With dockers striking, going slow and generally becoming more expensive all around the world, one cannot help brooding over the sort of work they do. To the outsider, it seems to be not unpleasant and, whatever it was in years past, it is

no longer arduous. It involves exposure to all kinds of weather, but so do farming and a dozen other pursuits. I suppose one's attitude to other men's work (and hence one's sympathy or lack of it when they go on strike) is based on adolescent prejudice. Having spent many hours of happy idleness as a boy hanging around the waterfront, and having nearly died of fright on the one occasion I went down a coalmine, I have retained a solid sympathy for miners whatever their demands—and also some puzzlement at the continued restiveness of "wharfies". Uncertainty about whether or not there will be work on any one day must of course be nerve-racking, but casualisation schemes, attendance pay and union-managed employment bureaux have mitigated this in various parts of the world without any visible improvement in the temper of the dockers. It is hard to resist the conclusion that the wharfies are exploiting the peculiarly sensitive position they hold in any economy that depends on sea trade, as almost all do. That sensitive position appears to be due to the simple fact that goods have to be lifted up from the level of a wharf, over the side of a ship and then lowered down into the hold; or vice versa. Nothing else. The notion that therefore ships should have doors in their sides, which could be lowered like a drawbridge to the wharf so that mechanical handling trucks could run into the hold, might be perfectly idiotic from a marine engineering point of view—but it occurs with some force to the layman. Admittedly, the relation between the level of the hold and the wharf varies, so there might always be some lowering and raising to do, but probably no more than in any factory or warehouse. If any class of people tries so hard to exploit its crucial situation in the economy, others are entitled to think of ways of dispensing with them as far as possible.

The credulity of the Indian Press can be quite extraordinary on occasion. I remember circumstantial reports of young men being hypnotised in Calcutta streets by passing magicians and having parts of their body charmed away (the missing parts were restored on police intervention); of a mermaid who was seen flitting about the paddy fields of East Bengal (a report that was "corroborated" by a well-known zamindari family); of a woman who never, never, never ate anything at all (until a tin trunk full of parathas was found under her bed); and of a dead seer whose corpse was defying natural law by declining to decompose (the sixth instalment of this serial was an account of a hasty funeral). And now the newspaper's excel themselves by uniformly reporting the attempt of a tourist to perform the Indian rope trick, an attempt that did not really succeed because he only managed to make four feet of rope stand on end. Only four feet! What do you want for your money, as the huckster says at the fair. If he had made forty feet of rope stand erect without visible means of support, our newspapermen would have been impressed. But a mere four feet—nothing very clever about that, our hard-boiled journalists say. This sort of selective credulity reminds me of the rookie at the searchlight battery who was invited to climb up the beam of light, but refused knowingly because he guessed that when he was half way up his mates would switch the light off. The poor tourist who can only do four feet of the Indian rope trick will have to go somewhere else where people are more easily impressed, or alternatively hire himself a haughty manager of the sort Beachcomber described as standing outside a tent, at a fair within which was supposed to be exhibited an astonishing dwarf: when patrons emerged complaining that they had paid sixpence to see a man of perfectly normal height, he would reply: "Sir, you have been privileged to see the tallest dwarf in Europe".

P. & O. STEAM NAVIGATION COMPANY

SIR WILLIAM CURRIE COMPLAINS OF INDIAN PORT DELAYS

The One Hundred and Fifteenth Annual General Meeting of the P. & O. Steam Navigation Company was held in London on the 25th May, 1955.

The Chairman, Sir William Currie, G.B.E., began by thanking the staffs ashore, afloat and at the Agencies for loyal and efficient service.

On the Accounts, the Group surplus after Taxation at £5,226,000 did not differ materially from the 1953 surplus of £4,953,000.

India and Pakistan

Referring to the Indian Trade, the Chairman said that the P. & O. and B. I. Companies had maintained joint freight services to India and Pakistan. Outward traffic had been well maintained but homewards the movement of cargo was irregular, and they had had at times to sail short of cargo, particularly from the West Coast. On occasions it had been possible to secure filling up cargo from Red Sea ports.

Their ships had suffered grievous delays, particularly at Calcutta and Bombay, and conditions at these ports had become progressively worse since the close of the year.

Port delays were one of the shipowner's unsolved problems today. It was wrong, that, despite all the expensive mechanical devices of the present age, ships were taking much longer to turn round in most ports than they did before the war. The effect of these delays was that the trade to India now required about 25 per cent more tonnage to maintain a given frequency of sailing than before the war. The greatly increased cost that this involved must necessarily be reflected in the rates of freight which were charged.

