.—Borough of Westminster: Covent Garden, Strand, and Charing Cross Wards.

B.M.A. LIBRARY

A SERVICE TO MEMBERS

It may not be generally known that the services of the library at B.M.A. House, situated on the first floor of the garden block on the south side of the main building, is available free to members of the Association resident in Great Britain and Northern Ireland, and by special arrangement to members of the Irish Medical Association. The only charge is for postage of books.

The B.M.A. library has one of the finest collections of modern medical books in London and the largest holding in the country of current medical periodicals. The Librarian will supply references and literature on specific medical subjects.

A copy of the library rules can be obtained on application to the Librarian.

EVIDENCE TO GUILLEBAUD

The Association's memorandum of evidence has been sent to the Guillebaud Committee. In due course the Association's representatives will present oral evidence to the Committee.

NEW FILMS FOR THE FILM LIBRARY

The Film Committee will shortly be considering the possibility of adding to its library and will welcome any suggestions from members as to suitable films for this purpose. The Secretary will be grateful to receive suggestions or particulars of any films considered suitable.

TUNBRIDGE WELLS DIVISION

SPECIAL MEETING

The Tunbridge Wells Division of the B.M.A. has arranged a special meeting on Sunday, February 28, to give all its members an opportunity to discuss various aspects of the National Health Service. Secretaries of neighbouring Divisions have also been notified, and an invitation extended to their members to attend the meeting. The discussion will be opened by four speakers—Dr. A. E. Loden ("The general practitioner in relation to the local authority and the facilities available under the local authority"), Dr. A. Elliott ("The facilities available under the local authority, their use and abuse"), Dr. A. V. Adams ("The general practitioner in relation to the hospital service"), and Mr. John Simons ("The hospital services, their use and abuse"). The meeting will conclude with a brains trust on the National Health Service, in which Dr. F. Langford will take part, in addition to the four speakers.

Drs. Loden and Adams are general practitioners. Dr. Elliott is M.O.H., Kent County Council, and Dr. Langford is M.O.H., East Sussex County Council. Mr. Simons is an F.N.T. specialist.

U.S. HEALTH PLAN

QUALIFIED APPROVAL BY A.M.A.

According to the *New York Times* the American Medical Association has endorsed the "general objectives" of President Eisenhower's health plan (*Supplement*, January 23, p. 23), but has withheld specific approval.

In a statement on behalf of the American Medical Association issued by the chairman of its Board of Trustees, Dr. Dwight H. Murray, it was said that the Board was pleased to find in the President's message to Congress so many of the ideas and principles for which the American Medical Association had striven so long. The Association, however, could make no comment on the Administration's Federal re-insurance proposal until it became clear whether this was true re-insurance or another form of government subsidy. At present the proposal was indefinite and the whole subject needed careful study.

U.S. Medical Costs

The total private medical bill of the United States exceeds \$9,000,000,000, an average of nearly \$200 a family. Last July, according to a survey by the National Opinion Research Centre of the University of Chicago, about 1,000,000 families were in debt for medical services to the extent of \$195 or more. About 58% of the population are covered by the voluntary insurance of some sort. Fifteen per cent. of the total cost of illness in the year ended June, 1953, was covered by such insurance.

SERVICE COMMITTEE AND TRIBUNAL
REGULATIONS

DEPUTATION TO MINISTRY

Representatives from the G.M.S. Committee of the B.M.A., the British Dental Association, and the National Pharmaceutical Union went to the Ministry of Health on Monday, February 1, to put forward proposals for amending the National Health Service Committee and Tribunal Regulations. The proposed amendments were recommended by a subcommittee of the G.M.S. Committee under the chairmanship of Dr. H. Guy Dain¹ and were approved by the Conference of Local Medical Committees at its meeting last year.²

A report of the discussions at the Ministry will be given to the G.M.S. Committee and the Conference of Local Medical Committees.

¹ *Supplement*, 1953, 1, 190.
² *Ibid.*, 1953, 1, 293.

Correspondence

Service Recruitment

SIR,—I apologize because this letter is in reply to letters published in the *Supplement* of November 28 last year. There is a normal delay of four to six weeks in sea-mail from U.K. Also my duties take me away from base frequently, which usually means delay of another week or two before I actually read your *Journals*.

"N.S.M.O." and Dr. W. J. Atkinson (*Supplement*, November 28, 1953, p. 213) both state that Service doctors waste too much time on administrative duties and have not sufficient opportunity for professional work. "N.S.M.O." further states that new rates of pay will increase bad feeling between medical and other officers. To argue the case it is first necessary to stress that a doctor who joins the Regular Army does so to serve his Queen and country. The importance of the word *service* must be stressed. The basic principle of the individual serving the community rather than the community serving the individual does not seem to appeal to many young doctors to-day. This is perhaps not surprising, because since the end of the war the ideals of the Welfare State have gained much prominence. Out of this grows the frame of mind "to get" rather than "to give."

Secondly, the medical services exist to keep the soldier fit, and when he gets sick or injured to attempt to make him fit for duty again. The medical services have been organized to do these things in the most efficient manner possible. The system has evolved over a considerable number of years through trial and error to its present form. It is quite wrong to suggest that non-medical officers could carry out administrative duties entirely. It is ridiculous to think that an assistant director of medical services were he a non-professional officer could understand and advise a regimental medical officer on his work when he himself had never been an R.M.O. No self-respecting Service doctor would accept this situation. In other words, the "tail would wag the dog" rather than the reverse, and thus efficiency would be impaired.

Dr. Atkinson suggests that senior R.A.M.C. doctors are professionally out of date. It should be remembered that every regular R.A.M.C. doctor does a professional refresher course at the R.A.M.C. College and Hospital between his fourth and tenth year of service. This is followed by a competitive examination. All regular R.A.M.C. officers are permitted to specialize if they wish. Many do so, and if some officers get out of date it is largely their own fault. Senior officers with zeal and energy can always combine both professional and administrative duties.

Finally, "N.S.M.O." thinks that bad feeling will be increased between other officers and doctors by further pay increases. This may be so in the case of a few short-sighted "other officers." However, any sensible officer without specialist qualifications expects a doctor to draw higher pay than him. It should be remembered that engineer officers, R.E.M.E., and others with specialist qualifications also get extra pay even if not quite so high as that of medical officers.—I am, etc.,

Seremban, Malaya.

J. G. P. POWER.

Remuneration of Hospital Medical Staff

SIR,—I support absolutely Dr. E. Snell (*Supplement*, December 19, 1953, p. 237) and the other correspondents on this subject. Six years have gone by since 1948. It is incredible to think that negotiations, if they have been going on, have outlived the war in Korea and the truce talks too.—I am, etc.,

Oxford.

J. M. BLACK.

SIR,—The recent letters show quite clearly that the delay in the implementation of the Spens Report is causing disquietude among the consultants. It is now obvious that

our present negotiators are powerless to bring about the desired results. The time has now come when they should immediately withdraw and produce a factual report on the reasons for this impasse. In the meanwhile I should suggest that every consultant should write to his or her M.P. and request their aid in bringing this matter into the open. The negotiations may be delicate, but after seven years' treatment without any clinical cure the patient is entitled to change his physician.—I am, etc.,

Farnborough, Kent.

LOUIS L. GRIFFITHS.

Association Notices

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows:

An Ernest Hart Memorial Scholarship of the value of £250.
A Walter Dixon Scholarship of the value of £250.

These scholarships will be awarded to candidates whom the Science Committee of the Association recommends as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease.

Each scholarship is tenable for one year commencing October 1, 1954. A current scholar may apply to be re-appointed for an additional year. No scholarship may be held for more than three years. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships must be made not later than March 1, 1954, on the prescribed form, a copy of which will be supplied on application to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

MARCH

- 19 Fri. Joint Committee of B.M.A. and the Magistrate's Association, 10.30 a.m.

Branch and Division Meetings to be Held

BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, Queens Drive, Blackpool, Wednesday, February 10, 7.15 p.m., dinner; 8.30 p.m. Sir Heneage Ogilvie.

BRADFORD DIVISION.—At Bradford Royal Infirmary, Wednesday, February 10, 8.15 p.m., meeting. Dr. P. H. Addison: "Medico-Legal Problems Facing the Profession at the Present Day."

CHESTERFIELD DIVISION.—At Walton Sanatorium, Chesterfield, Friday, February 12, 8.45 p.m., meeting. Dr. J. M. Rice-Oxley: "Ulcerative Colitis."

CITY DIVISION.—At Finsbury Health Centre, Pine Street, E.C., Tuesday, February 9, 8.30 p.m., meeting. Mr. E. F. King: "Some Recent Work in Ophthalmology in its Relation to General Practice."

COVENTRY DIVISION.—At Gymnasium, Coventry and Warwickshire Hospital, Tuesday, February 9, 8.30 p.m., clinical meeting. Mr. O. T. Mansfield: "Surgery of Repair."

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, February 9, 8.30 p.m., general meeting. Address by Mr. J. G. Yates-Bell: "Some Aspects of Urology in General Practice."

DORSET DIVISION.—At the Clinic, Glyde Path Road, Dorchester, Wednesday, February 10, 8.30 p.m., meeting. Demonstrations by Dr. T. V. Cooper and his staff.

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, February 11, 7.30 p.m., dinner; 8.45 p.m., Dr. Michael Kremer: "Pain in the Upper Limb."

GLOUCESTERSHIRE BRANCH.—At Gloucestershire Royal Hospital, Thursday, February 11, 6.15 p.m., meeting. B.M.A. Lecture by Dr. Ffrangcon Roberts: "Health, Wealth, and Population."

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, February 11, 8.30 p.m., Mr. J. D. S. Flew: "Modern Obstetric Practice."

HAMPSTEAD DIVISION.—At New End Hospital, Hampstead, N.W., Wednesday, February 10, 8.30 p.m., meeting. Film: "Vascular Diseases and the Management of Ulceration of the Leg."

HASTINGS DIVISION.—At Royal East Sussex Hospital, Hastings, Tuesday, February 9, 8.15 p.m., B.M.A. Lecture by Dr. Wilfrid Sheldon: "Some Common Problems in a Paediatric Out-patient Department."

HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, February 9, 8.45 p.m., meeting. Dr. J. W. McCarthy: "Complaints Against the G.P."

KINGSTON-ON-THAMES DIVISION.—At Griffin Hotel, Kingston-on-Thames, Thursday, February 11, dinner, followed by "Brains Trust."

LEICESTERSHIRE AND RUTLAND BRANCH.—At Grand Hotel, Leicester, Saturday, February 13, 7.30 for 8 p.m., dinner dance.

LEIGH DIVISION.—At Courts Hotel, Church Street, Leigh, Tuesday, February 9, 8.30 p.m., meeting. Address by Professor Wilfrid Gaisford: "Oral Therapy in Paediatrics."

ROCHDALE DIVISION.—At Kingsway Hotel, Rochdale, Monday, February 8, 8.30 p.m., clinical meeting. Dr. E. T. Baker-Bates: "Some Critical Observations on Modern Medical Treatment."

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, February 11, 8.30 p.m., meeting. Dr. J. S. Richardson: "Tenacity in Troublesome Treatments."

SHROPSHIRE AND MID-WALES BRANCH.—At Copthorne Hospital, Shrewsbury, Wednesday, February 10, 3.30 p.m., meeting of Clinical and Pathological Section: "Case Conference."

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Friday, February 12, 9 p.m., meeting. Mr. L. R. Broster: "Adrenal and Allied Conditions" (illustrated by films and slides).

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Tuesday, February 9, 8.30 p.m., meeting. Address by Dr. F. E. Camps: "The Queen v. Christie."

SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, February 5, 9 p.m., meeting. Dr. W. J. Smither, seconded by Dr. E. A. Atkinson: "Gastro-enteritis in General Practice."

SOUTH-WEST ESSEX DIVISION.—At Whipps Cross Hospital, Leytonstone, E., Tuesday, February 9, 8.30 p.m., meeting. Lecture by Dr. William Evans: "Cardiac Pain." A discussion will follow.

SUNDERLAND DIVISION.—At Royal Infirmary, Sunderland, Friday, February 12, 8 p.m., clinical evening.

TOWER HAMLETS DIVISION.—At Poplar Hospital, East India Dock Road, E., Friday, February 12, 8 p.m., clinical meeting.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Tuesday, February 9, 8.30 p.m., clinical meeting. Symposium on the Thyroid Gland.

WEST SUFFOLK DIVISION.—At Everard's Hotel, Bury St. Edmunds, Tuesday, February 9, 8.30 p.m., annual meeting.

WEST SUSSEX DIVISION.—At Burlington Hotel, Worthing, Wednesday, February 10, 6 p.m., general meeting.

Meetings of Branches and Divisions

SOUTH-EASTERN COUNTIES DIVISION

A meeting was held at the Royal Hotel, Galashiels, on July 19, 1953. Dr. Smith was in the chair, and there were 15 members present. On December 5, 1953, 86 members and guests attended a dinner-dance at the Dryburgh Abbey Hotel.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

HOSPITAL JUNIOR STAFFING ARRANGEMENTS

An all-day meeting of the Central Consultants and Specialists Committee was held on February 4 under the chairmanship of Dr. T. ROWLAND HILL. The Committee congratulated those responsible for the arrangements for the dinner on the previous evening in celebration of five years' work of the Committee (see page 42), and expressed its gratification that the Minister of Health in spite of the pressure of parliamentary duties had found it possible to attend.

Professor G. I. STRACHAN introduced a report on the work of the Hospital Junior Staffing Subcommittee, which had been set up to study the urgent problems arising from the shortage of hospital junior staff. He said that his subcommittee felt that many of the present difficulties were due to the rigid staffing structure, which was proving unsuitable for the needs of many peripheral hospitals. Another difficulty was the deterioration in the prospects of advancement in the non-teaching hospitals, which was adversely affecting the recruitment of junior staff.

Professor Strachan submitted a series of recommendations covering matters of general principle which, he explained, were put forward to test the feeling of the parent committee. If they met with approval his subcommittee would then continue with its deliberations, and frame detailed proposals to meet the present situation.

The proposals were the subject of a long debate, in the course of which Dr. S. WAND drew attention to some considerations affecting the general practitioner. He pointed out that there was at present no method whereby the general practitioner with higher qualifications, once he got into general practice, could become a consultant unless he left general practice and started all over again. If any arrangement could be made whereby that anomaly was overcome it would be a very good thing. There were doctors who, after having gone into general practice, wanted to turn to consultant practice, but there was no opportunity for them to do so without incommensurate sacrifice. He suggested that it might be a good thing before the Committee arrived at any firm decisions to consult the General Medical Services Committee.

After further discussion Professor STRACHAN undertook to reconsider the proposals in the light of the remarks made, and bring forward an elaborated report at the next meeting. He was reminded that his subcommittee had power to co-opt.

On other matters concerning hospital junior staffing arising out of a memorandum from the Ministry on the distribution of such staff at various types of hospital and some comments from the Joint Committee, Professor

STRACHAN said that his subcommittee had formed the conclusion that the possibility of solving this particular staffing problem by the training of additional medical practitioners could not be entertained, since this would lead to the gross overcrowding of the profession. But the facts of the present junior staffing should be brought forcibly to the notice of hospital boards and committees with a view to obtaining the better use and distribution of available manpower and the employment of general practitioners on a part-time basis.

The G.P. and the Hospital Anaesthetic Service

Another matter which arose out of this general subject was on a report from the Faculty of Anaesthetists drawing attention to the shortage of anaesthetic staff at hospitals. One suggestion in the report was that an attempt should be made to provide more opportunities for general practitioners to play a part in the hospital anaesthetic services, such as supplementary staff. They would be required to produce evidence of special training in anaesthesia and would be under contract for a limited, but reasonable, number of years.

Dr. TALBOT ROGERS, on behalf of the G.M.S. Committee, welcomed the suggestion that suitably qualified general practitioners should be employed in anaesthetic duties in hospitals, but pointed out that, if there was any suggestion that general practitioners were to be looked upon as an inferior group of people who could only be integrated into the work of the hospital in very junior capacities, very few of them would come forward.

The Committee endorsed the suggestion and asked the subcommittee to look again at the conditions under which such appointments should be made.

Organization of Consultants and Specialists

Mr. H. H. LANGSTON reported on the work of a subcommittee which is considering the reorganization of the Consultants machinery. Suggestions to amend the constitution of the Central Committee included the elimination of group representatives as full members, though representatives of the groups would be invited to attend when matters of special interest to them were under consideration. This and another suggestion would have the effect of bringing down the total membership of the Committee from 77 to 59. The suggestions are to go to the Group Committees for their consideration.

With regard to the regional committees, Mr. Langston said that it was desired to discuss their functions as well as their constitution. He reminded the Committee that it had already expressed the opinion that there should not be separate representation of whole-time consultants and of part-time consultants, and he thought the same applied to consultants and S.H.M.O.s. To split up the constituency

into separate electorates in this way would be quite wrong. It was proposed in the model constitution put forward that the electorate of regional committees should consist of those members of hospital medical staffs who were graded as consultants or S.H.M.O.s.

Review of S.H.M.O. Grade

Dr. PETER EDWARDS, for the Tuberculosis and Diseases of the Chest Group Committee, urged the Committee to press for the adoption of the principle that S.H.M.O.s in posts which are established as consultant should be remunerated on the consultant scale. He said that in his own group as well as in others numbers of men who were S.H.M.O.s were carrying complete responsibility. Mr. NICHOLSON-LAILEY supported this contention. These men were doing their work entirely on their own responsibility, and were not under supervision. It was agreed by a majority that this proposal should be sent to the staff side of Whitley Committee "B." One or two members expressed the fear that action on these lines might in some cases result in disservice to the officers concerned.

Privilege for Hospital Reports

Dr. S. COCHRANE SHANKS reported that a subcommittee under his chairmanship had been considering the possibility of securing that reports of untoward incidents in hospital should be regarded as privileged documents so that they would not be liable to compulsory disclosure in legal actions. It was agreed that this matter be further discussed with the Ministry.

Machinery for Investigating Complaints

The procedure for investigating complaints against the professional competence or personal conduct of hospital medical staff was also the subject of a report by Dr. COCHRANE SHANKS. He said that his subcommittee had worked out a procedure which, subject to the approval of the Council, of the Joint Committee, and of the three defence societies, would be recommended to the Ministry. In brief summary, when a charge was made, the chairman of the employing authority, if satisfied that a prima facie case had been made out, would authorize an inquiry to be conducted by a committee appointed by the authority. The procedure provided for consultation by the respondent with his medical defence organization and for his right to be heard in his own defence. The proposed constitution of the committee of inquiry was carefully defined. The committee would have no disciplinary powers; it would be empowered only to make recommendations. Provision was made for appeal.

The report was approved by the Central Committee, and the subcommittee was thanked for its work.

Study Leave

The question of study leave was raised by Mr. NICHOLSON-LAILEY, who called attention to the unsatisfactory position which had arisen in the South-western Region. It appeared that a limited period of six days' study leave was granted by the hospital board without question, but any further period was almost impossible to obtain. He spoke of an extremely unsympathetic attitude in this matter, especially towards consultants in the smaller hospitals.

Mr. LANGSTON said that the difficulty was that the Ministry had never given any guidance concerning the amount of study leave that might be granted in any one year or other period. Another difficulty was that in a regional area one individual might apply repeatedly for study leave, while another, whom it was desired to send on study leave, could not easily be encouraged to apply.

Other members of the Committee spoke of the difference between the practice of boards of governors and regional boards, the former being much more generous in granting study leave.

The CHAIRMAN suggested that this matter was one which should go to the Joint Committee, and it was agreed that this course be taken.

Other Business

Consideration was given to the question of defraying the expenses, including travelling expenses, of members attending meetings of regional committees, and it was agreed that inquiries be made to ascertain the total financial liability with a view to an expense levy.

At its previous meeting the Committee approved the policy of sending a bulletin at intervals to the medical staffs of hospitals throughout the country with a view to supplying them with information about the work done at the centre. It was reported that many letters of appreciation had been received from hospital group medical committees with regard to the usefulness of the first of these issues, and it was agreed that in future copies of the bulletin should be supplied in bulk for all members of hospital group committees.

Scottish News

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

In view of the increasing amount of work which has fallen to the Subcommittee during the winter it has been decided that meetings of the Subcommittee will be held monthly and that every third meeting will take place in the Glasgow Regional Office for the convenience of the many members in the West of Scotland. The Subcommittee met in the Scottish Office twice in December and the January meeting was held in the Glasgow Regional Office. The following are some of the matters which arose at those meetings.

It was intimated with regret that owing to pressure of work Dr. D. S. Robertson, of Edinburgh, and Dr. W. A. Weatherhead, of Galashiels, had been forced to resign from the Subcommittee. They were replaced by Dr. E. V. Kuenssberg, of Edinburgh, and Dr. R. McGregor, of Hawick, respectively.

Highlands and Islands Affairs

Representatives of the Subcommittee had a meeting with certain practitioners from the Highlands and Islands areas to discuss points which seemed to be causing these practitioners some concern—namely, the mileage fund and the representation of their views centrally. The meeting was most successful, and further meetings are being arranged.

Group Practice Loans

The Subcommittee has been in consultation with the Department of Health regarding the proposal to set up a fund to make loans available to practitioners to encourage the establishment of group practice. In England, the Cohen Committee produced a definition of group practice for the purpose of a similar fund (*Supplement*, January 30, p. 27), and their definition, while not being accepted rigidly in Scotland, will form the basis on which claims will be considered—the intention in Scotland being that the availability of such loans should be on as wide a basis as possible. The fund will be administered by a Joint Committee with representatives of the Department of Health and the Subcommittee. The representatives from the Subcommittee are: Dr. J. T. Baldwin, chairman; Dr. C. J. Swanson, vice-chairman; and Dr. J. T. McCutcheon, secretary. The Subcommittee has almost completed its discussions with the Department, and it is hoped that the scheme will commence on April 1, 1954. Additional details should be available to practitioners in the near future.

Trainee Assistants Scheme

The Subcommittee has approved a note of guidance for "trainers" under the Trainee General Practitioners Scheme

which is to be issued by the Department of Health to all "trainers." It is hoped that this memorandum, which contains items of administrative interest, will prevent the recurrence of some minor difficulties which have arisen.

The Subcommittee has had discussions with the Ministry of National Insurance and the Department of Health regarding the reference of cases to regional medical officers. Every endeavour is being made to persuade the Department that the reports submitted by practitioners on patients called for examination by regional medical officers should influence them on whether or not the patient should, in actual fact, be required to attend for examination.

Prescribing Costs

The Subcommittee is also discussing with the Department the question of the investigation into extravagant and excessive prescribing. Areal statistics will again be available shortly, and it is hoped that these will ease the work of local medical committees in the investigation of prescribing and enable practitioners to keep an eye on their own prescribing, since they will know the average for their own area. Discussions are about to take place on the subject of examination of prescriptions for drugs listed in categories 5 and 6 of the classifications by the Joint Committee on Prescribing, and an announcement about this will be made as soon as possible.

At the request of the Scottish Committee the Subcommittee is undertaking at an early date a revision of the Partnership Memorandum which the Subcommittee prepared originally in 1951. It is hoped to improve on the Memorandum in the light of experience.

SALARY SCALES OF L.C.C. MEDICAL STAFF

A report made by the several committees concerned to the London County Council on February 2 contained proposals for new salary scales for the senior medical staff. In general the scales for the senior staff have not been altered since 1951, apart from the cases of the deputy medical officer of health and the senior principal medical officer, for whom increases were approved in November last. The junior grades of assistant medical officer and senior assistant medical officer have lately received increases. It is considered that it would be equitable to grant increases as from July 1 to the intermediate grades of medical staff and to the chief dental officer. For these grades and for divisional medical officers increases of £100 are suggested throughout the salary scales, and for assistant divisional medical officers of health in five of £50. For the divisional medical officers of health in five divisions with populations under 400,000 the increase is proposed on the understanding that it will be merged in any future increase in the relevant national rates; the salaries of the other grades are not prescribed nationally. The proposals do not apply to one division where the divisional officer is also medical officer of health for two metropolitan boroughs and each of the two assistant medical officers is deputy medical officer for one of the boroughs; these positions will be dealt with later. The proposed revised scale will be as follows:

Principal medical officer	£1,750 by £50 to £2,050
Chief dental officer	£1,750 by £50 to £2,050
Divisional medical officer, divisions 1, 2, 7	£1,700 by £50 to £2,050
Divisional medical officer, divisions 3, 4, 5, 6, 8	£1,600 by £50 to £2,000
Psychiatrist (whole-time)	£1,750 by £50 to £2,050
Assistant divisional medical officer, divisions 1, 2, 7	£1,450 by £50 to £1,750
Assistant divisional medical officer, divisions 3, 4, 5, 6, 8	£1,400 by £50 to £1,700

The County Council agreed to the proposals.

AMBULANCE SERVICES

THE LOCAL AUTHORITY WITHIN THE HOSPITAL

A circular (H.M.(54)11) for the guidance of hospital boards on the question of indemnifying local health authorities against legal liability incurred by their ambulance crews on hospital premises has been issued to regional hospital boards, hospital management committees, and boards of governors of hospitals by the Ministry of Health. Local health authorities have received a similar circular.

The Ministry states that "for reasons of economy of expenditure and manpower" it is desirable that the practice in some hospitals, where local authority ambulance crews carry patients within the hospital, should be continued. The ultimate responsibility for meeting all awards of damages, etc., against the local health authority in respect of negligence of its employees in these cases, however, rests with the hospital board, as it is not a local authority duty under the Act to transport patients beyond the reception point (the point at which the patient leaves the ambulance). The local authority should be indemnified accordingly.

PAYMENTS ON ACCOUNT

SHEFFIELD EXECUTIVE COUNCIL'S DECISION

The Sheffield Executive Council at its meeting on November 3, 1953, considered whether the Minister should be asked to approve an amendment of the distribution scheme to ensure definite provision for payments on account to doctors, apart from any considerations of difficulty or hardship to individual medical practitioners. The local medical committee had recommended appropriate amendment of paragraph 19 of the model scheme, and the council resolved "That, subject to the approval of the Minister of Health, the council's distribution scheme be amended by the deletion of paragraph 19, and the substitution therefor of the following amended paragraph:

Advances on Account

19. (1) The Council may on the request of the local medical committee make a payment on account in advance of the payment due to a practitioner at the end of a quarter. The payment on account shall consist of a single advance payment not earlier than the middle of the quarter of not more than one-half of the amount estimated to be due to the practitioner for the quarter by way of capitation payments and loadings having regard to the number of persons on his list on the first day of the quarter and the quarterly rates notified by the Minister for the immediately preceding quarter in respect of capitation payments and loadings.

(2) If a practitioner, after receipt of an advance payment made in accordance with sub-paragraph (1) of this paragraph but before the end of the quarter in respect of which such an advance is made, can satisfy the Council that it would involve difficulty or hardship for him to wait for further payment until the end of the quarter, the Council may, at their discretion, make a supplementary advance which shall not exceed the balance of the amount estimated to be due to the practitioner for the period from the beginning of the quarter to the date on which the supplementary advance is made.

Minister's Approval

The clerk of the executive council was instructed to seek the Minister of Health's approval to this amendment, to have effect from April 1, 1954.

At its meeting on January 5 the clerk reported that, following the last meeting, he had conveyed to the Ministry of Health the council's feelings concerning its proposed amendment; and he stated that he had received from the Department a letter dated November 21, 1953, in which it was stated that the Minister was prepared to accept the proposed amendment on the understanding that no additional staff would be required to cope with the work involved.

WHITLEY COUNCILS FOR THE HEALTH SERVICES (GREAT BRITAIN)

MEDICAL COUNCIL COMMITTEE "C"

The following M.D.C. circular (No. 21) signed by the joint secretaries, Dr. A. V. Kelynack and Mr. J. S. B. Butler, and dated February 4, 1954, has been issued to all local authorities in Scotland.

CAR AND SUBSISTENCE ALLOWANCES FOR PUBLIC HEALTH MEDICAL OFFICERS IN SCOTLAND

"Committee 'C' of the Medical Whitley Council have over a long period of time been considering the question of car and subsistence allowances for public health medical officers in Scotland. The arrangements in England and Wales for payment of subsistence allowances to public health medical officers are set out in Appendix II to M.D.C. Circular No. 11; and for the payment of car allowances, in the enclosure to M.D.C. Circular No. 13 as revised by the enclosure to M.D.C. Circular No. 15 and by M.D.C. Circular No. 18. No final agreement has yet been reached for Scotland, but as an interim measure the Committee have agreed to make the following recommendation to all local authorities in Scotland:

"That if by May 16, 1954, no final agreement has been reached in Committee 'C' on car and subsistence allowances for public health medical officers in Scotland then the arrangements made by the Committee for the payment of these allowances to public health medical officers in England and Wales should be applied to public health medical officers in Scotland. This provision is an interim arrangement, which shall cease upon the expiry of three months after the promulgation of any agreement relating to local authority officers in Scotland reached by the Joint Negotiating Committee for Chief Officials of Local Authorities (Scotland)."

"Our Committee wish to make it clear that, since the arrangement described above is an interim one, they do not regard their recommendation as in any way constituting a precedent in support of any representations that may be made in negotiations in Scotland relating to the fixing of car and subsistence allowances for chief officials."

THE COST OF HEALTH, 1952-3 CIVIL APPROPRIATION ACCOUNTS

For the year 1952-3 the National Health Service (England and Wales) cost £450,818,689,* an increase of over £40m. on the cost for 1951-2. Included in this increase is a supplementary grant of £34,569,000 to cover the cost of the Danckwerts award. The administrative expenses of the Ministry of Health and the Welsh Board of Health were £2,153,567. The World Health Organization received £343,535 on grant-in-aid from the Ministry of Health.

Hospital Services

The total expenditure on the hospital, specialist, and ancillary services in England and Wales during 1952-3 was £255,925,715. Of this amount, advances to regional hospital boards and to boards of governors of teaching hospitals accounted for £214,740,965 and £35,808,861 respectively. Capital expenditure by the Minister in the acquisition of land, hospitals, and equipment was £685,850. The expenses of the Minister in connexion with research were £29,786. The treatment abroad of residents of England and Wales

The treatment abroad of respiratory tuberculosis cost £96,573 (an increase of over £68,000 over the previous year, when this was a new service). Current expenditure of the Public Health Laboratory Service was £831,209.

Local Health Authorities

The cost of grants to local health authorities was of the order of £18,553,086. Midwifery and the care of mothers

*Civil Appropriation Accounts (Classes I-VIII), 1952-3. H.M. Stationery Office, London.

and young children cost £6,445,119, and £5,490,176 was spent on health visiting, home nursing, and domestic help. The cost of vaccination and immunization was £243,102. £4,574,699 was spent on the ambulance services.

General Medical Services, etc.

The total expenditure on general medical and dental services, pharmaceutical services, and supplementary ophthalmic services in England and Wales was £149,832,859. In this were included the expenses of executive councils as follows: administration, £2,372,897; general medical services, £75,631,433; pharmaceutical services, £42,886,979; general dental services, £22,089,093; supplementary ophthalmic services, £6,034,701.

Other Expenditure

The general expenses of Broadmoor Institution and mental deficiency hospitals administered by the Board of Control were £451,327. Salaries, etc., in these institutions amounted to £448,075.

Maintenance of the National Health Service Central Register by the Registrar-General's Office cost £175,321.

**MINISTER AT CONSULTANTS' DINNER
WHOLE-TIME SALARIED SERVICE "DISASTROUS"**

A dinner to celebrate five years' work of the Central Consultants and Specialists Committee was held in the Great Hall of B.M.A. House on February 3 under the chairmanship of Dr. T. Rowland Hill. The Minister of Health was the principal guest. Before he could make his speech, however, he was called to the House of Commons. He returned at a later stage of the proceedings and delivered the final speech of the evening.

Mr. T. HOLMES SELLORS, in proposing the Minister's health, referred to the pre-N.H.S. days as the bachelorhood of the profession, when it went along in a fairly happy-go-lucky way and managed its own affairs. Since then there had been a "shot-gun marriage," and from that time onwards most of its housekeeping had been done for it. This argument and difference of opinion. It might be that they were now on their way to greater harmony. Certainly both sides realized that nagging and too much attention to detail were the easiest way to destroy unity. He expressed appreciation of the sympathetic attitude shown by the Minister and officials of the Ministry which had helped to make things run smoothly in one of the greatest social experiments in this country's history.

Mr. D. W. C. NORTHFIELD, in toasting the guests, said that these included the Presidents of the three Royal Colleges and of the British Medical Association. He highly praised Sir Russell Brain's chairmanship of the Joint Consultants Committee. He referred also to the presence of Mr. A. M. A. Moore, who was one of the principal architects of the Central Consultants and Specialists Committee and who must be rejoicing in its sturdy growth. A tribute was also due to the staff of the Association, in particular to the Committee clerk, Mr. Hacker.

The President of the Royal College of Physicians
Sir RUSSELL BRANDE

Sir RUSSELL BRAIN, P.R.C.P., referred to the happy relations existing between consultants and general practitioners. If there were any serious difference between the two branches of the profession on any matter of moment it would be a kind of professional schizophrenia. The two branches were in constant consultation, and he thought it was true to say that no important step was taken on either side without joint discussion. Speaking of the Joint Consultants Committee, he said that it might be thought that this was rather an illogical body, but in practice it worked extremely well.

The Joint Committee and the staff side of Whitley Council had very great responsibilities, and their difficulties were not diminished by the fact that from time to time, for reasons outside their control, they were not able to say exactly what was going forward. Physicists told him of the principle of indeterminacy. He had discovered the principle that a thing might be completely motionless and even so be completely undiscoverable, and this he proposed to call the Whitley principle of obscurity.

The Minister would agree with him, Sir Russell Brain went on, that neither politics nor administration was an end in itself. The purpose of administration, and even of Whitely Councils, was to create conditions in which the best possible work could be done. Let it also be remembered that they were now legislating for the future. What happened to themselves at this time did not matter so much as what happened to their successors, the conditions they would be called upon to work under, the sort of freedom they would enjoy.

Dr. J. D. S. CAMERON proposed the health of the Central Consultants and Specialists Committee. He said that complete harmony existed between the representatives of the Colleges and Corporations on the Joint Committee and the representatives of the Central Committee. The Chairman of the Central Committee (Dr. Rowland Hill) had proved a most admirable member (and vice-chairman) of the Joint Committee, and in addition to him five other members of the Central Committee served on the joint body. The motto of them all might be "With One Aim," and the primary aim was to secure a smooth-running health service.

The Chairman of the Committee

Dr. T. ROWLAND HILL, in replying to the toast, briefly outlined the constitution of the Committee. After five years it was not surprising that some of the machinery required attention from the point of view of efficiency, and a subcommittee was working under Mr. H. H. Langston with a view to strengthening it. Between the Joint Committee and the Central Committee there was perfect amity in the formation of policy. During the last five years an enormous amount of hard constructive work had been done by both bodies.

He felt at times that they might have done better than they had done, and that in particular not sufficient attention had been given to the technique of joint consultation. He pleaded for more systematic study of the art of thinking together. Too often perhaps consultation took place after, and not before, one or both sides had already made up their mind to a certain course of action or inaction.

Another important aspect of the work of the representative consultant organizations was the humdrum but very necessary down-to-earth work on terms and conditions of service and their modification from time to time. Many critics of the Whitley machine to-day had expressed the view that it was not working satisfactorily in the Health Service, and was in need of re-examination. They were all agreed that negotiating machinery of this kind was absolutely essential, but it was a question of making it work. He hoped that as time went on something warmer and better than the cash nexus would unite the profession with the public administration of hospitals.

The Minister of Health

The Rt. Hon. IAIN MACLEOD, M.P., who had by this time returned from the House of Commons, made the last speech of the evening. He said that if we looked back to the White Paper of 1944 which plotted the Health Service we should find that it said that there were not enough consultants, and that, of those who were in their posts, many of them were not in the right place. In so far as numbers were concerned, there had been an increase in five years of something like 25%—that is to say, an annual increase of about 6%, compared with an increase in the number of beds brought into use of 14%. Thus there had been an increase both

some danger of suggestions that I think are utterly unworthy being made. I am particularly concerned at the suggestion that in some strange way whole-time specialists are different from part-time specialists. There was a particularly unworthy article in a weekly newspaper about 10 days ago on that subject, and to read that sort of article and listen to the speeches which are made on the subject one might come to think that all the whole-time consultants are unselfish, righteous, holy people—and, of course, Socialists—while the part-time consultants are wicked, money-grabbing charlatans—and, of course, Tories. It is not necessary for me to comment on that to you, but it may be necessary to make a comment on it for the benefit of people outside these walls. Consultants and specialists are not primarily whole-time or part-time, they are primarily doctors, and they have the same standard of ethics and conduct towards their patients whether those patients are in private rooms or in wards, and whether the consultant works whole-time or part-time or in fact is not within the N.H.S. at all."

Questions Answered

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

University Lecturer and Tax Relief

Q.—I am a full-time university lecturer, holding an honorary contract from the regional board as a consultant in medicine. The regional board will grant car allowance for visits to peripheral hospitals only when these are concerned with the care of patients. The majority of visits are connected with research, and these are not allowable for expenses. Claims for income-tax relief on these car journeys have been refused. The inspector of taxes has also refused relief for telephone expenses, replacement of textbooks, subscriptions to societies, and cleaning and heating of a study used for private work, such as writing textbooks and occasional examination of private patients. Is he correct in all these refusals?

A.—It is assumed that the remuneration as a whole-time university lecturer is the only source of income with which the taxing authority is concerned—the contract with the regional board being an honorary one and the receipts from private patients appear to be negligible. Unless, therefore, the holding of the regional board's appointment is a condition attached to the university appointment, the only expenses that are allowable are those incurred "wholly, exclusively, and necessarily in the performance of the duties of the office" of university lecturer. The phrase quoted has been the subject of judicial consideration in many cases, and the courts have construed it strictly. For instance, in the case of *Nolder v. Walters*, Rowlatt J. said: "In the performance of the duties means in doing the work of the office—in doing things which it is his duty to do while doing the duty of the office. Expenses incurred in getting to the work are not incurred in the performance of the duties—although he is obliged to perform them."

Taking the various expenses mentioned *seriatim*:—(1) Car expenses and telephone expenses: The questioner is unlikely to succeed in his claim unless his holding of the regional board's appointment is an express condition of his contract of service with the university. If there is such a condition it is considered that a reasonable allowance can be claimed. (2) Textbooks and subscriptions: Expenditure of this nature has been regarded by the High Court as incurred to maintain ability to do the work required, but not incurred in "the performance of the duties" and consequently not allowable. (3) Use of part of residence for writing textbooks and seeing occasional private patients:

A reasonable amount can be deducted as expenses in the calculation of the income derived from those sources.

Entertainment Expenses

Q.—I am a part-time consultant in pathology, and depend for my private practice on the good will and close liaison with other consultants, as patients never come directly to me. The inspector of taxes refuses my claim for entertainment expenses. May I have an opinion on this matter?

A.—The leading case on the question of expenses incurred in entertaining with a view to financial gain is the case of *Bentleys, Stokes and Lowless v. Beeson*, which was heard by the Court of Appeal in May, 1952. The expenses then concerned were incurred in entertaining clients to lunch at a club or at restaurants. The entertainment was confined to existing clients, who alone were present and with whom the discussions, which were an essential feature of the professional work of the firm, then took place. The Court allowed the firm's appeal against disallowance of the expenses so incurred, holding that the professional purpose was the sole purpose of the hospitality given. It was, however, stated that, "if the activity be undertaken with the object both of promoting business and also with some other purpose, for example with the object of indulging an independent wish of entertaining a friend or stranger," then the statutory requirement is not satisfied. It is, of course, difficult to say how far the questioner's case falls within the principles laid down as governing the allowance of the expenses incurred by him, but there are two rather important distinctions. In the decided case only existing clients were entertained, and professional work was done during the entertainment. I doubt whether other consultants would be regarded as clients, and, while the questioner's case has claims to sympathy, I should not regard an appeal against the inspector's decision as likely to succeed.

Correspondence

Grading of S.H.M.O.s

SIR.—One aspect of the Ministry of Health's economy campaign calls not only for close scrutiny but also for action by the B.M.A. It is becoming increasingly obvious that the Ministry is not only ready to confirm S.H.M.O.s in an occupational "dead-end," but under the guise of retrenchment is exacerbating the position by its refusal to implement the recommendations of regional boards with regard to consultant posts; with the result that these positions, initially regarded as warranting consultant status by those best fitted to judge, are eventually advertised under an S.H.M.O. grading. But the work remains the same. The Ministry doubtless counts on filling the ranks of the "dead-end kids" from the Cinderellas of the registrars.

If this policy is permitted to continue and to expand—as expand it will, unless strongly challenged—the prospects of the S.H.M.O. and the registrar will become increasingly gloomy. The position is not ameliorated either by the decline in the purchasing power of the £ since 1947 or by the refusal of the elementary right of arbitration. Any trade union may go to arbitration: indeed, refusal so to do is regarded, in the Shavian sense, as immoral. But the consultants and specialists are denied this right.

Substantial economies can and must be made, but the niggling saving resulting from the downgrading of posts, and similar cheese-paring, gives rise to grave discontent and is effected at the expense of the morale of the Service.—I am, etc.,

Middlesbrough.

STEWART GOURLAY.

Remuneration of Hospital Medical Staff

SIR.—The remuneration of hospital staffs seems to be following a familiar pattern. Some years ago when negotiations concerning panel fees were in progress the B.M.A. stated

that the Government displayed not only lack of good will but bad faith. In respect of the Spens award the same situation arises. The Government knows that it is disregarding its obligations and that dispassionate arbitration would show this. It therefore refuses arbitration.

The interest of the hospital staffs is divided by the distinction awards. Those in receipt of these Government payments do not feel the pinch as do those who remain undistinguished. It is curious that the Minister should be so disinclined to earn the respect of hospital staffs and so careless of the prospects of recruitment. It is to be regretted that arrangements for remuneration intended to provide incentives should rest on obvious inequity and favour divisions within the profession.—I am, etc.,

K. E. BARLOW.

Ipswich.

Regional Medical Officers

SIR. It would be instructive to have the views of other practitioners on the need for regional medical officers. At the present time when much is being done to reduce the cost of the Health Service, this particular office seems to be an unnecessary luxury.

Surely, when a registered practitioner is regularly seeing a patient at short intervals and supervising his treatment he is able to judge whether the patient is fit for work or not without the patient having to go to the R.M.O. for him to decide. Moreover, when the practitioner in charge has sent detailed notes to the R.M.O. explaining why the patient is unfit for work, and in many cases points out that he is also having treatment as a hospital out-patient under the care of a specialist, and the R.M.O. still insists on seeing the case, it is an insult to both general practitioner and specialist, as it questions either their professional competence or honesty.

For over 29 years I have had to send patients, whom I have certified as unfit for employment, to the R.M.O. for him to decide whether I am right in my judgment, and out of hundreds of cases only once has he disagreed with my opinion. This must be the experience of many others, and I would like to suggest that the R.M.O.'s services be done away with, except in those cases in which there is a real difficulty in deciding whether a patient can do a certain job or not.—I am, etc.,

H. TUDOR EDMUNDS.

Slough.

Ophthalmic Group Committee

SIR. The Supplement of January 2 (p. 5) had a report of an Ophthalmic Group Committee meeting held on December 11, 1953, at which evidence to be produced to the Guillebaud Committee was discussed. It appears that this evidence was agreed by the Council of the B.M.A. and duly submitted, and that it recommended the introduction of a sessional refraction service, to be run by hospital boards, in place of the present per capita Supplementary Eye Service.

It is very doubtful if such a service—considering the capital expense involved in establishing the clinics, and the swollen overheads inevitably associated with hospital boards—would involve any overall saving to the National Health Service. But there is no doubt whatever that such a service would involve reduced earnings for ophthalmologists, and it would be interesting to know whose interests the Group Committee consider they are serving in making this recommendation—those of the general taxpayer or those of ophthalmologists? And if the latter, which ophthalmologists?

The report talks glibly about "the enhanced status" to be enjoyed by working in a clinic, but who wants an enhanced status if it means that one's earnings are reduced to a maximum of £1,500 per annum (as a part-time S.H.M.O.)? And, pray, just what "opportunities for promotion and advancement in the hospital service" are there for the S.H.M.O. without his Fellowship?

Unlike other groups, the Ophthalmic Group never holds general meetings. The Committee, once elected, becomes the complete dictator of ophthalmic politics. It never takes any steps to find out what are the views of its members before taking important decisions such as the above. As the earnings of all ophthalmologists, be they well known or small fry, are now so largely dependent on politics, I would suggest that all who wish to have some say in their future should: (1) join the Ophthalmic Group. There is no extra fee apart from the B.M.A. subscription, (2) take a very active interest in the election of Committee members, (3) in voting, pay more attention to the candidate's political views (if these can be found out) than to his professional eminence.—I am, etc.,

Petersfield.

R. L. KERR.

Reforming General Practice

SIR.—From time to time some criticism of the Health Service has appeared in the *Journal*. Also, recently, responsible and far-sighted men have been saying that the expenditure on the Welfare State is more than can be afforded. As economic realities come to be faced, these voices will grow stronger and louder, and presently no doubt will insist on pruning the Service to reduce its cost to the country.

The general-practitioner service as it stands now is not sacrosanct, and after five years some modifications are both desirable and necessary. First, the flat capitation rate of 17s. needs to be more flexible. In most walks of life age and experience achieve some measure of acknowledgment. A recently qualified man may, under certain fortuitous circumstances, command the same reward as his senior who has a lifetime of hard work and experience behind him. That both should receive the same level of remuneration is a matter for thought and reflection. After 50, age with its flagging energies limits a doctor's plans as well as his list. In the past some of these anxieties were relieved by the employment of an assistant. To-day the expense is prohibitive.

Partnership is another item requiring attention, with a reversal of the official encouragement to the grouping of doctors. Collectivization of practices and the monopolizing of whole areas by a firm or firms of doctors does not lend itself to healthy competition. Such partnerships are evolved and formed for personal gain, usually of a financial nature. Public interest is scarcely considered in the deliberations of these transactors. To subsidize them is a misuse of funds that could be better applied elsewhere.

Lastly, the closure of any area should be abolished and a doctor left free to practise where he chooses. On the other hand the classification should remain, and the financial inducements to such areas retained. As things stand, an incompetent or indifferent doctor need not fear the spur of active competition in a closed district. He is not going to be disturbed by anything less than an explosion. Changes along these lines might well be taken while there is time. We were caught on the wrong foot once. Why repeat the operation?—I am, etc.,

Blakeney, Glos.

J. M. ASHTON.

Notes and News

A State of Too Much Welfare?—A young collier aged 22 recently walked into a doctor's surgery on a bitterly cold morning with temperatures below freezing point. He asked for a certificate for the National Coal Board to cover his bonus due to absence from work the previous day—because he had overslept. He then remarked that he wasn't going to work the rest of the week, and appeared completely surprised on being informed that the doctor could not comply with his demand for a National Insurance "Compo" certificate.

H.M. Forces Appointments**ROYAL ARMY MEDICAL CORPS**

Major R. L. MacPherson, M.B.E., to be Lieutenant-Colonel.
Major L. R. Taylor has retired with a gratuity and has been granted the honorary rank of Lieutenant-Colonel.
Captain J. H. G. Brodribb to be Major.
Short Service Commission.—Captain C. C. Langford to be Major.

REGULAR ARMY RESERVE OF OFFICERS

Colonel H. C. Godding, M.C., late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the R.A.R.O.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel W. H. Scriven, M.B.E., from T.A., to be Lieutenant-Colonel.
Captain (Honorary Major) C. C. Langford has relinquished his commission.

ARMY EMERGENCY RESERVE OF OFFICERS**ROYAL ARMY MEDICAL CORPS**

Majors T. E. Jones-Davies and C. Cameron to be Lieutenant-Colonels.
Captain (acting Major) R. A. Shanks has been granted the acting rank of Lieutenant-Colonel.
Captains P. W. Ingram and F. Smith to be Lieutenant-Colonels.
Lieutenant (acting Major) A. W. Naddell has been granted the acting rank of Lieutenant-Colonel.

COLONIAL MEDICAL SERVICE

The following appointments have been announced: G. Ashe, M.B., Ch.B., D.T.M.&H., Medical Officer (T.B.), Aden; A. B. Da Costa, M.B., B.S., M.R.C.P., Senior Physician, British Guiana; C. H. Gurd, M.B., Ch.B., M.R.C.P., C.P.H., Physician Specialist, Fiji; D. H. Mackay, M.R.C.S., L.R.C.P., D.P.H., Senior Medical Officer, Kenya; F. Zammit, M.D., Medical Officer, Nigeria; Maureen D. Connolly, M.B., Ch.B., M.R.C.O.G., D.C.H., and J. A. McKinnon, M.B., Ch.B., Medical Officers, Kenya; J. S. Holden, M.B., Ch.B., Medical Officer, Uganda; A. G. Larson, M.B., B.S., and G. Y. McCrirk, M.B., Ch.B., Medical Officers, Fiji; P. O'Driscoll, M.B., Temporary Medical Officer, Nigeria; M. J. Robertson, M.R.C.S., L.R.C.P., Medical Officer, Federation of Malaya; F. J. Wickremasinghe, M.B., B.S., D.P.H., Temporary Medical Officer of Health, Gold Coast; A. E. O. Williams, L.R.C.P.&S.I., Medical Officer, Sierra Leone.

Branch and Division Meetings to be Held

BATH, BRISTOL, AND SOMERSET BRANCH.—At Royal United Hospital, Bath, Wednesday, February 17, 8.30 p.m., Branch meeting, Dr. W. E. W. Bridger: "The Scope of Psychiatry To-day," with particular reference to the principles and procedures as they affect general practitioners and consultants.

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, February 16, 8.30 p.m., meeting. Address by Dr. Clifford G. Parsons.

BRIGHTON AND MID-SUSSEX DIVISION.—At Hotel Metropole, Brighton, Friday, February 19, 8 for 8.30 p.m., annual dinner.
ENFIELD AND POTTERS BAR DIVISION.—At Chase Farm Hospital, Enfield, Friday, February 19, 8.30 p.m., meeting. Lecture by Dr. G. F. Newbold: "Hypnotism and its Importance in Medicine." Some diagrams and a film will be shown, and there will be a demonstration of hypnotism.

LAMBETH AND SOUTHWARK DIVISION.—(1) At Lambeth Hospital, Brook Drive, Kennington Road, S.E., Sunday, February 14, 11 a.m., clinical meeting. (2) At South Western Hospital, Landor Road, Stockwell, S.W., Friday, February 19, 2.15 p.m., clinical meeting.

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, February 16, 2.30 p.m., clinical meeting.

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thursday, February 18, 7.15 p.m., clinical demonstration by Mr. J. D. T. Jones: "Treatment of Portal Hypertension"; 8.45 p.m., address by Professor E. Farquhar Murray: "Return Trip to China and Japan."

OLDHAM DIVISION.—At Oldham Hotel, Rhodes Bank, Oldham, Monday, February 15, 9 p.m., meeting. Dr. J. W. A. Hunter: Discussion on some aspects of Prolapse, illustrated by a film.

SOUTH STAFFS DIVISION.—At Bradmore Hotel, Trysull Road, Wolverhampton, Friday, February 19, 8 p.m., supper meeting; 9.15 p.m., lecture by Dr. J. H. Sheldon: "Obesity."

SUNDERLAND DIVISION.—At Bay Hotel, Sunderland, Thursday, February 18, annual dance.

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Friday, February 19, 9.15 p.m., meeting. Annual B.M.A. Lecture by Dr. R. M. B. MacKenna: "Some Difficulties in Dermatology," illustrated by coloured lantern slides.

SWANSEA DIVISION.—At Osborne Hotel, Swansea, Thursday, February 18, B.M.A. lecture by Dr. R. Donald Teare.

WINCHESTER DIVISION.—At Royal Hotel, Winchester, Wednesday, February 17, 8.15 for 8.30 p.m., meeting. Annual B.M.A. lecture by Dr. Macdonald Critchley: "The Body Image."

Meetings of Branches and Divisions**GLASGOW DIVISION**

A meeting was held in the Glasgow Regional Office on December 9, 1953. Fourteen members were present, and Dr. W. D. Anderson took the chair. Arrangements were discussed for the Annual Meeting to be held at Glasgow.

MOMBASA DIVISION

A meeting was held at the Pandya Memorial Clinic on October 23, 1953. Dr. A. U. Sheth took the chair in the absence of the chairman, and there were eight members present. At a meeting at the Rahimtulla Waljee Hirji Asian Hospital on October 27, when 10 members attended, Dr. Harries presented interesting cases. Another meeting was held on November 27, 1953, at the Pandya Memorial Clinic, when Dr. Sheth again took the chair, and 12 members were present.

ROCHESTER, CHATHAM, AND GILLINGHAM DIVISION

The annual general meeting was held at the Guildhall, Rochester, on January 17, 1954. In the unavoidable absence of the chairman, the chair was taken by Dr. H. J. Hoby. There were 20 members present. The following officers were appointed:

Chairman.—Dr. E. C. Gross.
Vice-chairman.—Dr. M. Landau.
Hon. Secretary.—Dr. J. O. Murray.
Hon. Treasurer.—Mr. E. J. Greenwood.

Dangerous Drugs Act: Restoration of Authority

The Home Office announces that the authorities granted by the Dangerous Drugs Regulations under the Dangerous Drugs Act, 1951, have been restored to Dr. Geoffrey Roderick Richards (Swansea).

THE B.M.A. AND THE PROVISIONALLY REGISTERED PRACTITIONER**ORGANIZATION COMMITTEE'S DISCUSSION**

The Organization Committee of the Association at its meeting on January 26 discussed a report of one of its subcommittees, known as "The Medical Students and Newly Qualified Practitioners Subcommittee," about the relationship between the B.M.A. and the hospital resident, with particular reference to the provisionally registered practitioner. The subcommittee includes representatives of the teaching schools and of the British Medical Students Association, and, as its name implies, its chief concern is the recruitment to the B.M.A. of the newly qualified practitioner. It has done much to stimulate the interest of senior students, and in co-operation with the B.M.S.A. has initiated, among other things, the arrangement by which they receive the *Journal* at a special rate and the holding of B.M.A. lectures in the teaching centres.

Student or Doctor?

The Organization Committee had in mind the value of the close co-operation between the Association and the students organization which was shown during the discussions that accompanied the passing of the Medical Act, 1950, and the start of the pre-registration year. At that time it was not clear at first whether the pre-registration house-officer would look to the B.M.A. to watch his interests or whether he would continue to rely on the British Medical Students Association, with which he was familiar and in which presumably he had confidence. When it became clear that while holding an approved post the provisionally registered houseman would virtually be regarded as a duly qualified and registered practitioner, the Association altered its by-laws to admit the provisionally registered practitioner to membership. The Organization Committee, therefore, recognizes its obligation to provide means by which both as an individual and as a member of a definite group he can have the full benefits of membership.

Reduced Subscription

The newly qualified practitioner has always paid a reduced subscription to the B.M.A. This is not, as was pointed out in the Committee, solely because the payment of the full rate might cause hardship but rather because in the days before the Health Service many of the privileges of membership were of no value to him. The house-officer's world was then bounded by his hospital and he had few interests in common with the Division in which he was temporarily resident. Indeed, he frequently belonged to

another Division with which his home address was registered. He had no special problems and could not be expected to take an interest in medical politics.

By virtue of the N.H.S. Act, 1946, however, the provisionally registered practitioner is now an officer of a hospital in a national service. He has terms and conditions of service and superannuation rights. Under the Medical Act, 1950, he has become subject to certain special regulations. Problems of hospital policy with which he is closely concerned are being discussed by committees of the Association—for example, the shortage of junior hospital staff and the position of the married house-officer. The subscription paid by the newly qualified practitioner still remains at a special reduced rate.

Channel for Particular Problems

The Organization Committee does not deal with medico-political matters, which are rightly the task of other committees. It is concerned with providing means by which the provisionally registered group of members may find its proper place in the Association's machinery and through which its problems may be brought to the notice of the committees directly concerned. The Committee feels that a great deal can and must necessarily be done in the Divisions and Branches, and for this reason one of the main topics of the Annual Conference of Honorary Secretaries, which will be held in the late spring, will be, "What is the Association doing for the hospital resident?"

A Voice at the Centre

Meanwhile, as an interim measure the Committee has decided that the provisionally registered house-officer shall be represented in the Medical Students and Newly Qualified Practitioners Subcommittee at Headquarters. The difficulties of securing effective representation of a group of this kind are very great. These doctors are scattered and have few opportunities, except in the teaching hospital areas and in the large cities, for discussing questions which interest them. It is almost impossible for them to nominate or elect a representative who would be known to more than a very few. It is suggested, therefore, that the members of the Subcommittee appointed by the B.M.S.A. should continue to remain members of the Subcommittee for a further session after they are qualified. This suggestion has many advantages. The representative will belong to the same year as those he represents and whom he formerly represented as a B.M.S.A. member. He will be known to many. What is more important, there will be continuity, as he will have been a member of the Subcommittee for at least a year and will have become familiar with its work. Meanwhile other possibilities are being explored.

SIR.—In reply to Dr. H. J. Bliss's letter (*Supplement*, January 30, p. 31) about supplies of aureomycin to general practitioners, the following information may be of value. The supply of aureomycin in Britain is controlled by the Ministry of Health at the present time because most of the crude

aureomycin is imported from the United States, and this involves dollar expenditure. However, the production of aureomycin in Great Britain is now under way, and as soon as adequate supplies are forthcoming we understand that the Ministry of Health may make it freely available.—I am, etc.,

London, W.C.2.

A. T. MENNIE,
Medical Director,
Lederle Laboratories Division,
Cyanamid Products, Limited.

Association Notices

ELECTION OF MEMBER OF THE COUNCIL BY THE WEST INDIAN BRANCHES

Notice is hereby given that, owing to the resignation of Aubrey G. Leacock, there is a vacancy in the Council of the Association. Nominations of candidates for election as a member of Council by the West Indian Branches for the remainder of the period ending at the conclusion of the Annual Representative Meeting, 1955, must be forwarded in writing so as to reach the Secretary not later than April 17, 1954.

The Branches in the Group are: Barbados, Bermuda, British Guiana, British Honduras, Grenada, Jamaica, Leeward Islands, St. Lucia, St. Vincent, Trinidad and Tobago. Nominations must be signed by not fewer than three members of any Branch in the Group, and should be in the following form:

We, the undersigned, hereby nominate

of (full name and address to be given) for election by the Barbados, Bermuda, British Guiana, British Honduras, Grenada, Jamaica, Leeward Islands, St. Lucia, St. Vincent, and Trinidad and Tobago Branches as a member of the Council of the Association for the period ending July 23, 1955.

Signatures and addresses of three nominators

Branch

If a contest occurs voting papers will be issued from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member of the Group.

A. MACRAE,
Secretary.

- 19 Fri Joint Committee of B.M.A. and the Magistrates' Association, 10.30 a.m.

Branch and Division Meetings to be Held

BRADFORD DIVISION.—At Princes' Ballroom, Midland Hotel, Bradford, Thursday, February 25, 7 for 7.45 p.m., annual dinner and dance.

CARDIFF DIVISION.—At Pathological Lecture Theatre, Royal Infirmary, Cardiff, Wednesday, February 24, 8.15 p.m., general meeting followed by B.M.A. Lecture by Professor Wilfrid F. Gaisford: "The General Therapeutic Principles in the Treatment of Children." Members may take friends who are interested.

CITY DIVISION.—(1) At Hackney Hospital, Homerton High Street, E. Wednesday, February 24, 2 p.m., films: (a) "Thrombosis and Embolism"; (b) "Marrow Puncture." (2) At Institute of Laryngology and Otology, Gray's Inn Road, W.C., Friday, February 26, 3.30 p.m., clinical meeting. Mr. G. H. Howells: "Modern Trends in Treatment of Cancer of the Ear, Nose, and Throat."

DARTFORD DIVISION.—At Nurses' Home, West Hill Hospital, Dartford, Thursday, February 25, 8.45 p.m., meeting. Lecture by Mr. W. P. Cleland: "Cardiac Surgery" (illustrated by lantern slides).

DEWSBURY DIVISION.—At Batley Hospital, Friday, February 26, 8.15 p.m., clinical meeting.

DUDLEY DIVISION.—At Bell Hotel, Market Street, Stourbridge, Thursday, February 25, 7.45 for 8.15 p.m., annual dinner. Principal guest, Dr. A. Macrae (Secretary, B.M.A.).

FINCHLEY DIVISION.—At Finchley Memorial Hospital, Bow Lane, N., Friday, February 26, 8.45 p.m., meeting. Dr. A. Lisle Punch: "Antibiotics in the Treatment of Pulmonary Tuberculosis."

GREENWICH AND DEPTFORD DIVISION.—At Miller General Hospital, Greenwich High Road, S.E., Wednesday, February 24, 8.45 p.m., meeting. Annual B.M.A. lecture by Dr. J. C. M. Matheson: "Prison and Prisoners." Wives and other guests of members are invited. Members of the Woolwich Division are also invited.

GRIMSBY DIVISION.—At Scartho Road Infirmary, Thursday, February 25, 8.30 p.m., meeting. Lecture by Dr. W. E. Orchard: "Recent Advances in Venereology." All members of the profession are invited.

KESTEVEN DIVISION.—At Grantham and Kesteven General Hospital, Thursday, February 25, 8.15 p.m., meeting. Address by Mr. Malcolm Donaldson: "Cancer, What the Public Should Know." A film will also be shown.

MID-ESSEX DIVISION.—At Out-patients Department, Chelmsford and Essex Hospital, Wednesday, February 24, 8.15 p.m., meeting. Mr. Aleck W. Bourne: "Forty Years of Obstetrics." A general discussion will follow.

MID-HERTS DIVISION.—At Pea Hen Hotel, London Road, St. Albans, Friday, February 19, 8.15 for 8.30 p.m., joint meeting with Bedfordshire and Hertfordshire Veterinary Society. Dr. R. Cove-Smith: "Fitness and its Implications in Men and Animals."

MIDLAND BRANCH.—At Selly Oak Hospital, Birmingham, Friday, February 26, 8 p.m., meeting of clinical and pathological section.

NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Tuesday, February 23, 8 p.m., supper meeting. Lecture by Dr. P. H. Davison: "Modern Views on Arteriosclerosis."

SALFORD DIVISION.—At Hope Hospital, Salford, Friday, February 26, 8 for 8.15 p.m., meeting. Address by Dr. Bernard Sandler: "The Infertile Marriage."

SOUTH ESSEX DIVISION.—At Rush Green Hospital, Romford, Sunday, February 28, 10.30 a.m., clinical meeting.

STOCKPORT DIVISION.—At Alma Lodge Hotel, Stockport, Thursday, February 25, 7.30 for 8 p.m., Annual B.M.A. dinner and dance.

STRATFORD DIVISION.—At Queen Mary's Hospital, West Ham Lane, E., Tuesday, February 23, 9 p.m., meeting. Address by Mr. W. McKim H. McCullagh: "Curable Causes of Marital Unhappiness."

SWINDON DIVISION.—At St. Margaret's Hospital, Stratton St. Margaret, Wednesday, February 24, 8 for 8.30 p.m., joint meeting with Swindon Medical Society. Film: "The Accessible Cancers. (1) Skin; (2) Lip and Tongue; (3) Cervix and Uterus."

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, February 26, 3 p.m., clinical meeting.

TUNBRIDGE WELLS DIVISION.—At Royal Mount Ephraim Hotel, Tunbridge Wells, Sunday, February 28, 3 p.m., discussion on the National Health Service. Speakers: Dr. A. E. Loden (General Practitioner), "The General Practitioner in Relation to the Local Authority and the Facilities available under the Local Authority"; Dr. A. Elliott (Medical Officer of Health for Kent), "The Facilities available under the Local Authority, Their Use and Abuse"; Dr. W. B. Adam (General Practitioner), "The General Practitioner in Relation to the Hospital Services"; Mr. John A. Simons, "The Hospital Services, Their Use and Abuse." Followed by a "Brains Trust" on the National Health Service, in which Dr. Frank Langford (Medical Officer of Health for East Sussex) will take part with the four speakers named above.

WOOLWICH DIVISION.—At St. Nicholas Hospital, Plumstead, S.E., Tuesday, February 23, 8 p.m., clinical meeting. Members of the Greenwich and Deptford Division are welcome.

PRIVATE PRACTICE CERTIFICATES FOR MINERS

A meeting of the Private Practice Committee of the Association was held, under the chairmanship of Dr. IAN D. GRANT, on February 10.

Attention was drawn to the correspondence with the National Coal Board on the extension of the bonus shift agreement which had resulted in a greatly increased demand by miners for medical certificates from their family doctors. The reply of the National Coal Board to representations on this subject was published in the *Supplement* of December 19, 1953 (p. 233). The CHAIRMAN said that he thought the result was about as satisfactory as could be expected. A member of the Committee from a mining area said that the problem of these certificates was not as formidable as it was three or four months ago. In Scotland in some areas it appeared that miners were not yet aware of the conditions under which these certificates were required. This was being discussed with the National Coal Board.

On a further matter dealing with colliery practice it was reported that the Ministry of Health had confirmed that under the National Health Service a practitioner in the hospital field or one providing general medical services who suffered injury or death in attending an accident at a colliery would be eligible for benefit under regulation 9 of the N.H.S. Superannuation Regulations, 1950.

The question was raised whether the private practitioner not under contract would be covered. It was decided to take up this point.

Life Assurance Fees

Reference was made to the statement published in the *Supplement* of December 19, 1953, on the fee for the "long" form of life assurance examination. The Annual Representative Meeting had urged that the fee for this form should be increased from one and a half guineas to two guineas, but the Life Offices Association held that the present fee was adequate. The CHAIRMAN said that there had been differences of opinion as to the amount of time required for the completion of these reports. He himself had suggested 30 to 45 minutes.

Another point in this connexion was brought forward by a member—namely, that two companies for which he acted as referee had recently decided that no medical examination was required for policies below £2,000 unless for some special reason; the result had been to reduce his income from this source to negligible proportions.

It was decided to inform the Life Offices Association that the present fee should apply only for examination at the doctor's consulting-room. Where a life assurance office required examination at the patient's home, mileage should be paid. In addition the attention of the Life Offices Association is to be drawn to the varying fees for reports made from medical records without an examination of the proposer. A minimum fee of £1 1s. is to be requested.

Fees for Medical Witnesses

Dr. ROBERT FORBES introduced a report of the Medical Witnesses Subcommittee. A scale of allowances for professional witnesses at criminal courts was approved at the last Annual Representative Meeting. The Consultants and Specialists Committee had expressed the view that when consultants gave evidence of fact they should be paid at higher rates. The view taken in the Private Practice Committee was that so far as evidence of fact was concerned there was no difference between the consultant and the general practitioner or any other member of the profession. The regulations lay down a maximum fee of £5 a day for professional witnesses to fact, and this maximum applies to all classes of the profession, whether consultants or not. As for allowances for the expert witness, it was for him to make his arrangements before he gave evidence at all. Dr. Forbes stated that the subcommittee was to consider expert witnesses' fees at the next meeting, and in the meantime one of the members had agreed to obtain information from police surgeons as to time involved in attendance at court and the allowances paid.

Drivers over 70

The Committee had been asked by a Division to consider the question of drivers over 70 years of age who were refused full car insurance unless they brought a medical certificate from their own doctor that they were physically fit to drive. A correspondent had suggested that if these examinations were to be of any value they must be comprehensive and adequately remunerated and possibly best undertaken by an independent medical practitioner appointed by the insurance company.

One member pointed out that the Government did not insist that applicants for a driving licence who were over 70 should have a medical examination. In his own practice he had not come upon anything specially disturbing among drivers over 70, and he considered that conditions likely to be a cause of danger in a driver were not limited to

this age group. Moreover, he had found these old people were as a rule quite reasonable if any serious physical defect was brought to their attention. It was decided to watch the situation, but not to take action at the moment.

National Gas Industry

The Committee resolved to advise practitioners that the minimum fee for reports of examinations of employees in the gas industry for fitness to enter the national sick pay scheme should be 25s., and that in cases of doubt a copy of the report required might be submitted to B.M.A. Headquarters for a decision on the appropriate fee.

The Committee considered a very large number of other detailed matters, relating to insurance examinations, fees for cremation certificates, various aspects of certification, and so on. The agenda included 50 items.

NATIONAL HEALTH SERVICE COSTS

TREASURY MINUTE TO COMMITTEE OF PUBLIC ACCOUNTS

A Special Report from the Committee of Public Accounts (session 1953-4) has just been published.* It contains the Treasury's comments (dated December 15, 1953) on the First, Second, and Third Reports from the Committee of Public Accounts, session 1952-3. The following are some extracts from the sections which deal with the National Health Service.

Levels of Remuneration

The Treasury agrees that no increase in the scale of remuneration for work under the National Health Service should be considered unless the fullest facilities are given for the inspection of books and records from which the facts about past remuneration and expenses can be established. This is the answer that has been given to claims for higher remuneration submitted by the dentists, opticians, and (in England and Wales) chemists who provide services under Part IV of the National Health Service Acts. Discussions are now proceeding with the representatives of the dentists and opticians to secure their co-operation in full fact-finding investigations into the remuneration of those two professions, and also with the representatives of the chemists regarding the conclusions to be drawn from certain facts about the remuneration of chemists which they collected and submitted in 1952.

Investigation into Profits on Commodities

Steps have already been taken to intensify measures to ensure that only fair and reasonable prices are paid for commodities in substantial demand for the National Health Service. Reliance must be placed on competition for many of the supplies used in substantial quantities in the National Health Service. This applies particularly to goods for which the National Health Service are not the major buyers, or users, such as provisions, linen, and household goods. A very large number of items, however, which are mainly used by or supplied through the N.H.S. are now being covered by costs and profits investigations. These investigations cover certain widely used basic drugs, dressings, and selected proprietary preparations, and spectacles.

Control of Hospital Expenditure

Review of Hospital Establishments.—Regional reviews have been continuing in all areas. Progress is being made in central reviews, but has been limited by the number of experienced investigators available. While it is expected that the central reviews of administrative and clerical staff

*Special Report from the Committee of Public Accounts, session 1953-4. H.M.S.O., London.

(including those of non-teaching as well as teaching hospitals) will be completed well before the end of 1954, it will not be possible to finish the reviews of teaching hospital domestic and ancillary staff by the same date.

Hospital Cost Accounting.—The Treasury agrees that the costing of hospital expenditure offers considerable possibilities for the securing of economical administration. The Ministry of Health has impressed on the authorities more than once the desirability of their co-operation in making comparisons of items of cost shown in the hospital costing returns. On the question of introducing more detailed departmental hospital costing, the Ministry has completed preliminary discussions with hospital bodies and organizations, and has set up an expert working party to consider the manner in which such a costing system can best be applied in the hospital service.

It is understood that in Scotland a working party composed of officers of the Department of Health and of regional hospital boards and boards of management is now engaged in the study of the results of experiments in departmental costing at some of the multi-purpose hospitals in Scotland, and that the Department foresees no difficulty in devising a practical scheme of functional costing for the larger hospitals in Scotland.

Property Acquired for Hospital Purposes

The Treasury has reviewed with the Ministry the general arrangements for examining accommodation requirements in the hospital service and the use made of property acquired for that service. It has not been the practice of the Ministry hitherto systematically to follow up subsequent action taken by regional hospital boards. A special review which has recently been made has shown that in a number of cases property acquired between 1950 and early 1952 has not yet been brought into use, principally because of the inability of the boards concerned to undertake immediately, with the limited capital resources available, the necessary work of adaptation. Arrangements have been made to avoid such delays in the future.

Grants to Local Health Authorities

The Departments are making further efforts to ascertain and examine the unit costs of services provided by local health authorities. So far as ambulance services are concerned, no evidence of substantial misuse has been found. The Department is now giving consideration to the desirability of a more widespread inquiry in this field.

There is a lack of uniformity in the methods of calculating the unit costs for services other than ambulances (for example, in apportioning the cost of administration over the various services), which renders it extremely difficult to use the results for the purpose of making comparisons in the costs of different areas. The evidence so far does not suggest that there is any general extravagance. The fact that half the cost falls upon the local health authority is itself a strong disincentive to extravagance.

B.M.A. LECTURES

Each Division and Branch is entitled to one "B.M.A. Lecture" each year. This arrangement provides an opportunity of hearing—at the expense of the Association's central funds—a distinguished speaker, if desired, from a distant centre, whose services could not otherwise be secured because his travelling expenses would not be a legitimate charge on Division or Branch funds. The rules require that the invitation to a "B.M.A. lecturer" should be sent from Headquarters on behalf of the Council. If, as has happened occasionally, a Division makes all the arrangements without reference to Headquarters, it is not possible after the event to regard the lecture as a "B.M.A. lecture" and to pay the honorarium and expenses from central funds.

ANNUAL MEETING, GLASGOW,

JULY 1-9, 1954

HOTEL ACCOMMODATION

A number of rooms have been reserved for members in the Central Hotel, Glasgow, 1½ miles from the University. Those wishing to take advantage of this reservation should write direct to the Manager, Central Hotel, Glasgow, C.1, as soon as possible, mentioning that they are attending the B.M.A. Meeting. The tariff is as follows:

Type of Room	Bed and Breakfast Rate*
Single	40s.
Double	50s.
Double with bath	60s. (for 2)
Twin-bedded	83s. 6d. (for 2)
with bath	73s. 6d. (for 2)
Three-bedded	89s. (for 2)
	86s. (for 3)

* Please note that these prices are subject to modification and a guarantee can be given that there will be no increase in price before July, 1954.

Members are advised that no further accommodation is available at Green's Hotel, 22-24, Woodlands Terrace, Glasgow, W.3, during the period of the Meeting.

HOSTEL ACCOMMODATION

Members wishing to reserve hostel accommodation in Glasgow during the Annual Meeting are asked to write direct to the *Executive Officer, B.M.A. House, Tavistock Square, London, W.C.1*, stating their requirements, and not to the hostel concerned.

The hostels available are as follows:

Name and Address of Hostel	Tel. No.	Distance from University	Rooms Available for	Tariff B/B
MacBrayne Hall, 11, Park Circus Place, C.3	Douglas 5626	½ mile	35 men (single and twin-bedded rooms)	12/6
Douglas House, Jordanhill College, Southbrae Drive, W.3	Scotstoun 2694	2½ miles	50 men or women (single rooms)	14/6

The Provisional Programme of the Meeting was published in the *Supplement* of January 16 (p. 13).

SLEEPER ACCOMMODATION ON TRAINS

Members are reminded that sleeper accommodation on trains from London to Glasgow during July is booked up at a very early date. It is advisable to make reservations as soon as possible, and this can be done through Messrs. Shirley James' Travel Service Ltd., Tavistock House South, Tavistock Square, London, W.C.1 (Euston 5930).

COST OF ATTENDANCE AT L.C.C. DAY NURSERIES

The average cost per day for a child attending a London County Council day nursery during 1952-3 was 18s. 7d. This figure was given by the chairman of the L.C.C.'s health committee in answer to a question at the Council's meeting on February 16. It was stated, however, that this figure was inflated owing to arrears of pay to nursing staff for the period from February, 1949, to March, 1952. If this factor were eliminated the daily cost would be 14s. 8d. More recent figures of cost were not available.

The average number of approved places in the Council's day nurseries, 1952-3, was about 5,900. Attendance was roughly 83%.

MARCH MEETING OF B.M.A. COUNCIL

Owing to increased pressure of business it has been decided to extend the next meeting of Council to more than the usual one day. The meeting will therefore start at 2 p.m. on Tuesday, March 9, and continue as long as may be necessary on Wednesday, March 10.

SECRETARIES' CONFERENCE

The Secretaries' Conference this year will be held at B.M.A. House on Wednesday, May 19. It will begin at 10.30 a.m. and occupy both the morning and afternoon. There will be the usual informal dinner in the evening.

L.C.C. EVIDENCE FOR GUILLEBAUD COMMITTEE

The evidence to be given to the Guillebaud Committee by the London County Council proposes that the division of responsibility for maternity services between the local health authorities, the hospitals, and general practitioners, which results in overlapping of duties, should be reviewed. It points out that the Council is responsible for domiciliary midwifery and for ante- and post-natal care, which includes, in addition to medical supervision, a full range of educational and mothercraft services. There is danger of duplication of effort, as the hospitals which provide for confinements also provide antenatal clinics, in which little emphasis is placed on the education of the mother in the management of her baby. Similar overlapping may exist when a general practitioner or general-practitioner obstetrician provides maternity medical services.

The Council also holds the view that general practitioners should be encouraged to care for their patients in their own homes rather than seek their admission to hospital. If this were done better use could be made of available beds, and this might in the long run lead to a reduction in the cost of the service. This presupposes more district nursing service. The cost of providing a district nurse for a patient at home in London is about £1 per week.

Ambulance Service

The Council is specially exercised about its ambulance service. Hospital and clinic out-patient work, over which the Council has no control, now accounts for 75% of the total demands on the ambulance. One important factor increasing ambulance cost may be the developing practice of treating people as out-patients rather than in-patients wherever possible. This may indeed produce financial saving from the national standpoint, but the ultimate demand on the ambulance service is very great. The number of patients carried by the County of London Hospital Car Service increased from 17,266 in 1947, when the hospitals paid at the rate of 3d. a mile, to 149,046 in 1951, when no charge was made. Another factor is that patients under the National Health Service are free to choose their hospital and their doctor, and this frequently results in patients being carried long distances for treatment which could be obtained nearer home. It is considered that general practitioners do not always bear in mind the transport difficulties when selecting the hospital to which to refer patients.

Tuberculosis Service

Other recommendations are that one authority should be responsible for both the hospital and the home treatment of tuberculous patients to ensure that each is treated where it best serves his needs; that miniature mass x-ray units should be under the control of local health authorities, as this is essentially a part of preventive medicine; and that more hospital beds should be provided for mentally defective patients.

KEEP YOUR CIRCULARS

ADVICE TO MEDICAL OFFICERS IN THE
PUBLIC HEALTH SERVICE

The Secretaries of the British Medical Association and the Society of Medical Officers of Health and the Staff Side Secretary of Committee "C" of the Medical Whitley Council are constantly receiving inquiries regarding matters which have been the subject of negotiation and agreement in Committee "C" and which are fully covered in M.D.C. Circulars issued from time to time by the Joint Secretaries of Committee "C."

All these circulars (Nos. 1-21) which have so far been issued have been published in the medical press. In this way it had been hoped that every medical officer in the public health service would possess a complete set for his or her personal use.

In addition, copies of the circulars are issued by the Joint Secretaries of Committee "C" to local authorities, and every medical officer of health should have a set available in the public health department. Medical officers are strongly advised to read and keep copies of the circulars as they are issued and published.

Assistance Offered

It is regretted that additional copies are not available for issue to individual doctors but the Secretary of the Staff Side of Committee "C," to whom correspondence should be addressed at B.M.A. House, is always glad to assist in the explanation or clarification of any matter arising out of the Whitley agreements.

A list of the M.D.C. Circulars Nos. 1 to 16 was published in the *Supplement* of May 30, 1953 (p. 251). Nos. 17 to 21 are listed below.

No. 17, July 9, 1953. Acceptance of Award 2452. Remuneration of Assistant or Departmental Medical Officers. Revised (*Supplement*, July 25, 1953, p. 65).

No. 18, October 17, 1953. Motor-car allowances. Interpretation of M.D.C. Circular No. 15 (*Supplement*, October 31, 1953, p. 183).

No. 19, January 22, 1954. Increments for Part-time Medical Officers (*Supplement*, February 6, p. 35).

No. 20, January 22, 1954. Maternity Leave Scheme. Revised (*Supplement*, February 6, p. 35).

No. 21, February 4, 1954. Car and Subsistence Allowances in Scotland (*Supplement*, February 13, p. 42).

FILM COMMITTEE

At the first meeting this session of the Film Committee, which was held recently, Dr. R. P. LISTON was re-elected to the chair. Dr. FRANGCON ROBERTS, representing the Science Committee, and Miss A. D. BRAHAM, representing the B.M.S.A., were welcomed as new members. It was agreed to co-opt a member of the Medical Committee of the Scientific Film Association.

A report was received of the successful and well-attended lunch-time showings of medical films arranged by the Committee on the occasion of the first World Conference on Medical Education held in August, 1953. The Committee expressed its thanks to those who had introduced the films and to the Wellcome Foundation for the loan of their Film Theatre. Gratitude was also expressed to Drs. Cardew and Hansell and to the Royal Photographic Society for an exhibition of Medical Photography which had been displayed in the Great Hall of B.M.A. House for the period of the Conference and had aroused widespread interest.

Information Wanted

A report on the hiring of films from the Film Library showed a slight falling off in 1953 as compared with 1952 and the Committee considered the possibilities of acquiring fresh films for the Library. Difficulty is experienced in learning of films being made, especially in teaching hospitals

and medical departments. Members of the Committee believe that a considerable number of these films are being made and knowledge of them does not, in many cases, permeate beyond the confines of the hospital or department in which they are made, despite the fact that some of them would be of general interest and would prove popular additions to the B.M.A. Film Library.

It was agreed to circularize as many as possible of those likely to be making, or who have recently made, medical films suitable for the Film Library with a view to obtaining permission to have copies made. It was hoped also that members becoming aware of new films in the making or already made would notify the Secretary so that, as well as making additions to the Library, as much information as possible about medical films should be available at B.M.A. House.

It was reported that the following films have been added to the Film Library since the last meeting of the Committee:

Sciatic-Gastrocnemius Preparation, by A. Bligh and C. Rashbass. *Congenital Pyloric Stenosis*, by J. T. Rice Edwards. *Marrow Puncture*, presented by Imperial Chemical Industries, Ltd. *Milestones in Medicine*, presented by the American Medical Association. *Pentothal*, made for the B.M.A. and presented by Abbott Laboratories, Ltd. *Hay Fever*, presented by Parke, Davis and Co.

ARBITRATION

The Annual Representative Meeting last July called for urgent action to secure, within the Whitley Council procedure, the right to refer a dispute to a suitable arbitration tribunal (*Supplement*, July 18, 1953, p. 15).

The Whitley Council constitution provides for the drawing up of an arbitration agreement, but there is a long-standing dispute between the Staff and Management Sides about the form that this agreement should take. The Management Side is opposed to the idea of unilateral action, and insists that recourse to arbitration must be by mutual consent. This means that when the two sides hold conflicting views and no satisfactory compromise can be found, the dispute may remain unresolved because arbitration is vetoed by one side or the other. The Staff Side is insistent that it should be open to either side independently to demand arbitration. The very strong pressure which the Staff Side has continued to exert has had no effect, and urgent consideration is now being given to other possible methods of influencing the situation.

THE SMALL-LIST PRACTITIONER

At the Extraordinary General Meeting last May, the chairman of the G.M.S. Committee promised an inquiry into the position of doctors with small lists under the new distribution scheme (*Supplement*, May 9, 1953, p. 205). Full information has now been obtained through local executive councils and local medical committees, and this will be studied in the near future by the Working Party—composed of representatives of the G.M.S. Committee and of the Ministry—which was responsible for the distribution scheme in its present form.

B.M.A. CHARITIES BALL, MAY 6, 1954

The B.M.A. Charities Ball, organized by the Metropolitan Counties Branch, will be held in B.M.A. House on Thursday, May 6, 1954. It is hoped that as many members of the profession as possible, including those outside the Branch area, will attend and thus enable the Branch to make a handsome contribution to the medical charities. Dancing to the music of the Sydney Lipton Ballroom Orchestra; buffet and bars. Tickets £2 2s. each, or six for £11 11s. Further particulars will be issued in due course.

OPHTHALMIC GROUP COMMITTEE
HOSPITAL TRAINING OF OPTICIANS

A meeting of the Ophthalmic Group Committee was held at B.M.A. House on February 12, with Mr. O. GAYER MORGAN in the chair.

The Committee considered a letter from the President of the Association, Mr. J. W. TUDOR THOMAS, in which he said that the Welsh Regional Hospital Board had been approached by certain persons, including the president of the local association of ophthalmic opticians, with a request for facilities for opticians and optical students to attend hospital departments as observers and for the purpose of training. It was feared that the continued lack of such facilities in Wales would result in the department at the Cardiff Technical College having to close down. Mr. Tudor Thomas asked the Group Committee for its opinion as to the propriety or otherwise of affording these facilities, but said that his impression was that this type of training for ophthalmic opticians in hospital departments was not acceptable, and it was only in the case of those who were entering whole-time into the hospital service that such training might in due course be given.

The Committee endorsed a reply which had already been sent by Dr. Stevenson, Deputy Secretary, that the Group Committee had expressed the view on a previous occasion that it was undesirable for ophthalmologists personally to impart instruction to optical students or opticians except those employed whole-time in the hospital service. It was true that the Crook Committee had recommended that opticians and students should have opportunity for clinical training by medical men in suitable hospital departments, but discussions were taking place with the Ministry on all aspects of the Crook report, and no doubt the question of medical training would come under review.

Contact Lens Centres

A letter from a member drew attention to the difficulties surrounding contact lens practice. It was stated that no ophthalmologist could hope to compete in private contact lens practice with lay practitioners who had built up their practice by advertising. The most serious factor was that the ophthalmologist interested in this work could not secure the adequate and regular experience which was essential if he was to offer an efficient service himself to the public.

Mr. G. W. BLACK pointed out that while dentists employed technicians, and nobody had cavilled, the idea of technical assistance for the ophthalmologist had been looked on with disfavour. The CHAIRMAN said that the question of "covering" had to be watched. Mr. J. H. DOGGART said that the Faculty of Ophthalmologists in December last had set up a subcommittee on this subject, under the chairmanship of Dr. Dorothy Campbell, and already a certain amount of information was being accumulated. It was decided to await the considerations of this subcommittee.

Representation of the Group Committee

It was reported that the Central Consultants and Specialists Committee was considering the reorganization of its constitution, and one proposal put forward was for the elimination of Group Committee representation in order to reduce the size of the Central Committee. The CHAIRMAN said that he had represented the Ophthalmic Group Committee on the Central Committee and from his experience he thought it would be a great pity if the Group Committee's representatives, numbering 20 in all from the various groups, could no longer take part in its work. It was also pointed out that much of the work of the Central Committee concerned S.H.M.O.s, who were probably more numerous in the ranks of ophthalmology than in any other specialty. Another member said that the proposal would relegate Group Committees to the role of Cinderella.

On the motion of Mr. McKIE REID, a resolution was unanimously agreed to expressing grave concern at the proposal that Group Committee representation should cease.

Spectacles for Schoolchildren

The question of spectacles for schoolchildren and additional charges for special frames again came forward. A circular from the Ministry had suggested that opticians should do what they could to dissuade parents from choosing unsuitable frames for their children, reminding them that in deciding whether breakage was due to carelessness the Ophthalmic Services Committee would be bound to disregard any greater likelihood of accidents owing to the type of frame. It was urged that what was wanted for the child was something extremely rigid.

Dr. LLOYD JOHNSTONE produced some details of charges for spectacle frames for children, and agreed to put them in writing with a view to supporting certain representations by the Committee to the Minister.

Treatment of Cataract and Glaucoma

A circular recently issued by the Ministry to hospital authorities on the treatment of cataract and glaucoma in the National Health Service evoked some discussion. Mr. G. W. BLACK considered that this circular should receive very close attention because it gave such support to their claims. It stated, for example, that "early diagnosis [of glaucoma] appears to be all too frequent, although it is in the early stages of the condition that there is the best chance of successful treatment." The reason for this was fairly obvious. It was that so many cases were seen by opticians in the Supplementary Ophthalmic Service. He thought that a subcommittee should be appointed to make a detailed commentary on the circular and bring it to the attention of general practitioners and others concerned.

It was agreed to set up such a subcommittee.

Arising out of this circular it was also agreed to ask the Ministry to remove the word "normally" from the instructions for the Supplementary Ophthalmic Service concerning cases referred back—i.e., to make it obligatory not to prescribe glasses under the Service for cases referred back to the general practitioner.

Domiciliary Consultation Arrangements

A letter was read to the Committee from an S.H.M.O. employed by two Metropolitan Regional Hospital Boards, with a hospital appointment in both areas. In one area he was debarred from doing domiciliary visits on the ground that there were sufficient consultants to cover the work, while still allowed to do so in the other.

In the discussion it was pointed out that if S.H.M.O.s did consultant work without certain safeguards there would be a tendency on the part of the authorities to get consultant work done at the cheaper rate. The discussion widened into the question whether inquiry should be made in every case of the receipt of an advertisement for an S.H.M.O. post to find out whether it fulfilled the requirements laid down for S.H.M.O. posts in ophthalmology—namely, posts primarily concerned with non-operative work—e.g., refraction. One member said that S.H.M.O.s were complete consulting ophthalmologists in the majority of cases.

It was decided to make certain representations on the subject to the Central Consultants and Specialists Committee, though these did not cover the immediate point of the correspondent who had raised the subject, which was that he was not permitted to do in one regional area what he was permitted to do in the other.

On the suggestion of Dr. J. MARSHALL the Committee agreed to the appointment of a Scottish representative to the deputation from the Group Committee and the Faculty to discuss with the Ministry the Crook report.

CONSTITUTION COMMITTEE

The Council at its last meeting completed the appointment of the members of the Constitution Committee (*Supplement*, January 23, p. 19). The Committee has the following terms of reference:

"To examine and report on the present structure and constitution of the Association, with special reference to the reorganization of the Representative Body."

The first meeting of the Committee was held on February 23. Mr. H. H. Langston was elected chairman. At this meeting the programme of work was considered and the general procedure laid down.

Scottish News

ENCOURAGEMENT OF GROUP PRACTICES
IMPLEMENTATION OF WORKING PARTY'S REPORT

The General Medical Services Subcommittee (Scotland) has now completed its discussions with the Department of Health on the subject of Group Practice Loans, and every general practitioner in Scotland in the National Health Service should have received, from the Department, a memorandum explaining details of the scheme. The following points are worthy of note:

(1) In the first year of the scheme, approximately £12,000 will be available for loans in Scotland.

(2) No hard and fast definition of group practice has been laid down, but the following description—which is taken from the report of the Committee on General Practice set up by the Central Health Services Council in England and Wales—indicates the kind of arrangements which would qualify for assistance:

"Group Practice applied to General Medical Practice means that the medical practice is carried on by several general practitioners working together in close association, consulting one another about their patients, and doing their 'surgery work' in whole or in part in a common building controlled by the doctors. All members of a 'group' should work in the common surgery premises even if on occasions they also work at separate branch surgeries. A group practice should employ ancillary help to the extent of one or more persons who can provide services of the secretarial, nursing, receptionist, or almoner type. Normally, a group should consist of three, four, five, or six principals. Large numbers tend to diminish the value of group association. The group may or may not be a partnership, but, if not, there must be a proper understanding between the members of a group on the sharing of the earnings of the group and particularly as to the sharing of expenses. Patients must continue to be the responsibility of the doctor of their choice in the group. The group should provide a 24 hours' service to patients and also proper off-duty and holiday relief for its members."

This account of group practice is not to be regarded as an exhaustive definition of arrangements which would qualify for assistance; and doctors should not refrain from applying for a loan because their group arrangements are different from those described above.

(3) Any loan granted will be interest free and will be towards the cost of providing premises for group practice.

(4) The loans will be advanced by the executive council on the recommendation of a joint committee representing the General Medical Services Subcommittee (Scotland) and the Department of Health for Scotland.

(5) The loans will be available for the following purposes: (a) the acquisition of land and the erection of consulting premises on it; (b) the acquisition of existing premises and their conversion into consulting premises; and (c) the conversion into consulting premises of premises leased by the group.

(6) The period for repayment of the loan will depend on the circumstances of the particular application. Normally, however, the period will be ten years; and it will in

no case exceed 20 years. Repayment will be made by quarterly deduction from remuneration. The first deduction must be made not later than two years from the date on which the loan is advanced; subject to this, the practitioners may themselves propose the quarter at the end of which repayment is begun.

(7) Application for a loan may be made by practitioners taking part in the general medical service who propose to form a group practice of two or more members; plans carried out since April 1, 1953, are eligible for assistance on an equal footing with plans to be carried out in future; plans carried out before April 1, 1953, will be eligible if resources permit. Applications should be made to the executive council, who, after consulting the local medical committee, will forward them to the Department of Health for Scotland with their comments, for consideration by the Joint Committee referred to in paragraph 4.

GENERAL MEDICAL SERVICES
SUBCOMMITTEE (SCOTLAND)PRESCRIBING AND CATEGORIES 5 AND 6 OF THE
JOINT COMMITTEE ON PRESCRIBING
CLASSIFICATIONS

Representatives of the General Medical Services Subcommittee (Scotland) have had a meeting with representatives of the Department of Health in connexion with the Department's proposal that any items listed in Categories 5 and 6 of the Cohen Committee's Report and prescribed by general practitioners should automatically be referred to local medical committees for investigation.

The Department have now agreed to reconsider this proposal on the following conditions:

(1) The Department have undertaken to collect statistics over a period in an endeavour to ascertain the number of prescriptions containing items listed in Categories 5 and 6.

(2) The Department will review their proposal with the Subcommittee when the above statistics are available.

(3) In the meantime prescribing of such items will not automatically lead to the scripts being referred to local medical committees for investigation.

(4) The Subcommittee have agreed, however, that the Department shall not be precluded meanwhile from referring to an executive council for investigation by a local medical committee any unduly frequent prescribing of such items by a practitioner. It is understood, however, that such reference may only be made in exceptional circumstances.

After the Subcommittee have consulted with the Department again a further announcement will be made.

Questions Answered

Car Allowance on Transfer from Whole-time to
Part-time Post

Q.—I purchased a new car in 1950, and as I have always held a whole-time salaried post I have had no income-tax relief for the car. In the event of taking up a part-time post, how would the income-tax authorities assess the value of the car?

A.—In a case where a car was acquired before the date at which it gives ground for an allowance the value of the car for the purposes of the calculation is reckoned at the amount it would have stood at if the normal allowance had been given. To take a very simple example, suppose a car was acquired for £800 on April 5, 1953, and the purchaser goes into general practice as from April 5, 1954, the allowance for the financial year 1954-5 would be 25% of £600—i.e., of £800, less the £200 which would have been the allowance for 1953-4 if the owner had then been able to claim an allowance.

The Garden Path

Q.—I have a front garden measuring about 400 sq. yd., through which all my patients walk to reach the surgery door. The cost of maintaining this garden in a presentable manner is £100 per annum, including labour and material. The local inspector of taxes has only agreed to allow £10 per annum for materials only. May I have your advice?

A.—It is generally admitted that a practitioner is entitled to regard as an allowable expense the cost of maintaining a reasonably presentable access to the consulting-room, etc., as well as keeping up the condition of the rooms themselves. On the other hand, it is thought that it would be difficult to maintain to the satisfaction of a body of appeal commissioners that more than a part of the expenditure on 400 sq. yd. of garden was incurred for purposes of the practice. The questioner cannot therefore succeed in claiming the full amount of £100, but whether £10 is an adequate allowance must depend on the actual facts of the particular case. The fact that it is given "for materials only" is not understood; surely if that cost is allowable so is the cost of using them.

OCCUPATIONAL HEALTH

An all-day meeting of the Occupational Health Committee of the Association was held on February 17, with Dr. J. A. L. VAUGHAN JONES in the chair.

It was reported that the memorandum on the future of occupational health services on which the Committee has expended so much labour had been submitted to the Ministry of Labour and National Service. Discussions with the Ministry would be entered into, as it was believed that the Ministry desired to proceed with the development of a service, even though legislation might not be possible for some time.

Industrial Chest Diseases

A memorandum on industrial chest diseases was prepared by the Tuberculosis Group Committee some time ago, was revised as a result of various discussions, including one in the Joint B.M.A. and T.U.C. Committee, and now it again came before the Occupational Health Committee. Its main proposal for a central statutory register of industrial chest diseases, one of the purposes of which would be to detect cases of pulmonary disease in industries not at present scheduled, had been generally favoured, but some difference of opinion had arisen on the proposal that the register should be maintained by the Home Office, with close liaison with the Ministry of Pensions and National Insurance, and the corresponding departments in Scotland and Northern Ireland.

One member of the Occupational Health Committee considered that the Ministry of Health was the appropriate department to have charge of the register, and after discussion this appeared to be the general feeling of the Committee. It was agreed that after the B.M.A. representatives on the Joint B.M.A. and T.U.C. Committee had considered the matter it should be brought forward at a meeting of the Joint Committee, which it was known the T.U.C. representatives were anxious to have at an early date.

Industrial Surveys

It was mentioned that at a meeting of the Planning Subcommittee a few days previously the subcommittee had considered industrial surveys forwarded by the medical officers of health concerned from the Govan ward of Glasgow, the Southampton dock area, a central ward in Reading, the borough of Tottenham, and certain rural areas in Cheshire, borough of Tottenham, and certain rural areas in Cheshire, also a survey by the chief medical officer of five different types of factory in the Unilever Organization. Each of the reports had been carefully studied and appropriate comments had been made.

The CHAIRMAN said that thanks were due to the medical officers concerned for this particularly good job of work. An endeavour had been made to get the universities or the Nuffield Trust to undertake surveys of this kind, but without success. Then the Society of Medical Officers of Health offered its services, and to that Society also their thanks were due. A member of the Committee said that the surveys were most useful, but, of course, they represented the personal opinion of the man responsible for the work. There was as yet no standard by which they could be judged.

The report was sent back to the Planning Subcommittee with the suggestion that now specific questions based on the information already afforded might be put, with a view to achieving some standardization.

Industrial Injuries

Dr. J. COTTRELL presented a draft memorandum of evidence which had been prepared by the subcommittee set up for this purpose for submission in the name of the British Medical Association to the Departmental Committee which is reviewing the provisions of the Industrial Injuries Act. The Committee spent some two hours considering the draft and making certain revisions.

Dr. M. E. M. HERFORD gave the Committee a statement on the Federal and State laboratory services available in the United States for service to industry, and suggested that a parallel service be instituted in the United Kingdom.

It was agreed to add this as an appendix to the memorandum of evidence, and Dr. Cottrell, Dr. Alexander, and Dr. Herford were appointed to support the evidence orally.

Transport Medical Standards

Dr. L. G. NORMAN submitted draft notes for the guidance of doctors who undertake the medical examination of applicants for public service vehicle driving licences.

The Private Practice Committee, in intimating its view that the proper fee for the revised form P.S.V. 15 A was 25s., gave its opinion that it was important to prevent substitution at these medical examinations, where the applicant was not known to the examining practitioners, and that to this end it might be advantageous to insist that the form should contain a photograph of the applicant as well as a space for his signature in the presence of the doctor.

The Committee noted this suggestion, but did not endorse it.

Arrangements for the forthcoming joint conference of Advisory Councils on Occupational Health were considered. The conference is to be held on April 13.

PUBLIC HEALTH

PROFESSIONAL SECRECY

At its meeting on February 19, 1954, the Public Health Committee discussed the question of the disclosure of confidential medical details about patients in the course of inquiries by lay officers in various fields of local authority work. Some members said that in carrying out their statutory duties lay officials often had occasion to try to find out about the medical condition or history of those with whom they were dealing, and applied to the appropriate health department for the information they required. These inquiries sometimes put the medical officer concerned in a difficult position in relation to the rule of professional secrecy.

It was generally agreed that information should not be given under these conditions, but some members thought that confidential medical details did sometimes get into lay hands. It was decided to try to ascertain if there were specific examples of cases of this kind, and to bring the matter up again in the light of further information.

A full report of the meeting of the Public Health Committee will be printed in next week's *Supplement*.

Correspondence

Remuneration of Hospital Medical Staff

SIR,—At a time when large sections of the population are demanding and receiving increases in earnings, when solicitors have increased their scale of fees, M.P.s and judges are expecting increased remuneration, is it too much to expect that the hospital staffs should receive their proper salary? It is now many months since the decision at arbitration that the proper application of the Spens recommendations on general-practitioner earnings involved a betterment factor of 100%. When is this decision to be applied to the earnings of hospital staffs? Unless the salary of the consultant, based on the earnings of the full-time employee, is brought up to the level of his general-practitioner colleague the standard of hospital practice will deteriorate. It is to be hoped that the committee of distinguished and eminent members of the profession who represent our interests in any negotiations are not too eminent to realize how adversely the difference in earning capacity between the two main branches of the profession influences the hospital service. Can we expect an early announcement to the effect that the salaries of the hospital staffs are to receive the same betterment as that applied to the G.P.s and, as in their case, retrospective effect?—I am, etc.,

Middlesbrough.

H. LESLIE LEAMING.

Remuneration of Middle-grade Registrars

SIR,—In view of the reduced number of senior registrar posts, most middle-grade registrars face the prospect of holding their present grading for many years before a step to a higher salary level is made on the ladder to consultant status. In addition, if present trends continue, registrars in non-teaching hospitals will ultimately stand little chance of being consultants at all. Yet there is no doubt that there is a real need for the registrars now in office. They carry a large part of the executive burden of hospital practice, particularly in the out-patient clinic, on the operating list, and in anaesthetics. True, the post lasts but two years, but at the end of this there is an "all change" call which sends the same band of doctors about the same work, in new surroundings.

This may go on for six or eight years, but their salary is unchanged after the second year. If the disappointed registrar then enters general practice, usually as an assistant, his financial loss over the whole period, as against his colleague who originally entered G.P. work, is large. There seems to be a good case, therefore, for regarding the registrar grade as to some extent an *ad hoc* post, and for making annual increments up to a reasonable maximum of, say, six years; at this stage, the salary might approximate to that of a second-year senior registrar, at £1,100 per annum. For a doctor with some 10 years of experience of medicine, much of it spent doing near-consultant work, this is not a disproportionate reward. Alternatively, some sort of family allowance for married registrars might be applied after the second year in this grade.—We are, etc.,

The Survival of Private Practice

SIR,—In his speech at the Central Consultants and Specialists Committee dinner (*Supplement*, February 13, p. 43), the Minister of Health stated that he considered a whole-time salaried service would be disastrous. In other words, he was anxious that private practice should continue and thrive. If he spoke in good faith, he should immediately implement the words of his predecessor, Mr.

Aneurin Bevan, who stated that the free National Health Service would be available to all members of the community in part or in whole. He should, in fact, allow private patients to obtain their medicines, spectacles, dentures, surgical appliances, etc., on the same terms as the N.H.S. patient, and he should reduce the cost of private pay-beds in hospital by 50%. If he cannot see his way to correct this injustice, it were better to remain silent and not further embitter our once happy profession with empty words. Actions speak louder than words.—I am, etc.,

Camberley.

LESLIE HARTLEY.

Public Relations Committee

SIR,—The account of the Public Relations Committee (*Supplement*, February 6, p. 33) must have been an eye-opener to many, as it was to me. There was no such body in my time and I don't know that anybody missed it. But times have changed and now it is obvious that no body of the size and importance of the B.M.A. could do without it. Incidentally, the account shows how fortunate we have been in our choice of a Public Relations Officer. He has indeed created a department which is handling a difficult and delicate job with success.

The columns of the *Journal* were recently occupied with the thorny question of how far the claims of the Press for the right to give unlimited publicity to any matter it considers to be news can be reconciled with the claims of our profession to have its traditional right to the privacy of some of its relations with the public a claim equally in the interest of the public.

There is a body called the Press Council. Up to the present it does not seem to have done much to justify its existence. It seems to me that the problem which is troubling us is, to use a slang expression, "just up its street." I suggest that our Public Relations Committee should ask the Press Council to try its hand on the formulation of a pronouncement which, while satisfying all reasonable demands of the lay press, would meet the requirements of the medical profession, and at the same time safeguard the legitimate demands of the public for privacy in certain matters—if there is to be such a thing as privacy for the individual. I believe that our approach to the Press Council would be greatly strengthened by the fact that we have in existence a Public Relations Committee with a very capable Public Relations Officer.—I am, etc.,

London, S.W.7.

ALFRED COX.

Service Recruitment

SIR,—Having just read Dr. J. G. P. Power's letter (*Supplement*, February 6, p. 37), I would like to make a contribution to this correspondence. I am now doing my National Service as a doctor. For the past year I have served as R.M.O. to a regiment. I like my job. I have learnt not a little about minor injuries, skins, and other common ailments of troops. I don't claim that all my day is spent in practising medicine, or that my day is free of paper work, but altogether I am very happy in the regiment. I feel that my time in the Army is not being wasted, and I shall be extremely sorry to leave.

Why then do I not sign on? For undoubtedly Service life suits me, and the pay is good. My reason is this. I believe my *métier* to be general practice. Therefore, if I stayed in the Army I would not seek specialist status but remain as a general duties medical officer. Now what are my prospects of general practice in the Army? For my first five years with good fortune I would remain a regimental medical officer—that is, the G.P. of the Army medical officer with a field ambulance. In five to ten years' time, in all probability, I would be promoted to major. Now as a general duties major in R.A.M.C. as far as I know there are three posts I could fill: (1) deputy assistant director of medical services, (2) second-in-command of a field ambulance, or (3) regimental medical officer. The first I feel must be purely administrative, even in war. The second, in war, would probably be a very interesting job, but in peace, purely administration and training; and we are building our Army for peace. The third, though

theoretically possible, is actually unlikely. So in peacetime as a general duties major in R.A.M.C. I will in all probability have ceased to practise medicine. And should I rise higher to lieutenant- or even full colonel, then, as far as I know, only administrative posts are available.

Now I will agree that these administrative posts must be filled by doctors; and I would, I hope, have sufficient sense of serving the Queen to fill one of these posts for two, three, or even five years. But not for the remaining 15 to 20 years' service I would have left after my promotion to major—not when I feel that my *métier* is general practice.

If I leave the Army at the termination of my National Service next October I shall seek an opening in general practice (not easy to find, I agree). But when found I know that I will have the prospect of 30 years' practice in that branch of medicine that is my choice. That the Army cannot offer me; that is why I will not sign on.—I am, etc.,

ANOTHER N.S.M.O.

The G.M.C.'s Warning

SIR,—An account of each session of the General Medical Council is published in the *Supplement* to the *British Medical Journal*. I have carefully searched the records of each session from July, 1948, to November, 1953, to discover how many cases there have been of fraudulent claims on the National Health Service. I find the answer is that there have been only four cases in 5½ years—that is, less than one per year amongst the tens of thousands of doctors taking part in the Health Service. It follows that approximately one in 5,000 general practitioners over a period of six years has offended in this way. This is indeed a microscopic figure.

Sir, I ask you to publish this bare fact for the sake of the honour of British doctors, both now and in history.—I am, etc.,

Hemel Bay.

H.M. Forces Appointments

ROYAL ARMY MEDICAL CORPS

Major F. L. Holroyd has retired on account of disability.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Lieutenant (acting Lieutenant-Colonel) A. W. Naddell to be Captain.
Captain H. W. James has been granted the acting rank of Major.
Captain J. C. Grant, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.
Lieutenant (War Substantive Captain) C. W. S. F. Manning, from Emergency Commission to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel W. D. F. Lytle, O.B.E., T.D., has been granted the acting rank of Colonel.
Major J. S. H. Wade, M.C., to be Lieutenant-Colonel.
Captain (acting Major) R. P. Harwood has been granted the acting rank of Lieutenant-Colonel.
Major D. Macartney has retired.
Captain (Acting Major) J. S. Binning to be Major.
Captains A. C. P. D. Thomson and A. R. Currie have been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY
MEDICAL CORPS

Colonels R. F. Guymer, T.D., and R. W. Nevin, T.D., from Active List, to be Colonels.
Lieutenant-Colonel (Honorary Colonel) A. H. Whyte, D.S.O., T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O.
Lieutenant-Colonel F. J. Manning, T.D., and M. J. Lindsey, M.C., T.D., from Active List, to be Lieutenant-Colonels.
Majors (Honorary Lieutenant-Colonels) E. H. Brindle, T.D., H. S. Kent, T.D., and R. S. Creed, T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O.
Major A. K. Dougall, M.C., T.D., from Active List, to be Major.
Major S. Andrews, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O.

ROYAL AIR FORCE

ROYAL AUXILIARY AIR FORCE

Squadron Leader D. Turner has been transferred to the Reserve.
Flight Lieutenant I. Thomas to be Squadron Leader.

ROYAL AIR FORCE VOLUNTEER RESERVE

Squadron Leaders G. P. Arden and R. T. H. James have relinquished their commissions.

18 Thurs. Dermatologists Group Conference, 2 p.m.
19 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 10.30 a.m.

Branch and Division Meetings to be Held

BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Bournemouth, Friday, February 26, 8.15 p.m., meeting. Address by Dr. R. S. F. Schilling: "Industrial Medicine."

BRIGHTON AND MID-SUSSEX DIVISION.—Thursday, March 4, conjoint meeting with Brighton and Hove Association of Pharmacy. Subject: "The Nation's Drug Bill."

BUCKINGHAMSHIRE DIVISION.—At St. John's Hospital, Stone, Friday, March 5, 8.30 p.m., lecture-demonstration by Dr. S. L. Last: "Clinical Uses of Electroencephalography."

CHESTER DIVISION.—At Blossoms Hotel, Foregate Street, Chester, Friday, March 5, 8.30 p.m., joint meeting with Chester and North Wales Medical Society. Annual Lecture by Sir Arthur E. Porritt: "Abreast of the Times."

CHESTERFIELD DIVISION.—At Walton Sanatorium, Chesterfield, Friday, March 5, 8.45 p.m., meeting. Discussion to be opened by Dr. J. P. Davie, Dr. R. T. Gaunt, Dr. G. L. Fine, and Dr. Elizabeth Michael: "The Control of the Drug Bill."

CITY OF DUNDEE AND COUNTY OF ANGUS DIVISIONS.—At Medical School, Dundee, Thursday, March 4, 8.30 p.m., meeting. Lecture by Professor J. L. Henderson: "Some Nutritional Problems in Childhood."

COVENTRY DIVISION.—At Chace Hotel, London Road, Willenhall, Tuesday, March 2, 7.30 for 8 p.m., ordinary general supper meeting. Paper by Dr. D. W. Jones: "Some Aspects of Pneumococcosis."

DONCASTER DIVISION.—At Messrs. Parkinsons' Café, High Street, Doncaster, Tuesday, March 2, 7.30 p.m., joint meeting with Doncaster Medical Society. Dinner, followed by an address by Professor R. S. Illingworth: "Some Common Problems in Paediatrics."

EAST SOMERSET DIVISION.—At The Small Hall, Wells, Sunday, March 7, 3 p.m., general meeting.

GRIMSBY DIVISION.—At Field House, Grimsby, Thursday, March 4, 6.30 to 8.30 p.m., cocktail party.

HAMPSHIRE DIVISION.—At Hampstead Central Library, Finchley Road, N.W., Wednesday, March 3, 8.30 p.m., meeting. Discussion between Dr. Desmond Curran and an eminent barrister: "Insanity and the Law." Members' friends and members of the legal profession are invited.

LANCASTER DIVISION.—At Grosvenor Hotel, Morecambe, Saturday, March 6, 7.30 for 8 p.m., annual dinner.

LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, S.E., Friday, March 5, 8.30 p.m., meeting. Dr. F. H. R. Smithard: "Co-operation and Liaison between General Practitioner and Public Health Department."

NORTH BEDFORDSHIRE DIVISION.—At Bedford General Hospital, Friday, March 5, 8.30 p.m., joint meeting with Bedford Medical Society. Annual B.M.A. Lecture by Mr. L. Colebrook, F.R.S.: "The Treatment of Burns."

REIGATE DIVISION.—At Netherne Hospital, Coulsdon, Tuesday, March 2, 8.30 p.m., meeting. Subject: "Care of the Psychiatric Case."

ST. PANCRAS DIVISION.—At B.M.A. House, Tavistock Square, London, W.C., Wednesday, March 3, 8.30 p.m., meeting. Dr. N. J. Pratt: "Homoeopathy."

SCUNTHORPE DIVISION.—At Scunthorpe and District War Memorial Hospital, Wednesday, March 3, meeting. Mr. Eric Dyson: "The Coroner and the Doctor."

SOUTH ESSEX DIVISION.—At Rush Green Hospital, Romford, Sunday, February 28, 10.30 a.m., clinical meeting.

SOUTH WALES AND MONMOUTHSHIRE BRANCH.—At Morriston Hospital, Swansea, Thursday, March 4, 3 p.m., joint clinical meeting with Swansea Division.

WEMBLEY DIVISION.—At Myllet Arms, Western Avenue, Wednesday, March 3, 8 for 8.30 p.m., annual dinner and dance.

WEST DERBYSHIRE DIVISION.—At Card Room, Smedley's Hydro, Matlock, Wednesday, March 3, 8.30 p.m., meeting. Professor C. H. Stuart-Harris: "Chronic Bronchitis and Pulmonary Heart Failure." All medical practitioners in the area of the Division are invited.

WESTMINSTER AND HOLBORN DIVISION.—At Royal Society of Medicine, 1, Wimpole Street, W., Thursday, March 4, 7.30 for 7.45 p.m., dinner. 8.45 p.m., lecture by the Rt. Hon. Lord Amulree: "Geriatrics." Discussion to be opened by Dr. Geoffrey Hale.

Meetings of Branches and Divisions

SARAWAK BRANCH

A meeting was held at the General Hospital, Kuching, on November 18, 1953. Dr. Philpott was elected chairman. There were eight members present.

CHELSEA AND FULHAM DIVISION

A general meeting was held at St. Stephen's Hospital on January 29, 1954. With Colonel W. L. Harnett in the chair there were 40 members and guests of the Kensington and Hammersmith Division present. Dr. Dudley Hart gave a lecture on "Some Recent Advances in Therapeutics."

The Minister of Health has approved an increase of subscription from £50 to £65 by boards of governors of teaching hospitals to the Teaching Hospitals Association during the financial year 1954-5 and for subsequent years until further notice.

THE GENERAL PRACTITIONER AND THE
HEALTH VISITOR

The following Resolution was passed at the Annual Representative Meeting in 1953:

"That the Association welcomes health visitors working under the guidance of general practitioners as a means by which such practitioners may increase the help they can give to their patients, and that the Council be requested to consider ways whereby the help given by health visitors to general practitioners may be increased."

Since then the subject of co-operation between general practitioners and health visitors has been discussed in detail by a Joint Subcommittee of the General Medical Services and Public Health Committees, as a result of which the statement which follows has been approved by the Council of the Association and the Society of Medical Officers of Health. The statement has been sent to secretaries of local medical committees, medical officers of health of local health authorities, and honorary secretaries of Branches and Divisions. Secretaries of Branches and Divisions have been asked to convene meetings between the medical officer of health, together with senior members of his staff, and representatives of the B.M.A. Branch or Division and the local medical committee so that the matter of co-operation may be talked over between them.

THE STATEMENT

The need for the closest co-operation between general practitioners and health visitors is fully accepted by the Association, and in conjunction with the Society of Medical Officers of Health detailed consideration has been given to the most effective means of securing this co-operation. It is appreciated that in many areas reasonably satisfactory arrangements already exist with resultant benefit to all concerned, but it is apparent that in other areas the necessary degree of co-operation has yet to be attained. It is the view of both bodies that harmonious relations can be established if good will and interest are shown by all concerned and if the following principles are accepted:

- (1) Co-operation between general practitioners and the medical officer of health and his staff regarding the health, care, treatment, and aftercare of all patients is essential.
- (2) The local health authority has certain statutory obligations regarding the health of the community, and the health visitor who is employed by the local health authority is under the direction of the medical officer of health. This, however, in no way prevents the health visitor from working closely with the general practitioner and under his guidance in the care of individual patients.
- (3) Direct consultations should take place between general practitioners and health visitors with a view to the exchange of information regarding individual patients.

(4) The general practitioner is primarily responsible for the health of the individual and the family, while the health and welfare of the family in relation to the community is a responsibility of the medical officer of health and his staff. The close association of all concerned, as members of one team, is of vital importance if these responsibilities are to be adequately fulfilled.

The Association and the Society realize that to a great extent the question of co-operation is a local problem, and the means by which such co-operation can be obtained are for local consideration and arrangement. It is strongly recommended that urgent consideration be given to this matter in all areas. It is only in this way that the general practitioners, medical officers of health, and health visitors can work in partnership towards that co-operation which will ensure efficient and all-embracing care for the patient, whatever his age or state of health.

APPENDIX

The following suggestions of some of the ways by which greater co-operation between general practitioners and health visitors could be better understood and improved may be helpful:

- (1) In the first place discussions to this end should take place between the medical officer of health of the local health authority, together with senior members of his staff, and representatives of the B.M.A. Branch or Division and the local medical committee. This is essential, for the detailed arrangements will vary, not only between local health authorities but in different parts—that is, rural and urban—of a local health authority. Agreement on the principle of co-operation at this level should ensure full implementation elsewhere.
- (2) Close personal contact and exchange of information between individual general practitioners and health visitors is essential. In this way both parties will understand and appreciate the other's duties and responsibilities. In rural areas where the one individual is home nurse, midwife, and health visitor there is usually that understanding between her and her G.P. colleagues. In urban areas, particularly in the large towns and cities, and where in most cases the health visitor does not act as home nurse or midwife, general practitioners do not know personally the health visitors working in the area.
- (3) Complaints have been made by general practitioners that at times contradictory advice is given to patients by health visitors. It is clear that this must be avoided, and here close consultation and co-operation between general practitioners and health visitors is essential.
- (4) In addition to their statutory duties, health visitors are available, at the discretion of the medical officer of health, for visiting patients when requested by general practitioners. Full consultation between the parties will result in efficient and economic use of health visitors.
- (5) Many general practitioners are unaware of the many facilities which can be made available for their patients through the local authority health and welfare services. Some medical

officers of health regularly circulate all general practitioners in their area with detailed information, and it is strongly recommended that this should be done in all areas. It can be of great value to the general practitioner to know what assistance can be provided by his local authority. The full use of health visitors would tend to obviate repeated visits on the part of the general practitioner and would facilitate his work by securing rapid assistance through the local authority.

In all these ways the health visitor can supplement the service of the general practitioner, and by working in partnership they can weld together both the clinical and preventive aspects of the service within the existing arrangements under Parts III and IV of the National Health Service Act.

In certain areas a health visitor has been allocated by the medical officer of health to work with a group of general practitioners. This has proved to be a satisfactory arrangement, but its practicability depends on local circumstances. It is recommended that this arrangement could well be extended wherever possible.

GENERAL MEDICAL SERVICES COMMITTEE

The January meeting having been cancelled, the members of the General Medical Services Committee, meeting on February 18, had 50 items on the agenda and separate documents to the number of 25. The chair was taken by Dr. A. TALBOT ROGERS.

The Committee decided to renominate Dr. Joel Green to the Joint Pricing Committee, and Dr. Wand, with Dr. Gorsky as his alternate, were nominated for co-option by the Psychological Medicine Group Committee for the purpose of assisting in the preparation of evidence to the Royal Commission on Mental Illness and Deficiency. The Chairman said that the Government wanted a general practitioner to serve on the Advisory Council for Handicapped Persons. The name of Dr. Vaughan Jones, the chairman of the Occupational Health Committee, was put forward and agreed to unanimously.

Maternity Medical Services

Dr. CATHERINE HARROWER introduced the report of a subcommittee which had been appointed to review maternity medical services, with particular reference to the relation of fees to the work done. The subcommittee stressed that the abolition of the obstetric list as it now exists, for which the Association has been pressing, must not involve any reduction in the present fee which covers antenatal care during pregnancy, attendance at confinement if necessary, medical care of mother and child for 14 days after confinement, and a post-natal examination. Dr. Harrower said that the subcommittee was not at present making any recommendation as to the adequacy of existing fees, but was of opinion that, should this be the subject of examination at a later date, the fact that the great majority of general practitioners undertook the fullest antenatal care (not usually restricted to the two examinations which, when the regulations were framed, were regarded officially as discharging the doctor's obligation) should be borne in mind. The report also asked for more widespread facilities for the postgraduate education of the general-practitioner obstetrician.

Dr. A. B. DAVIES moved that the report be received with congratulations to the subcommittee. The CHAIRMAN said also that thanks were due to Dr. Harrower and her subcommittee for the work they had done. If this report were passed by the Conference it would embody their firm policy over a large number of matters connected with the maternity services.

A question was raised by the Rochester, Chatham, and Gillingham Division concerning institutional midwifery. The secretary of the Committee explained that the Ministry had sent out an R.H.B. circular in which it was stated that the social factors determining whether a patient should be confined in hospital should be assessed by the medical officer

of health on the advice of health visitors and midwives. The Ministry was not prepared to amend the circular, but the deputy chief medical officer had said that he would naturally be in favour of consultation with the general practitioner in regard to a patient's home conditions, and that he would deal with that through informal channels. But the county medical officer of health in the area mentioned had insisted on rigid adherence to the terms of the circular, and therefore there seemed nothing for it but to take up the point with the Ministry.

A small sampling inquiry is being made by the Ministry into analgesia in domiciliary midwifery, the purpose being to find out why some patients do not have gas-and-air analgesia. A copy of the questionnaire was shown to the Committee. One member expressed the fear that medical practitioners doing midwifery did not make use of this facility to the extent they might. Another said that the midwives were doing their job, and the parturient woman was having a much easier time than 15 or 20 years ago. The Chairman said that there should be universal availability of gas and air.

The Scottish Subcommittee

After Dr. J. T. BALDWIN had presented the minutes of three meetings of the General Medical Services Subcommittee (Scotland), the CHAIRMAN said that during the previous week he and the secretary of the Committee had attended in Scotland with a deputation from the subcommittee to the Department of Health, and had been very much impressed, not only with the way in which the subcommittee had tackled its problems, but particularly with the friendly atmosphere in the Department. There was a free and frank discussion and a willingness on the other side to see the profession's point of view.

Responsibility in Partnerships

A report was made to the Committee of a conference which had taken place with representatives of the medical defence societies on the question of responsibility for the acts or omissions of a partner or deputy. The conference had arrived at the following principles: that a practitioner remains responsible for the acts or omissions of any other practitioner acting as his deputy, where the deputy is an assistant or locum tenens not on the medical list; that where the deputy is also principal on the medical list, whether as partner or agent, he should be responsible for his own acts or omissions unless there is prima facie evidence that the principal upon whose list the name of the patient appeared had himself acted in breach of the terms of service; in the event of a complaint being made it should be the duty of the Service Committee before the hearing to decide whether there was a prima facie case against the first doctor or whether he had merely been cited because the patient's name appeared on his list. In the latter event, if he could show that he had made proper deputizing arrangements, no further action should be taken against him, and only the deputy should be required to appear.

After a short discussion it was agreed that the proposals should be referred to the Annual Conference of Local Medical Committees.

Woodberry Down Health Centre

The London Local Medical Committee sent a letter asking for advice on certain points of principle arising in connexion with the Woodberry Down Health Centre, which was opened in 1952. The practitioners working at the centre had asked that physiotherapy facilities should be provided there, these to be available also to local doctors outside the centre. The question arose whether such provision would place the doctors working at the centre in an unduly advantageous position as against their colleagues outside. A similar request had been made for a part-time technician in the pathological laboratory at the centre, and here the same considerations applied.

Dr. M. SORSBY said that it was obvious that what was being done in London might have its effect in other centres. He reminded the Committee that Woodberry Down was not established for the practitioners who worked in it, but for a specified unit of population in the neighbourhood. If the proposals for physiotherapy facilities and for technical assistance in the pathological laboratory went forward it must be always provided that other practitioners in the district would be allowed to share for the benefit of their patients.

Dr. DAVIES hoped that the Committee would give the utmost support to the London Local Medical Committee in these negotiations. Dr. WOOLLEY pointed out that health centres for the present were on an experimental basis. He suggested that the request for technical assistance in the pathological laboratory should be supported, but not the request for physiotherapy facilities.

The CHAIRMAN said that Woodberry Down was built lavishly, but also with some foresight, and it was intended by its planners to have a certain elasticity of function. He believed that the Committee was prepared provisionally to agree with the London Local Medical Committee in going forward with these negotiations, provided the facilities were available to all.

Asked whether the rent paid by the doctors using the centre would be increased in view of these additional facilities, Dr. SORSBY said that when the rent was fixed at £350 a year for each suite it was known that the facilities would be increased; that amount would remain the rent for a term of years.

It was finally agreed that the London Local Medical Committee should have full discretion in dealing with the proposal in the light of the views expressed.

Exchange of Practices

Dr. DAIN, in presenting the report of a subcommittee which had been appointed to explore ways and means of making it easier for general practitioners to exchange practices, said that no "clever" solution had been found. The ideal would be to have a clearing-house for all doctors who wished an exchange, having specially in mind those doctors who, approaching retirement age, desired perhaps to move from a large industrial practice to a small one in a residential area. Dr. Potter, medical director of the Medical Practices Advisory Bureau, had been able to put a large number of doctors in touch with one another, but for many reasons the results had been disappointing. With better publicity, however, and the co-operation of the executive councils, more might be done.

Dr. POTTER said that the mass advertisement which appeared in a recent issue of the *Journal* had produced a large number of inquiries, but again the results had been disappointing. The reason why there were not more exchanges was that the people who wanted to exchange all wanted the same thing—in other words, the best of the bargain. The machinery was in the Bureau ready for use. Dr. WAND suggested the possibility, with the co-operation of the Medical Practices Committee, of earmarking certain of the Medical Practices Committee would certainly co-operate. Already a certain number of men over 50 were being put on short lists, and only the previous week his committee had agreed to a recommendation for a man aged 62 to a small practice.

It was agreed to bring this matter before the Conference, and in the meantime to discuss it with the Medical Practices Committee.

The Defence Trusts

The Committee resolved itself successively into the National Insurance Defence Trust and the General Medical Services Defence Trust. Dr. CATHERINE HARROWER, the treasurer, reported that at the end of 1953 the total accumulated funds of the former amounted to £453,674 and of the latter, £73,368. The income of the N.I.D.T. in 1953

was £14,462, exceeding the expenditure by £448, and the income of the G.M.S.D.T. was, from subscriptions, £37,601, and from investments £1,601.

The Springfield Story

The Committee heard a report by one of its members, Dr. A. CAMPBELL, on the closure of Springfield maternity home at Blackburn. For over a quarter of a century Springfield, a 20-bedded hospital, the only general-practitioner hospital in the town, had served a population of over 110,000 people. Dr. Campbell said that in October, 1953, without consultation with the Blackburn or Lancashire Executive Councils or the general practitioners concerned, the hospital management committee recommended closure to the regional hospital board. Vigorous opposition to this step was evoked, and the strongest protest went to the Ministry. On the evening of January 7, however, the secretary of the hospital management committee announced to the patients that the hospital was to be closed on the morrow and they were given the alternative of transfer to a maternity hospital eight miles away or return to their homes. Some of the general practitioners who had charge of patients in the hospital were informed of this development by telephone on the morning of the evacuation. In one case the patient had been delivered on the previous day, but she was removed in spite of the protests of her doctor. Complaint was also made concerning the attitude of the Minister of Health when speaking at a political meeting at Darwen a month later, in which he declared that he was satisfied that the right thing was done at the right time. Dr. Campbell urged that a deputation should go from the Committee to the Ministry.

After a very full discussion it was agreed that Sir John Hawton, permanent secretary to the Ministry of Health, should be asked to receive a small deputation to discuss the matter.

Other Business

It was stated that the Joint Committee on Prescribing, which had now completed the task for which it was set up, had recommended to the Central Health Services Council that a small permanent committee should be appointed to continue its work, and that the Association would be asked to make a nomination. The CHAIRMAN said that this should be a purely advisory committee, and that further information about its constitution and terms of reference should be sought before any nomination was made. The Committee approved the Chairman's proposal.

The report of a section set up by the London Local Medical Committee to examine the problem of the aged and infirm sick had been sent to the General Medical Services Committee for consideration. It was referred first of all to the Geriatrics Subcommittee.

Representatives of the Committee had met officials of the Board of Customs and Excise to discuss the Committee's contention that general practitioners should no longer be called upon to provide certificates to enable surgical corsets to be obtained free of tax. The customs officials had expressed their full sympathy with the Committee's views on the abuse of the present arrangements and were glad of the opportunity of first-hand medical advice on the subject. It was pointed out, however, that there were difficulties in the way of completely abolishing certificates for this purpose. Surgical corsets were only part of the wider problem of surgical appliances as a whole. The feeling was expressed that any conditions which might give rise to abuse should be deleted from the prescribed list. To this end severe splanchnoptosis had already been deleted. It was agreed that the Committee should keep the complete list under review and suggest any further deletions which might be made in order to reduce the certification burden.

Much other detailed business, some of it arising out of questions from local medical committees, was dispatched.

THE AMENDING ACTS COMMITTEE

RESTORATION OF GOODWILL

The Amending Acts Committee met on February 25, with Dr. H. H. D. Sutherland in the chair, to consider for presentation to the Council a scheme for the optional restoration of the right to buy and sell practice goodwill. The Committee had before it the observations of a subcommittee which had been appointed to go into the details of the matter.

The Committee agreed to a scheme which will be put before the Council of the Association for debate at its next meeting on March 9.

FRIENDLY SOCIETIES' DROP IN MEMBERSHIP

CHIEF REGISTRAR'S REPORT

The principal object of friendly societies is to ensure sickness pay and death benefit, although they often provide other benefits such as accident pay, superannuation, etc. They suffered "serious set-backs" when the Government, in 1946, created its own machinery for administering the National Health Insurance Scheme, and extended the range of compulsory insurance to include almost the whole of the working population. The Chief Registrar of Friendly Societies, in his report for the year 1952,* shows that membership of the societies fell by 21%, from 8,608,000 to 6,786,000, from 1947 to 1952, having previously risen by 3% since 1937 (the last year in which Part 2 of the yearly report was issued). Juvenile membership had the sharpest fall—by 47% as against the adult 23% in some branches, and by 54% as against 15% in others. In spite of the decline in membership, total funds have continued to rise—from £146,142,000 in 1937 to £215,996,000 at the end of 1952. During this period sickness pay dropped from £5,695,000 to £5,292,000, but death benefits increased from £1,628,000 to £1,889,000.

Among exceptions to the trend of declining membership the Hearts of Oak Benefit Society and the six largest Holloway societies have increased their membership. Societies providing institution treatment and whose main business is other than a cash sickness benefit have suffered only a negligible loss of membership.

Decline of Voluntary Service

The Chief Registrar in his report says that it would be wrong to attribute the decline of membership solely to the impact of National Insurance. The rate of decline, although still serious, has in fact slowed considerably since 1949. The need to supplement national by voluntary insurance is generally acknowledged, states the report, but far more activity on the part of the societies is needed than at any time in the past. One of the difficulties mentioned is that of finding members willing and able to give time to the societies' management; it has become increasingly harder to find volunteers to carry on the work, and the death or retirement of a secretary is often the signal for dissolution.

The group of medical societies providing medical attendance, medicines, or surgical appliances has been closed, as these benefits are provided by the State under the N.H.S. Act, 1946. Some of these societies have changed their object to that of the provision of cash benefits, and have been reclassified accordingly.

* Report of the Chief Registrar of Friendly Societies for the Year 1952, 1954, Part 2, H.M.S.O., London.

At the Royal Halifax Infirmary general practitioners are encouraged to meet members of the hospital medical staff in the hospital library between 11 and 11.30 a.m. Light refreshments are served.

Scottish News

PRESCRIBING STATISTICS FOR SCOTLAND

A circular (E.C.S.(P.)5/1954) issued by the Department of Health for Scotland to Scottish executive councils says that the Secretary of State for Scotland has made arrangements, in consultation with representatives of the medical profession and of executive councils, for the periodical issue of statistics about the prescribing of general practitioners. The statistics will be produced by the pricing bureaux three times a year and will cover a month's prescriptions in each case. The table will show, for each doctor resident in the area covered by the executive council, the average cost per prescription form and average cost per patient, together with corresponding averages for the area and for the whole of Scotland. About 55% of each doctor's prescription forms will be fully priced, and it is thought that this will produce reliable figures for comparing the different doctors' prescribing costs.

In the case of a partnership, the average cost per form E.C.10 will be calculated on the total number of patients and the total cost of prescriptions of the partners. In the case of a dispensing doctor paid on a capitation basis the average cost per patient will be found by adding 9d. for each "dispensing" patient to the total cost of forms E.C.10 issued and dividing this sum by the total number of patients on the list.

Use of the Statistics

The statistics will have a double function. They will show doctors how their prescribing costs compare with those of their colleagues, and they will indicate to local medical committees the doctors whose prescribing might merit investigation under the regulations. Executive councils are asked to send a slip to each doctor showing his own prescribing statistics and the corresponding averages for the area and for the whole of Scotland, in order to help him to compare his prescribing costs with those of his colleagues.

REMUNERATION OF CONSULTANTS

LIVERPOOL REGION MEETING

At the request of a number of consultants in the Liverpool Region a special general meeting was called on Sunday, February 28, to discuss the present state of the negotiations for the implementation of the Spens report. The meeting was attended by 110 consultants and specialists, together with some registrars who had been invited as observers. After lengthy discussion in which a number of speakers expressed their anxiety at the lack of knowledge regarding the negotiations and the length of time that they were proceeding, the following two resolutions were passed unanimously and with enthusiasm:

(1) "This Meeting is of the opinion that in any negotiations that may be undertaken it is essential that the Spens Report on terms and conditions for hospital medical staff should not be abandoned or altered without reference to the general body of all consultants and specialists. Furthermore, this Meeting is of the opinion that there has been undue delay in the full implementation of the Spens Report and considers that the Whitley machinery is an unsatisfactory method of negotiation. It calls for the right of arbitration, even if this necessitates an amendment in the National Health Service Act."

(2) "That this Meeting further calls on the Central Consultants and Specialists Committee to consider now what further steps should be taken to bring a speedy conclusion to these protracted negotiations."

It was furthermore resolved to send these resolutions to the Central Consultants and Specialists Committee, regional consultants and specialists committees, and the Registrars' Group with the hope that these bodies would give them their full support.

PUBLIC HEALTH COMMITTEE

A meeting of the Public Health Committee of the Association was held on February 19, with Dr. H. K. Cowan in the chair. It was reported that the evidence to be submitted on behalf of the Association to the Working Party on Health Visitors, the preparation of which had been the responsibility of a Joint Subcommittee of the Public Health, General Medical Services, and Central Consultants and Specialists Committees, had been completed and would be submitted to the parent committees at their next meetings, with a view to approval by the Council on May 5.

Remuneration

The Committee received a report that only three authorities have not yet implemented Industrial Court Awards Nos. 2285 and 2321. With reference to the recent Award to assistant medical officers (No. 2452) all local health authorities, with one exception, have accepted and are implementing the Award. The position in County Down in connexion with the remuneration of divisional medical officers had been the subject of a special report to the Ministry of Health and Local Government, Northern Ireland. This report was discussed by the Committee and the view was expressed that the advice given by the independent investigator was acceptable to the Committee subject to clarification on two points. It was agreed that an assurance should be sought from the Ministry and that if satisfactory the Council be recommended to concur with the advice set out in the report, which it was understood had been accepted by the Ministry.

Appeals Machinery in Northern Ireland

What was described as a step forward was contained in a letter from the Ministry of Health and Local Government, Northern Ireland, with regard to appeals machinery in Northern Ireland. A liaison committee representing the various interests in the health services found that in the absence of formal Whitley machinery for the health services in Northern Ireland it would be difficult for an appeals arrangement to be fashioned on the British model, yet benefit might be derived from the formation, where appropriate, of *ad hoc* committees consisting of representatives of the employing authority and of the professional association or trade union of the employee. The Minister appreciated the value of *ad hoc* committees in seeking to resolve disputes, but pointed out their limitations. Further consideration must be given to the point that if an *ad hoc* committee failed to agree there was no provision for further appeal save by recourse to the general machinery for the settlement of industrial disputes.

The Public Health Committee was reminded that the suggestions for the constitution of *ad hoc* committees had been put forward by the Association last year when a deputation led by the chairman had discussed the matter with the Minister of Health. It was felt that progress was being made but that details of the arrangements would need to be discussed further.

Public Health Representation on Regional Hospital Boards

An analysis was placed before the Committee of the medical membership of regional hospital boards in England and Wales. The total number of members of the boards is 379, and, of these, 115 are medical members, but include only three members of the public health services. It was felt that medical officers of health could give valuable assistance and advice to boards, and it was agreed to ask the Council to include in the list of doctors recommended for appointment to regional hospital boards and boards of governors the names of suitable members of the public health service.

"Added Years"

It was reported that as a result of representations made by the Association the Minister of Housing and Local Government had decided that the medical and nursing staff of local authorities (who had hitherto been excluded) should have the benefit of the "added years" regulation. This regulation (No. 12 of the Draft Local Government Superannuation (Benefits) Regulations) lays it down that where, for the efficient discharge of his duties, a contributory employee is required to possess professional or other qualifications which he has not acquired during employment with a local authority, he may request the authority to direct that a number of years be added to his service, and he will be entitled to reckon that number of additional years as contributing service.

Conference on Venereal Disease

The Venereologists Group Committee had represented to the chairman of the Public Health Committee the increasing difficulty in the follow-up of venereal cases and more particularly the tracing of contacts, and had suggested that it might be useful to call a conference of venereologists to which medical officers of health also might be invited.

The chairman reported that during the informal discussions held between representatives of the two committees it had been agreed to recommend that such a conference should be held in the form of a joint meeting of the Public Health and Venereologists Group Committees and that the Society of Medical Officers of Health and the Medical Society for the Study of Venereal Diseases be invited to send representatives. The Committee accepted the recommendation and provisional arrangements were made for the conference to be held in March.

Meat Production and Control

It was reported that the British Veterinary Association had submitted a memorandum to the Ministry of Agriculture in which it had suggested that the veterinary profession should be responsible for the supervisory control of meat inspection and that local authority meat inspection functions should be transferred to the Ministry's animal health service. An important implication of the plan was that medical supervision through the medical officer of health over meat inspection would be removed.

Regret was expressed that the British Veterinary Association had not seen fit to inform the British Medical Association of its intended action through the Joint Committee of the two bodies, which had already discussed the matter. After detailed discussion it was agreed that the principle of medical supervision was vital, especially bearing in mind the relationship between meat inspection and the prevention and control of human disease. It was understood that the Council of the Society of Medical Officers of Health felt strongly on this matter, and it was agreed that the Society of Medical Officers of Health be asked to join with the Committee in preparing a memorandum setting out the views of the profession to be submitted to the appropriate Government department.

Other Matters

Other matters under discussion included the occupational resettlement of tuberculous persons, vaccination, and institutional accommodation for mental patients.

At the conclusion of the Public Health Committee a formal meeting of the Trustees of the Public Health Service Defence Trust was held.

Correction.—In the report of the Ophthalmic Group Committee meeting (Supplement, February 27, p. 55), under the heading "Treatment of Cataract and Glaucoma," the quotation from a Ministry circular, "early diagnosis [of glaucoma] appears to be all too frequent . . ." should have read, ". . . appears to be all too infrequent."

HOSPITAL PUBLIC AND PROFESSIONAL RELATIONS

The Public and Professional Relations Subcommittee of the Central Consultants and Specialists Committee met on February 26. Professor P. C. P. Cloake was in the chair, and Dr. H. Guy Dain, the chairman of the Association's Public Relations Committee, attended the meeting by invitation. The Subcommittee gave further consideration to the questions of the improvement of professional relationships, the relations between hospital staffs and general practitioners, and the relations between hospitals and the public. Some recommendations on these matters were agreed to and will be put before the parent committee at its next meeting.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

The Clare Wand Fund

SIR.—At the last Annual Conference of Local Medical Committees the Chairman of the Conference gave a brief report on the progress of the Clare Wand Fund, which it will be remembered was established as a mark of appreciation of the services rendered to the profession by the Chairman and Secretary of the General Medical Services Committee during the course of the long negotiations which led up to the Danckwerts award. The Trustees of the Fund wish to express their grateful thanks to all those local medical committees and individual general practitioners who have responded to their appeal, and are glad to be able to report that as a result upwards of £12,000 now stands to the Fund's credit.

When making their appeal the Trustees stated that the principal object of the Fund would be to provide educational assistance to those in general practice, and since then a good deal of thought has been given to the precise use to which the Fund should be put. First, the Trustees wish to encourage projects which will enhance the prestige of general practice itself, and they have been in touch with a number of organizations which have shown a good deal of interest in the establishment of the Fund and offered much help and encouragement. Secondly, the Trustees have examined a number of specific projects which they consider would be appropriate for the Clare Wand Fund to undertake, and the following are among the suggestions that have been made:

- (1) Travelling scholarships to study methods of practice, either from the point of view of clinical method or of organization.
- (2) Financial help to general practitioners: (a) to enable them to carry out research, particularly in subjects which are regarded as primarily the concern of the general practitioner; and (b) to assist them to take postgraduate degrees or diplomas, including original work for a thesis.
- (3) Sponsored lectures and demonstrations for groups of general practitioners in their own localities for purposes of revision and keeping up to date.

For the time being the Trustees have decided to keep the allocation of grants approximately within the limits of the Fund's investment income, and this will mean that for the next 12 months about £700 will be available to finance approved projects. It is obvious that this figure may restrict the Trustees in making grants for research projects which they might otherwise have wished to encourage, and it is hoped that in certain cases it may be possible to provide financial assistance by means of a loan.

The suggestions set out above are to be regarded as tentative and exploratory and any additional suggestion which comes within the broad objective of the Fund, whether de-

signed to enhance the status of general practitioners, or individual items of research, will be sympathetically examined. The Trustees are anxious to receive all the help they can in launching the Fund, and they hope that general practitioners who wish to avail themselves of the opportunities which the Fund offers, either for purposes on the lines indicated above or for other projects which they themselves wish to suggest, will not hesitate to get in touch with them.

Full details should be sent with any application made, and addressed to Mr. R. H. Currey, Secretary of the Clare Wand Fund, British Medical Association House, Tavistock Square, London, W.C.1.—I am, etc.,

London, W.C.1

S. WAND,
Chairman

Remuneration of Hospital Medical Staff

SIR.—One of your correspondents (Dr. K. M. Hume, *Supplement*, February 20, p. 49) thinks it unjust to criticize the efforts of those dealing with this problem when we know nothing of the difficulties. I support him. I was connected with those efforts at the start, and I assure the critics that their representatives hold very strong views indeed on the matter. One of several reasons which made me give up my attempt to represent the profession was that I could not agree on the policy to adopt in this extraordinarily difficult problem, and was not happy in going as far as the present negotiators. Your correspondents can be sure that everything is being done they would wish.

But what happens is this. Negotiators have to persuade Ministry officials to advise the Minister to put to the Cabinet for submission to a House of Commons in which the Government has not too big a majority (depending on a small percentage of votes in the country) a proposal which would be the very probable target of criticism that might swing an appreciable number of votes in an election. These votes come from an electorate whose constitution must be considered by a Government whose future depends on it. According to the *Radio Times* (February 5, p. 12), of 23½ million people in this country 80% get no more than £500 a year, and 38% less than £250. *The Times* of February 17 stated that the purchasing power of £1,000 in 1946 is represented to-day by the sum of £1,446. Another of your correspondents (Dr. B. Sugden, p. 49) suggests at least an 80% betterment factor. This would raise the annual income of a whole-time consultant from £2,750 to £4,950. We cannot really expect the Government to suggest this straightaway to an electorate of whom 80% earn little more than a tenth of it, and 38% a twentieth.

Of course, net receipts from higher incomes are relatively small. At the same time, this will not be easily understood by the majorities and minorities referred to above, at whom the Government must look, and to whom (and this is the point of this letter) hospital medical staffs should equally make good their case.—I am, etc.,

Hove.

W. A. BOURNE.

SIR.—Most of us in general practice know very little of the work or economies of S.H.M.O.s. I presume they are specialists. Of their hours of duty and their work we know nothing, so we cannot judge, but obviously from the correspondence in the *B.M.J.* they feel they are very unfairly treated.

I feel that a lot of their trouble may be due to an unrealistic attitude. I am a country doctor whose work brings him into touch with the farm worker. This fine type of highly skilled and knowledgeable man owes his position at the bottom of the wage division to his scattered job—a few here and there on scattered farms—and his idealism. Much the same applies to S.H.M.O.s. Nowadays those employed by the Government do not obtain better pay and conditions by reasoned argument but by their ability to cause public distress if they withhold their services. In the case of the railways the effect of ceasing work is felt by the community

immediately, and especially at Christmas, so the State was obliged to pay up at once. The S.H.M.O.s, wishing to be good citizens and gentlemen, will not take drastic action, so they are not getting anywhere. Let us also realize that nowadays politics play a great part in relation to the pay packet. The voting power of the S.H.M.O.s is negligible. With a party political system the effect of economic policy is bound to be affected by considerations of political expediency.—I am, etc.,

Shrewsbury.

ALBERT E. NICHOLLS.

SIR.—Dr. K. M. Hume says (*Supplement*, February 20, p. 49) that he had to purchase a car at the peak of its price; that he is faced with obtaining and furnishing a house, and preparing for the schooling of a family. These are the aims, I infer, that he hopes to achieve on the salary of a consultant in the National Health Service. I am happy to be able to tell him how to obtain his ends. As a preliminary he should give up all hope of fulfilment of the recommendation of the Spens Report in his lifetime. He must then: (1) give up any idea of increasing his family; (2) give up paid domestic help; (3) give up endowment and life insurance policies; also sickness insurance policy; (4) give up holidays except those taken at home and spent in house redecoration, etc.; (5) give up all secretarial help other than what his wife can offer when she is not occupied in household chores or looking after the children; (6) give up all hope of ever replacing his car; (7) give up smoking, give up all entertaining; (8) become a teetotaller; (9) build his hospital department into an empire of underlings; and then (10) act the sycophant to any acquaintance who may promote his scanty hopes of a merit award.

By following these few simple instructions and not attending the cinema more than once in three months Dr. Hume should find himself in a position to send two children to a public school and live within his means.—I am, etc.,

D. J. ROSS STEEN.

Weymouth.

A Bob a Job

SIR.—I wonder that more protest is not made regarding the odious practice of rural practitioners being forced to collect a shilling in respect of medicine given to the patient. The point of this is completely lost on 90% of patients, who regard it as a direct supplement to their doctor's income. As one tersely said to me the other day: "It must be much better for you now, doctor."

I am continuously asked after suturing lacerations, syringing ears, and even on one occasion after examining a chest, if the fee for my services is 1s. But the climax came one evening when, out of surgery hours, a local man on the list of a colleague four miles away (and therefore not eligible to be a temporary patient) came in distress with a small piece of metal embedded in his conjunctiva. I removed this with a great deal of patience and a fair amount of dexterity, whereupon he flung down two sixpences, saying, "I suppose that'll be a bob," and left me standing open-mouthed. To what further depths can our reputations and the recognition of our skill sink?—I am, etc.,

Thirk.

MARGARET J. OLDFIELD.

Notes and News

A Closer View.—An executive council in the north of England recently asked nine applicants for a practice vacancy to come for interview. When five of the applicants—all assistants in general practice—failed to attend, inquiries were made and it was found that all five had received offers of partnerships from their own principals as a result of being short-listed.

Association Notices

ELECTION OF MEMBERS OF COUNCIL

Notice is hereby given that nomination of candidates for election as members of Council, 1954-5, (a) by the following Divisions and Branches, (b) by public health service members, and (c) by women members, must be forwarded in writing so as to reach me not later than Saturday, April 3, 1954.

Forty Members by Branches in Great Britain and Northern Ireland

Group	England and Wales	No. of Members of Council to be Elected by Group
1.	North of England Branch; Tees-side Branch	2
2.	East Yorkshire Branch; Yorkshire Branch	3
3.	North Lancashire and Westmorland Branch	1
4.	Divisions in Cheshire: Birkenhead and Wirral; Chester; Crewe; Hyde; Macclesfield and East Cheshire; Mid Cheshire; Stockport; Wallasey	1
5.	Lancashire Divisions of Merseyside Branch: Liverpool; St. Helens; Southport; Warrington. Isle of Man Branch	1

-----	-------------------------	---

Public Health Service Members

Two members of Council are nominated and elected by members of the Association employed in the public health service as defined in By-law 1 (3). Candidates must be members of the public health service as so defined.

One Woman Member

One woman member of Council is nominated and elected by women members of the Association.

Nominations

The nominations must be on the prescribed forms, copies of which can be obtained on application to me. In the case of the 40 members to be elected by Divisions and Branches, the nomination may be by a Division or Division-Branch as such, or by not fewer than three members of any Branch in the Group.

A notice will be published by the Council in the *British Medical Journal Supplement* on April 17, 1954, of the candidates nominated. Where contests occur, voting papers containing the names of all duly nominated candidates will be issued on April 24, 1954, from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group, or to the public health service members, or to women members. A notice will be published by the Council in the *Supplement* of May 15, 1954, giving the results of the elections where there have been contests.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

BIRMINGHAM REGIONAL REGISTRARS' GROUP.—At Small Committee Room, Queen Elizabeth Hospital, Birmingham, Monday, March 8, 8.15 p.m., extraordinary general meeting. Dr. E. E. Claxton (Assistant Secretary, B.M.A.): "Current Registrar Problems"—including remuneration, future prospects for Registrars, and other relevant matters. There will be an opportunity for questions and discussion.

BRADFORD DIVISION.—At Medical Society's Room, Bradford Royal Infirmary, Wednesday, March 10, 8.15 p.m., meeting. Dr. J. F. Wilkinson: "Modern Treatments of Blood Diseases."

BURTON-ON-TRENT DIVISION.—At Bretby Golf Club, Ashby Road, Burton-on-Trent, Tuesday, March 9, 8 p.m., informal supper, followed by annual B.M.A. Lecture by Dr. W. R. Russell: "Poliomyelitis."

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, March 9, 8.30 p.m., general meeting. B.M.A. Lecture by Dr. R. D. Lawrence: "Diabetes in General Practice."

DAREFORD DIVISION.—At Embassy Ballrooms, Welling, Wednesday, March 10, 8 for 8.30 p.m., annual dinner.

DONCASTER DIVISION AND DONCASTER MEDICAL SOCIETY.—At the Danum Hotel, Doncaster, Thursday, March 11, 7.15 for 7.45 p.m., annual dinner and dance.

EAST HERTS DIVISION.—At Hertford County Hospital, Wednesday, March 10, 8.45 p.m., meeting. Address by Dr. R. F. Tredgold: "The Relations Between the Psychiatrist and the General Practitioner."

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Heane Bay, Thursday, March 11, 7.30 p.m., dinner: 8.45 p.m., Dr. R. H. Andrews: "Present Trends in the Management of Pulmonary Tuberculosis."

GOOLE AND SELBY DIVISION.—At The Lodge, Snaith, Thursday, March 11, 7.30 p.m., meeting. Dr. S. T. Anning: "Varicose Ulceration of the Legs."

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, March 11, 8.30 p.m., meeting. Lecture by Dr. R. S. Hodge: "The Psychology of Crime."

HALIFAX DIVISION.—At Out-patients Department, Halifax General Hospital, Wednesday, March 10, 8.30 p.m., clinical meeting.

HASTINGS DIVISION.—At Royal East Sussex Hospital, Hastings, Tuesday, March 9, 8.15 p.m., meeting. Address by Mr. A. Hollingsworth: "Some Causes of Sudden Loss of Vision."

HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, March 9, 8.45 p.m., meeting. Dr. J. A. Hobson: "The Mentality of Christie." Illustrated by lantern slides.

KESTEVEN DIVISION.—At George Hotel, Grantham, Thursday, March 11, 7.15 for 7.30 p.m., dinner; 8.15 for 8.30 p.m., annual meeting. Address by Mr. E. A. J. Heath: "Health of the Doctor."

LAMBETH AND SOUTHWARK DIVISION.—(1) At Lambeth Hospital, Brook Drive, Kennington Road, S.E., Sunday, March 7, 11 a.m., clinical meeting. (2) At Court Room, Lambeth Town Hall, Brixton Hill, London, S.W., Tuesday, March 9, 8.15 p.m., meeting. Lecture by Dr. R. Forbes: "Recent Developments in Medical Litigation." Members of the Camberwell and Wandsworth Divisions are invited to this meeting.

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, March 9, 5 p.m., address for senior students by Dr. Michael Ward: "The Ascent of Everest." All recently qualified practitioners are invited.

MONMOUTHSHIRE DIVISION.—At St. Mellons County Club, Friday, March 12, 7.30 for 7.45 p.m., dinner. Lecture by Dr. R. Donald Teare: "Murder" (illustrated).

NOTTINGHAMSHIRE BRANCH.—At 64, St. James's Street, Nottingham, Thursday, March 11, 8.30 p.m., meeting. B.M.A. Lecture by Mr. Harold Dodd: "The Perils of Thrombosis."

SALFORD DIVISION.—At Kersal Cell, Lower Kersal, Salford, Wednesday, March 10, dinner. Principal guest and speaker, Mr. Leslie Walsh, LL.B., B.C.L. Members, their ladies, and friends are invited.

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, March 11, 8.30 p.m., meeting. B.M.A. Lecture by Dr. A. H. Douthwaite: "The Treatment of Peptic Ulcer." Illustrated by lantern slides.

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Thursday, March 11, 8.30 p.m., meeting. Address by Dr. R. H. Dobbs with the collaboration of Dr. Young: "Recent Advances in the Treatment of Coeliac Disease."

SOUTH-WEST WALES DIVISION.—At Stepney Hotel, Llanelli, Saturday, March 13, 7.30 p.m., dinner. Dr. F. E. Camps: "The Role of the General Practitioner in Criminal Investigation."

SWANSEA DIVISION.—At Langland Bay Hotel, Swansea, Thursday, March 11, lecture by Sir Lionel Whitby.

TOWER HAMLETS DIVISION.—At St. George-in-the-East Hospital, Raine Street, Wapping, E., Friday, March 12, 8 p.m., clinical meeting.

TUNBRIDGE WELLS DIVISION.—At Pembury Hospital, near Tunbridge Wells, Tuesday, March 9, 8.30 p.m., clinical meeting.

WEST BROMWICH AND SMETHWICK DIVISION.—At Pathological Laboratory, Hallam Hospital, West Bromwich, Tuesday, March 9, 8.15 p.m., meeting. Talk and demonstration by Dr. J. C. Ford: "The Practitioner and the Laboratory."

WEST HERTS DIVISION.—At Shrodell's Hospital, Watford, Friday, March 5, 9 p.m., joint clinical meeting with Watford and West Herts Medical Society.

WEST SUSSEX DIVISION.—At Dolphin Hotel, Chichester, Wednesday, March 10, 6 for 6.30 p.m., general meeting. Mr. D. H. MacLeod: "Common Disorders in Gynaecology."

Meetings of Branches and Divisions

BLACKPOOL AND FYLDE DIVISION

There were 48 members present on February 10, 1954, to hear Sir Heneage Ogilvie give the B.M.A. lecture on the subject of "Dyspepsia."

HAMPSTEAD DIVISION

A meeting was held at the New End Hospital on February 10, 1954. Nineteen members were present, together with guests and members of the hospital staff. Dr. Lena Williams took the chair.

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announce that Dr. Thomas Leven (Irvine, Ayrshire) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations apply.

THE GUILLEBAUD COMMITTEE*
MEMORANDUM OF EVIDENCE FROM THE
ROYAL COLLEGE OF PHYSICIANS

The following is a summary of some of the points in the evidence submitted by the Royal College of Physicians to the Committee of Inquiry into the cost of the National Health Service (the Guillebaud Committee).

Introductory

"In considering how a service should be financed," the evidence says, "one must consider its particular purpose and nature." It is pointed out that the name of the National Health Service is somewhat misleading. The 1946 Act did not set up a national service, like the post office. Though the Minister of Health took wide powers which he could hold in reserve, the Government's avowed object was to integrate, support, and supplement the work of existing medical agencies, rather than to unify, regulate, or supersede them. The N.H.S. should in fact be regarded as a confederation of medical institutions, from single-handed practice to the large hospital, whose activities need co-ordination and sometimes leadership. It is they, not the Minister, who are directly responsible for what happens to the people who seek their help, and the Act was framed in such a way that personal responsibility to the patient, and local responsibility to the public, should be weakened as little as possible by the co-ordinating measures needed to ensure medical care for everybody.

Control of the Service

The College points out that in the hospital service efficiency depends largely on finding able and knowledgeable members for committees and boards; and such people will eventually cease to give their time to this work if they have little or no money to spend as they think fit.

Referring to hospital management committees, the College draws the difference between the management of the financial affairs of the old voluntary hospitals and the present hospital financial arrangements. On the whole it favours the present N.H.S. method, but points out that, until there are better methods of costing, it will tend to favour the hospital that asks for too much, and loses again if it spends less than it is authorized to spend. In the opinion of the College, "a sense of fuller responsibility, with incentives to economy, should be restored to management committees (1) by giving them the whole sum that they are authorized to spend during the year, (2) by making it easier for them to transfer expenditure from one budgetary heading to another, and (3) by letting them use savings for minor capital improvements or for establishing a contingency fund."

*The British Medical Association's evidence to the Guillebaud Committee will be published in the *Supplement* after the Association's representatives have presented their oral evidence.

Control over their housekeeping would be exercised by providing that deficits must be carried forward. A management committee finding itself in arrears would apply to the regional board, which (for good reason shown) might be prepared to pay off the deficit, in part or whole, from its own contingency fund; but failing such help the management committee would have to meet its obligations out of its own future income. . . . If a committee is to act responsibly it must feel responsible; and it will never feel responsible unless it can make its own choices and its own mistakes."

Regional Hospital Boards

The College, in its evidence, defines the primary function of the regional board as that of seeing that all the needs of the public are met. While keeping within the general policies which integrate the service it must have power to reduce the supply to one consumer while increasing the supply to another. So long as it is the executive intermediary between the centre and the periphery, it should also be responsible for transmitting, and if necessary interpreting, all directives or statements of policy to the hospitals of its region, and it should likewise receive the returns and accounts of those hospitals.

Capital expenditure must be planned in consultation with the Ministry, but, once a project has been approved in general terms, a regional board should be free to carry it out and tackle its problems in its own way unhindered by detailed blue-prints from London.

Ministry of Health

Funds for capital development, the College thinks, should be kept separate from those for maintenance. It would be a considerable improvement if capital development were financed by grants-in-aid from the Exchequer to the Ministry for periods of five years. It is advocated that the Ministry should have the advice of some central advisory body, possessing the confidence of the professions concerned, which should be charged with keeping the development policy of the service under continuous review. The College had hoped that the Central Health Services Council would fulfil this function, but it has not done so.

The Treasury

The College is aware that established financial practice is incompatible with its wish that the Ministry, the regional boards, and the management committees should each receive the sum allocated to them and should bear full responsibility for its proper use. Social innovations so great as the N.H.S., however, may necessitate innovations also in financial practice. A system devised for controlling Government department expenditure is not necessarily suitable for controlling the expenditure of a new kind of service administered basically by voluntary boards and committees. In the past five years, by continually exercising its final

authority, the Treasury has assumed no small responsibility for the administration and development of the N.H.S. and has thereby weakened the responsibility felt by everybody else. In the College's experience the conventional system of financial control has in fact removed incentives to economy, encouraged peripheral expenditure on non-essentials, and antagonized or depressed many of the abler voluntary administrators on whom success depends. The alternative put forward is to place financial responsibility squarely on the people, at all levels, who are administering the service. With severe penalties for irresponsible overspending, and real rewards for economy, the risk of the N.H.S. presenting supplementary estimates would be lessened.

Modifications in Organization

While agreeing that consideration of eventual alterations in the structure of the N.H.S. is desirable, the College thinks that any basic reconstruction now would be premature and done without sufficient knowledge. Little would be gained by abolishing the regional hospital boards, and the College favours giving them more scope.

With regard to the unification of the three branches of the Service under one local administrative authority, the College says: "Such unification might look good on paper yet do little to help patients; and its possible advantages in practice cannot usefully be assessed until the present organization has had full trial."

Public Health

The College feels that consideration of the nation's needs would show that the National Health Service could profitably devote more of its funds to public health. Such expenditure might reduce the demand on the expensive curative services.

General Practice

Pointing out that hospital care is the most costly care, the College says that money would be saved if more cases were investigated and treated by the general practitioner. "In the technical revolution in medicine general practice has lagged behind. With the rise of specialism, the scope of the work undertaken by the average practitioner has steadily narrowed, and the public has come to believe that all but the most trivial ailments need the attention of a specialist. Since 1948, when consultations with the practitioner became free, the number of patients going to him has risen and he has often responded by sending more of them to hospital. Yet the introduction of various new and effective remedies has made it possible for him—given the time and the will—to treat more patients in their homes or in general-practitioner hospitals of a simple kind. The Danckwerts award should lead to an increase in the number of practitioners, to a reduction in the size of their lists, and consequently to a better opportunity to practise as a doctor rather than a disposal agent. In many areas the practitioner already has direct access to pathological and radiological departments, which helps him to make his own diagnosis; but he also needs beds for the care of minor illnesses (with specialist advice at hand where required)."

The College also stresses the value of group practices.

Hospitals

The College states that a higher turnover of hospital beds, although desirable, will not lessen the cost of hospitals so long as there is a waiting-list.

The following is said about pay-beds: "Many potential paying patients are now deterred by the unnecessarily high charges made, and accordingly enter the ordinary beds of the hospitals where they are treated free. If pay-beds were regarded as an ordinary business proposition, the service would surely encourage, rather than discourage, people who want to pay for themselves."

Whole-time Service

The College gives its opinion that a whole-time salaried service for general practitioners "would make it easier

for practitioners to refuse unreasonable demands by patients; but the consequent saving of money on drugs would be offset by disadvantages. The remuneration of nearly all practitioners almost wholly by capitation fee is a sufficient innovation for the time being, and until its merits and demerits have been proved by many years' trial the profession will oppose any fresh experiment."

The evidence goes on to say that "some money might be saved by making all consultant appointments full-time. The possible saving is difficult to gauge, but the College does not believe that it would amount to much. Again, a long period of time would have to elapse before such a change could be made. More important is the harm that might be done to the service through this alteration in policy. Medical or surgical practice in a large hospital, with the aid of registrars and housemen, is quite different from medical practice more or less single-handed, or with the aid of a practitioner, in the patient's home, in which responsibility cannot be shared and the consultant gets to know the patient as a person. Senior consultants commonly believe that private practice has provided a discipline and experience which they could never have gained in hospital, and they look with apprehension towards a system in which the young physician or surgeon may lose alike in self-assurance, in understanding, in humanity, through having always worked within four walls as one of a large team aiming at a high turnover. . . . Examples of shortcoming, and also examples of outstanding success, can be found both among full-time and among part-time staff. If the part-timer can sometimes be accused of excessive interest in his private practice, the full-timer can sometimes be accused of deficient interest in anything except his leisure—a fault even graver."

"Medicine is unique in its scope, since it has to concern itself with the welfare of body and mind, and, in the modern world, every citizen, in health and even more in sickness, is increasingly brought into relation with the State. The independence of the medical profession is therefore of fundamental importance to every individual, and there is a widespread fear that, if almost all doctors were to become whole-time servants of the State, the traditional independence of the medical profession would be seriously compromised, and our society would have lost an asset, the value of which cannot be estimated in economic terms."

"An Adequate Service"

In discussing the future of the National Health Service the College says: "It is generally agreed (1) that, as medicine grows more complex, and undertakes more and more difficult cures, doctors will go on asking for more and more money for their work; (2) that neither this nor any other country can afford a perfect curative medical service. Nevertheless the word 'adequate' strikes chill because it suggests a dead level of uniformity in which medical progress itself must die. Clearly, in a service committed to providing medical care for everybody, the standard reached must be 'adequate' throughout; but this is not enough. In some at least of its institutions the N.H.S. must afford conditions in which medicine at the most advanced level can be practised. Otherwise British medicine will be quickly deprived of the remarkable position of leadership it has gained during and since the war, and will go into a slow decline until even adequacy will be unattainable."

Pointing out that when they were taken over in 1948 the hospitals were in various stages of development and that even now they are not by any means consistently adequate, the College's evidence tells of the difficulties and problems that have had to be overcome. It is thought that £35m. already spent on capital expenditure in five years has paid a good dividend, but nevertheless, a sum at least two or three times more is required to complete the necessary re-fore anything approaching adequacy can be claimed, much more will have to be done for the mental hospitals and institutions for the mentally sick and mentally deficient is far

below the standard of other social provisions . . . and a dangerous situation is arising in which the supply of mental nurses, on whom these institutions of course depend, is beginning to dry up."

A Rising Charge

The evidence concludes by discussing whether—if income and prices remained stable—an adequate service could be kept going on the sum now allocated to maintenance. Inducements to economy are needed, and money would also be saved by bringing more buildings and equipment up to date. "But the higher annual expenditure needed merely to put the care of mental patients on a level comparable with the care of other patients would more than offset any saving that economy or better buildings could conceivably achieve. Moreover, there are other parts of the N.H.S., including the establishment of consultants and specialists, in which the College believes that adequacy has not yet been attained. Hence, even if incomes and prices remained stable, a larger annual sum is likely to be needed for maintenance."

"Since," the evidence states, "a perfect service is impracticable, the nation should decide what proportion of the national income it is prepared to spend on medical care; and the N.H.S. should then be left to do the best it can with this allowance."

MEDICAL ETHICS

In response to requests from members, the Central Ethical Committee of the B.M.A. has asked that the Association's ethical rules relating to consultations and other matters should be published again in the Supplement. These rules were approved by the Representative Body in 1950 and were first published in the Supplement on June 10, 1950.

I.—RULES AS TO THE ETHICS OF MEDICAL CONSULTATIONS IN PRACTICE

1. In these Rules a practitioner consulted is a practitioner who, with the acquiescence of the practitioner already in attendance, examines a patient under this practitioner's care and, either at a meeting of the two practitioners or by correspondence, co-operates in the formulation of diagnosis, prognosis, and treatment of the case. The term "consultation" means such a co-operation between practitioners.

2. It is the duty of an Attending Practitioner to accept the opportunity of consultation in obscure and difficult cases, or to acquiesce in any reasonable request for consultation expressed by the patient or his representatives.

3. The Attending Practitioner should nominate the practitioner to be consulted, and should advise accordingly, but he ought not to refuse to meet a registered medical practitioner selected by the patient or by the patient's representatives, although he is entitled, if such is his opinion, to urge that the practitioner selected has not the qualifications or the experience demanded by the particular requirements of the case.

4. The arrangements for consultation should be made or initiated by the Attending Practitioner. The Attending Practitioner should ascertain in advance the amount of the fee, if any, to be paid to the practitioner consulted, and should inform the patient or his representatives that this should be paid at the time of the consultation.

5. In cases where the Consultant and the Attending Practitioner meet and personally examine the patient together, the following procedure is generally adopted and should be observed, unless in any particular instance there is substantial reason for departing from it.

(a) All parties meeting in consultation should be punctual, and if the Attending Practitioner fails to keep the appointment the practitioner consulted, after a reasonable time, may examine the patient, and should communicate his conclusions to the Attending Practitioner in writing and in a sealed envelope.

(b) If the consultation takes place at the patient's residence, the Attending Practitioner should, on entering the room of the patient, precede the practitioner consulted, and after the examination the Attending Practitioner should be the last to leave the room.

(c) The diagnosis, prognosis, and treatment should be discussed by the practitioner consulted and the Attending Practitioner in private.

(d) The opinion on the case and the treatment as agreed should be communicated to the patient or the patient's representatives where practicable by the practitioner consulted in the presence of the Attending Practitioner.

(e) It is the duty of the Attending Practitioner loyally to carry out the measures agreed at, or subsequently to, the consultation. He should refrain from making any radical alteration in these measures except upon urgent grounds or after adequate trial.

6. If for any reason the practitioner consulted and the Attending Practitioner cannot examine the patient together, the Attending Practitioner should send to the practitioner consulted a brief history of the case. After examining the patient, the practitioner consulted shall forward his opinion, together with any advice as to treatment he may advise, in a sealed envelope addressed to the Attending Practitioner, and he may give to the patient or to the patient's representatives such information as he judges appropriate to the position.

In cases where the Attending Practitioner accepts the opinion and advice of the practitioner consulted he should carry out the measures recommended as in the event of agreement (Rule 5); where, however, the Attending Practitioner finds he is in disagreement with the opinion and advice of the practitioner consulted he should by suitable means communicate his disagreement to the practitioner consulted.

7. Except in emergency, the arrangements for any future or other consultation or additional investigation shall be left to the initiative of the Attending Practitioner.

8. The practitioner consulted shall not attempt to secure for himself the care of a patient seen in consultation. It is his duty to avoid any word or action which might disturb the confidence of the patient in the Attending Practitioner. The practitioner consulted should not communicate with the patient or the patient's representatives subsequent to the consultation except through the Attending Practitioner.

9. The Attending Practitioner should carefully avoid any remark or suggestion which would seem to disparage the skill or judgment of the practitioner consulted.

10. Except by mutual consent the practitioner consulted shall neither supersede the Attending Practitioner during the illness with which the consultation was concerned, nor shall he act as Attending Practitioner to the patient in any subsequent illness.

11. Should the practitioner consulted and the Attending Practitioner hold divergent views, either on the diagnosis or on the treatment of the case, and should the Attending Practitioner be unwilling to pursue the course of action advised by the practitioner consulted, this difference of opinion should be communicated to the patient or his representatives by the practitioner consulted and the Attending Practitioner jointly, and the patient or his representatives shall then be advised either to choose one or other of the suggested alternatives or to obtain further professional advice.

Note.—In the following circumstances it is especially desirable that the Attending Practitioner should endeavour to secure consultation with a colleague:

(a) When the propriety has to be considered of performing an operation or of adopting some course of treatment which may involve considerable risk to the life of the patient or may permanently prejudice his activities or capacities and particularly when the condition which it is sought to relieve by this treatment is not itself dangerous to life;

(b) When any procedure likely to result in death of a foetus or of an unborn child is contemplated, especially if labour has not commenced;

(c) When continued administration of any drug of addiction is deemed desirable in the case of a person who does not need it otherwise than for the relief of symptoms of addiction;

(d) When there is reason to suspect that the patient (i) has been subjected to an illegal operation, or (ii) is the victim of suspected criminal poisoning.

II.—OTHER INTRA-PROFESSIONAL OBLIGATIONS

Under the code of ethics of the profession a practitioner ought not to accept as his patient (except with the consent of the colleague concerned),

1. Any patient or member of a patient's household whom he has previously attended either as a consulting practitioner or as a deputy for a colleague.

2. Any patient or member of the patient's household whom he has attended within the previous five years in the capacity of assistant or locumtenent.

3. Any patient who at the time of the application is under the active care of a colleague, unless he is personally satisfied that the colleague concerned has been notified by the patient or his representatives that his services are no longer required.

4. Any patient who so applies because his regular medical attendant is temporarily unavailable. In such case he should render whatever treatment may for the time be required, and should subsequently notify the patient's regular attendant of the steps he has taken.

5. Notwithstanding Rule 3 above, when a practitioner in whatever form of practice is asked for advice or treatment by a patient and has reason to believe that the patient is already under medical care and that the request is made without the knowledge of the attending practitioner, it is the duty of the practitioner so approached to urge the patient to permit him to communicate with the attending practitioner. Should the patient refuse this proposal and if the circumstances are exceptional the practitioner is at liberty to examine the patient and to tell the patient his findings and conclusions, but, save for any emergency which exists, he shall not accept the patient for treatment.

III.—GUIDANCE FOR PROFESSIONAL CONDUCT
IN RELATION TO DENTISTS

(As agreed with the British Dental Association)

Rules Governing Consultations

(1) Where a patient, in the opinion of his medical attendant, needs simple dental treatment, the patient should be referred in all but exceptional circumstances to his own dentist. In the event of the patient having no regular dentist, there is no objection to a doctor recommending a dentist of his own choice.

(2) Where a doctor (for the benefit of one of his patients) requires to consult a dentist, the doctor should communicate in the first instance with the patient's own dentist. In the event of the patient having no regular dentist there is no objection to the doctor consulting the dentist of his own choice.

(3) Where, for any reason, the patient's doctor considers that the patient should be sent to a dentist other than his own, or where a further dental opinion is sought, the patient's usual dentist should be informed.

Note.—Apart from simple dental treatment—that is, in the presence of a dental condition which might affect the general health of the patient or necessitate a major dental operation—the dentist should consult the patient's doctor before carrying out such treatment.

Anaesthetics

Where an anaesthetic is advised by the dentist, it is competent for him to select the anaesthetist, but, if such anaesthetist is not the patient's doctor, no objection should be taken to the patient inviting his doctor to be present. Where the operation proposed is a major one, or if it is known to the dentist that the patient is under medical care, the dentist should consult the patient's doctor upon the operation proposed and should invite him to be present if the patient so desires. Similarly, where the patient is under dental care and the doctor advises operative or other major treatment arising from the patient's dental condition, the dentist should be consulted.

On the completion of any dental operation, and especially if there is any reason to think that post-operative complications may ensue, the patient should be advised to consult the dentist immediately if such complications arise and the dentist should take all reasonable steps to facilitate such consultation.

IV.—EXAMINING MEDICAL OFFICERS

Ethical Rules

For the purpose of these Rules an examining medical officer is a practitioner undertaking the examination of a patient of another practitioner at the request of a third party with the exception of examinations under statutory requirements. Rules 2 and 3 do not apply to examinations in connexion with superannuation, pre-employment, or proposals for life or sickness assurance.

(1) An Examining Practitioner must be satisfied that the individual to be examined consents, personally or through his legal representative, to submit to medical examination and understands the reason for it.

(2) When the individual to be examined is under medical care, the Examining Practitioner shall cause the Attending Practitioner to be given such notice of the time, place, and purpose of his examinations as will enable the Attending Practitioner to be present should he or the patient so desire. (Preferably such notice should be sent to the Attending Practitioner through the post, or by telephone, but in certain circumstances a communication might properly be conveyed by the patient.)

Exceptions to this are:

- (a) When circumstances justify a surprise visit.
- (b) When circumstances necessitate a visit within a period which does not afford time for notification.

Where the Examining Practitioner has acted under (a) or (b) he shall promptly inform the Attending Practitioner of the fact of his visit and the reason for his action.

(3) If the Attending Practitioner fails to attend at the time arranged the Examining Practitioner shall be at liberty to proceed with the examination.

(4) An Examining Practitioner must avoid any word or action which might disturb the confidence of the patient in the Attending Practitioner and must not, without the consent of the Attending Practitioner, do anything which involves interference with the treatment of the patient.

(5) An Examining Practitioner shall confine himself strictly to such investigation and examination as are necessary for the purpose of submitting an adequate report.

(6) Any proposal or suggestion which an Examining Practitioner may wish to put forward regarding treatment shall be first discussed with the Attending Practitioner either personally or by correspondence.

(7) When in the course of an examination there come to light material clinical findings, of which the Attending Practitioner is believed to be unaware, the Examining Practitioner shall, with the consent of the patient, inform the Attending Practitioner of the relevant details.

(8) An Examining Practitioner shall not utilize his position to influence the person examined to choose him as his medical attendant.

(9) When the terms of contract with his employing body interfere with the free application of these rules, a Medical Officer shall make honest endeavour to obtain the necessary alteration of his contract either individually or through the British Medical Association.

ADDITIONS TO THE FILM LIBRARY

The following have been added to the Film Library of the Association:

Marrow Puncture: Presented by Imperial Chemical Industries Ltd. Colour, sound, 33 minutes. 1953.

Milestone in Medicine: Presented by the American Medical Association. Colour, sound, 12 minutes. 1951.

Hay-fever: Presented by Parke, Davis & Co. Black and white, sound, 18 minutes. 1953.

Pentothal—Its Use in Intravenous Anaesthesia: Presented by Abbott Laboratories Ltd. Colour, sound, 42 minutes. 1953.

The above films are now available for hire from the Film Library. Applications should be made to the Secretary. A catalogue of the films held by the Association has been published, and copies, price 5s., can be obtained on application to the Secretary.

Scottish News

TOUR OF DENMARK FOR SCOTTISH
DOCTORS

In view of the great success of the visit of a group of Scottish doctors to Denmark last autumn and of the fact that it was not then possible to include anything like all those who wished to go, the Danish Institute has repeated its invitation this year. Before accepting this invitation the Scottish Committee instructed the office to ascertain if the British Council or other similar body would sponsor a similar visit of Danish doctors to Scotland. Subsequent inquiries have shown that this is not possible at the moment. The Committee has gratefully accepted the Institute's invitation, at the same time resolving that steps be taken to arrange for a reciprocal visit of Danish doctors next year.

The tour will again be in the first fortnight of September, and will be on the same lines as last year—that is, visits to hospitals, university medical departments, medical institutes, and other places of interest to doctors. It is hoped to provide alternative programmes so as to meet the particular interests of the visiting doctors.

The cost of the tour will be approximately £40, including travel Newcastle-Copenhagen-Newcastle and the stay in Denmark. All expenses of travelling in Denmark will be met by the Danish Institute, who will make the programme arrangements in co-operation with the Danish Medical Association.

Doctors in Scotland who are interested in this tour should communicate with the Scottish Secretary, British Medical Association, 7, Drumsheugh Gardens, Edinburgh, 3, without delay.

IRISH HEALTH ACT

COMMENT BY I.M.A.'S PRIVATE PRACTITIONERS'
GROUP

The *Journal of the Irish Medical Association* (March, 1954, p. 87) reports that at a meeting of the Private Practitioners' Group of the Irish Medical Association on February 7, the secretary summarized some 50 communications received from members of the Group giving their opinions of the Health Act, 1953. Among other things, they stated that the remuneration offered was totally inadequate, that members should refuse under all circumstances to dispense medicines, and that travelling allowances should be payable in country districts. The chairman, Dr. Sean McCann, outlined the recent decisions of the Central Council of the Association (see *Supplement*, February 20, p. 48).

The members present at the meeting signed a document declaring their refusal to accept service under the Health Act until it conformed to the principles of the I.M.A., or until participation was approved by the Association. The view was expressed that similar action should be taken throughout the Association.

JOINT ANNUAL MEETING, TORONTO, 1955

Already the number of members of the Association who have notified their wish to attend the Joint Annual Meeting with the Canadian Medical Association in Toronto, June 20-24, 1955, considerably exceeds the number for whom the Exchange Control authorities are likely to supply the Canadian currency. Any other members who would like to attend the meeting are asked to notify the Secretary of the Association, B.M.A. House, Tavistock Square, London, W.C.1, as soon as possible, and not later than April 15, stating whether they prefer air or surface travel and whether they wish to accept the offer of private hospitality in Toronto. Details of costs were given in the *Journal* of November 7, 1953 (p. 1055).

CHANGES IN MATERNITY BENEFITS

New National Insurance (Maternity Benefits and Miscellaneous Provisions) Regulations, which came into force on March 1 and which supersede the provisional 1953 Regulations (*Supplement*, August 15, 1953, p. 78), make changes in the conditions for payment of maternity grants for multiple births and of the maternity allowance in the case of early confinement.

The £9 grant for each child of a multiple birth is now payable if the child survives 12 hours or longer. Previously the condition was that the child should survive until the day following confinement.

In cases of confinement earlier than expected and where the mother does not claim maternity allowance until after the confinement, the allowance of 32s. 6d. a week is now payable for the number of weeks by which the confinement is early in addition to the seven weeks' allowance which previously was all that could be claimed in such cases.

Correspondence

Remuneration of Hospital Medical Staff

SIR,—Your correspondents on the subject of hospital staff remuneration will, I am sure, find your leading article (*Journal*, February 27, p. 507) singularly unhelpful. Beyond summarizing the Spens report in its relevant parts and saying that it is a good thing, you do little to alleviate their "impatience and alarm," not to say well-founded anxiety. They know that the Spens report is a good thing and have been saying so for weeks. What, I imagine, is required is a statement of the present position in the negotiations and evidence that the Staff Side is pressing vigorously for a retrospective settlement.

Your emphasis, in the title and substance of the leading article on consultants rather than all hospital grades, while no doubt unintentional, was unfortunate. It would be a pity if the lower grades were to gain the impression that their badly needed salary increases are being held up while the consultants haggle about increasing their merit awards. —I am, etc.,

Edinburgh.

E. A. HARRIS.

SIR,—I have followed with interest the correspondence regarding the pay of hospital medical staff. You point out in your leading article (*Journal*, February 27, p. 507) that new features have been introduced which make any comparison with the position in 1939 difficult. This is an understatement of the position. The whole question of the "betterment" factor as applied to the pay of consultants has been bedevilled by the acceptance of the principle of the payment of merit awards. It would clearly be quite unrealistic to expect the Treasury to meet not only the cost of these awards but also a betterment factor comparable with that granted to general practitioners.

It is unfortunate that that section of the consultants chiefly interested in securing the implementation of the Spens recommendations consists of those with the least influence in shaping of medical policies. A large proportion of them work in smaller provincial centres and in rural areas. Though their work is at times meritorious it has not those particular qualities which are likely to attract the attention of the Merit Awards Committee.

You rightly say that the acceptance by the Government of the Spens report played a large part in persuading consultants to enter the Health Service, "albeit with reluctance." Another influence of equal importance was the promise to part-time consultants of continued opportunity for private practice. There has been a double dereliction of faith by the Minister of Health. The Spens recommendations have not been implemented, and in the smaller centres of population private practice has been effectively destroyed by fixing the cost of pay-beds at a prohibitive level. The result is that

the "undistinguished" consultant subsists on a part-time salary based on income rates ruling in the year 1938-9, plus 20%. He is at the present time worse off than the majority of his general-practitioner colleagues.

Any funds available for distribution as a "betterment" factor for consultants are likely to be limited. It would be following accepted principles if in the first instance some increase should be granted to the worst-paid group. Those who are clearly without distinction and are prepared to accept this fact as a permanent disability might well be granted a modest betterment increment as a consolation prize. It is unnecessary to stress the importance of maintaining secrecy in the payment of such awards based as they will be upon the absence of professional merit.—I am, etc.,

Sudbury, Suffolk.

H. BATHURST NORMAN.

SIR,—I have read your leading article on remuneration of consultants (*Journal*, February 27, p. 507) and other correspondence on this subject, and become more and more uneasy at the tardiness with which our affairs are conducted. Your leader offers no hope of an early settlement—in fact, tells us nothing that we do not already know. What we want to know is when are we going to receive our award and how much will it be. To those of us with families to educate these are urgent questions which must be answered soon.—I am, etc.,

Northampton.

T. K. DAVIDSON.

SIR,—We, the undersigned, find the letter of Dr. W. A. Bourne (*Supplement*, March 6, p. 66) quite astonishing. He appears quite content to throw overboard the sheet anchor of the Spens report and its corollaries. He accepts, without apparent demur, the continued absence of the right of arbitration, on which his population income statistics have no bearing.

The present situation arises directly from devaluation; had the 80% of the population received no redress for the fall in the value of money, there might be some substance in his argument. We are not prepared to allow his doctrine to pass unchallenged, because the fulfilment of the Spens recommendations and the grant of the right of arbitration are matters upon which the whole future of successive generations of the profession must depend. We are not aware that the foundations of Parliamentary stability were in any way shaken by the promulgation of the Danckwerts award. That the welfare state appears to survive solely on continuous inflation is a fundamental weakness, but if Parliament cannot stabilize the currency we must hold the administration to its bond, if persuasion fails, by direct action.—We are, etc.,

Dorchester.

T. V. COOPER.
A. N. BLADES.G. H. TEE.
R. O. J. CLARK.

Association Notices

Diary of Central Meetings

MARCH

- 16 Tues. Anaesthetic Services Subcommittee, Anaesthetists Group Committee, 1.30 p.m.
16 Tues. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, London, W.C.), 2 p.m.
17 Wed. Remuneration Subcommittee, Occupational Health Committee, 2 p.m.
17 Wed. Joint meeting of Public Health and Venereologists Group Committees, 2.30 p.m.
18 Thurs. G.M.S. Committee, 10.30 a.m.
18 Thurs. Dermatologists Group Committee, 12 noon.
18 Thurs. Dermatologists Group Conference, 2 p.m.
18 Thurs. Organization Subcommittee, Central Consultants and Specialists Committee, 2 p.m.
19 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 10.30 a.m.

- 19 Fri. Joint Conference on B.V.A. Memorandum, 1934, 10.30 a.m.
24 Wed. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
24 Wed. Geriatrics Joint Subcommittee, Central Consultants and Specialists, G.M.S., and Public Health Committee, 2.15 p.m.
25 Thurs. International Relations Committee, 2 p.m.
25 Thurs. Medico-Legal Subcommittee, Central Consultants and Specialists Committee, 6 p.m.
26 Fri. Charities Committee, 11.30 a.m.
26 Fri. Hospital Junior Staffing Subcommittee, Central Consultants and Specialists Committee, 11.30 a.m.
30 Tues. Waverley Evidence Committee, 11 a.m.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Cambridge Hospital, Aldershot, Thursday, March 18, 8.30 p.m., clinical meeting.
ASHTON-UNDER-LYNE DIVISION.—At Physiotherapy Department, Lake Hospital, Ashton-under-Lyne, Friday, March 12, 8.45 for 9 p.m., meeting. Film: "Senile Obliterative Arteritis of the Legs." Mr. R. T. Grime will give a few comments after the film. Members of adjacent Divisions within the Hospital Group are invited.

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, March 16, 8.30 p.m., meeting. Lecture by Mr. Hugh Carson: "Abdominal Emergencies."

BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, Queens Drive, Blackpool, Wednesday, March 17, 7.15 p.m., dinner; 8.30 p.m., Dr. M. C. G. Isaacs: "The Anaemias."

CHELSEA AND FULHAM DIVISION.—At West London Hospital, Hammersmith, W., Friday, March 19, 8.30 p.m., clinical meeting. Papers by Drs. L. S. Konstam, L. P. E. Laurent, and Mr. H. W. Burge. Members of the Kensington and Hammersmith Division are invited.

ENFIELD AND POTTERS BAR DIVISION.—At St. Michael's Hospital, Chase Side Crescent, Enfield, Wednesday, March 17, 8.30 p.m., clinical meeting. Short clinical papers by Dr. J. Hutton Chisholm, Dr. W. D. Hyde, Dr. Gerard Lang, and Dr. C. Allan Birch.

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Abbey Road, Barrow-in-Furness, Friday, March 19, 7.30 for 8 p.m., attending. Male members and male guests only will be attending.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, March 11, 8.30 p.m., Dr. R. S. Hodge: "The Psychology of Crime."

LEEDS DIVISION.—At the Mansion, Roundhay Park, Leeds, Friday, March 19, 7.30 for 8 p.m., Hot Pot Supper.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Dr. C. A. K. Bird's house, Scriven Lodge, Prestbury Road, Macclesfield, Thursday, March 18, 8.30 p.m., meeting. Address by Dr. D. G. Evans: "Whooping Cough."

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thursday, March 18, 7.15 p.m., clinical demonstration by Dr. T. H. Boon: "Indigestion"; 8.45 p.m., address by Mr. Andrew Logan: "Surgical Treatment of Mitral Disease."

NOTTINGHAMSHIRE BRANCH.—Correction: The notice of a meeting of this Branch printed in the *Supplement* of March 6 (p. 68), Perils of Thrombosis" would be delivered at that meeting on March 11, was incorrect. Mr. Harold Dodd's B.M.A. Lecture will be on April 29 at 8.30 p.m.

OLDHAM DIVISION.—At Oldham Hotel, Rhodes Bank, Oldham, Monday, March 15, 9 p.m., meeting. Dr. A. Morgan Jones: "Recent Advances in the Diagnosis of Heart Disease."

SOUTHAMPTON DIVISION.—(1) At Polygon Hotel, Friday, March 19, 7.30 for 8 p.m., annual dinner dance. (2) At Canute Room, Polygon Hotel, Southampton, Wednesday, March 17, 8.30 p.m., general meeting. Address by Dr. F. E. Camps: "The Changing Face of Forensic Medicine in Relation to Murder."

SOUTH MIDDLESEX DIVISION.—At Red Lion Hotel, Hounslow, Wednesday, March 17, 8.45 p.m., meeting. Lantern slide lecture by Dr. R. Donald Teare.

SOUTHPORT DIVISION.—At the Assembly Rooms, Prince of Wales Hotel, Southport, Thursday, March 18, 8.30 p.m., meeting. B.M.A. Lecture by Dr. W. S. C. Copeman: "Treatment of the Rheumatic Diseases."

SUNDERLAND DIVISION.—At Royal Infirmary, Sunderland, Friday, March 19, 8 p.m., meeting. Address by Professor A. M. Claye.

SWINDON DIVISION.—At Goddard Arms Hotel, Swindon, Friday, March 19, 8 for 8.15 p.m., annual dinner. B.M.A. Lecture by Sir Heneage Ogilvie.

WEST BROMWICH AND SMETHWICK DIVISION.—At the Red Cow, High Street, Smethtwick, Friday, March 19, 8 p.m., dinner (9 p.m., dinner).

WEST HERTS DIVISION.—At Stanbroughs Hydro, Watford, Wednesday, March 17, 8.30 p.m., general meeting. Two films: (1) "Dental Anaesthetics in Adults"; (2) "Dental Anaesthetics in Children."

British Medical Association PROCEEDINGS OF COUNCIL

A meeting of the Council of the Association was held at B.M.A. House, Tavistock Square, on Tuesday afternoon, March 9, and on Wednesday, March 10. The chair was taken by Dr. E. A. GREGG. The Council was faced with a formidable amount of business, the agenda consisting of more than 60 items, with 11 separate documents.

Obituary

The CHAIRMAN with regret announced the deaths of Dr. H. E. Gibbs (Wellington, New Zealand), a Vice-President of the Association, Dr. H. W. Pooler (Ashover), Vice-President and former member of Council, and Professor K. H. Digby (Bromley) and Dr. T. W. Morgan (New Malden), former members of Council. The Chairman said how much they all grieved at the loss of these old associates.

He also announced with regret the death of Dr. N. G. Horner, Editor of the *British Medical Journal* from 1928 to 1946. He succeeded Sir Dawson Williams and before that he was assistant editor.

He had written to Lord Horder in the name of the Council expressing sympathy on the death of Lady Horder.

Award of Gold Medal

The Chairman said that it was with great personal pleasure that he moved, on behalf of the Office Committee, that the Gold Medal of the Association for Distinguished Merit be awarded to Dr. S. Wand in recognition of his outstanding services to the Association and to the medical profession. Dr. Wand had been a member of Council since 1935, and he had been associated with many committees, of a number of which he had been chairman. He was chairman of the General Medical Services Committee during the difficult time of the final culmination of the efforts made on behalf of general practitioners in the National Health Service to get an adequate remuneration for their services. He did devoted work in that connexion and spent an enormous amount of time and energy, which finally led to what was now known as the Danckwerts award. Opportunities had already been taken of expressing the gratitude of the profession to Dr. Wand, but his friends in the Council had felt that the presentation of the Gold Medal was the only suitable and proper recognition which the Association could make, because it was the highest award in its power to bestow.

By the regulations governing the award the resolution had to be voted on by ballot, and when the ballot papers were collected it was announced, amid continued applause, that the award of the Gold Medal to Dr. Wand had been made unanimously.

Dr. WAND said that this was the one occasion on which he really could not find words, though it might come as a

surprise to some members of Council that that should have happened. He was deeply indebted to the Council for this award. It was the greatest possible honour, in his view, that could come to a member of the profession, and that it should have come to him, when in fact he had enjoyed doing the work so very much, seemed somehow all wrong.

Election of Vice-Presidents

The CHAIRMAN further moved that it be recommended to the Representative Body that, with effect from the conclusion of his term of office as President, Mr. J. W. Tudor Thomas be elected a Vice-President of the Association in recognition of his valuable services. He said that they all appreciated immensely the work that Mr. Tudor Thomas had put into the Association. Before he became President he was an active member. He had taken the duties of his Presidency very seriously, and they all still had in mind the memorable meeting in Cardiff when he was the moving spirit. They looked forward to many years when they would have his co-operation. They also would wish to convey their thanks and felicitations to Mrs. Tudor Thomas. The President was setting out that very night on his journey to the Middle and Far East to represent the Association. He would carry with him their greetings to their colleagues in those regions.

The recommendation was carried unanimously, and Mr. TUDOR THOMAS said how greatly he appreciated the honour and the words of Dr. Gregg about himself and his wife, to whom he would certainly convey the message.

At a later stage in the afternoon the Council took leave of the President and bade him God-speed on his journey.

The CHAIRMAN also proposed that it be recommended to the Representative Body that Mr. A. M. A. Moore be elected a Vice-President in recognition of his valuable services. He said that Mr. Moore, who had served the Association as Treasurer for six years, would not be continuing in that office after the Annual Meeting. Mr. Moore had put in a long period of service. He had taken great interest in the Metropolitan Counties Branch and he was also one of the moving spirits in connexion with the Board of Registration of Medical Auxiliaries. His work in the formative years of the Central Consultants and Specialists Committee would also be remembered. As Treasurer he had spent a great deal more time in that building in connexion with the financial affairs of the Association than the majority of members of Council could suppose. They felt it was a fitting thing that they should recognize the work he had done by adding his name to their roll of Vice-Presidents. This recommendation was also carried unanimously, and Mr. MOORE expressed his sense of the honour done to him.

Appointments

It was announced that Dr. R. Hale-White and Mr. S. A. S. Malkin would be the official delegates from the B.M.A. at the Annual Meeting of the Canadian Medical Association in Vancouver in June, 1954. Lord Horder had been invited by the Chairman to be the Association's delegate at the Annual Conference of the Cremation Society in July next. Dr. Annis Gillie and Dr. D. F. Hutchinson were appointed to represent the Association on the Central Council for District Nursing for London. Dr. I. D. Grant was appointed delegate of the Association to the 57th Conference of German Doctors to be held in Hamburg in June next.

Gift to the Association

Dr. D. BROWN (Liverpool) said that the Merseyside Branch Council had recently purchased the original minute book of the ancient Newton Medical and Surgical Association, established in 1837 as a Branch of the Provincial Medical and Surgical Association, which later became the B.M.A. It was proposed to keep this book at the Regional Office for the next few months and that the President of the Merseyside Branch should formally present it to the President of the Association at the Annual Meeting in Glasgow. The book could then be kept in the B.M.A. Library and be available to any member who wished to see it. The minute book was interesting to read because it showed the zeal which their illustrious founder, Sir Charles Hastings, put into the foundation of the Association. It dealt with medical reform and among many other matters with the inadequacy of doctors' remuneration at that time. There was even a reference in it to a proposal to form a college of general practitioners. His Merseyside friends felt that the rightful place for such a volume was in the Library.

The CHAIRMAN expressed the Council's thanks to the Merseyside Branch.

Staffing of Public Relations Department

Dr. GUY DAIN moved as a recommendation of the Public Relations Committee that a senior assistant to the Public Relations Officer be appointed at a salary of £1,500 per annum. He thought that the time had come for the development of the Public Relations Department to the level of its opportunities. It was originally thought of as a means of obtaining publicity for the case put forward on behalf of general practitioners, but public relations now entered into all branches of the National Health Service. The National Insurance Defence Trust had made itself responsible for half the expenditure of the department up to a limit of £5,000 per annum, but this contribution did not cover any part of the salary of the Public Relations Officer, and, after further consideration, the Trustees did not feel justified in agreeing to meet half the salary of any assistant who might be appointed, although willing to pay part of the additional cost within the agreed limit of £5,000.