The Far East

The rapid expansion of Japanese shipping continued to be a source of concern. It was apparent that the policy of the Japanese Government had been to use its shipping as an instrument of commercial policy. Japanese lines had entered specific trades, and by their competition and conduct had brought down the rates of freight in those trades to uneconomic levels. The Chairman was aware that this was a matter of concern to certain established Japanese shipping companies, with whom they had had friendly relations dating back for many years. He appreciated that Japan, like this country, needed—and had the right to expect—to operate a mercantile marine. He did not feel, however, that the extensive aid being given by the Japanese Government to their shipping without regard to the need for shipping to pay its way, was in the best commercial interests of Japan. He sincerely trusted that those in authority in Japan would come to appreciate that a commercial and shipping policy based on orderly progress and friendship would prove of more lasting benefit than a policy of hasty and aggressive expansion.

Australia

In the Australian trade, with which the P. & O., B. I., Orient and Federal Companies were concerned,

the volume of freight traffic to and from Europe had been well maintained, but results were adversely affected by increased costs and a deterioration in turn round. Stoppages on the Australian waterfront were still painfully frequent, and the rate of work deplorably slow.

Survey of Group Structure

There had been three main reasons for conserving the Group reserves during the ten post-war years. First because of the large replacement programme ahead with so many unknown factors such as type, number and cost of ships; secondly, the impossibility of estimating the scale and requirements of the trade opportunities open as a result of the war; and lastly the steady increase in price levels, particularly in shipbuilding.

A postwar pattern had emerged last year which enabled them to take stock. This seemed an appropriate moment to look at their capital structure and have a survey made by Lazard, the well-known bankers, and Deloitte, the accountants. The form of the Annual Accounts of future years would be altered. For instance, the fleet would be depreciated on the basis of a 20-year life. On the new basis, the 1954 reserves and unappropriated profits would have been increased from £86 millions to £100 millions, and the Group profits for 1954 by about £28,000.

The financial structure of each of the important subsidiaries and of the P. & O. Company itself had been examined. Some of the subsidiaries were taking steps to increase their capital and permission had been received from the C.I.C. to capitalise further P. & O. reserves and to make a new scrip issue of one for one. It should not be assumed that any larger total distribution on the Deferred Stock would necessarily follow from that issue. It was, however, the intention to reduce to some extent the disparity between the interim and final distributions.

The non-shipowning subsidiaries were not a separate interest but were all linked in different degrees with the shipowning companies of the Group. It would thus be misleading to isolate them in the accounts.

As for the organisation of the Group, the P. & O. was both a trading and a holding company, but it represented historical growth and not deliberate creation. Subsidiaries were left enough freedom to keep them vital. P. & O. could only shed its trading interests and become a purely holding company at the cost of heavy additional tax burdens, so they had decided to follow a line of administrative devolution. Accordingly, the Chairmen of five of the subsidiaries had been appointed to the P. & O. Board.

The Chairman believed that the practice of financing capital expenditure programmes as far as possible from the business was well justified. They must take a long term view of their policy on capital investment, but this must eventually pay for itself and earn a fair return having regard to the risks run, and they must always keep that object in view.

The net dividends paid for 1954 represented 1.1 per cent of the net assets of the Group. This was low but it represented nearly 30 per cent of the available profit which was comparable to other leading industries.

Finance in India and Abroad

CONTINENTAL CURRENCIES MAY BE FREED

EARLY ANNOUNCEMENT EXPECTED

Wednesday, 1st June.

IT is believed in Calcutta that the Government of India will shortly announce that the exchange rates between the rupee and Continental currencies will be freed, perhaps as from 15th June. These rates are now fixed uniformly by the banks in agreement with the Reserve Bank. Under the arrangement which is expected to be introduced soon, the rates will be freed from the control of the Reserve Bank and each bank will be able to quote its own rate for each of the European currencies.

Obviously this change will have nothing to do with the convertibility of the rupee into these currencies. The change will simply affect the way in which the exchange rate is determined.

Thus, the significance of this development is relatively limited, but it will enable Indian banks to acquire experience in arbitrage which will stand them in good stead when all exchange rates are eventually freed.

The volume of transactions in Continental currencies effected in Calcutta is not large. Much more is done in Bombay, especially in Swiss francs which, from India's point of view, are perhaps the most important of the Continental currencies. Less business is done in French francs and some in German marks. It is expected that the banks concerned will be able to make their own quotation for these and all other European currencies.