Mr. MOORE said that the Finance Committee had felt that this proposal should be postponed for a year.

Dr. D. F. HUTCHINSON supported the proposal, saying that the Public Relations Officer had been heavily overworked.

The resolution to appoint a senior assistant was carried with one dissentient.

Salaries of Civil Service Medical Officers

The SECRETARY reminded the Council that at its last meeting it was reported that the Joint Negotiating Committee in connexion with the salaries of Civil Service Medical Officers appeared to be on the verge of agreement with the Treasury, and that all that remained was written confirmation. Since then there had been some further argument, but full agreement had now been reached, and all that remained was an exchange of letters between the Joint Committee and the Treasury. Both parties remained free to ask the Royal Commission on the Civil Service to consider any representations they might think fit to make about the remuneration of all grades in the medical officer class.

**Scheme for Restoration of Goodwill:
Amending Acts Committee's Proposals**

Dr. H. H. D. SUTHERLAND, chairman of the Amending Acts Committee, brought forward a scheme which his Committee had elaborated for the restoration of the right to buy and sell goodwill. He said that this followed from the instruction given by the Representative Body last year. His Committee had not produced a series of resolutions and recommendations, but had formulated what it believed to be the best possible scheme and was also submitting for the information of the Council two memoranda prepared by Mr. A. N. Dixon, general manager of the Medical Insurance Agency, on the subject of practice loans.

After a long debate, in which varied opinions were expressed about the practicability of some parts of the scheme, it was decided to refer the scheme back for reconsideration of certain matters. The CHAIRMAN of the Committee accepted the suggestion that additional members should be co-opted and that the scheme should come before the Council again at its next meeting. It would then be published in the Supplementary Report of Council, together with the Council's comments.

Rehabilitation of Disabled Persons

Professor R. E. TUNBRIDGE, chairman of the Committee appointed to prepare a memorandum of evidence for presentation to the Inter-Departmental Committee on Rehabilitation and Resettlement of Disabled Persons, attended the Council to present the draft memorandum. This was a document of nearly 60 foolscap pages, and Professor Tunbridge laid stress only on certain major items. The evidence covered the general principles of rehabilitation, the stage of acute illness, the stage of convalescence, recovery, and return to work, some special problems of resettlement relating to those suffering from tuberculosis, from rheumatism, from dermatitis, and other diseases, the administration of schemes of rehabilitation, including the Disabled Persons Register, and the question of research and education. He stressed the point that there should be established in hospitals or in hospital groups a resettlement clinic for the purpose of providing expert guidance for patients with special difficulties, whether medical, industrial, economic, or social. The Committee believed that such a clinic should be available to local general practitioners as well as to hospital staffs for the reference of patients. Its staff should comprise a consultant, possibly retired, with time to give to the work; a medical practitioner from outside the hospital (who might be a general practitioner, an industrial medical officer, or a medical officer of health), and an almoner and a resettlement officer.

It had been thought by the Committee that more attention should be given to planned convalescence. Workmen would be returned much sooner to their employment if convalescent facilities were available on a planned scale. Much prevention work could be done with a better resettlement service. Among other recommendations it was suggested that the Ministry of Labour and National Service should keep in constant review the register of disabled persons and refer the names of handicapped persons to the appropriate medical officer of health. An interdepartmental review, assisted by professional experts, of the registration of disabled persons was desirable.

Questions were asked about the staffing of the resettlement clinics, and Professor Tunbridge said that it was proposed that the chairman of each clinic should be either the consultant or the outside medical practitioner, or the two might alternate. Remuneration would be on a sessional basis.

The CHAIRMAN said that this document was one of the finest ever produced in the name of the Association. Dr. VAUGHAN JONES and Dr. H. ALEXANDER, as members of the Committee, spoke in high praise of the work which Professor Tunbridge himself had done in guiding its

The memorandum was approved and it was agreed that Professor Tunbridge, Dr. Alexander, Dr. Vaughan Jones, Dr. H. Osmond Clarke, and Dr. J. Rogan should be appointed to give oral evidence, if this was required, and that, subject to the permission of the Inter-Departmental Committee, the memorandum be published as a special report of the Association.

Consultants and Specialists

Dr. ROWLAND HILL, on behalf of the Central Consultants and Specialists Committee, presented a report on the business of the Committee, which was recorded in the *Supplement* of February 13 (p. 39). He moved a recommendation that when submitting nominations of consultants to fill vacancies on regional hospital boards the Association should in future not confine itself to supporting only one nomination in respect of each vacancy. This was agreed to. A further recommendation setting out the procedure for investigating complaints involving personal conduct or professional competence of members of hospital medical staffs was also adopted.

Dr. ROWLAND HILL reported that the Ministry of Health had refused to accept the advice of the Joint Committee that information in the records of chest clinics should not be disclosed to the Ministry of Labour in connexion with call-up of men for national service unless the prior consent of the man concerned had been obtained.

Dr. H. D. CHALKE and Dr. TALBOT ROGERS spoke of the importance of preserving the secrecy of these records. Dr. ROWLAND HILL said that the Joint Consultants Committee was continuing to make representations on the subject.

Dr. DAHNE congratulated Dr. Hill on the fact that as a result of further representations by him the Ministry had now been persuaded to look into the question of the grading of those S.H.M.O.s who, in the view of the Committee, appeared to have been wrongly graded. Following his own letter on the subject in the *Journal* he had received a large number of communications from S.H.M.O.s.

Public Health Representation on Regional Hospital Boards

Dr. K. COWAN presented the report of the Public Health Committee, which covered the business set out in the report of this meeting in the *Supplement* of March 6 (p. 65). He moved as a recommendation that the names of suitable members of the public health service be included in the list of doctors nominated by the Association for membership of regional hospital boards and boards of governors.

The SECRETARY said that the present procedure was that the Association was invited to nominate only for vacancies arising owing to a certain number of members of the board being due to retire at the end of their term of office. Almost invariably the medical members due to retire were either general practitioners or consultants. So far as general practitioners were concerned, most of the boards had not more than one such member, and presumably the Council would not wish to substitute a medical officer of health for that one, and he would have thought there might be some disinclination also on the part of consultants and specialists to sacrifice any of their representation. The Ministry might be asked to create an additional seat on the board for a medical officer of health, but the number of members serving on each board was defined by regulation. It might be as well to have some inter-committee consultation and bring the matter up at the next meeting of Council. With regard to boards of governors the Association did not and was not invited to nominate.

Dr. CHALKE said that there were only three public health representatives on regional hospital boards in England and Wales. Mr. STAVELEY GOUGH pointed out that hospital medical staffs frequently had a very small representation on these boards, and he thought they should be careful before they pressed for any alteration at regional hospital level which might reduce the representation of consultants.

It was agreed to refer this matter to the Liaison Committee of the General Medical Services, Consultants and Specialists, and Public Health Committees.

Meat Inspection

The Council agreed that formal protest should be sent by the Association to the British Veterinary Association in connexion with its proposal that the supervisory control of meat inspection and the local authority meat inspection functions should be transferred to the Ministry of Agriculture Animal Health Service, whereby medical supervision through medical officers of health over meat inspection would cease. It was decided that the appropriate Ministries be informed that the Association dissociated itself from the views expressed by the British Veterinary Association, and that a memorandum setting out the views of the profession should be submitted.

Hospital Records and Government Departments

Dr. R. FORBES, in presenting the report of the Central Ethical Committee, brought forward for approval a statement on the question of the loan of hospital records to Government departments. The Committee considered that medical records should be lent to the medical officers employed by Government departments only when written consent had been given by or on behalf of the patient. The form of consent should include a statement that the patient agreed to his hospital records being made available to the medical board in order to assist them in determining the degree of his disablement and any relation of it to an industrial accident. Wherever practicable, and particularly where disclosure of information might have an adverse psychological effect on the patient, the practitioner who compiled the record should be consulted, on the wisdom of disclosing all the confidential information to the patient, at the same time taking the opportunity of reviewing the notes before these left the hospital. The statement was approved.

The "British Medical Journal"

Dr. O. C. CARTER, in presenting the report, referred to the work of the late Dr. Horner, who was for nearly 20 years Editor of the *Journal*. He said that he was a very modest and self-effacing man. During his last few years of office uncertain health had prevented him from doing all that he would otherwise have done. The *Journal* Committee and the Council mourned the death of one who served the Association with such loyalty and ability and who added greatly to the *Journal's* reputation.

Dr. Carter went on to say that the Association's publications in total showed a satisfactory financial position. He also reported the satisfactory financial position of *Family Doctor*.

Association Membership

For the Organization Committee Dr. J. A. PRIDHAM reported that the figures for membership were satisfactory notwithstanding the increase in subscriptions. On December 31, 1953, the membership stood at 67,506, as compared with 67,905 on the corresponding date of 1952. There had been an increase in receipts from subscriptions during January, 1954, of approximately £10,000, as compared with January, 1953. A disturbing feature, however, was that the percentage of membership of the entire profession showed a slight but definite recession. This seemed to be due to an increase in resignations and a decrease in intake, particularly among the newly qualified. It called for special efforts to attract to and retain in the Association the newly qualified practitioner, particularly the provisionally registered. The Organization Committee was taking steps to strengthen the contact with the newly qualified and to provide for direct representation on the Medical Students and Newly-qualified Practitioners Subcommittee. A subject of discussion at the forthcoming conference of honorary secretaries would be "What is the Association doing for the Hospital Residents?"

Committee Reports

The report of the General Medical Services Committee, which contained no recommendations, was presented by Dr. TALBOT ROGERS and approved. The principal business

was set out in the report of the meeting of the Committee (*Supplement*, March 6, p. 62). The report of the Private Practice Committee was presented by Dr. GRANT. The various matters were set out in the report of the meeting of the Committee (*Supplement*, February 27, p. 51). Dr. VAUGHAN JONES, on behalf of the Occupational Health Committee, submitted a draft memorandum of evidence to be given to the Departmental Committee which is reviewing the provisions of the Industrial Injuries Act (*Supplement*, February 27, p. 57). The memorandum was approved.

It was reported that the Waverley Evidence Committee was continuing the preparation of the memorandum of evidence and had received contributions from the Armed Forces and Overseas Committees.

Dr. J. G. M. HAMILTON presented a report from the Scottish Committee embodying the memorandum of evidence to be submitted to the Guillebaud Committee.

Dr. WAND, for the Compensation and Superannuation Committee, submitted a report on the financial position of practitioners on retirement. This was approved for submission to the Representative Body, and will be published as an appendix to the Annual Report of Council.

The report of the Science Committee, presented by Dr. NOY SCOTT, contained recommendations, which were approved, for the awards in the competitions for the Sir Charles Hastings Clinical Prize, the Medical Students Prize, and the B.M.A. Research Scholarships.

General DOWSE presented the reports of the Armed Forces Committee and the Overseas Committee. With regard to the former he said that no satisfactory answer had as yet been received from the Ministry of Defence concerning the new arrangement of antedating new commissions according to civilian experience and the effect of this on promotion prospects and seniority of serving officers. On overseas business he reported that, although the Government of Cyprus had been included in the "Important Notice" for some time past, the vacant post of orthopaedic surgeon in the island had been filled by a member of the Cyprus Branch.

A report by the Arrangements Committee on the nominations of officers of scientific sections for the Joint Annual Meeting in Toronto, 1955, and on the arrangements for plenary sessions and special lectures was approved.

The TREASURER (Mr. A. M. A. MOORE) presented the Financial Report for 1953. The important figures will be given with the Supplementary Annual Report of Council. Dr. HALE WHITE said he hoped the amount earmarked for debt reduction would be placed in a prominent position in the report.

Mr. L. DOUGAL CALLANDER presented reports from the Building Committee (henceforth to be designated Estates Committee) and the Catering Committee.

Other Business

A letter was read from the honorary secretary of the Isle of Man Medical Society (Isle of Man Branch of the Association) in which "heartfelt thanks and deep gratitude" was expressed for the assistance given to the Isle of Man doctors in negotiations with the Commission appointed by Tynwald to consider the matter of salaries and emoluments in the island. "We feel sure that had it not been for the support which we have received from Headquarters the result would not have been so satisfactory."

Reports were presented to the Council on the year's work of the Medical Practices Advisory Bureau, the Empire Medical Advisory Bureau, and the International Medical Visitors Bureau. The thanks of the Council were accorded to Mr. L. R. BROSTER for his work as chairman of the committee of management of the two latter Bureaux, to Brigadier Sandiford, Director of these Bureaux, and to Dr. Potter, Director of the Medical Practices Advisory Bureau.

Dr. DAENE reported to the Council the result of conversations with the College of Heralds on a coat of arms for the Association. The Office Committee would have the matter fully before it at the next meeting, and it was hoped to present a definite proposal, satisfactory in both the

artistic and heraldic sense, to the next meeting of Council. Finally, the Council considered the duration of future Council meetings. Dr. HAMILTON moved that future meetings of Council be held, as had been done on this occasion, on two successive days. Other members spoke in favour of future two-day meetings, but some considered that the position might be met by arranging an additional meeting of Council during the year. It was agreed to circularize the members of Council with a view to ascertaining their wishes.

The Council began its proceedings on the first day at 2 p.m., and adjourned at 6.30 p.m., and on the second day, starting at 10 a.m., concluded its business at 5.45 p.m.

Scottish News

B.M.A. SCOTTISH COMMITTEE'S MEMORANDUM OF EVIDENCE TO THE GUILLEBAUD COMMITTEE

The Committee of Inquiry into the cost of the National Health Service (the Guillebaud Committee) is at present taking evidence in Scotland. The following is a summary of the memorandum of evidence sent to the Guillebaud Committee by the Association's Scottish Committee. Representatives of the Scottish Committee gave oral evidence on March 18.

Introductory

Of nearly 8,000 registered medical practitioners resident in Scotland approximately 6,000 are members of the British Medical Association. Among the approximately 5,300 providing medical services under the National Health Service (Scotland) Act the proportion of members of the Association is substantially higher. The Scottish Committee is a standing committee of the Council of the Association, whose remit is: "To consider all matters specially concerning Scotland, and, in conformity with the decisions of the Representative Body, deal with all such matters."

General Considerations

The Committee's evidence, starting with some general considerations, points out that an enterprise such as the Health Service differs essentially from a business undertaking in that, while its expenses are readily ascertainable, its "profits," which are in effect the improved mental and physical health of the community, are neither necessarily nor immediately assessable in monetary terms. If steps designed to increase efficiency and achieve economy in the medical services of the nation are to have their full effect they must at all times take account of the essential nature of these services; attempts to organize and administer health services as though medicine were nothing more than a skilled technological procedure will in the long run harm rather than benefit the community.

The ultimate unit of a health service is the individual. The conservation of his fitness must need planning in three particular respects. First, to ensure that his total environment as a member of a community is adequately safeguarded; this must entail an appropriate emphasis on the public health and preventive aspects of medicine. Secondly, he must be able to depend upon an efficient domiciliary service when he suffers illness—everything which affects the health of the individual and his family should be the concern of his general practitioner. Thirdly, the more specialized medical and surgical procedures require an elaborate, expensive, and efficient hospital and specialist service.

The Committee goes on to say that the Health Service can be fully efficient only if the administration of each of its parts is managed not in isolation but as a different aspect of a single enterprise. In particular, it was concerned at the apparently subsidiary role that is now assigned to the public health service. From the preventive aspects of medicine the greatest and most desirable economies will ultimately be made. The separation of public health departments from

the main stream of the Health Service has hindered recruitment to a branch of the profession which should stimulate the profession and the public alike in the preventive ideal.

The Committee says that the large cost of the Hospital Service makes it appear that this is the most important aspect of a health service—a very dangerous fallacy. Yet the Committee saw little prospect of materially reducing the cost of the hospital service. Each new advance in methods of investigation and of treatment tended to make hospital treatment more expensive. Furthermore, prolongation of life in itself increased the numbers of the elderly and the chronic sick who will ultimately require some form of hospital care. A hospital service is, and always would be, an expensive service, and the only way to lower its cost is to encourage the study of methods of keeping patients out of hospital. The Committee favoured more extensive provision of facilities for domiciliary care and the establishment, where appropriate, of hostel and other suitable residential accommodation for the elderly. The sums at present allocated from the annual Health Service Vote for capital development are inadequate for the extensive rebuilding, rehabilitation, and modernization which, in themselves, would result in reducing the running costs of the hospitals.

The Committee also points out that a large proportion of the annual expenditure is represented by nationally negotiated salaries and wages, and that any material economy will be contingent upon reduction in the numbers employed in the service.

The general conclusion is that economies in the hospital service are to be looked for in the direction of (1) increased attention to the promotion of health and prevention of disease, (2) the pursuit of a policy designed to improve the facilities for the treatment and care of sick and infirm persons outside hospital, (3) the reduction in maintenance and running costs which would follow modernization or replacement of obsolete buildings, and (4) the more efficient and economic use of lay staff, also following upon modernization of hospitals.

The Committee ends its introductory observations by drawing attention to the danger that things might be done in the name of efficiency or economy which could in time endanger the professional freedom of the doctor—"the widespread tendency, which we cannot too strongly deplore, to conceive of medicine as a sort of applied technology is in our view threatening this fundamental relationship between doctor and patient."

Organization and Administration

The Committee states that, "short of radical alteration in present conceptions of State responsibility for the provision of medical service, it is in our view to improvements in the two related fields of organization and administration that the community must look for any major and early reduction in the cost of its health services."

Tribute is paid to the patience, skill, and tact of the officials of the Department of Health, and no important criticisms are levelled at the central administrative arrangements. But attention is drawn to what is thought to be a potential weakness in the present scheme—namely, the impotence of appointment to any particular branch of permanence of appointment to any particular branch of work among the senior ranks of the central administration, which is inherent in the Civil Service system of promotion. "It is," the Committee says, "a matter for consideration whether, just as in the province of individual medical practice it is desirable to preserve the greatest possible continuity of treatment, provision should be made to ensure continuity of experience and policy in the central department. It is entirely possible that the relative success of the present central administration derives more from the chance of particular appointment to it than from the suitability of its design."

Turning to local administration, the Committee refers to the general criticism of the tripartite system and its undesirable effect of isolating the branches of medical practice from each other. To achieve closer co-ordination between general, specialist, and public health practice, the Com-

mittee thinks that the choice would seem to lie between strengthening and improving the existing co-ordinating mechanism, but preserving the present tripartite system, possibly with modifications, and amalgamating the local administration by constituting, for areas of a suitable size, authorities charged with the duty of planning, developing, and administering the whole service in these areas. There are some—particularly the general practitioners, with their favourable experience with executive councils—who would favour the first and less radical suggestion. Others argue that, even if under the existing provisions an effective co-ordinating mechanism could be devised, this would not lead to any direct and immediate economy, although, of course, it would lead ultimately to economy by improving efficiency.

The Committee thinks that amalgamation, in addition to meeting the need to foster co-operation and integration of the various services, might be expected to effect considerable economy; it gave much thought to its practicability, and the memorandum of evidence goes on to say: "We are assured by the representatives of the public health service that there would be no insurmountable obstacle to the transfer to the contemplated single administration of those medical services at present administered by local authorities. We realize, however, that so drastic an alteration of present local authority functions would carry with it many other implications and this alone would indicate that a solution on this line could not be contemplated without the fullest possible investigation. . . . Our conclusion in this matter, therefore, is that a full and careful investigation of the system of organization and administration of the service should be undertaken at an early date. It would be for consideration how best to undertake this task, but one possibility would be that it should be carried out under the aegis of the Scottish Health Services Council."

The Committee sets out some views of its own about the solution to the problems of local administration. The question of the need for "two tiers" of hospital administration is discussed, and the conclusion is reached that the advantages of abolishing one or other of the tiers would be outweighed by the disadvantages. Nor is the suggestion of the board of governors system for teaching hospitals which pertains in England and Wales favoured for Scotland.

Turning to the public health field, the Committee says that it has been widely canvassed that efficiency and economy would be served by amalgamating the health and welfare departments of local authorities. It believes that this view is right, and points out that such amalgamation has already been successfully achieved in approximately one-third of the Scottish local authorities, including some of the largest. Where these departments are separate, cases not infrequently occur in which a health visitor (or other health department officer) and a welfare officer from the welfare department duplicate each other's visits; arguments sometimes take place about whether a border-line patient is a case for aftercare services or for welfare services, and cases about which full information is already in the hands of one department are sometimes reinvestigated to supply similar information for the other department. The artificial separation of two departments with closely related functions is inconvenient and unnecessarily expensive for the community.

The Place of the Doctor in Administration of Health Services

Referring to the advocacy of the Scottish Trade Union Congress that doctors should not be appointed as members of administrative bodies in the National Health Service (see *Supplement*, November 21, 1953, p. 206) on the grounds that such appointments create irritation among other members of the hospital team and that the presence of medical members with professional axes to grind on committees prejudices the possibility of effecting economies, the memorandum of evidence says: "This opinion presumably rests on the proposition, commonly accepted in relation to public administration in this country, that 'interested parties'

should not be in a position to determine matters which directly affect them financially. To suggest, as this does, that doctors are 'interested' in the sense implied in the proposition is, in our view, thoroughly misleading and indicates a serious misunderstanding of the functions of the administrative bodies concerned. . . . It is incontrovertible that, in a nationally organized medical service, or indeed any medical service, the medical profession must hold the key position. Without doctors, there could be no medical service of any kind. The very *raison d'être* of the Health Service is to make available to the community the professional services of medically trained and skilled persons. It appears to us a self-evident corollary to this proposition that the special knowledge and experience of such persons should be available to the administration, not just occasionally and on request, but continuously and in all phases of administration."

The Committee discusses the related question of providing for the administrative authorities appropriate means of consulting the doctors concerned on staffing, projected developments, and so on. In any case, the Committee says, it is a sound principle of administration whenever possible to "take with you" those who will be affected by administrative decisions. No small part of the success of executive council administration has been the existence of the statutorily recognized local medical committees. In the Committee's view this system should be adopted in respect of both regional and management hospital boards. In the local authority field also the cultivation of such relations would make for better design and operation of the authorities' schemes.

Medical Superintendents of Hospitals

The medical superintendent is a distinctive, traditional, and valued feature of Scottish hospitals. It was established that the Department of Health for Scotland had no intention of abandoning the medical superintendent system. But the Committee goes on to say, "The highest salary attainable in this field (applicable in only three posts in the whole of Scotland) is £650 per annum less than the maximum of the *basic* whole-time consultant scale. There can be no reasonable doubt at all that a continuance of this discrepancy must inevitably jeopardize the Scottish system of hospital administration by preventing the recruitment of first-class men. Believing as we do that this system makes for both efficiency and economy, we regard it as a matter of urgency that the terms of service of our medical superintendents should be brought into line with those of their clinical colleagues on the senior medical staff."

Hospital Finance

The memorandum of evidence refers to the inflexibility of the present system of hospital finance and the fact that it militates against economy and frustrates responsible members of hospital boards. The Committee has this to say about a block grant system: "We have considered as a possible alternative a block grant system of finance on the model of the University Grants Committee's system, but we have come to the conclusion that this would not be wholly appropriate in the hospital field, particularly in regard to day-to-day running expenses. There is in this regard an important difference between the universities and the hospitals, in that, whereas the former have available other sources of income, the latter are dependent for all ordinary purposes on revenue from the Exchequer. If, therefore, the hospitals were to be financed by block grants covering periods of, say, three to five years, it would be necessary to make provision for contingencies such as rising food costs and increased wage and salary awards. Contrariwise, if there were deflationary developments, more money than necessary might be allocated to the hospitals. Block grants for lesser periods would in effect be little different from the present system. We believe that the main advantage claimed for the block grant system could be achieved by permitting boards, under suitable safeguards,

to carry over from year to year credit or debit balances in respect of their accounts for running costs and maintenance."

Charges under the N.H.S.

The Committee thinks that the charges for medicines and dressings and spectacles has not discouraged any genuinely needed consultation. It thinks that the dental charges have tended to discourage consultation for conservative treatment. Charges for surgical appliances are regarded generally as reasonable.

The Committee's evidence under this heading goes on to say: "While we fully subscribe to the view that no person should be excluded from admission to any hospital bed because of inability to pay, we are certain that many individuals would be prepared to pay reasonable sums for the advantages of private bed accommodation. The present cost, however, is prohibitive so far as most of the potential users of this accommodation are concerned, so that there is little income from this source. . . . It is economically unsound that hospitals should be forced to price themselves out of what might well be a useful source of income. . . . It should be possible to discover the proportion of beds of this category which would be in constant use without interfering with the efficient conduct of the 'free' service. We consider that each board of management might be given discretion as to the charges it might make, having regard to the local competitive rate."

Need for Adequate Development of Local Health Authority Services

The Committee reviews the purpose and some of the achievements of the public health service (it is calculated that eradication of diphtheria alone saved over £300,000 per annum in Scotland) and gives its opinion that with effective development the service could reduce the incidence of many diseases, and gives, among others, the following examples: immunization of school-leavers against tuberculosis; health education of food handlers, commercial and domestic, to reduce the incidence of food-poisoning, gastro-enteritis, and similar conditions; trained health visitors, working in close co-operation with general practitioners, who could do much to guide and advise parents about the elements of mental hygiene and parent-child relationships; further efforts to prevent home accidents, especially burns and scalds in the young and falls in the elderly.

The Committee says the following about the medical officer of health: "It is essential to appreciate that, while the medical officer of health has important functions as a co-ordinator and as a medical administrator in charge of an extensive branch of the whole Health Service, he is also a specialist in epidemiology (as applied to non-infectious diseases as well as to the infectious) and in health education. To fulfil the duties of such a post calls for capacities of high order, and, unless the public health service continues to attract doctors who possess them, both the health and the economy of the country will suffer. In the interests of efficiency and long-term economy, therefore, we feel that remuneration in the public health service should be examined afresh. . . ."

Whole-time and Part-time Appointments in Hospital

After tracing the history of the growth of whole-time consultant appointments in hospital, the Committee says that it is aware that it is being canvassed that a system of staffing hospitals with whole-time salaried personnel would effect economy. The Committee is not certain that this would be so and thinks that in the long run it would prove a false economy. Attention is drawn to the fact that, although the part-time consultant's remuneration is calculated on so many half-day sessions a week, he does in fact accept responsibility throughout the 24 hours of every day for his hospital patients.

The Committee goes on to say: "We believe that a prime consideration in a nationally organized medical service must

Correspondence

Group Practice and the Single-handed Practitioner

SIR,—We have recently been informed of the details of the £100,000 fund to promote group practice (*Supplement*, January 30, p. 27), and I wish to register a strong protest and invite all the other single-handed practitioners to do likewise.

I am unaware of any agreed policy by the profession that intended to put single-handed general practitioners out of business and conduct future practice only in groups operating from a single centre. This money comes out of all our pockets, and whilst the single-handed general practitioner is denied an interest-free loan to improve his practice he is forced to provide money to a possible opposition practice to create a veritable medical palace from which to operate. Could anything be more unfair? It would seem that "group practice" is to be the ideal of the future, perhaps so that we are conditioned for a State-salaried service when it comes at some future date. The first step along this path presumably is to eradicate the sturdy individualist, who often gives a far better personal service to his patients than some multiple partnerships.

It is claimed for group practice that each member will be a specialist in some aspect of medical practice. What nonsense this is! There is not enough of any one department in general practice to enable a G.P. to become a specialist in anything. Perhaps it is intended to replace G.P.s by registrars who find consultant status denied to them? Surely the curse of modern medicine is that there is too much narrow specialism in all fields, and the widely experienced general practitioner is an absolute necessity to-day. If our negotiators were forced to make us subscribe some of our income to improve the State service, then at least they could have insisted that all G.P.s who subscribe to this fund should have an equal opportunity of sharing in the benefits, or is it asking too much to insist on elementary justice?—I am, etc.,

Upminster, Essex.

E. ANTHONY.

A Bob a Job

SIR,—I think the reason why more protest is not made is because it would be a waste of time. I think it is a most degrading job for the doctor to do, but unlike Dr. Margaret J. Oldfield (*Supplement*, March 6, p. 67) I do not find any patients think I snaffle all or any of the shillings. I say, "Shilling for the Government, please, and put your initials in one of those squares," and they take that as a receipt. At the end of the month I stick a £1 stamp on each sheet, stamp it, and send it in.—I am, etc.,

Maldstone.

L. H. TAYLOR.

Grading of S.H.M.O.s

SIR,—There has been an ever-increasing volume of correspondence recently on the question of the regrading of officers in the S.H.M.O. grade. At the meeting of the Central Consultants and Specialists Committee on February 4 (*Supplement*, February 13, p. 39), Dr. Peter Edwards, for the Tuberculosis and Diseases of the Chest Group Committee, urged that the Committee press for the adoption of the principle that S.H.M.O.s in posts which are established as consultant should be remunerated on the consultant scale. This, of course, is a self-evident justice. Dr. Edwards added that in his group many S.H.M.O.s were carrying complete responsibility, and he was supported in his contention by Mr. Nicholson-Lailey.

Not only in the tuberculosis service but also in other "minor" specialties are S.H.M.O.s doing consultant work in jobs which are not graded as consultant posts and with (at present) no prospect of being regraded. I know of a colleague in charge of an important department in two important provincial hospitals serving a wide area who was

be the maintenance of the faith of the patient in his doctor outside or within the hospital. There must be no suspicion that the doctor, either in general or hospital practice, has not complete freedom to exercise his professional judgment and skill in the manner he thinks best for his patients. Likewise, there must be no feeling on the part of the doctors themselves that it would be inexpedient for any reason whatever to do what they think best. The conversion of the hospital service to a system of whole-time, or even mainly whole-time, staffing would tend, we claim, to raise in the minds of the public the feeling that the doctors were medical Civil Servants and therefore not entirely free to exercise their unfettered clinical judgment and skill, and in the minds of the doctors the fear that clinical control and direction might at any time be imposed for reasons not immediately concerned with the care of the patient. We repeat our admiration for the conscientiousness, ethics, and practice of the whole-time members of hospital staffs, but we claim that their admirable work and more or less unfettered conditions derive in great measure from the parallel existence of a large, indeed much larger, body of part-time men who also provide a private medical service for those who wish it as an alternative to that provided by the State, against which the quality of the latter can be measured."

The Committee also expresses a belief that a whole-time salaried hospital service would complete the separation and isolation of the general practitioner from the hospital service—a trend which is deplored.

Pharmaceutical Service

The Committee believes that the most effective of the measures which have been or are being instituted in the endeavour to arrest the rising cost of the pharmaceutical service is that of letting each prescriber have a regular note of his average prescribing costs together with the average for the area in which he works (*Supplement*, March 6, p. 64). It also believes that a similar procedure should be applied to the hospital service. No measure, however, should be taken which would infringe the fundamental principle that a doctor must be free to prescribe whatever he conscientiously believes to be essential for the efficient treatment of his patient, provided he can justify its use.

The Committee goes on to stress the need to educate the public by every means that it is in the public's interest to leave it to the doctor to decide what and when to prescribe. It also gives an opinion that too little attention is given in medical schools "to what might be called the art and economy of prescribing." The Committee also thinks that "there is a tendency to forget that the exhibition of many of the modern drugs, apart from saving lives, materially shortens many illnesses. Thus, regarding the matter from a purely economic standpoint, the high cost of these drugs may actually be more than offset by the saving in sickness benefit and in time lost to productive work."

Reference is made to the fact that part of the cost of proprietary preparations must be related to the research undertaken by the firms which produce them and the benefit of this research to the community and, incidentally, to the export trade.

The Committee also puts forward evidence on the organization of the geriatric service, the mental health service, the maternity service, and the ambulance service.

Copies of the Scottish Committee's evidence may be obtained from the Scottish Secretary, B.M.A. Scottish House, 7, Drumsheugh Gardens, Edinburgh, 3.

PRESCRIBING OF SCHEDULE IV POISONS

The Ministry of Health, in a circular addressed to clerks of executive councils (E.C.L. 13/54), draws attention to the fact that pharmacists and pricing offices are having difficulty in dispensing and pricing prescriptions ordering Schedule IV in poisons because prescribers are in many cases failing to give full particulars on the prescription of the quantity and strength of the drug required.

appointed before the appointed day on the understanding that he would be of "honorary" standing one year after joining the staff, who now finds himself apparently permanently tied to the S.H.M.O. grade. Neither his hospital colleagues nor the general practitioners doubt that he is of consultant status and treat him accordingly, but the employing authority think otherwise.

It is an undeniable fact that in some cases the grading of S.H.M.O. is not ungenerous. But in the case of men doing consultant work unsupervised, and in charge of important clinical departments with heavy responsibility, surely it is not beyond the wit of man to devise a way of obtaining fair play and of having these colleagues of ours regraded to their correct status.—I am, etc.,

Bristol.

DONAL F. EARLY.

Domiciliary Physiotherapy

Sir,—We read with interest the report of a recent discussion on domiciliary physiotherapy by the Physical Medicine Group Committee with representatives of the General Medical Services Committee (*Supplement*, November 7, 1953, p. 189). Physiotherapists in private practice would all agree that the success of domiciliary physiotherapy depends on the contact of general practitioners and physiotherapists with the physical medicine specialists and the physiotherapy departments of local hospitals. To provide this service appears to present two main difficulties: the supply of physiotherapists, and the cost involved. The supply of physiotherapists is probably larger than the meeting realized, and their distribution is known to the Organization of Chartered Physiotherapists in Private Practice, who will send information on request. The cost of treatment for occasional patients is economical if carried out by private practitioners who already have cars and are equipped with portable apparatus. In some areas mobile physiotherapy vans are already in use and could be increased should the need arise.

We are of the opinion that a domiciliary service could be quickly and easily put into operation.—We are, etc.,

T. A. C. OVERINGTON,
Chairman.Organization of Chartered
Physiotherapists in Private Practice,
London, S.E.11.OLIVE F. SANDS,
Hon. Secretary.

Branch and Division Meetings to be Held

ASHTON-UNDER-LYNE DIVISION.—At Broadoak Hotel, Wednesday, March 24, annual general meeting.
BRIGHTON AND MID-SUSSEX DIVISION.—At St. Francis and Hurstwood Park Hospital, Haywards Heath, Thursday, March 25, clinical meeting.
CHESTERFIELD DIVISION.—At Station Hotel, Chesterfield, Friday, March 26, 7.30 for 8 p.m.; Dinner; 9 p.m., Annual B.M.A. Lecture by Dr. J. H. Cyriax: "Lumbar Disk Lesions."

CITY DIVISION.—(1) At Town Hall, Upper Street, Islington, N., Friday, March 19, 2.30 p.m., special meeting. Discussion: "Sonne Dysentery." To be opened by Dr. W. Gunn, Dr. A. J. H. Tomlinson, and Dr. V. Freeman. All medical practitioners (including non-members B.M.A.) are invited. (2) At B.M.A. House, Tavistock Square, London, W.C., Tuesday, March 23, 8.30 p.m., meeting. B.M.A. Lecture by Mr. R. C. Brock: "The Present Position of Cardiac Surgery (illustrated by films and slides). All members of the St. Pancras Division are invited. (3) At Institute of Laryngology and Otology, Gray's Inn Road, W.C., Friday, March 26, 3.30 p.m., clinical meeting. Professor F. C. Ormerod: "Foreign Bodies in the Food and Air Passages."

CITY OF DUNDEE AND COUNTY OF ANGUS DIVISIONS.—At Medical School, Dundee, Friday, March 26, 8.30 p.m., meeting. Annual B.M.A. Lecture by Professor M. L. Rosenheim: "The Treatment of Hypertension."

DEWSBURY DIVISION.—At General Hospital, Dewsbury, Friday, March 26, 8.30 p.m., meeting. B.M.A. Lecture by Mr. A. Lawrence Abel: "Some Common Diseases of the Rectum and Anal Canal" illustrated by a cinematograph film.

DUDLEY DIVISION.—At Lecture Theatre, Guest Hospital, Dudley, Tuesday, March 23, 8.15 p.m., meeting. Lecture by Professor J. M. Webster: "Forensic Science." (Illustrated by slides.)

EAST HERTS DIVISION.—At Haymeads Hospital, Bishops Stortford, Thursday, April 1, 8.15 p.m., clinical evening.

GREENWICH AND DEPTFORD DIVISION.—At Greenwich Town Hall, S.E., Thursday, March 25, 7 for 7.30 p.m., Annual Dinner and Dance.

GRIMSBY DIVISION.—At Scartho Road Infirmary, Grimsby, Thursday, March 25, 8.30 p.m., meeting. Lecture by Dr. J. M. Clow: "Medical Missionary Work in China." All medical practitioners in the area of the Division are invited.

HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Tuesday, March 23, 8.30 p.m., clinical meeting. Discussion on Tuberculosis. Short addresses by Dr. R. Grenville Mathers: "Pulmonary and Primary Tuberculosis"; Mr. M. F. Nicholls: "Renal Tuberculosis"; Mr. K. I. Nissen: "Tuberculosis of Bone and Joints."

HOLLAND DIVISION.—At Peacock and Royal Hotel, Boston, Saturday, March 27, 7.15 for 7.45 p.m., Supper; 9 p.m., Address by Dr. D. Evan Bedford: "Common Difficulties in Diagnosis of Heart Diseases."

MANCHESTER DIVISION.—At the Fallowfield Hotel, Wilbraham Road, Manchester, Thursday, March 25, 8.30 p.m., "Medical Forum." (a) Postgraduate Education, introduced by Mr. R. L. Newell; (b) The Relationship of the Industrial Medical Officer and the General Practitioner, introduced by Dr. P. J. Webb; (c) Entry into General Practice, introduced by Dr. Forbes S. Catto.

MID-ESSEX DIVISION.—At Out-patients Department, Chelmsford and Essex Hospital, London Road, Chelmsford, Wednesday, March 24, 8.15 p.m., meeting. Address by Dr. S. J. L. Taylor: "The Future of General Practice in the Light of My Recent Survey." A general discussion will follow.

MID-HERTS DIVISION.—At Red Lion Hotel, St. Albans, Friday, March 19, 8.45 p.m., meeting. Mr. John Beattie: "Abnormal Uterine Bleeding."

NORWICH DIVISION.—At Assembly House, Theatre Street, Ellis: "Some Natural History Adventures in Norfolk."

OXFORD DIVISION.—At Maternity Department, Lecture Theatre, Radcliffe Infirmary, Oxford, Wednesday, March 24, 8.15 p.m., meeting. Wing Commander A. J. Barwood: "Medical Aspects of High Speed and High Altitude Flight."

ROCHDALE DIVISION.—At Kingsway Hotel, Rochdale, Monday, March 22, 8.30 p.m., clinical meeting. Talk by Dr. E. T. Baker: "Some Critical Observations on Modern Medical Treatment."

RUGBY DIVISION.—At Grand Hotel, Rugby, Thursday, March 25, 8 for 8.15 p.m., supper; 9.15 p.m., annual general meeting.

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, March 25, 8.30 p.m., annual general meeting. Two films: "Anaesthesia in the Dental Chair for Adults and Children."

SHEFFIELD DIVISION.—At University Medical Library, Sheffield, Friday 26, 8.30 p.m., annual general meeting.

SHROPSHIRE AND MID-WALES BRANCH.—At Lecture Room, Copthorne Hospital, Shrewsbury, Wednesday, March 24, 8 p.m., meeting of Clinical and Pathological Section. Professor T. N. A. Jeffcoate: "The Position of the General Practitioner in Relation to Obstetric Services."

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Wednesday, March 24, 9 p.m., meeting. Mr. A. W. Badenoch: "Haematuria."

SOUTH ESSEX DIVISION.—At Ye Olde King's Head, Chigwell, Thursday, March 25, 7.30 p.m., Dinner. Male guests, non-members of the Association, may be invited.

SOUTH STAFFS DIVISION.—At Bell Library, Royal Hospital, Wolverhampton, Wednesday, March 24, 8 p.m., meeting of Executive Committee; 8.30 p.m., Annual B.M.A. Lecture by Mr. R. D. Owen: "Prognosis and Treatment of Cancer of the Lower Pharynx and Upper Oesophagus."

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devon's Road, Bow, E., Friday, March 26, 3 p.m., clinical meeting.

WOOLWICH DIVISION.—At Woolwich Memorial Hospital, Shooters Hill, S.E., Tuesday, March 23, 8.30 p.m., meeting. "Plastic Surgery" (illustrated by lantern slides). Members of the Greenwich and Deptford Division are invited.

PRELIMINARY

Award of Gold Medal to Dr. S. Wand

1. The Council has much pleasure in reporting that it has decided to award the Gold Medal of the Association for Distinguished Merit to Dr. S. Wand in recognition of his outstanding services to the Association and to the medical profession.

Election of Vice-Presidents

2. The Council has much pleasure in recommending:
Recommendation: That, with effect from the conclusion of his term of office as President, Mr. J. W. Tudor Thomas, D.Sc., M.D., M.S., F.R.C.S., be elected a Vice-President of the Association in recognition of his valuable services to the Association.
Recommendation: That Mr. A. M. A. Moore, F.R.C.S., be elected a Vice-President of the Association in recognition of his valuable services to the Association.

Annual Meetings

3. The Annual Meeting of the Association will be held this year in Glasgow from July 1 to 9. A provisional programme of the Meeting appeared in the *Supplement* to

the *British Medical Journal* of January 16 and a revised programme will be published in the *Supplement* of April 3.

As already announced, the Annual Meeting in 1955 will be held in Toronto, as a joint meeting of the B.M.A. and the Canadian Medical Association; and in 1956 in Brighton.

The preliminary arrangements for the Toronto Meeting (June 20 to 24, 1955) are proceeding satisfactorily. The number of members for whom the Association will be able to obtain an allotment of Canadian dollars is likely to be much smaller than the number wishing to attend the Meeting, but the Canadian Medical Association, aware of this difficulty, has made a generous offer of private hospitality. The Annual Representative Meeting in 1955 will be held in London from July 20 to July 23.

In 1959 the Annual Meeting will be held in the British Isles jointly with the Canadian Medical Association, which has kindly invited the B.M.A. to nominate one of its members as President of the C.M.A. for that year.

The Council has received with much pleasure, and will consider at a later date, an invitation from the New Zealand Branch to hold the Annual Meeting in New Zealand in 1961.

Representatives of Overseas Branches on the Council

4. Two vacancies have arisen among the members of Council who represent Overseas Branches. Professor Kenelm H. Digby, Bromley (Far Eastern Branches) resigned in January and died shortly afterwards. Mr. A. G. Leacock, London (West Indian Branches) resigned in February. The necessary steps to fill the vacancies have been taken.

Representatives at Conferences of Other Bodies

5. The Council appointed the following to represent the Association at the Conferences named:

Danish Medical Association, Annual Meeting, Nyborg, September, 1953	Mr. J. W. Tudor Thomas
West German Medical Association, Lindau, September, 1953	Dr. A. Talbot Rogers
National Safety Congress, London, October, 1953	Dr. J. A. L. Vaughan Jones
Paul Ehrlich and Emil von Behring Centenary Celebrations, Frankfurt-am-Main, March, 1954	Dr. Hugh Clegg (Editor, B.M.J.)
Royal Sanitary Institute Congress, April, 1954	Dr. H. K. Cowan
Canadian Medical Association, Annual Meeting, June, 1954	Dr. Llywelyn Roberts
West German Medical Association, Hamburg, June, 1954	Dr. R. Hale-White
Annual Conference of the Cremation Society, Torquay, July 6-8, 1954	Mr. S. A. S. Malkin
	Dr. I. D. Grant
	Lord Horder

War Memorial

6. A licence to proceed with the erection of the War Memorial having at long last been granted, substantial progress has been made and it is confidently expected that the Memorial will be completed within the next few months. The Memorial, which was designed by Mr. J. Woodford, will bear the inscription "In Memoriam—1939–1945." This form of words was approved by the Council after careful consideration of the many suggestions made in response to the appeal by the Chairman of the War Memorial Committee (Dr. H. Guy Dain). It was felt that simplicity should be the keynote of the inscription and that it should be completely visible from the front of the Memorial. In addition to the inscription, it is proposed to place a bronze tablet at the entrance to the Memorial, bearing the following words:

In honour of the medical men and women of the British Empire and Commonwealth of Nations who gave their lives in the Second World War.

Roll of Honour

7. The Roll of Honour of members who fell in the First World War is being extended to incorporate the names of members who gave their lives in the Second World War.

Subscriptions to War Memorial Fund Earmarked for Charitable Purposes

8. When members of the Association were asked to contribute to the War Memorial Fund they were informed that after the cost of the Memorial had been met any surplus funds would be devoted to assisting the education of the sons and daughters of members of the profession who gave their lives in the Second World War. It is not yet known whether there will be any surplus funds, but approximately £330 was donated specifically for charitable purposes. After careful consideration, the Council has decided to transfer this sum to the Medical War Relief Fund with a request that it be used to assist in the education of children of medical practitioners, victims of the Second World War, who are in need of such assistance.

Staff

9. Because of the great increase in the work of the Public Relations Department the Council has decided to appoint a Senior Assistant to the Public Relations Officer.

The Council records with deep regret the death of a former member of the staff, Dr. N. G. Horner, who gave distinguished service to the Association as Editor of the *British Medical Journal* from 1928 to 1946.

Cost of Arms

10. Some years ago the Council applied to the College of Arms for Armorial Bearings for the Association, but the designs produced at that time were not judged altogether suitable. A new design is now under consideration and the Council hopes to include further information on this matter in its Supplementary Report.

Churches' Council of Healing

11. For some years the Association has had two representatives on the Churches' Council of Healing. This body is reorganizing its constitution and revising its functions, and, with a view to strengthening the co-operation between Medicine and the Churches, has sought additional representation of the Churches and the medical profession. The Council has accepted an invitation to increase its representation and has appointed the following as its representatives for three years: Dr. Peter W. Edwards (Market Drayton), Dr. Mary Esslemont (Aberdeen), Dr. Robert Forbes (London), Dr. Doris Odium (Bournemouth), Dr. H. H. D. Sutherland (London), and Dr. E. E. Claxton (Assistant Secretary, B.M.A.).

Council Dinner

12. The biennial Autumn Council Dinner, which was discontinued during the war, was reinstituted in 1951. Partly for reasons of economy, it was not held in 1953. The Council proposes to hold it in the autumn of this year.

Gifts to the Association

13. The Council has pleasure in reporting the generosity of one of its former members, Dr. J. A. Ireland, in presenting a Chinese Vase to the Association, to be placed in the Hastings Room.

It is very glad to report also a gift from the Merseyside Branch in the form of the original minute book of the Newton Medical and Surgical Association. This association was founded at Newton, in Lancashire, in 1837 as a branch of the Provincial Medical and Surgical Association, which later became the B.M.A. The book will be presented to the President of the Association during the Annual Meeting in Glasgow and will be placed in the Library at B.M.A. House.

Cricket Match Against the Law Society

14. A very enjoyable cricket match was played at Hurlingham on July 3, 1953, between teams representing the Association and the Law Society and was won by the Association's team.

The Council is indebted to Dr. R. P. Liston (Tunbridge Wells) for kindly making the necessary arrangements on behalf of the Association. A return match has been fixed for May 30, 1954.

Professor Raffaele Bastianelli

15. The Council has sent congratulations and good wishes to one of the Association's Foreign Corresponding Members—Professor Raffaele Bastianelli, of Rome—on the occasion of his ninetieth birthday.

Review of General Practice

16. The report of the General Practice Review Committee and the report of the personal survey of general practice by Dr. Stephen Hadfield (Assistant Secretary) were published in the *British Medical Journal* of September 26, 1953, and had a very good press.

Deaths

17. The Council regrets to report the deaths of 549 members during the year 1953.

GENERAL MEDICAL SERVICES**Liaison between the General Medical Services and the Public Health Committees**

18. During the present session a closer liaison between the G.M.S. and the Public Health Committees has been attained by the appointment of a direct representative of the G.M.S. Committee on the Public Health Committee and the appointment of a representative of the Public Health Service (jointly by the Public Health Committee and the Society of Medical Officers of Health) to the G.M.S. Committee.

It is hoped that even closer co-operation between the two committees will be attained by the decision to invite representatives of the Public Health Committee to join the liaison committee already existing between the G.M.S. and the Central Consultants and Specialists Committees.

Remuneration**SIZE OF THE CENTRAL POOL**

19. The principles established by the Danckwerts award made it necessary for the G.M.S. Committee to reach agreement with the Ministry each year on the detailed application of the variable factors which are involved in calculating the size of the Central Professional Pool. The following paragraphs set out the action which is being taken:

Number of Doctors in the Service.—Agreement has been reached on the method which is to be used in calculating the precise number of doctors in the Service in each financial year. Two actual counts of the numbers of principals on executive council lists will take place in each year, and the mean of the two figures will be taken for the purposes of calculating the size of the Pool. The count will not be confined solely to those whose names appear on the medical lists at the relevant dates but will have regard to applications for admission to the list which are under consideration at the time when the count is taking place.

Practice Expenses.—It will be remembered that Mr. Justice Danckwerts accepted an expense ratio of 38.7%, and this percentage has so far been used in calculating the size of the Central Pool. It is clearly desirable, however, that this figure should be brought up to date, and arrangements were made for a further review of the level of practice expenses, including an inquiry undertaken by the Board of Inland Revenue and based upon doctors' accounts for the financial year which ended during the March quarter of 1952. This inquiry is now complete and the results are to be discussed with the Ministry of Health. The agreed expense ratio will be applied retrospectively to the 1952-3 Pool.

Receipts from Private Practice.—The Ministry made the suggestion that the Inland Revenue inquiry into practice expenses should also be used to obtain an estimate of the receipts of general practitioners from private practice. The method of calculation which the Ministry proposed to adopt made it obvious to the Committee that no accurate assessment of private practice receipts could be obtained in this way. The Committee does not dispute that an up-to-date figure for private practice must eventually be ascertained, but it was unable to agree that the practice expenses inquiry was an appropriate way of obtaining the information.

These views have been accepted by the Ministry, and further thought is being given to possible ways and means of obtaining an accurate estimate of total receipts from private practice. In the meantime, both sides have agreed that the figure of £2,000,000 accepted by Mr. Justice Danckwerts should be used as a provisional basis for the calculation of the Pool for 1952-3, and that an adjustment either way should be made when a more detailed assessment of this source of income is made.

The Distribution Scheme

20. **Appeals Machinery.**—It will be remembered that the Committee felt that it was necessary to provide means whereby an appeal could be made against (1) the rejection

of any application for an initial practice allowance; (2) the refusal of a hardship payment; and (3) the refusal of an application to be paid on the basis of "notional lists." The Committee has been able to ensure that in those circumstances a practitioner will have a right of appeal to the Minister, and in reaching a decision the Minister will be advised by a committee consisting of equal numbers of representatives of the Ministry and of general practitioners from a panel nominated by the G.M.S. Committee.

Notional Lists.—The original E.C.L. on this subject made special provision that, where a new partnership had recently been formed but one of the partners could not be admitted to the list until some time in April, 1953, executive councils would be given discretion to determine the number of loadings due to the partnership as if the name of the incoming doctor had been included in the list on April 1, 1953. The Ministry has now agreed that a similar concession should be granted in the first month of any quarter. In other words, where an executive council is satisfied that a partnership was, in fact, effective from the beginning of a quarter but that there is some delay in the admission of the new member of the partnership to the medical list, so that inclusion in the list actually takes place at a date between the first and last days of the first month of a quarter, the executive council can agree to calculate the number of loadings due to the partnership as if the name of the incoming doctor had been included in the medical list from the beginning of the quarter. It has also been agreed that the Medical Practices Committee can, at its discretion, grant a partnership application from the date on which it first receives the application, provided that it is satisfied that the partnership was, in fact, effective from that date.

Maximum Lists.—Although normally most general practitioners complete their National Service soon after registration, occasionally call-up is deferred until after a practitioner has become established as a principal. The position of partnerships where one member is liable to be called up for National Service has therefore been considered, particularly in regard to the size of the partnership lists.

Following discussions with the Committee, the Ministry agreed that where a member of a partnership was called up for National Service this should not affect the calculation of the maximum lists for the partnership, provided that adequate deputizing arrangements had been made for the care of the patients of the absent practitioner. In addition, the Ministry agreed that there would, in the circumstances, be no need to disturb any arrangement for payment on notional lists which might then be in existence, since the deputizing arrangements should normally be accepted as complying with the requirements of the distribution scheme.

Initial Practice Allowances.—Attention has been drawn to an anomaly in the method of assessing total professional income in connexion with claims for Initial Practice Allowances. In the case of doctors filling vacancies in small single-handed practices executive councils are required to take dispensing payments into account, and the Committee felt that some allowance should be made for the fact that the amounts involved include the actual cost of the drugs supplied. Following consultation with the Ministry, it has been agreed that the total sums paid for dispensing should be disregarded.

The Danckwerts Award and the Small-list Practitioner

21. It will be remembered that the Extraordinary General Meeting of the Association and the Special Conference of Local Medical Committees last year reaffirmed their support of the new distribution scheme and endorsed the action which the Committee proposed to take to give effect to the rider passed by the Conference of L.M.C.s in 1952. The sense of the rider was briefly that if, after the new scheme of distribution had been endorsed by both parties, it was found in the light of experience that certain groups who might have expected to have benefited had, in fact, not done so, it should be left to the Working Party provi-

nationally to allocate an appropriate proportion of the final settlement moneys for the purpose of remedying any obvious defects in the distribution scheme.

Clearly, the wishes of the Conference could be implemented only after the new distribution scheme had been in operation for some time and its effects assessed in the light of experience. Again, it was felt that a comprehensive inquiry into the position of practitioners with small lists would be necessary before any revision of the distribution scheme could be justified.

In consequence the Committee, in consultation with the Ministry, called the Working Party together again to investigate the problem, and it was agreed to initiate an official inquiry designed to reveal both the number and groups of general practitioners who might in the light of experience have been found to be adversely affected by the new distribution scheme. The Committee felt that such a step would not only safeguard the accuracy of the information which was being sought but would also have the advantage that the Ministry would be aware of the Committee's intention to examine the situation and would be prepared, in advance, for any adjustment in the Working Party's scheme which might prove necessary.

At the same time, the Committee secured the inclusion in the regulations of a provision whereby, should it be decided to revise the distribution scheme in any way, the steps taken to this end could be applied retrospectively.

As a first step, the Ministry prepared a list of single-handed practitioners who, on January 1, 1953, were recorded as having lists of not more than 1,200 patients, and executive councils were asked to supply certain particulars about these doctors from their own records.

Although this official inquiry was designed to give the Working Party some knowledge of the circumstances of the practitioners concerned, it was felt to be desirable to invite local medical committees to supply additional information, mainly concerning the work which those within the scope of the survey were undertaking outside the provision of general medical services under the Act.

These two inquiries have been completed, and a further meeting of the Working Party has been arranged. Any further information on this subject will be given in the Supplementary Report of Council.

Future Proposals for the Administration of the Inducement Fund

22. In Scotland it has been agreed that, in future, an income level of £1,400 shall be taken into account when considering the provision of inducement payments. As a result of the Danckwerts award the Inducement Fund as such no longer exists, but it is the Ministry's intention to continue to make grants of this nature as and where they may be necessary. In future, they will be made upon a more generous scale to take account of the increased remuneration established by the award, and, although no specific figure has been laid down for England and Wales, the amounts will not, in any case, be lower than the Scottish scale. Instructions to this effect have been issued to executive councils.

Group Practice

23. Following its acceptance of the definition of group practice made by the Committee on General Practice of the Central Health Services Council, the G.M.S. Committee, in conjunction with the Ministry, has prepared a scheme for the allocation of the sum of £100,000 set aside by the Working Party to encourage group practice. An appropriate proportion of this sum will be set aside for use in Scotland, where a separate but similar scheme will operate. Group practice is defined, in brief, as a practice carried on by several general practitioners working together in close association, consulting one another about their patients, and doing their surgery work wholly or in part in a common building controlled by the members. Normally, it should consist of between three and six members, who may or may not be in partnership but who would have a proper

understanding between them on the sharing of the earnings of the group and of their expenses.

The Ministry has agreed with the Committee's view that while a group will not normally consist of fewer than three persons, in exceptional cases, particularly in rural areas, two will be recognized as a sufficient number for the purposes of this scheme. Financial assistance to a group will take the form of an interest-free, long-term loan which will be recoverable by quarterly deductions from the remuneration payable by executive councils to individual members of the group. Loans will be available for the purposes of erecting new buildings, the acquisition of existing buildings and their conversion into surgery premises, or the conversion of buildings already owned by members of the group.

A committee—the Group Practice Loans Committee—consisting of four members of the Committee and four officers of the Ministry of Health, together with legal advisers, has been set up to consider applications for loans. This committee will advise the executive council, to whom the application will in the first instance have been submitted, whether a loan should be made, and, if so, the amount which should be lent. Normally, the period of the loan will be not less than 10 years and not more than 20, although no standard term has been prescribed.

After considering whether any security should be given to the executive council for the repayment of the loan, it was decided not to require a formal mortgage to be taken out on the group premises, as while this would afford good security, it was felt that it might unduly restrict the operation of the scheme. The model agreement has accordingly been drawn to provide for the joint and several liability of the various members of the group and, in order to cover the possibility that one member may decide to leave the group before the expiry of the loan period, it is a requirement of the issue of the loan that the various members will enter into some formal agreement between themselves defining their respective rights and liabilities.

The Committee has also discussed with the Ministry and the Medical Practices Committee the question of the admission of a new member of the group to the medical list for the area. It was agreed that in a restricted area, while the group should have the right to replace an outgoing member they should not have a similar automatic right to add to their number by taking in an additional member. In an open area both replacements and additions will, of course, be without restriction.

In order therefore to regulate the position in a closed area it has been decided that where a group wishes to admit a new member either as an addition to the existing group or to fill a vacancy, whether in formal partnership or not, admission to the medical list will be as if the group were in formal partnership—i.e., the right to replace a member can be assumed although additional members whose names are not already included in the medical list in the locality will not normally be admitted. It would be necessary for the members of the group to reach agreement as to the new member's share of liability for the outstanding or continuing loan.

Admission of Students to Medical Schools

24. In its last Annual Report the Council announced that the G.M.S. Committee had established a special subcommittee to investigate the number of students entering medical schools, the number qualifying from the schools, and the number of newly qualified practitioners likely to be absorbed into the various branches of the profession. The Committee has, for a number of reasons, been concerned about this important problem, particularly since any surplus of medical practitioners will inevitably have to be absorbed into general practice.

Firstly, Mr. Justice Danckwerts in his award had expressed the view that it might be necessary to reconsider his decision that the Central Pool should be based on the number of doctors in the Service if the number of new entrants to

general practice subsequently proved to be disproportionately high. Secondly, although the new distribution scheme with its system of Initial Practice Allowances, etc., had eased the problem of new entrants, there was no doubt that some difficulties were being experienced in finding enough suitable openings in general practice.

Nevertheless, the reduction in the registrar establishment—a step which had aggravated the difficulties in general practice—and the many problems of those wishing to enter other branches of the profession made it essential that the investigations should not be confined solely to general practice, and, in consequence, representatives of the Central Consultants and Specialists, Public Health, Overseas, and Armed Forces Committees were invited to participate in the discussions.

As a first step, consideration was given to the various available sources of information on which the investigation could be based. Inquiries were made as to the data which could be obtained both from the Association's own records and from a number of outside bodies such as the General Medical Council, the Medical Practices Committee, the Ministry of Labour, etc.; and, since the inquiry which was envisaged involved an estimate of how the future output of the medical schools should be related to the recruiting needs of the various branches of the profession over a period of years, expert actuarial advice was also sought at an early stage in the proceedings.

As a result of these preliminary investigations, the experts expressed the opinion that before any attempt could be made to relate the output of doctors to the opportunities which would be open to them, an estimate would first have to be made of the medical needs of the country and, in the case of the National Health Service, the requirements for doctors in all its branches. The acceptance of this view clearly involved consideration of matters of the highest policy. For example, at what point could it be said that general practice was likely to reach saturation? What should be the average doctor-patient ratio throughout the country, and, on a long-term basis, was there a possibility that the maximum number of patients which a single-handed practitioner might have on his list would be revised?

Another problem was the overall establishment of hospital officers and the question of hospital staffing generally. The Ministry has made it quite clear that there is no possibility of any substantial increase in the number of consultant posts, and over the next 10 years there would inevitably be a heavy wastage of senior registrars and registrars. As this fact became known, fewer practitioners would be prepared to extend their hospital appointments, and this, in time, would necessitate their absorption into other branches of the profession.

Two other fields can be quoted as examples of the complexity of the problem. Firstly, could it be argued that the Colonial Service establishment was likely to decline because of the move towards self-government in the Colonies which are at present manned by British doctors? Secondly, how wide were likely to be the recommendations of the Waverley Committee, which was examining the requirements of the Services in peace and war?

All these factors having been given full consideration, it became obvious that, as so many outside interests were involved, no one organization could solve so complex a problem or obtain, with any pretence of accuracy, the statistical data which alone could give the general picture upon which an estimate of future requirements of medical personnel could be based.

The question then arose whether, taking all these factors into account, it would not be in the best interests of the profession for the Association to invite the Ministry of Health to co-operate in the establishment of a Working Party to examine on a long-term basis and with the widest possible terms of reference the future number of medical practitioners likely to be required in all branches of the profession, and to correlate the intake of students to the medical schools with these needs. Even so, before taking such a step, it was felt that every effort should be made to

secure some data which might indicate the extent of the problem and justify the fear that there was likely to be a substantial excess of doctors over the number of openings available during the next few years.

Although the limited data available made it impracticable to secure a strictly actuarial picture of the situation, it nevertheless proved possible to produce estimates based on the Association's own records which more than substantiated the view that if existing trends continued a surplus of doctors over the next few years was inevitable.

The Council has therefore asked the Minister to set up a working party to review the whole problem. In making this suggestion the Council informed the Ministry that it was envisaged that such a working party would, in addition to the members nominated by the Ministry and the Association, include officers of the Colonial Office, the Ministry of Defence, the Ministry of Labour, the Home Office, the General Medical Council, and deans of medical schools, etc.

The Minister's reaction to this proposal is awaited.

Change of Practice

25. The G.M.S. Committee has for some time been conscious of the difficulties facing established general practitioners who wish to change the area of their practice. Efforts have been made in the past to facilitate the exchange of practices, though, unfortunately, with disappointing results.

Attention has been drawn to this matter once again by the Representative Body, and the Committee established a special subcommittee to examine the problem. It has not confined its efforts to possible methods of improving the existing machinery for direct exchange between two practitioners, but has approached the problem from the point of view of the establishment of a general "clearing-house" through which the differing requirements of practitioners might be met—in other words, machinery whereby those wishing to change their area of practice will be able to do so by a number of methods. There are three possible lines of approach to the problem: (1) direct exchange of practices between established practitioners; (2) the appointment to small vacancies from a panel of practitioners who have notified their desire for this type of opening; and (3) exchange of vacancies by arrangement between executive councils whereby two applicants may both gain advantages.

Machinery has already been set up to facilitate the direct exchange of practices between established practitioners, whilst, similarly, measures have been taken to form a panel of practitioners who have notified their wish to be considered for appointment to small vacancies. Thus, the first two methods are to some extent covered, and there remains the third method visualized by the Committee—an exchange of vacancies by arrangement between executive councils. The Committee proposes that a general practitioner wishing to change the area of his practice would, when applying for the vacancy of his choice, be given special consideration on the ground that he would be surrendering an equivalent or better practice in another part of the country, thus leaving an opening for another practitioner. Such a proposal would in no way imply that the vacancies would not be advertised in the normal way, but merely that an applicant with a practice to offer in exchange would have that fact taken into account.

The success of such a scheme obviously depends upon the full co-operation of both executive councils and the Medical Practices Committee on the one hand and the maintenance of a central bureau on the other. The possibilities of such a scheme are being explored with the Medical Practices Committee.

Machinery for Filling Practice Vacancies

26. Discussions have taken place with the Ministry of Health on the recommendations which were approved by the Representative Body last year for modifying the present machinery for filling practice vacancies.

The Ministry feels that, as the Committee on General Practice of the Central Health Services Council is expected to report in the fairly near future, and as this report may well recommend changes in the existing methods of filling practice vacancies, it is preferable to defer further consideration of this question until the report has been published. The Committee has not dissented from this view.

Succession to a Vacant Medical Practice by a Partner

27. The Annual Representative Meeting referred back to the Council the section of the last Annual Report which dealt with the agreement reached between the Ministry of Health and the G.M.S. Committee on the steps to be taken to regulate the position of short-term partnerships. In effect the proposal was that, in the absence of special circumstances, the Medical Practices Committee would not accept one partner as a logical successor to another unless the partners had been in active practice together for about a year. Some doubt was raised as to the legal position of a local medical committee in giving advice of this nature to an executive council when considering a particular case.

The G.M.S. Committee has examined this question in detail with the Ministry in the light of views expressed by the legal advisers of both sides. It is confident that, provided the local medical committee acts in good faith, there are no grounds for fear that it might be liable to damages. In the circumstances, the Committee has reaffirmed its view that the agreement reached with the Ministry and the Medical Practices Committee on this issue should not be modified. Even so, the Ministry is being asked to afford the same measure of indemnity to local medical committees as has been promised to executive councils.

Allocation of Patients to General Practitioners

28. The G.M.S. Committee has once again discussed with the Ministry the considerable disquiet which exists about the position of a general practitioner who may be required to give medical attention to a patient already receiving treatment from an unqualified practitioner.

The Ministry is appreciative of the profession's point of view, but the only effective solution of the problem lies in the introduction of amending legislation. Not only is there little chance of early legislation in the health field, but the political implications of an amendment on the lines required are considerable. The Ministry felt, therefore, that at this stage they could only repeat their suggestion that a suitable reference should be made in the "Notes for Guidance of Service Committees," advising these committees that the attitude of the General Medical Council to covering should be borne in mind—if a practitioner is required to appear before them as a result of refusing treatment to a patient who is also receiving treatment from an unqualified practitioner.

The Committee has accepted this proposal as an interim solution, but has reiterated its firm opinion that, ultimately, this anomaly must be corrected by a suitable amendment of the Act itself. The position will be kept under constant review.

Acceptance by a Locumtenent of Patients of a Vacant Practice

29. The Committee has discussed at some length with the Central Ethical Committee the circumstances in which the patients of a vacant practice might be accepted by other doctors in the vicinity.

The main problem has been the difficulty of reconciling the right of the patient to select his own doctor with the obligation of an acting practitioner to hold the practice together for the eventual successor. At the same time, the Committee has been anxious to ensure that practitioners who, in order to help the widow of a colleague, temporarily take over responsibility for his practice, shall not as a result be placed in a less favourable position than other practitioners in the area who do not volunteer to help.

Initially, it was thought that the situation might be overcome by imposing a time limit during which patients should not be accepted by an acting practitioner, but it soon became apparent that such a course would not satisfactorily solve the problem.

In consequence, the Committee felt that it would be unwise to lay down any definite prohibition and that the problem could best be met by the issue of a general statement to the effect that a locum, by reason of the advantages he enjoys through his introduction to patients of the vacant practice, should in fairness to the incoming practitioner or successor exercise the utmost discretion in the acceptance of patients.

This suggestion is now under consideration by the Central Ethical Committee.

Economy in Prescribing

30. Following the Minister's speech to the Annual Conference last year, early discussions took place with the Ministry on ways and means of securing further economies in prescribing costs. The following paragraphs set out the steps which have been taken or which are in contemplation:

(1) The co-operation of the deans of medical schools, the vice-chancellors of universities, and the members of other examining bodies is being sought on the problem of training medical students in economical prescribing, and particularly newly qualified practitioners during the pre-registration period.

(2) The G.M.S. Committee is seeking an early return to the system of full pricing and areal averages whereby the individual doctor is notified of the average cost of prescribing in his own area. This the Committee considers to be one of the most effective ways of combating excessive prescribing, but at the present time the arrears of work which face pricing bureaux make it impossible for the system to be introduced at once on a national basis. Therefore the areas where pricing averages can be computed will, for the time being, be restricted possibly to groups of counties which will be selected in rotation.

(3) The issue of *Prescribers' Notes* is being extended to all professors of pharmacology and therapeutics. It is already being issued to hospital medical staffs, and the introduction of notes of special interest to consultants is also envisaged.

(4) Price lists showing the cost of preparations which appear in the *National Formulary* and the price of analogous proprietary preparations of equivalent therapeutic value have been circulated to all general practitioners, and it is hoped that by this method the general practitioner will more readily appreciate the cost of some of the items which he prescribes.

(5) It is felt that there is a need to simplify the names of the preparations in the *National Formulary*, and the assistance of the *National Formulary Committee* is being sought to this end.

(6) As the Representative Body will be aware, the Committee has for a considerable time been urging the immediate introduction of stock orders for doctors' surgeries—a step which it is convinced would result in a substantial and early saving. In this the Committee has the full support of the Ministry, but, unfortunately, without whose participation the scheme cannot, of course, be operated. Every opportunity is being taken to overcome these difficulties.

Apart from the steps which are being taken in consultation with the Ministry, the Joint Committee on Prescribing, under the Chairmanship of Professor Sir Henry Cohen, has now issued the detailed lists in which proprietary preparations are classified into a number of categories. With the concern lest pricing bureaux might be instructed to question all prescriptions for substances in categories 5 and 6—those drugs which the Cohen Committee considered should not normally be prescribed. It also became clear that many general practitioners were under the impression that any prescriptions which they might write for drugs in these categories would automatically be referred by the pricing bureaux for investigation.

This point was therefore taken up with the Ministry, and as a result a categorical assurance has been given that those drugs listed in categories 5 and 6 will not be referred by the pricing bureaux for investigation merely because they come within these categories. Indeed, the regulations themselves do not permit of investigations on this count.

Only where an individual practitioner's prescribing costs are excessive and are the subject of an inquiry on that ground will the prescribing of drugs in categories 5 and 6 be one of the factors which may be taken into account. In such circumstances the frequency of prescriptions for substances in the two categories will also be considered.

This important statement has been given publicity in the *Supplement to the British Medical Journal*.

The Association has been informed that the Central and Scottish Health Services Councils have decided to appoint a Joint Standing Committee on the classification of proprietary preparations, under the Chairmanship of Sir Henry Cohen, to undertake the classification of new proprietary preparations as they are introduced. This will take the place of the original Joint Committee on Prescribing on Form E.C.10.

The Association has been invited to nominate a general practitioner to serve on this committee, but before making any nomination has asked for details of its composition and terms of reference.

Dangerous Drugs Regulations

31. Following consultation with the Committee the Ministry has issued a circular letter drawing attention to the fact that midwives are forbidden to administer pethidine except under the supervision, and in the presence, of a doctor, unless the drug is obtained on the authority of the medical officer of health. General practitioners have accordingly been reminded that it is undesirable that they should supply or prescribe pethidine for use at confinements unless they themselves intend to be present.

Supply of Medicines to Private Patients

32. Joint representations to the Ministry are being made by the General Medical Services and Private Practice Committees to secure the implementation of the resolution passed by the Representative Body last year that private patients should be permitted to be supplied with drugs and appliances on Form E.C.10.

Medical Service Committee Procedure

33. The report of the special subcommittee appointed to review the whole of the disciplinary machinery under the National Health Service, amended in accordance with suggestions made by the A.R.M. and the Annual Conference of Local Medical Committees, has now been discussed with representatives of the Ministry of Health.

The majority of the Subcommittee's recommendations were accepted by the Ministry, which also put forward a number of suggestions of its own for revising the present regulations.

Discussions are proceeding, and it is hoped that it will be possible to give details of the progress which has been made in the Supplementary Annual Report.

The Committee is working in close contact with the B.D.A. and the N.P.U., and representatives of these organizations are taking part in the discussions with the Ministry of Health.

Responsibility for the Acts and Omissions of a Partner

34. Further consideration has been given to the anomalous position which arises under the terms of service whereby a general practitioner is responsible for all acts and omissions of any practitioner acting as his deputy or assistant. Whilst this provision is equitable in the case of assistants and locums, in the case of members of a partnership the Committee held that each partner should be held responsible for his own acts, as is the position under the Partnership Act.

The matter was accordingly discussed with the Ministry, which suggested that the Committee's objection to the present arrangements would be largely overcome if partners were treated as jointly responsible for the acts and omissions

of one in treating the patients of the other. The executive council would then be entitled to take action for a breach of the terms of service against the person who was in actual fact responsible for the treatment of the patient at the time when the complaint was lodged.

The G.M.S. Committee felt that this proposal went part of the way to meeting its objections to the present position, but there was the risk that if the action against one practitioner failed the Service Committee might then proceed against his partner.

Attention has also been focused on the larger question of the responsibility of individual principals in contract with an executive council who deputize for other principals with whom they are not necessarily in formal partnership.

Prior to making a further approach to the Ministry the whole position was discussed with the Medical Defence Societies. The meeting formulated the following proposals as a basis for a revision of the regulations, bearing in mind the need to reconcile the personal responsibility of the deputy with the contractual relationship which exists between doctor and patient:

(1) That a practitioner should remain responsible for the acts and omissions of any other practitioner acting as his deputy where the deputy is an assistant or a locumtenent not on the medical list of an executive council.

(2) Where the deputy is also a principal on the medical list, in any executive council area, whether as a partner or not, the deputy should be responsible for his own acts and omissions, unless it can be shown that there is *prima facie* evidence that the principal upon whose list the name of the patient appears had himself acted in breach of his terms of service.

(3) That in the event of a complaint being made it should be the duty of the Chairman of the Service Committee before a case is heard to decide (upon the advice of a panel nominated by the profession) whether there is a *prima facie* case against the first principal or whether he had been cited in the complaint merely because the name of the patient appeared on his list. In such an event, provided he was able to show that he had made proper and adequate deputizing arrangements, no further action should be taken against him, and only the deputy should be required to appear before the Service Committee.

These proposals will be placed before the Annual Conference, and if approved will be discussed with the Ministry of Health.

Standard of Accommodation in Surgeries and Waiting-rooms

35. A circular letter has been sent by the Chairman of the G.M.S. Committee to every general practitioner in the National Health Service, drawing attention to the necessity of maintaining a high standard of surgery and waiting-room accommodation.

Geriatric Units

36. Following consideration of a resolution of the Representative Body that the Minister should be urged to consider the establishment of geriatric units, a special subcommittee was set up jointly with the Central Consultants and Specialists and Public Health Committees to examine this problem. (See para. 71.)

Co-operation between General Practitioners and Health Visitors

37. Following consideration of a resolution passed by the Representative Body to the effect that health visitors working under the guidance of general practitioners could be of great assistance, a special subcommittee was set up jointly with the Public Health Committee to consider ways and means whereby the help given by the health visitors to general practitioners might be increased. (See para. 94.)

Employment of General Practitioners in Hospitals

38. Discussions have continued with the Joint Consultants Committee and the Staff Side of Committee "B" of the Medical Whitley Council on the terms and conditions of service for general practitioners employed in hospitals.

It will be remembered that the Ministry's proposals entailed the classification of general practitioners working in hospitals into several categories according to the work undertaken and the responsibilities involved. The Committee took the view that this subdivision was unnecessary, and maintained that, with the exception of a small number of posts of a purely training nature, the vast majority of general practitioners working in hospitals, although undertaking duties of a diverse character, carried a comparable degree of responsibility. It was therefore felt that no practitioner working as a clinical assistant under supervision should be paid less than the rate laid down in paragraph 10 (b) of the terms and conditions of service for hospital staff—that is, £175 per annum per weekly half-day.

The Ministry has now conceded the principle that a composite rate should apply to all these posts, but, at the same time, it maintains that a rate of £125 per annum per weekly session would be appropriate.

In view of the fact that negotiations are now proceeding in Whitley Committee "B" for a review of the remuneration of hospital medical staffs, it has been agreed between the Staff and Management Sides that the actual rate of payment for general practitioners working as clinical assistants should be left until the major question is resolved.

Representation of General Practitioners in Hospital Administration

39. The question of general-practitioner representation on regional hospital boards has once again been taken up with the Ministry of Health. The G.M.S. Committee is glad to be able to report that there is now at least one general practitioner on every board, but it is nevertheless perturbing that in several instances the general practitioners appointed were not those nominated by the general practitioners in the area. The Committee holds that it is essential that the general-practitioner representatives should always enjoy the confidence of their local colleagues.

Whilst the Ministry accepted the Committee's views in this matter, during the course of discussion it emerged that certain of the nominations made by the Association in these particular instances had been rejected primarily for geographical reasons and in order to preserve the balance of representation of different localities on the boards. To overcome this difficulty the Ministry has suggested that the Association should make more than one nomination for any particular vacancy, so that if the first nomination is unacceptable for geographical or other reasons there will be a second nomination available.

The Committee is in full agreement with this suggestion.

The Committee, through its liaison committee with the Central Consultants and Specialists Committee, has also considered the problem of obtaining adequate general-practitioner representation on other hospital administrative bodies. In the case of staff committees of the individual hospitals, the Committee feels that they should consist of all the members of the hospital medical staff, and, if there are general practitioners on the staff, then they would be so included. On group medical committees or on local medical advisory committees, whether constituted by the hospital staffs or by the hospital management committees, there should be adequate representation both of general practitioners, whether employed in the hospital or working outside, and of the public health service.

So far as the regional medical advisory committees are concerned, the Committee feels that the establishment of adequate general-practitioner representation on the boards themselves would largely ensure representation on the advisory committees.

Consolidation of the N.H.S. (General Medical and Pharmaceutical Services) Regulations

40. The National Health Service (General Medical and Pharmaceutical Services) Regulations were originally published in 1948, and since that time they have been considerably amended to meet changing conditions in the

Service. The Ministry has now incorporated these various amendments in the new regulations and proposes to issue them in consolidated form. The draft of the new regulations was submitted to the G.M.S. Committee, and various minor alterations have been suggested to and accepted by the Ministry.

The considerable amendments which have been made to the original regulations have also necessitated a revision of the Ministry's handbook for general practitioners. This is now under way, and the Committee hopes that it will be possible to issue the new handbook shortly.

Maternity Medical Services

41. The G.M.S. Committee established a special subcommittee to review the maternity medical services, with particular reference to the relation of fees to the work done and to the obligations of the general practitioner under the regulations. It was also asked to consider what steps could be taken to secure more effective co-ordination of the different sections of the maternity service.

The conclusion has been reached that, although the present framework of the Act and regulations is in some ways cumbersome, generally speaking a very satisfactory service is given to the public. A number of suggestions have been made designed to secure greater integration of the three branches of the Service. No definite recommendations have been made for any variation in the fees at the present time, but, should there be any alteration in the requirements made of the general practitioner providing maternity medical services, the question of the adequacy of the fees now paid would require re-examination.

The Obstetric List.—The Representative Body last year called upon the Council to report the steps which were being taken to secure the abolition of the obstetric list. As the Representative Body will be aware, this measure has the full support of the G.M.S. Committee, and particular emphasis was given to it in the Association's evidence to the Committee on General Practice of the Central Health Services Council.

The Committee is awaiting the report of the Cohen Committee on General Practice before it reopens discussions with the Ministry on the abolition of the Obstetric List.

Analgesia in Domiciliary Midwifery

42. The Ministry, after consultation with the Committee, is undertaking a small sampling inquiry into analgesia in domiciliary midwifery for the purpose of ascertaining why some patients do not have gas-and-air analgesia. Medical officers of health from selected local authorities are participating in the inquiry.

Trainee General Practitioner Scheme

43. Discussions have taken place with the Ministry on a report prepared by a special subcommittee of the G.M.S. Committee on the operation of the Trainee General Practitioner Scheme. The Ministry expressed its agreement with the recommendations made by this Subcommittee, and the report has since been circulated to executive councils with a request that they should consider the implementation of the various proposals contained in it, in the light of local circumstances. Similarly, the Committee, for its part, has sent copies to local medical committees.

Discount on Drugs

44. Discussions have taken place between representatives of the G.M.S. Committee and the National Pharmaceutical Union and the Association of the British Pharmaceutical Industry about the present unsatisfactory position whereby, as a result of differential rates of discount allowed to retail pharmacists and general practitioners, the dispensing doctor may suffer financial loss when supplying a number of proprietary preparations. Inquiries are being made to determine the exact extent of the problem, and further meetings are being arranged.

Reports to General Practitioners on the Death or Discharge of Hospital Patients

45. It will be remembered that the Representative Body expressed the view that the Ministry of Health should be pressed to instruct hospitals to send an immediate notification to the family doctor on the death or discharge of his patient from hospital.

The G.M.S. Committee, in common with the Central Consultants and Specialists Committee, felt, however, that this was a question for professional co-operation rather than for the issue of instructions by the Ministry.

Following discussions between the two committees, a letter has been sent to the chairmen of Hospital Group Advisory Committees, with copies to other hospital officers where appropriate, drawing attention to the importance of ensuring that general practitioners are promptly notified of the death or discharge of hospital patients.

The matter will be reviewed at a later date to see whether this action has in fact had the desired result.

Report by the Medical Research Council on Clinical Research in Relation to the National Health Service

46. The G.M.S. Committee was disturbed to see that the recent White Paper on the subject of clinical research in the National Health Service contained no specific provision for general practitioners to avail themselves of the funds which are being provided for this purpose. It was also felt to be unfortunate that it had not been possible to provide direct general-practitioner representation on the Clinical Research Board.

This matter was discussed with the Ministry of Health, and representatives of the College of General Practitioners were invited to take part in these discussions. The Ministry maintains that the terms of the White Paper do not exclude general practitioners from participating in the funds provided for research purposes, but it is not prepared to support the suggestion that a general practitioner should be nominated to sit on the Research Board as a right. Nevertheless, it conceded that if there were a vacancy there was no reason why a general practitioner nominee should not be considered. The board has now been set up, and contains no general practitioner amongst its members.

Joint representations to the board are being made with the College of General Practitioners—firstly, with a view to securing an adequate allocation of available funds for research in general practice, and, secondly, to press the rightful claim of the general practitioner to be represented on the board itself.

Health Centres

47. Two questions have arisen in connexion with the London County Council's health centre at Woodberry Down, upon which the advice of the Committee has been sought. Firstly, the Committee looked at the advisability of the County Council's policy not to employ any general practitioner working at the centre on a part-time sessional basis in their welfare clinics which operate at Woodberry Down. Secondly, the Committee's views were sought on the desirability of providing physiotherapy and pathological laboratory facilities at the centre.

The Committee, for its part, can see no objection to doctors working at the centre being employed by the county council upon a part-time sessional basis at these welfare clinics, although of course they should not receive preferential treatment compared with general practitioners from outside the centre who also wish to take these posts. Similarly, the Committee can see no objection to the provision of physiotherapy and pathological facilities at the centre, provided that they are not restricted to general practitioners working in the centre.

The Committee is conscious of the experimental nature of health centre practice as a whole, and it has recommended the local medical committee to proceed on the lines envisaged above and to review the situation in the light of experience.

Certification for Surgical Corsets

48. Although the Committee was successful in securing a reduction in the number of prescribed diseases for which tax-free corsets could be obtained and a consequent reduction in this form of certification, it still felt that the only solution to the problem lay in the total abolition of certificates for this purpose. It therefore made strong representations to the Board of Customs and Excise that further consideration should be given to the early removal of the need to obtain a certificate before a surgical corset could be secured free of purchase tax.

The Board were fully in sympathy with the Committee's views that it was difficult to prevent abuse of the present arrangements, but pointed out that the question of surgical corsets was part of the wider problem of surgical appliances as a whole, and they felt that the Committee would not object in principle to a scheme of purchase-tax exemption for any necessary surgical appliances. Whilst in the case of most appliances it would be readily apparent that they were required purely on medical grounds, in the case of corsets there was frequently room for doubt, and it was for this reason that a certificate was required as evidence of medical need. To withdraw the concession *in toto* would fall most hardly on private patients and on those National Health Service patients who prefer to buy their own appliances and corsets rather than get them through the National Health Service. There were also political difficulties involved in such a step.

Nevertheless, the Board were concerned to prevent unnecessary demands and abuse of any scheme for purchase-tax concessions, and they felt that the best course would be for any condition which might give rise to abuse to be deleted from the prescribed list. To this end they themselves had already deleted severe splanchnoptosis, and the Committee was provided with figures which showed that the demand for corsets supplied free of tax had shown a considerable drop since the list had last been pruned.

The Committee, at the invitation of the Board of Customs and Excise, will keep the list of prescribed diseases under review and, should it become apparent that there is any abuse of the scheme, steps will be taken to revise the list further. It is hoped that, by so doing, the demand for medical certificates for this purpose will be still further reduced.

Pension Scheme for Medical and Dental Employees

49. It will be remembered that during 1950 approval was given to the broad outline of a scheme to provide pensions and other benefits for employees of doctors and dentists. This scheme has now been completed in detail, and provides, *inter alia*, for: (a) pension on retirement at 65, or 60 in the case of a woman, based on salary and length of service with, in the case of men, the option of a "survivor" pension for widows; (b) death benefits for women; and (c) return of contributions on withdrawal from the scheme on death or retirement.

The Council acts as trustees to the scheme through the medium of a small committee appointed for the purpose of its administration. Full details can be obtained from the Medical Insurance Agency, Tavistock House North, Tavistock Square, London, W.C.1.

COMPENSATION AND SUPERANNUATION

Compensation

50. The following points which have been the subject of various resolutions of the Representative Body, including Minutes 230 and 231 of the A.R.M., 1953, have been discussed with the Ministry of Health: (a) The payment of compensation whenever a share in a practice is relinquished in favour of a new or existing partner; (b) the payment of compensation where a practitioner moves from one area to another; (c) the criteria for making hardship payments; (d) the publication of a definition of "hardship" in the context of the Compensation Regulations.

Following the meeting, the Ministry explained that, in general, the payment of compensation, except on retirement or in cases of hardship arising out of the purchase of a practice before the appointed day, could not be made at the present time. It was stated that, in reaching this conclusion, the Ministry had had regard not only to existing statutory provisions and the reasons therefor, but also to the general financial position of the country, which prevents any expenditure not essential to the maintenance of a service or vitally important for its development. However, the Ministry has recognized that there will be individual cases of hardship where an elderly doctor or one whose health is failing finds it necessary to take a partner in order to prevent the complete disintegration of his practice, and it will look sympathetically at cases of this nature.

In the opinion of the Council this new principle should be established in full before further representations are made on the four points set out above. The Council has decided, however, to press at once for an extension of this principle to include advance payment of compensation where an elderly doctor continues to work because he is unable to retire on economic grounds.

Financial Position of Practitioners on Retirement

51. The Council has considered the following resolution of the A.R.M., 1953:

233. Resolved: That the Council be instructed to inquire into the financial position of members of the profession who retire at the age of 60 or later, with special reference to the position of those who were over 45 years of age on the introduction of the N.H.S.

A report on the Council's inquiry and the conclusions reached are set out in Appendix II.

Concurrent Employments

52. The Ministry of Health has informed the Council that examination of the National Health Service (Superannuation) Regulations, 1950, has disclosed that an officer who holds more than one N.H.S. appointment concurrently is, for superannuation purposes, treated separately in respect of each appointment. This would result in anomalies which would be very much to the disadvantage of the practitioners concerned. The Ministry is prepared to amend the regulations to deal with this situation, and the Council has informed the Department that it welcomes this step.

HOSPITAL AND CONSULTANT SERVICES

53. The Council, through the Central Consultants and Specialists Committee, has continued to watch over the interests of hospital medical staffs, and an active part in negotiations on their behalf has been taken by the representatives of this Committee who serve on the Joint Consultants Committee and on the Staff Side of Committee "B" of the Medical Whitley Council.

The Committee is considering methods of improving the peripheral organization for consultants, and in particular the contact between the central and regional consultants and specialists committees and hospital group medical committees. In pursuance of this aim the Central Committee has already begun the issue through hospital group medical committees of regular bulletins giving an account of current items of interest for the information of all consultants and S.H.M.O.s.

Hospital Junior Staffing

54. The Ministry has asked the Joint Committee for its advice on the problem of shortage of hospital junior staff. It has given the Joint Committee details of the distribution of junior staff, numbers of posts in various grades—both filled and vacant—and other relevant information, and this has been made available to a special subcommittee appointed by the Central Consultants and Specialists Committee to study this intricate problem. The shortage appears to be

mainly in the non-teaching hospitals, where it occurs in most specialties at all levels between the pre-registration house officer and the consultant.

The number of doctors qualifying each year is between 2,000 and 3,000 less than the number of house officer and senior house officer posts. Since the training of many additional doctors would result in gross overcrowding of the profession, the problem must be solved in other ways, such as by a redistribution of available manpower, by the creation of inducements to young practitioners to continue longer in hospital posts, and by a greater use of general practitioners in the hospital service.

Some reduction in the total number of junior posts could probably be achieved, and a redistribution of posts as between teaching and non-teaching hospitals appears to be essential. The Central Committee is advocating a searching review of junior medical establishments with these considerations in mind.

The problem has been aggravated by the deterioration in the prospects of promotion in the non-teaching hospitals. The Representative Body drew attention to this position in the following resolution of the A.R.M., 1953:

That the Representative Body observes with concern that preference is being given to teaching hospital registrars in appointing consultants and senior registrars. This policy has seriously affected the recruitment of registrars to the non-teaching hospitals, with an ultimate threat to their efficiency and the comprehensive training of registrars, and the Council is asked to seek a remedy.

Another aspect of this problem is the breakdown of the old custom whereby a practitioner combined an appointment on the staff of the local hospital with a general practice. This has led young practitioners to doubt whether anything is to be gained by remaining in the hospital service longer than absolutely necessary if they intend ultimately to enter general practice. In this connexion the Committee welcomes the resolution of the Representative Body "that the Minister be asked to advise that executive councils should give equal consideration to practitioners who have spent several years in hospital, provided that they have adequate experience in general practice, as to other applicants for practice vacancies."

The Committee considers it necessary, in order to improve recruitment in the non-teaching hospitals, to provide in them better prospects both for those who intend to make a career in the hospital service and for those who would like to combine hospital work with general practice. Further consideration is being given to these and other aspects of the problem.

Senior Registrars and Additional Consultant Posts

55. The Council has considered the following resolution of the A.R.M., 1953:

That this Meeting is of the opinion that the Minister should increase the number of part-time consultant posts in general medicine and general surgery.

There has been a substantial increase in the total number of consultant posts in the past five years, but it appears that there are comparatively few vacancies in general medicine and surgery, and it is in these specialties in particular that there is an excess of senior registrars who are reaching, or have reached, the end of their training. No doubt the paucity of consultant posts in general medicine and surgery is to some extent due to the fact that many senior registrars in these specialties are engaged in work of a consultant nature. The Ministry agreed in May, 1953, that boards should be allowed to retain, for a further period not exceeding two years, senior registrar posts in excess of the fixed establishment where the abolition of the posts would involve transitional posts are to be filled in other grades. These "time-expired" senior registrars.

The Ministry has been urged to impress upon hospital boards the necessity of taking the opportunity offered by this arrangement to review their medical staffing so as to ensure that by the time these transitional posts come to an

end more permanent arrangements, including where necessary the creation of new consultant posts, are made to provide for the work of the hospitals.

In accordance with the circular on "Economy in Manpower," issued in December, 1952, hospital boards are not permitted to create additional consultant posts without the approval of the Ministry. The Ministry has now set up a small committee to consider applications from boards for permission to appoint additional consultants, and this committee includes representatives of the Joint Committee.

Senior Registrars: Removal Expenses

56. During the discussions between the Joint Committee and the Ministry on the question of the senior registrar establishment it was agreed that so far as practicable senior registrars should spend part of their four-year term in a teaching hospital and part in a regional board hospital. This had a twofold purpose: to widen the scope of the senior registrar's training and experience and to remove the handicap suffered by senior registrars whose experience was restricted to non-teaching hospitals when competing for consultant posts. This principle had the support of the Representative Body.

Despite the practical difficulties the system of interchange is being put into operation by most hospital boards. As a result, many married senior registrars have been faced with the problem of moving their homes during the period of their appointment, but the Ministry has informed hospital boards that a General Whitley Council agreement providing for reimbursement of removal expenses may be applied in cases of this kind.

Security of Tenure

57. The Council has considered the following resolution of the A.R.M., 1953:

That no contract made by the regional hospital board with its medical staff should be varied without prior consultation with the individual and medical committees of the establishments concerned.

So far as senior medical staff are concerned, this resolution is in accord with the policy accepted in principle by the Ministry. Moreover, it has now been established that a consultant or S.H.M.O. who feels that his contract is being modified unfairly has a right of appeal under paragraph 16 of the terms and conditions of service.

Remuneration of Hospital Medical Staff

58. The Council is fully in sympathy with the following resolution of the A.R.M., 1953:

That this Meeting is of the opinion that an adequate betterment factor should now be accorded to the consultants and specialists, in conformity with the intention of the Spens report accepted by the Government and the profession and already implemented in the case of the general practitioners by the Dankwerts award.

In 1952 the Staff Side of Committee "B" of the Medical Whitley Council submitted a claim for a review of the remuneration of hospital medical staff.

The Council understands that the Staff Side is making every effort to bring the negotiations to a satisfactory conclusion.

Legal Actions Involving Hospital Authorities and Members of their Medical Staffs

59. The Council has had before it the following resolutions of the A.R.M., 1953:

That this Meeting is concerned with the position of casualty officers as the result of recent legal actions, and the effect that it will have on the future staffing of casualty departments of hospitals, and urges the Council to continue its efforts to seek a solution to the problem.

That this Meeting (i) bearing ever in mind that medicine is not an exact science and that clinical phenomena never follow rigid laws, (ii) asserts that medical practitioners should not be held responsible (and liable) for damages on account of an incorrect diagnosis, provided that reasonable care and attention have been

given and no negligence has been proved, and (iii) urges that steps should be taken to re-emphasize this principle.

It is possible that the increasing risk of litigation has been one cause of difficulty in recruiting medical staff in casualty departments. The Joint Committee has informed the Ministry that, while it does not consider a uniform pattern of staffing in casualty departments to be desirable, it is strongly of the opinion that the casualty officer in many hospitals should be a more experienced practitioner than is often employed at present. It suggested to the Ministry that in appropriate cases, where the appointment of a practitioner with rather more experience than a S.H.O. or registrar (but not a consultant) was desirable, a senior casualty officer might be appointed for a period not exceeding four years at a salary within the range of £1,300 to £1,750. The Ministry has accepted this suggestion and a number of appointments of this kind have already been made.

With regard to the Representative Body's second resolution, the Council again points out that the law of negligence has not changed. The principle still holds that a medical practitioner owes to his patient the duty of exercising reasonable care and skill, and it is a breach of this duty which usually supports an action for negligence. The words "reasonable care and skill" have to be interpreted in the light of the circumstances of each case, and a house officer, for example, is not *ipso facto* negligent because someone of greater knowledge and skill would have acted differently.

There are probably many reasons for the increase in recent years in the number of legal actions involving hospital authorities and members of their medical staffs, but there can be no doubt that the action of the Ministry itself put the profession in a peculiarly vulnerable position.

In September, 1949, the Ministry issued a Circular (R.H.B. 49/128) instructing hospital authorities that they should not undertake the legal defence of any member of their medical staffs involved in a legal action. If it was sought to make the authority responsible for the alleged negligence of the practitioner, the authority should take such steps as were open to it by legal process to obtain a contribution from the practitioner in respect of any damages awarded to the plaintiff.

This new policy gave rise to two difficulties. If the practitioner made a report to his employing authority on any untoward incident that later became the subject of a legal action, the court might compel the disclosure of the report or the hospital authority itself might disclose the report to the complainant or use it in an endeavour to place the onus upon the practitioner. At the same time it was acknowledged that hospital authorities had a duty to investigate complaints and also that it was in the best interests of the practitioner involved that the facts of the situation should be placed on record while they were still fresh in his mind, and, if practicable, substantiated by independent witnesses.

It therefore became imperative to reach some arrangement with the Ministry that would enable hospital medical staffs to co-operate with their employing authorities, as they had done in the past, without prejudicing their own interests. Discussions, in which the three medical defence societies participated, took place with the Ministry. It was not suggested that the whole cost of "hospital" litigation should be borne by the hospital authorities. It was urged, however, that there should be some agreed method of settling the apportionment of any damages as between the hospital authority and its medical officer such as would remove the possibility of conflict between them, which could only be to the advantage of the plaintiff.

The Ministry readily co-operated in trying to find a solution of this problem, which was becoming as embarrassing to hospital authorities as to their medical staffs, and a satisfactory arrangement has now been reached between the Ministry and the three defence societies which in effect means an abandonment of the policy introduced in 1949. In future the hospital authority and the prac-

defence society will endeavour to reach agreement beforehand on the way in which any damages awarded to the plaintiff shall be apportioned, and failing agreement they will bear the damages in equal shares. Where, however, either the practitioner or the hospital authority decides, without the consent of the other, to settle the action out of court, the party settling the action will bear the whole of the plaintiff's damages and costs.

Discussions are now proceeding with the Ministry regarding the advice which should be given to hospital authorities and their staffs to ensure that so far as practicable reports made in connexion with untoward incidents are treated as privileged documents which will not be subject to compulsory disclosure in the event of legal action.

Consideration is also being given to the method of investigating incidents in hospitals which may result in a charge being made against the personal conduct or professional competence of a member of the medical staff.

Medical Advisory Machinery

60. After discussions with the Joint Committee, the Ministry has issued an important circular regarding the constitution and functions of medical advisory committees at board of governors and hospital management committee level.

This circular makes it clear that the constitution of these committees rests with the hospital medical staffs themselves. It specifies a number of matters on which hospital authorities should consult their medical committees, and it lays down the principle that the authorities should regularly seek the advice of these committees on all matters within their sphere.

It is hoped that the advice given in this circular will go a long way to restore hospital medical committees to the place they held in the counsels of hospital governing bodies before the appointed day, and thus remove what has become one of the most serious defects of the Service.

Unfortunately the circular does not apply to regional hospital boards, but the Joint Committee is continuing to urge the importance of establishing similar advisory machinery at that level.

Medical Reports and Loan of Hospital Records

61. There is considerable uneasiness among consultants about the arrangements which exist in many hospitals for giving medical reports, or copies of or extracts from hospital notes, to outside bodies. In some instances clinical records have been allowed to leave the hospital without the knowledge of the consultant concerned, despite the fact that this might be prejudicial to the interests of his patient or of the consultant himself. Some months ago the Law Society published a statement for the guidance of solicitors which did little to allay the fears of consultants as to the way in which the matter is being handled. The statement dealt primarily with the question of medical reports (which is within the consultant's control) and did not cover satisfactorily the loan of hospital notes. A comprehensive statement is now being prepared as a basis for discussion with the Ministry.

Whole-time or Part-time Service

62. The Council is disturbed to find that since 1948 there has been a slow but steady increase in the proportion of consultants employed on a whole-time basis. Some boards now allow candidates for consultant posts in most specialties to exercise an option for whole-time or maximum part-time service. In other regions, however, there is a tendency for the boards to prefer whole-time appointments, particularly in certain specialties, and to refuse existing whole-time consultants an opportunity of transferring to a part-time basis.

The Joint Committee is representing to the Ministry that boards should be asked to offer the option wherever it is consistent with the interests of the Service. The Ministry is

being asked also to consider the possibility of an independent hearing when a board refuses without good reason to agree to appoint on a part-time basis.

Representation of Whole-time Officers and S.H.M.O.s

63. The Council has given further consideration to the question of affording special representation to whole-time officers and S.H.M.O.s in the light of the following resolutions of the A.R.M., 1953:

That this Meeting is of opinion that senior hospital medical officers are not adequately represented at all discussions concerning their terms and conditions of service.

That this Meeting welcomes the action of the Staff Side of Whitley Committee "B" in consulting the representatives of whole-time specialists and urges that this be continued; and that whole-time specialists should have reasonable representation on the Whitley Committee "B."

The electorate of Regional Consultants and Specialists Committees is made up of all consultants and S.H.M.O.s in the region, whether whole-time or part-time. Through this avenue there is an opportunity for the whole-time consultant or S.H.M.O. to find his way to the central committee. The Council considers that to split up the electorate into a number of different groups would be a fundamental mistake, since it would tend to divide hospital staffs rather than unite them in one representative organization.

The Joint Committee and the Staff Side of Committee "B" are much smaller bodies, and in the opinion of the Council it is impossible to place representation on these negotiating bodies on the basis of sectional interest without weakening their authority. The Council is able to report, however, that through the normal channels one of the members of the Central Consultants and Specialists Committee who is a whole-time consultant from a regional board hospital has been appointed to the Joint Committee and to the Staff Side of Committee "B." Moreover, the Committees and the Staff Side are always willing to discuss with representatives of particular sections of hospital medical staffs any problems specially affecting them.

Delays in Out-patient Departments

64. The Council has considered the following resolution of the A.R.M., 1953:

That the Council be requested to investigate (a) the long wait for appointments at hospital out-patient departments, (b) the long wait by general practitioners for reports on patients, and to make recommendations to remove the difficulties.

Some of the reasons for the delays in obtaining appointments at out-patient clinics are not far to seek. Before 1948 a much higher proportion of patients were seen by the consultant in his private consulting-room than is the case to-day. Patients are more and more tending to seek the advantage of the consultant services provided under the Act, and there is increased pressure upon general practitioners for a second opinion. Again, the appointments system itself, by restricting the number of patients seen at an out-patient session, sometimes places a limitation on the work of the department, and the frequency with which out-patients fail to keep appointments without notifying the hospital tends to defeat the object of the appointments system and to lengthen the waiting period.

It appears that the service at present provided is not equal to the demands made upon it, and that the only remedy is an increase in the number, or a lengthening of the duration, of out-patient sessions. But in many hospitals the accommodation and other facilities are already in full use and any further extension of existing services is impracticable.

The Council considers it important that general practitioners, when seeking to arrange out-patient appointments, should indicate those cases which require an urgent appointment on medical grounds, and that these cases should be given priority. This practice already obtains in many areas, but its successful operation depends upon general practitioners asking for priority in really urgent cases only.

Wherever practicable, hospital out-patients should be referred back to their general practitioners for intermediate treatment or supervision.

The delay in sending reports on hospital out-patients to general practitioners is part of the problem of the pressure on out-patient departments. It is largely in those hospitals where the staff are fully extended in clinical work that delay in sending reports occurs. In all urgent cases, however, it should be possible to see that the general practitioner receives a report promptly.

Domiciliary Consultation Arrangements

65. In the light of the objections raised by the Representative Body in 1952 the Joint Committee has reopened with the Ministry the question whether consultants should be required to disclose the diagnosis in the domiciliary consultation certificate.

One of the objections put forward to such disclosure is that the information, which should be confidential, may be misused. The Ministry has asked for any evidence that the information has in fact been misused.

In support of its view that the diagnosis should be given, the Ministry claims that hospital boards need information regarding the types of case requiring the services of consultants to assist them in planning developments in the Service, and that the information is useful in other ways. The Joint Committee has asked the Ministry to substantiate its claim by giving specific details of the ways in which the information has assisted the boards.

Representations have again been made to the Ministry that the domiciliary consultation arrangements should be extended to cover visits by consultants in any specialty to babies born in private maternity homes.

The Ministry, while agreeing that the present arrangement (which permits visits by paediatricians only) is illogical, points out that there is no statutory authority to provide the services of consultants at private nursing-homes. For this reason it is unable to extend the present arrangements.

Domiciliary Consultations by Dental Consultants

66. Difficulty has been experienced by dentists in at least one region in obtaining the services of a dental consultant in the patient's home because of the board's ruling that domiciliary consultations may be arranged only at the request of a medical practitioner. Although the need for such a domiciliary consultation arises only infrequently, the services of a dental consultant in the patient's home are usually required in an emergency, when any delay—such as might be occasioned by the necessity to consult a general practitioner—might have serious results.

Domiciliary consultations are permissible only when the patient is unfit to attend hospital, and this normally involves a medical opinion. In order to meet the difficulty which has arisen the Joint Committee has suggested to the Ministry that in cases where the patient's unfitness to attend hospital arises from a dental condition the dentist should be allowed to arrange a domiciliary consultation directly with the dental consultant.

Filling of Part-time Consultant Vacancies

67. The Council has had before it the following resolution of the A.R.M., 1953:

That the Representative Body of the B.M.A. observes with concern that vacant part-time consultant appointments are not being advertised, and are filled by seconding existing whole-time consultants to them, and asks the Council to consider the propriety of such policy and its ultimate consequences.

The Council would strongly oppose any policy to transfer part-time consultant vacancies to whole-time consultant staff, and it is watching the position closely. Although there have been isolated instances where the duties of a vacant part-time post have been transferred to a whole-time consultant without the post being advertised, there is so far no evidence that this has been done in pursuance of a definite policy. Whole-time consultants, equally with their

part-time colleagues, are entitled to receive every help their employing authorities can give in finding them alternative employment under the "moral obligation" clause when they are threatened with a reduction of work as a result of a reorganization of hospital services. Moreover, when a part-time consultant is relinquishing one or two sessions it may not be practicable to offer the vacancy on a part-time basis. The Council considers, therefore, that each case must be considered on its merits.

Advertisement of Consultant Posts

68. The Council has considered the following resolution of the A.R.M., 1953:

That all advertisements for consultant posts should contain full details of the appointments and duties of the individual concerned, or that these details should be available in full at the time of the original application.

The Council has no reason to doubt that in most instances full details of advertised vacant consultant posts are in fact available to the candidate on application, even if not stated in the advertisement.

Welfare of Hospital Patients

69. The Central Committee is considering how the welfare of patients in hospital and the facilities for visitors might be improved, and how best the public might be given a better insight into the working of the hospitals. Attention is also being given to practical methods of bringing hospital medical staffs and general practitioners into closer touch in the treatment of patients.

Provision of Diagnostic Facilities

70. The Council has had before it the following resolution of the A.R.M., 1953:

That the Ministry of Health be urged to supply the means for pathological laboratories and radiological departments in hospitals to give direct service to general practitioners.

In this matter the policy of the Association is also the policy of the Ministry, which—in its report for the year ended December, 1952—states that these facilities are now available to general practitioners in more than four-fifths of hospital centres. During 1952 an additional 100 hospitals made their x-ray departments, and 40 hospitals their pathological laboratories, available to general practitioners.

Geriatric Units

71. The following resolution of the A.R.M., 1953, has been considered by the Council:

That this Meeting, realizing the pressing need for co-ordination of the various authorities caring for the aged, recommends the Minister to consider the establishment of geriatric units for that purpose, under the guidance of an experienced physician.

The problem of the care and treatment of the elderly and infirm was reviewed in a report by a special committee of the Association published in 1949, and some of the recommendations of that committee have already been put into effect.

The Council is, however, fully in sympathy with the view of the Representative Body that the question of co-ordination between the various authorities responsible for the care of the aged and chronic sick requires urgent consideration. Having regard to the clinical, social, and economic considerations involved, it believes that no piecemeal development is likely to be adequate to the needs of the situation. What is required is a closely integrated service for the treatment and rehabilitation of all chronically sick persons (including the elderly).

A joint subcommittee composed of representatives of the Central Consultants and Specialists, General Medical Services, and Public Health Committees has been appointed to study the problem. Assistance will be invited from practitioners with special experience in this field. The aim is to formulate practical recommendations which can be put into operation without delay.

Dependants of Services Personnel and Hospital Waiting-Lists

72. The Council is fully in sympathy with the spirit of the following resolution of the A.R.M., 1953:

That a recommendation (not a "directive") be issued by each regional hospital board to the effect that the dependants of Services personnel (and possibly of others) who are posted from area to area when on civil hospital waiting-lists (both in-patient and out-patient) be sympathetically reviewed on arrival in the new area, and the time already on a waiting-list be taken into consideration.

The Council considers that the matter is essentially one for local arrangement. The attention of the regional consultants and specialists committees has been drawn to the resolution so that they may press for its implementation so far as the circumstances of individual hospitals will permit.

Reports to General Practitioners on the Death or Discharge of Hospital Patients

73. The following resolution of the A.R.M., 1953, has been considered by the Council:

That the Ministry be pressed to instruct hospitals that on the day of discharge of a patient a preliminary note containing diagnosis and treatment be sent (a sealed note is not to be given to a patient) to a patient's doctor. This should be followed in the usual way by a complete report.

It is thought that this is a matter which can best be dealt with within the profession. Accordingly a letter has been sent to all hospital group medical committees emphasizing the importance of ensuring that general practitioners are promptly notified of the death or discharge of hospital patients, and urging that the committees should advise their hospital authorities to include this duty in the list of duties of all house officers and to draw the attention of new house officers to the obligation at the time of their appointment.

Regional consultants and specialists committees have also been asked to do all they can locally to see that general practitioners are given up-to-date information regarding their patients while in hospital, and from reports received it is apparent that in many areas appropriate steps are already being taken to deal with the matter.

Hospital Locums

74. Complaints have been received that practitioners employed as locums in the hospital service are not allowed any annual leave or sick leave. The attitude of the Ministry hitherto has been that locums should normally be engaged only for short periods in respect of which the granting of leave would be inappropriate. In practice, however, locums are sometimes employed for long periods, and the Staff Side of Committee "B" has suggested to the Management Side that practitioners employed as long-term locums should, at the discretion of the employing authority, be given two weeks' leave in every six months.

Whitley Appeals Machinery

75. In 1950 the General Whitley Council established an appeals machinery to deal with disputes between individual officers and their employing authorities on the application of nationally agreed terms and conditions of service which could not be resolved locally. In the past few years this machinery has proved itself to be a valuable safeguard for the officer who considered himself to be unfairly treated by his employing authority. Unfortunately, however, this right of appeal is now being denied to some members of hospital medical staffs who feel that they have a genuine grievance.

Under the terms and conditions of service certain matters are left to the discretion of hospital boards. For example, boards have a discretionary power to advance the starting salary of a consultant first appointed above the age of 32 on the ground of the age, special experience, and qualifications of the candidate. The starting salary may be advanced on the score of age alone where seniority has been lost because of service with H.M. Forces.

Caution has been exercised in sponsoring appeals on behalf of consultants aggrieved at the manner in which hospital boards have exercised this discretion, because of the risks of endangering the discretionary provisions in the terms of service, and of bringing the appeals machinery into disrepute. There have been cases, however, where the board has clearly been less than just to a newly appointed consultant of mature age and experience, and in at least one region there is evidence to suggest that the discretion is seldom if ever used. There is also the problem of the S.H.M.O.'s who as a result of the last review were upgraded to consultant status. So far as is known, these practitioners when occupying consultant posts have all been placed at the minimum of the consultant salary scale, despite the fact that many of them have been carrying out the same duties for very many years. They have particular justification for their sense of grievance, because the Ministry has advised their employing authorities that it did not consider it appropriate that the discretion should be exercised in their favour.

After a careful examination of the circumstances of a number of cases it was decided to lodge appeals on behalf of certain of these practitioners. Unfortunately, however, the Management Side of Committee "B" has refused to agree that these appeals should be heard, and in the absence of a unilateral right of arbitration there is nothing further that can be done to help these members of the profession except to press further that the competence of such appeals shall be acknowledged.

Appointment of Medical Members of Regional Hospital Boards

76. Regional consultants and specialists committees, local medical committees, and Divisions and Branches of the Association have been invited to recommend practitioners to be nominated by the Council for consideration by the Minister in filling vacancies arising on regional boards in March, 1954, when the term of office of one-third of the members expires.

In the past it has normally been the practice to recommend names equal in number to the vacancies due to the retirement of medical members. It appears, however, that on occasion this might lead to a nomination being rejected by the Minister solely because of the desirability of preserving the balance in the representation of different localities on the board: in other words, because the practitioner nominated came from the wrong area.

In future, therefore, it is proposed to send to the Minister more names than there are vacancies in the hope that this will assist in securing the appointment of a greater number of practitioners chosen by their colleagues.

The Council has noted the following resolution of the A.R.M., 1953:

That this Meeting feels that general practitioners are not sufficiently represented on hospital management committees, and asks that the Council will approach the Minister and urge that there should be representation of general practitioners on all hospital management committees.

The Council is dissatisfied with the present representation not only of general practitioners but also of hospital medical staffs, and is adhering to its policy that hospital management committees should include an adequate proportion of medical members democratically elected by the profession. This policy will be pursued in discussions with the Ministry as the opportunity arises.

Mental Health Officers

77. Members of hospital medical staffs who devote the whole or substantially the whole of their time to the treatment or care of mental patients are classified as "mental health officers." Under the terms and conditions of service their normal retiring age is 60, as compared with 65 in the case of hospital medical staff in other specialties, but to offset this earlier retiring age mental health officers enjoy special superannuation benefits.

This position has given rise to a number of anomalies. The designation "mental health officer" appears to have been applied in an entirely arbitrary manner by different boards, with the result that where two consultant psychiatrists are engaged in exactly similar duties one may be classified as a mental health officer but not the other. Furthermore, some of the older mental health officers have insufficient superannuable service to their credit to benefit by the special superannuation provisions, and they will suffer hardship if obliged to retire at the age of 60.

These problems are now being considered by the Joint Committee in consultation with the professional bodies representing psychiatrists.

Disclosure of Information Regarding Tuberculous Patients to the Ministry of Labour and National Service

78. A protest has been made to the Ministry regarding the instructions given to hospital management committees to send to local offices of the Ministry of Labour particulars from chest clinic records of men liable for National Service who have a history of tuberculosis. It was urged upon the Ministry that the prior consent of the patient should be obtained to the disclosure of this information.

The Ministry was unable to accept this advice, on the ground that the disclosure was in the public interest, and that there were practical difficulties in the way of obtaining prior consent to the disclosure. At the same time the Ministry gave an assurance that the information would be used only for the purpose for which it was sought. The Council is not satisfied with the position, and is pursuing the matter further.

Fees for Part-time Services for Government Departments

79. Representations are being made to the Treasury for an improvement in the fees paid by Government departments for part-time services undertaken by consultant members of the profession.

Royal Commission on Mental Illness

80. The Royal Commission recently appointed to consider the existing law and administration machinery governing the certification, detention, etc., of persons suffering from mental illness or defect has been invited to give the Association an opportunity of submitting evidence. A statement of evidence is now being prepared.

Study Leave

81. It appears that there is considerable variation in the policies of different hospital boards in dealing with applications from medical staff for study leave. The matter is now being considered in the light of the study leave provisions in the terms and conditions of service and the advice given by the Ministry on their application, with a view to securing a uniform standard of treatment throughout the country.

REFORM OF THE NATIONAL HEALTH SERVICE

Goodwill

82. The A.R.M. in 1953 passed the following resolution:

176. Resolved: That, the Amending Acts Committee having recommended the restoration of the right to sell goodwill, this Representative Meeting instructs the Council of the Association to produce a scheme for the return of goodwill and to report to the Representative Body in 1954.

The Meeting agreed that this decision was to be interpreted as an instruction to the Council to prepare a scheme for consideration by the Representative Body and was not intended as a determination of policy.

The Council has given preliminary consideration to a draft scheme prepared by the Amending Acts Committee, and has asked for further information on a number of points. Full details of the scheme, together with a statement on its advantages and disadvantages, will be submitted to the Representative Body as part of the Supplementary Report of Council.

ARBITRATION MACHINERY

83. The Council has been actively engaged in seeking ways and means of giving effect to the instructions of the A.R.M., 1953, relating to the establishment of a Whitley Court of Arbitration to which there should be a right of appeal by unilateral reference. The Council learnt with regret that the Minister of Health and the Secretary of State for Scotland had declined to receive representatives of the Staff Side of the General Whitley Council to discuss the important matter of arbitration, on which no agreement had been reached with the Management Side at the meeting of the General Whitley Council in July, 1953. When the Council became aware that the constitution of the recently established Police Council provided for arbitration, the Staff Side of the Medical Whitley Council was requested to raise the whole question again through the Staff Side of the General Whitley Council. This was done and in October, 1953, the Management Side of the General Whitley Council agreed to reconsider the matter. On January 25, 1954, the Management Side stated that it was unable to agree that there should be arbitration machinery for the Health Service which would provide an unrestricted right to refer disputes to arbitration.

This whole question is receiving urgent consideration by the Council and a statement on further developments will be made in the Supplementary Report.

OCCUPATIONAL HEALTH

Future of Occupational Health Services

84. As a result of discussions with the Ministry of Labour and National Service regarding action being taken to implement the recommendations of the Dale Report on Industrial Health Services, a Memorandum on "The Future of Occupational Health Services" has been prepared and submitted to the Ministry of Labour and National Service, the Ministry of Health and the Trades Union Congress. This Memorandum, which is set out in Appendix III, amplifies the policy of the Association in regard to a Comprehensive Occupational Health Service, as laid down by the Representative Body in 1949. In the course of its preparation, consideration has been given to the Report of the Dale Committee, published in 1951, to which the Association gave evidence. Informal discussions on the Memorandum have already taken place with the Ministry of Labour, and discussions with the Ministry of Health and, ultimately, with the Trades Union Congress, through the Joint B.M.A. and T.U.C. Committee, are being arranged.

Reports on surveys made during the past year in the following areas, to ascertain future requirements for Occupational Health Services in different types of areas, are now being studied in detail: (1) Govan Ward of Glasgow; (2) Southampton Dock area; (3) five different types of factory in the Unilever Organization; (4) Abbey Ward of Reading; (5) Borough of Tottenham; (6) Rural areas in Cheshire.

The Council wishes to take this opportunity of expressing its appreciation to all those who assisted with these surveys.

Medical Standards for Road, Rail, and Air Transport

85. In consequence of a request from the Ministry of Transport for the views of the Association on the advisability of employing diabetic bus drivers, a special sub-committee was set up to investigate the whole question of medical standards for road, rail, and air transport. The Memorandum subsequently prepared, which is set out in Appendix IV, has been submitted to the Ministry of Transport. Arrangements are being made to discuss with the Ministry the implementation of the recommendations contained in the report.

Duties of, and Ethical Rules for, Industrial Medical Officers

86. Consideration has been given to the decision of the Representative Body in 1953 confirming the Duties of, and Ethical Rules for, Industrial Medical Officers, as approved

by it in 1949, and urging that these Rules be brought specifically to the notice of all industrial medical officers, whether members of the Association or not. It has not been found practicable to give full implementation to this decision, as information is not available regarding part-time industrial medical officers. The Council accordingly decided to insert a notice in the *British Medical Journal* (B.M.J. Supplement, November 21, 1953, p. 205) drawing the attention of both whole-time and part-time industrial medical officers to the existence of the Rules and informing them that copies were available on request for any medical officer unfamiliar with them.

National Insurance (Industrial Injuries) Act

87. An invitation was received from the Ministry of National Insurance for the Association to present evidence to a committee appointed "to review the present provisions of the Industrial Injuries Act, whereby benefit is paid for the personal injuries not caused by accidents." A Memorandum of Evidence, set out in Appendix V, has now been prepared and submitted to the Ministry. The Council has also appointed representatives to give oral evidence to the Departmental Committee.

PUBLIC HEALTH

Salaries in the Public Health Service

88. The Industrial Court awards relating to public health medical officers have been implemented by almost all authorities throughout the country. In two instances employing authorities have refused to accept the rulings of Regional Appeals Committees, and the possibility of obtaining agreement to refer these disputes for settlement by arbitration before the Industrial Court is being considered. The recent award for assistant medical officers has been put into operation by all local health authorities.

A dispute, in which the Association has been actively involved, regarding the remuneration of divisional medical officers in a county in Northern Ireland is understood to be on the point of settlement.

The provisions of Ministry of Health circular 3/53, relating to the joint use of medical staff by hospital authorities and local authorities, have been extended to cover medical officers giving services to county districts and regional hospital boards, and implementation of the agreement is almost complete.

It has been agreed by Committee "C" of the Medical Whitley Council that part-time public health medical officers who are paid an annual salary related to full-time pay should receive the appropriate annual increment.

Car and Subsistence Allowances

89. The recommendations of Committee "C" of the Medical Whitley Council, promulgated in August, 1953, relating to revised car allowances in England and Wales, are being applied by the great majority of employing authorities. All local authorities in Scotland have recently been recommended by Committee "C" to pay allowances at the same rate as those applicable in England and Wales. This is an interim arrangement pending an agreement on this matter in the Joint Negotiating Committee for Chief Officers of Local Authorities (Scotland).

Subsistence allowances agreed in Committee "C" for England and Wales are being paid by all local authorities, and in Scotland an interim arrangement similar to that mentioned above has been recommended by Committee "C" to all Scottish local authorities.

Appeals Machinery

90. The Whitley Appeals Machinery continues to be invoked on behalf of medical officers in the public health service in those cases in which the matter in dispute appears to justify such action. A current appeal involving a county medical officer of health is based on a claim for increased remuneration in view of additional responsibilities under-

taken since his employing authority originally determined the salary scale under the award of the Industrial Court. A further appeal relates to the failure of a borough council to implement in full the agreed conditions of service for medical officers of health.

As a result of representations made to the Northern Ireland Ministry of Health and Local Government, the question of establishing appeals machinery for the Health Service in Northern Ireland is now under active consideration.

Superannuation

91. Careful consideration has been given to the draft Local Government Superannuation (Benefits) Regulations, 1953, which have been introduced with the object of securing benefits substantially the same as those under the N.H.S. superannuation regulations. In the Council's opinion these represent an appreciable advance on the benefits granted under the Local Government Superannuation Act, 1937. Successful representations have been made to the Ministry of Housing and Local Government regarding the extension to medical officers of the provision for "added years."

Infectious Diseases

92. The Council has considered Minute 86 of the A.R.M., 1953, and has received from the Ministry of Health an assurance that the Minister fully appreciates the need to achieve a high level of infant vaccination. All local health authorities take steps to ensure that infant vaccination is publicized and made readily available in their areas. The Council is satisfied that local health authorities are giving adequate publicity to the arrangements whereby infant vaccination can be obtained through the family doctor or the local health authority clinic. A circular letter has been addressed to the honorary secretaries of Branches and Divisions in England and Wales stressing the part which individual doctors should play in impressing upon parents the importance of infant vaccination.

The difficulties in following up cases of venereal disease and in the tracing of contacts have been under discussion, and steps are being taken to convene a conference of representatives of the interested committees of the Association, the Society of Medical Officers of Health, and the Medical Society for the Study of V.D.

Tuberculosis

93. The occupational resettlement of tuberculous persons has continued to receive the close attention of the Council. The views of the Association on this matter were made known to the Ministry of Health last year, and a memorandum on the prevention of tuberculosis has now been prepared by the Standing Tuberculosis Advisory Committee of the Central Health Services Council. The Council desires to express its appreciation of an opportunity given for comment on the draft of the memorandum.

Health Visitors

94. Full consideration has been given to Minute 95 of the A.R.M., 1953, regarding ways whereby the help given by health visitors to general practitioners may be increased. The Council has drawn up a statement (see Appendix VI) embodying principles and suggestions which, if put into force, should prove an effective means of securing co-operation between general practitioners and health visitors in all areas. It is gratifying to note that the council of the Society of Medical Officers of Health has approved the statement. Full publicity to this matter has been given in the *British Medical Journal*, and a communication has been issued to the honorary secretaries of Divisions and Branches, secretaries of local medical committees, and medical officers of health of local health authorities.

The Council is preparing evidence for submission to the Working Party appointed by the Ministers of Health and Education and the Secretary of State for Scotland "to advise on the proper field of work and the recruitment and training

of health visitors in the N.H.S. and the school health service." Reference will be made to this matter in the Council's supplementary report.

District Nurses

95. The Council is preparing evidence for submission to the Working Party which has been appointed by the Minister of Health and the Secretary of State for Scotland "to consider what training it is desirable that registered nurses and enrolled assistant nurses, respectively, should undertake prior to their employment on home nursing duties, and the means by which such training should be provided."

School Health Service Regulations

96. The new School Health Service and Handicapped Pupils Regulations, 1953, which came into force on August 4, 1953, incorporate a number of suggestions put forward by the Council.

Definition of "Public Health Service Member"

97. The Council has reviewed the definition in the By-laws of the term "Public Health Service Member" which was approved by the A.R.M. in 1953, and, after consultations with the Society of Medical Officers of Health, has come to the conclusion that no further amendment is necessary.

Liaison with other Branches of the Profession

98. The Liaison Committee which had originally been appointed for the discussion of matters of common interest to consultants and general practitioners has now been extended to include representatives of the Public Health Committee.

MEDICAL ETHICS

Professional Secrecy

99. Advice is frequently sought by members on questions relating to professional secrecy. The Council has considered the procedure which should be followed when the police ask to search the records of an antenatal clinic in connexion with the finding of the body of a newborn child. In the opinion of the Council, such information should not be disclosed at the request of the police in order to assist them in carrying out their investigations.

Ethical Inquiries

100. A number of inquiries into complaints regarding professional conduct have been investigated both locally and centrally. It is the constant endeavour of the ethical committees to effect reconciliation wherever a breach has occurred between neighbouring practitioners, and, although this is not always practicable, the Association's ethical machinery provides a valuable means of ventilating grievances.

The great majority of Divisions and Branches have now adopted the revised Ethical Rules. The Council is anxious that all units of the Association should adopt these rules so that there may be effective machinery throughout the country for the local investigation of complaints.

Medical Practitioners and Publicity

101. The Association's policy on the observance of anonymity by medical practitioners taking part in sound and visual broadcast programmes is brought to the notice of all members who seek advice on this matter. The Council has continued to examine the question of undesirable publicity which is sometimes given in the press to medical practitioners.

Psychiatrists

102. Patients sometimes approach psychiatrists without the knowledge of their general practitioner. This may at times cause undesirable results, such as dual prescribing of seda-

tives. The right of the patient to consult the practitioner of his choice is accepted, but it is desirable that every effort should be made to encourage a patient to agree to the psychiatrist communicating with the family doctor.

General-practitioner Obstetricians

103. If a patient is introduced by her own doctor to a "general-practitioner obstetrician" it would, in the opinion of the Council, be unethical for the latter subsequently to accept that patient on his list without the consent of his colleague. The acceptance of the patient by the general-practitioner obstetrician would not be unethical if he had been approached spontaneously by the patient for obstetric services.

Issuing of Circulars

104. The Council considers that an ophthalmic medical practitioner should not issue change of address notices to private or N.H.S. ophthalmic patients, although it would be in order for him to inform those practitioners who had been accustomed to send patients to him in the past.

It is considered undesirable that a general practitioner should provide those persons wishing to change to his N.H.S. list with a ready typed letter for signature, addressed to the local executive council.

PRIVATE PRACTICE

Bonus Shift Certificates

105. Further discussions have been held with representatives of the National Coal Board in accordance with the following resolution of the A.R.M., 1953:

That the Representative Body disapproves of the issuing of bonus shift certificates to a miner, unless he has been actually attended by the doctor during his illness, and that the Council be asked to consider reopening the question with the National Coal Board.

The Board has stated that it does not regard an "ipse dixit" certificate as a medical certificate and that it has discussed these difficulties with the National Union of Mineworkers. Both the Union and the Board are concerned that only cases of genuine sickness should be eligible for proportionate bonus under the five-day week agreement. By agreement with the Union, the National Coal Board has informed its divisions that if a man who is sick sees or calls in a doctor the following day and is still sick, a proper medical certificate covering the whole period of sickness would not be challenged. In the Board's view, however, it is essential, if abuse of the new provisions is to be avoided, that medical certificates should be issued only where a doctor has actually examined the patient at the time of sickness, and should state the nature of the incapacity which renders the man incapable of following his employment. A copy of the Board's statement appeared in the *Supplement* to the *British Medical Journal* of December 19, 1953.

Life Assurance—Fee for Ordinary Form

106. The A.R.M., 1953, resolved (Minute 267) that the fee for the ordinary form of medical report for life assurance should be increased from £1 11s. 6d. to £2 2s.

In the course of discussions with the Life Offices' Association, the Council was informed that insurance companies are agreed that £1 11s. 6d. is an adequate fee. In support of this contention, it was stated that companies have little evidence that doctors are dissatisfied with the present fee; in fact, the contrary appeared to be the case. The attention of members was drawn to this statement through the *Supplement* to the *British Medical Journal* in the hope that this would stimulate correspondence, but no evidence was forthcoming that an increase in the fee was justified and the Council has decided not to press for an increase at this juncture. However, in order to save the medical examiner's time the Life Offices' Association has been asked to ensure that proposers have ready the informa-

tion they will be required to give on their previous medical history and that of close relatives. Representations have also been made that a higher fee should be paid if the doctor is required to undertake the examination at the home of the proposer.

Life Assurance—Attendance Reports

107. It has previously been the view of the Council that the use of attendance reports (reports without medical examination) should be discouraged and that to attempt to agree with the Life Offices' Association on the fee to be paid would appear to give official approval to the practice of asking for these reports. At present, therefore, the fee is a matter for arrangement between the practitioner and the assurance company concerned. The Council has reason to believe that the use of attendance reports is increasing, and is now of the opinion that the minimum fee for these reports should be £1 1s. Representations have been made to the Life Offices' Association.

Duration Certificates

108. The following motion was referred to the Council by the A.R.M., 1953:

That a practitioner should never comply with a request to issue a "Duration Certificate"—that is, a medical report about the previous health and medical history of a person who has died shortly after having been accepted for life assurance (without prior medical examination). Such a certificate could jeopardize but could never be essential to establish the claim to the assurance.

This matter has been discussed with the Life Offices' Association. It is clear that many life assurance policies which are entered into without prior medical examination do contain a clause which gives the company the right to demand a duration certificate before the sum assured is paid. The representatives of the Life Offices' Association stated that the main concern of its members in asking for a duration certificate is to ensure that payment is not made in cases where relevant information relating to the health of the life assured has been deliberately withheld. It is only in cases where there has been attempted fraud that payment is refused and a return of premiums made.

The Council is satisfied that there are *bona fide* cases where a doctor may give information after the death of the patient, subject to the consent of the nearest competent relative, and, in its view, there is no reason to depart from the policy of the Association as laid down in the following resolution of the A.R.M., 1937, which was reaffirmed by the A.R.M. in 1949:

That the Representative Body is of the opinion that where any medical certificate is required by an insurance company in the case of a deceased person not previously examined for life insurance such certificate should be obtained direct from the medical practitioner of the deceased; that it should not be furnished without the previous consent of the nearest available competent relative; and that a fee should be paid by the insurance companies for any such certificate.

Also relevant to this issue is the fact that doctors who refuse to give a duration certificate at the request of the insurance company may be subpoenaed to appear before the Insurance Commissioners.

Life Assurance: Disclosure of Medical Information

109. The form to be used by the proposer for giving consent to the disclosure of medical information, which was approved by the Council for use in connexion with life assurance, has been adopted by all Life Offices which may require such information prior to the issue of a policy. The use of the new form of consent is not yet universal as there are still stocks of old forms in use. Until old stocks are exhausted the Life Offices have suggested that if a doctor is in any doubt whether adequate consent has been given he may approach the office concerned, or its local representative, or inquire from the patient direct. The Life Offices are not prepared to notify the doctor in each

case of the form in which consent has been given, and the Council has decided not to press the matter further at this stage.

Encouragement of Private Practice

110. The Council is agreed that, although there will always be a proportion of the public who will prefer to make private arrangements for medical treatment, there is a danger that the field of private practice may be materially reduced; that the continuation of private practice, which offers the public an alternative to the National Health Service, should be regarded as a form of insurance against a fully salaried service; and that, as the maintenance of private practice is Association policy, every means possible should be used to encourage private practice. To this end various methods, including the following, have been considered: (a) that patients should be allowed to opt out of the general medical services provided under the National Health Service; (b) that there should be a grant-in-aid to a person who elects to be treated in a private nursing-home instead of in a hospital; (c) that practitioners should be allowed to prescribe for private patients on Form E.C.10.

After the advice of an actuary had been sought, the Council came reluctantly to the conclusion that to allow patients to opt out was not practicable at the present time, and that, until there is an adequate number of hospital beds to ensure that admission to hospital can always be arranged without undue delay, the provision of grants-in-aid could only result in increased Government expenditure.

In the circumstances, it was decided not to take action in these matters at present. The Council, however, is in agreement with Minutes 210 and 211 of the A.R.M., 1953, concerning the prescribing of medicines for private patients on Form E.C.10, and representations are being made to the Ministry of Health on this question. The Council has also published in the *British Medical Journal* a statement of the benefits to which patients remain entitled under both the National Health Service and National Insurance when they elect to be treated by a private practitioner.

The Unattended Telephone

111. The A.R.M., 1953, resolved (Minute 266) that even stronger pressure be brought to bear on the General Post Office in order that a satisfactory solution may speedily be found for the problem of the unattended telephone. It is clear from further discussions held with the G.P.O. that the Post Office authorities are as anxious as the Association to secure an early solution of the problems of the unattended telephone, but Treasury restrictions on capital expenditure, and difficulties in the supply of labour and the special equipment required, make it impossible for all exchanges to be provided with adequate facilities for the frequent transfer of calls to an alternative number, although in some areas these facilities already exist. The Council is satisfied that the G.P.O. is alive to the problem and that it will do all it can to help in individual cases. The G.P.O. is also prepared to assist in the provision of special lines and equipment where local arrangements are made for calls to be handled by answering bureaux such as those operating in Glasgow and Carlisle, whether they are organized on a commercial basis or on a private co-operative basis amongst a number of practitioners.

A memorandum produced jointly with the G.P.O. was published in the *Supplement to the British Medical Journal* of January 16, 1954. This advised doctors with individual telephone problems to discuss them with the local telephone manager, who would be ready to give advice on the best method of meeting the problem in the light of local circumstances. If there were any difficulties which could not be resolved in that way, doctors were advised to bring them to the notice of B.M.A. Headquarters, which would seek the co-operation of the G.P.O. to find an acceptable solution wherever possible. Copies of the memorandum have been sent by the Post Office authorities to all telephone managers.

Car Badges

112. In 1950 three types of car badges were ordered: the bumper pattern, the radiator pattern, and the plastic badge with suction pad for attaching to the windscreen. The greatest demand has been for badges of the bumper pattern, and it has been necessary to order a further supply. Previously the bumper pattern was cast in two plates, and in some cases these separated in the course of normal wear and tear. In order to rectify this defect the badge is now cast in one piece.

Mortuary Accommodation

113. Further discussions have taken place with the Ministry of Housing and Local Government with a view to the implementation of the recommendations on mortuary accommodation contained in the 1949 Report by Council on the working of the Coroners Acts. At the request of the Ministry, medical officers of local health authorities were asked to complete a questionnaire relating to the mortuary accommodation available in the area of each authority. At a later date the Ministry hopes to be able to advise local authorities on the lay-out and siting of mortuary accommodation.

Friendly Societies—Medical Certificates

114. The Council has considered a request from the National Union of Holloway Friendly Societies that practitioners be recommended not to charge for medical certificates given to women and juvenile members of Friendly Societies who are not entitled to certificates under the National Insurance Act. The Union has been informed that the Council is unable to agree to this.

Form N.S.175

115. The Ministry of Labour and National Service has agreed to the payment of a fee of 5s. for Form N.S.175. This form is sent to the family doctor of a person examined by a Medical Board when information relating to previous medical history is required. Previously no fee was payable.

Coroners Bill

116. The Council has welcomed the Private Member's Bill which seeks to amend the Coroners (Amendment) Act, 1926, so that the fees and allowances payable to witnesses at coroners' courts and to medical practitioners making post-mortem examinations on the direction, or at the request, of the coroner will be set out in rules which may be made by the Secretary of State. As the power of the Secretary of State to make rules is not mandatory, the Council is seeking an assurance that rules will be made if the Coroners Bill receives Royal Assent. If this assurance is not forthcoming, then it may be necessary to press for an amendment to the Bill during the Committee stage so that the fees and allowances shall be so prescribed.

Hire Purchase: Doctors' Cars

117. The Council has continued to give its support, in appropriate cases, to applications made to the Board of Trade for licences under the Hire Purchase Control Order whereby the purchase price of a car may be repaid over an extended period of three years. The conditions laid down by the Board remain unchanged, and the concession applies only where the doctor is able to show that relief from the standard maximum period of 18 months is necessary on financial grounds and that there is a professional need, in the interest of service to the public, for a reliable car. The licences issued to practitioners who have applied through the Association over the past two years number 286.

"BRITISH MEDICAL JOURNAL"

118. During the past year there have been no startling developments in the work of the *British Medical Journal* to report. The steadying of the price of paper since its

astronomical increase in 1951 has made for greater financial stability in relation to the *Journal* and the 14 specialist periodicals the Association publishes. Although conditions have been much easier the strictest economy has been observed in production, and the size of the *B.M.J.* has been maintained within the limits imposed by Council in 1952. The number of papers submitted for publication in the *Journal* continues at a very high level, and what is published inevitably reflects the growing complexity of modern medicine and the more exact methods of measuring and recording results it is now possible to use. Medicine and medicine's changing face look less attractive to the older medical men than to those more recently qualified, and some of the former complain that, as expressed in the columns of the *Journal*, medicine has become too high-brow.

The *Journal* has a growing circulation in other countries and its income from non-members' subscriptions has steadily risen over the past few years. The successful results of the sale in book form of collections of articles that have appeared in the *Refresher Course* and "Any Questions?" sections of the *Journal* show that these are widely appreciated by readers who want practical information which can be applied in the day-to-day work of medicine.

The special journals, which now cover a wide range of subjects, maintain a high standard of content and presentation and enhance the prestige of British medicine in this country and abroad. A few years ago their high cost to the Association caused the Journal Committee much concern, and it is satisfactory to record that they are much less a burden on the Association's finances than in recent years. The Association publishes these journals and *Abstracts of World Medicine* to fulfil its first object—namely, "to promote the medical and allied sciences, and to maintain the honour and interests of the medical profession." *Abstracts of World Medicine* has a steady core of readers who find that more than any other publication it succeeds in providing succinct information of current progress in medicine in all subjects in different parts of the world.

"FAMILY DOCTOR"

119. In the Report of Council last year it was stated that the aim for 1953 was to conduct the affairs of *Family Doctor* "at no cost to the general funds of the Association." This aim has almost been achieved. The final figures for *Family Doctor* show a variation from the precise "break even" point corresponding to approximately 1% of the total financial turnover.

This financial result is the more satisfactory in the sense that, following criticisms made at the Annual Representative Meeting last year, steps were taken promptly to exclude a number of advertisements which had previously been regarded as acceptable.

For the first three issues of 1954, the advertisement revenue has been increased by £6,000, a figure which is only £1,500 less than the total increase in advertisement revenue achieved in the whole of 1953. So, on trading for the first quarter of the year, despite the fact that there has been a large expenditure on promotion at the *Daily Mail* Ideal Homes Exhibition in March, *Family Doctor* has been conducted at no cost to the general funds of the Association.

Over the past year the position of *Family Doctor* has been consolidated in a number of ways. The magazine is now being sold at over 800 local authority clinics. In the coming year it is hoped to expand this method of distribution and the special distribution in the London and Home Counties area which is operated through a small fleet of vans.

For the first time a number of *Family Doctor* pamphlets have been produced and have been well received. These pamphlets are available at 3d. and 6d. and are distributed to individual readers and in bulk quantities to the profession, and particularly to medical officers of health. Among

the most popular pamphlets are those on the "Rh Factor," "Feeding Your Family," "Having a Baby," "Infectious Diseases," and "Feeding in the First Two Years."

Articles in *Family Doctor* are widely quoted in the national press in this country, and many individual articles have been reproduced in newspapers and periodicals all over the world.

The existence of *Family Doctor* has already exerted a considerable influence upon the lay press in this country. For example, the appearance of an article about the value of crash helmets by the late Sir Hugh Cairns was promptly followed by a national newspaper campaign along the same lines. The decision of the tobacco manufacturers to make available the sum of £250,000 to aid research on lung cancer followed a clear proposal along these lines first put forward in *Family Doctor* in an article entitled "Is Smoking Harmful?—The Facts." Other articles in *Family Doctor* taking a critical view of the fish lens protein treatment for cataract, nature cure methods, and the Bates method have attracted a great deal of attention.

There is now a regular income from the sale abroad of the reproduction rights of *Family Doctor* articles, and these articles have frequently been quoted by the B.B.C. Overseas Service.

Three comments on *Family Doctor* from widely different sources may be quoted. A national advertiser wrote about the many thousands of applications for catalogues for his product received as a result of a recent advertisement in *Family Doctor*. His letter concluded:

"The total number of applications received up to date is a far greater number than we have ever had from any one previous advertisement in any other national magazine or newspaper."

A well-known Member of Parliament wrote to the Editor recently:

"*Family Doctor* is very popular with my family, which happens to include five doctors. I find it of great interest and read it right through. I think it should be in every home and is much more valuable than many women's magazines so prolific these days. . . ."

The editorial director of a publishing house of the highest repute, and one responsible for many standard educational books, also commented recently in these terms:

"*Family Doctor* holds a unique place in periodical literature, being the first serious enterprise aimed at the education of the laity in matters of health through the guidance of most-authoritative instructors who proceed along absolutely ethical lines—a most courageous design to meet a crying need."

Over the past year the influence exerted by *Family Doctor* has continued to grow, and the financial position of the magazine has greatly improved.

For the year 1954, the *Family Doctor* Committee hopes to increase the distribution and effective influence of *Family Doctor*, which is now recognized as one of the most important media of health education in the English-speaking world. Again, the intention is to do this at no cost to the general funds of the Association.

FINANCE

(As the auditing of the Association's accounts has not yet been completed, the Annual Financial Statement will be published in the Council's Supplementary Report.)

120. A close watch has been exercised on the level of income and expenditure throughout the year and the budgets of all the "spending" departments and committees have been subjected to the closest scrutiny by the Finance Committee and the Financial Advisory Committee. With this method of financial control the Council has endeavoured to achieve early redemption of the indebtedness resulting from the losses of earlier years. Whilst the accounts prepared for the past year show that the measures taken have met with a marked degree of success, it is evident that they must be continued if a complete stabilization of the Association's finances is to be achieved.

Income

121. As from January 1, 1953, higher rates of subscription were introduced for certain classes of members and it was anticipated that a substantial increase in the revenue from this source would follow. The Council is glad to report that this additional revenue has been realized without any material loss in membership and acknowledges the co-operation of all the members affected by the new rates.

Of this additional income the sum available for the clearing of the Association's indebtedness is considerably in excess of the proportion referred to by the Annual Representative Meeting at Dublin, which approved the raising of the annual subscription on the understanding that at least one-half of the moneys brought in by this increase was applied to debt redemption.

Expenditure

122. The budget for 1953 made provision for a total expenditure under all the headings, with the exclusion of the publications account, of £256,000. It is satisfactory to note, therefore, that the total expenditure of the "spending" committees concerned was only slightly in excess of £250,000.

As regards the cost of Representative, Council, and Committee Meetings the savings on estimates was £2,400. The number of meetings held has been reduced to a minimum and every economy has been exercised in the production of committee documents. The Council gratefully acknowledges the help given by the Trustees of the National Insurance Defence Trust, which has continued to bear all but £1,000 of the cost of the General Medical Services Committee.

Expenditure on the Medical Practices Advisory Bureau did not exceed the level anticipated in the budget, although there has been a marked increase in the numbers making use of the services of the Bureau, which are available to both members and non-members.

The Empire Medical Advisory Bureau and the International Medical Visitors' Bureau, too, have limited expenditure to the reduced budget accepted by the Committee of Management.

An improvement on estimates of over £2,000 was effected in the case of financial charges, as the cost of operating the bank overdraft was considerably less than had been anticipated.

Publications Account

123. With the emphasis upon economy the committees responsible for the management of the Association's publications have followed a cautious policy in regard to the size and make-up of the various journals. The price of paper has been steady throughout the year, and it has been possible to control the cost of production of the journals within the limits imposed by the budget.

During the year the Council authorized additional expenditure, not provided in the original estimates, for the publication of the Report of the General Practice Review Committee. Nevertheless the final accounts of the publications show an improvement on the budget expectations.

With regard to *Family Doctor*, the Council is well satisfied with the financial position at the close of the year.

Trust Funds and Medical Charities

124. By the close of the year there was an improvement in the market value of the investments held by the Trust Funds and their financial position can be regarded as satisfactory. In the case of the prize funds the income has been sufficient to meet the cost of the normal awards.

There was a slight falling off in the subscriptions and donations to the medical charities, although increased bequests were received. The total amounts distributed to the benevolent funds in the year again exceeded £10,000.

Revenue Budget for Twelve Months ending December 31, 1954

125. Based on estimates submitted by the "spending" committees and departments, the Council has approved a master budget setting out the anticipated income and expenditure for the 12 months ending December 31, 1954.

It is estimated that the income from membership subscriptions, rents, and investments, together with the surplus on publications, will total £317,971.

Out of this sum it will be necessary to make provision for expenditure under the various budgets for general expenses, salaries and wages, establishment costs, etc., amounting in all to £272,662.

After setting aside a reserve of £5,000 for contingencies, it is anticipated that the net surplus for the year will reach £40,309, which the Council is earmarking for debt redemption.

Membership Subscription of Members Assessed for Income Tax under Schedule E

126. The Council has considered the following motion referred to it by the A.R.M., 1953 (Minute 52):

That the membership subscription be modified for members who are assessed under Schedule E so that the net cost of membership may be equitable throughout the profession.

The various factors taken into account in assessing medical practitioners for income tax under Schedule E are such that without an inquiry into the financial circumstances of each practitioner it would be quite impossible to arrive at any modified form of subscription which would be equitable.

In the view of the Council the administrative difficulties and the anomalies involved are such as to make the proposal unworkable.

Subscription Payable by Whole-time Salaried Members in Receipt of Income up to £1,500 Per Annum

127. The Council has also considered the following motion referred to it in Minute 53 of the A.R.M., 1953:

That this Meeting considers that the reduced subscription of four guineas should be granted to all whole-time salaried members of the Association.

In its view there is no justification for extending the reduced subscription as suggested. The Council has, however, reviewed the equity of the present income limit of £1,500 which governs the four guineas subscription. This has proved satisfactory in the light of experience and the Council believes that any attempt to vary it would create considerable anomalies.

By-law 16 gives the Council authority to decide in cases of doubt whether a member comes within the four guineas subscription group. Acting under this authority, the Council has granted "marginal relief," up to a maximum of £100, in a small number of cases where, by reason of a small increment, a member paying the £4 4s. rate has slightly exceeded the £1,500 limit, though continuing to do the same work.

BUILDING

128. Throughout the past year it has been the policy of the Council to limit expenditure on maintenance and repairs to work considered essential for the preservation of the various parts of the building. It is recognized, however, that a considerable amount of work must be undertaken if the interior and exterior of the building are to be maintained in a good state of repair. The Council has approved in principle a maintenance programme which will ensure that all parts of the structure are covered in rotation within a limited number of years.

Approval has also been given to the interior reconstruction of the Scottish Office in Edinburgh, the plans of which were originally formulated in 1951. The Council has now approved a building programme for the carrying out of these alterations in phases, the first of which is expected to be started in July next. In this way the capital cost will be spread over a period of three years.

After considerable delay, through circumstances beyond the control of the Council, negotiations with the Bedford Office in regard to the acquisition of the Burton Street site have been resumed on the basis of the terms originally proposed in 1952. It will now be necessary for the Association to enter into a contract to develop the site in accordance with plans for which permission under the Town and Country Planning Act must be sought.

From a provisional survey of the site the architect has estimated that a building can be erected which will provide over 23,000 square feet of floor area, which will be approachable from the existing building. It will also be possible to add to and improve the facilities available to members for garaging and servicing their cars.

Although the Association continues to receive a substantial income in rents paid by the medical and other professional organizations occupying accommodation in Tavistock House North and South, it is apparent to the Council that it may be necessary to study the needs of the various departments of the Association before renewing the present tenant leases as and when they expire.

SCIENCE

Association Prizes

Sir Charles Hastings and Charles Oliver Hawthorne Clinical Prizes, 1954

129. The Sir Charles Hastings Clinical Prize, established to stimulate observation, research, and record in general practice, has been awarded for 1954 to G. I. Watson, of Peaslake, Surrey, for his essay on "A Study of the Problems Involved in the Prevention of the Bacterial Complications of Measles, with Special Reference to Prophylactic Sulphadiazine." The award consists of a certificate and a cheque for 50 guineas.

The Charles Oliver Hawthorne Prize, awarded to the author of the essay judged to be the second best in this competition, has been awarded for 1954 to Katharina Dalton, of London, for her essay on "The Similarity of Symptomatology of Pre-menstrual Syndrome and Toxaemia of Pregnancy and their Response to Progesterone." The award consists of a certificate and a cheque for 40 guineas.

Stewart Prize

The Stewart Prize, established for the recognition and encouragement of work carried out or of researches promising good results regarding the origin and spread of epidemic disease, has been awarded for 1954 to Professor H. E. Shortt, at present working in East Pakistan in connexion with the Colombo Plan, for his work on the pre-erythrocytic and exo-erythrocytic stages of the malaria parasite.

Prizes for Medical Students

"Is the Medical Curriculum Too Heavily Loaded?" was the subject set for the 1954 Medical Students' Prize Essay Competition. The number of entries received was small, and the Council has this year approved the award of only two prizes of £25 each to medical students in the United Kingdom. The winners of these prizes are:

A. W. Beatson (London Hospital Medical College).
G. Hatcher (Middlesex Hospital Medical School).

A prize of £25 has also been awarded to the following medical student, who submitted the best entry from overseas:

A. M. Nhonoli (Makerere Medical School).

As the number of entries received has been steadily decreasing, the Council is considering whether the future form of this competition should be altered. A further report on this matter will be included in the Supplementary Report.

Research Scholarships

The following Research Scholarships, tenable for twelve months from October 1, 1953, have been awarded:

Ernest Hart Memorial Scholarship (£250).—J. M. Tanner, M.B., B.S., D.P.M., Ph.D., for research into the relation of bodily growth in the first five years of life to size and build at maturity.

Walter Dixon Memorial Scholarship (£250).—H. M. Carey, M.Sc., M.B., B.S., D.G.O. (Sydney), F.R.C.S.Ed., M.R.C.O.G., for research into the action of oxytocics and spasmolytics on the human uterus at term.

Ordinary Research Scholarship (£200).—I. J. MacQueen, M.B., B.S., for research into the response of skeletal muscle to progressive resistance exercise.

Insole Scholarship (Joint Award) (£125 each).—G. W. Csonka, M.D., M.R.C.P., M.R.C.P.Ed., and A. S. Grimble, M.D., for research into the nature of non-specific urethritis.

The Council wishes to express its appreciation of the valuable work undertaken by the Visitors in connexion with the Research Scholarships.

B.M.A. Lectures

130. At the invitation of the Council, experts in various fields of medicine have continued to give B.M.A. Lectures to Branches and Divisions. The number of lectures arranged during 1953 was 71. Payment of an honorarium of 10 guineas to each lecturer, which was suspended in January, 1952, as an economy measure, has been reintroduced. The Council wishes to record its appreciation of the services of the lecturers.

Mackenzie Industrial Health Lecture, 1954

131. Dr. W. M. Goldblatt, of Welwyn, has accepted an invitation to deliver the Mackenzie Industrial Health Lecture in 1954. At the invitation of the Association of Industrial Medical Officers, this lecture will be given in Manchester in July, in conjunction with the Provincial Meeting of that Association.

Control of Therapeutic Substances

132. The Council has discussed the decision of the Representative Body in 1953 that the advisability of seeking restrictions on the free sale of oestrogen preparations should be considered, in view of the known dangers of these preparations and possible abuse due to their unrestricted sale to members of the public. Information on the subject has been sought from the honorary secretaries of Divisions and Branches and also, through the *British Medical Journal*, from individual members of the Association. Joint discussions have taken place with representatives of the Royal College of Nursing and the Pharmaceutical Society and further information is being sought on the extent of possible abuses. It is hoped that these inquiries will be of assistance in deciding upon appropriate action, particularly as any approach to the Government will require to be supported by strong evidence. The possibility is being considered of securing regulations under the Therapeutic Substances (Prevention of Misuse) Act or inclusion in Schedule IV of the Poisons List. Possible action in regard to the increasing number of advertisements for beauty preparations containing hormones is also being considered.

British Pharmacopoeia

133. The British Pharmacopoeia Commission once again sought the co-operation of the Association in connexion with the revision of the *British Pharmacopoeia* for the new edition to be published in 1958. The proposed additions and deletions have been considered and some additional amendments suggested.

Library

134. There has been a very slight drop in the recorded number of members visiting the Library and in the number of books borrowed, but it is noted that the majority of visitors do not sign the attendance book. During the year over 150 books have been presented to the Library by members of the Association, to whom the Council is extremely grateful. The cost of postage for books borrowed from the Library, which amounts to over £750 during the year, has continued to be borne by the individual members

concerned. Whenever the opportunity has arisen second-hand copies of journals missing from sets in the Library have been acquired, and books no longer required have been sold. The mutual borrowing arrangements with other medical libraries throughout the country have continued to work satisfactorily.

The Library continues to expand and the Council has been faced with difficulties in providing adequate storage space. It has been found possible, however, to make available additional storage space within the B.M.A. premises for a further three or four years, pending development of the Association's plan to build a new and larger Library.

The Charles Hastings Collection and other historical books in the possession of the Association are at present housed in the Library. As this is closed during the evening and at week-ends, when social functions take place, arrangements have been made for a portable display case which will enable these books to be on show in other parts of B.M.A. House on special occasions.

PUBLIC RELATIONS

135. The Council has considered the following Minute 73 of the A.R.M., 1953:

73. Proposed by E. Herts (J. S. Ross): That with a view to keeping the Public Relations machinery of the B.M.A. in readiness for an emergency, a meeting of the Divisional Public Relations Officers be held once a year.

The Chairman drew attention to the fact that the motion had not received the two months' notice necessary under the Standing Orders for a motion involving special expenditure which had not been considered by the Council, and it was

Resolved: That this matter be referred to the Council for consideration.

Whilst appreciating the importance of keeping in close touch with Honorary Public Relations Secretaries, the Council thinks it undesirable that it should be committed to an annual conference. It has decided, however, to hold a conference of Honorary Public Relations Secretaries during the present session and to leave it to the Public Relations Committee to call future conferences whenever necessary.

The Council has noted the following Minute 278 of the A.R.M., 1953, and is keeping a close watch on the situation:

278. That this Meeting deplores the publication in the popular press of extracts from medical articles and newspaper articles of an irresponsible character praising new drugs without illustrating any potential dangers.

Information Service

136. The good relations with the Press built up by the Department have been further strengthened. The work of the Information Service has also considerably increased, both in range and in volume. Of the many thousands of inquiries which are dealt with annually by telephone or personal visit, 24% come from the Press, 33% from the public, 12% from industry, 9% from universities, colleges, societies, and other institutions, 9% from staff at B.M.A. House, 7% from doctors, 5% from Government Departments and Embassies, and smaller percentages from research associations and the like. The following is an analysis of the information sought: particulars about organizations or individuals (34%); verification of statements and inquiries regarding B.M.A. policy (20%); sources of specialized information (10%); details of medical conferences (10%); statistical information (4%); medical procedure and ethics (4%); training in medicine, the curriculum, qualifications, etc. (3%); personal medical cases (2%); complaints of one kind or another (2%); names of manufacturers of drugs or special equipment (1.5%); homes for old people and the like (1.5%).

The register of conferences maintained by the Department continues to be added to. A selected list of national and international congresses is issued periodically to over 150 professional organizations, Government Departments, and interested persons.

A Press conference was held in connexion with the publication of the Report of the General Practice Review Committee in September, 1953, when Dr. C. W. Walker, Chair-

man of that Committee, and the Assistant Secretary (Dr. Hadfield) were present to explain the report and answer questions. The resultant press "coverage" was very heavy and the tone of editorial comment was sympathetic and favourable to the profession.

Hospital Public Relations

137. A Memorandum on Hospital Public Relations prepared by the Department was considered by the Central Consultants and Specialists Committee. As a result, copies were distributed to Regional Consultants and Specialists Committees, and a Public and Professional Relations Subcommittee of the Central Consultants and Specialists Committee was set up. The Council is anxious that the consultants and specialists should be given all possible help in the field of public relations.

First World Conference on Medical Education

138. The World Medical Association invited the Public Relations Officer to act as Press and Publicity Officer to the First World Conference on Medical Education held in London between August 22 and 29, 1953. The Department undertook to produce the official *Handbook* of the Conference. Separate editions were prepared in the three official languages—English, French, and Spanish. Complete press and publicity arrangements were also made by the Department. No fewer than 58 representatives of the Press attended the Conference, including correspondents from Germany, Ireland, Sweden, the United States of America, the Netherlands, Switzerland, France, Poland, Ceylon, and India. Press rooms were provided and copies of most of the 130 addresses were made available to the Press. As a result, very wide publicity was obtained for the Conference in the lay and medical press throughout the world.

Sir Charles Hastings Lecture

139. A highly successful Sir Charles Hastings Lecture was held on May 6, 1953, in the Great Hall. Professor F. A. E. Crew, of Edinburgh, spoke on "Medicine and Social Policy." Mr. Walter Elliot, M.P., was in the chair. The Great Hall was filled to capacity, over 700 people being present.

ARMED FORCES

Conditions of Service

140. At the end of 1952 the Council prepared, at the request of the Ministry of Defence, a Memorandum for the Working Party set up to consider all aspects of the Service medical officer's career, including remuneration. Despite repeated requests for information on subsequent action which the Ministry of Defence proposed to take, which it was hoped the Association would have been permitted to discuss before any public announcement was made, no information was received. Eventually, in September, 1953, the Ministry of Defence announced certain changes in the conditions of service for medical officers which it was hoped would result in an increase in the number of medical practitioners making the Service a career. These amendments, operative from October 1, 1953, were briefly as follows: (a) improved rates of pay for medical officers in the middle ranks—that is, major to brigadier, and their equivalents in other Services; (b) increased specialist pay, up to a maximum of £220; (c) introduction of a Permanent Commission Grant of £1,500 (taxable); (d) posts for retired medical officers; (e) opportunities to take a regular commission on entry to the R.A.M.C. instead of first being required to take a short-service commission; (f) antedating of commissions for all late entrants to the Service, according to civil experience, up to a maximum of seven years; (g) extension to the R.A.M.C. of the R.A.F. scheme for granting three-year short-service commissions to doctors with a National Service liability.

These are intended to be temporary measures pending the report of a committee, set up under the chairmanship of Lord Waverley, to review the arrangements for providing

medical and dental services for the armed Forces. In a later announcement on increases in pay for certain ranks in all branches of H.M. Forces, Captains R.A.M.C. (and equivalent ranks in the R.N. and R.A.F.) with at least four years' service in the rank were granted an increase of 4s. per day from April 1, 1954.

The Association was not given any opportunity to discuss these interim proposals before their publication, and more detailed information on a number of points was sought. Considerable concern was expressed at the proposal to antedate all commissions up to a maximum of seven years, in view of the effect which this proposal might have on the promotion prospects and prestige of medical officers already serving. Particular concern was expressed about those Service medical officers whose applications for antedating of commissions made prior to October 1, 1953, had been refused or only partially granted. Representations have been made to the Directors-General of the Medical Branches of H.M. Forces that any applications from Service medical officers for their previous claims for antedating to be reopened should be given favourable consideration. Attention has been drawn to the fact that if the new Permanent Commission Grant was paid within one tax year the amount of income tax payable would be high, particularly in the case of married medical officers.

The improved rates of pay do not conform in any way to the proposals submitted to the Ministry of Defence by the Council, and it is considered unlikely that the new conditions of service will attract a greater number of medical officers of the right quality.

ORGANIZATION

Association Membership

141. The Council submits the following report upon the membership of the Association for 1953:

New members	3,646	
Resignations withdrawn	250	
Reinstated	7	3,903
Removed in arrears	2,601	
Less paid arrears	1,164	1,437
Deaths	549	
Resignations	2,315	
Erased from Register	1	4,302
		Decrease 399
Membership, December 31, 1952	67,905	
Membership, December 31, 1953	67,506	

The membership of the Association in the United Kingdom represents 72% of the total profession and 81% of the working profession. The membership on March 16, 1954, was 65,654.

As will be seen from the above figures, the Association's membership has not met with any serious setback as a result of the increase of subscription rates, and the Council has noted with satisfaction that receipts from subscriptions paid during the first month of 1954 showed an increase of approximately £10,000 as compared with the amount received in the corresponding period of 1953. The Council feels, however, that the situation should not be viewed with complacency and that a special effort should be made to restore the normal annual increase in numbers.

The Newly Qualified Practitioner

142. The Council regards the recruitment of the newly qualified to the Association as a matter of considerable importance. The Medical Act, 1950, with its requirement of a year's compulsory residence in hospital as a house-officer, has created problems for these young practitioners. Provisionally registered practitioners are eligible under the By-laws for membership of the Association, and they have a right, therefore, to look to the Association for assistance in their difficulties. The fact that they are engaged in hospital appointments and are resident in one area for only

a limited period makes it difficult at present for them to use the ordinary Division machinery. The Council is actively considering how these newly qualified practitioners can be made to feel that membership of the Association is of real value to them and how they can be enabled through the Association's machinery to voice their views effectively. One of the items of the Agenda of the 1954 Conference of Honorary Secretaries will be a discussion on "What is the Association Doing for the Hospital Resident?" with particular reference to the role of the Branch and Division. The situation will be reviewed further in the light of the discussion at the Conference, and meanwhile other measures are being considered.

Honorary Secretaries

143. The Council, on behalf of the general body of members of the Association, desires once more to express its grateful thanks to the honorary secretaries of the Divisions and Branches, upon whose loyal co-operation the effective local organization of the Association so largely depends. The Council has noted with satisfaction a general increase in activity, particularly on the clinical and social sides.

Annual Conference of Honorary Secretaries

144. The 1953 Conference expressed by a very large majority its preference for holding the next annual session at the Central Office in London as a full day's meeting. This plan has been adopted, and the Conference will meet at B.M.A. House on May 19. Dr. D. M. Hughes, joint honorary secretary of the South Wales and Monmouthshire Branch, will be in the chair.

Conference of Regional Officers

145. A conference of regional officers was held at B.M.A. House on June 12, 1953. Developments affecting the regional offices were discussed, and there was a free and useful exchange of views. A similar conference will be held in 1954.

Financial Year of Divisions and Branches

146. The new procedure in respect of capitation grants to Branches arising from the system of budgetary control has been applied in respect of 1954. Under this procedure grants are determined at the beginning of the session and not towards the end, as heretofore. One result of the change in procedure will be that the grant, or first instalment of the grant, will be in the hands of the honorary secretary of the Branch at the beginning of the year to which it relates and not in the late spring as formerly.

An important result of the revised procedure is that Branches and Divisions are now asked to return their annual reports and accounts in the summer instead of at the beginning of the year.

Statements received from Divisions and Branches indicate that the action taken during 1952 and 1953 to disperse accumulated balances in Branch and Division accounts has had very satisfactory results. The policy of the Council in allocating grants continues to be to provide Branches and Divisions with funds adequate to meet their requirements, but without extravagance.

Areas of Branches and Divisions

147. The Council has pleasure in reporting the formation, after due notice in the *Supplement to the British Medical Journal*, of a Gold Coast Branch. Changes in areas to facilitate local organization have been approved, with due notice, both in home and in overseas Branches and Divisions.

Autonomous Bodies

148. The Council has referred to the Constitution Committee Minute 27 of the A.R.M., 1950, which lays down that the autonomous powers of the General Medical Services and Central Consultants and Specialists Committees, in so

far as they derive from the Representative Body, require to be specifically renewed by successive Annual Representative Meetings.

Pending the Report of the Constitution Committee and any changes in procedure which may result therefrom, it will be necessary to comply with the provisions of the resolution of the A.R.M., 1950.

The Council therefore recommends:

Recommendation: That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1954-5.

That the Representative Body looks to these Committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

Election of "Ten" Members of Council

149. The Council has considered the advisability of amending By-law 53 (c) and By-law 49 (1) to place beyond doubt the fact that the election by the Representative Body of the "ten" members of Council rests with representatives of constituencies and not with the Representative Body as a whole, as might be inferred from the wording of By-law 53 (c).

It recommends:

Recommendation: 1. That By-law 49 be amended as follows:

(i) By inserting the following new subparagraph:

(2) For the purpose of electing the President, the Chairman and the Deputy Chairman of the Representative Body, the Treasurer, and the members of the Council and of any Standing Committees required to be elected by the Representative Body votes shall be recorded at such time and in such manner as the Representative Meeting may decide.

(ii) By altering the numbering of the existing subparagraphs (2)-(5) to (3)-(6) respectively and by adding at the commencement of new subparagraph (3) the words "Except as aforesaid."

2. That By-law 53 (c) be altered by the deletion of all words after "as to" in line 3 and the substitution therefor of the following:

"ten by Representatives of Constituencies and of Public Health Service Members and Members of Council representing the medical branches of the armed Forces, as to a further two by the elected representatives of Constituencies comprised in the Branches and Divisions in Scotland, and as to a further one by the elected Representatives of Constituencies comprised in the Branches and Divisions in Wales, including Monmouthshire."

The By-laws as amended would read:

"Voting"

49
(2) For the purpose of electing the President, the Chairman and the Deputy Chairman of the Representative Body, the Treasurer, and the members of the Council and of any Standing Committees required to be elected by the Representative Body, votes shall be recorded at such time and in such manner as the Representative Meeting may decide.

(3) Except as aforesaid, voting shall be by show of hands, unless before the vote is taken fifteen Representatives present request that the vote be taken by roll-call, in which event it shall (subject as hereinafter provided) be so taken. If, however, upon the Chairman proceeding to take the vote, a vote by card is demanded by a majority of the Representatives present the vote shall be taken by card.

(4)

"Council: Composition"

53

(c) Thirteen (being persons who have been members of the Association for at least the period aforesaid), at the Representative Meeting being elected as to ten by Representatives of Constituencies and of Public Health Service Members and Members of Council representing the medical branches of the armed Forces, as to a further two by the elected Representatives of Constituencies comprised in the Branches and Divisions in Scotland, and as to a further one by the elected Representatives of Constituencies comprised in the Branches and Divisions in Wales, including Monmouthshire.

(d)

Membership of Divisions and Branches

150. The Council has considered Minute 255 of the A.R.M., 1953, which referred to it the following motion:

That members of the Association shall ordinarily be allocated, as hitherto, to the various Divisions (and Branches) purely on an address basis, but where, by reason of ease of access, professional association, or for any other reason, a member finds it more convenient to attend the meetings of some other Division (or Branch), that member may, on application to Head Office, be transferred to the Division (or Branch) of his choice.

The view of the Council is that the adoption of this proposal would not only involve administrative difficulties but would also lead to unnecessary anomalies and complications. The object of the proposal is obviously to meet the convenience of the member in respect of local Association activities. This is already provided for. At the present time a member practising in one area and living in another may register the practice address for membership purposes and so automatically become eligible for all the privileges of membership in the area where he practises. Moreover, under By-law 12, any Division or Branch may elect as a Visiting Member any Ordinary Member of any other Division or Branch, and confer upon the Visiting Member such privileges (other than that of receiving notices of General Meetings or of voting) as the Division or Branch may think desirable, subject to the sanction of the Council. These privileges appear adequately to meet the object of the motion and no further action seems necessary.

Branches of the Association

151. The Council has referred to the Constitution Committee the following motion referred to it by Minute 256 of the A.R.M., 1953:

That the Council be requested to inquire into the position of Branches in the United Kingdom as intermediary between Headquarters and the Divisions, having particular regard to the increased efficiency and economy that might result from their abolition.

Medical Act, 1950: Appeal Against Decision of Employing Authority not to Grant a Certificate of Satisfactory Service

152. Full registration in the *Medical Register* is dependent upon a certificate of sufficient and satisfactory service in approved hospital appointments during the pre-registration year. This certificate is furnished by the licensing body after receipt of reports from the hospital authorities that the practitioner has completed such service.

The Medical Act, 1950, contains no specific provision for appeal by the practitioner where a satisfactory report is not forthcoming, and, after consultation with the Solicitor, licensing bodies have been approached regarding possible action in such circumstances. There is conflict of opinion between certain of the licensing bodies as to their role in the matter and as to whether in such cases they are required "to act judicially" or to exercise "administrative discretion." There is an important distinction between the two phrases. Exercise of administrative discretion might deny to the candidate for full registration the right of appeal to the courts, as the courts could not act unless satisfied that the licensing body was required to act judicially.

The Council is advised that an important principle is involved, and the opinion of leading counsel on the issue is being obtained.

The B.M.S.A. and the B.M.A.

153. The Association maintains its close connexion with the British Medical Students' Association. At its Annual General Meeting in November, 1953, the B.M.S.A. again expressed its thanks to the B.M.A. for the continued use of accommodation at B.M.A. House and for clerical services. It also thanked the B.M.A. for its interest and support in the negotiations with Government departments on the subject of the continuation of allowances to ex-Service married housemen during their pre-registration hospital appointments.

Group of Forensic Pathologists

154. A petition by members of the Association engaged in the practice of forensic pathology for the formation of a group of forensic pathologists has not received the approval of the Council, pending further exploration of the facilities for adequate representation of the specialty within the existing Consulting Pathologists Group.

CONSTITUTION OF THE ASSOCIATION

155. The A.R.M., 1953, passed the following resolutions:

249. **Resolved:** That an *ad hoc* Constitution Committee be formed to take evidence, consider, and report on a reorganization of the Representative Body, and such other constitutional matters as Council may decide.

253. **Resolved:** That the Council be instructed to appoint this Committee and that not more than 50% shall be members of Council.

In considering how it should carry out the mandate of the Representative Body, the Council accepted the principle that the Constitution Committee should be one which, while not too large for efficiency, should so far as possible be representative of the members of the Association and of its units both at home and abroad. Acting on this principle, the Council appointed a Committee consisting of 26 members—13 members of the Council and 13 others—with power to co-opt, provided the balance between Council members and others laid down by the Representative Body is maintained.

The Committee is constituted on a broad geographical basis and includes the four chief Officers of the Association and the Chairman of the Organization Committee *ex officio*. Overseas members are represented by the Chairman of the Overseas Committee, and the remaining members have been selected from the various Association regions in the United Kingdom with a minimal representation of three from Scotland, one from Wales, and one from Northern Ireland. The Committee has strengthened its geographical representation by co-opting three further members, one of whom is a member of the Council.

The members of the Committee as finally constituted are:

Council Members (14)

Ex Officio

J. W. Tudor Thomas, Cardiff (*President*)
S. Wand, Birmingham (*Chairman of Representative Body*)
E. A. Gregg, London (*Chairman of Council*)
A. M. A. Moore, London (*Treasurer*)
J. A. Pridham, Weymouth (*Chairman of Organization Committee*)

J. Cottrell, Grimsby
H. Guy Dain, Birmingham
R. G. Gibson, Winchester
I. D. Grant, Glasgow
F. Gray, London
R. Hale-White, London
J. G. M. Hamilton, Edinburgh
H. H. Langston, Winchester (*Chairman*)
A. Talbot Rogers, Bromley

Non-Council Members (15)

Ex Officio

J. L. Gilks, Petersfield (*Chairman of Overseas Committee*)
G. N. Bailey, Harrogate
J. T. Baldwin, Penicuik, Midlothian
H. J. Browne, Barlaston, Staffs.
Joan Chappell, Edmonton, Middlesex
R. Cove-Smith, London
H. J. Cronhelm, Belfast
A. B. Davies, Walsall
D. L. Gullick, Stevenage
F. Lishman, Crook, Co. Durham
P. Lyle, Southport
J. H. E. Moore, Leeds
J. R. Nicholson-Lailey, Taunton
D. F. Whitaker, Guildford
Morgan G. Williams, Cardiff

The terms of reference of the Committee have been deliberately made as wide as possible while keeping in the forefront the primary object of the resolution of the Representative Body—namely, consideration of possible reorganization of the Representative Body. They are:

To examine and report on the present structure and constitution of the Association with special reference to the reorganization of the Representative Body.

In carrying out its reference, the Committee will review the changes which have occurred during the last fifty years and the problems created by the enormous increase in the membership of the Association and the great increase in the association of the State with the provision of medical services for the community. It will consider the constituent parts of the Association's administration and the changes necessary to bring their functions and constitution into accord with present-day circumstances and needs.

SCOTLAND

Chairman and Deputy Chairman of Scottish Committee

156. Dr. J. G. M. Hamilton and Dr. W. M. Knox were appointed Chairman and Deputy Chairman respectively of the Scottish Committee for the session 1953-4.

Scottish Committee Jubilee

157. To celebrate the fiftieth anniversary of the founding of the Scottish Committee at Swansea in 1903, the Scottish Committee held a dinner in B.M.A. Scottish House on October 9, 1953. Advantage was taken of the occasion to entertain a number of prominent representatives of public life in Scotland, the guest of honour being the Secretary of State for Scotland, the Right Honourable James Stuart.

Visit to Denmark by Scottish Doctors

158. In view of the very successful visit of a party of Scottish doctors to Denmark in September, 1953, it is hoped to arrange another similar visit to Denmark this year. The Committee is endeavouring to arrange for a reciprocal visit to Scotland by Danish doctors in 1955.

Press Officer to Scottish Office

159. Mr. Alexander Bowman has been appointed part-time Press Officer to the Scottish Office in succession to Mr. George Donaldson.

Nominations to Fill Vacancies on Regional Hospital Boards

160. The Committee has been disturbed at the small proportion among medical members of boards of those nominated by the Association, and this matter is being pursued with the Department of Health.

Memorandum of Evidence to the Committee of Inquiry into the Cost of the National Health Service

161. The Committee has approved a memorandum of evidence for submission to the Committee of Inquiry into the Cost of the National Health Service. It has also appointed four members to give oral evidence to the Committee of Inquiry.

Partnership Advisory Memorandum

162. The Committee has asked the General Medical Services Subcommittee (Scotland) to revise the memorandum on Medical Partnerships under the National Health Service (Scotland) Act which was drawn up in October, 1951.

Maternity Services

163. The Maternity Services Subcommittee has considered a number of subjects in connexion with maternity services in Scotland. On the suggestion of the Sub-

committee, the Department of Health has agreed to certain alterations in the maternity record card. The Subcommittee has also drawn up draft forms which can be used by general practitioners and by hospital and local health authority doctors to facilitate closer co-operation in the field of maternity work.

Committees which Report to the Scottish Committee

164. (a) *General Medical Services Subcommittee (Scotland)*.—In connexion with the Working Party's recommendation that £100,000 should be set aside for the purpose of stimulating group practice, the Subcommittee has discussed with the Department the question of interest-free loans. It has been agreed that approximately £12,000 will be available for the scheme in Scotland. The Subcommittee feels that no hard-and-fast definition of "group practice" can be laid down until some experience has been gained as to how the scheme works. Agreement has been reached on certain conditions concerning loans and the Subcommittee has approved a draft agreement between a group and an executive council for use in connexion with these loans.

In response to an appeal by the Subcommittee the sum of £1,630 has been subscribed by local medical committees and individual doctors for the widow of a practitioner in Scotland who, owing to illness, had failed to lodge his claim for compensation.

(b) *Central Consultants and Specialists Committee (Scotland)*.—Dr. J. G. M. Hamilton and Dr. I. D. Easton were appointed Chairman and Deputy Chairman respectively of the Committee for the session 1953-4.

In addition to ordinary meetings, the Committee has met twice to prepare evidence for submission to the Scottish Committee in connexion with the Ministers' Committee of Inquiry into the Cost of the National Health Service.

The Committee has asked the Scottish Joint Committee to take action in connexion with the implications of Section 70 of the N.H.S. (Scotland) Act, which refers to the legal responsibilities of hospital authorities. Scottish Courts, unlike those in England, have so far held that hospital authorities are not vicariously responsible for the negligence of their medical staff. The Committee feels that acceptance of the principle of vicarious responsibility carries with it grave potential dangers to clinical freedom and thus threatens the true interests of both the community and the profession. Accordingly they are concerned to preserve the present position in Scots Law.

The Committee has considered representations from several whole-time hospital doctors relative to home to hospital mileage allowances. Two distinct groups are involved—namely, (1) those who hold whole-time contracts with regional hospital boards, and (2) whole-time university teachers holding honorary contracts with regional boards. It is appreciated that this is a matter which falls to be dealt with through Whitley Committee "B," and appropriate action to this end is being taken. Policy considerations are, however, also involved, and a summary of the position has been submitted to the Scottish Joint Committee with a request that it be discussed with the Department of Health.

The Committee's specialist subcommittees—namely, Ophthalmic, Anaesthetic, Radiological Services, and Tuberculosis and Diseases of the Chest—have also met and discussed matters relating to their respective services under the National Health Service.

The Committee's fourth Annual Report (1952-3) has now been issued to all consultants, S.H.M.O.s, and senior registrars in Scotland.

WALES

165. The Welsh Committee, which includes representatives of all the Divisions and Branches in Wales and Monmouthshire, has met in Shrewsbury under the chairmanship of Dr. Morgan G. Williams. It provides opportunities for discussion of all matters affecting Welsh members.

The Annual Welsh Dinner is to be held in Glasgow on Saturday, July 3.

OVERSEAS

Visit to the Far Eastern Branches

166. The Council is fully seized of the importance of maintaining personal links between the Overseas Branches and the parent body, and is happy therefore to report that the President of the Association (Mr. J. W. Tudor Thomas) has agreed to undertake a tour by air of the Borneo, Ceylon, Hong Kong, and Malaya Branches. Occasion will also be taken for the President to break his journey in Beirut and Bagdad, where he will meet members of the Middle East Branch.

The President's visit has been timed to coincide with the Annual General Meeting of the Malaya Branch at Kuala Lumpur from April 16 to 19, and at this and all other centres he will lecture, demonstrate cases, and operate, if invited to do so.

Gold Coast

167. Following the visit of Mr. Ian Fraser to the Gold Coast in March, 1953, a copy of his report was sent to the Secretary of State for the Colonies. At the same time, attention was drawn to the difficulty of attracting expatriate medical officers to the Gold Coast in the present uncertainty as to future constitutional developments and their possible effect on the careers of officers in the Colonial Service. It was suggested that a deputation from the Council might attend the Colonial Office for a general discussion on the position of British doctors in the Gold Coast and in other territories which are approaching self-government.

A reply was received from the Colonial Office which referred to the fact that officers in the public service of the various Colonial Governments were the servants of those Governments, and the Secretary of State was not therefore in a position to give any positive assurance in respect of the period during which their employment might continue. Attention was drawn to the statement made by the Prime Minister of the Gold Coast in the Legislative Assembly on July 8, 1953, to the effect that, in order to maintain an efficient administrative machine, the Gold Coast Government would for some years need the services of overseas officers and therefore guaranteed them pensions and terms of service no less favourable than those now obtaining.

A deputation was received by a Deputy Under-Secretary of State and other officials of the Colonial Office on December 18, 1953. A long discussion took place in which the Council's representatives emphasized the feeling of insecurity which, in spite of assurances given by the Prime Minister of the Gold Coast, still existed among British doctors as to the future of the Gold Coast Medical Service, and the consequent reluctance to take up vacancies as they occurred. They also pointed out the dangers of a situation which might open the door to the employment of unqualified and semi-qualified practitioners and to a general lowering of standards of practice.

The Colonial Office representatives took the view that security of tenure in the Gold Coast had not been impaired by recent events in spite of contrary impressions which had gained ground in many quarters. No further guarantees could be given beyond those which already existed, but it was their impression that the Gold Coast Government wished to retain its expatriate officers. The Council's representatives felt that it would be of assistance if greater publicity could be given to the safeguards which already existed.

The discussion then continued on the subject of articles and correspondence which had appeared in *The Times*, suggesting that a Civil Service might be organized on a Commonwealth basis. The Colonial Office representatives were interested in the suggestion, although some aspects of it were felt to be impracticable.

Cyprus

168. The Council regrets that it cannot report a settlement of the dispute with the Government of Cyprus over the remuneration of Government medical staff. Certain proposals were made by the Government of Cyprus to the effect that, in lieu of increasing the pensionable salaries of specialists in the manner suggested by the Association, special contract terms should be offered whenever it was necessary to recruit specialists from outside Cyprus. Neither the substance of this offer nor the terms suggested were considered to be satisfactory and, as from May 23, 1953 (nearly two years after the opening of negotiations), all appointments under the Government of Cyprus have been included in the "Important Notice."

The Council was, however, glad to learn of the appointment in November, 1953, of a Salaries Commissioner to examine the salary structure of the Government Service generally and to advise whether any measure of reorganization was called for and if there were any anomalies or inequities which should be removed. The Cyprus Branch submitted evidence, both written and oral, and a supplementary memorandum of evidence was also submitted by the Council. The Commissioner has not yet reported.

Hong Kong: Amendment to the Medical Registration Ordinance

169. The attention of the Council was drawn to an amendment of the Medical Registration Ordinance of Hong Kong which had been made without prior consultation with the local Branch of the British Medical Association, the Chinese Medical Association, or the Medical Board of Hong Kong, which is the statutory registration authority.

The law regarding medical registration is of the most intimate concern to the medical profession in every country. In amending the registration law of Hong Kong without consulting either of the representative medical associations of the Colony, and without even consulting the registration authority which is charged with the administration of that law, the Hong Kong Government has acted in an arbitrary manner which the Council deeply deplores. A strong protest has been lodged with the Colonial Office.

East Africa

170. A Commission to examine Civil Service salaries and conditions of service was appointed under the Chairmanship of Sir David Lidbury. Evidence, both written and oral, was submitted to the Commission by the Uganda Branch of the Association. Special attention was drawn to the decrease in recruitment to the Colonial Medical Service in the face of the counter-attractions of the National Health Service in the United Kingdom, to the increased demand for medical services in Uganda, and to difficulties arising from the devolution of local government to native authorities.

A supplementary memorandum of evidence was also submitted by the Council, dealing in greater detail with relative salaries of doctors in the United Kingdom and in the Colonial Medical Service. The report of the Commission is awaited.

Resolutions of the Caribbean Conference

171. It will be remembered that a number of resolutions were passed by the Caribbean Conference in January, 1951, and were remitted to the Colonial Office for consideration.

The Colonial Office has now informed the Council that the Caribbean Governments concerned are generally sympathetic towards the resolutions, some of which have already been given effect. The detailed comments of the Colonial Office will be brought to the notice of the next meeting of the Caribbean Council of the Association, which was scheduled to be held in December, 1953, in Barbados but has been temporarily postponed.

Testimonials for Ex-Colonial Medical Officers

172. The Council suggested to the Colonial Office that former members of the Colonial Medical Service should be permitted to give the name of a Director of Medical Services as a personal referee to whom any prospective employer might refer for a personal and confidential opinion. The Colonial Office undertook to forward the suggestion to the Colonial Governments, all of which have agreed to adopt it.

EMPIRE MEDICAL ADVISORY BUREAU

173. The Empire Medical Advisory Bureau, on behalf of the Association, welcomes and provides a personal advisory service to medical practitioners from the Dominions and Colonies visiting the United Kingdom.

The Committee of Management has met three times during 1953, and the Advisory Committee held its sixth Annual Meeting on May 28, 1953. The attendance of members at meetings and their help throughout the year with the problems of individual visitors is much appreciated.

The volume of inquiries dealt with by the Bureau continued at the same high level in 1953 as in the previous year; there were slight increases in the numbers of new visitors and new correspondents seeking advice or assistance, and a record number of more than two thousand visits were paid to the Bureau by old and new visitors.

The majority of new inquirers seek information about some aspect of postgraduate medical education and experience, including information on courses of instruction, examinations, and appointments in and visits to hospitals.

The "Summary of Regulations for Postgraduate Diplomas and of Courses of Instruction in Postgraduate Medicine," compiled and produced by the Bureau, has been revised and reprinted, as is usual each year. The "Summary" has been dispatched overseas to all Branches of the Association, Affiliated Associations, Deans of Medical Faculties of Commonwealth Universities, Postgraduate Committees, and Editors of Journals. These copies are intended for reference by overseas inquirers, and many tributes to their usefulness have been received.

Between two and three hundred doctors inquired about junior hospital appointments, and advice was given on the types, grades, and availability of these and on medical registration and protection.

Visits to hospitals, clinics, and special centres in many parts of the country have been arranged at the request of more senior visitors, who often combine a holiday visit with an intention to see methods and developments in the particular fields of medicine in which they are interested. The courteous co-operation of hospital authorities and consultants has enabled these requests to be met.

Many visitors have been met personally by the Port Health Medical Officers on arrival, and a letter of welcome from the Bureau is sent to every visitor whose place and date of arrival are known. There is no doubt that these attentions are much appreciated by the newly arrived visitor. Through the kindly co-operation of authorities arranging courses of instruction, the Bureau is enabled to contact those overseas visitors, already arrived in the country, who do not know of the Bureau's facilities; liaison letters are sent to all these visitors, and in many cases result in the Bureau being able to be of service and to invite the visitors to social functions.

The Bureau has found accommodation for visitors in readiness for their arrival, and all such requests have been met. In addition, visitors, after their arrival, have secured furnished flats and houses with the Bureau's help. Nearly three hundred doctors and families have been successfully helped with the difficult problem of accommodation during the year.

Overseas visitors have been enabled to meet their fellow practitioners from all parts of the Commonwealth, including senior members of the profession in the United Kingdom, at social functions arranged by the Bureau. "At

Homes" were held in Cardiff, Edinburgh, and London, and the Coronation "At Home" at B.M.A. House on May 28, 1953, was attended by 350 overseas guests. A total of nearly 1,100 overseas doctors and wives attended the social functions during the year, and many expressed their appreciation of the opportunities these afforded to make contacts which otherwise would not have been made.

The majority of visitors have inquiries which fall into the wide field of "General Information," and every endeavour is made to answer these or to assist the inquirer to find the answer.

That the Bureau's services are needed and welcome is shown by the many expressions of appreciation received from overseas visitors, and the Council is glad to feel that medical colleagues from the other parts of the British Commonwealth can obtain the assistance they require to make the most of their visits to this country.

INTERNATIONAL MEDICAL VISITORS BUREAU

174. The International Medical Visitors Bureau, established in 1950, provides a personal advisory service for medical practitioners desiring to visit the United Kingdom from countries other than those of the British Commonwealth. The Committee of Management met three times during 1953.

New inquirers from 33 countries consulted the Bureau, and the numbers of these were increased by about one-seventh as compared with 1952. In addition, more than 200 United Kingdom and Continental doctors, or their families, inquired about holiday exchanges. Many inquiries concerned postgraduate courses of instruction, diplomas, and examinations.

Temporary hospital appointments were sought, more especially by recently qualified practitioners who wished to gain experience in this country. Advice and assistance were given by the Bureau, and it is known that several doctors secured appointments.

Visits to hospitals, clinics, and other institutions were arranged at the request of visitors, and during the First World Conference on Medical Education several visits to medical schools were arranged for delegates. The Bureau is much indebted to the Heads of Departments, Consultants, the Chief Medical Officer of the London County Council, and others for the co-operation received in this field.

Suitable accommodation has been found in London and the provinces for all visitors requesting this.

Many inquiries in the field of "General Information" have been received and dealt with, and visitors are encouraged to make requests with a view to making their visits successful.

Inquiries about holiday exchanges for themselves or their families or children and about *au pair* visits were received from many doctors in Europe and in the United Kingdom. With the co-operation of national medical associations, the Bureau endeavoured to put the inquirers in touch with suitable professional contacts, and it is known that more than fifty "exchanges" were arranged.

Visitors have been very appreciative of the help they have received, and the Council is glad to know this assistance helps to strengthen international medical relations.

MEDICAL FILMS

175. There has been a slight decrease in the use of the Film Library during the past year. The Council believes this is partly due to the fact that some of the films are no longer up to date, and it is endeavouring to obtain information about medical films produced recently with a view to acquiring new films for the Library.

Fourteen films have been added to the Library, and a second addendum to the Film Catalogue has been issued.

Appraisal panels have met as required to view medical films which have been brought to the notice of the Association, and the Council wishes to express its thanks to the members of the profession who have served on these panels.

The Council is greatly indebted to the following, who have kindly presented films to the Association in the past year: American Medical Association; Abbott Laboratories Ltd.; Ciba Laboratories Ltd.; Imperial Chemical Industries Ltd.; and Parke, Davis & Co., Ltd.

During the period of the first World Conference on Medical Education in August, 1953, arrangements were made for an exhibition of medical photography, through the kind co-operation of the Royal Photographic Society, and for a series of lunch-time film showings in the Film Theatre kindly lent by the Wellcome Foundation. The attendance was good and the arrangements were much appreciated by members of the Conference.

WORLD RELATIONS**First World Conference on Medical Education**

176. In August, 1953, the Association had the pleasure of acting as host to the First World Conference on Medical Education, sponsored by the World Medical Association in collaboration with the World Health Organization, the Council for International Organizations of the Medical Sciences, and the International Association of Universities. The Conference, which was an outstanding success, was attended by 617 persons from 62 countries, and 127 universities and medical schools were represented.

World Medical Association

177. The Association was represented at the seventh General Assembly of the World Medical Association, held at The Hague in September, 1953, by the Chairman of Council and Dr. T. Rowland Hill as delegates, with the Chairman of the Representative Body and the Secretary as alternate delegates. Dr. J. A. Pridham was present as a member of the W.M.A. Council and the Editor of the *British Medical Journal* as a member of W.M.A. Committees; Dr. Mary Esslemont attended as an observer. The Public Relations Officer read an invited paper on the relations between the medical press and the public press at the annual meeting of medical editors of the world which followed the General Assembly.

Prior to the General Assembly, the Council of the World Medical Association met at B.M.A. House for four days. The members of the B.M.A. Council entertained the W.M.A. Council to dinner in the Great Hall.

It has been necessary to raise the subscription payable by member-associations, and the B.M.A. contribution for 1954 is £1,230.

World Health Organization

178. The Council has repeatedly represented to the Ministry of Health that the United Kingdom delegation to the W.H.O. should include a representative of the medical profession generally—that is, a non-official medical practitioner. So far these representations have been unsuccessful.

Anglo-American and Anglo-Canadian Exchange Schemes

179. The Council has continued to operate the Anglo-American and Anglo-Canadian exchange schemes, and seven British doctors visited Canada and the U.S.A. during 1953. Their reports say that the schemes are of real value in promoting contact between medicine in Britain and in North America.

OTHER ASSOCIATION ACTIVITIES**"The Recognition of Intoxication"**

180. A Special Committee was appointed by the Council in 1951 under the Chairmanship of Professor E. J. Wayne "to revise and bring up to date the Association's Reports on 'Tests for Drunkenness,' 1927, and 'The Relation of Alcohol to Road Accidents,' 1935." A Report from this Committee, entitled "The Recognition of Intoxication," is being issued in booklet form. It is a revised edition of "Tests for Drunkenness." The revision of the second

report mentioned in the Committee's terms of reference awaits the result of certain work now in progress in this country concerning the physiological effects of alcoholic intoxication.

"The Recognition of Intoxication" is intended primarily to offer to the general practitioner some guidance in the practical aspects of the medical examination of persons detained by the police and suspected of being under the influence of alcohol. It contains information on procedure, notes on pathological conditions which may simulate alcoholic intoxication, a model scheme for the examination of detained persons, and a section on the determination of alcohol in body fluids. In the preparation of the last-named section the Committee was assisted by a panel of the Royal Institute of Chemistry. Copies of the report may be obtained on application to the Publishing Manager.

Medical Practices Advisory Bureau

181. The volume of work in the agency section of the Bureau continues to be very high. During 1953 the Bureau was able to place over 650 prospective partners or assistants. Nearly 2,500 locums were introduced, and in addition the office dealt with a large variety of miscellaneous appointments both at home and overseas. It will be appreciated that the Bureau cannot nominate for advertised posts or vacancies, though occasionally it is asked to bring appointments to the notice of suitable candidates in order that they may be given the opportunity to apply. During the session the Bureau has reviewed its arrangements for facilitating the exchange of practices and has taken steps to make opportunities more widely known.

Very close liaison is maintained between Headquarters in London and the main branches in Manchester, Edinburgh, and Glasgow. The last-named can now be regarded as fully established and is doing an increasing amount of good work.

There is evidence that the personal advisory services are much appreciated, not only by members of the Association but also by solicitors and accountants acting on their behalf. A very large proportion of the requests for advice received during the past 18 months has been in connexion with the admission of new partners and with partnership agreements from the point of view of the doctor rather than the lawyer.

Guillebaud Committee

182. The Council was invited to submit evidence to the Committee, under the Chairmanship of Mr. C. W. Guillebaud, appointed by the Government to consider the cost of the National Health Service. A Memorandum of Evidence has accordingly been prepared and submitted to the Guillebaud Committee. Oral evidence will be given at a later date.

Control of Medical Manpower

183. As in the past, the Council has provided secretarial and clerical assistance and other facilities for the two Central Medical Recruitment Committees, and will recover three-quarters of the cost from the Government.

The constitution of the Metropolitan Regional Medical Recruitment Committee (for hospital and university officers in the four metropolitan hospital regions) was originally approved by the Council on the understanding that it would be reviewed after one year's working, as it was feared that there was inadequate representation of the hospital staffs in the Western Area of the South-west Metropolitan Region, which extends westwards as far as Bridport. The Council has accordingly reviewed the position, and has recommended to the Ministry of Health that a new and independent regional medical recruitment committee should be established in the Western Area of the South-west Metropolitan Region, with a constitution similar to that of the provincial regional medical recruitment committees.

At the request of the National Medical Manpower Committee, a detailed analysis (by sex, age, and occupation) of

the Central Medical Recruitment Committee's emergency register of the whole medical profession in Great Britain has been carried out.

Salaries of Civil Service Medical Officers

184. The Representative Body is aware of the long dispute with the Treasury regarding the salaries now being paid to medical officers in the Civil Service in accordance with the recommendations of the Howitt Committee. After much fruitless discussion of the possibility of arranging arbitration, or a review of the Howitt salary scales by an independent committee, the Treasury agreed to resume direct negotiations with the Civil Service Medical Officers' Joint Committee, on which the Council is represented together with the Medical Group of the Institution of Professional Civil Servants and the Ministry of Health Medical Staff Association.

The position has recently been complicated by the appointment of the Royal Commission on the Civil Service, but the Council is glad to report that a satisfactory interim agreement is about to be concluded between the Treasury and the Joint Committee. This provides for increases in pay for certain grades of the medical officer class in the Civil Service, and both parties remain free to ask the Royal Commission to consider any representations they may see fit to make regarding the remuneration of any of the medical grades. The arrangements for preparation of evidence for submission to the Royal Commission are under consideration by the Council. Meantime, the Council will afford the normal facilities for advertisement of Civil Service medical vacancies in the *British Medical Journal* at the rates of pay set out in the interim agreement, full details of which will be published in due course.

Rehabilitation

185. The Council has prepared, for submission to the Interdepartmental Committee under the Chairmanship of Lord Piercy, a Memorandum of Evidence on the Rehabilitation and Resettlement of Disabled Persons. This reviews the scope of rehabilitation and the available facilities. It makes a number of recommendations for the improvement of rehabilitation and resettlement services. The Council has authorized the publication of the Memorandum as a Special Report when it has been received by the Interdepartmental Committee.

The Council thinks that there is a need for educational work in the field of rehabilitation, and it is considering ways in which the nature, scope, and potentialities of rehabilitation may be brought to the notice of the medical profession and the public.

Joint Committee of the B.M.A. and the Magistrates' Association

186. This Committee has continued its study of the problem of cruelty to, and neglect of, children with a view to the preparation of a comprehensive report on this subject.

Tynwald Commission on Salaries and Emoluments

187. Last August the Council was called upon, at extremely short notice, to give evidence to a Commission appointed by the Manx Government with the following terms of reference:

To consider how far it is equitable and in the general interest of the Isle of Man that different conditions appertaining here (with particular reference to income tax) should be taken into consideration when applying English emoluments to positions in the Isle of Man, and to recommend in what way such emoluments can best be adjusted to Manx conditions.

The setting up of this Commission caused alarm to the Isle of Man Medical Society (Isle of Man Branch of the Association), since the Island has a health service similar to that on the mainland, the remuneration of the doctors being identical.

A hurriedly prepared memorandum of evidence was submitted to the Commission on behalf of the Council. This was followed by oral evidence and by a short supporting memorandum written by an eminent economist. It was strongly contended that any adjustment of the remuneration of the local doctors to take account of the lower local rate of income tax would be wrong in principle and inequitable in practice.

The Council is glad to report that its representations have been successful. The recently published Report of the Commission states that much thought was given to a suggested formula whereby salaries and emoluments amounting to £700 and upwards would be automatically reduced by an amount equivalent to the difference between the income tax and surtax in the Isle of Man and the corresponding taxes in the United Kingdom. The Commission estimated, however, that the net annual saving would not exceed £7,000, and it took the view that the magnitude of the economy was a relevant factor in the consideration of a measure attended with practical difficulties, likely to be resented by important sections of the community and "possibly involving a serious administrative deadlock." It did not appear to the Commission that the amount likely to be saved was sufficient to outweigh the disadvantages of the suggested method of saving.

The two memoranda submitted on behalf of the Council were published in the *Supplements* to the issues of the *British Medical Journal* dated August 29 and September 5, 1953.

"National Formulary"

188. The work of revising the *National Formulary*, 1952, is nearing completion and preparations are proceeding for the publication of a further edition towards the end of 1954 or early in 1955. Because of criticisms of the arrangement of the *National Formulary*, 1952, received from medical and pharmaceutical organizations and from individual members of both professions, the arrangement of the new edition will be similar to that of the 1949 edition. The headings of the main sections will be in Latin, but abbreviated Latin titles will be used as the main titles for individual preparations instead of the full Latin titles.

Catering

189. On the recommendation of the firm of management consultants which investigated the Association's Headquarters organization, a new committee known as the Catering Committee was appointed by the Council in July, 1953, to manage the Catering Establishment at B.M.A. House.

Representatives of those who make use of the catering facilities in the Members' Common Room and the Staff Canteen have been appointed to attend meetings of the Committee when their presence is required, or at their own request, for the special purpose of liaison between their "constituents" and the Committee.

The Committee has begun a review of the existing arrangements, and in the first instance has directed its attention to the equipment available in the kitchens and dining-rooms, with a view to ensuring an efficient service. Recent staff changes have already led to considerable improvement in the range and quality of the meals served and have made it possible for the manageress to devote more of her time to the tasks of buying and staff control.

The Catering Department now undertakes the provision of refreshments for certain of the larger meetings and receptions, a service which hitherto has necessitated the employment of an outside caterer. This has been done at a competitive price and the Council anticipates that when fully equipped the Catering Department will be able to undertake more of this class of work both for the Association and for other professional bodies using the building.

E. A. GREGG,
Chairman of Council.

APPENDIX II

FINANCIAL POSITION OF PRACTITIONERS ON RETIREMENT

The Representative Body instructed the Council to inquire into the financial position of members of the profession who retire at the age of 60 or later, with special reference to the position of those who were over 45 years of age on the introduction of the National Health Service.

In carrying out its inquiry the Council, after consultation with the movers of the motion, has interpreted the resolu-

tion as referring to those doctors who became subscribers to the National Health Service Superannuation Scheme at an age which prevented them from receiving on retirement benefits commensurate with their seniority and long service under the N.H.I. Acts. The Council has also taken into account the fact that a number of practitioners may have been unable to make adequate provision for retirement, owing to circumstances outside their control. For instance, the war may have depreciated the value of a practice, with the result that the capital sum the practitioner will receive in compensation, and on which he had relied, may be insufficient even for the purpose of a modest annuity.

Although it is clear that the movers of the resolution had in mind the inadequacy of the superannuation scheme to deal with certain hard cases, the resolution itself does not refer to the scheme but asks in effect whether anything can be done by some form of subsidy to augment the pension which a doctor who is unable to complete more than 20 years' service will receive (15 years if, as is implied by the resolution, he wishes to retire at age of 60). That there is a problem here involving hardship in individual cases cannot be denied, but in referring to doctors who retire at 60 with only 15 years' service the resolution ignores the fact that a general practitioner may continue to contribute for a further 10 years up to the age of 70, making 25 years in all, and even then need not retire. It is true that in the hospital service extension of retiring age is exceptional, but the rule under which the great majority of consultants must retire at 65 has nothing to do with the superannuation scheme. It is relevant to suggest, however, that should some special provision be devised to supplement the superannuation benefits of "short-term" contributors, consultants and specialists would have at least as good a claim to participate; indeed, the principle applies to all contributors, medical or non-medical, who have not transferred from other pension schemes.

With regard to the second consideration, though in some cases a practitioner's compensation may be insufficient to purchase an adequate annuity, it must be borne in mind that the capital that he would realize from the goodwill of his practice could have been estimated (within reasonable limits) before the appointed day and provision made to supplement this by voluntary insurance to take into account increases in taxation and the cost of living. Before the N.H.S. Superannuation Scheme was envisaged it was always possible for general practitioners to arrange for a pension and to have contributions deducted by insurance companies.

The superannuation scheme has, in fact, made allowance for private arrangements of this kind by applying the employer's contribution to the maintenance of endowment assurance premiums. It is relevant to consider the effect on those who had exercised the option to contract out of the scheme if, at this stage, non-contributory annuities were added to the benefits they had forgone.

As in other contributory schemes, after the appropriate qualifying period, pensions and other benefits increase with each year of service. The Council has considered, therefore, the position of those who can only just serve the ten years enabling them to obtain a minimum pension, or who cannot even qualify, rather than those whose benefits are small because of their comparatively short service. If the inquiry were extended to include those with up to twenty years' service, there would inevitably be borderline cases who would feel aggrieved; in other words, it would be impossible to draw a line. Furthermore, benefits also vary according to salary on retirement or total net income; therefore, in trying to estimate the size of the problem, the Council has selected as its examples the average case.

Any scheme must apply to all members of a defined group and to single out those with very low incomes on the ground that they could not have been able to save for their retirement is to introduce a compassionate element into a question which must be treated as one of equity. It might well necessitate a means test of a most searching character and an inquiry into the opportunities for making alternative provision privately.

The following hypothetical examples are intended to illustrate the position of doctors who will reach normal retiring age after ten years' service—that is, practitioners who had reached the age of 55 in the third quarter of 1948 or practitioners who were beyond this age and could not therefore qualify for a pension without being forced to apply for extension and to continue to work after the normal age of retirement. Benefits for different incomes will be roughly in proportion. All figures are approximate, and although the examples take into account the capital received as compensation, they do not take into account National Insurance benefits, private capital resources, or voluntary provision by insurance.

Case 1.—Doctor aged 55 on July 5, 1948, married, wife aged 50. Gross income £2,000.

	A Retires at 65 after 10 Years' Service	B Retires at 70 with 15 Years' Service (Extension of Pensionable Age)
1. Pension	£ 210	£ 315
2. Retiring allowance	210	315
3. Compensation	3,200	3,200
4. Joint annuity (based on 2 + 3 above)	220	245
5. Income (1 + 4 above)	430	560
6. Widow's pension	70	105
7. Widow's income (4 + 6)	290	350
(National Insurance pension 54s. weekly (husband and wife), widow's pension 32s. 6d. weekly.)		

Case 2.—Doctor, single—as above.

	A	B
1. Pension	£ 210	£ 315
2. Retiring allowance	630	945
3. Compensation	3,200	3,200
4. Annuity	380	415
5. Income (1 + 4)	590	730
(National Insurance pension 32s. 6d. weekly.)		

Case 3.—Doctor aged 55 on July 5, 1948, forced to retire in 1954 (after more than five but less than ten years' service) because of permanent incapacity. Average income £2,000.

Short service gratuity (Reg. 10)	£ 1,400
Compensation	£ 3,200
Annuity	£ 460

Case 4.—Doctor having completed ten years' service who is forced to retire through permanent incapacity—income £2,000. In these circumstances the pension of a doctor whose "aggregate service" is less than 20 years may be increased by applying a rather complex formula contained in Regulations 8 and 46.

	A Aged 45 on July 5, 1948	B Aged 50 on July 5, 1948
Net pension	£ 210	£ 210
As corrected by applying the formula in the proviso to Regulation 46.3.e.	420	315
Add annuity derived from retiring allowance plus compensation	240	290
Annual income	660	605

Note.—The pension payable under these circumstances may be considerably more if the incapacity is attributable (Reg. 9)—up to two-thirds average income (£900) at discretion of Minister.

Case 5.—Part-time specialist compulsorily retired at age 65 after six years' service and unable to qualify for pension under Regulation 46.3.e. The retiring allowance may be increased by the capital value of the death gratuity (no death gratuity being payable thereafter). Average remuneration £1,560 (actual case).

	£
Lump sum retiring allowance (the amount of his contributions plus interest)	500
Average remuneration	1,560
Less retiring allowance	500
Normal death gratuity	£ 1,060
Capital value of normal death gratuity discounted for payment in advance	800
Total net amount payable	800 + 500 = £ 1,300

It is important to emphasize that the N.H.S. Superannuation Scheme is a contributory scheme and any modification in favour of a particular group of practitioners will have to be financed by the general body of contributors. It seems almost certain that an increase in pensions (or other benefits) which could be regarded as adequate would result in reduced benefits to all other classes in the scheme or in increased contributions.

In the N.H.S. Superannuation Scheme, as in other contributory pension schemes, the benefits have in the long run to be paid out of contributions. Under Regulation 45 it is incumbent on the Minister to maintain a balance between the assets of the scheme and its liabilities. There is to be an actuarial investigation every seven years, commencing in 1955. The purpose of these investigations is to determine what adjustments, if any, are needed to maintain this balance. It follows that if provision is to be made for increased benefits to certain officers, for instance, elderly practitioners and others who would not otherwise have qualified for a pension or will have qualified only for a comparatively small pension, these additional payments may result in the reduction of benefits to other classes.

It is clear that it would be impossible to provide for supplementary benefits in a limited group of cases without challenging the whole basis of the present superannuation scheme. Even if the profession were prepared to accept increased contributions to subsidize a relatively small group within its ranks, it is doubtful whether the scheme could be amended without taking into account all non-medical contributors and also the effect on other contributory pension schemes.

Conclusions

(1) In any contributory superannuation scheme there must always be a minority who, because they are unable to qualify for a pension, or because the number of years they can serve is limited, cannot hope to receive an adequate pension.

(2) To provide for non-contributory annuities or to subsidize other benefits would challenge the whole basis of contributory pension schemes.

(3) To provide subsidies for non-contributory pensions to individuals on hardship grounds would create anomalies and would imply a means test.

(4) The financial position of a late entrant to the N.H.S. Superannuation Scheme with a practice of average size would not appear to entail hardship sufficient to justify radical revision of the principles on which the scheme is based.

APPENDIX III

MEMORANDUM TO MINISTRY OF LABOUR AND NATIONAL SERVICE ON FUTURE OF OCCUPATIONAL HEALTH SERVICES

Introduction

1. For many years the British Medical Association has sought to promote the development of health services in industry as a service complementary to, and in no way encroaching upon, the personal health services available to industrial workers outside their working environment.

2. In 1936 a Subcommittee of the General Practice Committee of the Association was appointed to deal with industrial medical matters. Ten years later this Subcommittee was replaced by a Standing Committee now known as the Occupational Health Committee. This Committee includes members nominated by the Association of Certifying Factory Surgeons and the Association of Industrial Medical Officers. Members of these two independent bodies have served also on the Planning Subcommittee of the Occupational Health Committee, which has drafted the present memorandum. Neither of these bodies, however, is to be regarded as necessarily agreeing in all respects with the policy of the British Medical Association in regard to Occupational Health Services, or subscribing to the views expressed in this memorandum. In 1939 the Association published a report entitled "First-Aid in Industry." This report stressed the importance of efficient care of industrial injuries, even when apparently trivial, and the possibility of prolonged disability due to delays in treatment. The report

recommended that in all cases the First-Aid Service should be supervised by a medical practitioner: it defined the various categories of nursing staff and auxiliary medical workers in industry; and it gave an outline of a syllabus of instruction in industrial first-aid, supplementary to a general first-aid training.

3. The arms production drive of 1940 led to a fresh recognition of the value, so clearly demonstrated during the 1914-18 war, of medical supervision in factories. In 1940 the Council of the Association believed, on both humanitarian and economic grounds, that the time was ripe for the expansion of industrial health services, not merely to meet the stress of war but as a permanent feature of the industrial organization of the country. It therefore appointed a special Committee to consider and make recommendations on the principles which should govern the medical supervision of industrial workers. The report of this "Committee on Industrial Health in Factories" was published in 1941. It urged the importance of medical supervision in all factories, large or small. It described the various functions of the industrial medical officer and his relations with other medical services, and it recommended an extension of industrial health research. An Appendix contained a concise statement drawn up by the Association in 1937 of the Duties of, and Ethical Rules for, Industrial Medical Officers. A second Appendix, contributed by the Association of Industrial Medical Officers, dealt with training in industrial medicine and included a suggested syllabus for a postgraduate diploma. A revised version of the Duties of, and Ethical Rules for, Industrial Medical Officers was published in 1949.

4. In 1946 the Association published a "Report on Rehabilitation" prepared by a special Committee. This report stressed the complementary nature of the medical and industrial aspects of rehabilitation, the importance of co-operation in this field between medicine and industry, and the need for closer liaison between the general medical practitioner, the hospital medical staff, and the Industrial Medical Officer.

5. In 1949 the Representative Body of the Association approved a report on "A Comprehensive Occupational Health Service." This recommended that the Ministry of Health should arrange surveys to ascertain the special requirements of different areas in respect of occupational health services, and should thereafter assume responsibility for planning and supervising a service of a national character closely integrated with the National Health Service and in a form acceptable to both managements and employees. Since the preparation of that report the types of occupational health services already in existence have been considered. Following a suggestion by the B.M.A., the Society of Medical Officers of Health is arranging a number of small surveys which are now being undertaken in different types of areas to ascertain the occupational health requirements of industry.

6. The Association publishes the *British Journal of Industrial Medicine*, which was instituted in 1944, and under the Mackenzie Trust it arranges biennially a public lecture on an industrial health topic. Among the scientific sections at the Annual Meeting of the Association is one devoted to Occupational Health. Finally, through its local Divisions the Association has promoted the establishment of Advisory Councils on Occupational Health in which representatives of local employers, employees, and medical practitioners discuss matters of common interest relating to health in industry.

7. *Pari passu*, there have been other pronouncements in relation to occupational health services:

1944. The Government White Paper on "A National Health Service" included a reference to industrial medical services linked with but not a part of the proposed National Health Service.

1945. The Social and Preventive Medicine Committee of the Royal College of Physicians published its Second Interim Report on Industrial Medicine.

1948. The following statement was made by the Government after receiving a deputation from the T.U.C. on the subject:

"... In short, the policy of the Government is that there should be a National Industrial Medical Service properly co-ordinated with the National Health Service as soon as there is a sufficiently large cadre of suitably qualified doctors to form a sound foundation for the establishment of such a Service; and that in the meantime steps should continue to be taken to encourage the building up of such a cadre."

1951. The report of a Committee of Inquiry on Industrial Health Services (the Dale Report) was published. In the House of Commons on February 26, 1951, the Prime Minister stated:

"The Government accept the Report generally, subject to detailed consideration of the co-ordination machinery proposed. Accordingly, although the need for the utmost economy in the use of medical manpower still persists, the suggestion I made on June 1, 1949, that further development of industrial health services should be postponed for the time being is to be regarded as being no longer operative."

Policy of the Association

8. (1) The Association is convinced of the value of occupational health services and of the importance of all practicable measures being taken to provide such services for all occupational groups, large or small, both in industry and in non-industrial occupations.

(2) The Association considers that full provision to meet special health needs of occupational groups is not made under the existing administration of the National Health Service, and that additional arrangements, closely integrated with those of the National Health Service, are necessary.

(3) The Association believes that the State should assume responsibility for giving direction to the development of an occupational health service of a national character; for exercising central supervision of such a service, preferably through the Ministry of Health, with possibly delegated responsibility to other Departments for day-to-day administration, and for providing, at least in part, the necessary financial resources.

(4) The Association considers that the precise form of a comprehensive occupational health service cannot yet be defined. It thinks that it is desirable to introduce experimental forms of service acceptable to employers, employees, and the medical and allied professions; and to arrange surveys to ascertain exactly the existing position in different regions and the special character of the further services required. The Association is continuing, through its Occupational Health Committee, to give active consideration to this problem, and is assisting in the conduct of small surveys.

Proposals for Future Occupational Health Services

9. In order to give an adequate service to industry an occupational health service should include the functions which are listed below. In carrying out these functions the Industrial Medical Officer will be greatly assisted by the existence of a nursing service, which is a necessity for industry. The medical officer, the nurse, the dressing-station attendant, the first-aid attendant, and other ancillary workers will form a team operating for the benefit of the workers and the industry. It is intended that the carrying out of these functions shall be subject to the usual professional ethical relationships.

(1) General Advisory Services to Management on

- occupational hygiene—including advice, in collaboration with technical experts, on the design, construction, and layout of buildings and machines;
- the conditions affecting the health of the workers;
- the occurrence, risk, and significance of dangerous hazards;
- medical aspects of safety precautions, including questions as to the effects and avoidance of fatigue;
- medical aspects of "employee" services, including medical inspection of canteen facilities and medical supervision of the health and hygiene of canteen workers;
- study of sickness absenteeism and questions of personal and group morale;
- the causation and prevention of industrial disease, enlisting the help of inside and outside research and technical departments;
- medical aspects of legislation on health matters which places obligations on the employer or employee.

(2) Examination of individual workers with a view to advising management as to their conditions of employment

- (a) pre-placement examinations and the examination of persons returning to work after illness or injury, with a view to determining the work on which the worker is to be employed and his fitness for it;
- (b) periodical examinations of persons exposed to occupational hazards or where a hazard is suspected;
- (c) examination of persons doing work of such a nature that ill-health or the development of certain disabilities might endanger the lives of themselves or others.

(3) Therapeutic Services

- (a) supervision of nursing services and equipment;
- (b) supervision of ancillary services—that is, chiropody—and equipment;
- (c) supervision of first-aid services, including maintenance of the efficiency of first-aid personnel and equipment;
- (d) immediate treatment of medical and surgical emergencies occurring at the place of employment;
- (e) examination and continued observation of persons, including those returning to work after absence due to illness or accident, and advice on suitable work or change of occupation;
- (f) treatment for minor conditions, in agreement with the general practitioner, in order that the worker may be enabled to continue at work.

(4) Certain General Health Services to workers

- (a) general health supervision of all employees in relation to their work and working conditions, including diagnostic or periodic health examinations in addition to those referred to in Section (2), where, for example, there is doubt as to a person's fitness to continue in a particular occupation and with special reference to (a) young persons, (b) married women, (c) elderly persons, and (d) disabled persons;
- (b) promotion of the education of employees collectively and individually in matters of general and personal hygiene;
- (c) advice to those committees within the factory which are responsible for the health, safety, and welfare of the employees;
- (d) study of work and working environment and their effects on the health of employees.

10. The Council attaches importance to the supervision of environmental circumstances in relation to employees at the place of work. To this end there is a real need for an occupational hygiene laboratory service for industry.

11. There is also a great need for more research into problems of occupational health by the Medical Research Council, Government Departments, and Universities.

12. Particularly in the small factories one of the major problems concerns the resettlement of workers after injury or serious illness. In this connexion a medical practitioner with knowledge of the processes involved can prove extremely helpful. If alternative work is not available he may be able to suggest a modification of the worker's usual job. It is inevitable that some hazards will remain in industry whatever precautions are taken, but an adequate resettlement service can greatly assist in fitting the man into the job or modifying the job for the man.

13. The placement of disabled persons is another important problem which requires experience in assessment of capacity, not in general terms, as is more usually required in general medical practice, but in relation to the requirements of industry. Such assessment can best be made by practitioners with experience in industry. Liaison should be maintained with the Disablement Resettlement Service of the Ministry of Labour.

14. The Association has already expressed the view that before the establishment of any comprehensive occupational health service there is need for surveys and experimental services. From these surveys and experiments it may be possible to determine whether it would be preferable to provide occupational health services for selected types of industries only, or a basic service applicable to all workers. It may also be shown whether there is need for priority in any group or area for the establishment of a service. In any event, it is considered that there should be central supervision of any comprehensive occupational health service and it should have an administrative link with the National Health Service.

15. Under the Factories Acts there are certain statutory requirements for medical examinations and inspections, but, in the view of the Council, the Medical Inspectors of Factories are too few in number to supervise all these provisions. An enlargement of this Medical Inspectorate would bring about a greater enforcement of powers already in existence and is urgently required. This would lead to an expansion of occupational health services in industry.

16. It is the view of the Association that occupational health services should normally be available to all workers, but it recommends that as a first step the Government should consider the introduction of legislation requiring the occupiers of factories employing 51 or more workers to provide and maintain, in such form and in such degree as required and approved by a Central Supervisory Authority, their own occupational health services. (This would involve, at most, 22,694 out of 243,769 factories (see Dale Report), some of which already have their own occupational health services). There are certain occupations which, irrespective of the size of the factories, require general medical supervision. In such cases regulations could provide for the necessary arrangements to be made.

17. It is desirable that the appointment of the Medical Officers should be made by the management, but the conditions of the appointment should be in conformity with principles enunciated by the Central Supervisory Authority, to which both parties should have the right of appeal in the event of a dispute. In many instances general practitioners, public health medical officers, and others would be able to provide the necessary medical supervision, on a part-time basis, and employers should be encouraged to make use of their services.

18. The Association believes that supervision of such a service should be unified and co-ordinated. Unification at the centre whereby an Occupational Health Service is under the general direction and supervision of the Ministry of Health, together with full co-ordination of all interests at the periphery, would produce a service which would be of the greatest benefit to the nation.

19. An Occupational Health Service must have close relation to the General Medical Services, the Consultant Services, and the Public Health Sections of the National Health Service. The Consultant and General Medical Services are at present predominantly concerned with treatment of the patient when sick, which field, apart from emergencies, is not considered to be the province of an Occupational Health Service. On the other hand, the Public Health Service has a special responsibility towards the prevention of disease and ill-health and has special statutory duties in this direction.

20. The Council has given careful thought to the part to be played by local authorities in any Occupational Health Service. The Council appreciates that the local authorities, under the Factories Act, 1937, are charged with the enforcement of provisions as to sanitary conveniences in all factories and as to certain other environmental conditions in respect of any factory in which mechanical power is not used. They also have responsibilities in relation to premises and employees not covered by the Factories Acts, and they have other health functions which may have a direct bearing on the development of occupational health.

21. This would seem to imply that the Public Health Service has an important contribution to make to the development of an Occupational Health Service and may be the principal agent of co-ordination at the periphery. The closest relationship should be established between the Factory Medical Inspectorate, the Department of the Medical Officer of Health, and the School Health Service.

22. So far as their contributions to the promotion of occupational health in any future Occupational Health Service of a national character are concerned there should be integration of the three divisions of the National Health Service. The closer the relationship between an Occupational Health Service, the Public Health Service, and the

National Health Service, the less likelihood there is of overlapping of function.

23. At the present moment it is agreed generally that an Occupational Health Service is of great national importance. Its development should be encouraged, independently of the National Health Service, but co-ordinated with it. Such a Service requires suitably qualified consultants, specialists, research workers, and whole- and part-time industrial medical officers.

24. It seems also evident that suitably trained and experienced personnel are insufficient in number to form a comprehensive service at the present time. But the provision of the medical component of a comprehensive Occupational Health Service would be much encouraged with every step taken towards the development of a service.

25. If there is not to be further delay the first step must be more general recognition that occupational health should no longer be looked upon as something ancillary to a personal health service. The service should be able to provide conditions of service and opportunities for promotion not less favourable than those in other branches of medicine.

26. With this achieved, sufficient recruits of the necessary quality should be forthcoming to provide an adequate occupational health service. The Association regards this as an urgent matter without prejudice to the subsequent development of the service.

APPENDIX IV**MEMORANDUM ON MEDICAL STANDARDS FOR ROAD, RAIL, AND AIR TRANSPORT****Introduction**

1. A request for general advice on the suitability of diabetics to drive buses was received by the Association from the Minister of Transport. At the same time a similar problem was raised by a member of the Association regarding railway locomotive drivers. Two cases were quoted. The first concerned a bus driver in the provinces who was apparently fit on initial examination, but who was subsequently discovered to be receiving injections of insulin four times a day. The second was of a recent railway accident in which, happily, there was no loss of life, but which was due to the driver of the locomotive passing into diabetic coma.

2. These matters were referred to the Occupational Health Committee, which decided that it would be opportune to review the whole question of medical fitness as related to the safe handling of various forms of transport and not to confine attention to the study of diabetics alone. A Subcommittee was therefore appointed with the following terms of reference:

To examine, in the interests of public safety, the medical standards required for drivers and others concerned with the operation of all road, rail, and air transport, and to make recommendations.

3. The members of the Subcommittee were as follows:

L. G. Norman (Chairman).

H. Alexander.	R. M. S. McConaghey.
J. Bishop Harman.	J. A. A. Mekelburg.
A. Buchanan Barbour.	D. S. Pracy.
R. Forbes.	T. D. Spencer.
G. E. Graves Peirce.	J. A. L. Vaughan Jones.
T. C. Hunt.	P. J. Webb.

Advice was also received from Myles L. Formby, T. Rowland Hill, T. P. Rees, and P. D. Trevor Roper.

4. The above terms of reference relate to the medical standards of rail and air transport in addition to road transport. Brief consideration only has, however, as yet been given to the first two groups. Both the railways and the airlines have their own medical services, and it is acknow-

ledged that they are consequently in a far better position than many road transport undertakings to review their own medical standards. In addition, so far as the airlines are concerned, the medical standards for aircrew are laid down by international agreement through the International Civil Aviation Organization, which is a Government body. It is understood that these standards are constantly under review.

5. Some comments on existing standards for rail and air transport are set out briefly below:

Eyesight examinations at regular intervals for footplate staff and signalmen are required to be undertaken from the age of 50 upwards. Examinations also take place at earlier ages on promotion. Medical re-examination does not at present take place until the age of 60. Although a high standard of medical fitness on appointment is ensured by the railway medical officers, it is felt that the arrangements for re-examination could well be strengthened by requiring a full medical re-examination every five years. In cases of absence due to prolonged sickness there should be additional examinations. Insufficient information is available to enable comment to be made on the existing standards for aircrew, but the insistence on annual re-examination (every six months for pilots) and the rigid adherence to a high standard of re-examination after accident or sickness has been noted.

6. Although it is probable that the major causes of accidents lie more commonly in such factors as fatigue, inattention, and carelessness than in detectable illness, the Committee considered that a general examination of the question of medical fitness should be undertaken with a view to making recommendations regarding safety standards. The question of alcohol in relation to driving, which has been, and continues to be, dealt with elsewhere has not been considered.

7. Information on eyesight and medical standards at present in use together with the requirements, if any, for periodic or special re-examination was received from 20 undertakings and authorities (including the armed Forces) responsible for the operation of road, rail, and air transport. In addition the forms of application for a licence to drive public service vehicles (Forms P.S.V. 15, 15A, and 15B), private cars (Form D.L. 1), and London taxis (Forms P.C.O. 296, 296A, 297, and 9) were studied.

8. The information thus obtained was examined under the following broad headings: (1) visual standards; (2) hearing standards; (3) physique; (4) general medical condition, including emotional stability; and (5) frequency of examinations.

9. Inquiries were made of certain insurance companies from which it appears that records, which might indicate an association between medical defects and accidents, are not maintained. One or two insurance companies did compile statistics at one time, but found that insufficient evidence was forthcoming on which to base any modification of policy. The Committee has been singularly unsuccessful in its search for evidence revealing medical and surgical conditions as a common cause of accidents. If, however, it is accepted that the majority of accidents are due to such factors as impaired concentration, fatigue, errors of judgment, and emotional instability, then most accidents must be attributed to medical or psychological causes. These causes may operate in the case of others concerned in accidents quite apart from the drivers, although of course primary responsibility for the avoidance of accidents is placed on the person who drives the vehicle.

10. Certain medical conditions of sudden onset render a driver incapable of remaining in control of his vehicle and result in the possibility of a serious accident. This possibility is sufficient justification for insisting on the exclusion of drivers suffering from medical conditions which may constitute an ever-present but hidden danger. It is not an easy matter to decide which diseases fall into this category; certain of them are generally discussed in paragraphs 43-50.

11. The medical examination required before a licence to drive a public service vehicle is issued may be carried out by any registered medical practitioner. This means in prac-

tice that any one practitioner may be called upon only occasionally to undertake this type of examination, without the essential requirements as regards safety having been placed constantly before him. It is therefore recommended that the attention of all practitioners should be drawn to the essential features of this Memorandum.

12. It was noted with satisfaction that a high standard of medical and eyesight requirements is maintained by the London Transport Executive in the case of drivers of passenger transport in London. Indeed, the standards for periodic medical and eyesight examinations now applicable in the London area might with advantage be extended so as to apply to the remainder of the country (see also para. 32).

13. Medical examinations of passenger road service drivers in London take place on the following occasions, in addition to those required before issue and renewal of the public service vehicle driver's licence:

(a) on return to work as driver after 28 or more days' absence due to sickness; (b) on return to work as driver after three or more days' absence due to accident on or off duty; (c) on reaching the age of 65, and annually, thereafter, if still employed as a driver; (d) at any time at the request of the supervisor if there is any reason to suppose that a driver's state of health may be affecting his safety; (e) whenever a driver is stated to be suffering from epilepsy, fainting, heart disease, or vertigo whether he has been absent from duty or not; (f) of eyesight only at the ages of 50, 55, 58, 60, 62, 64 (and annually thereafter as part of the general medical examination).

The Application Forms for a Licence to Drive Public Service Vehicles (P.S.V. 15 and P.S.V. 15A)

14. Form P.S.V. 15 consists of a declaration by the applicant and includes the following question:

Do you suffer from epilepsy, or from sudden attacks of disabling giddiness or fainting, or from any disease, mental or physical, or disability likely to interfere with the efficient discharge of your duties as a driver or to cause the driving by you of a public service vehicle to be a source of danger to the public?

This question is on a form separate from the medical report form (P.S.V. 15A) and is not necessarily seen by the medical practitioner examining the applicant. The Committee observed that the question refers to the applicant's present condition and makes no reference to his past medical history. There is no reference to "blackouts," petit mal, or diabetes.

15. Form P.S.V. 15A comprises six questions to be answered by the medical practitioner, and involves a full clinical examination. There is, however, no specific requirement for a urine test or any mention of diabetes.

16. In addition to the examination of limbs, heart, lungs, vision, and hearing, the medical practitioner is required to state whether the applicant shows any evidence of addiction to excessive consumption of alcohol, tobacco, or drugs, and whether he is suffering from "any other disease or physical disability likely to interfere with the efficient discharge of his duties as a driver or to cause the driving by him of a public service vehicle to be a source of danger to the public." The medical standards required for the issue of a P.S.V. licence are not stated on the form, nor, as far as the Committee is aware, are they given in any other published document. The decision as to the applicant's fitness to drive is thus left to the discretion of the examining practitioner. It is therefore felt that in some circumstances examining practitioners may have difficulty in assessing the fitness to drive of an applicant for a P.S.V. licence. A note should be included on Form P.S.V. 15A inviting the examining practitioner to recommend a second opinion in cases where he considers this necessary, stating the reasons for making this suggestion. In addition, a question should be added to Form P.S.V. 15A inviting the examining practitioner to indicate those applicants who should be re-examined periodically.

17. If the visual acuity is below 6/12 in one eye and 6/36 in the other with glasses, or if the field of vision is "un-

satisfactory" (which presumably means restricted) a statement is required of the practitioner as to whether or not he considers the applicant's driving of a public service vehicle is likely to be a source of danger to the public.

18. In the opinion of the Committee, Forms P.S.V. 15 and 15A should be on a combined perforated form, and the latter form, after completion, should be detached and sent direct to the Licensing Authority by the examining practitioner. It is realized that this amendment of the present arrangements would presumably involve the payment of the fee for the examination and report by the licensing authority instead of by the applicant. The questions put to the applicant should include a reference to the past medical history, and also to "blackouts," petit mal, and diabetes. It is clearly necessary for the examining practitioner to know the answers given to these questions. He should also be able to assess each applicant against standards which should be indicated where possible. At present much is left to the personal opinion of practitioners who may have received no official guidance in the matter. A revision of Form P.S.V. 15A to include the Association's recommendations is attached as a Sub-appendix.

19. Similar considerations to those discussed in paragraphs 14-18 apply to the drivers of trams and trolley-buses.

20. In the London area applicants for a licence to drive a public service vehicle are required by the licensing authority—that is, the Commissioner of Police—to be medically examined at the time of first application and at the licence renewal date nearest the fiftieth birthday and every six years thereafter until 65, then annually. The London Transport Executive has additional requirements for periodic re-examinations, as stated in paras. 12 and 13. Outside the London area no re-examination is compulsory, but some individual undertakings themselves require certain re-examinations.

Passenger Transport Undertakings in General

21. From the information obtained from a number of passenger transport undertakings, it appeared that, in general, the minimum medical requirements complied with those for public service vehicle drivers as mentioned above. Some companies require a higher standard of visual acuity and some require accurate colour vision; one undertaking insists on normal hearing in the right ear.

22. In some areas there are provisions for re-examination after sickness or accidents, sometimes rather vaguely laid down. The Committee thinks it desirable that appropriately spaced re-examination should be applied by undertakings throughout the country. There should not be too much rigidity as to the period of sickness after which re-examination is necessary. To lay down a period of sickness may give a false sense of security, as in certain circumstances re-examination may be imperative after a very short illness.

23. In making the above recommendations the Committee is aware that statistics published by the Road Research Laboratory suggest that public service vehicle drivers have fewer accidents per million vehicle miles than any other drivers on the road. The Committee nevertheless feels that, in view of the special responsibility of P.S.V. drivers for large numbers of passengers, the arrangements for medical examination of these drivers should be particularly thorough.

Heavy Goods Vehicle Drivers

24. Prior to 1940 there was a regulation that an applicant for a licence to drive a heavy goods vehicle was required to undergo a medical examination. This requirement has not been reimposed. Despite wide differences between the two services, the Committee could not avoid drawing comparison between the rigid medical requirements for air pilots and the complete absence of medical standards for heavy goods vehicle drivers. Little evidence has so far been collected in regard to the relationship between accidents and medical conditions in drivers, but there must be an increased risk of accident, particularly where heavy goods vehicles are concerned, if the driver is suffering from any condition

which may cause a sudden collapse or impairment of his mental alertness. For this reason it is recommended that drivers of heavy goods vehicles should be medically examined before a licence is issued and that periodic medical examination should take place on the same basis as recommended above for P.S.V. drivers, the standard of medical examination being the same as for P.S.V. drivers.

Private Car Drivers

25. As on the P.S.V. driver's licence form, the application form for a licence to drive private cars and similar vehicles (D.L. 1) contains no reference to past medical history, to "blackouts," petit mal, or diabetes.

26. Owing to the fact that about five million licences are issued or renewed every year it is impracticable for drivers of private cars to be given periodic eyesight tests or medical examinations.

27. There is probably a number of drivers who, by reason of medical defect, constitute a potential danger to public safety on the roads. Defects of eyesight probably account for a considerable proportion of these. The dangers may not be realized by those with limitations or defects, particularly where the defect is insidiously progressive. Increased publicity and encouragement to seek medical opinion when in doubt should do much to bring the dangers home to the consciences of drivers. This should be supported by the laying down of certain minimum standards, particularly as to vision, below which a person should not be allowed to drive. The application of such standards by medical practitioners called on to advise would have the effect of removing a number of potentially dangerous drivers from the road.

28. The Committee suggests that in a case where a driving licence has been suspended, before its restoration is approved the Court should have power to require a medical certificate to the effect that the applicant is medically fit to drive, and such certificates should normally be required as a routine.

Visual Standards

Visual Field

29. As described in paragraph 15, Form P.S.V. 15A requires a statement that there is a satisfactory visual field. This is also a requirement of certain transport undertakings, but it is far from being universal. The Committee believes that in the case of drivers of all types of vehicle there should be no serious diminution of the normal visual field made apparent by a hand confrontation test. If there is such a diminution reference should be made to an ophthalmologist for an opinion as to fitness to drive. In certain ophthalmic conditions the individual can read a number plate at 25 yards, but the visual field is so restricted as to render the driving of a vehicle by that individual a potential source of danger.

Visual Acuity

30. The Committee believes that the wearing of spectacles in itself does not constitute any sort of danger, except in cases of extreme myopia where the thickness of the lenses may slightly interfere with the peripheral vision, and therefore any consideration of visual acuity should allow for correction by spectacles. In cases where the P.S.V. visual standard of 6/12, 6/36 is not reached without spectacles the Committee notes a requirement by one or two undertakings that driving is only permitted if the driver's record is endorsed "spectacles must always be worn when driving." In long-distance driving particularly, where the uncorrected vision is less than 6/12, 6/36, the carrying of a spare pair of spectacles should be insisted upon.

31. The P.S.V. standards appear to require a visual acuity corrected to at least 6/12 in one eye and 6/36 in the other. It is noted that some undertakings, particularly those operating city passenger services, insist on a considerably higher standard on recruitment. Since rapid deterioration may take place a recruitment standard well above the minimum requirement is highly desirable in order to allow for deterioration.

32. The Committee believes that a test of the vision of drivers of public transport every five years would represent a considerable step in the direction of safety. There should be a minimum standard of 6/9 corrected in one eye and 6/24 in the other for drivers of public transport and heavy vehicles.

33. The reading of a motor-car number plate at 25 yards is equivalent to a visual acuity of 6/12 using both eyes together. This appears to be an adequate standard for drivers of private cars, provided that the visual fields are satisfactory, as discussed in paragraph 29.

34. The driver with monocular vision is clearly at a disadvantage even though the loss of visual field is less than might be expected. The Committee believes that drivers whose vision is restricted in this way should not be recruited for driving public service or heavy goods vehicles. On the other hand, an experienced driver whose sight fails gradually in one eye should not necessarily be prohibited from driving even when he has become virtually one-eyed.

Colour Vision

35. It is interesting to note that normal colour vision is not required of the majority of drivers of public vehicles. Colour vision is not mentioned on Form P.S.V. 15A. It is insisted upon with drivers operating at certain airports. The Committee is unaware of any accidents that have occurred as a result of inability to distinguish traffic lights. The reason for this may well be that the red light is always placed at the top, and even the colour-defective can usually detect whether it is this or the bottom light that is shining. If, at any time, proof were forthcoming that accidents were caused by inability to distinguish between the red and the green lights the possibility of a different shape for the two would need to be considered. In view of the fact that about 4% of men are red-green colour defective, the Committee recommends that a British Standard Specification be prepared for traffic-light colours and that, in this connexion, consideration should be given to the suggestion that the green light should contain a strong blue component.

36. Where an accident has occurred which raises some doubt as to the visual acuity of the holder of a licence to drive a private vehicle it is desirable that he should undergo a general visual test, including a test of colour vision.

Hearing Standards

37. Form P.S.V. 15A inquires whether there is "any serious defect of hearing." Certain undertakings require "near normal" or good hearing in one ear, the right ear being specified by one undertaking.

38. The Committee is advised that hearing may sometimes be more acute in the roar of traffic than in the hush of the audiometer room. It is doubtful whether driving safety is materially affected by the absence of such higher degrees of auditory perception as are required to hear a whispered voice in a still room at a considerable distance.

39. The Committee agrees with the view expressed to it by a consultant in ear diseases that, while good hearing is an undoubted asset to a driver, it is by no means essential. Driving should be visual rather than auditory. In countries in which driving is on the left side of the road hearing in the right ear is sometimes regarded as being more important than in the left. On the other hand, the importance of this must not be exaggerated, for, whichever side the defect, unilateral deafness results in some difficulty in locating a source of sound.

40. It is unlikely that the development of impairment of hearing in a competent and experienced driver will constitute a danger or even detract from his driving ability. The Committee is in no doubt that in the interests of safety an applicant for a P.S.V. licence whose hearing is defective should be subjected to a driving test before the licence is granted.

41. Deafness must be regarded as a handicap, and consequently to entail a slightly added risk to the ordinary

hazards of the road. The Committee does not consider that deaf persons should be encouraged to drive, but believes that some advantage would result were those deaf persons who elect to take up driving taught and tested by deaf drivers of experience.

General Physique

42. Three of the undertakings consulted lay down height standards for drivers. These are presumably to ensure that a driver is not so tall or so short that he cannot achieve a comfortable position which gives him adequate and unhampered control of the vehicle.

Medical Conditions Barring Acceptance or Given Special Consideration

43. The Form P.S.V. 15A seems to demand a general cover by asking, in the final question to the examining practitioner, whether the applicant suffers from any disease or disability likely to interfere with the efficient discharge of his duties or to cause danger to the public. The wording is similar to that in the regulations made under the Road Traffic Acts and is concerned only with the efficiency of a driver in relation to his driving duties and not with his efficiency as an individual employee.

44. The requirements of many authorities mention certain conditions as barring acceptance as drivers. The Committee has sought to eliminate from its considerations those conditions which are an obvious bar because they will result in recurrent sickness or inefficiency in the performance of duties. The conditions listed below are those which appear to the Committee to carry with them a possibility of danger.

Cardiac Disease, Including Coronary Thrombosis (Previous Attack) and Angina Pectoris

45. The Committee believes that in the majority of cases it is possible for a driver who has recovered from an attack of coronary thrombosis to have safe charge of a vehicle. Available evidence suggests that the victim of a coronary occlusion usually but not always experiences sufficient warning to apply the brakes and disengage the gear of the vehicle before the final collapse overwhelms him. Nevertheless it would appear that a person who has been the subject of a confirmed coronary thrombosis is more liable to a further attack, and, in view of this, there is additional danger if he drives. It is therefore recommended that such an individual should be debarred from driving a public service vehicle.

46. Aortic regurgitation renders the patient liable to attacks of fainting; sufferers should not drive passenger or goods vehicles and practitioners should advise drivers of private cars in accordance with the severity of the condition. Cases of fainting attacks must be considered on their individual merits, but the examining practitioner should always advise his patient on the side of safety.

Hypertension

47. With a severe degree of hypertension the possibility of a cerebral accident is always present and there is some risk of sudden collapse. The Committee believes that careful and repeated appraisal of the patient's condition should therefore be made in drivers of passenger and heavy goods vehicles in cases where the blood pressure is raised above the normal limits.

Epilepsy

48. The Committee is in no doubt that anyone known to be the subject of epileptic fits, whether grand mal or petit mal, should not drive any type of vehicle. There seems little doubt that a number of drivers suffer from minor forms of epilepsy and consequently should not be driving, and in some cases neither they nor their relations or doctors are aware that such a condition exists. On the other hand, there is no doubt that there are some epileptics driving today who are aware that they have epilepsy. They rely on

the fact that an aura may warn them in time to prevent an accident. The Committee again stressed the desirability of clarifying the question relating to fits, giddiness, etc., on Forms P.S.V. 15, 15B, and D.L. 1, so that much fuller information may be obtained as to past medical history and the purport of the question may be made crystal clear to the applicant answering it. The Committee considered the desirability of the provision of special facilities for electroencephalographic examination in doubtful cases after accident in the presence of a sufficiently strong suspicion of epilepsy, but it must be stressed that only positive findings are of value in such examinations. A negative finding does not eliminate epilepsy, and the most important factor in accurate diagnosis of this condition is the obtaining of a neurologist's opinion, together with an accurate history not only from the subject himself, but also from relatives, friends, and eye-witnesses of attacks.

Vertigo

49. All forms of giddiness require careful consideration, but, in general, the existence of recurring attacks of sudden vertigo, such as Ménière's disease, should debar from driving unless of very slight degree.

Diabetes

50. The Committee has considered carefully the question of the diabetic driver, and it is quite clear that wide variations of opinion exist. There are those who say that no one taking insulin should be permitted to drive either a public or a private vehicle because of the danger of hypoglycaemic coma. This may be induced by an overdose of insulin or by added exertion due, for instance, to the changing of a wheel. On the other hand, there are those who consider that a co-operative well-controlled diabetic who is fully aware of the consequences of over- or under-dosage of insulin can be regarded as safe to drive. Great risks may be run by long-distance goods drivers due to irregularity in meals or incorrect injections of insulin. Whilst some are of the opinion that although the fully stabilized diabetic taking average doses of insulin can be safely allowed to drive, those taking large doses—for example, 50 units a day—or who are not well controlled should be automatically barred. It seems clear to the Committee that anyone suffering from diabetes who wishes to drive should be given careful individual consideration and kept under periodic review. In general, the Committee agrees with the opinion expressed by the Diabetic Association to the effect that great care is necessary in all instances where persons are suffering from diabetes, especially when taking insulin. Every effort must be made to ensure that those persons understand the possible causes of hypoglycaemic attacks and how they can be prevented by the regular intake of carbohydrates in their usual meals. The need for punctuality in meals is stressed and also the need to carry extra carbohydrates to guard against the possibility of unusual exertion or the unavoidable postponement of a meal. The Committee stresses that a very considerable proportion of the burden of responsibility in this connexion rests with the patient himself; in other words, the most likely interference with safety might come from failure of the patient to observe the rules. The Committee also agrees that a doctor who is not satisfied that a particular patient is able to recognize the symptoms of hypoglycaemia should advise that patient strongly against applying for a driving licence.

Other Conditions

51. In addition to the diseases which are mentioned above the Committee has considered certain other conditions which might interfere with safety in driving. The Committee reviewed such conditions as clouded judgment and general ineptitude or inefficiency, which can be induced, for example, by the taking of drugs. The Committee believes that such factors should be taken into account in any medical standard. It noted with interest that one undertaking debar from

driving any person who takes phenobarbitone or anti-histaminic drugs. In the case of the former there is an obvious double danger in that the individual might be an epileptic taking a maintenance dose of phenobarbitone. Another point on similar lines was made by the mention of exhaustion. The Committee was informed that a driver of a Continental holiday bus might be required to drive 300 miles in a day, as the national restrictions on the permissible number of hours' driving do not apply abroad. The Committee felt that the attention of the Ministry of Transport should be drawn to the possibility of dangerous fatigue occurring in drivers under such conditions.

Research

52. The Committee noted that there was almost no evidence available as to the relationship between medical conditions and accidents. In the standard accident coding form used by the police and prepared by the Ministry of Transport there are spaces for recording illness in the driver(s) concerned, but it is doubtful whether this would give any clear evidence. The Committee considered that research should be intensified into the relationship between accidents on the roads and the physical and mental fitness of drivers, possibly by the detailed investigation of a relatively small number of drivers concerned in accidents, and that the views of the Medical Research Council should be sought on this matter.

Summary of Recommendations

Public Service Vehicle Drivers

1. It is recommended that the attention of all medical practitioners should be drawn to the contents of this Memorandum. (Para. 11.)

2. It is recommended to the Ministry of Transport that:

(a) Question 2 on Form P.S.V. 15 should include a reference to "blackouts," petit mal, and diabetes, and be reworded in order to cover past as well as present disabilities. (Para. 14.)

(b) Question 3 on Form P.S.V. 15B should be similarly revised. (Para. 14.)

(c) A note be added to Form P.S.V. 15A inviting the examining practitioner to recommend a second opinion in cases where he considers this is necessary and stating the reasons for making this suggestion. (Para. 16.)

(d) A question be added to Form P.S.V. 15A inviting the examining practitioner to indicate those cases in which he considers re-examination should take place at periodic intervals. (Para. 16.)

(e) Forms P.S.V. 15 and P.S.V. 15A, the latter amended in the form set out in the Sub-appendix, should be on a combined perforated form, in order to ensure that the applicant's statement is seen by the examining practitioner. (Para. 18.)

(f) Form P.S.V. 15A when completed by the examining practitioner should be detached and sent by him direct to the Licensing Authority, by whom the fee for the examination and report should be paid. (Para. 18.)

3. It is recommended that the following standards should apply in regard to applicants for Public Service Vehicle Driving Licences:

(a) Where a hand-confrontation test suggests that there is any serious diminution in the normal visual field, applicants should be referred to an ophthalmologist. (Para. 29.)

(b) The minimum visual acuity, corrected with spectacles if necessary, should be 6/9 in one eye and 6/24 in the other. Though new applicants with only one eye should not be accepted, the position of experienced drivers who gradually lose the sight of one eye should be dealt with individually, on merit. (Paras. 32, 34.)

(c) Applicants for licence renewal who suffer from defective hearing should be subjected to a careful driving test. (Paras. 37-41.)

(d) Applicants who have been the subject of a confirmed coronary thrombosis, or who suffer from aortic regurgitation or recurring sudden vertigo, should not be accepted. (Paras. 45, 46.)

(e) Applicants with blood pressure above the normal limits should be given careful and repeated assessment. (Para. 47.)

4. It is recommended to the Ministry of Transport that medical re-examinations for Public Service Vehicle drivers should take place throughout the country on the lines

applied by the Licensing Authority in London. In addition, examinations of the eyesight of P.S.V. drivers every five years would be a further step in the direction of safety. (Paras. 20, 22, and 32.)

5. It is recommended that transport undertakings outside the London Area which do not at present have such standards for periodic medical and eyesight examinations might usefully adopt those of the London Transport Executive. (Paras. 12, 13.)

Heavy Goods Vehicle Drivers

6. It is recommended to the Ministry of Transport that applicants for a heavy goods vehicle driving licence should be medically examined before the initial licence is granted, and be re-examined periodically; both examinations being on the same basis as recommended for Public Service Vehicle drivers. (Para. 24.)

Private Car Drivers

7. It is recommended to the Ministry of Transport:

(a) That Question 15 on Form D.L. 1 be amended to include a specific reference to "blackouts," petit mal, and diabetes, and to cover past as well as present disabilities. (Para. 25.)

(b) That increased publicity should be given to the need for private car drivers to seek a medical opinion when in any doubt about their fitness to drive. (Para. 27.)

(c) That sufferers from aortic regurgitation should be advised by their medical practitioner not to drive when the severity of the condition constitutes a possible danger to other road users. (Para. 46.)

General

8. It is recommended that where a driving licence has been suspended, the Courts be given power to require a medical certificate of fitness to drive before the licence is restored, and that such certificates be required as a routine. (Para. 28.)

9. It is recommended that where the uncorrected vision of a P.S.V. driver is less than 6/12, 6/36, he should carry a spare pair of spectacles, particularly on long-distance driving. (Para. 30.)

10. It is recommended to the British Standards Institution that a British Standard for traffic-light colours be prepared, and consideration be given to the suggestion that the green light should contain a strong blue component. (Para. 35.)

11. It is recommended to the Ministry of Transport that where a deaf person elects to take up driving, both training and testing should be given by deaf drivers of experience. (Paras. 37-41.)

12. It is recommended to the Ministry of Transport that no person who is subject to epileptic fits, whether grand mal or petit mal, or recurring sudden vertigo, should be permitted to drive any type of vehicle. (Paras. 48, 49.)

13. It is recommended that facilities should be made available for the obtaining of a neurologist's opinion after accidents where a sufficiently strong suspicion of epilepsy exists. (Para. 48.)

14. Persons suffering from diabetes and receiving insulin injections should not be accepted for driving passenger or heavy goods vehicles in the first instance; when trained and experienced drivers develop diabetes which is treated with insulin, each individual case should be treated on its merits. (Para. 50.)

15. It is recommended that the Diabetic Association and the Ministry of Transport be informed of the Committee's view that diabetics wishing to drive require careful individual consideration and should be kept under periodic medical review. (Para. 50.)

16. It is recommended to the Ministry of Transport that attention be directed to the possibilities of danger arising due to fatigue occurring in Continental holiday bus drivers who may drive for abnormally long hours. (Para. 51.)

17. It is recommended that the views of the Medical Research Council be sought on the advisability of research being intensified into the personal factors responsible for accidents on the road. (Para. 52.)

SUB-APPENDIX

Form P.S.V. 15A.

NOTE.—This form, when completed, must be detached and forwarded by the medical practitioner to the Licensing Authority.

ROAD TRAFFIC ACTS, 1930 to 1947

I CERTIFY that I have to-day submitted myself for medical examination and agree that the report shall be submitted to the Licensing Authority.

Signature of applicant

(To be signed in the presence of the Medical Practitioner signing the report.)

Application by
residing at
for a LICENCE TO DRIVE A PUBLIC SERVICE VEHICLE.

DESCRIPTION OF APPLICANT

These particulars must be filled in before the Certificates below are completed.

Age Height
Colour of eyes Colour of hair
Complexion

CERTIFICATE OF PRESENT OR LAST EMPLOYER

NOTE.—If this certificate is not completed, the applicant must give the reason. If inability to complete this certificate is due to service in H.M. Forces you should forward your documents of release or discharge with your application; they will be returned as soon as possible.

I, the undersigned, hereby certify that the above-named applicant
* (was employed by me from to) as a
{ has been employed by me since }

*Strike out whichever is not applicable.

NOTE.—If any person for the purpose of obtaining the grant of a licence to himself or any other person knowingly makes any false statement, he becomes liable to a fine not exceeding £50 or to imprisonment for a term not exceeding six months, or to both such imprisonment and fine.

CERTIFICATE OF CHARACTER

NOTE.—If for any reason the applicant is unable to have this certificate completed, he should state the reason and forward such evidence of good character as he can.

To be completed by a householder or ratepayer, not a near relative, and by a Minister of Religion, Schoolmaster, Lawyer, Bank Officer, Senior Public Official, or other responsible person, who has known the applicant personally for the past three years.

I, the undersigned, hereby certify (see note below) that the above-named applicant has been known to me personally during the period stated opposite my name and that he is sober, honest, of good character, cleanly in his person and civil in manner and behaviour. In my opinion, he is a suitable person to be licensed to drive a public service vehicle.

I also certify that the signature of the applicant appearing opposite my name was written by him in my presence.

Signature of Applicant (to be Signed in Presence of Recommender)	Signature and Qualification of Person Recommending and Date	Address of Person Recommending (Please write clearly)	Period during which Such Person has Known the Applicant
			From To
			From To

NOTE.—If any person for the purpose of obtaining the grant of a licence to himself or any other person knowingly makes any false statement, he becomes liable to a fine not exceeding £50 or to imprisonment for a term not exceeding six months, or to both such imprisonment and fine.

MEDICAL REPORT (back of form)

(To be completed by a registered medical practitioner)

NOTE.—This report is not one which must be issued free of charge as part of the National Health Service. The Licensing Authority will pay the fee direct to the examining practitioner.

Question	Answer
1. Is the applicant, to the best of your judgment, subject to epilepsy, vertigo, sudden attacks of disabling giddiness or fainting, or any mental ailment likely to interfere with the efficient discharge of his duties as a driver of a public service vehicle?	1.
2. Has the applicant any deformity, loss of members or physical disability likely to interfere with the efficient discharge of his duties as a driver of a public service vehicle?	2.
(Special attention should be paid to the condition of the arms, hands, and joints).	
3. Does the applicant suffer from, or has he any history of, organic heart or lung disease or diabetes, likely to interfere with the efficient discharge of his duties as a driver of a public service vehicle?	3.
If so give details	
4. (a) Acuity of vision (with glasses if worn) by Snellens test type?	4. (a) Right eye Left eye
(b) Were the readings taken with the applicant's own glasses?	(b)
(c) Is the applicant's field of vision by hand test satisfactory?	(c)
(d) Do you consider that the applicant's vision is likely to cause the driving by him of a public service vehicle to be a source of danger to the public?	(d)
(This question need only be answered if the acuity with glasses, if worn, is below 6/9 with one eye and 6/24 with the other eye, or if the field of vision is unsatisfactory.)	
(e) Is there any serious defect of hearing?	(e)
5. Does the applicant show any evidence of addiction to excessive consumption of alcohol, tobacco, or drugs?	5.
6. Does the applicant appear to be suffering from any other disease or physical disability likely to interfere with the efficient discharge of his duties as a driver or to cause the driving by him of a public service vehicle to be a source of danger to the public?	6.
(If considered necessary the examining practitioner may request a second medical opinion; the reasons for such a request should be stated here.)	
7. Does the applicant suffer from any condition which makes it advisable for him to be re-examined periodically? If so, please give particulars.	7.

I certify that I have this day examined the applicant named overleaf, who has signed this form in my presence and who in my opinion is to drive a public service vehicle.

NOTE.—If any person for the purpose of obtaining the grant of a licence to himself or any other person knowingly makes any false statement, he becomes liable to a fine not exceeding £50 or to imprisonment for a term not exceeding six months, or to both such imprisonment and fine.

APPENDIX V

NATIONAL INSURANCE (INDUSTRIAL INJURIES)
ACT: MEMORANDUM OF EVIDENCE TO
DEPARTMENTAL COMMITTEE

The British Medical Association is a voluntary Association to which the majority of members of the medical profession in the United Kingdom belong, including many industrial medical officers. The Association welcomes this opportunity to submit evidence to the Departmental Committee which is reviewing the present provisions of the National Insurance (Industrial Injuries) Act. Amongst its Standing Committees, the Association has an Occupational Health Committee, which is concerned with matters affecting the health and welfare of persons at work and the practice of medicine in industry and allied occupations. This Committee has appointed a special Subcommittee for the purpose of preparing this Memorandum of Evidence. Particular consideration has been given to the questions on which it is understood the Beney Committee is seeking information, namely:

1. What is likely to happen if the Industrial Injuries Act were thrown open to cover all diseases of occupational origin?

(a) Is it probable that there would be a very large increase in the number of claims under the Industrial Injuries Act?

The Association believes that the throwing open of the clauses of the Act, or any widening of its scope, would result in a very large increase in the number of claims made under the Act. There are many medical conditions which in a particular case may have no known cause or origin. The same medical conditions may arise in circumstances which offer strong presumptive evidence that the circumstances are the cause of or the exciting factor in the onset of the disease. These circumstances may occur in the occupational environment, in the home, or in other environments not associated with the individual's occupation. A simple example is the case of fibrositis, which may arise seemingly spontaneously with no apparent cause or exciting factor, or may be due to a draught or sudden chilling in either the factory or the home. In all three cases the same medical condition results. It is clear that any widening of the scope of the Act would, in fact, encourage a very large proportion of sufferers from complaints in this category to claim on the offchance of attributability being conceded. The very real clinical difficulties of declaring a condition non-attributable would be a source of embarrassment and would probably mean the acceptance of a large number of claims.

(b) In what kinds of case are there prospects that a claimant whose disease and occupation are not such as to satisfy the existing conditions for prescription laid down in section 55(2) of the Act would be able to show that in his particular instance the disease was attributable to his employment?

The Association believes there will always be types of case in which, though the disease is not prescribed, the individual could show that in his particular instance the disease is attributable to his employment. An exhaustive list would require an encyclopaedic knowledge of industry, and it should suffice to mention some examples.

Raynaud's disease can be caused by constant vibration from mechanical drills. Continued exposure to excessive noise may cause deafness, particular instances being exposure to engine noise in aero-engine test-beds and the condition commonly known as "boilermakers' disease."

As a further example the attention of the Association was drawn to the occurrence of keratitis in workers in artificial-silk factories. It appears that preventive measures taken when this condition was first recorded have virtually eliminated the incidence of keratitis, but it might well be that occasionally an individual would be affected.

The Association sought to obtain detailed information on the types of illness on which claims were put forward and subsequently rejected. Detailed information and figures were obtained on the number of claims granted and the

number of successful appeals against rejection. The Association was, however, informed that a detailed analysis of rejected claims would be of no value, because whether a man made a claim or not was often fortuitous. A man might put in a claim on his own initiative without first seeking any advice, and the claim would be rejected. Had he happened to mention his intention to someone knowledgeable, his union representative or an official at the Labour Exchange, for example, he might well have been told that his illness was not one in which there was any prospect of a claim succeeding, and he would presumably accept the advice and not make a claim.

While accepting that from a purely statistical point of view the validity of such a detailed analysis was open to question the Association believes strongly that such an analysis would be of value in another way.

The number of rejected claims is considerable. An analysis of these, over a number of years might indicate trends which could well point to a new disease that should be prescribed, or accepted in certain cases. For example, an increase in the number of claims put forward for a certain condition in a certain industry should point to a careful examination of the possible hazards associated with changed conditions of work and new processes in that industry.

The Association, therefore, urges that a full detailed analysis of all claims be made, these analyses to include the correlation between each category of claim and the occupational group at risk, and the results to be made publicly available. In making this recommendation the Association believes that the publication of such figures and analyses could well constitute a valuable factor in research in industrial medicine.

The Association would encourage the establishment of a central bureau to which cases of occupational disease could be notified. At present the number of cases of industrial disease occurring in an area remains a local matter, whereas a central bureau could perform a valuable service in advising industry and in collating information from various localities and providing material for research into occupational health problems (see Sub-Appendix).

The Association believes that there may be particular dangers of industrial diseases arising in workers engaged on new processes before any hazards of the process are known. It would be impracticable for all new processes, before being introduced, to be subjected to research and test for industrial hazards. Such a requirement would delay the introduction of new and important processes and would constitute a serious interference with industry. The Association, however, does not feel satisfied that managers, engineers, and others associated with the introduction of new processes are fully aware that dangers may follow the introduction of these processes. Members of the Association engaged in industrial medicine have experienced difficulties, from time to time, on discovering that a new process has been introduced into part of a factory without it having occurred to those responsible that the process might constitute an occupational hazard. Such discovery may well be only the result of inquiry by the medical officer or by his finding two or three workers suffering from some complaint a short time after a new process has been introduced. The Association, therefore, strongly urges that steps be taken to ensure that management, industrial engineers, industrial chemists, and others concerned should be constantly aware of the need to consider the possible hazards of a new process and seek advice. The medical officer should be informed of the proposed introduction of any new process in the factory. By this means the medical officer will be immediately on the lookout for any unusual conditions arising—and may even be able to point out an obvious hazard and its prevention before any worker is affected.

Firms should be left in no doubt that they are under a constant moral obligation to watch for dangers and to seek the help of the medical officer and of any available service of expert knowledge, such as the suggested occupa-

tional health laboratory service, in anticipating them. Full implementation of section 73 of the Industrial Injuries Act is urged.

(c) *Can any guidance be given as to the approximate number of cases where claims for benefit in respect of diseases shown to be due to employment have been defeated by the requirements of section 55 of the Act and the regulations made under it?*

The Association is unable to give any guidance on this question. Such information should be in the hands of the Ministry of Pensions and National Insurance.

(d) *What are the difficulties of proof of the medical questions involved and what would be the cost of trying to obtain such proof?*

The preparation of a report on the difficulties of proof would, in the opinion of the Association, be a lengthy task which could well be carried out by the central research organization recommended by the Association.

(e) *What proportion of the additional claims which would be made would be likely to be successful?*

The Association considers that it is quite impossible to attempt to answer this question.

2. Is there any middle way, wider than the present system but short of giving general cover for all diseases arising out of work in insurable employment, which would be practicable without producing anomalies?

In answering this question, the Association has been greatly handicapped by the lack of data, but, nevertheless, it feels that if section 55, particularly the following subsections, of the National Insurance (Industrial Injuries) Act, 1946, was interpreted liberally, anomalies would not arise:

"55. (1) Subject to the provisions of this part of this Act, a person who is under this Act insured against personal injury caused by accident arising out of and in the course of his employment shall be insured also against any prescribed disease and against any prescribed personal injury not so caused, being a disease or injury due to the nature of that employment and developed on or after the appointed day.

(2) A disease or injury may be prescribed for the purposes of this part of this Act in relation to any insured persons, if the Minister is satisfied that—

(a) it ought to be treated, having regard to its causes and incidence and any other relevant considerations, as a risk of their occupations and not as a risk common to all persons; and

(b) it is such that, in the absence of special circumstances, the attribution of particular cases to the nature of the employment can be established or presumed with reasonable certainty.

3. To what extent is it desirable to use the resources of the Industrial Injuries Fund for groups of cases where the administrative cost of settling claims is high in relation to the amount of benefit eventually awarded?

Whilst regarding this as an administrative rather than a medical question, the Association feels that where prescription of a particular disease is justified, the necessary action to secure its inclusion in the Schedule should be taken, regardless of increased expenditure from the Industrial Injuries Fund.

4. Are the present conditions for the prescription of diseases, as laid down in Section 55(2) of the Act and interpreted by the Dale Committee, satisfactory? If not, how should they be amended?

As already stated in answer to question 2 above, the Association feels that, with a liberal interpretation of section 55 of the Act, the present conditions would be satisfactory. The Association wishes to point out, however, that there have in the past been difficulties in obtaining prescription of a disease where the evidence of its attributability to employment was strong. Before tuberculosis became a prescribed disease for certain groups of doctors and nurses it was necessary to make a claim at Common Law against the employer in order to secure compensation for any injury alleged to have arisen as a result of the employment. There is doubt as to whether nurses working in fever hospitals would succeed in claims for benefit in respect of diseases contracted in the course of their work, by virtue of

the special risks they run. Similar doubts apply to nurses who contract encephalitis or poliomyelitis as a result of their ordinary duties. These conditions should be prescribed in relation to occupation.

5. Has the machinery for making additions to the list of prescribed diseases worked adequately? If not, in what respects could it be improved?

The Association appreciates that the Minister must be guided by the advice of his Industrial Injuries Advisory Council. This Council has to consider in great detail any diseases proposed for prescription, and the examination of any one disease takes a long time.

It appears to the Association that this question can be answered more fully and with wider knowledge by the Trade Unions, which are more fully informed of cases of hardship resulting from a disease which is not prescribed.

Students

The Association wishes to draw the attention of the Departmental Committee to a special class of workers exposed to certain risks and yet not covered by either the National Insurance Act or the National Insurance (Industrial Injuries) Act. The class referred to are students, not only of medicine, but also of ancillary professions, masseurs, chiropodists, and others having direct contact with patients during the course of their training. The risks to which these students are exposed are at least comparable to those run by nurses, and the Association recommends that this group should be entitled to pay contributions to qualify them for benefit under the Industrial Injuries Act.

SUB-APPENDIX

In the United States there is a central Federal Laboratory Service of the U.S. Public Health Service staffed by doctors, engineers, and chemists, and having a library, statistical staff, and very comprehensively equipped laboratories. The Bureau is able to give advice on the potential hazards of any new process about to be introduced, so far as these can be estimated from previous experience. In the case of new processes they can organize experiments and advise on safety measures. These services are fully and generally freely available to industry, and have been instrumental not only in preserving and improving health but in avoiding the loss of large sums of money through faulty installation.

The pattern of this organization has been a model for every State of the Union and many other countries. These State Bureaux are often closely associated with a University. Many of the larger firms and industries have their own laboratories on a smaller scale but still with an experienced doctor, engineer, and chemist.

There is no doubt that the benefits to industrial health have been immense. Not only may employers ask for advice, but if employees think that their health is being adversely affected they are free to report to the State Service for advice. In a number of instances the employer when contacted (without revealing the source of the information) has taken the necessary steps to safeguard health and remove hazards.

Some of the larger insurance companies have their own very comprehensive occupational health laboratory services and reduce the premiums of firms which improve their sickness and accident experience. They make good conditions pay.

In this country there is as yet no comparable system. The Ministry of Labour has a laboratory staff and information service, but the scale of equipment and personnel precludes effective detailed work on a national scale. The occupational health laboratory at the London School of Hygiene and Tropical Medicine, linked with the Slough Industrial Health Service, is a small beginning from which a valuable organization might develop.

It is suggested that a system in this country might be developed parallel to the Public Health Laboratory Service, with regional occupational health teams and fully equipped laboratories linked to a teaching hospital and university

in each region under the National Health Service. This service would be intimately connected with the Medical Inspectorate of Factories, but the primary association with a teaching hospital and university would provide stimulus for research and training of all members of the health team.

Some of the State Bureaux are under the State Department of Labour and have legal powers and can apply sanctions. In most States they are under the State Department of Health and only advisory, leaving sanctions to the Department of Labour. There is much to be said for both arrangements, though perhaps the latter is less likely to make employers hesitant in seeking advice, and readiness to seek advice is of fundamental importance.

APPENDIX VI

THE GENERAL PRACTITIONER AND THE HEALTH VISITOR

The need for the closest co-operation between general practitioners and health visitors is fully accepted by the Association, and, in conjunction with the Society of Medical Officers of Health, detailed consideration has been given to the most effective means of securing this co-operation.

It is appreciated that in many areas reasonably satisfactory arrangements already exist with resultant benefit to all concerned, but it is apparent that in other areas the necessary degree of co-operation has yet to be attained.

It is the view of both bodies that harmonious relations can be established if good will and interest are shown by all concerned and if the following principles are accepted:

1. Co-operation between general practitioners and the medical officer of health and his staff regarding the health, care, treatment, and aftercare of all patients is essential.

2. The local health authority has certain statutory obligations regarding the health of the community, and the health visitor who is employed by the local health authority is under the direction of the medical officer of health. This, however, in no way prevents the health visitor from working closely with the general practitioner and under his guidance in the care of individual patients.

3. Direct consultations should take place between general practitioners and health visitors with a view to the exchange of information regarding individual patients.

4. The general practitioner is primarily responsible for the health of the individual and the family, while the health and welfare of the family in relation to the community is a responsibility of the medical officer of health and his staff. The close association of all concerned, as members of one team, is of vital importance if these responsibilities are to be adequately fulfilled.

The Association and the Society realize that to a great extent the question of co-operation is a local problem and the means by which such co-operation can be obtained are for local consideration and arrangement. It is strongly recommended that urgent consideration be given to this matter in all areas. It is only in this way that the general practitioners, medical officers of health, and health visitors can work in partnership towards that co-operation which will ensure efficient and all-embracing care for the patient, whatever his age or state of health.

Appendix

The following suggestions of some of the ways by which greater co-operation between general practitioners and health visitors could be better understood and improved may be helpful:

1. In the first place discussions to this end should take place between the medical officer of health of the local health authority, together with senior members of his staff, and representatives of the B.M.A. Branch or Division and the local medical committee.

This is essential, for the detailed arrangements will vary, not only between local health authorities but in different parts (i.e., rural and urban) of a local health authority.

Agreement on the principle of co-operation at this level should ensure full implementation elsewhere.

2. Close personal contact and exchange of information between individual general practitioners and health visitors is essential.

In this way both parties will understand and appreciate the other's duties and responsibilities.

In rural areas where the one individual is home nurse, midwife, and health visitor, there is usually that understanding between her and her G.P. colleagues. In urban areas, particularly in the large towns and cities, and where in most cases the health visitor does not act as home nurse or midwife, general practitioners do not know personally the health visitors working in the area.

3. Complaints have been made by general practitioners that at times contradictory advice is given to patients by health visitors. It is clear that this must be avoided and here close consultation and co-operation between general practitioners and health visitors is essential.

4. In addition to their statutory duties, health visitors are available, at the discretion of the medical officer of health, for visiting patients when requested by general practitioners. Full consultation between the parties will result in efficient and economic use of health visitors.

5. Many general practitioners are unaware of the many facilities which can be made available for their patients through the local authority health and welfare services. Some medical officers of health regularly circulate all general practitioners in their area with detailed information, and it is strongly recommended that this should be done in all areas. It can be of great value to the general practitioner to know what assistance can be provided by his local authority. The full use of health visitors would tend to obviate repeated visits on the part of the general practitioner and would facilitate his work by securing rapid assistance through the local authority.

In all these ways the health visitor can supplement the service of the general practitioner, and by working in partnership they can weld together both the clinical and the preventive aspects of the service, within the existing arrangements under Parts III and IV of the National Health Service Act.

6. In certain areas a health visitor has been allocated by the medical officer of health to work with a group of general practitioners. This has proved to be a satisfactory arrangement, but its practicability depends on local circumstances. It is recommended that this arrangement could well be extended wherever possible.

Scottish News

INCREASED COST OF HOSPITAL PATIENTS IN SCOTLAND

The weekly average cost of maintaining a patient in hospital in Scotland, excluding specialists' salaries and overhead charges for unoccupied beds, was £7 18s. 9d. for the year ended March 31, 1953. An analysis of the running costs of Scottish hospitals, recently published by the Department of Health, shows that £4 1s. of this sum was spent on staff salaries, food, laundry, etc., and that the patient's food, drugs, laundry, etc., cost £1 15s. 9d. The remaining £2 2s. was spent on maintenance and administration. During this period the average number of in-patients increased by nearly 1,500 (2.8%) over the previous year and the average cost of treatment increased by 54%.

More Beds, More Cost

The cost of maintaining and treating a patient in 1952-3 was highest in the maternity hospitals, with a national average of £15 7s. 3d. a week—an increase of about £1 over the previous year. The lowest costs were in the mental and mental deficiency hospitals (£4 14s. 2d. and £4 7s. 7d. a week respectively, compared with £4 8s. 1d. and £3 19s. 4d. during 1951-2). At the small general hospitals with under 50 beds the average cost per patient per week was £9 10s. 2d., while in the general hospitals with over 300 beds the cost was £11 10s. 3d. The same costs in 1951-2 were £8 16s. 9d. and £11 4s.

The average cost of treating out-patients at hospitals was 17s. 8d. per case, or 4s. 11d. per attendance. The total number of attendances was 4,989,373.

¹ *Analysis of Running Costs of Hospitals in Scotland, 1954.* H.M.S.O., price 8s. 6d.

PARTNERSHIP LISTS AND NATIONAL SERVICE

If a member of a partnership in general practice is called up for National Service, the calculation of the maximum lists for the partnership should not be affected, provided that adequate arrangements have been made for a deputy or assistant to care for the patients of the practitioner who is away. In giving this information the Ministry of Health circular to executive councils (E.C.L. 11/54) also states that, in the Minister's view, there would be no need to terminate any existing arrangement for payment on notional lists should the arrangements for a deputy prove satisfactory.

RETURN OF GOODWILL LIVERPOOL L.M.C.'S OPINION

The Liverpool Local Medical Committee has been considering the desirability of the return of doctors' practice goodwill to their private ownership. The February issue of the *Liverpool Local Medical Committee Bulletin* reports that, after obtaining an opinion as representative of the practitioners in the area as possible, and after a discussion at which a representative of the local registrars' group was invited to attend, the Committee took the view that, although in theory the restitution of goodwill was an attractive idea, the practical difficulties and probable anxieties and hardship involved were so real that the scheme must be regarded as quite impracticable. The *Bulletin* adds that the registrars' representative was against the return of goodwill because he felt it would make entry into general practice for members of his group even more difficult than at present.

Employment of General Practitioners in Hospitals

The Committee has also discussed the staffing difficulties of some of the hospitals in Liverpool—the urgent need being for cover to be provided in the evenings in the absence of members of the junior staff. Representatives of the Committee met the regional hospital board in association with officers of the Bootle Medical Committee, and the Committee has agreed in principle to an experiment lasting for one year of employing general practitioners for terms of four guineas for a four-hour session.

PUBLIC HEALTH SERVICE DISPUTE REFERRED FOR ARBITRATION

The Renfrew County Council has agreed to refer the unresolved dispute about the status and remuneration of one of its medical officers for arbitration under the Industrial Courts Act. The Trustees of the Public Health Service Defence Trust have instructed their solicitor to take the necessary action. Costs of the case will be borne by the Public Health Service Defence Trust.

REGIONAL APPEAL ON CONDITIONS OF SERVICE

The first regional appeal regarding a condition of service was heard recently. The case, which was presented by the Association on behalf of the medical officer of health, involved the refusal by a Metropolitan Borough to accept one of the conditions of service for medical officers of health, promulgated in M.D.C. Circular No. 16.

The ruling of the Appeals Committee was in favour of the medical officer, the appeal being allowed.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

PRESCRIBING FOR PRIVATE PATIENTS

At Cardiff in 1953 the Representative Body reaffirmed the Association's policy that every effort should be made to secure the right for the private patient to obtain his medicines free under the National Health Service.

Last week representatives of the Private Practice and General Medical Services Committees met officers of the Ministry of Health to discuss this matter. A promise was given that the Association's views on this issue and the many points raised would be placed before the Minister.

REMUNERATION OF HOSPITAL MEDICAL STAFFS

SOUTHAMPTON GROUP MEETING

At the annual meeting of the senior medical staff of the Southampton Group on March 18 the present state of the negotiations for the implementation of the Spens Report was under discussion. No member was able to express satisfaction with either the method or progress of the negotiations, and it was unanimously agreed to support the Liverpool Region and to forward for publication the following resolutions:

- (1) That this Meeting is of the unanimous opinion that the Association should publish a frank statement outlining the results of their negotiations to date regarding the implementation of the Spens Report as it affects the remuneration of hospital medical staffs.
- (2) Further, that if there appears no reasonable hope of obtaining a settlement which can be considered comparable to that of the general practitioners, the Staff Side should immediately withdraw from Whitley negotiations and take every step in their power to refer the case to arbitration and to ensure that such an action should in future negotiations be our right.
- (3) Finally that the demand for full and retrospective implementation of the Spens Report is merely asking that the promises under which we entered the Service should be honoured.

Members hoped that the action of the Liverpool Region would stimulate hospital medical staff committees throughout the country to take similar action and to use the columns of the *Journal* in order to publicize their views.

MARYLEBONE DIVISION ANNUAL MEETING RETURN OF GOODWILL

In view of the Representative Body's decision last year to instruct the Council to produce a scheme for the return of goodwill, and because the possibility of the return of goodwill to doctors has aroused a good deal of interest in certain quarters of the profession, the Marylebone Division has asked Dr. H. Guy Dain and Dr. H. H. D. Sutherland to speak on this subject at the Division's annual general meeting on April 5. The meeting will be held at 9 p.m. at 11, Chandos Street, W.1 (Medical Society of London), and the Marylebone Division will welcome any members of other Divisions who would like to come.

Notes and News

Hospitality.—A Belgian doctor's son, aged 17, would like to receive hospitality in a British medical family, preferably with several children, for nine or twelve months, after Easter, 1954, in exchange for similar hospitality in Belgium to a British boy or girl.

A French doctor would like his daughter, aged 14, and son, aged 12, to stay with a medical family in Britain during July, and in return offers hospitality to two children before mid-June or after September 1; or the use of a house during June on the north coast of France; or to send his children as paying guests.

Anyone interested should contact Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correspondence

Hospital Staff Appointments

SIR,—It is now several years since procedure was laid down by Statutory Instrument (1950, No. 1258) for the formation, by regional hospital boards and boards of governors, of advisory appointments committees when consultant and S.H.M.O. appointments are to be made. Such committees consist of seven members, of whom only one is a member of the medical or dental staff of the hospital concerned. A similar sort of arrangement was later made for senior registrar and registrar appointments. Enough time has now elapsed to suggest that a review of these arrangements is due or overdue.

The motives which led to this procedure were presumably to avoid favouritism, to allow all candidates a fair field, and to ensure due consideration being given to special ability from whatever quarter it might come. One may, however, question whether, in being fair to the candidate, the regulations are also fair to the hospital and its patients. One may even doubt whether the arrangements do in fact achieve their objects. It is not for an outsider like myself to say whether favouritism may occur in such committees, and, in any case, favouritism is often a thoroughly good and sensible thing. But, on the other hand, one may suggest that such a committee interview, even when fortified by the opinions of referees, is not a particularly good way of gauging a candidate's clinical capacities, and still less of assessing how he or she will co-operate with colleagues of whom only one has had any say in his appointment. Staff harmony would seem, *prima facie*, to be at a discount in these regulations.

A further criticism is the lack of incentive which such a system provides for junior staff at a hospital. In peripherally situated hospitals especially, such junior staff may readily have the paralysing feeling that, no matter how hard they work, how helpful and obliging they may be, how diligent in study, it will all count for virtually nothing in the struggle for promotion. For they know how small a voice their hospital has in the appointments committees. What standard of work can then be expected from them? And how attractive are such hospitals when they need junior staff?

Surely the time has come to allow hospital staffs a larger, and a fairer, share in the appointment of their own future colleagues and assistants.—I am, etc.,

Wirral.

DAVID WILKIE.

Remuneration of Hospital Medical Staff

SIR, Contributors to the correspondence on this subject have raised several points which should be emphasized. Of first importance, I think, is the fact that the negotiations affect not only established consultants and specialists but also those "in training." The outcome is therefore certain, provided only that we remain united and adamant on full implementation of the Spens recommendations. In addition we must realize that the N.H.S. is here to stay, and that the attitude of the Ministry of Health to our successors will be governed by the firmness of our present stand; if we give an inch of ground now, a yard will be taken in 10 years' time.

The point most consistently made by contributors is that there should be free choice of the right to demand arbitration on disputes over terms and conditions of service. The importance of this is emphasized by the fact that even now, almost six years from the inception of the N.H.S., we are not receiving adequate remuneration, and by Dr. W. A. Bourne's suggestion (*Supplement*, March 6, p. 66) that the Ministry's attitude over the past 16 months of "active" negotiation has been governed by political expediency. Only arbitration can protect us against the dead-hand control of the Treasury and the tactics of opportunist politicians. It is interesting to note that the Parliamentary committee ap-

pointed last November to consider the salaries of Members of Parliament produced its report and recommendations in less than four months.

Some contributors have questioned the fitness of our negotiators for their task, and the *British Medical Journal's* leading article (February 27, p. 507) reinforces this doubt by remarking that consultants and hospital medical staffs have very much less experience in negotiation than do general practitioners. Confidence in their ability to represent all members of hospital medical staffs is not strengthened by consideration of the facts that the average age of the 18 members of the Staff Side of the Medical Whitley Council "B" is in the region of 52 years, that 11 of the 18 are Londoners, and that only two are from small provincial centres. It is difficult to see why anyone should find the leading article "singularly unhelpful." On the contrary, it makes a positive reaffirmation of B.M.A. policy—namely, Spens, the whole of Spens, and Spens undiluted by the corruption of political jockey and expediency. If we abandon Spens—either wholly or in the smallest part—we discard the only standard by which our financial worth can at any time be assessed. Any of our present negotiators who are not wholly Spens-minded will serve us best by resigning at once. In the minds of many of us, the Spens recommendations on salaries are statements of bread-and-butter requirements, and the "certain new features . . . which make comparison with 1939 difficult—for example, payment of clinical teachers and merit awards"—are merely well-flavoured red herrings. Whole-time clinical teaching salaries are payable by universities, as also is remuneration for part-time clinical teaching undertaken by N.H.S. hospital staffs; both of these, but especially the former, will automatically become tied to N.H.S. remuneration—and neither of them was the concern of the Spens Committee (see paragraph 14 of Report: "We did not regard it as within our terms of reference to make recommendations regarding the remuneration of specialists holding whole-time teaching appointments"). Merit awards should be just what the term implies, not a matter of grace and favour, and, as such, should be subject to the same "betterment" as the basic salaries.

Some contributors have suggested that there should be a public statement of the present stage of the negotiations. Such a statement would, one hopes, give the lie to some of the rumours referred to in the *British Medical Journal's* leading article, and which may have originated in a meeting here last October. At that meeting consultants and specialists were told by an influential member of the profession that within six weeks of that date we would receive an offer from the Government. This offer was, we were told, the result of a behind-the-scenes effort to break the Whitley Council deadlock, and represented the furthest the Government—unpleasantly surprised as it was by the Danckwerts award—would go towards implementing the consultants' Spens. It would consist of a differential increase in salary, the increase being greater for younger than for older consultants, and we would be well advised to accept it. The statement appeared authentic, but I was relieved to learn in two letters from the Secretary of the B.M.A. (dated October 28 and November 5) that the Association had no knowledge of any intention by the Government to depart from the Spens recommendations, and that the Association was strongly in favour of adherence to the Spens recommendations. I was further relieved to learn in a letter from the Minister of Health (dated November 12) that the speaker referred to above was in no sense a Government spokesman and that the views which he expressed on that occasion were therefore entirely personal.

In summary the important matters for which we must press are: undisputed right to arbitration; full adherence to Spens; disclosure of the present stage of negotiations. In addition, the Association's Public Relations Officer should open a campaign designed to make the public realize that we are not making "just another wage-claim." It should not be difficult to present to the public the comparison between present hospital salaries and wages in general in relation to 1939 and 1954 levels and values, and to convince the public that the present salary level has resulted in genuine distress and hardship among younger consultants, specialists, and trainees. I am, etc.,

Bristol.

V. TORRY BAXTER.

SIR,—Whilst appreciating the points made in Dr. W. A. Bourne's letter (*Supplement*, March 6, p. 66), I cannot help hoping that our present negotiators have a more critical attitude to published statistics than he apparently has. I

quote from his letter. "We cannot really expect the Government to suggest this [an 80% salary increase for hospital medical staff] straightaway to an electorate of whom 80% earn little more than a tenth of it, and 38% a twentieth." Since when was the electorate of this country composed of 23½ million wage-earners? And surely many of the 38% in the under £250 per annum group are also in the under 21 age group, and are thus not entitled to vote; more important, they are not all "principal wage-earners," but many are youngsters who provide an addition to the family income. Dr. Bourne's preoccupation with percentages does not, it appears, extend to the professional side of the picture. He does not stress or even state how small is the percentage of medical men in the hospital service receiving £2,700 per annum. He, like the general public, seems to regard this figure as a basic medical salary. May I be permitted to point out that a by no means negligible proportion of his own profession help to swell the number of unfortunates attempting to exist in the under £500 per annum group of "the electorate"?

I cannot believe that our negotiators negotiate only for the benefit of a handful of men at the top of the profession, and that for all those below the rank of senior consultant the answer will always be that time-honoured but fallacious chestnut: "It was worse in our day."

No, we are faced with many problems and I do not know all the answers to them, but I think I know one of the most important; and that is for each member of the profession to be a little more concerned with the welfare of sections other than his own; to become a little less like your correspondent (Dr. A. E. Nicholls, p. 66), who asserts unashamedly that he "presumes" S.H.M.O.s are people intermediate between housemen and recognized specialists; fancy a doctor admitting such a "presumption" in print. Before we attempt to "make good our case to the public"—which of course we must—we could make a start by trying to understand the problems of our immediate, and particularly our less fortunate, associates.—I am, etc.,

London, W.14.

MICHAEL P. COPLANS.

SIR.—The Spens Report laid down a basic salary scale for whole-time consultants ranging from £1,500 to £2,500 a year in terms of the 1939 value of money. This scale was to be adjusted to the "present-day value of money." It is important to consider the effect of taxation on the present-day value of money earned by all sections of the community and the extent to which this has been met by pay increases. Cogent arguments have been advanced to show that income tax is not a separate item in the cost of living (memorandum by Mr. George Schwartz, Association's supplementary memorandum of evidence to the Isle of Man Commission on Salaries and Emoluments, *Supplement*, September 5, 1953, p. 95), and that the general level of prices and incomes in the community is not affected by income tax which transfers money to the State, which thereupon rediscurses it on behalf of the taxpayer.

It is difficult to see why indirect taxation should not be regarded in exactly the same light, because all forms of taxation transfer some of the spending power of the individual to the State. If we compare the two chief methods of raising money we find that during the financial year ended March 31, 1953, income tax collected amounted to £1,682 million. During the same period Britain's overtaxed people paid out the all-time record total of £1,764 million in taxes on such things as clothing, boots and shoes, matches, beer, tobacco, and entertainments. These figures show that a larger sum of money is actually raised by indirect taxation than by direct taxation. Moreover, indirect taxation affects the consumer in two ways, (a) directly when he pays purchase tax or other form of tax on consumer goods or entertainment, (b) indirectly when he pays an enhanced price for articles because, for example, of increased transport charges due to the heavy tax on petrol. Incidentally, income tax also affects the citizen-consumer indirectly because the price he pays for goods and services includes not only the

cost of production but also covers the income tax which the manufacturer pays out of his profits.

In calculating the cost-of-living index I do not think that deductions are made for the various forms of indirect taxation, which must in the aggregate represent a very considerable factor. In any case, most of the lower-paid sections of the community have received pay increases which bear a close relation to the increased cost of living; in other words, indirect taxation which they pay in various ways has been regarded as an item in their cost of living. The average pay of adult male workers is more than two and a half times the level of 1938. One of your correspondents, Dr. B. Sugden (*Supplement*, January 31, 1953, p. 34), states that prices are at least 100% over pre-war. This is an understatement. Whole-time consultants have to pay three times the pre-war prices for heavy and essential items such as cars, children's schooling, domestic help, clothing, house-purchase, and rates (perhaps the latter, like income tax, is not to be regarded as an item in the cost of living, as the local council merely rediscurses the money on behalf of the ratepayer). No tax concessions can be obtained on any of these items, which have to be paid for after taxation (usually including super-tax) has been paid.

Mr. A. J. Cummings, in a recent article in the *News Chronicle*, quoted Mr. Attlee writing to *The Times* (February 18) in support of increased pay for Members of Parliament. Mr. Attlee pointed out that "having regard to the rate of income tax [£1,500 a year to-day] is not more attractive than was £400 in 1911." It is evident that the Leader of the Opposition believes that income tax should be taken into account when claims for salary increases are considered. We may think that he is mistaken, and personally I do not complain about the "levelling-down" process of income tax and I am in agreement with Mr. Schwartz to the extent that salary increases which fully compensated for a rise in income tax would lead to catastrophic inflation. It should be made plain, however, that a betterment factor of even 100% applied to the salary scale of consultants and hospital medical staff, fixed in terms of the 1938 value of money, not only takes no account of income tax but is actually less than the average increase already obtained by other sections of the community who pay relatively little income tax and whose indirect taxation has been met by their pay increases.

I think that your correspondent, Dr. W. A. Bourne (*Supplement*, March 6, p. 66), is mistaken in calculating that an 80% "betterment factor" would raise the annual income of a whole-time consultant from £2,750 to £4,950. The "betterment factor" is based on £2,500 and includes the Government's contribution of 8%. On this calculation the consultant's salary would be raised from £2,750 to £4,170. From this would be deducted superannuation contribution of £250, giving a net figure of £3,920. —I am, etc.,

Newcastle-upon-Tyne.

RICHARD NORTON.

SIR.—As one who also, like your correspondent Dr. W. A. Bourne (*Supplement*, March 6, p. 66), was concerned at the start in the discussions on the conditions of service of hospital staffs, I have been surprised at the contents of some of the letters you have published on this matter and indeed also of your leading article (*Journal*, February 27, p. 507). The terms of remuneration are just one of the conditions in the N.H.S. due to unwise decisions at the beginning which are making the lot of doctors (and patients) in hospitals hard. The facts, as the records of the time show, are that the Ministry, advised hospital staffs to enter into permanent contracts in an unbusinesslike way before a number of important points were settled. It made no mention of the decision of the Central Consultants and Specialists Committee that that factor should be not less than 35%. It merely accepted the general assurance of the Ministry that, "save in exceptional circumstances, and after the conciliation machinery of Whitley has been exhausted, issues of remuneration remaining in dispute will go either to arbitration or for

inquiry and report by a Committee." Apparently it was not until three years later, after urging by individual specialists in your columns and through the Regional and Central Consultants and Specialists Committees, that the matter of remuneration was reopened in the Whitley Committee "B," to which the Joint Committee had appointed itself as the Staff Side. It may have been too late in 1949 for the salaries for specialists to be settled with the full betterment which the Spens report presumed, for the economic and social changes in this country since the Spens investigation year of 1939 had altered both the position of specialists and the nation's ability to pay. But by 1952 it was surely too late, as it is now, to argue for an increase in the levels of remuneration by any higher adjustment of the betterment factor; for a contract had been signed without objection to the offered betterment factor of 20%, and even such a peculiar and timeless kind of contract as that for hospital staffs is still a contract.

What could be properly claimed now is an adjustment of remuneration on the basis of the rise of the cost of living since July, 1949, when the contracts were accepted. In that way the claim of specialists would be understandable and probably acceptable, being the same sort of claim as employees in other occupations are making. It is questionable, however, whether, if accepted, specialists would really be better off, for they would incur increased liability to taxation, and the increased cost on the N.H.S. would have the same effects of rise in the cost of living and reduction in the value of pensions and savings that other such increases are producing.

This matter is perhaps more important to the whole-time than to the part-time specialist; for the part-timer should have the alternative of private practice by which to augment his income. It seems to be forgotten that the Spens investigation was based on the total professional incomes of specialists and that the recommendations of the Spens Committee as to remuneration in the Service and the terms of service themselves were based on the assumption that private practice would continue. That is why it was so essential for specialists that the safeguards for private practice, such as certainty of provision of private wards in hospitals and fixing of the charge for such wards not on the general cost for a hospital bed plus a premium but only on the premium itself, removal of the Minister's powers to acquire nursing-homes compulsorily, and the right of private patients to free drugs and appliances, should be assured before their contracts were signed.

None of these safeguards were in fact assured, and at least partly in consequence private practice has declined and with it the total income of specialists. He would be an optimist to expect that those safeguards for private practice will still be provided or that the decline in income from private practice would be considered, as it should be, as an argument for increasing the salaries of part-time specialists in the Service. But specialists can do much to ensure the re-growth of private practice, and thereby of their total professional incomes, by seeing that nursing-homes are retained in their areas, and by helping to make known the benefits of membership of a provident association. The rapidly rising membership of provident associations shows that many people of small and moderate means still wish for privacy and selectiveness and prompt attention when they are seriously ill, which the N.H.S. with its deficiencies often cannot give them, and are willing to join an insurance scheme for that purpose. Here is the way, which has been found realizable in this area and I suppose elsewhere, for revival of private practice and for increase in the incomes of part-time specialists towards their former levels without adding to public expenditure. Continuance of private practice is of course important not merely for the part-time specialists' incomes but also as giving an alternative to the Service and preventing it from becoming a fully whole-time one in which the incomes of all as well as their freedom might eventually be impaired.—I am, etc.,

Bournemouth.

N. ROSS SMITH.

SIR.—Dr. W. A. Bourne's interpretation of the mind of the Ministry on the remuneration of hospital staffs (*Supplement*, March 6, p. 66) is a true one in that the Government is anxious about its votes. So far as the profession is concerned, I imagine that many medical men would hesitate to ask for more on moral grounds, since the average income of the population is circumscribed, if the Treasury could not be trusted to keep their consciences most scrupulously year by year and ease them of any superfluity of wealth. Yet the Government shows no sign of a tender conscience in dividing a profession on the interior matter of its income.

The Spens recommendations were for all, and they have been applied to a proportion only. This is the offence which Dr. Bourne should recognize as the cause of so much indignation. The present situation has been engendered by the politicians, it is repellent to the profession, it is contrary to the ordinances of justice, and by this token the Government must provide a righteous solution.—I am, etc.,

Worcester.

P. W. HOUGHTON.

Whole-time Specialist Appointments

SIR.—The tone of your leading article under the above heading (*Journal*, March 13, p. 634) is very surprising. It demands the right to dictate a policy which many regional boards are finding increasingly expensive. Our profession would do well to consider the effect this attitude is having on those who attempt to administer the service at various levels. Chairmen of many committees often feel that the advice given by consultants, particularly those in part-time practice, is not always impartial. In some quarters this is leading to a demand that doctors shall only hold positions on advisory committees at regional and management level. Should this change eventually commend itself to Parliament its effect will be unfortunate. Leading articles such as the one mentioned will only tend to hasten such a decision.—I am, etc.,

HORACE JOULES.

London, N.W.10.

Waiting for the Ambulance

SIR.—In a recent report about the Surrey Medical Services Committee's recommendation that a doctor should be censured for "a serious failure" to comply with his terms of service it adds: "... he telephoned for an ambulance and left before it arrived." Without wishing to extenuate the gravamen of the charge, am I correct in inferring that it is considered the doctor's duty to await the arrival of an ambulance?—I am, etc.,

London, N.W.6.

W. LEVY.

Dismissal of Senior Registrars

SIR.—The Registrars Group is anxious to know how many senior registrars have completed, or are likely to complete within the next six months, their four years' appointments as senior registrar, and now find themselves in danger of having to change from their chosen career to some other field of work.

In May, 1953, transitional posts were authorized by the Ministry of Health which permitted the creation of extra senior-registrar appointments outside the regional establishment. It has been suggested that some regional boards have not taken full advantage of this scheme. These posts were designed for senior registrars who had completed four years' training and could be held for a maximum of two years, thus giving such senior registrars further time in which to obtain consultant or specialist appointments. I should be grateful if any senior registrar so affected would write to me personally, giving full details of his case, particularly where his post has been abolished or changed in character and no transitional post created in its place.—I am, etc.,

Clatterbridge Hospital,
Bebington, Cheshire.PHILIP L. ROBINSON,
Chairman, Registrars Group.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). The only charge made is for postage of books. A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Alexander, L.: Treatment of Mental Disorder. 1953.
Allen, F. M. B., and Fisher, O. D.: Aids to Diagnosis and Treatment of Diseases of Children. Ninth edition. 1953.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Lieutenant-Commander G. Hayes, R.N.V.R., has been entered on the Permanent List in the rank of Surgeon Lieutenant-Commander.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant-Commander G. Hayes, V.R.D., has terminated his commission.

Surgeon Lieutenant L. A. Cruttenden to be Surgeon Lieutenant-Commander.

Temporary Surgeon Lieutenant G. A. Dingemans has been granted an Honorary Commission in the Permanent R.N.V.R. in the rank of Honorary Surgeon Lieutenant-Commander.

ARMY

Colonel G. Moulson, late R.A.M.C., has retired on retired pay.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel R. L. Whittaker has retired on retired pay and has been granted the honorary rank of Colonel.

Majors A. W. Box and P. R. Wheatley, D.S.O., to be Lieutenant-Colonels.

Captain D. Olliver to be Major. (Substituted for the notification in a Supplement to the London Gazette dated November 13, 1953.)

Captain W. S. Miller to be Major.
Short Service Commission.—Captain R. W. Doy has retired with a gratuity, and has been granted the honorary rank of Major.

2 Fri.	Science Committee, 2 p.m.
3 Sat.	Hypnotism Subcommittee, Psychological Medicine Group Committee, 10 a.m.
6 Tues.	Constitution Committee, 2 p.m.
6 Tues.	Planning Subcommittee, Occupational Health Committee, 10 a.m.; Joint meeting with Occupational Health Committee, Society of Medical Officers of Health, 2 p.m.
7 Wed.	Central Ethical Committee, 2 p.m.
7 Wed.	Film Committee, 2 p.m.
9 Fri.	Public Health Committee, 2 p.m.
9 Fri.	Scholarships Subcommittee, Science Committee, 2 p.m.
13 Tues.	Joint Conference of Advisory Councils on Occupational Health, 12 noon.
14 Wed.	Occupational Health Committee, 10.30 a.m.
14 Wed.	Private Practice Committee, 2 p.m.
21 Wed.	G.M.S. Committee, 11.30 a.m.

Branch and Division Meetings to be Held

- CAMBERWELL DIVISION.—At St. Giles' Hospital, Camberwell, S.E., Tuesday, March 30, 8.45 p.m., meeting. Address by Sir Heneage Ogilvie: "Advances in Surgery."
- CITY DIVISION.—At Hackney Hospital, Homerton High Street, E., Wednesday, March 31, 2 p.m., films: "Cardiac Arrhythmias"; (2) "Cardiac Output in Man."
- CORNWALL DIVISION.—At Royal Cornwall Infirmary, Truro, Thursday, April 1, 8.30 p.m., Annual B.M.A. Lecture by Dr. B. E. Schlesinger: "The Primary Complex in Childhood."
- DORSET DIVISION.—At "The Clinic," Glyde Path Road, Dorchester, Wednesday, March 31, 8.30 p.m., meeting. Dissertation by Dr. J. A. G. F. Rose: "The Radiology of the Gastro-intestinal Tract."
- FINCHLEY DIVISION.—At Finchley Memorial Hospital, Granville Road, North Finchley, N., Friday, March 26, 8.45 p.m., meeting. Talk by Mr. Robert Lund: "Recent Advances in Chest Surgery."
- HALIFAX DIVISION.—At Royal Halifax Infirmary, Halifax, Wednesday, March 31, 8.30 p.m., meeting. Annual B.M.A. Lecture by Mr. W. Mortimer H. Shaw: "Experiences of a Plastic Surgeon," illustrated by lantern slides and films.
- HAMPSTEAD DIVISION.—At Westfield College, Kidderpore Avenue, N.W., Thursday, April 1, 8.30 p.m., meeting. "Brains Trust": Mr. A. Dickson Wright, Mr. R. S. Murley, Dr. I. P. F. Laurent, Dr. Lindsey W. Batten, and Miss Maighamta Taski. Members' friends are invited.
- LANCASTER DIVISION.—At Lancaster Royal Infirmary, Saturday, April 3, meeting. B.M.A. Lecture by Dr. R. W. Fairbrother: "Antibiotics in General Practice—Their Use and Abuse."
- LEWISHAM DIVISION.—At St. John's Hospital, Morden Hill, Lewisham, S.E., Sunday, April 4, 10.45 a.m., clinical meeting.
- MID-HERTS DIVISION.—At Hill End Hospital, St. Albans, Thursday, April 1, 4 p.m., clinical meeting.
- NORFOLK BRANCH.—At Nurses' Lecture Hall, Norfolk and Norwich Hospital, Norwich, Wednesday, March 31, 3.15 p.m., meeting. B.M.A. Lecture by Dr. W. G. Marley, M.Sc., Ph.D.: "The Development of Atomic Energy for Peaceful Purposes and Some Medical Implications."
- NORTH WALFS BRANCH.—At Ruthin Castle, Thursday, April 1, 3 p.m., spring meeting. Short papers by Dr. E. Clifford-Jones, Mr. W. Skyrme Rees, and Dr. B. Samet. A discussion will follow each paper. Dr. S. W. Patterson has invited members and their wives to take tea with him at the conclusion of the meeting.
- NUNFATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, March 30, 8 p.m., informal supper; 8.45 p.m., talk by Dr. J. A. L. Vaughan Jones: "Occupational Health and the Hazards of the Housewife." Members' wives are invited.
- RICHMOND DIVISION.—At Royal Hospital, Richmond, Tuesday, March 30, 9 p.m., general meeting. Illustrated lecture by Dr. J. G. Scadding: "Bronchial Carcinoma."
- SOUTH-WEST WALES DIVISION.—At Black Lion Hotel, Cardigan, Saturday, April 3, 7.30 p.m., meeting. Dr. A. Barham Carter: "Functional Symptoms Occurring in Organic Disease."
- SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Monday, March 29, 8.30 p.m., annual general meeting.
- WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, March 30, 9 p.m., film show: (1) "Marrow Puncture"; (2) "Gastric Secretion." Both sound and colour films.

REMUNERATION OF HOSPITAL MEDICAL STAFF
STATEMENT BY SIR RUSSELL BRAIN, CHAIRMAN OF STAFF SIDE OF
COMMITTEE "B" OF THE MEDICAL WHITLEY COUNCIL

NEW INCREASES AGREED

Committee "B" of the Medical Whitley Council has reached agreement on increases in the rates of pay of hospital medical staff which have been in operation since 1948.

The agreement, which has effect from April 1, includes the following provisions:

- The basic scale for consultants is to be £2,100, rising by annual increments of £125 to £3,100. This new scale gives an increase over the 1948 scale of £400 at the minimum and of £350 at the maximum.
- The new basic scale applies to consultants with C distinction awards, who therefore obtain the same increase as consultants without distinction awards.
- The increases for consultants with B and A distinction awards are, however, limited to £150 and £50 respectively.
- The basic scale for senior hospital medical officers is to be £1,500, rising by annual increments of £50 to £1,950, an increase of £200 over the 1948 scale.
- Senior registrars will receive £1,100, £1,200, £1,300, or £1,400, according to their year of service, an increase of £100 over the 1948 rates.
- Registrars will receive £850 or £965, according to their year of service, an increase of £75 over the 1948 rates.
- Junior hospital medical officers will receive a scale of £775, rising by annual increment of £50 to £1,075, an increase of £75 over their 1948 scale.
- Senior house officers will receive £745, an increase of £75 over their 1948 salary.
- House officers are to receive an annual rate of £425 for the first, £475 for the second, and £525 for the third and subsequent posts, an increase of £75 over the 1948 rates, but the annual charge made to them for residence is to be increased by £25.
- A maximum of three-quarters of a session is to be placed on the weighting that part-time consultants and senior hospital medical officers are allowed when their salaries are calculated. This replaces the present maximum weighting of one and one-quarter sessions.
- There is a protection against any individual losing pay on the coming into operation of the new agreement.

The details of the new arrangements are being worked out by the two sides of Committee "B," and the full agreement will be transmitted to the Minister of Health and the Secretary of State for Scotland as soon as it is ready.

These increases are the final outcome of lengthy negotiations, and should be judged in the light of the following background and history of events.

History

Before the introduction of the National Health Service it was agreed that the range of remuneration for both general practitioners and consultants in that Service should be determined by two interdepartmental committees, both under the chairmanship of Sir Will Spens. The Minister of Health and Secretary of State for Scotland on the one hand, and the profession on the other, agreed to accept the recommendations of these committees, which became in effect the basis on which professional income in the National Health Service was fixed.

The recommendations of the Spens Committees were framed in terms of the 1939 value of money, and both committees explicitly stated that they "left it to others to make the necessary adjustment to present-day values, such adjustment to have regard not only to changes in the value of money, but to increases in income which had in fact taken place in other professions since 1939." The Consultant Spens Committee went further and stated that the adjustment should have regard to changes in income in other branches of the medical profession.

The Consultant Spens Report was not published until May, 1948, and when the National Health Service was introduced in July of that year hospital staff entered the new Service on interim terms, relying on the assurance that the Minister had accepted the findings of the Spens Committee and would incorporate them in the new terms of service.

Subsequently the Government submitted the draft terms of service for hospital staff, which, although following the recommendations of the Consultant Spens Committee, applied to them the same betterment factor as was given to general practitioners (20%). This betterment factor of 20% was not accepted by the profession as being an adequate or realistic adjustment of the 1939 figures to post-war conditions, and as early as January, 1949, a deputation from the Joint Consultants Committee and the General Medical

Services Committee made joint representations to the Ministry on the subject. The Ministry's attitude at that time was wholly influenced by the White Paper on National Expenditure, and it declined to make any upward adjustment to the betterment factor.

In July, 1949, following discussions on the terms and conditions of service for hospital medical staff, the Joint Committee received certain assurances from the Ministry, among which were the following:

1. That no changes would be made in the terms and conditions of service without discussions in the appropriate part of the Whitley machinery;
2. That remuneration was regarded as a subject suitable for arbitration; and
3. That save in exceptional circumstances, and after the conciliation machinery of Whitley had been exhausted, issues of remuneration remaining in dispute would go either to arbitration or for inquiry and report by a committee.

Thereupon the Joint Committee advised hospital staff to accept permanent contracts on the basis of the terms and conditions of service then offered.

Meanwhile there was growing unrest amongst general practitioners about the inadequacy of the capitation fee, and after prolonged negotiations the Ministry in October, 1951, agreed to refer the question of the size of the Central Pool to arbitration, on the understanding that whatever the result of the arbitration might be no additional moneys would be paid unless agreement was reached upon a redistribution of the Central Pool.

Mr. Justice Danckwerts was appointed adjudicator, and his award was published in March, 1952.

A Claim Submitted

In June, 1952—shortly before Parliament approved the necessary Supplementary Estimate to implement the Danckwerts award—the Staff Side notified the Management Side of Committee "B" of its intention to submit a claim for increased betterment for hospital medical staff in the light of the Danckwerts award.

At the outset of negotiations, and before detailed discussion had begun, the attention of the Staff Side was directed to the following statement by the Chancellor of the Exchequer in the House of Commons on July 2, 1952:

"I want to make it clear that the terms of reference of Mr. Justice Danckwerts's award were confined solely to the question of the remuneration of general practitioners in the National Health Service and his award has no wider application. In accepting the results of the adjudication, which was of an exceptional nature, the Government have by no means adopted the view that similar adjustments in other fields should follow. In their view there is no justification for any assumption that the appropriate standard of remuneration for the professional classes is a rate of 100% above that in force in 1939. They consider that remuneration should be determined in the light of all relevant circumstances."

The Staff Side was left in no uncertainty as to the Government's policy in the matter, and the attitude of the Management Side. It was quite clear that in no circumstances could a claim be considered for hospital staff based on the Danckwerts award, nor could there be any agreement to submit any such claim to arbitration.

Legal Advice Sought

At this stage the Staff Side decided to take legal advice and consulted Mr. F. Grant, Q.C., who had presented the general practitioners' claim at the Danckwerts adjudication. Amongst other things Mr. Grant was asked whether there were arguments to support a legal claim that the Minister's promise to implement the recommendations of the Spens

Committee was implicit in the contracts which consultants had accepted with hospital boards. After studying all the available files, records of past meetings with the Ministry, and other relevant documents, Mr. Grant reached the conclusion that the Staff Side had no claim which was enforceable at law. He did not think that it could be argued that an undertaking by the Ministry to implement the terms of the Consultant Spens Report was a part of the contract on which consultants entered the Service. But even if it could be so argued the Minister could claim that the terms of the contract also included an agreement between the Minister and the consultants' representatives that a dispute about outstanding matters concerning the terms and conditions of service should be referred either to arbitration or to a committee of inquiry.

In view of the Government's known attitude towards arbitration, Mr. Grant pointed out that if negotiations broke down in Whitley the Minister could fulfil his undertaking by referring all aspects of consultant remuneration to a committee of inquiry. The results of such an inquiry could not be foreseen, but one danger was that the findings could in effect replace the Spens Report as the basis of consultant remuneration for the future.

Basis of Claim

During the course of negotiations it became clear that, while there was no question of departing from the Chancellor's statement on the application of the Danckwerts award, there seemed to be a realization that the balance between general-practitioner and consultant remuneration had been disturbed, that this factor alone might have an adverse effect on the future recruitment of hospital staff, and that a claim based on such considerations might well form a basis for discussion and possibly agreement. Thus the Staff Side was faced with two alternatives: either, despite the Chancellor's statement, to press its claim for a strict application of the Danckwerts betterment, or to examine the increases which general practitioners had in fact received as a result of the Danckwerts award, and to see how far these had disturbed the balance of remuneration.

After very careful consideration the Staff Side reached the conclusion that it had very little choice in the matter. The Government, it was clear, had no intention of departing from the Chancellor's statement and the profession in spite of continuous pressure has still been denied the right of unilateral arbitration. Again, because of the different methods of remuneration in general practice and consultant practice, a straightforward application of the Danckwerts "betterment" of 100% to the "Spens salaries" would have meant that a consultant aged 32 would start at £3,000 per annum and rise automatically to £5,000. Again, a consultant holding an A merit award would receive £10,000. Apart from the fact that a claim of this magnitude would have been totally unacceptable to the Management Side the effect would be again to upset the balance of remuneration between the two branches of the profession.

There were also the inescapable facts that the Government acceptance of the Danckwerts award had been conditional upon an agreed redistribution of general-practitioner income, and that the effect of the award, coupled with the redistribution scheme, had not been to increase the remuneration of individual general practitioners by 100%. For all these reasons the Staff Side considered that the only practicable course was to examine the effects of the Danckwerts award in the general-practitioner field and to relate them to the position of hospital staffs.

It accordingly looked at the percentage increases of remuneration received by general practitioners with varying sized lists, in order to compare them—so far as it was possible to do so—with hospital staff at different levels on the salary scales. Of necessity the comparison could not be precise because of the fundamental differences in the two methods of remuneration.

In the general-practitioner field the effect of Danckwerts had been that the most financially successful general practitioners, with the largest lists, gained virtually no increase of income; again, at the other end of the scale practitioners with very small lists received only a small percentage increase. Practitioners with medium-sized lists, on the other hand, received the greatest benefit from the award.

It proved far from easy to translate the comparison into salary increases for hospital staff. The Staff Side felt, however, that, as in the case of general practitioners, if recruitment to the hospital service was not to be affected the major benefit must be applied to the basic consultant grade in which the majority of hospital staff would make their permanent career rather than to the highest grades in which, in any case, taxation would largely nullify the effect of any increase, or to the lower grades in which most practitioners would not expect to have their permanent career.

Whole-time Consultants

The Staff Side had for some time been pressing the Management Side to review the position of whole-time consultants in the light of the recommendation of the Spens Committee that, in addition to their salary, consultants should receive allowances to cover the expenses reasonably incurred by them in connexion with their duties (e.g. car, telephone, membership of learned societies, and purchase of necessary textbooks). Few of these expenses had been met under the terms and conditions of service, and none of them adequately, and it was the intention of the Staff Side that in the claim for increased remuneration the opportunity should be taken of meeting the just grievances of the whole-time consultant.

The solution proposed to the Staff Side for meeting the whole-time consultant's difficulties was that as part-time consultants and S.H.M.O.s were enjoying disproportionate advantages in the calculation of their salaries the weighting of sessions should be entirely abandoned, all future part-time consultants and S.H.M.O.s and existing part-time men on promotion to a higher scale being paid unweighted elevenths of the full-time scale.

Apart from the fact that a proposal of this nature would not result in any addition to the whole-time scale, but merely a relative advantage at the expense of his part-time colleagues, the Staff Side felt that it would involve an abandonment of one of the vital principles of the Spens Report to which it could in no circumstances agree. After a very long discussion, the Staff Side agreed that a case had been made for modifying the Spens weighting which at 5 and 6 sessions rises to 14 elevenths, and that a ceiling of 4 eleventh for weighting should in future be applied. Existing hospital officers would, however, be fully protected against any loss of salary.

Pressure will continue to be exerted on the Management Side to improve the allowances for whole-time consultants.

The Spens Report

The Staff Side is satisfied that the settlement it has achieved does in fact restore the balance between consultant and general-practitioner remuneration which was upset by the Danckwerts award. The differential increases now to be enjoyed by members of hospital staff are a result of a new system of distribution and are no more a departure from the Consultant Spens Report than were the differential increases enjoyed by general practitioners as a result of their new distribution scheme a departure from the General Practitioner Spens Report. In the face of strong pressure to have it abolished the principle of weighting for part-time consultants has been retained. The small modification agreed is but a part of the general redistribution of incomes.

The Staff Side is therefore satisfied that the agreement it has made with the Management Side in no way weakens the Spens Report as the basis of consultant remuneration. In

its view Spens remains the yardstick of consultant remuneration and either Side of Committee "B" is free to seek future adjustments in any grade, if experience shows that the present settlement is working unfairly.

Consultation with the Profession

The Staff Side confidently hopes that hospital staffs will regard these increases as satisfactory. Consultants and other members of hospital staffs are, however, entitled to know why it was not found possible to consult them upon the outcome of the negotiations before agreement was reached. This is a difficulty which must always be faced when major issues are at stake. It is implicit in the Whitley machinery that representatives of both Sides have authority to negotiate and eventually to reach agreement. Failure to reach a settlement in Whitley without reference to the profession would undoubtedly have led to the appointment of a committee of inquiry into the question of hospital staff remuneration in all its aspects. This would have delayed a settlement for a very long time and would not necessarily have led to a final agreement better than the one now reached. Moreover, the Staff Side was told that, as an inquiry would probably follow any breakdown in negotiations, it was impossible for the proposed terms of a settlement to be made public, because, if they were rejected, the position of one or other party to the inquiry would be severely prejudiced.

Full consultation with the profession even had it been possible would therefore have meant interminable delays and possibly a hardening of the Government's views. Again, the Staff Side was informed that one of the bodies represented upon it, the Central Consultants and Specialists Committee of the British Medical Association, had in July, 1953, passed the following resolution:

That the Central Consultants and Specialists Committee expresses its appreciation of the efforts of the Staff Side of Committee "B," and of the Central Committee's representatives on the Staff Side, in the matter of the remuneration of hospital medical staffs, and gives such representatives full authority to agree, should they think fit, to such terms as the Staff Side can obtain; provided always that the principles embodied in the Report of the Consultant Spens Committee are maintained, and that the Committee's representatives will act without further reference to this Committee only in case of necessity.

The Staff Side, being satisfied that its negotiations had safeguarded Spens and knowing that it could not refer the terms of the settlement to its constituent bodies, none the less feels confident that the profession will agree that it took the right course in reaching agreement on the new increases. It realizes that hospital staffs will be disappointed to find the increases in remuneration are not retrospective, but the Staff Side was convinced that insistence on retrospective application would have led to a complete breakdown in negotiations.

The Staff Side's task over the past 18 months has been far from easy. It has had to press its claim during a period of national retrenchment and in the face of the Government's declared policy on the implications of the Danckwerts award. Only experience can show how far the increases obtained will improve recruitment in the hospital field, but in all the circumstances the Staff Side is satisfied that hospital staffs will welcome them as a reasonable adjustment to the position as it exists to-day.

A leading article appears at page 860 of the Journal

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

DISCUSSION ON ITS CONSTITUTION

An all-day meeting of the Central Consultants and Specialists Committee was held on April 1, with Dr. T. ROWLAND HILL in the chair. The Committee spent most of the morning considering its own constitution. A report on the subject was presented by Mr. H. H. LANGSTON, who proposed a number of recommendations, the principal of which was the deletion of the provision in the constitution for the appointment of one representative from each of the specialist Group Committees. At present 32 members (nearly half the total membership of 70) are appointed by the regional consultants and specialists committees and 10 by the committee for Scotland. The committees of the Consulting Pathologists, Ophthalmic, Psychological Medicine, Tuberculosis and Diseases of the Chest, and Venereologists Groups had written in opposition to the proposal to discontinue Group membership; the Dermatologists Group had acquiesced in the proposal only if a substantial reduction was made in the size of the Central Committee.

Mr. LANGSTON said that his committee had been guided by the strong feeling in every regional committee that the representation of special groups should be discontinued and that the basis of membership should be regional representation. They felt that they would get better unification if the representation of special interests took place first at regional level. It was recognized, however, that the Groups had their special problems and it was agreed that if this proposal were carried the agenda of every meeting of the Central Committee should be sent to the Chairmen of the Group Committees and their representatives could attend if desired.

Mr. HOLMES SELLORS thought the first question to determine was the optimum size of the Central Committee. Was anyone prepared to say what it was? Mr. C. E. KINDERSLEY said that the Committee should be a forum for debate for the entire consulting profession rather than an executive. He felt that large numbers of the profession would be offended if Group representation were eliminated or reduced. Mr. STAVELEY GOUGH said that there was nothing essential to Group interests which could not be dealt with by the committee without special Group representation. Dr. PETER EDWARDS pointed out the undesirability of antagonizing the Groups.

The CHAIRMAN suggested that this question should not be concluded that day and that the subcommittee should discuss it with representatives of the Groups themselves in the hope of an agreed representation.

Mr. A. LAWRENCE ABEL urged an immediate decision and asked the Committee to declare against the proposal to eliminate Group representation. Mr. LANGSTON said that they could not settle the question that day in view of the evident feeling in many of the regions, and the CHAIRMAN added that an immediate decision would be premature and might have to be reconsidered.

It was agreed that the question be referred back for further consideration.

Functions of Regional Committees

A number of proposals concerning the constitution and functions of regional consultants and specialists committees were also brought forward by Mr. LANGSTON. Criticism was made of one of the proposed functions—namely, "To make representations to regional hospital boards or boards of governors regarding the arrangements for the staffing or efficient running of hospitals in the region, and to give advice on the organization of the hospital services in the region if requested to do so." Mr. ABEL and others took exception to the last five words, which they construed as referring to requests from the boards, but Mr. LANGSTON explained that what his subcommittee had in mind were requests from hospital medical staff committees. It was agreed for the sake of clarity to delete the words "if requested to do so."

Another suggested function: "To establish informal and unofficial machinery to ensure the highest level of ethical behaviour among members of hospital staffs" was the subject of some criticism. Mr. LANGSTON said that the subcommittee had thought it would not be right to suggest that regional committees should set up official technical bodies for this purpose. On the other hand it was known that on certain occasions regional committees or their subcommittees had been able to help in a local problem at group level, and it was that sort of unofficial action as a means of solving ethical problems which they had had in mind.

After discussions the proposed functions, with one or two verbal alterations, were agreed to, and it was also agreed to urge that regional committees should be invited to nominate members to medical advisory committees of regional hospital boards and that there should be at regional board level machinery for joint consultation comparable to that of the Joint Consultants Committee at Ministry level.

Hospital Junior Staff

Professor G. I. STRACHAN presented a report on hospital junior staff. He said that there was general agreement in his subcommittee that there was need for a long-term or career grade below the consultant in certain types of hospital. Bearing in mind the experience of the S.H.M.O. and J.H.M.O. grades, it was felt that the title of such appointment was of considerable importance; some such title as Senior Medical (or Surgical) Officer would be more attractive and suitable as a name for a career post than that of Registrar. Although short-term appointments would probably continue to suit the needs of the teaching hospitals the posts between house officer and consultant in the non-teaching hospitals should offer better prospects of promotion than at present, also a greater degree of security and the likelihood of a permanent career. It should be possible, particularly at the higher levels, for posts to be held on a part-time basis and combined with other forms of medical practice. The senior registrar post should be retained, though it would probably be held more particularly in the teaching hospitals and should remain a post of limited tenure.

In the discussion some objection was taken to the title S.M.O., in view of the associations of S.H.M.O. Mr. KINDERSLEY said that S.H.M.O.s were supposed to work under the aegis of consultants; but how many in fact did? Were they not really underpaid consultants? The creation of a grade S.M.O., not very different from S.H.M.O., would present an opportunity for a board to use underpaid personnel to do consultants' jobs. If this was so the number of consultant posts would be reduced and the number of S.H.M.O. posts would be increased and that would be a disaster.

Professor STRACHAN replied that one of their great considerations had been that the number of consultant posts should not be reduced. The CHAIRMAN called attention to the statement in the proposals that the ultimate responsibility for the treatment of patients in hospital must remain in the hands of practitioners of full consultant status.

Dr. COCHRANE SHANKS congratulated the subcommittee on what it had achieved and moved that general approval be given to the proposals. This was seconded by Mr. NICHOLSON-LAILEY and was carried by a very large majority.

The CHAIRMAN said that this would mean that the Joint Committee would have the opportunity of examining the proposals in detail, and he knew that the Ministry of Health was also interested. Professor STRACHAN suggested that a meeting be arranged between the Joint Committee and the members of his subcommittee.

Legal Actions

Dr. COCHRANE SHANKS reported that the Ministry had approved the draft memorandum on the procedure for dealing with legal actions involving hospitals and doctors on their staffs, together with the addition of a paragraph to the effect that the provisions should be applied to all proceedings from

April 1 and also, if it was agreed by and on behalf of the hospital authority and doctors concerned, it should be applied to any proceedings which were pending on that date and in which judgment had not been given. He said that this would mean that from now onwards the hospital and the doctor would never, save in exceptional circumstances, fight each other in open court.

A procedure for investigating complaints relating to personal conduct or professional competence of members of hospital medical staffs, which had been adopted at the last meeting, again came forward after certain suggestions made by the Council had been incorporated in it, and it was agreed that, subject to the acceptance of the proposals by the Minister, consideration should be given to the details of procedure, disciplinary action, and the like.

Public and Professional Relations

Professor P. C. P. CLOAKE presented a report on behalf of the Public and Professional Relations Subcommittee. This contained certain recommendations as to means of improving public relations which it was suggested should be sent to regional committees and to the hospital group medical committees. These were agreed to and it was also agreed to recommend to the Joint Committee that the Ministry be urged to arrange for copies of the report of the Central Health Services Council on the reception and welfare of hospital in-patients to be issued to all members of hospital medical staffs and to new officers at the time of their appointment. The Public Relations Officer was asked to bear in mind the possibility of securing more publicity for the various aspects of hospital work in the national press and in radio and television programmes.

Other Business

Attention was drawn to the second issue of the *Central Consultants and Specialists Committee Bulletin*. The CHAIRMAN said that the *Bulletin* had been welcomed in many quarters, and it was hoped that it would now become a regular feature in the consultant machinery and be an effective instrument in maintaining close relationships between consultants up and down the country. It would be issued about four times a year.

A useful memorandum was placed before the Committee by the Association's solicitor (Mr. Leigh Taylor) on the assessment of income tax on remuneration of part-time consultants. The advice of the Association's solicitor was also forthcoming on complaints which had been received from whole-time officers, who were required under their contract to have a telephone at their homes and who had been refused relief from income tax in respect of the expense involved.

A memorandum of evidence to be submitted to the Health Visitors Working Party was considered, also resolutions on various subjects from regional committees, and other routine business was transacted.

LOSS OF PRESCRIPTIONS CHARGES DOCTORS RESPONSIBLE

The General Medical Services Committee of the B.M.A. has heard recently of a case where a dispensing doctor had a considerable sum of money, collected from prescription charges, stolen from his surgery. Responsibility for such sums of money rests with the doctor concerned, and legally he is liable to make good any loss incurred if money or stamps are lost or stolen in the post. He is also responsible if he sends stamps by post without paying a sufficient registration fee to cover the value, and the Post Office will not accept liability.

The Committee suggests, therefore, that dispensing practitioners should insure against possible losses of this kind, and has asked local medical committees to recommend this to dispensing doctors in their areas.

Scottish News

SCOTLAND'S HEALTH SERVICES

REPORT BY DEPARTMENT OF HEALTH

The Department of Health for Scotland in its report¹ for 1953 states that, of 2,527 doctors taking part in the National Health Service in Scotland as principals at the end of the year, 1,427 were in partnership practice. The marked increase in the numbers of doctors practising in partnership is attributed to the introduction of the new system of general-practitioner remuneration, which has also contributed to a more even distribution of patients.

The report refers to the "purely experimental" health centres at Sighthill and Stranraer, which it says do not represent the first steps in a settled policy of health-centre provision. Until experience has been gained of the working of arrangements for encouraging partnerships and group practices, no further experiments are contemplated, with the possible exception of setting up a small health centre in a new town.

Expenditure

Expenditure on general medical services during the year ended March 31, 1953, amounted to £9,296,073. Of this sum, payments against executive council remuneration pools, including retrospective Danckwerts award payments, accounted for £7,944,500; mileage payments to rural doctors £430,416; inducement payments (including retrospective increases), £34,478; maternity medical services, £355,338; and grants for training of assistants, £97,278.

The estimated number of prescriptions dispensed in 1953 was 2,049,500, an increase of 106,000 over the 1952 figure. The report notes an apparent reduction in the average cost of prescriptions since publication of the findings of a committee on prescribing, indicating proprietaries not of proved therapeutic value.

Hospitals

The number of whole-time consultants in the N.H.S. in Scotland at December 31, 1953, was 384 as compared with 372 at December 31, 1952; part-time consultants totalled 384 in 1953 and 378 in 1952. There were 249 whole-time and 111 part-time senior hospital medical officers in the Service at the end of 1953, and 219 whole-time and 111 part-time at the end of 1952.

The report says that in some parts of Scotland hospitals found it difficult to obtain sufficient numbers of junior staff, particularly house officers, during 1953. This could partly be attributed to a temporary fall in the number of graduates from the Universities of Edinburgh and St. Andrews, where a five-year course of studies has been changed to a six-year course. But, even when the transition phase has passed, the number of graduates from Scottish universities will still be below the high level of the post-war years.

The Department regards the linking of general practice with the hospital service as important, both for the hospitals and for domiciliary practice. Arrangements were therefore put in hand during the year for pilot surveys of selected areas to discover the extent to which suitable openings for part-time assistants are available in general practice, preferably with a view to partnership, with the idea of introducing hospital doctors, mainly in the registrar grade, to general practice as a part-time occupation. The Eastern Regional Board has drawn up a comprehensive complementary scheme to encourage the appointment of general practitioners to hospital posts.

Numbers Employed

About 66,000 people were employed in the N.H.S. in Scotland at September 30, 1953, of whom about 53,000 were employed whole-time or substantially so. The main groups are: doctors, 5,200; dentists, 1,400; nurses and midwives,

¹Report of the Department of Health for Scotland for the Year 1953. 1954 H.M.S.O.

26,900; pharmacists, 2,800; opticians, 950; medical auxiliaries, 1,500; administrative and clerical, 3,900; ancillary and domestics, 22,500.

The total number of approved posts in hospitals for the purpose of the pre-registration year for newly qualified doctors was increased during the year from 557 to 559. There was an excess of posts over applicants, so that these doctors had no difficulty in obtaining suitable appointments.

TOUR OF DENMARK FOR SCOTTISH DOCTORS

Applications for the tour by Scottish doctors to Denmark in September, 1954, can still be entertained. The first announcement giving preliminary details appeared in the *Supplement* on March 13, 1954.

The tour will extend from August 31 to September 13, and will include visits to hospitals, universities, and medical institutes, as well as sightseeing excursions. The cost of the tour will be approximately £40, including travel Newcastle-Copenhagen and the stay in Denmark. All expenses of travelling in Denmark will be met by the Danish Society.

Doctors in Scotland who are interested in this tour should communicate with the Scottish Secretary, British Medical Association, 7, Drumsheugh Gardens, Edinburgh, 3, without delay.

NATIONAL HEALTH SERVICE ESTIMATES, 1954-5

It is estimated¹ that £384,215,685 will be required during the year ending March 31, 1955, for the provision of a comprehensive health service for England and Wales, and other connected services, including medical services for pensioners, treatment abroad of respiratory tuberculosis, purchases of equipment, etc., and certain civil defence expenses. This is an increase over the 1953-4 estimates of £11,683,365. The corresponding estimate for Scotland in the same period is £48,917,800, an increase of £1,773,242 over 1953-4.

Mostly Up

The estimates provide for an extra £9,670,590 (£284,463,525) for hospital, specialist, and ancillary services in England and Wales, and an extra £1,310,432 (£37,029,000) in Scotland. Increased figures are also given for the general medical, dental, and supplementary ophthalmic services in England and Wales—a total of £124,882,900, which is £4,107,400 more than last year. A reduction of £154,000 in the pharmaceutical service is, however, listed. In Scotland an extra expenditure in these services is estimated at £973,080, and here there is no reduction in the pharmaceutical service.

Grants to local health authorities in England and Wales rise by £1,663,500 to £21,277,510. Similar grants in Scotland are reduced by £23,510 to £1,920,500.

Notes and News

Hospitality.—Two Norwegian doctors would like to arrange exchanges for their daughters, both aged 16, for the summer of 1954, and in return British girls could go to Norway in 1955. One family live in the country near Oslo, and the other family, who live in Oslo, spend part of the summer in their mountain hut. Would anyone interested please contact Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

¹1954-55 Civil Estimates, 1954, Class V: Health, Housing, and Local Government. H.M.S.O., London. See *Journal*, p. 864.

REVISED ALLOWANCES FOR MEMBERS OF LOCAL AUTHORITIES

New maximum rates for subsistence and travelling allowances and financial loss payments of local authorities and certain other bodies under the Local Government Act, 1948, are laid down in regulations¹ which came into force on March 30.

Rates of subsistence allowances are increased from 5s. to 7s. 6d. for a period of between four and eight hours; from 10s. to 12s. 6d. for a period of between 8 and 12 hours; and from 15s. to 20s. for a period of more than 12 hours. For absence overnight from the usual place of residence the rate is raised from 32s. 6d. to 42s. The supplementary allowance for stay in London or for the purpose of attending certain specified annual conferences is reduced from 9s. 6d. a night to 8s. a night. Mileage allowances for members using their own motor vehicles will now vary between 9½d. a mile and 2d. a mile, instead of between 9d. and 2d. a mile.

The Financial Loss Allowance Regulations² increase the daily rates of reimbursement under this heading from 10s. to 15s. where the period of time over which earnings are lost or additional expense is incurred is not more than four hours; and from 20s. to 30s. where the period is more than four hours.

INTERNATIONAL RELATIONS BRITISH DOCTORS IN THE U.S.A.

The International Relations Committee of the B.M.A. has considered the position of members of the Association who are resident, permanently or temporarily, in the U.S.A. They are not attached to any Branch of the B.M.A., and they are frequently not eligible for membership of the State Medical Societies, which constitute the American Medical Association, because some of these societies require American citizenship. The Committee asked the American Medical Association whether it could introduce some form of membership for these doctors on the lines of the associate or complimentary memberships of the B.M.A., which are available for American and other foreign doctors while resident in the United Kingdom. The American Medical Association has replied that such membership cannot be provided under its constitution. It has offered, however, "the courtesies of the Association, including attendance at all scientific sessions" to any member of the British Medical Association in America who writes to the Secretary of the American Medical Association, 535, North Dearborn Street, Chicago, 10, Ill., stating that he is a member of the B.M.A., and indicating how long he intends to remain in the U.S.A.

Letters of Introduction for Doctors Going Abroad

The International Relations Committee has been informed that the West German Medical Association issues identity cards, printed in four languages, for the use of its members when visiting foreign countries in which the national medical association is a member of the World Medical Association. The card is issued to the doctor on production of evidence "that he is in good standing with his local medical society," and is intended to serve both as a means of identification and as an introduction to colleagues in the country visited. The West German Medical Association invites other member associations of the W.M.A. to assist German doctors presenting the card, and promises in its turn to help foreign doctors visiting West Germany who can be similarly identified.

While the Committee does not consider it desirable to issue identity cards, it wishes to draw the attention of mem-

¹The Local Government (Allowances to Members) Regulations, 1954. S.I. 1954, No. 397. H.M. Stationery Office, price 4d.

²The Local Government (Financial Loss Allowance) Regulations, 1954. S.I. 1954, No. 398. H.M. Stationery Office, price 2d.

bers of the B.M.A. to the practice which has been satisfactorily followed by the B.M.A. for many years, and which serves the same purpose. Any member going abroad may apply to the Secretary of the Association for a letter of introduction, and this will readily be given. The letter will be suited to the individual purposes of the member. It may, for example, be an introduction for general use, or it may introduce the member to a particular foreign doctor or to a particular hospital or clinic.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Hospital Staff Appointments

SIR,—Mr. David Wilkie in his letter about hospital staff appointments (*Supplement*, March 27, p. 127) raises important issues. I have had some experience of serving on appointments advisory committees both in England and in Scotland, and I think he can rest assured that the greatest possible weight is given to the views of the hospital concerned, when those views can be clearly expressed. The candidate's academic qualifications and research achievements can be assessed fairly easily, and some hints as to his personality may emerge at the interview; but an estimate of his clinical ability and of his attitude to patients and staff can only be obtained by a colleague in his own branch who has observed his work over a period. It follows that, unless there happens to be on the committee one qualified so to report on the candidate, the committee have to rely on the information supplied by a referee.

Now to make adverse comments in writing about a man who has worked with one is repugnant to most of us; the worst the committee can expect to hear is "faint praise"; and if the referee is too laudatory the committee may wonder if his chief might be not unwilling to part with his marvellous young colleague. I have even heard it suggested that, because a particular referee gave a candidate a poor report, that candidate was probably very good. Personally I have come largely to discount such references. I feel with Mr. Wilkie that the present procedure is unsatisfactory in the case of those candidates whose work is not personally known to at least one suitable medical member of the committee.

The remedy which I suggest consists in ensuring that the committee will have assisting it, for each interviewed candidate, a suitable consultant who can speak from personal knowledge of the candidate's work and character. This might be achieved by appointing as the two consultants from other regions persons with such knowledge and, in the case of candidates not so covered, by sending a suitable consultant, who might well be from the hospital concerned, to pay a private visit to the hospital employing the candidate to see his work and make local inquiries, and, without informing the candidate of the purpose of his visit, reporting verbally to the committee.

After all, these appointments are virtually permanent, and the appointment of a consultant or of an S.H.M.O. of less than the necessary clinical standard, or with a personality unsuitable for the post, may cause endless friction over a period of years, not to mention the risks of patients receiving sub-standard treatment, with the possibilities and liabilities involved. I feel that what is needed is not so much increased representation of the hospital concerned as the placing before the committee of observed facts on the candidate's clinical ability and character by a consultant, who can be asked to amplify and if necessary clarify his observations at the meeting.—I am, etc.,

Aberdeen.

R. R. M. PORTER.

Remuneration of Hospital Medical Staff

SIR,—In the *Daily Express* of April 2 there appeared an article which states that the nation's income for 1953 was the highest in history. "Everybody shared in the prosperity—soldiers, sailors, tinkers, tailors. Wages of the workers and salaries of the black-coated . . . bounded £475m. The men in the Forces pulled in £13m. more. Farmers earned £397m., a gain of £4m. Theirs was the smallest gain of all. Professional men, doctors, dentists, lawyers, collected £8m. more in fees. . . ." I hope that our Public Relations Officer will take steps to remind the Press and the public that doctors in the hospital service have received no benefit so far from this prosperity wave. Our case for the implementation of Spens for the hospital services now seems unanswerable.—I am, etc.,

Beckenham.

A. J. MERRY.

Life Assurance Fee

SIR,—With reference to paragraph 106 of the Annual Report of Council (*Supplement*, March 27, p. 99), I was surprised to read that the Life Assurance Officers' Association have notified the Council that the fee of £1 11s. 6d. is regarded as adequate when an examination and report is carried out.

Some time ago, in conversation with the London general manager of one of the largest insurance companies, he stated that it was up to the doctors to make representations for an increase in this fee. To-day I received a request from the Prudential Assurance Company for an attendance report, for which is offered a fee of £1 1s. Completion of such a report from my records never takes more than five minutes, whereas an examination and report I find necessitates a minimum of 40 minutes, with, on occasions, a further 5-10 minutes if the applicant has been unable to pass a specimen at the first consultation. It seems to me that 10s. 6d. for a full examination is completely inadequate, and that the fee for an examination and report should be a minimum of £3 3s.—I am, etc.,

Gravesend.

H. RICHARDSON GRAY.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). The only charge made is for postage of books. A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Aberle, S. D., and Corner, G. W.: *Twenty-five Years of Sex Research: History of the National Research Council Committee for Research in Problems of Sex, 1922-1947*. 1953.
- Austin, R. G.: *Aids to Inorganic Chemistry*. Second edition. 1953.
- Bertram, F.: *Die Zuckerkrankheit*. 4 Auflage. 1953.
- Bosselman, B. C.: *The Troubled Mind: A Psychiatric Study of Success and Failure in Human Adaptation*. 1953.

Association Notices

ELECTION OF MEMBER OF THE COUNCIL BY THE FAR EASTERN BRANCHES

Dr. J. W. Winchester (Omagh, Co. Tyrone) is the only candidate nominated to represent the Far Eastern Branches on the Central Council, in place of the late Professor Kenelm H. Digby. Accordingly, Dr. Winchester is hereby declared elected for the remainder of the term of office—that is, until the close of the Annual Representative Meeting, 1955.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, April 13, 8.30 p.m., meeting. Address by Mr. Samuel Davidson.

BURTON-ON-TRENT DIVISION.—At Bretby Golf Club, Ashby Road, Burton-on-Trent, Tuesday, April 13, 8 p.m., dinner, followed by lecture by Dr. W. Carey Smallwood: "Some Corticoids and their Uses."

EAST YORKSHIRE BRANCH.—At Quern House, Park Street, Hull, Wednesday, April 14, 8.30 p.m., meeting. Dr. J. Hunt (Secretary, College of General Practitioners): "Progress in General Practice and the new College of General Practitioners."

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, April 15, 8.30 p.m., meeting. Mr. Philip Wiles: "Osteoarthritis, with Special Reference to the Hip."

HASTINGS DIVISION.—At Out-patient Department, Bexhill Hospital, Tuesday, April 13, 8.15 p.m., clinical meeting.

KINGSTON-ON-THAMES DIVISION.—At Epsom District Hospital, Dorking Road, Epsom, Tuesday, April 13, 7.45 p.m., joint clinical meeting with Surrey Medical Society.

SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, April 9, 9 p.m., meeting. Discussion on Annual Report of Council.

SOUTH-WEST ESSEX DIVISION.—At Wanstead Hospital, Hermon Hill, Wanstead, E., Wednesday, April 14, 8.30 p.m., meeting. Lecture by Dr. Oswald A. Savage: "New Treatments in Rheumatism." A discussion will follow.

SOUTH MIDDLESEX DIVISION.—At Anchor Hotel, Shepperton, Monday, April 12, 9 p.m., meeting.

STRATFORD DIVISION.—At Queen Mary's Hospital, West Ham Lane, E., Tuesday, April 13, 9 p.m., general meeting.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Tuesday, April 13, 8.30 p.m., clinical meeting. Dr. F. E. Camps: "A Trace of Arsenic, Murder."

WEST BROMWICH AND SMETHWICK DIVISION.—At the Sandwell Hotel, West Bromwich, Wednesday, April 14, 8.15 p.m., supper meeting. Talk by Mr. W. E. Wimberger: "Transatlantic Journey."

WEST SUSSEX DIVISION.—At 73, Richmond Road, Worthing, Sunday, April 11, 4 p.m., annual general meeting.

Meetings of Branches and Divisions

BRITISH GUIANA BRANCH

At a general meeting held on January 29, 1954, at the Public Hospital, Georgetown, a resolution was unanimously passed expressing the Branch's thanks to Dr. H. Ho for his services to the Association as President, Secretary, and member of the Branch Council of the British Guiana Branch. Dr. Ho has left the colony to practise elsewhere.

HAMPSTEAD DIVISION

At a meeting of the Hampstead Division on March 3, 1954, with Dr. Lena Williams in the chair and 23 members and 14 other guests and members of the legal profession present, Dr. Desmond Curran opened a discussion on "Insanity and the Law." Speaking as an expert witness as a psychiatrist and with exceptional experience in criminal cases, Dr. Curran found that there was very much that was unsatisfactory in the psychiatrist's position in law. The law was confused in its own mind. The first thing that the court wanted to know was whether the accused suffered from a disease of the mind, but there was no definition of what was a disease of the mind. In the case of Straffen, he was mentally defective, but this was not regarded as a disease of the mind. The M'Naghten rules, which still acted as a guide in criminal matters, formed a fair working rule in capital cases, but were less applicable in other cases. If the death penalty was to be abolished there would be little point in their retention. Both Dr. Curran and subsequent legal speakers felt that the best possible psychiatric advice was not always available to the court, and Dr. Curran thought it was wrong that solicitors should tout round psychiatrists and other medical men until they found one whose opinion fitted the plea they wished to put forward for their client. Dr. Curran was followed by Mr. Henry Elam, who related many interesting cases out of his wide experience in the criminal courts, and by his colleague, Mr. Hugh Park, who contributed further details of the cases of Straffen and Giffard. A number of members and legal guests contributed to the subsequent discussion.

KENYA BRANCH

The annual general meeting was held on January 15, 1954. The following officers were elected:

President.—Mr. W. E. Powell.
 Vice-president.—Dr. A. T. G. Thomas.
 Hon. Secretary.—Mr. Andrew Hicks.
 Hon. Treasurer.—Dr. J. A. Carman.

MOMBASA DIVISION

The annual general meeting was held at the Pandya Memorial Clinic on January 28, 1954. Dr. C. Cochrane took the chair and there were nine members present. The following officers were elected:

President.—Dr. Cochrane.
 Vice-president.—Dr. Karve.
 Secretary and Treasurer.—Dr. A. U. Sheth.

WEST SUFFOLK DIVISION

The annual meeting was held at Everards Hotel, Bury St. Edmunds, on February 9, 1954. Dr. M. G. St. M. Rees took the chair, and there were fifteen members present. The following officers were appointed for the ensuing year:

Chairman.—Dr. R. H. Clayton.
 Vice-chairman.—Dr. H. G. St. M. Rees.
 Hon. Secretary and Treasurer.—Dr. J. W. E. Cory.

GENERAL MEDICAL SERVICES COMMITTEE

REPORT OF THE GENERAL MEDICAL SERVICES COMMITTEE TO THE ANNUAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL COMMITTEES, 1954

PERSONNEL OF GENERAL MEDICAL SERVICES COMMITTEE, 1953-4

Ex officio: J. W. Tudor Thomas, Cardiff (President); S. Wand, Birmingham (Chairman of Representative Body); E. A. Gregg, London (Chairman of Council); A. M. A. Moore, Upminster, Essex (Treasurer); W. M. Knox, Glasgow (Chairman of Conference of Local Medical Committees).

Elected by A.R.M. of B.M.A. (1953): England and Wales: J. C. Arthur, Gateshead; A. Brown, Linton, Cambs; J. A. Brown, Birmingham; H. Guy Dain, Birmingham; Scotland: J. T. Baldwin, Milton Bridge, Midlothian; Northern Ireland: J. Bleakley, Belfast (Deputy: J. H. Cronhelm).

Direct Representatives of Local Medical Committees: W. Neil Darling, Edinburgh (Group "A.1"); C. J. Swanson, Aberfeldy, Perthshire (Group "A.2"); J. R. Langmuir, Glasgow (Group "A.3"); R. C. Hamilton, Kilmarnock (Group "A.4"); F. Lishman, Bishop Auckland, and D. T. McDonald, Belford (Group "B"); H. F. Hollis, Leeds, and H. Thorp, Todmorden, Yorks (Group "C"); A. Campbell, Accrington, Lancs, F. S. Catto, Manchester, and P. J. Gibbons, Liverpool (Group "D"); Miles Parkes, Crewe (Group "E"); T. J. Hargest, Swansea, and G. P. Williams, Holyhead (Group "F"); E. W. Goodwin, Leicester, and A. S. Wilson, Gosberton, Lincs (Group "G"); A. B. Davies, Walsall (Group "H"); F. A. Smorffitt, Southam, Warwickshire (Group "I"); C. F. R. Killick, Williton, Somerset (Group "J"); R. W. McConnell, Wendover, Bucks (Group "K"); J. D. R. Murray, Exmouth, Devon (Group "L"); K. S. Maurice-Smith, Ely, Cambs (Group "M"); H. S. Howie Wood, Isle of Wight (Group "N"); D. F. Whitaker, Guildford (Group "O"); A. W. Gardner, Lewes (Group "P"); A. T. Rogers, Bromley, Kent (Group "Q"); D. F. Hutchinson, Middlesex, and A. N. Mathias,

Cricklewood, N.W.2 (Group "R"); J. L. McKenzie Brown, London, and C. M. Scott, New Barnet, Herts (Group "S"); H. H. D. Sutherland, London, and Max Sorsby, London (Group "T"); J. B. Young, Belfast (Group "U").

Elected by Annual Conference of Local Medical Committees, 1953: A. Beauchamp, Birmingham; J. A. Gorsky, London; I. G. Innes, Hull; J. A. Pridham, Weymouth; F. M. Rose, Preston; W. Woolley, Bristol.

Nominees of Other Bodies: T. Rowland Hill, London, W.1, and L. Dougal Callander, Doncaster (Central Consultants and Specialists Committee); Kate Harrower, Glasgow (Medical Women's Federation); H. D. Chalke, London, N.W.3 (Public Health Committee and Society of Medical Officers of Health); Bruce Cardew, London, W.C.1, and H. C. Faulkner, London, N.W.5 (Medical Practitioners' Union).

Co-opted Members: O. C. Carter, Bournemouth; A. Joffe, London, W.1, and L. Russell, London, N.W.10 (Assistants and Young Practitioners Subcommittee); D. C. Bowie, London, W.C.1.

Observer from the British Dental Association: G. M. Hickley, London, S.W.9.

CHAIRMAN

1. A. Talbot Rogers was appointed Chairman for the session 1953-4.

THE WORK OF THE COMMITTEE

2. The past session has again proved a busy period for the Committee and meetings have been frequent.

3. Negotiations with the Ministry of Health on the application of the principles established by the Danckwerts award to the calculation of the size of the Central Pool have occupied much of its time, and, inevitably, the new distribution scheme itself has given rise to a number of administrative

tive problems during the year. Happily, the new scheme seems to have operated smoothly, though there remains the major problem of the practitioner with the small list. Here again the Committee has been active in obtaining information which is so vital to the Working Party in its review of the situation. Discussions in the Working Party have continued, and an account of the investigation into the problem appears elsewhere in the Report.

4. Another major task which the Committee has undertaken during the year has been the preparation of a memorandum which the Council of the Association has incorporated in its evidence to the Guillebaud Committee, set up by the Minister to examine the cost and efficiency of the Health Service.

5. In addition, the report by the special subcommittee on the Service Committees and Tribunal Regulations has been revised in accordance with the wishes of last year's Conference and is now being discussed with the Ministry.

6. Comprehensive reviews have also been made of the maternity service and of methods of facilitating the means by which established general practitioners can change their areas of practice.

7. Throughout the year representatives of the Committee have met officers of the Ministry at regular intervals to discuss the many detailed points of day-to-day administration of the Service which continue to arise. These discussions have been of great value and have enabled many minor faults in the Service to be put right.

8. A close liaison has been maintained with the Medical Practices Committee and matters of mutual interest have been discussed to the advantage of both bodies. Close contact has also been maintained with the organizations representing other professions engaged in the Health Service.

9. A list of attendances at various meetings has been given as a further Appendix (Appendix A) which appears in the copies of the Report that have been sent to local medical committees.

REPRESENTATION ON B.M.A. COMMITTEES

10. The G.M.S. Committee is represented on the following B.M.A. Committees: Private Practice (A. N. Mathias: Deputy—C. M. Scott); Public Health (C. M. Scott: Deputy—K. S. Maurice-Smith); Central Consultants and Specialists (A. Talbot Rogers and D. F. Hutchinson: Deputies—F. A. Smorffitt and J. D. R. Murray); Ophthalmic Group (M. Sorsby); Occupational Health Committee (F. Lishman: Deputy—A. Brown); Public Relations (A. Talbot Rogers, D. F. Hutchinson, F. M. Rose, and W. Woolley: Deputies—J. T. Baldwin, P. J. Gibbons, R. W. McConnel, and H. H. D. Sutherland); Compensation and Superannuation (A. B. Davies, A. N. Mathias, and W. Woolley); Joint Committee of B.M.A. and Pharmaceutical Society (A. Talbot Rogers, F. Gray, and E. W. Goodwin); Consultants, General Practitioners, and Public Health Liaison Committee (A. Talbot Rogers, H. S. Howie Wood, D. F. Hutchinson, A. W. Gardner, J. D. R. Murray, S. Wand, and D. F. Whitaker); Joint Formulary Committee of the B.M.A. and the Pharmaceutical Society (H. Guy Dain, M. Sorsby, D. F. Whitaker, and A. B. Davies); Arrangements Committee (A. Talbot Rogers, I. G. Innes, and F. M. Rose: Deputy member—A. Beauchamp); Pharmacopoeia Subcommittee of Science Committee (A. B. Davies); Committee on the relation of Drunkenness and Alcohol to Road Accidents (A. B. Davies).

LIAISON BETWEEN THE GENERAL MEDICAL SERVICES, CENTRAL CONSULTANTS AND SPECIALISTS, AND PUBLIC HEALTH COMMITTEES

11. It will be remembered that last year the Committee welcomed a proposal that the Public Health Service representative on the General Medical Services Committee should be jointly nominated by the Public Health Committee and

the Society of Medical Officers of Health, and that a direct representative of the G.M.S. Committee should be appointed to the Public Health Committee. This arrangement has been put into effect during the past session and has done much to promote a closer liaison between the two branches of the Service.

12. For some years past liaison with the Central Consultants and Specialists Committee of the Association has been maintained by means of a small joint subcommittee. On a number of occasions the matters under discussion were found to be of interest not only to general practitioners and consultants but also to medical officers engaged in the public health service. It was therefore felt that it would be most useful if the membership of this joint subcommittee were enlarged to include representatives of the Public Health Committee, and the necessary arrangements have now been made.

13. It is believed that this standing arrangement will greatly facilitate discussion upon matters which are of vital interest to the three main branches of the profession.

NOMINEES ON MINISTRY OF HEALTH DISTRIBUTION COMMITTEES

14. The following nominees were accepted by the Ministry for appointment on Central Distribution Committees for 1953-4:

International Distribution Committee: F. Gray (London), E. R. C. Walker (Scottish Secretary), G. P. Williams (Holyhead), and D. P. Stevenson (Deputy Secretary).

Distribution Committee for England and Wales: A. Talbot Rogers (Bromley, Kent), F. Gray (London), W. Woolley (Bristol), G. P. Williams (Holyhead), and D. P. Stevenson (Deputy Secretary); together with A. Brown (Linton, Cambs), J. D. Wells (Billericay, Essex), and C. F. R. Killick (Williton, Somerset) when questions concerning mileage are under consideration.

BRITISH DENTAL ASSOCIATION'S GENERAL DENTAL SERVICES COMMITTEE

15. A close liaison has been maintained with the General Dental Services Committee of the British Dental Association, and an observer from the B.D.A. (G. M. Hickley, London) has attended meetings of the Committee. F. Gray (London) has attended meetings of the General Dental Services Committee of the B.D.A.

16. This cross representation has enabled the two bodies to discuss and reach agreement on a number of matters of mutual interest.

REMUNERATION

Size of the Central Pool

17. The principles established by the Danckwerts award make it necessary for the Committee to reach agreement with the Ministry each year on the detailed application of the variable factors which are involved in calculating the size of the Central Professional Pool. The number of doctors in the Service, the level of practice expenses, and the amount of the earnings of general practitioners from sources outside the general medical services vary from year to year and so necessitate an appropriate adjustment to the amount contributed by the Ministry of Health to bring the Pool up to the required level. Precise information on these points is not available until after the end of the financial year, and the Pool is therefore calculated initially on a provisional basis and a final settlement is made when the full picture emerges.

18. It is hoped that the final settlement in respect of the financial year 1952-3 will be distributed very shortly.

19. The Committee has devoted a good deal of time to discussions upon the best method of assessing these variable factors, and the following paragraphs set out the action which is being taken in respect of each.

Number of Doctors in the Service

20. Detailed discussions have taken place with officials of the Ministry on the method of calculating the precise number of doctors in the Service. To base the calculations on the number of doctors on the lists of executive councils at either the commencement or the end of the year would obviously be inequitable, and it has been agreed that there should be a count on January 1 and July 1 of each year; the mean of the two figures being taken for the purpose.

21. It has also been agreed that the count should not be confined solely to those whose names appear on the medical lists at the relevant dates but that due regard should be paid to applications for admission to the list which are under consideration at the time that the count is taking place.

22. In the case of single-handed doctors appointed to advertised vacancies the Ministry will take into account those who find their way to the medical list of any area by the end of the calendar month commencing with the date of the count, provided that the original doctor died or retired before the date of the count and was not therefore included in it.

23. Those entering partnership practice have been dealt with by including in the count doctors who satisfy the following conditions:

(1) they were on the date of the count effective members of a partnership which provided services under Part IV of the Act;

(2) they had made application by the date of the count for their names to be included in an executive council's medical list;

(3) their names had, during the calendar month commencing with the date of the count, been included in the medical list as partners as a result of these applications, and the numbers of partners in the partnerships concerned, who were providing services under the Act, had not been reduced again during the month by the retirement of one of the original doctors.

24. These methods adequately safeguard the position of doctors who are admitted to the Service during the financial year in question but after the date of either count.

25. The Ministry for its part felt that there were four groups of practitioners whose position should be considered before they were included in the calculation. These groups are:

(1) those practitioners with no patients at all;

(2) doctors with very few N.H.S. patients;

(3) salaried partners; and

(4) partners whose share in the practice is less than one-third of the share of any other partner.

26. As far as the first group is concerned, the Committee felt that as these doctors had been included for the purposes of the original Spens calculations they should likewise be included for the purpose of calculating the size of the Pool. The Ministry was unable to accept this point of view, and as a compromise it has been agreed that the count will exclude any single-handed doctor who at the material date has no patients on his list and who has been on an executive council's list for a year or more.

27. The Ministry is obtaining further information about doctors in the second group, and further discussions will then take place.

28. In the case of salaried partners, the Committee has agreed that they should be excluded so long as care is taken that the share of practice expenses attributable to them are, in fact, included as such.

29. Both the Ministry and the Committee have agreed that doctors in the fourth category should be included in the count.

Practice Expenses

30. It will be remembered that Mr. Justice Danckwerts accepted an expense ratio of 38.7%, and this percentage has so far been used in calculating the size of the Pool. Clearly it is desirable that this figure should be brought up to date, and arrangements were made for a further review of the level of practice expenses, including an inquiry undertaken

by the Board of Inland Revenue based upon accounts for financial years ended during the March quarter of 1952. This inquiry is now complete and its results are to be discussed with the Ministry of Health. The resultant expense ratio will be applied retrospectively to the 1952-3 Pool.

Receipts from Private Practice

31. The Ministry suggested that the Inland Revenue inquiry into practice expenses should be used to obtain an estimate of the receipts of general practitioners from private practice. The actual method which the Ministry proposed to use made it obvious to the Committee that there was no possibility of any accurate assessment being made in this way.

32. The Committee does not dispute that an accurate figure for private practice must be obtained, but it was unable to agree that the practice expenses inquiry, framed to elicit such different information, should also be used for this purpose.

33. These views have been accepted by the Ministry, and further thought is being given to possible ways and means of obtaining an accurate estimate of total receipts from private practice. In the meantime, both sides have agreed that the figure of £2,000,000 accepted by Mr. Justice Danckwerts should be used as a provisional basis for the calculation of the Pool for 1952-3, and that an adjustment either way should be made when a more detailed assessment of this source of income is made.

The Distribution Scheme

Appeals Machinery

34. It will be remembered that the Committee felt that it was necessary to provide means whereby an appeal could be made against:

(1) the rejection of any application for an initial practice allowance;

(2) the refusal of a hardship payment; and

(3) the refusal of an application to be paid on the basis of "notional lists."

35. It has now been agreed that in these circumstances the practitioner concerned will have a right of appeal to the Minister, and in reaching a decision the Minister will be advised by a committee consisting of equal numbers of representatives of the Ministry and of general practitioners from a panel nominated by the G.M.S. Committee.

Notional Lists

36. It will be remembered that the original E.C.L. on the subject made specific provision that, where a new partnership had recently been formed but one of the partners would not be admitted to the list under the existing procedure until some time in April, 1953, executive councils would be given discretion to determine the number of loadings due to the partnership as if the name of the incoming doctor had been included in the list on April 1, 1953.

37. The Ministry has now agreed that a similar concession should be granted in the first month of any quarter. In other words, where an executive council is satisfied that a partnership was in fact effective from the beginning of a quarter but that there is some delay in the admission of the new member of the partnership to the medical list, so that inclusion in the list actually takes place at a date between the first and last days of the first month of a quarter, the executive council can agree to calculate the number of loadings due to the partnership as if the name of the incoming doctor had been included in the medical list from the beginning of the quarter.

38. It has also been agreed that in future the Medical Practices Committee when granting a partnership application will indicate the date on which they have been informed the partnership became effective.

Maximum Lists

39. Although normally most general practitioners complete their National Service immediately after registration, occasionally call-up is deferred until after the practitioner

concerned has become established as a principal in general practice. The position of partnerships where one member might be called up for National Service has been discussed with the Ministry. The Ministry has agreed that where a member of a partnership is called up for National Service it should not affect the calculation of the maximum lists for the partnership, provided that adequate deputizing arrangements have been made for the care of the patients of the practitioner who is away on National Service. In addition, the Ministry agreed that there would, in the circumstances, be no need to disturb any arrangement for payment on notional lists which might then be in existence, since the deputizing arrangements should normally be accepted as complying with the requirements of the distribution scheme.

Initial Practice Allowances

40. Attention was drawn to an anomaly in the method of assessing income in connexion with claims for Initial Practice Allowances. In the case of doctors filling vacancies in small single-handed practices executive councils are required to take dispensing payments into account, and the Committee felt that some allowance should be made for the fact that the amounts involved include a considerable element in respect of the actual cost of the drugs supplied.

41. Following consultation with the Ministry, it has been agreed that the total sums paid for dispensing should be disregarded.

School Medical Officers

42. The Committee has received representations from the Medical Officers of Schools Association against the provision in the model distribution scheme whereby a 20% reduction is made in the capitation fee in respect of limited lists.

43. Full consideration has been given to this matter on a number of occasions, but the Committee does not feel that it is able to take any action on a national basis to alter the present arrangements in favour of the whole-time school medical officer.

44. Subject to the Ministry's consent local medical committees, in consultation with local executive councils, have discretion to vary the model distribution scheme should this be necessary to meet the needs of their own areas, and the Committee feels that this possibility safeguards the position of the medical officer of a school who can show that the present arrangements are inequitable in his particular case.

Back Debts and Back Credits

45. The Committee's attention has been drawn to a problem which arises from the provisions in the regulations which govern the retrospective adjustments which sometimes prove necessary to the amounts paid to the general practitioner by way of quarterly capitation fees. Whereas there appears to be no limit placed upon the period in respect of which either back debts or back credits can be made, in practice, retrospective debts are more easily applied than adjustments in the practitioner's favour. The Committee is to discuss this matter with the Ministry of Health.

THE DANCKWERTS AWARD AND THE SMALL-LIST PRACTITIONER

46. It will be remembered that the Special Conference, held on May 5 last year, not only reaffirmed its support of the new distribution scheme but endorsed to the full the action which the Committee proposed to take to give effect to the rider passed by the Conference in 1952, when the Working Party's proposals were originally approved. The sense of the rider was briefly that, if after the new scheme of distribution had been endorsed by both parties it was found in the light of experience that certain groups who might have been expected to have benefited had, in fact, not done so, it should be left to the Working Party provisionally to allocate an appropriate proportion of the final settlement moneys for the purpose of remedying any obvious defects in the distribution scheme.

47. Clearly, the wishes of the Conference could be implemented only after the new distribution scheme had been in operation for some time and its effects assessed in the light of experience. Again, the Committee felt that a comprehensive inquiry into the position of practitioners with small lists would be necessary before any revision of the distribution scheme in favour of this particular section of the profession could be justified.

48. For these reasons the Committee, in consultation with the Ministry, called the Working Party together again to investigate the problem and to initiate an official inquiry designed to reveal both the number and groups of general practitioners who might in the light of experience have been found to be adversely affected by the new distribution scheme. The Committee felt that such a step would not only safeguard the accuracy of the information which was being sought but would also have the advantage that the Ministry would be aware of the Committee's intention to examine the situation and would be prepared, in advance, for any adjustment in the Working Party's scheme which might prove necessary.

49. At the same time, the Committee secured the inclusion in the regulations of a provision whereby, should it be decided to revise the distribution scheme in any way, the steps taken to this end could be applied retrospectively.

50. As a first step the Ministry prepared a list of single-handed practitioners who on January 1, 1953, were recorded as having lists of not more than 1,200 patients, and executive councils were asked to supply certain particulars about these doctors from their own records.

51. Although this official information gave the Working Party a good deal of information about the circumstances of the practitioners concerned, it was thought to be desirable to invite local medical committees to supply other information mainly concerning the work which those within the scope of the survey were undertaking outside the provision of general medical services under the Act.

52. These two inquiries have now been completed, and the results analysed. A further meeting of the Working Party has been held and a full account of the progress which has been made will be included in the Committee's Supplementary Report.

MONTHLY PAYMENTS TO GENERAL PRACTITIONERS

53. The question of monthly payments to general practitioners has been discussed with the Ministry of Health. Although the Committee does not consider it necessary to make special provision in the distribution scheme itself, it felt that it should be possible to arrange monthly payments to general practitioners who so wished without placing upon them the necessity of proving that hardship would otherwise arise.

54. The Ministry fully accepted the Committee's view, and, in a letter to the Executive Councils' Association published in their Journal, has suggested that requests for monthly payments should be interpreted in a reasonable way and without insistence upon detailed proof of the nature of a practitioner's difficulty.

55. The Committee believes that these new arrangements should be given a trial, and hopes that local medical committees will report any cases of difficulty which may arise in their areas.

INDUCEMENT PAYMENTS

56. Discussions have taken place with the Ministry on the new levels of income which should be taken into account in deciding upon the future scale of inducement payments, with special reference to the position in Scotland, where it was agreed that an income level of £1,400 should be taken into account when considering the provision of inducement payments. As a result of the Danckwerts award the Inducement Fund, as such, no longer exists, but the Committee secured an assurance from the Ministry that it was its intention to continue to make grants of this nature. In future,

they will be made upon an enhanced scale to take account of the increased level of remuneration established by the award, and although no specific figure has been laid down for England and Wales, the amounts will not be lower than the Scottish scale. Instructions to this effect have been issued to executive councils.

GROUP PRACTICE

57. As soon as the definition of group practice formulated by the Committee on General Practice of the Central Health Services Council was available the Committee, in conjunction with the Ministry, discussed possible ways of allocating the sum of £100,000 set aside by the Working Party to encourage group practice. A proportion of this sum will be set aside for use in Scotland, where a separate but similar scheme will operate.

58. In brief, Sir Henry Cohen's committee has defined group practice as a practice carried on by several general practitioners working together in close association, consulting one another about their patients, and doing their surgery work in whole or in part in a common building controlled by the members. Normally a group will consist of between three and six members, who may or may not be in partnership but who will have a proper understanding between them on the sharing of the earnings of the group and of their expenses.

59. The Ministry has agreed with the Committee's view that while a group will not normally consist of less than three persons, in exceptional cases, particularly in rural areas, two will be recognized as a sufficient number. Financial assistance to a group will take the form of an interest-free loan which will be recoverable by quarterly deductions from the remuneration payable by executive councils to individual members of the group. Loans will be available for the purposes of the erection of new buildings, the acquisition of existing buildings and their conversion into surgery premises, or the conversion of buildings already owned by members of the group.

60. A Committee—the Group Practice Loans Committee—has been set up consisting of four members of the Committee and four officers of the Ministry of Health, together with legal advisers, to consider applications for loans. This Committee will advise the executive council, to whom the application will in the first instance have been submitted, whether a loan should be made, and, if so, the amount which should be lent. Normally, the period of the loan will be not less than 10 years and not more than 20, although no standard term has been prescribed.

61. The Committee's representatives, in consultation with the Ministry, have also considered what security should be taken by the executive council for the repayment of the loan. It was decided not to require a mortgage to be taken out on the group premises, as, while this would afford good security, it was felt that it might unduly restrict the operation of the scheme. The model agreement has accordingly been drawn to provide for the joint and several liability of the various members of the group, and, in order to cover the possible contingency of one member leaving the group before the expiry of the loan period, it is a requirement of the issue of the loan that the various members will enter into some formal agreement between themselves defining their respective rights and liabilities.

62. The Committee has also discussed with the Ministry and the Medical Practices Committee the question of the admission of a new member of the group to the medical list for the area. It was agreed that in a closed area, while the group should have the right to replace an outgoing member, they should not have a similar right to add to their numbers by taking in an additional member. In any open area both replacements and additions will, of course, be without restriction.

63. In order to regulate the position in a closed area it has been decided that where a group wish to admit a new member, either as an addition to the existing group or to fill a vacancy, whether in formal partnership or not, admission to the medical list will be as if the group were in

formal partnership. It would be necessary for the members of the group to reach agreement as to the new member's share of liability for the outstanding or continuing loan. Full details of the scheme have now been sent to executive councils and individual general practitioners.

THE COST OF THE NATIONAL HEALTH SERVICE

64. As local medical committees are aware, the Minister of Health in 1953 established a committee under the Chairmanship of Mr. C. W. Guillebaud, a Cambridge economist, to review the present cost of the National Health Service and to suggest means—whether by modifications in organization or otherwise—of ensuring the most effective control and efficient use of Exchequer funds and to advise how a rising charge upon the Exchequer could be avoided while still providing for the maintenance of an adequate Service.

65. The Association was invited to give evidence to the Guillebaud Committee, and the Council, in turn, invited the G.M.S. Committee to consider what evidence should be given on those aspects of the National Health Service with which the Committee is directly concerned. In common with the other Standing Committees of the Association the Committee was also invited to comment as it saw fit upon any other aspect of the Service.

66. A special subcommittee was set up to prepare a draft memorandum of evidence and local medical committees were invited to suggest any points which they felt should be included.

67. The Committee wishes to thank local medical committees, who, in spite of the very short time available, responded so readily to its request for suggestions as to ways and means of securing economies in the Service. Many of the suggestions made were included in the Committee's memorandum, which has been accepted by the Association and incorporated in the main body of evidence to the Guillebaud Committee.

68. The evidence was, of necessity, confined to recommendations and observations of a general character based almost entirely upon policy which has already been determined either by the Conference or by the Representative Body. The Guillebaud Committee has been asked to receive a deputation from the Association to give oral evidence, and the memorandum of evidence will be published in the *British Medical Journal* at a later date.

ADMISSION OF STUDENTS TO MEDICAL SCHOOLS

69. It will be remembered that in its report to the last Annual Conference the Committee announced that a special subcommittee had been established to investigate the number of students entering medical schools, the number qualifying from the schools, and the number of newly qualified practitioners likely to be absorbed into the various branches of the profession.

70. The decision to investigate this problem was originally taken by the Council of the Association, but the Committee felt that for a number of reasons this was a matter of particular concern to general practitioners. Firstly, Mr. Justice Danckwerts had expressed the view at the Adjudication that it might be necessary to reconsider his decision that the Central Pool should be based on the number of doctors in the Service if the number of new entrants to general practice subsequently proved to be disproportionately high. Secondly, although the new distribution scheme with its system of Initial Practice Allowances and notional lists had eased the problem of new entrants there was no doubt that practitioners were finding it increasingly difficult to establish themselves in general practice.

71. Nevertheless, the reduction in the registrar establishment—a step which had aggravated the difficulties in general practice—and the many problems of those wishing to enter other branches of the profession, made it essential that the investigations should not be confined solely to general practice, and in consequence representatives of the Central

Consultants and Specialists, Public Health, Overseas, and Armed Forces Committees were invited to participate in the discussions.

72. As a first step consideration was given to the various available sources of information on which the investigation could be based. Inquiries were made as to the data which could be obtained both from the Association's own records and from a number of outside bodies, such as the General Medical Council, the Medical Practices Committee, the Ministry of Labour, etc., and, since the inquiry which was envisaged involved an estimate of how the future output of the medical schools should be related to the recruiting needs of the various branches of the profession over a period of years, expert actuarial advice was also sought at an early stage in the proceedings.

73. As a result of these preliminary investigations the experts advised that before any attempt could be made to relate the output of doctors to the opportunities which would be open to them, an estimate would first have to be made of the medical needs of the country and, in the case of the National Health Service, the requirements for medical personnel in all its branches. The acceptance of this view clearly involved consideration of matters of the highest policy. For example—at what point could it be said that general practice was likely to reach saturation? What should be the average doctor-patient ratio throughout the country, and, on a long-term basis, was there a possibility that the maximum number of patients which a single-handed practitioner might have on his list (at present 3,500) would be revised?

74. Again, not only had the needs of the public to be met in peace, but an allowance had to be made for the overall medical manpower likely to be necessary to meet the needs of both the Services and civilian community in time of total war. The first considerations were matters of concern to the profession and the Ministry of Health; the latter was one of national policy which could presumably be resolved only at the highest Government level.

75. Another problem was the overall establishment of hospital officers and the question of senior hospital staffing generally. The Ministry has made it quite clear that there is no possibility of any substantial increase in the number of consultant posts, and over the next ten years there would inevitably be numbers of senior registrars and registrars unable to achieve consultant appointments. In consequence, fewer practitioners would be prepared to extend their hospital appointments, and this, in time, would necessitate their absorption, as well as that of the redundant registrars, into other branches of the profession.

76. Two other fields can be quoted as examples of the complexity of the problem. Firstly, could it be argued that the Colonial Service establishment was likely to decline because of the move towards self-government in the Colonies which are at present manned by British doctors? Secondly, how wide were likely to be the recommendations of the Waverley Committee, which was examining the requirements of the Services in peace and war?

77. Having given all these factors full consideration, it became obvious that, as so many outside interests were involved, no one organization could solve so complex a problem or obtain, with any pretence of accuracy, the statistical data which alone could give the general picture upon which an estimate of future requirements of medical personnel could be based.

78. The question then arose as to whether, taking all these factors into account, it would not be in the best interests of the profession for the Council of the Association to invite the Ministry of Health to co-operate in the establishment of a Working Party to examine on a long-term basis and with the widest possible terms of reference the future number of medical practitioners likely to be required in all branches of the profession, and to correlate the intake of students to the teaching schools to the estimated needs. Even so, before putting forward a recommendation on these lines, it was felt that every effort should still be made to secure some data which would indicate the extent of the problem and support

the fear that there was likely to be a substantial excess of doctors over the number of openings available over the next few years.

79. Unfortunately, because of the limited data available, it was not practicable to secure a strictly actuarial picture of the situation, but it nevertheless proved possible to produce estimates based on the Association's own records which more than substantiated the view that if existing trends continued a surplus of doctors qualifying over the number needed each year would inevitably appear within a very few years.

80. The Council was therefore recommended to invite the Ministry of Health to set up a Working Party to study the whole problem.

81. In making this suggestion it is envisaged that the Working Party would, in addition to the members of the Ministry of Health and the Association, include officers of the Colonial Office, the Ministry of Defence, the Ministry of Labour, the Home Office, the General Medical Council, and Deans of Medical Schools, etc. By so doing the statistical resources of all these bodies could be made available and examined, and consultation between the parties concerned and their constituent bodies could take place on the matters of future policy which would inevitably arise.

82. This recommendation was accepted by the Council and the Minister's reaction to the proposal is now awaited.

ENTRY OF EX-REGISTRARS INTO GENERAL PRACTICE

83. The reduction in the registrar establishment in hospitals had inevitably led to an increase in the number of ex-registrars seeking openings in general practice, and the Committee has been asked to do what it can to encourage executive councils to give equal consideration with other applicants to doctors who have spent several years in hospital, provided that they have also had adequate experience in general practice. The difficulties of the ex-registrar entering general practice are very real. There is a feeling among registrars that their hospital experience goes against them when they apply for vacancies in general practice. The Committee, however, from the experience of its members, claims that, provided an ex-registrar also has adequate experience in general practice, there is no question of executive councils discriminating against him. Obviously, a single-handed vacancy with a large list of patients demands the appointment of a doctor who already has good general practice experience. The registrars themselves are often unwilling to accept a reduction in income which is inevitable where succession is to a small practice, or where entry to general practice is sought via an assistantship.

84. This matter has been discussed with the Ministry of Health and every effort will be made to overcome the present difficulties. The Ministry is to ask hospital authorities to consider ex-registrars wherever possible in their plans for the junior staffing of hospitals. A further approach is to be made both to the Medical Practices Committee and local executive councils to see that ex-registrars with suitable experience in general practice are given every opportunity of applying for suitable vacancies when they arise.

APPOINTMENTS TO PRACTICE VACANCIES AND JUNIOR HOSPITAL APPOINTMENTS

85. The Committee's attention has been drawn to a suggestion which if adopted might help the hospital service in overcoming the shortage of junior hospital staff. The suggestion is that where there is a vacancy in the medical list either for a successor to a practice declared vacant or for an additional doctor in a designated area, and where at the same time there is a vacant hospital appointment, the advertisement for the appointment to the practice should, in addition, state that there is a hospital appointment which might be available to a suitably experienced applicant for the practice.

86. The Medical Practices Committee, who asked for the Committee's views on the subject, have been informed that

in the opinion of the G.M.S. Committee such a scheme has considerable possibilities and might well be tried out experimentally.

CONSOLIDATION OF THE NATIONAL HEALTH SERVICE (GENERAL MEDICAL AND PHARMACEUTICAL SERVICES) REGULATIONS

87. The National Health Service (General Medical and Pharmaceutical Services) Regulations were originally published in 1948, and since that time they have been considerably amended to meet changing conditions in the Service. The Ministry has now incorporated these various amendments in the new regulations and will shortly issue them in consolidated form. The draft of the new regulations was submitted to the Committee and various minor alterations have been suggested to, and accepted by, the Ministry.

88. The considerable amendments which have been made to the original regulations have also necessitated a revision of the Ministry's handbook for general practitioners. This is now under way, and the Committee hopes that it will be possible to issue the amended handbook in the near future.

CIRCULATION OF AMENDING REGULATIONS

89. The Ministry of Health put forward a suggestion that amending regulations should no longer be circulated to individual practitioners, but rather that minor amendments should be dealt with by means of circular letters. The Committee, however, takes the view that it is important that every general practitioner should be kept fully aware of all alterations which are made to his terms of service. The Ministry has been informed of this view and has agreed to make no change in the existing practice.

MACHINERY FOR FILLING PRACTICE VACANCIES

90. Last year the Annual Conference, and subsequently the Representative Body of the Association, gave approval to the Committee's recommendation that the machinery for filling practice vacancies should be overhauled and improved. It will be remembered that briefly the Committee proposed: firstly, that the executive council itself, after consultation with the local medical committee, should be responsible for appointing a successor; secondly, that the decision as to whether a practice is to be dispersed or a vacancy to be declared and advertised should remain with the executive council in consultation with the local medical committee; and, thirdly, that the Medical Practices Committee should act as an appeals body.

91. Although these proposals have now been discussed with the Ministry it was pointed out that as the Committee on General Practice of the Central Health Services Council is expected to report in the near future, and as this report may well recommend changes in the existing methods of filling practice vacancies, it would be preferable to defer consideration of this question until their views are known. The Committee has therefore agreed that further discussion on this matter should be resumed when the report is available.

SUCCESSION TO A VACANT MEDICAL PRACTICE BY A PARTNER

92. The Conference last year referred to the Committee an amendment to a section of its Report which dealt with the agreement reached between the Ministry and the Committee on the steps to be taken to regulate the position of short-term partnerships.

93. It will be remembered that the Committee had agreed that, in the absence of special circumstances, the Medical Practices Committee should not accept one partner as a logical successor to another unless the partners had been in active practice together for about a year. Some doubt had been raised as to the position of local medical committees in giving advice of this nature to the executive council when considering a particular case, and it was suggested that the decision by a local medical committee not

to accept a practitioner as a logical successor might be challenged in the Courts.

94. The Committee has now examined this question in detail with the Ministry and, after careful consideration and in the light of the views expressed by legal advisers, it is confident that provided the local medical committee acts in good faith there are no grounds for the fear that it might be liable to damages. In the circumstances, the Committee has reaffirmed its view that the agreement reached with the Ministry and the Medical Practices Committee on this issue should not be modified.

CHANGE OF PRACTICE

95. The Committee has for some time been conscious of the difficulties experienced by general practitioners who wish to change the area of their practice, and attention was once again drawn to this problem at last year's Annual Representative Meeting. Although efforts have been made in the past to facilitate the exchange of practices, the results have so far been disappointing.

96. The Committee therefore established a special sub-committee to examine the problem, and its report is set out in Appendix B. The Committee fully concurs with the suggestions outlined in this report and preliminary discussions upon them are taking place with the Medical Practices Committee.

97. Should these proposals be acceptable to the Annual Conference, steps will then be taken to give wide publicity among local medical committees and executive councils to the methods which are available for overcoming this problem.

REMOVAL FROM THE "MEDICAL REGISTER"

98. Although arrangements already exist with the General Medical Council for the Association to check the last known address of any practitioner whom the Council proposes to remove from the Register under Section 14 of the Medical Act, at least one case has come to light in which a general practitioner still in practice was removed from the Register because of his failure to notify the General Medical Council of a change of address. The legal implications of this position will be obvious to all.

99. The Committee would like to take the opportunity of emphasizing the fact that doctors who change their permanent address should always notify the General Medical Council, and that failure to do so may result in deletion of their registration if the Council is unable to trace them.

ALLOCATION OF PATIENTS TO GENERAL PRACTITIONERS

100. The Committee's representatives have once again discussed with the Ministry the considerable disquiet which still exists about the position of a general practitioner who may be required to provide medical attention for a patient already receiving treatment from an unqualified practitioner.

101. The Ministry is appreciative of the profession's point of view, but it appears that the only effective solution to the problem is an amendment of the N.H.S. Act. Unfortunately there is little hope of any early legislation in the health field, and the political difficulties of an amendment on the lines required are considerable. The Ministry felt, therefore, that at this stage it could only repeat its suggestion that a suitable reference should be made in the "Notes for Guidance of Service Committees," advising these committees that the attitude of the General Medical Council to "covering" should be borne in mind when a practitioner is required to appear before them as a result of refusing attention to a patient who is also receiving treatment from an unqualified practitioner.

102. The Committee has accepted this proposal as an interim solution but has reiterated its firm view that, ultimately, this anomaly must be corrected by a suitable amendment of the Act itself. The position will be kept under constant review.

**REINSTATEMENT OF EX-SERVICE MEN ON
DOCTORS' LISTS**

103. The Committee has again made representations to the Ministry of Health to make provision for the automatic reinstatement of demobilized Services personnel. It will be remembered that the Ministry had previously undertaken to amend Form E.C. 13 (the application form for inclusion in a doctor's list which is used by a person discharged from the Services) so as to ensure that the discharged person is reminded not only to reinstate himself on a doctor's list but also to hand the form to his former doctor if he wished once again to become his patient.

104. This leaflet has now been redrafted on these lines and the Ministry does not propose to take further action in the matter until it is seen whether the amended Form E.C. 13 has the desired effect. The Committee will continue to watch the position closely.

105. The Committee also drew the Ministry's attention to the danger that, where an ex-Service man fails to apply for reinstatement upon discharge from the Forces, his medical records may sometimes be destroyed. Arrangements have now been made to ensure that the medical records of persons enlisting in the Forces are retained by the Central Register pending notification of the acceptance of the ex-Service man by a doctor on his return to civilian life. They will be retained for a period of 10 years.

REDUCTION OF LISTS

106. The Committee's attention was drawn to difficulties which had arisen in one area in connexion with the notice which is sent by the executive council to a patient who is to be removed from the list of a doctor in consequence of the reduction of lists under the distribution scheme. The notice used gave the impression that the doctor himself was for some reason or other taking the opportunity of ridding himself of a particular patient. Although the executive council was appreciative of the doctor's point of view, it nevertheless felt that it must include in its notice some indication of the fact that the doctor himself had nominated the patient as one to be removed from his list, and that the council had no part in deciding upon the actual patients who were to be transferred to another doctor.

107. Consultation on this problem has taken place with the Executive Councils Association, and the Committee is giving further consideration to the wording of a model form which might be unexceptionable and which would be capable of national application.

ELIMINATION OF INFLATION

108. The recent large-scale operation to eliminate inflation from doctors' lists proved effective in reducing it to a very low level. The Committee is anxious to ensure that an unsatisfactory situation should not arise again. It is essential to the distribution scheme that full accuracy of lists should be maintained. If any substantial degree of inflation should occur, the profession might once again be faced with a recurrence of the fluctuating capitation fee and the variations between different areas which gave rise to so much difficulty in the past, and which prevented an equitable distribution of the Pool.

109. With these considerations in mind, the Committee is disturbed to find that there is evidence of inflation beginning to creep in again. Moreover, with the end of national registration, it will be impossible to carry out any detailed check on the same lines as the recent "purge" when executive council indexes were compared with national registration records. The Central Register in its present form cannot entirely eliminate the danger of inflation, and the machinery must be extended and made fully comprehensive. To this end, it will be remembered that the Committee, as it reported to the last Conference, has for some time been pressing for the introduction of a central alphabetical index to complement the present numerical Central Register. This essential adjunct to the Central

Register machinery is now a matter of urgency, and strong representations are being made to the Ministry.

110. The Committee has also discussed a proposal that in order to curb inflation instructions should be printed on the medical card requiring the patient to notify the executive council of any change in name or address. The Ministry maintained that there are considerable difficulties in placing any requirement of this nature on the patient and has been unable to accept the suggestion.

**ACCEPTANCE OF PATIENTS OF A VACANT
PRACTICE**

111. The Central Ethical Committee of the Association sought the views of the General Medical Services Committee on the ethical considerations which arise when the patients of a vacant practice seek acceptance by other doctors in the vicinity temporarily looking after the practice. The main problem which confronted both Committees was the difficulty of reconciling the right of the patient to select his own doctor with the obligation of the acting practitioner to hold the practice together for the eventual successor. The Central Ethical Committee felt that, following the appointment of a successor, it was, in general, undesirable on ethical grounds for the acting practitioner, without the consent of the successor, to accept as his patient anyone to whom he had been introduced or with whom he had been in professional relationship while acting in the capacity of a locum.

112. In the case of a whole-time locum tenent specially engaged for the purpose of keeping the vacant practice in being, the Central Ethical Committee put forward the view that if the locum was not appointed as the successor he would be bound by the ordinary ethical rules, and in the absence of the consent of the successor should not within a period of five years from the termination of the locum-tenency set up in opposition in the area of the practice concerned. The Committee fully accepts the principle behind this suggestion, but feels that a definite prohibition for so long a period as five years might bear harshly on those seeking to establish themselves in practice.

113. In many cases, however, vacant practices are looked after by colleagues in the neighbourhood, and the Committee did not feel that it was practicable to impose any absolute prohibition on the acceptance of patients by other practitioners in the neighbourhood who had acted as locums once the successor had been appointed. It feels rather that the best way of dealing with the position is to leave it to the discretion of the practitioner concerned rather than place him under any definite obligation, and by the issue of a general statement that a locum, by reason of the advantages he enjoys through his introduction to patients of the vacant practice, should, in fairness to the incoming practitioner, exercise the utmost discretion in the acceptance of patients of the vacant practice.

114. Discussions are continuing with the Central Ethical Committee.

**TREATMENT OF SERVICES PERSONNEL ON
LEAVE**

115. It will be remembered that the Committee had already expressed its general agreement with a proposal made by the Service departments that Services personnel on leave should be treated as temporary residents under the National Health Service. Before these arrangements could be put into effect, however, the Committee sought certain assurances concerning the position of private practitioners who undertook this work. The Committee understands that, although the matter is still under consideration by the Service departments, the outstanding difficulties will soon be resolved.

**TEMPORARY RESIDENT FEES FOR PATIENTS
IN COTTAGE HOSPITALS**

116. The Committee's attention has been drawn to the question of the payment of temporary resident fees in

respect of patients who are receiving treatment from general practitioners on the staffs of cottage hospitals. The situation has arisen because temporary resident claims had been submitted in one area by general practitioners on the staffs of cottage hospitals in respect of patients who were not normally resident within the area of the executive council and who had therefore applied to be treated as temporary residents by general practitioners on the medical list within the council's area.

117. The terms of service for hospital medical staff make it clear that remuneration from the Bed Fund is for services rendered to patients other than those paid for by the executive council, and the Ministry's explanatory circular on the subject stipulates that the services which are, in fact, paid for by the Bed Fund are those within the scope of a general practitioner and given to non-paying hospital patients other than those on the list of the doctor concerned or on the list of either his partner or assistant. No differentiation is drawn between patients from inside the area of the executive council and those from outside the area. Furthermore, the regulations for the payment of temporary resident fees do not stipulate domiciliary treatment, the only condition being that treatment shall actually have been given.

118. The Committee is strongly of the opinion that although the regulations might not specifically exclude payment of temporary resident fees in such cases, it is clearly intended that they should not be paid, and this view has also been taken by the Ministry's auditors, who have refused to pass the temporary resident claims concerned for payment.

119. The Committee deprecates the submission of temporary resident claims in respect of patients receiving treatment in cottage hospitals, and the matter is to be discussed with the Ministry of Health.

MILEAGE

120. The Government Mileage Committee, upon which the Committee is represented by members of its Rural Practices Subcommittee, has now completed the first phase of its work—namely, its review of the adequacy of the Mileage Fund. After an initial delay, caused by lack of accurate information and subsequent adjustments which had to be made to the available data as a result of the Danckwerts award, the Mileage Committee prepared certain statistics which purported to show that there was a case to reduce the total size of the Mileage Fund. These figures were considered by the Rural Practices Subcommittee, and a memorandum was prepared pointing to fallacies in the Mileage Committee's statistics and recommending that the Fund be retained at its present size.

121. The Subcommittee's views were endorsed by the G.M.S. Committee, and its report has now been accepted by both the Mileage Committee and the Ministry itself. As a result, the Fund will remain at £2,000,000.

122. It does appear, though, that in spite of the interim redistribution of the Fund which was carried out in April, 1950, and the subsequent withdrawal of a number of predominantly urban areas from the mileage scheme, there remain a number of anomalies in the payment of mileage in different parts of the country which can be remedied only by a detailed examination of the whole basis of present mileage payments.

123. It is upon this task that the Mileage Committee is now engaged, and executive councils are already providing the data necessary for the survey. Unfortunately, this means that it will still be some little time before the Mileage Committee is in a position to come forward with definite proposals which can be considered by the Conference. Although the Committee naturally regrets the slow progress which has been made, it has not been possible for very many years to carry out a detailed survey of this nature, and the Committee feels that it is only by this lengthy process that it will be possible to secure an equitable scheme of distribution based upon a full knowledge of all the facts.

MEDICAL SERVICES FOR LIGHTHOUSES

124. Further discussions have taken place on the question of payment for medical services given to personnel on lighthouses. In the area of an executive council having a mileage scheme in operation, mileage will be paid at the ordinary rate as far as the shore. The cost of sea transport will be met by an *ad hoc* payment from the Central Pool. The special payment which is made in the case of doctors called to attend lighthouses is also met from the Central Pool. The amount involved throughout the course of a year is, of course, extremely small.

ARBITRATION

125. The Committee has given full support to the Association's Arbitration Committee in its efforts to secure completion of the Whitley Arbitration Agreement. The view is held that there must be an established Court of Arbitration as a top tier to the Whitley Council, to which either side can submit a case for arbitration without the consent of the other.

**REPORT BY THE MEDICAL RESEARCH COUNCIL
ON CLINICAL RESEARCH IN RELATION TO THE
NATIONAL HEALTH SERVICE**

126. The Committee was disturbed to see that the recent White Paper on the subject of clinical research in the National Health Service contained no specific provision for general practitioners to avail themselves of the funds which were being provided for this purpose. The Committee also felt it unfortunate that it had not been possible to provide direct general-practitioner representation on the Clinical Research Board.

127. This matter was discussed with the Ministry of Health and the Committee emphasized its view that the White Paper did not fully recognize the important and vital role which the general practitioner could play in this field. Representatives of the College of General Practitioners were invited to take part in these discussions.

128. The Ministry maintained that the terms of the White Paper did not exclude general practitioners from participating in the funds to be provided for research purposes, but it was not prepared to support the suggestion that a general practitioner should be nominated to sit on the Research Board as of right, although it conceded that if there were a vacancy there was no reason why a general-practitioner nominee should not be considered.

129. Subsequently, the Board was set up but contained no general practitioner amongst its members. Joint representations were made by the College of General Practitioners and the Committee; firstly, with a view to securing an adequate allocation of available funds for research in general practice, and, secondly, to press the rightful claim of the general practitioner to be represented on the Board itself.

130. The Chairman and Secretary of the Committee, accompanied by representatives of the College of General Practitioners, have had informal discussions with Sir Harold Himsworth, Secretary of the Medical Research Council, on all aspects of this important matter, and this had led to a wider understanding of the problems involved. The matter is now under further review by the Committee and the College, and it is hoped to arrange a further meeting with Sir Harold Himsworth in the near future.

**STANDARD OF ACCOMMODATION IN SURGERIES
AND WAITING-ROOMS**

131. It will be remembered that when the Minister of Health addressed the Annual Conference of Local Medical Committees last year he paid tribute to the unique position of the general practitioner as the leader of the clinical team in the health field. The Committee felt considerable satisfaction at this public recognition of the general practitioner's

work and felt that everything possible should be done to maintain and enhance the status of this section of the profession.

132. The Committee felt that one important factor which, in the mind of the public, reflected directly on the status of the individual doctor was his surgery and waiting-room accommodation, and although in spite of post-war difficulties the general standard was of a high order, a number of general practitioners had, by reason of building restrictions and the high cost of repairs and maintenance, been prevented from doing all that they would have wished in this respect.

133. In consequence, the Chairman of the Committee issued a circular letter to every general practitioner in the National Health Service drawing attention to the necessity for maintaining a high standard of surgery and waiting-room accommodation. At the same time, a circular letter was sent to local medical committees explaining the reasons why the Committee had found it necessary to issue such a letter and seeking their co-operation in assisting individual practitioners in their own areas to maintain surgery and waiting-room accommodation of a high order.

SERVICE COMMITTEE AND TRIBUNAL REGULATIONS

134. Subject to certain minor amendments, the Annual Conference and the Annual Representative Meeting last year approved the recommendations made by the special subcommittee which was established to review the disciplinary machinery. The Report has been brought into line with the decisions of the Conference and its recommendations are being discussed with the Ministry of Health. Representatives of the British Dental Association and the National Pharmaceutical Union are taking part in these discussions.

135. The Ministry itself has put forward a number of additional suggestions for amending the regulations, and these are being carefully examined in conjunction with the Committee's own recommendations. A large measure of agreement has now been reached. The next step is for the Ministry to seek the views of the Executive Councils' Association, who are primarily responsible for the administration of the disciplinary machinery and who, it is felt, should have an opportunity of commenting upon the proposed amendments from the point of view of the patient. If the outcome of this consultation with the Executive Councils' Association is not available in time for inclusion in the Committee's Supplementary Report, it is intended that an oral report should be given at the Conference itself.

RESPONSIBILITY FOR THE ACTS AND OMISSIONS OF A PARTNER

136. Further consideration has been given to the anomalous position which arises under the terms of service whereby a general practitioner is responsible for all acts and omissions of any practitioner acting as his deputy or assistant. While this provision is equitable in the case of assistants and locums, in the case of members of a partnership the Committee held that each partner should be held responsible for his own acts as is the position under the Partnership Act.

137. The matter was accordingly discussed with the Ministry of Health and the Ministry suggested that the Committee's objection to the present arrangements would be largely overcome if partners were treated as jointly responsible for the acts and omissions of one in treating the patients of the other. The executive council would then be entitled to take action for a breach of the terms of service against the person who was in actual fact responsible for the treatment of the patient at the time when the complaint was lodged.

138. The Committee felt that the new draft regulation went part of the way to meeting its objections to the present

position, but there was the risk that, if the action against one practitioner failed, the Service Committee might then proceed against his partner.

139. The attention of the Committee has also been focused on the larger question of the responsibility of individual principals in contract with an executive council who deputize for other principals with whom they are not necessarily in formal partnership.

140. Prior to making a further approach to the Ministry the whole position was discussed with the Medical Defence Societies. The meeting formulated the following proposals as a basis for a revision of the regulations, bearing in mind the need to reconcile the personal responsibility of the deputy with the contractual relationship which exists between doctor and patient:

(1) That a practitioner should remain responsible for the acts and omissions of any other practitioner acting as his deputy where the deputy is an assistant or a locum-tenent not on the medical list of an executive council.