Money is still tight although there is a slightly easier tendency in the Calcutta interbank market. The call rate quotes 3 percent with lenders over.

More export bills have been seen in the past week. They were mainly gunny bills; one or two tea bills have already been reported. There has been a fair demand for remittance. Sterling was stronger after the Conservative victory in the British elections but has weakened since because of the railway and dock strikes. The rupee-dollar rate has not changed and stands at Rs. 479-8 T.T. selling.

Bullion was quiet last week. The price of silver declined from the previous week's level of Rs. 162-14 to Rs. 162-10 quoted to-day. The rate for forward delivery was quoted at Rs. 161-14. The price was unchanged at 78-1d. in London and at 90-1 cents in New York.

Gold fell from Rs. 94-12 to Rs. 94-10. The sovereign at Rs. 60-12 showed a loss of 5 annas.

Tenders for Rs. 1 crore of three month Government of India Treasury Bills, which were opened on Tuesday, 31st May, 1955, totalled Rs. 2,29,50,000. The average rate of acceptance decreased from Rs. 2-9-1 to Rs. 2-9-0 percent per annum. Tenders at Rs. 99-5-0 percent were accepted in full and those at Rs. 99-5-9 percent were allotted approximately 92 percent. Tenders for a further Rs. 1 crore of three month Government of India Treasury Bills will be received at all centres up to the close of business on Monday, 6th June, 1955. During the week ended 27th May, 1955, Government of India Treasury Bills for Rs. 6,60,00,000 were sold in favour of the Reserve Bank of India.

A further decline of Rs. 6.32 crores in notes in circulation to Rs. 1,316.09 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 27th May, 1955. The total note issue was fractionally higher by Rs. 25 lakhs to Rs. 1,340.12 crores. Notes held in the Banking Department consequently rose by Rs. 6.57 crores to Rs. 24.03 crores. Deposits showed an all round decrease. Deposits of the Government of India and other Government accounts fell by Rs. 60 lakhs and Rs. 82 lakhs to total Rs. 54.63 crores and Rs. 14.17 crores, respectively. Balances of commercial banks at Rs. 49.46 crores were Rs. 1.41 crores lower. Balances held abroad dropped by Rs. 5.12 crores to Rs. 48.46 crores. Investments at Rs. 41.79 crores showed a rise of Rs. 51 lakhs. Other loans and advances fell from Rs. 40.47 crores to Rs. 35.78 crores, of which advances to scheduled banks declined from Rs. 30.05 crores to Rs. 25.57 crores. These advances amounted to Rs. 108.96 crores since 1st January, 1955. Ways and means advances stood at Rs. 80 lakhs (same).

The return of the Imperial Bank of India for the week ended 20th May, 1955, shows a fall of Rs. 65 lakhs in total deposits to Rs. 211.61 crores. Investments in Government Securities are up by Rs. 9 lakhs to Rs. 90.85 crores, while other authorised investments are down by Rs. 18 lakhs to Rs. 11.38 crores. Advances, including loans, cash credits and overdrafts, and bills discounted and purchased have decreased by Rs. 3.94 crores to Rs. 122.31 crores. Cash and balances are, in consequence, shown at Rs. 18.61 crores or Rs. 93 lakhs higher.

The statement of the position of scheduled banks for the week ended 20th May, 1955, discloses Demand and Time liabilities at Rs. 587.78 crores (Rs. 9.22 crores on account of borrowings from banks) and Rs. 387.63 crores (Rs. 2.20 crores) compared with Rs. 581.37 crores (Rs. 7.55 crores) and Rs. 385.89 crores (Rs. 1.90 crores), respectively in the previous week. Cash has declined by Rs. 51 lakhs to Rs. 34.32 crores, while balances with the

Reserve Bank have advanced by Rs. 2.62 crores to Rs. 48.59 crores. There is a rise of Rs. 1 lakh in investments to Rs. 344.29 crores. Advances and bills discounted at Rs. 622.60 crores reveal a drop of Rs. 3.64 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.5 percent and 63.5 percent against 8.4 percent and 64.7 percent.

According to the land-borne trade returns received in the Department of Commercial Intelligence Statistics, the provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during April 1955 are as follows (in lakhs of rupees):

	Exports	Imports
to		from
Eastern Pakistan	26	136
Western Pakistan	19	1
Other countries	5	16
	50	153

Re-exports were nil and trade in treasure negligible. There was thus an adverse balance of trade amounting to Rs. 103 lakhs.