(2) Where the deputy is also a principal on the medical list, in any executive council area, whether as a partner or not, the deputy should be responsible for his own acts and omissions, unless it can be shown that there is prima facie evidence that the principal upon whose list the name of the patient appears had himself acted in breach of his terms of service.

(3) That in the event of a complaint being made it should be the duty of the Chairman of the Service Committee before a case is heard to decide (upon the advice of a panel) whether there is a prima facie case against the first principal or whether he had been cited in the complaint merely because the name of the patient appeared on his list. In such an event, provided he was able to show that he had made proper and adequate deputizing arrangements, no further action should be taken against him and only the deputy should be required to appear before the Service Committee.

141. The Committee is of the opinion that the acceptance of the principles outlined above would do much to obviate the present unsatisfactory situation. It therefore recommends that an approach be made to the Ministry of Health to secure an amendment both to the Service Committees and Tribunal Regulations and to the terms of service for general practitioners on the lines indicated in para. 140 above.

APPOINTMENT OF PROFESSIONAL MEMBER OF THE TRIBUNAL

142. It will be remembered that provision is made in the Act whereby the "practitioner" member of the Tribunal is appointed by the Minister from a panel established for the purpose. With the death of S. A. Winstanley (Urmston), the Committee nominated F. M. Rose (Preston) and I. G. Innes (Hull) for membership of this panel. These nominations were accepted by the Minister.

EMPLOYMENT OF GENERAL PRACTITIONERS IN HOSPITALS

143. In its Report to the last Annual Conference the Committee gave a detailed account of the negotiations which had been taking place between the Joint Committee for Consultants and the Ministry of Health on the terms upon which general practitioners should be employed in hospitals.

144. It will be remembered that the Ministry's proposals entailed the classification of general practitioners working in hospitals into several categories according to the work undertaken and the responsibilities involved. The Committee took the view that this subdivision was unnecessary as, with the exception of a small number of posts of a purely training nature, the vast majority of posts of a general practitioner working in hospitals, although undertaking duties of a diverse character, carried a comparable degree of responsibility. Exceptionally, however, the Committee agreed that

posts which could legitimately be held to be of a training nature should not carry a salary, although if they involved work over and above that which would normally be expected of a post of a training nature an honorarium of, say, £50 should be paid. The Committee therefore informed the Joint Consultants Committee, firstly, that no agreement on principles should be reached with the Ministry which might subsequently prejudice negotiations in Whitley Council on the remuneration of clinical assistants; and, secondly, that no practitioner working as a clinical assistant under supervision should be paid less than the rate laid down in paragraph 10 (b) of the terms and conditions of service for hospital staff—i.e., £175 per annum per weekly half-day.

145. The Ministry had previously held that the rate of £175 per annum per weekly half-day should apply only to those practitioners in independent charge of hospital units who were not directly responsible to a consultant or S.H.M.O. in a specialty, and that a suitable rate for general practitioners working under supervision would have to be negotiated through the Whitley machinery. Subsequently the Ministry put forward a proposal that a rate of pay of £125 per annum per weekly session would be appropriate.

146. In view, however, of the fact that negotiations are now proceeding in Committee "B" of the Whitley Council for a review of the remuneration of hospital medical staffs, it has been agreed between the Staff and Management Sides that the actual rate of payment for general practitioners working as clinical assistants should be left until the major question is resolved.

JUNIOR STAFFING OF HOSPITALS

147. The views of the Committee were sought by the Joint Consultants Committee on a memorandum prepared by the Ministry of Health on the subject of the junior staffing of hospitals. Briefly, the Ministry's view was that the present acute shortage of junior hospital staff could be met only by the complete reorganisation of hospital staffs generally and by a far wider employment of general practitioners in hospitals. This question is, of course, of particular significance in view of the negotiations which are taking place through the Joint Consultants Committee on the remuneration of general practitioners employed in hospitals, and the matter has been fully examined with the Joint Consultants Committee. Apart from the remuneration aspect, both Committees are in agreement with the broad outline of the Ministry's views, and discussions are proceeding.

PROVISION OF DIAGNOSTIC AND ANCILLARY FACILITIES

148. The Committee has once again drawn the attention of the Ministry to the urgent need to provide direct access for all general practitioners to diagnostic and ancillary facilities in hospitals. The Ministry has given an assurance that it will continue to make every effort to improve the facilities available to general practitioners.

REPRESENTATION OF GENERAL PRACTITIONERS IN HOSPITAL ADMINISTRATION

149. The Committee has again taken up with the Ministry of Health the question of general-practitioner representation on regional hospital boards. The Committee is glad to be able to report that there is now at least one general practitioner on every board, but it was, nevertheless, perturbed that in some instances the general practitioners appointed were not those nominated by the general practitioners in the area. The Committee holds that it is essential that the general-practitioner representatives should always enjoy the confidence of their local colleagues.

150. Whilst the Ministry appreciated the Committee's views in this matter, during the course of discussion it emerged that certain of the nominations made by the Association in particular instances had been rejected

primarily for geographical reasons and in order to preserve the balance of areal representation on the board. To overcome this difficulty the Ministry has suggested that the Association should make more than one nomination for any particular vacancy, so that if the first nomination is unacceptable for geographical or similar reasons there will be other nominations available. The Committee is in full agreement with this suggestion.

151. The Committee, through its liaison with the Central Consultants and Specialists Committee, has also considered the problem of obtaining adequate general-practitioner representation on other hospital administrative bodies. In the case of staff committees of the individual hospitals, the Committee feels that they should consist of all the members of the hospital medical staff, and if there are general practitioners on the staff, then they would be so included. On group medical committees or on local medical advisory committees, whether constituted by the hospital staffs or by hospital management committees, there should be adequate representation both of general practitioners, whether employed in the hospital or working outside, and of the public health service.

152. As far as the regional medical advisory committees are concerned, the Committee feels that the establishment of adequate general-practitioner representation on the boards themselves would equally ensure adequate representation on the advisory committees. The Ministry itself endorses this policy, and the Committee will continue to press for its full implementation.

REPORTS TO GENERAL PRACTITIONERS ON THE DEATH OR DISCHARGE OF HOSPITAL PATIENTS

153. Both the Conference and the Representative Body last year stressed the need for hospitals to send an immediate notification to the family doctor on the death or discharge of his patient from hospital. The Representative Body suggested that the Ministry should be pressed to send appropriate instructions to hospital authorities.

154. The Committee feels, in common with the Central Consultants and Specialists Committee, that this is a question for professional co-operation rather than for instruction on the part of the Ministry of Health, and accordingly the matter has been discussed in the liaison committee between the two bodies with a view to overcoming the difficulties which are now experienced.

155. As a result of these discussions it has been agreed that a letter will be sent by the chairmen of the two committees to the chairmen of hospital group medical advisory committees drawing attention to the importance of ensuring that general practitioners are promptly notified of the death or discharge of hospital patients. Copies of this letter will also be sent to the secretaries of boards of governors and hospital management committees, and to the senior administrative medical officer of each regional hospital board.

156. The Committee intends to keep this matter under review, and, if the action which has been taken does not produce an improvement in the situation, further consideration will be given to other methods of facilitating the transmission of this information.

MATERNITY MEDICAL SERVICES

Review of the Maternity Service

157. The Annual Conference last year called upon the Committee to review the whole question of the maternity medical service with particular reference to the relation of fees to work done and to the obligations of the general practitioner under the regulations. The Committee accordingly established a special subcommittee for the purpose which, at the same time, was asked to pay special attention to the problem of properly co-ordinating the different sections of the maternity service. This subcommittee has now completed its work and its report is set out in Appendix C.

158. It will be seen that the conclusion has been reached that, although the present framework of the Act and regulations is in some ways cumbersome, generally speaking a very satisfactory service is given to the public. Certain suggestions have also been made where, by local action on a voluntary basis, it would be possible to secure the greater integration of the three branches of the service. No definite recommendations have been made for any variation in the fees at the present time, but should any alteration be made in the requirements made of the general practitioner providing maternity medical services, the question of the adequacy of the fees now paid would require re-examination. The Committee is in full agreement with the findings of its subcommittee.

Ante- and Post-natal Care

159. It will be remembered that special provision has been made under the arrangements for maternity services whereby, although the patient elects to be confined in hospital, in exceptional cases where, in the opinion of the general practitioner, it is inconvenient for the patient to attend the hospital for her antenatal or post-natal care or where at the hospital's request the general practitioner undertakes these services, the latter is entitled to claim appropriate fees from the executive council.

160. Difficulties have arisen in a number of areas on this point and, although the request has come from the hospital authorities in the first place, the validity of the claim on the executive council has been questioned.

161. The Committee is firmly of the opinion that, in the circumstances outlined above, there is no doubt that the general practitioner should receive a fee for the services which he provides, and the matter is to be taken up with the Ministry of Health.

Drugs and Dressings for Maternity Patients

162. The Ministry's attention has been drawn to the fact that, in spite of circulars which have been issued to local health authorities, general practitioners in some areas were still being asked to supplement the contents of the maternity packs. The Ministry maintained that considerable emphasis has been given to the fact that the general practitioner should not be asked for additional supplies and that in any particular case where this has happened the attention of the local medical officer of health should immediately be drawn to its own instructions on the subject. The Ministry for its part has undertaken to investigate any cases in which difficulty is experienced in this respect in the future.

163. In addition, the Committee has again sought the provision of maternity packs for patients who elect to be confined in private nursing-homes, particularly as the decision not to be confined at home is often taken on social grounds rather than as a matter of choice. The Ministry, however, feels that, in the present circumstances of financial stringency, it cannot envisage any extension of existing arrangements.

Analgesia in Domiciliary Midwifery

164. The Ministry after consultation with the Committee is undertaking a small sampling inquiry into analgesia in domiciliary midwifery, for the purpose of ascertaining why some patients do not have gas-and-air analgesia. Medical officers of health from selected local authorities are participating in the inquiry.

General Practitioners and Institutional Midwifery

165. The Committee has again emphasized to the Ministry its view that the expectant mother should be referred to hospital only with the knowledge and consent of her family doctor. It must be said that the Ministry for its part fully supports this policy, but, unfortunately, it is apparent that in some parts of the country the practice of making a direct reference from the antenatal clinic or the out-patients'

department without prior consultation with the patient's general practitioner still persists. The Ministry has therefore agreed that further efforts should be made to bring this undesirable procedure to an end, and an appropriate paragraph will be included in a future Ministry circular. In addition, the Ministry has undertaken to investigate any individual cases which are brought to its notice.

166. Strong protests are being made to the Ministry against the decision to close the Springfield Maternity Home at Blackburn, and the proposal to close the Parsons Green Maternity Home at Fulham. The Committee strongly deprecates these attempts to reduce the number of beds available for general-practitioner institutional midwifery, and in particular is disturbed about the manner in which patients were transferred from the Springfield Maternity Home without, in some cases, the consent of the practitioner-in charge.

CARE OF THE ELDERLY SICK

167. The Representative Body of the Association last year passed a resolution to the effect that, having regard to the present need for co-ordination of the various authorities caring for the aged, the Minister should be urged to consider the establishment of geriatric units for the purpose under the guidance of an experienced physician.

168. This matter was considered by the Liaison Committee with the Central Consultants and Specialists Committee, and it was decided to establish a special subcommittee jointly with the Central Consultants and Specialists and Public Health Committees to give further study to the question of the establishment of an integrated service for the treatment and rehabilitation of chronic disablement arising from either age or illness. This special subcommittee has commenced consideration of the problems involved.

CO-OPERATION BETWEEN GENERAL PRACTITIONERS AND HEALTH VISITORS

169. Following consideration of a resolution passed by the Representative Body welcoming health visitors working under the guidance of general practitioners as a means whereby practitioners might increase the help they can give to their patients, a special subcommittee was set up jointly with the Public Health Committee to see what steps could be taken to further this policy.

170. The Joint Subcommittee prepared a statement which has since received the approval of both parent bodies and which emphasizes the need for close co-operation between general practitioners and health visitors. Harmonious relations can always be established if good will and interest are present, and the Subcommittee suggested that the acceptance of the following principles would do much to this end:

(1) Co-operation between the general practitioners and the medical officer of health and his staff regarding the help, care, treatment, and aftercare of all patients is essential.

(2) The local health authority has certain statutory obligations regarding the health of the community, and the health visitor who is employed by the local health authority is under the direction of the medical officer of health. This, however, in no way prevents a health visitor from working closely with the general practitioner and under his guidance in the care of individual patients.

(3) Direct consultation should take place between general practitioners and health visitors with a view to the exchange of information regarding individual patients.

(4) The general practitioner is primarily responsible for the health of the individual and the family, while the health and welfare of the family in relation to the community is a responsibility of the medical officer of health and his staff. The close association of all concerned as members of one team is of vital importance if this responsibility is to be adequately fulfilled.

171. In addition, the Subcommittee put forward the following suggestions of ways in which greater co-operation might be achieved:

(1) In the first place discussions to this end should take place between the medical officer of health of the local health authority, together with senior members of his staff, and representatives of the B.M.A. Branch or Division and the local medical committee.

This is essential, for the detailed arrangements will vary, not only between local health authorities but in different parts—that is, rural and urban—of a local health authority.

Agreement on the principle of co-operation at this level should ensure full implementation elsewhere.

(2) Close personal contact and exchange of information between individual general practitioners and health visitors is essential. In this way both parties will understand and appreciate the other's duties and responsibilities.

In rural areas where the one individual is home nurse, midwife, and health visitor, there is usually that understanding between her and her G.P. colleagues. In urban areas, particularly in the large towns and cities, and where in most cases the health visitor does not act as home nurse or midwife, general practitioners do not know personally the health visitors working in the area.

(3) Complaints have been made by general practitioners that at times contradictory advice is given to patients by health visitors. It is clear that this must be avoided, and here close consultation and co-operation between general practitioners and health visitors is essential.

(4) In addition to their statutory duties, health visitors are available, at the discretion of the medical officer of health, for visiting patients when requested by general practitioners. Full consultation between the parties will result in efficient and economic use of health visitors.

(5) Many general practitioners are unaware of the many facilities which can be made available for their patients through the local authority health and welfare services. Some medical officers of health regularly circulate all general practitioners in their area with detailed information, and it is strongly recommended that this should be done in all areas. It can be of great value to the general practitioner to know what assistance can be provided by his local authority. The full use of health visitors would tend to obviate repeated visits on the part of the general practitioner and would facilitate his work by securing rapid assistance through the local authority. In all these ways the health visitor can supplement the service of the general practitioner, and by working in partnership they can weld together both the clinical and preventive aspects of the service within the existing arrangements under parts III and IV of the National Health Service Act.

(6) In certain areas a health visitor has been allocated by the medical officer of health to work with a group of general practitioners. This has proved to be a satisfactory arrangement, but its practicability depends on local circumstances. It is recommended that this arrangement could well be extended wherever possible.

172. Copies of this statement have been sent to the secretaries of local medical committees and Branches and Divisions of the Association and to medical officers of health of local health authorities.

173. The Joint Subcommittee has also prepared a memorandum of evidence for submission to the Working Party which was established by the Minister on the work, recruitment, and training of health visitors.

HEALTH CENTRES

174. Two questions have arisen in connexion with the London County Council's health centre at Woodberry Down, upon which the advice of the Committee has been sought. Firstly, it looked at the advisability of the county council's policy not to employ any general practitioner who is working at the centre on a part-time sessional basis in their wel-

fare clinics which operate at Woodberry Down. Secondly, the Committee's views were sought on the desirability of providing physiotherapy and pathological laboratory facilities at the centre.

175. The Committee, for its part, can see no objection to doctors working at the centre being employed by the county council upon a part-time sessional basis at these welfare clinics, although, of course, they should not receive preferential treatment compared with general practitioners from outside the centre who also wish to take these posts. Similarly, the Committee can see no objection to the provision of physiotherapy and pathological facilities at the centre, provided that they are not restricted merely to general practitioners working in the centre.

176. The Committee is, of course, conscious of the experimental nature of health-centre practice as a whole, and it has recommended the local medical committee to proceed on the lines envisaged above and to review the situation in the light of experience.

NURSING SERVICE

177. Following a resolution passed by the Conference last year the Committee has made inquiries of the Ministry of Health as to the possibility of making increased use of assistant nurses in connexion with the home nursing service.

178. The Ministry is in full agreement with this policy, and, indeed, the number of assistant nurses both full-time and part-time employed in the home nursing service is steadily rising. Every opportunity will be taken to make use of assistant nurses in this capacity.

TRAINING OF DISTRICT NURSES

179. The Minister of Health has established a Working Party to consider the question of the training of district nurses. The Committee supported the nomination of J. Stanley Thomas (East Ham) to serve on the Working Party.

MEDICAL EXAMINATION OF STUDENT NURSES

180. As a result of representations by the Committee the Ministry has now reconsidered the arrangements whereby the fee for the medical examination of student nurse candidates is paid by the candidate to the doctor, the former being reimbursed by the hospital. The position varies in different parts of the country, and in many cases the hospital authorities do not require a report from the candidate's own doctor.

181. The Ministry is unwilling to issue any circular to hospital authorities which might have the effect of encouraging them to require a medical report from the candidate's family doctor, but it has agreed that hospital authorities shall be reminded that where such a report is called for, the hospital authorities have power to pay a fee of up to a maximum of one guinea, and that there is no reason why this should not be paid direct to the doctor furnishing the report.

182. The Ministry has agreed to look into any difficulties which may arise in any particular area.

CERTIFICATION

Standard of Certification

183. The Committee's attention was drawn to one or two isolated instances where the accuracy of medical certificates given by general practitioners had been called to question and, indeed, the validity of the certificates themselves challenged by regional medical officers of the Ministry of Health. The Committee was in no doubt as to the high standards which the vast majority of general practitioners have set themselves in issuing certificates, but it felt the increased call for certificates resulting from the National Insurance scheme and the rising tendency of employers to demand

certificates for even short periods of absence had considerably added to the difficulties of general practitioners in this respect.

184. It is, in the Committee's view, of the greatest importance that the public should continue to have a proper respect for the value of certificates which are issued by general practitioners, and it therefore sought the assistance of local medical committees not only in drawing the attention of practitioners in their areas to their obligations in this matter but to take up on their behalf any cases where it would appear that unreasonable demands had been made by a patient.

Explanatory Leaflet on Certification

185. As is mentioned elsewhere in this Report, the Ministry of Health is now in the process of revising its handbook for general practitioners. Subsequently the Ministry of National Insurance suggested that the present explanatory leaflet on National Insurance certification should similarly be revised and issued in the form of a supplement to the Ministry of Health handbook.

186. The Committee is fully in agreement with this suggestion and has had an opportunity of considering in detail the revised draft of the certification leaflet, which it considers will be of considerable use to general practitioners.

Revision of Form Med. 1

187. The Committee has agreed to the amendment of the part of the first medical certificate which the insured person fills up as his claim form. The reason for the amendment is that it will obviate further inquiries being made in respect of claimants who have no dependants. The part of the certificate used by the doctor is not affected in any way by this revision.

"Vague" Certificates

188. The Committee examined a suggestion that, as an economy measure, the one copy of Form Med. 6 (the "vague" certificate) which is included in every pad of medical certificates should be omitted and that special pads of Form Med. 6 should be made available.

189. The Committee, after consultation with the Ministry of National Insurance, did not feel that much saving would accrue from this proposal, nor did it feel that general practitioners would welcome the issue of separate pads of these forms. The use at present made of Form Med. 6 is small, and the Committee would like to take this opportunity of pointing out that a wider use of this form would do much to prevent unnecessary references to regional medical officers, particularly in the case of those claimants for insurance benefit who are much more ill than the cause of incapacity given on the medical certificate would normally suggest.

Certificates for Patients in Convalescent Homes

190. It was pointed out to the Committee that much of the attendance on temporary residents in convalescent homes was for the sole purpose of issuing a formal certificate of incapacity, when the mere presence of the patient in such a home was reasonable evidence of this fact. It was therefore suggested to overcome this unnecessary burden of certification, firstly, that responsible persons in recognized convalescent homes should be permitted to issue certificates of residence, which would be accepted by the Ministry of National Insurance in place of the usual medical certificate; and, secondly, that doctors should be allowed to issue convalescent certificates after a period of illness shorter than the 28 days at present in force.

191. The Committee feels that these proposals have much to commend them, and they are being discussed with the Ministry.

Certification for Surgical Corsets

192. Although the Committee was successful in securing a reduction in the number of prescribed diseases for which tax-free corsets could be obtained, and so reducing this form

of certification, it still felt that the only solution to the problem lay in the total abolition of certificates for this purpose. The Committee therefore made strong representations to the Board of Customs and Excise that further consideration should be given to the early removal of the need to obtain a certificate before a surgical corset could be secured free of purchase tax.

193. The Board is fully in sympathy with the Committee's views that it was difficult to prevent abuse of the present arrangements, but the whole question of surgical corsets was part of the wider problem of surgical appliances as a whole, and it felt that the Committee would not object in principle to a scheme of purchase-tax exemption for any necessary surgical appliances. Whilst in the case of most appliances it would be readily apparent that they were required purely on medical grounds, in the case of corsets there was frequently room for doubt, and it was for this reason that a certificate was required as evidence of medical need. To withdraw the concession *in toto* would fall hardest on private patients and on those N.H.S. patients who prefer to buy their own appliances and corsets rather than get them through the National Health Service.

194. Nevertheless, the Board was concerned to prevent unnecessary demands and abuse of any scheme for purchase-tax concessions, and it felt that the best course would be for any condition which might easily give rise to abuse to be deleted from the prescribed list. The Committee was provided with figures which showed that the demand for corsets supplied free of tax had shown a considerable drop since the list of certifiable conditions was reduced last year. Since then, the Board had itself removed "severe splanchnoptosis" from the list.

195. The Committee, at the invitation of the Board of Trade, will continue to keep the list of prescribed diseases under review, and should it become apparent that there is any abuse of the scheme, steps will be taken to revise the list further. It is hoped that, by so doing, the demand for medical certificates for this purpose will continue to fall.

NOTIFICATION OF CAUSE OF DEATH

196. The attention of the Ministry was drawn to the doubt which existed in some quarters as to whether it was part of a practitioner's terms of service to obtain details of the cause of death and to insert these on the medical record envelope in particular, in those cases which were reported to the coroner by the general practitioner.

197. The Ministry's view is that there is no definite obligation on doctors to obtain such details, and that in these circumstances they should merely record such information as they have at their disposal.

COMPENSATION

198. It will be remembered that the Annual Conference last year called upon the Committee to press for the payment of compensation at an early date. With the support of the G.M.S. Committee, the Compensation Committee of the Association is continuing to make strong representations on this subject to the Ministry of Health.

PRESCRIBING AND DISPENSING

Discount on Drugs

199. The Annual Conference last year again expressed concern that dispensing doctors paid on the basis of the Drug Tariff should continue to sustain financial loss when supplying a number of proprietary preparations. The Committee has therefore made further attempts to overcome this grossly inequitable situation, and a joint meeting was held with representatives of the National Pharmaceutical Union and the Association of the British Pharmaceutical Industry.

200. The matter was discussed in great detail, and arrangements have been made for information to be obtained as to the amount of money involved and the precise extent of the loss. The Committee, for its part, has agreed to consider

possible safeguards which, if a revised discount allowance were agreed, might be introduced to restrict such an allowance to those doctors who were dispensing under the National Health Service.

201. Negotiations continue, but the complexity of the problem makes it difficult to attain rapid progress.

List of Appliances

202. The Ministry has agreed to the inclusion of one-inch plastic strapping in one-yard and two-and-a-half-yard lengths in the list of appliances which may be prescribed by general practitioners in the National Health Service.

203. As from July 1, 1953, a syringe manufactured in accordance with B.S. 1619/1950 will normally be supplied whenever an insulin syringe or a hypodermic syringe with insulin is ordered. The Standard provides for a Luer nozzle to the syringe, and each outfit will include two Luer mount needles and an adaptor for the use of Record-pattern needles if these are desired. If a doctor does not wish a patient to have a syringe of this type he is free to specify on the prescription that the alternative Record pattern is to be supplied, although at some future date the Ministry intends that the Luer mount pattern will be the only type to be included in the Drug Tariff. The new standard type has the support of the Diabetic Association.

204. The Committee has sought to make it possible for a practitioner to prescribe diagnostic tuberculin jelly and control jelly for administration by him to his patients. Part 2 of the third schedule to the National Health Service (General Medical and Pharmaceutical Services) Regulations specifies those chemical reagents which may be prescribed, but tuberculin-test materials, together with one or other diagnostic reagents, cannot properly be described as chemical reagents. The Ministry has therefore agreed to regard these reagents as drugs and executive councils will reimburse the cost which the general practitioner incurs in supplying them for his patients.

205. Representations were also made for the inclusion of catheter lubricant. The question of finger-cots and eye-pads is also under consideration.

206. The Ministry of Health has also added to the list masks intended to protect persons suffering from cardiac and respiratory diseases from the effects of smoke-polluted fog. The Chairman of the Committee was informed of the proposed action as soon as the decision to issue the masks had been taken, and he made it clear to the Ministry that, whilst in the special circumstances he could raise no objection to the issue of the circular without prior consultation and discussion with his Committee, he was not in any way departing from the Association's view that the most important step to be taken was to tackle the fog nuisance at source by the prevention of smoke pollution. A statement to the press was issued on behalf of the Committee stressing this point and also reminding the general public of the fact that the masks were only intended for persons suffering from cardiac or respiratory diseases, and not as a general issue. At the same time, it was emphasized that those persons who were entitled to masks should be guided by their general practitioner as to whether or not such masks would be beneficial in their own case, and the public was asked to minimize the calls made on the doctor's time by not asking him to make a special visit for the sole purpose of prescribing the mask.

207. The Committee feels that the Government acted with unnecessary haste, particularly as adequate supplies of the mask were not available at the time that the Ministry's circular was issued.

Prescribing of Elastic Hosiery

208. It appears that on a number of occasions patients have expressed their dissatisfaction with elastic hosiery supplied by a chemist. It has been suggested that the doctor might, in these circumstances, be called upon to decide as to whether or not the hosiery supplied by the chemist is in accordance with the prescription which he has given. The

Committee has accepted this suggestion, but pointed out to the Ministry that in its opinion the original prescription should be returned to the doctor should he be called upon to adjudicate in a particular case.

Prescribing of Disinfectants

209. Following representations by the Committee the Ministry informed Pricing Bureaux that, in the case of disinfectants, only prescriptions ordering more than 16 fluid ounces should be referred to executive councils for subsequent investigation by local medical committees.

210. Although the Committee felt that this step would greatly diminish the number of prescriptions referred, unfortunately this has not been the case, and the Committee therefore suggested that the instructions to Pricing Bureaux should be amended so that normally only prescriptions for over 1 pint of disinfectant should be subject to examination. Many practitioners were in the habit of prescribing in this manner. The Ministry is looking into the quantities of disinfectants which are normally ordered, and discussions are proceeding.

Prescribing of "Casilan"

211. The Committee has received a number of requests for advice on the subject of the prescribing of casilan. This substance is, of course, not one of those which have been classified as foods by the Joint Committee on the Definition of Drugs, and, in pursuance of its policy that every case must be considered on its merits, the Committee does not feel able to give any general guidance on the subject. It is firmly of the opinion that local medical committees must themselves continue to decide such questions in the light of the full circumstances appertaining in each case.

Aureomycin

212. The Committee has asked the Ministry whether aureomycin, which is at present available only through the hospital service, might not be made more freely available to general practitioners. The difficulty is that the supply of aureomycin is still essentially a problem of finding dollars to meet the cost of bulk importation of the crude drug. Nevertheless, the Ministry has given an assurance that it will be freely available as soon as supplies warrant such a step.

List of Specially Expensive Drugs and Appliances

213. Following representations by the Committee, the Ministry has added, or agreed to add, the following drugs and appliances to the specially expensive list: penicillin tulle; sulphonamide compound preparations; porous "elastoplast" bandage; urine sugar analysis sets with refills of diagnostic solution—tablets of copper; and phenylbutazone ("butazolidin"). The Committee has also asked for the inclusion of erythromycin.

214. It is understood that the Ministry proposes to publish a revised list which will take account of the various amendments which have from time to time been made.

Prescriptions for Items on the Specially Expensive List

215. The Committee's attention was drawn by the Ministry to the fact that on a number of occasions prescriptions have been issued by general practitioners to their dispensing patients for items which were not included in the special list and for which payment of the capitation fee was intended to cover. In view of the complexity of these lists it is hardly surprising that such occurrences should sometimes arise.

216. The Ministry suggested that similar errors in the future could be prevented if prescriptions issued by general practitioners for items on the special list could in some way be made distinguishable from ordinary prescriptions. The Committee has accepted this proposal and the method to be adopted will be the use of Form E.C. 10 printed on coloured paper.

242. It will be remembered that, in addition to increasing the maternity benefit in certain circumstances, the Act also

abolished the condition that payment of a maternity grant was dependent upon the production of a medical certificate that the confinement had taken place, and substituted merely the requirement that the woman had been confined. Similarly, in the case of the maternity allowance it abolished the need for a certificate of expected confinement within a stated number of weeks and substituted a requirement that the applicant was pregnant and had reached a stage in pregnancy not more than a prescribed number of weeks before the expected date of confinement. This has the effect that, although the certificate of confinement and expected confinement will normally be required, the statutory authorities will be able to accept other evidence in support of claims to maternity benefit. In particular, it will not normally be necessary for a doctor who has given a certificate of expected confinement to give a certificate in respect of the same confinement when benefit is claimed after confinement.

243. Regulations have now been made to give effect to these changes and the certificates revised accordingly.

VACCINATION AND IMMUNIZATION

244. The Committee was disturbed to learn that a number of local authorities were proposing to discontinue the payment of fees for records of successful vaccination in the case of adults. The Committee felt that this action was a radical departure from the tripartite agreement which was reached by the Committee with the Ministry of Health and the Local Authorities Associations. Accordingly, representations were made to the Ministry of Health, and, whilst the Committee accepts the view that local authorities do not require records for the vaccination of persons going abroad, it strongly opposes any suggestion that other adult records should no longer be required. The Ministry, for its part, has stated that there has been no change in its policy but that, nevertheless, local authorities could only be required to act in accordance with the schemes originally approved by the Minister for carrying out their duties under section 26 of the Act. Whilst the Minister would not approve amendments which would allow the authorities concerned to exclude payment for adult records, in a number of cases the schemes do not specifically call for these records and the Ministry has no power to require local authorities to pay for them.

245. Nevertheless, in order that there shall be no misunderstanding on the subject, the Ministry is proposing to issue a circular setting out its policy on vaccination. This will be submitted to the Committee in draft form.

Vaccination Pad

246. The Committee's attention was drawn to the unsatisfactory nature of the present vaccination pad, and the Ministry has been urged to introduce an improved design.

THE ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

247. The Assistants and Young Practitioners Subcommittee has considered a number of problems during the session.

248. Firstly, the Subcommittee has been concerned with the method of its own election. Although steps were taken to enlarge the electoral rolls last year, it has still proved difficult to secure the adequate representation of all areas on the Subcommittee itself. New methods of compiling the rolls and of keeping them up to date have therefore been devised. In addition, to stimulate interest in the Subcommittee, a short report of its work is to be sent to each member of the electorate when nominations are next sought.

249. The Subcommittee is continuing to examine those problems which particularly affect the assistant and the new entrant into practice. It is particularly interested in the investigation which the Working Party is carrying out into the problem of the small-list practitioner, and its views are being sought by the Amending Acts Committee of the Association on the practicability of reintroducing the right to buy and sell the goodwill of medical practices.

250. Two other major problems are now under consideration. Firstly, whether any alteration should be made to the size of the extra list of patients which a principal is permitted by virtue of the employment of an assistant. Secondly, whether any change should be made in the present requirement that a patient wishing to change his doctor, in the absence of the consent of the two doctors concerned, must give 14 days' notice in writing to the executive council. The Subcommittee's views on both these matters will be reported to the parent committee in due course.

PENSION SCHEME FOR MEDICAL AND DENTAL EMPLOYEES

251. The Committee has previously reported that a scheme was in course of preparation to provide for superannuation and death benefits for employees of doctors. The scheme provides for, *inter alia*:

(a) Pension on retirement at 65, or 60 in the case of a woman, based on salary and length of service with, in the case of men, the option of a "survivor" pension for widows;

(b) death benefits for women, and

(c) return of contributions on withdrawal from the scheme on death or retirement.

252. The Council of the Association has accepted office as Trustees to the scheme through the medium of a small committee appointed for the purpose of its administration. Full details can be obtained from the Medical Insurance Agency, Tavistock House North, Tavistock Square, London, W.C.1.

SPONSORED TELEVISION

253. In view of the many exhortations which are made to the general practitioner to reduce prescribing costs, the Committee felt apprehensive at the possible effect of sponsored television on the public demand for various proprietary medicaments and the consequent rise in the Drug Bill. Accordingly, the Committee drew the Minister's attention to this problem.

TRAINEE GENERAL PRACTITIONER SCHEME

254. Following the approval given by the Conference to the Report prepared by a special subcommittee on the operation of the Trainee General Practitioner Scheme, the Committee discussed the recommendations contained in the Report with the Ministry. It is pleased to be able to report that the Ministry was in full agreement with the recommendations made by the Subcommittee, and the Report has now been circulated to executive councils, who are being urged to consider the implementation of the various proposals made in it in the light of local circumstances.

255. In its report to the last Annual Conference the Committee referred to its proposal to discuss with the Ministry the remuneration of trainee general practitioners in the light of the standards of remuneration established by the Danckwerts award. Preliminary discussions have taken place with the Ministry, and the Department is now in the process of collecting information as to the extent to which the scheme is being used. The Committee, for its part, is awaiting some evidence as to the effect of the Danckwerts award on the salaries paid to ordinary assistants before proceeding any further in this matter.

HOSPITAL REPORT SHEETS

256. The Conference last year called upon the Committee to secure the adoption by all regional hospital boards of a standard size and form of hospital report sheet which would fit a standard medical record envelope.

257. This matter has now been discussed with the Ministry, which is itself in favour of some measure of standardization, but the difficulty is that, at the present time, various hospital authorities are using their own types and styles of stationery and it is difficult to secure uniformity without considerable local opposition. The differing types of office equipment also create problems so far as standardization is concerned.

Nevertheless, the question of standardized reports will be fully considered by the Ministry in connexion with the wider problem of economy in the use of paper, and the difficulties of general practitioners in this respect have been brought to the notice of regional hospital boards through their senior administrative medical officers.

MEDICAL RECORDS

258. Prior to July, 1948, local insurance committees were sent reminders where medical records were required following transfer from one area to another if the records were not promptly forthcoming. At present there is no follow-up of applications to transfer records between one executive council and another, and the failure to pursue initial applications often results in some deterioration in maintaining and transferring records.

259. This matter was accordingly brought to the notice of the Ministry of Health, and whilst the Ministry feels that it is unnecessary, as a matter of routine, for executive councils to send reminders to other executive councils, there is no reason why the clerk of one council should not approach another if there appears to be any obvious delay in transmitting individual records. In any area where delay is experienced, the Committee hopes that local medical committees will be able to take this matter up with the executive council on the lines indicated above.

ACCIDENTAL POISONING OF CHILDREN BY MEDICINAL PREPARATIONS

260. It will be remembered that in recent years a number of discussions have taken place with the Pharmaceutical Society on the measures which might be taken to protect children against accidental poisoning by medicinal preparations. Unfortunately it has not been found practicable to find any method by which the professions themselves could supply any absolute safeguard. Rather, the main duty of protection must always rest with the parents or guardians of the children, and it has been decided that the situation could best be met by instigating some form of publicity campaign emphasizing the known dangers to children. Discussions on this proposal are still in progress.

HEALTH EDUCATION SCHEMES—CANCER

261. The Committee was invited to comment on a draft circular which the Ministry of Health has since issued to local health authorities on the subject of cancer education. It informed the Ministry that it was not convinced of the wisdom of instituting any campaign of this nature, but that, if the Ministry felt that such a campaign should be launched, then it should be confined to education in the more easily accessible cancers. At the same time, it was emphasized that any scheme should be of an exploratory nature and that any scheme should be reviewed in the light of experience after a relatively short period. The Ministry was also informed that general practitioners should be represented on any committee which was formed to sponsor work on cancer education.

262. Subsequently, it appeared that the Ministry was confining itself in the present instance to inviting local health authorities to explore the possibilities of launching local cancer education schemes and that it was not proposed to institute a general campaign but to gain such experience from a few local schemes as will enable the Minister to decide whether to proceed further.

263. The Ministry, while welcoming the suggestion that general practitioners should be represented on any Committee which is formed, was unable to accept the Committee's suggestion that schemes should be limited to easily accessible cancers, as it hoped that education would lead to early diagnosis in all sites. Nevertheless, emphasis in education will be laid on the more easily diagnosed cancers where the possibility of cure is greater.

264. No objection has therefore been raised to the operation of a pilot scheme in a limited number of areas, but

the Committee has stated its wish to be consulted again, in the light of experience of the pilot survey, before any general scheme for cancer education is inaugurated.

CENTRAL COUNCIL FOR HEALTH EDUCATION

265. In its last Annual Report the Committee referred to discussions which had taken place with the Central Council for Health Education with the object of securing a closer liaison between the Central Council and the Committee on matters affecting the general practitioner. As a result of these discussions the Committee is pleased to report that arrangements were made for it to see in draft form existing pamphlets which the Council proposed to reprint and new pamphlets before issue. The Committee has been able to suggest a number of amendments to the council's pamphlets to bring them more into line with the viewpoint of the general practitioner.

THE DEFENCE TRUSTS

266. The Balance Sheets and Statements of Income and Expenditure of the National Insurance Defence Trust and the General Medical Services Defence Trust for the year ended December 31, 1953 (Appendices D and E), will appear in next week's Supplement.

267. A statement showing the contributions so far received from each area is being circulated to local medical committees.

A. TALBOT ROGERS,
Chairman.

General Medical Services Committee.

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

Chairman and Vice-chairman

268. J. T. Baldwin and C. J. Swanson were reappointed Chairman and Vice-Chairman respectively for the Session 1953-4.

Subcommittees

269. The following Subcommittees were appointed for the session: Chairman's, Rural Practitioners', Colliery Practitioners', Dispensing Capitation Fee, Joint Subcommittee with the Central Consultants and Specialists Committee (Scotland) on Relation of General Practitioners to Hospitals, and a Special Subcommittee to consider the effect of the Working Party's Proposals on General Practitioner Remuneration in Scotland.

Representation

270. Representatives of the Subcommittee were appointed to the following committees: Central Consultants and Specialists Committee (Scotland) and their Anaesthetic Services, Ophthalmic Services, and Radiological Services Subcommittees; Maternity Services, Public Health, Partnership Advisory, and N.H.S. (Scotland) Review Subcommittee of Scottish Committee; Assistants and Young Practitioners Subcommittee of G.M.S. Committee; N.H.S. (Scotland) Subcommittee of G.M.S. Committee; Staff Side of Medical Sub-Drug Accounts Committee (Whitley); committee of Scottish Advisory Committee (Whitley); Liaison Committee with Scottish Association of Executive Councils; International and Scottish Advisory Distribution Committees; Editorial Committee of *Prescribers' Bulletin*; Scottish Central Medical Recruitment Committee; Medical Advisory Committee under Regulation II of the Medical and Pharmaceutical Committees and Tribunal Regulations; and Pharmaceutical Committees and Tribunal Regulations; Scottish General Dental Services Committee of the British Dental Association.

Meetings

271. In order to overtake the increasing amount of work falling to the Subcommittee, meetings are being held once a month instead of every other month until such time as it is

no longer necessary. For the convenience of members in the West of Scotland, every third meeting is being held in the Glasgow Regional Office.

Admission of Assistants to Executive Council Lists

272. The question of the admission of a full-time assistant as a principal to the executive council list appears to be presenting some difficulty, and the Subcommittee has been examining the position. There is some doubt as to whether an assistant, on being admitted to the list, is admitted as an assistant or as a principal, and this has been one of the points under discussion. The Subcommittee has taken the matter up with the Department in an endeavour to clarify the general question of the inclusion of assistants in medical lists.

"Restricted" Lists

273. An anomalous situation has arisen concerning the remuneration of practitioners with "restricted" lists who have other patients outside the establishment to which their restricted lists apply. The Subcommittee is examining this position in consultation with the Department, and figures are being obtained showing the size of the problem. On receipt of these figures, further meetings will be held in an endeavour to rectify any anomalies which may exist at present.

Group Practice

274. The Subcommittee has completed its discussion with the Department on the subject of group practice loans, and a memorandum explaining details of the scheme has been issued by the Department to every general practitioner.

275. In the first year of the scheme approximately £12,000 will be available for loans in Scotland, and these will be granted, interest free, towards the cost of providing premises for group practice. The Cohen Committee's definition of group practice for the purpose of the fund, while not being accepted rigidly in Scotland, will form the basis on which claims will be considered—the intention in Scotland being that the availability of such loans should be on as wide a basis as possible. The fund will be administered by a joint committee with representatives of the Department and the Subcommittee. Plans carried out since April 1, 1953, are eligible for assistance on an equal footing with plans to be carried out in the future; plans carried out before that date will be eligible if resources permit.

Partnership Practice

276. A small Subcommittee has been set up to revise and redraft the Partnership Memorandum which was prepared by the G.M.S. Subcommittee in 1951. This subcommittee has met once when various suggestions were made for the improvement and amplification of the memorandum in the light of experience. The Association's legal adviser in Scotland is being consulted with particular regard to the difficult question of restrictive covenants, and the views of the Scottish Medical Practices Committee are also being sought.

Guillebaud Committee

277. After it was announced that the Guillebaud Committee, set up to inquire into the cost and efficiency of the National Health Service, intended to take separate evidence in Scotland, the Scottish Committee of the Association arranged to give evidence to that Committee on behalf of the Association in Scotland. The Scottish Committee consulted the General Medical Services Subcommittee (Scotland) in connexion with the evidence to be submitted and the Subcommittee held a special meeting to consider any recommendations and/or comments it had to make to the Scottish Committee.

Handbook on General Practice

278. A handbook for general practitioners has been prepared by the Department and will be printed in loose-leaf form so that it can more easily be kept up to date. The

Chairman, the Vice-Chairman, and the Secretary, who undertook to examine the handbook in detail, reported to the Subcommittee that, in their view, it was a most helpful document. The handbook sets out very clearly the many administrative details which a general practitioner working in the National Health Service ought to know. It is felt that it will be a most useful book for reference.

Medical Service Committee and Tribunal Procedure

279. The Department has been reviewing the provisions of the National Health Service (Medical and Pharmaceutical Service Committees and Tribunal) (Scotland) Regulations, 1948, in the light of experience over the past five years. It has suggested certain amendments designed to make the intentions of the regulations more clear and to simplify the procedure. The Subcommittee decided to defer consideration of the procedure from the Scottish point of view and the Department's suggested amendments to the regulations until the G.M.S. Committee has completed its negotiations with the Ministry concerning the position in England and Wales.

Ambulance Service

280. The Subcommittee has had several discussions with the Department regarding the Ambulance Service. The discussions have covered the administrative arrangements together with certain suggestions that the Subcommittee has had to make for improving the service. In addition, both the Department and the Subcommittee have paid considerable attention to the marked increase in the use of the Ambulance Service and have agreed on certain steps to be taken to prevent any possible abuse.

National Union of Mineworkers—Counter Certificates

281. The Subcommittee, through its Colliery Practitioners' Subcommittee, has completed satisfactorily its negotiations with the National Union of Mineworkers (Scottish Branch) in connexion with the form of "Counter Certificate" and the fee to be paid. Agreement has been reached on this matter and practitioners in colliery areas have been notified regarding the form of certificate and the fee to be paid.

Maternity Record Card

282. The Maternity Services Subcommittee of the Scottish Committee has agreed with the Department that certain small alterations should be made in the maternity record card. The Subcommittee also approved of the modifications.

Mileage

283. The Mileage Subcommittee of the Scottish Advisory Distribution Committee is still considering the distribution of the Mileage Fund in Scotland and the Department is being pressed to pursue the matter actively. Certain proposals have been forwarded by the Stirling and Clackmannan Local Medical Committee, and these have been passed to the Mileage Subcommittee for consideration. It has been agreed that any proposals from the Department should, in the first place, be submitted to the Rural Practitioners' Subcommittee of the General Medical Services Subcommittee (Scotland) for consideration.

Highlands and Islands Practice

284. Representatives of the Subcommittee had a meeting with certain practitioners from the Highlands and Islands areas to discuss various points which seemed to be causing those practitioners some concern. Some of the practitioners in the more remote areas felt that they were not being adequately compensated for the disadvantages and difficulties borne by them in their particular type of practice—for example, the higher cost of living, practice expenses, housing and transport difficulties. They also expressed concern at the present unsatisfactory position regarding mileage and indicated that a definite mileage scheme would go a long way towards meeting some of their grievances.

Another point brought to the Subcommittee's attention was that, owing to the difficulty of attending meetings of local medical committees, those practitioners felt that they were not adequately represented and that consequently their problems and views did not reach the central administration.

285. There seemed to be considerable doubt in the minds of many remotely placed practitioners regarding the purpose of inducement payments, and to try to clear up any misunderstanding about them an explanatory communication was issued to all practitioners in the Highlands and Islands areas. It is intended to hold further discussions on general topics in the near future, particularly when more definite progress has been made with regard to mileage payments. It is also hoped to consider the preparation of a report for submission to the General Medical Services Subcommittee incorporating a detailed statement on the question of the representation of the views of these practitioners. The suggestion was made that the General Medical Services Subcommittee might set up a special Subcommittee, but, before doing this, the Subcommittee wishes to have a written report as to the actual position.

Trainee General Practitioners' Scheme

286. A note of guidance for trainers under the above scheme, which has the approval of the Subcommittee, has been issued by the Department to all trainers. It is hoped that this memorandum, which contains items of administrative interest, will prevent the recurrence of some minor difficulties which have arisen.

Prescribing

287. The Subcommittee has had several discussions with the Department on the question of the investigation of extravagant and excessive prescribing. Areal statistics will again be available and it is hoped that these will ease the work of local medical committees in their investigations, and enable practitioners to keep an eye on their own area, since they will know the average for their own area. The question of the examination of prescriptions for drugs listed in Categories 5 and 6 of the Cohen Committee's Report has also been discussed, and the Subcommittee did not agree to the Department's proposal that these prescriptions should automatically be referred to local medical committees for investigation. The Department has agreed, therefore, to reconsider this proposal on the following conditions:

- (1) The Department has undertaken to collect statistics over a period in an endeavour to ascertain the number of prescriptions containing items listed in Categories 5 and 6.
 - (2) The Department will review its proposal with the Subcommittee when the above statistics are available.
 - (3) In the meantime prescribing of such items will not automatically lead to the scripts being referred to local medical committees for investigation.
 - (4) The Subcommittee has agreed, however, that the Department shall not be precluded meanwhile from referring to an executive council for investigation by a local medical committee any unduly frequent prescribing of such items by a practitioner. It is understood, however, that such reference may only be made in exceptional circumstances.
288. Further discussions will be held with the Department in due course.

Filling of Small Practice Vacancies

289. The Subcommittee has been consulting with the Scottish Association of Executive Councils and the Scottish Medical Practices Committee regarding the question of a small practice vacancy and the most expedient method for filling it when it was felt that the practice would only

survive if filled immediately. The adoption of the method used in England, whereby executive councils are encouraged to deal with nucleus vacancies by direct approach to the Medical Practices Advisory Bureau in order that valuable time would not be lost by advertising, is under consideration.

J. T. BALDWIN,
Chairman,

General Medical Services Subcommittee (Scotland)

Owing to shortage of space the Appendices to this report and the financial statement of the National Insurance Defence Trust and of the General Medical Services Defence Trust (Appendices D and E) will be published in next week's "Supplement."

EVIDENCE TO GUILLEBAUD COMMITTEE

MEDICAL PRACTITIONERS' UNION

The Medical Practitioners' Union has added its views on the financial aspects of the National Health Service to those of many other bodies who have already submitted evidence to the Guillebaud Committee. Taking a long-term view, the Union believes that a fully efficient Service will be developed only when there is complete administrative integration of the three branches of the Service at a regional level. What is termed "a democratically based regional health authority," financed by a system of block grants, should be responsible for all aspects of health that now come under the National Health Service, with the addition of occupational and school health services. Block grants should be for running costs and capital expenditure, the first on the basis of a two- or three-year programme, the second for five years. Regions with high morbidity rates should attract higher grants.

Health an Investment

Pointing out that wise spending can, in effect, save money, the Union in its memorandum says that the failure to appreciate "the great economic costs of ill-health" has sometimes led to short-sighted economies and failure to spend money where it would give the greatest return. The Union believes that in comparison with health expenditure in other countries, and with our own pre-war expenditure, the present costs of the Service are not excessive.

Too Many Doctors?

The Union believes that with proper practice organization it is possible for a doctor to give good service to 2,400 patients, but it looks forward to a gradual increase in the number of general practitioners so that as time goes on the average list will be 2,000 or less. As redistribution takes place there will be a strong case for reducing the maximum list to 3,000, and later perhaps still lower. It is considered that the proper approach to this "rather difficult question" is to plan a gradual small increase in the number of general practitioners over the years.

Organization of General Practice

Generally speaking, the Union regards the single-handed practitioner as an uneconomic unit. He cannot afford to employ adequate ancillary help. The Union's support of the health centre policy is referred to and meanwhile it believes that group practices should be encouraged in every way. The policy advocated by the Union "on a number of occasions" that general practitioners should be paid for practice expenses apart from their remuneration is restated. Practice expenses, the Union feels, should be repaid on the basis of actual expenditure because this system would encourage expenditure where it leads to efficiency.

The Union maintains its opposition to charges in the Health Service.

HOSPITAL MEDICAL STAFF REMUNERATION SCALES

We set out below figures which illustrate some comparisons between new and old salary scales for hospital medical staff as affected by the recent award.

Whole-time Consultants			
	Spens	Old	New
Minimum	1,500	1,700	2,100
Increments	125	3 × 125, 2 × 150, 3 × 125	125
Maximum	2,500	2,750	3,100

Effect of Awards				
Year (From Top of Scale)	No Award	C Award	B Award	A Award
<i>Spens Scale</i>				
3	2,125	2,625	3,625	4,625
2	2,250	2,750	3,750	4,750
1	2,375	2,875	3,875	4,875
0	2,500	3,000	4,000	5,000
<i>Old Scale</i>				
3	2,375	2,875	3,875	4,875
2	2,500	3,000	4,000	5,000
1	2,625	3,125	4,125	5,125
0	2,750	3,250	4,250	5,250
<i>New Scale</i>				
3	2,725	3,225	4,025	4,925
2	2,850	3,350	4,150	5,050
1	2,975	3,475	4,275	5,175
0	3,100	3,600	4,400	5,300

Hospital Medical Staff

The Table below shows the actual increases and percentage increases. In the last two columns the percentage increase over Spens scales of the old scales and the new scales are shown.

Grade	Increase in £	Percentage Increase	Spens Betterment ²	
			Old Scale	New Scale
Consultant (A award)	50	1.2-0.95	13-13	15-14
" (B ")	150	4.7-3.5	15-15	21-19
" (C ")	400-350	18.2-10.8	19-17	40-30
" (no ")	400-350	23.5-12.7	22-19	51-34
S.H.M.O. ¹	200	15.4-11.4	20-20	38-34
Senior registrar	100	10.0-7.7	20-17	32-26
Registrar	75	9.7-8.4	20-20	31-30
J.H.M.O. ¹	75	10.7-7.5	20-20	33-29
Senior H.O.	75	11.2	21	34
House officer ^{1,3}	75	21.4-16.7	20-20	46-40

¹ The grades of S.H.M.O., J.H.M.O., and House Officer were not provided for in the Spens Report. The figures shown under "Spens" for these grades are the "Spens equivalents"—i.e., five-sixths—of the old salary scales.

² The figures under "Betterment" show, separately for the old and the new scale, the percentage addition to the Spens (or "Spens equivalent") figure both at the minimum and at the maximum of the scale. The 8% Government superannuation contribution has been added to the salary figures in the calculation of "betterment."

³ In the new scale for House Officers the actual increase in the amount paid as salary is less than the increase shown in the table, since the sum deducted in respect of residential emoluments has been increased from £100 to £125.

House Officers

Spens Scale	Old Scale	New Scale
—	350-100=250	425-125=300
—	400-100=300	475-125=350
—	450-100=350	525-125=400

Registrars

Grade	Spens Scale	Old Scale	New Scale
3	600	670	745
2	700-800	775-890	850-965
1	900-1,100	1,000-1,300	1,100-1,400

J.H.M.O.s and S.H.M.O.s

Grade	Spens Scale	Old Scale	New Scale
J.H.M.O. ...	—	700-1,000	775-1,075
S.H.M.O. ...	—	1,300-1,750	1,500-1,950

THE PREVENTION OF TUBERCULOSIS MEMORANDUM TO LOCAL AND HOSPITAL AUTHORITIES

Deaths from tuberculosis have been falling rapidly during the last five years. For instance, there were 9,335 deaths in 1952 and 7,911 in 1953—a difference of 1,424. At the same time the incidence of the disease has not fallen to a comparable extent. It is believed that this may be due in part to better diagnosis bringing to light cases which were formerly undiagnosed and therefore unnotified; but the very slight improvement in notification rates in comparison with the dramatic improvement in mortality emphasizes the importance of renewed effort to bring the incidence of tuberculosis finally under control. These remarks preface a call for action in a memorandum on the prevention of tuberculosis circulated by the Minister of Health to local authorities and hospital authorities and prepared in consultation with the Minister's Standing Tuberculosis Advisory Council and the Central Health Services Council.

Tracing Contacts

The memorandum suggests that, while there are no entirely new methods of controlling the spread of tuberculosis, recent developments and improvements in methods should be a stimulus to each local authority to look at its preventive programme, and that the same epidemiological approach which has brought other infectious diseases under control might be applied to tuberculosis. Referring to tracing of contacts, for instance, the memorandum says that it is rarely possible to trace them all, but it is believed that tracing can and should be carried further than it is now in many areas, if not in all. The investigation of family contacts of school entrants found tuberculin positive has yielded a high proportion of cases of pulmonary infection among the adults so investigated.

Other aspects covered include employment of the tuberculous, home conditions, and use of B.C.G. vaccine. One of the points made regarding employment is that it is obviously far better that the infectious patient should be placed in suitable work where he would not be a danger to others than that he should be allowed to find his own employment without precaution. He should be given every help to secure suitable employment. It is considered that there is much to be gained by the selective use of mass radiography for groups which show some evidence of special risk rather than for the re-examination of large groups of employed persons.

The General Practitioner

Saying that the prevention of tuberculosis depends on a number of people, the memorandum puts the primary responsibility on the medical officer of health working with and through the chest physician, family doctor, and industrial medical officer. The role of the general practitioner is stressed and he should be fully informed of what measures are being taken. It is stated that "no campaign which is not fully explained to and supported by the general practitioners can succeed." Copies of the memorandum have not been sent to local medical committees.

Notes and News

Paying Guests.—Requests are received from French doctors who wish to send their children to medical families in Great Britain as paying guests. Anyone who is willing to receive these children on these terms is asked to communicate with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

APPROACH TO MINISTRIES ON MEAT CONTROL

DISAGREEMENT WITH VETERINARY SURGEONS

As reported in the *Supplement* (March 20, p. 77) the Council of the Association at its meeting on March 9 agreed to the recommendation of the Public Health Committee that a formal protest should be sent to the British Veterinary Association about that Association's recent memorandum on meat production and control. An important implication of the Veterinary Association's plan was that the medical officer of health's supervision over meat inspection should be removed. The B.M.A., the Society of Medical Officers of Health, and the Sanitary Inspectors Association have now sent the following agreed statement about the Veterinary Association's memorandum to the Ministries of Health, Food, and Agriculture and Fisheries:

"The British Medical Association, the Society of Medical Officers of Health, and the Sanitary Inspectors Association have jointly considered the recent memorandum prepared by the British Veterinary Association on Meat Production and Control (1953). While concurring with much of the contents of the memorandum the three bodies above mentioned dissent from certain views expressed and desire to draw attention to four principles, the application of which is considered essential in connexion with any arrangements now in force or under consideration for the future in connexion with meat inspection and control.

"(1) *Health.*—The close association between animal and human disease must be fully appreciated at all times, but the fundamental purpose of meat inspection is to safeguard the health of the individual consumer and the community as a whole. All other considerations must be regarded as secondary to this main purpose. It is therefore necessary that all action with regard to these matters should be considered as an intrinsic responsibility of the public health service.

"(2) *Administration.*—The British Veterinary Association memorandum recommends that in future meat inspection should be the responsibility, both administrative and executive, of the Animal Health Division of the Ministry of Agriculture. Here the British Veterinary Association has failed to appreciate the fundamental principle that meat inspection is primarily concerned with the health of the community, not with meat production. The three bodies are unanimous in stating that in their view the central government department responsible for general supervision and advice should be the Ministry of Health, acting jointly with the Ministry of Food.

"(3) *Local Responsibility.*—The British Veterinary Association memorandum envisages that all meat inspection shall be 'under the direction and control of the Animal Health Service of the Ministry of Agriculture and Fisheries' and includes the 'taking over of the existing staffs.' This implies that the responsibilities which at present lie with local authorities shall be removed. The three bodies cannot agree with this recommendation and would urge most strongly that the responsibility for local administration shall remain with the local authorities.

"(4) *Medical Responsibility.*—Meat inspection is only one part of the public health supervision of food in this country, and any suggestion that the control of meat should be divorced from that exercised over other foodstuffs is strongly to be deprecated. All those at present associated with these duties fully appreciate the importance of this service to the public health. The British Veterinary Association has apparently ignored this important principle and in particular the general responsibility of the medical officer of health for the prevention and control of disease, including that transmissible by meat, in so far as local government administration is concerned. It is the unanimous view of the three bodies that this responsibility should continue.

"According to the Interdepartmental Committee on Meat Inspection, 'the great majority of meat inspectors will, no doubt, continue to be sanitary inspectors trained in meat inspection, and we regard this as a satisfactory arrangement.' The three bodies are confident that this is a satisfactory arrangement and see no justification for the British Veterinary Association's insistence that veterinary inspectors should be appointed to supervise and control this service.

"The British Veterinary Association further suggests that non-veterinary inspectors should function merely as detention officers. The Interdepartmental Committee on Meat Inspection considered this system of inspection, and concluded that such a system should not be adopted in England and Wales, a conclusion with which the three bodies agree."

RISING COST OF AMBULANCE SERVICE

MINISTRY SURVEYS TO BE UNDERTAKEN

The Ministry of Health has sent a circular (No. 7/54) to all local health authorities in England and Wales notifying them of advisory surveys to be made into all aspects of the ambulance service, because of the rising cost. A limited series of local surveys, covering both the authorities' organization of the ambulance service and the demands made on it by the hospitals, will be carried out by one of the Minister's ambulance advisers and one of his medical officers. Any conclusions reached, together with any recommendations, will be passed on to both the authorities and the hospitals concerned.

The rules on the use of local ambulance services are reprinted in an appendix to the circular.

HOSPITAL SERVICE REFORM IN NEW ZEALAND

MINISTERIAL DIRECTION

According to the April issue of *Forefront* (published by the office of the High Commissioner for New Zealand in London) widespread changes in the administration of New Zealand's hospital services are recommended by the Consultative Committee on Hospital Reform which recently reported to the Minister of Health for New Zealand.

In its report the committee points out that the present hospital system is a relic of the days when the country was sparsely populated, communications were slow and inadequate, and such hospital services as existed were the result of the activities of more or less isolated groups of people who took their own measures to provide for their own needs. The hospitals were largely financed by voluntary contributions and locally imposed rates. "From 1957 and onwards the State will be entirely responsible for financing the service," the report says.

Changes Recommended

The recommended changes include the reversal of the present policy of placing the responsibility of providing hospital services primarily on local boards. It is suggested that five regional boards, under the direction of the Minister of Health, be set up to co-ordinate and control the activities of the hospital boards in their particular regions, and that the Minister should appoint the members of the regional authorities. Other recommendations are the contraction of the Dominion's present hospital boards by amalgamation from 37 to 23; the immediate appointment of a special investigator to report on hospital costing to overcome "serious defects" in the present system of hospital board finance; the replacement by a commission, for

up to three years, of boards which exceed their approved estimates plus additional sums allowed them for emergencies; and payment of increased subsidies to private hospitals without applying a means test to either hospital or patient.

Ministerial Responsibility

Commenting that there is already little that a hospital board can do or spend without the sanction in some form of the Minister of Health, the report says that the frustration and confusion resulting from the present system could be obviated if the initial responsibility and authority rested with the Minister instead of with the board. This would leave the boards to carry out their task in accordance with a policy already determined from time to time by the Minister.

THE RECENTLY QUALIFIED PRACTITIONER WINCHESTER MEETING

On the initiative of Dr. Ronald Gibson, the member of the B.M.A. Council for the Southern, Dorset, and West Hants Branches of the Association, provisionally registered practitioners, fully registered practitioners holding junior house appointments, and those doing National Service were invited to an informal conference at the Royal Hampshire County Hospital, Winchester, on April 3. Dr. L. S. Potter, Assistant Secretary of the Association, attended the meeting, and an attempt was made to find out what were the particular problems and anxieties facing those recently qualified, and also how they could be brought under the Association's organization both locally and centrally.

Hospital Posts

A question which came to the fore at the meeting was that of the difficulty of filling appointments on the junior staffs of hospitals. Some hospital residents have to "double up," and many are overworked. Leisure is curtailed, and there is little or no time for reading or postgraduate study. There is, however, an apparent paradox in that provisionally registered practitioners are complaining of the difficulty of obtaining appointments, or of long waiting periods during which they are virtually unemployed and may suffer financial hardship. While more evidence is needed, the discussion at Winchester showed that both points had substance and that the period that has elapsed since the inauguration of the pre-registration year has disclosed new and serious problems.

Dr. Gibson reported that a number of Divisions in his constituency had decided to elect or appoint to their executive committees a hospital resident or a doctor on National Service. It was hoped this move would help to foster unity in the profession locally and assure young doctors that the Association's interest is by no means confined to those who are established in practice.

The Organization Committee of the B.M.A. is at present considering the question of the representation of the recently qualified practitioners.

B.M.A. ANNUAL MEETING—GLASGOW, JULY 1-9, 1954

TRAVEL RESERVATIONS

Members are reminded that accommodation on trains and on aircraft between London and Glasgow during July is booked at a very early date. It is advisable to make reservations as soon as possible. The programme of the Annual Meeting was published in the *Supplement* to the *British Medical Journal* of April 3 (p. 131).

GROUP PRACTICE LOANS

The Scottish Group Practice Loans Committee has discussed the procedure to be adopted in granting loans under the arrangements set out in Memorandum E.C.S. (M) 3A/1954 (*Supplement*, February 27, p. 56). In order to ensure that the limited funds available are allocated fairly, the committee will meet twice yearly to consider applications received during the previous six months, and it is proposed that the first meeting should be held in May.

Practitioners who wish their applications to be considered at this May meeting should make sure that their proposals are in the hands of the clerk to the executive council by April 30 at the latest. Applications after that date will be considered by the Committee at its second half-yearly meeting. Proposals submitted to the council should be as full as possible and accompanied by such detailed information as will enable the Committee to consider the application on its merits.

Practitioners are reminded that plans carried out since April, 1953, are eligible for assistance on an equal footing with plans to be carried out in the future and that plans carried out before April, 1953, will also be eligible if resources permit. Practitioners seeking a loan who have already carried out their plans should make application to the council as soon as possible.

Correspondence

Remuneration of Hospital Medical Staff

SIR,—The medical profession entered the National Health Service in July, 1948, after having been promised the remuneration proposed in the Spens Report, which specifically stated that its figures were in terms of 1939 money values and must be adjusted in accordance with the rise in the cost of living. Once the profession had agreed to serve it found that its official betterment factor was only 20% (half of which is used by the Government for its superannuation contribution, and is therefore not recoverable on leaving the Service. It is consequently nonsensical to include it in our betterment factor).

In 1952 Mr. Justice Danckwerts after a most painstaking inquiry into the facts of the situation awarded 100% betterment to the general practitioners, but up to now this has been refused to all those in the hospital service, from consultants down to housemen. The issue is quite clear. The profession was inveigled into the Health Service by a device which most closely resembles a confidence trick. The Government's honour is at stake, and we are waiting to see whether it is prepared to go on employing its doctors almost under false pretences for reasons of political expediency.

We have been waiting 18 months now, Sir, and, at a time when the average income of the workers in this country stands at 201% above the pre-war level, it behoves us to consider seriously what action we should take to remedy this gross injustice. If the Government continues adamant in its refusal to honour its pledged word, then we have no alternative but to demand as of right to put our case before an impartial arbitrator. If this is refused, then we cannot but make use of the powerful weapons at our disposal. This would be distasteful to professional people, but when elementary justice is denied there can unfortunately be no alternative. May I suggest that all your readers who feel as I do should write to their Members of Parliament and put the facts to them, asking at the same time that justice should not be denied to us?—I am, etc.,

Walton-on-Thames.

A. ARNAUD REID.

SIR,—A letter of mine in the *Supplement* of March (p. 66) has caused discussion. I would be glad to explain that I wrote because I felt that negotiators with the

Ministry on behalf of hospital staffs were getting less than justice (unless they have changed very much since I knew them). It was my intention to suggest reasons why their results must seem small and slow, as factually as anyone can who discusses the working of the British Constitution and quotes percentages from the public press. It was not my intention to set out my own views, an occupation which has long wearied me and others.

These views are, however, very like those of Dr. J. H. Middlemiss (*Supplement*, April 3, p. 143). I certainly do not wish to stabilize hospital staffs' pay at its present level. I differ, however, from some others in thinking that young consultants should get better betterment than established ones, except perhaps those close to retirement, who get no pension. I think that would get good young men on to hospital staffs just now, and help old ones going off. I know that means departing from Spens, and to that extent I do.—I am, etc.,

Hove.

W. A. BOURNE.

The Election of Committees

SIR,—In this committee-ridden world, in medical and many other spheres, we have the useful democratic principle that the same caucus of individuals should not serve and control too long. Four years should be the limit, although a few members may be usefully eligible for re-election. For the latter, the choice is often difficult, and the following suggestions may be useful.

(1) The number of attendances at committees is often recorded. I suggest that the number of speeches per attendance should also be before us. Apart from the chairman and people asked to speak by him, the highest scores in speeches should be ineligible for re-election. (2) I suggest also that sound-recordings of audible range be taken, and, if these do not extend beyond the lowest waistcoat button of the nearest ears in front, re-election should be ruled out. This would eliminate 60% of most large committees. The same should be applied rigorously to the chairman. (3) Apart from the above, it is perhaps too much to suggest that the lowest scorers in attendance and speeches should automatically be re-elected, but this possible advantage should be borne in mind. With such a reconstituted committee, the real business and work would move apace.

This question might well be examined by the Constitution Committee of the B.M.A.—I am, etc.,

London, W.1.

R. D. LAWRENCE.

Parking Facilities

SIR,—The question of parking facilities in the Harley-Wimpole Street area for those doctors who practise in that district is one of increasing difficulty. Regularly when visiting my consulting-room I am obliged to circle the block several times, and then, in all probability, I am forced to leave my car a considerable distance from my destination.

Were all the parking spaces being used by my colleagues the position would be less intolerable, but observation shows that Oxford Street shoppers are using these streets for their own convenience. Would it not be possible to devise some method, or to issue some form of priority badge, whereby the medical confraternity might be allowed some priority in their own district?—I am, etc.,

London, W.1

J. LYLE CAMERON.

Service Recruitment

SIR,—I have followed the recent correspondence on Service recruitment with some interest. Anyone with illusions that the modern Army M.O. can prescribe such treatment for his patients as he personally considers most suitable should consider the latest circular from G.H.Q. (Middle East Land Forces), which states: "The strictest economy will be exercised in the use of antibiotics, and especially in the use of aureomycin and chloromycetin, both of which are very expensive. Administrative officers will

supervise and control issues to medical centres, and O.C.s medical units will supervise and control the use of these drugs within these units."

The situation becomes ludicrous when an R.M.O. has literally to "wangle" a supply of wide-spectrum antibiotic to treat his own dysentery. Here, therefore, is one example of the red tape which is the main reason for my refusing to consider for one moment making the Army my career.—I am, etc.,

"HARVEY."

Whole-time Specialist Appointments

SIR,—It is strange to hear Dr. Horace Joules (*Supplement*, March 27, p. 129) accusing others of partiality. One is justified in asking him what evidence there is that the employment of part-time specialists is "increasingly expensive." Judged from a purely quantitative point of view a careless or doctrinaire regional hospital board could waste money on both part-time and whole-time specialists, either by oversessioning the former or underworking the latter. Examples of both types of wastage can be observed, but neither is susceptible to any accurate assessment. Judged from the more important viewpoint of quality of service (a matter scarcely mentioned by advocates of money-saving), surely the most important thing is to have contented doctors. If a majority of specialists prefer to be part-time (and of this there can be no possible doubt), then any reasonable regional hospital board should recognize that the patient and the service will gain if specialists are allowed to exercise that preference.

Dr. Joules says "chairmen of many committees often feel that advice given by consultants, particularly those in part-time practice, is not always impartial." I fancy that this may be an example of the wish being father to the thought, for Dr. Joules is evincing considerable partiality in the views which he expresses in his letter. It surely would be a peculiarly spunkless and worthless committee whose members did not show partiality in one direction or another. Or does Dr. Joules want all committees to consist of those who will support his particular line?

If in "some quarters" there is a demand that doctors should only hold advisory positions at regional and management level it is likely that this emanates from those who dislike hearing any viewpoint but their own. It is because the majority of specialists have no faith in such people that they will support your leading article (*Journal*, March 13, p. 634) as being both timely and reasonable. The independence and freedom of medicine will be preserved in many ways, not the least important of which is by protecting the profession from the introduction of a whole-time salaried service.—I am, etc.,

Radlett, Herts.

R. S. MURLEY.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). The only charge made is for postage of books. A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Davis, D. M.: Mechanisms of Urologic Disease. 1953.
- Davis, L. J., and Brown, A.: The Megaloblastic Anaemias. 1953.
- Freeman, P., and de Meillon, B.: Simuliidae of the Ethiopian Region. 1953.
- French's Index of Differential Diagnosis. Seventh edition edited by Arthur H. Douthwaite. 1954.
- Hochrein, M., and Hochrein-Schleicher, I.: Leistungssteigerung. 3 Auflage. 1953.
- Holt's Pediatrics. Twelfth edition by L. E. Holt, jun., and R. McIntosh. 1953.
- Ingals, R. G.: Tumors of the Orbit and Allied Pseudo Tumors. 1953.
- Jaensch, P. A.: Einführung in die Augenheilkunde. 2 Auflage. 1953.
- Johnston, J. A.: Nutritional Studies in Adolescent Girls and their Relation to Tuberculosis. 1953.
- Karpovich, P. V.: Physiology of Muscular Activity. Fourth edition. 1953.
- Kessler, H. H.: Rehabilitation of the Physically Handicapped. Revised edition. 1953.
- Koller, T., Held, E., and Neuweiler, W. (Editors): Lehrbuch der Geburtshilfe. 2 Auflage. 1953.
- Kyser, F. A.: Therapeutics in Internal Medicine. 1953.

Association Notices

COUNCIL OF THE B.M.A.

Election of 40 Members by Grouped Branches in the British Isles, of 2 Public Health Service Members, and of 1 Woman Member

The following have been elected unopposed for the session 1954-5:

North of England and Tees-side Branches:	J. C. Arthur, Gateshead.
East Yorkshire and Yorkshire Branches:	Weldon P. T. Watts, Newcastle-upon-Tyne.
North Lancashire and Westmorland Branch:	L. Dougal Callander, Doncaster.
Divisions in Cheshire—Birkenhead and Wirral; Chester; Crewe; Hyde; Macclesfield and East Cheshire; Mid-Cheshire; Stockport; Wallasey:	W. E. Dornan, Sheffield.
Lancashire Divisions of Merseyside Branch—Liverpool; St. Helens; Southport; Warrington. Isle of Man Branch:	Ian G. Innes, Hull.
Lancashire Divisions of South Lancashire and East Cheshire Branch—Ashton-under-Lyne; Bolton; Bury; Leigh; Manchester; Oldham; Rochdale; Salford; Wigan:	F. M. Rose, Preston.
Derbyshire, Leicester and Rutland, Lincolnshire and Nottinghamshire Branches:	D. R. Owen, Chester.
Midland Branch:	David Brown, Liverpool.
Staffordshire and Worcester and Hereford Branches:	J. I. Milne, Manchester.
Berks, Bucks and Oxford and Northamptonshire Branches:	
Cambs and Hunts, Norfolk and Suffolk Branches:	
Divisions of Metropolitan Counties Branch in Middlesex:	
Marylebone Division:	
City, South-West Essex, Stratford and Tower Hamlets Divisions:	J. Cottrell, Grimsby.
Hampstead, St. Pancras and Westminster and Holborn Divisions:	E. C. Dawson, Derby.
Chelsea and Fulham, Kensington and Hammersmith and Paddington Divisions:	D. S. Pracy, Atherstone.
Camberwell, Greenwich and Deptford, Lambeth and Southwark, Lewisham, Wandsworth and Woolwich Divisions:	A. V. Russell, Wolverhampton.
Bedfordshire, Essex and Hertfordshire Branches:	S. F. Logan Dahne, Caversham.
Surrey Branch:	Alexander Brown, Linton, Cambs.
Kent Branch:	D. F. Hutchinson, London, W.C.1.
Sussex Branch:	Angus Weston, Greenford.
Dorset and West Hants and Southern Branches:	R. Hale-White, London, N.W.1.
South-Western Branch:	J. Arthur Moody, Ilford.
South Wales and Monmouthshire Branch:	F. Gray, London, W.C.1.
Edinburgh and South-East of Scotland and Fife Branches:	H. H. D. Sutherland, London, W.10.

Glasgow and West of Scotland Branch (Glasgow Division):
Glasgow and West of Scotland Branch (County Divisions), Stirling and Border Counties Branches:
Northern Ireland Branch:

The following candidates have been nominated for the Groups in which there are contests:

Bath, Bristol and Somerset, Gloucestershire and Wiltshire Branches (two seats):
North Wales and Shropshire and Mid-Wales Branches (one seat):
Aberdeen, Dundee, Northern Counties of Scotland and Perth Branches (one seat):

Voting papers will be issued to the members of these Groups on April 24, 1954.

Public Health Service

The following have been elected unopposed:

H. D. Chalke (London, N.W.4), Kenneth Cowan (Chelmsford)

Woman Member

Annis Gillie, London, W.2, has been elected unopposed.

A. MACRAE,
Secretary.

Diary of Central Meetings

APRIL

21 Wed. G.M.S. Committee, 11.30 a.m.
21 Wed. Dain Fund Trustees, 1 p.m. (Date changed from April 15.)
21 Wed. Financial Advisory Committee, 2 p.m.
21 Wed. Registrars Group Executive Committee, 2 p.m. (Date changed from April 22.)
22 Thurs. G.M.S. Committee, 10.30 a.m.
22 Thurs. Public Relations Committee, 2 p.m.
27 Tues. Questionnaire Subcommittee, Constitution Committee, 10.30 a.m.
27 Tues. Estates Committee, 2 p.m.
27 Tues. Joint Formulary Committee, 2 p.m.
28 Wed. Finance Committee, 2 p.m.
30 Fri. Welsh Committee (at Raven Hotel, Shrewsbury), 2.15 p.m.

MAY

5 Wed. Office Committee, 11 a.m.
5 Wed. Arbitration Machinery Committee, 1 p.m.
5 Wed. Council, 2 p.m.
6 Thurs. Council, 10 a.m.

Branch and Division Meetings to be Held

CHELSEA AND FULHAM DIVISION.—At Fulham Town Hall, London, S.W., Friday, April 23, 9 p.m., annual general meeting.
CROYDON DIVISION.—At The Greyhound, Croydon, Thursday, April 22, 7.30 for 8 p.m., annual dinner and dance.
DARTFORD DIVISION.—At Nurses' Home, West Hill Hospital, Dartford, Wednesday, April 21, 8.45 p.m., meeting. Talk by Dr. Alan Stoddard: "The Place of Osteopathy in Medicine."
KESTEVEN DIVISION.—At Red Lion Hotel, High Street, Grantham, Thursday, April 22, 7.15 for 7.30 p.m., dinner. 9 p.m. address by Mr. Richard S. Handley: "Doctors among the Pirates and Privateers of the Spanish Main," illustrated by slides.
SCUNTHORPE DIVISION.—At Scunthorpe and District War Memorial Hospital, Sunday, April 25, clinical meeting.
TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tuesday, April 20, 8.30 p.m., annual general meeting.
WESTMINSTER AND HOLBORN DIVISION.—At Lamb Public House, 94, Lamb's Conduit Street, London, W.C., Thursday, April 22, 7 p.m., short business meeting; 7.30 p.m., dinner; 8.30 p.m., film, to be introduced by Dr. A. A. Bradley: "Chemotherapy of Tuberculosis." Discussion to be opened by Dr. A. J. Morland.

A DOCTOR LOOKS AT CRIME

BY

OLIVER GRAY, M.B.E., M.A., M.D., J.P.

It is natural that a doctor should regard the antisocial behaviour of his fellow mortals with an outlook somewhat different from others; when the layman talks of motive and guilt the doctor is thinking more in terms of human frailty, realizing that deficiencies in man's nature may be related to weaknesses of the body, and that the behaviour of the mind is compounded of infinitely subtle determinants not the least of which is the influence of heredity. His training teaches him to search deeply for the causes that bring disaster to the human frame, and his experience tells him that without knowledge of these causes he can do little to relieve suffering and bring back health. Seated on the magistrate's bench he is puzzled by the recurrent delinquent and the habitual criminal, and a little dubious of the facile explanations of what leads a juvenile repeatedly to commit larceny, while the older lag has a lengthy and shocking crime sheet. He is not alone in discovering that punitive measures, however expedient, provide little hope for reform in the individual, and prove of small value as a deterrent to others.

Nature and Nurture

The seed from which we all derive contains within its tiny bulk all those genetic factors that make Tom so different from Harry. It has been estimated that the infant at birth is approximately three million times the size of the unit of heritable life from which it originated. Yet within this infinitely small entity we know that the genetic factors exist which predetermine the functional behaviour as well as the nature of the individual. What is inherited is particulate and quantitative and is derived in equal proportions from the father and the mother—a fixed and durable reality. Upon this unalterable complexity, known as the genotype, environment proceeds to influence growth and development till we get what is called the phenotype, the consequence of the interaction between the genotype and his or her ecological surroundings.

In simpler language, there is the seed and the soil, the struggle between nature and nurture; and of these two enormous influences on human behaviour—and particularly in relation to crime—I believe that, of the two, heredity plays the greater part. There is a third mysterious factor which cannot, in any way, be measured or defined. A man

may be exceptionally endowed and fortune may have provided him with the most favourable upbringing, yet, when faced with a choice between good and evil, he may act nobly or basely, with courage or with cowardice. Because he was favourably gifted and conditioned to resist temptation, his offence might, under certain circumstances, constitute more of a moral lapse, because standards must be gauged by such matters.

The problem child, found in the progeny of the rich and poor, the surprise black sheep in families of exemplary behaviour, are reminders, and often very sad reminders, that nature is stronger than nurture. The delinquent, thus constitutionally disposed, may be saved by a constant favourable environment, but he is always liable to fall from grace if ill fortune deprives him of those who have hitherto given him help.

I may be wrong, for it is difficult to estimate these things scientifically, but I believe that much crime originates from genetically unstable personalities whose instability is not pathological, but who are not built to conform to the social restrictions which are accepted by convention or laid down by law. Some confirmation of this comes from the knowledge that similar crimes have been perpetrated by similar (uniovular) twins brought up in different countries. It is as well, therefore, to make what allowances we can, remembering that "to step aside is human."

Prevention and Cure

The greatest factors in the prevention of crime are wise upbringing and education, using the word education in its widest sense. It is here that the greatest hope lies. The precious relationship between parent and child is obviously beyond the scope of this short monograph, as, also, is education; but I am an advocate of teaching the youth of our country something about the law, partly for the reason that the fear of the consequences of breaking that law is the greatest deterrent that we possess. To the average citizen, being detected, and eventually convicted of an offence, is anticipated with dread. Even the most trivial matter, such as a fine for a minor motoring transgression, is a thing that Mr. Everyman would wish to avoid. The disgrace and humiliation which might result from the detection of a graver offence must, on many occasions, help the irresolute to resist temptation. It is, however, questionable whether the fear of punishment enters much into the calculation of those who embark, for the first time, on serious crime, and it is even more doubtful if it counts for much as a deterrent to the constant offender.

This is not to say that punishment is therefore illogical. It is quite logical to include it in any sentence so long as it is related to the nature of the crime. It may sometimes be quite irrational, as, for instance, to impose a fine for a homosexual offence. In cases of this sort the dread of exposure may by itself act as a deterrent, especially to those younger members of West End society to whom it appears to be a special temptation, and in whom the indulgence has not yet become a habit; for this reason, perhaps, it is best kept on the statute book as a recognized crime. This inexplicable urge is common, and, under certain conditions, may become a real problem. In little ships, particularly during hostilities, sodomy is the commonest major crime on the charge sheet.

To regard punishment as in any way retributive, in the retaliatory sense, is wrong. It is often, however, the only way of dealing with an awkward situation, and then it should be dealt out as a hint that worse is in store for any further transgressions—a threat that may end in the deprivation of liberty. The psychological effect of any threat of something sinister and ill-defined which has, as yet, not been experienced may prove effective in certain forms of wrongdoing. In practice, punishment is the only weapon that the magistrate holds as a sanction against those who flout the law, and perhaps this is its chief justification.

Responsibility

Frankly admitting that he had no experience or first-hand knowledge of penal procedure or of the psychological treatment of delinquency, Professor Guisberg, in his recent Clarke Hall Lecture,¹ attacked the present system of the assessment of responsibility as illogical. Much of what he infers about retributive measures and punishment in dealing with criminals is a scholarly if theoretical attack on present-day methods, some of which is justified; much of it is inconclusive.

It is rather easy to point out where justice as now administered fails in that quality of mercy which we would all desire. Such individualism as he advocates cannot be achieved for two reasons. First, personnel, money, and time are involved beyond our present means. Secondly, and this is more fundamental, it is impossible to measure the degree of temptation to which a delinquent has been exposed considering all the factors conditioned by his environment and his inherited weakness, together with the genuine effort he may have made, but in which he has failed, to put aside temptation.

I am thinking of a man of otherwise good behaviour who was on probation for interfering with boys. On the same afternoon of the day in which he had an interview in the morning with his probation officer he visited the house of the lad he had previously assaulted, induced his brother to come for a drive in his car, and committed a similar offence, to which he confessed.

I can think of no satisfactory way of dealing with a case such as this. He knew that what he was doing was wrong, he could easily calculate the obvious risk he was running, and he must have foreseen the disgrace and ostracism that would ensue as a result of his detection. The conclusion must be that his resistance had sunk so low that he was past all hope of reform. Yet the man was a good worker with a good record in all other respects. In law he must be held responsible, but the assessment of his culpability is difficult, and there is at present no satisfactory way of dealing with him.

I am also thinking, by way of contrast, of an unctuous and plausible type who is constantly coming up before the bench for arrears of payment of maintenance, the type who lives on public assistance because he will not demean himself to menial employment. The threat of imprisonment in such cases has a most salutary effect.

¹Guisberg, M., "The Nature of Responsibility," Nineteenth Clarke Hall Lecture, 1953.

The M'Naghten Rules

The M'Naghten rules are seldom invoked in a magistrate's court. They come into action in capital offences when the mental state of the accused is in question. Indeed, the bench has no rules restricting it in coming to a conclusion in this matter, and must decide each case on the facts laid before it, together with the medical opinion put forward in a plea of not guilty, or when mental instability is proffered by way of mitigation after conviction. At present, these rules are thought by many to be out of date, but it is noteworthy that they have survived for over a hundred years in this country where they originated. They are used in the United States to this day, where certain individual states modify them or apply them differently. These rules require that the defendant must show "that he was labouring under such a defect of reason from disease of the mind as not to know the nature and quality of his act, or, if he did know it, that he did not know he was doing what was wrong."

In law the question of responsibility hinges very largely on what was decided in the famous M'Naghten case and what has been said since. Reading these classic utterances may help a magistrate in the many cases in which he must be ready to reach a decision on responsibility and culpability. In the great majority of individuals the inherent tendency towards crime is not pathological—the temperament varies greatly, some people being docile and amenable, while others are passionate, volatile, temperamental, or what you will. There is no borderline between the "normal" and the type whose mental state is in doubt, and one medical opinion is as good as another. The inherited morbid predisposition varies, and environment acts upon the latent tendencies for better or for worse.

Certifiable lunacy as a cause of crime is usually traceable to inborn defect, the exceptions being the general paralysis of the insane due to syphilis, alcoholism when it directly impairs the brain, and less common conditions such as encephalitis. In psychopaths, in whom the predisposition is great, it is clear, in crimes related to the mental state, that criminal responsibility is proportionately less.

Culpability

Decisions as to responsibility should not often present difficulty. The mere fact that the accused is unstable may have, and often has, little to do with the question of irresponsibility. It is extremely important that this should always be borne in mind, and it may assist to ask oneself in each case: How much did the accused profit by his action? What did he do to avoid detection? Are his replies to questions simple or elaborate? In crimes that can be decided in a magistrate's court there cannot be many cases in which the temptation was quite irresistible on account of the mental condition of the offender, and it is inconsistent to accept a plea of not guilty on this account. It is far otherwise when it comes to an assessment of the degree of culpability. Every effort should be made to collect and weigh all the evidence before deciding what should be done after guilt has been established.

The further happenings in court are not quite within the scope of this article. The protection of society must be the first consideration, and the redemption of the offender, if this be possible, is the best way of achieving this end. In suitable cases the probation officers can bring this about, and it is refreshing to find how many men and women they once more set upon the right road.

If I have made it appear that because heredity plays such an important part it is therefore more influential than anything else, I must correct this impression. Environment is almost as great, but greater than either is character, that spiritual attribute that we create for ourselves, one ingredient of which is conscience. And every time we fail in this respect we stoop to kiss the devil's feet.

MEDICAL PRACTICES COMMITTEE

CLASSIFICATION OF AREAS

The Committee has reconsidered the classification of areas for England and Wales as a result of further reports furnished by executive councils. These classifications are up to and including April 1, 1954, and supersede those previously published. They come into force forthwith. A doctor who is proposing to enter practice in a particular district should apply for up-to-date information from the executive council for the district in question before taking positive steps to secure surgery and waiting-room accommodation.

The numerals I, II, and III denote Designated, Intermediate, and Restricted areas respectively. In those Designated areas marked with an asterisk, the admission of one or two doctors may result in reclassification of the area.

In urban areas the designation does not necessarily apply to any part where the population density is lower than in the area generally—for example, the rural fringe of many urban areas. In rural areas the designation applies to the centres of population only.

ENGLAND: COUNTIES

Bedfordshire.—I: Luton. II: Barford, Eaton Socon, Sandy and Potton; Barton and Shillington; Bedford; Biggleswade; Dunstable; Harrold; Sharnbrook, Riseley and Turvey; Leighton Buzzard; Shefford and Arlesey; Woburn, Toddington, Ampthill and Cranfield. III: Nil.

Berkshire.—I: Nil. II: Borough of Maidenhead; Borough and Rural Districts of Windsor; Wokingham; Urban and Rural Districts of Abingdon; Newbury; Wallingford; Wantage (except Brightwalton); Rural Districts of Bradfield; Cookham; Easthampstead; Faringdon. III: Rural District of Hungerford; Brightwalton (Wantage Rural District).

Buckinghamshire.—I: *Slough and Cippenham. II: Aylesham; Aylesbury; Blechley; Buckingham; Burnham and Taplow; Chalfont St. Giles, Chalfont St. Peter, and Gerrards Cross; Chesham; Colnbrook; Datchet; Eton; Flackwell Heath; High Wycombe; Iwer; New Bradwell and Wolverton; Newport Pagnell; Olney; Princes Risborough and Hampden; Stony Stratford; Wendover; Whitchurch and Cublington; Wing; Winslow; Woburn Sands; Wraybury. III: Beaconsfield and Seer Green; Bourne End; Great Missenden and Prestwood; Haddenham; Hambleton; Hanslope; Horsley Green; Lane End; Long Crendon; Marlow; Steeple Claydon; Stokenchurch; Waddesdon.

Cambridgeshire.—I: Nil. II: Whole area (except Isleham). III: Isleham.

Cheshire.—I: Chester (sub-districts of *Ellesmere and Whitby); Crewe and Nantwich (*Crewe and Haslington); Runcorn (*Run-corn); Wirral (*New Ferry and Bebington). II: Altrincham (Altrincham, Bowdon, Broadheath and West Timperley, Hale, Timperley); Bredbury and Romiley (Bredbury, Romiley and Timperley); Hazel Grove and Bramhall, Marple and Marple Bridge, Disley and High Lane); Cheadle and Gatley (Cheadle and Gatley, Cheadle Hulme); Chester (Hoole and Newton, Little Sutton, Tarporley); Congleton (Congleton); Crewe and Nantwich (Nantwich, Sandbach, Alsager); Hoylake and West Kirby (Hoylake and Meols, West Kirby and Caldys, Heswall, Irby and Pensby); Hyde, Dukinfield, and Stalybridge (Hyde, Dukinfield, Stalybridge); Knutsford and Wilmslow (Knutsford, Lymm, Styal); Macclesfield (Macclesfield, Poynton); Mid-Cheshire (Northwich and Weaverham with Cuddington, Sandiway and Rudheath, Winsford, Middlewich); Runcorn (Frodsham, Stockton Heath); Sale (Sale); Wirral (Bromborough and Eastham, Neston, Parkgate and Willaston). III: Chester (Upton-by-Chester and Bache, Farndon, Malpas, Tattenhall); Crewe and Nantwich (Audlem, Wrenbury, Holmes Chapel, Shavington); Nantwich (Audlem, Wrenbury, Holmes Chapel, Shavington); Hoylake and West Kirby (Greasy); Hyde, Dukinfield, and Stalybridge (Hollingworth and Mottram); Knutsford and Wilmslow (Wilmslow and Handforth, Alderley Edge, Chelford, Mobberley, Warford, and Great Warford); Macclesfield (Bollington); Mid-Cheshire (Great Budworth, Davenham); Runcorn (Helsby, Stretton, Grappenhall).

Cornwall.—I: Nil. II: Albaston, Callington and Calstock; Bodmin; Bude; Bugle and St. Dennis; Camborne; Carn Brea; Falmouth; Helston; Launceston; Liskeard; Newquay; Penryn; Penzance; Perranporth; Porthleven; Port Isaac; Redruth; St. Agnes; St. Austell; St. Blazey; St. Columb; St. Ives and Carbis Bay; St. Just; Saltash; Truro. III: Boscawen; Camelford; Cawsand; Chacewater; Constantine; Constantine Bay; Dela-

*For meaning of asterisk, see preamble.

bole; Downderry; Fowey; Grampound; Hayle; The Lizard; Looe; Lostwithiel; Marazion; Mevagissey; Millbrook; Mullion; Padstow; Perranarworthal; Pensilva; Polperro; Polyphant; Praze; Probus; Rock; Ruanhighlanes; St. Germans; St. Keverne; St. Mawes; St. Stephens; Tintagel; Torpoint; Townshend; Tywardreath; Upton Cross; Wadebridge; Widemouth Bay.

Cumberland.—I: *Cockermouth; *Whitehaven. II: Aspatria; Brampton; Cleator Moor; Egremont; Keswick; Longtown; Maryport; Millom; Penrith; Silloth; Wigton; Workington. III: Alston; Bootle; Caldbeck; Dalston; Distington; Gosforth; Harrington; High Hesket; Kirkbride; Kirkoswald; Ravensglass; Rowrah; Wetheral.

Derbyshire.—I: Borough of *Chesterfield. Urban Districts of *Long Eaton; *Swadlincote. Rural Districts of *Blackwell; Chesterfield. II: Boroughs of Buxton; Glossop; Ilkeston. Urban Districts of Alfreton; Bolsover; Clay Cross; Dronfield; Heanor; New Mills; Ripley; Staveley; Wirksworth. Rural Districts of Chapel-en-le-Frith; Clowne; Repton; Shardlow. Urban and Rural Districts of Ashbourne; Bakewell; Belper. III: Urban District of Whaley Bridge.

Devon and Exeter.—I: Nil. II: County Borough of Exeter. Boroughs of Barnstaple; Bideford; Dartmouth; Honiton; Okehampton; South Molton; Tiverton; Torquay. Urban Districts of Ashburton and Buckfastleigh; Axminster; Brixham; Crediton; Dawlish; Exmouth; Ilfracombe with Combe Martin and Woolacombe; Kingsbridge; Newton Abbot with Kingsteignton; Northam with Appledore; Paignton; Tavistock. Rural District of Plympton St. Mary (except Newton Ferrers and Yealmpton); Kingskerswell and Ipplepen (Newton Abbot Rural District); Topsham (St. Thomas' Rural District); Cullompton (Tiverton Rural District). III: Boroughs of Great Torrington; Totnes. Urban Districts of Budleigh Salterton; Holsworthy; Lynton with Lymouth; Ottery St. Mary; Salcombe; Seaton with Colyton; Sidmouth with Sidbury; Teignmouth with Shaldon and Bishops-teignton. Rural Districts of Axminster; Barnstaple; Bideford; Crediton; Holsworthy; Kingsbridge; Newton Abbot (except Kingskerswell and Ipplepen); Okehampton; St. Thomas (except Topsham); South Molton; Tavistock; Tiverton (except Cullompton); Torrington; Totnes; Newton Ferrers and Yealmpton (Plympton St. Mary Rural District).

Dorset.—I: Nil. II: Bournemouth; Blandford and district; Bridport and district; Dorchester and district; Poole with Branksome, Canford Cliffs, Parkstone and Sandbanks; Portland; Shaftesbury and district; Sherborne and district; Sturminster Newton, Marnhull and district; Swanage and district; Wareham and district; Weymouth with Broadway, Chickerell, Preston and Wyke Regis; Wimborne and district. III: Abbotsbury; Bere Regis; Broadstone and district; Cerne Abbas and district; Charmouth, Lyme Regis and district; Childe Okeford and district; Corfe Castle and district; Cranborne and district; Evershot and district; Ferndown and West Moors; Gillingham, Bournemouth and district; Glanvilles Wootton, Buckland Newton and district; Handley and district; Maiden Newton and district; Milton Abbas and Winterborne Stickland; Puddletown and district; Stalbridge and district; Verwood and district; Winfrith, Wool and district; Yetminster and district.

Durham.—I: *Billingham Urban District; *Bishop Auckland Urban District (except Bishop Auckland Town); *Bishop Auckland Town; *Blaydon Urban District; *Brandon and Byshottles Urban District; *Chester-le-Street Rural District; *Easington Rural District; *Felling Urban District; *Hebburn Urban District; *Hetton Urban District; *Houghton-le-Spring Urban District; *Seaham Urban District; *Sedgefield Rural District (except Sedgefield village and Stillington); *Spennymoor Urban District; *Stanley Urban District; *Dunston. II: Barnard Castle Urban District; Boldon Urban District; Chester-le-Street Urban District; Consett Urban District; Crook and Willington Urban District; Darlington Rural District; Durham Municipal Borough; Durham Rural District; Evenwood, Cockfield and Butterknowle (Barnard Castle Rural District); Hartlepool Municipal Borough; Jarrow Municipal Borough; Ryton Urban District; Shildon Urban District; Stockton-on-Tees Municipal Borough with Norton-on-Tees; Sunderland Rural District; Tow Law Urban District; Washington Urban District; Whickham. III: Gainford (Barnard Castle Rural District); Lanchester Rural District; Middleton-in-Teesdale (Barnard Castle Rural District); Sedgefield village (Sedgefield Rural District); Stillington (Sedgefield Rural District); Stockton-on-Tees Rural District; Weardale Rural District.

Essex.—I: Municipal Boroughs of Barking; Dagenham; *Harwich; *Ilford; Romford (excluding Harold Hill Estate). Urban Districts of *Billericay (excluding Basildon New Town Development Area); *Braintree and Bocking; *Canvey Island; *Hornchurch; *Basildon New Town Development Area (Billericay

Urban District). II: Municipal Boroughs of Chelmsford; Chingford; Colchester; Leyton; Maldon; Saffron Walden; Walthamstow; Wanstead and Woodford. Urban Districts of Benfleet; Brentwood; Burnham-on-Crouch; Chigwell; Clacton-on-Sea; Epping; Halstead; Rayleigh; Thurrock (except Aveley Housing Estate); Waltham Holy Cross; Witham. Rural District of Chelmsford; Epping (excluding Harlow New Town Development Area); Great Dunmow; Halstead; Lexden and Winstree; Ongar; Rochford; Saffron Walden; Tendring (except Great Bentley, St. Osyth and Thorpe-le-Soken); Aveley Housing Estate (Thurrock Urban District); Harlow New Town Development Area (Epping Rural District); Harold Hill Housing Estate (Romford Municipal Borough). III: Urban Districts of Brightlingsea; Frinton and Walton; West Mersea; Wivenhoe. Rural Districts of Braintree; Maldon; Great Bentley, St. Osyth, Thorpe-le-Soken (Tendring Rural District).

Gloucester County and City.—I: *Dursley, Uley and Wootton-under-Edge. II: Almondsbury; Olveston and Patchway; Bishops Cleeve, Cleeve Hill and Winchcomb; Bourton-on-the-Water and Stow-on-the-Wold; Brockworth, Churchdown and Hucclecote; Charlton Kings, Cheltenham and Prestbury; Chipping Sodbury; Cinderford and Drybrook; Cirencester and Rendcomb; Coleford and Parkend and Yorkley; Filton, Little Stoke and Stoke Gifford; Frampton Cotterell, Hambrook and Stapleton; Gloucester; Hanham, Kingswood and Warmley; Lydbrook and Ruardean; Lydney; Mangotsfield; St. Briavels; Stonehouse; Stroud; Tetbury; Tewkesbury; Tidenham. III: Berkeley; Bitton, Oldland and Oldland Common; Blakeney; Blockley and Moreton-in-Marsh; Bream; Brimscombe (Burleigh) and Minchinhampton; Chalford and Eastcombe; Chipping Campden and Mickleton; Corse and Newent; Cranham and Painswick; Fairford and Lechlade; Frampton-on-Severn; Marshfield and Wick; Mitcheldean; Nailsworth; Newnham and Westbury-on-Severn; Northleach; Pilning; Thornbury.

Hampshire.—I: Municipal Borough of *Aldershot. II: Municipal Boroughs of Christchurch; Gosport; Eastleigh; Lymington. Municipal Boroughs and Rural Districts of Andover; Basingstoke; Romsey. Municipal Borough and Northern half of Rural District Winchester; Urban Districts of Fareham; Farnborough; Havant and Waterloo (except Leigh Park Housing Estate). Rural Districts of Droxford; Kingsclere and Whitechurch; New Forest; Ringwood and Fordingbridge; Winchester (Southern half). Urban and Rural Districts of Alton; Petersfield; Hartley Wintney Rural District and Fleet Urban District. III: Leigh Park Housing Estate (Havant and Waterloo) Urban District; Rural District of Stockbridge.

Herefordshire.—I: Nil. II: Bromyard and district; Hereford and district; Ledbury and Malvern (except Cradley and Colwall); Leominster and district; Ross and district; Vowchurch (with Grosmont which is situated in Monmouthshire). III: Cradley and Colwall; Eardisley; Kington and district; Leintwardine (and South Shropshire); Pembridge; Weobley.

Hertfordshire.—I: Urban Districts of *Cheshunt and Goff's Oak. II: City of St. Albans; Boroughs of Hemel Hempstead; Hertford; Watford. Urban Districts of Baldock; Barnet and East Barnet; Berkhamsted; Bishops Stortford; Bushey; Chorley Wood; Harpenden; Hitchin; Hoddesdon; Letchworth; Rickmansworth; Royston; Sawbridgeworth; Stevenage; Tring; Ware; Welwyn Garden City. Rural Districts of Braughing; Elstree and Boreham Wood; Hatfield; Hemel Hempstead; Hertford; Hitchin; St. Albans; Watford. District of Waltham Cross. III: Rural Districts of Ware; Welwyn.

Huntingdonshire.—I: Nil. II: Districts of Huntingdon; Kimbolton; Ramsey; St. Ives; St. Neots; Warboys; Yaxley. III: Districts of Alconbury Weston; Buckden; Somersham.

Isle of Ely.—I: *March; *Whittlesey. II: Chatteris; Doddington; Ely; Haddenham; Littleport; Parsons Drove; Sutton; Wisbech. III: Manea; Thorney.

Isle of Wight.—I: Nil. II: Cowes district; Newport district; Ryde district (including Seaview and St. Helens); Sandown and Shanklin district; Ventnor district. III: Rural District Totland, Freshwater and Yarmouth; Bembridge; Niton; Shorwell; Limerstone.

Isles of Scilly.—I: Nil. II: Nil. III: Whole area.

Kent and Canterbury.—I: Boroughs of *Bexley; *Dartford; Erith; Gravesend; *Strood (North of River Medway). Urban Districts of *Crayford; *Northfleet. II: Boroughs of Beckenham; Bromley; Canterbury; Chatham; Deal; Dover; Faversham; Folkestone; Gillingham; Hythe; Maidstone; Margate; Ramsgate; Rochester (South of River Medway); Tenterden; Royal Borough of Tunbridge Wells. Urban Districts of Ashford; Broadstairs and St. Peters; Chislehurst and Sidcup; Herne Bay; Orpington; Penge; Sittingbourne and Milton Regis; Southborough; Swanscombe; Tonbridge; Whitstable. Rural Districts of Dartford; Estry (except Estry and Minster); Hollingbourne;

Maidstone; Malling (except East Peckham); Strood (except Halling); Swale; Tonbridge (except Brencley, Langton and Pembury). District of Otford and Shoreham (Sevenoaks Rural District); Isle of Sheppey. III: Boroughs of Lydd; New Romney; Sandwich. Urban Districts of Sevenoaks. Rural Districts of Ashford East; Ashford West; Bridge Blean; Cranbrook; Dover; Elham; Romney Marsh. Rural Districts of Sevenoaks (except Otford and Shoreham); Tenterden. Districts of Brencley (Tonbridge Rural District); Estry and Minster (Estry Rural District); East Peckham (Malling Rural District); Halling (Strood Rural District); Langton (Tonbridge Rural District); Pembury (Tonbridge Rural District).

Lancashire.—I: Districts of *Ashton-under-Lyne; *Ashton-in-Makerfield; *Bacup; *Barrowford; *Chadderton; *Chorley; *Denton; *Droylesden; *Farnworth and Kearsley; *Haydock; *Hindley; *Leigh; *Litherland; *Middleton; *Prescot; *Radcliffe; *Swinton and Pendlebury; *Westhoughton; *Whitworth; *Widnes; *Worsley; *Wigan Rural District. II: Districts of Abram; Accrington; Adlington; Aspall; Atherton; Billinge and Winstanley; Brierfield; Carnforth; Clayton-le-Moor; Clitheroe; Colne; Crompton; Crosby; Dalton-in-Furness; Darwen; Eccles; Failsworth; Fleetwood; Formby; Fulwood; Golborne; Great Harwood; Haslingden; Heywood; Horwich; Huyton with Roby; Ince-in-Makerfield; Irlam; Kirkham; Lancaster; Leyland; Littleborough; Lees; Little Lever; Longridge; Lytham St. Anne; Milnrow; Morecambe and Heysham; Mossley; Nelson; Newton-le-Willows; Ormskirk; Orrell; Oswaldtwistle; Padiham; Poulton-le-Fylde; Prestwich; Ramabottom; Rawtenstall; Rishton; Royton; Skelmersdale; Standish with Langtree; Stretford; Thornton Cleverleys; Toddlington; Turton; Tyldesley; Ulverston; Upholland; Urmston; Walton-le-Dale; Wardle; Whitefield; Withnell; Rural Districts of Blackburn; Burnley; Chorley; Garstang; Lancaster; Preston; Warrington; West Lanes; Whiston. III: Districts of Blackrod; Church; Grange; Preesall; Rainford. Rural Districts of Clitheroe; Fylde; Lunesdale; Ulverston.

Leicestershire and Rutland.—I: Districts of *Ashby-de-la-Zouch; *Loughborough Borough. II: Districts of Coalville; Hinckley; Leicester (surrounding places); Loughborough Rural District; Lutterworth (except Peatling Magna); Market Harborough (except Hallaton); Melton Mowbray (except Batters Market Overton and Uppingham). Rutland (except Mowbray); Hallaton (Market Harborough); Market Overton (Rutland); Peatling Magna (Lutterworth); Somerby (Melton Mowbray); Uppingham (Rutland).

Lincolnshire (Holland).—I: Nil. II: Whole area. III: Nil. Lincolnshire (Kesteven).—I: Districts of *Grantham; *Sleaford. II: Districts of Bourne; Market Deeping; North Hykeham; Sleaford. III: Districts of Ancaster and Caythorpe; Bassingham; Billinghay; Castle Bytham; Colsterworth; Corby; Heckington; Heighington; Horbling and Billingborough; Long Bonnington and Bottesford; Martin; Metheringham; Navenby; Rippingale; Ropsley; Ruskington and Leasingham; Woolsorpe-by-Belvoir.

Lincolnshire (Lindsey).—I: Brigg area (*Barton-upon-Humber Urban District; *Brigg Urban District; *Broughton, Granford Brigg Rural District). II: Brigg area (Granford Brigg Rural District, except Broughton; Scunthorpe Borough); Gainsborough area (Gainsborough Urban District and Rural District, except Willingham-by-Stow and Newton-on-Trent); Grimsby area (Cleethorpes Borough; Grimsby Rural District); Horncastle area (Horncastle Urban District and Rural District, except Tetford); Isle of Axholme area (Isle of Axholme Rural District); Louth North; Spilsby area (Spilsby Rural District, except Thoresby Alford Urban District; Skegness Urban District; Welton area (Welton Rural District, except Bardney). III: Caistor Rural District (Caistor Rural District; Market Rasen Urban District); Gainsborough Rural District; Willingham-by-Stow; Newton-on-Trent; castle Rural District); Louth area (Mablethorpe and Sutton Urban District; Thoresby North, Louth Rural District); Spilsby area (Hogsthorpe, Spilsby Rural District); Welton area (Bardney, Welton Rural District).

London.—I: Boroughs of Greenwich (Wards of *St. Nicholas, North-West, West, and South); Hackney (Wards of *Kingsmead and *Wick); Lambeth (Wards of *Prince's and Central, North-West, and North-East); Poplar (Wards of *Bronley (Ward of *Clapham North); Southwark; Wandsworth St. Mary's, River, St. George's and Herbert, *Central and St. Nicholas, and Abbey Wood). II: Boroughs of Battersea; Bermondsey; Bethnal Green; Camberwell; City of London and Shoreditch; Deptford; Finsbury; Fulham; Greenwich (except

Wards of St. Nicholas, North-West, West and South); Hackney (except Wards of Chatham, Kingsmead and Wick); Hammer-smith; Hampstead (except Wards of Town, Central); Holborn; Islington; Lambeth (except Wards of Prince's and Oval, Lansdowne and Springfield); Lewisham; Paddington, North and South; Poplar (except Wards of Bromley Central, North-West, and North-East); St. Marylebone North; St. Pancras; Stepney; Stoke Newington; Wandsworth (except Ward of Clapham Stoke Newington); Westminster (Wards of Covent Garden, Charing Cross and Strand; St. John's, Victoria); Woolwich (except Wards of Dockyard, St. Mary's, River, St. George's and Herbert, Central and St. Nicholas, and Abbey Wood). III: Chelsea; Hampstead (Wards of Town, Central); Kensington, North and South; St. Marylebone, South; Westminster (except Wards of Covent Garden, Charing Cross and Strand, St. John's, Victoria).

Middlesex.—I: Boroughs of Brentford and Chiswick (combined Wards of *Brentford East, Brentford West, Chiswick Park, and Grove Park); Hendon (*Burnt Oak Ward); *Southall; Tottenham (*Coleraine Ward, *Park Ward, *Stamford Hill Ward); *Twickenham; Willesden (*Carlton Ward, *Stonebridge Ward); Wood Green (*Town Hall Ward). Urban Districts of Enfield (combined Wards of *Bush Hill Park, Enfield Wash, Ordnance and Ponders End); Harrow (*Harrow Weald Ward, *Roxeth and Roxbourne Wards); Hayes and Harlington (*East Ward, *West Ward); Staines (*Staines Ward); Yiewsley and West Drayton (*Harmondsworth Ward). II: Boroughs of Acton; Brentford and Chiswick (Brentford Central, Gunnersbury, and Turnham Green Wards); Ealing; Edmonton; Finchley (Glebe, Moss Hall, St. Pauls, Tudor, and West Hendon Wards); Heston and Isleworth; Hornsey; Southgate; Tottenham (Bruce Grove and Central, Chestnuts, Green Lanes, High Cross and Stoneleigh, Seven Sisters, Town Hall, West Green, and White Hart Lane Wards); Wembley; Willesden (Brentwater, Brondesbury Park, Church End, Cricklewood, Gladstone, Harlesden, Kensal Rise, Kilburn, Manor, Mapesbury, Roundwood and Willesden Green Wards); Wood Green (Alexandra-Bowes and Noel Park Wards). Urban Districts of Enfield (Cambridge Road, Chase, Green Street, Town, West and Willow Wards); Feltham; Friern Barnet; Harrow (Belmont, Harrow-on-the-Hill, Headstone, Kenton, Pinner North and Hatch End, Pinner South, Queensbury, Stanmore North, Stanmore South, Wealdstone North, Wealdstone South and West Harrow Wards); Hayes and Harlington (South Ward); Potters Bar; Ruislip (Northwood); Staines (Ashford, Laleham and Stanwell Wards); Sunbury-on-Thames; Uxbridge; Yiewsley and West Drayton (West Drayton and Yiewsley Wards). III: Boroughs of Brentford and Chiswick (Bedford Park and Old Chiswick Wards); Finchley (Manor, St. Mary's, and The Bishop's Wards); Hendon (Edgware, Garden Suburb and Golders Green Wards); Hayes and Harlington (Harlington Ward).

Norfolk.—I: Nil. II: Boroughs of King's Lynn; Thetford; Urban Districts of Cromer; Diss; Downham Market; North Walsham; Sheringham; Swaffham and Swaffham Rural District; Wymondham. Rural Districts of Blofield and Flegg; Depwade; Docking; Downham; Erpingham; Forehoe and Henstead; Loddon; Marshland; Mildford and Launditch and East Dere-don; Norwich; St. Faiths and Aylsham; Smallburgh; ham Urban District; Walsingham; Wayland. III: Urban Districts of New Hunstan-ton; Wells-next-Sea. Rural District of Freebridge Lynn.

Northamptonshire.—I: Districts of *Burton Latimer and Finedon; *Corby; *Irthlingborough; Kettering; *Welling-borough. II: Districts of Brackley; Daventry; Desborough and Rothwell; Oundle; Paulerspury; Rushden and Higham Ferrers; Thrapston; Towcester. III: Districts of Blisworth and Roade; Brixworth; Bugbrooke and Kissingbury; Byfield and Woodford Halse; Cold Ashby; Crick and West Haddon; Earls Barton; Flore; Guilsborough; Islip; Kingscliffe; Long Buckby; Moulton; Raunds; Weedon; Welford; Wollaston; Yardley Hastings.

Northumberland.—I: Ashington (including Newbiggin-by-the-Sea); *Hollywell and *Shiremoor (Seaton Valley district). II: Sea; *Hollywell and *Shiremoor (Seaton Valley district); Alnwick (including Alnwick); Bedlingtonshire; Berwick-on-Tweed and Norham and Islandshires Blyth; Castleward Rural District; Gosforth; Haltwhistle; Hexham; Longbenton; Morpeth; New-prudhoe; Seaton Valley (except Hollywell and Shiremoor); burn; Walsend; Whitley Bay. III: Belford, Bellingham; Glendale; Rothbury.

Nottingham County and City.—I: Nottingham City (District No. 2, District No. 4). Borough of *Workop. Districts of *Carlton and Netherfield; *Eastwood; *Stapleford; *Sutton-in-Ashfield; *Warsop. II: Nottingham City (District No. 1, Ashfield; District No. 3, District No. 5). Boroughs of Mansfield; Newark; Retford. Districts of Arnold; Beeston; Bingham; Blidworth and Rainworth; Carlton-in-Lindrick; Costock and Ruddington; Edwinstowe and Ollerton; Harworth; Hucknall; Kimberley;

Kirkby-in-Ashfield; Mansfield Woodhouse; Selston; Southwell; Sutton Bonington; West Bridgford. III: Districts of Carlton-on-Trent; Colston Bassett and Keyworth; Gringley-on-the-Hill; Lowdham; Misterton; North Clifton; North Collingham; North Leverton; Tuxford.

Oxford County and City.—I: Nil. II: Banbury and district; Bicester; Burford and district; Charlbury and district; Chipping Norton and district; Deddington and district; Eynsham and district; Henley-on-Thames and district; Oxford (West of the River Cherwell); Oxford (East of the River Cherwell); Wheatley; Witney; Woodstock. III: Bampton and district; Chinnor; Clifton Hampden; Dorchester-on-Thames; Filkins district; Goring-on-Thames and district; Islip; Kidlington; Little Milton; Shipton-under-Wychwood; Thame; Watlington.

Shropshire.—I: *Wellington Town. II: Bridgnorth; Chir-bury; Cleobury Mortimer; Ellesmere; Ludlow; Market Dray-ton; Newport; Oswestry; Shifnal; Shrewsbury; Wellington Rural District; Wenlock; Whitchurch. III: Cleobury North; Clun.

Soke of Peterborough.—I: Nil. II: Whole area. III: Nil. Somerset.—I: Nil. II: Boroughs of Chard; Glastonbury and Street; Taunton; Weston-super-Mare; Yeovil. Urban Districts of Bridgwater; Burnham-on-Sea; Clevedon; Crekerne; Frome; Keynsham; Midsomer Norton; Portishead; Radstock; Shepton Mallet; Wellington; Wells. Rural Districts of Axbridge; Bath-avon; Bridgwater; Chard; Clutton; Frome; Long Ashton; Taunton; Wellington; Wincanton; Yeovil. III: Urban Districts of Minehead; Watchet. Rural Districts of Dulverton; Lang-port; Shepton Mallet; Williton.

Staffordshire.—I: City of *Lichfield. Boroughs of Bilton; Rowley Regis; *Stafford; Tipton; Wednesbury. Urban Districts of *Amblecote; *Brierley Hill; *Brownhills; *Darlaston; *Kiddsgrove; *Sedgley. II: Boroughs of Newcastle; Tamworth. Urban Districts of Aldridge; Biddulph; Cannock; Coseley; Leek; Rugeley; Stone; Tettenhall; Uttoxeter; Wednes-field; Willenhall. Rural Districts of Cannock; Cheadle (except Waterhouses); Lichfield (except Armitage); Newcastle (except Ashley, Market Drayton and Betley); Seisdon; Stafford (except Great Haywood); Stone (except Sandon); Tutbury. III: Rural Districts of Leek; Uttoxeter. Districts of Armitage (Lichfield Rural District); Ashley, Market Drayton (Newcastle Rural Dis-trict); Betley (Newcastle Rural District); Great Haywood (Stafford Rural District); Sandon (Stone Rural District); Waterhouses (Cheadle Rural District).

Suffolk (East).—I: Nil. II: Blyth district (excluding Earl Soham, Peasenhall, and Yoxford); Deben district (excluding Alderton and Orford); Gipping district (excluding Debenham); Hartismere district (excluding Fressingfield, Hoxne and Strad-broke); Lotherland district (excluding Kessingland); Samford district; Wainford district. III: Blyth district (Earl Soham, Peasenhall; Yoxford); Deben district (Alderton, Orford); Gipping district (Debenham); Hartismere district (Stradbroke, Fressingfield, Hoxne); Lotherland district (Kessingland).

Suffolk (West).—I: Borough of *Bury St. Edmunds. II: Borough of Sudbury. Urban Districts of Hadleigh; Haverhill; Newmarket. Rural Districts of Clare; Cosford; Mildenhall; Thedwastre; Thingoe. III: Rural District of Melford.

Surrey.—I: Nil. II: Boroughs of Barnes; Beddington and Wallington; Epsom and Ewell; Godalming; Kingston-upon-Thames; Malden and Coombe; Mitcham; Reigate; Richmond; Surbiton; Sutton and Cheam; Wimbledon. Urban Districts of Carshalton; Caterham and Warlingham; Chertsey; Coulsdon and Purley; Dorking; Egham; Esher; Farnham; Frimley and Camberley; Leatherhead; Merton and Morden; Walton and Weybridge; Woking. Rural Districts of Bagshot; Dorking and Horley; Godstone; Guildford; Hambledon. III: Urban Dis-tricts of Banstead; Guildford; Haslemere.

Sussex (East).—I: Nil. II: Boroughs of Hove; Lewes. Urban Districts of Burgess Hill; East Grinstead; Newhaven; Portslade; Seaford. Rural Districts of Chailey; Hailsham; Uckfield. Urban and Rural Districts of Cuckfield. The Rural District of Battle and the Borough of Rye. III: Borough of Bexhill.

Sussex (West).—I: Nil. II: Angmering, Rustington and East Preston; Arundel; Billingshurst; Bognor Regis; Chichester; Cowfold; Emsworth; Haslemere (area adjoining the Surrey border); Horsham; Lancing; Littlehampton; Midhurst; Pul-borough; Shoreham and Southwick; Steyning; Worthing. III: Barnham; Eastgate and Yapton; Crawley Development Area; Harting and Rogate; Henfield; Loxwood; Petworth; Rudgwick and Slinfold; Selsey; Storrington; West Wittering.

Warwickshire.—I: Boroughs of *Nuneaton. II: Boroughs of Leamington Spa; Rugby; Stratford-on-Avon; Sutton Coldfield; Warwick. Urban Districts of Bedworth; Kenilworth; Solihull. Rural Districts of Alcester (except Alcester); Atherstone; Meri-

Yorkshire (W.R.) Executive Council.—I: Borough of *Ossett; Urban Districts of *Adwick-le-Street; *Bentley with Arksey; *Bingley (South and East Wards); *Conisborough; *Maltby; *Mexborough; *Royston; *Sowerby Bridge; *Stanley. Urban and Rural Districts *Hemsworth; *Penistowe. Rural Districts of *Kiveton Park; *Thorne (Parishes of Hatfield and Stainforth); *Wortley. II: City of Ripon; Boroughs of Batley; Brighouse; Harrogate; Keighley; Morley; Pontefract; Pudsey; Todmorden. Borough and Rural District Goole. Urban Districts of Aireborough; Baildon; Barnoldswick and Earby; Bingley (Central, North, West, Cullingworth, and Wilsden Wards); Castleford; Colne Valley; Cudworth; Darfield; Darton; Dearne; Denby Dale; Dodworth; Elland; Featherstone; Garforth; Hebden Royd; Heckmondwike; Holmfirth (except Scholes, near Huddersfield); Horbury; Horsforth; Hoyland Nether; Ilkley; Kirkburton; Knaresborough; Knottingley; Meltham; Mirfield; Normanton; Otley; Queensbury and Shelf; Rawmarsh; Ripponden; Rothwell; Saddleworth; Shipley; Silsden; Spenborough; Stocksbridge; Swinton; Tickhill; Wath-on-Deane—Wombwell (including Brampton Bierlow Parish in Rotherham Rural District); Worsborough. Urban and Rural Districts of Selby; Skipton (except Grassington and Addingham). Rural Districts of Doncaster; Hepton; Osgoldcross; Rotherham (except Brampton Bierlow Parish and Wentworth Parish); Tadcaster (except South Milford); Thorne (Parishes of Fishlake, Sykehouse and Thorne); Wakefield;

Sunderland (I). Tynemouth (II). Wakefield (II). Wallace

wellty; *Risca; Tredegar. Urban and Rural District of *Pontypool. II: County Borough of Newport. Municipal Borough and Rural District of Abergavenny. Urban Districts of Abercarn; Abertillery; Bedwas and Machen; Blaenavon; Cwmbran.

Swansea.—I: Swansea East. II: Swansea West. III: Nil.

When local food offices close at or about the end of June this year, the local health authorities will take on the distribution of National dried milk, orange juice, cod-liver oil, and vitamin A and D tablets to those who are entitled to them under the welfare service. The local health authorities will have no responsibility at all in the provision of liquid milk, which will continue to be distributed through retail dairymen.

MEDICAL PRACTICES ADVISORY BUREAU ANNUAL REPORT FOR THE YEAR ENDING DECEMBER 31, 1953, BY THE MEDICAL DIRECTOR

During the year 1953 the four main branches of the Bureau have continued to work at high pressure. The records of appointments and vacancies successfully filled do not give a reliable indication of the work entailed, since each one may mean the dispatch of anything up to 200 circular letters. These records show, however, that over the past three years a fairly constant level has been maintained. It seems probable that the demand on the agency services of the Bureau has been stabilized following the rapid expansion in the first two years, which reached a peak in the middle of 1950. A temporary falling off in the Manchester branch following the death of Mr. Beedle was more than offset by the increase in Scotland following the establishment of the additional branch in Glasgow. The following table shows the analysis and totals of the Bureau's work in the three main types of appointments in general practice:

	1951	1952	1953
Prospective partnerships (Assistants with view)	211	213	175
Assistants and Trainees*	435	450	483
Locums	2,452	2,395	2,465
	3,098	3,058	3,123

*The proportion of trainees represents about 40%.

Entry into General Practice

Contrary to expectation, there has been no increase in the number of assistantships with view to partnership, and the trend which was apparent before the new distribution scheme came into effect in April, 1953, has continued. The number of vacancies in this category has continued to fall (with periodic fluctuations) since the peak figure attained in the second quarter of 1950, whereas the number of vacancies for assistants has steadily increased, reaching its peak in December, 1953.

In my last report I suggested that there was evidence that a large number of new partnerships were being formed and that it was justifiable to assume that principals were entering into agreements with assistants already engaged without view rather than making new appointments. This was subsequently borne out by figures published by the Medical Practices Committee. It seems likely that this will continue for some time. Though it would be difficult to produce factual evidence, my experience, and that of my staff, is that the great increase noted last year in the number of requests for advice on the procedure for forming partnerships, and the drawing up of partnership agreements, is likely to continue.

Locums

A great deal of the work associated with the supply of locums is done by telephone, and, owing to short notice, it is not always easy to complete the routine formalities. Very occasionally this gives rise to difficulties which could have been avoided if the appointment had been confirmed to the Bureau. If, as should happen in every case, the Bureau is notified that an appointment has been made, a "Contract Note" confirming the terms agreed and containing a brief summary of the obligations accepted by both principal and locum is sent to both parties. This acts as a protection to both in the event of a dispute. Unfortunately, once the introduction is effected, the parties all too frequently make their own arrangements; the Bureau is not informed, and the contract note cannot then be sent. Considering the number of introductions made and the volume of work involved, complaints and disputes are very few—but they do occur, and will inevitably occur in the future. Many difficulties, even amounting to threatened litigation, could be avoided if the normal procedure could be followed in every case.

There is a period each year covering the holiday months when the demand for locums is very much in excess of the supply. During these months a locum is in a position to pick and choose, and there is little likelihood of his facing a waiting period between successive appointments. For this reason there is an understandable reluctance on the part of prospective locums to make firm engagements in advance, for fear that the dates of other posts will clash, or that they may miss the opportunity of accepting more attractive alternatives. This leads, on occasion, to much anxiety and occasionally disappointment to principals who have taken the precaution of registering their dates with the Bureau many weeks or even months ahead. It is embarrassing to the Bureau, which may be suspected of discrimination. The shortage of locums during this period also has the effect of introducing competitive rates for holiday locums to the disadvantage of practitioners in industrial areas.

Other Appointments

The help of the Bureau is sought for a very wide range of appointments both at home and overseas. Those abroad comprise mainly short-term or long-term specialist and industrial appointments (usually renewable), and also openings in general practice, most of which, of course, involve the sale of goodwill. Great care is taken to ensure that the applicant is in possession of full information, and, where possible, a contract or agreement in writing. I should like to take this opportunity of acknowledging the help received by the Bureau from Overseas Branches of the Association and affiliated associations with which we are in close touch.

Exchange of Practices

During the past four years the Bureau has made over 2,000 introductions under a scheme for the exchange of practices sponsored by the Medical Practices Committee with the assurance of co-operation from the majority of executive councils. The results have been extremely disappointing. Recently, as part of an attempt to facilitate freer movement among general practitioners, a list comprising some 70 practices available for exchange was advertised in the *British Medical Journal*, care being taken to avoid disclosing the exact locality of the practice and the identity of the practitioner. This stimulated inquiries temporarily, but, to judge by the progress of such negotiations as have followed, the results have continued to be disappointing. I am satisfied, however, that the machinery for dealing with this problem is adequate.

Advisory Services

The advice given by the Bureau covers a great variety of personal problems, by far the larger proportion being questions concerning relationships between doctors, and contracts and agreements arising therefrom. As already mentioned, the formation of new partnerships has been a predominant feature during 1953. Experience has proved the value of a disinterested opinion from the point of view of the doctor rather than the lawyer. For instance, it has been possible to find common ground and reach an acceptable compromise when the exchanges between the solicitors, acting in the interests of their respective clients, threaten to widen the disagreement and cause an impasse. Advice is sought with increasing frequency by solicitors at the request of members on such questions as the criteria for payment on notional lists, the methods of dealing with superannuation contributions, the effect of the ban on the sale of goodwill on existing partnership agreements, and many other similar problems. There is no doubt that the close personal relationship which the Bureau is able to establish, both in correspondence and especially by interview, is much appreciated by members of the Association.

British Medical Association

GENERAL MEDICAL SERVICES COMMITTEE

REPORT OF THE GENERAL MEDICAL SERVICES COMMITTEE TO THE ANNUAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL COMMITTEES, 1954 (continued)

APPENDIX B REPORT OF THE EXCHANGE OF PRACTICES SUBCOMMITTEE

Preliminary

1. The Subcommittee was appointed by the General Medical Services Committee on September 17, 1953, with the following terms of reference and personnel:

Resolved: That a special subcommittee be set up to consider the following resolution of the Annual Representative Meeting:

219. Resolved: that the following motion be referred to the Council:

That ways and means be explored to make it easier for general practitioners to change practice.

and the personnel be the Chairman, B. Cardew, H. Guy Dain, C. J. Swanson, and G. P. Williams.

Chairman

2. H. Guy Dain was appointed Chairman of the Subcommittee.

Meetings

3. The Subcommittee has met on two occasions: November 3, 1953, and January 14, 1954.

Change of Practice

4. The Subcommittee is fully conscious of the efforts which have been made in the past to facilitate the exchange of practices, but unfortunately the results so far have proved somewhat disappointing. In view of the wording of the resolution passed by the Annual Representative Meeting, it has not confined itself to possible methods of improving the existing machinery for direct exchange between two practitioners, rather has it approached the problem from the point of view of the establishment of a general "clearing house" through which the differing requirements of practitioners might be met—in other words, machinery whereby those wishing to change their area of practice would be able to do so by a number of alternative methods.

5. In the view of the Subcommittee there are three possible lines of approach to the problem: (1) Direct exchange of practices between established practitioners. (2) The appointment to small vacancies from a panel of practitioners who have notified their desire for this type of opening. (3) Exchange of vacancies by arrangement between executive councils whereby two applicants may both gain advantages.

6. At its first meeting the Subcommittee was presented with a memorandum by the Medical Director of the Medical Practices Advisory Bureau which set out in detail both the machinery which has been established and the results which have been achieved in regard to direct exchanges. This memorandum is reproduced in Sub-appendix (i). The Subcommittee for its part has not suggested any radical improvements but has accepted the suggestions made by Dr. Potter

(1) That the Editor of the *British Medical Journal* should be asked to publish from time to time summaries of the advertisements now appearing each week with possibly an annotation to give additional publicity to the facilities available, and (2) That complete lists of all practices available for exchange should be sent to doctors registered with the Bureau for this purpose rather than merely a list of those which appear to meet the requirements of the individual concerned.

7. With regard to the second method, Dr. Potter has shown in a further memorandum (Sub-appendix (ii)) that machinery exists for this, but that although attractive in theory it has not proved effective in practice. Thus the first two methods were to some extent covered and there remained the third method visualized by the Subcommittee—an exchange of vacancies by arrangement between executive councils. A general practitioner who wished to change the area of his practice would, when applying for the vacancy of his choice, be given special consideration on the grounds that he would be surrendering an equivalent or better practice in another part of the country, thus leaving an opening for another practitioner. Such a proposal would in no way imply that the vacancies would not be advertised in the normal way, but merely that an applicant with a practice to offer in exchange would have that fact taken into account.

8. The Subcommittee fully concurs with the view that the success of such a scheme would depend on the full co-operation of executive councils and the Medical Practices Committee on the one hand, and the maintenance of a central bureau on the other. The Subcommittee feels that there is much to be said for exploring the possibilities of such a scheme and accordingly recommends:

Recommendation: That the Medical Practices Committee be asked to discuss the proposal outlined above that additional machinery should be established to facilitate the exchange of vacancies by executive councils.

SUB-APPENDIX (I)

MEMORANDUM BY THE MEDICAL DIRECTOR OF THE MEDICAL PRACTICES ADVISORY BUREAU

1. Very soon after the appointed day it was apparent that the ability of practitioners to change the areas of their practices would be very much restricted. This was a direct consequence of the ban on the sale and purchase of goodwill.

2. Before the appointed day a doctor wishing, for instance, to reduce his work could sell his practice with the reasonable certainty that he would be able to purchase another without a waiting period which would strain his resources unduly. After July, 1948, although on resignation from the list a doctor could obtain payment of his compensation, the only way he could resume general practice in another area was by applying for a vacancy. There is reason to believe that a number of doctors do try this method of effecting an exchange: they apply for suitable vacancies, intending, if successful, to resign from the list, affording cover by deputy until the vacancy can be filled. The Bureau has little evidence that those on the list for exchange who have tried this method have been successful, and, in any case, under these circumstances compensation would not be payable immediately.

3. During 1949 the opinion of the Medical Practices Committee was sought on a possible mechanism, acceptable to executive councils and local medical committees, whereby exchanges could be facilitated or even encouraged. As a result, the Medical Practices Committee sent a letter to executive councils, and this was published in the *Supplement* to the *B.M.J.* on March 18, 1950, in the following form:

"The following is a circular letter which has been addressed to executive councils (and local medical committees) by the Medical Practices Committee after discussions with representatives of the G.M.S. Committee and the Medical Director of the Medical Practices Advisory Bureau. The Bureau is anxious to play its part in this field, and the suggested procedure should be of help to the profession. Clearly, the greater the number of practitioners who are registered with the Bureau for this purpose, the greater the opportunity of effecting suitable introductions. The fullest possible information concerning the doctor's present practice and his wishes for the future should be given. The letter is, of course, self-explanatory and needs no further comment.

Exchange of Practices

"Prior to July 5, 1948, general practitioners who desired for some reason, personal or domestic, a change in the type of

practice or area they worked were able as one method of achieving this to arrange mutually with other practitioners an exchange of practices. Thus the practitioner with years of industrial practice behind him, who naturally desired less arduous practice in rural surrounds or coastal resort, could exchange with the younger man who found his family commitments beyond the scope of any possible expansion of the practice he had in such an area. These arrangements were the occasion of minimum disturbance and worked well to the advantage of the public and the doctors alike.

* Since the appointed day only two such exchanges have been made. In each instance the arrangements were made between the doctors provisionally and completed by the assent of the executive councils concerned, recognizing the advantages of such an arrangement, without any difficulty.

"The Medical Practices Committee is informed that there is still a desire among practitioners that exchanges should go on, and holds the view that normally no difficulty should be experienced in making the necessary arrangements. We believe that it is the apparent difficulty only that has deterred practitioners from taking such steps. Obviously it would be an essential prerequisite that, before either of two practitioners who had made provisional arrangements to exchange practices resigned from the list of their present executive councils, not only the admission of both of them to the new council's lists, but the transfer of the patients of each to the other must be assured. Only in very exceptional cases should such assurance be withheld by the executive councils concerned in consultation with their local medical committees (the actual committee being preferably the local consultative committee comprised of members of each of these statutory bodies). They can be certain that the Medical Practices Committee would endorse the action they took in any recommended case. The fact that either area had been declared a 'closed area' by the Medical Practices Committee should not generally affect the decision to agree to an exchange.

"The initiative must of course be taken by the doctors themselves. The normal channels would be by advertisements in the journals or through the Bureau at B.M.A. House.

"The Medical Practices Committee requests the observations of your council and the local medical committee upon the suggestions outlined above, which it is hoped will be effective immediately.

"A copy of this letter is enclosed for transmission to the local medical committee."

4. The results have been very disappointing, but although few exchanges have actually been effected, there are a number of cases in which preliminary steps have been taken. In no instance has there been reason to doubt the full co-operation of executive councils.

5. Between January 1, 1950, and October, 1953, there have been 275 doctors registered with the Bureau for exchange. In all 2,290 introductions have been given (1,145 cases each involving two doctors). Only 7 exchanges have been completed—that is, 14 doctors have exchanged practices.

6. A recent review of the register held by the Bureau has suggested some of the reasons for this. At the beginning of October, 1953, there were 158 names on the register. These have been circularized with a view to revising the particulars, thus giving an opportunity of "pruning" the list. More than half have not replied, but those who have, together with a number with whom there has been recent correspondence, make a total at present of 68 who definitely desire exchange.

7. Of these, 16 are in practice in the Midlands or northern industrial areas, but only six are prepared to face a real sacrifice of income in order to secure a practice in the South. Two are restricting their search to London only.

8. Of those in the southern half of the country only three are prepared to go to the North or Midlands, and of the remainder 29 want exchange but will not go north or to industrial areas of the Midlands, and are not prepared to make any sacrificial reduction of income.

9. Consideration of this analysis suggests that there are two main attractions which prompt the wish to exchange practices—area and income. A doctor who wishes to move from an industrial to a country or seaside area must be prepared to offer a substantial inducement if he is to be successful. In other words, he himself must face a substantial drop in income. The evidence suggests that few

are prepared to do this, and, by inference, that the majority on the list are prepared to wait until an opportunity for a really good bargain occurs. As each exchange involves two practitioners, each seeking an advantage, it is not surprising that a scheme which in theory sounds attractive and feasible should prove disappointing in practice. There are, of course, other factors, such as exchange of houses, the lack of educational facilities, social amenities, etc., but experience suggests that if the need to move is urgent, these secondary difficulties can be surmounted.

10. The question arises: Could an improvement in the position be obtained by wider dissemination of information? It has been suggested, for instance, that a complete list of practices with essential particulars briefly set out should be published from time to time in the *Journal*, giving for each a reference number which could be used in the initial correspondence with the Bureau. This would not replace the small advertisements appearing each week under the title Exchange in the general practice section. These average 2-3 each week, the majority being inserted by the Bureau. It must be borne in mind, however, that most doctors when initiating inquiries stress the need for strict secrecy. It is common knowledge that a rumour of a doctor's impending departure can affect adversely his practice, although no doubt this effect is often exaggerated. Apart from publication in the *Journal*, a full list can, of course, be sent by post with supplements from time to time to all doctors registered for exchange with the Bureau.

SUB-APPENDIX (II)

SUPPLEMENTARY MEMORANDUM BY THE MEDICAL DIRECTOR OF THE MEDICAL PRACTICES ADVISORY BUREAU

1. The memorandum submitted to the Subcommittee on November 3, 1953, dealt mainly with the direct exchange of practices between doctors wishing to change their areas or to reduce or increase their commitments. It has been suggested that there is a distinction between exchange of practices and change of area in that the former implies a transaction between two practitioners, whereas in the latter only one is involved. This is only partially true, because by leaving one practice to take up another the doctor concerned is creating a vacancy which will presumably be filled, if not by a colleague who is also relinquishing a practice, by a new entrant. A change of practice area, therefore, really involves an exchange of vacancies, and it may be that the machinery already set up to deal with practice exchanges could be extended and adapted to cover also exchange of vacancies. It is, of course, essential that any scheme should have the fullest co-operation of executive councils and the positive support of the Medical Practices Committee.

2. It can, I think, be assumed that a doctor wishing to change his area either wishes to reduce his commitments or, if he wishes to move to a locality more suitable for health or other reasons, faces a drop in income by so doing. This means that it is the vacancy in the small or medium-sized practice which will attract the doctor wishing to change his area.

3. In the early days of the National Health Service a scheme was evolved to deal with vacancies in small practices which, in the ordinary way, would be dispersed. Set out below is a copy of a memorandum by the Medical Practices Committee which was sent to executive councils and local medical committees on May 3, 1949. Briefly this suggests that when faced with a vacancy with a list of between 400 and 1,000 the council, before deciding to disperse the practice, should ask the M.P.A.B. whether they had on their register any practitioner seeking such a vacancy. It must be borne in mind that this scheme covers a wider field than those wishing to change their areas. It includes, for example, doctors completing service abroad and others wishing to enter general practice after some years in salaried appointments.

4. The suggestion has not been very widely adopted. A few executive councils refer to the Bureau when they wish to fill this type of vacancy. Some councils form their own panels and one at least invites, by advertisement in the *Journal*, doctors seeking small vacancies to enter a panel for the purpose. While there is no need to discourage the formation of local panels, they have disadvantages in that the field is likely to be restricted. It would be preferable if this scheme could be dealt with, as originally suggested, through a central exchange of information such as the Bureau.

5. Thus there are two schemes sponsored by the Medical Practices Committee which, if used effectively, would facilitate change of area. Both, though attractive in theory, have proved disappointing in practice. Probably the reason lies in the fact that the new entrant and the doctor wishing to change are both seeking the same thing—a medium-sized practice with a list of 1,000 to 2,000 in a non-industrial area—though there is probably a point below which the size of the list is more likely to attract those wishing to limit their commitments than new entrants into practice who, if given the choice, would be more likely to apply for the vacancy created by the change.

6. The vacancy with a medium-sized list is almost certain to be advertised, and in open competition with new entrants a practitioner already established is unlikely to succeed unless the selection committee can be satisfied that, if appointed, he will create a vacancy even more desirable from the point of view of the new entrant. Even so, this implies an exchange of vacancies between executive councils and also their willingness to consider favourably an applicant who has himself a desirable practice to offer.

7. To sum up, there are three methods of approach to the problem: (1) Direct exchange of practices between established practitioners. (2) The appointment to small vacant practices from a panel of practitioners who have notified their desire for this type of opening. (3) Exchange of vacant practices by arrangement between executive councils where by two applicants may both gain advantages.

8. For success, all three methods require: (1) the co-operation of executive councils and the sponsorship of the Medical Practices Committee (in respect of the first two these are already assured); and (2) a central bureau of information. Granted these two considerations, there is nothing difficult or impossible in the administration of such a scheme. The Medical Practices Advisory Bureau already has facilities. Time alone will show whether the results, which have so far been disappointing, would justify the very considerable amount of additional work involved.

Memorandum by Medical Practices Committee Regarding the Dispersal of Small Practices

(See para. 3 above)

The Medical Practices Committee has been concerned about the position of young doctors wishing to enter into practice as principals for the first time and the lack of opportunities for them to do so since July 5.

Entry by succession to substantial practices is not possible (or desirable), such vacancies are usually awarded to more experienced men. Partnership arrangements, usually after preliminary assistantships, are more readily available, but are still too few and in any case do not satisfy the man who wishes to practise single-handed.

"Squatting" in an area deemed suitable remains. Even if the basic salary is awarded, much financial stringency inevitably follows for a number of years, the earlier ones at least being a period of enforced idleness at a time when the doctor ought to be occupied in learning the art of general practice and seeing his patients. The lack of these latter prevents his achieving either object.

The Committee has noted that many vacancies following upon the death or retirement of practitioners, even in areas where an executive council with the local medical committee would agree

that the numbers of patients on the lists of neighbouring doctors are high, are frequently not filled and the list is dispersed.

This is particularly noticeable where the list is of 400-1,000 units. The reason for this is that it would not be economic to appoint a locum to run it temporarily, and if continued at all it is by the good offices of the neighbouring doctors, who inevitably absorb the patients and indeed could scarcely avoid doing so.

To go through the routine of selection, after advertisement and appointment by the Medical Practices Committee, would manifestly be a waste of effort. By the time a successor was appointed the practice in most cases would have melted away.

Nevertheless where the executive council, after consultation with the local medical committee, agrees that it would be better if a new doctor should, if possible, be appointed right away, it is very desirable that this should be done. Alternatively, rather than dispersal, the executive council might invite one or more practitioners in the neighbourhood who have small lists to take over.

Names of young practitioners in a position to and desirous of taking up such vacancies at short notice may already be in the hands of the executive council or local medical committee. Alternatively such might be obtained by telephone from the new Bureau established at British Medical Association House and Branch Offices.

The Medical Practices Committee would, if the applicant was not already on the list (without restriction), endorse any such appointment to a vacancy of this sort which an executive council might make. Appointment to such a list would represent vast advantages and probably avoid two to three years' distress to many doctors who otherwise must start from scratch.

APPENDIX C

REPORT OF THE MATERNITY SUBCOMMITTEE

Preliminary

1. The Subcommittee was appointed on July 23, 1953, with the following reference and personnel:

Resolved: That a special subcommittee be appointed to consider the question raised in the following Conference resolution, and that the Subcommittee be asked also to investigate the co-ordination of the maternity services and the existing obligations of general practitioners who undertake this work.

Resolved: That this Conference instructs the General Medical Services Committee to review the whole question of the Maternity Medical Service with particular reference to the relation of fees to the work done.

Personnel: K. Harrower, J. C. Arthur, A. N. Mathias, D. F. Hutchinson, H. S. Howie Wood, I. G. Innes, A. Beauchamp, and S. Wand.

2. The Subcommittee appointed K. Harrower as its Chairman, and has met on two occasions—October 20 and November 26, 1953.

Memorandum from the Middlesex Local Medical Committee

3. At its first meeting the Subcommittee considered a memorandum submitted by the Middlesex Local Medical Committee. It also had the advantage of hearing R. B. L. Ridge, of the Middlesex Local Medical Committee, who attended the first meeting by invitation to elaborate the views summarized in the Middlesex memorandum. The Subcommittee wishes to record its appreciation of the work which has been done by the Middlesex Local Medical Committee in its survey of the maternity service.

Obstetric List

4. The Subcommittee has had referred to it by the G.M.S. Committee the following resolution of the A.R.M., 1953, with regard to the obstetric list.

192. **Resolved:** That Council be asked to report the steps that have been taken to secure the abolition of the obstetric list.

5. The views of the Association on this subject, which were formulated by the A.R.M. in 1952, have been expressed on a number of occasions. Quite recently, in a memorandum of evidence which was submitted to the Committee of the Central Health Services Council on General Practice, it was pointed out that every general practitioner was qualified in law to practise midwifery, and that the artificial distinction imposed by the present regulations had done little to raise the standard of practice. It was submitted that what the general practitioner required was the opportunity to gain experience and so further his skill in obstetrics, both domiciliary and institutional, and that this would never be achieved by the purely administrative and artificial device of an obstetric list—particularly as the standards imposed by local obstetric committees for admission to the list were by no means uniform. The Association saw considerable advantages in the procedure followed in Scotland and Northern Ireland, where every registered medical practitioner is entitled without further question to contract to provide maternity medical services and to receive the full fee for so doing; or, if he so desires, to provide maternity medical services solely for patients on his own list, at a reduced fee. In other words, he has the right to take part in the maternity service of his own volition, without having to satisfy a committee as to his professional experience and qualifications.

6. Apart from the A.R.M., the Subcommittee was aware that similar views had been advanced by its parent Committee and by the Conference. As recently as February, 1953, at the time that the Ministry issued a circular of guidance to the chairmen of obstetric committees, the Committee's representatives reaffirmed their desire to extend the Scottish system to England and Wales. The Subcommittee considers, therefore, that an appropriate opportunity should be sought again to remind the Ministry of the Association's view that the obstetric list as it now exists should be abolished, and that every general practitioner should be allowed to practise domiciliary midwifery as of right. As, however, the Ministry will in all probability wish to await the report of the Committee of the Central Health Services Council on General Practice, the Subcommittee recommends that no action be taken with the Ministry until that report is available.

Fees for Maternity Medical Services

7. The Subcommittee wishes to stress that in any discussions with the Ministry it should be a *sine qua non* that the abolition of the obstetric list will not result in the reduction of the present 7-guinea fee which covers an initial medical and obstetric examination and an examination at or about the thirty-sixth week of pregnancy, together with such other examination and antenatal care as the practitioner thinks necessary, attendance at the confinement (if necessary), a medical and pelvic examination of the mother between six and twelve weeks after confinement, and the medical care of the mother and child for 14 days after the confinement. The present regulations also provide that if a doctor does not give the complete service, the payment for the initial examination and supervision to the end of pregnancy shall be 3½ guineas (Period 1) and for attendance at the confinement, during the puerperium, and for post-natal supervision, 4½ guineas (Period 2). A fee of 10s. 6d. attaches to a single antenatal examination where only one such examination is given, and a fee of one guinea where post-natal supervision only is carried out.

8. Although to qualify for the prescribed fee only two antenatal examinations at specified times are necessary, most practitioners see the patient at frequent intervals during pregnancy. While the Subcommittee would be opposed to the imposition of further statutory requirements, it does consider that every encouragement short of financial inducement should be given to practitioners to see their maternity patients at regular and frequent intervals, and it recom-

mends that an early opportunity be taken to bring home to general practitioners their responsibility in this connexion. In fact, the Subcommittee believes that the majority of doctors already undertake more examinations than are, by regulation, required and it is only the minority of patients who receive less than adequate attention.

9. Statistics show that there is a definite correlation between the number of antenatal examinations made and the maternity morbidity and mortality rates. The Subcommittee cannot express too strongly its disagreement with the view expressed by the Minister when the regulations governing the maternity medical services were framed, that two examinations only would normally discharge the obligation of the doctor with regard to antenatal care. While the Subcommittee does not at the present wish to make any recommendations as to the adequacy of the present fees for maternity medical services, it is of the opinion that, should these be the subject of examination at a later date, the fact that the great majority of general practitioners undertake the fullest antenatal care should be borne in mind.

Co-ordination of the Maternity Medical Services

10. The Subcommittee's terms of appointment made specific reference to the co-ordination of the maternity medical services. As the Committee will be aware there are three authorities with statutory responsibilities—namely, the executive council and the local health authority, which are concerned with domiciliary midwifery; and the regional hospital board, which is concerned with institutional midwifery. The local health authority has a duty to make arrangements for the care, including dental care, of expectant and nursing mothers, and of children who have not attained the age of 5 years and are attending primary schools maintained by a local education authority. In addition, they have power to provide domestic help where such help is required owing to the disability of the mother during her pregnancy and following her confinement. It is thus essential that the closest co-operation should exist between the general practitioner, the midwife, and the consultant. For example, where a woman wishes to book a midwife in anticipation of a domiciliary confinement, the general practitioner should be advised of the fact, and of any action taken by the staff of the local health authority's clinic. In this way the general practitioner can keep in touch with his patient, and with the midwife, during the course of pregnancy, and is able to retain full responsibility for the care and safety of his patient. It could not happen then, as has occurred in the past, that a woman becoming pregnant could book a midwife for her confinement, and that the general practitioner could be called to the confinement by the midwife in an emergency, without being previously aware that his patient was pregnant. Again, it is most desirable that if a woman approaches the antenatal clinic in the first instance, she shall be left in no doubt of her right to book a general practitioner of her own choice. If it is necessary for the clinic to refer the woman to a consultant, the general practitioner should be promptly advised and, where practicable, should make the necessary arrangements. The Subcommittee has received samples of clinic doctor, the midwife, and the general practitioner. These forms can and do serve a useful purpose, provided that it is remembered that wherever possible the patient should be referred to her own doctor.

11. The Subcommittee has been particularly heartened to learn of several excellent schemes for co-ordination which are in force in different areas, largely as a result of friendly discussions between the local medical practitioners, the schemes, though varying in minor detail, are based upon record cards which pass to and fro between the general practitioner, the clinic doctor, the midwife, and the consultant, and which, augmented by verbal instructions or

written communications where necessary, have been found to be of the greatest practical value.

12. The following scheme, based on one actually in operation, is put forward as an example of good planning and is designed to ensure the antenatal and post-natal care of the mother with the minimum of overlapping between the three branches of the maternity medical services. It is based on the following ideal considerations:

(1) That normally, where home conditions are satisfactory, the proper place for the confinement is the patient's own home.

(2) That the person who conducts the confinement should also be responsible for antenatal care. Where this is not practicable for any reason, the antenatal examinations should be carried out by the practitioner who is at risk for the patient during the period of pregnancy—that is, the family doctor.

(3) That the antenatal clinic should provide certain facilities for educational work such as the teaching of mothercraft and of relaxation exercises; and that, by arrangement, it should offer facilities to the general practitioner who wishes to conduct his own antenatal clinic at the centre in preference to his own surgery. The Subcommittee considers that vacancies on the clinic medical staffs should wherever possible be filled by general practitioners working on a sessional basis. Wherever practicable, the midwife who has been booked for the confinement should be present when the practitioner conducts his antenatal clinic.

13. The details of a general scheme of this kind should be worked out by the medical officer of health in consultation with the local medical committee and representatives of the regional hospital board and boards of governors, and should be widely circulated so that every doctor is aware of its provisions.

Model Scheme for Antenatal Care

Every woman on first suspecting pregnancy should consult her own doctor. If pregnancy is confirmed the doctor will ascertain whether the patient wishes to book a midwife. The midwife, if she has been consulted first, will advise the patient's doctor. The patient should be aware of her right to book her own doctor.

The doctor and midwife should then meet and plan out the next few months, deciding from their combined knowledge of the patient's environment where the confinement is to take place.

Then follows a joint interview of patient, doctor, and midwife at which the patient can be advised, after the first joint antenatal examination,

(1) That as normally, where home conditions are satisfactory, the proper place for a confinement is in the patient's own home, if it has been decided to advise a domiciliary confinement (if the patient raises objections to a domiciliary confinement because she has no help at home she can be advised about the home help service of the local health authority); or

(2) That owing to adverse home conditions or for some medical reason admission to hospital is advised.

Should a domiciliary confinement be decided on then the doctor will arrange with the midwife how often he wishes to see the patient during the pregnancy, arrange for the necessary blood tests either by himself or through the local health authority clinic, and he or the midwife will inform the woman of the facilities available at the local health authority antenatal clinic.

If admission to hospital is recommended on either ground then the necessary forms should be completed and forwarded to the county medical officer.

The midwife should make herself responsible for filling up the preliminary pages of the main antenatal card and the patient's travelling card, the doctor making the necessary medical entries. If the woman is to attend the health authority's antenatal clinic then the main card should be retained by the midwife, who will be responsible for producing it either the next time the patient sees her own doctor or goes to the clinic.

If the hospital accepts the case the midwife or doctor will forward the woman's antenatal card to the consultant, who will make the necessary entries and return the card to the midwife or doctor. The woman will then continue to receive the same routine antenatal care as if she were to be confined at home, returning to the specialist's clinic at stated intervals only. If, however, the woman approaches the hospital in the first instance, she should be referred to her own doctor.

If at all these interviews appropriate entries are made on both the antenatal card and the patient's personal card, then in an

emergency (if the main record is for any reason not immediately available) sufficient information will be found on the personal card.

N.B.—It should be the midwife's responsibility to ensure that the woman realizes the importance of the personal card.

14. The success of a scheme of this kind depends obviously to a large extent on the existence of a good professional relationship between the midwife and the doctor. The Subcommittee feels that it cannot do better than to reiterate the views which the Association expressed on this subject in 1949 when considering the Report of the Working Party on Midwives:

The Association considers that it must be made clear to both doctors and midwives that they form a team. Both doctor and midwife have a complementary function, neither alone can give a complete service. The report seems unsound in speaking of the midwife as the practitioner of *normal* midwifery, just as it would be unwise to call a doctor the practitioner of *abnormal* midwifery.

A balanced judgment of what constitutes the abnormal can only be gained by experience of and familiarity with the normal, and to attempt arbitrarily to apportion the sphere of activity of the midwife and the doctor into "normal" and "abnormal" cases would deprive the doctor of the opportunity of gaining knowledge of the variations of normality and a consequent lessening of his value to the midwife as a consultant. The report tends to lose sight of the fact that there is a part helpful to the mother to be played in every case by both midwife and doctor, and that it is only the degree of activity of each which varies in various types of case.

It should be appreciated by the midwife, the medical profession, and the public, that where doctor and midwife are working together, this in no way relegates the midwife to an inferior status. She is a midwife and is working as such and at any time may be called upon to act as such. The Association feels strongly that this situation is not fully appreciated either by doctors or midwives and has an important bearing on the present confused ideas as to the correct professional relationship between midwife and doctor.

There is tending to grow up a feeling of "competition" between the two professions, and this is fostered by recommendations which attempt to define or divide up the spheres of activity of either.

15. The Association also recommended that the Central Midwives Board should drop the use of the term "maternity nurse" for a midwife working with a doctor.

16. The Subcommittee appreciates that some opposition exists to the presence of the doctor at normal confinements on the ground that the greater the number of cases booked by the doctor, the fewer are available for the midwife. The Subcommittee takes the view, however, that if the distinction between booked and unbooked cases were abolished and the midwife and the general practitioner co-operated on all cases, the midwife would take part in a greater number of cases than under the old system, and the risk of a doctor receiving a medical aid call from the midwife to a case of which he had no previous knowledge would be greatly diminished. General practitioners should, however, encourage the attendance of medical students and pupil midwives at confinements. Every doctor present at a confinement might well consider the desirability of allowing the conduct of a normal delivery to remain with the midwife, he himself only giving such advice and help as may appear necessary. Such an arrangement is, generally speaking, in the best interests of both the doctor and the midwife as well as of the patient.

17. The Subcommittee is in full agreement with this concept of the doctor-midwife relationship and, for this reason, has rejected the suggestion which was made to it that while the doctor's attendance at the actual confinement should remain optional it should attract a special fee. The Subcommittee feels that the doctor is himself the best judge of whether or not his presence is required and that whenever he feels that he can be of assistance, irrespective of whether or not he actually conducts the labour, he will be present as a matter of course, and the question of his rendering an additional service which will attract an additional payment will not arise.

Postgraduate Education of the General-practitioner
Obstetrician

18. It will be remembered that the Central Health Services Council recently advised the Minister on the procedure for admission to the obstetric list. This advice was communicated to local obstetric committees in the form of a circular letter addressed to the chairmen, and therefore had no mandatory force behind it. The circular contained the advice that, in considering future applications for admission to the obstetric list, local obstetric committees should apply the criterion that the applicant should have held a six months' resident appointment in an obstetric unit. In the Subcommittee's view it would clearly not always be practicable for a busy general practitioner to acquire experience in this way, and, indeed, there might not always be a sufficient number of suitable vacancies to cover all needs. The Subcommittee realizes that there are many young doctors entering general practice to-day who are inexperienced in obstetrics. It considers that every facility should be given to them to improve their knowledge and that the General Medical Council might well consider a revision of the medical curriculum to this end.

19. The Subcommittee feels that, whatever changes might be made in the medical curriculum, it is still essential that there should be ample facilities for postgraduate instruction to enable general practitioners to keep abreast of modern knowledge and developments. One of the ways in which this can best be effected is by the closer association of the general practitioner with hospital life, and the Subcommittee would here emphasize the view, which has been put forward on many occasions, that there should be an adequate number of general-practitioner beds in hospital maternity units where a general practitioner could conduct the confinement of his own patients. The employment of the general practitioner as a part-time clinical assistant in a maternity department also affords valuable postgraduate training.

20. The Subcommittee has emphasized already the need for a high standard of antenatal care. This is largely a matter of education—both of the practitioner in making him aware of the value of such matters as regular antenatal visits, the instruction of the mother in mothercraft and relaxation exercises, and routine blood testing; and of the patient in securing early co-operation with the doctor.

21. The encouragement of the mother to attend for a post-natal examination as a matter of routine in all maternity cases is a comparatively recent development, and it is largely due to the efforts of the general-practitioner obstetrician that its value has now been widely recognized even by those mothers who, in the past, would not have bothered to present themselves for examination. Many general practitioners, in order to encourage attendance, are prepared to visit the mother at home when her domestic commitments make it difficult for her to come to the surgery.

22. The Subcommittee is of opinion that a blood test should be carried out as a matter of routine in every first pregnancy, and that in addition every rhesus-negative woman should be tested on the occasion of subsequent pregnancies. With this in mind, it suggests that blood should be tested wherever the following indications exist: (1) In every first pregnancy. (2) Where there is a history of a previous transfusion. (3) Where from previous blood examination there is evidence of the presence of antibodies. (4) Where there is a history of abortion or, more particularly, habitual abortion. (5) Where there is a history of one or more stillbirths and particularly where there is associated abnormality such as hydrops foetalis, etc. (6) Where there is a history of neonatal death accompanied by jaundice, etc. (7) Where surviving children have shown jaundice or anaemia in the first few weeks after birth.

23. It is appreciated that these tests may place a considerable burden upon the shoulders both of the doctors and of the laboratory staff, and the Subcommittee has considered with interest a report that, following extensive

inquiries in Scotland, it was found that routine blood testing was by no means impracticable. In many areas it was reported that a good deal of additional work would be involved, but in no area was it found that it could not be accomplished.

Maternity Packs

24. A number of local health authorities in pursuance of the general powers given to them under Section 20 of the National Health Service Act, 1946, have submitted to the Minister of Health schemes which have included the provision of maternity packs. The actual conditions under which these packs are supplied vary according to the precise wording of the individual scheme, and the situation has therefore arisen that in some areas they are supplied free of charge to all pregnant women, irrespective of whether they are confined at home or in a nursing-home, while in others the issue is restricted to those who have booked the services of a local authority midwife. Others restrict them to all domiciliary cases.

25. In this connexion the Subcommittee has considered the following resolution of the A.R.M.:

191. **Resolved:** That the maternity pack supplied by the local authority for use in domiciliary confinements be also supplied for confinements in nursing-homes.

While it is appreciated that the onus necessarily rests with the local authority either to frame or amend its scheme in such a way as to secure the wider distribution of the maternity outfits which the A.R.M. desires, it is unlikely that the Minister would sanction any amendment widening an authority's powers in this respect. The position is therefore likely to remain that those authorities who took the necessary powers in the first instance will continue to exercise them, but that it will not be easy for any authority to take fresh powers. Nevertheless, the Subcommittee considers that, as and when possible, pressure should be brought to bear on local authorities to implement the resolution of the A.R.M., and that no charge should be made for the outfits, wherever supplied. At the same time the Subcommittee endorses the view already expressed by the parent committee, that doctors should not be expected to prescribe items additional to the standard pack on Form E.C. 10, but that where these are required, they should be obtained from the local authority. Many local authorities in consultation with the local medical committees provide a pack superior to the minimum standards laid down by the Ministry of Health in Circular 99/50, and this is a practice which should be encouraged.

Conclusion

26. The discussions have ranged widely over the various aspects of the maternity medical services, and the Subcommittee has reached the conclusion that, although the present framework of the Act and the regulations is in some ways cumbersome, generally speaking a very satisfactory service is given to the public. The Subcommittee does not therefore wish to put forward any specific recommendations for amending the Act or the regulations. It has confined its recommendations to measures designed to secure greater co-ordination between the three branches of the service as they now exist. This is a matter which is best dealt with on a local and voluntary basis, and one already interested themselves to good effect.

27. The second point which the Subcommittee wishes to stress is the need for more widespread postgraduate education, for which it believes the parent committee will wish to press.

28. On the specific question raised by the Conference of the relation of fees to work done, it does not wish to put forward any definite recommendation for a variation in fees at the present time, but merely to enter a caveat that, should the statutory requirements governing participation by general practitioners in the maternity medical services be reviewed at some future date, consideration should then be given to the adequacy of the fees paid.

CIVIL SERVICE MEDICAL OFFICERS' PAY

The pay of three grades of medical officer in the Civil Service has now been revised and the new scales are to operate as from January 1, 1952. The details are as follows:

Grade	Age	Salary Scales (Basic plus Pay Addition)	
		Old Scale	New Scale
Basic grade	35	£ 1,331 5 0	£ 1,500
	36	1,382 10 0	1,575
	37	1,433 15 0	1,650
	38	1,485 0 0	1,725
	39	1,536 5 0	1,800
	40	1,600 0 0	1,900
		1,675 0 0	2,000
		1,750 0 0	2,100
		1,825 0 0	
Senior Medical Officer, £1,900 × 100—£2,100			2,200
Principal Medical Officer £2,250			2,300

The negotiations which have led up to this conclusion have been carried out by the Civil Service Medical Officers Joint Committee, which is a committee of the British Medical Association and the Institution of Professional Civil Servants.

The Howitt Committee

A claim was first presented to the Treasury in August, 1949. In February, 1950, it was rejected. The Chancellor then decided to appoint a committee (the Howitt Committee) to consider the remuneration, structure, and organization of the medical Civil Service. The members of this committee were Sir Harold Howitt (chairman), Mr. S. A. Bailey, Sir Harold Boldero, Dr. C. J. T. Cronshaw, Sir Thomas Gardiner, Sir Walter Haward, Sir Wilson Jameson, and Dr. Andrew Topping.

Advertisements Refused

The committee reported to the Chancellor of the Exchequer on August 31, 1951. The proposed scales of the Howitt Committee were those shown in the column headed "Old Scale" in the Table above. They were not accepted by Civil Service medical officers or the B.M.A., and in July, 1952, the Representative Body of the British Medical Association decided not to publish further advertisements for Civil Service medical officers until a satisfactory agreement had been reached.

A steady campaign was carried out by the Civil Service Medical Officers Joint Committee, and eventually, after much discussion, the Treasury agreed to make fresh proposals. The new scales that have now been agreed are the result.

Understanding with Treasury

The scales are accompanied by a set of "understandings" which are set out in the following letter from the Treasury:

"(1) The Treasury propose that, with effect from January 1, 1952, the salary scales of the undermentioned grades of the Medical Officer class shall be:

Medical Officer, £1,500 by £75 to £1,800 by £100 to £2,100.
Senior Medical Officer, £2,200.
Principal Medical Officer, £2,300.

"(2) The above scale for the Medical Officer grade is not a consolidated scale, but one in which pay addition is assumed to be included. It does not, therefore, attract pay addition.

"(3) The minimum of the Medical Officer scale (£1,500) is linked to age 35, and is subject to an increase of one increment for each year above that age up to and exceeding 40. For each year of age below age 35 it is subject to a deduction of £50.

"(4) The scale and rates above set out are the same for women as for men and are subject to provincial differentiation in accordance with Estacode C c 2.

"(5) Agreement on these terms would be entered into by both parties on the following understandings: (a) both parties remain free to ask the Royal Commission on the Civil Service to con-

sider any proposals they think fit to make about the remuneration of all grades in the medical officer class. This particularly applies to the rates of pay for senior and principal medical officers the increases in which both sides regard as purely token; (b) the scale now agreed for the basic grade cannot be regarded as establishing any particular relativity between that grade and any grade or grades in other classes in the Civil Service; and (c) no new arrangements made in the remuneration of medical work outside the Civil Service—for instance, in the remuneration of consultants or other hospital medical staff in the National Health Service—will be made the basis of a claim to the Treasury prior to the publication of the Report of the Royal Commission, but this in no way limits either party's freedom of action in using any such factors in its submissions to the Royal Commission, or in using any other new considerations in fresh representations either before or after the Royal Commission has reported."

It will be seen from the above letter from the Treasury that the Civil Service Medical Officers Joint Committee is free to ask the Royal Commission on the Civil Service to consider its full claim for the Medical Officer class. That claim is that medical officers in the Civil Service should be given salaries that equate with the remuneration of the medical profession generally, following on the reports of the Spens Committees and the negotiations and decisions which have taken place since then.

PENSION AND SICKNESS BENEFITS FOR
DOCTORS' EMPLOYEES

SCHEME SPONSORED BY B.M.A.

Many practitioners have felt the need for a uniform plan which will provide reasonable pension and death benefits for their employees. Such provision, quite apart from its ethical aspect, does much to foster a sense of loyalty among employees and thus helps to bring about a continuity of service and interest of great value to the busy practitioner.

Tax Concessions

The question of cost is, of course, of paramount importance, but where the employer's contribution is allowed to rank as a business expense the position is much improved. A plan has now been approved by the Inland Revenue which not only allows the employer's contribution to be treated as a business expense, but under which the employee also receives substantial tax concessions. Further, the scheme allows for the transfer of employees from one practitioner to another without loss of pension rights and thus provides for succession in the case of single-handed practice or within a partnership. The Council of the British Medical Association has approved the terms of the pension plan and has agreed to act as trustees of the scheme, which will be operated solely by the Medical Insurance Agency on behalf of the Association. It is known as "The Medical and Dental Employees Pension Scheme." The M.I.A. negotiated the scheme from its inception and secured Inland Revenue approval. The terms of the trust deed provide that dental practitioners in addition to all medical practitioners can secure the benefits offered by the scheme.

Supplementary Sickness Scheme

Apart from providing for pension or death during service, every employer is faced from time to time with the question of what should be done for an employee during periods of sickness. Most employers feel that payment of salary should continue for a time, but this can prove expensive and sometimes embarrassing if sickness is prolonged. A supplementary plan has been arranged which caters for this problem at reasonable cost. It can be effected in conjunction with, or quite separately from, the pension scheme already mentioned. However, it should be made clear that while overall Revenue authority has been given to the major scheme—i.e., for the provision of pension and death bene-

Correspondence

Remuneration of Hospital Medical Staff

SIR,—As the first Chairman of the Central Consultants and Specialists Committee and a member of the original Joint Committee which negotiated the Terms and Conditions of Service for Hospital Medical Staff, I feel forced to comment on the report of Sir Russell Brain on the recent negotiations with the Whitley Council (*Supplement*, April 10, p. 145).

I know that the Staff Side of the Medical Whitley Council have had a difficult time, as they presumably set out to get an implementation of the Spens Committee Report. It is true that they have gained some concessions for the staff below S.H.M.O. and consultant level, which no doubt will be very welcome. But what about the consultants? Here they have indeed gained for them an Irishman's rise.

The weighting factor for the part-time consultant has been reduced to a maximum of $\frac{1}{2}$. What the minimum may be we do not yet know. Consider a consultant who undertakes only five sessions. What is his position?

No award			
Present basis	6½ at £2,750	=	£1,562 10 0
5 sessions	11		
Proposed basis	5½ at £3,100	=	£1,620 9 1
5 sessions	11		
		Gain	£57 19 1
C award			
Present basis	6½ at £3,250	=	£1,846 11 10
5 sessions	11		
Proposed basis	5½ at £3,600	=	£1,881 17 7
5 sessions	11		
		Gain	£35 5 9
B award			
Present basis	6½ at £4,250	=	£2,414 15 4
5 sessions	11		
Proposed basis	5½ at £4,400	=	£2,300 0 0
5 sessions	11		
		Loss	£114 15 4
A award			
Present basis	6½ at £5,250	=	£2,982 19 0
5 sessions	11		
Proposed basis	5½ at £5,300	=	£2,770 9 0
5 sessions	11		
		Loss	£212 10 0

I of course assume that such a consultant would be granted the maximum weighting factor.

It is a great pity that the negotiators, as you point out in your leading article (p. 860), "were not armed with the facts and advice that an expert economist and statistician might have given them." It is truly a Gilbertian situation that when negotiating for a betterment factor a clause should have to be inserted stating: "There is a protection against an individual losing pay on the coming into operation of the new agreement."

After our strenuous time during the negotiations in the early days I feel that the present settlement between the Staff and Management Sides of Whitley Committee "B" is a betrayal of our agreement and totally disregards the Spens Report. In saying this I am not suggesting we should have had a 100% betterment factor, but the result of the negotiations will satisfy neither the part-time nor the whole-time consultants. The consultants' Spens Report recommended that consultants' and hospital staffs' remuneration should be adjusted both to the altered value of money and to increases in income in the medical and other professions. A careful analysis of these factors should have been made before our negotiators entered into discussions. But this apparently was not done.

I hope the Central Consultants and Specialists Committee will not accept these terms without obtaining an assurance

fits, thus allowing the employer's contribution to rank as a business expense—the same authority does not extend to the supplementary sickness scheme. The additional premium required for that purpose would have to be the subject of individual negotiation by the practitioner with the Inland Revenue, but likewise there is no reason to suppose that it would not be allowed as a business expense.

Full details of the major and supplementary schemes can be obtained from the Chief Office of the Medical Insurance Agency, B.M.A. House, Tavistock Square, London, W.C.1, or from any of the Agency's branches in Birmingham, Cardiff, Edinburgh, Glasgow, Leeds, Manchester, and Newcastle.

TERMS AND CONDITIONS OF SERVICE OF
HOSPITAL MEDICAL STAFF

TENURE OF POST

The Medical Whitley Council (Committee "B") has agreed that, where a local change of organization in the hospital and specialist service involves displacement or serious disturbance of a senior hospital medical officer's services, the provision of the second sub-paragraph of paragraph 16 of the Terms and Conditions of Service of Hospital Medical and Dental Staff (England and Wales) or of the second sub-paragraph of paragraph 16 of the Terms and Conditions of Service of Hospital Medical and Dental Staff (Scotland) should apply to him as to a consultant.

To meet this the existing second sub-paragraph of paragraph 16 of the Terms and Conditions of Service of Hospital Medical and Dental Staff has been deleted and the following substituted:

"It is understood that, where a local change of organization in the hospital and specialist services involves displacement or serious disturbance of the services of a consultant, a senior hospital medical officer, or a senior hospital dental officer, the board recognizes that it has a moral obligation to render the greatest possible assistance to the officer, with a view to his obtaining comparable work in another hospital."

THE PRESIDENT'S TOUR
STAY IN BAGDAD

The honorary secretary of the Middle East Branch of the Association reports that the President of the B.M.A. and Mrs. Tudor Thomas left for Beirut by air on March 17 after a four days' stay in Bagdad. Mr. and Mrs. Tudor Thomas were the guests of H.E. the British Ambassador and Lady Troutbeck, who also gave a dinner in their honour on the first evening. The following three days were a busy mixture of official calls, lunches, cocktail parties, B.M.A. business meetings, and lectures to medical audiences and to students of the Royal Medical College. Judging from the number and diversity of people that the President met in the short time available, it would seem that the good will of the Council of the B.M.A. towards its Middle East Branch was also felt in circles other than medical in the capital of the kingdom of Iraq.

The President has now completed his tour and is expected back in this country this week-end.

B.M.A. CHARITIES BALL, MAY 6, 1954

The B.M.A. Charities Ball, organized by the Metropolitan Counties Branch, will be held in B.M.A. House on Thursday, May 6. It is hoped that as many members of the profession as possible, including those outside the Branch area, will attend and thus enable the Branch to make a handsome contribution to the medical charities. Dancing to the music of the Sydney Lipton Ballroom Orchestra; buffet and bars. Tickets £2 2s. each, or six for £11 11s. Further particulars will be issued in due course.

from the Minister of Health that the consultant Spens Report still constitutes the basis for all future negotiations on remuneration.—I am, etc.,

Manchester, 13.

R. L. NEWELL.

SIR,—The Chairman of the Staff Side of Committee "B" of the Medical Whitley Council confidently hopes that hospital staffs will regard their increases as satisfactory. Expressed as percentages over 1948 earnings, these increases are set out in the following Table :

Grade	Position on Scale	Percentage Increases in Remuneration over 1948
Consultant (A award)	Top	0.9
" (B ")	"	3.5
" (C ")	"	10.7
" basic	Bottom	12.7
		23.5
S.H.M.O.	Top	11.4
	Bottom	15.4
Senior registrar	Top	7.7
	Bottom	10.0
Registrar	Top	8.4
	Bottom	9.7
J.H.M.O.	Top	7.5
	Bottom	10.7
S.H.O.	Through-out	11.2
House officer	Top	16.7
	Bottom	21.4
Average for all grades		11.3

It can be seen that the average increase is 11.3%, and it is interesting to note that the Management Side have been more realistic by slipping in a less out-of-date adjustment (25%) to the residential charges for house officers. (Either the Staff Side negotiators were sound asleep when this was done, or they were so busy shouting the odds about part-time weighting that the significance of this little item passed unnoticed.) We are asked to accept this 11.3% increase as a fair upward adjustment to compensate for a 30% plus rise in the cost of living (since 1948), in spite of the fact that wages generally have more or less kept pace with the rising living costs.

The agreement, then, is completely unsatisfactory from the pure cost-of-living point of view, and if we dare look back at Spens it is even worse. But the very worst feature of all is the claim by the Chairman of the Staff Side that the negotiators have safeguarded Spens; one or two of the frills of Spens, such as part-time weighting, may have been preserved in a diluted form, but the meat in Spens—the hard cash which we all understand—is certainly not visible in the agreement. To crown it all, whole-timers are told that this same Staff Side will continue to exert pressure on the Management Side to improve the allowances for whole-time consultants. As a whole-time consultant I would much prefer to think that this matter of allowances will be considered by a Committee of Inquiry, remembering that a similar committee recently spent only four months to determine that the 1954 remuneration of a Member of Parliament should be £1,500 per annum, representing a "betterment factor" of 150% and 50% over 1939 and 1947 respectively.—I am, etc.,

KENNETH W. BEETHAM.

SIR,—Is everybody happy? They should be, for the windfall which Sir Russell Brain and his friends have struggled for twenty months to secure for us (*Supplement*, April 10, p. 145) is surely the laugh of the year. Everybody is now on the pig's back except the junior hospital doctor, who is obviously the animal in question.

This is wage negotiation at its lowest level. There is not a trade union leader in the country that would dare accept such a settlement on behalf of his members. However else we like to think of it, we are now all employees of the State negotiating for higher wages. The unfortunate thing is that we have got amateurs doing the job, in addition to which, when it comes to pressing wage claims as a profession, we

are too respectable. If we are not to continue the 1948 practice of sitting back and taking what is given us, the B.M.A. must stop being an association of professional gentlemen and become a militant trade union. Sectional representation such as registrars' committees, etc., is useless. The consolation prize is knowing how much is our worth. Mr. Macleod is casting no pearls away.—I am, etc.,

Norwich.

J. M. BROWNLEE.

SIR,—While appreciating the difficulties of the situation and the strenuous efforts of the Staff Side of Whitley "B" on behalf of both whole- and part-time specialists, most of us feel profoundly disappointed with the settlement reached. Since July, 1948, the cost of living has risen by 30%, so even if we consider the 20% betterment factor given in 1948 adequate, a rise of 30% on our present salaries would be required to restore them to the 1948 level. Yet the rise in consultant's salary is only 22% at the bottom of the scale and 12% at the top. Does this make sense?

A salary of £3,000 gross to-day is equivalent to £1,000 gross in 1939, yet the whole-time specialist's maximum according to the Spens Report should be £2,500 in terms of the 1939 values of money. As a whole-time consultant has to meet most of his expenses out of his salary, which is only 40% of what it should be, and is then denied income-tax relief on them, his present salary is equivalent to about one-third of what he is entitled to. Would any other section of the community tolerate this? It is to be hoped that whole-time specialists will be given adequate representation on the Staff Side for the future negotiations for expense allowances and domiciliary visiting.—I am, etc.,

Farnborough, Kent.

LEO GILCHRIST.

SIR,—I am sure my fellow part-time consultants will be "thrilled to bits" at the result of the agreed salary scale for hospital staff. Their rightful claim was for an implementation of Spens, and the result of all these months of negotiations is Section XI of the agreement: "There is protection against any individual losing pay. . . ."

I do not doubt that the Staff Side did their best, but one wishes they would sound apologetic rather than satisfied when the outcome of their endeavours for many of their colleagues was so nearly a decrease in pay rather than a negotiated increase. One knows now how a mother feels who has a difficult pregnancy, and a protracted labour, and produces a living monster—an early abortion would have been a blessed release.—I am, etc.,

Hove.

PAUL F. B. GILLET.

SIR,—No doubt there will be many comments about the Whitley award to hospital staff, especially in relation to the size [sic] of the award, the fact that it is retrospective to eight days, and the fact that house officers have to pay income tax at a relatively higher rate. I wish to raise the question of the S.H.M.O. As a "passed-over S.H.M.O." I wish to protest in the strongest manner at the differentiation in the agreed scales between S.H.M.O.s and consultants. Sir Russell Brain, in his statement (*Supplement*, April 10, p. 145), says that "the major benefit must be applied to the basic consultant grade in which the majority of hospital staff would make their permanent career. . . . The majority will probably agree with the principle; but the Staff Side of Whitley "B" does not appear to appreciate that their agreement *does* apply to the past, as opposed to the present and the future. Any individual who applies for an S.H.M.O. job knows the terms and the risks; but those who were transferred in 1948 did not do so, and only of the bitterness felt by ourselves on this matter.

This award could have reduced that ill-feeling; instead it has widened the gap between the S.H.M.O. and the consultant and has advertised to the G.P. and to the public that an S.H.M.O. can *not* be regarded as being in any way com-

parable to the consultant in ability, experience, or status: these factors do not appear to have been taken into consideration in grading, in this region at least, and the fact that this award has made the difference more obvious not only reflects upon Whitley "B," hard as they have worked, but is not likely to make passed-over S.H.M.O.s less bitter or more likely to make them participate in the Service as they do, at heart, wish to do.

I put forward three constructive suggestions: (1) the Staff Side of Whitley "B" should immediately open negotiations designed to close the increased gap between S.H.M.O. and consultant; the burden to the Treasury would be infinitesimal; (2) executive councils should obtain lists of "passed-over" S.H.M.O.s and recommend those whom they regard as of consultant status to be graded as such; and (3) should no action result from 1 or 2, at least those posts graded as consultant posts, but held by S.H.M.O.s, should be advertised and filled by consultants.—I am, etc.,

Portsmouth.

J. D. LENDRUM.

SIR,—I hope that this letter is but one of many. Your readers should strongly approve of the leading article (*Journal*, April 10, p. 860) regarding the remuneration of hospital medical staff. It shows a sense of responsibility sadly lacking in our negotiators. If it has taken these gentlemen 18 months to obtain such ridiculous increases they have been wasting their time. Surely it was obvious to them months ago that they were gaining no advantage? They should have walked out and told us why.—I am, etc.,

Aberdeen.

SENIOR REGISTRAR.

Work of the S.H.M.O.

SIR,—Dr. J. J. Bell (*Supplement*, April 3, p. 142) is to be commended on his moral courage, not only in enlightening Dr. A. E. Nicholls (*Supplement*, March 6, p. 66) on the duties of the S.H.M.O. in general, but in laying his own cards on the table and enumerating his own duties as a full-time S.H.M.O. surgeon. All other S.H.M.O.s in a similar plight must now follow suit and expose this iniquitous grading without further ado.

The fact is, of course, that our leaders should never have agreed to this grade in the first place. We all know that it was nothing less than an economic manoeuvre—a money-saving device—at the expense of men who should have been graded consultants. The rot set in with the grading fiasco of 1949—surely the most disgraceful episode in the history of the profession—when eminent people succeeded, heaven knows how, in neatly pigeon-holing hundreds of their colleagues into "grades" without knowing half of them and without reference to testimonials, referees, or anything else. It was a remarkable feat, but one which brought about considerable injustice, untold frustration, and permanent bitterness. It is highly probable that of those qualifying for consultancies the unlucky ones, not known personally to the graders, were relegated to the S.H.M.O. class. For if there had to be economy in this matter, how else could the graders have acted, human nature being what it is? In surgery, as in other specialties, there still remain many highly experienced men who must now be permanently condemned to this status, and their maximum salary will not rise above £1,950 per annum. Compared with the lot of these people, the part-time consultants are in clover.

A colleague of mine, a married man with two children, was graded S.H.M.O. in 1949. He was then 41 years of age, had 20 years' continuous experience in surgery, including several years' continuous experience in surgical fellowships and had contri- buted at least four original articles to the medical journals. In 1950 he deputized for twelve months for a consultant surgeon who was ill. As a full-time S.H.M.O. he received no extra remuneration for this, yet at the final review of grading in 1951 he was still not upgraded. Needless to say, his efforts to ascertain the reasons for this most unjust decision were met with a stony silence and skilful evasion characteristic of the medical bureaucrat.

One of the most distressing factors in the whole business is the complete absence of any court of appeal. The machinery set up to deal with "those who were aggrieved" was a complete farce. As a matter of fact, the S.H.M.O. can now only acquire consultant status by open competition. On the surface, this may seem a fair proposition. In practice, however, this is by no means the case, for he must now compete against young senior registrars from teaching schools, and in this respect he is in the same boat as senior registrars from non-teaching hospitals. The implication of this statement will be evident to all who have studied the system of appointing consultants in recent years.

The facts must now be faced. Here is a specialist group being treated as registrars, used as consultants, and paid as S.H.M.O.s. No trade union would ever tolerate such a monstrous situation in industry. The continued employment of the S.H.M.O. at his present salary is nothing other than professional exploitation. Both the Minister and the regional boards are well aware of this fact. Under the present set-up what incentive has he to do his work happily and efficiently? He is, in fact, in the same position as an aggrieved employee working in a nationalized industry without a trade union to protect his rights. Has the B.M.A. completely given up hope of getting the Ministry to re-examine the desperate plight of this group? Is anything going to be done for this grossly underpaid and permanently exploited section of our profession?—I am, etc.,

Macclesfield.

E. W. THOMAS.

Whole-time Medical Officers in the Public Health Service

SIR,—In reply to Dr. E. D. Irvine's letter (*Supplement*, April 3, p. 143), I am quite in agreement and would like to make a few more comments. The possession of the D.P.H. is essential and compulsory for a medical officer of health's appointment; yet this is about the only postgraduate diploma where a year's full course at a medical school is required prior to the candidate being admitted to the examination. In addition, the examination is far from easy—in fact, it is more difficult than the majority of other diplomas. Furthermore, many candidates possess other postgraduate degrees. Many medical officers of health, prior to 1948, were superintendents of infectious diseases hospitals, sanatoria, etc. In some cases, mine for instance, pulmonary collapse therapy was performed twice weekly on out-patients and others in wards, the indications for such therapy being definitely a matter of experience. Unfortunately, the majority of medical officers of health lost their hospitals at the change-over, to the regret of the local health committees. To this latter regressive step I attribute the unwillingness of local authorities in some cases to implement the 1951 award.

Many medical officers, now middle-aged, find themselves with a salary of a registrar's grade, yet are unable to improve their status. In my view the time is now ripe for the Association to press forward for a salary in keeping for the specialists in public health. If the medical officer of health, with his experience of fevers, preventive medicine, is not a specialist in these, then who is? Naturally, many local authorities take the view that, since the hospitals have gone over to regional boards, much responsibility has been removed from the M.O.H., therefore an increase of salary is not justified. That is merely begging the question; the M.O.H. was not responsible for such moves. A possible remedy is that a medical officer of health with special experience in a specialty—tuberculosis, fevers, etc.—shall work on a sessional basis, as a specialist, in such hospitals; be paid for doing so; and therefore increase his salary. Those with no such experience should be given the choice of learning a specialty and be paid as a clinical assistant.

There is still a shortage of doctors in hospitals, sanatoria, etc., and the extra help in such institutions would not only prove an asset but would improve the status of many medical officers of health, as well as from a monetary angle.—I am, etc.,

Sunderland.

R. C. F. SMITH.

Diary of Central Meetings

APRIL

- 27 Tues. Questionnaire Subcommittee, Constitution Committee, 10.30 a.m.
 27 Tues. Estates Committee, 2 p.m.
 27 Tues. Joint Formulary Committee, 2 p.m.
 28 Wed. Central Consultants and Specialists Executive, 10.30 a.m.
 28 Wed. Central Consultants and Specialists Committee, special meeting, 12 noon.
 28 Wed. Finance Committee, 2 p.m.
 29 Thurs. Liaison Committee of G.M.S. Committee and representatives of College of General Practitioners, 3 p.m.
 30 Fri. Psychological Medicine Group Committee, 2 p.m.
 30 Fri. Welsh Committee (at Raven Hotel, Shrewsbury), 2.15 p.m.

MAY

- 4 Tues. Evidence Committee on Divine Healing, 1.30 p.m.
 5 Wed. Consultants, General Practitioners, and Public Health Liaison Committee, 11 a.m.
 5 Wed. Office Committee, 11 a.m.
 5 Wed. Arbitration Machinery Committee, 1 p.m.
 5 Wed. Council, 2 p.m.
 6 Thurs. Council, 10 a.m.
 10 Mon. Subcommittee on Diagnosis of Eye Diseases, Ophthalmic Group Committee, 2 p.m.
 12 Wed. Central Consultants and Specialists Executive, 12 noon.
 12 Wed. Medico-Legal Subcommittee, Central Consultants and Specialists Committee, 4.30 p.m.
 13 Thurs. Physical Medicine Group Committee, 2 p.m.
 19 Wed. Conference of Honorary Secretaries, 10.30 a.m.
 20 Thurs. Radiologists Group Committee, 12 noon.
 28 Fri. Conference of Regional Officers, 12 noon.

Branch and Division Meetings to be Held

CITY DIVISION.—(1) At Hackney Hospital, Homerton High Street, E., Wednesday, April 28, 2 p.m., films: (a) "Physiology of the Kidney"; (b) "Humoral Transmission of the Sympathetic Impulses." (2) At Institute of Laryngology and Otology, Gray's Inn Road, W.C., Friday, April 30, 3.30 p.m., clinical meeting. Mr. W. D. Doey: "The Indications for Tonsillectomy."
CORNWALL DIVISION.—At Red Lion Hotel, Truro, Tuesday, April 27, 3.30 p.m., annual general meeting.
DARTFORD DIVISION.—At Bexley Maternity Hospital, Laverstock Road, Bexleyheath, Kent, Friday, April 23, 8.45 p.m., annual general meeting.
FINCHLEY DIVISION.—At Finchley Memorial Hospital, Bow Lane, N., Friday, April 30, 8.45 p.m., annual general meeting.
GREENWICH AND DEPTFORD DIVISION.—At St. Alfege's Hospital, Vanbrugh Hill, Greenwich, S.E., Wednesday, April 28, 8.30 p.m., clinical meeting.
HENDON DIVISION.—At Hendon Hall Hotel, Ashley Lane, N.W., Tuesday, April 27, 7.30 for 8 p.m., annual dinner. Members' wives, relatives, and friends are invited.
HYDE DIVISION.—Wednesday, April 28, 9 p.m., visit to the offices of the *Manchester Guardian*, 3, Cross Street, Manchester.
LAMBETH AND SOUTHWARK DIVISION.—At Lambeth Hospital, Brook Drive, S.E., Tuesday, April 27, 8.30 p.m., A.G.M.
LINCOLN DIVISION.—At County Hospital, Lincoln, Thursday, April 29, 8 p.m., meeting.
MID-ESSEX DIVISION.—At Out-patients Department, Chelmsford and Essex Hospital, London Road, Chelmsford, Wednesday, April 28, 8.15 p.m., meeting. Address by Sir Ernest Rock Carling: "Medicine After the Atomic Bomb." Questions and a general discussion will follow.
MID-HERTS DIVISION.—At Red Lion Hotel, St. Albans, Friday, April 30, 8.45 p.m., annual general meeting.
NORTH-WEST WALES DIVISION.—At the Clinic, Sackville Road, Bangor, Saturday, April 24, 4 p.m., annual meeting. Election of Officers; consideration of Annual Report of Council, etc.
NOTTINGHAMSHIRE BRANCH.—At 64, St. James's Street, Nottingham, Thursday, April 29, 8.30 p.m., meeting. B.M.A. Lecture by Mr. Harold Dodd: "The Perils of Thrombosis."
OLDHAM DIVISION.—At Oldham Hotel, Rhodes Bank, Oldham, Monday, April 26, 9 p.m., meeting. Professor R. E. Lane: "Industrial Medicine and the General Practitioner."
ROCHDALE DIVISION.—At Kingsway Hotel, Rochdale, Monday, April 26, 8.30 p.m., meeting.
SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Friday, April 30, 8.30 p.m., clinical meeting.
SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, April 23, 9 p.m., meeting. Dr. R. M. B. MacKenna: "Dermatology in General Practice."
SOUTH MIDDLESEX DIVISION.—At Red Lion Hotel, Hounslow, Wednesday, April 28, 8.45 p.m., meeting. Talk by Dr. Gerald M. J. Slot: "Recent Advances in Therapy with Special Reference to Antibiotics and Chemotherapy" (illustrated by a cinematograph film). A discussion will follow.

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, April 30, 3 p.m., clinical meeting.
WEST MIDDLESEX DIVISION.—At Paul's Restaurant, New Broadway, Ealing, W., Wednesday, April 28, 8.30 p.m., annual general meeting. Members' wives are invited.
WEST SOMERSET DIVISION.—At Musgrove Park Hospital, Taunton, Thursday, April 29, 7.30 p.m., annual general meeting.
WOOLWICH DIVISION.—A refresher course has been arranged by the Dartford Hospital Group, from April 23 to July 2.

Meetings of Branches and Divisions

CHELSEA AND FULHAM DIVISION

A general meeting was held at the West London Hospital, W.6, on March 19, 1954. Lectures were given by Dr. Geoffrey Konstam ("Some Factors Predisposing to Myocardial Ischaemia"), Dr. L. P. Laurent ("Management of Thyroid Disorders"), and Mr. H. Burge ("Dysphagia").

HOLLAND DIVISION

A meeting was held at the Peacock and Royal Hotel, Boston, on March 27, 1954. Dr. Gibson Barrie took the chair and there was an attendance of 43. Dr. D. Evan Bedford gave a lecture on "Common Difficulties in Diagnosis of Heart Disease," illustrated by lantern slides. He also answered a considerable number of questions.

MARYLEBONE DIVISION

After the main business of its annual general meeting on April 5, the Marylebone Division held a discussion on the optional right to sell the goodwill of medical practices. Dr. H. Guy Dain, Dr. H. H. D. Sutherland, and Dr. E. C. Warner were the principal speakers. Dr. Dain, speaking first, outlined the history of events which led up to the loss of the right to sell goodwill in the N.H.S. Remarking that it had been said that it was immoral to buy and sell patients, Dr. Dain pointed out that that is exactly what the State does now when it transfers blocks of patients from one doctor to another. Dr. Dain went on to mention some of the effects which the loss of the right to buy and sell goodwill had had on the profession. The argument had been put forward that a return of the right to buy and sell goodwill would affect the number of doctors entering practice and therefore upset the Danckwerts award, but Dr. Dain said that the Ministry would never agree to any scheme where there was a possibility of this happening.

Dr. Sutherland spoke next, and briefly outlined the scheme for buying and selling goodwill in the N.H.S. which the Amending Acts Committee of the B.M.A. (of which Committee he is Chairman) had prepared for the Council of the Association on the instructions of the Representative Body. He said that his Committee had been working on the problem for a long time and was still finding out new points. It was for the Representative Meeting at Glasgow to decide what was the right thing to do and whether the right to goodwill should be regained. Dr. E. C. Warner, the third speaker, said that he would like to see the young man of to-day invest in himself and in his ability to stand on his own feet. Drs. H. B. Woodhouse, Elizabeth Jacobs, A. C. E. Breach, C. Watney Roe (who put in a word of caution), R. Hale-White, W. M. Levitt, R. Cove-Smith, A. G. Manley, Alistair French, and R. H. Moore were among those who spoke in the ensuing discussion. Dr. Hale-White and Mr. Lawrence Abel proposed and seconded the vote of thanks to the speakers.

SARAWAK BRANCH

A meeting was held on February 16, 1954, with Dr. P. M. Philpott in the chair. There were eight members present. A general discussion took place on fixing a programme for the stay of the President of the Association, Mr. J. W. Tudor Thomas, in Kuching from April 6 to 8. The meeting closed with a clinical session at which three cases were presented—osteogenesis by Dr. Elsie Wong, osteosarcoma by Dr. T. M. Kraszewski, and hydronephrosis also by Dr. Kraszewski.

SOUTH STAFFORDSHIRE DIVISION

A meeting was held at the Bradmore Hotel, Wolverhampton, on February 19, 1954. Mr. Leslie Thomas took the chair, and there were 45 members present to hear a lecture on "Obesity" given by Dr. J. H. Sheldon. Another meeting was held in the Royal Hospital on March 24, when Mr. Leslie Thomas again took the chair. Mr. Robert D. Owen gave the B.M.A. lecture on "Diagnosis and Treatment of Cancer of the Lower Pharynx and Upper Oesophagus." Twenty-eight members attended.

WEST LOTHIAN DIVISION

The new West Lothian Division has made a successful start as an active Division of the B.M.A. Since its inaugural meeting on October 29, 1953, monthly meetings have been held, and speakers at these meetings have included Dr. E. R. C. Walker ("History of the B.M.A. in Scotland"), Mr. Peter F. Hamilton ("Aspects of the Law in Relation to the Doctor"), Dr. G. A. G. Peterkin ("Pruritus Ani et Vulvae"), Dr. T. N. MacGregor ("Modern Trends in Treatment with Steroid Hormones"), and Mr. L. H. Daiches ("The Link between Law and Medicine"). The first annual dinner dance was held on April 9 at Lea Park Hotel, Grangemouth.

THE CITY OF GLASGOW

BY
ARCHD. L. GOODALL, M.D., F.R.C.S.Ed., F.R.F.P.S., D.P.H.

Honorary Librarian, Royal Faculty of Physicians and Surgeons

"Let Glasgow flourish by the preaching of the Word and praising Thy name"

Those of us who advocate a return to the unshortened version of Glasgow's motto remember with pride that our city had been for a thousand years a centre of learning and piety before it was engulfed by industrialism within comparatively recent times.

In fact, the only continuing factor in her history has been her cultural activity, and the joke of the raffle where the first prize was a week in Glasgow and the second prize two weeks in Glasgow could not have been made when Pepys described her as "a very extraordinary town for beauty and trade much superior to anything to be seen in Scotland" (1682).

It is probable that the Romans had a fort there to protect the crossings of the Clyde and that one of their roads followed the line of the present Rottenrow and Drygate. Maybe the Druids carried on their rites on the hill behind the Cathedral.

The first Christian impact on Glasgow came about 397, when Ninian travelled from his settlement in Whithorn, the Candida Casa, and consecrated a burying-ground there. The next Christian visit is recognized as the true foundation of the city, and the story of the kindly founder is sufficiently unfamiliar to allow its retelling.

Owen, nephew of King Arthur, had had an affair with Thenau (commemorated as St. Enoch), daughter of Loth, King of Lothian. Her barbaric father, finding her pregnant and, furthermore, a Christian, had her cast from his fort on Traprain Law, and when she was saved by a miracle had her cast on the Firth of Forth in a coracle. She was carried

to Culross, where her son was born and taken into the care of St. Serf. He flourished under the patronage of the old saint and was called Kentigern, which means "chief lord." We prefer his pet name of Mungo, which means "beloved one." But his pre-eminence aroused jealousy and his fellow acolytes made life uncomfortable for him. On one occasion they killed one of St. Serf's favourite robins, but it was brought to life again by Mungo. On another, they destroyed all the lamps and Mungo brought in a frosted twig of oak (or hazel) which lit the whole shrine. These miracles are commemorated on our coat of arms.

The jealousy of the novices of Culross drove Mungo and a few companions westward in 543. One night they sheltered at Carnoch with an old saint called Fergus, who, Simeon-like, was awaiting the revelation before he died. In a vision Mungo was instructed to place Fergus's body on a cart and hitch it to two wild cattle, allowing them to wander where they would. They stopped on the bank of the Molendinar and there Mungo established his settlement. The story is commemorated on the roof of the Blacader aisle of the Cathedral, where Fergus is buried.

The Molendinar Burn has since disappeared into a sewerage pipe under Wishart Street, but is visible at two points. It is long since

"The good St. Mungo smiled and said, 'No prospect could be finer: We'll build our cell by this crystal well On the banks of the Molendinar.'"

The University of Glasgow.

Still Mungo had not yet reached peace and he was driven out by Morken to Wales. He was brought back by Rydderch Hael, whose castle was at Partick and whose queen was saved by another miracle of Mungo when her betrothal ring was found in the mouth of a salmon.

Mungo died in 603 and joined the Christian saints; his tomb is in the lower church of Glasgow Cathedral, and in St. Giles he had an altar, for the maintenance of which the Royal College of Surgeons of Edinburgh was first

View of the Cathedral from the north (from an old engraving by R. Paul, a pupil of the Fowles Academy of Art).

chartered. The name of our city may come from eglais-acha (*ecclesiae ager*) or from glas gu, "beloved green place."

Ecclesiastical Rule

There is no more word of Glasgow for five hundred years, but there must have been a Christian settlement there, for the next record is an inventory ordered by David I, the "sair sanct for the Crown." David, under the influence of his mother, Margaret, replaced the Culdee Church with a Roman priesthood and established feudalism. He endowed the Cathedral with the income from the lands of Govan. At this time Glasgow was a prosperous little town, living entirely upon its ecclesiastical functions. Shopkeepers, fishermen, and building tradesmen would be kept busy by the clerical authorities. The Wars of Independence touched her; Wallace had a tuzie with the English at the Bell of the Brae in 1296, and the Bishop of Glasgow, Wishart, absolved Bruce for his murder of the Red Comyn.

Irritated by the behaviour of some of his neighbouring Royal Burghs, Bishop Turnbull applied to the Pope in 1450 for certain privileges. These included the setting up of a university in 1451, an occasion duly celebrated 500 years later in 1951. The first building, "the auld pedagogy," was in Rottenrow, but soon the College moved to the High Street, where it remained for 400 years. A plate records the site.

Mary, Queen of Scots, paid several visits to Glasgow. On one occasion she probably stayed in Provand's Lordship while visiting the dissolute Darnley one week before his violent death. One of the "casket letters," used at the time and since to prove her complicity in Darnley's murder, was written from Glasgow. Her last visit was with her army to try her strength against James, her half-brother, at Langside, from which battle she fled to England and the block.

The Reformation changed the whole character of the city. The ecclesiastical foundations were seized by greedy nobles; the main employer of labour, the Church, was displaced. The Merchants and Crafts set up protective guilds, consolidated by the foundation of the Merchants and Trades Houses in 1605. From that time trade took an increasing part in directing Glasgow's development.

In 1638 the General Assembly, meeting in Glasgow Cathedral, passed the resolutions which established Presbyterianism as the church form of Scotland, and started the bloody fifty-year struggle of the Scots for religious freedom.

Charles Edward Stuart had no great popularity in Glasgow and he fined the citizens for their lukewarm support in 1745. The sack of the city was prevented by the gentle Lochiel, whose descendants are still honoured in Glasgow for his clemency. A plate on the wall at the corner of Glassford Street and Trongate records the site of Charles's lodging in Shawfield House.

The Growth of Trade

The native genius for trade began to turn the clerical centre into a mercantile town. Port Glasgow was opened in 1668 to allow direct trade with the countries beyond the seas. The Darien scheme might have set up Glasgow as the greatest seaport of Britain, but its failure with the loss of half of Scotland's capital resources, mainly due to English jealousy, postponed this realization.

The most important clause of the Treaty of Union of 1707 is number IV, which allows "freedom of intercourse of trade and navigation to and from any part or place within the said United Kingdom and the Dominions and Plantations thereunto belonging," to all subjects of the United Kingdom. Glasgow merchants seized this opportunity with both hands, and in fifty years had established an exceedingly prosperous tobacco trade with America. This trade collapsed after the American Rebellion, but, before that, steps had been taken to deepen the Clyde, the first steps in Glasgow's expansion. An Act of Parliament was passed in 1759 authorizing the deepening of the river. Another was passed in 1770 and the Clyde became navigable to the Broomielaw.

With the collapse of the tobacco trade, the Glasgow merchants turned to sugar and the manufacture of linen. Linen manufacture was introduced by a surgeon and a physician, William Stirling and John Gordon. The latter is "Potion" of *Roderick Random*, and it was to him that Tobias Smollett was apprenticed. Robert Owen's social experiment at New Lanark stands out for its far-seeing partnership between employer and worker.

Already in 1760 the Carron Iron Works had begun to produce the best ironware in the country, and the development of the Forth and Clyde Canal and the Napoleonic Wars spread industrialization to Glasgow. Steamships were developed under the lead of Symington and Bell. Railways flourished, and, to meet the demands for labour, the Highlands were depopulated and there began the Irish

The Trongate in 1774.

immigration, which has not yet ceased. In the past hundred years dependence on heavy industry has led to the acme of prosperity and the nadir of depression. Recent efforts will, we hope, insulate us against any repetition of the early thirties.

Glasgow as an Educational Centre

The first educational institution of Glasgow was probably the Grammar School, still in existence as the High School of Glasgow. Its origin is lost in the mists of antiquity, but it probably predates the University.

The University had a shaky beginning and was for a hundred years financially embarrassed and unsuitably housed. The *nova erectio* of 1577 changed these circumstances, and thenceforth the University has given more than its share of famous names to the world of learning. The names on the quincenary gates range from the great lawyer, Stair, to the great surgeon, Lister. What diverse fields of thought and achievement are epitomized in the names Adam Smith, Lord Kelvin, William Hunter, Joseph Black, Joseph Hooker, Robert Henryson, Joseph Coats, William Macewen, William Cullen, John Caird, James Boswell, James Watt, Robert and Andrew Foulis, and Gilbert Murray. The history of the University impinges on the history of the city at every point. The citizens supported the University, and in many ways the University's work supported the citizens. This symbiosis is still evident. William Hunter's museum and library are in some ways more outstanding than those of his brother.

The Royal Faculty of Physicians and Surgeons was founded in 1599 by a grant from James VI to Maister Peter Lowe and Maister Robert Hamilton. It was the first teaching and examining body in the West of Scotland, and for many years it scrutinized the credentials of Glasgow medical men for the good of the lieges. Its Fellowship Roll contains the names of William Cullen, Joseph Black, Thomas Graham, William Smellie, Joseph Lister, William Macewen, David Livingstone, Robert Watt, and Robert Perry among many other national and international figures.

The only large part of the grandiose plans of John Anderson which still survives is the Royal Technical College, Glasgow the first and largest technical college in Britain. Glasgow also boasts a School of Dentistry and a Veterinary College (both under the wing of the University); a School of Art; an Agricultural College; a College of Domestic Science; and the Scottish Academy of Music. The Art Gallery contains the finest collection of pictures in Britain, outside London.

Glasgow Medicine

Glasgow Medicine began before records were kept. City surgeons are recorded in the mid-sixteenth century, but only after the Royal Faculty had been founded in 1599 was there efficient oversight of the profession begun. This Royal Faculty is unique in that both physicians and surgeons have been amicably incorporated during its whole history. Its present function is largely the encouragement of post-graduate education and organization and the maintenance of a first-class library. The University began teaching medicine at the beginning of the eighteenth century, but provided a surgical course only in 1815. After various vicissitudes, the University now provides the only medical teaching in Glasgow and it has recently incorporated the dental and veterinary schools.

The hospitals of Glasgow began as clerical almshouses, one of which still stands. This is the Hospital of St. Nicholas, also known as Provand's Lordship, in Cathedral Square. The Town's Hospital was the name applied in 1734 to the poorhouse, but it had an attached infirmary in which Fellows of the Faculty gave their services and medicines free of charge.

The first of the modern hospitals was the Royal Infirmary, founded in 1792 and rebuilt in 1912. It was closely associated with medical education from its beginnings and housed most of Glasgow's medical history in the making. The

Western Infirmary became necessary after the removal of the University to Gilmorehill from High Street in 1870. It opened its gates in 1874 and, after a quiet start, is now a busy teaching and research institution. With the growth of the city southward, the need for the Victoria Infirmary arose and it was opened in 1890. The hospitals previously administered by the Corporation include Stobhill, Southern General, Eastern District, and Western District as general hospitals; Belvidere, Knightswood, and Ruchill as fever hospitals; Woodilee, Gartloch, Stoneyetts, Hawkhead, and Lennox Castle as mental hospitals; and Robroyston and Mearnskirk as tuberculosis institutions. The specialist hospitals include the Royal Mental Hospital (1810); the Eye Infirmary (1824); the Royal Maternity and Women's Hospital (1834); the Ophthalmic Institute (1869); the Ear, Nose, and Throat Hospital (1872); the Eastpark Home for Infirm Children (1874); the Royal Beatson Memorial Hospital (1890); Redlands Hospital for Women (1903); and the Homoeopathic Hospital (1914).

This profusion of teaching hospitals and clinical material has made Glasgow a centre of clinical study and research second to none other in the country. This alliance of the academic centre with the large commercial city, the union of Town and Gown, has produced nothing but good.

It is often said that one of Glasgow's great advantages is the ease with which one can get out of it. Certainly it is within easy reach of Loch Lomond, the Clyde Estuary, Ayrshire, and the West Highlands. It is surrounded by good golf courses and by centres of all forms of sport. Perhaps the most pleasing of the commonly heard remarks of the visitor to Glasgow is that the people are amongst the kindest and most hospitable in the world. We shall attempt to justify this tradition in July.

OCCUPATIONAL HEALTH

JOINT CONFERENCE OF ADVISORY COUNCILS

A Joint Conference of Advisory Councils of Occupational Health was held on April 13 at B.M.A. House, London. It was sponsored by the Occupational Health Committee, whose Chairman, Dr. J. A. L. VAUGHAN JONES, presided. The Conference was attended by representatives of ten advisory councils, and, as observers, by representatives of the British Employers' Confederation, the Occupational Health Section of the Royal College of Nursing, the Industrial Welfare Society, the Institute of Personnel Management, and the Society of Medical Officers of Health.

Chairman of Council's Welcome

Dr. E. A. GREGG, Chairman of Council, in welcoming the Conference, said that the British Medical Association's interest in occupational health went back now for some years. In 1945 the Annual Representative Meeting instructed the Association to promote local advisory committees, representing doctors, employers, and employed. In 1948 all Divisions were circularized with a view to the establishment of joint councils of industrial medicine (as they were called then), and in 1951 a model constitution for advisory councils was drawn up by the Committee. For many years there had been a Joint Committee of the B.M.A. with the Trades Union Congress. Up to the present moment liaison with the British Employers' Confederation had not been effected, but he hoped this would come about before long. Finally, it gave him pleasure to see Dr. Vaughan Jones in the position of Chairman. On the Council of the Association he had fought for the recognition of occupational health, and it was thanks to his efforts that the Occupational Health Committee was formed.

Dr. VAUGHAN JONES, from the Chair, said that it was 11½ years since the first advisory council was formed, and ten years since, at Leeds, the first conference was held.

Doctors in industry had realized that they could not get very far unless the point of view of employers and employees was appreciated in addition to their own. Progress had been slow, sometimes owing to the apathy of doctors. Altogether 17 councils had been formed, although only ten were represented in the present Conference. Twenty-one other Divisions had considered the question, but had decided for various reasons not to set up advisory councils. The arrangement of central conferences had been a difficulty in view of the isolated character of the organizations. Conferences had been held at Leeds, Burton-on-Trent, and Derby, but it had now been decided that they would like to have a conference with the B.M.A. as host and at its headquarters. He looked forward to an accession of strength at future conferences. He suggested also that advisory councils might widen their invitation list, bringing in factory inspectors, medical and lay, and representatives of the industrial section of the Royal College of Nursing and of the Institute of Personnel Management, and that a medical officer of health, if not elected in the usual way, should be invited. Occupational health to-day was on the verge of considerable expansion. In this movement they served industry and each other, and helped to make a happy working community.

Central Federation Proposed

Mr. C. F. GOTHARD (Burton and District) moved a recommendation in favour of some form of voluntary federation or association of all advisory councils of occupational health, to provide a centre for the co-ordination, expansion, and consolidation of the work of the councils. This Conference, he said, might well mark the end of a probationary period. The foundation of the movement had been excellent. On the one hand it had been fostered by the B.M.A. with its expert knowledge, and on the other by the employers and the trade unions. There was every reason for setting up some form of central organization. Its exact character remained to be worked out by the B.M.A. through its appropriate committees. The motion was seconded by Mr. W. G. M. TWIGG, also from Burton, who pointed out the need for co-ordination and distribution of knowledge, functions which could only properly be discharged by a central body.

Mr. A. E. GREGORY (Southampton) said that the central organization should be on tripartite lines. He also suggested that the Associated Chambers of Commerce was one of the bodies which should be brought into the picture.

Dr. H. ALEXANDER (Wandsworth and Battersea) urged that new methods should be devised for implementing the recommendations or decisions reached by the councils. He asked in particular for more frequent meetings of the joint B.M.A. and T.U.C. Committee, that advisory councils should have freedom of approach to their local authorities, and that in the personnel of advisory councils there should be included the medical officer of health or his deputy.

A long discussion followed in which representatives of advisory councils from Leeds, Coventry, York, Brighton, Derby, and Wolverhampton took part.

The CHAIRMAN pointed out the alternatives which had been proposed: a central organization composed of bodies representing employers, employees, and doctors; a committee of existing advisory councils; a central organization with direct representation, in the first instance, of each advisory council and, at a later stage, representatives elected from an annual conference.

When it came to voting it appeared that all but two representatives were in favour of the Burton resolution that some form of voluntary federation or association of all advisory councils should be set up to provide a centre for co-ordination and expansion. It was also agreed that it should be formed on tripartite lines. It was further agreed that the central body should consist of representatives of the B.M.A., the British Employers' Confederation, and the Trades Union Congress plus a representative from each Advisory Council, and that an annual conference of Advi-

sory Councils should be held. The next conference is to be held in London in a year's time. Mr. Gothard, of Burton and District, was elected Chairman of the next Conference.

Publicity

The Conference next turned to the question of publicity. It was proposed by Wandsworth and Battersea that in order to promote the closest possible liaison between advisory councils each council should send copies of its minutes to the other councils. Wandsworth and Battersea also asked that steps should be taken to make the public aware of the existence and work of advisory councils by means of public meetings, with films, demonstrations, and local press publicity. This last matter proved more difficult owing to a paragraph in the model constitution which laid it down that there should be published in the local press only agreed reports of advisory councils' proceedings, and then only provided that the decisions were unanimous. The feeling of the Conference was against the admission of the press to advisory councils' meetings. So far as national publicity was concerned it was the feeling of the Conference that representations should be made to the T.U.C., the employers' organizations, and the B.M.A. to endeavour to secure the formation of further advisory councils.

OCCUPATIONAL HEALTH SERVICES

Another all-day meeting of the Occupational Health Committee of the Association was held on April 14, Dr. J. A. L. VAUGHAN JONES presiding.

The Memorandum on the Future of Occupational Health Services was again the subject of detailed discussion in connexion with a report by representatives of informal discussions with other interested bodies.

It was understood that the Trades Union Congress would like to discuss the memorandum through the medium of the Joint B.M.A. and T.U.C. Committee, and it was agreed to ask the Council of the Association to arrange for this meeting in the near future. It was mentioned that the B.M.A. side of the Joint Committee, apart from the Chairmen (or their nominees) of the Central Consultants and Specialists, General Medical Services, Public Health, and Occupational Health Committees, included members chosen by the Chairman of Council for their familiarity with the subject to be discussed at a particular meeting. It was agreed that the names of Drs. H. Alexander, M.E.M. Herford, and L. G. Norman should be recommended to the Chairman of Council for inclusion amongst the B.M.A. representatives on this occasion.

Administration of Morphine by Nurses

A letter was read from the medical adviser of a large industrial concern stating that he had been informed by the Medical Protection Society that the practice of issuing supplies of morphine to nurses in factories for administration to patients other than under the direct personal supervision and in the presence of a medical practitioner was a criminal offence under the Dangerous Drugs Act. In his view it was time the law was changed in this respect.

It was reported that the Public Health Committee at its meeting the previous week had considered this matter from a wider point of view—namely, the injection by nurses of any substance into the blood stream directly or indirectly—and had decided to await a report by the Royal College of Nursing following a conference on the subject. The Royal College itself had written expressing its concern about the legal position of the occupational health nurse with regard to the administration of dangerous drugs in cases of emergency. The Occupational Health Section of the Royal College desired an opportunity of discussing the matter with the Occupational Health Committee of the B.M.A. It was agreed to accept this invitation for an informal discussion and to report back to the Committee.

Medical Standards in Transport

Dr. L. G. NORMAN, referring to the notes for the guidance of practitioners examining applicants for public service vehicle driving licences, said that a member of the subcommittee, who was out of the country when the recommendations were framed, had sent certain suggestions for modification of the notes, in particular with regard to heart disease, diabetes, and albuminuria.

The suggestions were accepted, and the Committee reconsidered the notes again, making certain revisions, which will be reported to the Council.

Advisory Councils

A report was made on the Joint Conference of Advisory Councils which had been held on the previous day (see this Supplement, p. 201). Representatives of ten advisory councils attended, together with members of the Committee and observers from the British Employers' Confederation, the Industrial Welfare Society, the Royal College of Nursing, the Institute of Personnel Management, and the Society of Medical Officers of Health. Various recommendations from the Conference regarding the extension of the work of the Advisory Councils and the setting up of a central body were discussed by the Committee, and a full report will be submitted to Council at its next meeting. Representatives of the British Employers' Confederation had attended on the previous day, and it was hoped to have informal discussions with the Confederation with a view to securing close liaison, such as already exists between the British Medical Association and the Trades Union Congress through the Joint B.M.A. and T.U.C. Committee.

Remuneration of Industrial Medical Officers

The Remuneration Subcommittee presented a report covering several matters. The Subcommittee had considered the advisability of revising the wording of the Association's scale of remuneration for industrial medical officers to facilitate its adoption by all sections of industry. A revised draft was submitted, and after some discussion a statement was agreed for submission to the Council.

It was felt that a survey of the present remuneration in different industries was now necessary, and it was agreed that the Subcommittee be instructed to examine the whole subject in the light of recent increases in professional remuneration and of the probable extension of the occupational health services. It appeared that much detailed information was required and the offer of co-operation from members of the Association of Industrial Medical Officers was gratefully accepted.

Other matters discussed included Mule Spinning (Health) Special Regulations, 1953; Part-time Industrial Medical Officers; and the matter of the examination of applicants for public service vehicle driving licences.

N.H.S. COSTS IN SURREY

The estimated population of the Administrative County of Surrey on June 30, 1953, was 1,359,672; 1,284,228 names were included in the Health Service lists of general medical practitioners at January 1, 1954.

During the year ended March 31, 1954, the cost of the services administered by the Surrey Executive Council was £4,584,048. Of this amount, general medical services accounted for £1,556,016, pharmaceutical service £1,212,826, dental service £1,306,432, ophthalmic service £442,360, and administration £66,414. Pharmaceutical charges to patients during the year were £172,422 (about 14% of the cost), dental charges £276,023 (21% of cost), and ophthalmic charges £170,380 (38.5%). The net cost to the Exchequer was £3,965,223.

These figures were given in a statement presented by the chairman of the Surrey Executive Council at its annual meeting on April 14.

PRIVATE PRACTICE COMMITTEE

The Private Practice Committee at its meeting on April 14, with Dr. Ian Grant in the chair, was as usual confronted by a long and varied agenda. Tributes were paid to a member of the Committee, Dr. T. W. Morgan, whose death had occurred since the last meeting.

A report was made on the present position of bonus shift certificates. The National Coal Board had stated that, apart from one Division, the tightening up of administrative procedure in connexion with these certificates had not given rise to any appreciable difficulty. From the general discussion it appeared that in some areas individual miners were not yet aware of the need to see their doctor on the day on which they were unable to work. It was agreed that a watchful eye be kept on the situation. An assurance from the National Coal Board relating to the benefits to be paid in the event of any medical practitioner being killed or injured when called to a colliery was considered satisfactory.

Drugs for Private Patients

Representatives of the Committee and of the General Medical Services Committee had recently met officers of the Ministry of Health to discuss the possibility of prescribing for private patients on Form E.C.10. It was stated that the promise had been given that the case would be put before the Minister.

It was agreed to discuss with the Home Office the possibility of securing an agreed scale of minimum allowances for professional witnesses to fact at all criminal courts.

The Committee was informed that the Hearts of Oak Benefit Society had now agreed to pay a fee of one and a half guineas for medical reports when the sum assured exceeded £300. For policies below this sum the approved "short form" would be used and the agreed fee of 15s. would be paid.

Correspondence concerning cremation fees was laid before the Committee. The Association's Solicitors, who had been consulted on the question, gave the opinion that no member of a hospital medical staff signing Certificate B was entitled to charge for it. The Committee of the Registrars Group had asked that representations be made to the Home Office to recommend that when Certificate B was given by a house-officer Certificate C should be accepted if signed by a registrar of the requisite standing. It was stated that this was already an accepted practice in a number of areas. The view of the Central Consultants and Specialists Committee is to be sought.

Remuneration of Ship Surgeons

The Committee devoted some time to the consideration of a letter from a member of the Association, a ship surgeon, who stated that he had served his company for a number of years, that his salary was £65 per month, and fees received from passengers in addition to salary did not average more than £250 per annum. It had been ascertained that the salary was about average, but that a surgeon serving in a large passenger liner would receive at least £500 a year in fees. The Committee recalled that five years ago it had put forward certain basic proposals which had not been acceptable to the employers. It was stated that the shipping companies had no difficulty in obtaining ship surgeons at current rates. It was agreed that this matter should be referred to a meeting of the Maritime Subcommittee.

The final matter considered by the Committee concerned freedom of choice of doctor. A correspondent had drawn attention to a practice, which he said was on the increase, whereby employers tried to insist that their staffs should be on the list of a National Health Service general practitioner. A similar situation, he said, occurred in certain public and preparatory schools where the pupils were obliged to be attended by the school doctor under N.H.S. arrangements even though their parents might prefer them to receive attention from the school doctor under private arrangements. Further information is to be sought.

British Medical Association

GENERAL MEDICAL SERVICES COMMITTEE

SUPPLEMENTARY REPORT OF THE GENERAL MEDICAL SERVICES COMMITTEE TO THE ANNUAL
CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL COMMITTEES, 1954

REMUNERATION

Size of the Central Pool

(Paras. 17-33 of Report)

290. In its main report the Committee gave a detailed account of the way in which the size of the pool is calculated afresh each year and the various steps which must be taken before the precise amount of the final settlement can be determined.

291. The very detailed information which must be sought before the size of the pool can be calculated means inevitably that some considerable interval must elapse between the end of the financial year in question and the payment of the final settlement moneys. This is particularly true of the year 1952-3, during which lengthy investigations and discussions with the Ministry on such matters as the number of doctors in the Service, the level of practice expenses, and the extent of receipts from private practice and from other sources have been conducted.

292. Agreement has, however, now been reached on most of the outstanding points, and it is hoped to reach final agreement on the pool for that year in the very near future. The Committee would, however, like to give early notice that, on the basis of the data now available, the size of the final settlement for 1952-3 will be negligible. This is not altogether unexpected, as in that year, the final year of the old distribution scheme, the capitation fee was deliberately augmented to the full extent of the additional moneys made available by the award—in other words, the total amount of the increased pool, so far as it could then be calculated, was distributed within the year, as a percentage increase on capitation fees and fixed annual payments.

293. It is expected, however, that the following year when a change was made to payment by fixed capitation fee and by loading, and when an increase took place in the number of doctors in the Service, will show a balance remaining to be distributed to the profession as final settlement. The task of negotiating this final settlement for 1953-4 is already under way, though it will necessarily be some time before agreement can be reached.

Back Debits and Back Credits

(Para. 45 of Report)

294. The Ministry has accepted the Committee's view that it would be reasonable to impose an overall time limit equally on both back debits and back credits. In future it is proposed that retrospective adjustments either way will not be made for more than two years, and by way of further simplifying the present procedure they will be calculated on the same basis as the capitation fees for the quarter in which any adjustment takes place.

THE DANCKWERTS AWARD AND THE SMALL-LIST
PRACTITIONER

(Paras. 46-52 of Report)

295. The Working Party has now completed its detailed examination of the effects of the new distribution scheme on the small-list practitioner, and its report on the subject is set out in Appendix F.

296. The findings, based upon a careful survey of the facts, happily show that the number of cases in which there is a loss of income solely attributable to the new scheme is very small.

297. The Committee is satisfied that the new proposals which operate retrospectively to April 1, 1953, will deal equitably with the position as it is now shown to exist. In recommending these proposals it wishes to draw particular attention to the following considerations. Firstly, the proposals will secure the principle of "no detriment"; secondly, they avoid any question of a "means test"; and thirdly, in assessing hardship no account will be taken of outside sources of professional remuneration; above all, the basic principles of the distribution scheme, accepted by both the profession and Parliament, will remain undisturbed and the cost of the new scheme met out of the final settlement moneys in each year, as was intended by the Conference. The Committee therefore recommends:

Recommendation: That the report of the Working Party be approved.

RESTORATION OF THE RIGHT TO BUY AND SELL
GOODWILL

298. It will be remembered that the Conference last year passed the following resolution on a proposal for the optional return of goodwill put forward by the Amending Acts Committee of the Association:

"That the Conference of Local Medical Committees, representing National Health Service Practitioners throughout the country, having considered the memorandum prepared by the Amending Acts Committee and the comments of the General Medical Services Committee and the Compensation and Superannuation Committee upon it, is not in favour of the optional return of the right to buy and sell goodwill of practices, which it believes to be impracticable."

299. Subsequently the Representative Body of the Association at its meeting in Cardiff in 1953 passed the following resolution:

"That the Amending Acts Committee having recommended the restoration of the right to sell goodwill, this Representative Meeting instructs the Council of the Association to produce a scheme for the return of goodwill and to report to the Representative Body in 1954."

300. At the commencement of the present session the Council instructed the Amending Acts Committee to prepare a detailed scheme for the restoration of goodwill and a great deal of thought has since been given by that Committee to the many difficult problems involved.

301. At its meeting in March the Council received a draft scheme, together with a memorandum on the economic difficulties involved, prepared by Mr. A. N. Dixon, the General Manager of the Medical Insurance Agency. The Council decided that the scheme prepared by the Amending Acts Committee should be submitted to the Representative Body at its meeting in Glasgow, but that in the first place the views of the General Medical Services Committee should be sought on the general principles of the scheme and in particular its practicability. The Committee has once more given most careful consideration to the whole problem of the restoration of goodwill and detailed study to the scheme submitted.

302. Any scheme for the restoration of goodwill must be examined in the light of present-day economic circumstances, and the Committee is in no doubt that a return to the buying and selling of goodwill has become economically impossible to-day. If the purchase of practice goodwill became compulsory to the future generation of doctors

(now students)—a generation who have taken up the study of medicine in the knowledge that they would not be required to enter practice by purchase—real hardship would be caused.

303. The Committee, after careful consideration, has informed the Council that, whilst it wished to pay tribute to the constructive efforts of the Amending Acts Committee to produce a scheme for the restoration of the right to buy and sell goodwill, it did not support the scheme which had been submitted. This view has also been expressed by the Assistants and Young Practitioners' Subcommittee and by the British Medical Students Association. Further, the Council has been informed that, from the information contained in a memorandum prepared by the General Manager of the Medical Insurance Agency on the possibility of loans for the purpose, the Committee has reached the firm conclusion that the very difficult economic circumstances which have developed since 1948, in addition to the many other practical difficulties involved, would render it impossible to carry out this or any similar scheme for the restoration of goodwill.

304. The Committee sees nothing in the present proposals which would justify asking the Conference to modify the view it took last year. It is not possible to submit the detailed scheme and its appendices to Local Medical Committees before the Council has met in May to consider its own final attitude to the proposals. It is expected that the proposals and the Council's report on this subject will be published on May 22 in the Supplementary Report of the Council to the Representative Body. The fact that the General Medical Services Committee cannot recommend any change of policy to the Conference does not prevent any Local Medical Committee putting down a motion on the subject if it so wishes. Should the outcome of the discussion on the report of the Amending Acts Committee in Council, or in the Representative Body, make it seem desirable, the General Medical Services Committee would always be willing to discuss the advisability of calling a Special Conference to obtain the considered views of Local Medical Committees on this important matter.

MATERNITY MEDICAL SERVICES

Ante- and Post-natal Care

(Paras. 159-161 of Report)

305. Following representations by the Committee, the Ministry has now agreed to issue a memorandum which will make it quite clear that the general practitioner is entitled to claim the appropriate fees when he provides maternity medical services for a woman who has arranged to be confined in hospital when exceptionally either he himself decides that it would be inconvenient for her to attend at the hospital for her ante- or post-natal care, or where the hospital itself requests him to undertake this work.

306. It is hoped that the Ministry's memorandum will avoid the difficulties referred to in the main body of the Committee's Report.

General Practitioners and Institutional Midwifery

(Paras. 165-166 of Report)

307. Representations have been made to the Ministry about the decision to close the Springfield Maternity Home at Blackburn. Not only was the decision to close Springfield taken without adequate consultation with local general practitioners, but the actual evacuation of the patients was carried out with complete disregard for their responsibility for the patients then in the home. This Maternity Home played an essential part in the maternity services of the area, and the alternative accommodation offered was neither convenient nor practicable for the doctors in Blackburn itself.

308. The Ministry has now given an assurance that this aspect of the problem will be given careful consideration with a view to providing alternative and conveniently situated institutional maternity accommodation for the doctors in Blackburn.

309. The Committee took the opportunity during the course of these discussions of stressing the need for maintaining an adequate number of general practitioner maternity beds throughout the country, and emphasized that, should it be found necessary to divert maternity beds to other uses, then the proportion of general practitioner to consultant maternity beds should not be reduced.

DRUGS PRESCRIBED BY DISPENSING DOCTORS
OVER PROLONGED PERIODS

(Paras. 218-219 of Report)

310. In its main Report the Committee referred to the compromise which had been reached with the Ministry on the question of putting these claims on a three-monthly as opposed to a strict quarterly basis. In effect the Ministry has agreed that, whilst the present quarterly basis will be retained for normal cases and for claims that have been continuous for some time, special arrangements will be introduced to cover exceptional cases where drugs costing more than £1 have been supplied during a period of three consecutive months, not comprising a calendar quarter.

311. The procedure which the Ministry now suggests for the purpose is that individual practitioners should continue to submit all claims at the end of each quarter, but that, in these exceptional cases, separate claims would be made for expensive drugs supplied in any three-month period which began in the previous quarter. In sending in claims for the March quarter, for instance, separate claims would be made for cases in which the cost of dispensing for a particular patient exceeded £1 during the period December to February. The special payments will not be made for consecutive three-month periods for the same patient, as, here, the normal quarterly basis will continue to operate.

ECONOMY IN PRESCRIBING

(Para. 231 of Report)

312. The Committee has now had an opportunity of considering the terms of reference and constitution of the new standing joint committee on the classification of proprietary preparations which is taking the place of the original Joint Committee on Prescribing on Form E.C.10.

313. The Committee had originally been uncertain as to whether the work of the new joint committee would be solely concerned with the classification of new proprietary preparations or whether it would be called upon, as was its predecessor, to consider the desirability of restricting or discouraging prescribing by general practitioners in the National Health Service. An assurance has now been received that the function of the new committee will be purely to classify proprietary preparations into the six categories already laid down by the previous Committee on Prescribing on Form E.C.10. The Committee feels, however, that as the work of the new Committee primarily affects those in general practice the proposed general practitioner representation is inadequate, and it is inviting the Council of the Association to press for the appointment of a greater number of general practitioners.

GRANTS FOR LOCUMS DURING REFRESHER
COURSES

(Para. 239 of Report)

314. Discussions have taken place with the Ministry on the question of increasing the payment made to general practitioners attending postgraduate courses in order to defray the cost of employing locums during their absence. The Committee has evidence that the current rate for locums is in excess of the amount of the present grant, and it is asking the Ministry to make the necessary adjustment.

315. In addition, the Committee has once again pressed the claim of assistants in general practice to take part in these courses. The Ministry, though foreseeing difficulty, is looking into the possibilities of such a proposal.

VACCINATION AND IMMUNIZATION

(Paras. 244-245 of Report)

316. The Committee has now had an opportunity of studying a draft circular prepared by the Ministry setting out its policy in regard to vaccination. The Committee hopes that the issue of this circular will do much to remove some of the difficulties which have arisen in some parts of the country over the payment of notification fees for vaccination of adults.

317. The Committee is to invite the Ministry of Health to consider the initiation of a national publicity campaign to encourage vaccination and immunization.

TEMPORARY RESIDENT FEES—HOLIDAY CAMPS

318. Under the arrangements for temporary residents Executive Councils, in consultation with Local Medical Committees, are required to classify holiday camps and institutions so that, under certain circumstances, the residents attract a temporary resident fee of 5s. only as compared with the normal temporary resident rate of 17s. The decision as to whether an institution is to be classified for the purposes of payment at the lower rate depends largely upon whether the doctor is in regular attendance and has facilities for seeing a number of patients at a fixed time and place. Difficulties have arisen over the application of this criterion, and the Committee is to discuss the matter with the Ministry of Health.

JOINT FORMULARY COMMITTEE OF THE B.M.A. AND THE PHARMACEUTICAL SOCIETY

319. Although the Committee is represented on the Joint Formulary Committee, since the constitution of that Committee was originally devised, events have made it necessary for other interested bodies to appoint members to it—with a consequent reduction in the proportion of general practitioner representatives to other members. This situation has been met in agreement with the Joint Formulary Committee by enlarging the general practitioner representation on its Executive Subcommittee which undertakes much of the work which is of importance to general practitioners.

APPENDIX F

DISTRIBUTION OF REMUNERATION AMONG
GENERAL PRACTITIONERS

SECOND REPORT OF WORKING PARTY

Introduction

1. In order that the matters dealt with in this Report may be seen in proper perspective, it may be helpful to recapitulate the circumstances which have led up to it.

The original terms of reference of the Working Party were:

"To secure an equitable distribution of the Central Pool based upon the recommendations of the Spens Committee, the object being to enable the best possible medical service to be available to the public, and to safeguard the standard of medical service by discouraging unduly large lists; at the same time, to bring about a relative improvement in the position of those practitioners least favourably placed under the present plan of distribution, to make it easier for new doctors to enter practice, and to stimulate group practice."

These terms of reference were a condition of the acceptance of the award of Mr. Justice Danckwerts and were binding on the Working Party in all their deliberations, those subsequent to their first report as well as those preceding it. The scheme of distribution recommended in the Working Party's first report was accepted by the Government and has been put into effect by arrangements embodied in Regulations laid before Parliament.

2. The Working Party have carefully considered the following resolution passed by the Special Conference of Local Medical Committees on June 26, 1952:

"That if, when the new scheme of distribution has been endorsed by both parties, it is found in the light of experience that certain groups of practitioners who under the terms of reference of the Working Party might have expected to have benefited have, in fact, not done so, it be left to the Working Party provisionally to allocate an appropriate proportion of the final settlement moneys for the purpose of remedying any obvious defects in the distribution scheme, such allocation to be subject to confirmation by the next Conference before it becomes a permanent feature of the scheme."

It has been claimed by some practitioners with small lists that, to give effect to the Conference rider, comparison must be made between the amount received under the arrangement introduced in 1953 and that received before that date when taking into account the retrospective payments under the award.

The implementation of the award by Parliament was contingent upon a new scheme of distribution which was to be largely aimed at improving the relative position of the practitioner with the medium-sized list. It is in these middle ranges that the greatest benefit now accrues.

Clearly, given a fixed sum to distribute, any system of priorities necessarily means that certain classes must secure relatively greater advantages than others from the award. The Working Party originally concluded that the requirements of their terms of reference would best be implemented by the loading of capitation rates for lists between 500 and 1,500, and later considerations have not led them to think that on merits there is a case for any general additions to the capitation rate for lists either below 500 or above 1,500. It must be stressed that any modification of the scheme of distribution in favour of any section of practitioners must necessarily mean less money for other groups of practitioners and would undoubtedly lead to other claims, the justice of which it might be difficult to deny.

In the view of the Working Party it is also not proper to make a comparison between remuneration under the arrangements introduced in April, 1953, and the augmented capitation fee which, under the retrospective provisions of the award, was paid at a flat rate in respect of the years prior to 1953-4. Arrears of money due under the award had, of necessity, to be related to the actual capitation payments made to general practitioners in each of these preceding years, as it was not practicable to calculate the arrears by reference to the new method of distribution.

For these various reasons the Working Party have confined themselves to considering the distribution of the moneys set aside from the Central Pool in accordance with the recommendation in paragraph 19 of the first report, which referred to the possibility of hardship arising under the new arrangements, particularly for elderly practitioners losing a fixed annual payment.

Possible Reasons for Hardship under the Present
Distribution of Remuneration

3. The effects of the arrangements introduced in April, 1953, could be assessed only in the light of practical evidence of their operation, and a comprehensive inquiry was therefore put under way as soon as practicable. This inquiry was designed to reveal both the number and groups of general practitioners who might, in the light of experience, be found to have been adversely affected, and went into the remuneration of single-handed doctors with National Health Service lists of less than 1,200 patients.

It showed that only two groups could be said to have been placed at a disadvantage: the first, a small group of doctors who had not been able to counteract the adverse effect on them of the replacement of the fixed annual payment by initial practice allowances, and the second, the elderly doctors who comprise the largest category of practi-

tioners with small lists of patients. The latter, for practical reasons, as well as the former, had not been able to take sufficient advantage of the opportunities and incentives offered by the new scheme of distribution for building up their lists and for becoming members of partnerships. To some extent, the two groups overlap.

The Application of the Proposed Scheme of Supplementary Payments

4. The Working Party have designed a scheme to apply to both the groups referred to in paragraph 3 (which might altogether cover as many as 500 to 600 doctors with lists of up to 1,200 patients). Of this number it is likely that about half, say, some 300, will have lists of under 700, representing something like one-third of the doctors with lists below 700. In drawing up the scheme outlined below, the Working Party considered that payments should be made without regard to the doctor's total professional income but should be related to the size of a practitioner's list. Without disturbing the main scheme of distributing the Central Pool, which has been accepted by the profession and has been in operation for a year, the supplementary payments now recommended should ensure that the main scheme will not operate to the detriment of any individual practitioner.

Details of the Supplementary Payments and Eligibility

5. (i) Outline of the Scheme

The recommended scheme for supplementary payments provides, subject to one or other of the two sets of conditions described below, a basic payment of £250 per annum for single-handed doctors with lists of not less than 300 and not more than 1,200 patients. For each patient, a normal capitation fee would be payable and there would be a special additional fee of 10s. for each patient above the three hundredth and up to the five hundredth. No loadings under the usual arrangements would be payable. A table showing the practical application of this scheme is appended to this paper.

The Working Party recommend that central committees (for England and Wales, and Scotland respectively) should be established which should be solely responsible for exercising any discretion on questions arising out of the application of the criteria referred to below. These central committees should be composed equally of representatives of the Health Departments and of the profession.

(ii) Conditions Applicable to Doctors Previously in Receipt of a Fixed Annual Payment

The duration of payment according to this scheme should be five years at most. Doctors in this category who are to become eligible under the scheme must fulfil the following conditions:

(a) They must be single-handed practitioners who, on March 31, 1953, were under 60 years of age and were then in receipt of a fixed annual payment. Subject to condition (b), they would become eligible to apply to be paid under this scheme as from April 1, 1953.

(b) The doctor should normally have an increasing list, and payment would be withdrawn if his list gradually decreased over four consecutive quarters by more than 10% in all.

(iii) Conditions Applicable to Doctors aged 60 and Over

Doctors aged 60 years and over who are to become eligible under the scheme must fulfil the following conditions:

(a) The doctor should normally have been in single-handed practice for at least ten years in the area in which he is now practising.

(b) Doctors aged 60 or over at April 1, 1953, should be entitled to claim a payment for the year 1953-4.

(c) Doctors who attain the age of 60 years subsequent to April 1, 1953, should be allowed to claim a payment as from the next succeeding quarter.

(d) The payments should cease if the doctor's list drops below 300 and remains below 300 for four consecutive quarters.

(e) Payment under the scheme would be reviewed when the doctor reaches the age of 70. Payment would not cease automatically, and it would be open to the doctor to apply annually for continued payment on the grounds that he is still efficiently providing the full range of general medical services. Such a claim should be submitted to the appropriate local medical committees to advise whether they consider the doctor is continuing to provide effective medical services. These applications should be passed to the central committee, which, after consultation with the local medical committee, should if they see fit authorize payment from year to year.

Future of the Present Hardship Scheme

6. The proposed scheme should ultimately replace the present hardship scheme. It could not, however, do so immediately on the introduction of the proposed scheme, and the change-over would have to be gradual.

The central committees should review all payments under the present hardship scheme with a view to merging them over a period into the proposed new scheme. The committees should be directed to work on the general principle that doctors with lists below 300 should not be eligible for payments, but should ensure that the change-over did not work out to the detriment of the individual. The committees should for some years be given latitude in dealing with individual cases.

The Operation of the Proposed Scheme Compared to the Normal Capitation and Loading Payments

No. of Patients on List	Payments under Proposed Scheme				Normal Capitation Fees and Loadings	Excess of Payment under Proposed Scheme over Normal Capitation Fees and Loadings (Col. 5 minus Col. 6)

B.M.A. CHARITIES BALL, MAY 6, 1954

The B.M.A. Charities Ball, organized by the Metropolitan Counties Branch, will be held in B.M.A. House on Thursday, May 6, 1954. It is hoped that as many members of the profession as possible, including those outside the Branch area, will attend and thus enable the Branch to make a handsome contribution to the medical charities. Dancing to the music of the Sydney Lipton Ballroom Orchestra; buffet and bars. Tickets £2 2s. each, or six for £11 11s.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

Scottish News

SIR ANDREW DAVIDSON

The following letter from Sir Andrew Davidson, Chief Medical Officer of the Department of Health, has been received by the Scottish Secretary of the B.M.A.

"The date of my retirement as Chief Medical Officer is rapidly approaching: but, before it is actually upon me, I would like the Scottish Committee of the B.M.A. to know how much I have valued their help and guidance during the past strenuous, if most interesting, period of thirteen years spent in that appointment. I have always realized how fortunate it was for me to have such an understanding and co-operative group of colleagues; and my not insignificant experience of other countries has frequently strengthened that view. Scotland is fortunate in many respects, not least in its high tradition of medical practice, and its understanding leaders.

"Please convey my personal thanks to the Chairman and members of the Committee for the consistent support they have given to me and for the unfailing consideration they have shown to me. At the same time I would like you to help yourself to more than a modicum for the many little kindnesses you have done me, especially in dealing with foreign guests interested in our National Health Service. The friendly relationship between your office and mine is best typified by the two visitors from a Scandinavian country who, returning to me after a session with you and some members of the Committee, observed: 'We couldn't do that in our country.' The best assurance for the future is a strengthening of that happy relationship.

"Again, very many thanks to the Committee and to yourself."

THE ASSOCIATION AND PUBLIC HEALTH IMPLEMENTATION OF INDUSTRIAL COURT AWARDS

A meeting of the Public Health Committee of the Association was held on April 9, with Dr. Kenneth Cowan in the chair. Dr. T. H. Parkman, M.O.H., Hastings, was welcomed as a new member.

The Secretary of the Committee (Dr. Kelynack) reported on the position regarding the industrial court awards. Following agreement with Renfrewshire County Council, a dispute notified to the Minister of Labour under the Industrial Courts Act about the status and remuneration of a medical officer had been referred to the Industrial Court for Arbitration. The hearing had been fixed for April 27.

What the Chairman described as a very satisfactory solution of a difficulty was reported in the form of correspondence between the Secretary of the Association and the Secretary of the Ministry of Health and Local Government, Northern Ireland, concerning the status of certain medical officers employed by the County Down Health Committee. The salary scale, method of assimilation, and incremental date in the case of these officers had been agreed. The Northern Ireland Branch Council had also expressed its satisfaction of the settlement of the long-drawn-out discussions.

It was reported that Award No. 2452 for assistant medical officers had been accepted and implemented by all local health authorities. With regard to Award No. 2321, only one authority was outstanding.

Appeals Machinery

It was reported that the discussions regarding appeals machinery in Northern Ireland were progressing, and it was hoped that an agreement on this matter would be concluded in the near future.

Legal Position of Nurses

Dr. John Fenton reported on a Joint Conference which he had attended on behalf of the Association to discuss the legal position of the nurse who was sometimes called upon to undertake procedures such as immunization, the giving of anaesthetics, and the reading of skin tests, which were normally outside her professional scope. The Joint Conference was also attended by representatives of the Medical Defence Union, the Society of Medical Officers of Health, and the Institute of Hospital Administrators. Some divergent views had been expressed. Dr. Fenton's own view was that there was no good reason why either hospital or home nurses should have to carry out immunization procedures and Mantoux testing, for adequate medical help appeared to be available to local health authorities and to hospitals.

Dr. R. Forbes, who attended the Committee for this item, put forward the contention which he had made at the conference, that it was undesirable, except in emergency, that a nurse should be allowed to participate in any procedure whereby something was put into the blood stream either directly or indirectly, though this, he said, was not the unanimous view of the profession.

The Chairman pointed out that as the Royal College of Nursing, which had called the conference, had agreed to draw up a comprehensive memorandum which would form the subject of further discussion it might be well for the Committee to await the publication of this memorandum and then to make detailed comments upon it. Dr. Mary Esslemont, on the other hand, said that the nurses were anxiously awaiting some help from the medical profession, and she urged that the Committee make its own comments now. After discussion, however, the view of the Chairman prevailed.

Health Visitors

The draft memorandum of evidence for submission to the Health Visitors Working Party, drawn up by the Joint Subcommittee of the General Medical Services, Central Consultants and Specialists, and Public Health Committees, was considered and approved. The memorandum has also been approved by the other two parent committees and now goes forward to Council for formal approval.

Meat Inspection

At the last meeting, when a memorandum from the British Veterinary Association urging that meat inspection should in future be the responsibility of the Animal Health Division of the Ministry of Agriculture was considered, the Committee had recommended action by Council to counter and clarify certain points. A statement drawn up jointly by the British Medical Association, the Society of Medical Officers of Health, and the Sanitary Inspectors Association (*Supplement*, April 17, p. 175) was received and was regarded by the Committee as an excellent one. The Chairman said that there appeared to have been considerable misunderstanding on the part of the British Veterinary Association. It would be regrettable if anything occurred to impair the good relationship between that body and the British Medical Association, and it was hoped that the statement and any subsequent discussions would clarify the points of principle on which the B.M.A. felt strongly.

Vaccination

A letter from the Brighton Division on the subject of vaccination came before the Committee. This drew attention to the low level of the infancy vaccination figure,¹ and urged that representations be made to the Ministry of Health for more intensive propaganda on the subject, and for

¹The number of persons under 1 year who were primarily vaccinated in England and Wales in 1952 was 206,131; the number of births during the 12 months ended June 30, 1952, was 669,832, so that the acceptance rate was 30.7%. The corresponding rates for 1950 and 1951 were 23.8% and 29.6% respectively.

Notes and News

Hospitality.—The following requests have been received from the Continent:

Spanish doctor in Madrid requires exchange for son, aged 14, during summer.

Norwegian doctor in Bergen requires exchange for daughter, aged 15, with girl living near London, for two or three weeks during summer.

Austrian doctor in Tyrol requires exchange for daughter, aged 11.

Austrian doctor in Vienna requires exchange for daughter, aged 13.

Swedish dental surgeon's son, aged 15, would like to stay as paying guest in family for two months from June 15, preferably near sea.

French doctor's son in Paris, aged 15, would like to stay as paying guest during July with family having son of similar age.

French doctor's daughter would like to stay *au pair* for one year in family.

French girl student would like to stay *au pair* with family in or near London during summer vacation.

Would anyone interested in these requests please contact Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Questions Answered

Appropriate Schedule for Locumtenent Work

Q.—My income-tax liability is assessed under Schedule E for the salary I receive as a consultant from regional hospital boards, and under Schedule D for receipts from private practice. Under which Schedule should sessional fees which I receive from regional boards as a locumtenent be assessed?

A.—The Income Tax Acts bring under Schedule E all the earnings of employment, and sessional fees payable by regional hospital boards for locumtenent work would legally be assessable under Schedule E. "Employment" assumes the existence of the relationship of master and servant, and the above assumes that that relationship would apply to such locumtenent work—for example, that the work would be performed subject to similar control by the board to that exercised (or exercisable) in the case of the work for which the salary is paid. It is, of course, true that remuneration for doing locumtenent work for a general practitioner is usually assessed under Schedule D, but that seems to be customary not so much because "employment" is not involved as from the greater convenience, both for the individual and the revenue, of the Schedule D assessment, where, as is usually the case, a locumtenency is one of a number of temporary professional activities in the same year, but often in different places.

Regimental Dinner Nights

Q.—Regulations state that resident officers must attend regimental dinner nights while living in an Army mess. An extra charge is made in the accounts for these functions. Can a claim for income-tax allowance for these extra charges be made on the grounds that they are "expenses which you were necessarily obliged to incur, and bear yourself out of your earnings"?

A.—Two cases were heard in the High Court last year which have a bearing on the questioner's inquiry. The officers were in the Territorial Army and claimed to deduct certain mess expenses—for example, mess subscriptions and shares of mess guest expenditure—on the grounds that they were required by Queen's Regulations to be members of a mess, and that failure to make the payments in question were breaches of Army discipline. The contention put forward by the revenue was that only expenses incurred wholly, exclusively, and necessarily in the performance of their

action by the B.M.A. centrally and locally. The Committee expressed entire agreement with the Brighton point of view, and it was agreed to call the attention of the Brighton Division to action which had already been taken, and which was covered in the Annual Report of Council on the subject (*Supplement*, March 27, p. 83).

Other matters placed before the Committee included a memorandum regarding the Fever Nursing Register, certain correspondence on the revised draft of the Local Government Superannuation (Benefits) Regulations, and points in connexion with the work of the School Health Service.

A meeting of the trustees of the Public Health Services Defence Trust was also held, and formal matters were approved.

MEDICAL ETHICS

The Central Ethical Committee met on Wednesday, April 7. The chairman, Dr. Robert Forbes, gave an account of a recent meeting between representatives of the B.M.A. and the B.B.C. He indicated that there had been, among other things, an exchange of views on the subject of anonymity of medical practitioners taking part in radio or television programmes. Following a later agenda item it was also decided to communicate with the General Medical Council about the Association's policy of anonymity in medical broadcasting and to ascertain the G.M.C.'s attitude towards the matter.

The Committee also reaffirmed its view that it is unethical for a practitioner to participate in sound or television programmes which are being presented for or on behalf of firms using sponsored radio as a means of advertising.

Ethics of Therapeutic Trials

Representatives of the Research Committee of the College of General Practitioners attended to discuss the kind of ethical problems which might arise in the course of conducting therapeutic trials of proprietary substances, and how ethical difficulties could be avoided.

A meeting between representatives of the medical staffs of the Seamen's Hospitals, the Shipping Federation, a shipping line, and the chairman of the Committee had been held to discuss special ethical problems connected with the disclosure of information concerning seafaring patients of the Seamen's Hospitals; a report was received by the Committee.

Community Centre Surgeries

A proposal that doctors should seek to have their surgery hours published in telephone directories was not approved and was considered impracticable. In considering a number of matters relating to the use of premises in community centres, the Committee endorsed the decision given at a previous meeting deprecating the use of surgery accommodation in community centres where by so doing individual doctors or a group of doctors obtained an unfair advantage over colleagues in the neighbourhood.

Advice had been sought whether it was justifiable for a general practitioner to refuse to retain a patient on his list unless all members of the family came under his care. The Committee disapproved of any discriminatory attitude by a medical practitioner that would interfere with a patient's freedom of choice of doctor.

A number of other items were considered, dealing with such varied matters as colour-vision tests, dental anaesthetics, medical representatives of pharmaceutical firms, and epileptic drivers. The session closed soon after 6 p.m.

Mixed Metaphor.—From a speech at a World Health Day celebration in London: "The World Health Organization holds the key because it is the pivot around which everything circulates and it has a finger in every pie."

duties were allowable and that the expense claimed did not come within that category; in addition there was an element of private benefit resulting from the payments. Vaisey J. upheld the revenue view and decided against the allowance of the mess expenses. The questioner's claim may have some points of difference from the claims referred to above, but I think it is unlikely that he would be able to obtain a favourable decision on appeal.

Taxation on Wife's Income

Q.—My wife and I practise in partnership and are taxed and surtaxed as one person. Could my wife be taxed separately on her private income? If my wife retires from the Service is her superannuation taxable?

A.—The incomes of husband and wife are required by law to be aggregated and the amount of surtax payable for any financial year is calculated on the aggregate amount—each item of income being computed on the basis laid down by statute for that class of income. The amount of superannuation payable to a wife is chargeable to tax. Unless separate assessment has been claimed (and there is little or no financial advantage in such claims) the husband will be assessable on that income, but the special reliefs granted for the earned income of a wife will be due.

Wife's Assistance in Practice Work

Q.—I employ a resident maid and am allowed a third of her wages for answering the door and telephone. I pay my wife £120 a year for answering the door and telephone when the maid is not available, and for minor secretarial work. I am in partnership with three other doctors, and we have combined surgery premises where we employ a dispenser and assistant for the major day work. The inspector of taxes has offered to allow only £13 a year for my wife, which I feel is an absurd sum. Could you give me a guide to what is commonly paid to doctors' wives in the circumstances?

A.—It seems to be generally agreed by inspectors of taxes that in cases where a practitioner's wife deals with personal and telephone calls during the absence of the maid some remuneration for such service is a reasonable expense in calculating income-tax liability. The question of how much should be allowed is difficult—particularly where, as in this case, the partners have a combined surgery—and it is not possible to suggest any standard amount. Clearly the amount allowable must depend to a large extent on the number of calls of all kinds on the wife's time and the degree of interference with her other activities and relaxations. The revenue authorities usually claim—and not without some grounds—that what the employment of some other person would cost is not necessarily a fair criterion; the amount should be what is reasonable remuneration in view of the actual circumstances. But it is considered that £13 per annum would in general be an inadequate allowance.

Telephone Expenses

Q.—As a full-time assistant chest physician my duties include being on call to two sanatoria. There is no mention as to my providing a telephone at my house in my contract, but as I live several miles from both institutions it seems to me the only reasonable way of contacting me after my clinic is closed. Can I claim the telephone rent as an expense on my income-tax return?

A.—The question as to whether an individual whose working conditions made it necessary for him to have a private telephone connexion so that he could be contacted by his employer was the subject of a judicial decision in the case of *Nolder v. Walters* some years ago. Rowlatt J. pointed out that the statutory rule applying to the remuneration of an employment required that to be allowable expenses should be incurred "wholly, exclusively, and necessarily in the performance of the duties," and held that "in the performance of the duties" meant "in doing things

which it is his duty to do while doing the work of the office." In his opinion which has not been overruled by a subsequent judgment expenses incurred in getting to the work were not incurred in the performance of the duties even though the employee was obliged to incur them. In view of that decision the questioner cannot be advised to press his claim to a part of his telephone expense.

Board and Lodging Expenses

Q.—I am a full-time S.H.M.O., and I am specifically required to live in my hospital for a certain number of nights, for which I am charged £30 per annum board and lodging. I am also charged £10 per annum for garaging my car in a shed in the hospital grounds. Can I claim part or whole of this compulsory addition to my cost of living from the inland revenue as justifiable expenses?

A.—The questioner is assessable under Schedule E, and the relevant statutory rule requires that to be allowable expenses shall be incurred "wholly, exclusively, and necessarily in the performance of the duties." The expenses in question are evidently necessarily incurred, but I fear do not meet the other requirements of the rule. There is some analogy with the mess expenses (or some of them) incurred by officers serving in H.M. Forces, the deduction of which is refused on the authority of a High Court decision. An appeal against the refusal to allow the deduction of the sums in question is not advised.

CORBY DIAGNOSTIC CENTRE NEW "SOCIAL ADVENTURE" OF NUFFIELD PROVINCIAL HOSPITALS TRUST

A diagnostic centre sponsored by the Nuffield Provincial Hospitals Trust and the Oxford Regional Hospital Board was opened at Corby, Northamptonshire, on April 23 by Lord Nuffield. Until the thirties Corby was a small farming village of 1,500 inhabitants. Then some large steelworks were established which brought an accession of population, and in 1950 a Development Corporation was set up under the New Towns Act with a view to the creation of a new town of 40,000 people. Already the population is half that number, an increase of 8,000 since 1947. The new town is rising rapidly, with dual carriage-ways stretching over the area.

The new diagnostic centre is the product of a survey of the medical needs of Corby organized by the Nuffield Trust in 1949. The basis of the plan was that no general hospital for Corby was likely to be built for many years, and meanwhile the general practitioners of the area felt that they lacked proper facilities for diagnosis, minor operative treatment, and ready consultation with specialists. The arrangement is that the family doctors of Corby will retain their existing surgeries, but patients needing more complete examination or investigation will be given appointments at the Diagnostic Centre, where the general practitioners will rent some of the consulting-rooms. The bodies also co-operating in the scheme are the Regional Hospital Board, Northamptonshire County Council (the local public health authority), Corby Urban District Council, the Development Corporation, and the local practitioners, and the owners of the local steelworks, Messrs. Stewarts and Lloyds, Ltd., have assured financial support towards the running costs of the centre during the early years of the experiment.

Inaugural Ceremony

Presiding at the opening ceremony, the Hon. Geoffrey C. Gibbs, chairman of the Nuffield Provincial Hospitals Trust, recalled that, from the moment in 1939 when Lord Nuffield established the organization, the Trust had tried to work for integration. It had always hoped for close liaison between the three arms of the National Health Service, and it would be foolish to deny that the Trust, in common with others, had at times tempered its enthusiasm for the Health Act

with regret that the Act in some respects should have emphasized the isolation of the different branches of the Service. It might well be that diagnostic centres, of which Corby was a prototype, would prove to be the link between these branches.

Sir George Schuster, chairman of the Oxford Regional Hospital Board, said that the most significant part of the experiment was the provision of an opportunity for general practitioners and consultants and specialists to get together and know each other. He welcomed it also as a result of co-operation between a great State service and the enterprise and initiative of an individual (Lord Nuffield). He hoped that the centre would do something to help to diminish the load put on hospital services. In the Oxford Region one in every 12 of the population became an in-patient every year and one in 7.5 a new out-patient.

Lord Nuffield, in declaring the centre open, said that it had always been his pleasure to help anything in the way of

centre now provides examination and treatment rooms for general practitioners and visiting consultants; a small pathological laboratory; a chest clinic and x-ray department; and a physiotherapy department. At a later stage a unit of maternity beds will be added. A unit of general-practitioner beds may also be included, and when the need arises for additional local authority clinics in the area the county council has agreed that they can best be sited on the diagnostic centre.

The regional board is providing and staffing the chest clinic and x-ray and physiotherapy departments, and its consultants will use some of the consulting-rooms, for which the board will pay. The specialist clinics are medical, surgical, obstetric and gynaecological, paediatric, chest diseases, physical medicine, psychiatric, ear, nose, and throat, radiological, dermatological, ophthalmological, and orthopaedic. Both the pathology and x-ray services will operate under the control of specialists from Kettering;

PHYSIOTHERAPY

X-RAY & CHEST CLINIC

health services. He hoped that these institutions would be followed all over the country very soon, to the great advantage of the health of everyone concerned.

Dr. W. P. Blackstock, a member of the local Joint Management Committee, speaking on behalf of the local practitioners, said that the centre had been planned in accordance with the views and convenience of the people of Corby. Every suggestion or request which the general practitioners had made throughout the planning had been most generously conceded. He hoped that the centre would prove to be a successful experiment in the integration of the health services.

The ceremony concluded with a short dedicatory service.

Design of the Centre

The diagnostic centre, designed by Mr. R. Llewelyn Davies, A.R.I.B.A., is a single-story building situated in ample grounds. The existing building represents the first stage of a scheme. Up to the present patients have had to travel 8 miles to Kettering or 25 to Northampton for out-patient investigations, consultations, and treatment. The

some of the simpler pathological investigations will be carried out by the general practitioners themselves. Antenatal consultative clinics may be held at the centre both for normal and for abnormal cases.

The three blocks of the centre—the consulting and treatment wing, the physiotherapy department, and the combined chest clinic and x-ray department—are grouped around a central entrance hall. Each department and each consulting suite has its own small waiting space for patients. One of the objects of the experiment has been to demonstrate that the essential requirements of a diagnostic centre could be provided at a reasonable cost. Economy has therefore been practised, both in design and in the choice of materials and finishes.

To measure the effect of the centre the Trust organized in the late summer of 1953 a sample survey of the domestic, social, and economic difficulties arising from the lack of a hospital and out-patient clinics in Corby. The survey will be repeated approximately one year and two years after the opening of the centre to ascertain how far these difficulties have disappeared.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Remuneration of Hospital Medical Staff

SIR,—I should be grateful if you would allow me space in your columns to record a few observations on the statement by Sir Russell Brain on remuneration of hospital staff (*Supplement*, April 10, p. 145). Few will share the frequently expressed confidence and satisfaction of the Staff Side in its own activities during the recent discussions. House officers will wonder why the annual charge for residence is to be raised for them but not, apparently, for registrars and other residents. Registrars will have plenty to say for themselves regarding their share of the increases. Senior hospital medical officers may confidently prophesy that the oft-repeated charge that this grade was invented as a means of getting a consultant's work done at a cheap rate will now be repeated twice as often and twice as justifiably. And I think all grades will take exception to the theory that "... if recruitment to the hospital service was not to be affected the major benefit must be applied to the basic consultant grade. . . ." First, if the way to the stars is unbearably difficult, then merely making them brighter will not swell the numbers of those who try to reach them. Secondly, the statement suggests that the main incentive to specialization is, and should be, mercenary. Even in this day and age I do not believe one is being too naive in denying this suggestion. In the consultant grade itself the principle has been reversed, and those with higher distinction awards are to receive smaller increases. One is forced to the conclusion that on achieving consultant status incentive is unnecessary for obtaining the so-called distinction awards—which resurrects the old bogey of how exactly these awards are made. The committee's excuse for this anomaly is that in the higher grades "taxation would largely nullify the effect of any increase." But financial incentives are judged on their gross value. Moreover, since the committee raises the point, taxation makes all the increases sillier in fact than they look on paper, even taking into account the extra benefits from superannuation.

In the final section of the statement, headed with such tasteless irony "Consultation with the Profession," the Staff Side makes its excuses for not consulting the members of hospital staffs after discussions were started. But the tragedy is that they were not consulted before discussions started. The general practitioners were first circularized to find out how many were prepared to go so far as resigning from the Health Service to attain their objective, and provision was made for financial aid should this extreme become necessary. In this light our negotiators resemble an army starting a war without a hydrogen bomb, and it is small wonder that they suffered such heavy defeats in so one-sided a battle.

Unfortunately, the Staff Side were apparently unconvinced that we had a just claim. Certainly they rejected "a straightforward application of the Danckwerts betterment of 100% to the Spens salaries" because "apart from the fact that a claim of this magnitude would have been totally unacceptable to the Management Side the effect would be again to upset the balance of remuneration between the two branches of the profession." If Spens was considered so impracticable and undesirable, it is futile for the Staff Side to inform us that "in its view Spens remains the yardstick of consultant remuneration" and that it was "satisfied that its negotiations had safeguarded Spens"; and why was it so intent on avoiding any move which "would undoubtedly have led to the appointment of a committee of inquiry into the question of hospital staff remuneration in all its aspects"? It is true that the results of such an inquiry "would not necessarily have led to a final agreement better than the one now reached," but at least it could

hardly have been worse for many of us. And one would think that the committee would have welcomed the chance of finding a workable "yardstick of consultant remuneration." As for the Staff Side's preoccupation with avoiding "interminable delays," we would have preferred to have waited even longer than we have for a more satisfactory outcome, and above all for an outcome that did not appear to have shattered hopes for the future.

Now that all is over bar the shouting, it would be interesting if the names of the members of the Staff Side could be published together with their grading and information as to whether they are employed in a whole-time or part-time capacity. I am sure all will join with me in expressing sympathy with these gentlemen whose "task over the past 18 months has been far from easy." But I hope they will remember that many of their lesser colleagues have been finding things far from easy for much longer than 18 months and will now have to continue the struggle.

The committee believes that "only experience can show how far the increases obtained will improve recruitment in the hospital field." I believe the house officers, junior hospital medical officers, and registrars can give the answer immediately. And I think the answer will be a very bitter lemon.—I am, etc.,

Southampton.

C. J. S. HOLDSWORTH.

SIR,—As one of the pioneers of the struggle to obtain an equitable adjustment of salary for hospital medical staffs, I was bitterly disappointed and disgusted when the results of nearly two years of negotiation were announced. I would urge that this "medical Munich" is not accepted as the final chapter but as the prologue to the real battle for justice.

Although the Joint Committee have tried their best to justify their surrender to the all-powerful Ministry, the results when carefully analysed are a hollow mockery of all that the Spens Report recommended. Whether the Spens Committee visualized tax assessment of salary under Schedule E, or whether this has been a cunning move of the Exchequer to take back that which the Ministry of Health gives, I do not know, but I do know that the Spens figures transposed to 1948 values was the intention of all parties as the basis for our salaries. In my own case (maximum part-time) the award amounts to a total 35% betterment over 1939 values, which, when compared with the Government's own cost-of-living index, is ludicrous.

When the new method of tax assessment of salary under Schedule E is in action specialists will experience some very nasty shocks. I have taken accountant's advice, and in spite of an increase in salary of £300 I find to my horror that, depending upon the leniency or hardness of the inspector of taxes in respect of allowable expenses, the best I can hope for is a net gain of £40 per annum, but if the last drop is extracted the result is a net loss of £70 per annum. What sort of readjustment of salary is it which results in an increased income of £300 offset by the possibility of an increased tax demand of £370?

There has been no attempt on the part of the Association to put the results of recent negotiations to the lay press in their proper perspective. The adjustment was announced as a simple increase of salary, but no mention has been made of nearly six years during which we have tried to live as specialists and to prepare for enforced idleness at the age of 65 on a salary based on 1939 values plus the iniquitous 20%. Either let us have an honest Spens salary or tear the Report up and start from scratch. The latter action would be unlikely to prove to our detriment provided we have unity, for we have learned much in the last six years as to the trust which can be placed in ministries.

The Joint Committee have tried, failed, and surrendered. Therefore, not only for our own sake but for those who follow us, must we refuse to bow down in defeat to this farcical salary settlement. Unless we obtain the right to unilateral arbitration there will be more and more "territorial demands." The guilty party only fears unbiased justice, therefore the refusal of the Ministry to allow arbitration

tration condemns them without trial. Soft words, pleas, and kid gloves are no weapons to fight dictators. Therefore, if we value our heritage, some form of strike mechanism must be built up at once, no matter how obnoxious this may be, in order to obtain an equitable settlement for our underpaid services during the last six years and to ensure security for the future.—I am, etc.,

Southampton.

BERNARD SUGDEN.

SIR,—Dr. A. Arnaud Reid's letter (*Supplement*, April 17, p. 176) brings the current situation into brilliantly sharp focus when he states: "The profession was inveigled into the Health Service by a device which most closely resembles a confidence trick."

In my own case, I received an assurance in writing that my interim salary at the commencement of the National Health Service would be reviewed not later than March, 1949, in the light of the Spens Report, and all the salary derived from the increase would be back-paid to July, 1948. In actual fact, I was employed for fifteen months at a salary approximately 25% below the recommended minimum of the Spens scale in terms of 1939 monetary values. Having come out of the Services with very little capital, and with a rapidly growing family to maintain, I was obliged to overdraw by several hundred pounds. When the new (1948) rates were announced and back-pay given in 1950 the 13.3% effective increase did not clear the over-draft. This has continued to increase with the cost of living and the growth of one's family, but the feeling of insecurity this created was to some extent offset by the Danckwerts award to the general practitioners, and the comparatively prompt settlement of their back-pay. Believing as I then did in the complete moral integrity of the Government, my wife and I felt that it was only a matter of time before similar justice was done to the claims of hospital medical staff.

Our simple child-like trust has been very rudely shattered by the totalitarian technique of the recent award. The *Daily Telegraph* of April 15, under the heading, "Cost-of-Living Index Goes Up," states that the Ministry of Labour announced that the interim index of retail prices was 141 on March 16 against 100 on June 17, 1947. This starkly realistic index makes an interesting comparison with the percentage increase over the 1948 level to be given to hospital medical staff as from April 1, 1954. The highest increase shown is only 23.5% for consultants at the lower end of the scale, and the average increases are approximately 10%. To add the grossest insult to injury, no back-pay is to be awarded, although many, like myself, have faithfully waited six years for an equitable fulfilment of our hopes and aspirations. No valid explanation of the rationale of the negotiations has been given, no doubt for the very good reason that there is none.

We, who accepted the Government's bond in 1948, are faced with the inescapable fact that we have subsidized the commencement of the hospital service from our own pockets, and sacrificed the happiness of our families to boost the political ego of the current party in power. We have little hope of buying a house or making proper provision for the future, unless a just increase in pay, with full back-pay, is given without further delay. The puerile explanations of our previous so-called representatives concerning their weak-kneed ineptitude can be best summarized by the well-known quotation from *Macbeth*: "It is a tale told by an idiot, full of sound and fury, signifying nothing."—I am, etc.,

"CYCLOSTOME."

SIR,—With many members of the Association I feel the utmost distress over the result of the deliberations of the Staff Side of Committee "B" of the Medical Whitley Council. It is quite clear that consultants and specialists had a very difficult problem to contend with, and over and above that the medico-political field was new country to them. It is not so much the inadequacy of the increased rates of pay which have been accepted, but, far more

important still, the complete abandonment of the principles underlying the Spens Reports, implications which have been accepted both by the Ministry and by the profession.

I was a member of the first Spens Committee, and it was quite clear to everyone—as indeed it was stated in the Report—that recommendations with regard to remuneration were made in terms of 1939 value of money, and that the appropriate adjustments had to be made for increases in the cost of living and expenses and also for the increases which other sections of the profession had received. These Spens Reports were the Magna Charta of each section of the profession, and in abandoning the principles enunciated in the Spens Specialist Report the consultants and specialists have sold their birthright for a mess of pottage, and this is bound to have repercussions on every section of the profession. I would like to come down on the side of those who express their complete dissatisfaction with the outcome of the negotiations.—I am, etc.,

Bournemouth.

O. C. CARTER.

SIR,—The consultant body has a threefold duty to secure the interests (and primarily, perhaps, the adequate remuneration) of our juniors on the hospital medical staff, of ourselves, and of our successors in this, the most learned and exacting role in medicine.

We have been singularly ill-served by our negotiating bodies, and I feel that the sooner consultants in each hospital group take a direct interest—as suggested by the Southampton Group (*Supplement*, March 27, p. 126)—the better. The discharge of the Staff Side of Whitley "B" Committee would follow almost automatically. That these representatives should accept such paltry remuneration for their brethren is sufficiently damning. But the reasons advanced to justify not putting the figures forward for our consideration are so specious as to be absurd. With two-thirds of our consultants paid less than the equivalent of £1,000 per annum in 1939, with no power and no right to arbitration, we are about as far from the dignified position envisaged by the Consultant Spens Report as we can well be. There is no fear that an independent inquiry would make things worse.

The crucial figure in remuneration is the whole-time specialist's maximum without merit awards. All ranks below are adjusted to this. By refusing anything less than £5,000 per annum we secure proper remuneration for a learned, arduous, and responsible post, proper treatment for our juniors, and a decent future for our successors.—I am, etc.,

RANDLE LUNT.

Littleover, Derby.

SIR,—I am glad to read in the leading article in the *Journal* (April 10, p. 860) that the Association is not directly responsible for the disastrous agreement with the Ministry by Whitley Council Committee "B," announced to operate, most appropriately one feels, from April 1. Again it seems that we have seen the key points to our position given away, and although I have read with care the apologia written by the Chairman of the Committee (*Supplement*, April 10, p. 145) I feel myself unable to agree with his reasonings. Dr. Rowland Hill at the A.R.M. last year, and a leading article in the *Journal* only a few weeks ago (February 27, p. 507), showed strength and determination, but apparently they were but "sound and fury, signifying nothing" when we hear of the pathetic surrender of our negotiators, who, after elephantine labour, have delivered a mouse.

I think, incidentally, that all fair-minded consultants will feel rather ashamed of themselves when they read that most of them will receive a 20% increase, whereas their registrars and housemen, whose need is surely greater, will receive only 10%. I find myself unable to agree with Sir Russell Brain's apparent contention that a registrar or house officer is in any way equivalent to an unpopular G.P., and should therefore be given a lower proportional increase. Nor is the total amount to be paid in hospital salaries to be

doubled as it was in the case of the G.P.s' central pool, so it is difficult to accept his argument that we have received parallel treatment. Of course, as we registrars and house officers received little or no representation at the negotiations it is hardly surprising that our terms of service were decided in a most cavalier manner to anything but our advantage. We are told that adequate betterment of the Consultant Spens was not legally enforceable. Since when has any section of the community other than doctors ever been inhibited by this? Wages have increased by up to 200% without the help of any "legally enforceable" agreements. It is time our profession woke up to the fact that asking for one's rights is futile in present-day society. Only those who are prepared to be unpleasant if necessary, and who possess the power to do so, get much consideration. Disabled ex-Servicemen and the clergy, who cannot, or will not, take strong action to better their conditions, illustrate this point. Furthermore, if our seniors actually signed a blank contract with Mr. Bevan—on the face of it an action not without risk—is that any reason why we, the majority of hospital doctors who have done no such ill-advised thing, should in perpetuity be denied the Spens which we were promised and which was designed to give all, irrespective of private means, an equal chance to specialize? A High Court judge has decided that in the case of the general practitioners the Spens figures must be increased by 100%, and the present miserable award which we have received is not Spens by any stretch of the imagination. The Government's fair promises remain dishonoured.

The profession has been outmanoeuvred again and again by the Ministry, and its biggest recent mistake was not to demand arbitration, a demand which all fair-minded citizens would have understood. In view of the Danckwerts award, no reasonable and fair judge would have awarded as little as the present miserable *pourboire*. The Minister has very cleverly kept wasting time for two years at our expense, and we are told that if we had insisted on retrospective application negotiations might have broken down. What a pity they did not! We would have been better as we were, with an unprejudiced case. As it is, we are still 15% behind 1949 money values, and 70% or 80% behind 1939, and for this we have yielded the vital principle of Spens. We must formally and publicly announce that the Spens Report remains dishonoured, that we regard the present agreement as only an interim one, and that we propose further negotiations at once. Let us forcefully demand the right to arbitration and see we get it; let the registrars and housemen have some say in their own fate; and let us, above all, choose other negotiators than those who are responsible for the present ignominious surrender.—I am, etc.,

Walton-on-Thames.

A. A. REID.

SIR.—Registrars, J.H.M.O.s, and house officers alike must view with dismay the outcome of the Whitley Council's deliberations, which compare almost unfavourably with our international conferences with slavonic delegates as to protraction and progress.

If an attempt was being made to meet changes in the cost of living, why was not a set percentage increase applied to the group mentioned above? I fail to see the equity of adding a fixed sum of £75 to annual amounts ranging from £350 to £1,000 unless it was considered that all these salaries were originally in error; in which case retrospective adjustment is the logical remedy. But the adjustment goes back only a few days; and to a singularly appropriate date, in view of these considerations.

Can it be that the Ministry, being not legally bound to what would be fair play in light of the Danckwerts award, and not yielding to the sweet reasonableness of our respected Whitley representatives, might respond to a little pressure? If hospital medical staff refused collectively to put pen to paper on any but the most essential documents, such pressure might be felt, and a "paper strike" might obtain for us the arbitration which is the only just mode of settlement of problems like ours.—I am, etc.,

Buckhurst Hill, Essex.

J. D. KEITH PALMER.

Pre-registration Appointments

SIR,—I recently applied for a hospital post which was "recognized for the purpose of pre-registration service, preference being given to provisionally registered persons who have served six months in a medical or surgical post since qualification." At interview there were three applicants for the appointment, two of us, with satisfactory testimonials, fulfilling the requirements as advertised. The post, however, was given to the third applicant, who qualified in 1950.

It does seem to be most unfair that advertisements should be worded as giving preference to a certain class of applicant who is then, following interview, completely cut out by other applicants who, though better qualified by experience, do not fulfil conditions as set out in the advertisements. I do feel that this form of procedure on the part of selection committees is extremely wasteful in time and money, both to the State and the individual. Junior colleagues to whom I have spoken recount similar experiences to that of my own.—I am, etc.,

"PRE-REGISTERED."

MAY 1, 1954

CORRESPONDENCE

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

215

Life Assurance Fee

SIR,—I support Dr. H. Richardson Gray's observations (*Supplement*, April 10, p. 151). I, too, find that an examination and report take me a *minimum* of 40 minutes to complete, and I agree that the present fee of £1 11s. 6d. is completely inadequate.

I had occasion to protest against the many extra questions on the form supplied by a well-known air transport company in connexion with employees joining their superannuation scheme. In reply, their medical officer informed me that over 1,100—I believe that was the figure, it may have been more—examinations had been made by other doctors without protest. I promptly asked the B.M.A. to investigate. The result was an agreement with the firm that in future a fee of £2 2s. would be paid for an examination and report on that particular form.

An irritating point about many examinations is the accompanying request to do the examination urgently—one suspects that either the agent fears to lose the business or the candidate's birthday is imminent. Also the answers to all these preliminary family and medical questions should be filled in before the form is passed to the doctor.

Finally, why cannot "life" offices standardize their forms? After all, the actuarial information on which they are presumably based is the same.—I am, etc.,

Maldon, Essex.

IVAN PIRRIE.

Grading of S.H.M.O.s

SIR,—Since the publication of my letter (*Supplement*, November 14, 1953, p. 201) I have received a number of letters from S.H.M.O.s, not only from my own constituency but from all over the country. Each letter confirms my already strongly held opinion that there is still a vast amount of injustice and hardship among these medical officers, some considering leaving the country, several living on capital, and all suffering from a strong sense of being unfairly treated. Politicians and lawyers say that hard cases make bad law, but surely here it is a bad law that is making hard cases.

I consider that each S.H.M.O. who has written to me has a genuine and strong grievance, and I am taking the liberty of sending their names and relevant details to the secretary of the Central Consultants and Specialists Committee, especially now that the Minister has agreed to consider selected names. So something has been achieved at last, but the pressure must be kept up, and, though the recent increase in remuneration of all medical members of hospital staffs is also a success to be grateful for, it is, as your leading article clearly points out, not enough. It is not Spens. It does not remove the gross medical and financial injustices put upon this particular group of medical practitioners. Meanwhile, until full justice is done, and seen to be done, I recommend certain interim measures. (a) A special meeting of the Central Consultants and Specialists Committee and a selected group of S.H.M.O.s to discuss the problem; (b) an increase of S.H.M.O. representation on the Central Consultants and Specialists Committee; (c) the abolition of the hateful letters S.H.M.O. (they cannot be dignified as a title) for those who only practise their specialty, and the substitution of the appropriate assistant surgeon or physician, etc. I have heard a rumour that this is in fact legal, and that the Minister has agreed to it. I would be most grateful if Dr. Rowland Hill would be kind enough to answer this point in the *Journal*, as, if it is true, I suggest that all S.H.M.O.s at once drop this style, and call themselves by their proper medical titles, and, further, that regional hospital boards be instructed to do so too; (d) an annual, or at least biennial, review of all of this grade, thus breaking this "dead end"; (e) support for the Central Consultants and Specialists Committee in its fight for the full and pledged implementation of the Spens Report.

I am sure all realize that Dr. Rowland Hill and his committee have a very difficult task in dealing with the Treasury and the fixed ideas of the Minister's advisers, so, although continuing to keep up the pressure, all in this grade will,

at both the inquest and the inquiry that part of the reason she did not admit the case was she did not consider it advisable for so ill a patient to travel a distance of several miles. At the second hospital, I was told by the telephonist that the receiving officer had given her instructions to say that the medical beds were full and that therefore they were not admitting any further cases.

How, therefore, the bed bureau could obtain a bed in these circumstances is beyond my comprehension. In fact, at the same day and hour, another local practitioner was faced with the same emergency. He contacted a local hospital and then a bed bureau—but no bed was obtained and this patient died. A year ago a woman in her 40's also died in very similar circumstances in this area. The "Bed Bureau" is, in fact, one of a series of red herrings produced "out of the bag" by the hospital management committees concerned to create a diversion and confuse the issue.

The point at issue is the autocracy of receiving officers and the wisdom with which this autocracy is exercised. How widespread is this defect, which concerns every doctor in the country?—I am, etc.,

S. STOWE.

Wolverhampton.

SIR,—You report (*Journal*, April 17, p. 940) the findings of an investigating committee of the Birmingham Regional Hospital Board into the case where a local general practitioner had failed to gain hospital admission for a patient dying from haematemesis. In view of the rather adverse publicity which the general practitioner has received owing to the statement that his failure to use the Bed Bureau was partially responsible, I think it is only fair to communicate the following information.

At no time have general practitioners in this area been informed that the Bed Bureau was in operation after 6 p.m. Indeed, most of them will have had the experience of being advised, when trying to get the Bed Bureau's help after this time, that it was closed.—I am, etc.,

R. S. V. MARSHALL.

Hon. Secretary,
Wolverhampton Local Medical Committee.

Building in Islay

SIR,—With reference to the vacancy in Islay, advertised by the Argyll and Bute Executive Council in the *B.M.J.* dated April 10 (advertisement page 22), where there is no house available for doctor, I think it but right that anyone interested should know that building costs on the island of houses of traditional type are at least 50% higher than on the mainland.

Council houses at present being built in Islay cost over £3,000 per house as against around £2,000 for similar type on the mainland.

In 1952 I proposed to build a modest dwelling—three bedrooms, with professional accommodation—and went through the necessary preliminaries, but abandoned the project, as the estimated cost of between £5,000 and £6,000 rendered it impracticable.—I am, etc.,

Isle of Islay.

ALASDAIR McI. SMITH.

Service Recruitment

SIR,—Your correspondent "Harvey" (*Supplement*, April 17, p. 177) is surely wide of the mark in his estimation of clinical freedom. Freedom to prescribe what one thinks best is always subject to the availability of the treatment and the ability of someone to pay for it, whether this be the State or the patient himself. Clinical freedom is the right to use available resources as one thinks fit, without let or hindrance.

Both as a taxpayer and a doctor I am glad to know that wide-spectrum antibiotics are subject to control. "Harvey" can treat his own dysentery with them—not mine!—I am, etc.,

Church Crookham, Hants.

C. R. TILLY.

Emergency Admissions

SIR,—With reference to your summary of the findings of the Birmingham Regional Hospital Board inquiry, headed "Lack of Hospital-G.P. Liaison" (*Journal*, April 17, p. 940), may I make the following observations?

I spent over an hour contacting the four hospitals suitable for so grave an emergency as a severe haematemesis following a protracted melaena associated with a duodenal ulcer. I then considered it advisable to visit my patient, whom I found moribund and who died shortly after. I spoke on two separate occasions to the two local hospitals—they at least can hardly claim that I failed to impress the seriousness of the case. Of the two more distant hospitals, the receiving officer of one was so "impressed" that she said

I am certain, give due credit to him and his committee for what has already been achieved. What is needed in simple justice is the total abolition of the grade, with the automatic granting of consultant status to all, except those who may wish to remain in the grade, solely because they are in the main general practitioners and have not the time to become fully consultant. Then, in my view, those not in senior posts would accept the title of assistant consultant willingly, and there would no longer be this sense of injustice, of being fixed in a dead-end job, of being degraded in status in a profession which above all others should be without such stigma and admit only to eminence.—I am, etc.,

Reading.

S. F. LOGAN DAHNE.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Lieutenant H. A. Wismayer to be Surgeon Lieutenant-Commander.

Temporary Surgeon Lieutenant B. V. Jones, R.N.V.R., has been re-entered on the Permanent List, R.N., in the rank of Surgeon Lieutenant-Commander.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commanders H. E. Holling, V.R.D., and A. L. Gunn, V.R.D., have retired.

Surgeon Lieutenant S. P. C. O'Reagan to be Surgeon Lieutenant-Commander.

COLONIAL MEDICAL SERVICE

The following appointments have been announced: R. H. Bland, M.D., M.R.C.P., Director of Medical Services, Singapore; R. G. Ladkin, M.B.E., B.M., B.Ch., D.P.H., Senior Medical Officer, Uganda; H. T. Laycock, M.B., F.R.C.S., Surgeon Specialist, Nyasaland; D. P. Bowler, M.B., B.S., M.R.C.P., Medical Officer, Federation of Malaya; E. N. F. Browne, M.B., B.Ch., Medical Officer, Hong Kong; P. D. Grant, B.M., B.Ch., Medical Officer, Tanganyika; Z. Lett, M.D., D.A., Specialist/Anaesthetist, Hong Kong; M. G. Rogoff, M.B., Ch.B., Medical Officer, Kenya; B. T. M. Aboko-Cole, M.B., Medical Officer, Sierra Leone; C. A. Cusack, L.R.C.P.&S.I., and E. Taylor, M.B., B.Ch., B.A.O., Medical Officers, Northern Rhodesia; I. A. Moolan, M.B., B.S., Medical Officer, Mauritius; J. D. Vervoon, M.D., P. A. Ruggli, M.D., and Miss M. A. Schaefer, M.D., Medical Officers, Gold Coast; T. H. L. Montgomery, M.B., B.Ch., B.A.O., D.P.H., D.T.M.&H., Director of Medical Services, Western Region, Nigeria; J. D. Arneaud, M.B., B.S., D.C.P., Pathologist, Grade B, Trinidad; Mary M. Bools, M.B., B.Ch., B.A.O., Pathologist, Sierra Leone; G. F. Grave, M.B., B.S., and D. G. G. Greenaway, M.R.C.S., L.R.C.P., Medical Officers, Falkland Islands; A. J. Hibell, M.B., B.S., Medical Officer, South Pacific Health Service; J. B. David, M.B., F.R.C.S., D.L.O., Ear, Nose, and Throat Specialist, Gold Coast; R. S. Francis, L.M.P., Medical Officer, Seychelles; J. W. Gabrynowicz, M.B., B.Ch., B.A.O., Medical Officer, Nigeria; J. E. Latham, M.B., B.Ch., B.A.O., Resident Medical Officer (Intern), Kenya; A. G. Leacock, M.B., B.Chir., F.R.C.S., Surgeon Specialist, Barbados; B. E. R. Symonds, M.D., M.R.C.P., D.C.H., Medical Officer, Grade A (Physician), Health Department, Trinidad; A. G. E. Fung-a-Fat, M.B., B.S., Medical Officer, British Guiana; J. Taylor, M.B., Ch.B., D.P.H., D.T.M.&H., Deputy Director of Medical Services, Sarawak; E. C. Vardy, M.D., B.S., Deputy Director of Medical Services, Sarawak (Brunei); J. G. Cameron, M.B., Ch.B., M.R.C.O.G., Specialist (Obstetrician and Gynaecologist), Medical Department, Gold Coast; F. S. MacMahon, M.B., B.Ch., B.A.O., House Physician, Colonial Hospital, Windward Islands.

Association Notices

ELECTION OF MEMBER OF THE COUNCIL BY THE WEST INDIAN BRANCHES

Mr. C. Belfield Clarke (London, S.E.1) is the only candidate nominated to represent the West Indian Branches on the Central Council in place of Mr. Aubrey Leacock, who has resigned. Accordingly, Mr. Belfield Clarke is hereby declared elected for the remainder of the term of office—that is, until the close of the Annual Representative Meeting, 1955.

A. MACRAE,
Secretary.

Diary of Central Meetings

MAY

- 4 Tues. Evidence Committee on Divine Healing, 1.30 p.m.
5 Wed. Consultants, General Practitioners, and Public Health Liaison Committee, 11 a.m.
5 Wed. Office Committee, 11 a.m.
5 Wed. Arbitration Machinery Committee, 1 p.m.
5 Wed. Council, 2 p.m.
6 Thurs. Council, 10 a.m.
7 Fri. Anaesthetists Group Committee, 2 p.m.
10 Mon. Subcommittee on Diagnosis of Eye Diseases, Ophthalmic Group Committee, 2 p.m.
11 Tues. Joint Consultants Committee (at Royal College of Surgeons of England, Lincoln's Inn Fields, London, W.C.), 10.30 a.m.
12 Wed. Central Consultants and Specialists Executive, 12 noon.
12 Wed. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
12 Wed. Medico-Legal Subcommittee, Central Consultants and Specialists Committee, 4.30 p.m.
13 Thurs. Physical Medicine Group Committee, 2 p.m.
17 Mon. Joint meeting of B.M.A. and British Veterinary Association, 4 p.m.
19 Wed. Conference of Honorary Secretaries, 10.30 a.m.
20 Thurs. Radiologists Group Committee, 12 noon.
20 Thurs. Organization Subcommittee, Central Consultants and Specialists Committee, 2 p.m.
21 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 10.30 a.m.
21 Fri. Medical Witnesses Subcommittee, Private Practice Committee, 2 p.m.
21 Fri. Overseas Committee, 2 p.m.
28 Fri. Conference of Regional Officers, 12 noon.

Branch and Division Meetings to be Held

- BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Bournemouth (i) Friday, April 30, 8.15 p.m., meeting. Address by Dr. A. T. Roden: "Recent Developments in the Work of the annual meeting." (2) Friday, May 7, 8.15 p.m.
CITY DIVISION.—At Old Library, B.M.A. House, Tavistock Square, London, W.C., Tuesday, May 4, 8.30 p.m., A.G.M.
COVENTRY DIVISION.—At Gymnasium, Coventry and Warwickshire Hospital, Tuesday, May 4, 8.30 p.m., annual general meeting. Film: "Radiography of the Vertebrae."
DORSET DIVISION.—At Oak Room, Antelope Hotel, Dorchester, Tuesday, May 4, 7.45 for 8 p.m., dinner; 9 p.m., meeting.
HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Tuesday, May 4, 8.30 p.m., clinical meeting. Address with colour-film by Professor Ian Aird: "The Joined (Siamese) Twins."
HOLLAND DIVISION.—At Peacock and Royal Hotel, Boston, Saturday, May 8, 7.15 for 7.45 p.m., supper; 9 p.m., annual meeting.
ISLE OF WIGHT DIVISION.—At St. Mary's Hospital, Newport, Thursday, May 6, 8.30 p.m., meeting. Lecture by Mr. David Problem? "The Gastric Ulcer—a Medical or Surgical Problem?" All Island medical practitioners are invited.
KENSINGTON AND HAMMERSMITH DIVISION.—At St. Mary's Hospital, Marlborough Road, Kensington, W., Friday, May 7, 8.30 p.m., annual general meeting.
LAMBETH AND SOUTHWARK DIVISION.—At Belgrave Hospital for Children, Clapham Road, London, S.W., Tuesday, May 4, 3 p.m., clinical meeting.
LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, S.E., Friday, May 7, 8.30 p.m., annual general meeting.
METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., (1) Thursday, May 6, 8.30 p.m. to annual general meeting. President's address by Dr. D. F. Hutchinson.
REIGATE DIVISION.—At Redhill County Hospital, Tuesday, May 4, 8.30 p.m., meeting. Discussion to be opened by Dr. Liaison.
RUGBY AND SOUTH WARWICKSHIRE DIVISIONS.—At Grand Hotel, Rugby, Thursday, May 6, 8 for 8.30 p.m., informal supper; 9.15 p.m., joint meeting.
SOUTH STAFFS DIVISION.—At Bell Library, Royal Hospital, Wolverhampton, Tuesday, May 4, 8.30 p.m., annual general meeting.
SWINDON DIVISION.—At Swindon and North Wilts Victoria Hospital, Wednesday, May 5, 8.30 p.m., A.G.M.
WEMBLEY DIVISION.—At Wembley Hospital, Fairview Avenue, High Road, Wembley, Tuesday, May 4, 9 p.m., A.G.M.

Meetings of Branches and Divisions

ISLE OF WIGHT DIVISION
The first of the spring series of clinical meetings was held in St. Mary's Hospital, Newport, on April 7. Mr. E. F. Chin lectured on "Some Common Entities in Thoracic Work." The meeting ended with an open discussion. The meeting was attended by the majority of the Isle of Wight practitioners.

UNDERGRADUATE COURSE IN GENERAL PRACTICE

PRELIMINARY OBSERVATIONS

BY

E. A. W. MARIEN, M.B., B.S., D.I.H.
General Practitioner

WITH THE CO-OPERATION OF

A. P. ARDOUIN

Undergraduate, Charing Cross Hospital Medical School

"General practice; keystone of medicine": some believe it, many pay it lip-service, few refute it.

Of recent years, medical schools have attempted to give their students an insight into general practice by lectures or visits to general practitioners. Since 1952 Charing Cross Hospital Medical School has included in its curriculum compulsory attendance at a general practice for its final-year students (who have passed Part I M.B., B.S.). The student resides with the general practitioner for three weeks and accompanies him on all his work. This is termed a general-practice firm.

The scheme is still very much in its infancy. Little has been written on how this project is being tackled or how it may be improved so that the student can obtain the maximum benefit from his brief contact with general practice. For the general practitioner this is also a new problem, and several years will be required before the different methods and ideas crystallize.

The general-practice firm will of necessity, and we think with advantage, always be highly individualistic. As experience grows the teachers will be able to incorporate not only their own improvements but those of others into the running of this scheme. Regular conferences of general-practice teachers and the staff of the medical school are essential for the interchange of ideas and the eventual success or failure of the project.

This report reviews the ground covered on such a firm, and in no way attempts to define what a general-practice firm should aspire to.

GENERAL CONSIDERATIONS

The method of introducing the student to the patient is important. We think the term "student doctor" is best;

it is both truthful and ethical, and at the same time maintains professional dignity. The student examines all patients, both in the surgery and on visits, and, so far, on no occasion has a patient raised any objection. The general practitioner has to work more slowly than usual, but if properly organized his actual day's work need not be prolonged by more than a fifth. This can be increased according to the circumstances, so that the student may obtain the maximum experience.

The general practitioner must also be willing, after the day's work (i) to discuss in more detail the patients seen; (ii) to debate non-clinical medical problems (as shown below); and (iii) to study academic medicine with the student. It was impossible to fulfil the last-mentioned requirement during this particular firm, but it was carried out by one of us (E. A. W. M.) on a previous firm and will be reintroduced. We consider it most important, as the student is in the middle of his final examinations, and it is exhilarating to the general practitioner to pit his memory and experience against the more theoretical knowledge of the student.

It is difficult to give a complete list of what is learnt in general practice, but the following, we believe, are the main aspects (excluding those mentioned later) with which the student becomes acquainted: (1) co-ordination of general medical care; (2) doctor-patient relationship; (3) medical ethics; (4) application of theoretical medicine to general practice; (5) care of the young and aged; (6) midwifery; (7) common ailments; (8) early symptoms of serious disease; (9) treatment of serious disease in the home; (10) emergencies in general practice; (11) use of hospital and ancillary facilities; (12) preventive, social, and industrial medicine; and (13) health education.

Quantitative Data

One of us (A. P. A.) attended 16 morning, 12 evening, and three antenatal surgeries. Table I shows the quantitative work done in these surgeries, and the breakdown into new and repeat cases both for adults and for children.

TABLE I.—Surgery Visits

	Adults	Children	Total
No. of consultations	363	95	458
Repeat cases	218	28	246
New	128	67	195
Attending for certificates only ..	17		17

Table II is similar, but deals with patients visited in the home. It is to be noted that all new cases were new

TABLE II.—Home Visits

	Adults	Children	Total
No. of visits	101	113	214
Repeat cases	89	88	177
New	12	25	37

diagnoses to the practice, although many of the repeat cases were new to the student. During the three weeks of the firm we saw 674 patients. Of those seen at the surgery, the following were referred elsewhere for diagnosis or treatment:

	Adults	Children
To hospital for diagnosis	12	2
" " treatment	18	2
" dentist	2	—
" chest clinic for routine x-ray examination	5	4

Of the patients visited the following were referred to hospitals:

	Adults	Children
Emergencies	3	—
To out-patient department for treatment	2	—
" " " " diagnosis	—	1

The high proportion of patients referred to hospital for diagnosis is due to the fact that no open x-ray facilities exist and that those sent for exclusion of fractures, etc., are included. In those referred for treatment the diagnosis was firmly made, but treatment could be carried out only in hospital—for example, operative intervention, physiotherapy. The period under review occurred at the tail-end of a mild epidemic of pertussis, and all these cases have a routine x-ray examination on clinical recovery. The adult routine x-ray films of the chest are O'Delea films, while those requiring a large film after a serious lung condition are included under cases sent to hospital for diagnosis.

The three emergencies were a case of peritonitis due to a ruptured ectopic gestation, and two cases of inevitable abortion; while cases referred to the out-patient department were a case of recurrent subacute appendicitis for interval appendectomy and a case of hysteria for a psychiatric opinion.

The following case report on one of these emergencies is included because the family doctor often feels a sense of inferiority when he receives the hospital report giving a precise diagnosis after full investigation.

Case Report.—A woman aged 37 had symptoms suggestive of gastric ulcer in October, 1950. This was confirmed radiologically. There was no other relevant past history. In the early hours of the morning of December 1, 1953, she awakened with severe central abdominal pain and vomiting. Later shoulder-tip pain developed. She looked ill, with ashen-grey complexion and cold sweat. Her pulse was 88, temperature 99.4° F. (37.4° C.), and blood pressure 116/82. No abnormality was detected on examination of the throat and the respiratory, cardiovascular, and central nervous systems. The abdomen revealed generalized tenderness with guarding. There was no board-like rigidity or diminution of liver dullness. On palpation the impression was gained that the site of maximum tenderness was in the hypogastrium, but no mass was found. Micturition and bowel action were normal and the urine was clear. Her menses had been entirely regular and normal, and on direct questioning she denied any intermenstrual bleeding and thought it most unlikely that she was pregnant. Her last menses had started a fortnight previously, there was no vaginal discharge, and rectal examination revealed tenderness only. The clinical diagnosis made was peritonitis with diaphragmatic irritation, ? perforated ulcer, ? pelvic cause.

We telephoned the hospital the following day to find out the correct diagnosis. The patient had a ruptured ectopic gestation, but on inquiry the doctor stated frankly that this had not been diagnosed pre-operatively. The hospital report, after discharge of the patient, stated: "On admission she was found to have a ruptured ectopic gestation. At laparotomy . . ." Had we not previously made inquiries we should have believed our diagnostic ability to have been lacking.

Table III shows the analysis of the consultations and visits into system groups. The high incidence in the upper

respiratory virus infections and the E.N.T. group is to be expected in the late autumn, and the large number of orthopaedic cases is explained by the inclusion in this group of disorders of the locomotor system.

The "psychiatric" group comprises less than 10% of all cases seen in consultation; this is much lower than expected, but no importance can be attached to a percentage obtained in this short period. The immense importance of the family doctor in this field is well shown in the following case report.

A married woman moved into the area of the practice about three and a half years ago. She had received psychotherapy without much improvement. A report in 1948 stated: "She is a very determined neurotic, and one who would not respond readily to psychotherapy." She had attended the practice frequently since 1950.

The following history was elicited at an appointment two days before the arrival of the student. The mother of the patient (whom we shall call Mrs. A.) was deserted by her husband before our patient was born. Mr. A. went to live with another woman (whom we shall call Mrs. B.). Mrs. A. contacted Mr. B., who was then serving in France, to tell him the state of affairs. Eventually Mrs. A. and Mr. B. met, and after a time tried unsuccessfully to obtain their respective divorces, and then lived together as man and wife. Mrs. A. had two children and Mr. B. also had two. Mrs. A. then had two children by Mr. B. out of wedlock (the patient and a younger sister). The patient's mother was good to them but very strict. The children were often left alone, and the patient and her sister were put to bed by the elder children, who, to amuse themselves, used to tell the youngsters never go to bed without first looking underneath it.

At the age of 7 or 8 one of the boys (a son of Mr. and Mrs. B.) used to interfere with her. She did not know what it all meant, but "used to wonder where the mess came from." At school she used to feel that she was not the same as the other children, because her sisters and brothers had different surnames.

She met her husband at the age of 15½ and married him at the age of 20. She was constantly afraid that on her honeymoon adolescent she had severe dysmenorrhoea, but defied everyone, including the family doctor, by refusing to go to hospital because of the same fear.

When she was a married woman her parents obtained their respective divorces and became legally man and wife. At this time she had been at one firm for 14 years and liked it very much. One of her friends saw notices of the divorce, and it became known at the firm. Until this time the patient had no idea she had been born out of wedlock, and it was a great shock to her. She left the firm where she had been happy for so long.

Apart from the patient and her family doctor no other person knows this distressing story of her childhood, any part of which would be sufficient to produce a neurosis in later life.

Additional Activities

Two factories were visited—one manufacturing plastics from the basic material, the other manufacturing end-products. The factories provided, apart from general interest in plastic manufacture, excellent examples of the application of some of the principles of industrial medicine—in particular (1) pre-placement examinations and their importance; (2) rehabilitation of sick or injured back to full routine or work suitable to their functional capacity; (3) safety devices on machinery; (4) local exhaust ventilation, protective barrier creams, and protective clothing in dermatitis-risk occupations; (5) respirators and protective clothing in the formaldehyde sheds; (6) precautions in the cyanide processes; and (7) routine lay-out and ancillary services of an industrial medical department.

A meeting between the medical officer of health, the general-practitioner obstetricians, and the midwives, to improve and co-ordinate their efforts in domiciliary midwifery, took place during the three weeks under review, and the opportunity was taken for the student to be present. It is interesting, if not amusing, to record that one of the main points of the discussion was the correct designation of status of midwives on a particular form.

Two lectures were attended: one dealt with the relationship between sinus infection and lung lesions; the other was of a non-medical nature, and other professions were invited. The meeting was mainly attended by doctors, magistrates, and the teaching profession, and the motion was put that "Corporal Punishment has no Place in the Penal Code of an Enlightened Civilization."

The value of a courteous and helpful pathologist, who affords every facility that he and his laboratory can provide, was demonstrated to the student. A completed request form is all that is required for ambulant patients, who then attend the local hospital laboratory on any day between 10 a.m. and 2 p.m., where a technician takes the samples for the doctor. For the non-ambulant patient ill at home, a specially constructed case with dry sterile syringes and the necessary equipment has been designed by one of us (E. A. W. M.), and is always kept in the car. When investigations are required on a patient visited, all the doctor has to do is to walk to the car for his case and take the sample—a matter of minutes. A relative takes the specimens at once to the laboratory.

It is often thought that the general practitioner's work is mainly concerned with trivial ailments, and, although these do form a part (often an important part towards maintaining positive health), the keeping of the records gives a clear indication of the interesting clinical material seen in so short a period as three weeks. The following is an example of only some of this material: *acute otitis media; *atypical pneumonia; *severe hypochromic anaemia, presenting as cardiac pain; *Raynaud's disease; *thrombophlebitis; *carcinoma of oesophagus; idiopathic mesenteric adenitis; *pityriasis rosea; *cholecystitis; *malignant pleural effusion; *pleural tap in the home; severe hypertensive retinitis; multiple myelomatosis; myeloid leukaemia; *Manson's wood dermatitis.

Non-clinical Subjects

We considered and discussed a broad range of subjects appertaining to general practice. Often the student had not even heard about some of these, let alone given them serious thought. These discussions took the form of "armchair talks" after the day's work, the general practitioner and the student obtaining each other's opinions and reasoning. The subjects were considered in a broad sense, and any tendency to become entangled in detail was avoided.

Many hours were spent in discussion, and it is impossible without going into lengthy detail, to give any real indication of the ground covered. The subjects are therefore grouped for convenience under the following main headings, with only occasional comment.

*These were new diagnoses occurring in the period under review.

Surgery.—(1) Surgery lay-out; (2) ideal surgery for single-handed practices; (3) ideal surgery for group practices; (4) ancillary services (secretary, receptionist, nurse, laboratories, x rays); (5) financial considerations. The planning of the general practitioner's own surgery; the good points, the deficiencies, and the improvements required are shown. The student proves very interested in the running of the surgery, and the general practitioner must be on his guard not to omit this, although to him it is ordinary routine. A general outline of the many articles on surgery planning are conveyed to the student, and one of the evenings ended by planning and drawing sketches of how to adapt an imaginary double-fronted house. We consider that one of the prime needs of general practice to-day is, without doubt, well-designed premises and full ancillary services. The office worker has a "pending" tray, and the hospital doctor an appointment system to buffer any sudden increase in work, but the general practitioner has to deal forthwith with the work to hand. Therefore it is all the more necessary that lay help should be available to relieve him of non-clinical duties. The young general practitioner not only wishes to learn the art and skill of his older colleagues, but desires, and justly considers it his right, to have readily available the modern scientific aids, which in hospital he has taken for granted, to maintain a high and satisfactory standard.

National Health Service Administration.—(1) Advantages and disadvantages of present organization. (2) Integration of the three services. (3) Modifications and alternatives to the N.H.S. (4) Executive council, terms of service. The administration of the general medical services is explained to the student and discussed with him.

Group Practice or Health Centres.—(1) Ideal health centre: lay-out and number required; financial impracticability. (2) Group practice: advantages and disadvantages.

Financial Considerations in General Practice.—(1) Present method of payment. (2) Disadvantages of capitation system: lack of financial inducement to better medical practice, lack of incentive to develop ancillary services, non-provision for capital expenditure. (3) Alternatives. It is thought that the *per capita* method of payment can never take into account the conscientiousness, skill, experience, and amount of work of a particular doctor. It is purely a quantity payment, and as such cannot provide a financial inducement (theoretically unnecessary) to higher standards of practice. All the alternatives we have discussed presented difficulties and flaws on detailed examination, but their consideration is stimulating and tempers one's criticism.

Paper Work.—(1) Records. (2) Certificates. (3) Letters to hospital. (4) Miscellaneous. The student obtains an insight into this when with the firm, but one evening is set aside to talk about it. Medical note-keeping is of prime importance, and can, in general practice, so easily become a voluminous jumble among which the important data are difficult to locate. The back of the medical record envelope is used only for major diagnoses, and not, as so often at present, for entering trivial detail of no future significance. If a patient is a potentially dangerous schizophrenic it is obviously desirable that this little detail should catch the doctor's eye immediately he takes out the record envelope, and not the various placebos which in long past years have served to facilitate the patient's egress from the surgery. On the continuation cards are entered the medical notes, divided into years by an ink line, while the diagnoses are underlined with red ink, and investigation results entered in red. Reports, when they become bulky, are filed in a separate filing cabinet, after a précis of them has been entered and a distinguishing mark to note the fact added to the top left-hand corner of the face of the record envelope.

Midwifery.—(1) Antenatal and post-natal care. (2) Delivery: home or hospital. (3) Liaison with consultants and midwives. (4) N.H.S. regulations. Normal pregnancy, as a natural phenomenon and dealt with in its natural environment when this is suitable, is seen.

Public Health.—(1) Preventive medicine; notification. (2) District nurses and midwives. (3) Welfare centres; school medical service. (4) Ancillary services: health visitors; domestic help; meals on wheels; tuberculosis aftercare committee. (5) Sanitary considerations. The student, who has mainly learnt his public health from a course of lectures, sees the practical application of this branch of medicine. He sees that practically the whole of public health is closely connected with the work of the family doctor, who often needs one or other of its services to bring to his patient comprehensive care and treatment.

Industrial Medicine.—(1) Industrial medical service. (2) Pre-placement examination. (3) Ancillary services. (4) Rehabilitation. On this particular firm we spent an evening discussing industrial medicine because one of us (E. A. W. M.) is interested in this branch. On other firms some subject the general practitioner has a detailed knowledge about would doubtless be substituted. The general practitioner is the ideal person, if he is willing to acquire the knowledge and experience, to furnish the part-time personnel for this service.

Postgraduate Study in General Practice.—(1) Public lectures, local B.M.A. lectures. (2) Local medical societies. (3) N.H.S. courses: part- and full-time. (4) Home reading. (5) College of General Practitioners/research in general practice. (6) Access to cases in local hospitals. Ample facilities exist in most areas for the general practitioner to keep abreast with the advances in medicine, but the single-handed doctor must experience difficulties in finding the necessary time. General practice is an exacting and time-consuming occupation and, even in the less busy part of the year, the day's work is usually so arranged (for the convenience of the patient) that the family doctor has never more than two or, at the most, three consecutive hours free at any time of the day or evening.

Conclusion

We feel that this course has something to offer to the student. It widens his field of vision beyond the boundaries of the hospital, he sees the only branch of "medicine" left in which he can obtain an overall picture, and he also realizes the value of continuous care with intermingling of early diagnosis, curative, preventive, social, and occupational medicine, and public health. He should become increasingly aware that the patient is not a case; that the patient is indivisible, and therefore "medicine" is also indivisible; that specialization can fulfil its proper aims only when co-ordinated with the general care of the patient.

This report relates to the student in his final year; the course lasts three weeks, and usually begins at the end of November. We realize that many arguments can be made against these present arrangements, but, in this experimental stage, we feel they should not be changed until more experience is gained.

The type of practice the student attends is important. We have no knowledge which is the most suitable, but this will become evident at the conferences. One thing, however, is certain: if the general practitioner believes that he has a service to give and is enthusiastic the student's time will not be wasted.

Summary

The undergraduate course in general practice is a compulsory part of the curriculum of Charing Cross Hospital Medical School. The final-year student resides with the general-practitioner teacher for three weeks.

The ground covered, the material seen, and the methods adopted are recorded.

We regard the scheme as a useful one, and urge the interchange of ideas and experience.

We wish to thank Dr. F. Sanders, the other principal and partner in the practice concerned, for his help and advice at all times.

GENERAL MEDICAL SERVICES COMMITTEE DISTRIBUTION OF REMUNERATION

A meeting of the General Medical Services Committee lasting a day and a half was held on April 21 and 22 under the chairmanship of Dr. A. TALBOT ROGERS. The Committee dealt with a number of matters which will be included in the Supplementary Annual Report to the Conference.

The second report of the Working Party on the distribution of remuneration among general practitioners (published in the *Supplement*, May 1, p. 206) was presented. The CHAIRMAN said that this report—an agreed one—followed upon the resolution passed by the Special Conference in 1952 that if, in the light of experience, it was found that the new scheme of distribution arrived at after the Danckwerts award left certain groups of practitioners—small-list men—without the benefit to be expected under the terms of reference of the Working Party, an appropriate proportion of the final settlement moneys might be allocated for the remedying of any such obvious defects.

By passing this resolution, the Chairman went on, the Conference desired that help should be given to men in practice who were doing a good job of work but with very small lists. Obviously the lower limit had to be drawn somewhere, and the Working Party had drawn it at a list of 300. It proposed, in addition to the ordinary capitation fee, a basic payment of £250 per annum for doctors with lists of not less than 300 or more than 1,200, together with a special additional fee of 10s. for each patient above the 300th and up to the 500th. It was believed that the number of single-handed practitioners to whom the scheme would apply would be between 500 and 600.

Asked for an estimate of the cost of the new proposals, the Chairman said that the gross sum would be about £120,000 a year at present. It was expected that this would be a diminishing amount as some of the elderly doctors—who comprised the largest category of practitioners with small lists—retired from practice. He pointed out that this was not new money; it was part of the total amount allocated to all practitioners.

Dr. WOOLLEY suggested certain anomalies in the scheme. The practitioners who would gain most advantage would be those with lists of 500. They would receive an additional £350 a year, an amount per patient which compared rather sharply with the smaller amount received per patient by practitioners with larger lists. After all, nobody suffered under the redistribution, not that certain groups were enriched.

The CHAIRMAN mentioned the numbers of single-handed practitioners graded according to size of lists, and said that there was a fairly even spread from the lowest to the highest numbers. The amount of money which had to be paid out in the last financial year because of the extra claiming payment on the basis of notional lists had come already to a very considerable sum—a good deal more than was paid out in the previous financial year. This number of principals, and there was more than enough to cover the extra amount of money already absorbed and extravagant scheme might not have been possible to maintain for years ahead. Another point was that there was no means test in relation to the scheme. Further, the modification proposed was not a major change necessitating parliamentary approval.

Dr. BRUCE CARDEW said that the Working Party had done a good piece of work, and even if it had been a little over-generous it entailed a very small sacrifice for others spoke to the same effect, and the scheme was accepted by the Committee.

Scheme for Restoration of Goodwill

The Committee discussed at length the scheme for the restoration of the right to buy and sell goodwill. The scheme had been worked out by the Amending Acts Committee on the instruction of Council, following the resolution of the Representative Body.

The CHAIRMAN said that the scheme had occupied the Amending Acts Committee for a considerable time, and its discussions had been attended by observers from the G.M.S. Committee. All that the G.M.S. Committee was asked to do was to say whether or not this was a practicable scheme on which further negotiations might proceed. It was not asked to say what should be done with the report. That was for the decision of the Council.

The committee's conclusions were expressed in the following resolution:

"The General Medical Services Committee, whilst paying tribute to the constructive efforts of the Amending Acts Committee to produce a scheme for the restoration of the right to buy and sell goodwill, does not support the scheme which has been submitted. This view is endorsed by opinions expressed by the Assistants and Young Practitioners Subcommittee and by the British Medical Students Association. Further, from the information contained in the memorandum by Mr. Dixon [Medical Insurance Agency] the Committee has reached the firm conclusion that the very difficult economic circumstances which have developed since 1948, in addition to the many practical difficulties involved, would render it impossible to carry out this or any other similar scheme for the restoration of goodwill."

Central Pool Calculations

A report was given of a meeting between representatives of the Committee and officers of the Ministry of Health for the discussion of the calculation of the size of the central pool. The CHAIRMAN said that he and the other representatives, as well as the experts who had accompanied them, had urged that the expenses ratio of 32.23% which had emerged from the inquiry by the Inland Revenue was for a number of reasons lower than the actual expense ratio for the period. The exclusion of non-typical practices from the accounts upon which the survey had been based was one of these reasons. He contended that an appropriate adjustment was necessary, and in this he was supported by Professor Allen, the economist, who gave grounds for the opinion that an addition of between 0.5 and 0.8% should be made.

The Ministry had since written to the effect that they would like to do a little research into the sort of doctors who had been omitted from the sample before making any reply to the proposal that the ratio used in the calculations should be higher than the figure set out. It will probably be some time before a final answer can be given.

It was also stated that, although both sides had agreed to accept the continuation of the use of the figure of £2m. for private practice pending a more accurate assessment of this source of income, the Ministry felt that a start should be made with a view to obtaining further information on this subject. The Committee's representatives had pointed out the obvious fallacy in using the practice expenses inquiry for this purpose, the sample on which the inquiry had been based not being sufficiently representative. This might very well result in a distortion of the picture, and here again they had been supported by Professor Allen, who said that, in his view, if private practice earnings were to be revealed by any form of survey this should be on a very much broader basis. The Chairman said that some of them felt that nothing short of an inquiry of all doctors in the country could give the real answer, but it seemed to be felt by the Ministry that such an inquiry would be too expensive and time-consuming for the offices of inspectors of taxes. He added that it was for the Committee to say whether it insisted on a 100% inquiry or whether anything short of it was acceptable in the interests of an agreed settlement which would continue for a period of years. A factor to be borne in mind was that the amount which practitioners were earn-

ing from private practice was steadily diminishing and would continue to diminish as older patients died and were not replaced by younger.

After some discussion it was agreed that the matter be taken up with the economics experts who had been concerned in these discussions, and that a report should be made again to the Committee.

Miscellaneous Business

The composition of the Joint Committee on Prescribing again came forward. Dissatisfaction was expressed with the extent of the general-practitioner representation. It was felt that this was far too small and it was agreed to submit a recommendation to this effect to the Council.

A highly detailed question was brought forward by the London Local Medical Committee concerning the succession to a vacant practice by a partner. This led to a long discussion, and in the end it was suggested that the Local Medical Committee should seek an interview with the Medical Practices Committee, and, if still dissatisfied, reopen the matter with the General Medical Services Committee.

The question of eligibility of general practitioners for grants to attend courses on occupational health arose on a case from Scotland, in which the Ministry of Health was quoted as having given the opinion that general practitioners were not eligible. It was agreed that the general position should be explored with the Ministry.

On the question of the legal position of nurses in respect of giving injections—a subject which has been before other committees of the Association following a conference called by the Royal College of Nursing at which the Association was represented—it was decided after discussion to await a memorandum from the Royal College.

A request was received from the Yorkshire Local Medical Committee that whenever a recruit was rejected by the medical board his own doctor should be notified and given the reasons for the rejection. Dr. Knox pointed out that if the patient's own doctor had any difficulty in learning why a patient had been down-graded he had only to write to the board and he would receive a reply from the chairman. It was agreed to discuss the matter with the Ministry and see if anything could be done to improve the position.

PROPOSED TAX RELIEFS

Some tax relief would be given, especially to married people, if the Government were to put into effect the proposals made in the second report of the Royal Commission on the Taxation of Profits and Income (H.M.S.O., 4s. 6d.). The proposals are an attempt to give some relief to the hard-pressed middle-class. And, while this may be difficult to define, most doctors would probably own, if pressed, to belonging to it. Certainly many would have less income tax to pay if the commission's recommendations were adopted.

Five of the thirteen recommendations are on child allowances. The main one is that the child allowances should vary within limits with the taxpayer's income. Up to £850 the allowance would remain at £85 as at present; between £850 and £1,000 it would be 10% of income; and for incomes over £1,000 it would be £100 plus 6% of the excess of the income over £1,000, but subject to a maximum of £160.

Surtax, which now begins at £2,000, should according to the commission begin at £1,500 for a single man, at £2,000 for a married man without children, and for a married man with children at £2,000 plus £160 for each child. The earned income relief of two-ninths of the income at present reaches a maximum of £450 at an income of £2,025. The commission recommends raising the limit of £2,025 to £2,500 and extending the relief at half the full rate to incomes between £2,500 and £3,000. A minority report signed by four members of the commission dissents in some respects from the report.

British Medical Association

ANNUAL MEETING—GLASGOW, JULY 1-9, 1954

President-Elect: Emeritus Professor Sir JOHN McNEE, D.S.O., M.D., D.Sc., F.R.C.P., F.R.F.P.S.

Joint General Secretaries: J. INGLIS CAMERON, M.B., Ch.B., F.R.F.P.S.; J. T. McCUICHERON, M.A., L.R.C.P., L.R.C.S., L.R.F.P.S.

Science Secretary: J. BASIL RENNIE, M.D., F.R.C.P., F.R.F.P.S.

Executive Officer: G. A. PECK, B.Sc., British Medical Association, Glasgow Regional Office, 234, St. Vincent Street, Glasgow, C.2.

PROGRAMME

The 122nd Annual Meeting of the British Medical Association will be held in Glasgow from Thursday, July 1, to Friday, July 9, 1954, inclusive.

On the evening of Wednesday, June 30, there will be a Cocktail Party for Representatives and their Ladies, arranged by the Glasgow Division.

The Annual Representative Meeting will begin on Thursday, July 1, and continue on Friday, Saturday, and Monday, July 2, 3, and 5.

The Representatives' Dinner and Ladies' Dinner will take place on Thursday, July 1, followed by a dance.

The Overseas Luncheon has been arranged for Friday, July 2.

On Sunday, July 4, an all-day sail on the Firth of Clyde has been arranged, and this will be followed by a concert in the evening.

The Adjourned Annual General Meeting and President's Address will take place in the Kelvin Hall on the evening of Monday, July 5, and the President's Reception, which follows, will be held in the Bute Hall, at the University.

The Annual Scientific Meeting and associated functions occupy the period from Tuesday morning, July 6, to the evening of Friday, July 9.

The Official Religious Service will be held in Glasgow Cathedral on the afternoon of Tuesday, July 6, and arrangements for a Roman Catholic Service, on the same day, are also being made.

The Annual Dinner of the Association will be held in the Central Hotel on Thursday, July 8.

A full social programme is being arranged, including a Civic Reception on Tuesday evening, July 6, and a University Reception on Wednesday evening, July 7. There will also be a dance on Friday evening, July 9.

Several special functions have been arranged for ladies accompanying members, including visits to Loch Lomond, Lake of Menteith and Stirling, the Burns Country, and Edinburgh. Also included among these is an all-day excursion to Loch Katrine and the Trossachs.

The usual golf competitions will take place.

The Overseas Conference will be held on the afternoon of Wednesday, July 7, and there will also be an "At Home" for Overseas Visitors given by the Empire Medical Advisory Bureau on Thursday, July 8.

The Reception Room for Registration will be open in the Kelvin Hall on Monday, July 5, at 9 a.m.

Three Plenary Scientific Sessions have been arranged as follows: Tuesday, July 6, at 9.30 a.m., subject "The Problem of Sleep"; Wednesday, July 7, at 3 p.m., subject "Food and Disease"; Thursday, July 8, at 9.15 a.m., subject "The Problem of Pulmonary Tuberculosis To-day."

Seventeen Scientific Sections have been arranged, the meetings to take place on Wednesday morning, July 7, Thursday afternoon, July 8, and Friday morning and afternoon, July 9 (details are given below).

The Scientific Exhibition will be held in the Kelvin Hall, and will be open daily from July 5 to 9. Demonstrations will be given at fixed advertised times and a wide field of medical interests will be covered. For details see page 226.

The Annual Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications will also be housed in the Kelvin Hall. The Exhibition will be open from 9 a.m. to 6 p.m. from July 5 to 9 inclusive.

The Ladies' Club will be situated in the College Club, University, and will be open throughout the Meeting.

REGULATIONS REGARDING DRESS

Academic Dress is to be worn at the President's Address, the President's Reception, the Official Religious Service, the Roman Catholic Service, the Civic Reception, and the University Reception.

Robes may be hired from Messrs. Ede and Ravenscroft, Ltd., 93, Chancery Lane, London, W.C.2, or, in the case of Glasgow graduates, from Messrs. Thomson, Sons and Wright, Ltd., 173, St. Vincent Street, Glasgow, C.2. Early application is advised, as the supply of gowns is limited, and it is suggested that the gowns be sent to the home address of the individual concerned.

Evening Dress (Tails or Dinner Jacket), with Decorations, is to be worn at the President's Reception, Civic Reception, University Reception, and Annual Dinner. Evening Dress without Decorations should be worn at the Representatives' Dinner, the Representatives' Dance, and the Dance in the Union on July 9.

REGISTRATION FEE

Members attending the Annual Meeting (other than members of the Representative Body and overseas visitors) are required to pay a fee of one guinea towards the expenses of the Meeting. The fee will be payable when members register at the Reception Office.

TICKETS

All tickets for functions up to Sunday, July 4, will be available for Representatives at the A.R.M. Inquiry Office at the Bute Hall, University, on June 30, July 1, 2, and 3, and for ladies at the Ladies' Club, the College Club, University.

Tickets for all other functions after Sunday, July 4, will be available from Monday, July 5, at the Reception Office, Kelvin Hall, or at the Ladies' Club.

BADGES

Members will not be admitted to Plenary Sessions, Scientific Sections, or Exhibitions unless wearing badges. They should therefore visit the Reception Office, Kelvin Hall, on the first day of the Annual Meeting to obtain their handbook, badge, registration card, and tickets.

Officers of Scientific Sections and other office-holders should inquire for special badges at the Reception Office.

HOTEL ACCOMMODATION IN GLASGOW

The following is a list of hotel and hostel accommodation still available for the Glasgow Meeting.

For hotel accommodation, reservations should be made direct with the hotels and not through the B.M.A.

For hostel accommodation, all requests should be made to the Executive Officer, B.M.A. Glasgow Regional Office, 234, St. Vincent Street, Glasgow, C.2, and not direct to the hostels.

REVISED HOTEL LIST

Name and Address of Hotel	Tel. No.	Distance from University	Rooms Available	Tariff, 1953 B.B.
*Buchanan St. Station Hotel, Buchanan St., Glasgow, C.2	Douglas 9016	1½ miles	Single Double	24/- 48/-
*Central Hotel, Glasgow, C.1	Central 9680	1½ "	Double	60/-
*St. Enoch Hotel, St. Enoch Sq., Glasgow, C.1	Central 7033	1½ "	Single Double	35/- 60/-
Y.M.C.A. Club, 100, Bothwell St., Glasgow, C.2	City 0388	1½ miles	Single (men)	12/6
<i>Hostel Accommodation</i>				
MacBrayne Hall, 11, Park Circus Place, C.3	Douglas 5626	½ mile	Men (share twin-bedded rooms)	12/6 p.p.
Douglas House, Jordanhill College, Southbrae Drive, W.3	Scotstoun 2694	2½ miles	Men or women (single rooms)	14 6

* Licensed hotels.

TRAVEL RESERVATIONS

Accommodation on trains and on aircraft between London and Glasgow during July is booked at a very early date. It is advisable to make reservations as soon as possible.

ABERDEEN GRADUATES' DINNER

A dinner arranged by the Glasgow Aberdeen University Association will be held in the North British Hotel, Glasgow, on Saturday, July 3, 1954, at 7.30 p.m. Tickets will be 25s.

All Aberdeen graduates and their ladies attending the Annual Representative Meeting will be welcome. Those intending to be present should apply by the end of May to Mr. W. E. S. Thomson, 23, Thorn Drive, Bearsden, Glasgow, for further information.

GLASGOW GRADUATES' DINNER

The Glasgow Graduates' Dinner will be held in the Royal Faculty of Physicians and Surgeons of Glasgow, 242, St. Vincent Street, Glasgow, C.2, on Saturday, July 3, at 7 for 7.30 p.m. The dinner is open to Glasgow graduates and their ladies who are attending the Annual Representative Meeting.

The cost is 30s. each, including aperitifs. Numbers are limited, and early application, with appropriate remittance, should be made to Dr. J. C. Macarthur, Roadmeetings House, Carlisle, Lanarkshire.

CHRISTIAN MEDICAL FELLOWSHIP ANNUAL BREAKFAST

The Annual Breakfast of the Christian Medical Fellowship will be held in the Students' Union, University Avenue, Glasgow, on Wednesday, July 7, at 8.15 a.m. The chairman will be Sir John McNece, and the speaker Mr. Howard Somervell. The proceedings will terminate at 9.15 a.m. Those intending to be present are asked to notify the local secretary, Dr. J. C. Eaton, 19, Boclair Road, Bearsden, Glasgow.

SCIENTIFIC MEETING

PLENARY SESSIONS

Tuesday, July 6, 9.30 a.m.: "The Problem of Sleep"

Chairman: Professor Sir DAVID CAMPBELL (Aberdeen).
Speakers: Professor Sir GEOFFREY JEFFERSON (Manchester), Professor D. M. DUNLOP (Edinburgh), Dr. J. O. McDONAGH (Stanley), Dr. A. H. DOUTHWAITE (London), Dr. MACDONALD CRITCHLEY (London).

Wednesday, July 7, 3 p.m.: "Food and Disease"

Chairman: Dr. W. G. CLARK (Edinburgh).
Speakers: Dr. C. METCALFE BROWN (Manchester), Professor B. S. PLATT (London), Dr. JOAN TAYLOR (London), Dr. J. S. K. BOYD (London), Professor R. CRUICKSHANK (London), Mr. A. E. BURDETT (London).

Thursday, July 8, 9.15 a.m.: "The Problem of Pulmonary Tuberculosis To-day"

Chairman: Sir ANDREW DAVIDSON (Edinburgh).
Speakers: Dr. PETER MCKINLAY (Edinburgh), Dr. A. B. SEMPLE (Liverpool), Dr. J. R. LANGMUIR (Glasgow), Dr. W. D. W. BROOKS (London), Mr. T. HOLMES SELLORS (London), Dr. R. R. TRAIL (London).

SCIENTIFIC SECTIONS

All sessions will be held in the University and details are given of the lecture theatres where the sessions are to be held.

*The names of additional speakers in some sessions will be published later.

MEDICINE

President: G. E. BEAUMONT, D.M., F.R.C.P., D.P.H. (London).

Vice-Presidents: Professor S. ALSTEAD, M.D., F.R.C.P., F.R.F.P.S. (Glasgow); Professor L. J. DAVIS, M.D., F.R.C.P., F.R.C.P.Ed., F.R.F.P.S., F.R.S.Ed. (Glasgow); Professor S. J. HARTFALL, T.D., M.D., B.Sc., F.R.C.P. (Leeds); W. R. SNODGRASS, M.A., M.D., B.Sc., F.R.F.P.S. (Glasgow).

Hon. Secretaries: JOHN H. HUNT, D.M., M.R.C.P., 54, Sloane Street, London, S.W.1; E. G. OASTLER, T.D., M.A., M.B., Ch.B., F.R.C.P., F.R.F.P.S., 4, Woodside Terrace, Glasgow, C.3.

Sessions

Physiology Lecture Theatre.
Wednesday, July 7.—9.30 a.m., Management of Old Age in General Practice, Dr. TREVOR HOWELL (London).
Prevention and Treatment of Respiratory Infection in Old Age, Sir GEOFFREY MARSHALL (London), Dr. NEVILLE OSWALD (London), Dr. T. McEWAN (Glasgow).
Treatment of Parkinsonism, Dr. H. G. GARLAND (Leeds), Dr. H. G. MILLER (Newcastle-upon-Tyne).
Treatment of Peripheral Vascular Disease in Old Age, Professor E. J. WAYNE (Glasgow), Professor MICHAEL BOYD (Manchester), Dr. WM. FERGUSON ANDERSON (Glasgow), Dr. O. T. BROWN (Dundee).
Thursday, July 8.—2.30 p.m., Medical Treatment of Hypertension, Dr. GEOFFREY BOURNE (London), Dr. J. GIBSON GRAHAM (Glasgow), Dr. GAVIN SHAW (Glasgow).
Anticoagulants in Coronary Thrombosis, Dr. RAE GILCHRIST (Edinburgh), Professor R. B. HUNTER (Dundee), Dr. A. BROWN (Glasgow).
Anticoagulants in Thrombophlebitis, Dr. BODLEY SCOTT (London), Mr. R. S. MURLEY (London), Mr. R. B. WRIGHT (Glasgow).

SURGERY

President: Sir HENEAGE OGILVIE, K.B.E., M.A., M.D., M.Ch., F.R.C.S. (London).

Vice-Presidents: JOHN DUNBAR, M.B., F.R.F.P.S. (Glasgow); Professor C. F. W. ILLINGWORTH, C.B.E., M.D., Ch.M., F.R.C.S.Ed., F.R.F.P.S. (Glasgow); T. MURRAY NEWTON, M.B., F.R.F.P.S. (Glasgow); Sir ARTHUR PORRITT, K.C.M.G., C.B.E., M.Ch., F.R.C.S., LL.D. (London).

Hon. Secretaries: A. B. KERR, O.B.E., T.D., M.B., F.R.F.P.S., F.R.C.S.Ed., 5, La Belle Place, Glasgow, C.3; IAN M. ORR, O.B.E., M.D., Ch.M., F.R.C.S.Ed., Brooklands, Garstang, Preston, Lancs.

Sessions

Zoology Lecture Theatre.
Wednesday, July 7.—9.30 a.m., The Surgical Treatment of Peptic Ulcer. Panel discussion: Mr. JOHN BRUCE (Edinburgh).

Botany Lecture Theatre.
Friday, July 9.—2 p.m., *Symposium on Occupational Neurological Diseases*. Pressure Neuropathy, Dr. H. G. GARLAND (Leeds); Metallic Poisons and the Nervous System, Dr. J. W. ALDREN TURNER (London); Damage to the Nervous System from Gas Poisoning, Dr. R. S. ALLISON (Belfast); The New Insecticides and the Nervous System, Dr. A. M. G. CAMPBELL (Bristol). Cerebral Abscess, Mr. J. E. PATERSON (Glasgow); Mr. W. S. LEWIN (Oxford).

President : W. S. TEGNER, B.M., B.Ch., F.R.C.P. (London).
Vice-Presidents : P. BAUWENS, M.R.C.S., L.R.C.P. (London); H. A. BURT, M.A., M.B., B.Ch., F.R.C.P. (London); DONALD WILSON, M.B., B.S., M.R.C.P. (Chichester).

Hon. Secretaries: A. C. BOYLE, M.D., M.R.C.P., D.Phys.Med., Department of Physical Medicine, the Middlesex Hospital, W.1; T. N. FRASER, M.D., F.R.C.P., F.R.F.P.S., 112, Southbrae Drive, Glasgow, W.3.

Session

Zoology Lecture Theatre.

Friday, July 9.—2 p.m., Recent Developments in Rehabilitation. Group Captain C. J. S. O'MALLEY (London), Dr. F. S. COOKSEY (London), Lieutenant-Colonel J. FRASER (Inverness). Management of Degenerative Joint Disease, Dr. H. A. BURT (London), Dr. LOGIE S. BAIN (Aberdeen), Dr. DONALD WILSON (Chichester). Electro-Diagnosis, Professor A. E. RITCHIE (St. Andrews), Dr. A. T. RICHARDSON (London), Squadron Leader C. B. WYNN PARRY (Farnham Common).

PREVENTIVE MEDICINE AND INFECTIOUS DISEASES

President: T. ANDERSON, M.D., F.R.C.P.Ed., F.R.F.P.S. (Glasgow).

Vice-Presidents: C. METCALFE BROWN, M.D., D.P.H., Barrister-at-Law (Manchester); S. C. GAWNE, M.D., B.S., M.R.C.S., L.R.C.P., D.C.H., D.P.H., Barrister-at-Law (Liverpool); STUART LAIDLAW, J.P., O.St.J., M.D., B.Sc., F.R.F.P.S., D.P.H., B.L., D.P.A. (Glasgow); LLYWELYN ROBERTS, M.D., M.R.C.P., D.P.H. (Sheffield).

Hon. Secretaries: JAMES H. LAWSON, M.D., D.P.H., Ruchill Fever Hospital, Glasgow, N.W.; J. B. S. MORGAN, M.B., B.Sc., M.R.C.S., D.P.H., County Health Department, County Offices, St. Mary's Gate, Derby.

Sessions

Chemistry Lecture Theatre.

Wednesday, July 7.—9.30 a.m. (Joint Session with Section of Microbiology and Pathology). Poliomyelitis: Recent Advances in Knowledge of the Virus, Dr. ALLAN P. GOFFE (London); Epidemiology, Dr. W. H. BRADLEY (London); The Acute Case, with Special Reference to Respiratory Failure, Dr. A. B. CHRISTIE (Liverpool).

Thursday, July 8.—2.30 p.m., The Epidemiology of Non-Infectious Diseases: The Epidemiological Method, Dr. J. N. MORRIS (London); The Epidemiology of Old Age, Dr. W. FERGUSON ANDERSON (Glasgow); The Epidemiological Approach to Obstetric Medicine, Dr. ANGUS M. THOMSON (Aberdeen); The Role of the Medical Officer of Health, Dr. JOHN RIDDELL (Edinburgh).

PSYCHIATRY

President: Professor T. FERGUSON RODGER, M.B., F.R.C.P.Ed. (Glasgow).

Vice-Presidents: MURIEL BARTON HALL, M.D., Ch.B., (Liverpool); Professor ALEXANDER KENNEDY, M.D., F.R.C.P. (Newcastle-upon-Tyne); DAVID YELLOWLEES, M.B., Ch.B. (Glasgow).

Hon. Secretaries: T. C. N. GIBBENS, M.D., D.P.M., Institute of Psychiatry, Maudsley Hospital, Denmark Hill, London, S.E.5; HUNTER GILLIES, M.D., F.R.C.P.Ed., D.P.M., Psychiatric Unit, Stobhill General Hospital, Glasgow, N.

Session

Natural Philosophy Lecture Theatre (new buildings).

Friday, July 9.—9.30 a.m., Depression: The Diagnosis of Depression, Dr. W. MAYER-GROSS (Dumfries); The Risks of Suicide in States of Depression, Dr. E. STENGEL (London); The Treatment of Depression, Dr. I. R. C. BATCHELOR (Edinburgh); The Rationale of Electrical Convulsion Treatment, Dr. D. A. POND (London); Failures with Electrical Convulsion Treatment, Dr. J. L. CAMERON (Glasgow); The Effects of Depression on Industrial Efficiency, Dr. M. MARKOWE (London); Depression in Relation to Crime, Dr. J. C. M. MATHESON (London).

RADIOLOGY

President: Professor B. W. WINDEYER, M.B., B.S., F.R.C.S., F.F.R., D.M.R.E. (London).

Vice-Presidents: Professor ROBERT McWHIRTER, F.R.C.S.Ed., F.F.R., F.R.S.Ed. (Edinburgh); JOHN R. NUTTALL, M.D., F.F.R., D.M.R. (Leeds); S. D. SCOTT PARK, M.B., Ch.B., D.M.R.E. (Glasgow).

Hon. Secretaries: DAVID STENHOUSE, M.B., F.R.F.P.S., F.F.R., D.M.R., X-ray Department, McAlpin Nursing Home, 121, Hill Street, Glasgow, C.3; J. J. STEVENSON, M.D., D.M.R., The Royal Cancer Hospital, Fulham Road, London, S.W.3.

Session

Natural Philosophy Lecture Theatre (new building).

Friday, July 9.—2 p.m., Carcinoma of Bladder, Mr. A. H. JACOBS (Glasgow), Dr. G. W. BLONFIELD (Sheffield), Leukaemia, Dr. R. BODLEY SCOTT (London), Dr. A. A. CHARTERIS (Glasgow), Dr. S. P. RAWSON (Glasgow).

SCIENTIFIC EXHIBITION

Kelvin Hall, July 5-9, 1954

The Exhibition will be open each day at 9 a.m. and will close on the first three days at 6 p.m. and on the last two at 5 p.m.

The following list gives brief details of the exhibit:

Royal Samaritan Hospital for Women and the Royal Infirmary, Glasgow. Diagnostic survey of the infertile marriage.

Department of Ophthalmology, University of Glasgow. Eye changes in vascular disease with examples of clinical retinal photographs. Retrolental fibroplasia.

Scottish National Blood Transfusion Association, Edinburgh. Economical production in the laboratory of useful plasma fractions and illustrations of their use.

Department of Pharmacology and Therapeutics, University of Sheffield; National Centre of Radiotherapy, Sheffield; Department of Medicine, Royal Infirmary, Glasgow; and Department of Therapeutics, University of Edinburgh. The role of radioactive iodine in modern medicine.

Departments of Pathology and Surgery, Glasgow Royal Infirmary. Phaeochromocytosis: clinical aspects, diagnosis by adrenergic blocking drugs, treatment, and pathology, with special reference to malignancy.

Department of Anaesthesia, Glasgow Royal Infirmary. Hand plethysmography unit for use during surgical anaesthesia, with charts illustrating results.

Department of Child Health, University of Glasgow, and Hospital for Sick Children, Glasgow. (1) Radioactive iodine studies in familial cretinism. (2) Chromatography, bio-assay, and electrophoresis in the hormone treatment of nephrosis. (3) Fibrocystic disease of the pancreas.

Department of Health for Scotland. Statistical presentation of certain topics within the interest of the department. Rowett Research Institute, Bucksburn, Aberdeenshire. The effect on the skeleton of different levels of dietary calcium during pregnancy and lactation, in experimental animals.

Department of Dermatology, Leeds General Infirmary. Some mycotic infections of the smooth skin and nails.

Department of Child Health, University of Sheffield. Tuberculous meningitis.

Nuffield Department of Clinical Medicine, Radcliffe Infirmary, Oxford. The stomach in anaemia: (1) histology; (2) studies on the intrinsic factor of Castle; and (3) estimation of pepsin and uropepsinogen.

Nuffield Orthopaedic Centre, Oxford. (1) The aetiology of osteoarthritis of the hip. (2) Research on the clinical characteristics of scoliosis.

Departments of Medical Art, Neuroradiology, and Neurosurgery, Manchester Royal Infirmary. The radiological diagnosis of brain tumour.

Liverpool Psychiatric Clinic. Demonstration of modern techniques in child psychiatry.

PROVISIONAL TIME-TABLE OF MEETINGS

R.—Events available for members of Representative Body and Ladies accompanying them.
L.—Events primarily arranged for Ladies.
U.—Events for all Members and Ladies accompanying them.
*Academic Robes should be worn.

Wednesday, June 30

4.30 to 6.30 p.m.—Annual Representative Meeting Inquiry Office opens at Bute Hall, University.
8.30 to 10.30 p.m.—R. Cocktail Party (by invitation of the Glasgow Division), Trades House, Glassford Street, Glasgow, C.1.

Thursday, July 1

9.00 a.m.—Annual Representative Meeting Inquiry Office opens at Bute Hall, University.
9.00 a.m.—Ladies' Club opens, the College Club, University.
10.00 a.m.—Annual Representative Meeting commences, Bute Hall, University.
11.00 a.m.—Welcome by the Right Honourable the Lord Provost of Glasgow to Annual Representative Meeting.
2.00 p.m.—L. Excursion to Loch Lomond (afternoon tea by kind invitation of Lady Colquhoun of Luss and Major-General A. P. D. Telfer-Smollett, Lord Lieutenant of Dunbartonshire).
7.30 p.m.—R. Representatives' Dinner, Central Hotel, Gordon Street, Glasgow, C.1.
8.00 p.m.—L. Representatives' Ladies' Dinner, Central Hotel, Gordon Street, Glasgow, C.1.
9.30 p.m.—R. Representatives' Dance, Central Hotel, Gordon Street, Glasgow, C.1.

Friday, July 2

9.00 a.m.—Annual Representative Meeting Inquiry Office open.
9.30 a.m.—Ladies' Club open.
9.30 a.m.—Annual Representative Meeting.
9.30 a.m.—L. All-day excursion to the Trossachs, returning via Duchray Valley, including the State Forest (Sail on Loch Katrine and luncheon by kind invitation of Glasgow Corporation).
1.00 p.m.—Overseas Luncheon, Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, Glasgow, C.2.
2.00 p.m.—L. Visit to Livingstone Memorial, Blantyre; Clyde Valley and Lanark (afternoon tea at Clydesdale Hotel by kind invitation of the Lanarkshire Division).
5.00 p.m.—Cocktail Party for Women Representatives and medical women accompanying Representatives, Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, Glasgow, C.2 (by invitation of the Medical Women's Federation, Scottish Western Association).
8.00 p.m.—Reception and Demonstration by Director and Staff at Glasgow Art Gallery, Kelvingrove.

Saturday, July 3

9.00 a.m.—Annual Representative Meeting Inquiry Office open.
9.00 a.m.—Council Meeting, Forchall, University.
9.30 a.m.—Ladies' Club open.
10.00 a.m.—Annual Representative Meeting.
10.30 a.m.—L. Excursion to the Lake of Menteith and visit to Stirling Castle. Luncheon at the Lake of Menteith Hotel or the Lion and the Unicorn, Thornhill. (Tea by kind invitation of the Stirling Branch.)
7.30 p.m.—Aberdeen Graduates' Dinner, North British Hotel, George Square, Glasgow, C.2.
7.30 p.m.—Edinburgh Graduates' Dinner, Grosvenor Restaurant, Gordon Street, Glasgow, C.1.
7.30 p.m.—Glasgow Graduates' Dinner, Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, Glasgow, C.2.
7.30 p.m.—Welsh Dinner, Grosvenor Restaurant, Gordon Street, Glasgow, C.1.
8.30 p.m.—R. Block Booking, "Half-past Eight" (Summer Revue), Alhambra Theatre, Wellington Street, Glasgow, C.2.

Sunday, July 4

10.15 a.m.—All-day sail on the Firth of Clyde with luncheon and afternoon tea.
8.30 p.m.—Concert, Kelvin Hall, Kelvingrove, specially arranged by the B.B.C. and to be broadcast on the Scottish Home Service from 9.15 to 10.15 p.m.

Department of Psychological Research, Crichton Royal Hospital, Dumfries. Demonstration of psychometric testing.
Department of Psychological Medicine, King's College Medical School, Newcastle-upon-Tyne, and Biophysics Unit, Crichton Royal Hospital, Dumfries. Portable E.E.G. equipment.

The National Maternity Hospital, Dublin. Medical conditions complicating pregnancy.

Cancer Research Department, Royal Beatson Memorial Hospital, Glasgow. (1) Atmospheric pollution tests for (a) arsenic, (b) benzpyrene, (c) radioactivity. (2) Analysis of tobacco smoke. (3) Liver cancer in animals.

Urological Units, Victoria Infirmary, Glasgow, and Hairmyres Hospital, Lanarkshire. (1) Prostatic obstruction. (2) Carcinoma of bladder. (3) Cases of aberrant ureter in the female causing incontinence.

Department of Pathology, Glasgow Royal Infirmary. The effect of A.C.T.H. and cortisone on repair of lesions induced experimentally in animals—for example, in peptic ulceration, hepatic cirrhosis, and quartz granuloma.

Department of Pathology, Glasgow Royal Infirmary. Pituitary and adrenal changes in pathological conditions of man and animals.

Royal Infirmary, Glasgow. Mitral disease. Pre-operation investigation, especially cardiac catheterization and auricular puncture. Comparison of operation findings with pre-operation assessment. Post-operation assessment. Auricular biopsy findings. Pathological specimens showing complications of interest.

Department of Infectious Diseases, University of Glasgow. (1) and Public Health Department, City of Glasgow. (1) Statistics of the City of Glasgow for acute respiratory diseases during the last 25 years. (2) Results of bacteriological examination. (3) Results of virological examination.

Department of Pathology, Western Infirmary, Glasgow. Studies on iron metabolism in man and experimental animals, illustrated by colour photography.

Royal Army Medical College. Mite-borne (scrub) typhus. National Coal Board Medical Service. Research into the physiological and psychological effects of work in hot and humid atmospheres.

The Royal Cancer Hospital, London. Demonstration of cancer of the breast.

St. Bartholomew's Hospital, London, and the Royal Cancer Hospital. Portal hypertension; distribution, effect of different treatments on prognosis, liver function, blood counts.

Rehabilitation Committee of B.M.A.; Ministry of Labour. Scope and facilities for rehabilitation.

Food Hygiene Laboratory of the Central Public Health Laboratory, Colindale. Bacterial food-poisoning and other food poison disease.

The Wright-Fleming Institute of Microbiology, St. Mary's Hospital, London. Demonstration of basic mechanisms of immediate (pollen) and delayed (tuberculin) reactions and their clinical significance.

British European Airways, with the Scottish Air Ambulance Scheme of the Department of Health for Scotland. Medical aspects of the Highlands and Islands Air Ambulance Service.

Royal Air Force, Directorate General of Medical Services. Recent advances in electrodiagnosis and electrotherapy.

Royal Navy (Royal Naval Personnel Research Committee, Naval Life Saving Committee, and Director of Victualling). Advances made since the 1939-45 war on survival at sea and cold- and foul-weather clothing.

SPECIAL EXHIBITIONS

Kelvin Hall, July 5-9, 1954

Royal Faculty of Physicians and Surgeons of Glasgow. Glasgow in the history of medicine.

Pharmaceutical Society of Great Britain. Recent advances in pharmaceutical science; objects of historical interest.

Royal Photographic Society, Medical Group. One hundred years of medical photography.

"It was made plain in the Committee Stage of the Amending Bill that no party in the House of Commons will allow either side to compel arbitration. The Joint Committee may be congratulated on having secured from the Ministry agreement that remuneration is open to arbitration, and it is reasonable to assume that in the event of serious disagreement neither the Minister of Health nor the medical profession would in practice fail to seek the obvious and fair method of resolving a dispute—arbitration or a committee of inquiry."

In June, 1952, the Staff Side notified the Management Side of Committee "B" of its intention to submit a claim for increased betterment in the light of the Danckwerts award to general practitioners. There was some opposition within the profession itself to pressing the claim at that moment. It was pointed out that doctors, including consultants, were well paid in comparison with members of other professions and that nothing could be worse than for the profession to press the claim at that time. Nevertheless it was resolved in July, 1952, to go on with the claim. Sir Russell said that one of the great obstacles to obtaining what consultants regarded as proper remuneration was the Danckwerts award. This was nobody's fault, but an agreement was reached by which general practitioners should go forward alone with their claim in the first place and the consultant side should await events. That episode was surely a lesson from which they could all profit in the future. The effect of it was that as soon as the consultants put up their case they were referred to a statement by the Chancellor of the Exchequer that there could be no implementation of anything corresponding to the Danckwerts award for them. The Management Side refused to discuss the betterment factor in relation to consultants' pay. The only claim which it was prepared to discuss was one which aimed at restoring the balance between G.P. and consultant remuneration which had been disturbed by the Danckwerts award, particularly as this might affect recruitment to hospital medical staffs. Any appeal to arbitration was refused. The Joint Committee was left in this confined field to make a claim on its merits. An alternative offered was an inquiry. But, Sir Russell stated, this inquiry would have been a kind of Guillebaud Committee. It would not have concerned itself with cost-of-living betterment but would have looked into the earnings of part-time consultants. Sir Russell implied that this might have had unfortunate results. The committee of inquiry might have taken the line that here were consultants earning money for services for which they had not been paid before, and still allowed to carry on private practice. It must be remembered also that those in whole-time service before the war were not very well remunerated, and there were many whose incomes had increased very greatly.

In the face of all this, and the political situation being what it was, Sir Russell Brain believed that they had achieved in these new terms something very substantial. In particular, they had restored the balance between the income of the general practitioner and that of the consultant and specialist. Moreover, this agreement was not likely to be thrown over within a short period of years. He was not satisfied even in this agreement with the award

They had claimed from the very beginning that they ought to have arbitration, but even if they got it it would not follow at all that they would get another Danckwerts Arbitration was a double-edged weapon. Sir Russell stated categorically that neither side had repudiated Spens in the settlement and that "Spens still remains our (the Staff Side's) charter." The Staff Side were free to open negotiations at any time on any point, including betterment "Politics," said Sir Russell in conclusion, "was the art of the possible," and they had always to bear that in mind. The important thing was that they should go forward unitedly as they had done in the past, and he hoped for their confidence and support in the battles that lay ahead.

In reply to one member, who asked if it would not have been better if the negotiations had been conducted on a wider basis, and that a combined approach should have been made on behalf of the consultants by an organization representing the whole profession, Sir Russell said that the existing negotiation arrangement had worked very well.

Mr. C. E. KINDERSLEY also expressed thanks to Sir Russell Brain and his committee. He believed that there was some feeling that on the Joint Committee the representatives of the Central Consultants and Specialists Committee were outvoted, but the question of being outvoted had never arisen; they had worked harmoniously together. Sir Russell Brain agreed with this view.

In some general discussion, after Sir Russell Brain had left the meeting, Mr. NICHOLSON LAILEY said that he came from an area containing a number of consultants practising in small towns. It was important that the views of these people should be clearly heard in this committee. He agreed on the absolute necessity of keeping a united front in the profession, particularly among consultants in the hospital service. If they separated into a number of parties the Government would play off one against the others. He was sure that Sir Russell Brain and those associated with him had done their best, but there were various criticisms as to the secrecy with which the negotiations had been conducted. The people at the periphery did not believe this secrecy to have been necessary, though reasons had been given for it.

Dr. Stevenson in his calculations seemed to have overlooked one point—namely, that consultants began their career at a later age than general practitioners and retired at an earlier age. They were compulsorily retired at 65, whereas the general practitioner in many instances went on for ten or more years longer. Also he was sure that income from private work had dropped far more than some people thought. Some allowance should be made for the relative shortness of the consultant's career. Mr. Nicholson Lailey went on to ask that there should be an examination of hospital staff remuneration in relation to Spens by experts and the result put before hospital staffs throughout the country. He did not think that the agreement was entirely satisfactory as an implementation of Spens. He would

Avenue, Glasgow.

**SPECIAL MEETING OF CENTRAL CONSULTANTS
AND SPECIALISTS COMMITTEE**

A special meeting of the Central Consultants and Specialists Committee was held on April 28 under the chairmanship of Dr. T. ROWLAND HULL to discuss the statement by Sir Russell Brain, Chairman of the Staff Side of Committee "B" of the Medical Whitley Council, on the remuneration of hospital medical staff. The statement appeared in the *Supplement* of April 10 (p. 145). Forty-five members of the Committee were present. Sir Russell Brain himself attended the first part of the meeting.

Dr. D. P. STEVENSON, Deputy Secretary, made a preliminary statement. He said that since the publication of the new increases there had been remarkably little correspondence on the subject, a fact which might argue contentment or apathy. From such correspondence it seemed that complaints were on two scores: that Spens had not been implemented, and that the comparison between what hospital medical staff had now obtained and what general practitioners had obtained thanks to the Danckwerts award was unfavourable to the former.

It was difficult to make a valid comparison between the remuneration of consultants and general practitioners, but he presented to the Committee a rough analysis comparing the remuneration of general practitioners and consultants respectively. Broadly speaking, so far as it was possible to make a comparison between the two groups, there was a very close approximation in the actual increases which each side had received on the basis of the 1939 figures submitted by Professor Bradford Hill.

The CHAIRMAN said that a high tribute should be paid to Dr. Stevenson for the skill and care with which he had assembled the facts and figures in these negotiations.

Sir RUSSELL BRAIN reminded the Committee that in 1949 certain terms and conditions of service for consultants and specialists were put forward by the Ministry. How these were received by the profession might be judged from a leading article in the *British Medical Journal* of June 11, 1949, which said:

"It is questionable whether these terms adequately translate the Spens recommendations into present-day values, since the

like to see a statement go out from the Central Consultants and Specialists Committee that it accepted the agreement as an interim award; that the award went some way but did not implement Spens; and that there should be reconsideration of the award in the light of careful examination. Mr. Lailey said that it was their duty to convince the Government of the justice of their case. If they had a good case, why be afraid of a committee of inquiry?

No Reference Back

Dr. J. G. M. HAMILTON said that what had been given to hospital medical staff was not an award. It was an agreement in Whitley and nothing more. It was too small, and the distribution of the money was not the best. He complained that at no time did the rank and file know what was taking place. During last winter it had been confidently expected that a draft agreement would be available for discussion. The Central Consultants and Specialists Committee had been assured by its chairman that the terms would be referred back to them before acceptance. The Staff Side had no remit to carry on without reference back. He thought that the Staff Side should have sought fresh instructions from its constituents in 1952 when the Government refused to discuss betterment. The Joint Committee had gone into these negotiations on the basis of something which had not come up from below. He particularly drew attention to the passage in Sir Russell Brain's published statement which, after saying that consultants and all hospital staffs were entitled to know why it was not found possible to consult them upon the outcome of the negotiations before agreement was reached, added, "This is a difficulty which must always be faced when major issues are at stake." He objected to the implication of those words. He wanted to know if it meant that the greater the issue the greater the secrecy? Dr. Hamilton concluded with a plea that in future all negotiations should be conducted with the support and knowledge of those below.

The CHAIRMAN thought that this matter should have been brought forward while Sir Russell was present. He proceeded to read a long extract from the minutes of the meeting of the Central Consultants and Specialists Committee of July 30, 1953, which gave the Staff Side a free hand, but with certain provisos, to proceed and take decisions. Dr. Hamilton intervened to say that he was talking about 1952, not 1953.

Dr. S. R. F. WHITTAKER, expressing support of the agreement, said that any reference back to the constituent bodies of the Staff Side before the agreement would have had its disadvantages. It would have meant giving similar information to the Management Side and its constituent bodies, and a consequent risk of rousing opposition which might have resulted in a less favourable agreement or no agreement at all. Since becoming a member of the Joint Committee he realized the difficulties in negotiation.

Mr. D. W. C. NORTHFIELD agreed that Dr. Hamilton's criticism about the failure to refer the question back in 1952 was a valid one, but did not think the result would have been different. He could not agree that there should have been reference back once the negotiations had started in the Whitley Council.

A speaker asked the Chairman whether the question of betterment was now finished with. Dr. HILL replied that in his view betterment had been legally finished with in 1949.

Resolution of Confidence

Dr. S. COCHRANE SHANKS commended the work of the Staff Side of Committee "B." One of the outstanding obstacles to agreement had been the Government's desire to abolish the weighting factor, but he thought this had been fairly dealt with. He moved a resolution in two parts, and the first part read as follows:

Bearing in mind the difficulties under which the negotiations have been conducted, the Central Consultants and Specialists Committee approves the action of the Staff Side representatives on Committee "B" of the Medical Whitley Council in agreeing to the terms of remuneration recently announced. In particular, it notes the view of the Staff Side that the Spens Report remains

the yardstick of remuneration of hospital staffs and that they hold themselves free to seek future revisions thereof.

This was seconded by Professor G. I. STRACHAN and supported by several members, including representatives of the Registrars Group, who stated that although they were still not satisfied with the position of junior hospital staff they realized that this question was still under consideration.

Mr. C. E. KINDERSLEY said the profession should trust its elected representatives. He hoped that the regions would trust the Committee to represent them in the future.

This first part of the resolution was carried *nemine contradicente*.

The second part of Dr. Shanks's resolution was carried, again without dissent, in the following form:

The Central Consultants and Specialists Committee in particular notes with satisfaction the intention of its Staff Side representatives to seek further improvement in the salary scales of S.H.M.O.s and to press for payment of allowances and domiciliary consultation fees to whole-time officers.

Some resolutions from regional committees expressing dissatisfaction with the agreement were received but were not discussed specifically.

In closing the discussion the CHAIRMAN reminded the committee of the origin of the Joint Committee. It was initiated by the British Medical Association, whose Chairman of Council at the time started informal discussions to establish machinery whereby the views of consultants and specialists could be heard. The Joint Committee was concerned not only with remuneration but with policy and the development of the health services. Since it was set up its components, the representatives of their own committee and of the royal colleges and corporations, had worked in the greatest harmony, and he trusted that the spirit in which the Joint Committee had been initiated would be borne in mind and that they would continue to build upon its past achievements.

Journal Criticized

At the end of the meeting Mr. LANGSTON remarked that a leading article in the *British Medical Journal* had been critical of the agreement reached on the remuneration of hospital medical staff, and he feared that some people might regard this as the official view of the British Medical Association, which it was not. Mr. NORTHFIELD said that the leading article was reprehensible and irresponsible, and the Chairman added that it contained substantial factual inaccuracies.

Questions Answered

Building Outlay

Q.—The inspector of taxes has refused to agree to an allowance for depreciation of a building erected, at my own cost, on a plot of land under a 21-year lease, and used for a waiting-room for patients. No compensation for the building may be claimed at the end of the lease, and in fact I may be required to restore the land to its former state, so that the money spent on the building will be lost. Is the inspector of taxes justified in his refusal?

A.—The expenditure is undoubtedly capital outlay, and the Income Tax Acts do not provide any form of allowance of that expenditure. The building is clearly outside the category of "machinery and plant" and is not within the definition of an "industrial building."

Car Depreciation

Q.—I am a whole-time consultant and have never attempted to claim tax relief for depreciation of my car. If I purchase a new car would normal annual depreciation be allowed or is depreciation supposed to be covered by the travelling allowance, which averages about 7½d. per mile, whereas the true cost is almost double?

A.—It is understood that the mileage allowances paid by employing authorities are intended to cover depreciation and

Correspondence

Remuneration of Hospital Medical Staff

SIR.—What with weighting, allowances for travelling time, and for duties at hospitals with which we are not in sessional contract, increments, statutory deductions and the like, most of us accept our salary cheque and leave its calculation to the regional treasurer. It appears to me that it is impossible for part-time consultants to forecast the effect of the recent award on their pay, and that no good purpose is to be served by bursting into denunciation at this stage. Whilst comment may well be withheld meanwhile, my view is that for men to accept the admittedly thankless office of negotiators and then accept without prior reference to their fellows an award which demands a saving clause to the effect that as a result no one shall suffer loss is to invite well-merited criticism.

Let us therefore hold our hands—and our pens and tongues—until we can talk facts and not surmises. We know our gross pay for the month of March. Soon we shall know our gross pay as the result of the award. May I suggest that the B.M.A. circularize all members of hospital staffs and ask them to return (a) their grade, (b) their sessional duties, (c) their emoluments prior to the award, (d) their pay for the month of March, and (e) their gross and net pay for the first month during which the effects of the award are shown on their pay slips? Let the B.M.A. then collate and publish these figures.

If, as a result of analysis, the award is to our advantage, let us be gratefully silent. If not, then let us leave our affairs in the hands of the Association with instructions to bring their propaganda department into the fullest and most militant blast.—I am, etc.,

Hull.

R. D. MILLER.

SIR.—May I, as a junior consultant, add my protest against these ludicrous and insulting salary increases? May we hope that the storm they have raised among consultants young and old will ensure that they are not final, and that those to whom we have entrusted not only our own future but the future of our profession will be able to convince those in authority that the increases are unrealistic?

We can all write letters to your eminent journal, but it seems that we can do very little to help ourselves, and, even more sadly, it seems that our seniors are also powerless. Surely there is some strength in the profession still. Cannot we refuse to accept these increases and insist on reopening negotiations? We could not be worse off than we are left now, at least before we had hope.—I am, etc.,

London, W.1.

DOROTHEA HALSTEAD.

SIR.—"Divide and rule" has been the policy of many regimes from the time of the Roman Empire and probably before it. This policy, whether adopted intentionally or not in the present case, has undoubtedly been so far successful. Junior hospital staff, part-time consultants, whole-time consultants, S.H.M.O.s, etc., have all made pleas for special consideration for their own particular group. The G.P.s have been divided off from the specialists right from the beginning. The time has now come for us to cease our internecine strife, and to realize that we are all in the same box, the only solution to the problem which will satisfy everyone being a rigid implementation of the recommendations of the Spens Committee. Notwithstanding that those recommendations were not embodied in our contracts, the fact remains that there was a gentlemen's agreement between the medical profession and the government of the day that such recommendations would be carried out.

I am sure that everyone feels very grateful to Sir Russell Brain and the members of the Negotiating Committee for their efforts on our behalf, and sympathizes with their

are so regarded by the inland revenue officials. So far as income tax is concerned, the matter is governed by the statutory rule which requires expenses to be incurred "wholly, exclusively, and necessarily in the performance of the duties." If the amount of the expenses (including the appropriate depreciation allowance) exceeds the amount of the mileage allowance the taxpayer is entitled to claim the excess as an expense. But it should be borne in mind that the rule quoted above is strictly construed, and that for instance the expense of travel between residence and the main place where the work is done has been held not to be incurred "in the performance of the duties," and also that if a car is used which is of higher standard or power than is "necessary" some proportion of the expense incurred will be disallowed. Experience suggests that it is very difficult to convince one authority (the inland revenue) that an expense allowance given by another authority is inadequate to comply with the terms of the income-tax rule.

Treatment of Tuberculosis in Switzerland under N.H.S.

Q.—Are there any facilities available under the N.H.S. for the treatment of cases of tuberculosis in Swiss sanatoria, and, if so, which patients are considered suitable for such treatment?

A.—There are facilities available under the National Health Service for treatment of cases of tuberculosis in Switzerland. Particulars in each hospital region are obtainable from the senior administrative medical officer, who should be approached initially. Adult cases appropriate for this type of treatment go to Switzerland. Children are sent to Denmark by arrangement with the Anglo-Danish Society.

Wife's Remuneration

Q.—I allow my wife a certain sum every week for answering the telephone at my residence, as distinct from the partnership surgery at the senior partner's house. My accountant tells me that the inspector of taxes requires that this sum, which I claim as an allowance for income-tax purposes, should be included in the practice accounts. Is this necessary?

A.—The Income Tax Acts require partnership profits to be assessed in one sum on the partners jointly. In the case of a medical firm the assessment is usually calculated by deducting from what may be called the "surgery" profit by deducting from what may be called the "surgery" profit the allowable expenses of each partner. Presumably what the questioner has done in the past is to deduct in his return his wife's remuneration from his share of the firm's profit, but if effect has been given to the claim it can only have been in the working out of the partnership assessment. It seems that it should make no difference whether the wife is regarded as employed by the questioner or by the firm, provided that the tax assessed on the firm is correctly allocated between the partners.

REGISTRARS GROUP COUNCIL DINNER

The Registrars Group Council's annual dinner will take place at the Connaught Rooms, Great Queen Street, Kingsway, London, W.C.2, on Friday, May 14, at 7 for 7.30 p.m. (dress informal). Any senior registrar or registrar who would like to attend the dinner and meet the members of the Group Council will be most welcome, and should notify the Secretary of the Association as soon as possible. The cost will be £1 (exclusive of wines and gratuities).

AMERICAN DELEGATE

Dr. R. L. MacCormack, of Wisconsin, U.S.A., has been elected to represent the American Medical Association at the B.M.A. Annual Meeting in Glasgow from July 5-9.

natural desire to produce some tangible results from their labours, especially in the face of increasingly urgent demands for settlement. The absence of any proposal to make retrospective payment is a poor reward for the patience displayed by that Committee, and the profession as a whole, in the attempts to settle their differences in a constitutional manner. Any settlement should surely take into account the time spent in the negotiation, otherwise the use of "Molotov" to clog the negotiating machinery is inevitable.

Are we being unreasonable or avaricious in our demands? We are certainly open to such accusations, and are therefore placed in a very invidious position *vis-à-vis* the general public and our own consciences. Why then not do the reasonable thing and submit the whole matter to an impartial judge? Refusal of one party to agree to this can surely mean only one thing—namely, that it believes itself to be in the wrong.—I am, etc.,

Birmingham, 15.

ROBERT EVANS.

Remuneration in the Public Health Service

SIR,—I have watched with mixed feelings the correspondence on pay in the hospital service, but have withheld any contribution of my own until the negotiations reached a conclusion. The burden of this correspondence has been the difficulty of keeping the wolf from the door, and the unfairness of the Minister of Health in refusing to give the same betterment factor that general practitioners secured in the Danckwerts award. No doubt this correspondence has been conducted in good faith, and under a sense of grievance, because general and hospital practitioners alike secured the promise of Spens conditions, including betterment. There can be no doubt, either, that general practice and hospital medical practice now provide careers with great financial possibilities for able and ambitious practitioners.

May I therefore point out that general and hospital practitioners have acquiesced in very inferior rates of pay for doctors in public health? The first error was to fail to secure the promise of Spens conditions for the public health service. This has led to a very raw deal for that branch, in spite of a valiant but belated effort by the B.M.A. before the Industrial Court. In Scotland, for instance, there are about 260 doctors in public health appointments. Of these, some 65 have £1,400 per annum or more, and about a dozen of these 65 have £2,000 per annum or more. There is therefore no career in public health comparable with the opportunities in general or hospital practice. Yet the public health training follows a pattern identical with that of the consultant—undergraduate training, postgraduate hospital posts, an additional qualification, followed by posts of gradually increasing responsibility. If, therefore, it is necessary for a doctor to follow a specialist training to do public health, surely it is necessary to offer him the same financial reward as hospital practice offers. Otherwise public health does not justify, as a career, the time and money spent on the training.

I am therefore putting forward a plea for more active support of the Public Health Service by the B.M.A. I call for a policy declaration that pay in public health should be brought into line with that of consultants and specialists. And I am asking that this should be done immediately—very soon it will be too late. If something on these lines is not done at once, one effect might well be a substantial breakaway from the B.M.A. by the public health doctors, with consequent loss of subscriptions. Another might be that the Society of Medical Officers of Health would disavow the B.M.A. as the body entrusted with pay negotiations. Hitherto the B.M.A. has acted for the Society in order to present a united medical front. This unity has led to a good deal of hardship to the public health doctors, who might well feel they could do better on their own—*divide et impera*. Can't you imagine an ambitious politician throwing a spanner in the works with the catch-phrase "What's good enough for the M.O.H. is good enough for the Consultant"? I repeat, therefore, my earnest plea for the whole-hearted support of the Association. We in public

health are doctors, and have done our best to uphold the interests of the profession. Is it too much to ask for reciprocal treatment by our professional brethren?—I am, etc.,

Elgin

I. C. MONRO.

Armed Forces Medical Officers' Pay

SIR,—I was interested to see the rates of pay for Civil Service medical officers in the basic grade (*Supplement*, April 24, p. 194). It may be of interest to readers to see the following tables, which compare the basic pay and the basic pay plus maximum marriage allowance of a medical officer in any of the armed Forces with the pay of a Civil Service M.O. of the same age.

Age	Civil Service Basic	Service M.O. Basic	Service M.O. Basic + Marriage	
35	£ 1,500	£ s. d. 1,222 15 0	£ s. d. 1,560 7 6	Lt. Cdr., Maj.-Sqn. Ldr. (4 years in rank)
36	1,575	" " "	" " "	" " "
37	1,650	1,277 10 0	1,615 2 6	" " "
38	1,725	" " "	" " "	" " "
39	1,800	" " "	" " "	" " "
40	1,900	1,332 5 0	1,669 17 6	Cdr., Lt. Col., W. Cdr. (2 years in rank)
41	2,000	" " "	" " "	" " "
42	2,100	1,441 15 0	1,825 0 0	" " "

It will be seen that the armed Forces M.O. is £60 better off at age 35 if he has the good fortune to be married; at age 42 he is £275 worse off if he is married, and lags £658 behind if he is unmarried. I have no doubt that these comparisons are already being made by the appropriate B.M.A. committee. It is to be hoped that they will also have the opportunity of putting these figures to the Waverley Committee which has been appointed "to review the arrangements for providing medical and dental services for the armed Forces at home and abroad in peace and war; and to make recommendations."

Whatever other factors may have some bearing on the present grave manning situation in the armed Forces, there can be no doubt that basically no doctor is going to be persuaded to undergo the many inconveniences of discipline, frequent movements all over the world, and time rather than merit promotion, without a financial reward at least comparable on a reasonable scale with the salaries of his colleagues in other spheres of medicine.—I am, etc.,

REGULAR MEDICAL OFFICER.

A Doctor Looks at Crime

SIR,—Dr. Oliver Gray's paper (*Supplement*, April 24, p. 179) is of great interest, not only for what it says but for what it leaves unsaid. The main theme is the old one of heredity and environment, and the chief remedy for crime appears to be education. It is implicit in Dr. Gray's context that he means education as moral learning. Clearly, a man may be a leading mathematician or a nuclear physicist, the product of half a lifetime of modern education, and have no more sense of right and wrong than he had when he learned the alphabet. Dr. Gray looks to education to form character—i.e., the ability to recognize right and wrong and the strength to resist temptation to do wrong. But who decides what should be taught about moral values? I doubt whether the director of education for Moscow would reach full agreement with Miss Florence Horsbrugh in this matter.

We thus come to the very kernel of our dilemma. Western civilization is running on the failing momentum of Christian morality, and the generally accepted idea that we can keep the morality and abandon the faith is the most pathetic of modern delusions. This should surprise nobody. The old belief that man was made in the image of God, that materialism was spiritual death, and that temptation should be resisted, have given place to the theory of evolution, dialectical materialism as a faith, the belief that repression of natural instincts is harmful. The attempt to run these horses in harness with old-fashioned religious morality is

what causes the laughter known as Homeric. It may well be that man needs a religion and a faith; that without either he is in a vacuum which will in the end be filled. A faith he must have. It may be communism, devil worship, or a hundred others. It was rash to abandon the old religion without having something ready to put in its place—i.e., a better religion, more up to date, more in keeping with Darwin and Freud, elastic, expandable, constantly conforming to the latest science, a common religion for the age of the common man. Anyone who is keeping this new religion up his sleeve because it still lacks the finishing touches or because there are one or two dark places of the soul unilluminated by science, should be warned that time is running short.

Dr. Gray deserves our thanks for so ably and subtly posing the problem. His final conclusion that every time conscience is flouted we kiss the devil's feet is striking. God may have been blotted out of the modern curriculum, but it is cheering to know that the devil is still alive.—I am, etc.,

R. W. COCKSHUT.

Lieutenant-Colonels (Acting Colonels) J. A. Hooker, T.D., and G. T. Hanky, O.B.E., T.D., to be Colonels.
Majors (Acting Colonels) E. J. Sibley, F. W. A. Warren, O.B.E., T.D., and P. R. Mitchell, O.B.E., T.D., to be Colonels.
Lieutenant-Colonel F. J. Manning, T.D., from T.A.R.O., to be Lieutenant-Colonel.
Majors (Acting Lieutenant-Colonels) A. H. Charles, T.D., J. A. Ross, M.B.E., S. T. Anning, G. M. Warrack, D.S.O., O.B.E., T.D., G. F. Edwards, M.B.E., A. McC. Campbell, D.S.O., O.B.E., T.D., K. W. N. Palmer, T.D., and E. M. Elmhirst, T.D., to be Lieutenant-Colonels.
Major A. J. Webster, T.D., to be Lieutenant-Colonel.
Captain B. Holden to be Lieutenant-Colonel.
Captain I. P. Todd, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.
Captain W. A. H. Stevenson, T.D., from T.A.R.O., to be Captain, and has been granted the acting rank of Major.
Captain F. S. Mooney to be Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS
Colonel J. F. Fraser, T.D., having exceeded the age limit, has retired, retaining the rank of Colonel.
Lieutenant-Colonel (Brevet Colonel) O. G. Prosser, M.C., from T.A.R.O., to be Acting Colonel.
Lieutenant-Colonel (Acting Colonel) W. D. F. Lytle, O.B.E., T.D., to be Colonel.

Lieutenant-Colonel E. H. Evans has been granted the acting rank of Colonel.

Lieutenant-Colonels H. D. Chalke, O.B.E., T.D., and M. J. Lindsey, M.C., T.D., to be Brevet Colonels.

Major (Honorary Colonel) H. H. Kenshole, D.S.O., T.D., from T.A.R.O., to be Major, and has relinquished the honorary rank of Colonel.

Major (Acting Lieutenant-Colonel) J. A. Dudgeon, M.C., T.D., has been granted the acting rank of Colonel.

Major (Acting Lieutenant-Colonel) R. W. Biagi, M.B.E., to be Lieutenant-Colonel.

Major (Honorary Lieutenant-Colonel) M. I. Silverton, from T.A.R.O., to be Major, relinquishing the honorary rank of Lieutenant-Colonel, and has been granted the acting rank of Lieutenant-Colonel.

Major J. B. Mackay, M.B.E., T.D., has been granted the acting rank of Colonel.

Major T. F. Redman to be Lieutenant-Colonel.

Major M. N. S. Duncan has been granted the acting rank of Lieutenant-Colonel.

Major K. C. MacKellvie, from T.A.R.O., to be Major.

Captain (acting Lieutenant-Colonel) D. L. Nicholls to be Major.

Captains (Acting Majors) D. L. Nicholls, A. J. Bathurst, and C. O. Carter have been granted the acting rank of Lieutenant-Colonel.

Captains (Acting Majors) J. C. Fulford and A. A. Guild to be Majors.

Captains D. J. Ellison, G. A. Gresham, R. G. Tasker, A. E. W. Gregson, G. D. Teague, and G. J. Hadfield have been granted the acting rank of Major.

Captains R. W. J. Naismith, H. Grylls, R. M. S. Parker, and F. G. Morse to be Majors.

Lieutenant (War Substantive Major) J. L. D. Roberts, from Emergency Commission, to be Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel A. Swindale, C.B.E., T.D., from the Active List, to be Colonel, and has been granted the honorary rank of Brigadier.

Colonels D. P. Holmes, T.D., and G. E. Parker, D.S.O., from Active List, to be Colonels.

Lieutenant-Colonel (Brevet Colonel) M. J. Lindsey, M.C., T.D., from the Active List, to be Lieutenant-Colonel (Brevet Colonel).

The notification concerning Lieutenant-Colonel M. J. Lindsey, M.C., T.D., in a *Supplement to the London Gazette* dated February 16 has been cancelled.

Lieutenant-Colonel F. D. Murphy, O.B.E., from Active List, to be Lieutenant-Colonel.

Majors (Honorary Colonels) N. Heath, T.D., and R. K. Hanlin, T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O.

Majors W. F. Mair, T.D., and J. C. Fulford, from Active List, to be Majors.

Captain (Honorary Major) R. Selby, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O.

Captain (War Substantive Major) C. E. Sykes, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., and has been granted the honorary rank of Lieutenant-Colonel.

REGULAR ARMY: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

Lieutenant (War Substantive Captain) D. R. Brown has relinquished his commission, and has been granted the honorary rank of Major.

ROYAL AIR FORCE

Air Commodore E. C. K. H. Foreman, C.B.E., has retired.

Group Captain J. Hill to be Air Commodore.

Wing Commander K. L. G. Nobbs, G.M., has retired on account of medical unfitness for air force service.

Wing Commanders A. W. Smith, L. E. A. Dearberg, and H. E. Bellringer to be Group Captains.

Wing Commander G. H. J. Williams has retired.

Squadron Leaders A. C. Camm and M. W. L. White to be Wing Commanders.

Flight Lieutenants T. C. D. Whiteside, D. G. V. Whittingham, I. M. Perkins, W. J. L. Harries, J. M. Cuthill, P. D. Sutton, J. A. Wheeler-Bennett, C. G. White, P. J. R. Nichols, S. J. Krister, R. E. Woolley, G.M., I. H. Mercer, T. C. Nicol, R. C. Robb, and W. E. Hassan to be Squadron Leaders.

Flight Lieutenant J. M. Cuthill has been transferred to the Reserve, retaining the rank of Squadron Leader.

Flight Lieutenant C. E. Law has relinquished his Short Service Commission on account of medical unfitness for air force service, retaining the rank of Squadron Leader.

Flying Officer H. B. Kelly to be Squadron Leader.

F. L. A. Vernon, P. W. Robertson, and D. O. Williams to be Squadron Leaders (Permanent).

Woman Medical Officers (Employed with the R.A.F.).—Flight Lieutenant B. M. Parker to be Squadron Leader. Marie D. McCabe to be Squadron Leader.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). The only charge made is for postage of books. A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Marocco, N.: *Le Infiltrazioni Anestetiche in Urologia*. 1953.
 Marois, M.: *Contrôle Hormonal de la Ceinture Pelvienne et Endocrinologie Sexuelle*. 1953.
 Martius, H.: *Die Kreuzschmerzen der Frau*. 4. Auflage. 1953.
 Mela, B.: *Manuale di Stomatologia*. 1953.
 Mitchell-Heggs, F.: *Hernia: A Manual for Truss Fitters*. 1953.
 Molino, F.: *Manuale di Medicina del Lavoro*. 1953.
 Montgomery, G. L.: *Pathology for Students of Dentistry*. 1953.
 Moskov, V. N.: *Liečebná Teložycha*. 1952.
 Myles, M. F.: *Textbook for Midwives*. 1953.
 New York Heart Association, Criteria Committee: *Nomenclature and Criteria for Diagnosis of Diseases of the Heart and Blood Vessels*. 1953.

Diary of Central Meetings

MAY

- 10 Mon. Subcommittee on Diagnosis of Eye Diseases, Ophthalmic Group Committee, 2 p.m.
 11 Tues. Joint Consultants Committee (at Royal College of Surgeons of England, Lincoln's Inn Fields, London, W.C.), 10.30 a.m.
 12 Wed. Central Consultants and Specialists Executive, 12 noon.
 12 Wed. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
 12 Wed. Medico-Legal Subcommittee, Central Consultants and Specialists Committee, 4.30 p.m.
 13 Thurs. Physical Medicine Group Committee, 2 p.m.
 14 Fri. Registrars Group Council, 2 p.m.
 17 Mon. Joint meeting of B.M.A. and British Veterinary Association, 4 p.m.
 18 Tues. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, W.C.), 2 p.m.
 18 Tues. Full-time Non-professional Medical Teachers and Research Workers Group Committee, 2 p.m.
 19 Wed. Conference of Honorary Secretaries, 10.30 a.m.
 20 Thurs. G.M.S. Committee, 10.30 a.m.
 20 Thurs. Radiologists Group Committee, 12 noon.
 20 Thurs. Organization Subcommittee, Central Consultants and Specialists Committee, 2 p.m.
 20 Thurs. Tuberculosis and Diseases of the Chest Group Committee, 2.30 p.m.
 21 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 10.30 a.m.
 21 Fri. Ophthalmic Qualifications Committee, 1.45 p.m.
 21 Fri. Medical Witnesses Subcommittee, Private Practice Committee, 2 p.m.
 21 Fri. Ophthalmic Group Committee, 2 p.m.
 21 Fri. Overseas Committee, 2 p.m.
 28 Fri. Conference of Regional Officers, 12 noon.

JUNE

- 2 Wed. Film Committee, 11 a.m.
 9 Wed. Central Ethical Committee, 12 noon.
 10 Thurs. Central Consultants and Specialists Committee, 10.30 a.m.

JULY

- 1 Thurs. Annual Representative Meeting (at Glasgow), 10 a.m.
 2 Fri. Annual Representative Meeting (at Glasgow), 9.30 a.m.
 3 Sat. Council (at Glasgow), 9 a.m.
 3 Sat. Annual Representative Meeting (at Glasgow), 10 a.m.
 5 Mon. Annual Representative Meeting (at Glasgow), 10 a.m.
 5 Mon. Annual General Meeting (at Glasgow), 12.30 p.m.
 5 Mon. Council (at Glasgow), at conclusion of A.R.M.
 5 Mon. Adjourned Annual General Meeting and President's Address (at Glasgow), 8.15 p.m.

Branch and Division Meetings to be Held

- ALDERSHOT AND FARNHAM DIVISION.—At Aldershot Civil Infectious Diseases Hospital, Wednesday, May 12, 8.30 p.m., meeting. Two films and a discussion.
 BURNLEY DIVISION.—At Sparrow Hawk Hotel, Burnley, Friday, May 14, 8.30 p.m., annual general meeting.
 BURTON-ON-TRENT DIVISION.—At Stanhope Arms Hotel, Bretby, Burton-on-Trent, Tuesday, May 11, 7.45 p.m., dinner, followed by annual general meeting. Address by Dr. R. Mitchell: "The General Practitioner and the Health Visitor."
 CAMBERWELL DIVISION.—At Dulwich Hospital, East Dulwich Grove, London, S.E., Tuesday, May 11, 8.30 p.m., annual meeting and Guest Night. Talk by Mr. G. Salter (Detective Superintendent, Police Laboratories, Scotland Yard): "Methods of Detection—Can Crime be Hidden?" Members' wives and friends are invited.
 CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, May 11, 8.30 p.m., annual general meeting. Film: "Senile Obliterative Arteritis of the Leg" (Its Course, Diagnosis, and Management).
 DONCASTER DIVISION.—At Danum Hotel, Doncaster, Friday, May 7, 8 p.m., annual meeting.
 EAST HERTS DIVISION.—At Hertford County Hospital, Thursday, May 13, 8.30 p.m., annual general meeting.
 EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, May 13, 7.30 p.m., dinner; 8.45 p.m., business meeting.
 GREENWICH AND DEPTFORD DIVISION.—At Miller General Hospital, Greenwich High Road, S.E., Wednesday, May 12, 8.30 p.m., annual general meeting.
 GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, May 13, 8.15 p.m., general practitioners' clinical meeting.
 HAMPSHIRE DIVISION.—Thursday, May 13, 8 for 8.30 p.m., dinner and tour of London Airport.
 HASTINGS DIVISION.—At Royal East Sussex Hospital, Hastings, Tuesday, May 11, 8.15 p.m., annual meeting. Film: "Polio—Diagnosis and Treatment."
 KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Wotton Avenue, Kingston-on-Thames, Tuesday, May 11, 8 for 8.30 p.m., annual general meeting. Film by Professor Ian Aird: "Conjoined Twins of Kano." (Sound and colour).
 MARLBORNE DIVISION.—At Old Library, B.M.A. House, Tavistock Square, London, W.C., Tuesday, May 11, 5 p.m., general meeting. Discussion: "The Restoration of the Right to Buy and Sell the Goodwill of Medical Practices." Opening speakers, Dr. E. C. Warner, and Dr. F. G. Tomlins.
 METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Wednesday, June 2, 3 p.m., annual general meeting. President's address by Dr. D. F. Hutchinson.
 NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, May 11, 8.45 p.m., meeting. B.M.A. Lecture by Mr. W. W. Davey: "Is Your Gastroscopy Really Necessary?" Members of Enfield and Whittington Hospital are welcome. The lecture will be illustrated by lantern slides and other demonstrations.
 SCUNTHORPE DIVISION.—At Blue Bell Hotel, Scunthorpe, Wednesday, May 12, 8.30 p.m., general meeting.
 SHEFFIELD DIVISION.—At University Medical Library, Wednesday, May 12, 8 p.m., meeting.
 SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, May 14, 9 p.m., clinical meeting.
 TOWER HAMLETS DIVISION.—At St. George-in-the-East Hospital, Raine Street, Wapping, E., Friday, May 14, 8 p.m., clinical meeting.
 WIGAN DIVISION.—At Haigh Hall, Thursday, May 13, 8.15 p.m., annual general meeting.
 WILLESDEN DIVISION.—At Rehabilitation Department, Willesden General Hospital, Harlesden Road, N.W., Friday, May 7, 9 p.m., meeting. Discussion: "The Health Visitor and the General Practitioner." The annual general meeting will follow.

Meetings of Branches and Divisions

- CAMBRIDGE AND HUNTINGDON DIVISION
 At the annual general meeting on April 9, 1954, the following officers were elected for 1954-5:
 Chairman.—Dr. A. Brown.
 Vice-chairman.—Dr. C. W. Walker.
 Secretary and Treasurer.—Dr. J. A. Sadler.

PROCEEDINGS OF COUNCIL

SCHEME FOR RESTORATION OF "GOODWILL"

Amending Acts Committee's Proposals

A meeting of the Council was held on the afternoon of May 5 and the morning and afternoon of May 6. Dr. E. A. GREGG presided.

A warm welcome was given to the President of the Association, Mr. J. W. Tudor Thomas, on his return from his visit to the Middle and Far Eastern Branches. The CHAIRMAN said that the Council and the whole Association were very grateful to Mr. Tudor Thomas for undertaking a journey which must have meant great personal inconvenience in order to discharge his duties to the Association. A new member of Council was welcomed in Dr. C. Belfield Clarke, who had been elected to fill the vacancy in the representation of the West Indian Branches.

The members stood in silence as a tribute to the late Dr. Colin D. Lindsay, whose death was recently announced, and who was President of the Association at the Plymouth Meeting in 1938.

The congratulations of the Council were accorded to two of its members—Dr. Mary Esslemont, who has been chosen to receive the Hon.L.L.D. of the University of Aberdeen, and Dr. H. D. Chalke, the first recipient of the Mitchiner Medal of the Royal College of Surgeons for distinguished services to military medicine; also to Professor Bradford Hill, not a member of Council but one who had been closely connected with the Association's work, on becoming a Fellow of the Royal Society.

The Council discussed the duration of future Council meetings. It appeared that one additional Council meeting in the year was required in order to cope with the increasing volume of business, and it was decided that, in addition to the two short meetings at the Annual Meeting, five meetings should be held in the year.

After inspecting a coloured drawing of the proposed Coat of Arms for the Association, the device, which includes the figures of Hippocrates and Harvey, was approved. The CHAIRMAN said that they were specially grateful to Dr. S. F. L. Dahne and Dr. O. C. Carter for their work in connexion with this matter. On the motion of Dr. DAHNE, seconded by Dr. F. M. ROSE, it was agreed that the members of Council should offer to present the Coat of Arms to the Association, and that it be submitted to the Representative Body.

The Council considered at length the scheme prepared by the Amending Acts Committee for the restoration of the right to buy and sell goodwill, together with a statement, also prepared by the Committee, on the advantages and disadvantages of the scheme. Dr. H. H. D. SUTHERLAND, chairman of the Committee, introduced the subject. He acknowledged the great help which the Committee had received from certain co-opted members—Drs. A. Brown, S. F. L. Dahne, A. B. Davies, I. D. Grant, and R. Hale-White. Mr. A. N. Dixon, general manager of the Medical Insurance Agency, had also assisted the Committee on the financial aspects of the scheme, and Mr. Leigh Taylor, solicitor, on the legal aspects.

Opening an interesting debate, Dr. W. WOOLLEY said that, apart from the pros and cons of this particular scheme, the first decision the Council should take was whether or not it should give a lead to the Representative Body. If it was not going to give a lead there was no reason to embark upon a discussion of the document. The Council must say whether or not it believed this to be a workable scheme.

The CHAIRMAN said that the Representative Body would expect a lead from the Council. They must first look at the statement and then make a decision as to whether they should commend the scheme.

Dr. VAUGHAN JONES asked how the Committee had arrived at the figure of 1.25 years as representing the purchase price at or below which practices producing smaller incomes than £1,750 would probably remain. This figure, he said, had never been suggested before, and, having regard to the fact that the purchaser would be buying a practice with a larger stable portion than in pre-N.H.S. days, it seemed to him that the figure was ridiculously low. Dr. SUTHERLAND explained how the figure had been arrived at as a result of calculations by a co-opted member of the Committee, Dr. A. B. Davies, who had taken into account the effect of the Dankwerts award, but he himself thought that 1.5 years might be nearer the mark. Dr. TALBOT ROGERS said that the original figure was 1.57, but it was considered that it could be reduced to 1.25 in view of the

Danckwerts award. Dr. VAUGHAN JONES still maintained that 1.25 was entirely illusory.

Dr. FRANK GRAY said that one of the advantages mentioned in the scheme was that the restoration of goodwill would be advantageous to the Government in relieving it of a substantial portion of the £66m. set aside under the Act to compensate practitioners for the loss of their right to sell their goodwill. But he thought that to this should be added the corresponding disadvantage from the Government's point of view that it would be left to pay the remaining portion of the £66m. in return for nothing whatever.

Dr. A. V. RUSSELL: Except the existence of a more contented profession.

A Lead to the Representative Body

Dr. E. C. DAWSON then moved the following resolution:

That the scheme as presented by the Amending Acts Committee is the best that can be devised in present conditions, but that in view of (a) the practical difficulties of implementing the scheme, (b) the high capital outlay required by young practitioners to launch into practice, (c) the divided opinion in the profession as to the desire to introduce such a scheme, and (d) the known political resistance to such a scheme, the Council recommend to the Representative Body that no further action be taken.

Dr. S. F. L. DAHNE, opposing the motion, said that freedom was the most important thing in the world, and he did not think general practitioners would ever get back their freedom unless they got back their goodwill. There were far more complicated issues involving the return of some form or other of goodwill now being negotiated by the present Government in other connexions than this relatively simple one concerning medical practices. Why should they not have such courage as was exhibited by the profession in Australia in standing up to any political party on this issue?

Dr. D. F. HUTCHINSON, who seconded Dr. Dawson's motion, said that there was no freedom in this scheme for future doctors. If the scheme came into force as from an appointed day three years hence no man thereafter could go into practice in the manner in which present-day medical students had been given to understand that they could enter. There would be freedom for doctors at present in practice, but no freedom for their successors, and the freedom of their successors was perhaps more important than their own.

Dr. TALBOT ROGERS said that the General Medical Services Committee had studied the proposals and the statement. Any scheme for the restoration of the right to buy and sell goodwill must be examined in the light of present-day economic circumstances, and his Committee believed that a return to the buying and selling of goodwill had become economically impossible to-day. If the purchase of practice goodwill became compulsory to the future generation of doctors who were now students—a generation who had taken up the study of medicine in the knowledge that they would not be required to enter practice by purchase—real hardship would be caused. Whilst wishing to pay sincere tribute to the constructive efforts of the Amending Acts Committee to produce a practical scheme, his Committee could not support the proposals. This view had also been expressed by the Assistants and Young Practitioners Subcommittee and by the British Medical Students Association, both bodies being vitally concerned with the question of entry into practice. Further, from the information contained in the financial memorandum which was appended to the scheme, the Committee had reached the firm conclusion that the very difficult economic circumstances which had developed since 1948, in addition to the many other practical difficulties involved, would render it impossible to carry out this or any similar scheme for the restoration of the sale and purchase of goodwill. Dr. Rogers added that the General Medical Services Committee did not want to be regarded as opponents of the scheme. They would support a workable scheme if it were produced. But he thought they were unanimous in their inability to support the present scheme. At the same time should the Council or the Repre-

sentative Body decide otherwise his Committee would certainly look at the scheme in the light of the new situation and probably call a Special Conference.

The Scheme Defended

Dr. A. V. RUSSELL said that Dr. Hutchinson would have them believe that the Amending Acts Committee had been preparing a scheme to sell future generations of doctors into slavery. This was not a scheme which would deny liberty to individual doctors. Once again he must emphasize that, even as things were, nobody could go into practice without a certain amount of capital. It was true that those who were in practice when the Service came in in 1948 could say that at the end of their professional lives they would draw compensation. But there would be no compensation at all for the following generations; these younger doctors would be tenants in their practices however hard they worked and however much they built their practices up. They all knew of ailing and elderly practitioners who would like to get out of their busy urban practice and take up a small practice in some quiet part of the country, but they could not do it as things were now, they had to stay where they were planted. He believed that if the right to buy and sell goodwill were returned the profession would rise to true independence. For that reason alone certain sacrifices were worth making. Much had been made of the hardship for the young man in finding the necessary capital to purchase a practice. For his own part he did not believe it was a bad thing for a young man to have to work and save to acquire something of his own. Those who in the Amending Acts Committee had drawn up this scheme were sincere in their beliefs, and he begged the Council not to send this scheme to the Representative Body damned from the word "Go."

Dr. O. C. CARTER, in supporting the scheme, reminded the Council that in the days of the Negotiating Committee five points were formulated on which they were not prepared to give way. But they went one by one and the last to go was this right to buy and sell goodwill. He hoped that the scheme now submitted would be amended and improved.

Dr. G. W. IRELAND said that the arguments had rather centred on financial and political details. The question should be approached from a wider aspect. There were a great many people who did not share the views of the Amending Acts Committee but had as great a regard for freedom.

Dr. SUTHERLAND said that they were all aware of the practical difficulties in implementing the scheme, but he thought some of the difficulties had been overstressed. It had been stated that the British Medical Students Association was opposed to the scheme, but he thought that what the student body wanted was, not this particular scheme, but the setting up of another. They were not wholly on the side of the General Medical Services Committee.