TREASURY BILL MATURITIES

Company Meeting

THE BURMAH OIL COMPANY LIMITED

SIR KENNETH B. HARPER REPORTS IMPROVED SALES
BUT LOWER PROFIT MARGINS

The Fifty-third Annual General Meeting of The Burma Oil Company Limited will be held on Friday 24th June, 1955, in the Merchants Hall, 30, George Square, Glasgow.

The following statement by the Chairman, Sir Kenneth B. Harper, has been circulated with the Directors' Report and Accounts for the year ended 31st December, 1954:—

Since our last Annual General Meeting two of your Directors have been signally honoured by Her Majesty. At the New Year a Barony was conferred on Sir William Fraser and Lord Blisland has recently been appointed a Knight of the Thistle. In the last New Year's Honours List also Mr. M. J. Condon, who manages your interests in West Pakistan, was made a Commander of the Order of the British Empire. To all three we offer our warmest congratulations.

As was recently announced in the press, Mr. W. E. V. Abraham has asked to be relieved of the duties of Managing Director and retired from the Company's service on 30th April, 1955. He will remain on the Board so that his advice and the experience of 35 years of notable service with the Company may continue to be available to us.

We are fortunate in having as his successor Mr. W. E. Eadie, who by experience and ability is particularly well fitted to assume the responsibilities of Managing Director.

Mr. R. P. Smith has been appointed a Director. Mr. Smith served Burmah-Shell in India for 24 years before joining your Company's London staff and the Board expects to receive valuable assistance from his knowledge and judgment.

Mr. E. Colman, after 21 years as Secretary to the Company, has decided to retire and will hand over his office to Mr. D. Andrew on 1st July. We wish Mr. Colman the long and happy retirement to which his loyal, valuable and efficient service so well entitles him.

Accounts

Last year, when comparing the 1953 results with those for 1952, I drew attention to a small increase in the volume of our Group sales and also to a slight reduction in profit margins. This year I am able to report a further increase in the volume of sales in each sphere of activity, although again this is accompanied by somewhat lower profit margins. After charging the cost of a comprehensive programme of exploration and including our interest in the trading of The Burma Oil Co. (1954) Ltd., the Group's trading profit for the year was £5,131,211, compared with £5,330,987 in 1953.

The deduction for depreciation amounts to £1,276,163, which corresponds closely to the charge in 1953.

Income from dividends and interest this year at £4,228,005 is £946,093 higher than last year, due mainly to increased dividends from The British Petroleum Co. Ltd. and other trade investments and to the receipt of dividends for the years 1952 and 1953 from The Tinsplate Company of India, Ltd.

Full provision has been made for U.K. and overseas taxation which absorbed £4,354,184 against £4,424,792 in 1953. Together with the balance of unappropriated profit of £596,411 brought forward from 1953 the total available for disposal becomes £4,325,280.

Your Board have allocated £1,100,000 of this amount to General Reserve and have set aside £1,599,445 for a final dividend of 13½ per cent. which they recommend should be paid on the Ordinary Stock. After providing for this final dividend and the interim dividend of 7½ per cent. paid on 19th November, 1954, together with the dividends on the Preference Stocks, the balance of unappropriated profit carried forward is £610,888.

I draw your attention to that part of the Directors' Report which sets out our proposals for revaluing our direct and indirect investment in The British Petroleum Co. Ltd. and, subject to the agreement of the Capital Issues Committee, for the *pro rata* distribution of shares to stockholders. There is nothing I need add here to what is contained in the Directors' Report.

The Burma Oil Co. (1954) Ltd. started to operate in Burma as from the 1st January, 1954, and this involves a change in the Parent Company's Balance Sheet. The cost of our investment in the new Company is now included in Shares in Subsidiary Companies with a consequent adjustment of Advances. The reduction of the finance tied up in them, is also reflected in the reduction of Advances by the Parent Company.

The ordinary share capital of The Burma Oil Co. (1954) Ltd. is the equivalent of £15,000,000. Your Company holds slightly over 55 per cent. of this equity and the Union Government 33½ per cent. The balance is held by Indo-Burma Petroleum Co. Ltd. and The British Burmah Petroleum Co. Ltd. A first payment of £2,500,000, of which your Company's share is £2,066,813, has been received from the Union Government in respect of the shares they have acquired. The balance is due to be paid by instalments or in one lump sum at the Government's option and your Company's share of this balance is shown in the Balance Sheet as a Loan to the Government of the Union of Burma. £51,670 of this loan has since been received.