After Mr. DAWSON had replied on the discussion on his motion, Dr. RUSSELL desired to move an amendment, but the Chairman said that it would not be fair to accept it at that stage. Dr. DAVID BROWN moved that the question be now put, and this was agreed to.

On Dr. Dawson's motion proposing to recommend to the Representative Body that no further action be taken there voted: In favour, 26; against, 16, with five abstentions.

REMUNERATION OF HOSPITAL MEDICAL STAFF Whitley Committee "B" Agreement

Dr. T. ROWLAND HILL, chairman of the Central Consultants and Specialists Committee, presented to the Council the recent Whitley Council agreement on increases in the remuneration of hospital medical staff. The details of the increases appeared in the *Supplement* of April 10 (p. 145), and a report of the discussion in the Central Consultants and Specialists Committee on May 8 (p. 228). Dr. Hill summarized the terms of the agreement and the events which had led up to it, following the lines of Sir Russell Brain's

exposition to the Central Committee. Dr. Hill also referred to the historical background, and in particular to the part taken by the Association in the organization of consultants and specialists. When the Central Consultants and Specialists Committee has been set up by the B.M.A. the need was felt for bringing in in some way the Royal Colleges and the Royal Scottish Corporations, and this was solved by the setting up of a Joint Committee, the initiative for which came from the Chairman of Council at that time. Informal discussions took place with a view to the interpretation of consultant opinion through the one channel. The Ministry was persuaded to recognize the Joint Committee. It was part of the agreement that where any one of the constituent bodies disagreed with the Joint Committee it had the right of individual approach to the Government. But the important thing was to keep a united front, and now for five or six years this had been done. It was felt that one constituent body should not override the others, and in these matters a reasonable compromise had been achieved.

Dr. ROWLAND HILL then proceeded to outline the circumstances which led up to the present agreement on remuneration. In 1949 consultants entered the N.H.S. on a permanent basis—on permanent contracts—and from that time onwards all legal rights in Spens disappeared. The consultants had been told that there could be no implication of anything corresponding to the Danckwerts award for general practitioners. The Management Side had refused to discuss practitioners. The betterment factor in relation to consultant pay. The only claim which could be discussed was one to restore the balance between general practitioner and consultant remuneration which had been upset by the Danckwerts award. Any appeal to arbitration was refused. A fresh examination by a court of inquiry might have been made, but, as Sir Russell Brain had said, this inquiry would not have concerned itself with cost-of-living betterment, it would have gone into much wider questions.

Immediately following the Danckwerts award the consultants had been concerned to get their moral right to betterment recognized, but had agreed not to press their claim at that moment. Later when the formal claim was presented they were met with these refusals. They were left, as Sir Russell Brain had said, to make a claim on its merits. Dr. Hill said he had forecast a four or five years' struggle, but they then heard the Government was prepared to give an immediate advance. Certain strings were attached to the new proposals, but after careful examination the Staff Side had come to the conclusion that these were not sufficient to warrant a decision against the proposals, which would have the effect of delaying a considerable improvement in remuneration for hospital medical staffs. He reminded the Council that this was not like a court award: they were not prevented from pursuing their full claims. Their position would not be weakened by the acceptance of this new proposal. The Staff Side would be free to reopen negotiations at any time; they were not precluded from reasserting their claim for betterment.

Could they rely upon Spens being continued? This question was put direct to the Minister of Health at a meeting between him and a group of consultants. Referring to an agreed minute of this meeting, Dr. Hill said that the Minister concurred fully with the importance attached to the Spens report; he, Dr. Hill, saw no reason why this should not be fully reported.

[The agreed minute reads as follows.—Ed., B.M.J.]
"SIR RUSSELL BRAIN asked the Minister to clarify some matters. He said that, leaving aside the actual level of remuneration, the profession felt that the Spens Report was in several other respects fundamental to the welfare of the Service. Could they rely upon its being continued? The Minister said that the only point he was now dealing with was the actual level of remuneration. On other matters he agreed fully with the importance attached to the Spens Report, which must continue to occupy the same place as before in any discussions the Government had with the profession about the consultant and specialist service."

What they had secured, continued Dr. Hill, was an immediate noncommittal *ad hoc* increase. There was no

finality in the agreement reached. As a permanent settlement it was thoroughly inadequate. But they had no legal rights under Spens, only a moral right. In response to a subsequent question, Dr. Hill agreed he should have said they had no legal right to betterment.

The following were the resolutions which had been adopted by the Central Consultants and Specialists Committee at its meeting the previous week:

(1) Bearing in mind the difficulties under which the negotiations have been conducted, the Central Consultants and Specialists Committee approves the action of the Staff Side representatives of Committee "B" of the Medical Whitley Council in agreeing to the terms of remuneration recently announced. In particular it notes the view of the Staff Side that the Spens report remains the yardstick of remuneration of hospital staffs, and that they hold themselves free to seek future revisions thereof.

(2) The Central Consultants and Specialists Committee in particular notes with satisfaction the intention of its Staff Side representatives to seek further improvement in the salary scales of S.H.M.O.s, and to press for payment of allowances and domiciliary consultation fees to whole-time officers.

Dr. Hill insisted that the door to further negotiation was left open. Spens, as the resolution stated, remained the yardstick. Although there were things which Spens had never taken into account, it embodied the principles which they would continue to seek to have established.

Criticisms of the Agreement

A succession of members criticized the terms of remuneration and the manner in which the negotiations had taken place, but all of them congratulated Dr. Rowland Hill on his presentation of the subject. Dr. A. V. RUSSELL confessed to a certain amount of uneasiness, especially with regard to the reply given by Sir John Hawton (see *Supplement*, p. 240), secretary of the Ministry of Health, to an inquiry by the secretary of the Association, in which he spoke deprecatingly of "a mere reference back to the contents of Reports which were produced years ago" (a reference to Spens). He felt that the agreement was unfortunate and might have equally unfortunate repercussions in other directions.

Dr. O. C. CARTER said that Dr. Rowland Hill's eloquent speech was an apology for what had been done. He was surprised to hear him refer to this agreement as a major triumph. The fact was, whether the Central Consultants and Specialists Committee liked it or not, Spens had been thrown to the four winds. As a correspondent in the *Journal* had said, what had been done meant the undermining of Spens. He urged that negotiations should be undertaken immediately to restore the Spens position. He went on to ask whether the Joint Consultants Committee under its terms of reference, which were to represent consultants and specialists and to negotiate for them, was entitled to agree to certain terms on their behalf. Negotiation was one matter and agreement another. He would have thought the Committee should have said, "We can do no more; we must go back to our constituent bodies." Dr. Rowland Hill had referred to a clause in the terms of reference whereby the constituent bodies which formed the Joint Committee could, in the event of disagreement, themselves make representations. But how could any individual constituent of the Joint Committee take exception to what was going on if it was not told of it? So far as he knew there had been complete secrecy from beginning to end. He was perfectly certain that this agreement would be received with the utmost dissatisfaction by members of hospital staffs, and, whatever might be the true position with regard to the responsibility of the Association in the matter, it would be judged to some extent responsible. The Central Consultants and Specialists Committee was an autonomous body, but he had supposed that no autonomous body would enter into an agreement which would have unfortunate repercussions on other sections of the

INTERNATIONAL RELATIONS

Dr. J. A. FRIDHAM, chairman of the International Relations Committee, proposed that the Council approve in principle the establishment of a supporting committee or league of friends for the World Medical Association. He said that some such proposal had been in his mind for several years, and the present was a particularly apposite moment to bring it forward, when there was special need to enhance the status of the W.M.A. in relation to the W.H.O. He reminded the Council that increasingly, through international bodies like the W.H.O. and the I.L.O., medicine was being brought into international politics, and it was necessary to know what was going forward. If the W.M.A. were not in existence the B.M.A. would require to have a section of staff to study these matters. The responsibility for countries without such a high standard of service as our own had also to be borne in mind. Moreover, what happened to doctors in one country would eventually affect those in others. The B.M.A. was the oldest and the second largest medical association in the world; it took the initiative in forming the W.M.A., and it had something to give to other countries.

The motion was agreed to.

REPORT ON GENERAL PRACTICE

The CHAIRMAN reminded the Council that it had been agreed eighteen months ago that a comprehensive report on general practice should be prepared and submitted at a later date for approval by the Representative Body and by the Conference of Representatives of Local Medical Committees, with a view to ultimate publication in book form.

Dr. VAUGHAN JONES urged that this should be done as quickly as possible. Any committee set up for this purpose should be asked to report within a year. Dr. HUTCHINSON suggested that the views of the General Medical Services Committee should be elicited as to the proper time for the publication of such a report.

The CHAIRMAN said that his own view was that the Council should have before it all the recent reports on general practice, and that a comprehensive book should be prepared dealing with general practitioners' problems, and also with the training of the doctor, with a view to getting something really authoritative emanating from the Association—the last word from the profession itself. It should not be done hurriedly and they should take the profession with them in doing it.

It was agreed to postpone further action until the first meeting of the Council after the Annual Meeting at Glasgow, and in the meantime to ask the General Medical Services Committee and the Private Practice Committee for their views on the projected publication.

Reporting for the Private Practice Committee, Dr. GRANT said that the Committee had viewed with concern the possibility that the Home Secretary might be asked to prescribe the maximum fees for cremation certificates, and had decided to draw the attention of the profession to the policy approved by the Annual Representative Meeting in 1951 that a suitable fee for the completion of certificate B or C was two guineas, plus mileage where applicable.

Dr. VAUGHAN JONES, for the Occupational Health Committee, brought forward a recommendation, which was agreed to, that an early meeting of the Joint B.M.A. and T.U.C. Committee be called to discuss the memorandum on the future of occupational health services. Dr. Vaughan Jones also spoke of the value of the recent joint conference of Advisory Councils on Occupational Health, held at B.M.A. House, and the Council agreed that the Association should sponsor another such conference in 1955.

OTHER COMMITTEES

Dr. DAIN, in presenting the report of the Public Relations Committee, made a brief statement on the manner in which the views of the profession on the Television Bill now before Parliament were being conveyed to those respon-

sible for the measure. This matter also figured in the report of the Central Ethical Committee, submitted by Dr. R. FORBES, who said that his Committee had decided to send to the General Medical Council the memorandum on indirect methods of advertising, and to inquire whether, in view of the popularity of television and the possibility of commercial television, there was any likelihood of a revision of the resolutions passed by the General Medical Council in 1934 regarding the anonymity of medical broadcasters.

Dr. D. F. HUTCHINSON submitted a draft memorandum of evidence which had been prepared by the special committee concerned for the Forces Medical and Dental Services Committee (the Waverley Committee). He said that the evidence committee had come to the conclusion that if the armed Forces wanted medical officers they must enter for them in a competitive market.

On behalf of the Science Committee Dr. NOY SCOTT brought forward a number of recommendations relating to the medical students' essay competition, the B.M.A. research scholarships, and other Association prizes, and these were approved.

Reporting for the Finance Committee in the absence of the Treasurer, Dr. IAN GRANT said that practically all the standing committees had kept well within their budget, and the prospects for the end of the financial year were good.

In reporting for the Scottish Committee, Dr. J. G. M. HAMILTON said that the Association's pamphlet on "The Recognition of Intoxication" had attracted the interest of the Crown Agent, who had requested a number of copies of it for study. The SECRETARY stated that 5,000 copies of the pamphlet had been printed; all had been disposed of, and reprinting was now taking place.

Preliminary or routine reports were presented from the Welsh Committee, the Film Committee, the Charities Committee, the Office Staff Superannuation Committee, the Overseas Committee, and the Evidence Committee on Divine Healing.

HOSPITAL STAFF REMUNERATION

CORRESPONDENCE BETWEEN B.M.A. SECRETARY
AND PERMANENT SECRETARY, MINISTRY
OF HEALTH

The following correspondence about the recent Medical Whitley Committee "B" agreement on the remuneration of hospital medical staff took place between Dr. A. Macrae, the Secretary of the B.M.A., and Sir John Hawton, Permanent Secretary to the Ministry of Health. On April 15 Dr. Macrae wrote to Sir John Hawton as follows:

"It has been the policy of the Association, as determined by the Representative Body, to secure 'an adequate betterment factor' for consultants and specialists in conformity with the intention of the Spens Report. At its meeting during the first week in May, the Council will receive a report of the recent agreement in Committee 'B' of the Medical Whitley Council and will have to decide what statement about this is to be included in its report to the Annual Representative Meeting in July. I shall be grateful if you will kindly give me an answer to the question which is asked below, as this, I think, will help the Council to express an informed opinion on the matter.

"The following is a quotation from Sir Russell Brain's published account of the Committee 'B' agreement: 'The Staff Side was left in no uncertainty as to the Government's policy in the matter and the attitude of the Management Side. It was quite clear that in no circumstances could a claim be considered for hospital staff based on the Danckwerts award.'

"I am slightly puzzled by this statement of Government policy, for I understand that the Committee 'B' agreement is in a sense 'based on the Danckwerts award.' Indeed, Sir Russell Brain writes, 'the Staff Side is satisfied that the settlement it has achieved does, in fact, restore the balance between consultant and general-practitioner remuneration which was upset by the Danckwerts award.' At the same time, it is quite clear that, whereas the Danckwerts award went a very long way towards full implementation of the one Spens Report, the Committee 'B'

MAY 15, 1954

HOSPITAL STAFF REMUNERATION

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

241

agreement falls very far short of full implementation of the other Spens Report.

"The recommendations of the two Spens Reports, considered together, present a proposed relationship between the financial rewards of general practice on the one hand and consultant practice on the other. My question is this. Would I be right in concluding that Government policy, while favouring the maintenance of an equitable relationship between the financial rewards of general practice and of hospital practice, is opposed to the recognition of what I may call the Spens relationship as the equitable one? Is this a correct statement of the view of the Government or of the view of the Minister of Health?

"I hope that Mr. Macleod will see no objection to your giving me a clear answer to this question, because I think that the profession is entitled to know what his attitude is."

Sir John Hawton replied on April 26 as follows:

"Thank you for your letter of April 15 about the recent pay agreement.

"The short answer to your question might best be put this way: that the Minister is certainly of the opinion that there should be a proper relationship between the financial rewards of general practice and of hospital practice; and that what constitutes a proper relationship must be determined in the light of all the relevant factors obtaining at any given time rather than by a mere reference back to the contents of Reports which were produced years ago and before there had been any experience of the working of the Service under modern conditions."

Dr. Macrae sent the following letter to Sir John Hawton on May 6:

"Your letter of April 26 was considered by the Council of the Association at its meeting to-day.

"I was asked to inform you that the Council repudiates the suggestion as to the present status of the Spens Reports which appears to be implied in your letter, and that it has adopted the following resolution:

"That the Council reaffirms its policy to adhere to the basis of remuneration enunciated in the Spens Reports."

THE B.M.A. IN AUSTRALIA

ANNUAL REPORT OF FEDERAL COUNCIL

The Report of the Federal Council of the British Medical Association in Australia has just been received. It covers the year ending December 31, 1953. The Council met twice, the year ending February for three days, and at Adelaide in October for four days. The Council consists of four representatives of New South Wales (Drs. A. J. Collins, W. F. Simmons, H. R. R. Grieve, and A. J. Murray), two from Queensland (Drs. A. E. Lee and H. W. Horn), two from Tasmania (Drs. T. Giblin and J. B. G. Muir), two from South Australia (Drs. L. R. Mallen and C. O. F. Rieger), three from Victoria (Drs. H. C. Colville, C. Byrne, and R. Southby), and two from Western Australia (Drs. H. Leigh Cook and D. E. Copping). Dr. A. J. Collins was elected President, Dr. H. C. Colville Vice-president, and Dr. W. F. Simmons Honorary Treasurer. Dr. J. G. Hunter, who is well known at B.M.A. House in London, is General Secretary.

The report records a year's work of a kind which is familiar to anyone connected with the work of a national medical association. With the National Health Bill in the offing, not unexpectedly much space is devoted to recounting activities in the field of medical planning. Several conferences were held with the Minister for Health (Sir Earle Page). A close working relationship between the Minister and the Federal Council exists. Among other things, the Council urged the Minister to place in the National Health Act the following provisos: (1) That the combined Government and organization benefit be never in excess of 90% of the doctor's account for the particular item concerned. (2) That except when hardship is involved, payment be made to the patient as a refund on presentation to the medical benefit organization of the doctor's receipted account.

Stabilization of Fees

Branch Councils were informed that the Federal Council was concerned with the need for stabilization of medical fees,

especially in view of the fact that the success of the National Health Service would depend on such stabilization, and they were requested to give serious thought to means of achieving this purpose.

In view of the fact that the Royal Australasian College of Physicians had written to the Minister for Health complaining of anomalies in the schedule of benefits in the health scheme, the Federal Council decided to reaffirm its previous policy that the Federal Council of the British Medical Association should be the one negotiating body to act on behalf of the profession and that letters be sent to all colleges and associated bodies drawing their attention to this.

Hospital Policy

The Council reaffirmed its hospital policy as laid down at the meeting on March 1, 1949, "that the Branch Councils be informed that it is the opinion of the Federal Council where public hospitals are available free to all members of the community and the whole financial responsibility for their upkeep has been accepted by the Government, no reason exists for the continuation of honorary services; and that the Federal Council is of the opinion that public hospitals should be open to and provide accommodation for all classes of patients—public bed, intermediate, and private, according to their means—and that intermediate and private patients should pay for medical attention. That all reputable medical practitioners should be entitled to render services to intermediate or private patients in all public hospitals, and that Branch Councils be asked to implement this policy."

The Minister for Health was advised that the Council was willing to co-operate in genuine tuberculosis case-finding schemes of the general population, provided its administration was entirely dissociated from hospital x-ray clinical departments. The examination should be confined to the primary detection of cases of pulmonary tuberculosis, and the report should be limited to those usually given in such case-finding schemes.

General Matters

The Council's gratitude and appreciation were conveyed to the Medical War Relief Fund Committee of the B.M.A. for its generous action in donating £500 sterling to the Federal Medical War Relief Fund.

The board of directors of the Australasian Medical Publishing Company advised that as from January 1, 1953, the per capita payment in respect of the supply of the *Medical Journal of Australia* would remain at £1 per annum, 10s. of which would be in payment for the Journal and 10s. towards the purchase of Series "E" Debentures.

The Federal Council decided to establish a fund, the Federal Council Medical Monograph Fund, the object of which would be the publication of monographs of a high standard on the medical and allied sciences on behalf of authors unable to bear the cost of publication. An appeal to members would be made through a letter published in the *Medical Journal of Australia* under the President's signature.

The Western Australia Branch had asked the Council to consider the ethical and legal implications of bilateral vasectomy, with a view to making a recommendation to Branches. The Branch was informed that the Council endorsed the opinion of the Victorian Branch's legal adviser that the sterilization of the male or female was unlawful except for adequate therapeutic reasons.

The Royal College of Obstetricians and Gynaecologists Regional Council in Australia sought the help of the Federal Council in an approach to the Queensland Government to alter the legislature so that medical practitioners whose only qualification was the D.Obst.R.C.O.G. should not be registered as specialists, and was informed that, as the D.Obst.R.C.O.G. is granted by the College following the fulfilment of prescribed conditions and examination, the Federal Council could not agree to recommend to the Queensland Government that it be not recognized for the purpose of specialist registration.

WORLD MEDICAL ASSOCIATION COUNCIL MEETING, APRIL, 1954

[FROM A CORRESPONDENT]

The Council of the W.M.A. held its annual spring meeting in Zurich at the end of last month under the chairmanship of Dr. DAG KNUTSON, of Stockholm. After an initial meeting of the council as a whole, the various council committees met and got through their very heavy agendas in time to present their respective reports to the council when it again met in full session. Most of the meetings were conducted in French and in English. Spanish is the third official language of the W.M.A., but the Spanish-speaking members of the council could follow the proceedings in either French or English, thus effecting a great saving of time.

The treasurer, Dr. OTTO LEUCH, of Zurich, was able to record an increase in receipts over the budgeted sum; among other things this was because of increased membership, payment of arrears, and, in the case of Switzerland, a rise in voluntary subscriptions.

International Occupational Health Committee

A full report of the Secretary-General, Dr. LOUIS H. BAUER (New York) showed that the activities of the W.M.A. have during the past year increased in scope and in intensity, though many member national medical associations are still tardy in supplying information asked for, especially when it comes to giving answers to questionnaires. For example, the question of a surplus or shortage of doctors especially concerns some countries, and it is difficult for the W.M.A. to ascertain the facts if member associations do not supply them when asked to do so. Dr. Bauer gave a report of steps taken to implement the General Assembly's resolution that a study be made of the feasibility of organizing a committee or conference on industrial and occupational medicine. Meetings had been held in New York of interested persons, including a representative of the World Health Organization. It was proposed that the term "Occupational Health Service" would be preferable to "Industrial and Occupational Medicine," and that an international committee on this subject should be set up by the World Medical Association. Such a committee would make contact with existing international organizations in this field, and recommend that member associations of the W.M.A. should establish Occupational Health Committees, and that such national committees should supply the international committee with required information. This move should bring within one focus much useful information on this important subject, and make it possible to formulate recommendations and principles on occupational health services.

Support for W.M.A.

The W.M.A. has now developed close contact with many international organizations, and its observers in different countries attend most international medical meetings held throughout the year. It has lent its active support to the International Federation of Medical Students Association. Perhaps its most important contact is with the World Health Organization, and in view of the growth of W.H.O. supporting committees in different countries the W.M.A. has informed its member associations of the resolution "that the Council of the W.M.A. respectfully suggests to the W.H.O. that the desired co-operation might best be encouraged by the W.H.O. proposing to each member government that there be included among the delegates to the World Health Assembly a representative of the organized medical profession of the country." The council of the W.M.A. considers it is the first duty of the national member associations to establish supporting committees for the World Medical Association.

Social Security

One of the most important committees of the W.M.A. is that dealing with the medical aspects of social security,

and at the meeting in Zurich much time was spent considering the conclusions drawn up last September by the International Social Security Association on the relations between social security institutions and members of the medical profession. The I.S.S.A. is an autonomous organization with which the International Labour Office co-operates by furnishing secretarial services. The 15 "conclusions" of the I.S.S.A. were published in its *Bulletin* last October. I.S.S.A. has in its membership 40 countries and 100 member institutions representing some 200,000,000 insured persons. Its views and attitude therefore carry great weight. It cannot be said that the attitude of I.S.S.A. to W.M.A. is one of cordiality. It is hoped that further reference to the "conclusions" of I.S.S.A. will be made in a future issue of the *B.M.J.*

Medical Ethics

The committee on medical ethics, under the chairmanship of Dr. P. CIBRIE (Paris), considered the General Assembly's resolution that an additional "chapter" on the social duties of doctors should be added to the International Code of Medical Ethics adopted by the W.M.A. General Assembly in 1949. Various drafts were considered, and the matter will be reported to the Rome General Assembly this autumn. The committee heard further of the claims of other international organizations to establish a code of international medical law, and of the W.M.A.'s strong contention that this came principally within its province, in view of its widely accepted code of ethics. A long discussion was also held on the ethics of experiments conducted on human beings, of which further will be heard in Rome this autumn.

Medical Education

The Committee on Medical Education and the Conference Education Committee were amalgamated into one new committee, and the chairman of the former, Dr. J. A. Pridham, proposed that the chairman of the new committee should be Sir Lionel Whitby, who presided over the First World Conference on Medical Education held by the W.M.A. last August. Under Sir Lionel Whitby the new committee received a report that the full proceedings of the conference would be published in October by the Oxford University Press. It had not proved practicable to publish it in the spring, as had been hoped. The committee agreed to recommend that a Second World Conference on Medical Education should be held in 1958, and it seems probable that this will be in North America. It was provisionally suggested that the second conference would be based on world regional studies of topics selected from the work of the first conference.

Miscellaneous Matters

The council discussed the resolution of the General Assembly that the W.M.A. should undertake the publication of future revisions and editions now published jointly by W.H.O. and Unesco. Both these organizations had agreed to relinquish their publishing rights to W.M.A., and the council agreed to be responsible for future revisions and editions, acknowledging, in doing so, the helpful co-operation of W.H.O. and Unesco in facilitating this decision. The council gave its approval to the new appearance of the *World Medical Journal*, which, under the editorship of Dr. Austin Smith, Editor of the *J.A.M.A.*, now appears six times a year instead of four. Plans for its continued improvement were discussed. The council was informed of the growing co-operation between the medical editors' section of the W.M.A. and the International Union of the Medical Press, whose representatives it hopes to see at the meeting in Rome this year.

Towards the end of the council meeting Dr. J. A. Pridham said that for personal reasons he had to retire from council before the expiry of his term of office. The council unanimously nominated Sir Lionel Whitby to fill the vacancy thus created, and at the same time placed on record its deep appreciation of the faithful and devoted service Dr. Pridham had for so many years rendered the World Medical Association.

APPOINTMENTS TO CHAIRMANSHIP OF REGIONAL BOARDS AND BOARDS OF GOVERNORS OF TEACHING HOSPITALS

The Minister of Health has made the following appointments or reappointments as chairmen of regional hospital boards and boards of governors of teaching hospitals. The appointments, which date from March 31, 1954, are for three years, the only exceptions being one or two instances where the new chairman has already served less than three years as a member of the board. Chairmen appointed for the first time are indicated by an asterisk.

South-west Metropolitan Regional Hospital Board.—Mr. Arthur George Linfield. Oxford Regional Hospital Board.—Sir George Schuster. Birmingham Regional Hospital Board.—Mr. V. M. Grosvenor. United Newcastle-upon-Tyne Hospitals.—Mr. Robert Muckle. United Leeds Hospitals.—Sir George W. Martin. United Sheffield Hospitals.—Mr. A. Ballard. United Cambridge Hospitals.—Mr. Thomas Knox-Shaw. United Oxford Hospitals.—Sir David Lindsay Keir. United Bristol Hospitals.—*Colonel H. Bland Stokes. United Cardiff Hospitals.—*Alderman Thomas Evans. United Birmingham Hospitals.—Mr. Evan A. Norton. Royal Hospital of St. Bartholomew.—Sir George Aylwen. The London Hospital.—Sir John Mann, Bt. The Royal Free Hospital.—Mr. Geoffrey Bostock. Eastman Dental Clinic.—*Mr. A. D. Page. University College Hospital.—Sir Alexander Maxwell. The Middlesex Hospital.—Colonel the Hon. John Jacob Astor. Charing Cross Hospital.—The Rt. Hon. Lord Inman. St. George's Hospital.—Sir Malcolm Trustram Eve, Bt. Westminster Hospital.—The Rt. Hon. the Lord Nathan of Churt. St. Mary's Hospital.—Mr. Anthony G. de Rothschild. Guy's Hospital.—The Rt. Hon. Lord Cunliffe. King's College Hospital.—The Marquess of Normanby. St. Thomas's Hospital.—The Hon. Sir Arthur J. P. Howard. The Hammersmith, West London and St. Mark's Hospitals.—*Major Sir Desmond Morton. The National Hospital for Nervous Diseases.—Sir Ernest Gowers. The Royal National Throat, Nose and Ear Hospital.—Mr. Ernest Edward Taylor. The Moorfields, Westminster and Central Eye Hospital.—Lieutenant-Colonel the Rt. Hon. Lord Luke. St. John's Hospital for Diseases of the Skin.—Mr. J. A. M. Ellison-Macartney. The Royal National Orthopaedic Hospital.—Mr. H. R. Kincaid Floyd, Bt. The National Heart Hospital.—Mr. J. M. Oakley. St. Peter's and St. Paul's Hospital.—Mr. Laurence E. D. Bevan. The Royal Cancer Hospital.—Sir Edward Stewart Cripps. Queen Charlotte's and Chelsea Hospitals.—*Mr. A. J. Espley.

ANGLO-AUSTRIAN HOLIDAY EXCHANGE

The Anglo-Austrian Society, whose presidents include the Earl of Harewood and the Austrian Ambassador, is again arranging exchange holidays for British and Austrian schoolchildren during the summer of 1954. Last year the exchange proved very successful, and over 850 boys and girls took part. Applications can still be accepted from British children for 1954, as many applications have been received from children of Austrian doctors in the Tyrol, Salzburg, Carinthia, the Austrian Lake District, Styria, and Vienna. Participants should be between 12 and 18 years of age. The principle of the exchange is that a suitable Austrian child, carefully selected by the Anglo-Austrian Society, comes to stay for a month, beginning about the middle of July, with the family of the British exchange partner. The two children then go to Austria about the middle of August to spend another month together at the Austrian family's home.

The Society makes all arrangements on a personal basis; organizes the journeys; and provides responsible escorts, who keep in touch with the children in Austria. The inclusive costs this year amount to £18 10s. Full particulars may be obtained from the secretary, Anglo-Austrian Society, 139, Kensington High Street, London, W.8.

TEES-SIDE CONSULTANTS MEETING

At a meeting of the Tees-side Hospitals Consultants and Specialists Committee held on May 5, 1954, the following resolution was carried unanimously:

"That this meeting, being disappointed at the outcome of the Whitley negotiations, wishes to take steps to review the whole of the negotiating machinery for consultants and specialists."

PRESCRIBING INVESTIGATION UNIT

The following information appears in the current issue of *Prescribers' Notes*.

A small pricing staff is set up in England and Wales to examine the prescriptions of doctors whose prescribing is above the average in cost. Where it seems justified a regional medical officer visits the doctors concerned, and as a result of discussion most practitioners are able to reduce their costs very appreciably without detriment to treatment.

In approximately 100 cases examined in this way, the average excess cost of the doctor's prescriptions over those of his fellow practitioners in the area was found to be £168 per month. After a visit by the regional medical officer and a sufficient lapse of time to allow them to modify their prescribing methods, most doctors had reduced their cost so that the average excess was £86 per month—a saving of about £100,000 a year.

Different arrangements for checking on excessive prescribing have been made in Scotland (see *Supplement*, March 6, p. 64).

ANNUAL MEETING, GLASGOW, 1954

IRISH GRADUATES' LUNCHEON

The Irish Graduates' Luncheon will be held at the Students' Union, University Avenue, Glasgow, on Wednesday, July 7, at 1 p.m. at a cost of 7s. per person (excluding wine). This luncheon is open to all Irish graduates and their ladies attending the Annual Meeting, and those intending to be present are asked to notify in advance the manager of the Students' Union. No tickets will be issued, and payment will be made at the luncheon.

EDINBURGH GRADUATES' DINNER

The Edinburgh Graduates' Dinner will be held at the Grosvenor Restaurant, 74, Gordon Street, Glasgow, on Saturday, July 3, at 7.30 for 8 p.m. It is hoped that all Edinburgh graduates and their ladies attending the Annual Representative Meeting will be able to be present. Tickets, price 30s. each, inclusive of aperitifs, may be obtained from Dr. J. Cottrell, Flottergate House, Grimsby.

GLASGOW ROTARY CLUBS

The Glasgow Rotary Club meets at 1 p.m. on Tuesdays in the Grosvenor Restaurant; the Govan Rotary Club meets in the Bella Houston Hotel on Mondays at 12.45 p.m.; the Queens Park Rotary Club meets on Wednesdays at 12.45 p.m. in the Ewington Hotel; and the Kelvin Rotary Club meets on Thursdays at 1 p.m. at the Grand Hotel. Rotarians visiting Glasgow during the period of the Annual Meeting will be welcomed at these clubs.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

culosis officers under the same local authority. Our work and our responsibilities were identical—and so were our status and salaries. Our work and our responsibilities are still identical, but now I am an S.H.M.O. island surrounded by an ocean of consultants. I do not wish to enter into competition with the Mad Hatter's tea party, but I would like to add that two of my consultant neighbours have seconds-in-command who are graded (and quite rightly) as consultants, while I, as an S.H.M.O. in charge, have a full-time assistant whose grading is the same as mine. In view of these facts, may I suggest that it might be more appropriate if we were first to demand instead of justice a return to sanity. The next step should be a return to decency—for to demand equal pay for equal jobs of identical responsibilities is again not a matter of justice but of elementary decency. If there should be any S.H.M.O.s left after our return to sanity and decency, then I would willingly join forces with Dr. S. F. Logan Dahne to invoke the honoured conception of justice to retrieve the situation.—I am, etc.,

ANONYMOUS.

Emergency Admissions

SIR,—Your two letters in the *Supplement* of May 1 (pp. 214 and 215) under "Emergency Admissions" may be justifiable for Wolverhampton, but it is quite unfair to the Bed Bureau Service as a whole to describe it as a "red herring" of the hospital management committees. In Edinburgh and Midlothian we enjoy a perfect Bed Bureau Service. Telephone calls are answered at once; the speakers are always polite; I have never failed to get my patients admitted at once; my description of a patient's condition is never questioned; there is an all-night service. What more could a man want?—I am, etc.,

H. MAITLAND MOIR.

Currie, Midlothian.

Association Notices**ELECTION OF COUNCIL**

The following are the results of the elections for members of Council in those Groups where there were contests:

Group 23 (Bath, Bristol, and Somerset, Gloucestershire and Wiltshire Branches)	
H. G. Dowler (Churchdown, Glos.)	366
H. M. Golding (Westbury-on Trym)	546 <i>Elected</i>
J. R. Nicholson-Lailey (Taunton)	503 <i>Elected</i>
No. of voting papers issued	1,606
No. returned	778
Spoiled papers	12
Group 25 (North Wales, and Shropshire and Mid-Wales Branches)	
W. J. Grant (Shrewsbury)	129
Leslie W. Jones (Anglesey)	249 <i>Elected</i>
No. of voting papers issued	726
No. returned	378
Spoiled papers	6
Group 27 (Aberdeen, Dundee, Northern Counties of Scotland and Perth Branches)	
Mary Esslemont (Aberdeen)	479 <i>Elected</i>
Noel Nelson, Dundee	163
No. of voting papers issued	1,281
No. returned	642
Spoiled papers	3
A. MACRAE, Secretary.	

Diary of Central Meetings

MAY	
17 Mon.	Joint meeting of B.M.A. and British Veterinary Association, 4 p.m.
18 Tues.	Estates Committee, 2 p.m.
18 Tues.	Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, W.C.), 2 p.m.
18 Tues.	Full-time Non-professional Medical Teachers and Research Workers Group Committee, 2 p.m.
19 Wed.	Conference of Honorary Secretaries, 10.30 a.m.

20 Thurs.	G.M.S. Committee, 10.30 a.m.
20 Thurs.	Radiologists Group Committee, 12 noon.
20 Thurs.	Organization Subcommittee, Central Consultants and Specialists Committee, 2 p.m.
20 Thurs.	Tuberculosis and Diseases of the Chest Group Committee, 2.30 p.m.
21 Fri.	Joint Committee of B.M.A. and the Magistrates' Association, 10.30 a.m.
21 Fri.	Ophthalmic Qualifications Committee, 1.45 p.m.
21 Fri.	Medical Witnesses Subcommittee, Private Practice Committee, 2 p.m.
21 Fri.	Ophthalmic Group Committee, 2 p.m.
21 Fri.	Overseas Committee, 2 p.m.
25 Tues.	Constitution Committee, 2 p.m.
28 Fri.	Conference of Regional Officers, 12 noon.

JUNE

2 Wed.	Film Committee, 11 a.m.
9 Wed.	Central Ethical Committee, 12 noon.
10 Thurs.	Central Consultants and Specialists Committee, 10.30 a.m.
10 Thurs.	Library Subcommittee, Science Committee, 2 p.m.
16 Wed.	Occupational Health Committee, 10.30 a.m.

Branch and Division Meetings to be Held

BUCKINGHAMSHIRE DIVISION.—At Griffin Hotel, Amersham, Friday, May 21, 8.30 p.m., annual general meeting.
EAST DENBIGH AND FLINT DIVISION.—At Westminster Hotel, City Road, Chester, Sunday, May 16, 5 p.m., A.G.M.
EAST HERTS DIVISION.—At Shire Hall, Hertford, Friday, May 21, 9 p.m., supper dance.
GREENWICH AND DEPTFORD DIVISION.—Thursday, May 20, leaving Greenwich 11.45 a.m., visit to Glaxo Laboratories, Greenford.
HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Tuesday, May 18, 8.30 p.m., annual general meeting.
LEICESTERSHIRE AND RUTLAND BRANCH.—At Leicester Royal Infirmary, Thursday, May 20, 8.45 p.m., annual meeting.
METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Wednesday, June 2, 3 p.m., annual general meeting. President's address by Dr. D. F. Hutchinson.
MID-HERTS DIVISION.—At Ashwell House, Verulam Road, St. Albans, Friday, May 21, 8.15 p.m., meeting. Annual B.M.A. Lecture by Dr. L. G. C. E. Pugh: "Medical and Physiological Aspects of the 1953 Everest Expedition" (illustrated with slides). Members' wives and friends and members and wives of the Baconian Society are invited. Lecture to be followed by buffet supper.
MONMOUTHSHIRE DIVISION.—At Constitution Club, Stow Hill, Newport, Wednesday, May 19, 8 p.m., joint meeting of members of the Division and the members of the Monmouthshire and Newport Chemists Association and Branch of the Pharmaceutical Society of Great Britain. Speakers: Dr. P. E. Dipple: "New Pharmaceuticals"; Dr. Hal Keane: "Proprieties"; Mr. J. B. Hough: "Matters of Mutual Interest"; Mr. E. Rees: "Pharmaceutical Problems."
NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Tuesday, May 18, 8 p.m., supper meeting, Dr. A. V. Russell: "The Return of Goodwill of Practices to Practitioners."
NORTHERN IRELAND BRANCH.—Thursday, May 20, (1) at Jubilee Hospital, Lisburn Road, Belfast, 2.30 p.m., clinical meeting; (2) at Belfast City Hospital, Lisburn Road, Belfast, 4 p.m., annual meeting.
REIGATE DIVISION.—At Redhill County Hospital, Tuesday, May 18, 8.30 p.m., annual general meeting. Films: (1) "Some Aspects of Accessible Cancers—Part IV Breast"; (2) "Marrow Puncture"; (3) "Insects as Carriers of Disease."
SCUNTHORPE DIVISION.—At Scunthorpe and District War Memorial Hospital, Sunday, May 23, 10 a.m., clinical meeting.
SOUTHAMPTON DIVISION.—At Royal South Hants Hospital, Southampton, Wednesday, May 19, 8.30 p.m., annual general meeting. Retiring Chairman's Address by Dr. W. P. Cargill: "Advisory Councils on Occupational Health."
SOUTH-WEST WALES DIVISION.—At St. David's Mental Hospital, Carmarthen, Sunday, May 16, 3 p.m., A.G.M.
SWINDON DIVISION.—At Out-patient Waiting Hall, Swindon and North Wilts Victoria Hospital, Wednesday, May 19, 8.30 p.m., annual general meeting.
WEST BROMWICH AND SMETHWICK DIVISION.—At Hallam Hospital, West Bromwich, Sunday, May 23, 11 a.m., general meeting.
WESTMINSTER AND HOLBORN DIVISION.—At Westminster City Chambers, Thursday, May 20, 7.30 p.m., ordinary meeting.
WINCHESTER DIVISION.—At Royal Hampshire County Hospital, Winchester, Friday, May 21, 8.45 p.m., general business meeting.

Meetings of Branches and Divisions**DORSET DIVISION**

A meeting was held at The Clinic, Dorchester, on February 10. Twenty-five members were present, and later attended pathological demonstrations in the laboratory arranged by Dr. T. V. Cooper and his staff.

PRELIMINARY**Service Representatives on Council**

190. The terms of office of the present representatives of the Royal Army Medical Corps and the Medical Branch of the Royal Air Force on the Council expire at the end of this session.

Recommendation: That the following be elected as representatives of the R.A.M.C. and the Medical Branch of the Royal Air Force on the Council for the period 1954-7: Royal Army Medical Corps, Major-General J. C. A. Dowse, C.B., C.B.E.; Medical Branch of the Royal Air Force, Air Vice-Marshal W. E. Barnes, C.B.E.

Representatives at Conferences of Other Bodies

(Continuation of para. 5 of Annual Report)

191. Owing to Lord Horder's absence from Great Britain at the time of the Annual Conference of the Cremation Society, he will be unable to represent the Association at the Conference. Dr. C. F. White (London) has kindly undertaken this duty.

Lord Horder will be attending the Sixth International Cancer Congress in São Paulo, Brazil, in July, and has kindly undertaken to act as the Association's representative at that Congress.

Dr. Gerald M. J. Slot (Kew, Surrey), who will be in America at the time of the Annual Meeting of the American Medical Association in San Francisco in June, 1954, has been appointed as the Association's delegate to this meeting.

Coat of Arms

192. The Council is indebted to two of its members, Dr. O. C. Carter and Dr. S. Logan Dahne, for valuable help in its further discussion of a suitable coat of arms for the Association. Dr. Dahne's expert knowledge of heraldry has been of particular value, and the design which has now been received from the College of Arms was produced to a specification mainly suggested by him. It contains an allusion to the Founder of the Association in the form of the "maunche" of the Hastings family, and incorporates other features symbolizing the Association's position as a

During the course of these discussions the deputation stressed both the inequity of excluding from the benefits of the Service those who were forced to contribute equally to its cost and the adverse effect on private practice which resulted. It was pointed out that it was unlikely that such a concession would greatly increase the cost to the Exchequer : any rise in the Drug Bill might well be more than offset by an increase in the earnings of general practitioners from private practice, with a corresponding reduction in the Ministry's contribution to the Central Pool. Again, any possibility of abuse could be dealt with by making the private doctor subject to the disciplinary machinery of the Service for checking excessive prescribing. An assurance was given that the views put forward would be placed before the Minister.

HOSPITAL AND CONSULTANT SERVICES

Review of Consultant Organization

(Continuation of para. 53 of Annual Report)

206. The Central Consultants and Specialists Committee has reviewed—and amplified in the light of experience—the model constitution of regional consultants and specialists committees suggested by the Representative Body in 1948. The following revised model constitution has been recommended to regional committees for their guidance:

(1) Regional Consultants and Specialists Committees should be composed of members elected annually by practitioners engaged in consultant or specialist practice in the region, the relative proportions of teaching and non-teaching representatives to be determined locally in the light of conditions obtaining in the region, bearing in mind the importance of securing adequate representation of teaching interests, which should not be based on numerical considerations alone.

(2) Membership should be based upon the representation of the medical staff of each hospital group or hospital groups aggregated for that purpose.

(3) The electorate of regional committees should consist of those members of hospital medical staffs and all other specialist units in the region (for example, blood transfusion and mass radiography) who are graded as consultants and senior hospital medical officers.

(4) Where possible the staffs of mental hospitals should form a separate electorate so as to secure a reasonable representation.

(5) Each regional committee should include representatives elected by the Regional Registrars Group.

(6) Representatives of the following should be co-opted with or without voting power, at the discretion of the Regional Committee: (a) A medical officer of health elected by medical officers employed whole-time by local authorities in the region. (b) Two general practitioners elected by grouped local medical committees within the region.

(7) Regional committees should have the power to co-opt representatives of special groups, or, at their discretion, to appoint subcommittees to consider special subjects.

(8) The advantages should be borne in mind of inviting the S.A.M.O. or an appropriate representative from the board of governors to attend meetings of the regional committee on specific occasions.

(9) Regional Consultants and Specialists Committees should hold annual meetings for the purpose of electing their officers.

(10) The representatives of regional committees on the Central Consultants and Specialists Committee should be elected annually, and be eligible for re-election.

(11) Regional representatives should be entitled to send deputies to meetings of the Central Consultants and Specialists Committee when they cannot themselves attend.

The following guidance has also been given to regional committees on their functions:

1. To consider and co-ordinate professional and medico-political aspects of hospital staffing in the region.

2. To arrange for the representation of medical staffs of hospitals and of other specialist work in the region and to act as their mouthpiece.

3. To act as a collecting body for proposals, problems, difficulties, and complaints of members of hospital staffs in the region, and to make representations for individual members of hospital staffs who appear to have specific grievances.

4. To make representations to regional hospital boards or boards of governors regarding the arrangements for the staffing or efficient running of hospitals in the region, and to give advice on the organization of the hospital services in the region.

5. To elect representatives to the Central Consultants and Specialists Committee, and to inform that body of the working of the hospital service in the region.

6. To hold or arrange for the holding of meetings of members of hospital staffs in the region as required.

7. To effect liaison with the various local medical committees in the region, and with the Divisions and Branches of the British Medical Association.

8. To organize collective action if necessary.

9. To establish informal and unofficial machinery to ensure the highest level of ethical behaviour amongst members of hospital staffs.

The Joint Consultants Committee has been asked to impress upon the Ministry the importance of securing that regional consultants and specialists committees are consulted

by hospital boards in connexion with the organization and development of the hospital services, as, for instance, upon the question whether new consultant appointments should be on a whole-time or part-time basis.

Experience has shown that perhaps the weakest link in the consultant organization is between the regional committee and the individual consultant, whose interest is centred mainly around his own hospital and hospital medical committee. The recent experiment of issuing bulletins of current information to all consultants and S.H.M.O.s has been greatly welcomed, and will undoubtedly assist in developing an active organization at the periphery. The opinion is strongly held, however, that it is essential to improve the status of the hospital group medical committee, and to integrate these committees within the consultant organization. Further thought is being given to this important question.

It has been decided again this year to arrange a Conference of Honorary Secretaries of Regional Consultants and Specialists Committees for an exchange of views and discussion of problems of current interest.

Hospital Junior Staffing

(Continuation of para. 54 of Annual Report)

207. Further consideration has been given to the problem of hospital junior staffing.

With the development of the hospital services in recent years there has been a substantial increase in the number of practitioners required to carry out adequately the clinical work in teaching and non-teaching hospitals. This has been accompanied by the adoption in the non-teaching hospitals of the traditional teaching hospital practice of making all posts below the consultant (and S.H.M.O.) short-term appointments. Inevitably this has made a heavy demand on medical man-power, which must be related to the career prospects in various branches of medicine. In general the teaching hospitals experience little difficulty in obtaining an ample flow of junior staff, and probably the traditional system of short-term appointments will continue to meet the circumstances peculiar to the teaching hospitals. In the opinion of the Central Committee it does not follow, however, that the system which has proved practicable for the teaching hospital is necessarily practicable, or indeed the most suitable, to meet the staffing needs of the non-teaching hospitals. The Committee feels that some attempt must be made to increase the average period spent in hospital. At the moment, however, there is no security of tenure below the consultant and S.H.M.O. appointment, and the need would therefore appear to be to balance the attraction of junior hospital posts with those of other, and more permanent, forms of medical practice. This objective, the Committee considers, might be assisted (1) by improving the prospects of promotion through the non-teaching hospitals, and (2) by providing incentives to encourage those practitioners who intend ultimately to make their career mainly in some form of medical practice outside the hospital service to seek hospital experience beyond that provided by pre-registration appointments.

It is suggested, therefore, that—particularly in the non-teaching hospitals—there should be a much greater flexibility in the medical staffing and to some extent a departure from the strictly limited tenure of appointment. The posts in these hospitals should offer better prospects of promotion, greater security, and, indeed, the prospect of a permanent career. The present salary grades of S.H.O., J.H.M.O., Registrar, Senior Registrar, and S.H.M.O. should be replaced by two broad salary ranges, the maximum of the higher range coming close to or overlapping the minimum of the consultant scale (for example, medical officer £700 to £1,000, and senior medical officer £1,100 to £2,000), and all medical staff below the consultant should be appointed within these ranges according to the needs of the hospital. All appointments should be initially for a three- or five-year term, but thereafter the higher range should offer a permanent career to those whose talents or ambitions do not

lead to consultant rank, but at the same time the whole range should provide a stepping-stone to consultant status. At both levels, but particularly in the S.M.O. grade, it should be possible for an appointment to be held on a part-time basis, combined with other medical work—for example, general practice. It should also be possible for a practitioner with hospital experience who has become established in general practice to come back into the hospital service on a part-time basis in the S.M.O. grade, and eventually, if he so wishes, to seek a consultant post in open competition.

It is considered that the registrar, and more particularly the senior registrar system, can be retained within the suggested new salary ranges, but that where posts are so designated they should continue to be for a limited tenure. Senior registrar posts should be so restricted in number as to allow fair competition between senior registrars and other senior medical officers for consultant posts.

The Council has approved these proposals in principle, and they will now receive further consideration in the Joint Consultants Committee.

Remuneration of Hospital Medical Staff

(Continuation of para. 58 of Annual Report)

208. The following rates of remuneration of hospital medical staff have now been agreed by the Staff and Management Sides of Committee "B" of the Medical Whitley Council, and approved by the Minister of Health and Secretary of State for Scotland, with effect from April 1, 1954.

(i) The basic scale for consultants is to be £2,100, rising by annual increments of £125 to £3,100. This new scale gives an increase over the 1948 scale of £400 at the minimum and of £350 at the maximum.

(ii) The new basic scale applies to consultants with C distinction awards, who therefore obtain the same increase as consultants without distinction awards.

(iii) The increases for consultants with B and A distinction awards are, however, limited to £150 and £50 respectively.

(iv) The basic scale for senior hospital medical officers is to be £1,500, rising by annual increments of £50 to £1,950, an increase of £200 over the 1948 scale.

(v) Senior registrars will receive £1,100, £1,200, £1,300, or £1,400, according to their year of service, an increase of £100 over the 1948 rates.

(vi) Registrars will receive £850 or £965, according to their year of service, an increase of £75 over the 1948 rates.

(vii) Junior hospital medical officers will receive a scale of £775, rising by annual increments of £50 to £1,075, an increase of £75 over their 1948 scale.

(viii) Senior house officers will receive £745, an increase of £75 over their 1948 salary.

(ix) House officers are to receive an annual rate of £425 for the first, £475 for the second, and £525 for the third and subsequent years, an increase of £75 over the 1948 rates, but the annual charge made to them for residence is to be increased by £25.

(x) A maximum of three-quarters of a session is to be placed on the weighting that part-time consultants and senior hospital medical officers are allowed when their salaries are calculated. This replaces the present maximum weighting of one and one-quarter sessions.

(xi) There is a protection against any individual losing pay on the coming into operation of the new agreement.

A statement by the Chairman of the Staff Side on the history of the negotiations was published in the *Supplement* to the *British Medical Journal* of April 10.

As reported to the Representative Body in 1953, the claim originally submitted by the Staff Side of Committee "B" was that the remuneration of hospital medical staff should be reviewed in order to fulfil the intention of the Spens Committee that the salary scales recommended by the Committee and based on 1939 values of money should be adjusted to meet post-war conditions. It was, in other words, a claim for the full implementation of "betterment" in the light of the Danckwerts award.

At the outset of the negotiations, however, and before detailed discussions had begun, the attention of the Staff

Side was drawn to the Government's policy regarding the implications of the Danckwerts award as expressed in the following statement by the Chancellor of the Exchequer in the House of Commons on July 2, 1952:

"I want to make it clear that the terms of reference of Mr. Justice Danckwerts's award were confined solely to the question of the remuneration of general practitioners in the National Health Service, and his award has no wider application. In accepting the results of the adjudication, which was of an exceptional nature, the Government have by no means adopted the view that similar adjustments in other fields should follow. In their view there is no justification for any assumption that the appropriate standard of remuneration for the professional classes is a rate of 100% above that in force in 1939. They consider that remuneration should be determined in the light of all relevant circumstances."

An assurance had been given to the Joint Committee in 1949 that disputes on remuneration which could not be resolved through the Whitley machinery would normally be referred either to arbitration or to a committee of inquiry. The Council understands, however, that the Staff Side was left in no doubt whatever that in no circumstances would a claim for increased "betterment" for hospital staff on the basis of the Danckwerts award be entertained, and that the Government would never agree to refer such a claim to arbitration. Moreover, the Staff Side was unable to obtain an assurance that if—as an alternative to arbitration—a committee of inquiry was set up, it would be limited to an examination of the "betterment" aspect of the Spens Report.

The Staff Side, faced with the impossibility at this stage of forcing its claim for increased "betterment" in the absence of any unilateral right to go to arbitration, decided to pursue an alternative course offered to it by the Government, which made it known that it was prepared to consider the possibility of granting increases of salary for hospital staff designed to restore the balance between consultant and general-practitioner remuneration which had been disturbed by the Danckwerts award, and to assist recruitment in the hospital field.

The present agreement is the outcome of these later negotiations. The Council has been assured that the agreement is not a final one but only a "stepping-stone," and that the Staff Side will continue without delay to press unremittably its claim for improved remuneration for hospital medical staff, and, in particular, will seek additional improvements in the conditions of S.H.M.O.s and of whole-time officers.

It appears to the Council that the result of the negotiations conducted so far in Committee "B" goes a long way to narrow the disparity between the remuneration of general practitioners and of hospital medical staff which was caused by the Danckwerts award; and, in the light of the assurance mentioned above, the Council considers that the terms of the recent agreement are acceptable as a "payment on account." Nevertheless, the Council deplors the secrecy which has enshrouded the negotiations and hopes that such secrecy may be avoided in future negotiations with the Government on the terms and conditions of service of hospital medical and dental staff.

It has been claimed on behalf of the Staff Side of Committee "B" that, despite the refusal of the Management Side to negotiate on Spens "betterment," the Staff Side has succeeded in safeguarding Spens, which "remains the yardstick of consultant remuneration." In this connexion the Council has considered a letter written by the Permanent Secretary to the Ministry of Health in reply to an inquiry by the Secretary of the Association as to whether the explanation of Government policy given to the Staff Side means that the Government, or the Minister of Health, is opposed to the recognition of the "Spens" relationship as the equitable relationship between the financial rewards of general practice on the one hand and of hospital practice on the other. This correspondence was published in the *Supplement* to the *British Medical Journal* of May 15 (p. 240).

The answer given to the question asked is in the following terms:

"The short answer to your question might best be put this way: that the Minister is certainly of the opinion that there should be a proper relation between the financial rewards of general practice and of hospital practice; and that what constitutes a proper relationship must be determined in the light of all the relevant factors obtaining at any given time rather than by a mere reference back to the contents of Reports which were produced years ago and before there had been any experience of the working of the Service under modern conditions."

The Council has been informed also of the terms of an agreed minute which records a conversation between the Minister of Health and a group of consultants. Sir Russell Brain had asked whether, leaving aside the actual level of remuneration, the profession could rely on the provisions of the Spens Report being continued. The reply to this question is recorded as follows:

"The Minister said that the only point he was now dealing with was the actual level of remuneration. On other matters he agreed fully with the importance attached to the Spens Report, which must continue to occupy the same place as before in any discussions the Government had with the profession about the consultant and specialist service."

The Council has informed the Ministry of Health that it repudiates the suggestion as to the present status of the Spens Reports which appears to be implied in the letter from the Permanent Secretary which is quoted above, and that it has reaffirmed its policy to adhere to the basis of remuneration enunciated in the Spens Reports.

REFORM OF THE NATIONAL HEALTH SERVICE Goodwill

(Continuation of para. 82 of Annual Report)

209. The Council has now completed its consideration of the scheme prepared by the Amending Acts Committee for the restoration of the right to buy and sell goodwill, and detailed proposals are submitted for the consideration of the Representative Body. (See Appendix VIII.)

The Council is fully aware of the divergent views held on the practicability of restoring this right, and wishes to record its appreciation of the immense amount of time and trouble taken by the Amending Acts Committee in studying all aspects of a difficult problem. While appreciative of the very strong views held by the profession before the "appointed day," it has necessarily had to examine the question of the restoration of the right to buy and sell goodwill in the light of the very different circumstances which exist to-day. It believes that the scheme now submitted is the best that can be devised in present conditions, and that the Representative Body would wish to have for its guidance a statement setting out the Council's views on the advantages and disadvantages pertaining to it.

The advantages will be familiar to all practitioners who entered practice by purchase of goodwill. They will not be familiar to those practitioners who entered practice after the "appointed day" or to those now seeking openings in general practice. The disadvantages are mainly of a practical and economic nature, and must be the concern not only of unestablished practitioners and medical students yet to qualify, but the whole body of practitioners who advocate so fundamental a change in the mode of entry into general practice. These advantages and disadvantages are summarized in a statement which accompanies the scheme. The Council wishes to express its thanks for the help given by Mr. A. N. Dixon, A.C.I.L., general manager of the Medical Insurance Agency. His "Memorandum on Practice Loans," as applied to the proposed scheme, accompanies the statement.

The Council has taken legal opinion and is advised that there would not appear to be any legal objection to a scheme of the nature proposed.

Having considered all aspects of the matter, the Council recommends:

Recommendation: That in view of (a) the practical difficulties of implementing the proposed scheme for the right to buy

and sell goodwill, (b) the high capital outlay required by young practitioners to launch into practice, (c) the divided opinion in the profession as to the desire to introduce such a scheme, and (d) the known political resistance to any such proposal, no further action be taken.

ARBITRATION MACHINERY

(Continuation of para. 83 of Annual Report)

210. The Council has been informed that as a result of action by the Staff Side representatives of the Medical Whitley Council, the matter of arbitration has been further discussed by the Staff Side of the General Whitley Council, and notice has been given to the Management Side of the General Whitley Council that the question of arbitration will be raised again by the Staff Side in the near future.

The Minister of Health has been made aware of the Council's regret at the long delay in clarification of this matter and of the profession's anxiety that the principle of arbitration should be accepted by all concerned. The Council has expressed the view that it would be an encouragement to the successful completion of negotiations in every field if such a principle could be accepted. It is understood that the Minister, with the Secretary of State for Scotland, has this matter under consideration.

OCCUPATIONAL HEALTH

Future of Occupational Health Services

(Continuation of para. 84 of Annual Report)

211. The reports on surveys carried out during the past year in different types of area have been discussed with the Occupational Health Committee of the Society of Medical Officers of Health, which has kindly undertaken to obtain for the Association additional information, on a number of specific questions, from the medical officers who undertook these surveys. It is anticipated that further joint meetings will be held with the Society of Medical Officers of Health in relation to the surveys and other matters connected with the future of occupational health services.

Medical Standards for Road, Rail, and Air Transport

(Continuation of para. 85 of Annual Report)

212. The Association has not yet had an opportunity to discuss with the Ministry of Transport the implementation of the recommendations contained in its memorandum on Medical Standards for Road, Rail, and Air Transport. In connexion with completion of Form P.S.V. 15A by medical practitioners after examination of applicants for public service vehicle driving licences, it was felt that some notes for guidance on the various questions set out on the form would be helpful. With the assistance of a number of experts, some notes have now been prepared and submitted to the Ministry of Transport for its consideration. It has been suggested that, although the notes should not be seen by the applicants, they should be made available to the medical practitioner at the time of each examination. The precise method of issuing them will be discussed with the Ministry of Transport.

Remuneration of Whole-time Industrial Medical Officers

213. In 1950 the Representative Body approved a scale of remuneration for whole-time industrial medical officers which included regular annual increments of not less than 6% of the salary on appointment. It has not been possible to negotiate this scale with industry generally, as there is no single body representing all employers, but from subsequent information obtained it appears that industry finds it difficult to tie itself to such a rigid scale. The possibility of simplifying the existing recommendations, in order to assist industry to accept them in full, has now been considered by the Council. A revised statement, which is set out in Appendix IX, has been prepared as an interim measure. During the next 12 months the Council proposes to give full consideration to the whole basis of the existing scale in rela-

PUBLIC HEALTH

Salaries in the Public Health Service

(Continuation of para. 88 of Annual Report)

216. The acceptance by all local authorities in the United Kingdom of the three industrial court awards for medical officers in the public health service has now been achieved. Of the two authorities which had previously stood out, one finally agreed to implement the rulings of the regional appeals committees, which had been in favour of the two medical officers concerned, and the other consented to have the dispute, which involved a single medical officer, resolved by arbitration under the Industrial Courts Act. The Council has been informed by the Trustees of the Public Health Service Defence Trust, which acted on behalf of the medical officer, that the Court had awarded in favour of the medical officer on all three issues which were before it—viz., status, appropriate remuneration for the duties undertaken, and fully retrospective application of the salary scale to October 1, 1950, as laid down in award No. 2285.

After prolonged negotiations with the Ministry of Health and Local Government, Northern Ireland, the status and remuneration of divisional medical officers in a county in Northern Ireland have been satisfactorily settled.

Appeals Machinery

(Continuation of para. 90 of Annual Report)

217. The two appeals referred to in paragraph 90 of the Annual Report have been heard, and in both cases the rulings of the regional appeals committees were in favour of the medical officers concerned.

Superannuation

(Continuation of para. 91 of Annual Report)

218. The Council has made representations to the Ministry of Housing and Local Government in an attempt to reduce from 27 to 25 the age from which the provision for "added years" should become operative.

Infectious Diseases

(Continuation of para. 92 of Annual Report)

219. A conference of members of the Public Health and Venereologists Group Committees of the Association with representatives of the Society of Medical Officers of Health and the Medical Society for the Study of Venereal Diseases has considered the scope of the social work required in connexion with the responsibilities of local health authorities in the prevention of the spread of infectious diseases, with particular reference to venereal disease. The conference drew up the following statement of principles, which the Council has accepted and submitted to the Ministry of Health as a basis for discussion:

(1) Social work should be an integral part of the V.D. service—this principle has been expressed by a large majority of physicians in charge of V.D. clinics.

(2) The staff of every clinic should be such as to ensure that social work can be undertaken by a suitably experienced person or persons, who should remain attached to the same clinic or clinics without being changed more frequently than is absolutely necessary.

(3) Social work undertaken at the clinic should include interviewing patients at the clinic, securing the attendance, by visit or otherwise, of contacts—that is, persons known or believed to be sources of venereal infection—and securing the readmittance of persons who have discontinued treatment prematurely.

(4) Staff engaged on social work should carry out their duties in the area served by the clinic without strict regard to local authority boundaries.

(5) The cost of providing staff for social work in the V.D. service might, in certain circumstances, be apportioned between the hospital authority and the local health authority concerned, on an agreed basis. Where more than one local authority is concerned, the cost might well be shared according to population

tion to the probable expansion of occupational health services in the near future and remuneration available at the present time in industry and in other branches of the medical profession. The Council accordingly recommends

Recommendation: That the revised statement on the remuneration of whole-time industrial medical officers, set out in Appendix IX, be approved.

Joint Conference of Advisory Councils on Occupational Health

214. A Joint Conference of Advisory Councils on Occupational Health, sponsored by the Association, has been held at B.M.A. House, attended by representatives from 10 advisory councils, members of the Association's Occupational Health Committee, and observers from the British Employers' Confederation, the Industrial Welfare Society, the Occupational Health Section of the Royal College of Nursing, the Institute of Personnel Management, and the Society of Medical Officers of Health.

This conference gave representatives from advisory councils, established largely on the initiative of the Association, an opportunity to exchange opinions on the functions of their local organizations and to consider means of extending their work. It was generally agreed that the opportunity which meetings of advisory councils afforded for joint discussions between employers, employees, and doctors, on matters of mutual interest affecting the health and welfare of the worker, have proved extremely beneficial, and it had often been possible to achieve agreement even on controversial subjects. There was, however, an increasing need for a central tripartite body to co-ordinate the activities of local advisory councils and to take action on any of their recommendations of national interest. The conference recommended that this tripartite central body should include representatives of the B.M.A., the British Employers' Confederation, and the Trades Union Congress, together with direct representatives from existing advisory councils on occupational health.

The Association already has a liaison with the Trades Union Congress, through the Joint B.M.A. and T.U.C. Committee, though previous attempts to establish a similar liaison with the British Employers' Confederation have not so far proved successful. It is, however, hoped that it may now be possible to establish an effective liaison with this body. The Conference dealt with a number of other matters concerning the functions of advisory councils, and urged the Association and other interested national organizations to encourage the formation of further advisory councils on occupational health. It was agreed that similar conferences should be held annually, and a decision was taken to hold the next conference again in London with Mr. C. F. Gothard, an employers' representative on the Burton and District Advisory Council, as its chairman.

Mule Spinning (Health) Special Regulations, 1953

215. Representations have been submitted to the Ministry of Labour and National Service regarding the fee for the periodic medical examination of cotton mule spinners under the Mule Spinning (Health) Special Regulations, 1953, the operative from July 1, 1954. The Ministry proposes that the fee should be on a similar basis to that for examinations for the first examination and 2s. 6d. for additional examinations undertaken on the same occasion. In view, however, of the nature of the examination required, this fee is not regarded as adequate. The Ministry has accordingly been informed that in the Association's opinion an appropriate fee would be 12s. 6d. for the first examination and 5s. for subsequent examinations undertaken on the same occasion. Similar representations have also been made by the Association of Certifying Factory Surgeons. The Ministry of Labour and National Service has not yet accepted the Association's views on this matter, and more detailed information is being sought before submitting further representations to this Department.

(6) With the object of securing full co-operation between venereologists and medical officers of health in the prevention of venereal diseases, arrangements should be made, where possible, for venereologists in charge of clinics to be attached to the public health departments of the local health authorities of the areas served by their clinics; and that the procedure described in paragraph 6 of Ministry of Health circular 5/48 for protecting medical officers engaged in V.D. work from actions for slander, etc., be applied to venereologists attached to public health departments for the above purpose.

(7) (i) With the object of securing a further diminution in the incidence of congenital syphilis, every effort should be made in hospitals, antenatal clinics, and general practice (a) to extend the practice of blood examinations for all pregnant patients, not only in the first but also in subsequent pregnancies; (b) to seek the co-operation of the consultant venereologist in any case of doubt. (ii) Special attention should be given to the importance of avoiding delay in reporting the results of tests.

Health Visitors

(Continuation of para. 94 of Annual Report)

220. The memorandum of evidence reproduced in Appendix X has been submitted by the Council to the Health Visitors Working Party. Oral evidence will also be given by representatives of the Association.

District Nurses

(Continuation of para. 95 of Annual Report)

221. The evidence submitted by the Council to the Working Party on the Training of District Nurses is set out in Appendix XI. It is anticipated that the Association will be asked to give oral evidence.

Legal Position of Nurses

222. The Council has been considering the legal position of nurses with particular reference to their responsibilities in connexion with immunization and the reading of skin tests. The Association sent representatives to a conference convened by the Royal College of Nursing, to which other interested bodies were also invited. The Association's policy that any procedures undertaken by nurses should be under the direction and supervision of a medical practitioner was made clear, but additional matters are to be considered when a memorandum containing their views on the proper sphere of activity of a nurse is received from the Royal College of Nursing.

British Veterinary Association

223. A memorandum on Meat Production and Control (1953), prepared by the British Veterinary Association and submitted to the Ministry of Agriculture and Fisheries, outlined a plan which would have the effect of removing the responsibility for meat inspection from the local authority and would exclude entirely any supervision by the medical officer of health. The Association, the Society of Medical Officers of Health, and the Sanitary Inspectors Association have submitted a joint statement to the Ministries of Health, Food, and Agriculture and Fisheries in which they dissent from certain views expressed in the B.V.A. memorandum and set out basic principles in regard to meat inspection. The full statement is given in Appendix XII.

Public Health Representation on Regional Hospital Boards

224. The Council has agreed in principle that names of suitable members of the public health service should be included in the list of doctors nominated by the Association for membership of regional hospital boards.

MEDICAL ETHICS

Loan of Hospital Records to Government Departments

225. The Council has given further consideration to the procedure for the loan of hospital records to Government Departments, and has prepared a statement on this question, which has been approved by the Joint Consultants Committee.

Recommendation: That the following statement on the loan of hospital records to Government Departments be approved:

(a) That medical records should be lent to the medical officers employed by Government Departments only when written consent has been given by or on behalf of the patient.

(b) That the form of consent signed by or on behalf of the patient should include a statement that the patient agrees to his hospital records being made available to the medical board in order to assist them in determining the degree of disablement and whether it is related to his industrial accident.

(c) That, wherever practicable, and particularly where disclosure of information may have an adverse psychological effect upon the patient, the practitioner who compiled the record or, if he is not available, one nominated by the hospital authority for the purpose, should be consulted on the wisdom of disclosing to the patient all of the confidential information contained therein, at the same time taking the opportunity of reviewing the notes before they leave the hospital.

PRIVATE PRACTICE

Bonus Shift Certificates

(Continuation of para. 105 of Annual Report)

226. It is clear from information received from various colliery areas that the agreement between the National Union of Mineworkers and the National Coal Board on the issue of bonus shift certificates has not completely solved the problem from the medical practitioner's point of view. In some areas the Union does not appear to have circularized its local secretaries, so that miners are unaware that the Union and the Board are agreed that medical certificates should be issued only where a doctor has actually examined the patient at the time of sickness. The Council has raised this matter with the Board and will continue to watch the situation. It will also seek an agreement with the Board on the wording of a notice to miners to be displayed at pitheads and in doctors' waiting-rooms.

Death and Disablement Benefit

227. Discussions have taken place with the National Coal Board concerning the payment of death and disablement benefit in respect of doctors who are killed or injured while attending at a colliery in an emergency. The Board has given an assurance that, if any registered medical practitioner not employed by the Board on a whole-time basis is killed or injured in a colliery, the Board will treat him fairly, having regard to the merits of his case and to the benefits provided under its Supplementary Injuries Scheme for senior non-industrial whole-time staff, and to benefits to which he might be entitled under any other arrangements. The Council regards this assurance as satisfactory.

Hearts of Oak Benefit Society

228. As a result of representations on behalf of the Association, the Hearts of Oak Benefit Society has agreed to pay a fee of £1 11s. 6d. for medical reports where the sum assured exceeds £300. The "approved" short form of report will be used where the sum assured does not exceed £300, and the agreed fee of 15s. will be paid. Previously the Society had proposed to use the "approved" short form for all policies up to £500, and to pay a fee of 15s. in all such cases.

Cremation—Fees for Medical Certificates

229. The Cremation Act, 1952, empowers the Secretary of State to fix, by regulations, fees for cremation certificates "B" and "C." The Secretary of State informed the House of Commons, however, that he would prefer to settle the matter by agreement with the profession without the exercise of his statutory power.

The subsequent negotiations with the Home Office were on the basis of the policy, laid down by the A.R.M., 1951, that a suitable fee for either certificate "B" or certificate "C" is £2 2s., plus a mileage allowance, where applicable, of 1s. per mile each way outside a radius of two miles. The Department, which did not propose to seek agreement on

the fees charged for certificate "B," accepted the Council's offer to recommend £2 2s. as a suitable fee for certificate "C." The Council was informed that the possibility of prescribing maximum fees by regulation would need to be reconsidered if the recommendation made by the Association did not achieve satisfactory results. An appropriate announcement was published in the *British Medical Journal* of August 1, 1953.

Treatment of Service Personnel on Leave

230. For several years the Council has regarded the fees payable for the occasional treatment of Service personnel as unsatisfactory in view of the increased cost of the drugs now in common use, but representations to the Service Departments have been held in abeyance pending the conclusion of negotiations for the treatment of Service personnel on leave as temporary residents. As the Departments concerned have not reached a final agreement on this point, the Council is pressing for an increase in the present fees.

Coroners Bill

(Continuation of para. 116 of Annual Report)

231. The Council has been given an assurance that if the Coroners Bill is approved by Parliament the Home Office will make rules dealing with the fees and allowances payable to witnesses at coroners courts and to medical practitioners who make post-mortem examinations on the direction, or at the request, of the coroner. In view of this no action was taken to press for any amendment to the Bill, which has now received its third reading in the House of Commons.

FINANCE

232. The Balance Sheet and Income and Expenditure Account for the year 1953, as audited by Messrs. Price, Waterhouse and Co., appear as an Appendix to this Report (Appendix XIII).

SCIENCE

Association Prizes

(Continuation of para. 129 of Annual Report)

Nathaniel Bishop Harman Prize

233. The Nathaniel Bishop Harman Prize, established to promote systematic observation and research among consultant members of the staffs of hospitals who are not attached to recognized medical schools, has been awarded for 1954 to H. R. E. Wallis for his essay on "Tuberculous Mesenteric Adenitis in Children." This prize consists of a certificate and cheque for £100.

Prizes for Medical Students

234. Consideration has been given to the future form of this competition in view of the decrease in both the number and quality of entries received in the last few years. The purpose of the essay competition for medical students is to promote systematic observation, and it is felt that subjects of a more literary nature might attract better entries. In of a more literary nature might attract better entries. It previously been given of the likely value of the prizes. It is proposed, in future, to make it clear that these prizes will normally be £25 each, although the Council reserves the right to vary the number and amount of the prizes awarded.

It is also proposed, in future, to establish a similar essay competition for provisionally registered practitioners. A different subject will be set for this group, and a prize of a higher value than that awarded to the medical students will be offered. Details of the competitions for 1955 will be published in the medical press and circulated to hospitals and medical schools later in the year.

Prizes for Nurses

235. First and second prizes, consisting of a certificate and a cheque for 20 guineas and 10 guineas respectively, have been awarded in each of the following categories:

1. *Student Nurses*.—1st prize, Lesley W. Elliott (Radcliffe Infirmary, Oxford); 2nd prize, Claire B. Chetwynd (Royal Northern Hospital, London, N.7); highly commended: Mary Restell (Guy's Hospital, London, S.E.1) and Stephanie A. Harrington (General Hospital, Newmarket); commended: Eileen M. Stoneham (Lincoln County Hospital) and Kathleen Stirk (County Hospital, York).

2. *State-Registered Nurses Working in Hospital*.—1st prize, Florence I. Radley (Middlesex Hospital, London, W.1); 2nd prize, Daphne J. Bonnett (Bedford General Hospital).

3. *State-Registered Nurses Not Working in Hospital*.—1st prize, Agnes M. Dalton (Coventry); 2nd prize, Elizabeth C. Wilson (Martock, Somerset).

B.M.A. Research Scholarships

236. The following Research Scholarships, tenable for 12 months from October 1, 1954, have been awarded:

Ernest Hart Memorial Scholarship (£250).—R. M. Acheson, M.A. Dublin and Oxon., M.B., B.Ch. Oxon., for research into radiological methods in diagnosis, assessment of progress, and prognosis in tuberculous meningitis.

Walter Dixon Memorial Scholarship (£250).—G. W. Taylor, M.B., B.S., F.R.C.S., for research into the aetiology, pathology, and treatment of idiopathic lymphoedema.

Ordinary Research Scholarship (£200) (Renewal).—I. J. MacQueen, M.B., B.S., for research on the response of skeletal muscle to progressive resistance exercise in human beings.

B.M.A. Lectures

(Continuation of para. 130 of Annual Report)

237. The following kindly consented to give B.M.A. Lectures during the current session:

Mr. A. Lawrence Abel.	Dr. Hector MacLennan.
Professor Ian Aird.	Dr. W. G. Marley.
Mr. R. C. Brock.	Mr. George Mason, V.R.D.
Dr. J. C. M. Matheson, D.S.O.	Professor W. Mercer,
Dr. F. Camps.	P.R.C.S.Ed.
Sir John Charles.	Mr. J. E. A. O'Connell.
Dr. T. Christie.	Sir Heneage Ogilvie, K.B.E.
Mr. Leonard Colebrook.	Mr. R. D. Owen.
Sir Zachary Cope.	Dr. W. N. Pickles.
Dr. W. S. C. Copeman.	Sir Arthur Porritt, K.C.M.G.,
Dr. Macdonald Critchley.	C.B.E.
Dr. A. C. Crooke.	Dr. L. G. C. E. Pugh.
Dr. J. H. Cyriax.	Dr. Ffrangcon Roberts.
Mr. W. W. Davey.	Professor M. L. Rosenheim.
Sir Daniel Davies, K.C.V.O.	Dr. W. Ritchie Russell, C.B.E.
Mr. Harold Dodd.	Dr. B. Schlesinger, O.B.E.
Dr. A. H. Douthwaite.	Mr. T. Holmes Sellors.
Mr. N. L. Eckhoff.	Dr. Wilfrid P. H. Sheldon,
Dr. R. W. Fairbrother.	C.V.O.
Dr. R. Forbes.	Dr. R. A. Shooter.
Professor W. Gaisford.	Dr. G. G. E. Smyth.
Dr. H. Garland.	Dr. A. W. Spence.
Dr. J. D. Allan Gray.	Dr. A. Brian Taylor.
Professor A. Haddow.	Mr. N. Leigh Taylor, M.B.E.
Dr. John Hunt.	Dr. R. D. Teare.
Professor T. N. A. Jeffcoate.	Sir Clement Price Thomas,
Sir Geoffrey Jefferson, C.B.E.	K.C.V.O.
Dr. J. A. L. Vaughan Jones.	Sir Cecil Wakeley, K.B.E.,
Professor T. Pomfret Kilner,	C.B., P.R.C.S.
C.B.E.	Dr. S. Wand.
Dr. R. D. Lawrence.	Dr. Marjorie Warren.
Mr. Emyln Lewis.	Sir Lionel Whitby, C.V.O.,
Sir William MacArthur,	M.C.
K.C.B., D.S.O., O.B.E.	Dr. D. A. Williams.
Dr. R. M. B. MacKenna.	Mr. A. Dickson Wright.
Professor J. M. Mackintosh.	

Metric System of Weights and Measures

238. The Council has informed the Board of Trade that it considers that the abolition of the apothecaries, troy, and pennyweight systems of measurement, recommended by the Hodgson Committee on Weights and Measures Legislation, should take place over a period of ten years rather than five years.

MEDICAL BENEVOLENCE

239. The sum received during 1953 by the Charities Trust Fund of the Association for medical charities was £11,086, which is £120 more than that received during 1952. The following statement shows the amounts collected and distributed during the twelve months:

To	1953 £
Subscriptions and Donations collected for:	
(a) Distribution at the discretion of B.M.A. Charities Trust Fund	4,381
(b) Royal Medical Benevolent Fund	3,749
(c) Royal Medical Foundation of Epsom College	811
(d) Royal Medical Benevolent Fund Society of Ireland	101
Bequests received and allocated to medical charities	1,000
Subscriptions and donations in respect of 1954, paid in advance	1,044
	£11,086
By amounts distributed to:	1953 £
(a) Royal Medical Benevolent Fund:	
(i) Allocated from B.M.A. Charities Trust Fund for General Fund	1,628
(ii) Allocated from bequests for General Fund	250
(iii) Earmarked for Fund	3,749
	5,627
(b) Royal Medical Foundation of Epsom College:	
(i) Allocated from B.M.A. Charities Trust Fund for General Fund	2,128
(ii) Allocated from bequests for General Fund	750
(iii) Allocated from B.M.A. Charities Trust Fund for Sherman Bigg Fund	152
(iv) Earmarked for General Fund	792
(v) Earmarked for Sherman Bigg Fund	19
	3,841
(c) Royal Medical Benevolent Fund Society of Ireland:	
Earmarked for Fund	101
(d) Dain Fund	473
Payments in advance carried forward	1,044
	£11,086

Other Benevolent Funds

240. The Council has continued to co-operate with the other medical benevolent funds, being in close touch with the committees of the Royal Medical Benevolent Fund and the Royal Medical Foundation of Epsom College.

The Council has also received reports of the work of the Dain Fund and the Sir Charles Hastings Fund, and is gratified to note the continued support given by members of the profession. A number of urgent cases have been assisted by the trustees of the Sir Charles Hastings Fund by emergency grants, and the work of the Dain Fund in assisting in the education of doctors' children continues and develops.

The Council is hopeful that members of the Association will continue their support and interest in the medical benevolent funds.

WORLD RELATIONS

(Continuation of paras. 176-9 of Annual Report)

Supporting Committee for W.M.A.

241. The Council has expressed approval of the principle that there should be established in the United Kingdom a group of doctors, and perhaps other persons, who would take an active interest in the work of the World Medical Association. During the next few months it will prepare a detailed scheme for the formation of such a supporting body. It is becoming increasingly clear that the W.M.A., as an international organization representing national medical associations, must be in a position to give authoritative advice on behalf of the doctors of the world to the World Health Organization, which is an international Governmental body, and to other international bodies.

History of the W.M.A.

242. It is fitting that the British medical profession should give the fullest possible support to the W.M.A., which was founded in B.M.A. House. It will be recalled that in the darkest days of the second world war, when Britain was the base for Allied operations against the enemy in Europe, North Africa, and the Middle East, and when Free French, Norwegians, Dutch, Czechs, and Poles mingled on British soil with Australians, Canadians, New Zealanders, South

Africans, Britons, and Americans, doctors of many different nationalities found their way to B.M.A. House in London. Most of them had left practices and appointments behind them, and their conversations with each other and with the medical staff of the British Medical Association showed to what a great extent practitioners from all parts of the world share common interests, common problems, and common ideals. When the war appeared to be drawing to a close the officers and secretariat of the British Medical Association considered how these valuable friendships could be maintained and utilized in more normal times, and in the spring of 1945 they decided to call an informal conference of doctors of different nationalities who were in London at the time, in order to obtain their views on a proposal to create some permanent organization or liaison among the medical profession in all countries. The conference was held at B.M.A. House in July, 1945.

About the same time Dr. F. Decourt, the grand old Secretary of the Association Professionnelle Internationale des Médecins, was stirring in Paris, and sent a circular letter to his pre-war members about the revival of that association. He was accordingly invited to the British Medical Association's conference and attended with Dr. P. Cibrice, Secretary of the Confédération des Syndicats Médicaux Français. The proposal for the formation of a permanent organization was enthusiastically received, though the members of the conference, not being appointed delegates, could not commit their national bodies. It was decided, therefore, that the B.M.A., on behalf of the A.P.I.M., should invite all national medical associations to send representatives to a further conference, which was held in London in September, 1946.

This second conference was the real beginning of the World Medical Association. The chairman was Sir Hugh Lett, Bart., K.C.V.O., C.B.E., D.C.L., F.R.C.S., President of the British Medical Association, and 33 countries were represented. The representatives of Great Britain were Dr. Alfred Cox, who, with Dr. Decourt, had been responsible for the creation of the A.P.I.M. in 1926, and Dr. J. A. Pridham. Notwithstanding a little doubt and hesitancy among those who had been staunch adherents of the A.P.I.M., the meeting resolved that a new Association of national medical associations should be formed with a broader basis and wider scope than the A.P.I.M. In choosing a title, the adjective "international" was rejected in favour of "world," which emphasized the universality of medicine and the community of medical interests and ideals irrespective of national boundaries. An organizing committee, which included Dr. Pridham, was appointed to draft a constitution and to proceed with the organization of the new Association. Dr. Decourt magnanimously offered to consult the Executive Committee of the A.P.I.M. with a view to dissolving that Association, so that there should be no duplication of machinery. Eventually, the A.P.I.M. was formally dissolved and its residual funds transferred to the W.M.A.

The Organizing Committee, which elected Dr. T. C. Routley, of Canada, as its Chairman, met in Paris in November, 1946, and in London in April, 1947. At the latter meeting the Committee was joined by Dr. Louis H. Bauer, the future Secretary-General, as the representative of the American Medical Association, which had recently announced its adherence to the World Medical Association. By the time of the first Meeting of the General Assembly of delegates in Paris in September, 1947, thirty-two national medical associations had become members, and it was already evident that the World Medical Association had an important role to fulfil in the post-war world. This first Annual Meeting was an important event in medical history. The Assembly adopted a Constitution, appointed officers and a Council, and drew up a programme of work for the ensuing year. There had come into existence a forum for the exchange of views and the discussion of common professional problems and a voluntary central authority which would be competent to express world professional opinion to official international bodies.

Objects

The objects of the World Medical Association are thus defined in its Articles: (i) To promote closer ties among the national medical organizations and among the doctors of the world by personal contact and all other means available. (ii) To maintain the honour and protect the interests of the medical profession. (iii) To study and report on the professional problems which confront the medical profession in the different countries. (iv) To organize an exchange of information on matters of interest to the medical profession. (v) To establish relations with, and to present the views of the medical profession to, the World Health Organization, Unesco, and other appropriate bodies. (vi) To assist all peoples of the world to attain the highest possible level of health. (vii) To promote world peace.

Activities

There is a real need for an organization which can act as the mouthpiece for the doctors of the world, especially in relation to other international organizations. Few doctors are aware of the number of international governmental bodies or of the wide scope of their activities and influence upon governments and public opinion. The best-known examples are the United Nations Organization (U.N.O.), the World Health Organization (W.H.O.), and the United Nations Educational, Scientific, and Cultural Organization (Unesco). These international agencies formulate Conventions which are considered by the member-governments with a view to ratification. Once a Convention has been ratified the member-governments are under an obligation to promote legislation to bring it into force.

The International Labour Organization (I.L.O.) is a specialized agency of U.N.O. composed of representatives of governments, employers, and workers. In 1952 the W.M.A. received information that I.L.O. was preparing a Convention dealing with social security and medical care. In consultation with W.H.O., I.L.O. had set up an "expert committee" of doctors, which did not contain one practising doctor or any doctor who had been selected on the advice of a national medical association. This committee reported, *inter alia*, that a national health service should be staffed by whole-time salaried doctors. The W.M.A. at once drew the attention of its member-associations to the proposed Convention and asked them to take such action as was possible with their governments to prevent its ratification. This prompt intervention by the W.M.A. partially achieved its object, and in time may wholly do so.

The W.M.A. can also assist the W.H.O. and other international agencies with information and with informed opinion. The W.M.A. has liaison officers in Geneva, Paris, and Brussels, who maintain contact with the international agencies.

In addition to this representative function, the W.M.A. helps the medical profession to organize itself in countries where at present the organization is poor. If the profession is exploited or oppressed in one country this may react to its detriment in others.

The third chief function of the W.M.A. is to keep its member-associations informed of developments affecting the medical profession in other countries, such as, for example, the recent health legislation in Australia. In this way the member-associations receive information that otherwise would not be obtained at all or could be obtained only by purchasing and studying large masses of books, documents, and reports. Further, there is great value in an international medical secretariat.

The accomplishments of the W.M.A. in its short existence of 64 years include the preparation of a modern version of the Hippocratic Oath, entitled the Declaration of Geneva, and of an international code of medical ethics; the exploration of different schemes of social security; the publication of twelve principles of social security; the publication of special reports on numerous subjects; and the organization of the First World Conference on Medical Education, which was held in London in 1953.

World Health Organization

(Continuation of para. 178 of Annual Report)

243. The Council of the World Medical Association at its meeting in Zurich in April passed the following resolution:

Whereas it is in the public interest that the closest possible co-operation exist between the World Medical Association and the World Health Organization, and

Whereas United Nations Associations and World Health Organization supporting committees have suggested to the World Medical Association that it encourage the establishment of supporting committees for the World Health Organization in the respective member countries, and

Whereas the national member associations are important factors in carrying out these objectives of close co-operation between the two organizations,

Therefore, Be It Resolved, that the Council of the World Medical Association respectfully suggests to the World Health Organization that the desired co-operation might best be encouraged by the World Health Organization proposing to each member Government that there be included among the delegates to the World Health Assembly a representative of the organized medical profession of the country.

The view expressed in this resolution is shared by the Council, and, as stated in paragraph 178 of the Council's Annual Report, representations along these lines have already been made to the Ministry of Health.

OTHER ASSOCIATION ACTIVITIES

"The Recognition of Intoxication"

(Continuation of para. 180 of Annual Report)

244. The recommendations made by the Special Committee which prepared the Report on "The Recognition of Intoxication," referred to in paragraph 180 of the Annual Report, have been considered by the Council. The Committee stated that there was evidence to show that doctors inexperienced in the medical problems of alcoholic intoxication did not always assist the court as much as they might, and it is suggested that more attention should be paid to the subject in the course of medical teaching, both undergraduate and postgraduate. This recommendation is being circulated to the deans of medical schools and to other teaching authorities.

The Committee felt that doctors who were interested in the examination of intoxicated persons should receive more encouragement to undertake it, and suggested that the appropriate authorities should be invited to give more consideration to: (i) the appointment of doctors, suitably qualified for and interested in this work, to conduct the medical examinations; (ii) the need for the payment of adequate fees for medical examination, report, and attendance at court; (iii) ways of preventing unnecessary loss of time by doctors waiting in court to give evidence. These recommendations have been referred, in the first instance, to the Associations of Local Authorities.

Other recommendations concerned equipment and procedure, and these also have been brought to the notice of the Associations of Local Authorities. They are as follows:

(i) All police stations should have: (a) adequate facilities for the conduct of medical examinations; (b) the necessary apparatus for collecting and transmitting samples of urine.

(ii) The detained person should always have an opportunity of receiving part of the sample.

(iii) The "official" methods used in court work for the determination of alcohol in urine should be: (a) a precisely described and amended Cavett (micro) method; (b) a detailed and slightly modified Kozelka and Hine (macro) method.

(iv) Tests for the determination of alcohol in urine should be undertaken only in officially recognized laboratories.

(v) A copy of the report of any laboratory tests should be made immediately available to the practitioner or practitioners who conducted the clinical examination.

Salaries of Civil Service Medical Officers

(Continuation of para. 184 of Annual Report)

245. Details of the interim agreement referred to in the Council's Annual Report were published in the *Supplement to the British Medical Journal* of April 24. The new scales for the three grades of medical officer concerned have effect from January 1, 1952. They are shown, together with the former scales, in the following table.

Grade	Age	Salary Scales (Basic plus Pay Addition)	
		Old Scale	New Scale
Basic Grade	35	£ 1,331 5 0	£ 1,500
	36	1,382 10 0	1,575
	37	1,433 15 0	1,650
	38	1,485 0 0	1,725
	39	1,536 5 0	1,800
	40	1,600 0 0	1,900
		1,675 0 0	2,000
		1,750 0 0	2,100
		1,825 0 0	
Senior Medical Officer, £1,900 × 100—£2,100			2,200
Principal Medical Officer £2,250			2,300

The full agreement is set out in the following letter from the Treasury:

"(1) The Treasury propose that, with effect from January 1, 1952, the salary scales of the undermentioned grades of the Medical Officer class shall be:

Medical Officer, £1,500 by £75 to £1,800 by £100 to £2,100.
Senior Medical Officer, £2,200.
Principal Medical Officer, £2,300.

"(2) The above scale for the Medical Officer Grade is not a consolidated scale, but one in which pay addition is assumed to be included. It does not, therefore, attract pay addition.

"(3) The minimum of the Medical Officer scale (£1,500) is linked to age 35, and is subject to an increase of one increment for each year above that age up to and exceeding 40. For each year of age below age 35 it is subject to a deduction of £50.

"(4) The scale and rates above set out are the same for women as for men and are subject to provincial differentiation in accordance with Estacode C c 2.

"(5) Agreement on these terms would be entered into by both parties on the following understandings: (a) both parties remain free to ask the Royal Commission on the Civil Service to consider any proposals they think fit to make about the remuneration of all grades in the medical officer class. This particularly applies to the rates of pay for senior and principal medical officers, the increases in which both sides regard as purely token; (b) the scale now agreed for the basic grade cannot be regarded as establishing any particular relativity between that grade and any grade or grades in other classes in the Civil Service; and (c) no new arrangements made in the remuneration of medical work outside the Civil Service—for instance, in the remuneration of consultants or other hospital medical staff in the National Health Service—will be made the basis of a claim on the Treasury prior to the publication of the Report of the Royal Commission, but this in no way limits either party's freedom of action in using any such factors in its submissions to the Royal Commission, or in using any other new considerations in fresh representations either before or after the Royal Commission has reported."

The next task is the preparation, for submission to the Royal Commission on the Civil Service, of evidence relating to the entire medical class of the service. For this purpose the Council proposes to continue its co-operation with the Institution of Professional Civil Servants in the Civil Service Medical Officers Joint Committee. The Institution has expressed to the Council its cordial thanks for the powerful assistance of the Association in the recent negotiations.

Rehabilitation

(Continuation of para. 185 of Annual Report)

246. The Council has now submitted its memorandum of evidence on the rehabilitation and resettlement of disabled persons to the Interdepartmental Committee under the Chairmanship of Lord Piercy. This memorandum is being

published as a special report, and will be summarized in the *Journal* at an appropriate date after oral evidence has been given to Lord Piercy's Committee. Copies of the report will be available for distribution at the Annual Meeting in Glasgow.

"National Formulary"

(Continuation of para. 188 of Annual Report)

247. The Council has considered the following resolution of the A.R.M., 1953:

"That the metric system equivalents should be printed in parenthesis, small amounts being stated in milligrams."

In the 1952 edition of the *National Formulary*, where the normal dose is given in the metric system, the imperial value is printed in parenthesis. There appeared to be no advantage to be gained in reversing this procedure, and the Worcester and Bromsgrove Division has since confirmed that its intention in moving the above resolution was that the imperial equivalents should follow doses given in the metric system and that the metric equivalents should follow doses given in imperial units.

The Division also suggested that metric equivalents should be given against all imperial doses. The most serious difficulty which arises from this suggestion is that these equivalents are not simple numbers. For instance, the formula for mist. rhei ammoniata cum soda would read:

	Imperial	Metric
Rhubarb, in powder	4 gr.	0.26 g.
Ammonium bicarbonate	3 gr.	0.194 g.
Sodium bicarbonate	15 gr.	0.97 g.
Peppermint water	to ½ fl. oz.	to 14.2 ml.

The figures in the second column are, in fact, more complicated than shown and have been approximated so far as possible. Further approximation, by amending 0.97 to 1.0, systems, and such approximations approach the tolerances allowed by the testing authorities, so that pharmacists dispensing in the metric system might be unfairly penalized. It might be practicable to give approximate metric equivalents, but care would have to be taken to make it clear that they were approximate and should not be used for dispensing purposes. Thus, no useful purpose would be served by including the additional information.

Similar considerations apply to tablets; although 7½ grains is regarded as equivalent to 0.5 g. for dosage purposes, in fact no 7½-grain tablets of sulphadiazine exist. In addition, the "Tablet" section of the revised *Formulary* will include under each monograph a list of the different sizes of tablets available. The inclusion of equivalents in each case would make the monographs more cumbersome, without adding anything of value. As an illustration, there are four sizes of aneurine hydrochloride tablets in the *N.F.* 1952. The addition of the imperial equivalents would read—"1 milligram (0.0154 grain); 3 milligrams (0.0463 grain); 10 milligrams (0.154 grain); 25 milligrams (0.388 grain)."

The Council is satisfied with the assurance of the Joint Formulary Committee that the information requested in the foregoing resolution is already included wherever practicable.

Medical Services for the Armed Forces

248. The Council has submitted a memorandum of evidence to the Forces Medical and Dental Services Committee (of which the chairman is Lord Waverley), which has been appointed by the Government to review the arrangements for providing medical and dental services for the Armed Forces, at home and abroad, in peace and war.

Commission on Divine Healing

249. The Association has accepted an invitation to assist the Commission appointed by the Archbishops of Canterbury and York which is "to consider the theological, medical, psychological, and pastoral aspects of 'divine healing,' with a view to providing, within two or three years, a report designed to guide the Church to clearer

understanding of the subject; and in particular to help the clergy in the exercise of the ministry of healing and to encourage increasing understanding and co-operation between them and the medical profession." A special committee, composed of the Association's representatives on the Churches' Council of Healing, with power to co-opt, has been appointed to prepare a memorandum of evidence, and, as a first step, has decided to seek relevant information from all sections of the medical profession.

British Commonwealth Medical Conference, 1955

250. The fourth meeting of the British Commonwealth Medical Conference will be held in Toronto from June 14 to 16, 1955, immediately before the Joint Annual Meeting of the British Medical Association and the Canadian Medical Association. The B.M.A. delegates will be the Chairman of Council, the Chairman of the Representative Body, and the Editor of the *British Medical Journal*; and the Secretary will attend as Honorary Secretary and Honorary Treasurer of the Conference.

British Veterinary Association

251. Arrangements have been made for the British Veterinary Association memorandum on Meat Production and Control (1953), to which reference is made in paragraph 223 of this Report, to be considered by the Joint Committee of the B.M.A. and the British Veterinary Association. The Committee will also consider the joint statement (Appendix XII) submitted to the appropriate Government Departments on behalf of the Association, the Society of Medical Officers of Health, and the Sanitary Inspectors' Association.

E. A. GREGG.

Chairman of Council.

APPENDIX VII**THE DANCKWERTS AWARD AND THE SMALL-LIST PRACTITIONER—SECOND REPORT OF WORKING PARTY****Introduction**

1. In order that the matters dealt with in this Report may be seen in proper perspective, it may be helpful to recapitulate the circumstances which have led up to it.

The original terms of reference of the Working Party were:

"To secure an equitable distribution of the Central Pool based upon the recommendations of the Spens Committee, the object being to enable the best possible medical service to be available to the public, and to safeguard the standard of medical service by discouraging unduly large lists; at the same time, to bring about a relative improvement in the position of those practitioners least favourably placed under the present plan of distribution, to make it easier for new doctors to enter practice, and to stimulate group practice."

These terms of reference were a condition of the acceptance of the award of Mr. Justice Danckwerts and were binding on the Working Party in all their deliberations, those subsequent to their first report as well as those preceding it. The scheme of distribution recommended in the Working Party's first report was accepted by the Government and has been put into effect by arrangements embodied in Regulations laid before Parliament.

2. The Working Party have carefully considered the following resolution passed by the Special Conference of Local Medical Committees on June 26, 1952:

"That if, when the new scheme of distribution has been endorsed by both parties, it is found in the light of experience that certain groups of practitioners who under the terms of reference of the Working Party might have been expected to have benefited have, in fact, not done so, it be left to the Working Party provisionally to allocate an appropriate proportion of the final settlement moneys for the purpose of remedying any obvious defects in the distribution scheme, such allocation to be subject to confirmation by the next Conference before it becomes a permanent feature of the scheme."

It has been claimed by some practitioners with small lists that, to give effect to the Conference rider, comparison must be made between the amount received under the arrangement introduced in 1953 and that received before that date when taking into account the retrospective payments under the award.

The implementation of the award by Parliament was contingent upon a new scheme of distribution which was to be largely aimed at improving the relative position of the practitioner with the medium-sized list. It is in these middle ranges that the greatest benefit now accrues. Clearly, given a fixed sum to distribute, any system of priorities necessarily means that certain classes must secure relatively greater advantages than others from the award. The Working Party originally concluded that the requirements of their terms of reference would best be implemented by the loading of capitation rates for lists between 500 and 1,500, and later considerations have not led them to think that on merits there is a case for any general additions to the capitation rate for lists either below 500 or above 1,500. It must be stressed that any modification of the scheme of distribution in favour of any section of practitioners must necessarily mean less money for other groups of practitioners and would undoubtedly lead to other claims, the justice of which it might be difficult to deny.

In the view of the Working Party it is also not proper to make a comparison between remuneration under the arrangements introduced in April, 1953, and the augmented capitation fee which, under the retrospective provisions of the award, was paid at a flat rate in respect of the years prior to 1953-4. Arrears of money due under the award had, of necessity, to be related to the actual capitation payments made to general practitioners in each of these preceding years, as it was not practicable to calculate the arrears by reference to the new method of distribution.

For these various reasons the Working Party have confined themselves to considering the distribution of the moneys set aside from the Central Pool in accordance with the recommendation in paragraph 19 of the first report, which referred to the possibility of hardship arising under the new arrangements, particularly for elderly practitioners losing a fixed annual payment.

Possible Reasons for Hardship under the Present Distribution of Remuneration

3. The effects of the arrangements introduced in April, 1953, could be assessed only in the light of practical evidence of their operation, and a comprehensive inquiry was therefore put under way as soon as practicable. This inquiry was designed to reveal both the number and groups of general practitioners who might, in the light of experience, be found to have been adversely affected, and went into the remuneration of single-handed doctors with National Health Service lists of less than 1,200 patients.

It showed that only two groups could be said to have been placed at a disadvantage: the first, a small group of doctors who had not been able to counteract the adverse effect on them of the replacement of the fixed annual payment by initial practice allowances, and the second, the elderly doctors who comprise the largest category of practitioners with small lists of patients. The latter, for practical reasons, as well as the former, had not been able to take sufficient advantage of the opportunities and incentives offered by the new scheme of distribution for building up their lists and for becoming members of partnerships. To some extent, the two groups overlap.

The Application of the Proposed Scheme of Supplementary Payments

4. The Working Party have designed a scheme to apply to both the groups referred to in paragraph 3 (which might altogether cover as many as 500 to 600 doctors with lists of

up to 1,200 patients). Of this number it is likely that about half, say, some 300, will have lists of under 700, representing something like one-third of the doctors with lists below 700. In drawing up the scheme outlined below, the Working Party considered that payments should be made without regard to the doctor's total professional income but should be related to the size of a practitioner's list. Without disturbing the main scheme of distributing the Central Pool, which has been accepted by the profession and has been in operation for a year, the supplementary payments now recommended should ensure that the main scheme will not operate to the detriment of any individual practitioner.

Details of the Supplementary Payments and Eligibility

5. (i) Outline of the Scheme

The recommended scheme for supplementary payments provides, subject to one or other of the two sets of conditions described below, a basic payment of £250 per annum for single-handed doctors with lists of not less than 300 and not more than 1,200 patients. For each patient, a normal capitation fee would be payable and there would be a special additional fee of 10s. for each patient above the three-hundredth and up to the five-hundredth. No loadings under the usual arrangements would be payable. A table showing the practical application of this scheme is appended to this paper.

The Working Party recommend that central committees (for England and Wales, and Scotland respectively) should be established which should be solely responsible for exercising any discretion on questions arising out of the application of the criteria referred to below. These central committees should be composed equally of representatives of the Health Departments and of the profession.

(ii) Conditions Applicable to Doctors Previously in Receipt of a Fixed Annual Payment

The duration of payment according to this scheme should be five years at most. Doctors in this category who are to become eligible under the scheme must fulfil the following conditions:

(a) They must be single-handed practitioners who, on March 31, 1953, were under 60 years of age and were then in receipt of a fixed annual payment. Subject to condition (b), they would become eligible to apply to be paid under this scheme as from April 1, 1953.

(b) The doctor should normally have an increasing list, and payment would be withdrawn if his list gradually decreased over four consecutive quarters by more than 10% in all.

(iii) Conditions Applicable to Doctors aged 60 and Over

Doctors aged 60 years and over who are to become eligible under the scheme must fulfil the following conditions:

(a) The doctor should normally have been in single-handed practice for at least ten years in the area in which he is now practising.

(b) Doctors aged 60 or over at April 1, 1953, should be entitled to claim a payment for the year 1953-4.

(c) Doctors who attain the age of 60 years subsequent to April 1, 1953, should be allowed to claim a payment as from the next succeeding quarter.

(d) The payments should cease if the doctor's list drops below 300 and remains below 300 for four consecutive quarters.

(e) Payment under the scheme would be reviewed when the doctor reaches the age of 70. Payment would not cease automatically, and it would be open to the doctor to apply annually for continued payment on the grounds that he is still efficiently providing the full range of general medical services. Such a claim should be submitted to the appropriate local medical committees to advise whether they consider the doctor is continuing to provide effective medical services. These applications should be passed to the central committee, which, after consultation with the

local medical committee, should if they see fit authorize payment from year to year.

Future of the Present Hardship Scheme

6. The proposed scheme should ultimately replace the present hardship scheme. It could not, however, do so immediately on the introduction of the proposed scheme, and the change-over would have to be gradual.

The central committees should review all payments under the present hardship scheme with a view to merging them over a period into the proposed new scheme. The committees should be directed to work on the general principle that doctors with lists below 300 should not be eligible for payments, but should ensure that the change-over did not work out to the detriment of the individual. The committees should for some years be given latitude in dealing with individual cases.

The Operation of the Proposed Scheme Compared to the Normal Capitation and Loading Payments

No. of Patients on List	Payments under Proposed Scheme				Normal Capitation Fees and Loadings	Excess of Payment under Proposed Scheme over Normal Capitation Fees and Loadings (Col. 5 minus Col. 6)
	Capitation Fees	Basic Pay	Special Additional Fees	Total		
(1)	(2)	(3)	(4)	(5)	(6)	(7)
100	£ 85	£ —	£ —	£ 85	£ 85	—
200	170	—	—	170	170	—
300	255	—	—	255	255	—
400	340	250	50	640	340	300
500	425	250	100	775	425	350
600	510	350	—	860	510	350

1,100	935	350	—	1,285	935	350
1,200	1,020	350	—	1,370	1,020	350

April, 1954.

APPENDIX VIII SCHEME FOR THE RESTORATION OF THE RIGHT TO BUY AND SELL GOODWILL

1. The following proposals are submitted as a scheme for the return of the right to buy and sell goodwill, which could be applied to the whole profession giving general medical services under the National Health Service.

SCHEME

2. For the purpose of the scheme, doctors are divided into four groups:

- Those in practice before July 5, 1948, who joined the list on the appointed day: (a) who are entitled to compensation, and (b) who have received their compensation in whole or part.
- Those who have joined the list since the appointed day: (a) by appointment, (b) by partnership, or (c) by squatting.
- Partnerships involving a mixture of the above with diverse partnership agreements.
- Those not yet in practice, but desirous of joining the list now, or at a future date.

The following paragraphs give in detail proposals applying the principle of the right to buy and sell goodwill to these four groups.

Group 1a—Pre-1948 Doctors who have Not Received their Compensation

3. This group would receive an option to take their compensation or renounce it. This option must remain open to them for a prolonged period—say, three years. If a doctor decided not to resume ownership of goodwill, or if at the end of three years he had not exercised his option, he would retain his right to compensation. If the doctor renounced his compensation he would regain the right to buy and sell his goodwill forthwith. If he decided on compensation his practice would revert to the State on his death or retirement.

4. It is assumed that the doctor who renounced his compensation and so regained the right to buy and sell his goodwill would not be called upon to repay to the State interest received in respect of compensation. In all equity no alternative could be contemplated.

Group 1b—Pre-1948 Doctors Still in N.H.S. Practice who have Received their Compensation in Whole or in Part

5. These doctors, whether they had already had all their compensation or only part, would be influenced by almost similar considerations, but their decision on the option would have different effects. If they opted for the return of goodwill, those who had received any compensation already would have to return it. If they opted for compensation, those who had not already had it in full would continue as before and retain their compensation rights, and their practices, when they became vacant, would revert to the State. The option in this group would similarly be available for three years. The method by which and the period within which the compensation would be repaid would be a matter for determination later.

Group 1c—Doctors who have Drawn their Compensation and Retired (or Died)

6. As these doctors no longer remain in practice they present no problem and have no option. Their practices have reverted to the Government and have presumably been filled by appointment. Their present incumbents will have the option to purchase the goodwill or not as they choose. In the latter case, the present incumbents will continue as they are and when they retire or die their practices will become available for sale by the Government.

Group 2—Doctors Entering Practice Since 1948 (Except those Mentioned in Group 4)

Doctors Appointed by the Selection Machinery since July, 1948—Group 2a

7. Doctors appointed by the selection machinery since July, 1948, will have to acquire full ownership of their practices, if they so desire, by purchase from the State, and they must have the same duration of option as the pre-1948 group. The price would have to be based on the number of patients on the list at the date of appointment, as any increase in value subsequent to that date must obviously be due to their efforts.

Doctors Entering Partnership Since July, 1948—Group 2b

8. A doctor who had entered a partnership since 1948, and who opted to assume the ownership of the goodwill and who had to pay a sum based on the value of his share on the date he entered into partnership either to his senior partner if he had resumed ownership of the goodwill or to the State if he had not done so.

"Squatters"—Group 2c

9. "Squatters" are in a different category, as they have been given nothing at all, and so, ordinarily, should be given the right to buy and sell what goodwill they had amassed, automatically and without payment, subject only to the repayment to the appropriate pool of such moneys as they have received under the fixed annual payment or the initial practice allowance.

Group 2d—Doctors Appointed Without a List on a New Estate

10. If they opt for goodwill, they should repay the Initial Practice Allowance or the value of their N.H.S. list after the first year at the prevailing purchase price, whichever is the greater.

Group 3—Partnerships

11. Partnerships are, of course, the biggest difficulty owing to the multitude and diversity of the provisions of the partnership agreements and the mixture of the pre-Act and post-Act members. The general principles, however, remain the same and each partner would have the same option as corresponding individual practitioners in categories 1 and 2.

Example: Let us take an example of a partnership of two—one pre-1948 and one post-1948.

Each partner would exercise the option available to him. If the pre-1948 doctor opted for the return of his right to buy and sell goodwill, it would be returned to him in respect of his share, and he would renounce that proportion of his compensation whilst receiving the proportion due in respect of his partner's share from the State.

If the post-1948 (junior) partner also opted for the right to buy and sell goodwill, the senior (pre-1948) partner would be able to renounce the remainder of his compensation and negotiate directly with his partner for payment. Alternatively, the senior partner could claim all his compensation from the State and leave the junior partner either to continue as he was, or to negotiate directly with the State for the ownership of his share of the goodwill. Non-taken-back shares would be sold by the State when they became vacant to the remaining partner or to the person approved by him at the then market value.

Group 4—New Entrants

12. This group has no vested interest at stake and no compensation to claim, and so represents the simplest problem. The problem of providing capital is common to all professions. It should be noted that, once purchased, a practice would provide capital security for a loan.

13. From an appointed day all new entrants would enter general practice by purchase or by "squatting." As a corollary there would be no classification of areas and, accordingly, the Medical Practices Committee would have no function in this particular respect. The Minister, as advised by the local executive council and the local medical committee, would, however, have power to refuse admission in very exceptional cases.

14. Subject to these remarks, arrangements for admission to the Medical List would be revised, namely:

A local executive council, advised by a local medical committee, should not unreasonably refuse an application of any registered medical practitioner for admission to the medical list in that area. A retiring practitioner could instruct a local executive council to circularize his patients as to the arrangements he was making for the succession to his practice. (Patients would be transferred to the successor according to these arrangements, subject to their overriding right to transfer to another doctor of their choice.)

Any practice which is vacant on this new appointed day would be sold by the State. A substantial number of all practices would have been compensated and would, therefore, if vacant, be immediately available for this method of disposal. With the return of free purchase and sale, payment of initial practice allowances would cease. There are, however, areas where it might not be easy to get doctors to live and practise, and, without some inducement, there might result a drift to the attractive areas with overdoctoring in these areas and an insufficiency of doctors in the unattractive or difficult areas. To overcome this, it is desirable that there should be a system of inducement payments such as were operative under the Highland and Islands Scheme in order to attract doctors to the unattractive or difficult areas.

Effect of Scheme

15. The effect of this scheme would be that at the end of the three years after the appointed day there would be two types of practitioners: (1) Practitioners who would have the right to buy and sell their practices and would enjoy full rights of ownership; and (2) practitioners who only had the right to enjoy the use of their practices, the disposal of which would be in the hands of the State on the owner's death or retirement. In the course of time this latter group would get fewer in number and gradually disappear.

ment in the minimum income by the appropriate amount. In other words, if the anticipated drop on change-over was to be of the order of 10%, then an example based on £1,500 would really require an income of some £1,650 at the date of purchase. This particular question is one on which the guidance of the profession would have to be sought in order to reach a proper conclusion.

Examples for Purchaser Aged 30-35—Married with One Child

	Practice or Share Income			
	£3,000 p.a.	£2,500 p.a.	£2,000 p.a.	£1,500 p.a.
1. Gross income	£ 3,000	£ 2,500	£ 2,000	£ 1,500
2. Expenses at 35%	1,050	875	700	525
3. Superannuation	126	105	84	63
Assessable income	1,824	1,520	1,216	912
4. Income tax assuming applicant married with one child	428	322	215	108
Net spendable income	1,396	1,198	1,001	804
5. Cost of goodwill at 1·25 years' purchase repayable over 15 years	307	256	205	154
Cost of house at £3,000, repayable over 20 years	195	195	195	195
Cost of car hire purchase—(say £400 borrowed) repayable over 3 years	153	153	153	153
Sickness policy to provide 20 guineas per week	48	48	48	48
	703	652	601	550
Net margin	693	546	400	254

Conclusions

(a) Assuming £500 per annum as acceptable margin and the borrower having only £300-£400 Initial Capital.—(i) In the worst case, that is, a borrower having to purchase a house (at £3,000), goodwill, and a car (at £400 loan), then the minimum gross income needed is approximately £2,300. (ii) If the house costs less or more than £3,000 appropriate adjustments should be made at approximately £65 per annum per £1,000 of loan. (iii) If the car costs less or more than £400 loan appropriate adjustments should be made at approximately £38 per annum for every £100 of loan. (iv) The applicant with a gross income of £1,500 per annum would only be on safe ground if there was no house to buy and he already owned a car without commitment.

(b) Assuming £500 per annum acceptable margin and the borrower having £300-£400 Initial Capital, and a further £500 free capital.—(i) In the worst case, that is, a borrower having to purchase a house (at £3,000) and goodwill, and using his £500 to purchase a car outright, then the minimum gross income needed would be approximately £1,750. (ii) Similar adjustments for variation of the loan cost for a house should be made as in (a) (ii) above. (iii) In such a case the applicant with £1,500 per annum gross income would still not have quite enough margin (even after purchasing his car outright) to contemplate house purchase (at £3,000) as well as goodwill purchase. He would need to find a practice where the house cost less or was to rent or, alternatively, the vendor required only part capital payment for the goodwill.

APPENDIX IX

REMUNERATION OF WHOLE-TIME INDUSTRIAL MEDICAL OFFICERS—REVISED STATEMENT

Starting Salary

A whole-time industrial medical officer who has had three years' experience in the practice of his profession after obtaining a registrable qualification should receive, when first appointed, a starting salary of from £1,000 to £1,800 per annum according to the degree of responsibility entailed

by the appointment; provided that (a) a whole-time industrial medical officer who holds a higher professional qualification or has had special postgraduate training in industrial medicine or more than three years' professional experience should receive, when first appointed, a starting salary at a suitable incremental point above the minimum which would otherwise be appropriate; (b) a whole-time industrial medical officer in charge should receive, when first appointed, a starting salary not less than £1,200 per annum.

Review of Salary

The salary should be reviewed at regular intervals not exceeding two years, in order to enable a medical officer, within seven years of appointment, and having regard to the nature of his responsibilities, to achieve an annual salary between £1,800 and £2,700.

Exceptional Responsibilities

A maximum annual salary in excess of £2,700 should be paid when the appointment entails exceptional responsibilities.

No Detriment

The introduction of this salary scale should in no circumstances result in the reduction of the existing salary of any industrial medical officer already appointed.

Note.—The description "medical officer in charge" refers to the medical officer who is in charge of the medical services of a firm or (in the case of a large firm) of one of its constituent units.

APPENDIX X

HEALTH VISITORS—MEMORANDUM OF EVIDENCE TO WORKING PARTY

1. The British Medical Association represents 65,000 registered medical practitioners, of whom 38,800 are working in the National Health Service.

2. The Association is glad of the opportunity of giving evidence to the Working Party, whose terms of reference are

"To advise on the proper field of work and the recruitment and training of health visitors in the National Health Service and School Health Service."

3. The Association is at all times in close touch with the Society of Medical Officers of Health, and it has had an opportunity of considering the document of evidence already submitted by the Society. The Association desires to express its agreement in principle to the Society's evidence and to inform the Working Party that on the matters of "recruitment and training of health visitors" there is full concurrence with the views of the Society. This being so, the Association does not desire to submit separate evidence on these two points.

4. The third matter on which the Working Party is asked to advise is "the proper field of work" of a health visitor. While not dissenting from the views set out in the Society's document, the Association wishes to amplify certain points and to refer particularly to the need for full co-operation between health visitors and the medical profession.

The Health Visitor as a Member of a Team

5. It is the opinion of the Association that the health visitor is an integral part of the team responsible for the care of the individual patient and the family. Her main duties are concerned with the patient in the home, though this at no time should exclude the closest co-operation with other parts of the Service, more especially the medical and nursing staff of the hospital.

The Health Visitor and the General Practitioner

6. The closest co-operation between general practitioners and health visitors is essential. This already exists to some extent, but there is room for improvement, and the establishment of harmonious relations based on good will and

mutual interest in the health, care, treatment, and aftercare of the patient can only result in great benefit to all concerned.

7. It is fully appreciated that the health visitor is employed by the local health authority and is therefore under the direction of the medical officer of health. This, however, is no bar to co-operation with the general practitioner whereby the health visitor acts under his guidance in the care of the individual patient. The interest, help, and co-operation of the medical officer of health is of course necessary, but it is the view of the Association that the majority of medical officers of health are willing and anxious to participate to the full.

8. The responsibilities of both general practitioner and medical officer of health are so closely related as to be complementary and supplementary the one to the other. The primary responsibility of the general practitioner is to the patient and the family. The responsibility of the medical officer of health and his staff involves the health and welfare of the family as a unit of the community as a whole. The responsibilities of both are of vital importance, and to fulfil these responsibilities the closest association of all concerned, being members of one team, must be appreciated and accepted.

9. The health visitor, by virtue of her training and experience, is usually already the friend of the family. With the family doctor, she is often in the position of finding the solution to a problem which, though primarily medical, may be complicated by social or psychological difficulties. At the same time she is the link with the many facilities which can be provided through the local authority, and through her such assistance can be speedily arranged when needed by the general practitioner.

10. The means whereby the co-operation suggested should be evolved must vary considerably. In many areas no special new arrangements will require to be made. In other areas it will be necessary to discuss what should be done. Much will depend on the number of health visitors available and whether some can be seconded to work almost entirely with general practitioners, whether these be in single-handed practice, partnership, or group practice. Again, integration of such co-operation with the other duties of the health visitor is a matter which must be discussed with the medical officer of health of the local health authority. It is therefore clear that local discussions must be the first step, in order that satisfactory arrangements suitable to individual authorities, or parts of authorities, can be agreed. By these means all the members of the team will fully understand the need for co-operation and each will be able to play his or her part in the successful implementation of any scheme.

11. The Working Party will have appreciated the importance which the Association places on the all-important co-operation between these two members of the Health Service and which has recently been the subject of detailed consideration. It may be of interest to the Working Party to see a statement which was approved by the Council of the Association in January, 1954, and which was published in the *Supplement to the British Medical Journal* of March 6, 1954. This statement is attached to this memorandum.

The Health Visitor and the Hospital

12. The health visitor, while mainly concerned with the patient in his home, should keep in touch with the hospital and its staff while the patient is receiving treatment in hospital. It is important, therefore, to ensure that adequate liaison exists between the health visitor and the almoner. By and this liaison should also include the home nurse. Visiting hospitals, the health visitor not only obtains detailed information regarding the individual patient, but, at the same time, gains the advantage of continuing clinical education, which will be most helpful in her general professional duties.

13. On many occasions a consultant would find it useful to have additional information regarding a patient's home and social background. This should be sought in the first place from the general practitioner, but further information possibly relating to matters which are the responsibility of

the local authority may be needed, and in such circumstances the health visitor, working in close touch with the general practitioner and the medical officer of health, may be able to provide important details.

14. The possibility of combining the functions of almoner and health visitor has been examined. It is the opinion of the Association that these dual functions can rarely be carried out by the same person, though it is understood that in certain small hospitals these arrangements do exist. While there is a degree of overlap of responsibility as between the almoner and the health visitor, the almoner is predominantly concerned with the patient in hospital while the health visitor's main concern is the patient and his family in the home.

15. The Association would urge strongly that every means whereby co-operation between the three parts of the service can be improved should receive the most careful discussion and consideration, both centrally and locally. An example of the need for full arrangements to be made is in connexion with the information given by the hospital regarding the discharge of a patient. This is an important matter which involves all members of what might be called the "domiciliary team." It is imperative that the general practitioner be informed by the hospital of the discharge of the patient. At the same time the medical officer of health should be informed of those cases where the services provided by the local authority may be required, in order that these services, which include assistance given by the health visitor, may be made available to the patient without any unnecessary delay.

Co-ordination and Co-operation

16. At the risk of repetition the Association stresses that only by the fullest co-operation and co-ordination of all parts of the Service, and of individual members of the Service, can the best use be made of many facilities available for the benefit of the patient.

Scope of Duties of the Health Visitor

17. This matter has been dealt with fully by the Society of Medical Officers of Health, but the Association desires to emphasize the following special types of cases where the help of the health visitor can play a most important part, always bearing in mind that the health visitor should be working in close, even daily, touch with the family doctor: (1) Mothers and babies (this is a statutory duty). (2) Children suffering from special diseases—for example, diabetes—where continued supervision by general practitioner and hospital are involved. (3) Handicapped children—physical and mental. (4) Adults of any age needing aftercare. (5) Chronic sick of any age. (6) Elderly and infirm. (7) Cases of tuberculosis.

18. There is a further point which the Association would like to recommend and which would extend the scope of the health visitor's work and would give her useful additional experience. The Association has already recommended to the Guillebaud Committee that research work in the field of public health and in the preservation of health and prevention of disease should be extended. In this connexion it is felt that the health visitor could and indeed should participate in such research.

The Health Visitor/Home Nurse/Midwife or "One-purpose Nurse"

19. The combination of duties of health visitor, home nurse, and midwife in one person has been known for a long time in rural areas, and as far as can be ascertained the arrangement has on the whole worked well.

20. It has been suggested that there would be saving in woman power if similar arrangements existed in towns and cities. On the other hand, it has been stated that there would be many difficulties in carrying out all the duties in a thickly populated area.

21. There are two possible but important disadvantages to such a plan. Firstly, it is inevitable that maternity cases would take priority, then cases involving nursing would fall

to be dealt with, leaving the health visiting duties to be undertaken in what time was left. Secondly, in those areas where domiciliary midwifery has declined there would be a very real danger that the "all-purpose" nurse would undertake few deliveries during the year and inevitably her skill as a midwife would decrease.

22. The Association feels that it is premature to make any definite decision either for or against the suggestion and it would recommend that a series of experiments in differing types of areas should be undertaken in order that the usefulness and efficiency of the "all-purpose" nurse may be fully investigated.

Working Party's "Schedule"

23. The Association has received the "Schedule: Matters on which evidence is particularly sought" (Doc. HV/ WP(54)3b). The comments to the specific items are set out in a separate document (Sub-Appendix B).

24. The Association appreciates that the Working Party may be limited in the amount of time which can be given to the receipt of oral evidence. It would, however, be glad if an opportunity could be given for representatives to expand the above evidence and in particular to speak on what, in the view of the Association, is the most important aspect of the health visitor's work—her co-operation with the medical profession and the other parts of the National Health Service.

SUB-APPENDIX A: THE GENERAL PRACTITIONER AND THE HEALTH VISITOR

(Here follows the statement printed as Appendix VI in the Annual Report of Council.)

SUB-APPENDIX B:—SCHEDULE: MATTERS ON WHICH EVIDENCE IS PARTICULARLY SOUGHT

Item 1.—The range of services on which health visitors are engaged, or it has been suggested they might be engaged, might be set out roughly as follows:

(a) Maternity and child welfare. School nursing. Health education (group teaching). Tuberculosis services. Venereal diseases. Infectious diseases. Mental illness. Mental deficiency. Care and aftercare of acute and chronic illnesses. Health and welfare of the aged or handicapped. Duties associated with the work of the children's department.

(b) Co-operation with general practitioners. Co-operation with hospitals. Co-ordination of family welfare services.

Comment.—(a) The Association agrees with the list as set out above, but would add under "Health education" the importance of education in accident prevention, with special reference to accidents in the home. (b) The first two matters are dealt with in detail in the Memorandum of Evidence (paras. 6-11 and 12-15). The Association has recently considered the question of co-ordination of welfare services. In evidence to the Guillebaud Committee the opinion has been expressed that integration of the services provided under Section 28 of the National Health Service Act and Sections 29 and 30 of the National Assistance Act would improve the arrangements for care and aftercare. General efficiency would accrue and national economy would result if all welfare work were to be the responsibility of the public health department of the local health authority.

Item 2.—What other duties, in addition to those mentioned in 1 above, do you consider that health visitors might carry out? Which of these duties, if any, should not be undertaken by health visitors?

Comment.—No additional duties are suggested, but the health visitor should be encouraged to take part in social investigations.

Item 3.—What are the essential duties involved in health visiting in the services set out in 1(a) above?

Comment.—It is impossible to specify "the essential duties involved in health visiting," because these will vary with every individual case or family. The Association is of the opinion that this is essentially a "Family Service." There is a continuing responsibility for the preservation or

restoration of the health of the family. The health visitor is "the educator" through whom and by whom, in close co-operation with her general-practitioner colleagues, this aim can be fulfilled.

Item 4.—In what circumstances should health visitors be employed solely in any one of the services listed in 1(a)?

Comment.—The Association concurs with the views of the Society expressed in para. 6 of its evidence. Only in exceptional cases should the duties of a health visitor be employed solely in one service.

Item 5.—Can health visiting duties be combined successfully with those of the home nurse and/or midwife, and, if so, in what circumstances?

Comment.—This point is fully answered in the Memorandum of Evidence (paras. 19 to 22).

Item 6.—To what extent does "overlapping" and duplication of effort exist in the provision to families of social services with which the health visitor is now concerned? How far can it be avoided by creating an all-purpose "family visitor"? To what extent could such a family visitor act as the co-ordinator of health and welfare services for the family? How far can purely administrative measures eliminate overlapping between health visitors and others?

Comment.—The need for co-ordination of the health and welfare services has already been mentioned—see comment on Item 1(b). The Association is anxious that unnecessary "overlapping" should be avoided, and it feels that much of the work now undertaken by "social" and other workers could be well included in the routine duties of the health visitor. There should be meetings between the voluntary and statutory workers concerned. In this way, individual cases can be discussed and decisions reached not only on the action needed to provide the necessary help but on the officer who would be responsible. Wherever possible, one senior health visitor should report to all the departments concerned, thus effecting a closer liaison within the local authority.

Items 7 and 8.—The duties at present carried out by the school nurse might be set out as follows: attendance at minor ailments and specialist clinics; preliminary inspection of children and attendance at medical examinations; nurses' surveys and inspection at schools; visits to nursery schools and classes; attendance at special schools (both day and residential); follow-up home visits; infectious disease control; health education (group teaching).

What school nursing duties other than home visiting do you consider should be carried out by a health visitor either because her skill is needed or because it provides a useful means of liaison with the child and/or his home? Which duties normally included in the range of school-nursing duties set out in Item 7 above might be carried out by lay helpers or persons with some nursing experience rather than by school nurses or health visitors?

Comment.—With reference to the list of duties set out in Item 7 the Association feels that follow-up home visits, infectious-disease control, and health education are essentially within the sphere of the health visitor.

On the question of assistance to be given by lay or semi-trained persons it is clear that much useful help can be and is being given by voluntary lay effort in many centres and clinics. Such interest and enthusiasm should be welcomed and extended, for it is obvious that in many ways the use of such personnel can save the health visitor and the doctor for their own more specialized duties. Examples are: undressing of babies and small children; weighing and measuring of children; keeping of weight and height records; filing of records; clerical assistance in note-taking; domestic duties in the clinic, etc.; sale of welfare foods.

Item 9.—Where the health visitor is not also the school nurse, what liaison is necessary in order that the health visitor may be aware of children who are handicapped, etc., and of any action that is being taken in connexion with children of school age in the families that she normally visits?

Comment.—Where the health visitor is not the school nurse it is imperative that the need for full co-ordination of their duties and exchange of information is appreciated and implemented. The two nurses must realize that they are both important members of the team, which also includes public health medical officers, general practitioners, and consultants. By administration and example the ideal of full and proper co-operation must be impressed on both health visitor and school nurse.

Item 10.—To what extent is there co-operation between health visitors and general practitioners? In what does it consist? What steps should be taken to improve it? Can health visitors help general practitioners over the whole range of their practice? Can they assist more in some fields than in others?

Comment.—The Association's views are already fully set out in the Memorandum (paras. 6 to 11). It is the considered opinion that the health visitor can and should help general practitioners over the whole range of practice.

Item 11.—How can the health visitor help to provide necessary information about new hospital patients? Can she play a part in aftercare? If so, what arrangements should be made between the local health authority, the general practitioner, and the hospital to ensure that the health visitor has the necessary information and effective knowledge of the case? Are any special arrangements necessary between the health visitor and such hospital departments as tuberculosis, maternity, and paediatric? Are special arrangements an advantage in connexion with any other hospital departments?

Comment.—Co-operation between the health visitor and the hospital is covered in paras. 12 to 15 of the Memorandum. Detailed arrangements will vary according to local circumstances, the size of the hospital, the type of hospital, etc. The health visitor should have access to information from any department if such information is helpful to her in her care and aftercare of individual patients. It is, however, particularly important that she should have a close link with those hospital departments dealing with (a) elderly and infirm; (b) chronic sick of all stages; (c) handicapped children, especially orthopaedic cases; (d) venereal diseases; (e) tuberculosis; (f) disabled persons. Here the health visitor is in a unique position whereby she can keep in touch with the patient, provide facilities available through the health department of the local health authority, and also act as a liaison with the appropriate local officer of Government departments, such as the Ministry of Labour, National Assistance Board, etc.

Items 12 to 17. Comments.—These points are fully answered by the evidence submitted by the Society of Medical Officers of Health, with which the Association concurs.

APPENDIX XI TRAINING OF DISTRICT NURSES—MEMORANDUM OF EVIDENCE TO WORKING PARTY

1. The British Medical Association represents 65,000 registered medical practitioners, of whom 38,800 are working in the National Health Service.

2. The Association is glad of the opportunity of giving evidence to the Working Party, whose terms of reference are

"To consider what training it is desirable that registered nurses and enrolled assistant nurses, respectively, should undertake prior to their employment on home nursing duties, and the means by which such training should be provided."

3. The Association has considered the questionnaire issued by the Working Party and has incorporated in one document the replies to these questions, together with its views on other points which are felt to be of importance and which are relevant to the matter under consideration.

4. The outstanding principle which has been in mind during the preparation of this memorandum is the import-

ance to the community of ensuring the highest possible standards of domiciliary nursing. It is fundamental, therefore, that the personnel, male and female, of the service must be nurses of exceptional personality, who look on their work as a true vocation, who have a real interest in social as well as individual problems, and who desire to make district nursing a career. These attributes, together with a sound training, should ensure the principle on which the Association feels so strongly.

5. Training.—This leads to the questions asked under Section I General.

Question 1.—"What should be the minimum length of the training that a nurse should undertake prior to taking up employment on home nursing duties?"

It is the view of the Association that prior to employment on home nursing duties the nurse must (a) have completed full training for and hold the qualification of a State-registered nurse; (b) have received postgraduate experience on "a case basis" of not less than one year, preferably in a responsible position in hospital such as a staff nurse or assistant ward sister; (c) have completed and qualified in a special course for district nurses of not less than four months.

Question 2.—"By what means should such training be provided—for example, by each local health authority, or group of local health authorities, or by some central body?"

Training should be provided by a central body.

The Association has always been impressed by the high standards of the training of the Queen's Institute, and would like to see the continuation of the traditions of this body. Indeed, the Association wishes to recommend that the present Queen's Institute, with additional representation on its governing body, might well be charged with the responsibilities of the central body for district nursing training.

In this connexion, however, if the above recommendation be accepted it is hoped that special consideration might be given to the Ranyard Nurses and to the excellent work which they have done in London. It is felt that in some way the Ranyard Organization should continue within any new central arrangements, so that the traditional vocational aspect of its work may be continued for the benefit of the people of London.

Question 3.—"How many training centres should be provided, where should they be located, and how should they be staffed?"

The Association has not gone into the details of the number of training centres which will be required, and it feels that at this stage any definite recommendation would be premature. It would, however, like to stress that in each centre there should be adequate arrangements whereby training in the special problems of rural areas can be included.

The present staffing arrangements of the training centres appear to be satisfactory, but it is hoped that general practitioners will always be included amongst the lecturers. Reference will be made to this point later in the document (see Sub-Appendix A, Section 1B, and Sub-Appendix B, Section 1).

Question 4.—"What should be the conditions of acceptance for training?"

The following conditions of acceptance of a student district nurse are recommended: (a) The applicant, male or female, must be a State-registered nurse. (b) There should not be any age limit. (c) The first month of training should be a probationary period. (d) If accepted on the completion of (c), and the nurse is in receipt of a training allowance, he or she should normally be required to sign an agreement and to undertake to practise as a district nurse for at least one year on completion of training. If, however, a nurse undertakes the training as an independent student, paying his or her own training fees, a binding contract for one year should not be required.

6. Pattern of Training.—The Association has given considerable thought to the appropriate time to be given to

the course. The present six months is satisfactory, but from many sources it has been suggested that there should be some reduction. The Association would accept this—subject to a definite minimum. This is dealt with in the replies to the following questions:

Question 1.—"How much of the total training time suggested at Item 1 above should be devoted to theoretical training?"

It is recommended that the period of training be not less than four months. If this be accepted the Association suggests that the theoretical training should be covered wherever practicable in one period of two to three weeks.

Question 2.—"What system of theoretical training should be adopted—for example, study days or block periods of study?"

While recommending that the theoretical training should if at all possible be in a block period of two to three weeks the Association realizes that in some of the smaller centres this might not be practicable and certain adjustments might have to be made.

Question 3.—"What should be the content of this theoretical training? Please give details under main subject headings of the number of lectures recommended and by whom it is suggested they should be given."

Before setting out the details of the theoretical training the Association wishes to stress the overriding importance of impressing on the student that the main work will involve problems in the home and in relation to other persons or bodies who may be helping, or in contact with the individual patient. It is therefore most important that the student district nurse should, throughout training, understand and appreciate the need for co-operation with the medical profession and particularly with the family doctor.

Furthermore, it must also be appreciated that a high proportion of patients will be elderly and in the infirm and chronic sick groups of the community.

In Sub-Appendix A the Association sets out its recommendations regarding the subject headings, the number of lectures, and the lecturers.

Question 4.—"What should be the extent of a student's practical work? Please give full details—for example, practical demonstrations both at the training centre and the patients' own homes, visits to hospital, clinics, etc., supervised experience, and the type of cases to be attended."

The importance of training and experience of practical nursing in the home cannot be overstressed and must take priority over all other parts of the syllabus. In addition, practical experience of other aspects of the health service must be available, and set out in Sub-Appendix B are the Association's suggestions.

7. Examinations.—It is felt that some form of examination is necessary, particularly in practical work. Detailed views are set out below.

Question 1.—"What tests should be given during the period of training?"

It is not considered necessary for there to be a formal examination during the period of training. It is however recommended that at the end of the probationary period (one month) there should be a full report on each candidate. In this way a check can be made on those students who appear to be unsuitable for the full training.

Question 2.—"Should a student district nurse be required to undergo a qualifying examination at the end of the course of training? If so—(a) What should be the extent of the final theoretical examination? (b) What should be the extent of the final practical examination?"

A qualifying examination at the end of the training is essential and should be of national standing. It must include both theory and practice, but particular stress should be laid on the practical examination.

It is suggested that the theoretical paper should be common to all student district nurses and be set at national level. The practical examination should, as at present, be taken locally at the students' training centre. The examiners for both theoretical and practical parts of the final test

should be independent persons and not associated with the teaching staff of the particular training school.

8. The Working Party requests "additional remarks," and the Association is glad of the opportunity to put forward certain additional points.

9. Economic Use of Available Woman Power.—The Association desires to draw the attention of the Working Party to the need to conserve woman power while still keeping a high standard of training in the service. It is for this reason that it has been recommended that there should be no firm age limit. It is felt that there are many older nurses, many married or widowed, who might undertake this work. They have the basic qualifications and their mature experience makes them particularly suitable to work as district nurses. The Association suggests that the Working Party should seriously consider this aspect of recruitment, but it would add that, overall and whatever the age of the candidate, the basic requirements (see Para. 5, Question 4) must be maintained.

10. Male District Nurses.—It may be thought by some that male district nurses are not needed in the service. This is incorrect. In view of the increasing number of elderly and infirm persons it is very clear that the male nurse has an important part to play in the service and every effort should be made to recruit an adequate number. One method of recruitment might be from male nurses retiring from the Forces. Family commitments may prove to be a bar to recruitment. To overcome this the Association wishes to suggest that the possibility of financial assistance to a married male student district nurse during his training should be considered. It should be added that a widowed female student district nurse may also require similar financial assistance.

11. Houses for District Nurses. The Association is of the opinion that the provision of a house for a district nurse (male or female) would undoubtedly assist recruitment. Local health authorities should wherever possible make the necessary arrangements within the district to which the nurse is appointed.

12. State-enrolled Assistant Nurse.—The Association is of the opinion that, wherever possible, a district nurse should have the full qualifications and training as set out in Para. 5, Question 1. It is agreed, however, that the State-enrolled assistant nurse has a part to play in domiciliary nursing, but it must be appreciated that here the degree of responsibility should be limited. With a modified district nursing training of not less than three months a State-enrolled assistant nurse can quite appropriately deal with elderly patients and cases of chronic illness where only simple nursing duties are required, but—and the Association cannot stress this point too emphatically—in every case the State-enrolled assistant nurse must work under the supervision of a State-registered district nurse. With regard to the arrangements for selection and training of the assistant nurse the Association recommends that the same central body should be responsible.

13. The "One-purpose" Nurse.—The combination of duties of home nurse, health visitor, and midwife in one person has been known for a long time in rural areas, and so far as can be ascertained the arrangement has on the whole worked well. It has been suggested that there would be a saving in woman power if similar arrangements existed in towns and cities. On the other hand, it has been stated that there would be many difficulties in carrying out all the duties in a thickly populated area. There are two possible but important disadvantages to such a plan. Firstly, it is inevitable that maternity cases would take priority, then cases involving nursing would fall to be dealt with, leaving the health-visiting duties to be undertaken in what time was left. Secondly, in those areas where domiciliary midwifery has declined there would be a very real danger that the "all-purpose" nurse would undertake few deliveries during the year and inevitably her skill as a midwife would decrease. The Association feels that it is premature to make any definite decision either for or against the suggestion, and

it would recommend that a series of experiments in differing types of areas should be undertaken in order that the usefulness and efficiency of the "all-purpose" nurse may be fully investigated. It should be clearly understood that, with regard to district nursing duties of the "one-purpose nurse," her training as a district nurse remains unaltered.

14. The Association appreciates that the Working Party may be limited in the amount of time which can be given to the receipt of oral evidence. It would, however, be glad if an opportunity could be given for representatives to expand the above evidence.

SUB-APPENDIX A: THEORETICAL TEACHING (25 LECTURES)

I. Nursing and Allied Services

A. District Nursing (Nine lectures, given by Queen's Nurse Teachers and Administrators):

(a) The history and development of district nursing.
(b) Administration of district nursing services by local health authorities and voluntary organizations in counties and county boroughs.

(c) The responsibilities of the district nurse to her patients, to the medical profession, and to her employing authority, and to other workers in the health and social welfare services. Ethics of district nursing.

(d) District management. Planning the day's work. Care of nursing equipment and articles loaned. Record keeping and reports on patients.

(e) The responsibilities of a district nurse in a rural area undertaking general nursing, midwifery, and health visiting duties.

(f) Barrier nursing in the home, with special emphasis on the nursing of tuberculosis. Nursing of infected maternity cases and miscarriages.

(g) Nursing and special care of those suffering from diabetes and from cancer. Special problems of the chronic sick and the aged.

(h) Special problems of the dying—last offices for the dead.
(i) First-aid in emergency midwifery. (For female nurses who are not midwives and for male nurses.)

B. Domiciliary Treatment in Relation to Special Problems.—(Three lectures given by a general practitioner.) It is suggested that these lectures might cover such diseases as diabetes, cancer, ear, nose, and throat diseases. Diseases of the aged.

C. Tuberculosis.—(Two lectures given by a chest physician.) Notification, common forms in various age groups, causes of infection, health education and preventive measures, work of chest clinic, work of tuberculosis visitors, special scales of National Assistance.

D. Physiotherapy.—(One lecture.) Facilities for and value of physiotherapy for patients in their own homes.

E. Occupational Therapy.—(One lecture.) Value for patients in their own homes, with special reference to rehabilitation of home-bound patients.

F. Prevention of Accidents in the Home.—(One lecture.)

II. Nutrition

One lecture: Practical suggestion regarding the care and preparation of food in the home.

III: Hygiene

One lecture given by a medical officer of health: General introduction to aspects of hygiene in the home.

IV. Health, Welfare, and Social Services

Six lectures. A brief introduction to constitution and development of Central and Local Government.

A. Health.—(Four lectures, given by medical officer of health.) General survey of the health and allied services before 1948 and outline of present legislation of importance to the district nurse:

Public Health Act, 1936: Part V, Regulations dealing with communicable diseases; Part VII, Notifications of Births. National Health Service Act, 1946 (particularly Parts III and V). Education Act, 1944, and School Health Service and Handicapped Pupils Regulations, 1953. Nurses Acts, 1919-49. Midwives Acts, 1902-50.

The Personal Health Services: Care of normal infant; breast and artificial feeding; weaning; infant hygiene. Care of toddler, feeding, general management, common ailments. Nursery and Child Minders Act, 1948. The unmarried mother and her child. The statutory M. & C.W., School Health, and Mental Health Services. Mental Treatment and Deficiency Acts.

Vital Statistics: Birth and Death Rates, Maternal, Infant, and Neonatal Mortality. Chief causes of death and morbidity, including those due to occupational diseases.

B. Welfare and Social Services.—(Two lectures given by medical officer of health):

Essentials for a normal family. Poverty—its causes and alleviation. Outline of main provisions of welfare and social legislation. National Insurance Act, 1946 (special reference to the benefits available). National Insurance (Industrial Injuries) Act, 1946. National Assistance Act, 1948 (special reference to the care of the aged and handicapped and help for the tuberculous). Disabled Persons (Employment) Act, 1944. Family Allowance Act, 1945. Children Act, 1948. Children and Young Persons Act, 1933. Part VII of the Public Health Act, 1936. Adoption Act, 1950.

The work of voluntary agencies and their relationship to Statutory Organizations: Council of Social Service, etc. Youth Organizations.

SUB-APPENDIX B: PRACTICAL TRAINING

1. This is to be given from the Training Centres approved for the purpose and should include: (i) Supervised practical experience of district nursing in patients' homes. (ii) Demonstrations in the district rooms on the use of equipment, care of bags, and certain nursing procedures. (iii) Experience in nursing various types of patients, including those suffering from acute medical and surgical conditions; from tuberculosis and other infectious diseases; the special requirements of children; the care of the chronic sick and of the elderly; the care of the dying and last offices for the dead. (iv) Daily report to superintendent or assistant superintendent on patient's progress, with discussion of particular needs and general welfare of family.

It is recommended that during this part of the training arrangements should be made if at all possible for the student to spend at least one day with a general practitioner, both in the surgery and on his rounds.

2. **Practical Work in a Rural Area.**—A minimum of seven days must be spent in a rural area with a fully trained district nurse assisting in routine duties, which should include general nursing, midwifery, and health visiting duties. An alternative arrangement would be to spend a similar period with a district nurse-midwife and a second period with a whole-time health visitor.

3. **Practical Visits**—including lecture demonstrations. The visits should include: A hospital for infectious diseases. Health centre—where available. Antenatal clinic. Post-natal clinic. Infant welfare centre. Day nursery. School medical inspection. Minor ailment clinic. Home for handicapped children. Child guidance clinic. Juvenile court. Chest clinic. Old people's home. Communal food centre—for example, civic restaurant, school, or factory canteen. Factory welfare department.

APPENDIX XII

BRITISH VETERINARY ASSOCIATION'S MEMORANDUM ON MEAT PRODUCTION AND CONTROL (1953)

The British Medical Association, the Society of Medical Officers of Health, and the Sanitary Inspectors Association have jointly considered the recent memorandum prepared by the British Veterinary Association on Meat Production and Control (1953).

While concurring with much of the contents of the Memorandum the three bodies above mentioned dissent from certain views expressed and desire to draw attention to four principles, the application of which is considered essential in connexion with any arrangements now in force or under

consideration for the future in connexion with meat inspection and control.

1. *Health.*—The close association between animal and human diseases must be fully appreciated at all times, but the fundamental purpose of meat inspection is to safeguard the health of the individual consumer and the community as a whole. All other considerations must be regarded as secondary to this main purpose. It is therefore necessary that all action with regard to these matters should be considered as an intrinsic responsibility of the Public Health Service.

2. *Administration.*—The British Veterinary Association memorandum recommends that in future meat inspection should be the responsibility, both administrative and executive, of the Animal Health Division of the Ministry of Agriculture. Here the British Veterinary Association has failed to appreciate the fundamental principle that meat inspection is primarily concerned with the health of the community, not with meat production. The three bodies are unanimous in stating that in their view the central government department responsible for general supervision and advice should be the Ministry of Health, acting jointly with the Ministry of Food.

3. *Local Responsibility.*—The British Veterinary Association memorandum envisages that all meat inspection shall be "under the direction and control of the Animal Health Service of the Ministry of Agriculture and Fisheries" and includes the "taking over of the existing staffs." This implies that the responsibilities which at present lie with local authorities shall be removed. The three bodies cannot agree with this recommendation and would urge most strongly that the responsibility for local administration shall remain with the local authorities.

4. *Medical Responsibility.*—Meat inspection is only one part of the public health supervision of food in this country, and any suggestion that the control of meat should be divorced from that exercised over other foodstuffs is strongly to be deprecated. All those at present associated with these duties fully appreciate the importance of this service to the public health. The British Veterinary Association has apparently ignored this important principle, and in particular the general responsibility of the medical officer of health for the prevention and control of disease, including that transmissible by meat, in so far as local government administration is concerned. It is the unanimous view of the three bodies that this responsibility should continue.

According to the Interdepartmental Committee on Meat Inspection, "The great majority of meat inspectors will no doubt continue to be sanitary inspectors trained in meat inspection, and we regard this as a satisfactory arrangement." The three bodies are confident that this is a satisfactory arrangement and see no justification for the British Veterinary Association's insistence that veterinary inspectors should be appointed to supervise and control this service.

The British Veterinary Association further suggests that non-veterinary inspectors should function merely as detention officers. The Interdepartmental Committee on Meat Inspection considered this system of inspection and concluded that such a system should not be adopted in England and Wales, a conclusion with which the three bodies agree.

[Appendix XIII, the Financial Statement, appears on pp. 273 and 274.]

NEW HEALTH CENTRES FOR HARLOW NUFFIELD PROVINCIAL HOSPITALS TRUST'S EXPERIMENT

The Nuffield Provincial Hospitals Trust is to build and equip three health centres in Harlow New Town, to meet the needs of the first 25,000 new town residents. Construction will start on all three centres in a few weeks' time, and they should be in use early in 1955. The centres will be used by general practitioners and dentists on a group practice basis, and by the Essex County health authority clinics. Health visitors and district nurses will

work with the general practitioners, who will be invited to staff some of the county council clinics. In one of the health centres there will be a county dental clinic for the "priority" classes, alongside a private dentist doing general N.H.S. dental work.

The capital cost (£60,000) of building and furnishing the three health centres will be borne by the Nuffield Provincial Hospitals Trust, and the health centres will be owned on behalf of the Trust by the Nuffield Health and Social Services Fund. The actual building and management of the health centres will be undertaken by the Harlow Development Corporation, acting as agents for the Nuffield Health and Social Services Fund. The doctors, dentists, and the county council will thus be the tenants of the Nuffield Health and Social Services Fund, which will continue in being when the Harlow Development Corporation has been wound up on the completion of the construction of the new town.

The development of further health centres in Harlow, to meet the general medical and dental needs of the town as it grows, is under consideration. The tenants of the three new centres will pay economic rents related to capital cost; after expenses have been met this money will provide a nucleus fund for further development.

Group Practice

The buildings will not be health centres of the type envisaged in the N.H.S. Act, but group practice centres with clinics attached. A temporary health centre has already been in operation at Harlow for two years. Each new centre will differ from its fellows in certain minor respects, so that as much as possible may be learnt from practical experience about health centre design. It is intended that one of the future health centres should be immediately adjacent to the future Harlow Hospital, and the Nuffield Trust hopes that it may help to provide a special link between all the general practitioners of the town and the hospital service.

Harlow has two large industrial estates. It is the wish of the Trust that in due course special steps should be taken to meet the health needs of workers and management by the establishment, on an economical scale, of an industrial health service. Again, it is intended that the general practitioners shall play a full part in this service. Thus it is hoped that Harlow may in due course provide an example to the country, and perhaps the world, of a completely integrated health service.

Successful Co-operation

In all these plans the general practitioners in the new town are co-operating to the full; those general practitioners in the old town who are not in need of group practice provision have been sympathetic and have not placed any obstacles in the way of the development. The dental surgeons also are giving their full support. The Essex local executive council has shared in each stage of the planning; the council has been consulted on the design of each health centre, and its suggestions have been embodied in the final plans.

The Health Committee of the Essex County Council, and in particular the county medical officer of health, Dr. Kenneth Cowan, have been behind the planning from its earliest stages. It was when the Ministry of Health issued its stand-still orders on health centre development that the Harlow Development Corporation, with the county council, devised the temporary scheme which has now been in operation for two years.

It was the success of the temporary health centre at Haygarth House that convinced the Trust that this was a development which should be extended. From the outset the Trust insisted that Haygarth House should have a "house committee" representing the general practitioners, the dentists, the county health authority, and the development corporation as landlords. This committee has met regularly; each party concerned has come to appreciate the problems and needs of the others, and as a result Haygarth House has developed with complete smoothness. There are now some 8,000 patients, of whom a third are children.

Appendix XIII—Financial Statement

Balance Sheet—December 31, 1953

	1953	1952	Fixed Assets at net book amount at January 1, 1947, of assets acquired before that date, with additions since at cost, less Sales, Depreciation, and Sinking Fund instalments—	1953	1952	1951
Accumulated Fund:						
Balance at January 1, 1953	408,438	406,458				
Add: Reserve for Development of Regional Offices—no longer required	89,787	99,737				
Surplus for year	118,659	—				
Balance at December 31, 1953	616,884	506,195				
Reserve for Development of Regional Offices	8,900	—				
Reserve for future taxation	2580,724	—				
Liabilities and Provisions:						
Loans	32,100	32,100				
Bank overdraft	16,078	118,588				
Creditors and accrued expenses	48,983	65,547				
Amounts received in advance (including subscriptions)	76,943	68,581				
Current Taxation	4,807	7,639				
Provisions for:						
Dilapidations and redecoration of premises	39,447	43,201				
Pensions	8,043	6,904				
	198,798	370,460				
Investments at cost—						
(a) Government and other securities (Market value at December 31, 1953, £143,786)	189,394	189,394				
(b) Sinking Fund Policies (Surrender value at December 31, 1953, £93,384)	70,989	70,989				
(c) Life Assurance Policies (Surrender value at December 31, 1953, £1,837)	1,874	1,874				
Loan to Irish Medical Association:						
Balance at January 1, 1953	8,000	8,000				
Less: Repaid during year	500	—				
Current Assets—						
Stocks of paper for publications, stationery, etc.	24,092	24,092				
Payments in advance	2,695	2,695				
Debtors (including unpaid subscriptions), less provision for losses	93,641	93,641				
Cash in hand	4,981	4,981				
	125,949	125,949				
	£785,680	£778,755

AUDITORS' REPORT TO THE MEMBERS OF THE BRITISH MEDICAL ASSOCIATION

In our opinion and to the best of our information and according to the explanations given to us the above balance sheet and the annexed income and expenditure account give a true and fair view of the state of the Association's affairs as at 31st December, 1953, and of its income and expenditure for the year ended on that date. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for our audit. In our opinion the Association has kept proper books of account and received proper branch returns, and the above-mentioned accounts, which are in agreement with them, give in the prescribed manner the information required by the Companies Act, 1948.

	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-------

28. **Motion** by LONDON: That practitioners in partnership shall be allowed a fixed period of nine months to bring their individual lists within the prescribed maxima; that any extension of this period shall be permitted only with the consent of the Minister, and that during the period of grace allowed a partner shall be paid for the actual number of patients on his individual list.

Elimination of Inflation (Paras. 108-10 of Report)

29. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 108-10 of the Report of the General Medical Services Committee be approved.

30. **Motion** by LONDON: That this Conference regards the establishment of an Alphabetical Index as essential to the efficiency of the Central Registry if inflation is to be avoided and the Distribution Scheme safeguarded, and calls upon the Ministry of Health to take immediate steps to establish such an index.

31. **Motion** by KENT AND CANTERBURY: That this Conference instructs the General Medical Services Committee to press for the establishment of a Central Alphabetical Index to complement the present Numerical Register, believing that this is the only effective way by which inflation of lists can be kept in check.

32. **Motion** by WORCESTER CITY: That the Ministry be pressed again to have instructions printed on the medical card requesting the patient to notify to the executive council any change of address.

Acceptance of Patients of a Vacant Practice (Paras. 111-14 of Report)

33. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 111-14 of the Report of the General Medical Services Committee be approved.

34. **Motion** by DEVON AND EXETER: That in the opinion of this Conference the question of the acceptance of patients of a vacant practice is not the concern of the Central Ethical Committee, the maintenance or dispersal of the practice being the responsibility of the local executive council.

Treatment of Services Personnel on Leave (Para. 115 of Report)

35. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 115 of the Report of the General Medical Services Committee be approved.

36. **Motion** by NORTHAMPTON: That Services personnel on leave should be treated as temporary residents and that Service departments make contribution of a round sum to the Central Pool to cover such cases.

Standard of Accommodation in Surgeries and Waiting-rooms (Paras. 131-3 of Report)

37. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 131-3 of the Report of the General Medical Services Committee be approved.

38. **Motion** by LANARKSHIRE: That in view of the desirability of providing a higher standard of surgery accommodation and considering the total inadequacy of the monetary inducement offered to practitioners by the Group Practice Loans Fund, this Conference recommends that action be taken forthwith to secure for medical practitioners relief of income duty on a proportion of capital expenditure on new buildings and equipment as is at present enjoyed by industry.

Responsibility for the Acts and Omissions of a Partner (Paras. 136-41 of Report)

39. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 136-41 of the Report of the General Medical Services Committee be approved.

40. **Amendment** by HASTINGS: That arrangements should be made whereby the general practitioner who appoints a deputy, locum, or assistant should not be liable for any breaches of the terms of service by the deputy, locum, or assistant.

Provision of Diagnostic and Ancillary Facilities (Para. 148 of Report)

41. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 148 of the Report of the General Medical Services Committee be approved.

42. **Motion** by LANCASHIRE: That the General Medical Services Committee be requested to consider the setting up of a Central Committee or body (analogous to the Working Party) to secure that no clinical facilities available to general practitioners at any hospital or medical institution should be withdrawn without prior consultation with such Central Committee, and that the Central Committee should have power to initiate steps to secure the granting of clinical facilities to general practitioners where such facilities are non-existent.

Representation of General Practitioners in Hospital Administration (Paras. 149-52 of Report)

43. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 149-52 of the Report of the General Medical Services Committee be approved.

44. **Motion** by DORSET: That there be at least one general practitioner on all group hospital management committees selected from lists submitted by local medical committees of the areas concerned.

45. **Motion** by BERKSHIRE: That the General Medical Services Committee be asked to explore the possibility of every hospital management committee having a general practitioner as one of its members.

Maternity Medical Services (Paras. 157-66 and 305-9 of Report) Review of the Maternity Service

46. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 157 and 158 of the Report of the General Medical Services Committee be approved.

47. **Amendment** by MIDDLESEX: That the principle governing the payment of fees for maternity services be amended so that the fee paid is related to the work done; for example:

Antenatal examinations—half-guinea each up to maximum of four guineas.

Attendance at confinement—two guineas.
Medical care of mother and child for 14 days after the confinement—half-guinea per attendance, up to maximum of three guineas.

Medical and pelvic examination of the mother between six and twelve weeks after confinement—one guinea.

48. **Motion** by ISLE OF ELY: That the procedure in operation in England and Wales with regard to obstetric lists be abolished, and that the procedure at present followed in Scotland and Northern Ireland be adopted in its place.

49. **Motion** by NORTHAMPTON: That practitioners be provided with maternity record cards of a size to fit inside Form E.C.6 (medical record envelope).

50. **Motion** by YORK: That for cases confined in a private nursing home it should be within the power of the general practitioner in charge of the case to call upon the services of a specialist anaesthetist under the domiciliary arrangements of the National Health Service.

Ante- and Post-natal Care

51. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 159-61 and 305-6 of

the Report of the General Medical Services Committee be approved.

52. **Amendment** by NORTHAMPTONSHIRE: That antenatal examinations for patients booked for hospital may be undertaken jointly by the hospital services and the general practitioner concerned and that the general practitioner be appropriately remunerated.

Training of District Nurses (Para. 179 of Report)

53. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 179 of the Report of the General Medical Services Committee be approved.

54. **Amendment** by PLYMOUTH: That the Ministry of Health be pressed to appoint one or more additional general-practitioner representatives on the Working Party which has been set up to consider what training it is desirable that registered nurses and enrolled assistant nurses should undertake prior to their employment on home nursing duties, and the means by which such training should be provided.

Certification Certification for Surgical Corsets (Paras. 192-5 of Report)

55. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 192-5 of the Report of the General Medical Services Committee be approved.

56. **Amendment** by DERBYSHIRE: That doctors' certificates at present required for surgical corsets be abolished.

57. **Motion** by GATESHEAD: That every effort be made to secure the abolition of purchase tax on corsets.

Prescribing and Dispensing (Paras. 199-225 of Report) Discount on Drugs

58. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 199-201 of the Report of the General Medical Services Committee be approved.

59. **Motion** by DEVON AND EXETER: That this Conference feels that it is time that a settlement was arranged in the matter of discount on drugs to dispensing doctors, as they continue to suffer a loss when supplying proprietary preparations.

60. **Motion** by YORKSHIRE (EAST RIDING): That this Conference calls the attention of the General Medical Services Committee to the serious discrepancy which exists between the discount allowed by the wholesale drug houses to the dispensing general practitioners and that allowed to retail chemists; so far as many proprietary preparations are concerned this variation results in actual monetary loss to the general practitioner, and this situation must be remedied either by allowing a discount to the general practitioners comparable to that allowed to the chemists, or by compensating the general practitioners for the financial loss they experience.

Prescribing of Elastic Hosiery (Para. 208 of Report)

61. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 208 of the Report of the General Medical Services Committee be approved.

62. **Motion** by DERBYSHIRE: That the General Medical Services Committee approach the Ministry with a view to simplifying the prescription on Forms E.C. 10 for trusses and elastic hosiery so as to leave reasonable latitude to the fitter.

Prescribing of Casilan (Para. 211 of Report)

63. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 211 of the Report of the General Medical Services Committee be approved.

64. **Amendment** by BUCKINGHAMSHIRE: That high protein substances such as casilan and similar preparations be regarded as foods in all cases.

Form E.C. 10 (Para. 220 of Report)

65. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 220 of the Report of the General Medical Services Committee be approved.

66. **Amendment** by KENT AND CANTERBURY: That in the opinion of this Conference the present type of pad of Form E.C. 10 has advantages that make its retention advisable.

Economy in Prescribing

(Paras. 228-31 and 312 and 313 of Report)

67. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 228-31 and 312 and 313 of the Report of the General Medical Services Committee be approved.

68. **Motion** by BIRMINGHAM: That this Conference instructs the General Medical Services Committee to re-examine the problem of the use of E.C. 10a in England in an effort to find a method whereby the pharmacists will not lose financially by the institution of this type of prescription.

Vaccination and Immunization

(Paras. 244-5 and 316-17 of Report)

69. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 244-5 and 316-17 of the Report of the General Medical Services Committee be approved.

70. **Motion** by WEST BROMWICH: That where local health authorities adopt with the Minister of Health's consent schemes for the immunization of children against diphtheria and whooping-cough, the Ministry of Health should supply the authorities with the antigen on the same terms that they supply antigen for schemes of diphtheria immunization, and that the G.M.S. Committee take this matter up with the Ministry forthwith.

Trainee General Practitioner Scheme (Paras. 254 and 255 of Report)

71. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 254 and 255 of the Report of the General Medical Services Committee be approved.

72. **Amendment** by WOLVERHAMPTON: That the present Trainee Assistant Scheme should be discontinued because it offers no advantages over the training given to ordinary assistants by their principals.

73. **Amendment** by COVENTRY, DUDLEY, WARWICKSHIRE, WORCESTERSHIRE, and WORCESTER CITY: That in view of the fact that the Trainee General Practitioner Scheme appears to be working with diverse success in different areas of the country, the General Medical Services Committee be instructed to re-examine the scheme in order to: (a) establish some uniformity in the suitability and commitments of the trainer practitioners, and (b) eliminate abuses.

Remainder of Annual Report of General Medical Services Committee

74. **Motion** by the Chairman of the General Medical Services Committee: That the remainder of the Annual Report and Supplementary Report of the General Medical Services Committee be approved.

MATTERS NOT REFERRED TO IN ANNUAL REPORT Election of Local Medical Committees

75. **Motion** by NEWCASTLE-UPON-TYNE: That the date for triennial elections of local medical committees should be advanced in order that the new committees may be

formed prior to the annual meetings of executive councils normally held in April.

Classification of Areas

76. **Motion** by NORTHUMBERLAND: That this Conference is of opinion that any area (not being a rural area) where the average list does not exceed 1,800 should be classified by the Medical Practices Committee as a "restricted area."

Compensation

77. **Motion** by DORSET: That the rate of interest on compensation moneys be raised to 5%.

Temporary Residents

78. **Motion** by BUCKINGHAMSHIRE: That the special temporary resident fee of 5s. for inmates of convalescent homes and similar places is inadequate and should be increased.

79. **Motion** by Lincs (LINDSEY): That this Conference asks the General Medical Services Committee to give detailed consideration to the method of payment for temporary residents in holiday camps with a view to seeking the Minister's permission to add to para. 15 (3) of the distribution scheme the following amendment: "The executive council may also, at their discretion, in consultation with the local medical committee, pay at an intermediate rate in certain cases when in their view neither the higher nor the lower rate is strictly applicable."

Dependants of American Service Personnel

80. **Motion** by YORKSHIRE (EAST RIDING): That this Conference seeks an assurance that the large numbers of dependants of American Service men resident in this country for periods exceeding three months are taken into account when determining the size of the Central Pool.

Removal of Names from Doctors' Lists

81. **Motion** by DUDLEY: That in the case of a practitioner who succeeds to a death or retirement vacancy, the responsibility for tracing patients on the list of the practice, whose addresses may have changed, shall rest not with the doctor but with the executive council, who shall satisfy themselves that all avenues of inquiry have been exhausted before removing the patient from the practice list.

Charges for Prescriptions

82. **Motion** by DERBYSHIRE: That the General Medical Services Committee asks the Ministry to alter the regulations relating to the monthly rendering of shillings by dispensing doctors paid on the drug tariff so as to align them with the regulations applied to dispensing chemists.

83. **Motion** by NORFOLK: That this Conference, believing that the collection of shilling charges by dispensing doctors is not only time-consuming but distasteful and undignified to professional men, calls upon the Minister of Health to abolish it at the earliest possible opportunity.

Prescribing of Cod-liver Oil and Malt

84. **Motion** by GATESHEAD: That only prescribed amounts of cod-liver oil and malt in excess of 4 lb. be subject to reference back by the Pricing Bureau.

Certification

85. **Motion** by NORFOLK: That in cases where it is apparent from the outset that the patient will be unfit for work for a considerable time, doctors should be able to give certificates of incapacity for longer than a week from the beginning.

86. **Motion** by NORTHAMPTON: That the Hospital In-patient Certificate Form Med. 10 be redrafted to state the fitness or unfitness for work of the patient.

Supplementary Ophthalmic Service

87. **Motion** by BLACKPOOL: That O.S.C. 1 forms should be abolished.

Registration of Babies

88. **Motion** by CUMBERLAND: That the Conference instructs the General Medical Services Committee to investigate some method whereby a baby is registered with a doctor within four weeks of birth.

Local Authority Children's Committees

89. **Motion** by WEST BROMWICH: That the General Medical Services Committee open negotiations with the appropriate Government department with a view to urging that department to do all in its power to persuade local authorities: (a) to co-opt to their Children's Committees general-practitioner representation nominated by local medical committees, and (b) to arrange for the attendance of one of the authority's medical officers at all meetings of the Children's Committee.

Road Accidents

90. **Motion** by CAERNARVONSHIRE: That as the legal obligations in road accidents, whereby doctors' fees are ultimately met by the insurance companies, seldom operate, and as in the majority of cases emergency treatment fees and costs are never recovered, the executive councils, as paying bodies, be made responsible for the administrative work involved in the recovery of fees and their payment to the doctor.

Conference Dinner

91. **Motion** by CAERNARVONSHIRE: That the sum of four guineas for the Conference Dinner is excessive and that a more reasonably priced meal could be arranged.

THE DEFENCE TRUSTS

92. **Motion** by the Chairman of the Trustees: That the Report of the Trustees of the National Insurance Defence Trust and General Medical Services Defence Trust, as to action taken since the last report to the Conference (paragraph 266 of Report), be received and approved.

93. **Motion** by the Chairman of the Trustees: That the report of contributions received from local medical committees up to March 31, 1954 (M.14), be received and approved.

CHAIRMAN OF CONFERENCE

94. Elect: Chairman of Conference for Session 1954-5. (See Standing Order 14—Nominations to be handed in not later than 11 a.m. on the day of the Conference.)

CONFERENCE AGENDA COMMITTEE

95. Elect: Three members of the Conference Agenda Committee. (See Standing Order 16—Nominations to be handed in not later than 12.30 p.m. on the day of the Conference.)

ELECTION OF SIX MEMBERS OF GENERAL MEDICAL SERVICES COMMITTEE

96. Elect: Six members of the General Medical Services Committee. (See Standing Order 15—Nominations to be handed in not later than 12.30 p.m. on the day of the Conference.)

THE CLAIRE WAND FUND

97. Elect: Six Trustees of the Claire Wand Fund.
98. Receive: Annual Report of the Trustees of the Claire Wand Fund.

THE DAIN FUND

99. Receive: Annual Report of the Trustees of the Dain Fund.

DINNER COMMITTEE

100. **Motion** by the Chairman: That five members of the Conference be appointed the Dinner Committee under Standing Order 17.

GENERAL MEDICAL SERVICES COMMITTEE ELECTION OF DIRECT REPRESENTATIVES, 1954-5

The following direct representatives upon the General Medical Services Committee have been elected unopposed for the Groups mentioned:

- Group A1
Dr. W. Neil Darling (Edinburgh).
Group A2
Dr. C. J. Swanson (Aberfeldy, Perthshire).
Group A3
Dr. W. M. Knox (Glasgow).
Group A4
Dr. R. C. Hamilton (Kilmarnock).
Group C
Dr. H. F. Hollis (Leeds).
Dr. H. Thorp (Tadmorden).
Group E
Dr. Miles Parkes (Crewe).
Group F
Dr. T. J. Hargest (Clydach, Swansea).
Dr. G. P. Williams (Holyhead).
Group H
Dr. A. B. Davies (Walsall).
Group I
Dr. F. A. Smoritt (Southam, Warwicks).
Group J
Dr. C. F. R. Killick (Williton, Somerset).
Group K
Dr. R. W. McConnell (Wendover, Bucks).
Group L
Dr. J. D. R. Murray (Exmouth).
Group M
Dr. K. S. Maurice-Smith (Ely).
Group N
Dr. H. S. Howie Wood (Shanklin, Isle of Wight).
Group O
Dr. D. F. Whitaker (Guildford).
Group P
Dr. R. Green (Lewes, Sussex).
Group Q
Dr. A. Talbot Rogers (Bromley, Kent).
Group R
Dr. D. F. Hutchinson (Middlesex).
Dr. A. N. Mathias (Cricklewood, N.W.2).
Group S
Dr. C. M. Scott (New Barnet).
Dr. H. N. Rose (Ilford, Essex).
Group T
Dr. H. H. D. Sutherland (London, W.10).
Dr. M. Sorsby (London, E.5).
Group U
Dr. J. B. Young (Belfast).
In the contested Groups—namely, B, D, and G—the results were as follows:
Group B
Dr. D. T. McDonald (Belford). Elected.
Dr. F. Lishman (Bishop Auckland). Elected.
Dr. F. J. Stevenson (Carlisle).
Group D
Dr. A. Campbell (Accrington). Elected.
Dr. F. S. Catto (Manchester). Elected.
Dr. P. J. Gibbons (Liverpool). Elected.
Dr. J. M. Dove (Blackpool).
Group G
Dr. F. W. Goodwin (Leicester). Elected.
Dr. A. S. Wilson (Gosberton). Elected.
Dr. A. D. Stoker (Winstar).

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

- Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

N.H.S. HOSPITAL ACCOUNTS SUMMARIZED ENGLAND AND WALES

The England and Wales summarized hospital accounts for 1952-3¹ show that the average net weekly cost of maintaining patients in the various types of hospital was highest in the general teaching hospitals (£30 6s. 5d.), and lowest in the mental, mental deficiency, and chronic sick hospitals (£4 8s. 6d., £4 4s. 4d., and £6 11s. 9d. respectively). In general hospitals the average cost was £19 12s. 6d.

Sir Frank Tribe, in his report on the accounts as Comptroller and Auditor-General, refers to his earlier reports which mentioned defects in the systems for paying salaries and wages in hospitals, and says that these defects have not yet been eliminated. The commonest is that the same people both prepare the wages list and pay out the wages on the list; he also mentions unsatisfactory arrangements for dealing with wages unclaimed at the normal time, and failure to certify or check pay sheets and overtime claims. Weakness in store accounting persisted during 1952-3. Checking of such inventories as existed revealed deficiencies of about £71,000—at two large hospitals the deficiencies amounted to £3,319 and £3,231, the larger part arising on bedding and linen.

Scotland

Similarly summarized accounts for Scotland for the same period follow much the same pattern. Expenditure on capital account included £1,099 (the second largest item) for alterations to a motor vessel to facilitate carrying stretcher cases from the Western Isles.

PUBLIC HEALTH SERVICE

FAVOURABLE INDUSTRIAL COURT AWARD

As reported in the Supplement (March 27, p. 126), the dispute between a medical officer employed by the Renfrew County Council and the County Council with regard to her status was notified by agreement to the Minister of Labour under the Industrial Courts Act. The Minister referred the case to the Industrial Court, and the hearing took place on April 27, 1954. The terms of reference were as follows:

"To determine a difference between Renfrew County Council and Dr. Sheila Thomson concerning the category of the appointment held by her in the Health Department of Renfrew County Council for the purpose of applying the Awards of the Industrial Court Nos. 2285 and 2327 and the decisions of Committee 'C' of the Medical Council of the Whitley Councils for Health Services (Great Britain) with effect from October 1, 1950."

The case for Dr. Sheila Thomson was presented by Counsel, Mr. S. B. R. Cooke, instructed by Messrs. Hempsons, acting on behalf of the Trustees of the Public Health Service Defence Trust. The Award of the Court has now been published in document 2508 and reads as follows:

"The Court is satisfied upon the evidence before it that, however her office may have been described by the Renfrew County Council, Dr. Thomson was at the time of her appointment, and at all material times thereafter, discharging the duties of a 'Senior Medical Officer,' and the Court find and so Award that though the population of the area in which she functions is below that of an area in which a Senior Medical Officer would in future normally be appointed, Dr. Thomson is entitled while she continues to discharge her present duties, and has been so entitled from and including October 1, 1950, to be paid on a personal basis, and in accordance with the provisions of the Industrial Court Award No. 2285 as interpreted by Industrial Court Award No. 2327, the salary applicable to a Senior Medical Officer, namely, on a scale of £1,250 per annum, rising by annual increments of £50 to £1,650 per annum."

¹Accounts 1952-3, 1954. H.M.S.O., London.

MEETING OF S.H.M.O.s

Mr. G. Waring Robinson, chairman of the S.H.M.O. Group of the Sheffield Region, is calling a general meeting of S.H.M.O.s of all Regions at B.M.A. House, London, on Saturday, May 29, at 3 p.m.

Among matters on the agenda for discussion are the following: (1) Status and future of grade; (2) the effect of the recent award on the percentage difference between S.H.M.O. and consultant salaries; (3) promotion by regular review; (4) S.H.M.O.s doing consultant work; (5) future policy—(a) short term: interim measures; (b) long term: abolition of title.

Every S.H.M.O. who can is invited to attend the meeting.

Correspondence

Remuneration of Hospital Medical Staff

SIR,—So many misconceptions have been expressed about the recent negotiations on the salaries of hospital medical staffs that I must ask to be allowed to state a few facts.

It seems necessary to recall that the negotiations were conducted, and the settlement reached, by the Staff Side of Whitley "B" Committee, which contains six members of the Consultants and Specialists Committee established by the British Medical Association. When the Staff Side is being criticized, it is only fair that it should be recognized that it was the Staff Side alone who took the initiative in putting forward a claim. Indeed, as lately as in June, 1952, the Central Consultants and Specialists Committee resolved that "a formal claim" should be lodged, "but that such claim be not pressed at the present time." If we had followed that advice, we should have got nothing now. Because the Staff Side were convinced that unless action was taken at once there was great danger that the claim of the hospital medical staffs would go by default we decided to press it in Whitley immediately.

What had happened to make it so urgent? The general practitioners, having asked to be allowed to take action independently of the consultants, had obtained the Danckwerts award, and thereby, as it turned out, made it impossible for the consultants to achieve anything comparable. For the Government's immediate reaction to the award was the statement of the Chancellor of the Exchequer in July, 1952, that it was not to be regarded as applicable to other branches of the profession. Whitley procedure made arbitration unobtainable except with the consent of the other side, which was refused. We were thus left with a moral claim which the Management Side refused to meet, and which was completely unenforceable.

By negotiations we saved from the wreck £34m., which was distributed where it was most needed to redress the balance upset by the Danckwerts award and to restore the financial attractiveness of the consultant branch. There is much confusion of thought about Spens. An agreement is not invalidated because one side repudiates it: if so, the county courts could close their doors. If it is true that "Spens has gone," it went when the Chancellor made his statement before the negotiations began. But the Staff Side has never taken that defeatist view. The settlement in no way ties our hands, and our claim to cost-of-living betterment is as valid as it was before—and as unenforceable. Finally, I hope that there will be an end to attempts to exploit the dissatisfaction, which we all feel, in order to cause dissension in the profession. Can we not continue to put unity before sectional interest?—I am, etc.,

London, W.1.

W. RUSSELL BRAIN,
Chairman, Joint Consultants Committee, and
Staff Side, Whitley Committee "B."

SIR,—Part-time consultants are no longer to be allowed, for income-tax purposes, to offset practice expenses against their total earnings—unless over 50% of those earnings be derived from private practice. This is a shrewd and calculated blow against the continuation of private practice in this country, for, although the established consultant will be undisturbed, the beginner will have his difficult task made nigh impossible.

Sessional work at hospitals is surely an integral part of consultant practice, and this principle should continue to be recognized for the struggling, as well as the established, consultant. Moreover, it is in the first years of a part-time consultant appointment that the disproportionately heavy expenses come, and this at a time when sessional payments are at the lower end of the scale and without distinction award. The private side of a consultant practice is inevitably run at a loss at first, and, in my case after three years, it is still so. There is no longer "big money" to be made in private practice except by the very few; nevertheless, the value of private practice to doctor and patient cannot be overestimated: the discipline it affords acts as a leaven in maintaining the standard of medicine.

The Spens scale, with its recent modification, was calculated under the then existing interpretation of tax regulations. Its balance has now been radically changed by this new interpretation, and negotiations should be reopened. Dr. Stevenson (*Supplement*, May 8, p. 228) should be assured that there is no contentment over the results of recent negotiations. Only two consultants out of the staff of four hospitals that I visit have expressed satisfaction, and one of these did so on the grounds that only one-fifth of his income came from the N.H.S. so that the change hardly affected him. All future negotiations with the Ministry on financial matters affecting any section of the profession should be handled by one body that has the backing of the profession as a whole—the B.M.A. Such negotiations must be carried out by experienced negotiators with skilled financial advisers.—I am, etc.,

"YOUNG CONSULTANT."

SIR,—The Medical Advisory Committee of the South Shields District group of hospitals considered at its last meeting the resolutions from the senior medical staff of the Southamptons Group, published in the *Supplement* of March 27 (p. 126).

My committee, in support of the views from Southampton, passed the following resolutions: (1) The award recently announced and agreed by our negotiators in Whitley "B" Committee fully justifies the resolutions of the Southamptons Group published in the *Supplement* to the *British Medical Journal* of March 27. (2) This Committee is of the unanimous opinion that every step should be taken to bring the question of remuneration for hospital medical staffs to arbitration.—I am, etc.,

N. STRANG,
Acting Hon. Secretary,
South Shields District Hospital Group Advisory Committee.

SIR,—The flood of letters from disgusted correspondents regarding the few crusts of bread that the Ministry has condescended to throw on the bare plates of junior hospital officers is sufficient proof of the unfairness of the new salaries.

It seems fruitless to blame the negotiators for this lean pittance—there is little else they could have done, and it is no pleasant task being a negotiator. The weakness lies with the hospital officers refusing to understand the psychology of the Ministerial beast. Professional people are too few in number and too sheepish to get increases by moral means: their few votes will not affect elections. In the eyes of politicians they count for little. The man prepared to strike for an increase of £20 per annum over his £250, to give up his holidays and to go hungry for a week, has a negotiator whom Ministries respect and treat with care. Only rough methods curb those impersonal bodies whose very salaries depend on playing up to the grinding masses.

As a casualty officer working 75 hours a week at a salary of £450 per annum I was earning less per hour than the porter who could hardly write his own name. But it matters little to the Ministry, because hospitals now have more porters than junior medical officers, not to mention the redundant administrative clerks hanging about hospital corridors.

The fact is that, unless we tell our negotiators that we stand by them, and are prepared to bring hospital work to a standstill, we shall achieve little—even if we took to a century to do it. It is no use subliming our fears by talks of immorality if a strike is suggested. We are employed by the State, whose revenues come from the public, and it is only by awaking that public to the present injustice that we shall get a redress.—I am, etc.,

Kingston-on-Thames.

L. R. CELESTIN.

SIR, I notice in the report on the remuneration of hospital medical staff (*Supplement*, May 8, p. 228) that the resolution of confidence proposed by Dr. S. Cochrane was carried *unanimously*. I am sorry to Shanks was carried *unanimously*. I think this five abstentions from the vote of confidence. I think this at least might have been added.

I have noticed in the past that there is always a considerable amount of matter, contradictory matter in particular, omitted from the report of the Central Consultants and Specialists Committee meetings.—I am, etc.,

Irvine, Ayrshire.

R. DE SOLDENHOFF.

SIR, It has been some comfort to learn that the Staff Side on Committee "B" of the Medical Whitley Council has decided not to accept the award granted to S.H.M.O.s in its present form as final, and to press on for a more equitable salary scale. There is no doubt that of all the groups of hospital medical staff the S.H.M.O.s have had the worst time in the past, and the recent award has been no exception. By granting a salary rise of 50% of what the consultants receive, the gap between the two sections has been widened.

It is to be hoped that, when the claim for a better salary scale is made, all the important facts concerning the S.H.M.O. will be marshalled to support it. The negotiating body will be able to point out that the S.H.M.O. post is not a stepping-stone in a specialist career, but a permanent dead-end job, and that consequently a large group of medical men and women are compelled never to attain a higher standard than £1,950 per annum. Just how large this group is at present, and will become in the future, is a matter of the greatest importance and should not be lost sight of in the negotiations.

The S.H.M.O. grade was originally conceived to accommodate a certain limited number of specialists with lesser responsibilities than consultants: it was to be a temporary grade which would shrink and eventually disappear with the gradual retirement of its original bearers. The Management Side was not slow to see that this grade was economically advantageous, and further recruitment was encouraged, though at first restricted to a few selected specialties. By now there is hardly any specialty without new openings for assistant physicians or surgeons, as those on the S.H.M.O. salary scale are now preferably called. The candidates for these posts will be those registrars with higher qualifications, and many years of experience who, having failed to secure a consultant post, will have to accept this inferior status if they prefer to stick to their specialty rather than start over again in general practice. But it can be said without exaggeration that "once an S.H.M.O. always an S.H.M.O." Promotion from this grade is quite exceptional. Those negotiating should know that they are speaking for a very large and growing group of specialists, whose financial standing must not be allowed to drop lower.

In fixing the new salary scale some thought should also be given to the annual increments, which at £50 are very

low. There is nothing sacrosanct and immutable about these £50, and, bearing in mind that its value has decreased by some 30% since 1948, a yearly increment of £75 would not be unreasonable. Another important feature of the S.H.M.O. grade is that most posts are whole-time, and this aspect emphasizes the importance of the further resolution which was passed, that Committee "B" of the Whitley Council is to persevere with its efforts to free whole-time officers from all the restrictions imposed on them contrary to Spens.—I am, etc.,

Leeds.

L. WITTELS.

Grading of S.H.M.O.s

SIR,—The report presented by Dr. T. Rowland Hill to the Council (*Supplement*, May 15, p. 235) on the recent increases in the remuneration of hospital medical staff has shown how timely will be the meeting of S.H.M.O.s of all regions to be held at B.M.A. House on Saturday, May 29, at 3 p.m., in Committee Room B. The agenda consists of (1) status and future of the grade; (2) the recent award which has accentuated the percentage difference between the S.H.M.O. and consultant salaries. Other matters to be discussed include S.H.M.O.s doing consultant work, and formation of future policy, including representation by S.H.M.O.s on any grading committee.

S.H.M.O.s here have an opportunity of speaking with one voice, not as a separate entity but as colleagues of the general body of specialists. Dr. S. F. Logan Dahne hopes to be present at the meeting.—I am, etc.,

G. WARING ROBINSON,
Chairman,
S.H.M.O. Groups (Sheffield Region).

Leicester.

Remuneration in the Public Health Service

SIR,—I have read with interest the letters from Drs. J. Grant (*Supplement*, May 1, p. 214), E. D. Irvine (*Supplement*, April 3, p. 143), and J. V. Walker (*Supplement*, May 15, p. 245) regarding the remuneration of medical officers in the public health service. I would like to assure your correspondents that the points which they have raised have been very much in the mind of the Staff Side of Committee "C," have already been the subject of discussion, and will certainly be taken into consideration at the meeting of the Staff Side of Committee "C" on June 11, when the main business of the meeting will be a review of the present situation in the public health service.—I am, etc.,

J. B. TILLEY,
Chairman, Staff Side of Committee "C."

SIR,—The plea put forward by Dr. I. C. Monro (*Supplement*, May 8, p. 232) that the B.M.A. should take immediate steps to remedy the "raw deal" to public health medical officers should appeal to all fair-minded members of the profession. Many of us are approaching the qualifying period for what is likely to be a grossly inadequate pension after years of valuable service to the community. It is largely due to our personal exertions that any worthwhile co-ordination of the tripartite Health Service has been achieved. The M.O.H. of a population of 50-70,000 (the ideal unit as far as a famous ex-Minister of Health is concerned) is left to the mercy of his local authority in applying a maximum salary, which in any event is now below that for S.H.M.O.s or junior Civil Service medical officers. He can only reflect ruefully that had he remained in the clinical post which he held in the nineteen-thirties his maximum would now be £3,100, or the same as his pre-1948 assistants who had the foresight or opportunity to transfer to the regional hospital boards.

In no other "service" and in no other country or industry has the normal promotion from specialist to administrator been accompanied by a penalty in terms of remuneration. The Minister of Health, who directs that every authority must appoint an M.O.H. possessing special qualifications (registrable, by the way), who holds office by his favour, and reports directly to him by statute, should have

more regard to the material position of his field officers. When the Minister appoints a permanent chief medical officer to advise him on all matters in the health services he invariably selects a medical officer of health of a local authority—and not necessarily the biggest authority. Would it be too much to expect the Minister and Committee "C" of the Whitley Council to take to heart paragraphs 50 and 51 of the memorandum prepared recently by the Scottish Committee of the B.M.A. as evidence to the Committee of Inquiry into the cost of the National Health Service (*Supplement*, March 20, p. 78)? The successive reports on health services in Scotland have always been characterized by vision and practical idealism, but the memorandum referred to echoes the fate of its precursors when it states that its emphasis on prevention and the need to attract first-class M.O.H.s "may call for something of reorientation of thought at the highest level."—I am, etc.,

Kirkcaldy.

JAMES R. W. HAY.

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At Chadwick Manor, Knowle, Friday, May 28, 8 p.m., B.M.A. annual dinner dance.
BROMLEY DIVISION.—At the Royal Bell Hotel, Bromley, Friday, May 28, 8.30 p.m., business meeting.
CARDIFF DIVISION.—At Whitehall Rooms, Park Hotel, Cardiff, Wednesday, May 26, 8 for 8.15 p.m., supper meeting. Address by Mr. J. W. Tudor Thomas: "A B.M.A. Tour in the Middle and Far East" (illustrated by lantern slides). Members' wives are invited.
CITY DIVISION.—(1) At Hackney Hospital, Homerton High Street, E., Wednesday, May 26, 2 p.m., films: (a) "Industrial Dermatitis"; (b) "The Lymphatic System." (2) At Institute of Laryngology and Otology, Gray's Inn Road, W.C., Friday, May 28, 3.30 p.m., clinical meeting. Mr. Wallace Black: "Ulcers of the Mouth and Pharynx."
CITY OF DUNDEE AND COUNTY OF ANGUS DIVISIONS.—At Physiology Department, Medical School, Dundee, Friday, May 28, 8.30 p.m., Branch annual general meeting and Dundee Division annual general meeting.
DERBY DIVISION.—At Derbyshire Royal Infirmary, Friday, May 28, 8.30 p.m., annual meeting.

ENFIELD AND POTTERS BAR DIVISION.—At St. Michael's Hospital, Chase Side Crescent, Enfield, Wednesday, May 26, 8.30 p.m., 4th annual meeting.

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Barrow-in-Furness, Tuesday, May 25, 8 p.m., annual general meeting.
GRIMSBY DIVISION.—At Scartho Road Infirmary, Grimsby, Tuesday, May 25, 8.30 p.m., meeting of all medical practitioners in the area of the Division.

HAMPSTEAD DIVISION.—(1) Joint visit with the Hampstead Medical Society to Central Public Health Laboratories, Colindale Avenue, N.W. Laboratories open from 3.30 p.m. on Tuesday and Wednesday, May 25 and 26. (2) At Central Library, Finchley Road, Hampstead, N.W., Friday, May 28, 8.30 p.m., A.G.M.
HENDON DIVISION.—At Hendon Hall Hotel, Ashley Lane, N.W., Tuesday, May 25, 8.45 p.m., medico-political meeting.

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Mary Abbots Hospital, Marloes Road, Kensington, W., Friday, May 28, 8.30 p.m., joint meeting with Chelsea and Fulham, and Paddington Divisions.

KESTEVEN DIVISION.—At Grantham and Kesteven General Hospital, Grantham, Sunday, May 23, 11 a.m., meeting.

LINCOLN DIVISION.—At County Hospital, Lincoln, Thursday, May 27, 8 p.m., annual general meeting.

METROPOLITAN COUNTIES BRANCH. At B.M.A. House, Tavistock Square, London, W.C., Wednesday, June 2, 3 p.m., annual general meeting. President's address by Dr. D. F. Hutchinson: "Chairborne."

MID-ESSEX DIVISION.—At Out-patient Department, Chelmsford and Essex Hospital, London Road, Chelmsford, Wednesday, May 26, 8.15 p.m., meeting. Dr. C. Keith Simpson: "Crime and the Doctor." Members of the Legal Profession and of the Essex Constabulary are invited.

MID-HERTS DIVISION.—At Mid-Herts Wing, St. Albans City Hospitals, Friday, May 28, 8.30 p.m., clinical meeting.
MONMOUTHSHIRE DIVISION.—At Constitutional Club, Stow Hill, Newport, Tuesday, May 25, 8.15 p.m., annual general meeting.

NORTH LANCASHIRE AND WESTMORLAND BRANCH. At Duke of Edinburgh Hotel, Barrow-in-Furness, Wednesday, May 26, 12.30 for 1 p.m., lunch, followed by 5th annual meeting. Presidential Address by Dr. J. R. Turner.

NORTH MIDDLESEX DIVISION. At Southgate Town Hall, London, N., Friday, May 28, 8.45 p.m., meeting of all medical practitioners in the area of the Division. Discussion on Health Visitors and the General Practitioner.

OXFORD DIVISION.—At Maternity Department, Lecture Theatre, Radcliffe Infirmary, Oxford, Wednesday, May 26, 8.15 p.m., meeting. Dr. Roger Ormrod: "Some Recent Cases of Medico-Legal Interest."

ST. PANCRA'S DIVISION.—At Old Library, B.M.A. House, Tavistock Square, London, W.C., Tuesday, May 25, 8.30 p.m., annual general meeting.

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Tuesday, May 25, 8.30 p.m., annual general meeting.

SOUTH MIDDLESEX DIVISION.—At Great Posters, Egham, Wednesday, May 26, 8 to 10 p.m., cocktail party with local Division of British Dental Association.

SOUTH-WEST ESSEX DIVISION. At Out-patient Department, Connaught Hospital, Oxford Road, Walthamstow, E., Wednesday, May 26, 8.30 p.m., annual general meeting.

SOUTH-WEST WALES DIVISION.—At Webley Hotel, Poppit, St. Dogmaels, Cardigan, Saturday, May 29, social meeting for members and their wives commencing with cocktail party at 6.30 p.m.

SUSSEX BRANCH.—At The Assembly Room, Town Hall, Lewes, Thursday, May 27, 12.30 p.m., 32nd annual general meeting. 1 p.m., luncheon.

TOWER HAMLETS DIVISION. At St. Andrew's Hospital, Devon's Road, Bow, E., Friday, May 28, 3 p.m., clinical meeting.

WEMBLEY DIVISION.—At Wembley Hospital, Fairview Avenue, High Road, Tuesday, May 25, 9 p.m., meeting. Dr. F. E. Camps: "The Christie Case." Illustrated by lantern slides. All medical practitioners in the area of the Division and members of the Hampstead, Willesden, and Harrow Divisions are invited.

WOOLWICH DIVISION.—At Eltham and Mottingham Hospital, Passy Place, S.E., Tuesday, May 25, 8.30 p.m., annual general meeting.

YORK DIVISION.—At 17, Stonegate, York, Saturday, May 29, 8.30 p.m., annual general meeting.

Meetings of Branches and Divisions

CHELSEA AND FULHAM DIVISION

The annual general meeting was held at Fulham Town Hall on April 23. With Dr. Harnett in the chair, there were 13 members present. The following officers were elected for 1954-5:

Chairman.—Colonel W. L. Harnett.

Vice-chairman.—Dr. G. Rosemont.

Joint Honorary Secretaries.—Drs. D. J. Thomas and C. Watney Roe.

MOMBASA DIVISION

A meeting was held at the Pandya Memorial Clinic on February 25. Dr. C. Cochran was in the chair. Dr. J. R. Harnett and Mr. D. O'Keefe presented medical and surgical cases respectively, and Dr. Sheth presented a case of Plummer-Vinson syndrome.

CONFERENCE OF HONORARY SECRETARIES
OF DIVISIONS AND BRANCHES

The annual Conference of Honorary Secretaries was held in the Great Hall of B.M.A. House on May 19, with Dr. D. M. HUGHES (Hon. Secretary of the South Wales and Monmouthshire Branch) in the chair. There was a large attendance, and there was no falling off in the spate of discussion morning or afternoon. An apology for absence was reported from Dr. Gregg, Chairman of Council, who was taking a well-earned holiday.

Review of the Present Position

Dr. A. MACRAE (Secretary of the Association) reminded the Conference that it was concerned principally with the organizational side of the work, how they as secretaries could help to maintain and increase membership and make the Association of maximum benefit to every side of the profession. He went on to refer to the new plan under which annual reports of Divisions were sent to Headquarters in the summer and not as formerly at the end of the year. The new system meant that they were able to start budgeting in the early autumn so that the complete budget would be available to the Council in January. He also asked for local help in approaching members who had not paid their subscriptions and whose membership would therefore lapse at the end of the year; also those who had intimated a wish to resign. If sound reasons for resignation were given, a man should not be pressed unreasonably to reconsider his decision. Some of the reasons, however, were based on complete misconceptions.

On the subject of B.M.A. lectures, Dr. Macrae called attention to the printed rules governing them. Three months' notice must be given to Headquarters of the date on which it was desired a lecture be given.

Ethical Committees

He called attention to the new rule whereby it was necessary for the Divisions to appoint an ethical committee. Under the old rule it was possible for a Division if it had omitted to appoint an ethical committee at the annual general meeting to make use of its executive. Un- less an ethical committee were appointed the Division was not competent to handle any ethical problems in the area. A circular was going out very soon about advisory councils on occupational health. These councils, which were tripartite bodies, had been established in a relatively

small number of Divisions on the initiative of the Association. Every effort should be made to encourage the establishment of additional councils of this kind.

Headquarters hoped that honorary secretaries would get the maximum help possible from regional offices. Constructive suggestions were desired as to how the regional office might be improved and made more helpful.

Dr. Macrae said that he had offered a year ago to restart the "Occasional Letter." The majority seemed to want it, but the four letters sent out so far this session had evoked very little in the way of comment. It would help him to have criticisms and suggestions.

Discussion

In the discussion following the Secretary's address, Dr. G. C. L. WOODROFFE (South Middlesex) asked about the method of approach to those who were tendering their resignations. Should this be in the hands of the secretary or in those of the senior officers if they knew the resigning members better? The CHAIRMAN said that the great thing was that there should be contact. The best method must be left to local discretion.

Dr. S. BREST (Lambeth and Southwark) suggested that the Association subscription should be lowered in the case of the younger man. A man with large family expenses might be dissuaded from joining, especially if he was able to see his partner's copy of the *Journal*. The CHAIRMAN said that the smaller fee was not a good idea. The younger men should be told that they could spend six guineas much less profitably than on the Association. In his opinion what the Association could give was well worth six guineas for any newly qualified practitioner, whatever his domestic responsibilities.

Dr. J. A. PRIDHAM (chairman of the Organization Committee) pointed out that the subscription was a reduced one for the first five years after qualification.

In reply to a question on the non-payment of subscriptions and the method of approach to defaulters, Dr. L. S. PORTER (Assistant Secretary) said that they did all they could from Headquarters, but London was at a disadvantage when it came to approaching men on Tyneside or in Cumberland. Dr. WARING TAYLOR (Leicester and Rutland) asked whether it was possible for a member to be more than one year in arrears, and if he rejoined after an interval would he have only one year's back subscription to pay? Dr. PORTER said that it was the usual practice not to require a man to be re-elected to the Association through normal channels if, having been struck off, he paid his arrears within a reason-

able time together with any subscription then due. Discretion was used in this matter.

The Basic Unit

Mr. H. H. LANGSTON (chairman of the Constitution Committee) opened a discussion on the question: "What is the most effective area as the basic unit of the Association?" The Council, he said, had set up a Constitution Committee to review and make recommendations on the whole constitutional structure of the Association. It had the widest possible terms of reference. The Committee had decided—rightly, in his opinion—that the proper place at which to start its work was at the periphery and to look at the needs of the individual member in his local Division, instead of beginning with the Representative Body. Long discussions had already taken place on the functions of the Division. It was realized that in these days the local Division of the Association was the only place in which doctors of all types had a chance of meeting, discussing their individual problems, and informing each other about their work and the things they did. It was an ideal forum in which local difficulties could be sorted out.

He proceeded to read from what he described as a most useful memorandum which had been received from the Cornwall Division, and which set out in an admirable way the principal functions of the Association.