The increase in Trade Investments results from your Company's share of the further capital required by Burmah-Shell Refineries Ltd. and from an investment of just over £1 million in the Sui Gas Transmission Co. Ltd.

During the year we received free issues of £21,371,940 British Petroleum Co. Ltd. Ordinary

Stock and £404,800 Shell Transport and Trading Co. Ltd. Ordinary Stock.

Trading

Our Group's share of the total trade in all petroleum products (excluding wax and candles) in Burma, India and Pakistan was 4.5 per cent., higher in volume than the corresponding figure for 1953 but there was, as I have already noted, a slight reduction in profit margins.

Assam Oil Company's production of wax during the year was the highest in its history and Burma started to produce wax again for the first time since 1942. Expanding demand in world markets enabled us to sell all our increased production and at somewhat better prices than in the previous year.

Burma. Indigenous and Imported Oil shared the trade in Burma about half and half. Total sales were some 11 per cent. higher than in 1953, a small part of this increase being attributable to an improvement in security conditions.

Pakistan. Pakistan is at present a small motor spirit market, an average kerosine market, by Eastern standards, and a substantial user of fuel oils. The Group's sales of kerosine showed a small increase over the previous year, which would have been larger but for restrictions on the importation of tinsplates involving foreign exchange. Some offtake of fuel oils was lost through the Eastern Bengal Railway converting a further number of their locomotives back to coal, but there are other developments in East Pakistan which should materially increase the demand for these oils.

India. There were substantial increases in the Group's trade in all products in the Assam Oil Company's sphere, while in the rest of India the increases were mainly in kerosine and fuel oils.

World trade of motor spirit increases steadily year by year and in the last three years, outside the Iron Curtain, the progressive increases have been 5 per cent., 6 per cent. and 4 per cent. One would normally expect that in an under-developed country like India, working to a deliberate programme of industrial expansion, consumption of motor spirit would increase by more than the world average, but that has not in fact been the case. Offtake has stood still during 1953 and 1954, and in both years has been slightly lower than in 1952. This is ascribed to a combination of factors—sales taxes on motor spirit by States (or Provinces as they used to be called) on top of substantial Central import duties, States' taxation of motor vehicles, vehicle licensing policies and the threat to nationalise motor transport. There has also been an increasing use of diesel vehicles, especially by state transport organisations, resulting in some transfer of motor spirit trade to automotive diesel fuel.

I have commented in previous statements on the damaging effect of high taxation on the development of motor transport. In India import duty on motor spirit has stayed at 15 annas 9 pies (or about 18.6d.) per gallon since 1951. That is a Central duty. States have the power to impose sales taxes on the same product and are using it to an extent varying in different States from 2 annas to 6 annas per gallon.

One can understand the attraction to Governments of taxation on motor spirit; it brings in substantial revenue and costs so little to collect. But whatever advantages Governments may get out of taxing motor spirit, there comes a time when they can be obtained only at the expense of the development of motor transport and of the important part it plays in the development of the country as a whole. That point seems to have been reached in India, and it is the sole of the increasing mileage of new roads and the improvement of road surfaces, as evidenced by sales of vehicles, which for the last three years have been 129,000, 125,000 and 168,700 tons. The figures suggest that the use of motor transport is not responding to the increase in motorable roads. It is to be hoped that the Central and States Governments will review their motor spirit and vehicle taxation policies in the light of the effect of these policies on their development plans.

Prospecting, Oilfield Development and Refining Operations

Burma. There appears to be some possibility that improvement in security conditions may permit resumption of a geophysical survey of the Irawaddy Delta area and this is now under investigation. Stockholders are aware that no exploration work has been feasible in Burma since the war.

The Burma Oil Co. (1954) Ltd. is now producing and refining crude oil from the concessions formerly held by the three participating Oil Companies and the products are sold through the agencies of our Burma Trading Company and Indo-Burma Petroleum Co. Ltd.

The "1954" Company has begun to rebuild at Sviriam, near Rangon, refining facilities which, combined with the existing facilities at Chauk, will make Burma self-sufficient in main petroleum products. The Union Government have undertaken that their nationalised Inland Water Transport organisation will provide sufficient tug and barge capacity to transport crude oil from Chauk to Sviriam.

I can still report no more progress in the matter of our "denial" claims against the Union Government than a slight advance in the preparatory steps to that Government's liability under the Defence of Burma Act, 1940.

India. As is a not uncommon experience, drilling results at Nahorkata have shown that the structure is geologically very complicated and further drilling will have to be done before the extent of the oil pools and the probable oil reserves can be reliably estimated, but I can say that results to date continue to be encouraging. In the meantime some crude oil

is being piped to Digboi, where the refinery throughput has been increased by 50 per cent.

As a result of evidence obtained from geophysical surveys in the Upper Assam Valley, Assom Oil Company, Ltd. has applied for prospecting rights over a number of further areas.

The new two million ton refinery built at Trombay Island at Bombay by Burmah-Shell Refineries Ltd. came on stream in January 1955 and is expected to be in full operation by about the middle of the current year.

Pakistan. Pakistan Petroleum Ltd., in which your Company has a 70 per cent. interest, is continuing to explore vigorously in both West and East Pakistan. Following a seismic survey of the Uch area in West Pakistan, about 35 miles from the Sui Gas field, a test well has been encountered. The first high pressure gas has been produced. The first indications are that Uch will produce a substantial supplement to the supplies of gas from Sui. Drilling is being continued in the hope of striking oil at a deeper level.

Further drilling by Pakistan Petroleum Ltd. on the Sui Field has shown the gas reserves to be even larger than originally estimated and a fresh appraisal is being made. The laying of the Sui Gas Transmission Company's main pipe line was completed in April 1955. The line is now being tested and deliveries to consumers are expected to begin in August.

Three related structures in this part of Baluchistan have now been drilled, namely at Sui, Zin and Uch. Gas has been found in all three, though at too low a pressure in Zin to be a commercial proposition. Other structures in this region remain to be tested. The Pakistan Government are as anxious as we are to find oil in one or more of them, as imports of oil are a heavy burden on their foreign exchange.

After a seismic survey of the structure near the town of Sylhet in East Pakistan, a test well was started in January this year.

In East Pakistan good progress was made at Chittagong with the new Ocean installation which should be in full operation in a few months time.

Private Enterprise in India

It is becoming increasingly difficult to be sure just how welcome private enterprise is in the India of to-day. The Prime Minister, Mr. Nehru, has proclaimed that India's aim is a socialist economy in which there is to be a planned expansion of industry; that in this socialist plan there is to be a public sector and a private sector; that the former will predominate but there will still be room for private enterprise because the policy will be to promote new state industries and, except in special circumstances, not to "nibble into the private sector"; to do the latter would be wasting the available resources because it would not add to the total development. Other responsible Ministers have declared that foreign capital will not only be admissible but will be necessary to the progress of industrial development.

All that being so, one would expect that foreign capital would be positively encouraged to continue to enter India but, instead, recent legislation gives a contrary impression. An amendment to Indian Company Law, at present on its way through Parliament, which not directly affecting our interests, indicates a disturbing trend in economic thought. An Act amending the Constitution does give a direct and adverse bearing on us, at least potentially, because it removes the right which the Constitution formerly gave to anyone whose property was acquired by the State to challenge the adequacy of the compensation in the Courts. The amount of compensation is now to be decided by the Legislature.

In the latter Amendment "searching for or winning Mineral Oils" is specified as one of the matters over which the State should be able to take full "control" by means of "the extinguishment or modification of any rights accruing by virtue of any agreement, lease or licence" which Government may have granted for that purpose.

The powers taken are permissive, and we are assured that the present Government of India have no intention of using them to expropriate foreign capital and so damage their international relations and credit in the world. I must state in all fairness that in our past experience they have always been as good as their word but Governments change, and this wide power and the removal of the protection of the Courts are now written into the Constitution. For those like ourselves, who are already established in India, the proof of the pudding must be in the eating.

Tankers

The Fleet has operated satisfactorily and without accident during the year. Our three new vessels have fully revised expectations and have been able to meet all demands made upon them. On two voyages no less than seven different grades of bulk oil as well as packed cargo were carried.

For the first time since they were built, the Special Surveys of s.s. "Badarun" and m.v. "Yenayauw" were carried out in U.K. instead of in India, when the opportunity was taken to increase the capacity of the latter to the size of our new ships. Both vessels returned to the East in March, 1954 and continue to give excellent service.

Labour

In the field of industrial relations I am glad to say that there was no serious interruption of the Group's operations in any area.

Our relations with Trades Unions have been satisfactory. Too often however, the opinion is expressed in Trade Union and other quarters that an Oil Company has an unlimited "capacity to pay." This is far from true and our mounting costs in clerical and labour salaries and wages are a source of some anxiety. Coupled with this is the desire of Governments, understandably in the light of national under-employment, to press for employment of the greatest possible numbers, a policy which can only militate against the ability to pay more in return for a higher over-all output per man.