Mr. Langston concluded by saying that the first thing to be thought about was the size and shape of the Division from the point of view of the service which the Association could render to its members. Sizes of Divisions varied greatly. There were 17 Divisions which had fewer than 60 members; the vast majority had between 300 and 450; 13 Divisions had between 500 and 1,000 members, and one Division had over 1,000. It appeared that type of practice did not much affect attendance at divisional meetings; the size of the Division did affect it.

Views of Division Secretaries

Dr. R. B. L. RIDGE (Enfield and Potters Bar) said that his Division had adopted the principle that its function was to provide a medium for the establishment of the maximum degree of friendship and co-operation among the doctors of the area. It had been gratifying to see the development of friendship among doctors who previously had hardly recognized each other in the street. Dr. A. B. KITTLE (East Somerset) said that his was a scattered Division with 200 members, but there were large towns just beyond its border, and naturally the members preferred to go to events in those towns rather than to anything arranged locally. Dr. L. R. G. ROBERTS (Leigh, Lancs) strongly advocated the retention of small Divisions. His own was a small Division, with an average of 25% attendance at its meetings.

Dr. HOWIE WOOD (Isle of Wight) said that for geographical reasons there was little opportunity for inter-Divisional contact in his area. Other things being equal, he thought the ideal membership of a Division was, like that of the Isle of Wight, 60 or 70. Since the advent of the N.H.S. members had many more local committees to attend, and there was not so much enthusiasm for Divisional meetings as formerly.

Dr. M. E. ARNOLD (Wembley) pleaded for the retention of small Divisions which gave the ordinary member an opportunity of serving as office bearer or on the committee. Dr. ERIC TOWNSEND (Cornwall) said that his Division had some 220 members scattered over a difficult geographical area. B.M.A. lectures were well attended, but social activities did not seem to get over the difficulty. Dr. J. E. MORRISON (Stirling) uttered a warning about statistics. The bigger the Division the more "paper" members there might be so far as Divisional matters were concerned. Dr. R. P. HENDRY (Rugby) referred to the position of a Division in whose area there was another local medical society. It was well to leave clinical meetings to such a body and leave the Divisional meetings for medico-political affairs.

Dr. J. W. STARKEY (Surrey Branch and Kingston Division) said that in one of the larger Divisions in his Branch they

had tried all sorts of attractions, but succeeded in getting an attendance of only about 10%. Many of the subjects which formerly came within the sphere of Divisional meetings had now been taken over by other bodies, such as local medical committees. He thought they should hold joint meetings with local medical societies and open their own meetings to such societies. Dr. R. PETERS (Stratford) said that members in the smaller groups did get to know one another and to co-operate better than in the larger. Dr. JAMES WATSON (Dumfries and Galloway) said that his Division had been divided into east, west, and centre, and members from each of these sections in turn were elected to the chairmanship. Dr. J. M. C. GILL (Aberdeen) spoke of Divisional experience in a university city where there was a first-class medical society. He still found that clinical meetings of the Division were popular and medical film shows in great demand.

Dr. T. J. LEE (Wandsworth) said that attendance at clinical meetings was not the only criterion of Divisional activity. Every representative on his own local medical committee was a member of the executive committee of the Division. Dr. E. J. R. PRIMROSE (Sutherland) said that in his Division the attendance at B.M.A. lectures was from 65 to 75%, and at business meetings it was never less than 40% and quite frequently over 60%. Dr. G. C. L. WOODROFFE (South Middlesex) said that there were large hospitals in his area. A good plan would be to have a "cell" or nucleus in each hospital. Dr. W. WOOLLEY (Bristol) asked whether the boundary lines between Divisional areas need be quite so rigid. Members situated in contiguous Divisions were, it was true, visiting members in his own, but they had no franchise in that Division, although it was the most convenient for them from the point of view of attendance at meetings.

On a show of hands it appeared that there was a general feeling in favour of the splitting up of larger Divisions into smaller ones.

Mr. LANGSTON said that it had been a most helpful discussion. There was a strong body of opinion that the smaller Divisions were often the more active and that in them the friendly spirit was more easily evoked. In the Constitution Committee it was proposed to send out a questionnaire to Divisions on this and other subjects.

The Association and the Hospital Resident

Dr. V. COTTON CORNWALL (Merseyside Branch) opened a discussion on the service of the Association to the hospital resident. He had written to a number of his colleagues asking for the name of a house physician or surgeon who would canvass his fellows on this subject. On the opinions he had received from these people—not just their own views, but those of other people in their respective hospitals—he proposed to base his remarks. There was a feeling that the Association did much for the general practitioner and the consultant, but not much for the house officer. He dealt with certain of the complaints which appeared to be current, such as the question of off-duty time, the delay before obtaining a pre-registration post, and so on.

He suggested five ways in which Divisions could help the houseman. In centres where there were medical schools the Division might hold a reception for the newly qualified. With all these men going into hospital for their pre-registration year, Divisions might do something about making contact with them. Applications for membership should be dealt with speedily by the Branches. If it was left for the ensuing Branch Council to decide whether a person was or was not eligible there might be considerable delay before the membership went through. He suggested that Branches, when they received the list from Headquarters, if there was not going to be a Council meeting in the near future, should get the regional office to duplicate copies of the applications and send them individually to members of the Council, and elect the persons concerned in the absence of objections. It gave a bad impression if these

applications were deferred for weeks. Finally, it would be helpful if due publicity were given in the *Journal* to the fact that the Association really had the interests of these housemen at heart.

Division the Shop-window

Dr. JOAN CHAPPELL (North Middlesex Division) said that the work of Divisional secretaries was increasing at an alarming rate. She was already wondering which of her three full-time jobs to resign—honorary secretary, general practitioner, and being a wife. Headquarters sent a very adequate series of letters to the newly qualified, but more should be done at Divisional level. With regard to Dr. Cornwall's suggestions, she just could not take on any more work in her job as secretary, but if regional headquarters could supply her with addressed cards to new applicants she would insert a notice of the next Divisional meeting and perhaps a line of personal contact. The Divisional meeting should be the local shop-window of the Association, and should be worthy of more than a glance.

On the question of off-duty times, she was formerly a resident in the Merseyside area, and then they had definite off-duty times and a duty roster at the hospital. She was surprised that it did not obtain now. The Association should take it up with the Regional Hospital Board.

Dr. D. L. GULLICK (East Hertfordshire) suggested that if the members of the Branch Council were circularized with the names of candidates for election they should make a special effort to get in contact with any of them who happened to be resident in their locality.

In some general discussion Dr. M. S. ARNOLD (Wembley) urged that general practitioners might help their busy consultant colleagues by taking a little interest in the residents in the local hospital. The hospital resident was very much isolated. Dr. W. WOOLLEY (Bristol) said that his executive included one or two nominees of the local branch of the British Medical Students Association. Medical students were invited to many of their business meetings. They heard from the students about the problems which the residents themselves were rather too shy to bring forward. Dr. P. S. STERN (South Essex) said that it would be difficult to get the addresses of some members of the Division who were working in hospitals quite outside his area. Many of them were birds of passage. Dr. J. H. E. MOORE (Leeds) said that on two occasions addresses on careers in medicine had been arranged in his Division for final-year students, and there had been very large attendances. There was also a graduation lunch. He suggested a calendar of posts falling vacant which would include the dates in the year when the vacancies occurred.

Dr. H. R. FREDERICK, a member of the Organization Committee, said that he had been informed recently that there were 1,340 pre-registration house-surgeons posts, 1,100 house-physicians' posts, and something like 400 obstetricians' posts, but for some reason people as soon as they became qualified at once applied for the six months' surgical posts, and that created a lag.

Dr. J. A. PRIDHAM said that the Association was very much interested in the problem of these young people. It had been said that the hospital resident had nowhere to go to make a complaint; he was afraid to go to the management committee, and hospital administrators were laymen and would not understand his problems. He should realize that the local B.M.A. people were the ones to approach. He also reminded the meeting that the Association had a Newly Qualified and Medical Students Subcommittee. This last year or two they had been a little disturbed because the newly qualified were not joining at quite the same rate as in former years.

Other Business

Dr. J. E. MORRISON (Stirling) was unanimously elected Chairman of the Conference for 1955. It was agreed that a one-day conference should be held in 1955, and that instead of the usual dinner a rather more formal luncheon should take place.

Suggestions were invited concerning any improvement which might seem necessary in regional office machinery, but no criticisms were voiced, and Dr. G. C. L. Woodroffe (South Middlesex), who was supported from several quarters of the Conference, spoke with appreciation of the work of the Regional Offices.

The Conference concluded with thanks to the Chairman, voiced by Mr. J. D. R. Murray (South-Western Branch).

In the evening a dinner was held, under the chairmanship of Dr. D. M. Hughes, who delighted the small company with some stories of Welsh country practice. His health was proposed by Dr. J. E. Crane. Mr. H. H. Langston proposed the health of "The Ladies," to which a response was given by Mrs. James, wife of the Honorary Secretary of the Portsmouth Division. Other speeches were made by Dr. Macrae, Dr. Potter, Mr. John Pringle, Public Relations Officer, and others.

GENERAL MEDICAL SERVICES COMMITTEE

A meeting of the General Medical Services Committee was held on May 20, with Dr. A. TALBOT ROGERS in the chair. Reference was made to the death of Dr. Mabel Ramsay, the first representative of the Medical Women's Federation on the Insurance Acts Committee. It was agreed to send a message of sympathy to Dr. Ramsay's relatives.

It was reported that the Committee's accountants had examined the calculations made by the Ministry of Health into the number of doctors in the service which would be used as a basis for computing the central pool, and therefore the final settlement, for the year 1952-3, and were satisfied of the accuracy of the Ministry's figures.

The CHAIRMAN stated that the Minister had now seen the second report of the Working Party on distribution of remuneration among general practitioners and was prepared to accept it. It was the intention of the Ministry to put the scheme into operation as soon as it had been approved by the Annual Conference.

A report was received from Professor Allen, who had assisted the Association in preparing evidence for the Danckwerts inquiry, on the possibility of instituting a sample inquiry on a scale sufficient to arrive at an accurate assessment of receipts from private practice (in connexion with calculation of the size of the central pool). Professor Allen had made some suggestions and pointed out some difficulties, which will be the subject of further discussions.

Prescribing of Proprietary Preparations

A letter was placed before the Committee from the Minister of Health enclosing a draft of a letter to be sent to all practitioners asking them not to prescribe certain proprietary preparations. The CHAIRMAN said that the Minister in his speech in the House of Commons on May 10 had mentioned that he was going to ask doctors not to prescribe those preparations which fell into categories 2, 3, and 4 where it had not been possible for the Government to make suitable arrangements with the manufacturers about cost. It was felt that the way in which this question was presented in Parliament, and stressed by the B.B.C., might mean that the Minister was contemplating some restriction on doctors' powers to prescribe what they thought necessary. Accordingly, accompanied by the Deputy Secretary, he had sought an interview at the Ministry and had received an assurance that the practitioner still retained the right to prescribe such drugs as he thought proper for the care of his patients. There had been no departure from that position at all, though, as before, the practitioner might be called upon to justify the overall cost of his prescribing before the local medical committee. The Minister, however, had thought it his duty to call attention to the fact that there were certain preparations with respect to which he had completely failed to make proper costing arrangements, and therefore he was drawing attention to

these drugs to see whether doctors could not make better use of the money available by prescribing equivalents. In fairness to the drug houses the deputation had pointed out that it should be borne in mind that a number of them had used the money to carry out important research on drugs, and an assurance was given that there was no intention on the part of the Ministry to cut down the amount of money which the drug houses were prepared to spend on legitimate research, though they were rather worried about the money which drug houses were spending on advertisement in the broadest sense of the word. The CHAIRMAN thought that the practitioner's position had been safeguarded, and, to quote the words of the draft memorandum, "The Minister . . . therefore feels sure that . . . he can rely on doctors to carry on the co-operation so successfully begun."

Dr. B. CARDEW said that he was worried about this move on the part of the Ministry. The preparations which came under this restriction comprised a number of inhalants; the next group might be hormones, antibiotics, or vitamin pills in elegant form. This might have very serious ramifications so far as the profession was concerned. The Minister did not say that the drugs in these categories were unsatisfactory, only that they were too expensive.

Dr. S. WAND pointed out that the Minister was not asking them not to prescribe these drugs because they were too expensive, but because he had not been able to arrive at an agreement with the firms concerned. The words "doctors are therefore asked not to prescribe them" were the nearest thing to an order that the Minister could give them. He thought that the Committee should not associate itself with the proposed E.C.N.

Dr. H. G. DAIN said that until they were offered in the *National Formulary* the exact constituents of one or several of these drugs doctors could not be expected to prescribe something which they could not agree to be an alternative. Patients who had had these drugs already might come and say that these drugs, and these alone, relieved them.

The CHAIRMAN agreed that the wording of this E.C.N. went further than previous communications of the kind, which had said, "Save in exceptional cases where there is an overriding medical consideration, doctors should seriously consider, before ordering one of these proprietary preparations; whether there is not a standard drug to serve the same purpose," or words to that effect. He thought a case had been made for further conversations with the Ministry with a view to modification of the document to meet their position. Practitioners could give co-operation and still maintain the rights they had stood for all along.

This course was agreed to, and the Chairman, Dr. Cardew, Dr. Killick, and the Deputy Secretary were appointed as a deputation to go to the Ministry, and if necessary to the Minister himself, at the earliest possible moment.

The CHAIRMAN added that they wished to preserve the right to prescribe whatever they thought was necessary, but he hoped that doctors would keep in mind that economy was required in the Service and would not allow themselves to be encouraged to prescribe these preparations when they were satisfied that less expensive preparations were adequate.

Group Practice Loans

The question of remunerating the Committee's representatives on the Group Practice Loans Committee was considered. At the previous meeting it had been suggested that funds for this purpose might be provided from the central pool. Dr. DAIN pointed out that the guiding principle in this matter was that, whereas ordinary committee work was done voluntarily, the members of a committee being in the capacity of advisers, when representatives were appointed to a committee for a definite administrative task it was not unusual to offer them remuneration. It was also pointed out that members of the Loans Committee might be required to visit areas of certain group practices—a time-taking labour. On the motion of Dr. F. M. ROSE, seconded by Dr. FLOWIE WOOD, it was agreed to recommend to the Conference that adequate remuneration should be paid to

members of the Loans Committee, also that the Deputy Secretary should be invited to attend its meetings and give his assistance.

Reports on Schoolchildren

The Committee devoted some time to a letter from the medical officer of a local education authority stating that in the case of schoolchildren who were sent by general practitioners to consultants no report was sent to the school medical officer, who often had considerable difficulty in learning what the specialist had advised. The Committee was asked whether it would not be in the interests of the child if arrangements should be made whereby the school medical officer was informed of the contents of the report—or received a copy of it—which went to the practitioner.

The CHAIRMAN reminded the Committee of the agreement reached in 1950 with the Society of Medical Officers of Health whereby a child might be sent to a specialist by the school medical officer after prior consultation with the family doctor, to whom any special report on the child received by the medical officer should be sent.

Dr. J. C. ARTHUR said that the family doctor must be responsible for his own patients and should not divide that responsibility with the school medical officer any more than with the industrial medical officer. If the medical officer wanted information he could approach the general practitioner. The inadvisability of the automatic passing of reports was pointed out. Dr. H. D. CHAIKE suggested, after further discussion, that a good deal of heavy weather had been made about this. The Public Health Committee had approved in principle the view of the medical officer.

It was agreed that further discussion should take place in the Liaison Committee on this matter.

Three sample posters bringing to the notice of the public the need for vaccination and immunization, prepared by the Central Council for Health Education, were exhibited, and it was agreed that doctors be encouraged to exhibit some such form of poster of suitable size in their surgeries.

Other Business

Dr. G. M. HICKLEY, representing the British Dental Association on the Committee, raised certain dental matters—the reference of patients by dentists for penicillin injections, the fees payable to doctors acting as anaesthetists for dentists, and the payment of fees for arrest of haemorrhage following dental operation—and these were duly considered.

The Committee had much other business on its agenda, this being the last meeting before the Annual Conference. The business included the consideration of a draft circular from the Ministry of Health on the maternity service, a report on matters which had been the subject of discussion between representatives of the Committee and of the College of General Practitioners, and a memorandum, following a discussion at the last meeting, from the Assistants and Young Practitioners Subcommittee in support of its proposal that the regulations be amended to permit a patient to change his doctor whenever he wished.

Scottish News

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

Meetings of the G.M.S. Subcommittee (Scotland) were held on March 16 and April 29, with Dr. J. T. Baldwin in the chair.

Medical Service Committee and Tribunal Proceedings

A small Subcommittee has been appointed to consider the recommendations of the special Subcommittee of the G.M.S. Committee dealing with the question of Medical Service Committee and Tribunal procedure in England and Wales, having regard to the National Health Service

(Scotland) Act, 1947. The G.M.S. Subcommittee (Scotland) will later consult with the Department of Health on the proposed amendments submitted by the latter, together with any other proposals regarding procedure. Local medical committees will be given an opportunity of expressing their views, and the dentists and pharmacists will be invited to send observers when the matter is being discussed.

Highlands and Islands Practitioners

The Subcommittee has had under consideration for some time the possibility of setting up a special Highlands and Islands Subcommittee to look after the interests of general practitioners in the more remote areas. Consultations have been held with certain representatives from the Islands and the western seaboard for the purpose of drawing up a plan for the constitution of such a committee, and proposals have been submitted to and agreed by the G.M.S. Subcommittee. It is intended that the Highlands and Islands Subcommittee should meet in different parts of the country for the convenience of the members, and according to the nature of the business on the agenda. The procedure for the setting up of the subcommittee has commenced, and it is hoped that it will meet for the first time in the autumn.

The suggestion has been put forward that practitioners in the more isolated areas should have better opportunities for keeping their clinical knowledge up to date by an "exchange" for short periods with appropriate members of hospital staffs. It was felt that such an arrangement would benefit the practitioner and the hospital doctor, and it was decided that the Department of Health should be asked to consider the possibility of a scheme of this kind.

Inducement Payments

The following motion by the County of Orkney Executive Council was put to the Subcommittee at its last meeting:

"That the Department be urged to fulfil its promise as contained in E.C.S.(M) 2/1953, given to increase the remuneration of small island doctors from the figure of £1,000 to £1,400, as this has not been done to date."

The Subcommittee had before it a statement showing the total income of practitioners in receipt of inducement payments in certain of the Islands. It was pointed out that the Department of Health did not give an assurance that the figure of £1,000 would be increased to £1,400. Following the Dankwerts award, it was agreed "that the figure of £1,000 which has hitherto been taken in determining applications for payments as a guide to the level of net professional income normally appropriate in such cases, should be raised to £1,400." In view of the figures before it, however, the Subcommittee felt that there was good reason to discuss the matter with the Department of Health, as it appeared that in certain cases the inducement allowances being paid were inadequate.

Medical Examination of Pupil Nurses

Following representations to the Department of Health, Scottish hospitals are being authorized to pay a fee of up to one guinea for reports from general practitioners on the fitness of candidates for the nursing service. The present arrangement, however, for most of these reports to be provided by members of hospital staffs remains unaltered.

Tuberculosis Campaign

A series of propaganda drives are being held in certain areas of Scotland to encourage people to present themselves for mass radiography. The Subcommittee gave its assurance to the Department of Health that the local medical committees of the selected areas would co-operate by giving all possible support to the campaign.

Scottish Medical Practices Committee

The terms of office of Dr. A. F. Wilkie Millar as chairman and of Dr. I. D. Grant as a member of the Scottish Medical Practices Committee expired at the end

of March. Dr. Wilkie Millar was re-nominated for appointment as chairman, and Dr. J. R. Langmuir was nominated for appointment as a member of the Committee. These nominations have been accepted.

Meeting with the Department

The Subcommittee is having its next routine meeting with the Department of Health towards the end of May when the following subjects will be among those to be discussed: elimination of inflation of doctors' lists; back debits; appointment of a central committee in connexion with the recommendation in the Working Party's Second Report; admission of assistants to medical lists; removal of patients' names from lists; and remuneration of doctors with restricted lists.

Appointments to Committees

The Subcommittee's representatives on the Drug Accounts Committee for the period of three years from April 1, 1954, are Drs. A. J. Pitkeathly and Angus Cameron.

Drs. W. Gibson, I. D. Grant, W. M. Knox, and C. J. Swanson have been reappointed as the Subcommittee's representatives on the Scottish Central Medical Recruitment Committee.

PRESENTATION TO DR. A. C. BLAIR

At an informal dinner at Stirling on May 16, Dr. Andrew C. Blair, of Kilsyth, former secretary of the Stirling and Clackmannan Local Medical Committee, was presented with a cine projector and screen, and a nest of coffee tables and an occasional chair for Mrs. Blair, subscribed by the members of the Stirling Branch of the B.M.A. and practitioners on the executive council list in appreciation of the many services he had rendered to the profession, not only locally but throughout Scotland.

In making the presentation, Dr. W. L. Cuthbert, chairman of the local medical committee, referred to the active and leading part Dr. Blair had played on many B.M.A. committees in addition to his work on numerous other committees in connexion with the National Health Service. He particularly mentioned Dr. Blair's work as chairman of the subcommittee which produced an excellent pamphlet on partnerships under the National Health Service in Scotland which had been in great demand.

THE HOSPITAL TELE-TROLLEY

Visitors' hours at hospitals are necessarily limited, but a device inaugurated the other day at Acton Hospital by the Central Middlesex Group Management Committee will do much to bring the lonely and isolated in-patient into contact with the outside world. The Postmaster-General (Earl De La Warr) opened a coin-operated telephone service to be available for patients at their bedside. The instrument is brought into the ward on a trolley, plugged in, the necessary coins are inserted, button A is pressed—a thing which the Postmaster-General forgot to do when making the first call—and the patient is connected up with whomsoever he will. The obvious call is to the patient's home for a mutual "how-are-you?" but on occasion he may wish to connect himself with his place of work if business worries are on his mind, not to speak of the Postmaster-General's suggestion that he might wish to get in touch with his turf accountant; or he might ring up his private doctor, to tell him of his progress and when he expects to be discharged. The child patient, too, might get reassurance from the voice of his parents, sometimes perhaps more reassurance in that way than he would have got from the sight of them. Anyway, it is a good idea, and Acton (80 beds) is believed to be the first hospital in this country to adopt it—the idea originated in Canada.

The amenity offers possibilities of usefulness and happiness, perhaps also some of misuse, but the risk is worth

taking. The Postmaster-General could not promise that Acton's lead would be followed by hospitals generally, owing to the length of the waiting-list for private and business telephone connexions in some areas. He did, however, promise to extend it wherever possible. The first call was put through by the Postmaster-General to the Minister of Health, and from his room at the Ministry Mr. Macleod expressed his pleasure at this development, and said a few words of encouragement to the patient at whose bedside the installation stood. It was stated that a farthing profit is received on each call.

NATIONAL HEALTH SERVICE

REGIONAL HOSPITAL BOARD APPOINTMENTS

Appointments mainly to fill vacancies caused by the retirement in rotation of one-third of the members of the 14 regional hospital boards set up under the National Health Service Act in England and Wales have been made by the Minister of Health, Mr. Iain Macleod. Out of a total of 118 appointments, 88 are reappointments of retiring members; 9 appointments are still outstanding. Among those reappointed 11 are women, and of the new appointments 8 are women.

Tenure of office will be for three years—until March 31, 1957. Another one-third of the members will retire on March 31, 1955. Total membership of the boards, excluding chairmen, is 364.

Those reappointed or newly appointed for each board are as follows:

Newcastle.—Reappointed: Mr. R. C. Cherry; Mr. Jack Cohen; Mr. Peter Strong Hancock; Dr. RONALD EDWARD JOWETT; Professor FREDERICK JOHN NATTRASS; Mr. A. C. R. Punnett; Mr. R. S. VENTERS. New Members: Mr. R. A. Anderson (North Shields); Mr. Kenneth D'Alby (West Hartlepool); Mr. B. E. Cosslett (Northumberland), appointed to March 31, 1955. One appointment outstanding.

Leeds.—Reappointed: Mrs. Norah Fienburgh; Mr. Sydney Clayton Fryers; Mr. Joseph Charles Hunter; Dr. WILLIAM ANTHONY HYSLOP; The Rt. Rev. Arthur H. Morris; Mrs. Irene Barbara Shaw. New Members: Mrs. H. S. Brocklehurst (East Yorks); Dr. G. WHYTE WATSON (Shipley). One appointment outstanding.

Sheffield.—Reappointed: Mrs. Gladys Buxton; Mrs. Hilda M. Clark; Sir ERNEST FINCH; Dr. G. H. GIBSON; Mr. J. L. A. GROUT; Dr. C. S. O'FLYNN; Lieutenant-Colonel Noel Gervis Person; Mr. Walter Scholey. New Members: Mrs. D. M. Bates (Leicester); Mrs. R. M. Frears (Nottingham).

East Anglia.—Reappointed: Professor A. LESLIE BANKS; Mr. C. H. Chandler; Mr. G. M. Macfarlane-Grieve; Sir Cecil Oakes; Mr. A. L. Symonds. New Members: Mr. H. R. Buck (Newmarket, Suffolk); Mr. J. H. Threfall (Huntingdon). Two appointments outstanding.

North-west Metropolitan.—Reappointments: Mr. Frederick J. Ballard; Sir V. ZACHARY COPE; Miss K. G. LLOYD-WILLIAMS; Mr. Frederick Lawrence; Mr. Horace R. Neate; Mr. Kenneth Robinson; Mr. Anthony G. de Rothschild; Mr. A. E. Ward. New Members: Mrs. Henry Brooke (Hampstead); Dr. E. C. WARNER.

North-east Metropolitan.—Reappointed: Mr. Herbert W. Butler; Dr. GEORGE GRAHAM; Dr. J. ARTHUR MOODY; Mr. RONALD W. REID; Mr. William V. Wakefield. New Member: Dr. T. ROWLAND HILL (London). One appointment outstanding.

South-east Metropolitan.—Reappointed: Dr. CHARLES WORTHAM BROOK; the Hon. Ruth B. Buckley; Sir WILLIAM KELSEY FRY; Dr. V. F. HALL; Mr. Stanley C. Harris; Mr. James Cameron McLean; Dr. WILLIAM GORDON MASEFIELD; the Hon. Mrs. Sylvia Fletcher-Moulton. One appointment outstanding.

South-west Metropolitan.—Reappointed: Mr. H. E. HARDING; Mrs. V. F. King; Mr. Richard Sargood; Sir GEOFFREY S. TODD; Colonel C. Chieveley Williams. New Members: Mr. A. L. ABEL (London); Miss E. Balfour (Winchester); Mr. R. P. Chester (Warrford).

Oxford.—Reappointed: Mr. J. E. S. Clapp; Mr. W. C. GLEDHILL; Mr. H. A. Goddard; Sir David Lindsay Keir. New Members: Mrs. Enid Maud Lane-Fox (Aston); Mrs. Francis Agnes Tonge (Swindon).

South-western.—Reappointed: Professor ROBERT J. BROCKLEHURST; Mr. G. G. Gilmour-White; Dr. LESLIE C. HILL; Mrs.

D. E. King; Mrs. Jacquetta Marshall. New Members: Mr. P. D. Clarke (Gloucester); Mr. D. R. Llewellyn (Bath); Mr. J. R. Mackie (Crewkerne); Professor A. V. NEALE (Bristol); Dr. T. H. BUTLER (Bristol), appointed to March 31, 1956.

Wales.—Reappointed: Colonel R. D. Briercliffe; Mr. William James Canton; Mr. Thomas Evans; Mr. William Evans; Dr. EMYR WYN JONES; Provost R. M. F. PICKEN; Dr. JOHN H. O. ROBERTS; Mr. E. K. ROY THOMAS; Rev. W. Degwel Thomas. New Members: Mr. John Lloyd (Merioneth); Dr. J. P. J. JENKINS (Griffithstown); Mr. W. H. Mathias (Whitland), appointed to March 31, 1955; Mr. W. L. Davies (Boncath, Pembro), appointed to March 31, 1956.

Birmingham.—Reappointed: Mr. Albert Frederick Bradbeer; Mr. W. T. Bowen; Mr. Walter Leslie Dingley; Mr. G. O. Langley; Major Keith Needham; Dr. JOSEPH H. SHELDON; Professor ARTHUR PEREGRINE THOMSON. One appointment outstanding.

Manchester.—Reappointed: Mr. S. H. Hampson; Professor V. F. LAMBERT; Sir James Lythgoe; Dr. MILES PARKES; Sir HARRY PLATT; Mrs. Lilian A. Pratt; Mr. G. C. Sumner. New Members: Mrs. N. Beer (Didsbury, Manchester); Dr. D. W. LUXTON (Cheshire). One appointment outstanding.

Liverpool.—Reappointed: Mr. Nathaniel Birch; Mr. J. J. Cleary; Professor WILLIAM M. FRAZER; Professor H. L. SHIFFHAN. New Members: Mr. Edward Hill (Appleton, Warrington); Mr. David A. Solomon (Southport). One appointment outstanding.

NATIONAL OPHTHALMIC TREATMENT BOARD

At the annual general meeting of the N.O.T.B. Association on May 7, the chairman, Dr. J. N. Tennent, said that the amount of the present sight-testing fee would have to be re-examined in view of the recent increase in consultants' remuneration. The original sight-testing fee was directly related to the sessional remuneration of consultant staffs. The whole question would be taken up through the proper channels. Dr. Tennent gave a detailed survey of the association's activities during the year, pointing out that 21 new medical eye centres had been opened, and that the dispensing membership had increased, though there had been a slight decrease in the medical membership. He reminded members of the vast and complicated work carried out in connexion with N.O.T.B. medical eye centres. The Medical Appointments Subcommittee, under the able chairmanship of Mr. O. Gayer Morgan, had carried out its difficult task with complete impartiality and much skill. The meeting passed an amendment to Standing Orders by which the Medical Advisory Subcommittee will now have six medical members elected by the medical members of the association.

G.P.s AND HEALTH VISITORS MEET

A meeting of health visitors and general practitioners in St. Pancras Division was held at a member's house on May 18. The acting M.O.H. of the borough, the divisional medical officer for the area, and several other local authority medical officers were also present, and all welcomed the opportunity of getting to know one another. About 40 people came to the meeting, and afterwards discussed what steps were practicable to bring about greater co-operation between health visitors and general practitioners.

ANNUAL MEETING, GLASGOW, 1954

WELSH DINNER

The Welsh Dinner will be held at the Grosvenor Restaurant, Gordon Street, Glasgow, at 7.30 p.m. on Saturday, July 3. All Welsh representatives, Welsh graduates, and others with Welsh associations, accompanied by their ladies, will be welcome at this dinner. Tickets will be 30s. per head (exclusive of wines), and those wishing to attend are asked to apply with remittance to Dr. W. F. Anderson, 40, Newlands Road, Glasgow, S.3, before June 26.

G.P. REFRESHER COURSES

LOCAL AUTHORITY M.O.s ENCOURAGED TO ATTEND

The Minister of Health thinks that it would be advantageous for local authority medical officers to attend refresher courses for general practitioners arranged by the British Postgraduate Medical Federation. As well as enabling the medical officers to keep in touch with developments in clinical medicine, this would bring the authority's medical officers into closer contact with general practitioners and officers in hospital medical staff, and encourage co-operation in this way. A circular outlining the arrangements has accordingly been sent by the Ministry to all local health authorities in England (No. 12/54, dated May 10, 1954). Courses open to the medical officers would normally be intensive week-end courses, or extended courses spread over a number of weeks or months, and would be held in local hospitals.

ISLE OF MAN HEALTH SERVICE ESTIMATES REDUCED BY TYNWALD

On Tuesday, May 18, Tynwald, the Manx Parliament, passed an amendment reducing the Isle of Man Health Services Board's estimates of £552,377 by £25,000.

In proposing the amendment, Mr. H. H. Nicholls suggested that the cut could be made up for by charging patients subsistence at 3s. a day, a charge for physiotherapy and electro-medical treatment at 2s. per treatment, revising the rates of medical remuneration and making them include maternity attendances, and a charge of 50% of the cost of dental services. Mr. J. B. Molton, seconding, suggested an annual fee of £1 to be paid by everyone registered with a doctor. This would bring in £20,000 a year. He said that the Board had been asked to save £100,000, but on no point had the members agreed on how the economies could be made.

Wisdom After the Event

Deemster Sir Percy Cowley said that unless substantial cuts were made the day would soon come when the Island's health services would not be able to function because of lack of money. The Health Service Act had been passed without full realization of its implications. A means test for medical and other treatment might have to be considered. The chairman of the Board, Mr. T. C. Cowin, stated that a reduction of cost of £100,000 could be effected only by a fundamental alteration in the structure of the health services.

A resolution was approved requesting the Lieutenant-Governor, Sir Ambrose Dundas, to appoint a commission of inquiry into the whole scope of the Health Service Act.

Past History

Last year Tynwald set up a Commission to investigate the possibility of reducing the remuneration of Manx Government employees to take account of the lower rate of income tax on the Island (*Supplement*, 1953, 2, p. 83). This proposal would have affected the remuneration of members of the medical and other professions in the Island and was strenuously opposed by the British Medical Association and other professional organizations. As a result the Commission decided that it would not recommend a measure which would be resented by important sections of the community, and "possibly involving a serious administrative deadlock."

B.M.A. FILM LIBRARY

The following films have been added to the Association's film library and are now available.

The Surgery of Varicose Veins. Presented by T. J. Smith and Nephew Ltd. Colour, silent, 25 mins. 1952.
Inoculating a Plate. On permanent loan from St. Mary's Hospital Medical School. Colour, silent, 12 mins. 1951.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Good General Practice

SIR,—I was most interested in the letter from Dr. Edmond A. D. Boyd, of Vancouver, B.C. (*Supplement*, May 15, p. 244). It so happens I have an aged and widowed aunt who resides in Vancouver. Over the past 10 years or more she has been suffering from some form of arthritis which causes her much pain and has lately confined her to her home. Nearly all her friends have died, and, were it not for a small Estonian boy who calls every day to see what she needs, the lady would be very unhappily placed. If she is to have any medical attention she has to pay 25s. to the doctor and the cost of medicines. Hence she suffers alone, having been told there is no cure. From time to time I have sent her supplies of analgesics. However content the profession in Vancouver may be, there are a number of poor people who are not nearly so pleased.

In an industrial practice among patients one has known for years and sees every few weeks or months, with established diagnoses, it is quite possible to attend to 20 patients in two hours. Some are in and out of the consulting-room in the time it takes to ask for a final certificate, watch it being written, and saying, "Thank you, Doctor." Here in Bristol the general practitioner has frequent opportunities of postgraduate clinical, and other, sessions, constant contact with consultants, and the clinical material to keep himself fairly efficient in that prime necessity—diagnosis. With the advent of so many powerful chemical weapons the practitioner can now treat with confidence many conditions which were beyond him—early infected fingers, acute primary pneumonia, diabetes, anaemias, etc. He is not expected to fiddle with surgical procedures and is seldom called to deal with accidents. In these circumstances he should have ample time to examine fully the small number of doubtful cases that crop up in the average day. All branches of the profession are subject to the occasional overwhelming that occurs when four or five really serious and time-consuming cases happen to coincide.

Dr. Boyd's complacency with being paid "no more and no less" value in cash for what work he does savours more of the trade union attitude than of the traditional professional outlook that, as long as he earns enough, the doctor is not overly concerned with remuneration per item of service. The latter attitude has been more and more evident ever since 1913, when lay persons became involved in the administration of public moneys. Is this too big a price to have paid for the comforting thought that, in this country, no elderly, ailing, and impoverished person need want for medical aid and comfort?—I am, etc.,

Bristol, 6.

J. L. FAULL.

SIR,—I read with intense interest the letter written by Dr. Edmond A. D. Boyd (*Supplement*, May 15, p. 244). Dr. Boyd is a good doctor and practises medicine, which is a different thing from Dr. Stephen Taylor's idea of "good general practice" to-day. With a long experience of private practice behind me I would go further than Dr. Boyd, and, including midwifery, anaesthetics, etc., I consider 15 "services" as the optimum for the day's task of a conscientious doctor. Some three years or so ago I wrote in this journal in answer to a medical student's query: "If Mr. Watson has one spark of individualism and believes in the freedom of the individual and freedom in medicine, then avoid the N.H.S. of to-day." At that time I suggested Australia, for there the medical profession is tough and has consistently refused to be dictated to by politicians.

Latterly, I have read letters from young medical men who have settled happily in Canada, and there are great possi-

bilities for keen doctors in that country, now confirmed by Dr. Boyd. Until medicine is taken out of politics—and we have had a recent deplorable example of this association—I see no hope for general practice in this country, and the high standards set by men like Dr. Boyd, which are the only ones worth while if you practise medicine.—I am, etc.,

St. Austell.

Service Recruitment

SIR,—Your correspondent "Harvey" (*Supplement*, April 17, p. 177) was scathing in his condemnation of the R.A.M.C. because the D.M.S. Middle East had dared to control the use of antibiotics. From his indignation one would infer that he thought the order had been given to frustrate the clinicians.

The supply of drugs in the Army is governed by the yearly grant of money from the Treasury, and it is not realized that, if a particular drug is prescribed for a patient in a military hospital, then in order to meet expected demands in distant theatres a year's supply of that drug has to be stored in the central medical equipment depot. I well remember the indignation expressed by a National Service Army doctor because a particular brand of antihistamine which he had been in the habit of prescribing in civil life was unavailable, although two other varieties were stocked. The medical officer said how scandalous it was. That was three years ago, and I wonder how much money has been wasted in the Army in stocking antihistamines whose popularity has now ended. One has only to visit the medical equipment depots throughout the world to see how much money has been wasted on discarded panaceas of the past. In my experience essential drugs for the treatment of disease have always been available, and measures to avoid excessive and wasteful prescribing have become a necessity in the National Health Service.

There may be valid reasons for not joining the R.A.M.C. at present, but this is not one of them.—I am, etc.,

East Cowes, I.O.W.

N. CANTLIE.

Grading of S.H.M.O.s

SIR,—I think Dr. S. F. Logan Dahne (*Supplement*, May 1, p. 215) would like my views on the titles that can be given to hospital posts held by S.H.M.O.s. Several years ago now the Ministry of Health issued an advisory circular on this matter to hospital boards, which was in fact published in the journals at the time,¹ informing them that a post held by a senior hospital medical officer need not be officially described as, for example, a senior hospital medical officer post in anaesthetics or pathology, but that the holder of such a post could be officially described as an assistant anaesthetist or an assistant pathologist. In many hospitals since this type of title has been used, and there is no official necessity to employ the title senior hospital medical officer in the name of any post held by an officer of such rank. The phrase "senior hospital medical officer" need apply only to his grading and remuneration.—I am, etc.,

London, W.1.

Employment of Tuberculosis Visitors

SIR,—Some remarks by Dr. Robert Hardy on tuberculosis visitors and the chest clinic, quoted from your *Journal* of June 21, 1952 (p. 1355), in the *Nursing Mirror* of May 7, urge me to draw the attention of all members of the medical profession who are interested in tuberculosis work to certain anomalies which are current in the employment of tuberculosis visitors. Most employing authorities require one to possess the Health Visitors Certificate, and in the

few cases in which tuberculosis experience is acceptable without this the nurse must be prepared to accept a cut in salary of perhaps £20 per annum. In this way a newly qualified health visitor, without any previous experience of this highly specialized branch, may, indeed does, stand a better chance of obtaining a post in a chest clinic than a S.R.N. with B.T.A. certificate and perhaps many years' experience of the work.

There must be many nurses working in sanatoria who, for some reason, have been unable to take even a first part midwifery certificate, without which they cannot proceed with the health visitors course. The amount of midwifery knowledge required of tuberculosis visitors must be small indeed, as most pregnant women are hospitalized during the greater part of their pregnancy. I have long advocated the institution of a tuberculosis health visitor's certificate based on State registration plus the Certificate of B.T.A., with the year's experience of tuberculosis work necessary to gain that certificate, then the health visitors course as it stands at present. I shall be interested to know the opinions of tuberculosis officers and other interested people on this point. Would they accept tuberculosis visitors, trained for the job, in the way I have indicated?—I am, etc.,

Sonning Common, Oxon.

SHIELA D. ROBINSON.

Return of Goodwill

SIR,—At the Annual Representative Meeting at Cardiff in 1953 a resolution was passed instructing the Council of the Association to produce a scheme for the return of goodwill and to report to the Representative Body in 1954. Council referred this matter to the Amending Acts Committee of the Association, and as a member of that Committee I know what a great deal of time and thought has been given to the report which it presented to Council.

As stated in the *Supplement of the British Medical Journal* (March 20, p. 76), the Council of the Association considered the Amending Acts Committee's report at its meetings on March 9–10, and "decided to refer the scheme back for reconsideration of certain matters." Clearly, the report must have received favourable comment at that Council meeting. Now we read (*Supplement*, May 15, p. 236) that a resolution was passed at the Council meeting of May 5–6 that "the Council recommend to the Representative Body that no further action be taken." This resolution was apparently passed by Council when only 47 members (out of a total of 76) were present, by a majority of 26 votes to 16.

This matter is one of great moment to the profession, particularly at a time when the rumblings of a possible full-time salaried service are to be heard. As Dr. O. C. Carter pointed out in Council, the right to buy and sell goodwill was probably the last of the five principles of the Negotiating Committee to be abandoned. When a matter of this importance is before the Council of the Association it is usual to take a vote on a resolution before referring the matter for further consideration by one of its subcommittees. Will the Secretary of the Association please inform the profession through your columns whether such a resolution or resolutions were considered by Council on March 9–10; if so, what was the wording of the resolutions, what were the results of the voting, and how many members were present?—I am, etc.,

London, W.1.

E. C. WARNER.

* The Secretary of the B.M.A. writes: At the meeting of the Council in March there was no resolution from the Amending Acts Committee recommending approval of the goodwill scheme. What the Committee did, in accordance with the Council's instructions, was to "submit for discussion by the Council" what it believed to be the best possible scheme.

At this meeting the Council made no comment, favourable or unfavourable, on the scheme. Individual members of the Council made comments, favourable and unfavourable. A motion was adopted to consult the solicitors as

to whether such a scheme was legally practicable. A motion in the following terms was rejected:

"(1) That the scheme as presented by the Amending Acts Committee is the best that can be devised in present conditions; (2) that in view of (a) the practical difficulties of implementing the scheme, (b) the high capital outlay required by young practitioners to launch into practice, (c) the divided opinion in the profession as to the desire to introduce such a scheme, and (d) the known political resistance to such a scheme, the Council recommend to the Representative Body that no further action be taken."

An amendment to this motion was carried by a very large majority—a count was not taken—and adopted as the substantive motion. It reads as follows:

"That the scheme be presented to the Representative Body, together with a statement of the advantages and disadvantages appertaining to that scheme."

The Council then resolved to refer to the Amending Acts Committee, with the addition of co-opted members, the preparation of the statement of advantages and disadvantages, and to submit the report of the Amending Acts Committee to the G.M.S. and Private Practice Committees for their comments.

No other resolution on this subject was considered by the Council at the March meeting. The resolutions referred to above were considered on March 10. The number of members who attended the meeting on that day was 62.

Radiology on Points

SIR,—At the beginning of 1953, correspondence appeared in your columns concerning "Radiology on Points" (leading article, *Journal*, January 10, p. 86, Dr. J. W. D. Bull and Dr. Hugh W. Davies, *Supplement*, January 10, p. 11, and Dr. Henry W. Gillespie, Dr. Anthony A. Vickers, and Dr. G. Edwin Tilsley, *Supplement*, January 24, pp. 28 and 29). This correspondence expressed indignation towards the "unit" system and exposed it to some ridicule. These "unit" system and exposed it to some ridicule. These sentiments have not borne fruit. The "unit" system of recording the work of diagnostic x-ray department has been in use at many places for the whole of 1953. It is assumed that any recording system of this sort, to be of value, must be reliable, informative, and its value must be such as to justify the amount of labour involved in compiling the statistics.

The "unit" system is unreliable because at many points it has been shown that different people apply different interpretations. For instance: (a) It is known that in some departments a chest examination is counted as one "unit." If a lateral film is required it is counted as two "units." (b) An enema examination is counted as six "units." It could be argued reasonably that if the patient is screened and fully re-examined after the evacuation study this should count as a separate examination, making 12 "units" in all; and that if this is followed by an air insufflation study this should be counted as another six "units," making 18 in all. (c) It could be argued that a routine orthopaedic Smith-Petersen pin examination, which required four pairs of films and four visits by the radiographer to the theatre, should be counted as 32 "units" (eight for each visit). There is little hope of uniformity of interpretation in a system as complex as the "units" system.

The "units" system is uninformative in that it takes no account of the different types of work done in the department, in spite of the 52 listed examinations. For instance: (a) An in-patient normally requires far more attention than an out-patient, and the points value should be adjusted accordingly. (b) Patients referred from outside doctors require additional clinical and clerical work. They require more work than a hospital out-patient but less than a hospital in-patient, and should receive an intermediate correction factor. (c) Patients x-rayed on an Odelca or Watson camera unit require less film and less time in the department, but they require more radiographic and clerical staff to handle them than other out-patients. A correction factor to account for these diverse factors is necessary. (d) Children require much more attention and time than adults, and should receive an appropriate correction factor. (e) Mental patients also require more work and an appropriate correction factor. (f) Old people, particularly those coming from hospitals or homes for aged persons, require a great deal of individual attention and time,

and their "units" value also requires a suitable correction. (g) Special examinations such as those of maternity patients in labour also require special correction factors in any system such as that based on the present "units." If the "unit" system is to do what it set out to do it will become a statistician's paradise; and still a given number of "units" can have no possible means of expressing the type of work done. This is very relevant to the proportions of radiographic, clerical, and nursing staff, the number of rooms available, and the type of apparatus in them. Therefore, any "units" system requires just as much additional written information as any other conceivable recording system, and can have no intrinsic merit. The amount of time spent by staff in the calculating, sorting, and collecting of the "units" values in a department contrasts strangely with the appeals which we receive at intervals from the Ministry of Health for economy in the administration, staffing, and operation of the Health Service. Many departments have counted the number of examinations in their figures, but this is open to the same differences in interpretations which have been mentioned in paragraph 2 above.

Arguments on these lines passed through the usual channels—that is, the regional hospitals boards and boards of management of teaching hospitals—are barren, as the subject is out of their jurisdiction. May I through your columns once more appeal for the application of a little common sense, and express the hope and prayer (1) that the Ministry of Health takes note of the failure of the "units" system of recording work of diagnostic x-ray departments; (2) that the Ministry replaces the "units" system by a record of the number of patient attendances (an attendance being defined as a visit or visits of a patient to an x-ray department on any one day, made in response to one request from one clinical source of reference); and (3) that in each case this record of the number of attendances be qualified by a statement of the main types of work passing through the department, and the main sources of reference which are relevant to any additional attention which each patient may require?

The "units" figures for x-ray departments are available as a yardstick by which the administrative and technical requirements of these departments may be assessed, and it is tragically obvious that the more scrupulously honest department is being left behind in the race. As long as the "units" system is operated the only hope of progress for the local administrator is for him to sacrifice his morals on the altar of bureaucracy, to amass the largest possible "units" values on the lines which I have indicated, and then tell his conscience that this involves no cheating.—I am, etc.,

Worcester.

ANTHONY A. VICKERS.

Prescribing Costs

SIR,—Your correspondent Dr. W. Edwards (*Supplement*, May 15, p. 244) has apparently overlooked the fact that the payment of 1s. 11d. to the pharmaceutical chemist for 24 tab. codein. co. includes the dispensing fee. The purchase of these tablets—on ordinary sale—does not entail other than the selling price.—I am, etc.,

Northampton.

F. G. FLEMING.

Emergency Admissions

SIR,—Dr. H. Maitland Moir (*Supplement*, May 15, p. 246) is indeed fortunate in having no difficulty in having his seriously ill patients admitted to hospital in the Edinburgh and Midlothian area. In my area recently I have had great difficulty in getting the following cases admitted: a child with severe recurrent convulsions of acute onset and no temperature; a woman badly burned about the head, neck, and hand when she fell into a fire—she is hemiplegic; a young man almost comatose from an overdose of phenobarbitone with suicidal intent; a woman with delay in labour and maternal distress; a woman with severe hyperemesis; a young child with bronchopneumonia from an overcrowded home; and a man, in semi-coma, with bronchopneumonia.

The last case, incidentally, was a person, not on my list, who originally lived in a shack in a wood and moved to a

lodging-house when he took ill. I was on the 'phone for one and three-quarter hours before I got a hospital to admit this man. Seven hospitals refused him, the eighth took him in and cured him, and he is still combing the local golf course for lost balls, which he occasionally presents to me. I have also had the experience of having three hospitals refuse admission to a 50-year-old railway guard who collapsed and went into a coma, and whom I had diagnosed as coma due to cerebral thrombosis. A fourth hospital took him in when I stated I had a patient in a coma and I was unable to make a diagnosis.—I am, etc.,

Lanark.

THOMAS M. GLAISTER.

The Small-list Practitioner

SIR,—It might appear churlish to cavil at the excellent work done by the Working Party and the G.M.S. Committee; but one or two points require some further elucidation and amplification. In the Supplementary Report of the General Medical Services Committee (*Supplement*, May 1, p. 204) it is stated that the proposals will secure the principle of "no detriment." With the very greatest respect to the G.M.S. Committee and the Working Party, they have succeeded in securing the very greatest detriment of all—namely, insecurity of tenure. It seems now that at age 70 or over a man must learn to beg for his bread-and-butter with no absolute certainty that any will be vouchsafed him. I do not recollect that in the original Act any particular age limit is fixed for the general practitioner. Has not the Working Party somewhat overreached itself in arrogating to itself the right thus to penalize the 70's and over? It is true that "payment would not cease automatically," but who is going to do good work with the threat constantly before him? And what of those many 70's and over, single-handed or in partnership, with large lists; do not they come under the threatening review; or does the Working Party consider that a large list can be managed more easily than a small list?

Another point is this: a careful perusal of the G.M.S. Committee's report leaves me quite in the dark as to what are the Working Party's intentions regarding the inducement and hardship payments.—I am, etc.,

Ashbourne.

ROY CLAYTON.

Certificates for Temporary Residents

SIR,—Those of us practising in holiday resorts frequently see patients who have been sent for a change by their doctors while still drawing weekly certificates. They are told to see a doctor when the next certificate becomes due, but it is quite unusual for the patient to be given a letter to bring with him. May I appeal to doctors always to send a brief note? It makes things much easier, quite apart from preventing any possible laxity in certification.—I am, etc.,

St. Ives, Cornwall.

T. E. BARWELL.

Association Notices

NOTICE TO SHIP SURGEONS

MARITIME SUBCOMMITTEE

The Private Practice Committee of the British Medical Association has reappointed for the current session a Subcommittee to consider all questions affecting medical practitioners concerned with merchant shipping.

A meeting of the Subcommittee is to be held at B.M.A. House, Tavistock Square, London, W.C.1, on Wednesday, July 14, at 2 p.m., when conditions and terms of service of ship surgeons will be considered. Any doctors in active practice as ship surgeons who find it convenient to attend are invited and should, if possible, give notice by letter or telephone of their intention to be present.

A. MACRAE,
Secretary.

15 Tues.	Medical Students and Newly Qualified Practitioners Subcommittee, Organization Committee, 2 p.m.
16 Wed.	Occupational Health Committee, 10.30 a.m.
18 Fri.	Public Relations Conference, 10.30 a.m.
23 Wed.	Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, London, W.C.1), 2 p.m.

Branch and Division Meetings to be Held

BARNSELY DIVISION.—At Queen's Hotel, Barnsley, Monday, May 31, 8.30 p.m., annual general meeting.

BOURNEMOUTH DIVISION.—At Criterion Restaurant, Old Christchurch Road, Bournemouth, Friday, May 28, 8.15 p.m., supper, followed by meeting. Address by Sir Daniel Davies, K.C.V.O.: "The Doctor and To-day."

CHELSEA AND FULHAM DIVISION.—At Fulham Town Hall, Walham Green, London, S.W., Tuesday, June 1, 8.45 p.m., general meeting.

DORSET DIVISION.—At the Clinic, Glyde Path Road, Dorchester, Tuesday, June 1, 8.30 p.m., meeting. B.M.A. Lecture by Dr. G. D. Kersley: "Recent Advances in the Treatment of Rheumatic Diseases."

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, (1) Saturday, May 29, 7 to 9 p.m., sherry party. Members' wives are invited. (2) Thursday, June 3, 8.30 p.m., special meeting. Address by Dr. S. F. Logan Dahne: "Goodwill."

LANCASTER DIVISION.—At King's Arms Hotel, Lancaster, Friday, May 28, 8 p.m., annual general meeting.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Macclesfield Arms Hotel, Macclesfield, Monday, May 31, 8.45 p.m., A.G.M.

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C.1, Wednesday, June 2, 3 p.m., annual general meeting. President's address by Dr. D. F. Hutchinson.

MONMOUTHSHIRE DIVISION.—At St. Mellons County Club, Monday, May 31, 8 p.m., summer dinner dance.

NORTH-EAST SUFFOLK DIVISION.—At Royal Norfolk and Suffolk Yacht Club, Royal Plain, Lowestoft, Thursday, June 3, 7.30 p.m., dinner; 8.45 p.m., annual general meeting.

SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, June 4, 9 p.m., annual general meeting.

SOUTH LANCASHIRE AND EAST CHESHIRE BRANCH.—At Salford Masonic Hall, The Crescent, Salford, Wednesday, June 2, 12.15 p.m., reception; 12.30 p.m., luncheon; 2.15 p.m., 5th annual meeting.

SOUTH STAFFS DIVISION.—At Bell Library, Royal Hospital, Wolverhampton, Friday, May 28, 8.30 p.m., ordinary meeting.

SOUTHERN BRANCH.—At the Guildhall, Winchester, (1) Friday, June 4, 9.30 p.m. to 2.30 a.m., charities ball; (2) Saturday, June 5, 2.30 p.m., 78th annual meeting; 3.15 p.m., Winchester Address by Dr. C. B. S. Fuller: "The Antibiotics and their Effect on the Changing Form of Disease"; 4.45 p.m., visits have been arranged.

STRATFORD DIVISION.—Thursday, June 3, 3 p.m., joint visit with Ilford Medical Society to Messrs. Allen and Hanburys, Ltd., at Ware, Herts.

SWANSEA DIVISION.—Thursday, June 3, annual meeting.

TROWBRIDGE DIVISION.—At Roundway Hospital, Devizes, Wednesday, June 2, 8 p.m., annual general meeting.

WINCHESTER DIVISION.—At Guildhall, Winchester, Friday, June 4, 9.30 p.m. to 2.30 a.m., annual Divisional charity ball.

Meetings of Branches and Divisions

HAMPSTEAD DIVISION

A brains trust was held at the Hampstead Division's meeting on April 1, 1954, and was attended by about 80 members and guests. Dr. Lena Williams took the chair, and introduced Sir Walter Fergusson Hannay as question master of the team, which consisted of Miss Marghanita Laski, Dr. L. P. E. Laurent, Mr. R. S. Murley, Dr. Lindsey Batten, and Mr. Dickson Wright. A good selection of questions, some of a not too serious nature—such as, "Do fighter pilots make good mothers?"—ensured an entertaining, as well as an instructive, evening.

THE ARCHBISHOPS' COMMISSION ON DIVINE HEALING

B.M.A.'S ASSISTANCE SOUGHT

In response to an invitation to assist the Commission on Divine Healing which has been set up by the Archbishops of Canterbury and York, the British Medical Association has appointed a committee to prepare evidence for the Commission. The Commission has the following terms of reference:

"To consider the theological, medical, psychological, and pastoral aspects of 'divine healing' with a view to providing, within two or three years, a report designed to guide the Church to clearer understanding of the subject; and in particular to help the clergy in the exercise of the ministry of healing and to encourage increasing understanding and co-operation between them and the medical profession."

The Commission, it is hoped, will afford a useful service to the community by ascertaining the value of what is referred to as "divine healing." It will seek evidence, among other things, on whether unexplained recovery from prolonged or incurable illnesses is due to suggestion, spontaneous remission, or divine intervention.

Co-operation with the Clergy

The Commission will also seek evidence about co-operation between doctors and clergy. In 1947 the Council of the Association issued a statement about co-operation with the clergy, and this was agreed by the Representative Body. The statement was as follows:

"It is considered that most useful work may be done by close personal contact between doctor and clergyman, with an interchange of views and active co-operation where possible. With regard to the co-operation which can be secured at a Divisional or parochial level, it is considered that arrangements can best be left to the B.M.A. Divisions' Council of Healing any branch organization of the Churches' Council of Healing, or similar body. Joint activities might include the appointment of and co-operation with hospital chaplains and their deputies, education of the public, and informal discussions between doctors and the clergy."

In addition to the above suggestions, which in some measure have already been the custom of doctors and clergy in different parts of the country, it would seem desirable that the whole field of medical practice in relation to the work of the Church should be explored. Moral aspects in the cause, treatment, and prevention of disease cannot be overlooked, and in this field also it is desirable that there should be fuller co-operation. Medicine and the Church working together should encourage a dynamic philosophy of health which would enable every citizen to find a way of life based on moral principle and on a sound knowledge of the factors which promote health and well-being. Health is more than a physical problem, and the patient's attitude both

to illness and to other problems is an important factor in his recovery and adjustment to life. Negative forces such as fear, resentment, jealousy, indulgence, and carelessness play no small part in the level of both personal and national health. For these reasons we welcome opportunities for discussion and co-operation in the future between qualified medical practitioners and all who have a concern for the religious needs of their patients."

Information Sought

The Association's Committee has drawn up a schema in the form of a questionnaire—printed below—to guide those willing to give information, and doctors who have experience of, or who have views on, the subject are invited to co-operate by answering the questions. Full details of diagnosis should be given, with special emphasis on the nature of the case—i.e., organic, with corroborative evidence (x-ray, histological, etc.), or mental or psychosomatic. It should also be stated how long the patients have been observed prior to their recovery, and subsequently. Although the word "recovery" is used, information with regard to remission, improvement, or restoration of function, even if not complete, should be given. The identity of patients should not be disclosed unless with their approval.

QUESTIONNAIRE

I. HEALING

1. Have you, in the course of your medical practice, had first-hand experience of illness in which there has been recovery from an apparently incurable disorder?
 - (a) where, to your knowledge, there has been no spiritual ministrations;
 - (b) through spiritual ministrations—for example,
 - (i) healing services;
 - (ii) the laying on of hands;
 - (iii) unction;
 - (iv) the influence of public or private prayer; and
 - (v) pilgrimages—for example, Lourdes;
 - (c) through a non-medical agency—for example, magic, faith cures, other than religious?
2. Are any of the above practices, in your opinion, of value or attended by possible harmful effects (including the risk of delay in seeking medical advice)?
3. Have you first-hand experience of cases in which you felt that the patients' attitude to some form of religion has played a part in their recovery?
4. Were the patients members of any religious body—Christian or non-Christian?

II. CO-OPERATION BETWEEN DOCTORS AND CLERGY

1. Should measures be promoted so that the clergy, ministers, or priests can give assistance to the medical profession in dealing with the spiritual needs of their patients, their attitude to illnesses, assistance over convalescence, rehabilitation, or resettlement? If so, state what kind of measures.

2. What experience have you of co-operation between doctors and the clergy and methods through which this has been achieved?

3. Should this be encouraged and extended in general by co-operation centrally between medical and church organizations, and locally between doctors and ministry, with particular reference to hospital and general practice? If so, by what methods? Details of any other relevant experiences or opinions would be welcomed.

Information should be submitted as soon as possible, and not later than September 15, to the Secretary of the Association, from whom separate copies of the questionnaire can be obtained if required.

GENERAL MEDICAL COUNCIL

SUMMER SESSION

The summer session of the General Medical Council opened on May 25, Sir DAVID CAMPBELL presiding. Notice was received of the reappointment to the Council of Sir Cecil Wakeley, Bart., P.R.C.S., as representative of the Royal College of Surgeons for one year, of Dr. J. M. O'Connor as representative of the National University of Ireland for three years, and of Mr. R. B. Green as representative of the University of Durham for five years.

President's Address

Sir DAVID CAMPBELL opened his address from the chair by recording with deep regret the death of a former member of the Council, Professor E. P. Cathcart, who had represented the University of Glasgow from 1933 to 1946. He went on to congratulate the Chairman of the Dental Board, Sir Wilfred Fish, on his recent knighthood, and Dr. George Clark on being made a C.B.

The President went on to say that a further stage in the implementation of the Medical Act, 1950, was reached early this year when applications for full registration began to reach the office of the Council in gradually increasing numbers. Up to the present time 110 practitioners holding qualifications granted in these islands have been fully registered. Eighty-eight of the applicants for full registration obtained their Certificates of Experience on the basis of six months spent in medicine and six months spent in surgery. The others combined surgery or medicine with midwifery.

Registration of Overseas Practitioners

Since the beginning of last year practitioners holding recognized overseas Commonwealth and other diplomas who wish to obtain full registration in this country have had to furnish the Council with evidence that they have had such house-officer experience as is required of applicants from the United Kingdom, or other experience not less extensive. The Council delegated to a small committee of four members the task of assessing the experience of every applicant. This task had not been light.

The President went on to say that 721 overseas Commonwealth applicants have been fully registered. Of these, 250 qualified in Australia, 213 in South Africa, 101 in India, 69 in New Zealand, 31 in Canada, 26 in Pakistan, 19 in Ceylon, and 22 in other parts of the Commonwealth. In addition, 2 practitioners holding recognized degrees granted in Burma have been fully registered in the Foreign List.

During the same period provisional registrations were granted to 74 Commonwealth practitioners, 20 of whom subsequently obtained full registration by service in the hospitals in this country; while temporary registration under Section 8 of the Medical Practitioners' and Pharmacists' Act, 1947, was granted to 456 practitioners from Commonwealth or foreign countries, not eligible for full or provisional registration, who were thus enabled to take up postgraduate employment in our hospitals. Most of the latter group qualified in foreign countries, including 144 in Europe, 42 in America, and 23 in Egypt. The great majority of overseas applicants for temporary, provisional, or full registration came for postgraduate study.

Visitation of Medical Schools

The President said that good progress had been made by those appointed within the past two years to visit or inspect examinations and to visit medical schools. Thirty examinations in various subjects in England and Wales, 10 in Scotland, and 7 in Ireland have now been visited or inspected, while 51 visits have been made to inquire about the teaching of different subjects—21 in England and Wales, 15 in Scotland, and 15 in Ireland. The reports of the Council's visitors and inspectors will be printed and forwarded as confidential documents to the licensing bodies concerned.

Recognition of Indian Degrees

The President reported that at its meeting the previous day the Executive Committee had resolved that the degrees of the University of Agra should be recognized in respect of the Agra Medical College, of the University of Delhi in respect of the Lady Hardinge Medical College, of the University of the Punjab, India, in respect of the Anritsar Medical College, and of the University of Gauhati in respect of the Assam Medical College.

A Wrong Interpretation

"In my address last November," said Sir David Campbell, "I expressed the concern of the Disciplinary Committee at the emergence of certain professional misdemeanours in connexion with the National Health Service which had kept recurring during the past few years, and on their advice issued a warning. I have since learned that this warning has been interpreted in some quarters as indicating that these misdemeanours are widespread and as a reflection on the high general ethical standard of the profession in Great Britain."

"This was neither intended nor implied. The Minister of Health, when asked in the House of Commons on January 21 as to what steps he had taken since my statement was made, said: 'I have taken no steps since the statement made by the President of the General Medical Council, but it is fair to say that perhaps the right interpretation has not been put on what was said. As I understand, it was a warning that the General Medical Council quite rightly take a grave view of laxity in these matters, and was not an allegation that fraudulent practices or conduct were at all widespread.'"

"That reply puts the matter in its proper perspective."

Omission from the Programme

Sir RUSSELL BRAIN reminded the President of his statement at the last session about the desirability of holding a debate on medical education and the entrance upon professional life, and he was sorry to see that there was no indication of this on the programme of the present session. There was no more important or urgent subject.

The President said that certain other matters, which he could not detail in open Council, had come forward, and it was evident that the work of the Medical Disciplinary Committee might extend over the week. He fully agreed about the importance of an early debate on the subject.

Elections

Sir SYDNEY SMITH was re-elected Chairman of Business. The Finance, Executive, Pharmacopoeia, and Medical Disciplinary Committees were elected. Dr. BROCKLEHURST, Sir SYDNEY SMITH, and Mr. STONEY were reappointed by the Council as members of the Dental Board, representing the Branch Councils for England, Scotland, and Ireland respectively.

Reports of Committees

Dr. H. G. DAIN presented a report from the Pharmacopoeia Committee, which embodied a report of the Pharmacopoeia Commission, 1953-8. The Commission recommended that new monographs on important drugs and preparations for which official standards were not provided, together with additions and amendments to existing

monographs, should be published towards the end of 1955. The report included a list of the committees of the Commission now working. They numbered 22.

The Council received the annual examination returns for 1953 and details of exemptions. The summary included, in addition to the usual particulars, the total number of students admitted by licensing bodies to premedical studies during 1953, the total number of students exempted from premedical courses and examinations, and the number commencing preclinical studies.

Professor R. M. F. PICKEN said that an interesting point was the contrast between medical schools regarding exemptions from the premedical course and examination. The premedical and preclinical teachers in his school were against such exemptions. Their point was that it was a good thing for students to have a year in the university before beginning the vocational side of their studies. This was a question which would have to be considered when the Council debated the general subject of medical education.

The President pointed out the smallness of the number exempted from the premedical course by the Scottish universities. He also drew attention to the percentages of passes in the final examination in the University of Cambridge in 1953: medicine, 74%; surgery, 64%; midwifery, 60%; and in the final examination as a whole, 39%.

Professor DEAN said that Cambridge students were now required to pass all parts at the same time.

The Diploma in Public Health

Sir ANDREW DAVIDSON presented the annual returns of examinations for certificates and diplomas in public health, also the report of a special committee appointed by the Council a year ago to report on the revision of the rules on the courses of study and examinations for the diplomas or degrees in sanitary science, public health, or State medicine. He said that the D.P.H. rules had been varied at intervals in 1930, 1938, and 1948. His committee felt that the policy should be to hasten slowly, and had decided as a first step towards further revision to invite the views of a number of bodies interested in the training of practitioners for the D.P.H.

The Council agreed, on the recommendation of the special committee, that the diploma in public health granted by the University of Malaya be recognized as registrable as an additional qualification.

It was reported that the following licensing bodies in public health, etc., might be granted held no examinations in 1953: the Universities of Birmingham, Cambridge, Oxford, Sheffield, and Dublin, and the Scottish and Irish Conjoint Boards.

Visitation of Schools and Examinations

Dr. BROCKLEHURST said that the visitation of schools and methods of examination had now been going on for some time. Up to date 51 visits had been made by visitors to medical schools and 47 visits to examinations. The special committee on visitation had now discharged the functions imposed on it by the Council and felt that it could be discharged, but it realized that as a result of the visits that were being made to schools and examinations there would be a considerable number of reports sent in, and it would be desirable for a smaller body than the Council as a whole to go over these reports when they came in and to study the observations of the licensing bodies on them. It recommended the setting up of a new committee which would deal with these reports.

The recommendation was seconded by Sir HENRY COHEN, and it was agreed that a committee be set up for this purpose.

The remainder of the business of the full Council was transacted in camera, and on its conclusion, on the following day, the Medical Disciplinary Committee met and continued its sittings throughout the week.

(To be continued)

REGISTRARS GROUP COUNCIL

A meeting of the Registrars Group Council was held at B.M.A. House on May 14, under the chairmanship of Dr. P. L. ROBINSON, of Liverpool. Twenty-six registrars, representing 16 of the 19 hospital regions in Great Britain, were present. The full membership of the Council is 38—two representatives from each region. The Council normally meets twice a year, and its executive committee quarterly.

Hospital Junior Staffing

The main discussion arose on the recommendations of the Hospital Junior Staffing Subcommittee of the Central Consultants and Specialists Committee. Dr. R. M. FORRESTER, who is a member of the Subcommittee, gave a full report of the Subcommittee's deliberations and conclusions.

There was some divergence of opinion on the Subcommittee's proposal to create a new permanent grade of hospital medical staff, with two broad salary ranges (corresponding to about £700-£1,000 and £1,100-£2,000 at the pre-April, 1954, level of remuneration), to replace the S.H.M.O. and J.H.M.O. grades, and, to a large extent, the registrar grades. Some members felt that such a measure would materially assist in solving the hospital junior staffing problem.

Other members expressed the view that the only way to attract greater numbers of doctors back to hospital work after National Service was to improve appreciably the remuneration and living conditions of house officers above the pre-registration level. It was pointed out that at the end of his National Service a married medical officer normally received about £820 per annum, whereas the newly agreed remuneration of a senior house officer was £745, less deductions for residential emoluments. This, in itself, deterred an intending general practitioner from returning to hospital appointments.

It was suggested that a new grade of hospital appointment would be undesirable, since there were many senior registrars of long standing who would be compelled to accept appointments in the new grade, even though they might not be attracted to them, because they had reached a point where it would be extremely difficult for them to start a career in any other branch of medical practice. It was considered that the Government should be pressed to recognize that many senior registrars were doing work of a consultant nature, and to create additional consultant posts accordingly and reduce the senior-registrar establishment. The hospital junior staffing problem could then be re-examined, and also the need for a new grade of permanent hospital medical officer.

Termination of Senior Registrar Posts

It was reported to the Group Council that a letter from the Chairman of the Group had been published in the medical press, in which he invited senior registrars whose appointments had been terminated without prospect of other suitable posts to notify him. As a result, particulars of a number of senior registrars in this difficult position had been forwarded to the Ministry of Health, with a request that it should consider as a matter of urgency what action could best be taken to assist these registrars.

The CHAIRMAN informed the Group Council that he had written to the Central Consultants and Specialists Committee urging that the Joint Committee should be recommended to press the Ministry to (1) draw the attention of regional boards again to the fact that senior registrars who have completed four years or more may, at the discretion of advisory appointments committees, be reappointed to the same or another post in the same specialty; (2) advise boards that in this way suitable senior registrars in non-teaching hospitals may be retained indefinitely, subject to periodic reappointment or review; (3) advise boards of governors that in general a senior registrar should not spend more than three, or at most four, years in a teaching hospital; and (4) advise that "transitional" posts be more

liberally created, and the time limit for their termination, at present set at December 31, 1955, be extended until a definite decision on future hospital staffing is agreed and implemented.

Remuneration

The new salary scales for hospital medical staffs agreed in Committee "B" of the Medical Whitley Council were fully discussed. Reference was again made to the relationship between the remuneration of hospital junior staff and the present junior staffing difficulties. The proposal to seek further improvement in the salary scales of S.H.M.O.s was noted, and a resolution was passed urging that consideration should at the same time be given to the following: (1) an appreciable increase in the remuneration of senior house officers, having regard to the disparity between the present remuneration of S.H.O.s and assistants in general practice; (2) a further increase for other grades of hospital junior staff; and (3) a narrowing of the gap between the remuneration at the top of the senior registrar scale and that at the bottom of the consultant scale.

The Group Council also decided to ask that when the Staff Side of Committee "B" considered the terms and conditions of service for hospital junior staff in future a representative of the Registrars Group should be co-opted to attend the Committee with Staff Side representatives.

Cremation Certificates

It was reported that the Executive Committee had recommended the withdrawal of the Home Office advice that, when Form B of the Cremation Certificates was given by a house officer in a hospital, Form C should not be accepted if signed by a registrar, even though he were of the requisite five years' standing. The Group Council decided to recommend also that a fee should be charged for Form B when it was completed by a hospital medical officer.

Other Matters Discussed

Among other matters discussed and referred to the Executive Committee for consideration were the possibility of interchange of appointments between registrars in the United Kingdom and registrars in other parts of the Commonwealth, and the issue of a periodic bulletin from the Group Council to all registrars.

Group Council Dinner

The meeting was followed in the evening by the Second Annual Dinner of the Group Council, which took place at the Connaught Rooms, and at which Dr. D. P. Stevenson, Deputy Secretary of the Association, was the principal guest.

CENTRAL HEALTH SERVICES COUNCIL AND STANDING ADVISORY COMMITTEES

The Minister of Health has made the following medical appointments and reappointments to the Central Health Services Council and Standing Advisory Committees for the period ending March 31, 1957 (new members are denoted by an asterisk):

Central Health Services Council.—*Mr. O. M. Duthie; Dr. W. G. Masefield; *Dr. F. M. Rose; Professor Sir Harry Platt; *Dr. J. G. Scadding.

Standing Medical Advisory Committee.—Dr. K. Cowan; Sir William Gilliatt; Dr. H. Joules; Dr. W. G. Masefield; Professor Sir Harry Platt.

Standing Ophthalmic Advisory Committee.—*Mr. J. H. Daggart; Mr. R. A. Greeves.

Standing Maternity and Midwifery Advisory Committee.—Mr. Arnold Walker.

Standing Mental Health Advisory Committee.—Dr. E. J. M. Bowby; Dr. W. G. Masefield.

Standing Tuberculosis Advisory Committee.—Professor Sir Harry Platt; *Dr. F. Ridehalgh; *Dr. G. W. H. Townsend.

Standing Cancer and Radiotherapy Advisory Committee.—Sir Harold Boldero; Sir Stanford Cade; Mr. C. E. Dukes; Mr. J. A. Stallworthy; Mr. C. J. L. Thurgar; Professor R. M. Walker.

ECONOMY IN PRESCRIBING

PRESCRIBING INVESTIGATION UNIT'S WORK

Some information about the work of the Ministry of Health's Prescribing Investigation Unit has already been published in the *Supplement* (May 15, p. 243). The secretary of the General Medical Services Committee has recently received a letter from the Ministry of Health which gives a more detailed account of the results of the investigation unit's activities. The letter is reproduced in full and is as follows:

"As you know the Minister of Health adopted, after consultation with the General Medical Services Committee of the British Medical Association, a procedure for examining cases where prescribing appears unnecessarily expensive. You may be interested to see the figures showing the work of the Ministry's Prescribing Investigation Unit, which give some idea how this procedure has been working since 1950.

"The Unit has reviewed the prescribing of no fewer than 4,400 doctors in England and Wales—that is, nearly 25% of the general practitioners in the two countries. As a result, the Unit prepared first reports on 883 doctors whose costs appeared unusually high. The reports compare the doctor's costs with those of his colleagues in the area, and also analyse the prescriptions to show where excessive cost appears to have been incurred.

"On the strength of these reports, the regional medical officer visits the doctor and discusses prescribing with him. In most cases the doctor is both willing and able to reduce his costs. In my letter to you of July 8 last I said that complete figures of comparative costs were not available, but that in approximately 100 cases examined the first report showed that the average excess cost of prescriptions dispensed, as compared with the average cost in the area, was £168 per month. A further check showed that most doctors had reduced costs, but some had not: the average excess cost had been reduced from £168 to £86 a month, a saving of the order of £10,000 a month (or about £100,000 a year) in respect of these doctors alone.

"I am now able to add that in the cases of the first 200 doctors whose prescribing was examined for the second time the average reduction in cost between the first and second examinations was £128 a month, totalling about £300,000 a year.

"Seventeen cases have been referred since 1950 to local medical committees for formal investigation under the appropriate regulations, and figures for the first eight of these cases are rather revealing. At the first investigation the prescribing costs in these eight cases were on the average £668 per month higher than the average for the area; after the full investigation procedure had been completed, this figure had been reduced to £154 per month. The saving over the year in these eight cases was thus approaching £50,000.

"Excess cost is largely accounted for by the following: (a) excessive frequency in prescribing; (b) prescribing of standard drugs and dressings in unnecessarily large quantities; (c) the prescribing of expensive proprietary preparations where a less costly standard preparation might have been equally effective. Of the 17 cases so far referred, remuneration has been withheld in nine cases (the sums ranging from £25 to £250). In one case it was found that no excess cost had been incurred. The remaining cases are not yet complete.

"On these results, it can, I think, fairly be claimed that this procedure is proving effective in practice: they also illustrate the ready co-operation accorded by most doctors when the matter is brought to their attention."

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

The County Medical Officer of Health for Northamptonshire, Dr. C. M. Smith, has issued a brochure giving details of the county's health services for the use of medical practitioners. Dr. Smith has recently been elected President of the local Branch of the B.M.A.

JOINT CONSULTANTS COMMITTEE

HOSPITAL JUNIOR STAFFING

A meeting of the Joint Consultants Committee was held at the Royal College of Surgeons on May 11, under the chairmanship of Sir Russell Brain. A large proportion of the time of the meeting was given to the problems of hospital junior staffing. The Committee received representation from the Hospital Junior Staffing Subcommittee of the B.M.A. Central Consultants and Specialists Committee of the B.M.A. which has studied a great deal of statistical information which has been furnished by the Ministry, and in bearing on the subject furnished by the Ministry, and in the light of which it had prepared a comprehensive report. The Subcommittee commented upon the weaknesses of the existing staffing structure, drawing particular attention to the fact that the development of the hospital services in recent years called for a demand upon medical manpower which could not easily be met solely by the system of short-term appointments. Other factors suggested by the Subcommittee as contributing towards the problem were compulsory national service, the widening gulf between hospital work and other forms of medical practice, the lack of security, and the deterioration of promotion prospects in the non-teaching hospitals.

Two New Grades

The proposals formulated by the Subcommittee to meet the situation included the abandonment of the present rigid registrar training ladder, and the appointment of all hospital staff below the consultant, according to the needs of the hospital, within two broad salary ranges rising to—or even overlapping—the lower end of the consultant scale. At the upper levels the Subcommittee envisaged that there would be scope for part-time appointments, which could be combined with other work—for example, general practice. The Subcommittee also stressed the need to provide greater security for hospital staff below the level of consultant, including the prospect of a permanent career, and an improvement of the prospects of promotion through the non-teaching hospitals. After a lengthy discussion the proposals were referred to a subcommittee of the Joint Committee for further examination.

S.H.M.O.s and Obstetrics

A report was also placed before the Committee on the use of the S.H.M.O. grade in obstetrics and gynaecology. In 1950 the Joint Committee had agreed with the Ministry that this grade might be appropriate for certain appointments where obstetrics was practised alone. In the light of experience, however, the Royal College of Obstetricians and Gynaecologists now felt that at this level of responsibility obstetrics and gynaecology should invariably be practised together, and accordingly it urged that the use of the grade should be discontinued in this specialty. The Committee endorsed this view and decided to make representations to the Ministry accordingly.

Medical Advisory Machinery

During the course of the meeting a number of points arose which again emphasized the need to improve the medical advisory machinery of regional hospital boards, and the Committee agreed to urge upon the Ministry more the desirability of giving advice to regional boards on this subject as it has done in the case of boards of governors and hospital management committees.

Other Matters

Consideration was again given to questions affecting the retiring age and superannuation rights of psychiatrists classified as mental health officers, and the Committee decided to seek further advice from the professional bodies representing these officers before discussing the matter with the Ministry. Other subjects dealt with in a lengthy agenda included matters relating to the interpretation of the pay-

bed regulations, study leave, the employment of hospital staff on pneumoconiosis panels, the loan of hospital records, and the investigation of complaints involving members of hospital medical staffs. At the conclusion of the meeting the members of the Committee were entertained to lunch by the Royal College of Surgeons.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Remuneration of Hospital Medical Staff

SIR,—The Council of the Scottish Branch of the Society of Medical Officers of Health has, by unanimous decision, instructed me to write in the strongest possible terms expressing the Branch's disgust and indignation at your leading article (*Journal*, May 15, p. 1139) on remuneration of hospital medical staff. The Branch is particularly horrified by your reference to consultants and general practitioners as "the two most important sections of the profession." It would be unfortunate in the extreme if any doctor in the public health service were misled by your leading article into the erroneous view that his work was any whit less important to the community than that of a consultant or a general practitioner. Any practitioner of preventive and social medicine who is in danger of being so misled might do well to study Sir Sheldon Dudley's recent book *Our National Ill Health Service*,¹ with its carefully reasoned comparison of the respective values to the public of the preventive and curative services.

The B.M.A. claims to represent members in the public health service equally with members in hospital and general practice, and it certainly never refuses annual subscriptions from health officers. Yet the Association and its *Journal* persistently ignore the interests of this section of the profession. Public health work is exacting and strenuous, and the medical officer of health is the only specialist who must by law possess a postgraduate qualification; but the Association and its *Journal* seem perfectly content with a situation in which most health officers reach retirement age with a salary maximum of £1,300 (or less than that of a trainee consultant) and in which less than 1% of doctors attain the salary maximum of a consultant without distinction award. I think I am correct in stating that, out of 260 doctors in the public health service in Scotland, there are only three whose salary maxima exceed £2,500, and only about 10 with salaries between £2,000 and £2,500.

It would appear that the B.M.A., while vigorously championing the cause of hospital doctors and general practitioners, is completely oblivious to the circumstances of medical officers in local government service, in the civil service, and in non-clinical university posts. It would also appear that, despite the inevitably close connexions between medicine and nursing, the B.M.A. is unwilling to draw public attention to the fact that nursing salaries—both in preventive and in curative nursing—have failed to advance like those of other professions, and in particular to the fact that a ward sister who takes one and a half years' further whole-time training in midwifery and health visiting receives as a health visitor a salary lower than she received as a ward sister.

Already one hears curious murmurs from the public: "Is a consultant with a second-class award really worth twice the pay of the medical officer of health of a moderate-sized borough? Is an average general practitioner worth the remuneration of 1½ departmental medical officers in local government service? Is a senior registrar as valuable as 2½ ward sisters? Is a general practitioner worth the money that would provide 3½ health visitors?" It is not possible to brush aside such queries by a lordly statement that preventive and curative work cannot be compared or by asserting that doctors and nurses cannot come into

comparison. Unless the B.M.A. alters its attitude it is plain that, sooner or later, the public will take steps to reduce considerably the remuneration of hospital and general practitioners.—I am, etc.,

I. A. G. MACQUEEN,
Honorary Secretary, Scottish Branch of
Society of Medical Officers of Health.

Aberdeen.

Our National Ill Health Service, 1953. Watts and Co., London.

"We regret it if we have unwittingly caused offence to the Scottish Branch of the Society of Medical Officers of Health. The phrase to which strong exception is taken was not intended to diminish the importance of the public health service or to decry the value of the work done by medical officers of health.—ED., B.M.J.

SIR,—As junior members of the staff of one of London's oldest mental hospitals, may we make use of your columns to point out how rapidly the recent rise in salary awarded to us has been dissipated? The residential charges of this hospital have just risen, despite protests, from £156 to £208 per annum. This, allowing for tax, etc., leaves us all precisely where we were. The extraction of £208 per year from junior staff seems quite viciously excessive to us. We feel that this is a trend that should be stopped.—We are, etc.,

J. COLLINS.
W. O. HEFFERNAN.
S. MACENTEE.

RICHARD P. MICHAEL.
D. N. SELL.
L. ELAINE WOODVINE.

Southall.

SIR,—Mr. de Solderhoff states (*Supplement*, May 22, p. 281) that, while the report of the meeting of the Central Consultants and Specialists Committee described the resolution of confidence moved by Dr. Cochrane Shanks as having been carried *nemine contradicente*, it did not state that "there were at least five abstentions." When a resolution is reported as having been carried *nemine contradicente*, instead of unanimously, it is to be assumed that there were abstentions, but if the number of abstentions is not counted from the platform and announced, it is impossible for the reporter to say how many there were. Your correspondent also says that much matter, "contradictory matter in particular," is omitted from the reports of the meetings of the committee. Excisions are inevitable when a whole day's proceedings, covering perhaps forty separate items of business, have to be compressed into two or three columns of the *Supplement*, but no reporter worth his salt will fail to give as impartial and objective an account of the proceedings as he can.—I am, etc.,

YOUR REPORTER.

Remuneration in the Public Health Service

SIR,—May I support the plea made by Dr. E. D. Irvine (*Supplement*, April 3, p. 143) and subsequent correspondents for a fair deal for the whole-time medical officers in the public health service?

The level of remuneration received by all whole-time medical officers of health, whatever type of local authority they serve, should be so related to that received by general practitioners and consultants as to encourage rather than discourage entry into the public health service. This is the fundamental requirement for a just and satisfactory solution of the problem of the adequate remuneration of the medical officer of health. Neither the training he undergoes, the professional qualifications he must hold, the experience he must acquire before attaining the status of medical officer of health, nor the importance of his work warrants the deplorably low salary at present received by the majority of medical officers of health. It is to the decided advantage of preventive medicine, and therefore of the community, that the public health service should not be at a disadvantage, because of its relatively poor financial prospects, in obtaining suitable medical recruits. The relationship between the salaries of medical officers of health and other chief officers

of local authorities, and the placing of the county borough medical officer of health at the apex of a hierarchical system of remuneration, require careful consideration.

The medical officer of health should not be deprived of his just reward because of the difficulty created by the habit of relating his salary to that of other officers employed by local authorities. Has not rather too much regard been paid to population figures and the civic status of a town in computing the salaries of medical officers of health? The demands made on the professional skill of a medical officer of health serving a comparatively small area are not necessarily less than those made on his colleague serving a much larger one. The same salary scale applies to all who achieve consultant status irrespective of the minutiae of their differing duties and responsibilities. Surely those who attain the status of medical officer of health are entitled to a salary scale fixed at such a level as not to deter the best type of medical graduate from embarking on a career in the public health service. I am, etc.,

Stockton-on-Tees.

HENRY J. PETERS.

SIR,—I have noted with interest in Dr. J. B. Tilley's letter (*Supplement*, May 22, p. 281) a reference to a proposed meeting of the Staff Side of Committee "C" on June 11, to review the present situation in the public health service. Let us hope that immediate reconsideration will be given to the deputy M.O.H. of the smaller authority. Committee "C" has acknowledged, rather grudgingly, that a local authority with a population of less than 75,000 may need the services of a deputy M.O.H. and, with laudable intent, has stated that it would not be unreasonable for such a deputy to be paid a personal salary of not more than £50 above that of his assistant medical officer, if the assistant M.O.'s salary would otherwise have been equal to, or greater than, his own. The deputy M.O.H. who is fortunate enough to have an assistant with long service is well placed. The unfortunate deputy, however, whose assistant has short service with a local authority, is stranded on the recognized deputy scale—that is, two-thirds of the salary of the M.O.H.—possibly for several years until the assistant's salary approaches his own (1958 in my case). The maximum of the deputy salary scale may be appreciably less than the maximum of the assistant's scale (in my own case £67 less). Furthermore, a deputy at the present moment may find himself receiving a salary less than that which he would have received had he remained as an assistant M.O.H. (in my case £67 less).

Such glaring anomalies, which embarrass both employer and employee, could be largely eradicated by the addition of a rider to the Committee "C" recommendation to the effect that no deputy M.O.H. should receive less than he would have received had he remained as an assistant M.O.H. If this modest plea be shelved, and promises made for the future, then the least Committee "C" could do to remedy its error of omission would be to post-date any future salary increases for such deputy M.O.H.s to June 1, 1953 (the date of application of the most recent award to assistant M.O.H.s). As a member of a poorly paid branch of the medical profession I, for one, cannot afford to lose up to £117 per annum until 1958, and even then my assistant might have left and been replaced by another newcomer to local authority service. I am, etc.,

"DEPUTY M.O.H."

Hospital G.P. Liaison

SIR,—Dr. A. Lask's account (*Supplement*, May 15, p. 244) of the failure of a well and highly qualified general practitioner to secure a place on the staff of the local G.P. hospital fills me with both amazement and indignation. In my view, a G.P. hospital is one in which any G.P. in the area served by the hospital is afforded every facility for the investigation and treatment of his patients in hospital if he chooses to do so. Where any doctor is debarred from this inalienable right, that hospital is not justifying its title of "G.P. hospital." It seems to me that some investigation

JUNE 5, 1954

into the administration of this hospital of which Dr. Lask speaks, so far as the appointment of G.P. staff is concerned, is urgently necessary, for I cannot conceive any motive other than personal prejudice which would debar a G.P. holding the M.D., M.R.C.O.G. qualifications from the staff of the G.P. hospital of the area in which he works.—I am, etc.,

St. Helens, Lancs.

LOUIS CRAWFORD.

Doctor-Patient Relationship

SIR,—The recent findings of the Middlesex Executive Council that a doctor should have shown more tact and understanding and that he was casual and facetious should be the subject of a strong protest to the Minister of Health by the B.M.A. This case should never have reached the stage of an investigation. The patient should have been told that the remedy was in his own hands. Let him transfer to another doctor. The widespread publicity of such cases in the Press only reduces the doctor-patient relationship to a lower level and encourages further frivolous complaints and litigation. There was no question here of any negligence. Admittedly tact and understanding should be part of a doctor's equipment. But how can anyone who was not present at the particular consultation judge such a case? Therapeutically one gets good results in certain types by discarding both.

What other profession would put up with discipline from laymen? Would a trade unionist put up with discipline from a body consisting mostly of doctors? The whole system of executive councils needs drastic revision. Too much power is in their hands and many of them abuse it. If we must have disciplinary bodies in the N.H.S., let us at least have competent ones, and let them have power to discipline patients also. My opinions are not based solely on the case mentioned but also on recent experiences, not of a disciplinary nature, I and my local colleagues have had with our executive council. We found it dictatorial, unco-operative and completely lacking either tact or understanding. As the matters in question have not yet been settled, I prefer anonymity.—I am, etc.,

"G.P."

Peripatetic Practitioners

SIR,—The Council of the Medical Defence Union is seriously disturbed at the number of its members, mainly recently qualified or temporarily registered practitioners, who fail to furnish an address at which they can be reached by postal communications. This operates to their disadvantage in two ways: (1) they do not receive a copy of the Annual Report containing useful advice on procedure to be followed in threatened or actual litigation associated with allegations of negligence, and (2) they do not receive communications advising them that they are in arrear with their subscriptions, whereby they cease to be entitled to the benefits of membership until payment of the arrears is made good.

With the present tidal wave of medical litigation the profession is experiencing it behoves every practitioner to satisfy himself that he is not only a member of a reputable defence organization but a member "in benefit." That may be ensured by paying the annual subscription through a banker's order and checking by reference to his bank or bank statement that payment has in fact been made at the due date. There is nothing more unfortunate than for a member to seek advice and legal representation in a case only to find that he is not entitled to any assistance through failure to pay his subscription.

On a further matter which has, perhaps, a similar cause for its occurrence: The attention of the Council has been drawn to numerous members whose names have been deleted from the *Medical Register* owing to their failure to reply to communications addressed to them by the Registrar of the General Medical Council. The need for practitioners to give an appropriate address at or through which they can always be reached by telephone or letter is of para-

mount importance, and any who are in doubt about the matters mentioned above should take early steps to verify their position.—I am, etc.,

ROBERT FORBES,
Secretary, Medical Defence Union.

London, W.C.1.

POINTS FROM LETTERS

Remuneration of Hospital Medical Staff

Dr. H. V. DEAKIN (St. Austell) writes: Apropos of the recent correspondence on the remuneration of hospital staff, I write as a disinterested retired doctor with a somewhat shattered faith and pride in my profession and medicine to-day. Some time ago I wrote in this *Journal*: "To be a part-time consultant is to have the best of all worlds," and it is obviously much truer to-day. Surely this last ignominious surrender is just one of the natural consequences of another earlier surrender which led to the N.H.S. in its present deplorable form. Until medicine is taken completely out of politics the same sickening happenings will recur, and eventually it will sink to the same low level of the latter.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). The only charge made is for postage of books. A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

H.M. Forces Appointments

ROYAL NAVY

Surgeon Lieutenant T. S. Law, M.B.E., to be Surgeon Lieutenant-Commander.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel W. H. Carter has retired on retired pay on account of disability.

Lieutenant-Colonel T. G. McNie, having reached the age for retirement, has been retained on the Active List.

Majors J. S. F. Watson and A. B. Fountain to be Lieutenant-Colonels.

Major K. Greenwood has retired with a gratuity and has been granted the honorary rank of Lieutenant-Colonel.

Major W. M. Owen has retired with a gratuity.

Captain E. G. Hardy to be Major.

Short Service Commissions.—Captain O. F. Paise to be Major.

Captain E. J. Gammon has retired with a gratuity.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Colonel J. C. Hawksley, C.B.E., has been appointed Honorary Colonel of an A.E.R. unit.

Colonel D. P. Holmes, T.D., from T.A.R.O., to be Colonel.

Major (Acting Colonel) E. W. Ashworth, T.D., to be Colonel.

Major (Acting Lieutenant-Colonel) G. S. Adams, T.D., to be Lieutenant-Colonel.

Captain (Honorary Major) Marie D. Kelleher, from R.A.R.O., to be Captain, relinquishing the honorary rank of Major.

Captain H. C. Reid, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel C. J. Wells, M.B.E., has been granted the acting rank of Colonel.

Majors W. K. McCollum, T.D., C. W. Healey, M.C., T.D., R. West, J. P. Parkinson, and A. C. D. Parsons have been granted the acting rank of Lieutenant-Colonel.

Captain C. Weymes, formerly Short Service Commission, to be Captain, and has been granted the acting rank of Major.

Captain A. P. Grimby to be Major.

Captains R. M. Lang, J. G. Kennedy, N. B. Sprague, and P. J. L. Hunter have been granted the acting rank of Major.

Lieutenants (War Substantive Majors) C. Bainbridge, O.B.E., and H. A. Palmer, from Emergency Commissions, to be Majors.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel P. Howe, T.D., from Active List, to be Colonel.

Lieutenant-Colonel and Brevet Colonel H. D. Chalke, O.B.E., T.D., from Active List, to be Lieutenant-Colonel and Brevet Colonel.

Lieutenant-Colonel C. S. McKendrick, from Active List, to be Lieutenant-Colonel.

Major (Honorary Lieutenant-Colonel) R. Anderton, having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O.

Major E. R. C. Walker, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O.

Captains (Acting Majors) J. Telfer and D. N. Stewart, from Active List, to be Captains, relinquishing the acting rank of Major.

Captain (Honorary Major) H. R. Vernon, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O.

COLONIAL MEDICAL SERVICE

The following appointments have been announced: C. H. J. Baker, M.R.C.S., L.R.C.P., D.P.H., Health Officer, Federation of Malaya; J. A. Gallagher, M.B., B.Ch., B.A.O., and H. W. Wheate, M.B., B.S., D.T.M.&H., Medical Officers, Tanganyika; A. M. Baker, M.R.C.S., L.R.C.P., Medical Officer, Uganda; P. P. Clifford, M.B., B.Ch., B.A.O., D.L.O., Medical Officer, Kenya; T. Taylor, M.B., B.S., Medical Officer, Hong Kong; P. J. van den Brul, M.B., B.S., Medical Officer, British Somaliland Protectorate; R. M. Melville, M.B., Ch.B., Medical Officer, Federation of Malaya; Mrs. B. K. Perks, M.B., B.S., and W. A. St. John, M.R.C.S., L.R.C.P., Medical Officer, Leeward Islands; D. Tavarra, M.B., B.Ch., D.P.H., Medical Officer, Barbados; A. Simon, M.D., D.P.H., District Medical Officer, Seychelles.

The Coventry Division of the B.M.A. has arranged five cricket matches during June and July this year. Among their opponents will be the Birmingham doctors, on June 24.

Association Notices

ANNUAL GENERAL MEETING

Notice is hereby given that the Annual General Meeting of the Association will be held in the Bute Hall, The University, Glasgow, on Monday, July 5, 1954, at 12.30 p.m. Business: (1) Minutes of the last meeting, held on July 13, 1953. (2) Induction of President, 1954-5. (3) Balance sheet and income and expenditure account for the year ending December 31, 1953. (4) Appointment of auditors.

A. MACRAE,
Secretary.

ANNUAL CONFERENCE OF
REPRESENTATIVES OF LOCAL MEDICAL
COMMITTEES

DISCUSSIONS ON THE DISTRIBUTION SCHEME

The Annual Conference of Representatives of Local Medical Committees was held in the Great Hall of B.M.A. House, London, on Thursday, June 3. The chair was taken by Dr. W. M. KNOX (Glasgow), who was supported by Dr. A. TALBOT ROGERS, chairman of the General Medical Services Committee. Almost all the local medical committees in Great Britain and Northern Ireland were represented. The day's discussions were based principally on the Annual and Supplementary Reports of the Committee (Supplement, April 17 (p. 153) and May 1 (p. 204)).

CHAIRMAN'S REVIEW

Dr. TALBOT ROGERS, in moving approval of the Reports, said that when he addressed last year's Conference they were concerned chiefly with matters under discussion with the Ministry with a view to implementing the new scheme of distribution following the Danckwerts award. They had had a special inquiry into the number and types of doctors who had small lists; a full discussion took place in the Working Party, and the scheme, if the Conference ratified it that day, would be implemented as soon as possible. The scheme would ensure that no active practitioner would lose as a result of the new distribution of the Pool. This would be done without bringing in any form of means test. Another point was that this was the type of problem where varying conditions in different parts of the country had in the past led to differences of interpretation and administration in executive council areas. They thought it wise to ask for a central committee which would be the official arbiter.

Group Practice

On the question of group practice, this time last year they knew that there was £100,000 to be annually set aside from the Pool for the encouragement of such practice. The committee came to the conclusion that the best way to use the money was in the form of interest-free loans. Terms had been arranged by which such loans could be made and the money returned eventually to the Pool. They had set up two central committees, one for England and the other for Scotland, to administer the loans. The Scottish Com-

mittee had already met. The English Committee will be meeting very soon. These looked like being busy committees; their members might well have to visit the practices for which loans were asked, and it was believed that these members should be remunerated.

The report of the subcommittee on Medical Service Committee regulations, of which Dr. Dain had been chairman, was approved by the Conference last year. A number of amendments were suggested by that Conference. The Ministry had accepted the majority of these, and it was possible to make some modifications in the proposals. It was not possible to submit the amended regulations to the present Conference, because the Ministry felt that the Executive Councils Association should be given an opportunity to comment.

Another subcommittee, also headed by Dr. Dain, was that dealing with exchange of practices. They did not pretend to have brought forward any epoch-making change, but they did feel that if their suggestions were carried out by executive councils it would materially ease the situation for a small number of practitioners.

The committee had had the opportunity of pressing for the implementation of their policy in their written and oral evidence to the Cohen Committee. Through the Council of the Association evidence had also been presented to the Guillebaud Committee which would be followed by oral evidence in a few weeks' time.

Another report which was received with great satisfaction was the one drawn up by the Maternity Services Subcommittee, with Dr. Harrower in the chair.

During the year there had been useful liaison with other committees of the Association—the Central Consultants and Specialists Committee and the Public Health Committee. They had also set up a special committee with Dr. H. D. Chalke in the chair to look into the whole question of the care of the elderly. It was believed that the time had come to review the whole situation.

Dr. Talbot Rogers went on to describe the action taken on the Television Bill now before Parliament. Agreement had been secured whereby representatives of the Association would sit on the committee concerned with the watching of advertisement matter on commercial television. He also commented on the Amending Acts Committee, which was given the task of trying to find the best possible scheme for the return of the right to buy and sell goodwill. Members of the G.M.S. Committee had been co-opted on to the Amending Acts Committee for this purpose. The G.M.S.

Committee felt that a good attempt had been made at producing a practical scheme, but it did not feel that in the light of economic circumstances and other practical difficulties it would be possible to carry out this or any other scheme for the restoration of goodwill. His committee did not see in this scheme anything to justify them in asking the Conference to recede from the position that they took up a year ago, but they did appreciate the work put into the scheme and the opportunity given them to co-operate with the Amending Acts Committee.

With regard to the Ministry of Health, they had found during the year an increasing willingness on the part of the Ministry to hear the practitioners' point of view. There had not been the amount of direction which might have been feared when their practices became predominantly State practices. If they could establish that the Ministry could come to the committee with its problems and that the committee itself would take practical action which produced satisfactory results, he felt that they could go on as they were for many more years without feeling any tightening of the rein.

Prescribing of Expensive Drugs

On the question of prescribing of drugs, in the recent debate in the House of Commons the Minister said definitely that he proposed to ask doctors not to prescribe certain drugs. Immediately after the debate Dr. Stevenson and he sought an interview with the Ministry to see whether this meant any change in policy. It had been their policy that the general practitioner should be the sole arbiter as to what drugs he prescribed for his patients, and that was a position which would be maintained. But as responsible citizens and taxpayers and as doctors who wanted to give the best service to their patients, they should not look lightly at the idea of money being spent wastefully in any part of the Service when this would be at the cost of another part. The Ministry gave them an assurance that they did not mean any change of policy. General practitioners would still be free to prescribe whatever drugs they thought proper, though a practitioner would still be required to justify persistent over-prescribing.

Dr. Talbot Rogers concluded by saying that during the coming year there would be discussions with the Financial Secretary of the Ministry about the whole make-up of the Pool. They were not satisfied that the expense ratio as worked out for the previous year should stand. Another matter which they were taking up with the Ministry was as to the right and proper amount of money to be agreed as the earnings from private practice when calculating the Pool. That would be a matter of report to the Conference next year.

REMUNERATION

Back Debits and Back Credits

Dr. R. A. PAUL (Middlesex) moved that the Conference should recommend the abolition of back debits and back credits.

Dr. J. T. BALDWIN (G.M.S. Committee) said that at a meeting in Scotland this question had been discussed and the Department of Health would be quite happy to accept the suggestion for the abolition of back debits and back credits if there was a feeling in England and Wales to that effect.

Dr. TALBOT ROGERS said that if they wanted to abolish back debits and back credits entirely it would mean that they could not apply for back credits for Service men later. The Middlesex motion was lost by a large majority.

The Danckwerts Award and the Small-list Practitioner

Dr. G. N. GROSE (Middlesex) moved as an amendment to the report of the Working Party that those members eligible for supplementary payment as defined in paragraph 5 (ii) (a) of the Second Report of the Working Party should include doctors who would have been eligible to be in receipt of a fixed annual payment at March 31, 1953, if

they had applied. He said that a number of practitioners in Middlesex had refused to apply for fixed annual payments, which they felt was a form of charity and at the expense of their fellow-practitioners. It seemed unjust that this group should now be precluded from the supplementary payment.

Dr. A. B. DAVIES (G.M.S. Committee) said that judging from this and other amendments which were coming forward there was an idea that the Working Party could produce golden eggs on demand for anyone. Hard cases made bad law. There might be a few practitioners who felt that they were not benefiting as well as they should from this scheme, but if the door were opened to this and all the other claims he did not know from what source the money was to come. There was no pool for extra bonuses for anybody and everybody.

Dr. B. CARDEW (G.M.S. Committee) thought the Working Party scheme a generous one. The amendment would open the door too widely to all sorts of categories which were never intended to come under benefit. But there were borderline cases which should be sympathetically considered by the central committee. That committee should have the right to exercise some degree of latitude within well-specified limits. He thought an assurance should be obtained from the Ministry on this point.

Dr. TALBOT ROGERS, in reply to Dr. R. LAWRENCE (Assistants and Young Practitioners Subcommittee), said that when the estimate of 1,200 small-list single-handed practitioners was made it was not supposed that it covered the exact number suffering hardship. By and large, however, they had here a scheme which did cover the difficulty and had been accepted by the Government. It was possible they had tied it up too tightly, and that latitude should be exercised. He agreed with Dr. Cardew that the regulations should not be too rigid, and thought that the central committee when it began its work would produce a kind of case law for itself and find a way of helping really deserving cases.

The Middlesex amendment was withdrawn on the understanding that the matter would be looked into.

Dr. MADDOCK-JONES (Caernarvonshire) asked that a similar amendment in his name should be referred to the committee.

Dr. TALBOT ROGERS said that his committee would accept the reference, but he could not accept an implication in the Caernarvonshire amendment that rural practitioners had been ignored in this arrangement.

Dr. T. K. COOKE (North Riding) moved:

That it is unjust that the additional payment which is to be made to the single-handed small-list doctor should not also apply to the small-list doctors in partnership.

He said that these doctors were slightly worse off last year than in the final year before the scheme.

Dr. TALBOT ROGERS hoped that the Conference would not pass this amendment. They had had enough difficulty already in getting agreement about the small-list, single-handed practitioner.

The amendment was lost.

Dr. COOKE proceeded further to move:

That in all cases regard should be taken of the total professional income.

Surely it was axiomatic that payments should be for a full day's work. Were practitioners with 300 on their N.H.S. list doing a full day's work? Such practitioners would probably see only four or five patients a day. Doctors who had small N.H.S. lists had probably a large number of private patients. If they restricted their lists why should they be given £350 fixed annual payment? In his view it was ridiculous. Many of them also held public health appointments.

Dr. TALBOT ROGERS said that the proposal would involve a means test, which would not be liked. He thought it would be a retrograde step to pass this amendment in order to pick out one or two people to whom they had been over-generous.

This amendment also was lost.

Dr. J. E. DARLOW (Holland, Lincs) moved:

That this Conference congratulates the Working Party on their report, but regrets that no provision has been made for elderly practitioners with lists under 300, who have been in receipt of a fixed annual allowance, and recommends that provision should be made to help this gradually diminishing number of practitioners, subject to the approval of the local medical committee.

He said that the Working Party had done a good job of work but rather at the expense of one type of practitioner—namely, the elderly—who now would lose everything except his capitation fee.

Dr. TALBOT ROGERS said that this was an agreed scheme. The Ministry was looking upon this as a subsidy to small practices. It had been urged that there should be an age limit (70) for practitioners; this had been resisted, but the Ministry did not feel that they could ask the Treasury to go on subsidizing people who were over an age at which they might retire. They had to agree that such a doctor must be shown to be doing an appreciable amount of work, and that was the reason for laying down the size of list at 300 patients.

The Lincolnshire amendment was lost.

Dr. C. J. GROSCH (London) moved:

That no doctor shall receive both supplementary payments under the scheme for small-list practitioners and an initial practice allowance, but any doctor who is eligible for both shall have the option to choose either.

He said that this was brought forward to clarify the position. They thought in London that doctors should choose which method of payment they would prefer.

It was agreed that this motion be referred to the committee, Dr. Talbot Rogers saying that they did not visualize a doctor receiving both payments.

Monthly Payments to General Practitioners

Dr. N. NELSON (Dundee) moved:

That general practitioners should be paid monthly on first application, to be continued until further notice, and this without any plea of hardship.

He knew of no other people in the National Health Service who were paid quarterly. This concession could be made with very little trouble.

Dr. WATSON said that in Birkenhead any practitioner might receive his payments monthly without any formality whatever.

The motion was carried.

Machinery for Filling Practice Vacancies

Dr. J. C. MCMASTER (Somerset) moved:

That all necessary steps should be taken to reconstitute the Medical Practices Committee as an appellate committee only in respect of appointments to vacancies in general practice by executive councils in consultation with local medical committees.

He said that vacancies in the West Country were rather popular. They had one vacancy recently for which they had 128 applicants. A great deal of time was spent in preparing a short list and asking certain people to be interviewed. When the matter went forward to the Medical Practices Committee, however, the local body received the criticism that they should have interviewed at least 10% of the applicants. They had only to think what that would have meant in time and expense.

Dr. TALBOT ROGERS said that what Somerset proposed was in line with the present policy of the Conference. This was a matter which would come up again in the near future.

The Somerset motion was carried.

Allocation of Patients to General Practitioners

Dr. C. T. MILLS (Worcestershire) moved:

That the Committee be requested to press for the provision of whatever machinery may be necessary so that when a patient is being attended by a registered practitioner other than his or her National Health Service practitioner and without the latter's

consent the National Health Service practitioner should be permitted, if he so desires, to have the patient removed from his list immediately.

He said that in Worcester they had had two cases of serious difficulty arising from the fact that the practitioner had no legal right to withdraw from a case even when it would appear in the best interests of the patient to do so. In one case the N.H.S. doctor referred the patient to a specialist who, after investigation, wished to admit the patient to hospital. This the patient refused and called in another non-N.H.S. doctor, against the wishes of his practitioner, yet at the same time he refused to relieve the N.H.S. practitioner of his responsibility for him.

Dr. J. A. PRIDHAM (G.M.S. Committee) asked them to consider the position of a doctor away from his practice by reason of illness, the practice being run by a deputy, and of a patient who did not want to be treated by the deputy and went to another doctor whom he was willing to pay, but at the same time he wished to remain on the former doctor's list. There were many anomalies of a similar sort, and by such a motion as Worcester proposed they would lay themselves open to legislate for hard cases which would bring in difficulties best avoided.

Dr. TALBOT ROGERS said that there were considerable ethical implications about this motion.

Dr. MILLS said that he still thought that the position was one for which a solution must be found. He was willing, however, to have it referred to the committee.

The motion was referred to the committee.

Reinstatement of Ex-Service Men on Doctors' Lists

Dr. W. G. MURRAY-BROWNE (Gloucestershire) moved:

That, as a National Service man's name is automatically removed from his doctor's medical list when he is called up, it should be automatically returned to the same doctor's medical list when he is discharged from the Forces.

He did not think that the procedure set out in the Annual Report (paras. 103-5) was sufficiently strong.

Dr. A. J. JOHNSON (Norfolk) said that he took a census of 50 or 60 National Service men who handed in their cards in his own practice. Of this number 18 handed in their cards within 6 months, 17 within 6 months to 2 years, and 25 within 2 years to 5 years. In almost all cases they handed their cards in when they wanted some service.

Dr. KENNEDY (Isle of Wight) said that as a National Service man's name was automatically removed from his doctor's medical list when he was called up it should be automatically returned to the same doctor's list when he was discharged from the Forces, if he returned to live in the same area.

Dr. TALBOT ROGERS said that he wanted to sound a note of caution. He believed that there was an appreciable and growing danger of inflation of lists, and therefore he asked them to look carefully at anything which might suggest an automatic return of names to the list.

Dr. F. E. GOULD (Birmingham) said that there was a possibility here that they might be endangering private practice. There was nothing to suggest that these men who had been in National Service would wish to go back under the National Health Service. There was nothing in the resolution to tell them on whose list a man was to be put if his doctor was dead when he came out of the Service. Was he to go on to the list of his successor?

The Gloucestershire motion was carried.

Dr. J. C. ARTHUR (Gateshead) moved:

That the Service Departments should notify the central registry office of the names and intended domiciles of Service men and women who are leaving the Forces and that the office should thereupon transmit this information to the appropriate executive council.

He thought that if this was adopted they would avoid inflation and give them all they wanted in the way of getting the man back on the list.

Dr. TALBOT ROGERS pointed out that the Gateshead motion only made sense if a motion on the lines of the remarks of the Isle of Wight representative were adopted.

amended so that the fee paid was related to the work done—for example:

Antenatal examinations.—Half a guinea each up to maximum of four guineas.

Attendance at confinement.—Two guineas.

Medical care of mother and child for 14 days after the confinement.—Half a guinea per attendance, up to maximum of three guineas.

Medical and pelvic examination of the mother between six and twelve weeks after confinement.—One guinea.

What Middlesex proposed was that there should be a fee for each item of service. This was according to the best traditions of the medical profession.

Dr. CATHERINE HARROWER (G.M.S. Committee) said that it would be a very bad thing to have a maximum laid down and for doctors to be allowed to do less work; she thought it better to have a minimum laid down and doctors to be able to do more work than was specified in the minimum. If a doctor had to go to the actual confinement, well, he had to go, and there was no point in bribing him to go.

Dr. RIDGE pointed out that the fees set out in his motion were only examples. This was a genuine attempt to secure improvement in the overall standard of the maternity services.

The Middlesex amendment was lost.

Dr. K. S. MAURICE-SMITH (Isle of Ely) moved that the procedure in operation in England and Wales with regard to obstetric lists be abolished and that the procedure at present followed in Scotland and Northern Ireland be adopted in its place. He said that if the present basic training in midwifery was such that when they encountered any complications they were not found fit to practise midwifery it was quite time that something should be done about it. He added that there was only one place in which to learn domiciliary midwifery, and that was in the home.

Dr. HARROWER said that what was set out in the motion was the present policy of the Committee.

The motion was agreed to.

Dr. H. O. CHISHOLM (York) moved:

That for cases confined in a private nursing-home it should be within the power of the general practitioner in charge of the case to call upon the services of a specialist anaesthetist under the domiciliary arrangements of the National Health Service.

This was referred to the G.M.S. Committee.

Dr. D. VINCENT SUMMERS (Northamptonshire) moved:

That antenatal examinations for patients booked for hospital may be undertaken jointly by the hospital services and the general practitioner concerned and that the general practitioner be appropriately remunerated.

He said that his Committee felt that the choice as to where and by whom the antenatal examination should be undertaken should finally rest with the expectant mother. The hospital was responsible for the care and health of booked cases and it was essential that it should be kept accurately informed as to antenatal examinations. In many hospitals, again, there were training centres for midwives, and some material must be provided for them. But if the patient were given the choice as to where she should have her antenatal examinations and she chose her general practitioner, it should be explained to her that it would be an advantage to her and to the hospital to have the examination at the hospital. The hospital could be joined with the general practitioner to their mutual benefit.

Dr. HARROWER thought that this could be left to the G.M.S. Committee, who were very much alive to the problem.

The motion was referred to the Committee.

On a Derbyshire motion, calling for the abolition of the requirement for doctors' certificates for surgical corsets, Dr. TALBOT ROGERS said that he hoped the Conference would leave matters as they stood, as the number of certificates issued by doctors for surgical corsets was slowly declining.

The Derbyshire motion was carried, but a further motion by Gateshead that every effort be made to secure the abolition of purchase tax on corsets was lost.

Prescribing and Dispensing

Dr. NOY SCOTT (Devon and Exeter) moved:

That this Conference feels that it is time that a settlement was arranged in the matter of discount on drugs to dispensing doctors, as they continue to suffer a loss when supplying proprietary preparations.

He said that this was a hardy annual, but a lot of practitioners still did not realize how much their colleagues in rural areas suffered in this respect. Drugs like chloro-thyretin were sold to the dispensing doctor at the retail price, less 10%, but they were sold to the chemist at the wholesale price.

Dr. S. F. FOURACRE (East Riding) supported the motion.

Dr. J. O. McDONAGH (Perth) pointed out that the amount of drugs which doctors dispensed was really only a drop in the ocean from the manufacturers' point of view. Doctors could not get in touch with the wholesalers on this point, but they could bring it home to travellers who visited them on behalf of drug manufacturers.

Dr. C. F. R. KILLICK (Chairman of the Rural Practices Subcommittee) said that he would not like the Conference to think that the Committee had been doing nothing. They had met the manufacturing chemists and the pharmacists. So far as the former were concerned they had their full support, but the pharmacists were people who made their living by what they sold, and if doctors got the same rate of discount as they did they would be inclined to buy from the wholesalers instead of from the pharmacists, who would lose their trade.

The motion was referred to the Committee.

A motion by Derbyshire that the Ministry be approached with a view to simplifying the prescriptions for trusses and elastic hosiery so as to leave reasonable latitude to the fitter was lost.

Dr. J. E. ELLIOTT (Buckinghamshire) moved that high protein substances such as "casilan" and similar preparations be regarded as food in all cases.

Dr. FRANK GRAY (London) said that what Buckinghamshire was proposing was to give away their freedom in respect of prescribing. True, it related to only one substance—one to begin with—which they might not prescribe, and with regard to which, whatever they felt about it in a particular case, they had no discretion whatever. This motion was asking the Ministry to draw up lists of prohibited substances.

Dr. HOWIE WOOD (G.M.S. Committee) asked that the motion be turned down and that the question be referred to a scientific body.

The Buckinghamshire amendment, however, was carried.

A motion by Dr. H. W. DONOVAN (Birmingham) instructing the Committee to re-examine the problem of the use of E.C. 10A in an effort to find a method whereby the pharmacist would not lose financially by the institution of this type of prescription was agreed to.

Dr. D. SAKLATVALA (West Bromwich) asked that where local health authorities adopted schemes for immunization of children against diphtheria and whooping-cough the Ministry should supply the authorities with the antigen on the same terms as it supplied antigen for schemes of diphtheria immunization. It appeared that there was some difference in the way the antigen had been supplied in these cases.

The suggestion was accepted as a reference to the Committee.

Trainee General Practitioner Scheme

Dr. A. V. RUSSELL (Wolverhampton) moved that the present trainee assistant scheme should be discontinued because it offered no advantages over the training given to ordinary assistants by their principals. He said that assistants employed in the ordinary way by conscientious doctors received as good if not better training.

Dr. R. W. McCONNEL (G.M.S. Committee) opposed the motion. If the scheme was abused the remedy lay in their own hands. The local medical committee must see that a suitable individual was chosen as trainer.

After some discussion Dr. Russell withdrew his amendment and supported one which was in the name of Coventry and other committees:

That in view of the fact that the trainee general practitioner scheme appears to be working with diverse success in different areas of the country, the General Medical Services Committee be instructed to re-examine the scheme in order to

(a) establish some uniformity in the suitability and commitments of the trainer practitioners, and

(b) eliminate abuses.

Dr. TALBOT ROGERS accepted the reference to the Committee but suggested that local medical committees at an early meeting should consider the scheme and transmit any points on which they thought there might be improvement.

Dr. J. H. PORTER (London) said that the general public was inclined to think that the trainee assistant scheme was a very good one and that it was nice for the medical novice to be associated with an experienced general practitioner. They forgot that the novice had always had this training in the past.

Dr. HOWIE WOOD hoped that this amendment would be passed. He suggested that if any areas were dissatisfied with the working of the scheme it was because there was something at fault with their selection of trainers in the first place or, alternatively, in their scrutiny of the methods adopted by the trainer. From the point of view of the trainee it could be a most instructive and enjoyable year, and he could obtain an introduction to general practice under almost ideal conditions.

The Coventry amendment was carried.

This concluded the matters which arose under the Annual Report of the Committee, and the Report, as amended, was then approved.

MISCELLANEOUS MATTERS

Classification of Areas

The Conference then turned to various matters not referred to in the Annual Report. Dr. J. R. ROWELL (Middlesbrough) moved a resolution expressing dissatisfaction with the attitude of the Medical Practices Committee in regard to the method of reclassifying areas and asking that in future such reclassification should be decided on numbers only with no reference to outside commitments. The motion was supported by Dr. A. SHERLOCK (East Suffolk), who spoke of "fantastic" classifications. Dr. F. GRAY (London) said that they wanted the Medical Practices Committee to do their job properly, and they could not do it properly unless they knew something of the commitments of the doctors. He thought it was known that if in any area the Medical Practices Committee had not been correct in its dispositions it was always prepared on a detailed statement to look again at the facts of the case. The Middlesbrough motion was lost.

Dr. J. V. COPE (Surrey) moved to urge the Medical Practices Committee to have more regard to recommendations which concerned themselves with certain areas of practice, which concerned themselves with their local geography, and that the type of practice, and their local geography, and that the minimum figure should be higher than 1,500. Dr. J. A. PRIDHAM (G.M.S. Committee) pointed out that the Medical Practices Committee was not concerned with the question of whether or not a doctor could earn a proper income or a restricted income. Questions of that type must be argued between the G.M.S. and the Ministry. The Medical Practices Committee was being urged to do something which it ought not to do. Dr. H. C. BROWN (Northumberland) urged that any area (not being a rural area) where the average list did not exceed 1,800 should be classified by the Medical Practices Committee as a "restricted area." Dr. TALBOT ROGERS said that his Committee had had frequent meetings with the Medical Practices Committee, and if it was the wish of the Conference they would have another meeting on this subject.

The matter was referred to the Committee. A motion by Dorset, "That the rate of interest on compensation moneys be raised to 5%," was met by cries of

"Agreed," but Dr. A. N. MATHIAS (Compensation and Superannuation Committee) pointed out that this was completely unrealistic. The rate of interest on compensation moneys was fixed by Act of Parliament, and only by an Act of Parliament could it be changed. The motion was lost.

Temporary Residents

A motion that the special temporary resident fee of 5s. for inmates of convalescent homes and similar places should be increased was referred to the Committee. Another motion referred to the Committee was from Lincolnshire (Lindsey) calling for detailed consideration of the method of payment for temporary residents in holiday camps. The mover mentioned a holiday camp near Skegness which for two weeks in the year had a population of 7,200. Over 1,000 were seen by the doctor last year. The motion was supported by Denbigh and Flint.

Dr. S. E. FOURACRE (East Riding) asked for an assurance that the large numbers of dependants of American servicemen resident in this country for periods exceeding three months were taken into account when determining the size of the Central Pool. Dr. TALBOT ROGERS pointed out that the pool was not nowadays calculated on the number of people at risk. He thought it would be unwise to press for an alteration which would involve calculation of the numbers on lists. The motion was withdrawn.

The Charge for Prescriptions

Derbyshire requested the Committee to urge the alteration of the regulations relating to the monthly rendering of shillings by dispensing doctors paid on the drug tariff so as to align them with the regulations applied to dispensing chemists. Dr. KILLICK pointed out some disadvantages which might attend an alteration of the procedure, but the Conference indicated its assent to what Derbyshire had suggested.

A motion by Norfolk calling for the abolition of the collection of shilling charges by dispensing doctors on the ground that it was not only time-consuming but distasteful and undignified to professional men was lost.

Another Norfolk motion which was lost was that in cases where it was apparent from the outset that the patient would be unfit for work for a considerable time, doctors should be able to give certificates of incapacity for longer than a week from the beginning. Dr. TALBOT ROGERS said that this had been taken up before the Ministry of National Insurance, who thought it undesirable and might lead to lax certification.

It was agreed to take up with the Ministry the question of redrafting the hospital in-patient certificate form on dis-charge to state the fitness or unfitness for work of the patient.

A motion by Cumberland to instruct the Committee to investigate some method whereby a baby was registered with a doctor within four weeks of birth was lost. Dr. F. E. GOULD bade the Conference remember that the baby was a possible private patient. Dr. TALBOT ROGERS thought the matter should be left to the parents.

On a motion from West Bromwich it was agreed that the Committee should consider opening negotiations with a view to persuading local authorities to co-opt general-practitioner representation to their children's committees and to arrange for the attendance of one of the authority's medical officers at all meetings of the children's committee.

Dr. A. MADDOCK-JONES (Caernarvonshire) moved to make executive councils responsible for the administrative work involved in the recovery of fees for attendance in road accidents and their payment to the doctor. Dr. F. E. GOULD said that there was no reason why the doctor should not be paid by the insurance companies for his services under the Road Traffic Act. He had never failed to obtain the money from the insurance company for attendance at any accident. The Caernarvonshire motion was lost.

A final motion by Birkenhead called for the discontinuance of the use of National Health Service numbers on Form E.C. 1 and other documents. This was withdrawn.

Dr. Ross, who was represented by Mr. C. Leigh Taylor, of Messrs. Hempsons, said that he had a nervous breakdown while he was a student at Edinburgh University, but was able to pass his examinations and qualified in 1943. In his first appointment he held two posts concurrently at hospitals about 15 miles apart; in one of them he was in sole charge of the maternity department. After about six months he felt the strain of double work. Heroin was in daily use at both hospitals and some research was being done on it. The drug was constantly at hand, and about the end of 1943 he started to take it to relieve the strain. He subsequently put himself under medical treatment. He was rejected on medical grounds for the R.A.M.C. and held two posts in general practice. It was difficult at that time to get employment because of the men returning from the Forces. Ultimately he went as a registrar in psychiatry to a mental hospital in Carlisle, and, working in the depressing atmosphere of such an institution, he himself became depressed. He had access to the dispensary and presently became seriously addicted to heroin. He again underwent withdrawal of the drug. Afterwards he went as casualty officer to a general hospital. It became clear to him that the craving was very apt to recur in conditions of stress, or for no reason at all. He then determined to take up a form of medical work in which he would have no contact with drugs. He took a public health post. He found it necessary to take a part-time course for the D.P.H., and to obtain money

for this he took a locumtenent job in general practice at Southend. This brought on another period of pressure, and "with the stuff at hand" he relapsed. The relapse, however, was not severe, and he returned to his public health post and had not taken drugs since. He added that he had now been successful in Part I of the D.P.H. examination, and he felt confident that if he remained in public health work without drugs at hand he could remain free from addiction. The drugs mentioned in the charge, with the exception of 100 tablets of amidone hydrochloride, were consumed during his work as locumtenent in a busy general practice last summer. The amidone he had used a week or two after he left that job, in order to recover normality.

Mr. Taylor read testimonials, including one from a medical officer of health, and the Committee, in order to assist Dr. Ross to overcome his tendency to drugs, postponed judgment for one year.

Erasures

William Arthur Chanmugan Nason, registered as of Hornsey, F.R.C.S. Edin. 1925, L.M.S. Ceylon M. Coll., 1918, appeared on the charge of having been convicted at the Central Criminal Court in November, 1953, upon indictment that on four occasions during that year he had unlawfully used an instrument on four women with intent to procure miscarriage. He had been ordered to be imprisoned for three years.

Dr. Nason said that the cases were of inevitable abortion. He had had no money to appeal.

The Registrar was directed to erase his name from the Register.

Hugh Ley Puxon Peregrine, registered as of Twyford, Winchester, M.R.C.S. Eng., L.R.C.P. Lond., 1915, appeared on the charge that he had been convicted (after pleading guilty) at Winchester on July 21, 1953, of sending an indecent written communication through the post and had been fined £10. The Council's solicitors said that Dr. Peregrine had written seven letters, but proceedings had been taken in respect of only one, as there was a limit of six months in these cases when they were dealt with summarily.

Mr. Leigh Taylor, solicitor, asked for Dr. Peregrine's evidence to be taken *in camera*. He wished to call a doctor and to read the report of another psychiatrist, and both had said that part of the information on which their evidence was based was obtained from persons other than Dr. Peregrine under seal of professional confidence.

The public were excluded during the evidence, but were readmitted when Mr. Taylor addressed the Committee. He said that there was no connexion between the offence to which Dr. Peregrine had pleaded guilty and any of his had been seen by him professionally.

The Committee directed the Registrar to erase from the Medical Register the name of Hugh Ley Puxon Peregrine.

In both the above cases in which there were erasures the respondents have 28 days in which to lodge an appeal against the Committee's decision.

Other Convictions

The case of Archibald Luke Basham, registered as of Rayleigh, Essex, was mentioned. It was alleged that he had been convicted at Chelmsford Assizes in February, 1954, of conspiring to defraud the Essex Executive Council by falsely pretending that he had prescribed certain medical requisites for the use of his patients, and had been ordered to be imprisoned for twelve months. Dr. Basham, who was now serving his sentence, wrote that he did not know that he would have to ask the Prison Commissioners for permission to attend the hearing before the Committee. The Committee decided to postpone the case.

Graham George Robertson, registered as of Bedlington, Northumberland, appeared following a conviction in 1948

of driving a motor vehicle when under the influence of drink, and another in 1953 of being in charge of a motor-car when in a similar condition. The Council's solicitor said that Dr. Robertson had been before the Council in 1944 on similar charges, and after judgment had been twice postponed his name was erased from the Register in 1946 and restored in 1948.

Mr. E. B. McLellan, on behalf of the Medical Protection Society, addressed the Committee and read a number of testimonials from medical colleagues on Dr. Robertson's behalf. The Committee postponed judgment for one year.

The case was considered of Herbert Trevor Duke, registered as of Manchester Street, London, W., against whom it was stated that at the Central Criminal Court in March, 1954, he had been convicted on indictment that he had committed an act of gross indecency with another male person and had been ordered to be imprisoned for six months. Evidence was given on his behalf by a probation officer, who stated that Dr. Duke had done exceptionally well on probation. The Chairman said that the conviction was discreditable to a medical man, but after careful consideration the Committee had decided to postpone judgment for one year.

Patrick Stephen Gerrard Cameron, registered as of North Shields, appeared in respect of five convictions since 1929, three for driving a motor-car whilst under the influence of drink and two for dangerous or reckless driving. On the last conviction, at Newcastle, in November, 1953, he was ordered to be imprisoned for six months on each of two counts, the sentences to run concurrently, and was disqualified for holding a driving licence for ten years. A report by the Chief Constable of Tynemouth stated that from January, 1948, the date of his penultimate conviction, until November, 1953, he had conducted himself in an exemplary manner, with real sobriety. Testimonials were read by Mr. E. B. McLellan, instructed by the Medical Protection Society. The Committee postponed judgment for one year.

Cases Previously Heard

In the case of Patrick Aloysius Gallen, registered as of Garscube Road, Glasgow, in which judgment had been postponed for one year until the present session, following convictions of being in charge of a motor vehicle when under the influence of drink, Dr. Gallen appeared, and his solicitor, Mr. E. Gardiner, read certain testimonials which had been sent in in his favour. The Legal Assessor said that one or more of the persons whose names had been furnished by Dr. Gallen had sent letters to the Registrar, but had asked that their letters be confidential. He asked whether Dr. Gallen was willing for these letters to be read to the Committee *in camera*. Dr. Gallen acceded to the suggestion that the letters be read. The Committee decided to postpone judgment for a further period of one year.

Joseph Henry Bentley, registered as of Limpsfield, Surrey, in whose case judgment had been postponed following convictions in 1952 under the Dangerous Drugs Regulations, 1937, and the Dangerous Drugs Act, 1951, appeared and presented testimonials. The Committee did not see fit to direct the Registrar to erase Dr. Bentley's name, and this closed the case.

In the case of Patrick Kennedy, registered as of Gillingham, Kent, in which judgment had been more than once postponed following convictions in 1949 and 1951 of being drunk, the Committee postponed the case for a further six months to enable Dr. Kennedy to produce further names of medical practitioners or others who would be willing to testify in his favour.

Judgment was again postponed to a future session in the case of Jonathan Shutt, registered as of Lower Deptford, who had been found to have been convicted in 1951 of unlawfully driving away a motor-car. The practitioner was not present, and the Council's solicitor said that they had been unable to serve him with a notice of the hearing.

In the case of Patrick Laurence Lyons, registered as of Kilkelly, Co. Mayo, in which judgment had been postponed following three convictions in 1951 and 1952 involving drunkenness, the practitioner appeared and presented what were described by his counsel as excellent testimonials, and in the view of this testimony to his conduct the Committee resolved not to direct the Registrar to erase his name. This closed the case.

The same course was taken with Florence Joseph O'Driscoll, registered as of Orrell Park, Liverpool, against whom convictions for drunkenness in 1949 and 1953 had been found proved. Testimonials were read, and the Registrar was directed not to erase his name.

In two other cases arising out of convictions the practitioners concerned were unable to be present, and the Committee adjourned the hearing to a special session which, it is understood, is to be held in July.

MEDICAL ADMINISTRATION

PRESIDENTIAL ADDRESS TO METROPOLITAN COUNTIES BRANCH

At the 96th annual general meeting of the Metropolitan Counties Branch on June 2 Dr. D. F. HUTCHINSON was installed as the new President and delivered from the chair a short address on medical administration.

Certain administrative jobs, he said, necessitated a medical background. He had made some research into the history of medical administration but had found its origins vague. Probably it started in some progressive towns by the appointment of somebody to look after the health of the community rather than the health of the individual. These early that Liverpool led the way in this matter. These early administrators were the pioneers of the public health service. In Scotland 100 or more years ago a number of voluntary hospitals were brought into being and these had at their head a medical superintendent—a very familiar figure in Scottish hospitals.

When the National Health Insurance scheme came in in Great Britain the general medical services became for the first time subject to a certain amount of Government control, and bodies were formed—local medical and panel committees—to look after the interests of the medical profession in this new situation. Yet in the whole course of fession in this new situation. Yet in the whole course of National Health Insurance only one such committee—London—found it necessary to appoint a whole-time secretary. As the Welfare State grew, however, there was more and more scope for the medical administrator.

According to a recent survey, there were 690 doctors in this country who were in the Government service; a certain number of these were doing clinical work, but the majority were administrators. Looking at other categories, he was surprised to find that 144 doctors were doing administrative work in medical organizations (11 in the B.M.A. secretariat). In the hospital field there was a considerable difference between the clinical and the administrative outlook. In Scotland there was a general belief, which he shared, that a hospital should be administered by a doctor. He was sure there was a place for the medical administrator in the hospital field.

The Medical Administrator in the Services

Dr. Hutchinson went on to speak, from his experience of the Army during the war, of medical administration in the Services. There had been a good deal of talk of waste of medical manpower in the Services, particularly in the Army, which made far more use of doctors in an administrative capacity than did the Navy or the Air Force. There was a great deal to be said for the medical administrator in the Army. The medical officer of long service in the Army was an amazingly good administrator—so good in fact that

to counterbalance it his clinical knowledge was sometimes rather inadequate. The medical staff officer was an adviser, and if he knew his job the senior fighting officers did rely very largely on what their A.D.M.S. or D.D.M.S. advised them. But the Army doctor should not lose his clinical touch. One of Dr. Hutchinson's several Army stories was of being asked to see a general whom he found at the point of developing pneumonia. This was during the war and he had not used his stethoscope for months. It was a great refreshment to use it again and to carry out treatment. On the evening of that day he called a second time on the general to see how he was faring and to endeavour to make him comfortable for the night. Afterwards the general told him that he was the only Army doctor who had ever been to see him twice in one day, and he persisted ever afterwards, to Dr. Hutchinson's embarrassment, in calling him his "beloved physician."

In the general medical services of the country there was undoubtedly now much greater need for the medical administrator than in the past. The majority of the 20,000 doctors or so running the general medical services had neither the time nor the inclination to look after all the "paper work" or to learn the answers to all the curious questions that were raised. It had been found necessary in London and Middlesex to appoint whole-time secretaries to the local medical committees, Dr. Frank Gray and himself, whose primary job was to advise their colleagues, many of whom were most excellent physicians and yet showed sometimes astonishing ignorance of the regulations. Another important part of their work was to maintain liaison with local health authority and hospital services. In other fields, as apart from the clinical work of the doctor, were such officials as the secretaries of medical defence societies and members of the editorial staff of medical journals.

Words of Advice

In conclusion, Dr. Hutchinson gave some advice to those who contemplated entering the field of medical administration. It was absolutely essential that they should have a sound clinical background. Again, they must always be prepared with an answer to any question, even if it was only to refer the inquirer to some other source of information. Medical administrators must be careful to avoid any accent of superiority. And they must have absolutely first-class lay assistants. If a medical administrator tried to do all the donkey work himself he would be bogged down by detail.

Finally, there were many jobs that a medical administrator could do which could not be done by the most brilliant lay administrator. That, indeed, was the burden of his argument. Medical administrators might be a small class, but he hoped and believed that there was a niche for them and that they were doing useful work.

A hearty vote of thanks was accorded to Dr. Hutchinson on the motion of Dr. J. W. McCarthy, and another vote of thanks to Dr. J. A. Moody, the retiring Branch President. Dr. R. Hale-White was unanimously elected President for 1955-6.

A GALLANT WOMAN DOCTOR

During a short visit to this country, Captain (Dr.) Valérie André, of the French Air Force, attended a small luncheon party given by the Medical Women's Federation at B.M.A. House on June 2 to enable her to meet executive officers of the Federation. Dr. Macrae, Secretary of the B.M.A., and Dr. Grey-Turner were among those present.

Captain André served four years in Indo-China. Although primarily a doctor, she volunteered to learn to pilot a helicopter, and so became the only person, man or woman, to combine medical duties with those of a pilot. She flew her helicopter to rescue wounded from the battlefield, and made 120 flights on this mission.

Among other decorations Captain André has gained the Legion of Honour, the Croix de Guerre with Palms, the Order of Vietnam, and the American Legion of Merit.

THE EXHIBITION OF PHARMACEUTICAL PRODUCTS, INSTRUMENTS, APPLIANCES, AND MEDICAL PUBLICATIONS AT GLASGOW

AN ANTICIPATORY GLANCE

The famous Kelvin Hall at Glasgow will be a busy and attractive place during the week of the Annual Meeting, from Monday, July 5, when this Exhibition is opened by the President, until the following Friday. The Exhibition, which has been a feature of Annual Meetings without number, suffers from only one defect, that no short descriptive title can be given it. It ranges over pharmaceutical products, instruments, appliances, and medical publications, but, even when all that has been said, its miscellany has not been covered. There are also foods and drinks (for display and sometimes for "sampling") as well as domestic gadgets and surgery equipment, not to speak of intangibles like medical insurance and various advisory services.

A preliminary notice cannot possibly cover some 70 separate displays, nor even mention all the new introductions. Those who "do" the Exhibition, as every medical visitor to Glasgow should, will find the catalogue a complete though pedestrian guide. Here we can touch on only a few of the things to look for, and for reasons of space and to prevent this in turn becoming a dry catalogue we must not even pay pedantic respect to all the full official titles of the exhibiting firms.

Pharmaceutical Products

More than half the stands are devoted to pharmaceutical products, and as usual one is left admiring the artistry of presentation and packaging and the fertility with which new names are invented for slightly differentiated preparations. Penicillin and other antibiotics in various forms figure prominently at many of the stands. The pride of place at the Glaxo stand is taken by "crystapen"—pure crystalline sodium penicillin G—and here also is the penicillin ester, "estopen," and, a relatively newcomer to the Glaxo range, "benapen," mentioned as the only new derivative of penicillin to be evolved in this country. Imperial Chemical (Pharmaceuticals) Limited present tablets and oral suspensions combining in one convenient dosage form one of the sulphonamides—"sulphamezathine"—and a salt of penicillin. The tablets and suspensions are no more expensive than corresponding preparations of their individual constituents.

John Wyeth and Brother Limited are showing the new penicillin salt, benzathine penicillin, under the name of "penidural," in three different forms for administration. One of these is an "all purpose" penicillin salt compound in aqueous suspension containing potassium crystalline penicillin G, procaine penicillin, and benzathine penicillin.

One feature at the stand of Boots Pure Drug Company will be "tabillin" penicillin oral tablets, to be announced to the profession this month. They are said to be the first penicillin oral tablets available, individually sealed, in a foil-pack presentation. Another Boots feature is a laxative—"blandlax"—declared to be free from the disadvantages of liquid paraffin.

"Terramycin" in oral suspension and other forms is a feature at the Pfizer stand. The value of terramycin in tropical medicine, owing to its wide antibacterial range, its versatility, and its ease of administration, is stressed. Several other antibiotics are being shown by this firm, among them "viocin" sulphate, offered for selected cases of tuberculosis. "Ilotylin"—brand erythromycin is the outstanding product shown by Eli Lilly.

A wide range of preparations is to be displayed by May and Baker. One of these is the "largactil" brand chlorpromazine hydrochloride. Another preparation—

"nivembin"—is a simple association of chloroquine and diiodohydroxyquinoline in tablet form.

The stand of Burroughs Wellcome offers a new product with the trade name of "marzine" for the prevention and treatment of travel sickness and nausea and also the vomiting of pregnancy. It has been subjected to extensive clinical trials among airline and seagoing passengers, and among pregnant women, and is said to be noteworthy for its low incidence of side-effects. Several other interesting preparations at this stand invite notice.

British Drug Houses Limited exhibit two of their most recent products—"entacyl" (piperazine adipate) tablets for the treatment of threadworm infections, and "anorvit" tablets containing ferrous sulphate, ascorbic acid, and acetomenaphthone.

Organon Laboratories have the advantage of a factory situated near Glasgow, and, with transport arrangements available, are to invite visitors, instead of concentrating on a skeleton exhibit, to go out and see the factory in action. Sandoz Products are giving prominence to three preparations. "Cafergot" is a combination of ergotamine tartrate and caffeine for the oral treatment of migraine; "ferronicum," a preparation of ferrous gluconate, for the treatment of iron deficiency; and "pursennid," a laxative. A new topical analgesic, "quotane," for relieving the symptoms of itching, burning, and pain associated with lesions of the skin, is the principal exhibit of Menley and James. Duncan, Flockhart have a new surface analgesic, "xyloclase," which also acts on mucous membranes.

Parke, Davis are having their customary display, and are calling special attention to two complementary mercurial diuretics, "mercloran" and "mercordan," the latter for initiating treatment in severe cases of congestive cardiac failure, with a view to maintenance therapy with the former. Mercloran, which is given orally, is said by the makers to produce a response virtually equivalent to that obtained by parenteral therapy, and to eliminate the necessity for injection in many patients.

Special attention is called at the Ciba stand to a new oral antihypertensive named "serpasil." It contains a pure crystalline alkaloid derived from the root of *Rauwolfia serpentina*, a shrub growing in India, Java, and other tropical countries. The Ciba research laboratories, after extensive research, succeeded in isolating the alkaloid named reserpine, which is said to have the sedative action of the whole root.

The Crookes Laboratories are showing two completely new preparations. One of these is named "trillekanin," nitrogen mustard hydrochloride, offered for the treatment of leukaemia and similar conditions. The other is named "seconesin," a relaxant and sedative. Another preparation at this stand is "dermasulf," for the treatment of dermatological conditions in which sulphur is known to be of value.

An entirely new organic iron salt, ferrous succinate, is to be introduced by Calmic, Ltd., under the name of "ferromyn." One tablet three times a day provides 105 mg. of available iron.

A new soda lime, marketed under the name "calona," is shown by the British Oxygen Company for carbon dioxide absorption in closed circuit anaesthesia. It is offered also for other medical uses, in oxygen therapy, basal metabolism estimation, and respirators. It is said to contain a constituent ensuring a longer effective life than ordinary soda lime.

Particulars of a "complete allergy service" are given at the stand of C. L. Bencard Limited. Information is offered on the various aspects of allergy problems, and a comprehensive range of allergenic extracts for skin testing is available. Among the new preparations of Roche Products Limited which are being shown are "asterol," a new fungicidal substance, "marcoumar," an oral anticoagulant, "konakion," synthetic vitamin K₁, and "ronicol," the alcohol corresponding to nicotinic acid, in tablets and ampoules. A new product at the stand of Paines and Byrne is "cobalin" crystalline vitamin B₁₂ (cyanocobalamin B.P.) in a specially

prepared snuff base for administration by nasal insufflation, self-administered. It is stated that upwards of 40 cases of pernicious anaemia have been adequately treated for approximately 12 months by one or two weekly insufflations. The Distillers Company (Biochemicals) concentrated on a new vitamin product, "distivit," an injection of vitamin B₁₂, intended for the treatment of trigeminal neuralgia and allied neurological disorders. G. D. Searle and Company Limited will be showing their new "dramamine" and "probanthine" vials for parenteral administration and a probanthine with phenobarbitone tablet.

The derationing of sugar commodities during the last 12 months has enabled manufacturers of glucose products to "fortify" their confectionery. A. L. Simpkin announce that they have been able to revert to their pre-war standard by incorporating in their products a high percentage of dextrose monohydrate B.P. They are drawing attention to the range of glucose barley sugar varieties they have on display. One glucose barley sugar confection is offered as a vehicle for the administration of vitamin A in small doses. A vehicle for the administration of vitamin A in small doses, a vehicle for the administration of vitamin A in small doses, ensure that a patient on restricted fluid intake cannot drink too much. The usual exhibits associated with their respective names appear at the stands of Energen Foods, Lederle Laboratories Division of Cyanamid Products Limited, and Reckitt and Colman Limited.

Instruments and Apparatus

A new instrument to be shown for the first time at Glasgow is the Cambridge vectorcardiograph. It has been designed by the Cambridge Instrument Company to meet the need of research workers in the cardiographical field and embodies all the requirements of such equipment that have at present been made known. It consists of two 5-in. (12.5-cm.) cathode-ray tubes mounted side by side and a special camera for photographing on bromide paper the loops or records obtained on the cathode-ray-tube screens. It records simultaneously any two vector or scalar electrocardiograms from any combination of 12 electrode placements. The whole outfit is mounted in a console cabinet of convenient size and height. It is believed to be the first industrially made instrument of the kind in Europe.

A new electrocardiograph—"cardiolux"—will be shown by Philips Electrical Limited. The makers claim that it eliminates completely the effect of mains interference, and that even with the mains lead draped round the patient the resultant E.C.G. is entirely free from mains pick-up. The first refrigerated oxygen tents to be designed and manufactured in this country are expected to be exhibited at Glasgow by Oxygenaire. It is claimed for the tents that they mark a considerable advance in the technique of oxygen therapy. They have been undergoing tests for the last 12 months. A new anaesthetic trolley and drawer space by Airmed Limited; it has adequate table and drawer space and is more compact and easily manoeuvred than the conventional types.

The old firm of Edward Taylor is showing a new elastic bandage—"ventilo 6," so named because it has six ventilating grooves, enabling the skin of the part under treatment to "breathe" by the admission of air and by allowing a certain amount of vapour transmission. The London Hospital Ligation Department will be as usual in its place, this time showing by the use of photographs some of the processes which go to make London Hospital catgut a dependable suture.

Ethicon Suture Laboratories are showing a surgical linen thread available on 100-yard reels coloured black and ivory. It is said to be the first linen thread specially produced for surgical purposes gauged to U.S.P. requirements and of high knot tensile strength. Another presentation at this stand is "ethi-pack," pre-cut lengths of linen thread and other materials packed in an envelope ready for sterilization, and intended to save the time that the theatre personnel would normally spend in cutting the materials to the required length.

S. H. Camp and Company are exhibiting a special pelvic traction belt, an adjunct in the treatment of low back injuries; also abdominal supports for use in pneumoperitoneum treatment of pulmonary tuberculosis, and designed to maintain the rise of the diaphragm by the injection of air. Abdominal binders for use in the treatment of emphysema are also shown.

Three inhalers for anaesthesia, all working on the same principle, for ether, trichlorethylene, and chloroform, are on view at the stand of E. Hutchings and Company. The inhaler is entirely new, and its exhibition at Glasgow is its first appearance. The inhaler, the complete equipment of which is contained in two small 9-in. transit cases, appears to be a convenient portable anaesthetic device with a wide range of applications. A safety steam bronchitis kettle is shown at the stand of Charles F. Thackray. It is designed to avoid such accidents as have occurred in hospital when boiling water has been ejected from the spout of the bronchitis kettle. It is hoped also by the time of the Exhibition to have available at the Thackray stand some British-manufactured unbreakable nylon syringes made by the same process as used by the French.

Down Brothers and Mayer and Phelps have their usual good array of instruments. Special devices which will catch the eye include a kymographic tubal insufflation apparatus for the diagnosis and treatment of sterility; toughened stainless steel sutures; drainage appliances for ileostomy and colostomy, with opaque disposable bags, and Guy's model noiseless suction unit, an improved version of the original apparatus in that it is now fitted with a flameproof motor, non-sparking motor control, and mechanical automatic vacuum release, and is completely anti-static. The Scholl Manufacturing Company are again to the fore with their foot appliances, and are also showing a new elastic amputation sock.

Books

The book stands always make pleasant places in the Exhibition. Butterworth's display includes two new major works in three volumes, *Paediatrics for the Practitioner*, under the general editorship of Wilfrid Gaisford and Reginald Lightwood, said to be the first major paediatric textbook written for the general practitioner, and *Industrial Medicine and Hygiene*, edited by E. R. A. Merewether. At the stand of H. K. Lewis one is reminded of the loss which ophthalmology has sustained in the recent death of Eugene Wolff; a new edition (the fourth) of his *Anatomy of the Eye and Orbit* is shown. Here again is another work touching on occupational health, a publication from the Roffey Park Institute, edited by T. M. Ling, and entitled *Mental Health and Human Relations in Industry*. Oxford University Press and E. and S. Livingstone, the Edinburgh publishers, have their usual attractive covers. The National Association for the Prevention of Tuberculosis is also exhibiting some new publications, including *Tuberculosis and Adolescence*, by Bentley, Grzybowski, and Benjamin, together with a handy guide to statutory and voluntary welfare services. The B.M.A. publications also should not be neglected.

A dictation system for use in the operating theatre by which the surgeon can record the details of his findings as the operation is in progress is being exhibited by E.M.I. Sales and Service. Hitherto the noise factor has made such recordings impossible, but this has been overcome by a specially designed microphone, and the Emidicta system, as it is called, makes it possible for the recording of all the details as the surgeon speaks them. Doctors can also dictate reports from the nearest telephone to which the appliance in the typing room at the hospital is linked.

Finally, Rempoy Limited are showing a series of domestic work aids for disabled people and a range of orthopaedic appliances.

Altogether the Exhibition this year seems likely to have more new introductions than in any post-war year; yet it retains its character, it is the old Exhibition, and it can be

said of it as has been said of so many other things, *Plus ça change, plus c'est la même chose*.

(A full list of all exhibitors at this exhibition will be included in the final programme of the Annual Meeting, which will be published in the "Supplement" next week. This programme will refer to all parts of the meeting, including plenary sessions, scientific sessions, and scientific and other exhibitions in addition to the exhibition described here.)

GENERAL PRACTICE AND THE N.H.S. QUALITY AND COST

BY

CYRIL BEARE, M.B., F.R.C.S.

A. C. E. BREACH, M.R.C.S., L.R.C.P.

R. M. COURTNEY, M.A., M.B., Ch.B., D.P.H.

D. B. HITCHINGS, M.R.C.S., L.R.C.P.

AND

A. V. RUSSELL, M.A., M.B., Ch.B.

The twofold problem of improving the National Health Service and at the same time reducing its cost within the economic capacity of the nation is of transcendent importance, not only to our own profession, but to the whole country. This problem is particularly topical now that the Guillebaud Committee is approaching the end of its important and difficult task.

It has been rightly contended that the best way to improve the quality of the Health Service and at the same time to limit its costs is to redirect the main emphasis away from the hospitals and toward the family doctor. If this contention be accepted, it follows that every effort must be made to maintain a high standard in general practice. The designers of the Health Service seem to have been unduly impressed with the glamour of modern technique as practised in the hospitals and to have paid but little regard to general practice. This is evidenced not only in the construction of the Acts themselves, but in the Government propaganda which preceded and followed the launching of the Service; and for this reason it will be necessary to use publicity methods in order to restore public confidence in the general practitioner and to reverse the new popular tendency to regard the hospital as the right and normal place for treatment. Conversely, if this publicity is to be justified it will be necessary to re-create in the general practitioner a sense of full personal responsibility, pride in his work and in maintaining his knowledge and his equipment at a high standard, and a willingness to reassume his old position as a trusted family friend and counsellor. It must be admitted that, since the introduction of the National Health Service, these qualities have become less common.

Standards of Practice

To restore standards of practice, it is necessary before all else to create such conditions as will attract to general practice men and women of the highest intellectual and ethical quality, and especially those with a sense of vocation. The present system, tending to a non-competitive State monopoly and providing a method of remuneration which takes no account of the quality of work done, fails to provide a stimulus to the highest standards of practice. Now that the Health Service is fully established there seems no valid reason for the deliberate discouragement of private practice outside the Service, and its restoration on a considerable scale would do much to stimulate a high standard of work by providing competition. It is true that the majority of the public have accepted the N.H.S.; but there remains a substantial minority who, if they could afford to do so, would much prefer to obtain their medical attention privately. For most of these the cost is prohibitive in

view of the enormous burden of taxation (necessitated in part by the Health Service itself); but it is not so much the professional fees that compel these patients to remain in the N.H.S. as the cost of modern life-saving drugs and of private rooms in hospitals and nursing-homes.

Drugs for Private Patients

The Conservative Party stated in *The Right Road for Britain* its intention to recognize the right of the private patient to receive drugs and appliances on the same terms as N.H.S. patients, but their policy has not been implemented. The Australian Government has wisely avoided the mistake of precipitate nationalization and has moved slowly, stage by stage, in the introduction of its Health Service. We believe that there is much to be learnt from this approach, in particular the careful building up by supplementing the efforts of existing institutions and the limiting of free drugs to a schedule of agreed essentials and specifics. This plan of excluding from the free list drugs which are not really essential deserves close attention and would certainly reduce the waste which is apparent in the mounting drug bills in our own N.H.S.; in any case private patients should be placed on the same footing as State patients for the provision of drugs and appliances.

Public Demand for Private Treatment

The enormous increase during the past five years in the number of private sickness insurance policies taken out clearly shows the strength of public demand for private medical treatment, and it would be sound policy to encourage this trend, both in the interests of public morale and for reasons of national economy. Indeed, the State would be amply repaid if it undertook to make some substantial contribution towards approved policies of sickness insurance. A further concession which would not only encourage practice outside the N.H.S. but would also reduce the capital expenditure needed for new hospitals and wings is the provision of grants-in-aid based upon part of the cost of a public bed and applied to reduce the present almost prohibitive cost of a private room in hospital or nursing-home.

The Central Remuneration Pool

It has been argued that the resuscitation of private practice would result in serious injustices and hardship to doctors practising in poor areas. This is probably true under the present system of a central remuneration pool, since receipts from private practice are taken into account itself only the aggregation of the recommended earnings of all general practitioners as outlined by the Spens Committee and interpreted by Mr. Justice Danckwerts. It has been found a convenient device, but it is in no way sacrosanct. The solution seems to be to abandon the present method of assessing the amount of the central pool and to stabilize the capitation fee, subject to certain agreed form-practitioner remuneration directly to the numbers of the population at risk instead of to the number of doctors in the Service. By adopting this course the State would stand to benefit financially in very large measure from a revival of private practice, which with suitable encouragement might well extend to seven or eight millions of the population.

The Capitation Fee System

While the method of remuneration by capitation fee has certain advantages and is administratively convenient, it has the number of patients for whom a doctor is at risk; that number will vary with such factors as the density of the population, the number of doctors available, and the individual doctor's popularity. The method tends to encourage unduly large practices in which an unnecessarily high

proportion of patients are referred to hospital for diagnosis and treatment in order to save time in the crowded surgeries. Conversely, the doctor who does his work with care and thoroughness, and who is prepared to give time to knowing his patients and listening to their troubles, is severely penalized under this system.

Recognition of Quality of Work

We believe that, even if it is not possible to relate remuneration under the capitation system to the actual quality of work done, it should at least be feasible to recognize such factual attributes as experience and higher qualifications acquired in practice. But we are convinced that the true solution is to allow an alternative system of assisted payments by the patient per item of service to grow up side by side with the present system. The two systems might remain distinct and competitive, or they might gradually fuse together so that a small capitation fee plus a small charge to the patient would become the usual method. Such a change would do much to revive the general practitioner's keenness and to counteract the present tendency towards "conveyor-belt" practice.

Clinical Interest and Opportunity

At the same time, if general practice is to maintain the highest standards and to prove attractive to the best doctors, it is necessary that clinical interest should be maintained, and this involves the provision of much greater facilities and than exist at present for study and refresher courses, together with adequate leisure and the means of obtaining relief from continuous petty responsibilities. It means, too, that the present tendency to narrow the scope of general practice must stop and the whole field of medicine be thrown open to the practitioner. He should be encouraged to take part in the work of specialized clinics, to do his own obstetrics, and to take responsible part in the work of hospitals. The bridge between general and consulting practice should be widened and inducements offered to the general practitioner to develop and practise a specialty in general practice. These suggestions will in themselves achieve economies and they will help to further the overall objective of re-establishing general practice in its rightful place as the main source of diagnosis and treatment. Above all, everything possible must be done to enable and encourage the general practitioner to take full control of his patients' health without reference to general hospitals except in complicated or surgical disease. This involves direct and greatly access to all kinds of ancillary diagnostic aids and greatly improved facilities for the nursing and domestic care of the sick in their homes, together with the care of their children and dependants where necessary. Such additional cost as this would involve would be negligible by comparison with the cost of a bed in hospital. Coupled with these provisions, the extended development and use of general-practitioner hospitals and G.P. wings of general hospitals, to which a patient can be admitted under the responsible care of his own doctor, will effect a further economy.

Goodwill of Practice

Finally, it is of outstanding importance in restoring to the general practitioner a proper pride in his work and a full sense of responsibility that he should be allowed to assume the full ownership and free disposal of the goodwill of his practice. The reasons which led to the confiscation of this ancient right were political, not economic. The decision was forced upon the profession against all advice; that it was a major error is now self-evident. To go back is difficult, but in this case not impossible; indeed there is good reason to hope that the scheme which will be presented to the Representative Meeting at Glasgow may secure general acceptance. This is the most obvious large economy open to the Guillebaud Committee; and upon its adoption depends the future status of the general practitioner.

Questions Answered

Temporary Appointment in U.K.

Q.—I have had to employ a locumtenent since December, 1953, and intend to do so until June, 1954. The locumtenent worked in the U.S.A. for two years before coming to me, and is not due for tax for the last financial year. He will only be three more months in the U.K. Must I comply with the income tax inspector's demand that he should be taxed on this year's earnings?

A.—The inspector of taxes is apparently within his legal rights in requiring the locumtenent's remuneration to be brought into the P.A.Y.E. tax deduction scheme. It may well be that the tax so deducted will ultimately be repayable, but that may be affected by the locumtenent's future professional activities and his past and future residential status.

Expenses of Postgraduate Course

Q.—I am in general practice under the N.H.S. Can I claim for income-tax assessment examination fees, postgraduate tuition fees, and accommodation expenses in London for a 10-weeks postgraduate course for my final F.R.C.S.?

A.—The expense of a postgraduate course or of the acquisition of further professional qualifications falls under the head of capital outlay, and is not allowable for income-tax purposes as an expense.

MANCHESTER UNIVERSITY HEALTH CENTRE

OPENING BY MINISTER OF HEALTH

On Wednesday of this week Mr. Iain Macleod, Minister of Health, opened the new Darbishire House Health Centre in Manchester. This experimental centre has been started by Manchester University outside the framework of the National Health Service, and assisted by grants of £30,000 each from the Nuffield Trust and the Rockefeller Foundation. The Nuffield Trust has bought and adapted the premises and the Rockefeller Foundation has provided £10,000 for equipment and is reserving £20,000 to meet extraordinary expenditure during the first few years. The University will meet the research and teaching expenses of the centre and the Manchester City Corporation is providing £3,500 a year to begin with for three years to cover maintenance and the cost of non-medical staff. A preliminary notice of this venture was published in the *Journal* of August 30, 1952 (p. 490).

The Building

The centre is in a large, three-storied old-fashioned type of detached house in an industrial area and close to the Manchester Royal Infirmary. On the ground floor are four general-practitioner suites each consisting of a waiting-room, lobby, examination room, and consulting-room. There is a large office off the entrance hall. The first floor contains the maternity and child welfare clinic rooms and the rooms for the ancillary G.P. services, such as the district nurses' treatment and physiotherapy room, x-ray room, and clinical laboratory. On the second floor are the school health clinic rooms and the caretaker's flat. There is a lift to all floors. The illustrations give an idea of the fittings and tasteful decoration of some of the rooms.

Staffing

The aim is to provide a first-class, comprehensive family practitioner service in a working-class district. Four established general practitioners who used to practise single-handed in the neighbourhood are already at work as a group in the centre. There are three secretaries, and the x-ray and pathological facilities are staffed from the hospital. A unique feature of the scheme is that three local authority district nurses, in addition to doing their home nursing duties from the centre, will also run a treatment room for injections, minor injuries, and physiotherapy. Later on it is hoped that health visitors will also work from the centre under the supervision of the family doctors. Eventually each practitioner will run two sessions a week of the local authority school medical service and maternity and child welfare clinics. The midwives will in this way also come into the picture.

The Objects of the Centre

As an experimental centre planned on preconceived ideas of what a health centre should achieve it is hoped to give theory the advantage of practical test. The centre will be the basis for some operational studies which will provide data for answering some of the present-day questions on general-practitioner medical care. For instance, can a health centre, by giving the G.P. new tools such as x-ray and laboratory services, the

medical aid of district nurses, and health visitors and social workers under his own direction, relieve the burden on hospitals? Will the G.P. be able to devote more time to essential medical work and less to non-essentials, and will it increase the scope and interest of his work?

It is also expected that the centre will provide practical information about the best way to integrate the local authority preventive services, the G.P. services, and the hospital specialist services. After the centre has had time to get into its stride—perhaps two or three years—it is intended to use it as a part of undergraduate medical education. It is considered to be one of the most important functions of the centre that all medical students will be able to do a course of training in some of the ailments and problems which they are likely to meet in future. Each G.P. on the staff will become an approved teacher of the University Medical School and will, in addition, do two sessions a week as a clinical assistant at a local regional board hospital.

As a long-term policy it is intended to use the centre for socio-medical research into the causation of disease in the individual and the community.

District nurses' treatment-room.

General practitioner's consulting-room.

General practitioner's examination-room.

An Important Experiment

Manchester University, with the aid of the Nuffield Trust, Rockefeller Foundation, and Manchester Corporation, has set on foot an important experiment which will be watched with interest. It has been launched under auspices which will allow free reign for the research which is its primary object.

Plans for health centres of various types have now been described in current medical literature, and within the last two years a few centres have started work. It will be some years before a proper appraisal can be made of their value, and by that time professional opinion, which is at present conservative in its attitude towards this innovation, will have had time to crystallize.

OPHTHALMIC GROUP COMMITTEE

PROPOSED REVISION OF SIGHT-TESTING FEE

A meeting of the Ophthalmic Group Committee was held at B.M.A. House on May 21, with Mr. GAYE MORGAN in the chair.

The DEPUTY SECRETARY placed before the Committee a note on the question of seeking revision of the sight-testing fee.

The CHAIRMAN reminded the meeting that on the last occasion when the sight-testing fee was revised the Ministry had insisted that one of the principal factors to be taken into consideration was the remuneration received by consultants and specialists in the hospital eye service. The recent increases for members of hospital medical staffs (negotiated in Committee "B" of the Medical Whitley Council) now made it necessary for the sight-testing fee to be adjusted, and it was agreed to appoint a deputation to discuss the matter with the Ministry.

The Supplementary Ophthalmic Service

A group of ophthalmic medical practitioners practising in and around Birmingham had sent a protest against the

reported action of the Group Committee in pressing for the early abolition of the Supplementary Ophthalmic Service.

Mr. G. W. BLACK pointed out that the Act itself looked forward to a time when facilities would be established to justify the replacement of the Supplementary Ophthalmic Service by an augmented hospital service, but there were those who desired the perpetuation of the S.O.S.

The CHAIRMAN said that what the Group Committee pressed for was not the early abolition of the S.O.S. but its improvement coupled with some augmentation of the existing hospital service. People might be in favour of the augmentation of the hospital service and nevertheless be against any early abolition of the S.O.S. He thought the Birmingham signatories laboured under a misapprehension. The Minister had recognized that the S.O.S. had operated smoothly and well, and fully appreciated the desire of those taking part in the service that it should be established on a permanent basis. He considered, however, that it was very unlikely that a move to end the service would be made in any time which would be a matter of concern at present, and did not feel that he was justified at the moment in introducing legislation to rescind sect. 41 (4) of the Act.

It was agreed to reply in these terms to the Birmingham protesters.

Service Ophthalmologists

Some discussion took place about the difficulty experienced by Service ophthalmologists in satisfying the criteria of admission to the Central Ophthalmic List and in meeting the requirement of two years' experience in hospital ophthalmic appointments. The CHAIRMAN said that Service ophthalmologists were doing the same work as the civil practitioner outside, and they ought to have the same qualifications. He did not know whether the Qualifications Committee could do anything about it.

It was mentioned that this whole matter was to be discussed by the Council of the Faculty of Ophthalmologists, whose views would be reported to the Committee. A suggestion for some form of provisional registration was made.

It was agreed to obtain further data on the subject.

Referred Patients

A point which arose at the previous meeting was again brought forward concerning the provision of spectacles to patients referred back to their general practitioner following a Supplementary Ophthalmic Service sight test. The view of the Ministry was that glasses should not be supplied in such cases until it was known whether medical treatment would be necessary. The Ministry had not felt able to give instructions that in no such case should an optician supply glasses, but if there was evidence that glasses were supplied prematurely with the result that numbers of patients who had been referred from the Service to the general practitioner did not in fact go to him, or did not obtain hospital treatment where necessary, the Ministry would have to consider the question again.

It was suggested that members of the Committee should look into this matter and report any such cases they discovered.

Mr. P. Trevor-Roper was re-nominated for co-option to the London Local Medical Committee.

PRESENTATION TO DR. F. E. GOULD

At the Annual Dinner Dance of the Birmingham Division, held at Chadwick Manor Hotel on Friday, May 28, 1954, Dr. F. E. Gould, former Honorary Secretary of the Division for 19 years, was presented with a silver tray subscribed to by his colleagues in appreciation of his many services to the Division. The presentation was made by Dr. A. Beauchamp.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Remuneration of Hospital Medical Staff

SIR.—I hope it will not be supposed that the comparatively few letters concerning remuneration of consultants that have appeared in your columns is an indication of widespread satisfaction with the result of recent negotiations. Many consultants were under the impression that the report of the Spens Committee had been accepted by the Minister of Health and that the recent negotiations concerned the betterment factor. This factor, according to the Spens report, was to take into consideration the change in the value of money and also increases which have, in fact, taken place since 1939 in incomes in both the medical and other professions. There are, of course, various ways in which this factor may be estimated, but by any calculation the remuneration of a specialist should be considerably above the 1948 figures—figures which many of us thought were provisional.

The rather lengthy report which has now been published of the results of the recent negotiations reveals that the betterment factor is practically non-existent. There have been some relative readjustments within the hospital service by which some receive comparatively small increases of remuneration, while others have to be guaranteed against loss. This, it seems, has helped to restore the balance between hospital staffs and general practitioners; this is, indeed, a good thing, but many members of hospital staffs would like to adjust the balance of their own budget, too.

It is perhaps on the whole a good thing that doctors are not particularly politically minded, especially when it comes to their own remuneration—and perhaps some of us are labouring under a misapprehension. Was it not agreed by the 1948 Government that the terms of the Spens report should be implemented? And, if so, has the Minister now said that in regard to the betterment factor he refuses to implement it? If this is so the present situation is intolerable and negotiations towards a realistic betterment factor should be undertaken at once.—I am, etc.,

London, W.1.

F. RAY BETTLEY.

SIR.—I have been following with growing interest the many letters in the *Supplement* on the above subject. I have also noted the rising indignation expressed by consultants in these letters. It is becoming increasingly obvious to me, as it must be to the Management Side of Whitley "B," that the profession is hopelessly split into three distinct and almost separate parts. This fact is obviously worrying Sir Russell Brain, when he appeals for some sort of cohesion, and asks for an end to attempts to exploit this dissatisfaction which he says we all feel (*Supplement*, May 22, p. 280).

The time has now come, surely, to see what order can be restored out of the chaos, and get back to Spens, as surely we must if we are not to lose for ever our self-respect. The profession can only do this provided it speaks with one voice, and we do not have the ludicrous state of affairs existing at the moment, with the different sections represented by multifarious bodies who are neither democratically elected nor have proper contact with the rank and file of the profession. The only section better off in this matter is that of the general practitioners, who are represented by a democratically elected body; but they were wise enough to employ counsel to negotiate.

Surely the time has come for the leaders to realize that the present machinery is defunct and to advise the profession as a whole to set up a body with trade union status and a full-time staff, particularly a capable general secretary, whose only job would be the terms of service of all mem-

bers. Such a body is bound to come sooner or later, so in my opinion the sooner the better if we are not to lose our birthright, Spens. I do not wish to belittle the efforts of the Staff Side of Whitley "B"—they have done well to get the small crumbs handed out—but the "writing is on the wall" when one reads the letter of Sir John Hawton in reply to Dr. Macrae (*Supplement*, May 15, p. 240). The general practitioners must realize that the apparent discarding of Spens by the Government can only mean an eventual scaling down of their betterment to the level of the consultants. No, sir! Let us all get down to business together and form a trade union, behind which body we could rightly defend our principles, and behind which we could develop some semblance of security.—I am, etc.,

Parkstone, Dorset.

J. R. HINDMARSH.

SIR.—The Ayrshire Consultants' and Specialists' Association has for some months been considering the question of hospital medical staff representation. At a meeting on May 28, 1954, the following resolutions were unanimously approved:

(1) That this association deprecates the growing dissociation of the British Medical Association and the hospital staff representative bodies.

(2) That this association considers the time has come to review the method of hospital staff representation with a view to obtaining two main objects: first, to secure a single central representative body consisting entirely of elected representatives; second, to secure the position of this representative body as a sub-committee of the British Medical Association under whose aegis future negotiations with Government departments should be carried out.

The results of the recent Whitley negotiations on salaries of hospital medical staff were also discussed and the following resolutions were formulated and unanimously approved.

(1) That this association has no confidence in the present constitution of the Joint Consultants Committee and considers it unsuited to represent hospital staffs in future.

(2) That this association strongly condemns the Staff Side of Whitley Committee "B" for concluding the agreement on remuneration without reference to the general body of consultants and specialists.

(3) That this association considers the rates of remuneration of hospital staff as agreed in Whitley Committee "B" to be unsatisfactory.

(4) That this association considers the proposed new salary scales should be accepted as a strictly interim agreement and that, following reconstruction of the hospital staff representative system, a determined drive be opened, with the backing of the whole profession through the British Medical Association, to secure, first, the right of unilateral appeal to arbitration and, second, implementation of the Spens report.

(5) That this association considers that, in reopening discussion with the Management Side of Whitley Committee "B," well as to securing an overall increase in the global sum available for distribution as salaries. It is suggested that the contentious C grades, the award of which seems to be a lottery. The use of continued to provide recognition of really exceptional merit, and those already holding B and C awards could be protected by a "no detriment clause" in any new contracts agreed.

The latter should remove any doubt as to the reaction of at least one group of hospital medical staff (see Dr. Stevenson's comment in Central Consultants and Specialists Committee, reported in the *Supplement* (May 8, p. 228) indicating either contentment or apathy). Copies of these resolutions have been circulated as far as possible to all local staff associations in Scotland and to the regional and central consultants and specialists committees in Scotland. It is hoped that this lead will stimulate such movement of public opinion as to constrain all levels of consultants and specialists committees to initiate reorganization of the system of representation.—I am, etc.,

Kilmarnock.

W. L. MUNRO,

Hon. Secretary,
Ayrshire Consultants' and Specialists' Association.

Remuneration in the Public Health Service

SIR.—There is a growing feeling that the present basis of remuneration in the Public Health Service is illogical, and that in future reference to Whitley machinery must be based entirely on the principle that grading, salaries, and conditions of service in public health should be the same as for any of the specialties in the hospital service.

The suggestion that in public health there must be gradings and salaries similar to the specialists in the hospital service is logical, but so far no practical and definitive scheme has been suggested which would be fair not only in its application to practitioners in the Public Health Service but in its reference to general practitioners, hospital medical staff, and employers in those various services. If we examine the hospital service we find that a consultant is a person employed full-time in the practice of a specialty and who fills a post that requires special knowledge and experience. The number of consultants is limited not only by the needs of an area but by the public purse, as is shown by the fact that there are many senior medical officers who could to-day grace consultant posts, but are precluded because of "establishment standards."

Keeping in mind these definitions and restrictive factors, the position of staff in public health with regard to grading is exactly the same, since the number of medical officers of health is regulated by statute. However, it is obviously unacceptable to any negotiating body to say that every medical officer of health should be a consultant, since many are not entirely engaged in the full-time practice and application of public health. For example, some medical officers of health as part of their duties do clinical, school, or child welfare work for their own or other public health authorities, or tuberculosis or fevers for hospital boards. The following suggested basic scheme—which of necessity in a short letter must be skeletal—gives a reasonable compromise to professional and lay opinion. Higher consultant awards would require to be given either on the basis of individual merit or of some "weighting factor."

(1) A person occupying the statutory position of medical officer of health to the area of a local health authority, and engaged full-time in the practice of such a post, shall be classified as a consultant (present salary £2,100 by £125 to £3,100)—see example (i). (2) Where a person occupies the statutory post of medical officer of health to the area of a local health authority, but is engaged part-time in the clinical public health or hospital services, then each portion of all services shall be remunerated on the basis of $x/11$ ths of his status in each service—see examples (ii), (iii), and (iv). (3) A senior officer or deputy is a person statutorily qualified in public health and engaged full-time in assisting a consultant medical officer of health in the practice of his post (present salary £1,500 by £50 to £1,950). (4) A senior registrar is a person in a public health clinical post who has been a registrar in clinical public health for two years (present salary £1,100 by £100 to £1,400). (5) A registrar is a person in a public health clinical post obtained not less than two years after registration as a medical practitioner (present salary £850 by £115 to £965). (6) Where a person designated as a medical officer of health is not responsible for the area of a local health authority, he shall be classified partly as a senior officer and partly in respect of public health clinical duties as senior registrar and/or, if employed by a regional hospital board, on a status determined by that authority—see examples (v) and (vi). (7) Where a senior registrar holds the Diploma in Public Health then £100 will be added to his salary one year after his attaining his maximum point in his salary scale.

Examples

(i) Medical Officer of Health to Local Health Authority:			
Full-time practice of public health, £2,100 by £125 to £3,100.			
(ii) Medical Officer of Health to Local Health Authority:			
Practice of public health, 3/11ths of £3,100	£845	9s.	0d.
Clinical school work, 4/11ths of £1,400	£509	1s.	8d.
Clinical child welfare work, 4/11ths of £1,400	£509	1s.	8d.
Total ..	£1,863	12s.	4d.

(iii) Medical Officer of Health to Local Health Authority:			
Practice of public health, 8/11ths of £3,100	£2,254	10s.	8d.
Clinical tuberculosis (graded as senior medical officer) 3/11ths of £1,950	£531	16s.	3d.

Total .. £2,786 6s. 11d.

(iv) Medical Officer of Health to Local Health Authority (Formal Year in Post):			
---	--	--	--

Practice of public health, 4/11ths of £2,475	£900	0s.	0d.
Clinical school or child welfare work, 4/11ths of £1,400	£509	1s.	8d.
Clinical tuberculosis as registrar, 3/11ths of £1,400	£381	16s.	3d.

Total .. £1,790 17s. 11d.

(v) Medical Officer of Health Not to a Local Health Authority:			
Full-time practice of public health, £1,500 by £50 to £1,950.			

(vi) Medical Officer of Health Not to a Local Health Authority:			
Practice of public health, 6/11ths of £1,950			
Clinical school or child welfare work, 5/11ths of £1,400	£636	7s.	1d.

Total .. £1,699 19s. 7d.

—I am, etc.,

Dumbarton.

SAMUEL HARVEY.

Radiology on Points

SIR.—I was very pleased to see that Dr. Anthony A. Vickers had again written to you on this subject (*Supplement*, May 29, p. 291). I fear that the "units" system of recording the work of diagnostic x-ray departments has come to stay, as there has been no indication that the comments made in your leading article (*Journal*, January 10, 1953, p. 86) and in the subsequent correspondence at the beginning of 1953 had any effect in inducing the Ministry of Health to have second thoughts. At the very least, a revision of the system is required and the values of the investigations reassessed to meet the criticisms which have been made.

As Dr. Vickers states, more scrupulously honest departments are being left behind in the race because the assessments are being left behind in the race because the assessment of units is widely open to misinterpretation. The "unit" system implies that the time and cost of materials involved in each type of investigation "averages out," but x-ray departments vary too much in their standard techniques for the system to be applied as a comparative yardstick of the work done and the staff and equipment required for this purpose. One department may expend two or three times more energy and films in a routine x-ray investigation than another and yet have the same number of "units" allotted. Some radiologists are content with one or two films while others require three or four for the same examination. The amount of film used would be a better indication of the work done. It is to be hoped that now the system has been given a fair trial the Ministry will listen to those who have to operate it.—I am, etc.,

Brighton.

JOSEPH RUBIN.

Return of Goodwill

SIR.—Having read Dr. E. C. Warner's letter on "Return of Goodwill" (*Supplement*, May 29, p. 290), it occurs to me that the report on the proceedings of Council for May 5 and 6 does not make clear what happened then with regard to the Amending Acts Committee's report on goodwill.

The report was not taken until late in the afternoon of May 5, when many members of Council had already left, and others were in process of leaving. Dr. Sutherland, chairman of the Amending Acts Committee, formally introduced the report, the lawyer's opinion on it, and the statement of advantages and disadvantages—and was about to propose its approval when the Chairman of Council intervened. He stated that he knew that we had at our March meeting turned down by a great majority a motion by Dr. Dawson which recommended that no further action be taken on the Amending Acts Committee's report—but since then he (the Chairman) had thought much about the matter

and had wondered whether we ought not to reverse our decision. He went on to say that lately he had been approached from an important and influential quarter with advice which he could not ignore, to the effect that it was imperative that Council should give a lead on the goodwill issue, and he made it clear that that lead ought to be a recommendation to reject the report. Dr. Sutherland pressed him to divulge the quarter from which this advice had come, pointing out that he had been at great pains to keep every committee of the Association in any way concerned with the goodwill issue informed of the A.A.C.'s work, and had had their representatives sitting with us to present their criticisms—but the Chairman of Council found himself unable to tell us what was the source of the advice he had been given, and once more urged upon Council the desirability of rescinding its March decision.

At this juncture Dr. Macrae rose to point out that, under Standing Orders, Council could not reverse any decision it had come to unless six months' previous notice had been given. Within twenty seconds suspension of Standing Orders was proposed, seconded, and carried, and Council found itself back where it had been in March. At once Dr. Dawson rose and again proposed word for word the motion which had been rejected "by a very large majority" in March, and he was seconded. I made a short speech in protest against this move and urged the Council not to go back on its former decision, and not to damn the A.A.C.'s report by sending it to the A.R.M. with a recommendation for rejection. As it became obvious, however, that my appeal was not carrying much weight, I begged leave to propose an amendment to the motion, but permission was refused. A vote was then taken and the motion was passed by 26 votes to 16, with five abstentions—a good many members of Council being absent.

It now remains for the Representative Body to decide what it shall do with this recommendation of Council, arrived at by a reversal of its previous decision, and I should like to point out that in the past the Representative Body has not always thought fit to accept Council's recommendations and especially not in cases where the R.B. has given Council specific instructions.—I am, etc.,

Wolverhampton.

A. VICTOR RUSSELL.

SIR,—Many will appreciate the strong line taken by Dr. E. C. Warner in his letter on this most important subject (*Supplement*, May 29, p. 290). The excellent scheme for the return of goodwill produced by the Amending Acts Committee was well received by the Council of the B.M.A. at the March meeting, subject to certain additions being made to the report before submission to the Divisions and Branches for consideration. At the May meeting of Council it was apparent that those who were opposed to the return of goodwill were determined to prejudice impartial consideration of the report of the Amending Acts Committee: for this purpose normal procedure was waived and the debate reopened, under the pretext of "giving the profession a lead." As a result it must now be concluded that the Council of the B.M.A. is opposed to the return of the ownership of goodwill: we should not hide our weakness behind such phrases as "in view of the practical difficulties of implementing the proposed scheme," etc.

It is to be hoped that the Representative Body will give a wiser and more courageous "lead" to Council than it has received from the latter; and that in the meantime the Divisions will give serious consideration to the report of the Amending Acts Committee. The importance is not one of finance, but of principle, for ownership of goodwill and encouragement of private practice constitute the main bulwark against a full-time salaried service. This probability in the fairly near future deserves a stronger description than Dr. Warner's "rumblings." Quite naturally, those who pursue a salaried mode of existence and are "salary-conditioned," which includes some of the Council members who were most strongly opposed to the return of goodwill, will not view the impending prospect with the same degree of dismay as those who prefer the traditional methods of

professional practice. But for members who look beyond the material satisfaction of the immediate moment the time has arrived for action to safeguard medicine from the uninspiring dead hand of nationalization; this may well be our last opportunity to do so, and the influence of lesser arguments must be put aside.—I am, etc.,

Guildford.

British Medical Association

ANNUAL MEETING—GLASGOW, JULY 1-9, 1954

President-Elect: Emeritus Professor Sir JOHN MCNEE, D.S.O., M.D., D.Sc., LL.D., F.R.C.P., F.R.F.P.S.

Joint General Secretaries: J. INGLIS CAMERON, M.B., Ch.B., F.R.F.P.S.; J. T. MCCUTCHEON, M.A., L.R.C.P., L.R.C.S., L.R.F.P.S.

Science Secretary: J. BASIL RENNIE, M.D., F.R.C.P., F.R.F.P.S.

Deputy Science Secretary: A. W. KAY, M.D., Ch.M., F.R.C.S.Ed.

Executive Officer: G. A. PECK, B.Sc., British Medical Association, Glasgow Regional Office, 234, St. Vincent Street, Glasgow, C.2.

PROGRAMME

The 122nd Annual Meeting of the British Medical Association will be held in Glasgow from Thursday, July 1, to Friday, July 9, 1954, inclusive.

On the evening of Wednesday, June 30, there will be a Cocktail Party for Representatives and their Ladies, arranged by the Glasgow Division.

The Annual Representative Meeting will begin on Thursday, July 1, and continue on Friday, Saturday, and Monday, July 2, 3, and 5.

The Representatives' Dinner and Ladies' Dinner will take place on Thursday, July 1, followed by a dance.

The Overseas Luncheon has been arranged for Friday, July 2.

On Sunday, July 4, an all-day cruise on the Firth of Clyde has been planned, and this will be followed in the evening by a concert, specially arranged by the B.B.C.

The Adjourned Annual General Meeting and President's Address will take place in the Kelvin Hall on the evening of Monday, July 5, and the President's Reception, which follows, will be held in the Bute Hall, at the University.

The Annual Scientific Meeting and associated functions occupy the period from Tuesday morning, July 6, to the evening of Friday, July 9.

The Official Religious Service will be held in Glasgow Cathedral on the afternoon of Tuesday, July 6, and the Roman Catholic Service will be held at St. Andrew's Cathedral at the same time.

The Annual Dinner of the Association will be held in the Central Hotel on Thursday, July 8.

A full social programme is being arranged, including a Civic Reception on Tuesday evening, July 6, and a University Reception on Wednesday evening, July 7. There will also be a dance on Friday evening, July 9.

Several special functions have been arranged for ladies accompanying members, including visits to Loch Lomond, Lake of Menteith and Stirling Castle, the Burns Country, and Edinburgh. Also included among these is an all-day excursion to Loch Katrine and the Trossachs.

The usual golf competitions will take place, and there will be an additional medal competition at Old Prestwick Golf Course on Thursday, July 8, for those not eligible for the Treasurer's Cup competition.

The Overseas Conference will be held on the afternoon of Wednesday, July 7, followed by a reception given by the Overseas League; there will also be an "At Home" for over-seas visitors given by the Empire Medical Advisory Bureau on Thursday, July 8.

The Reception Room for Registration will be open in the Kelvin Hall on Monday, July 5, at 9 a.m.

Three Plenary Scientific Sessions have been arranged as follows: Tuesday, July 6, at 9.30 a.m., subject "The Problem of Sleep"; Wednesday, July 7, at 3 p.m., subject "Food and Disease"; Thursday, July 8, at 9.15 a.m., subject "The Problem of Pulmonary Tuberculosis To-day."

Seventeen Scientific Sections have been arranged, the meetings to take place on Wednesday morning, July 7, Thursday afternoon, July 8, and Friday morning and afternoon, July 9 (details are given below).

The Scientific Exhibition will be held in the Kelvin Hall, and will be open daily from July 5 to 9. Demonstrations will be given at fixed advertised times and a wide field of medical interests will be covered. For details see page 326.

The Annual Exhibition of Pharmaceutical Products, Instruments, Appliances, and Medical Publications will also be housed in the Kelvin Hall. The Exhibition will be open from 9 a.m. to 6 p.m. from July 5 to 9 inclusive. For details of exhibitors see page 326.

The Ladies' Club will be situated in the College Rooms, University, and will be open throughout the Meeting.

REGULATIONS REGARDING DRESS

Academic Dress is to be worn at the President's Address, the President's Reception, the Official Religious Service, the Roman Catholic Service, the Civic Reception, and the University Reception.

Robes may be hired from Messrs. Ede and Ravenscroft, Ltd., 93, Chancery Lane, London, W.C.2, or, in the case of Glasgow graduates, from Messrs. Thomson, Son and Wright, Ltd., 173, St. Vincent Street, Glasgow, C.2. Early application is advised, as the supply of gowns is limited, and it is suggested that the gowns be sent to the home address of the individual concerned.

Evening Dress (Tails or Dinner Jacket), with Decorations, is to be worn at the President's Reception, Civic Reception, University Reception, and Annual Dinner. Evening Dress without Decorations should be worn at the Representatives' Dinner, the Representatives' Dance, and the Dance in the Union on July 9.

REGISTRATION FEE

Members attending the Annual Meeting (other than members of the Representative Body and overseas visitors) are required to pay a fee of one guinea towards the expenses of the Meeting. The fee will be payable when members register at the Reception Office.

TICKETS

All tickets for functions up to Sunday, July 4, will be available for Representatives at the A.R.M. Inquiry Office at the Bute Hall, University, on June 30, July 1, 2, and 3, and for ladies at the Ladies' Club, the College Rooms, University.

Tickets for all other functions after Sunday, July 4, will be available from Monday, July 5, at the Reception Office, Kelvin Hall, or at the Ladies' Club.

BADGES

Members will not be admitted to Plenary Sessions, Scientific Sections, or Exhibitions unless wearing badges. They should therefore visit the Reception Office, Kelvin Hall, on the first day of the Annual Meeting to obtain their handbook, badge, registration card, and tickets.

Officers of Scientific Sections and other office-holders should inquire for special badges at the Reception Office.

CAR PARKING

Windscreen labels may be obtained at the Reception Offices, and members bringing their own cars are advised to use these labels to facilitate car parking.

Members staying in hotels in the centre of the city may find it difficult to leave their cars overnight. Adjacent to the Central Hotel there is limited parking accommodation within the Central Station at a charge of 2s. for each 12-hour period, night or day.

THE ALL-DAY CRUISE ON THE FIRTH OF CLYDE

An all-day trip down the Clyde on the largest and most luxurious of the Clyde Fleet, the turbine vessel *Queen Mary II*, has been arranged for Sunday, July 4, commencing at 10.15 a.m. The route to be followed is designed to show visitors the scenic beauties of the Firth of Clyde.

Leaving from the heart of Glasgow at Bridge Wharf, the first stretch of the river to the Tail of the Bank includes

the world-famous Clyde shipyards. Thereafter, in more open waters, the ship will sail through Largs Channel, between the two islands—the Cumbraes—and round the southernmost point of the Island of Bute. Turning north, it will go through the Kyles of Bute, and return to the mainland at Wemyss Bay, passing Toward Point on the way.

A special train will take visitors from Wemyss Bay back to the Central Station, Glasgow, for 6 p.m., in good time for the evening concert.

Lunch and afternoon tea will be provided on board ship. Inclusive ticket: 30s. Except for Representatives, for whom special arrangements are being made, early application is advisable.

HOTEL ACCOMMODATION

Hotel accommodation in and around Glasgow is now very fully booked up. Those who have difficulty in making arrangements are advised to write direct to the *Executive Officer, B.M.A. Glasgow Regional Office*, 234, St. Vincent Street, Glasgow, C.2, stating their exact requirements.

TRAVEL RESERVATIONS

Accommodation on trains and on aircraft between London and Glasgow during July is booked at a very early date. It is advisable to make reservations as soon as possible.

ABERDEEN GRADUATES' DINNER

A dinner arranged by the Glasgow Aberdeen University Association will be held in the North British Hotel, Glasgow, on Saturday, July 3, at 7.30 p.m. Tickets will be 25s. (excluding wines).

All Aberdeen graduates and their ladies attending the Annual Representative Meeting will be welcome. Those intending to be present should apply without any delay to Mr. W. E. S. Thomson, 23, Thorn Drive, Bearsden, Glasgow, for further information.

EDINBURGH GRADUATES' DINNER

The Edinburgh Graduates' Dinner will be held at the Grosvenor Restaurant, 74, Gordon Street, Glasgow, on Saturday, July 3, at 7.30 for 8 p.m. It is hoped that all Edinburgh graduates and their ladies attending the Annual Representative Meeting will be able to be present. Tickets, price 30s. each, inclusive of aperitifs, may be obtained from Dr. J. Cottrell, Flottergate House, Grimsby.

GLASGOW GRADUATES' DINNER

The Glasgow Graduates' Dinner will be held in the Royal Faculty of Physicians and Surgeons of Glasgow, 242, St. Vincent Street, Glasgow, C.2, on Saturday, July 3, at 7 for 7.30 p.m. The dinner is open to Glasgow graduates and their ladies who are attending the Annual Representative Meeting.

The cost is 30s. each, including aperitifs. Numbers are limited, and early application, with appropriate remittance, should be made to Dr. J. C. Macarthur, Roadmeetings House, Carlisle, Lanarkshire.

IRISH GRADUATES' LUNCHEON

The Irish Graduates' Luncheon will be held at the Students' Union, University Avenue, Glasgow, on Wednesday, July 7, at 1 p.m. at a cost of 7s. per person (excluding wine). This luncheon is open to all Irish graduates and their ladies attending the Annual Meeting, and those intending to be present are asked to notify in advance the manager of the Students' Union. No tickets will be issued, and payment will be made at the luncheon.

WELSH DINNER

The Welsh Dinner will be held at the Grosvenor Restaurant, Gordon Street, Glasgow, at 7.30 p.m. on Saturday, July 3. All Welsh representatives, Welsh graduates, and others with Welsh associations, accompanied by their ladies,

will be welcome at this dinner. Tickets will be 30s. per head (exclusive of wines), and those wishing to attend are asked to apply with remittance to Dr. W. F. Anderson, 40, Newlands Road, Glasgow, S.3, before June 26.

CHRISTIAN MEDICAL FELLOWSHIP ANNUAL BREAKFAST

The Annual Breakfast of the Christian Medical Fellowship will be held in the Students' Union, University Avenue, Glasgow, on Wednesday, July 7, at 8.15 a.m. The chairman will be Sir John McNee, and the speaker Mr. Howard Somervell. The proceedings will terminate at 9.15 a.m. Those intending to be present are asked to notify the local secretary, Dr. J. C. Eaton, 19, Boclair Road, Bearsden, Glasgow.

SCIENTIFIC MEETING

PLENARY SESSIONS

The Arena, The Kelvin Hall

Tuesday, July 6, 9.30 a.m.: "The Problem of Sleep"

Chairman: Professor Sir DAVID CAMPBELL (Aberdeen).
Speakers: Professor Sir GEOFFREY JEFFERSON (Manchester), Professor D. M. DUNLOP (Edinburgh), Dr. J. O. McDONAGH (Stanley), Dr. A. H. DOUTHWAITE (London), Dr. MACDONALD CRITCHLEY (London).

Wednesday, July 7, 3 p.m.: "Food and Disease"

Chairman: Dr. W. G. CLARK (Edinburgh).
Speakers: Dr. C. METCALFE BROWN (Manchester), Dr. JOAN TAYLOR (London), Dr. J. S. K. BOYD (London), Professor R. CRUICKSHANK (London), Mr. A. E. BURDETT (London); Professor B. S. PLATT (London).

Thursday, July 8, 9.15 a.m.: "The Problem of Pulmonary Tuberculosis To-day"

Chairman: Sir ANDREW DAVIDSON (Edinburgh).
Speakers: Dr. PETER MCKINLAY (Edinburgh), Dr. A. B. SEMPLE (Liverpool), Dr. J. R. LANGMUIR (Glasgow), Dr. W. D. W. BROOKS (London), Mr. T. HOLMES SELLORS (London), Dr. R. R. TRAIL (London).

SCIENTIFIC SECTIONS

All sessions will be held in the University and details are given of the lecture theatres where the sessions are to be held.

MEDICINE

President: G. E. BEAUMONT, D.M., F.R.C.P., D.P.H. (London).

Vice-Presidents: Professor S. ALSTEAD, M.D., F.R.C.P., F.R.F.P.S. (Glasgow); Professor L. J. DAVIS, M.D., F.R.C.P., F.R.C.P.Ed., F.R.F.P.S., F.R.S.Ed. (Glasgow); Professor S. J. HARTFALL, T.D., M.D., B.Sc., F.R.C.P. (Leeds); W. R. SNODGRASS, M.A., M.D., B.Sc., F.R.F.P.S. (Glasgow).

Hon. Secretaries: JOHN H. HUNT, D.M., M.R.C.P., 54, Sloane Street, London, S.W.1; E. G. OASTLER, T.D., M.A., M.B., Ch.B., F.R.C.P., F.R.F.P.S., 4, Woodside Terrace, Glasgow, C.3.

Official Reporter: Dr. T. PARKINSON.

Sessions

Physiology Lecture Theatre.
Wednesday, July 7.—9.30 a.m., Management of Old Age in General Practice, Dr. TREVOR HOWELL (London). Prevention and Treatment of Respiratory Infection in Old Age, Sir GEOFFREY MARSHALL (London), Dr. NEVILLE OSWALD (London), Dr. T. MCEWAN (Glasgow). Treatment of Parkinsonism, Dr. H. G. GARLAND (Leeds), Dr. H. G. MILLER (Newcastle-upon-Tyne). Treatment of Peripheral Vascular Disease in Old Age, Professor E. J. WAYNE (Glasgow), Pro-

fessor MICHAEL BOYD (Manchester), Dr. W. M. FERGUSON ANDERSON (Glasgow), Dr. O. T. BROWN (Dundee).

Thursday, July 8.—2.30 p.m., Medical Treatment of Hypertension, Dr. GEOFFREY BOURNE (London), Dr. J. GIBSON GRAHAM (Glasgow), Dr. GAVIN SHAW (Glasgow). Anticoagulants in Coronary Thrombosis, Dr. RAE GILCHRIST (Edinburgh), Professor R. B. HUNTER (Dundee), Dr. A. BROWN (Glasgow). Anticoagulants in Thrombophlebitis, Dr. BODLEY SCOTT (London), Mr. R. S. MURLEY (London), Mr. R. B. WRIGHT (Glasgow).

SURGERY

President: Sir HENEAGE OGILVIE, K.B.E., M.A., M.D., M.Ch., F.R.C.S. (London).

Vice-Presidents: JOHN DUNBAR, M.B., F.R.F.P.S. (Glasgow); Professor C. F. W. ILLINGWORTH, C.B.E., M.D., Ch.M., F.R.C.S.Ed., F.R.F.P.S. (Glasgow); T. MURRAY NEWTON, M.B., F.R.F.P.S. (Glasgow); Sir ARTHUR PORRITT, K.C.M.G., C.B.E., M.Ch., F.R.C.S., LL.D. (London).

Hon. Secretaries: A. B. KERR, O.B.E., T.D., M.B., F.R.F.P.S., F.R.C.S.Ed., 5, La Belle Place, Glasgow, C.3; IAN M. ORR, O.B.E., M.D., Ch.M., F.R.C.S.Ed., Brooklands, Garstang, Preston, Lancs.

Official Reporters: Mr. R. S. MURLEY (July 7); Dr. G. W. HAYWARD (July 8).

Sessions

Zoology Lecture Theatre.
Wednesday, July 7.—9.30 a.m., The Surgical Treatment of Peptic Ulcer. Panel discussion: Mr. JOHN BRUCE (Edinburgh), Mr. R. L. HOLT (Manchester), Professor C. F. W. ILLINGWORTH (Glasgow), Dr. F. AVERY JONES (London). *Short Papers:* The Effects of Pregnancy and the Menopause on the Course of Peptic Ulcer, Mr. DOUGLAS H. CLARK (Glasgow); Cartilage Implants in Surgical Repair, Mr. THOMAS GIBSON (Glasgow).

Thursday, July 8.—2.30 p.m. (Joint Meeting with the Section of Cardiology), Surgery in the Treatment of Mitral Stenosis, Professor W. A. MACKEY (Glasgow), Dr. MAURICE CAMPBELL (London), Dr. R. W. D. TURNER (Edinburgh), Mr. P. R. ALLISON (Leeds). Arterial Grafting, Mr. H. G. EASTCOTT (London), Mr. W. P. CLELAND (London).