Personnel

It is once more a pleasure to record the Board's appreciation of the loyal and efficient services throughout the past year of the Group's personnel, both at home and overseas.

Stocks and Shares

SHARES DULL BUT UNDERTONE GENERALLY STEADY

Wednesday Evening.

THE stock exchange is dull, with an easier tendency in speculative counters. The amount of business passing is small, but the undertone is steady. The behaviour of the market suggests that operators are waiting for more favourable news; certainly the tea section is waiting for the re-opening of the Calcutta tea auctions next Monday. Apart from the fall in Indian Irons following on Press discussion of the danger of nationalisation and of the uninspiring dividend outlook, there have been no features.

Details of the week's trading follow.

* * * * *

The gilt-edged market continued firm and prices were marked up further. The volume of business, however, was on a smaller scale than the previous week and although the enquiry for short and medium-dated loans was maintained, there was a noticeable reluctance on the part of buyers to bid higher prices. During the week the Reserve Bank raised their selling prices of 3% 1966-68 and 3% 1970-75. Three percent Conversion Loan 1946-86 eased further to Rs. 80-8 with sellers over and 3% Non-terminable Paper was offered at Rs. 80-3. In short-dated loans 3% 1957 hardened to Rs. 89-9 but 3% 1958 was unchanged at Rs. 99-7. Amongst medium-dated issues, 3% 1959-61 was shaded at Rs. 97-13 and 3% National Plan Bonds 1961 were quoted at Rs. 100 cv. and later at Rs. 99-14 x.v.; 3% National Plan Loan 1964 was on offer at Rs. 98-12 and 3% 1963-65 was marked up to Rs. 94 cv. to be quoted later at Rs. 94-2 x.v.; 2½% 1961 was fairly steady at Rs. 92-2 while 2½% 1962 firmed up to Rs. 91-11. Amongst long-dated loans 3% 1966-68 was marked up 2 annas to Rs. 91 while 3% 1970-75 was taken 1 anna higher to Rs. 87-2. Provincial loans were a strong market but very little business was reported owing to the continued absence of sellers. Prices, however, were more or less unchanged.

Sellers of both jute and miscellaneous preference shares continued to be scarce and prices were again marked up by Rs. 1 to Rs. 2. A small lot of Auckland was quoted at Rs. 75. Budget-Budge were done at Rs. 118. Delta at Rs. 94 and Gourepore at Rs. 105. National came to hand at Rs. 126. Amongst miscellaneous industrials, Bharat Collieries changed hands at Rs. 57, a small lot of British India Corporation was marked at Rs. 137 and business was reported in Dalmia Cement Partly-Paid at Rs. 35. Birds Investments were crossed at Rs. 80-8 and Bengal Chemical 7½% were done at Rs. 13-6. Indian Iron and Steel changed hands at Rs. 109. Martin Burn were transacted at Rs. 104-8 and Richardson & Cruddas at Rs. 84-8. Rohtas Industries 7½% were marked at Rs. 124-8 and the "B" Preference at Rs. 64-8. Titagur Paper 8½% were taken at Rs. 153-8.

In the banking section business was reported in Imperial Bank Fully Paid and Contributory at Rs. 1,702-8 and Rs. 417-8. Hind Bank were done between Rs. 21-8 and Rs. 22-8 and Punjab National at Rs. 42-4. United Bank of India "D" shares were easier at Rs. 4-5 as were United Commercial at Rs. 43-12.

A solitary transaction was reported in the railway section namely in Dehri-Rohtas at Rs. 10-10.

* * * * *

Cotton shares were featureless. Cawnpore Textiles were unchanged at Rs. 8-8. Dunbar were done at Rs. 204. Elgins were easier at Rs. 18-11 and New Victoria were neglected at Rs. 1-7. Kesoram changed hands freely at around Rs. 13-3.

With the exception of Bokaro and Ramgur and Katras Jheriah which were very steady at Rs. 15-12 and Rs. 53-8 other coal shares were neglected. Bengal were easier at Rs. 493 and Burrakur were subdued at Rs. 12-7. Central India changed hands at Rs. 7-8 while East Indian and Equitable eased to Rs. 28-12 and Rs. 29-12 respectively. New Beerboom were marked at Rs. 19-4 and Western Bengal at Rs. 7-1.