OBSTETRICS AND GYNAECOLOGY

President: Professor R. A. LENNIE, T.D., M.D., F.R.F.P.S., F.R.C.O.G. (Glasgow).

Vice-Presidents: ROBERT M. CORBET, M.B., M.A.O., F.R.C.P.I., F.R.C.S.I., F.R.C.O.G. (Preston), DAVID W. CURRIE, M.D., Ch.M., F.R.C.S., F.R.C.O.G. (Leeds); W. F. T. HAULTAIN, O.B.E., M.C., B.A., M.B., F.R.C.P.Ed., F.R.C.S.Ed., F.R.C.O.G. (Edinburgh); JOHN HEWITT, M.B., F.R.F.P.S., F.R.C.O.G. (Glasgow); Professor G. GORDON LENNON, M.B., Ch.M., F.R.C.O.G., M.M.S.A. (Bristol).

Hon. Secretaries: R. MURDOCH, T.D., M.B., M.R.C.O.G., 16, Lilybank Gardens, Glasgow, W.2; R. B. K. RICKFORD, M.D., F.R.C.S., F.R.C.O.G., St. Thomas's Hospital, London, S.E.1.

Official Reporter: Mr. S. BENDER.

Sessions

Botany Lecture Theatre.
Wednesday, July 7.—9.30 a.m., Management of Labour in Contracted Pelvis, Dr. H. R. MACLENNAN (Glasgow), Professor W. I. C. MORRIS (Manchester), Dr. J. BRUCE DEWAR (Dumfries). Early Recognition of Cancer of the Uterus, Dr. R. M. CORBET (Preston), Professor G. GORDON LENNON (Bristol), Professor H. C. McLAREN (Birmingham), Miss M. E. ATTWOOD (Birmingham).

Thursday, July 8.—2.30 p.m., Indications for Induction of Labour, Dr. R. A. TENNENT (Glasgow), Mr. MASLEN-JONES (Wolverhampton), Mr. LESLIE PATRICK (Sheffield). Endometriosis, Mr. LESLIE WILLIAMS (London), Dr. JOHN STURROCK (Edinburgh), Mr. W. HAWKSWORTH (Oxford).

ANAESTHETICS

President: JOHN GILLIES, C.V.O., M.C., F.R.C.S.Ed., M.R.C.P.Ed., F.F.A.R.C.S., D.A. (Edinburgh).

Vice-Presidents: H. H. PINKERTON, M.B., F.R.F.P.S., F.F.A.R.C.S., D.A. (Glasgow); F. G. WOOD-SMITH, M.B., F.F.A.R.C.S., D.A. (London).

Hon. Secretaries: W. AUKIN, M.R.C.S., L.R.C.P., D.A., Wyncroft, 35, Gladhow Wood Road, Leeds, 8; I. M. CAMPBELL DEWAR, M.B., F.F.A.R.C.S., 57, Kelvinside Gardens, Glasgow, N.W.

Official Reporter: Dr. GEORGE ELLIS.

Session

Physiology Lecture Theatre.

Friday, July 9.—2 p.m., Medico-Legal Hazards in Anaesthesia, Professor W. W. MUSHIN (Cardiff), Mr. W. MAIR, B.L., LL.B. (Glasgow). *Occasional Papers:* Hand Blood Flow During Sleep, Dr. I. D. FERGUSON and Mr. A. PRINGLE, B.Sc. (Glasgow); Hand Blood Flow During Anaesthesia, Dr. A. C. FORRESTER (Glasgow); The Effects of Spontaneous and Artificial Pulmonary Ventilation on the Alveolar Carbon Dioxide Content in Man under Thiopentone Anaesthesia with Muscle Relaxant Drugs, Dr. R. P. HARBORD (Leeds); Second Thoughts on Neonatal Anaesthesia, Dr. G. JACKSON REES (Liverpool). *Film:* The Circulatory Effects of Artificial Respiration, Dr. E. TRIER MØRCH (Chicago, U.S.A.).

CARDIOLOGY

President: J. H. WRIGHT, J.P., M.D., F.R.C.P.Ed., F.R.F.P.S. (Glasgow).

Vice-Presidents: I. MACPHERSON, M.D., F.R.C.P. (Leeds); ALBERT A. F. PEEL, M.A., D.M., F.R.F.P.S. (Glasgow); K. SHIRLEY SMITH, M.D., B.Sc., F.R.C.P. (London).

Hon. Secretaries: G. J. AITKEN, M.B., B.Sc., F.R.F.P.S., 31, Kenmuir Avenue, North Mount Vernon, Glasgow, E.2; C. J. GAVEY, M.D., F.R.C.P., 106, Harley Street, London, W.1.

Official Reporter: Dr. G. W. HAYWARD.

Sessions

Zoology Lecture Theatre.

Thursday, July 8.—2.30 p.m. (Joint Meeting with the Section of Surgery), Surgery in the Treatment of Mitral Stenosis, Professor W. A. MACKAY (Glasgow), Dr. MAURICE CAMPBELL (London), Dr. R. W. D. TURNER (Edinburgh), Mr. P. R. ALLISON (Leeds). *Arterial Grafting*, Mr. H. G. EASTCOTT (London), Mr. W. P. CLELAND (London).

Physiology Lecture Theatre.

Friday, July 9.—9.30 a.m., Coronary Artery Disease: (1) The Aetiology of Coronary Artery Disease, Professor J. B. DUQUID (Newcastle-upon-Tyne); (2) The Significance of Cholesterol in the Causation of Atheroma and Coronary Artery Disease, Dr. T. D. V. LAWRIE (Glasgow); (3) Electrocardiography in Coronary Artery Disease, Dr. WILLIAM EVANS (London); (4) The Use of Oestrogens in the Treatment of Coronary Artery Disease, Dr. M. F. OLIVER (Edinburgh); (5) Treatment of Shock in Myocardial Infarction, Dr. K. SHIRLEY SMITH (London).

CHILD HEALTH

President: Professor STANLEY G. GRAHAM, M.D., F.R.C.P.Ed., F.R.F.P.S. (Glasgow).

Vice-Presidents: P. R. EVANS, M.D., M.Sc., F.R.C.P. (London); Professor J. L. HENDERSON, M.D., F.R.C.P.Ed. (Dundee); BERNARD E. SCHLESINGER, O.B.E., M.D., F.R.C.P. (London); MATTHEW WHITE, M.B., F.R.C.S.Ed., F.R.F.P.S. (Glasgow).

Hon. Secretaries: J. H. HUTCHISON, O.B.E., M.D., F.R.C.P., F.R.F.P.S., 21, Victoria Park Gardens North, Glasgow, W.1; A. P. NORMAN, M.B.E., M.D., M.R.C.P., D.C.H., Institute of Child Health, the Hospital for Sick Children, Great Ormond Street, London, W.C.1.

Official Reporter: Dr. P. R. EVANS.

Sessions

Natural Philosophy Lecture Theatre (new building).

Wednesday, July 7.—9.30 a.m., Recent Views on the Aetiology and Treatment of Marasmus: A General Survey of the Problem, Professor J. M. SMELLIE (Birmingham); The Social Aspects of Marasmus, Professor W. S. CRAIG (Leeds); Feeding Difficulties in Marasmus and their Correction, Professor R. W. B. ELLIS (Edinburgh); Renal Acidosis and Idiopathic Hypercalcaemia, Dr. REGINALD LIGHTWOOD (London); Fibrocystic Disease of the Pancreas, Dr. R. A. SHANKS (Glasgow). *Acute Haematogenous Osteitis: The Changing Picture*, Mr. MATTHEW WHITE (Glasgow); *The Diagnosis of Osteitis*, Dr. G. A. NELIGAN (Newcastle); *The Treatment of Osteitis*, Mr. J. S. MASON BROWN (Edinburgh); *Osteitis in the Newborn*, Mr. R. B. ZACHARY (Sheffield); *The Choice of Antibiotics in Osteitis*, Dr. I. A. B. CATHIE (London).

Thursday, July 8.—2.30 p.m., The Care and Management of the Epileptic Child: Epilepsy as a Social Problem, Dr. J. ROMANES DAVIDSON (Bridge of Weir); Disturbances of Behaviour in Epileptic Children, Dr. DESMOND A. POND (London); The Medical Treatment of Epilepsy, Dr. J. P. M. TIZARD (London); The Surgical Aspects of Epilepsy, Mr. F. J. GILLINGHAM (Edinburgh).

DERMATOLOGY

President: BRIAN F. RUSSELL, M.D., F.R.C.P., D.P.H. (London).

Vice-Presidents: F. F. HELLIER, O.B.E., M.A., M.D., F.R.C.P. (Leeds); J. FERGUSON SMITH, M.A., M.D., F.R.F.P.S. (Glasgow); JAMES SOMMERVILLE, M.B., F.R.F.P.S. (Glasgow); H. J. WALLACE, M.A., M.D., F.R.C.P. (London).

Hon. Secretaries: A. GIRDWOOD FERGUSSON, M.D., F.R.F.P.S., 3, Ashton Road, Glasgow, W.2; I. B. SNEDDON, M.B., M.R.C.P., 4, Claremont Place, Sheffield, 10.

Official Reporter: Dr. J. T. INGRAM.

Session

Dermatology Lecture Theatre.

Friday, July 9.—9.30 a.m., The Preventive Aspect of Dermatitis and Allied Disorders, Dr. F. F. HELLIER (Leeds), Dr. G. A. HODGSON (Cardiff), Dr. C. N. D. CRUICKSHANK (Birmingham), Dr. E. COLLIER (Glasgow). *Occasional Papers:* Otitis Externa, Mr. C. A. KEOGH (London); Treatment of Haemangiomas, Dr. W. L. LISTER (Plymouth). 2.30 p.m., Demonstration of Clinical Cases.

FORENSIC MEDICINE

President: Professor JOHN GLAISTER, M.D., D.Sc., F.R.F.P.S., F.R.S.Ed., Barrister-at-Law (Glasgow).

Vice-Presidents: FRANCIS E. CAMPS, M.D., D.T.M.&H. (London); Professor CYRIL J. POLSON, M.D., F.R.C.P., Barrister-at-Law (Leeds); R. DONALD TEARE, M.A., M.D., M.R.C.P. (London).

Hon. Secretaries: GILBERT FORBES, M.D., B.Sc., F.R.C.S.Ed., F.R.F.P.S., Department of Forensic Medicine, The University, Sheffield, 10; J. A. IMRIE, M.D., F.R.C.S.Ed., Police Headquarters, 21, St. Andrew's Street, Glasgow, C.1.

Official Reporter: Dr. GILBERT FORBES.

Session

Chemistry Lecture Theatre.

Friday, July 9.—2 p.m., Forensic Medicine in Relation to the General Public, Professor D. J. A. KERR (Edinburgh) and Mr. HECTOR MCKECHNIE, Q.C. (Edinburgh); Forensic Psychiatry, Dr. J. C. M. MATHESON (London); Forensic Pathology, Professor CYRIL J. POLSON (Leeds); Police Surgeons Dr. J. A. IMRIE (Glasgow) and Dr. RALPH SUMMERS (London); Forensic Chemistry, Mr. MAGNUS HERD (Glasgow).

MICROBIOLOGY AND PATHOLOGY

President: Professor D. F. CAPPELL, M.D., F.R.F.P.S., F.R.S.Ed. (Glasgow).

Vice-Presidents: Professor ROBERT CRUICKSHANK, M.D., F.R.C.P., D.P.H. (London); Professor J. W. HOWIE, M.D., (Glasgow); Professor G. L. MONTGOMERY, M.D., Ph.D., F.R.F.P.S. (Glasgow).

Hon. Secretaries: H. E. HUTCHISON, M.D., Department of Pathology, Western Infirmary, Glasgow, W.1; JOAN TAYLOR, M.B., D.P.H., Central Public Health Laboratory, Colindale Avenue, London, N.W.9.

Official Reporter: Dr. IAN TAYLOR.

Session

Chemistry Lecture Theatre.

Wednesday, July 7.—9.30 a.m. (Joint Session with Section of Preventive Medicine and Infectious Diseases), Poliomyelitis: Recent Advances in Knowledge of the Virus, Dr. ALLAN P. GOFFE (London); Epidemiology, Dr. W. H. BRADLEY (London); The Acute Case, with Special Reference to Respiratory Failure, Dr. A. B. CHRISTIE (Liverpool).

NEUROLOGY

President: MACDONALD CRITCHLEY, M.D., F.R.C.P. (London).

Vice-Presidents: WYLIE MCKISSOCK, O.B.E., M.S., F.R.C.S. (London); D. W. C. NORTHFIELD, M.S., F.R.C.S. (London); J. ERIC PATERSON, M.B., F.R.F.P.S. (Glasgow); JOHN D. SPILLANE, M.D., F.R.C.P. (Cardiff).

Hon. Secretaries: A. M. G. CAMPBELL, D.M., F.R.C.P., 79, Pembroke Road, Bristol; J. S. M. ROBERTSON, M.B., F.R.C.S., 23, Kingsborough Gardens, Glasgow, W.2.

Official Reporter: Dr. C. W. M. WHITTY.

Session

Botany Lecture Theatre.

Friday, July 9.—2 p.m., Symposium on Occupational Neurological Diseases. Pressure Neuropathy, Dr. H. G. GARLAND (Leeds); Metallic Poisons and the Nervous System, Dr. J. W. ALDREN TURNER (London); Damage to the Nervous System from Gas Poisoning, Dr. R. S. ALLISON (Belfast); The New Insecticides and the Nervous System, Dr. A. M. G. CAMPBELL (Bristol). *Cerebral Abscess*, Mr. J. E. PATERSON (Glasgow); Mr. W. S. LEWIN (Oxford).

OCCUPATIONAL HEALTH

President: Professor THOMAS FERGUSON, C.B.E., M.D., D.Sc., F.R.C.P.Ed., D.P.H., F.R.F.P.S. (Glasgow).

Vice-Presidents: H. ALEXANDER, M.B., D.P.H. (London); JOHN CRAW, M.B., F.R.F.P.S. (Whitehaven); J. J. O'DWYER, C.B.E., M.D., D.P.H. (London).

Hon. Secretaries: GEO. BUCHANAN, B.L., L.R.F.P.S., D.P.H., D.P.A., D.T.M.&H., D.I.H., 28, Langside Drive, Newlands, Glasgow, S.3; M. E. M. HERFORD, D.S.O., M.C., M.B.E., M.B., D.P.H., Ferneham, Farnham Royal, Bucks.

Official Reporter: Mr. S. J. H. MILLER.

Session

Ophthalmology Lecture Theatre.

Friday, July 9.—9.30 a.m. (Joint Session with the Section of Ophthalmology), The Employment of the Visually Handicapped, Dr. WILLIAM HUNTER (Glasgow), Visually Handicapped, Dr. WILLIAM HUNTER (Glasgow), Short papers related to the same subject will also be read by Dr. JAMES H. BELL (Glasgow), Dr. M. E. M. HERFORD (Slough)—Eye Defects of School-leavers, Dr. ARCHIBALD R. MILLER (Glasgow), and Mr. JOHN T. STEWART (Glasgow).

OPHTHALMOLOGY

President: Professor W. J. B. RIDDELL, M.D., F.R.F.P.S., F.R.S.Ed. (Glasgow).

Vice-Presidents: C. DEE SHAPLAND, M.B., M.R.C.P., F.R.C.S. (London); S. S. SUMNER, M.B., F.R.C.S.Ed. (Preston).

Hon. Secretaries: R. LEISHMAN, M.D., 11, Sandyford Place, Glasgow, C.3; S. J. H. MILLER, M.D., F.R.C.S., 21, Wimpole Street, London, W.1.

Official Reporter: Mr. S. J. H. MILLER.

Sessions

Ophthalmology Lecture Theatre.

Friday, July 9.—9.30 a.m. (Joint Session with the Section of Occupational Health), The Employment of the Visually Handicapped, Dr. WILLIAM HUNTER (Glasgow), Dr. EDWIN GORDON MACKIE (Sheffield). Short Papers related to the same subject will also be read by Dr. JAMES H. BELL (Glasgow), Dr. M. E. M. HERFORD (Slough)—Eye Defects of School-leavers, Dr. ARCHIBALD R. MILLER (Glasgow) and Mr. JOHN T. STEWART (Glasgow).

Friday, July 9.—2 p.m., Ocular Headache, Professor W. J. B. RIDDELL (Glasgow). *Occasional Papers:* Trachoma in Glasgow—Paper by the late Dr. S. SPENCE MEIGHAN to be read by Dr. D. CHRISTISON (Glasgow); Field Defects in Disseminated Sclerosis, Dr. R. J. MCWILLIAM (Glasgow).

ORTHOPAEDICS

President: Emeritus Professor Sir HARRY PLATT, M.D., M.S., F.R.C.S., F.A.C.S. (Manchester).

Vice-Presidents: ROLAND BARNES, F.R.C.S., F.R.F.P.S. (Glasgow); H. E. HARDING, F.R.C.S. (London); JAMES PATRICK, M.B., F.R.C.S. (Glasgow); Professor GEORGE PERKINS, M.C., M.Ch., F.R.C.S. (London).

Hon. Secretaries: J. G. BONNIN, M.B., F.R.C.S., Central Middlesex Hospital, Park Royal, London, N.W.10; ATHOL R. PARKES, M.B., F.R.C.S.Ed., Western Infirmary, Glasgow, W.1.

Official Reporter: Mr. J. G. BONNIN.

Session

Chemistry Lecture Theatre.

Friday, July 9.—9.30 a.m., Symposium on Poliomyelitis. The Management of the Infectious Phase of Poliomyelitis, Dr. T. ANDERSON (Glasgow); The Prevention of Deformity, Mr. J. M. P. CLARK (Leeds); The Flail and Shortened Limb, Mr. ROBERT ROAF (Liverpool). *Occasional Papers:* Treatment of Hallux Valgus by Arthrodesis, Mr. A. MACDOUGALL (Glasgow); Penicillin Nerve Lesions, Mr. A. R. PARKES (Glasgow).

PHYSICAL MEDICINE

President: W. S. TEGNER, B.M., B.Ch., F.R.C.P. (London).

Vice-Presidents: P. BAUWENS, M.R.C.S., L.R.C.P. (London); H. A. BURT, M.A., M.B., B.Ch., F.R.C.P. (London); DONALD WILSON, M.B., B.S., M.R.C.P. (Chichester).

Hon. Secretaries: A. C. BOYLE, M.D., M.R.C.P., D.Phys.Med., Department of Physical Medicine, the Middlesex Hospital, W.1; T. N. FRASER, M.D., F.R.C.P., F.R.F.P.S., 112, Southbrae Drive, Glasgow, W.3.

Official Reporter: Dr. A. C. BOYLE.

Session

Zoology Lecture Theatre.

Friday, July 9.—2 p.m., Recent Developments in Rehabilitation, Group Captain C. J. S. O'MALLEY (London), Dr. F. S. COOKSEY (London), Lieutenant-Colonel J. FRASER (Inverness). Management of Degenerative Joint Disease, Dr. H. A. BURT (London), Dr. LOGIE S. BAIN (Aberdeen), Dr. DONALD WILSON (Chichester). Electro-Diagnosis, Professor A. E. RITCHIE (St. Andrews), Dr. A. T. RICHARDSON (London), Squadron Leader C. B. WYNN PARRY (Farnham Common).

PREVENTIVE MEDICINE AND INFECTIOUS DISEASES

President: T. ANDERSON, M.D., F.R.C.P.Ed., F.R.F.P.S. (Glasgow).

Vice-Presidents: C. METCALFE BROWN, M.D., D.P.H., Barrister-at-Law (Manchester); S. C. GAWNE, M.D., B.S., M.R.C.S., L.R.C.P., D.C.H., D.P.H., Barrister-at-Law (Liverpool); STUART LAIDLAW, J.P., O.St.J., M.D., B.Sc., F.R.F.P.S., D.P.H., B.L., D.P.A. (Glasgow); LLYWELYN ROBERTS, M.D., M.R.C.P., D.P.H. (Sheffield).

Hon. Secretaries: JAMES H. LAWSON, M.D., D.P.H., Ruchill Fever Hospital, Glasgow, N.W.; J. B. S. MORGAN, M.B., B.Sc., M.R.C.S., D.P.H., County Health Department, County Offices, St. Mary's Gate, Derby.

Official Reporter: Dr. IAN TAYLOR.

Sessions

Chemistry Lecture Theatre.

Wednesday, July 7.—9.30 a.m. (Joint Session with Section of Microbiology and Pathology). Poliomyelitis: Recent Advances in Knowledge of the Virus, Dr. ALLAN P. GOFFE (London); Epidemiology, Dr. W. H. BRADLEY (London); The Acute Case, with Special Reference to Respiratory Failure, Dr. A. B. CHRISTIE (Liverpool).

Thursday, July 8.—2.30 p.m., The Epidemiology of Non-Infectious Diseases: The Epidemiological Method, Dr. J. N. MORRIS (London); The Epidemiology of Old Age, Dr. W. FERGUSON ANDERSON (Glasgow); The Epidemiological Approach to Obstetric Medicine, Dr. ANGUS M. THOMSON (Aberdeen); The Role of the Medical Officer of Health, Dr. JOHN RIDDELL (Edinburgh).

PSYCHIATRY

President: Professor T. FERGUSON RODGER, M.B., F.R.C.P.Ed. (Glasgow).

Vice-Presidents: MURIEL BARTON HALL, M.D., Ch.B. (Liverpool); Professor ALEXANDER KENNEDY, M.D., F.R.C.P. (Newcastle-upon-Tyne); DAVID YELLOWLEES, M.B., Ch.B. (Glasgow).

Hon. Secretaries: T. C. N. GIBBENS, M.D., D.P.M., Institute of Psychiatry, Maudsley Hospital, Denmark Hill, London, S.E.5; HUNTER GILLIES, M.D., F.R.C.P.Ed., D.P.M., Psychiatric Unit, Stobhill General Hospital, Glasgow, N.

Official Reporter: Professor A. KENNEDY.

Session

Natural Philosophy Lecture Theatre (new building).

Friday, July 9.—9.30 a.m., Depression: The Diagnosis of Depression, Dr. W. MAYER-GROSS (Dumfries); The Risks of Suicide in States of Depression, Dr. E. STENGEL (London); The Treatment of Depression, Dr. I. R. C. BATCHELOR (Edinburgh); The Rationale of Electrical Convulsion Treatment, Dr. D. A. POND (London); Failures with Electrical Convulsion Treatment, Dr. J. L. CAMERON (Glasgow); The Effects of Depression on Industrial Efficiency, Dr. M. MARKOWE (London); Depression in Relation to Crime, Dr. J. C. M. MATHESON (London).

RADIOLOGY

President: Professor B. W. WINDEYER, M.B., B.S., F.R.C.S., F.F.R., D.M.R.E. (London).

Vice-Presidents: Professor ROBERT MCWHIRTER, F.R.C.S.Ed., F.F.R., F.R.S.Ed. (Edinburgh); JOHN R. NUTTALL, M.D., F.F.R., D.M.R. (Leeds); S. D. SCOTT PARK, M.B., Ch.B., D.M.R.E. (Glasgow).

Hon. Secretaries: DAVID STENHOUSE, M.B., F.R.F.P.S., F.F.R., D.M.R., X-ray Department, McAlpin Nursing Home, 121, Hill Street, Glasgow, C.3; J. J. STEVENSON, M.D., D.M.R., The Royal Cancer Hospital, Fulham Road, London, S.W.3.

Official Reporter: Dr. A. E. JONES.

Session

Natural Philosophy Lecture Theatre (new building).

Friday, July 9.—2 p.m., Carcinoma of Bladder, Mr. A. H. JACOBS (Glasgow), Dr. G. W. BLOMFIELD (Sheffield). Leukaemia, Dr. R. BODLEY SCOTT (London), Dr. A. A. CHARTERIS (Glasgow), Dr. S. P. RAWSON (Glasgow).

SCIENTIFIC EXHIBITION

Kelvin Hall, July 5-9

The Exhibition will be open each day at 9 a.m. and will close on the first three days at 6 p.m. and on the last two at 5 p.m.

The following list gives brief details of the exhibit:

Royal Samaritan Hospital for Women and the Royal Infirmary, Glasgow. Diagnostic survey of the infertile marriage.

Department of Ophthalmology, University of Glasgow. Eye changes in vascular disease with examples of clinical retinal photographs.

Scottish National Blood Transfusion Association, Edinburgh. Economical production in the laboratory of useful plasma fractions and illustrations of their use.

Department of Pharmacology and Therapeutics, University of Sheffield; National Centre of Radiotherapy, Sheffield; Department of Medicine, University of Glasgow. Royal Infirmary; and Department of Therapeutics, University of Edinburgh. The role of radioactive iodine in modern medicine.

Departments of Pathology and Surgery, Glasgow Royal Infirmary. Phaeochromocytosis—clinical aspects, diagnosis by adrenergic blocking drugs, treatment, and pathology, with special reference to malignancy.

Department of Anaesthesia, Glasgow Royal Infirmary. Hand plethysmography unit for use during surgical anaesthesia, with charts illustrating results.

Department of Child Health, University of Glasgow, and Hospital for Sick Children, Glasgow. (1) Radioactive iodine studies in familial cretinism. (2) Chromatography, bio-assay, and electrophoresis in the hormone treatment of nephrosis. (3) Fibrocystic disease of the pancreas.

Department of Health for Scotland. Statistical presentation of certain topics within the interest of the department. Rowett Research Institute, Bucksburn, Aberdeenshire. The skeleton in lactation.

Department of Dermatology, Leeds General Infirmary. Some mycotic infections of the smooth skin and nails.

Department of Child Health, University of Sheffield. Tuberculous meningitis.

Nuffield Department of Clinical Medicine, Radcliffe Infirmary, Oxford. The stomach in anaemia: (1) histology; (2) studies on the intrinsic factor of Castle; and (3) estimation of pepsin and uropepsinogen.

Nuffield Orthopaedic Centre, Oxford. (1) The aetiology of osteoarthritis of the hip. (2) Research on the clinical characteristics of scoliosis.

Departments of Medical Art, Neuroradiology, and Neurosurgery, Manchester Royal Infirmary. The radiological diagnosis of brain tumour.

Crichton Royal Hospital, Dumfries. Demonstration of modern techniques in child psychiatry.

Department of Psychological Research, Crichton Royal Hospital, Dumfries. Demonstration of psychometric testing.

Department of Psychological Medicine, King's College Medical School, Newcastle-upon-Tyne, and Biophysics Unit, Crichton Royal Hospital, Dumfries. Portable E.E.G. equipment.

The National Maternity Hospital, Dublin. Medical conditions complicating pregnancy.

Cancer Research Department, Royal Beatson Memorial Hospital, Glasgow. (1) Atmospheric pollution tests for (a) arsenic, (b) benzpyrene, (c) radioactivity. (2) Analysis of tobacco smoke. (3) Liver cancer in animals.

Urological Units, Victoria Infirmary, Glasgow, and Hairmyres Hospital, Lanarkshire. (1) Prostatic obstruction.

(2) Carcinoma of bladder. (3) Cases of aberrant ureter in the female causing incontinence.

Department of Pathology, Glasgow Royal Infirmary. The effect of A.C.T.H. and cortisone on repair of lesions induced experimentally in animals—for example, in peptic ulceration, hepatic cirrhosis, and quartz granuloma.

Department of Pathology, Glasgow Royal Infirmary. Pituitary and adrenal changes in pathological conditions of man and animals.

Royal Infirmary, Glasgow. Mitral disease. Pre-operation investigation, especially cardiac catheterization and auricular puncture. Comparison of operation findings with pre-operation assessment. Post-operation assessment. Auricular biopsy findings. Pathological specimens showing complications of interest.

Department of Infectious Diseases, University of Glasgow, and Public Health Department, City of Glasgow. (1) Statistics of the City of Glasgow for acute respiratory diseases during the last 25 years. (2) Results of bacteriological examination. (3) Results of virological examination. logical examination. (3) Results of virological examination. Department of Pathology, Western Infirmary, Glasgow.

Studies on iron metabolism in man and experimental animals, illustrated by colour photography.

Royal Army Medical College. Mite-borne (scrub) typhus.

National Coal Board Medical Service. Research into the physiological and psychological effects of work in hot and humid atmospheres.

The Royal Cancer Hospital, London. Demonstration of cancer of the breast.

St. Bartholomew's Hospital, London, and the Royal Cancer Hospital. Portal hypertension; distribution, effect of different treatments on prognosis, liver function, blood counts.

Rehabilitation Committee of B.M.A.; Ministry of Labour. Scope and facilities for rehabilitation.

Food Hygiene Laboratory of the Central Public Health Laboratory, Colindale. Bacterial food-poisoning and other food-borne disease.

The Wright-Fleming Institute of Microbiology, St. Mary's Hospital, London. Demonstration of basic mechanisms of immediate (pollen) and delayed (tuberculin) reactions and their clinical significance.

British European Airways, with the Scottish Air Ambulance Scheme of the Department of Health for Scotland. Medical aspects of the Highlands and Islands Air Ambulance Service.

Royal Air Force, Directorate General of Medical Services. Recent advances in electrodiagnosis and electrotherapy.

Royal Navy (Royal Naval Personnel Research Committee). Naval Life Saving Committee, and Director of Victualling. Advances made since the 1939-45 war on survival at sea and cold- and foul-weather clothing.

SPECIAL EXHIBITIONS

Kelvin Hall, July 5-9

Royal Faculty of Physicians and Surgeons of Glasgow. Glasgow in the history of medicine.

Pharmaceutical Society of Great Britain. Recent advances in pharmaceutical science; objects of historical interest.

Royal Photographic Society, Medical Group. One hundred years of medical photography.

Ministry of Labour and National Service. The rehabilitation and resettlement of the disabled.

EXHIBITION OF PHARMACEUTICAL PRODUCTS, INSTRUMENTS, APPLIANCES, AND MEDICAL PUBLICATIONS

Kelvin Hall, July 5-9 (Open 9 a.m.-6 p.m. each day)

EXHIBITORS

- Stand No.
1.—Messrs. Down Bros. and Mayer and Phelps, Ltd., Chiron House, 32-34, New Cavendish Street, London, W.1.
2.—Genito Urinary Manufacturing Co. Ltd., 28, Devonshire Street, London, W.1.

- 3 and 4.—Messrs. H. K. Lewis and Co. Ltd., 136, Gower Street, W.C.1.
5.—Messrs. Paines and Byrne Ltd., Pabym Laboratories, Greenford, Middlesex.

Street map of Glasgow.

British Medical Association

AGENDA OF ANNUAL REPRESENTATIVE MEETING, JULY 1, 2, 3, AND 5, 1954, IN THE BUTE HALL, UNIVERSITY, GLASGOW

CHAIRMAN: Dr. S. WAND, Birmingham

PRELIMINARY BUSINESS

Items 1 to 7 relate to preliminary business.

REPORT OF AGENDA COMMITTEE

Grouping of Motions and Amendments

8. The Committee has arranged certain Motions and Amendments which cover substantially the same ground in groups and has selected in each group one Motion or Amendment (marked with an asterisk ★) on which it proposes that discussion should take place. The Representatives of the Constituencies concerned have been informed of these proposals in accordance with Standing Order 21 (iii).

Order of Business

9. The Committee recommends:

Recommendation: (1) That the business under "Overseas" be taken at 11 a.m. on Saturday, July 3;

(2) That "Other Motions by Divisions and Branches," if not previously dealt with, be considered as the first business on Monday, July 5, after the Official Votes of Thanks;

(3) That, with these exceptions, the order of the business be as set out in the Agenda.

STANDING ORDERS

10. **Motion** by the Chairman: That the Standing Orders (Doc. A.R.M. 5) as circulated with this Agenda be adopted as the Standing Orders of the Meeting.

PRELIMINARY

11. **Motion** by the Chairman of Council on behalf of the Council: That the Annual and Supplementary Reports of Council under "Preliminary" (Docs. A.R.M. 2, paras. 1-17, and A.R.M. 3, paras. 190-3) be received.

Election of Vice-Presidents

12. **Motion** by the Chairman of Council: That, with effect from the conclusion of his term of office as President, Mr. J. W. Tudor Thomas, M.D., M.S., D.Sc., F.R.C.S., be elected a Vice-President of the Association in recognition of his valuable services to the Association.

13. **Motion** by the Chairman of Council: That Mr. A. M. A. Moore, F.R.C.S., be elected a Vice-President of the Association in recognition of his valuable services to the Association.

Service Representatives on Council

14. **Motion** by the Chairman of Council: That the following be elected as representatives of the R.A.M.C. and the Medical Branch of the Royal Air Force on the Council for the period 1954-7: Royal Army Medical Corps: Major-General J. C. A. Dowse, C.B., C.B.E., M.C.; Medical Branch of the Royal Air Force: Air Vice-Marshal W. E. Barnes, C.B.E.

Coat of Arms

15. **Motion** by the Chairman of Council: That the proposed coat of arms, as designed by the College of Arms, be accepted as a gift to the Association from the members of Council.

Remainder of Report under "Preliminary"

16. **Motion** by the Chairman of Council: That the remainder of the Annual and Supplementary Reports of Council under "Preliminary" be approved.

SCOTLAND

17. **Motion** by the Chairman of the Scottish Committee on behalf of the Council: That the Annual Report of Council under "Scotland" (Doc. A.R.M. 2, paras. 156-64) be received.

18. **Motion** by the Chairman of the Scottish Committee: That the Annual Report of Council under "Scotland" be approved.

PRIVATE PRACTICE

19. **Motion** by the Chairman of the Private Practice Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Private Practice" (Docs. A.R.M. 2, paras. 105-17, and A.R.M. 3, paras. 226-31) be received.

One-day Certificates to Miners: Bonus Shift Certificates

20. **Motion** by MORPETH: That the B.M.A. approach the Minister of Health concerning the issue of one-day certificates to miners and requests him to institute negotiations with the Ministry of Fuel and Power with a view to their complete abolition.

Life Assurance: Fee for Ordinary Form

21. **Motion** by the Chairman of the Private Practice Committee: That para. 106 of the Annual Report of Council be approved.

22. **Amendment** by SOUTH-EAST ESSEX: That the standard fee for medical examination and report for life assurance should be increased from one and a half guineas to a minimum of two guineas.

★23. **Amendment** by GREENWICH AND DEPTFORD: That this Annual Representative Meeting is of the opinion that the fee for life assurance examination should be increased to £2 2s.

24. **Amendment** by HARROW: That this Meeting reaffirms the resolution passed at the 1953 A.R.M.—namely, that the fee for the ordinary form of life assurance examination should be increased from £1 11s. 6d. to £2 2s.

25. **Amendment** by BOLTON: That the fees for medical examinations or reports for life assurance purposes should be a minimum of two guineas for a full examination and one guinea for a report without examination.

Life Assurance—Attendance Reports

26. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting is of opinion that there is no objection to the issue of attendance reports (that is, reports, without medical examination, regarding persons proposing to take out life assurance policies), provided that: (i) a suitable form of consent signed by the patient agreeing to such a report being issued is forwarded by the company to the practitioner for his retention; and (ii) a suitable fee is agreed upon, depending on the complexity of the report required.

Duration Certificates

27. **Motion** by the Chairman of the Private Practice Committee: That para. 108 of the Annual Report of Council be approved.

28. **Amendment** by OXFORD: That this Meeting supports the motion concerning duration certificates, referred to Council at the A.R.M., 1953, and affirms that it should supersede the resolution of the A.R.M., 1937, reaffirmed in 1949.

29. **Amendment** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting is of the opinion that (1) a "duration certificate" (that is, a medical report about the previous health and medical history of a person who has died shortly after having been accepted for life assurance, without prior medical examination) could jeopardize, but could never be essential to, the claim to the assurance. (2) A practitioner should not, therefore, issue such a certificate unless all the following conditions have been fulfilled:

(a) The proposer dies within three years of taking out the policy.

(b) The original proposal, read and signed by the proposer, contained a clause authorizing the company to apply for, and the doctor to issue, a "duration certificate" in the event of early death.

(c) The original proposal be produced for the practitioner's inspection.

(d) A certified photostat copy (or a duplicate actually signed by the proposer) be supplied to the practitioner for his retention.

(e) The policy has been taken out prior to December 31, 1954.

30. **Motion** by NEWCASTLE-UPON-TYNE: That all industrial insurance companies should require a medical certificate from clients to the effect that he/she has been in good health for two years prior to taking a policy.

Remainder of Report under "Private Practice"

31. **Motion** by the Chairman of the Private Practice Committee: That the remainder of the Annual and Supplementary Reports of Council under "Private Practice" be approved.

Medical Witnesses in Law Courts

32. **Motion** by SWANSEA: That this Meeting, having considered the case where a local single-handed general practitioner was compelled, under a subpoena, to spend four days at the Assize Court recently held at a town 45 miles distant, the action in which his evidence was required not commencing until the third day of his attendance, and his medical evidence not being taken until the fourth day, and realizing that similar occurrences are taking place all over the country, causing great hardship to doctors and patients alike, calls upon the Council of the British Medical Association to approach the Lord Chancellor's department seeking a drastic change for the better in the present methods of summoning and hearing medical witnesses.

Fees for Services of Medical Practitioners Called in by the Police

33. **Motion** by ISLE OF WIGHT: That in those areas where adequate remuneration is not being paid by the Police authorities for the services of medical practitioners, the Council be asked to take action with the Associations of Local Authorities to support local claims.

Remuneration of Members of Medical Boards

34. **Motion** by CITY OF EDINBURGH: That in the opinion of the Representative Body the time has come for an increase in the remuneration of members of medical boards under the various Ministries (for example, the Ministry of Labour and National Service, and the Ministry of National Insurance and Pensions).

Constitution of Private Practice Committee

35. **Motion** by MARYLEBONE: That this Meeting instructs the Council to form a plan whereby the Private Practice Committee shall be truly representative of private practice, both general and consultant.

CONSTITUTION OF THE ASSOCIATION

36. **Motion** by the Chairman of the Constitution Committee on behalf of the Council: That the Annual Report of Council under "Constitution of the Association" (Doc. A.R.M. 2, para. 155) be received.

37. **Motion** by the Chairman of the Constitution Committee: That the Annual Report of Council under "Constitution of the Association" be approved.

Access to Parliament and Ministry of Health

38. **Motion** by MARYLEBONE: That this Meeting draws attention to the fact that the Representative Body has no access to Parliament nor to the Minister of Health, either directly or through its Council, and requires that plans be presented at the next Annual Representative Meeting to correct this anomaly.

ARBITRATION MACHINERY

39. **Motion** by the Chairman of the Committee on Arbitration Machinery on behalf of the Council: That the Annual and Supplementary Reports of Council under "Arbitration Machinery" (Docs. A.R.M. 2, para. 83, and A.R.M. 3, para. 210) be received.

40. **Motion** by LIVERPOOL: That this Meeting also notes with satisfaction that the question of arbitration is to be raised again by the Staff Side in the near future.

★41. **Motion** by WORCESTER AND BROMSGROVE: That there should be the unilateral right to arbitration.

42. **Motion** by WINCHESTER: That in view of the unsatisfactory consultant award, Council be instructed to press urgently for the right of unilateral access to arbitration.

43. **Motion** by the Chairman of the Committee on Arbitration Machinery: That the Annual and Supplementary Reports of Council under "Arbitration Machinery" be approved.

HOSPITAL AND CONSULTANT SERVICES

44. **Motion** by the Chairman of the Central Consultants and Specialists Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Hospital and Consultant Services" (Docs. A.R.M. 2, paras. 53-81, and A.R.M. 3, paras. 206-8) be received.

Review of Consultant Organization

45. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That paras. 53 and 206 of the Annual and Supplementary Reports of Council be approved.

46. **Amendment** by WORCESTER AND BROMSGROVE: That in subparagraph (3) of para. 206, the last words should be amended to read "who are graded as consultants, senior hospital medical officers, and G.P. 10(b)'s."

Hospital Junior Staffing

47. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That paras. 54 and 207 of the Annual and Supplementary Reports of Council be approved.

48. **Amendment** by SWANSEA: That this Meeting deplores the implied merger of the senior hospital medical officers with senior registrars in the senior medical officer grade, and it believes that the S.H.M.O. grade should remain linked with the consultants and specialists group.

49. **Motion** by CLEVELAND: That this Meeting urges that the training of registrars in all specialties should be a continuous and progressive process, and that a period of not less than 12 months in a non-teaching hospital should be necessary to qualify for consultant status.

50. **Motion** by BRIGHTON AND MID-SUSSEX: That the Representative Body feels that the ratio of all grades of registrars to consultants' sessions should be equal in teaching and non-teaching hospitals, and that both grades of these registrars should interchange between these respective hospitals.

51. Motion by WORCESTER AND BROMSGROVE: That the Council be asked to investigate the possibility of arranging suitable liaison between regional hospital boards, hospital management committees, and executive councils so that registrars who have failed to become consultants may find those vacancies in general practice where there is an opportunity to continue in the local hospital the specialist work for which they have been trained.

Senior Registrars and Additional Consultant Posts

52. Motion by NORTH GLAMORGAN AND BRECKNOCK: That this Meeting is of opinion that the Minister should increase the number of part-time consultant posts in general medicine and surgery and in psychiatry.

Remuneration of Hospital Medical Staff

53. Motion by the Chairman of the Central Consultants and Specialists Committee: That paras. 58 and 208 of the Annual and Supplementary Reports of Council be approved.

***54. Amendment** by HEXHAM: That this Meeting is dissatisfied with the recent consultants' award, and the reasons given therefor.

55. Amendment by WORCESTER AND BROMSGROVE: That this Meeting is profoundly dissatisfied with the alteration in remuneration and the manner of the negotiations.

56. Amendment by DARTFORD: That this Meeting deplores the departure from Spens in the recently negotiated readjustment of salaries of hospital medical staff and demands that acceptance of this interim settlement shall not prejudice the claim that further adjustments should be made which are in keeping with the recommendations of the Spens Report.

57. Amendment by CONSETT: That the recent new agreement for remuneration of hospital medical and dental staff is not satisfactory.

***58. Amendment** by MANCHESTER: That this Meeting deplores the inadequacy of the recent agreement reached on the remuneration of hospital medical staffs, and urges that steps be taken to reopen this matter immediately, with a view to obtaining the implementation of the Spens Report as applied to consultants and specialists and obtaining adequate betterment. In the event of disagreement the matter should be referred to arbitration.

59. Amendment by WORCESTER AND BROMSGROVE: That further negotiations be opened immediately to obtain a figure which is consistent with the Spens recommendations.

60. Amendment by HEREFORD: That the Representative Body is dissatisfied with the award of Committee "B" of the Medical Whitley Council for the remuneration of hospital and consultant services, in that the recommendations of the Spens Report have not been implemented, and directs the Council to insist that negotiations be reopened.

61. Amendment by HOLLAND: That the recent increase in remuneration of hospital medical officers does not implement or safeguard the Spens Report, and the Council is requested to take such immediate action as is possible to secure an award in the terms of the Spens Report.

62. Amendment by SOUTHPORT: That this Meeting expresses dissatisfaction both with the method of negotiation and the result in relation to remuneration of hospital medical staff, and urges that negotiations be reopened.

63. Amendment by WORCESTER AND BROMSGROVE: That a further attempt be made to make the present settlement retrospective to the date of commencement of negotiations.

64. Amendment by CLEVELAND: That this Meeting, being dissatisfied with the outcome of the Whitley negotiations, wishes to take steps to review the whole of the negotiating machinery for consultants and specialists.

65. Amendment by SUNDERLAND: That this Meeting recommends that a negotiating committee be elected (representative of all sections of the profession) to conduct all future negotiations on the subject of terms of service or remuneration of any section of the profession.

***66. Amendment** by AYRSHIRE: That the Annual Representative Meeting insists that future negotiations on behalf of the consultants and specialists shall be conducted by B.M.A. machinery.

67. Amendment by SOUTHPORT: That this Meeting recommends that future negotiations for remuneration of the profession should be conducted under the auspices of the B.M.A., which should insist on the right to arbitration.

68. Amendment by SOUTHAMPTON: That this Meeting does not recognize the recent agreement on hospital medical staffs' salaries as either adequate or just, and it urges the Association to take over negotiations and take every possible step to refer the problem to arbitration and to obtain for any future occasion the right of unilateral access to arbitration.

69. Amendment by CONSETT: That as the B.M.A. is criticized for not taking sufficient interest in the welfare of hospital medical staff and for not retaining full control of its Consultants and Specialists Committee, so that the full negotiating power and machinery of the B.M.A. could be used, this Meeting considers that an attempt should be made to reunite the various sections of the profession so that in any future negotiations there is a backing from the B.M.A. in toto.

70. Amendment by CONSETT: That the B.M.A. take over all negotiations on remuneration, conditions of service, and the right to arbitration for the profession as a whole.

71. Amendment by NOTTINGHAMSHIRE: That the recent agreement on the remuneration of hospital medical staff has led to a loss of confidence in the negotiators and to dissatisfaction with the constitution of the Joint Committee, and therefore with the Staff Side of Whitley Council. It is therefore resolved that the British Medical Association should become the negotiating body for all branches of the profession.

72. Amendment by SOUTHAMPTON: That, bearing in mind the limitations imposed on the Royal Colleges by their charter, which restricts their medico-political activities, this Meeting feels that a reorganization of the Joint Committee is essential and that the Consultants and Specialists Committee of the Association should have a greater part in all future negotiations as representatives of the hospital medical staff, and instructs Council to take urgent action to implement this resolution.

73. Amendment by CONSETT: That the Central Consultants and Specialists Committee be renamed the Hospital Medical Staff Committee and be a normal committee without autonomy and be composed of elected representatives from the Branches.

74. Amendment by CONSETT: That the Regional Consultants and Specialists Committees be abolished and that all matters connected with hospital medical staff be dealt with through the normal channels—that is, Division and Branch to the Representative Body and Council.

75. Amendment by MARYLEBONE: That in view of the frustration experienced in the Whitley machinery, this Meeting advises the Central Consultants and Specialists Committee and the Joint Consultants Committee to withdraw from Whitley, and to arrange a direct approach to the Minister.

76. Amendment by WEST DENBIGH AND FLINT: That the S.H.M.O. remuneration should be raised forthwith to approximate more nearly to that of consultant.

77. Amendment by SOUTH ESSEX: That the value of the emoluments of house officers should remain at £100.

78. Amendment by WORCESTER AND BROMSGROVE: That practitioners on the staffs of hospitals at present remunerated on G.P. 10(b) rates should also receive an increase in remuneration.

79. Motion by LIVERPOOL: That this Meeting endorses the views expressed by the Council in its Supplementary Report and notes with satisfaction that the Council has reaffirmed its policy to adhere to the basis of remuneration as enunciated in the Spens Reports. It urges that negotiations be continued and that the best actuarial and

legal advice be given to the negotiators, all of whom should be members of the Central Consultants and Specialists Committee either by election or *ex officio*.

80. Motion by WORCESTER AND BROMSGROVE: That in view of the damaging restrictions which make it impossible to have present on the Staff Side at meetings of Whitley Committee "B" expert legal and actuarial advisers, in future it is essential that the Staff Side should have available all the facilities for special legal or other advice both prior to and during the conduct of negotiations.

81. Motion by SUNDERLAND: That this Meeting requests that Council seek the formation of a court of inquiry to determine the proper level of hospital staffs' remuneration.

82. Motion by CITY OF EDINBURGH: That this Meeting considers it to be prejudicial to the best interests of medical teaching in this country that there should be such a large discrepancy, accentuated by the recent agreement on hospital staff remuneration, between the salaries of consultants paid by hospital boards and those employed full-time by the universities, particularly since both may be carrying out similar duties in the same hospitals. It is urged that immediate steps be taken to improve the financial position of medical members of university teaching staffs.

Contributions of B.M.A. to Negotiating Bodies

83. Motion by TORQUAY: That the contributions of the B.M.A. to the expenses of the Joint Consultants Committee and the Staff Side of Committee "B" of the Medical Whitley Council should be directly proportional to the representation of the B.M.A. on those Committees.

Legal Actions Involving Hospital Authorities and Members of their Medical Staffs

84. Motion by READING: That this Meeting deplores the apparent change in the law by which a practitioner can no longer successfully plead reasonable care and skill in defence, where he has made an error of judgment.

Whole-time or Part-time Service

85. Motion by HARROW: That regional hospital boards should permit whole-time salaried consultants to become part-time when they so desire.

86. Motion by WORCESTER AND BROMSGROVE: That consultants, including medical superintendents in the Mental Health Service, should be given the option of being on a part-time or a whole-time basis.

Domiciliary Consultation Arrangements

87. Motion by RUGBY AND SOUTH WARWICKSHIRE: That this Meeting is of opinion that the diagnosis should not be disclosed on domiciliary consultation certificates.

***88. Motion** by RICHMOND: That facilities for domiciliary visits under the National Health Service be made available to National Health Service patients in private nursing-homes.

89. Motion by EAST YORKSHIRE: That where in view of the shortage of hospital beds for chronic illness, many patients have to be admitted to private nursing-homes for social or domestic reasons, this Representative Body urges that they should not be debarred by such admission from the benefits of consultant services under the National Health Service.

90. Motion by YORK: That it should be within the powers of the general practitioner in charge of a patient confined in a private nursing-home to call in the aid of a consultant anaesthetist under the domiciliary consultation arrangements of the National Health Service.

Geriatric Units

91. Motion by LINCOLN: That this Meeting reaffirms its previous decision to recommend to the Minister the establishment of geriatric units under the guidance of an experienced physician and expresses grave concern at the delay in dealing with this urgent problem.

92. Motion by MANCHESTER: That this Meeting agrees in general principle that ultimately a closely integrated national service should be planned; this is meanwhile not to prejudice the further development of any local approved geriatric service already established and such as exists in Manchester.

93. Motion by WESTMINSTER AND HOLBORN: That this Meeting is alarmed at the absence of any organization in some areas for ensuring prompt admission to hospital of aged persons in need of full-time attention, and suggests that the early appointment of a doctor, able to assess the needs of each and authorized to arrange admission, is essential.

Representation on Regional Boards and Hospital Management Committees

94. Motion by DARTFORD: That this Meeting is of the opinion that medical members of regional hospital boards and hospital management committees should be elected by their professional colleagues.

95. Motion by READING: That every endeavour should be made to ensure that all hospital management committees have general-practitioner representation.

96. Motion by READING: That each hospital in the area of a hospital management committee should be represented on that committee by one member of its medical staff.

Remainder of Report under "Hospital and Consultant Services"

97. Motion by the Chairman of the Central Consultants and Specialists Committee: That the remainder of the Annual and Supplementary Reports of Council under "Hospital and Consultant Services" be approved.

Facilities for Hospital Staff to Attend Meetings of Professional Body

98. Motion by MARYLEBONE: That this Meeting requests the Council to urge regional hospital boards and boards of governors of hospitals to grant every facility to hospital medical staff for the purpose of attending the Annual Representative Meeting.

Consultants and Specialists Defence Fund

99. Motion by GLASGOW: That this Representative Body requests Council to take steps to ensure that an adequate Defence Fund is established by the consultants and specialists.

S.H.M.O. Appointments

100. Motion by GATESHEAD: That no further S.H.M.O. posts be established and that existing posts should be subject to biennial review with a view to upgrading.

Grading of S.H.M.O.s

101. Motion by WOOLWICH: That this Meeting draws attention to the complete lack of uniformity in different regions, and sometimes within the same region, in the use of the grade of S.H.M.O., particularly in relation to and to the detriment of the Tuberculosis Service; and that Council be requested to treat the correction of this injustice as a matter of priority, and to employ every means in the power of the British Medical Association to ensure the grading as consultants of these S.H.M.O.s who are at present inappropriately and unfairly graded.

Junior Hospital Medical Staffs

102. Motion by DORSET: That this Meeting considers that the interests of the junior hospital medical staff do not have adequate expression in the B.M.A. and that a standing committee should be set up to watch over these interests.

Accommodation of Medical Superintendents outside the Hospital

103. Motion by WORCESTER AND BROMSGROVE: That the Council be asked to investigate the possibility of medical superintendents being given the opportunity to live outside the hospital if they so desire.

Machinery for Appointment of Consultants and Registrars

104. **Motion** by SOUTH ESSEX: That this Meeting considers that at the appointment of registrars and consultants, both the hospital management committee and the assessors should have equal voting power, while the chairman should retain a casting vote.

105. **Motion** by BRIGHTON AND MID-SUSSEX: That the Representative Body considers that local group medical and lay committee members should have more say in the appointment of consultant staff.

Administration of Hospital Groups

106. **Motion** by DORSET: That this Meeting considers that the administration of hospital groups could be improved by occasionally appointing experienced doctors as secretaries to hospital management committees.

Control of Hospital Management

107. **Motion** by MID-CHESHIRE: That this Meeting would deprecate the return of hospital management from independent to municipal control.

Post-mortem Examinations

108. **Motion** by DEWSBURY: That it should be possible for a practitioner to have a post-mortem performed by a consultant pathologist on any patient who was of particular clinical interest to the practitioner. The cost of such a service could be borne by the research grant of the National Health Service.

Rh Tests and Blood Grouping

109. **Motion** by BUCKINGHAMSHIRE: That when Rh tests and blood grouping are carried out, a card should be supplied suitable for preservation by the patient.

Visits to Patients in London Fever Hospitals

110. **Motion** by PADDINGTON: That the London fever hospitals should permit daily visits to patients in all suitable cases, except in special circumstances.

OCCUPATIONAL HEALTH

111. **Motion** by the Chairman of the Occupational Health Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Occupational Health" (Docs. A.R.M. 2, paras. 84-7, and A.R.M. 3, paras. 211-15), the Memorandum to the Ministry of Labour and National Service on the Future of the Occupational Health Services (Appendix III), the Memorandum on Medical Standards for Road, Rail, and Air Transport (Appendix IV), the Memorandum on the National Insurance (Industrial Injuries) Act (Appendix V), and the Revised Statement on the Remuneration of Whole-time Industrial Medical Officers (Appendix IX) be received.

Medical Standards for Road, Rail, and Air Transport

112. **Motion** by the Chairman of the Occupational Health Committee: That para. 85 of the Annual Report of Council and the Memorandum submitted to the Ministry of Transport (Appendix IV to the Annual Report) be approved.

113. **Amendment** by SOUTHAMPTON: That in the opinion of the Meeting further consideration should be given to the information which should be disclosed on Form P.S.V. 15A (application for licence to drive public service vehicles).

Duties of and Ethical Rules for Industrial Medical Officers

114. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting urges Council to take further active steps to try to compile a comprehensive list of industrial medical officers, or, failing this, to circulate among all non-members of the Association a copy of "The Duties and Ethical Rules for Industrial Medical Officers," and also to publish them at periodic (say three-yearly) intervals in the Supplement.

Remuneration of Whole-time Industrial Medical Officers

115. **Motion** by the Chairman of the Occupational Health Committee: That the following recommendation of the Council be adopted:

That the revised statement on remuneration of whole-time industrial medical officers, set out in Appendix IX to the Annual Report of Council, be approved.

Remainder of Report under "Occupational Health"

116. **Motion** by the Chairman of the Occupational Health Committee on behalf of the Council: That the remainder of the Annual and Supplementary Reports of Council under "Occupational Health" be approved.

ORGANIZATION

117. **Motion** by the Chairman of the Organization Committee on behalf of the Council: That the Annual Report of Council under "Organization" (Doc. A.R.M. 2, paras. 141-54) be received.

Autonomous Bodies

118. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1954-5.

That the Representative Body looks to these committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

Election of "Ten" Members of Council

119. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

1. That By-law 49 be amended as follows:

(i) By inserting the following new subparagraph:

(2) For the purpose of electing the President, the Chairman, and the Deputy Chairman of the Representative Body, the Treasurer, and the members of the Council and of any Standing Committees required to be elected by the Representative Body votes shall be recorded at such time and in such manner as the Representative Meeting may decide.

(ii) By altering the numbering of the existing subparagraphs (2)-(5) to (3)-(6) respectively and by adding at the commencement of new subparagraph (3) the words "Except as aforesaid."

2. That By-law 53(c) be altered by the deletion of all words after "as to" in line 3 and the substitution thereof of the following:

"ten by Representatives of Constituencies and of Public Health Service Members and Members of Council representing the medical branches of the armed Forces, as to a further two by the elected Representatives of Constituencies comprised in the Branches and Divisions in Scotland, and as to a further one by the elected Representatives of Constituencies comprised in the Branches and Divisions in Wales, including Monmouthshire."

The By-laws as amended would read:

Voting

(2) For the purpose of electing the President, the Chairman, and the Deputy Chairman of the Representative Body, the Treasurer, and the members of the Council and of any Standing Committees required to be elected by the Representative Body votes shall be recorded at such time and in such manner as the Representative Meeting may decide.

(3) Except as aforesaid, voting shall be by show of hands, unless before the vote is taken fifteen Representatives present

request that the vote be taken by roll-call, in which event it shall (subject as hereinafter provided) be so taken. If, however, upon the Chairman proceeding to take the vote, a vote by card is demanded by a majority of the Representatives present the vote shall be taken by card. . . .

Council: Composition

53. . . .
(c) Thirteen (being persons who have been members of the Association for at least the period aforesaid), at the Representative Meeting being elected as to ten by Representatives of Constituencies and of Public Health Service Members and of Members of Council representing the medical branches of the armed Forces, as to a further two by the elected Representatives of Constituencies comprised in the Branches and Divisions in Scotland, and as to a further one by the elected Representatives of Constituencies comprised in the Branches and Divisions in Wales, including Monmouthshire. . . .

Membership of Divisions and Branches

120. **Motion** by the Chairman of the Organization Committee: That para. 150 of the Annual Report of Council be approved.

121. **Amendment** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting cannot accept Council's view that implementation of Minute 255 of the 1953 Annual Representative Meeting would cause any material administrative difficulties, or would lead to any insuperable complications or anomalies, and urges that the said Minute be implemented as soon as possible.

Remainder of Report under "Organization"

122. **Motion** by the Chairman of the Organization Committee: That the remainder of the Annual Report of Council under "Organization" be approved.

B.M.A. Year Book

123. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting considers that this publication is a very useful source of information on a variety of subjects, and urges that a free copy be issued to all members periodically (though not necessarily every year).

PUBLIC HEALTH

124. **Motion** by the Chairman of the Public Health Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Public Health" (Docs. A.R.M. 2, paras. 88-98, and A.R.M. 3, paras. 216-24), the Memorandum on the General Practitioner and the Health Visitor (Appendix VI), the Memorandum of Evidence submitted by the Council to the Health Visitors' Working Party (Appendix XI), the Memorandum of Evidence submitted by the Council to the Working Party on the Training of District Nurses (Appendix XI), and the Statement on the Memorandum submitted by the British Veterinary Association to the Ministry of Agriculture and Fisheries on the subject of Meat Production and Control (Appendix XII) be received.

125. **Motion** by the Chairman of the Public Health Committee: That the Annual and Supplementary Reports of Council under "Public Health" be approved.

Arbitration and the Public Health Service

126. **Motion** by DARLINGTON: That this Meeting considers that, the Council having failed to obtain a Whitley Court of Arbitration as mandated by the amended Mid-Herts resolution passed at the 1953 A.R.M. (Min. 83), the Council be instructed to withdraw all members from the Public Health Service if this court of arbitration has not been obtained by December 31, 1954.

(Min. 83 of the A.R.M., 1953, was as follows:

That this Meeting deplores the lack of a Whitley Court of Arbitration to which there should be a right of appeal by unilateral reference and where the ruling should be binding on both parties, and instructs Council to take immediate and urgent action.)

Salaries in the Public Health Service

*127. **Motion** by CITY OF ABERDEEN, BANFF, MORAY AND NAIRN, and DUNDEE: That the disparity between remuneration in the Public Health Service and that of the medical profession as a whole is a threat to the rest of the profession and contrary to public interest. It is therefore the declared policy of the Association that remuneration in the Public Health Service be brought into line with that of hospital and general practice, and the Council is instructed to take steps to implement this policy as a matter of urgency.

128. **Motion** by GATESHEAD: That the whole structure of public health remuneration be reviewed, as it is still out of line with that in other branches of the Service.

129. **Motion** by HARROW: That this Meeting considers that in view of the serious position developing with regard to recruitment in the Public Health Service, steps be taken to reopen the question of salaries in that service.

Constitution of Public Health Committee

130. **Motion** by LIVERPOOL: That this Meeting, while welcoming the Report of Council that the Industrial Court Awards have been accepted by all local authorities, is of the opinion that the organization of the Public Health Committee is not sufficiently representative of the junior grades of the Public Health Service; and that the matter be considered by the Constitution Committee.

Scales of Fees for Special Sessions

131. **Motion** by NORTH NORTHUMBERLAND: That in the opinion of this Meeting all scales of fees for special sessions—for example, dental anaesthetics, etc.—should be immediately revised.

REFORM OF THE NATIONAL HEALTH SERVICE

132. **Motion** by the Chairman of the Amending Acts Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Reform of the National Health Service" (Docs. A.R.M. 2, para. 82; and A.R.M. 3, para. 209) and the proposed scheme for the restoration of the right to buy and sell goodwill (Appendix VIII) be received.

Goodwill

133. **Motion** by the Chairman of Council: That the following recommendation of the Council be adopted:

That in view of (a) the practical difficulties of implementing the proposed scheme for the right to buy and sell goodwill, (b) the high capital outlay required by young practitioners to launch into practice, (c) the divided opinion in the profession as to the desire to introduce such a scheme, and (d) the known political resistance to any such proposal, no further action be taken.

134. **Amendment** by LINCOLN: That the recommendation of the Council be varied to read:

That no further action be taken regarding the scheme for the restoration of the right to buy and sell goodwill, contained in Appendix VIII of the Supplementary Report of Council.

135. **Amendment** by HARROW: That the principle of a general practitioner owning and being able to dispose of the goodwill of his practice in any way he likes is fundamentally sound and proper, but that this Meeting defers consideration of what action to take in regard to this principle until all Divisions have had an opportunity of studying Council's report on goodwill and of deciding what action should be taken.

136. **Amendment** by SOUTH-WEST ESSEX: That the scheme be referred back to the Council in order that it may consider arrangements whereby new entrants to practice will have an opportunity of entering the Service either (1) by purchase of the goodwill of the practice, or (2) by selection by the Medical Practices Committee.

137. **Amendment** by CHELSEA AND FULHAM: That the scheme for the reintroduction of buying and selling prac-

tices be referred back to Council for amendment and to devise regulations that will fully protect the financial position of new entrants.

138. **Amendment** by SOUTH STAFFORDSHIRE: That since the return of the right to buy and sell goodwill would appear to present no insuperable difficulties, Council be instructed as a matter of urgency to institute appropriate steps to try to regain this right.

139. **Amendment** by MARYLEBONE: That this Meeting commends the work of the Amending Acts Committee in its scheme for the restoration of the right to buy and sell the goodwill of practices and instructs the Council to implement the proposals.

140. **Amendment** by BRIGHTON AND MID-SUSSEX: That a referendum of the profession be taken as to the principle of the return of the right to buy and sell goodwill.

*141. **Amendment** by RICHMOND: That the return of the right to buy and sell goodwill being of such essential importance to the freedom of the profession, this Representative Meeting requests that the considered opinion of the profession should be ascertained by a plebiscite to be held before the next Annual Representative Meeting.

142. **Amendment** by MANCHESTER: That this Meeting requests Council to take a postal vote of all general practitioners on the question of the restoration of the sale of goodwill of practices.

143. **Motion** by AYRSHIRE and EAST KENT: That this Meeting considers that the restoration of the right to buy and sell the goodwill of medical practices in the National Health Service is impracticable.

MEDICAL FILMS

144. **Motion** by the Chairman of the Film Committee on behalf of the Council: That the Annual Report of Council under "Medical Films" (Doc. A.R.M. 2, para. 175) be received.

145. **Motion** by the Chairman of the Film Committee: That the Annual Report of Council under "Medical Films" be approved.

"BRITISH MEDICAL JOURNAL"

146. **Motion** by the Chairman of the Journal Committee on behalf of the Council: That the Annual Report of Council under "British Medical Journal" (Doc. A.R.M. 2, para. 118) be received.

147. **Motion** by the Chairman of the Journal Committee: That the Annual Report of Council under "British Medical Journal" be approved.

B.M.J. Advertisements and Nationality of Applicants for Appointments

148. **Motion** by CITY: That advertisements in the *British Medical Journal* shall not contain any inquiry as to the nationality of the applicant, except when the knowledge of certain languages is necessary for the treatment of patients.

"FAMILY DOCTOR"

149. **Motion** by the Chairman of the Family Doctor Committee on behalf of the Council: That the Annual Report of Council under "Family Doctor" (Doc. A.R.M. 2, para. 119) be received.

150. **Motion** by the Chairman of the Family Doctor Committee: That the Annual Report of Council under "Family Doctor" be approved.

151. **Motion** by ISLE OF WIGHT: That this Meeting congratulates the editorial staff of *Family Doctor* on the presentation of this publication.

GENERAL MEDICAL SERVICES

152. **Motion** by the Chairman of the General Medical Services Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "General Medical Services" (Docs. A.R.M. 2, paras. 18-49,

and A.R.M. 3, paras. 194-205) and the Second Report of the Working Party on the Danckwerts Award and the Small-list Practitioner (Appendix VII) be received.

The Danckwerts Award and the Small-list Practitioner

153. **Motion** by the Chairman of the General Medical Services Committee: That paras. 21 and 196 of the Annual and Supplementary Reports of Council and Appendix VII—Second Report of the Working Party on the Danckwerts Award and the Small-list Practitioner—be approved.

154. **Amendment** by CHELSEA AND FULHAM, KENSINGTON AND HAMMERSMITH, and PADDINGTON: That account should be taken of those practitioners who are under 60 years of age and also not in receipt of a fixed annual payment, who will now be worse off than they were under Danckwerts.

Admission of Students to Medical Schools

155. **Motion** by HEXHAM: That this Meeting considers that, in view of the saturation of certain branches of the medical profession, the Minister should be impressed with the extreme urgency of the situation, in setting up at the earliest possible moment the working party proposed in section 24 of the Annual Report of Council.

156. **Motion** by NEWCASTLE-UPON-TYNE: That in view of the serious consequences which would follow if the country became saturated with doctors, and pending the deliberations of the General Medical Services Committee on this problem, the Council should consider the advisability of taking immediate steps to reduce the intake of students into medical schools.

Change of Practice

157. **Motion** by KENSINGTON AND HAMMERSMITH: That this Meeting appreciates the efforts of the General Medical Services Committee to facilitate the exchange of practices, and urges it to continue to do all in its power to achieve this, since the inability to remove from some districts after years of hard work constitutes a grave hardship not only to the doctor but often even more so to his family, who suffer social and educational disabilities.

Machinery for Filling Practice Vacancies

158. **Motion** by WEST DENBIGH AND FLINT: That when vacancies in practices have to be filled, the appointment should be made by the local executive council.

159. **Motion** by HARROW: That advertised vacancies for practices on new estates or adjacent to existing built-up areas should not be advertised in the *British Medical Journal* until the matter has been referred to the local Division of the B.M.A. for its views.

Economy in Prescribing

*160. **Motion** by ST. PANCRAS: That the Council, through the General Medical Services Committee, urges once again the immediate introduction of stock orders for doctors' surgeries.

161. **Motion** by BUCKINGHAMSHIRE: That the Representative Body considers the introduction of Form E.C. 10A in England and Wales imperative within the next twelve months.

162. **Motion** by DARTFORD: That this Meeting deplores the present regulations regarding the supply of drugs and dressings for ready use in the surgery and recommends the stopping of payment for ready use dressings and the introduction of Form E.C. 10A.

163. **Motion** by BRIGHTON AND MID-SUSSEX: That to bring about a substantial saving in prescribing costs, the Council should continue to press for stock orders for doctors' surgeries in England and Wales.

164. **Motion** by WEST BROMWICH AND SMITHWICK: That it be referred to the Council to devise an alternative scheme whereby Form E.C. 10A or an effective equivalent may be operated for the ordering of stock drugs and surgical requisites.

165. **Motion** by GATESHEAD: That no prescriptions for cod-liver oil and malt be questioned by the Pricing Bureau unless in excess of 4 lb.

Dangerous Drugs Regulations

166. **Motion** by the Chairman of the General Medical Services Committee: That para. 31 of the Annual Report of Council be approved.

*167. **Amendment** by MANCHESTER: That this Meeting asks Council to press for the withdrawal of the circular issued by the Ministry dealing with the issue of pethidine to midwives.

168. **Amendment** by CAMBRIDGE AND HUNTINGDON: That representations be made to the Ministry of Health that midwifery practice will be made exceedingly difficult for general practitioners if midwives are not permitted to administer pethidine on the instruction of a general practitioner unless the latter is present.

169. **Amendment** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting is of opinion that pethidine should be administered only under the supervision of a doctor and only with his agreement, but not necessarily in his presence, and that the medical officer of health should not be allowed to issue or to authorize the administration of pethidine unless he personally accepts responsibility for the case.

170. **Amendment** by MID-CHESHIRE: That this Meeting protests at the wording of paragraph 31 of the Annual Report of Council, and recommends that this be clarified.

Supply of Medicines to Private Patients

171. **Motion** by MARYLEBONE: That this Meeting instructs the Council to continue to press the Minister to take immediate steps to allow the issue of medicine on Form E.C. 10 to private patients.

Accommodation in Surgeries and Waiting-rooms

172. **Motion** by CITY: That in order that single-handed practitioners may improve their surgery premises, a sum of money should be set aside from which a loan may be obtained on the same conditions as appertains to group practice.

Employment of General Practitioners in Hospitals

173. **Motion** by HEXHAM: That this Meeting views with great concern any possible reduction in the remuneration of general practitioners working in hospitals.

174. **Motion** by WEST DENBIGH AND FLINT: That general practitioners in hospital service should continue to receive not less than £175 per annum per session.

175. **Motion** by MID-CHESHIRE: That this Meeting urges the Council to expedite the payment to general practitioners in hospitals of the sum of £175 per annum.

Representation of General Practitioners in Hospital Administration

176. **Motion** by the Chairman of the General Medical Services Committee: That para. 39 of the Annual Report of Council be approved.

177. **Amendment** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting strongly supports the General Medical Services Committee's view that the general-practitioner representatives on regional hospital boards should always enjoy the confidence of their local colleagues, but views with deep dismay the Ministry's suggestion that the practitioner best suited, in his colleagues' opinion, for the post might be (and in fact very often is) excluded solely "to preserve the geographical balance of the other members of the Board," and this Meeting urges that the general practitioners' nominees should be accepted.

Maternity Medical Services: The Obstetric List

178. **Motion** by DARTFORD: That this Meeting reaffirms the opinion of the Representative Body of 1953 regarding the abolition of the Obstetric List and recommends that dis-

cussions with the Ministry with this in view should be reopened with the minimum of delay.

179. **Motion** by ISLE OF ELY: That this Annual Representative Meeting resolves that the procedure in operation in England and Wales with regard to Obstetric Lists under the National Health Service (Maternity Medical Services) be abolished, and that the procedure at present followed in Scotland and Northern Ireland be adopted in its place.

G.P. Maternity Beds in Hospitals

180. **Motion** by BATH: That this Meeting urges that regional hospital boards be instructed to refrain from reducing the number of general-practitioner maternity beds in hospitals.

Clinical Research Board

181. **Motion** by DORSET: That this Meeting considers that a general practitioner should sit on the Clinical Research Board as a right.

Certification for Surgical Corsets

182. **Motion** by the Chairman of the General Medical Services Committee: That para. 48 of the Annual Report of Council be approved.

183. **Amendment** by GATESHEAD: That every effort should be made to secure the abolition of the purchase tax on corsets.

184. **Amendment** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting is of opinion that general practitioners should not be required to issue certificates for surgical corsets solely for the purpose of obtaining exemption from purchase tax.

Elimination of Inflation

185. **Motion** by WORCESTER AND BROMSGROVE: That the Ministry be pressed again to have instructions printed on the Medical Card requesting the patient to notify to the executive council any change of address.

Remainder of Report under "General Medical Services"

186. **Motion** by the Chairman of the General Medical Services Committee: That the remainder of the Annual and Supplementary Reports of Council under "General Medical Services" be approved.

Disposal of Goodwill of Private Practice by N.H.S. Practitioner

187. **Motion** by BOURNEMOUTH: That any doctor who purchases the goodwill or a share of the goodwill of a private practice shall be entitled to sell the same even if he is engaged in National Health practice in the same area.

Employment of Assistants

188. **Motion** by GREENWICH AND DEPTFORD: That in the opinion of this Meeting any legislation regarding the taking or keeping of an assistant is a dangerous curtailment of liberty. The Representative Body therefore requests the Council to take active steps through the Medical Practices Advisory Bureau to protect the interests of applicants and inform them of the state of affairs in any particular case.

Single-handed Practitioners with Excessive Lists

189. **Motion** by LEWISHAM: That a principal with a list in excess of the maximum allowed for single-handed practice, having employed assistance for an aggregate period of two years, shall take a partner or have his list reduced to the maximum for a single-handed practitioner.

Practice Accommodation in Isolated Areas

190. **Motion** by WESTMORLAND: That the Representative Body invites the Council to review the difficulty experienced by practitioners in isolated areas in obtaining suitable practice accommodation, and that in appropriate cases the Ministry be asked to give powers to executive councils to provide such accommodation on payment of an appropriate rental.

Certification

191. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting considers that the present practice of requiring a full week's national insurance contribution for any portion of a week, for which a person (not otherwise exempt) is certified as fit for work, is unfair not only to the contributors but also to the doctors, since it at times jeopardizes the doctor-patient relationship. This Meeting therefore urges Council, in the interests of common justice, to raise this matter with the Ministry, notwithstanding the slight administrative problem which the adoption of the proposed alteration might involve.

Disclosure of Clinical Details to Local Medical Committees

192. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting is dissatisfied with the "suggested procedure" (B.M.J. Supplement, August 1, 1953, p. 68) for dealing with cases in which a practitioner who has been asked by an executive council for clinical details of a patient (so that it may be decided whether a preparation prescribed on Form E.C. 10 was a food or a drug) finds that the patient refuses to give consent to such disclosure. Objections are (a) that it would only be strictly ethical if the patient had consented to this specific arrangement, and (b) the onus of obtaining the patient's written consent should be on the executive council and not on the practitioner.

(The "suggested procedure" referred to is as follows:

"The practitioner sends the details of the case to the secretary of the local medical committee, who is, in most cases, himself a doctor, or to the chairman of the committee. The secretary or chairman, as the case may be, discloses to his committee the clinical details which he receives, but withholds the name of the patient. The committee, in informing the executive council of its findings, suppresses these clinical details, but the council will, of course, be in possession of the name of the patient through their clerk. Thus the secretary or chairman of the local medical committee is the only person who is in a position to connect the patient by name with the clinical details, and the objection to the disclosure of medical information to lay members and officials of the executive council is avoided.")

Valuation of Doctors' Houses

193. **Motion** by YORK: That the present system of valuation of the house of a doctor retiring from the National Health Service is unsatisfactory, inasmuch as no consideration is given by the valuer appointed for the purpose to the special accommodation for patients provided at the doctor's house.

London Local Medical Committee and Approval of Trainers

194. **Motion** by PADDINGTON: That this Meeting resents the persistent refusal of the Local Medical Committee for London to arrange for appeals against the decision of their subcommittee concerned with the approval of trainers, in spite of persistent representations made to it.

Postgraduate Instruction for General Practitioners

195. **Motion** by PADDINGTON: That the regional boards should be encouraged to provide postgraduate instruction to practitioners in all areas, to equip the practitioner to satisfy the requirements of the local medical committee.

COMPENSATION AND SUPERANNUATION

196. **Motion** by the Chairman of the Compensation and Superannuation Committee on behalf of the Council: That the Annual Report of Council under "Compensation and Superannuation" (Doc. A.R.M. 2, paras. 50-2), and the Memorandum on the Financial Position of Practitioners on Retirement (Appendix II), be received.

197. **Motion** by the Chairman of the Compensation and Superannuation Committee: That the Annual Report of Council under "Compensation and Superannuation" be approved.

Provision of Additional Voluntary Compensation Scheme

198. **Motion** by BUCKINGHAMSHIRE: That in view of the admitted inadequacies of the present superannuation scheme this Meeting suggests the provision of an additional voluntary scheme sponsored by the Ministry, equal payments being made by the practitioner and the Government.

MEDICAL ETHICS

199. **Motion** by the Chairman of the Central Ethical Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Medical Ethics" (Docs. A.R.M. 2, paras. 99-104, and A.R.M. 3, para. 225) be received.

Loan of Hospital Records to Government Departments

200. **Motion** by the Chairman of the Central Ethical Committee: That the following recommendation of the Council be adopted:

That the following statement on the loan of hospital records to Government departments be approved:

(a) That medical records should be lent to the medical officers employed by Government departments only when written consent has been given by or on behalf of the patient.

(b) That the form of consent signed by or on behalf of the patient should include a statement that the patient agrees to his hospital records being made available to the medical board in order to assist them in determining the degree of disablement and whether it is related to his industrial accident.

(c) That wherever practicable, and particularly where disclosure of information may have an adverse psychological effect upon the patient, the practitioner who compiled the record or, if he is not available, one nominated by the hospital authority for the purpose, should be consulted on the wisdom of disclosing to the patient all of the confidential information contained therein, at the same time taking the opportunity of reviewing the notes before they leave the hospital.

Remainder of Report under "Medical Ethics"

201. **Motion** by the Chairman of the Central Ethical Committee: That the remainder of the Annual and Supplementary Reports of Council under "Medical Ethics" be approved.

FINANCE

202. **Motion** by the Treasurer on behalf of the Council: That the Annual and Supplementary Reports of Council under "Finance" (Docs. A.R.M. 2, paras. 120-7, and A.R.M. 3, para. 232) and Appendix XIII and the Financial Statement for the year ending December 31, 1953 (Doc. A.R.M. 3A), be received.

203. **Motion** by the Treasurer: That the Annual and Supplementary Reports of Council under "Finance" be approved.

Association Membership Subscription

204. **Motion** by MARYLEBONE: That this Meeting notes with satisfaction the greatly improved financial position of the Association, which has resulted in part from the increase in subscription from four to six guineas in 1952, and instructs the Council to make plans for reducing the subscription to five guineas within two years.

205. **Motion** by GATESHEAD: That an assurance be given that, as soon as financial circumstances of the Association permit, the question of reducing all membership subscriptions will be seriously considered.

206. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting views with much concern the rather heavy fall in membership since the increased subscription rate, and asks for a clear statement from Council regarding the probable future trends of the Association's finances, membership, and subscription rates.

207. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting urges the Council to investigate the desirability of having different subscription rates for "town" and "country" members.

208. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That it be referred to the Council to consider the possibility of reducing the B.M.A. subscription to half a guinea or even less to members for the first 13 months after qualification.

Subscription Payable by Whole-time Salaried Members

209. **Motion** by the Treasurer: That para. 127 of the Annual Report of Council be approved.

*210. **Amendment** by HARROW: That this Meeting considers that the reduced subscription of four guineas should be granted to all whole-time salaried members of the Association.

211. **Amendment** by PERTH: That this Meeting reiterates its view that the reduced subscription of four guineas should be granted to all whole-time salaried members of the Association.

212. **Amendment** by MID-CHESHIRE: That this Meeting regrets that Council did not see fit to accept the resolution of the A.R.M., 1953, regarding subscriptions to be paid by members of the Association on full-time salaried service.

BUILDING

213. **Motion** by the Chairman of the Estates Committee on behalf of the Council: That the Annual Report of Council under "Building" (Doc. A.R.M. 2, para. 128) be received.

214. **Motion** by the Chairman of the Estates Committee: That the Annual Report of Council under "Building" be approved.

SCIENCE

215. **Motion** by the Chairman of the Science Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Science" (Docs. A.R.M. 2, paras. 129-34, and A.R.M. 3, paras. 233-8) be received.

Postage on Library Books

216. **Motion** by HUDDERSFIELD: That in the interests of provincial practitioners, whose opportunities to enjoy the facilities of B.M.A. House are limited, the Association return to the former system of paying outgoing postage on library books and periodicals sent out on loan.

Remainder of Report under "Science"

217. **Motion** by the Chairman of the Science Committee: That the remainder of the Annual and Supplementary Reports of Council under "Science" be approved.

PUBLIC RELATIONS

218. **Motion** by the Chairman of the Public Relations Committee on behalf of the Council: That the Annual Report of Council under "Public Relations" (Doc. A.R.M. 2, paras. 135-9) be received.

219. **Motion** by the Chairman of the Public Relations Committee: That the Annual Report of Council under "Public Relations" be approved.

National Insurance Contribution and Health Service

220. **Motion** by PADDINGTON: That greater publicity should be given to the fact that the National Insurance Scheme ceased in July, 1948, and that the present National Insurance contribution is not used for financing the health service, the finances being provided out of the general revenue.

Public Relations Officer and Unfair Criticism of the Profession

221. **Motion** by GREENWICH AND DEPTFORD: That the Council be instructed to ensure that the Public Relations Officer should take all steps to prevent unfair criticism of the medical profession passing unanswered.

ARMED FORCES

222. **Motion** by the Chairman of the Armed Forces Committee on behalf of the Council: That the Annual Report of Council under "Armed Forces" (Doc. A.R.M. 2, para. 140) be received.

223. **Motion** by the Chairman of the Armed Forces Committee: That the Annual Report of Council under "Armed Forces" be approved.

WALES

224. **Motion** by the Chairman of the Welsh Committee on behalf of the Council: That the Annual Report of Council under "Wales" (Doc. A.R.M. 2, para. 165) be received.

225. **Motion** by the Chairman of the Welsh Committee: That the Annual Report of Council under "Wales" be approved.

OVERSEAS

vation of the Government's prerogatives. A code of conduct is unlikely to be arbitrable, but a simple proposal for a change in wage or salary rates almost certainly is" (my italics).

Commenting upon this situation, the leading article of the *B.M.J.* (1949, 2, 63) stated: "In May, 1948, the Minister agreed that after the inception of the Service it would be open to the profession to raise through Whitley machinery the question of betterment. It was because of this that the chairman of Council, Dr. H. Guy Dain, was able to persuade the medical profession to enter the National Health Service."

The Basis of Remuneration

Two committees were set up under the chairmanship of Sir William Spens, the general practice committee subsequently issuing a report upon the remuneration of general practitioners; and the specialist committee some time later providing a report on the remuneration of consultants and specialists. Both reports were publicly accepted by the Minister of Health, Mr. Aneurin Bevan, and the profession, as the basis of future remuneration. Unfortunately, owing to the instability of social and economic conditions at that time, the Spens Reports defined remuneration in terms of the 1939 values of money, and stated those now well-known words: "We leave to others the problem of the necessary adjustments to present-day values of money, but we desire to emphasize as strongly as possible that such adjustments should have direct regard not only to estimates of the change in the value of money but to the increases which have in fact taken place since 1939 in incomes both in the medical and other professions. In our judgment it is only if corresponding changes are made in the incomes of consultants and specialists that the recruitment and status of the various branches of specialist practice will be maintained."

It is important to realize that the betterment factor in the case of general practitioners had been determined by the Government as long ago as 1946, and that this figure was imposed by the Government but not agreed to by the profession when the Health Service began on the appointed day, July 5, 1948.

July, 1948–March, 1952

Although the imposition of the 20% betterment factor upon the general practitioners took place from the outset, hospital medical and dental staffs were left in ignorance of the betterment factor which the Government intended to impose upon them, and were obliged to exist upon rates of pay which were 25% to 40% below the accepted minimum of the Spens scale in terms of 1939 money values, whilst at the same time paying compulsory superannuation contributions.

It was therefore necessary for the Ministry of Health to invite specialists to participate in the National Health Service upon a temporary basis, interim contracts being issued for this purpose, and these, *inter alia*, stated:

"The invitation to take part in the service on the basis of the remuneration and conditions now proposed is made for a limited period only in order to allow of review and the substitution of firm contracts on a permanent basis as soon as possible. The rates of remuneration, travelling expenses, etc., proposed in the invitation are provisional payments until the rates evolved from the Spens Report are known."

Part-time specialists were more fortunate, since the Appendix contained provisional rates which in their case amounted to £200 per annum per half-day. Many of the whole-time specialists thought that this could be taken to infer that 11 half-days or £2,200 per annum, a betterment factor of 47%, might be taken as a starting-point for negotiations regarding the betterment factor to be applied to the Spens Report for Consultants and Specialists.

Some support to this impression was given by the increases which had in fact taken place in the medical and other professions since 1938. The professional earnings of doctors, dentists, lawyers, artists, and journalists were sum-

marized for purposes of assessment of income tax under Schedule D in Table V of the *National Income and Expenditure of the United Kingdom*, published by the Central Statistical Office as follows: 1938, £105m.; 1946, £180m.; 1947, £200m.; 1948, £212m.

From this it might be assumed that, allowing for some increase in total numbers within the professions concerned, there had been approximately a 100% increase in remuneration, and that this factor would be taken into account when the adjustments in "relation to the present value of money" were subsequently made.

A few specialists wrote for personal confirmation of the situation, a typical reply being:

"I am writing to confirm that the salary is provisional and subject to review before March 31, 1949, in the light of recommendations made in the Spens Report. All changes in rates of salaries occasioned by this review will have retrospective effect from July 5, 1948" (my italics).

Review of Hospital Medical Staff

During this period hospital staffs were "graded" by grading committees, and in the light of subsequent events there can be little doubt that grave injustices occurred as the result of the introduction by the Government of the grades of S.H.M.O. and S.H.D.O., which provided a ready means of obtaining consultant services, in many cases, at a rate of remuneration £1,000 below the equivalent maximum of the consultant scale. The view of the Council of the B.M.A. on this matter was expressed in their Supplementary Report (*Supplement*, 1949, 1, 287), when it was stated:

"The committee feels that the creation of this grade, necessary as it may be for the appropriate classification of certain transferred officers, is fraught with danger in that it might lead to the establishment of two grades of specialist, involving a process of dilution which would be most undesirable. It is therefore insistent that the grade shall not be applied to practitioners of consultant status, and had recommended to the Joint Committee that the grade should be used only as a temporary expedient, and that no future appointments should be made in this grade."

Advertisements for appointments involving specialist duties in this grade were no longer accepted for insertion in the *Journal*. Unfortunately, there are still to-day many very experienced physicians and surgeons graded as S.H.M.O.s but performing consultant duties, thus providing a pool of what must be considered as "cheap labour."

Internal strife was created at the registrar level by the creation of an excessive number of posts which bore no relationship to the ultimate consultant establishment, so that considerable uncertainty for the future existed.

Senior consultants were divided among themselves over the question of merit awards, which were allotted secretly to a total of 34% of specialists. The whole basis of the merit award system, and in particular the secrecy surrounding them, was the subject of much criticism.

Divided Within

Thus the Minister had been able to exploit the weaknesses of human character by allowing the profession to sit in judgment upon themselves. A correspondent in the *Supplement* (1949, 2, 192) aptly summarized the situation when he wrote: "We may well ask ourselves, 'How could this situation come about?' It has come about because doctors have been, since the National Health Service was first mooted, woefully disunited and disorganized, pursuing selfish aims and sectional interests and failing to come together for their own protection. Thus wedges are being driven between various sections of the profession. If doctors do not now at this late hour organize and unite, then the outlook for the doctor and his family is black indeed. And the time is short." There will be few of the medical profession to-day employed in hospitals who would be inclined to cast the first stone at the writer of this shrewd comment of almost five years ago, and, as he inferred, the time was "later than you think."

Compulsory Arbitration

In the meanwhile the General Medical Services Committee had obtained the opinion of an expert economist, who came to the conclusion that the increase in middle-class budgets in 1948 was 85% over the pre-war figure. A report on remuneration went to the Ministry on March 4, 1949, and a deputation of members of the General Medical Services Committee went to the Ministry on April 14 to discuss remuneration in the light of the report. An indication of the attitude to be adopted from that time henceforward was given when the Ministry was asked whether, in the event of a dispute on remuneration, the profession's claims should be submitted through Whitley machinery and finally, if necessary, to arbitration; the reply given was as follows: "It must not be assumed without further discussion that participation in the Whitley machinery necessarily involves, in the event of disagreement, the right to resort compulsorily to arbitration on all subjects."

Commenting upon this in a leading article entitled "Breach of Faith," the *Journal* (1949, 1, 762) observed that the profession would be disturbed at the negative caution in the Ministry's reply. It added: "Without the right to resort compulsorily to arbitration on a subject such as remuneration the Whitley machinery may well be reduced to mere trifling, the correction of minor administrative errors here and there and the removal of the occasional straw from the camel's back. It is difficult to see how any claims on which the two sides of the Whitley Council fail to agree can be justly decided if, on the Government's prerogative, resort to independent arbitration is denied. Indeed, not only the claim but justice itself would be denied."

It should also be recalled that the Chairman of Council said at the Special Representative Meeting on May 28, 1948: "The Minister has agreed that when the Service starts on July 5 we can immediately raise with the Whitley Council which will be set up to consider general practitioner remuneration, this matter of the betterment factor and the implementation of the Spens Report. Therefore we are not bound to the present conditions as set out in the remuneration offer if we can prove to the Whitley Council that the amount is not the proper one."

The Betterment Factor

In the meantime, the Joint Committee had been advising consultants not to sign any contract with the Ministry, which had issued its proposed terms and conditions of service in March, 1949. The leading article (*Journal*, 1949, 1, 486) concerning "Remuneration of Specialists" noted the Spens recommendations that increases in the medical and other professions were to be taken into account in calculating the betterment factor, and drew attention to the Churley Committee's proposals for remunerating higher civil servants, which had just been accepted by the Government. It was observed that: "The salaries of permanent secretaries and deputy secretaries in Government Departments have been increased by 50% above the salaries of these officers in 1939. It is not unfair to assume from this that the Government regards 50% as a reasonable betterment factor."

Contracts Signed

In view of the long delay and the financial hardship suffered by hospital medical staffs, and that the Ministry was unlikely immediately to give any further concessions by negotiation, the Committee and the Joint Committee decided to advise hospital staff to sign contracts. This was, however, done only after certain very important safeguards had been obtained from the Minister: (a) That no changes would be made in the terms and conditions of service without discussion in the appropriate part of the Whitley machinery, when established. (b) That remuneration was a subject suitable for arbitration. (c) That, save in exceptional circumstances, and after the conciliation

machinery of Whitley had been exhausted, issues of remuneration remaining in dispute would go either to arbitration or for inquiry and report by a committee. (d) That the model form of contract would be amended to make it clear that it was not subject to unilateral modification.

By signing a contract at this time a specialist was not necessarily committing himself to an acceptance of 20% as an adequate betterment factor, but acknowledging only that he was prepared to enter the scheme under the terms and conditions of service which had at that time been assured for him by the Joint Committee, his contract including the proviso that remuneration was subject to "the terms and conditions of service determined from time to time," knowing full well that further negotiations on the subject of remuneration were under consideration.

In view of recent events, it is of some interest to note the substance of a letter at this time (*B.M.J. Supplement*, 1949, 2, 185) from the members of the S.W. Metropolitan (Western) Regional Committee, one of the signatories to which is a member of the present Joint Committee. A paragraph from the letter reads: "It has been noted also that the Joint Committee has omitted to report regularly its proceedings to the Central Committee and finally acted without authority in agreeing with the Ministry to recommend the terms for the permanent contracts for hospital staffs, while discarding almost all the points of objection or modification which had been previously put forward by the Regional and Central Committees. Such behaviour does not inspire confidence in the Joint Committee for the future conduct by it of the affairs of hospital staffs, even if the staffs were prepared to waive their right to democratic representation."

The Danckwerts Award

A fundamental error of policy took place when it was agreed to allow the general practitioners to press their claim for betterment independently, since it was, as future events proved, yet one more crack in the unity of the profession. Every possible means to effect a peaceful settlement by negotiation having been tried, the attitude of the Minister (Mr. Aneurin Bevan) may be observed from an extract of his letter (*B.M.J. Supplement*, 1950, 1, 179) in reply to the previous request for application of a 70% betterment factor in the light of a carefully assessed 85% increase in the cost of living. The letter concluded: "The Minister is clear that in the light of these figures no reasonable case can be made for any increase in the total remuneration of general practitioners, nor any argument substantiated to show that general practitioners as a group are inadequately paid. Nor, in his view, could any claim be justified that any future alteration of remuneration at any later date should be made retrospective, either to July, 1948, or to the present day. This view rests upon the sheer merits of the case as revealed by the plain figures and facts as they stand."

After a threat of mass withdrawal from the Service the bluff contained in this letter was called, the dispute went to arbitration, and the "sheer merits of the case as revealed by the plain figures and facts as they stand" resulted in the adjudication of Mr. Justice Danckwerts. The outcome was that a betterment factor of 85% was applied to the years 1948–50, and 100% to 1951.

The statistics for this inquiry were prepared by Professor R. G. D. Allen, who occupied the Chair of Statistics at London University. After a most detailed investigation, he came to the conclusion that in 1952 the rise in the cost of living represented an increase of approximately 120% over the 1939 level.

This complete vindication of the claims of the general practitioners badly rocked the complacency of the Government, which hastened, through the medium of the Chancellor of the Exchequer, to make a statement to the following effect:

"I want to make it clear that the terms of reference of Mr. Justice Danckwerts's award were confined solely to

the question of the remuneration of general practitioners in the National Health Service, and his award has no wider application. In accepting the results of the adjudication, which was of an exceptional nature, the Government have by no means adopted the view that similar adjustments in other fields should follow. In their view there is no justification for any assumption that the appropriate standard of remuneration for the professional classes is a rate of 100% above that in force in 1939. They consider that remuneration should be determined in the light of all relevant circumstances."

Whilst the Minister is entitled to take this view, if he wishes, he is of course not infallible in law, and the proper course would seem to be to have pressed immediately for an adjudication concerning the betterment factor to be applied to hospital medical staffs upon the sheer merits of the case and not, under the circumstances, in relation to the Danckwerts award. Whatever the Minister's views, it would have been very difficult, having regard to the figures available from Professor Allen's calculations, to have awarded a betterment factor very much below that of the general practitioner, particularly when we look back to the Chorley report which the Government accepted in 1949 as justifying the application of a betterment factor of 50% to higher civil servants.

At this juncture it should be remembered that, although both the Danckwerts award and the scale for hospital staff imposed in 1949 but not put into effect until 1950 were retrospective to July, 1948, the Government had obtained four years' services to a considerable extent upon credit in the case of general practitioners, and two years' credit facilities of a similar nature in the case of hospital staff—and in both instances these were free of interest. In addition the money from superannuation contributions was not in circulation, or available to meet the day-to-day financial commitments of an impoverished hospital medical staff.

Why no Inquiry?

Another two years' delay was no doubt imperative if the Government was to recover from the situation brought about by the Danckwerts award, and subsequent events have shown that this has indeed been the policy carried out in relation to the recent negotiations. Sir Russell Brain, Chairman of the Staff Side of Committee "B" of the Medical Whitley Council, stated (*Supplement*, April 10, p. 145) that if negotiations at this stage had broken down in the Whitley Council the Minister could fulfil his undertaking by referring all aspects of consultant remuneration to a committee of inquiry. In view of the indisputable merits of the case and the sound precedent created by the Danckwerts adjudication it is difficult to understand why this was not done immediately. The excuse offered was that there was a danger that the findings could in effect replace the Spens Report as the basis of consultant remuneration for the future. One is not aware that this has in fact been the effect of the Danckwerts award so far as the general practitioners are concerned, and it is impossible to conceive that the basis upon which the profession entered the National Health Service would be jeopardized by a properly constituted legal body.

Referring to the possibility of such an inquiry into the remuneration of hospital medical staff, Sir Russell Brain stated (*Supplement*, May 8, p. 228) that this "would not have concerned itself with cost-of-living betterment but

would have looked into the earnings of part-time consultants." Sir Russell implied that this might have had unfortunate results, but in the *Supplement* (May 22, p. 280) concluded a letter with these words: "Can we not continue to put unity before sectional interest?"

Comparative Figures

The accompanying graph attempts to illustrate the past, present, and future position of a whole-time consultant as from the appointed day in July, 1948, and to compare this with the increase in the cost of living which has taken place from the inception of the Health Service.

Chart showing relationship between cost-of-living index and remuneration of the whole-time consultant, 1948-56.

The graph is based upon percentage variations between the official cost-of-living index and the relationship of the 1948 scale to the 1939 Spens scale. The position at July, 1948, has been taken as the datum line of zero point in relation both to the salary minimum of £1,700 and to the cost-of-living index, which at that time stood at 108. The Spens minimum of £1,500 is £200 below this point, and is therefore shown as a decrease or minus factor of 11.7%, which is equivalent to saying that the minimum of the 1948 scale is 13.3% above the Spens minimum.

If the 1948 scale had been a true replica of the Spens scale with an even 13.3% increase throughout, the line depicting salary would of course be the same as the 1948 salary scale datum line; but it will be observed that this is not the case, and that, although declining slightly initially and then closely approximating to a 13.3% increase, subsequent increments are inadequate and the line declines sharply so that at the maximum of the scale the betterment factor is only 10% above the 1939 Spens level—this necessarily having to be shown as a 2.9% decrease from the corresponding point on the datum line representing a level 13.3% increase (£2,832) over the Spens maximum.

As from April 1, 1954, the 1948 scale is shown as a dotted line, the actual salary received rising abruptly in accordance with the recent increase. The next point or direction, expressed as a percentage increase above the equivalent point on the 1948 scale, and the percentage from the minimum to the maximum may be observed from the dotted line shown as a "back-projection" and continuation of the 1954 salary line.

The situation arising from the imposition of the 1948 scale may be seen by reference to Table I. The system of remuneration at the upper end of the scale is particularly reprehensible in view of the relatively greater burden of taxation which the higher-income groups are called upon

TABLE I

Grade	1948 Scale Plus Government 8% Superannuation Contribution	% Increase Over 1939 Spens Scale		1948 Scale Less 6% Compulsory Personal Superannuation Contribution and 8% Government Contribution	% Increase over 1939 Spens Scale of Taxable Income Remaining after Preceding Deductions

					£134

* The grades of house officer were not provided for in the Spens Report. There are therefore no 1939 equivalents.

to bear to-day in comparison with 1939. This pattern of remuneration has been followed in an exaggerated form by the 1954 scale.

Bearing in mind the fact that the 1948 pay scale did not become effective until 1950, thus securing two years' services to a large extent on credit, and that no retrospective pay has been given with the recent award, the extent of cheap labour obtained by the Government may be readily envisaged. Add to this the underpayment of hospital staff, particularly in the registrar grades, and it becomes immediately apparent that the whole scheme has been floated to a considerable extent upon the finances not of the Government but of the hospital medical staffs themselves. The back pay to which we are morally entitled is set out comprehensively for all grades in Tables II, III, IV, and V.

The inadequacy of the 1954 scale in relation to the 1948 scale at all points beyond July, 1951, is very obvious, and it might be said that it is almost three years out of date. The net effective increase of the 1954 maximum is only 9.4% above the corrected maximum of the 1948 scale.

An attempt has been made to construct a scale, accepting a true increase in 1948 of 13.3% over the Spens scale throughout the salary range, and applying to the corrected salary figures thus obtained an increase of 30.5% to offset the increase in the cost of living since 1948. In applying a betterment factor of 30.5% to the 1948 scale (which was an imposed 13.3% increase above the 1939 Spens scale), thus making a total betterment of approximately 44% above pre-war levels, it is not intended to suggest either that this is necessarily an adequate figure or that an assumption has been made to the effect that every increase in the cost of living should result automatically in the application of a corresponding betterment factor. The intention is rather to indicate that this is the absolute minimum betterment which could be considered in the light of all the relevant circumstances. The results may be seen in Tables VI, VII, and VIII. In order to preserve the essential structure

TABLE VI.—1954 Salary Scale for Whole-time Consultant Adjusted to Compensate for 30.5% Increase in Cost of Living

Increments	1948 Scale Adjusted to give 13.3% Level of Increase Over All Points on 1939 Spens Scale	30.5% Increase Over Corrected 1948 Scale	Adjusted Figure to Provide Even and Smooth Progression of Proposed Scale
Minimum ..	£1,700	£2,218	£2,250
First ..	£1,841	£2,402	£2,400
Second ..	£1,983	£2,588	£2,550
Third ..	£2,067	£2,697	£2,700
Fourth ..	£2,209	£2,883	£2,850
Fifth ..	£2,351	£3,068	£3,000
Sixth ..	£2,493	£3,253	£3,250
Seventh ..	£2,691	£3,512	£3,500
Maximum ..	£2,832	£3,696	£3,750

This scale may therefore be expressed as £2,250×£150—£3,000×£250—£3,750.

TABLE VII.—Whole-time Consultant in Receipt of Merit Award. (All Merit Awards Plus 30% Increase)

"A" award ..	£3,750+£3,250=£7,000	4% of consultants
"B" " ..	£3,750+£1,950=£5,700	10% " "
"C" " ..	£3,750+£650=£4,400	20% " "

N.B.—Equivalent pre-war purchasing power of 1954 income of £5,000 p.a. for a married man with two children = £1,090. This is provided by a tax-free income of approximately £2,600. A consultant in receipt of the maximum merit award will therefore not have the equivalent 1939 purchasing power of the minimum of the 1939 Spens scale for consultants without a merit award.

TABLE VIII.—Proposed Rates of Remuneration for Other Grades of Hospital Medical Staff

Senior hospital medical officer ..	£1,700×£100=£2,200
Junior " " ..	£900×£75=£1,275
House Officer: First six months ..	£455—£130=£325
Second " " ..	£530—£130=£400
Third " " ..	£580—£130=£450

N.B.—No Spens equivalent exists for the above grades to which an approximate increase of 30% over the 1948 level has been applied. In the case of House Officers an increase to the rates for residential emoluments has been made so as to bring the charge up to a level commensurate with the increase in the cost of living.

Senior registrar ..	£1,350×£100=£1,650
Registrar ..	£1,050×£150=£1,200
Senior house officer ..	£900

N.B.—The salaries for the above grades have been obtained by calculating the ratio for the Spens minimum of the grade in relation to the Spens minimum of the Consultant grade—e.g., senior registrar, £900; consultant, £1,500 = ratio 9/15ths or 3/5ths of proposed consultant's minimum of £2,250; equivalent to £1,350 p.a.

and principles of the Spens scale it is necessary to ensure that the ratio of remuneration between the different grades is maintained, and every effort has been made to ensure that this basis is preserved. It is also necessary to provide an increase of the maximum over the minimum of the scale equivalent to that recommended by the Spens Report, and thus to avoid the tendency to "make up on the swings what has been lost on the roundabouts," a technique which has already been exposed. A comparison between the Spens scale, 1948 scale, 1954 scale, and the proposed scale is shown in Table IX.

TABLE IX

	1939 Spens Scale	1948 Scale	1954 Scale	Proposed Scale
Minimum ..	£1,500	£1,700	£2,100	£2,250
First increment ..	£1,625	£1,825	£2,225	£2,400
Second " ..	£1,750	£1,950	£2,350	£2,550
Third " ..	£1,825	£2,075	£2,475	£2,700
Fourth " ..	£1,950	£2,225	£2,600	£2,850
Fifth " ..	£2,075	£2,375	£2,725	£3,000
Sixth " ..	£2,200	£2,500	£2,850	£3,250
Seventh " ..	£2,375	£2,625	£2,975	£3,500
Maximum ..	£2,500	£2,750	£3,100	£3,750
% increase from minimum to maximum ..	66½	61.8	47.6	66½

The extent to which the 1954 scale has implemented the Spens recommendations and the real value of the recent increase in salary may be observed in the figures in Table X. These have been calculated in accordance with Mr. Butler's

TABLE X

	Gross Salary 1954	Tax	Net	Superannuation	True Net	1938 Equivalent Net Income
Senior Registrar:						
Minimum ..	£1,100	£136	£964	£66	£898	£395
Maximum ..	£1,400	£241	£1,159	£84	£1,075	£473
S.H.M.O.:						
Minimum ..	£1,500	£276	£1,224	£90	£1,134	£499
Maximum ..	£1,950	£434	£1,516	£117	£1,399	£615
Consultant:						
Minimum ..	£2,100	£504	£1,596	£126	£1,470	£647
Maximum ..	£3,100	£1,074	£2,026	£186	£1,840	£809
Plus "C" merit award ..	£3,600	£1,386	£2,214	£216	£1,998	£879

statement on February 6, 1953, that the pound was then worth 44% of its 1938 value, and on the assumption that the individual concerned is married, with two children.

Apart from the many anomalies of the merit award system, there is one feature which is not always fully appreciated. The Spens Report laid down that 4% of consultants were to receive an "A" award of £2,500, 10% a "B" award of £1,500, and 20% a "C" award of £500 per annum additional to the normal rate of remuneration. Since part-time consultants receive only a proportionate amount of the merit award dependent upon the number of sessions they perform, the percentage quota may be fulfilled at a much smaller cost to the Exchequer by giving awards to part-time rather than whole-time consultants. For example, of 100 consultants eligible for "C" awards of £500 per annum only 20%, or a fifth, may receive them. If, therefore, 20 whole-time consultants receive awards the amount involved is 20×£500 per annum=£10,000. If 20 part-time consultants receive the award, each performing 2/11ths, they each receive approximately £90 per annum as their proportion of the merit award at a total cost of £1,800. In both cases the 20% quota has been satisfied.

Allowances for Whole-time Staff

So much has been said concerning this subject that it will suffice to repeat the recommendations of the Spens Report, which in assuming that whole-time specialists would be paid "any sums which represent expenses reasonably incurred in the course of their work" which would not be liable to tax, specified such items as: "... car expenses; to tax, specified such items as: "... car expenses; the cost of renewal of instruments and other equipment; the cost of books and journals, preparation of scientific papers, and subscriptions to professional societies; printing, stationery, postage and telephone costs; expenses of attendance at national and international professional meetings; and the expenses of visiting hospitals and clinics at home and abroad, and entertaining visiting colleagues."

The Future

Hospital medical and dental staff must now decide for themselves whether they are content to aim at a salary which will give them at the maximum of the consultant per scale, aged about 45, a spendable income of £1,840 per annum with an equivalent purchasing power of £809 in 1938, and whether in the light of all the facts this can be regarded as a proper implementation of the Spens Report in virtue of which the profession was induced to enter the Service. The Whitley machinery at the present time has broken down completely, and in view of the often-repeated assurances that the Minister would certainly agree to it, an inquiry, based upon the Spens recommendations and the merits of the case and not the Dankwerts award, should be instituted forthwith. It should also be made quite clear that an increase in pay is not being demanded, but that a rectification of the unjust rates of remuneration imposed by the Government in 1950 (retrospective to 1948) is being sought, together with full back pay as compensation for the severe personal financial hardship endured for six years by the hospital full-time staffs of this country. This is not to say that the correct proportion of back pay should not be given to part-time consultants, but rather to emphasize that, since they have been able to offset the increase in living by increased fees to private patients, and to obtain preferential allowances, the financial draught has not been so severe.

One point above all stands out in the clearest possible manner—unity is strength in the medical profession as it is elsewhere. As the B.M.J. has repeatedly pointed out, if we abandon Spens we abandon our birthright. The time has come to close our ranks, demand as a united body an impartial inquiry, and fight to the last ditch to ensure that we get it.

MAJOR ACCIDENTS

MOBILE HOSPITAL TEAMS

Arrangements are being made for certain hospitals in all areas to be ready to send mobile medical teams to the scene of major civil accidents involving large numbers of casualties. It will be the function of the ambulance service to call on the most appropriate hospital. The ambulance service will be kept informed by hospitals of the number of beds remaining available for casualties. If it is necessary to call upon more distant "support" hospitals, the hospital medical officer in charge of a mobile team will keep the ambulance service informed as to which of the hospitals should receive casualties. Mobile teams from hospitals will bring their own surgical and medical equipment.

The Ministry of Health has notified all local health authorities of these arrangements (circular 13/54).

MEDICAL CERTIFICATES FOR SERVICE MEN

Medical certificates submitted by civilian medical practitioners for Service men on leave who are prevented by illness from reporting to their units on the date specified do not always provide the information required by the Service authorities, and a certain amount of trouble is caused by this omission. The Service departments concerned expect certificates made out under these circumstances to state specifically that the patient is unfit to travel: a statement that the patient is unfit for duty is insufficient for Service requirements.

PATIENTS REFERRED BY DENTISTS FOR PENICILLIN INJECTIONS

The Secretary of the British Dental Association has sent the following letter to his association's branches and sections and to local dental committees:

"The British Medical Association has told us that difficulties have arisen in parts of the country where some dental practitioners have referred patients to doctors for penicillin injections. The doctor is sometimes placed in an awkward position in dental cases of this kind if he decides that risks of sensitization and bacteriological resistance preclude the use of penicillin on a particular patient. The British Medical Association has accordingly asked that any dentist referring a patient to a doctor for this treatment should make his request to the doctor in writing and should not give any details to the patient.

"The General Dental Services Committee agrees entirely with the suggestion of the British Medical Association on this point, and it would appreciate it if you could take steps to give the matter all possible publicity in your area."

A COMPREHENSIVE SERVICE

The following letter has been sent to us by the recipient.

"Dear Dr.,

"Please be as kind as give me cream for my leg also gauze and lint. And I would like if you will come down and see it when you are coming this way. And please do me a favour, Dr., by telling me the names of the three horses you think will come in on the Derby.

"Yours sincerely,
"Alice.

"Please write the names of the horses down to my husband as he might not remember."

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

A PLEA FOR REVIEW OF JUNIOR HOSPITAL STAFF

An all-day meeting of the Central Consultants and Specialists Committee was held on June 10, with Dr. T. ROWLAND HILL in the chair. A report on a number of detailed matters was presented by the Executive. One of these concerned the method to be adopted in reviewing part-time contracts, and in particular to the introduction of attendance registers and to the opposition already voiced by the Central and Joint Committees to the requirement to "clock in." The point was that the reassessment of part-time contracts on the evidence of an attendance register would tend to reduce consultant remuneration to a time basis. There were, however, allegations that some part-time men were not putting in the expected amount of time.

Mr. NORTHFIELD pointed out that, if some men were not putting in their full time, this might be due not to any lack of conscientiousness on their part but to the fact that there was not enough work presenting itself to enable the contract to be fulfilled. Mr. LAWRENCE ABEL suggested that any difficulties could be dealt with on the spot in a perfectly friendly manner, or, if necessary, by the local consultants committee; it was a domestic problem.

The CHAIRMAN said that with highly qualified professional men measurement by time could never be more than a broad criterion.

The Committee reaffirmed its opposition to the principle of "clocking in" and emphasized the importance of establishing a closer and more understanding relationship between a board's administrative officers and the consultants in the region. Professor CLOAKE undertook to bring forward a reasoned resolution on the subject at the next meeting of the Executive. It was also agreed that the correspondence on the subject should be referred to the Joint Committee.

The Expense Levy

The CHAIRMAN, in reporting on the work of the Joint Committee, said that a small subcommittee had been appointed to work out the details of a scheme for the introduction of an expense levy. The principle had been mooted of having one levy to cover the expense of the whole of the consultants' organization. The Ministry had so far consistently refused to entertain a proposal for deduction of contributions to an expense levy at source, but if necessary a personal interview with the Minister would be sought. It appeared from a rough calculation that no unreasonable demand would be made upon the individual.

Representation on Regional Hospital Boards

Attention was called to a recent resolution of the Council agreeing in principle that names of suitable members of the public health service should be included in the list of doctors nominated by the Association for membership of regional hospital boards, and the Liaison Committee had suggested that the attention of Branches and Divisions be drawn to the desirability of such an inclusion.

Some members of the Central Committee, however, pointed out the inadequacy of hospital medical staff representation on the boards and the likelihood that this would be further reduced if seats were allocated for the representation of other outside interests. It was agreed to refer the matter back to the Liaison Committee for further consideration.

Grading of S.H.M.O.s

The Tuberculosis and Diseases of the Chest Group Committee brought forward a resolution that the Staff Side of Committee "B" be urged to continue to press for a solution of the problem of securing for upgraded S.H.M.O.s a starting salary at an appropriate point above the minimum of the consultant scale as permitted by the terms and conditions of service. It was agreed that this should go forward to the Staff Side of Committee "B." The same Group drew

attention to previous resolutions that all S.H.M.O.s doing consultant work or who were in full charge of chest units should be given consultant status. Mr. STAVELEY GOUGH pointed out that, so far as beds were concerned, it could not be decided from the fact that if a man had charge of 10 beds or of 100 beds that he was a consultant or an S.H.M.O.

After some discussion the resolution of the Group was referred to the Joint Committee.

Employment of Locumtenents During Annual Leave

It was reported that the South-western Regional Committee had expressed concern regarding the non-provision of consultant locumtenent cover during holiday periods.

Dr. L. S. POTTER, for the Medical Practices Advisory Bureau, said that, although the demand was likely to exceed the supply, there were quite a number of locumtenents available for this purpose. One of the metropolitan regional boards kept a panel of locumtenents, and he did not see why this idea should not be carried out in other regions. He himself would do his best to provide names for the panels.

It was agreed to inform other regional boards of the panel system.

Remuneration of Hospital Medical Staff

The Committee had before it a number of communications from regional committees concerning the recent revision in remuneration. Mr. NICHOLSON-LAILEY, speaking for the South-western Region, said that it was their view that as an urgent matter the Joint Committee should obtain calculations regarding the betterment factor. These calculations should be made by economic experts of the highest authority, and if they proved to be materially in excess of the recent awards a further claim in exact and definite terms should be made forthwith.

The CHAIRMAN pointed out that in the latest *Bulletin* (Bulletin No. 3) all the considerations were set out. He felt confident that this was the first time the actual facts had been assembled in this manner.

The representative of the South-eastern Metropolitan Regional Committee urged that the Staff Side of Committee "B" should press for the implementation of the Spens report in respect of the payment of adequate allowances to cover professional expenses reasonably incurred by hospital medical staff in the performance of their duties, and that in view of recent changes in income-tax assessment such allowances should be obtained both for whole-time and for part-time consultants.

It was agreed to forward the proposals to the Staff Side of Committee "B."

Accessibility of Hospital Records

Dr. COCHRANE SHANKS submitted the minutes of the Medico-Legal Subcommittee. These included a statement by the Law Society concerning the furnishing of medical reports on hospital patients to solicitors or other interested third parties. He said that the statement contained nothing to which exception could be taken, and it made it abundantly clear that it rested solely within the discretion of the member of the medical staff concerned to furnish a report or not. There was no reference, however, in the statement to the furnishing of copies of hospital records, and his subcommittee thought that attention should be drawn to the Minister's assurance that copies of hospital notes should not be allowed to leave the hospital without reference to the practitioner concerned.

The Registrar Position

Resolutions from the Registrars Group Council were before the Committee calling attention to the need, when the remuneration of S.H.M.O.s was considered, for an appreciable increase in the remuneration of senior house officers and a further increase for other grades of hospital junior staff. The Group Council also submitted a report of a discussion which they had held on the general position

SOUTHERN BRANCH ANNUAL MEETING SUCCESSFUL GATHERING AT WINCHESTER

The Southern Branch of the B.M.A. held a successful and interesting annual meeting on June 4 and 5. The hosts this year were the Winchester Division, who arranged their annual charities ball for the night of June 4 to coincide with the meeting. About 250 members and their ladies attended the ball, which was held in the beautiful Old Guildhall, the proceeds going to the Council for the Care of Cripples.

The following day the 78th annual meeting of the Branch was held in the Guildhall. Dr. A. Orley, of Guernsey, the retiring president, invested the incoming president, Dr. C. B. S. Fuller (Winchester), with the presidential badge. Dr. R. H. Balfour Barrow was reappointed honorary secretary; Dr. J. C. Harland (Isle of Wight) was made president-elect. After a graciously expressed civic welcome by the Mayor of Winchester, Mrs. H. M. Charles, Dr. C. B. S. Fuller delivered the Winchester address on "The Antibiotics and Their Effect on the Changing Form of Disease."

Demonstration of Physical Medicine

Before ending the meeting with a visit to the library of Winchester College, members and their ladies saw a most interesting demonstration in the Physical Medicine Department of the Royal Hampshire County Hospital by Dr. Russell Grant. Dr. Grant pointed out how most of the apparatus and installations, from wax baths and light and heat apparatus to a hot pool, had been constructed at a fraction of the usual cost by careful improvisation and planning. The demonstrations showed how function could be restored by special training and surgical appliances, and by installing modifications and gadgets to enable disabled patients to cook and to run their homes. A well-knit organization has been built up through various agencies in each parish to ensure visiting, reading, and shopping for the homebound, infirm, and blind.

REDUCING WAITING-TIME OF OUT-PATIENTS

MINISTER URGES APPOINTMENTS SYSTEM

Hospital authorities throughout England and Wales have been asked by the Minister of Health, Mr. Iain Macleod, to review the working of out-patient departments so as to remove all reasonable causes of complaint. Matters which he thinks call for special attention are appointments systems, punctuality of staff, and reception of patients. While much public criticism may well arise from lack of an adequate appreciation of the difficulties involved, the complaints made have been so widespread as to suggest to Mr. Macleod that at a number of hospitals the suggestions previously made on this subject have either not been put into effect or are not being successfully applied. The main points of criticism he cites are: (a) that patients called for an appointment at a particular time frequently have to wait for an hour (and often much longer) before they are seen by the doctor; (b) that the consultants in charge of clinics are responsible for some of these delays by arriving late; (c) that appointments systems are badly organized; and (d) that little attempt is made to explain to patients the reason for delays, to win their confidence, or to consider their comfort or needs.

Suggestions for Improvement

The Minister suggests that regional boards and management committees should pay special attention to certain points. Appointments systems, he thinks, should not only be universal but designed to ensure, as far as possible, that each patient is called for the time that he is expected to see the doctor. The old practice of "multiple" or "block" bookings should be discontinued. The needs of parents

of hospital junior staff with a request that it be forwarded to the Joint Committee and submitted for publication in the medical press.

Dr. R. M. FORRESTER said that the Registrars Group was far more concerned with future prospects than with present remuneration, but there were also some points on remuneration which they had specially in mind. They had hoped that, when the Joint Committee and the Whitley Council were pressing for an improvement for seniors, consideration would also be given to the house officer, especially the house officer after his pre-registration term. If hospitals wanted junior staff they must be prepared to pay a remuneration which would compare favourably with what a young man could earn in general practice as an assistant and junior partner. Particularly now that senior registrars were allowed to re-apply and continue for more than four years, there should be a continuing increase of their remuneration up to a figure more closely approximating to that of the consultant service. They were very disappointed that the gap between the remuneration at the top of the senior registrar scale and that at the bottom of the consultant scale had not been narrowed.

Dr. Forrester went on to speak of the general position. He mentioned that recently for one consultant post in Bournemouth there were 128 applicants, and 108 of these were of less than consultant status. During recent years the Royal Colleges had turned out a large number of people with higher qualifications, and he thought the situation had got out of hand. When it was proposed to cut down the number of senior registrars from 1,400 to about 500 there was an outcry, and the final establishment was agreed at 960 senior registrars. This was based partly on the idea that there must be competition for senior registrar posts. He agreed that competition was necessary, but not to the extent of that shown by Bournemouth. The Ministry said that there were about 150 consultant posts coming up each year. But there were 240 senior registrars coming up each year and only 150 consultant jobs for them, and the following year the same thing would be repeated and worsened because of the numbers from the previous year who had perhaps taken research fellowships or lecturer posts, and the hung on in the hope of a consultant appointment. The whole idea of the competition was wrongly worked out. There were far too many senior registrars for too few prospective jobs. The Ministry had stated to the Joint Committee that as from 1956 the numbers of consultants reaching retiring age each year would be higher than in the past few years, and that this would allow for an increase in the number of men in training for the Ministry to be completely out of touch with the position. He believed that a perfectly honest mistake had been made. A great many senior registrars were, in fact, doing consultant work for which they were not being paid. He hoped that the statement on the subject which the Registrars Group Council had formulated would be sent for the information of the Joint Committee.

Professor G. I. STRACHAN, chairman of the subcommittee which has this matter in hand, said that clearly this and other cognate matters on the agenda relating to hospital junior staffing could not be adequately discussed at that late stage of the Committee's meeting, and he proposed that these very important and complicated considerations should be referred to his subcommittee, from which they would again come forward to the main committee with recommendations.

This was seconded and agreed to.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

with small children at home and of patients coming from a distance by infrequent buses or train also clearly call for separate consideration. It should be impressed upon consultants that the success of the appointments system depends on their being present on time, and an administrative officer of adequate seniority should be made responsible for the efficient running of the appointments system.

The Minister urges that special care should be taken in selecting the staff responsible for receiving patients, and they should remember that patients are often anxious, bewildered, or even frightened, and it is essential to attend to their needs and comfort. Much ill-informed criticism could be avoided by the development of better relations with patients and with the public at large. A helpful and kindly approach to out-patients by receptionists and other staff is only one example of this. Much more could be done to interest the public in the work of the hospitals and the difficulties with which they have to contend, and in the steps being taken to overcome them.

The Minister says that later he will call for a report showing the extent to which waiting-time has been eliminated.

The Consultants and Specialists Committee has asked its Executive Committee to examine the question of waiting-time in hospital out-patient departments, and to report.

Correspondence

Return of Goodwill

SIR.—I have read with interest the letters by Drs. E. C. Warner (*Supplement*, May 29, p. 290), A. V. Russell, and J. O. M. Rees (*Supplement*, June 12, p. 319) regarding the goodwill issue and the action taken by Council at its March and May meetings. I have re-read the minutes of the March meeting and find that the motion read as follows: "That the scheme be presented to the Representative Body together with a statement of the advantages and disadvantages appertaining to that scheme." It was decided that this statement should be drawn up by the Amending Acts Committee with the addition of co-opted members. There does not appear from the letters to be any dispute about or disagreement with this course. There is, however, something else which happened at the March meeting which they seemed to have ignored. The Chairman asked if it was the wish of the Council that the report of the Amending Acts Committee should be submitted to the G.M.S. Committee and Private Practice Committee for their comments, and the Council agreed to this being done. Surely it is clear from this that it was in the mind of the chairman, in common with many other members of Council, that when at the May meeting the report was again placed on the Council agenda it would be open for Council to take any action it might think fit.

Many of us thought that it was the duty of Council, having considered the full report, to give a lead to the Representative Body. Indeed, to fail to do so would, I think, have amounted to a failure to carry out our proper functions. We had been instructed to prepare a scheme for the return of the right to buy and sell goodwill and present it to the Representative Body. We have done the first part, and the second will be fulfilled at Glasgow. But I venture to assert that, if the Council, having examined the scheme in its totality, had failed to pass its opinion upon its merits and feasibility, it would rightly have been accused of cowardice and shirking its duty. I think the scheme is the best that can be prepared, and tribute should be paid to the ingenuity of those who devoted so much time and energy to its preparation; but this does not make it a wise, feasible, or by any means acceptable one. This, however, will be argued out at Glasgow.

Dr. Rees draws the red herring of the full-time salaried service across the trail. Quite unjustifiably he asserts that there are members of Council who are in favour of such

a service. This, in my opinion, is quite inaccurate and unjustified by anything said in Council during these debates.—I am, etc.,

Cambridge.

ALEXR. BROWN.

History of the W.M.A.

SIR.—I was interested to read in the Supplementary Report of Council (*Supplement*, May 22, p. 247) a short history of the World Medical Association, to which, however, in the interests of historical accuracy, I should like to add a couple of footnotes. In 1939 the B.M.A. Council had decided to dissociate itself entirely from the Association Professionnelle Internationale des Médecins, and a resolution to that effect was on the agenda of the Representative Body at Aberdeen in 1939. The Marylebone Division, at a meeting before the Annual Meeting, took serious exception to this and put forward a counter-resolution. I have not the reference by me here, but it was the first resolution discussed by the Representative Body in 1939, and a full report appears, I know, in the *Supplement*. I had the honour (and the temerity) of moving the Marylebone Division's resolution and had to reply at the end of the discussion to the then Chairman of Council, Sir Kaye Le Fleming, who denounced the Marylebone Division's views in the strongest terms. The Representative Body supported me, however, with a very large majority, and the B.M.A.'s association with the A.P.I.M. was thus continued—in spite of the Council—throughout and after the last war.

I well remember the conference at B.M.A. House in September, 1946, under the chairmanship of Sir Hugh Lett. Lord Horder and I were asked by the American Medical Association to attend it on their behalf as "observers," for they were hesitant and sent no official representatives. The French, Belgian, and Spanish delegates in particular wanted to retain the old A.P.I.M., but during the conference—thanks in the main to the tact of Dr. Routley, of Canada, and Dr. Charles Hill—the atmosphere changed from early suspicions to friendliness and co-operation. Lord Horder and I were therefore able to send a persuasive report to the American Medical Association, telling them (as was true) that without their co-operation the new W.M.A. would be as ineffective as the late lamented League of Nations, but that with them it might well become something worth the world, but to humanity at large—as, indeed, it is proving.—I am, etc.,

Gibraltar.

R. SCOTT STEVENSON.

** An account of the discussion Mr. Scott Stevenson refers to was published in the *Supplement* of July 29, 1939. The Marylebone amendment, carried by a "considerable majority," was as follows:

"That in view of the long association of the B.M.A. with the A.P.I.M., of the recognition by the Health Committee of the League of Nations of the A.P.I.M. as responsibly concerned with medico-social questions of high importance, and of the desirability, more especially in existing circumstances, of maintaining international contacts at the present juncture, the Association should continue to be represented as a constituent member at the Annual Conference of the A.P.I.M."—Ed., B.M.J.

Employment of Tuberculosis Visitors

SIR.—As in the first sentence of Miss Shiela D. Robinson's letter (*Supplement*, May 29, p. 290) my name is invoked, and the last paragraph invites the opinions of tuberculosis officers on certain modifications in training and qualifications of tuberculosis visitors advocated by her, I beg to reply, although I believe the views of individuals cannot influence future policy at all. My original letter (*Journal*, June 21, 1952, p. 1355) did not deal with training, but was written at a time when we in the chest clinic service locally were engaged in a "rearguard action" against a serious threat to withdraw tuberculosis visitors from the chest clinics, to base them in a distant guildhall, and to transform them—women

who had spent most of their professional life in tuberculosis—into the "all purpose" health visitor.

Miss Robinson will know—her letter gives little clue—that the future training and utilization of visitors is now being reviewed by a Working Party to which memoranda and oral evidence have been submitted by bodies such as the Society of Medical Officers of Health, B.M.A., etc., and that a report expressing its considered views will be issued in due course. Her attempt to reopen the subject in your columns seems, therefore, belated if not futile. I hope I am right in assuming that the Working Party will have listened to evidence from the British Tuberculosis Association or Joint Tuberculosis Council before its conclusions are reached on the future of tuberculosis visitors.

Responsible, with three colleagues, for the chest clinic and ancillary work in an area of 375,000 (approximately) population size, I am more concerned that we should keep tuberculosis visitors as essential members of the clinic's "team," co-operating to that degree only obtainable by daily personal contact with the others and working under a common roof, than with splitting hairs about their professional training requirements. The qualifications of visitors were laid down by Local Government Regulations (1930); these are changeable by legislation, and the Working Party's report may be the precursor of change.

In reply to Miss Robinson's specific question, my view is that a trained visitor (her certificate is equivalent to a D.P.H.) will usually fit into the chest clinic's team more smoothly than a nurse qualified S.R.N. and with the British Tuberculosis Association's certificate, who may never before have set foot in a tuberculous household, and will not as a rule know much of, or have any bias towards, preventive and social medicine. The late Sir R. Philip said that it was the chief job of a tuberculosis officer to prevent, not to treat, tuberculosis; were it translated into terms of the job of a visitor, his aphorism would still hold some truth. I disagree that a newly qualified visitor may be "without previous experience" of tuberculosis. Here, each student visitor spends about eight of her 50 weeks' training as a full-time member of the chest clinic's staff. As well, she receives the benefit, perhaps doubtful, of four one-hour lectures (based on the official syllabus) on tuberculosis, and tutorials on special subjects—for example, the rationale of Mantoux testing, B.C.G. vaccination, mass miniature radiography, etc. It has been my happy experience to work occasionally with visitors who had not the health visitor certificate, but were otherwise well trained in general and tuberculosis nursing. They accustomed themselves quickly to the new climate and conditions of the clinic, and proved of equal merit to their health visitor certificate sisters.

In conclusion, I would voice an appeal that, whatever change may be effected in the syllabus of training, it should be on the side of simplification and pruning of what has become an exotic growth, much of the theoretical instruction and "cramming" involved being of little practical use after qualification.—I am, etc.,

Hull.

R. HARDY.

Radiology on Points

SIR.—Dr. Anthony A. Vickers (*Supplement*, May 29, p. 291) and your previous correspondents have only touched the fringe of the anomalies arising through assessing various totals have little meaning because of the marked variations in many factors: the type of patient; the routine of individual radiologists; the demands of various specialists; the general facilities and stress of work in each department; and, probably most of all, in the interpretation of the "units" themselves. In the past each department has had a rough estimate of its own increasing work in the yearly totals of "investigations" or "examinations." To judge any further increase one must still use the older method. If a comparison between different departments is necessary, the numbers of the major investigations—barium meal, barium enema, I.V.P., etc.—give added information and can make some allowance for specialized work. Even this

method only gives an approximate comparison between departments doing the same type of work. If, in addition, the total number of films of each size used (calculated easily from stocks consumed) is divided by the number of investigations, a general indication is given as to whether techniques are extensive or "economical." In the excellent memorandum on diagnostic radiology drawn up by the Faculty of Radiologists, staffing of departments is assessed according to the number of "investigations" per annum. This rough guide has been of some limited value in the past. What advantage is there in changing to a mathematical system which superficially appears to be "scientific" but which actually neglects variation in factors sufficient to make a 100% error more probable than possible?

Most x-ray departments have difficulty, owing to shortage of staff, in coping with routine clerical duties. The bureaucratic tendencies of the National Health Service add further difficulties. Is this "unit" system a foretaste of the "costing" of each department which will shortly plague us? If so, we shall need far more clerks than radiographers, unless slot machines and comptometers are provided.—I am, etc.,

Port Talbot, Glam.

R. A. ROBERTS.

Remuneration of Hospital Medical Staff

SIR.—At the special meeting of the Central Consultants and Specialists Committee on April 28, 1954, to discuss the statement by Sir Russell Brain on remuneration of hospital medical staff (*Supplement*, May 8, p. 228), Dr. D. P. Stevenson stated that since the publication of the new increases there had been remarkably little correspondence on the subject, a fact which might argue contentment or apathy. I have heard these words—"contentment or apathy"—quoted on several occasions since then. This is a most irresponsible statement to make at this time.

The negotiations have been conducted in secrecy. The full facts are only now being revealed to us. Most of us here have received our first real information in the form of a bulletin only five days ago. These facts require considerable digestion. Surely correspondence, without some knowledge of the facts, such as has now been given to us, would have been premature. I would suggest that a more guarded phraseology would be more appropriate and that potential boomerangs should be avoided.—I am, etc.,

Kirkcaldy.

WILLIAM DRUMMOND.

Emergency Admissions

SIR.—Perhaps I am a little late regarding the question of Bed Bureau, which was discussed by Dr. S. Stowe (*Supplement*, May 1, p. 214) and Dr. R. S. V. Marshall (p. 215), following your medico-legal article (*Journal*, April 17, p. 940), and later by Dr. H. Maitland Moir (*Supplement*, May 15, p. 246) and Dr. Thomas M. Glaister (*Supplement*, May 29, p. 291). I can only say that in my area, the Plymouth Group, the Bureau is efficiency itself, twenty-four-hour service, kind, and helpful.—I am, etc.,

Kingsbridge.

T. H. STEELE-PERKINS.

A Doctor Looks at Crime

SIR.—Dr. Oliver Gray's short monograph as he himself describes it (*Supplement*, April 24, p. 179) deserves close and careful study by all. With Dr. R. W. Cockshut (*Supplement*, May 8, p. 232) I agree that the subject-matter is of great interest "not only for what it says but for what it leaves unsaid," especially for those who are concerned with the moral and social welfare of our juvenile and adolescent population. The whole problem of the young offender requires thorough discussion. The probable underlying causes and appropriate treatment must be studied seriously and from all aspects, but above all we must study likely methods of prevention. Wise action taken at this stage of their lives will often, in my view, act as a deterrent to adult crime.

In my opinion, as a family medical practitioner of many years' standing and practising in an area with a large

juvenile population, the present attitude to authority, the lack of honesty, truthfulness, and especially responsibility among certain sections of the juvenile population of to-day, can be remedied in the first place by the teaching of good moral principles from the home. The average adolescent of to-day is a self-centred individual lacking in good manners and with a definite lowering of moral standards. The reasons for this decline have resulted, in my opinion, from the upheavals of war, housing difficulties, the present-day speed of living, and the parents' willingness, almost eagerness, for the responsibility of the children to be passed on to the State.

A very important factor in the limited outlook of the young adolescent of to-day is the lack of true religion and moral principles that are so sadly lacking in their homes. The teaching of these matters must commence in the home. The groundings given by the parents can then be expanded during school years, but the first responsibility in this direction is the parents. The study of juvenile delinquency and of kindred subjects, as raised by Dr. Oliver Gray, is, I consider, one of the most fascinating, interesting, and vital subjects within the sphere of social welfare.—I am, etc.,

Leeds. HARRY SUGARÉ.

Prescribing Costs

SIR.—Mr. F. G. Fleming (*Supplement*, May 29, p. 291) suggests that I have overlooked the fact that the 1s. 11d. paid to chemists for 24 tab. codein. co. includes 1s. dispensing fee. Indeed, I have not. What puzzles me is why putting 24 tablets in a cardboard box should be dignified by the name of dispensing or attract a fee at all. When the pharmacist really does dispense, by all means let him be paid the rate for the job, but a vast number of prescriptions involve no dispensing at all, and are nothing more than retail sales, with the sole difference that, instead of the medicament being asked for verbally, the name is written on a piece of paper called a prescription form.

The retail price of 24 tab. codein. co., in a cardboard box, is 1s. 4d. Any doctor will, I am sure, find his chemist delighted to give him 10% discount on this. Presumably the Ministry could negotiate even better terms and get 15% or even 20%; thereby paying about 1s. 1d. instead of 1s. 11d. Why don't they?—I am, etc.,

Ashted, Surrey.

W. EDWARDS.

Keeping Clear of the Zebra

SIR.—From July 1, 1954, it will be an offence to stop a vehicle within 45 ft. of the approach side of a zebra crossing for setting down, picking up, loading, and unloading. There seem to be no exceptions, and if any hospital has a zebra crossing within this distance of its entrance it will be necessary for them to take local action to get the crossing moved. Ambulances will, apparently, no longer be permitted to take up patients from places within these zones, and, of course, the regulation also applies to doctors' cars. The Order does not seem to have received much publicity, and I am therefore writing to ask you to draw attention to the matter.—I am, etc.,

London, S.W.10.

Branch and Division Meetings to be Held

CITY DIVISION.—(1) At B.M.A. House, Tavistock Square, W.C., Tuesday, June 22, 8.30 p.m., consideration of Agenda of A.R.M. (2) At Institute of Laryngology and Otology, Gray's Inn Road, W.C., Friday, June 25, 3.30 p.m., clinical meeting. Mr. K. G. Rotter: "Otitis Media in Children and Infants."

COVENTRY DIVISION.—Wednesday, June 23, 2.30 p.m. Visit to Cadbury Brothers Ltd., Bournville.

DORSET DIVISION.—At Antelope Hotel, Dorchester, Friday, June 25, 7.45 for 8 p.m., dinner; 9 p.m., annual general meeting.

DUDLEY DIVISION.—At Prestwood Sanatorium, Stourbridge, Tuesday, June 22, 8.30 p.m., clinical meeting arranged by Dr. J. Stevenson and staff and Dr. A. W. B. MacDonald.

EAST SOMERSET DIVISION.—At the Small Hall, Wells, Sunday, June 20, 3 p.m., annual general meeting. Consideration of Annual Report of Council, etc.

EAST SUFFOLK DIVISION.—At East Suffolk and Ipswich Hospital, Tuesday, June 22, 8.30 p.m., annual general meeting; election of officers; consideration of Annual Report of Council, etc.

ENFIELD AND POTTERS BAR DIVISION.—Thursday, June 24, summer social meeting. Members to meet at Blomfield Road, Paddington, at 3.15 p.m., for trip by motor barge on Regent's Canal.

GLASGOW DIVISION.—At Institution of Engineers and Shipbuilders in Scotland, 39, Elmbank Crescent, Glasgow, Wednesday, June 23, 8.30 p.m.

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, W., Friday, June 25, 3.30 for 4 p.m., clinical meeting.

NORTH MIDDLESEX DIVISION.—Sunday, June 27, annual outing. Members to meet in the Lion House, Zoological Gardens, Regent's Park, N.W., at 10.30 a.m. Members wishing to join the party are asked to communicate immediately with the honorary secretary of the Division, Dr. Joan Chappell, 1, Winsford Terrace, London, N.18.

NORWICH DIVISION.—At Norfolk and Norwich Hospital, Tuesday, June 22, 8.30 p.m., annual meeting; election of officers; consideration of Annual Report of Council, etc.

OXFORD DIVISION.—At Radcliffe Infirmary, Oxford, Wednesday, June 23, 8.15 p.m., clinical meeting.

SALISBURY DIVISION.—At Salisbury Infirmary, Monday, June 21, 8.15 p.m., annual general meeting; election of officers, etc.

SHEFFIELD DIVISION.—(1) At Sheffield University Medical Library, Friday, June 18, 8.30 p.m., consideration of Annual Report of Council, etc. (2) At Royal Victoria Hotel, Sheffield, Friday, June 25, 12.30 p.m., annual luncheon to new medical graduates of Sheffield University.

SOUTH MIDDLESEX DIVISION.—At Anchor Hotel, Shepperton, Monday, June 21, 9 p.m., consideration of Agenda of A.R.M., etc.

STRATFORD DIVISION.—At the Clinic, Katherine Road, Forest Gate, E., Thursday, June 24, 2.45 p.m., lecture by Dr. Philip Ellman, followed by clinical demonstrations, on the Diagnosis, Differential Diagnosis, and Treatment of Pulmonary Tuberculosis in Clinical Practice.

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, June 25, 3 p.m., clinical meeting. Miss Gladys H. Dodds and Dr. S. D. Perchard: "Gynaecology."

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Wednesday, June 23, 8.30 p.m. Consideration of Supplementary Annual Report of Council and Agenda of A.R.M., etc.

WESTMINSTER AND HOLBORN DIVISION.—At Westminster City Chambers, Thursday, June 24, 8 p.m., annual general meeting. Consideration of A.R.M. Agenda; election of officers, etc.

A VISIT TO THE MIDDLE EAST AND FAR EASTERN BRANCHES

BY

J. W. TUDOR THOMAS, D.Sc., M.D., M.S., F.R.C.S.
President of the British Medical Association

It has been to me a great privilege and a pleasure to have had the opportunity of visiting B.M.A. Branches in the Middle and the Far East on behalf of the Association. My wife and I received everywhere the warmest welcome, and met nothing but kindness and hospitality wherever we went. In the course of the tour it was good to meet our members and members of the profession generally, and to discuss with them their difficulties and problems, as well as to see much of the medical work which is being carried on in those parts.

I was invited to give many lectures and addresses, and visited a large number of hospitals and saw much of the clinical work and the general arrangements. We also met many of those who occupied prominent positions in the various countries which we visited, and our personal contacts were extended by the many dinners, lunches, and receptions that were arranged on our behalf. We visited scenes of great beauty and places of historic interest, and with all the wealth and charm of unaccustomed surroundings the limited time at our disposal seemed all too short.

The details of the tour were arranged by Dr. Grey-Turner, Assistant Secretary to the Association, and I would like to acknowledge my indebtedness to him for all his careful preparation and interest. The object of the tour was to carry greetings and good wishes from the Association, its Council, and the Overseas Committee to our members overseas, and to express an interest in their welfare and to try to help them in any way possible. We left London Airport on March 9, and returned to the same airport on April 24, having travelled by air some 22,500 miles and visited many countries. The following is a brief summary of the tour, which, however, cannot include much of the detail, which was all of great interest.

THE TOUR

Lebanon

We left London Airport by B.O.A.C. Argonaut, arriving at Beirut in Lebanon at lunch-time on March 10, and were met by representatives of the B.M.A. and others. Our hosts in Beirut were Dr. and Mrs. Ford-Robertson, and we stayed with them at their house at the Hospital for Nervous and Mental Diseases at Asfuriyeh, of which he is the Director. The hospital is on a hill near Beirut, overlooking the Mediterranean.

I gave several lectures during my stay in Lebanon, and visited the American University of Beirut and the hospital, where I spent some time in the Department of Ophthal-

mology with Professor Diab. A visit was also made to Tripoli to meet and address members of the North Lebanon Medical Association. While in Lebanon we attended several pleasant functions arranged on our behalf by H.E. the Ambassador, B.M.A. members, the British Council, and others.

On Saturday, March 13, we left for Bagdad, some 500 miles away, across the Lebanese mountains and the desert, flying over Damascus.

Bagdad

On arrival at Bagdad we were met at the airport by Dr. Altounyan, of Aleppo (Syria), President of the Middle East Branch, and Professor M. Critchley, the Honorary Secretary, and others. We stayed at the Embassy, on the right bank of the Tigris between two main river bridges. The Government of Iraq had given their support to our visit to Bagdad, and a car and driver were put at my disposal by the Minister of Health for the duration of my stay.

The Branch B.M.A. Dinner was held in the Alwiyah Club. The guests included H.E. the Ambassador and Lady Troutbeck, and the Minister of Health. It was a well-attended and very pleasant function. I attended a special meeting of the Branch, at which I gave an address, and visited the Royal Medical College of Iraq and addressed the body of students and the profession. The Royal Medical College of Iraq was founded in 1927, and the medical course now takes six years. In 1953 there were 147 new students. A visit was also made to the hospital, where I spent some time in the eye department. We were entertained to a sumptuous lunch by the Iraqi Medical Society, and I had the pleasure of addressing the Society that evening.

We visited the Abdul Illah Tuberculosis Sanatorium some miles out of Bagdad and also the hospital at Hilla, and viewed the ruins of Babylon.

On Wednesday, March 17, we left Bagdad for Beirut, and attended a lunch there given by the Minister for Health and Agriculture. During our time in Beirut we had met Dr. Hitti, chairman of the B.M.A. members in the Lebanon, and in both Lebanon and in Iraq we had been received most kindly.

Ceylon

On March 18 we left Beirut for Colombo. We travelled overnight, and, passing over the brown landscape of India, reached the green vegetation of Ceylon with its beautiful coastline on March 19. Within three hours of our arrival

I was sitting alongside Dr. Abeyaratne at a meeting of the Ceylon Medical Association, which comprises the Ceylon Branch, while he gave his presidential address.

During our time in Ceylon I visited hospitals in various parts, and we saw many places of beauty and of historic interest. At Kandy I visited the new university centre, which is rapidly developing, and the Kandy Hospital, and was entertained to lunch by the Clinical Society of Kandy Hospital. I visited certain isolated hospitals, where one doctor has to cope with most of the work, and I admired the way he did his best to overcome his difficulties.

There were many hospitals to visit in Colombo, and much interesting medical work to be seen. Among them was the Ridgeway Hospital for women and children, with 350 beds and dealing with 1,000 out-patients a day. There was also the Colombo General Hospital of 1,364 beds, which is the main teaching hospital of the Medical School of Ceylon. About 150 medical students now qualify each year from the Medical School. I also visited the Eye Hospital and met the ophthalmic surgeons, and was their guest at a reception, and the guest of the Ceylon Medical Association to dinner.

Hong Kong

On March 26 we left Ceylon for Singapore, where we spent the night *en route* for Hong Kong. We arrived at Hong Kong on March 27, and landed at Kai Tak Airport after some delay due to considerable cloud.

We stayed with the president of the Branch, Surgeon Captain Panckridge, R.N., and Mrs. Panckridge, at the Royal Naval Hospital, some 1,400 feet up on the Peak in a most delightful position overlooking Hong Kong with its seacoast and islands. That night we were entertained to Chinese dinner by the Hong Kong Chinese Medical Association. There were about 130 present, including their genial president, Dr. Lee Hai Leong.

During the week we spent in Hong Kong we had much hospitality, including that of H.E. the Governor and Lady Grantham, and attended many functions, among them a B.M.A. Reception. Visits were made to several excellent hospitals, including the Government Hospital, the Queen Mary Hospital, and the Matilda Hospital, the Royal Naval Hospital, and the Hong Kong Sanatorium. At the invitation of the University I gave a public lecture, attended mostly by doctors, students, and nurses, and, as in other centres, I was given every opportunity to meet members of our profession and to address them on various occasions.

I had the pleasure of being entertained by Dr. Ride, the Vice-Chancellor of the University, and Mr. Black, the Colonial Secretary, and of meeting the Deputy Director of Medical Services, Dr. Liston, in the absence of Dr. Lee. The ophthalmic surgeons of Hong Kong also entertained us to dinner, and I spent some time with them at the Kowloon Eye Clinic. We were indeed made very welcome during our stay and were sorry to leave.

North Borneo

On Friday, April 2, we left by air for Jesselton in North Borneo, passing over glorious scenery with the vivid colours of the sea, the islands, and the submerged islands and colourings of coral and sand.

At Jesselton we were the guests of H.E. the Governor and Mrs. Turnbull, and in the small medical community of this centre we were received with a great warmth of welcome. The Jesselton Hospital has devoted medical officers doing splendid work, and it is fitting that a new hospital is now being built to serve the area with better facilities. In Jesselton I attended a Branch meeting with Dr. Christianson, the president, and was entertained to dinner by the B.M.A. members of Jesselton (chairman, Dr. Pan) and was pleased to make close personal contact with all the doctors in the area, including the Director of Medical Services, Dr. Clapham.

From Jesselton we left by air on April 6 for Kuching.

Kuching, Sarawak

At Kuching we were the guests of H.E. the Governor, whose residence, The Astana, was reached by sampan over the Kuching river, a most picturesque position. We were entertained to dinner by the B.M.A. Sarawak members (chairman, Dr. Philpott). I found much interest in seeing the work of the hospital and in visiting a leper settlement. Excellent work is being done by the Anti-tuberculosis Association of Sarawak, and there, as in some of the other countries we visited, tuberculosis constitutes a grave problem.

We had a most pleasant tea with the sisters and nurses of the General Hospital in the nurses home, which is a first-rate home and beautifully kept. We met the Director of Medical Services, Dr. Glyn Evans, and, as in other centres, we found nothing but kindness and hospitality during our stay in Sarawak.

Singapore and Malaya

On April 8 we left Kuching for Singapore and were the guests there of Professor Eric Mekié. I visited the hospital, where they have built a new nurses home, in which each bedroom is shared by two nurses but each nurse has her own bathroom.

While in Singapore I was shown around the hospital, which is the teaching hospital for their medical school. I also inspected several departments in the Faculty of Medicine, and addressed the students of the College. There were many opportunities for meeting members of the Division and for discussions with them, and we received much kindness at their hands. I also spent some time in the eye department at the General Hospital with Dr. Williamson (ophthalmologist).

Following Singapore, we went to Penang, to Ipoh, and to Kuala Lumpur. In each place there were lectures to give, hospitals to visit, and B.M.A. Divisional or Branch dinners. In Penang we stayed with Dr. and Mrs. Pallister, in Ipoh with Dr. and Mrs. Dickson, and in Kuala Lumpur with the Hon. James Whyte and Mrs. Whyte (who is a doctor).

During our stay in Malaya we made personal contact with many of the doctors, and we received great hospitality everywhere. In Kuala Lumpur I attended meetings of the Branch Council and the annual general meeting of the Branch, where I listened to Dr. Sodhy deliver his presidential address. I also inspected with much admiration the Institute for Medical Research at Kuala Lumpur under the direction of Dr. Field. In this beautiful and well-equipped building excellent work is being done on the subject of viruses and the nature and spread of disease under tropical conditions, as well as investigations on the practical control of those diseases.

We were privileged to meet H.E. the High Commissioner and Lady Templer as well as the Deputy High Commissioner and Lady MacGillivray. There is a great deal of tuberculosis in Malaya, and a new hospital is now being built for research in tuberculosis and for the treatment of patients. It will bear the name of Lady Templer, who has been actively interested in its establishment. We also visited the Leper Settlement at Sungei Bulloh, the Military Hospital at Kinrara, and the Royal Naval Base at Johore.

In Malaya, as in the other countries we visited, our members referred to the value of the *British Medical Journal*, which they are so glad to receive.

We left Singapore for home on Friday, April 23, arriving at London Airport on the 24th, where we were met by Dr. Grey-Turner and Dr. Bergin, the medical officer to the airport.

I would like to acknowledge my thanks to the B.O.A.C. for the excellence of their arrangements and for many personal kindnesses shown to us.

Retrospect

Looking back on the tour, I feel that it may serve a good purpose in directing attention to the fact that many of

our members live overseas and that they should never be forgotten. There are many very loyal members overseas and very many who deserve our warmest appreciation both for the excellence of their work and for the way that they keep up the best of British tradition in far-off lands.

It has been a great pleasure to make this official visit on behalf of the Association, and to do anything I could in every way to assist them and to carry that message of good will which I undertook to do. The greetings were warmly received, and there was an evident desire to know more about the British Medical Association and to learn about its standing, its traditions, and its functions. Many of the doctors whom I met had never been in England and had never seen the workings of the Association in this country. I felt that they were pleased to realize that they formed part of our organization, and that by my visit they were perhaps making a closer contact with the Association than they had done before. They were all interested to know of the Empire Medical Advisory Bureau, and of its interest in the visits of our members from overseas and in their welfare.

I have carried back with me many matters from our colleagues in the countries which I visited which will be considered by the Overseas Committee, and I was able to assure them of sympathetic and careful attention to their problems and difficulties. My wife and I look back on this tour with very pleasant memories, and, although at times it was strenuous, it was throughout most enjoyable and we are grateful for all the kindness shown to us.

CONDITIONS OF SERVICE IN THE ARMED FORCES

In September, 1953, the Government, in announcing the setting up of the Waverley Committee to review the arrangements for providing medical and dental services for the Armed Forces, at home and abroad, in peace and war, published details of increased remuneration and amendments of lished details of increased remuneration and amendments of certain conditions of service for officers in the medical branches of H.M. Forces. The improvements were intended to attract more practitioners to make the Services their career.

The changes were briefly: (1) increased rates of pay for the middle ranks in the medical branch of each Service; (2) increased specialist pay; (3) permanent commission grant of £1,500 (taxable) payable to all officers granted permanent commissions, subject to the completion of one year's satisfactory service as a medical officer on any type of compulsory mission; (4) more posts for retired officers to release young medical officers for more active appointments; (5) direct acceptance for a regular commission without first having held a short-service commission; (6) antedating of commissions granted to late entrants to the medical branches of the Services according to civilian experience, up to a maximum of seven years; and (7) extension to National Service medical officers in the R.A.M.C. of a scheme granting three-year short-service commissions.

Association Seeks Further Information

These revised conditions of service have been considered by the Association, and further information, together with certain assurances, has been sought from the Ministry of Defence and the Service Departments. Particularly has the Association been concerned to safeguard the prestige and promotion prospects of the medical officers already in the Services when these new arrangements became operative on October 1, 1953.

Information was sought on the method of payment of the new permanent commission grant, and it was learned that this is to be paid in one lump sum to the medical officer concerned, which means that his total remuneration for that year is considerably higher than normal. Thus a large pro-

portion of the grant will be paid back to the Government in the form of income tax. It is appreciated that, under income-tax law, this method of payment is necessary, but intending applicants should appreciate in advance what follows from the reference to a grant of £1,500 (taxable). The acceptance of a permanent commission implies an undertaking to serve until the normal retiring age, unless Service requirements permit premature retirement or there are compassionate grounds which are allowed to override Service requirements. The Service Departments have not, therefore, laid down any minimum period for which a medical officer must serve in order to be exempt from repayment of the whole or a part of the new permanent commission grant.

Concern About Antedated Commissions

The Association has expressed particular concern about the proposal to antedate commissions of all new entrants, for it is believed that this would affect the promotion prospects of medical officers commissioned prior to October 1, 1953, especially in relation to promotion to lieutenant-colonel and colonel in the R.A.M.C., after 17 and 23 years' service respectively. Thus it is hoped that this kind of manoeuvre is purely a temporary expedient in order to breach a dangerous gap in recruitment. On these points a statement has been made by the Ministry of Defence that relatively few medical officers have been appointed since the end of the war to permanent commissions. Ample opportunities for promotion are, it is stated, anticipated for medical officers appointed to the Services both before and after October 1, 1953. As, however, the provision of an adequate career up to retiring age is the aim of the Services, the Ministry stated that as recruiting improves appointments to permanent commissions would be limited in order to prevent blocks in promotion at later stages. It also stated that particular attention is being given, in a review of the R.A.M.C., to the authorized complement of posts in the ranks of lieutenant-colonel and colonel to ensure a fair opportunity of reaching these ranks for all officers suitable for such promotion.

No Firm Assurance

A communication has also been received from the War Office that the interest of all officers in the armed medical services is constantly kept under review, and it is not anticipated that any R.A.M.C. officer will be prevented, as a result of the new arrangements to antedate commissions, from attaining the rank which his abilities justify. The Association has, however, been unable to obtain any firm assurance from the Ministry of Defence that promotion to lieutenant-colonel and colonel in the R.A.M.C., after 17 and 23 years' service respectively, will—if necessary by increasing the establishment of these ranks—be sustained.

Representations that the possibility of retrospective application of the new arrangements to antedate all commissions might be considered in regard to medical officers granted permanent commissions since April 1, 1953, or whose previous applications had been rejected or only partially granted, have been made to the Service Departments, but have not been successful.

Approval Reserved

The Association does not consider that the additional information it has received enables it to give whole-hearted support to the interim proposals, particularly in view of the possible long-term effect these may have on medical officers who entered the Service before October 1, 1953, and those who enter under the new arrangements. For this reason it is anxious that medical practitioners contemplating making a career in one of the three Services should be fully aware of the above facts.

In addition, the Association awaits with interest the outcome of the deliberations of the Waverley Committee which it is hoped will result in the introduction of more acceptable terms and conditions of service.

MEDICAL PRACTICES COMMITTEE

The following amendments to the classification of areas (April 2 to June 4, 1954) have been issued by the Medical Practices Committee:

ENGLAND: COUNTIES

Buckinghamshire.—Long Crendon, Intermediate; Slough and Cippinham, Intermediate.
Cheshire.—Partington, Restricted.
Derbyshire.—Borough of Ilkeston, *Designated.
Durham.—Urban District of Hetton, Intermediate.
Gloucester County and City.—Dursley, Uley, and Wootton-under-Edge, Intermediate.
Hertfordshire.—Urban District of Cheshunt and Goff's Oak, Intermediate; District of Waltham Cross, *Designated.
Isle of Ely.—March, Intermediate.
Lincolnshire (Lindsey).—Rural District of Welton (except Bardney, Dunholme, and Ingham), Intermediate; Districts of Dunholme and Ingham, Restricted; Urban District of Barton-upon-Humber, Intermediate; Borough of Scunthorpe, *Designated.
London.—Borough of Lambeth: Herne Hill Ward, Restricted. Borough of Lewisham: Culverley and St. Andrew's Wards, *Designated. Borough of Paddington: South of Harrow Road, Restricted.
Middlesex.—Borough of Southall, Intermediate.
Northamptonshire.—Corby, Intermediate.
Northumberland.—Glendale, Intermediate.
Wiltshire.—Downton, Restricted.
Worcestershire.—Oldbury, Intermediate.
Yorkshire (W.R.).—Urban and Rural District of Penistone, Intermediate; Urban District of Earby, Restricted.

COUNTY BOROUGHES

Birmingham.—Washwood Heath, Intermediate; Stechford, *Designated.
Leeds.—Hyde Park, Roundhay Headingley, Harrogate Road and Cookridge Districts, Intermediate; Remainder of County Borough, Designated.
Stoke-on-Trent.—Burslem and Longport, *Designated.

WALES

Monmouthshire and Newport.—Urban and Rural Districts of Pontypool, Intermediate.

THE GENERAL PRACTITIONER AND THE HEALTH VISITOR

HERTFORDSHIRE MEETING

Following the joint circular issued by the British Medical Association and the Society of Medical Officers of Health (*Supplement*, March 27, p. 125), representatives of the Hertfordshire Branch of the B.M.A. and of the Hertfordshire Local Medical Committee and the county medical officer and senior members of his medical staff held a meeting at St. Albans on May 26 to discuss the question of co-operation between general practitioners and health visitors. Dr. D. G. Wilson was elected to the chair.

In opening the discussion the county medical officer, Dr. J. L. Dunlop, reviewed the circumstances which had militated against co-operation between the curative and health services in the past, and showed how some of the worst obstacles had been removed by the National Health Service. He welcomed the circular as likely to strengthen the efforts already being made. He put forward suggestions of ways in which the health visitor and general practitioner could work together, and invited criticisms and improvements from practitioners present.

Practical Suggestions

The following points emerged from the general discussion which followed. It was stated that the health visitor was at a disadvantage, compared with the nurse and the midwife,

in that her work seldom brought her into close contact with the general practitioner—who was not always aware of her exact function. Contact was made more difficult because health visitors were seldom on the telephone, and in any case were out at work at times when general practitioners found it most convenient to get in touch with them. Many practitioners, therefore, did not know how many, where, or what were the names of health visitors working in their areas.

To overcome these difficulties it was suggested that (a) the county medical officer should write to all general practitioners outlining the uses which could be made of the health visitor service, and telling them of his intention to instruct health visitors to call on all general practitioners with whose patients they might be concerned; (b) the health visitors should make this call in order to establish the personal contact so advantageous to the general practitioner and the district nurse; (c) where it was mutually agreed, the health visitor should follow up the first call with others either on the doctor or on his secretary, who might form a good connecting link for the exchange of information and messages.

It was felt that the improved liaison resulting from these measures would benefit patients, visitors, and doctors. It was recognized that the final achievement would depend on personalities, and that it would be better therefore to leave general practitioners and health visitors to develop their individual schemes.

WAITING FOR A LETTER

That there is more than one side to every problem is shown by the following letter in the current issue of *Family Doctor* from an out-patient's secretary in a general hospital. She tells her side of some of the difficulties in sending out prompt reports on patients. She writes as follows:

"Sometimes a report is delayed, or not sent at all, because we do not know the name and address of the doctor. The registration clerks who record this on the case sheets are not allowed to open the doctors' letters to find it for themselves. But when the patients are asked for this information: 25% give it incorrectly; 20% say they don't know the doctor's name but it is just past the Red Lion; 10% are too old, anxious or intimidated to be able to remember; 5% are too deaf to hear the question; 5% are of foreign origin and unable to speak English; 20% don't know. Of these, 2% have letters written on very small pieces of thin paper, which disintegrate or vanish during the session, leaving the consultant and me without a clue.

"Family doctors could, therefore, help us to help them by using envelopes with 'From Dr. So-and-So' printed on the outside. This could then be copied by the clerks in the first place."

PRESENTATIONS TO DRs. C. J. G. BOURHILL AND G. A. SINCLAIR

After an informal supper party on May 27 Dr. C. J. G. Bourhill, former chairman of the Warrington Local Medical Committee for 17 years, and Dr. G. A. Sinclair, former secretary for 27 years, were presented with a gold watch, and a silver tea service and tray, respectively. The gifts were subscribed by practitioners on the executive council list, of the public health department and attached to local hospitals, and others connected with the executive council, in appreciation of the services Drs. Bourhill and Sinclair had given to the profession, in particular in furthering mutual help and trust among practitioners in the area.

The presentations were made by Mr. W. A. Boulting, chairman of the Warrington Executive Council, Dr. L. S. B. Tasker, and Mr. G. E. Archer.

STATUS OF SENIOR HOSPITAL MEDICAL OFFICERS

NATIONAL SPECIALISTS' GROUP FORMED

A meeting of senior hospital medical officers from 13 of the 14 regions in England and Wales and including a representative from Scotland was held at B.M.A. House, London, on Saturday afternoon, May 29, 1954. Letters of support were received from the remaining region in England. The Convenor and Chairman was Mr. G. Waring Robinson, of Leicester, chairman of S.H.M.O. groups in the Sheffield Region. There was an unexpectedly large attendance, about 200 being present.

The CHAIRMAN said that it had been suggested to him that this occasion should be used to form a national Group of S.H.M.O.s. He wished to see the eventual abolition of the grade, and therefore hoped that this would prove to be the shortest-lived group of any.

Mr. GEORGE LOWE (Tiverton) proposed that an Official Group of S.H.M.O.s be formed, with Chairman, Secretary, and Committee, to represent all 14 regions. This proposition was unanimously adopted, and Mr. Waring Robinson was elected Chairman, Mr. G. Lowe Vice-chairman, and Dr. W. J. Wilson (Sheffield) Honorary Secretary. Members from each region then conferred to choose one of their number to serve on the Committee.

The Present Standing of the S.H.M.O.

The CHAIRMAN said that S.H.M.O.s had much more support from other branches of the profession than was generally realized. In his correspondence he had been surprised at the response, for example, from members of Council of the B.M.A. and from the Royal Colleges. With regard to the Regional Consultants and Specialists Association, he was reminded that the policy of the Association, as laid down at the Special Representative Meeting in December, 1949, was to seek the abolition of the grade altogether. The members of this grade, he said, felt a sense of injustice, but the airing of personal grievances was not the best way to advance a cause. The important thing was to get the whole profession and the Ministry of Health to realize that here was a large and important body of medical men—specialists—who could speak with a united voice.

There appeared to be a very hazy idea of the standing of the S.H.M.O., and he hoped that that meeting would express its opinion in no uncertain terms on that point. The S.H.M.O. was appointed only when it was known that he had a wide experience in his specialty; generally he possessed a higher qualification. He was expected to be able to take complete clinical control, differing in no way in this respect from his consultant colleagues. The relationship between consultants and S.H.M.O.s was not that of commanding officers to lower ranks. The senior area consultant was responsible for the smooth running of his department, and with his colleagues, whether consultants or S.H.M.O.s. On this question of status he felt that the S.H.M.O. was slowly being pushed down to a lower level. After all, the S.H.M.O. was a recognized specialist who at the time of his appointment was considered competent to be in complete clinical control of patients and beds. His professional standing, therefore, was similar to that of his consultant colleagues, and he should have equal representation on all appropriate committees.

At this point several of those present gave their experiences of difficulties in the several regions. Mr. Lowe said that there was not only a good deal of individual injustice but much variation between regions. He also protested against the assumption "Once an S.H.M.O., always an S.H.M.O." One speaker said that if it was proposed to abolish the grade of S.H.M.O. this should carry with it the implication that all in that grade immediately became consultants. The differential between the consultant and the

S.H.M.O., said this speaker, was under the present arrangement made to appear quite excessive.

The CHAIRMAN pointed out that the question of abolishing the grade was a separate one and would be considered under long-term policy. The meeting was at present discussing the professional standing of S.H.M.O.s on the assumption that the grade was retained. In some further discussion the difficulty was pointed out that S.H.M.O.s were not a homogeneous body, and that not all had come into the grade by the same route. One speaker expressed the view that a great injustice was done by not creating a rank of "Specialist." The term "Consultant," he said, should have been reserved for those in receipt of the Merit Award. "We shall never get anywhere until we create a specialist grade." Another speaker urged that no distinction be made between consultants and specialists.

The following resolution was carried unanimously:

That a Senior Hospital Medical Officer is a recognized specialist who at the time of his appointment was considered to be competent to have complete clinical control, and where applicable control of beds. His professional standing, therefore, is similar to that of his consultant colleagues, and he should have equal representation on all relevant committees.

It was further agreed unanimously, Dr. PUGH proposing and Dr. GOLDSTEIN seconding:

That, pending the abolition of the grade, a fully constituted Group of S.H.M.O.s should be recognized by the British Medical Association, with adequate representation on the Central and Regional Consultants and Specialists Committees.

The Recent Awards

The CHAIRMAN next drew attention to the recent revision of scales, which, he said, had accentuated the difference between the salaries of S.H.M.O.s and of consultants. The S.H.M.O.s had had an increase of 15.4% and the consultants an increase of 23.5% at the minimum of the scales. This also, he pointed out, affected status, because a man's status was largely judged by his remuneration. Dr. PUGH proposed and Dr. HARRISON seconded:

That this meeting considers the recent awards to S.H.M.O.s imply a lowering of their professional standing as compared with that of their consultant colleagues, and requests the immediate righting of this humiliating injustice.

This resolution also was carried unanimously.

Promotion by Regular Review

The CHAIRMAN said that in the grade at present the prospects of promotion were practically nil, except perhaps in certain specialties. Speaking broadly, the S.H.M.O., when applying for a post, was in competition with senior registrars from teaching hospitals. A senior registrar should attain consultant status by passing through an intermediate grade as long as such a grade is retained. A review committee should be appointed, meeting perhaps three or four times a year, to which S.H.M.O.s could apply, and on that committee S.H.M.O.s themselves should be represented. Mr. Lowe said that if the grade was retained promotion by merit should be an essential feature of the Service. The method of obtaining that promotion should be determined later, but it was essential that anybody worthy of the rank of consultant should have the chance to compete.

From further debate it was evident that there were those in the meeting who thought that the first thing to ask for was the abolition of the grade, but an amendment that no alternative proposal to the abolition of the grade be put forward to the Ministry was lost. The following motions were carried unanimously:

That if the grade be retained promotion on merit to consultant rank should be an essential feature of the Service and that age should be no obstacle.

That the meeting expresses its complete lack of confidence in the work of the earlier Review Committees, believing that in many instances the reviews were grossly unfair. It further requests that S.H.M.O.s have adequate representation on the Committees concerned with the proposed review of selected cases.

Revision of Salary Scales

The CHAIRMAN suggested that they should press for a revision of the salary scale to a minimum of £1,500 rising to a maximum of £2,500, the annual increments probably being £100. In the case of a man in the fullness of his professional career £2,500 was in no way excessive.

Considerable discussion followed on this matter. The Chairman pointed out that the salary scale he had suggested was only an interim measure pending the abolition of the grade, and he considered that a minimum of not less than 80% throughout the consultant's scale would be more in keeping with the professional standing of S.H.M.O.s.

Eventually the following resolution was passed unanimously:

That this meeting considers that pending the abolition of the grade the remuneration of Senior Hospital Medical Officers should be not less than 80% of the consultant scale.

Another proposal agreed to was that S.H.M.O.s should be represented—or at any rate called in to give their views—on any committee appointed to consider injustices pertaining to the grade.

Further Action

In reply to questions, the CHAIRMAN said that a succinct report of the present meeting would be sent to the Minister of Health, the Royal Colleges, the British Medical Association, the Central Consultants and Specialists Committee, and other appropriate bodies, and to the medical journals. It was suggested from the meeting that it be brought to the attention of all members of Parliament and to all S.H.M.O.s in the country. In reply to a question the Chairman said that he believed there were about 2,500 S.H.M.O.s in the country.

Discussion then took place on the question of title, and the resolution eventually adopted was:

That the title S.H.M.O. cease to exist, and that under the generic term "Specialist" the title "Physician," "Surgeon," "Pathologist," "Radiologist," etc., be used.

Finally Dr. SAUNDERS-JACOBS proposed and Dr. HARRISON seconded the proposal:

That the Council of the B.M.A. be requested to take urgent and vigorous action to further the resolutions adopted by this meeting.

This resolution was carried unanimously.

The meeting accorded an enthusiastic vote of thanks to Mr. Waring Robinson for his initiative in summoning the meeting, and his conduct of it, and an appeal was made, and quickly responded to, for contributing to defray the initial organizational expenses.

MINISTER OF HEALTH ON FUTURE OF GENERAL PRACTICE

HEALTH CENTRES NOT A UNIVERSAL ANSWER

The Minister of Health (Rt. Hon. Iain Macleod, M.P.), in opening extensions to the East Ham Chest Clinic on June 21, took occasion to address some remarks specially to general practitioners about the future of general practice.

The subject of general practice, he said, was particularly dear to him because he was the son and grandson of general practitioners, and if he had been clever enough at school he would have been a general practitioner himself. There were many in general practice who had feared the coming of the National Health Service, and he was much concerned when he became Minister in 1952 to be quite certain that all that old feeling had gone. He came to office at rather a fortunate time for himself: the Danckwerts award had just been announced, and the arguments about charges in the National Health Service had at any rate simmered down. One of the first things he decided was not to make his period as Minister of Health, whether long or short, memorable for new legislation in the field of health, and indeed during his two years of office he had not introduced a single Bill. It was not more legislation that was needed, but to make work

the legislation already in being. With that idea in mind he started—and it was still his guiding principle as a Minister—to try to bring his Ministry nearer to those who worked in the Service and to make the people working in the Service understand some of the problems that administration had to face.

New Horizons

A great deal had disappeared, Mr. Macleod continued, from the old conception of general practice, but there were new horizons ahead. Little more in this particular field could be done from Whitehall. One could not help noticing, he said, how areas differed one from another.

"You can find in a good area almost at once the reason why it is good. The leaders of general practice in that area are on friendly terms with the hospital and the local health authority, and that sort of co-operation is something you cannot order by circular or regulation. What I want to see is the spirit of team-work in general practice devoted to the service of the patient such as we have already in hospital."

It was easy enough to bring it about in hospital, with its discipline and its teams of physicians and surgeons and specialists, and behind them the nurses and other staff, not forgetting those who ought to provide the link between the hospital and the general practitioner—namely, the almoner and the health visitor. To get that team-work into general practice there were those who advocated health centres, or group practice, or some development of the ordinary partnership system.

"One thing I am certain is right, that the same pattern will not do for every area. Areas differ socially and medically. Medicine is a very individual profession, and it does not seem to make sense for the Minister to lay down that all general practice in this country be channelled into health centres. I have no doubt that in many areas health centres do provide a very good example, particularly where there is a new housing estate and, so to speak, a medical vacuum in which services must be provided. In such an area it may well be that the health centre is the answer if the doctors want to work together in that sort of way. But these principles I would lay down: that it cannot be the same everywhere, and that it must remain as the doctor's right to practise or not in these health centres as he chooses. It would be disastrous to attempt to force the medical profession into giving their services in a way that many of them would regard as unsatisfactory. I have no doubt that health centres are going to provide part of the answer in this field, but not the whole answer."

Nor, for the same reason, was the answer to be found in group practice or developments of it, though group practice was bound to develop in many areas as doctors came more closely to study their problems together and as, one by one, doctors in a certain area began to specialize in some particular subject.

Liaison Between G.P. and Hospital

What was most important was the soundness of the links between general practitioner and hospital. It was of first importance that the general practitioners should be welcome and know that they were welcome in all their local hospitals, and that the ordinary facilities of the hospital, like the x-ray department, should be available for them. It was of first importance also that when the patient left hospital the general practitioner should have a report on him—and not just a routine report, but a considered statement from a senior member of the hospital staff. If that linkage was continued through the work of the health visitor, then they ought to have got somewhere near the ideal of the general practitioner as the head of a clinical team as diverse in its own way as the team which looked after the patient in hospital.

As to whether the general practitioner should himself practise surgery in the hospital there might be different opinions, but he recalled that his own father, who was the head of a partnership at Skipton, in Yorkshire, did a good deal of surgery in his time at the local hospital, and on a recent visit there he was delighted to find that the practice continued. Along with the link between the general practitioner and the hospital he wanted to see as close a link as possible between the general practitioner and the medical officer of

health and thereby to assist the progress of preventive medicine. It was difficult at present to concentrate as much as one would desire on the preventive side when the demands on the resources of curative medicine were so great, but the National Health Service ought to be designed to promote health.

Mr. Macleod concluded by asking general practitioners in the audience to talk to him privately afterwards. He said that it was not possible for him to meet as he would like to that the general practitioners of the country. "What one usually does is to meet the representatives, admirable though they be, of those practitioners in session in the B.M.A."

The ceremony at the East Ham Chest Clinic was presided over by Dr. L. Comyns, chairman of the Hospital Management Committee, and among those who spoke were Dr. J. S. Coleman, medical officer of health for East Ham, and Dr. Philip Ellman, consultant physician to the clinic. The vote of thanks to the Minister was proposed by Dr. Stanley Thomas, secretary of the East Ham Local Medical Committee, and seconded by Dr. M. J. McCormack, chairman of the West Ham Local Medical Committee.

Correspondence**Merit Awards**

SIR.—The Council of the Regional Hospitals' Consultants and Specialists Association is aware that throughout the country there is considerable disquiet at the manner in which merit awards are distributed. This disquiet is no doubt due in the main to the overt secrecy which enshrouds the subject. Since the early days of the National Hospital Service there have in many regions been no local consultations and little or nothing is known of how recommendations are made or considered. In many areas local advisory committees have not been further consulted and, indeed, committees have not been further consulted and, indeed, committees have not been further consulted and, indeed, committees have not been further consulted.

At its meeting on June 3, the Council of this Association accepted the following resolution put forward by one of its constituent bodies:

"That the Council of the Regional Hospitals' Consultants and Specialists Association is of opinion that in the granting of Distinction Awards the Awards Committee should consult local medical opinion, and that this could best be done through small regional advisory panels of consultants elected by the consultants in each region."

—I am, etc.,

London, W.C.2.

JOHN SIMONS,
President, Regional Hospitals'
Consultants and Specialists Association.

Remuneration of Hospital Medical Staff

SIR.—I am writing this letter in the hope that it may appear in print before representatives gather at the A.R.M. A number of amendments appear in the *Supplement* of June 19 (p. 332) urging that future negotiations on behalf of hospital medical staffs should be undertaken exclusively by the B.M.A. Doubtless this agitation stems from your leading article of April 10 (p. 860), which at a recent meeting of the Central Consultants and Specialists Committee I described as reprehensible and irresponsible. In that article the attempt was made to dissociate the B.M.A. from all responsibility in the recent negotiations. I wish to point out that I owe my position on the Joint Committee (and thereby on Whitley "B" Staff Side) to my membership of the B.M.A., of the N.E. Metropolitan Region Consultants Committee, and of the Central Consultants and Specialists Committee. This is likewise true of the other members of the Central Consultants and Specialists Committee who sit on the Joint Committee. And though the Central Consultants and Specialists Committee is an autonomous body, nevertheless it is paradoxically a standing committee of the B.M.A. Consequently, through us the B.M.A. is represented on the Joint Committee and is responsible for the results of the recent negotiations to the precise degree that we—of

the Central Consultants and Specialists sitting on the Joint Committee—were responsible. The B.M.A. may wish not to recognize that responsibility, but it is nevertheless factual. I was disgusted by what, Sir, should have been a soberly worded commentary, but which served instead as a stab in the back.

Those who bring forward the amendments in question, and those who may have a burning desire to speak to them, should think carefully and be cautious. The consultants and specialists of this country already possess an organization through which they can criticize their representatives. I for one—and I am sure that here I speak for my colleagues—am very willing to be criticized, but only through our machinery and only by my fellow members of hospital staffs. Any criticisms of the negotiating machinery should be made by the members of hospital staffs, and the overhaul should be carried out by them. We are glad to have the good wishes of our general-practitioner colleagues, and we co-operate with them through our Liaison Committee. But I for one would strongly resent their interference. However well meant—in our affairs. I imagine that at the A.R.M. there will be a large majority of general practitioners, and I trust they will take no part in the discussions and in the voting on matters concerning our negotiating machinery.

I issue a solemn warning to those who may wish to destroy the present machinery that an endeavour to replace it by one entirely under the aegis of the B.M.A., to the exclusion of the other constituent bodies of the Joint Committee, at this stage in the development of the N.H.S., would with fair certainty completely destroy the influence of hospital staffs on the organization of the Service. This influence—now very considerable—has been built up slowly and with great difficulty in the last six years. Further, it is a conceit that all consultants would naturally and automatically support a "pure" B.M.A. negotiating committee. Any attempt by the A.R.M. or the Council to "push around" the consultants might easily lead to a split between general practitioners and consultants, and spell ruin for the B.M.A.

Finally, I hope it is crystal clear that I have no objection to criticisms of the outcome of the recent negotiations. Informed criticism of that nature by those to whom I owe a responsibility is right and proper; and the answers to such criticisms have been given particularly clearly in Bulletin No. 3 of the Central Consultants and Specialists Committee. But I write this letter because I am horrified by the thought of the chasm which might yawn before the profession in a few weeks' time as a result of the irresponsible actions of ill-informed persons.—I am, etc.,

London, N.6.

D. W. C. NORTHFIELD.

**The leading article in the *Journal* of April 10 described the constitution of the Staff Side of Whitley Committee "B" thus: "... the Staff Side negotiators on behalf of consultants and hospital medical staff are chosen by the Joint Consultants Committee, which has on it representatives from the Royal Colleges and Corporations of England and Scotland, and from the Central Consultants and Specialists Committee of the B.M.A., the distinguished President of the Royal College of Physicians acting as chairman. The British Medical Association has not in fact conducted the negotiations (as it did for the general practitioners)." These are the facts, and it is the recording of them which, it appears, Mr. Northfield describes as "reprehensible and irresponsible."—Ed., B.M.J.

Doctor-Patient Relationship

SIR.—I think that many of us in the profession will find ourselves in agreement with the opinions expressed by "G.P." in his letter (*Supplement*, June 5, p. 299) under the above heading. At the same time I must say that I am obviously more fortunate than him and his colleagues in that my local executive council has always treated me with much consideration and co-operation.

The point I wish to make, however, is concerned with the power of executive councils to discipline patients, and

here I do agree most heartily with your correspondent. I think there is a great injustice here. Apart from a mild injunction to patients on their medical cards (which, incidentally, I am certain are never perused) to try to send in their calls before 10 a.m., I know of no regulations attaching to the public whatever. On the other hand, vigorous disciplinary measures can be, and are, taken against doctors who may be delayed in responding to calls and for other reasons such as are mentioned in your correspondent's letter. This unilateral and unfair dissemination of "justice" can do no other than wreck completely what fragments remain of anything resembling a doctor-patient relationship, which is pretty well doomed already. Most of us realized its death knell was struck when the N.H.S. was launched, but were severely criticized for this opinion by the then Minister of Health. It is up to executive councils to try to preserve the remaining fragments of this relationship by every means possible and not the least by being much more careful in arriving at their conclusions regarding the conduct of those who, let them remember, are keeping the Service going. Laymen on councils are not conversant with the problems of the profession. They should realize this and try to understand the doctors' difficulties more sympathetically. Indeed, I consider they are fortunate to have such a docile and co-operative body of men and women under their jurisdiction. Bias in favour of the public will not, however, necessarily secure for them a continuation of such co-operation, and they would do well to contemplate this. Also, a bit more discipline directed towards the patients would not be out of place and would create infinitely better circumstances for the welfare of the Health Service.

One last point, which may at first sight seem irrelevant but which does in fact have a bearing on the subject: when are we going to have this iniquity wiped out of private patients having to pay for their medicines? They are just as entitled to free medicine as are the N.H.S. group, and the continuation of this wretched piece of political bias can in fact be very detrimental to the doctor-patient relationship. There can be no possible excuse for it, and it would be a much more worthy subject for press publicity than the alleged misdemeanours of a hard-worked and frequently distracted medical profession.—I am, etc.,

Great Haywood, Stafford.

A. D. MACDONALD.

Patients of Vacant Practices

SIR,—So Dr. A. Talbot Rogers "regretted the terms" in which the Devon and Exeter Local Medical Committee's motion at the Conference of Local Medical Committees regarding the patients of vacant practices was worded (*Supplement*, June 12, p. 304). Shades of Lord Acton, his regret was not greater than is mine at his apparent petulance. Had Dr. Talbot Rogers taken the trouble to try to explain in just what way the acceptance of such patients can become an ethical matter, using the word "ethical" in its ordinarily accepted sense as relating to morals, he would have interested many. The mere fact that the G.M.S. Committee, or a majority of its members, took this view proves nothing of the kind.

May I take my own case as a specific example? I am a singlehanded practitioner in a small town. If I die in harness a duty will devolve on my colleagues under their "terms of service" to render all necessary treatment to the patients of the practice until a successor shall have been appointed. It may well be that even now many of my patients would like an opportunity to transfer if they could do so without embarrassment. Why should my *exitus* debar them from transferring? What moral obligation would rest upon my colleagues to refuse to accept them and others? To whom do they stand under moral obligation in the matter? It would certainly not be to me, certainly not to my wife, whose only interest would be to remove herself and two dependent children from this vast, aesthetically pleasing, but back-breaking and impoverishing Georgian house with the least possible delay. I submit that apart from the con-

tractual obligation already mentioned they would be under no obligation of any kind and would be perfectly free to accept any patient who wished to transfer. This is the clear and obvious corollary of the fact that the goodwill of the practice belongs neither to me nor to my heirs.

If the matter is without objectively ethical content, if it is, in the language of theologians, "indifferent," then it cannot be the concern of a committee which, if its name means what it appears to mean, is concerned solely with ethics. This proposition is as simple as that two and two do not make five, and there is no very obvious reason why anyone should doff his cap to the chairman for the time being of the G.M.S. Committee before putting it forward. Dr. Talbot Rogers must have had some sound reason for his round declaration in a slightly different connexion that "freezing" of a death vacancy would not recommend itself to the Ministry, although one would have thought that on administrative grounds the suggestion might have much to commend it and should certainly be possible by regulation. To seek to "freeze" such a practice by an illogical, illusory appeal to our moral sense seems to be merely another example of the present frightening trend to direct other people in the conduct of their affairs.—I am, etc.,

Launceston, Cornwall.

DONALD M. O'CONNOR.

Waiting in Out-patients

SIR,—There has been much publicity in the lay press on the question of the long waits which out-patients have when attending hospital, and the Minister of Health has issued a rebuke to the hospitals. Many suggestions are offered, such as the establishment of more appointments officers of higher skill, etc., but the real cause of the waiting is perhaps so very simple that it has escaped the notice of the authorities. It is just this, that too many patients are being attended to by too few consultants. If a train is habitually overcrowded and late, the remedy is not to put an extra clerk in the booking-office but to put on another train. For every consultant appointment which is advertised there are usually some 40 to 50 applicants, and there is much unemployment amongst highly qualified men and women who have been registrars for far too long. If the number of consultants were doubled, the patients would no longer have to wait, and the cost to the State would be less in the end than the appointment of further lay staff which would do nothing to remedy this evil.

Finally, if registrars who had completed their training could get appointments as consultants, there would be more incentive to the newly qualified to take up registrar appointments. Many of these posts are unfilled at the moment, particularly in the provinces, because they are regarded as a blind alley.—I am, etc.,

Camberley.

LESLIE HARTLEY.

The Small-list Practitioner

SIR,—I should like to associate myself with the views expressed by Dr. W. J. Grant (*Supplement*, May 15, p. 244) and by Dr. Roy Clayton (*Supplement*, May 29, p. 292). As regards those of the latter, I, too, see no reason or justification for penalizing the over 70's on account of their age. The Working Party would seem to be still obsessed with the idea that three score years and ten are still the be-all and end-all of man's existence, and with a wish to retire or get rid of them (though we are not yet a salaried Civil Service) despite Government propaganda in the Press and over the radio in favour of encouraging old men to keep going and work as long as they feel fit to do so; and of life figures; and despite the fact that the Ministry categorically stated before the appointed day that it had no intention of introducing a retiring age. As to their efficiency, my impression is that there is quite as high a percentage of inefficients under 70 as over, yet the efficiency will it be judged? As regards "no detriment," surely the proposed scheme is definitely detrimental to the "under

300's," for they are not only not to get any additional help but are not even to be allowed the capitation fee judged equitable by Mr. Danckwerts—namely, about £1 a head—but which the Working Party apparently do not concede. In their view "it is not proper" to make comparison between the new scheme and the effect of the Danckwerts award. The amount necessary to provide that extra 3s. a head for the few remaining under 300's would, I should think, hurt nobody.—I am, etc.,

Thame.

C. H. BARBER.

SIR,—May I respectfully point out to Dr. W. J. Grant (*Supplement*, May 15, p. 244), and others who have hastily welcomed the second report of the Working Party, that its recommendations are designed to benefit only two groups of practitioners: (1) those who were in receipt of a fixed annual payment on March 31, 1953, and (2) doctors aged 60 and over, subject to certain conditions? The Working Party were asked, in making their second report, to amend their original distribution scheme where "those least favourably placed" who might have expected to have benefited from the new distribution had, in fact, not done so (resolution of Special Conference of Local Medical Committees—see *Supplement*, July 5, 1952, p. 1). That this was taken to mean the small-list practitioner is evident from the proposed scheme.

The capitation fee under the Danckwerts award, which, it must be remembered, was a first settlement and was made retrospective to July, 1948, was about 20s. It can be shown by simple arithmetic that the average capitation fee for lists up to 714 under the Working Party's original distribution scheme is less than 20s., and for lists up to 500 it is, of course, only 17s. These doctors are manifestly worse off, instead of having benefited, than under the Danckwerts system, and, except where they come into the categories shown above, will so remain if this report is adopted. Only a small proportion outside (1) and (2) will be eligible under the sickly "hardship scheme." At a combined meeting of the Kensington and Fulham, Hammer-smith, and Paddington B.M.A. Divisions on May 28, 1954, a motion was carried underlining the fact that the Working Party have failed to do what they were asked to do. I trust that the Annual Conference also rejects a scheme which further divides our profession into smaller groups, and continues discrimination against those who can least afford it.—I am, etc.,

London, W.6.

ROBERT JOHN.

Return of Goodwill

SIR,—Having read Dr. Alexander Brown's letter (*Supplement*, June 19, p. 350) there are one or two comments I should like to make, but first I should like to say that I have the greatest respect for Dr. Brown's integrity and I have always admired his sincerity. I hope he will concede that I too am sincere, and that my letter in the *Supplement* of June 12 (p. 319) was a simple statement of fact.

At the March meeting of Council it was certainly not decided that the Amending Acts Committee's scheme for the return of goodwill should be presented to the A.R.M. with Council's condemnation. Indeed, a move in that direction was defeated by a very large majority. As far as submission of the Amending Acts Committee's report to the G.M.S. Committee and the Private Practice Committee is concerned, I would point out again that, ever since the beginning of our session last autumn, representatives of these committees have been invited to our meetings, and have enjoyed, and used, the fullest liberty to make their criticisms known. It has become increasingly obvious as time has passed that there were those in Council, who, whilst paying lip-service to the feeling that it was a most unfortunate thing that we had ever relinquished the ownership of our goodwill, nevertheless were bitterly opposed to the idea of any attempt being made to regain it. Obviously, they are perfectly entitled to hold and express any opinions about the matter that they wish—but so, too, are those of us who support the idea of the restoration of goodwill.

Many of our opponents have been generous enough to compliment the Amending Acts Committee on its ingenuity, and on the time and energy it has expended on its work—and then they have gone on to say that its goodwill scheme is the best one possible, that no better one can be devised, but that it is just not feasible. Now there I would join issue with them, for I think that Dr. H. H. D. Sutherland has shown the scheme to be a perfectly practical one even as it stands, but I say again, as I said in Council on May 5, that our scheme in its present form is not necessarily the final one, that there were, perhaps, loose ends to be tidied up, omissions to be rectified, and new criticisms to be considered, and at Glasgow I hope we shall be able to prove that we have adequately met most of the objections levelled against us.

As to the "red herring" of a whole-time salaried general medical service, it is as well to remember that consideration of this subject was not excluded from the Guillebaud Committee's remit, and that therefore (in spite of views expressed by the Minister of Health) the thought is already in the minds of the politicians.

At the same time, I must agree with Dr. Brown that I have never heard any member of Council express, in debate, support for a whole-time salaried medical service, and I take this to be a most cheering indication that complete opposition to any such development continues to be—as it always has been—the official policy of the B.M.A.

In conclusion, I trust that representatives will keep an open mind on the goodwill issue till after the debate at Glasgow, when I hope, and expect, that Dr. Sutherland will be able to meet all fair criticism and will be able to persuade the Representative Body that our scheme is not only feasible but desirable.—I am, etc.,

Wolverhampton.

A. VICTOR RUSSELL.

Remuneration in the Public Health Service

SIR,—It occurs to me that in the correspondence I have read an important point has been overlooked. Under Section 17 of the Industrial Court on the Public Health Service Award (*Supplement*, December 30, 1950, p. 255) the following statement occurs on the part of the management: "... And it was submitted that for the purpose of fixing the appropriate scales of salary attaching to posts in the public health service regard should be had to the scales prevailing in the local authority hierarchy. This was the basis of the offer made by the management side." Yet since this award they have increased assistant dental officers' salaries to above that of assistant medical officers. This, in my view, completely destroys the grounds upon which the management side refused to grant the salaries asked for, as the dental officers concerned were previously on a lower-salaried scale compared with medical officers. It is interesting to note that our colleagues the chest physicians have enhanced their salaries by a change of nomenclature from tuberculosis medical officers.

I am wondering if a fresh appeal is not only justified but should be regarded as a matter of urgency.—I am, etc.,

Brighton.

LEWIS B. PETERS.

Information from National Service Medical Boards

SIR,—The Ministry of Pensions recently wrote to me about a patient who had been examined by a medical board and found to have a non-pensionable condition; they were "therefore unable to provide any treatment for it, but the information is passed to you for any action you may wish to take."

How different is the attitude of the National Service medical boards to the passing on of information. When I wrote to the B.M.A. on this subject in September, 1952, I was advised that the matter had been previously taken up with the Ministry of Labour, who had made the following points: (1) General practitioners could "readily" obtain the requisite information about a patient from the chairman of the medical board. (2) "It would be impractic-

able" to pass on any material information which might come to light at a medical board. (3) "The great majority" of recruits and/or their doctors know "the nature of the disability which causes rejection," but "in any case, however, where a man has been placed in Grade III or Grade IV and some serious condition has been found at the examination, of which the man has hitherto been ignorant, and for which, in the chairman's opinion, the man needs medical advice in his own interest, he is advised to consult his own doctor." I was told that the General Medical Services Committee "expressed itself satisfied with these arrangements."

But are these arrangements satisfactory? Indeed, are they implemented?

It is time-consuming for the general practitioner to have to communicate with boards, the addresses of which patients are frequently unable to supply (only three out of eleven sample patients who were graded III or IV by medical boards were able to supply me with the necessary addresses). Why should the onus be on the general practitioner? Why should it be "impracticable" for Ministry of Labour Boards to pass on information when the Ministry of Pensions can clearly (and courteously) do so? Is it not a waste of medical manpower when the general practitioner is not informed of the various special investigations carried out by hospitals at the request of medical boards? Why cannot the general practitioner receive copies of these investigation findings? Indeed, why should he not be allowed to refer these patients himself in the first instance, instead of having everything done for him above his head by medical boards?

Out of the eleven sample patients referred to above, the following cases stand out: One man was graded IV because he stated "part of his left lower lung was not functioning." He was x-rayed at the medical board, but not referred either to hospital or to me. Two men were graded III and another two graded IV, but were not told why. To this day neither they nor I know why—again they were not referred either to hospital or to me. According to his statement a patient was graded IV because of his eyes, and sent to my local hospital, where he was seen four times by the ophthalmologist, who could find nothing abnormal, but I have never received any official report from board or consultant. Another was graded III solely because he had six toes on his right foot, as far I can gather. Yet another was graded IV because of "stomach trouble" and was sent to hospital for a barium meal, but he was certainly not told to get in touch with me. It is nine years since the war ended, and six since July, 1948. Surely by now there should be more co-operation between National Service and the National Health Service.—I am, etc.,

London, E.9

D. G. BERRY.

Radiology on Points

SIR.—Within twenty-four hours of reading in your columns my letter (*Supplement*, May 29, p. 291) I heard of the supreme ludicrous (to date) of the "unit system." Finance officers have been, since January, 1953, relating their costing returns to the "unit" figures for pathological and radiological departments. H.M. (54) 37, section 16, reads as follows:

"In order to secure that the out-patient figures for these two departments for the 1953-4 costing returns are reasonably comparable with those for previous years it has been decided that where the actual numbers of specimens or examinations are not known the numbers of 'units' of work for each department will be converted on a notional basis, for the purpose of the costing return, into numbers of specimens or examinations. The factors to be used for this purpose will be determined by the department when forms SH3 for 1953 have been collated, and hospital authorities will be notified as soon as possible."

There are simple little arithmetical games which start off. "Think of a number, multiply by so and so, and take away the number you first thought of." It seems that we now pay Government departments to play these games.—I am, etc.,

Worcester.

ANTHONY A. VICKERS.

Peripatetic Practitioners

SIR.—May I strongly endorse Dr. Robert Forbes's advice (*Supplement*, June 5, p. 299) about the importance of doctors keeping their defence societies and the General Medical Council informed of a change of permanent address? There is another disadvantage in failing to do so which he does not mention. The Medical Protection Society sometimes hears of impending litigation which may involve a member whose present whereabouts are unknown to us, and delay in establishing contact with him at an early stage may later seriously prejudice his legal position or that of his colleagues as the action matures. The difficulty in tracing a woman practitioner may be further increased when she does not inform her defence society or the Registrar of the G.M.C. that she has changed her surname as well as her permanent address.—I am, etc.,

London, W.C.2.

ALISTAIR FRENCH,
Secretary, Medical Protection Society.

Christian Medical Fellowship

SIR.—As already announced in the Annual Meeting Programme (*Supplement*, June 19, p. 323), the annual breakfast of the Christian Medical Fellowship will be held during the B.M.A. Annual Meeting at Glasgow. This year's speaker will be Mr. T. Howard Somervell, until recently Professor of Surgery in the Vellore Christian Medical College, Madras. The address of the Christian Medical Fellowship is 39, Bedford Square, London, W.C.1, and not at Liverpool, as inadvertently given by Dr. J. H. Thompson in a letter to the *Journal* (June 5, p. 1323).—I am, etc.,

DOUGLAS JOHNSON,
Secretary, Christian Medical Fellowship.

Branch and Division Meetings to be Held

CAMBRIDGE AND HUNTINGDON BRANCH.—At Pembroke College, Cambridge, Wednesday, June 30, 12.30 p.m., annual general meeting, election of officers, etc. Address by president: "Surgery 40 Years On."

CITY DIVISION.—At Hackney Hospital, Homerton High Street, E., Wednesday, June 30, 2 p.m., films: "Functions of the Carotid Sinus and Aortic Nerve" (Part I and Part II).

WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, June 29, 8.30 p.m., clinical meeting.

Meetings of Branches and Divisions

MIDLANDS BRANCH, SOUTHERN RHODESIA

The annual general meeting was held at Que Que on April 2, 1954, at which 15 members were present. Dr. R. B. Saunders gave an address on the treatment of bilharzia. The following officials were elected:

President.—Mr. J. C. Comline.
Immediate Past-president.—Dr. R. B. Saunders.
Honorary Secretary.—Dr. G. A. Rail.