With the exception of Howrah and Bally which improved slightly from Rs. 29-10 to Rs. 30-6 and from Rs. 178 to Rs. 180 the rest of the jute section was lifeless. Agarpara were easier at Rs. 13-4, Barnagore were done at Rs. 170 and Belvedere at Rs. 207. Biria were quoted at Rs. 19 and Chitavalah changed hands at Rs. 13-14. Ganges were easier at Rs. 102. Gourepore were marked at Rs. 336, India at Rs. 189 and Lansdowne at Rs. 136-8. National fluctuated between Rs. 32-9 and Rs. 32-12 to close at Rs. 32-11. Nuddea were done at Rs. 55 and Reliance at Rs. 14-6.

Electric supply shares were fairly steady. Agra were quoted at Rs. 165. Benares were done at Rs. 19-7 and U.P. at Rs. 157-8. Calcutta changed hands freely at around Rs. 15-7 x.d.

Little interest was displayed in sugar shares. Beland were quoted at Rs. 10, Carew were easier at Rs. 10-12 as were Cawnpore at Rs. 19-14. Darbhanga were marked at Rs. 15-2, Ramnugger Cane at Rs. 23-8 and U.P. at Rs. 24.

Indian Iron & Steel shares on unfavourable newspaper comment needed from Rs. 33-3 to Rs. 32-4 to recover at the close to Rs. 32-10. Burn & Company were fairly steady at Rs. 271 while there were sellers of Indian Galvanizing at Rs. 23,

Telecommunication
Engineering Enterprise

One of the largest telecommunication engineering organisations in the British Commonwealth Standard Telephones and Cables Limited is engaged in the research, development, manufacture and installation of all types of communication and control systems.

Concerned with every aspect of telecommunication engineering, the Company is in an unrivalled position to undertake, within its own organisation, the co-ordinated systems-planning of complete communication projects involving interdependent systems of various types.

Standard Products Include:

Systems:—

Telecommunications Line Transmission
Radio Broadcasting, Communication and Navigation
Railway Communication and Control
Telephone and Telegraph
Supervisory and Remote Indication and Control
Sound Reproduction
Municipal and Industrial Fire Alarms
Street and Airfield Lighting Control
Signalling (Office and Factory)
Communication Cables

Equipment:—

SenarCet Selenium rectifier equipment
Power Factor Correction
Heat Treatment
Broadcast Studio equipment
Transmission Testing apparatus
Cable Testing equipment
Loading Coils

Components:—

Quartz Crystals
Transistors
Capacitors and Interference Suppressors
Germanium Rectifiers and Photoelectric Cells
Thermionic Valves

Magnetic Materials

Thermistors
Relays
SenarCet Selenium Rectifiers
Rubber, Plastic and Textile Insulated cables and wires

SOCIAL POPULARITY

Persons who become the centre of interest in social gatherings are not always the ones with the finest clothes or the best looks. Personal appearance is, of course, an important factor but unless it is reinforced by an interesting spoken expression, popularity is only momentary. It is good conversationalists that always win attention. They command respect! They quickly become not only popular, but often influential. That directly helps them to win the good things of life—friends, companions, happiness, status and success.

You too can become an entertaining conversationalist easily and quickly. Conversation has certain fundamental rules and principles just like any other art. Learn these rules in your spare moments at home through Miss Ethel Cotton's unique Mail Course in Conversation and you will make your talk bright and impressive. You will develop a new poise—a new power. Write for full particulars today enclosing two annas in stamps.

were Western Stockholders Investment Trust at Re. 1.

At the opening of the session, the tea section was dull but on Monday a good enquiry developed only to find more sellers yesterday and today so that prices closed below their best. Among Assam gardens, Baghmari were better at Rs. 27 as were Bormah Jan at Rs. 20.12, Dufflaghur at Rs. 49, East India at Rs. 27.12 and Telojian at Rs. 32.6. Bishnauth were at one time marked up to Rs. 46.8, but later turned sellers at Rs. 46 as did Grob 'A' from Rs. 39.8 to Rs. 35.8. Of the Doora's shares, Hasimara jumped to Rs. 35.8 but were later on offer at Rs. 45, whilst Nagasurree were slightly easier at Rs. 315 and Ranicherra were better at Rs. 26.6. Of the remaining shares, Hattikhira improved to Rs. 29.8 and Sonal River to Rs. 25. Hansqua were better at Rs. 26.8.

LARSEN & TOUBRO LTD. made a profit of Rs. 12.09 lakhs for the year ended last March, compared with Rs. 11.66 lakhs in the previous year. Adding Rs. 15.735 brought in and allowing Rs. 5 lakhs (same) for taxation there is Rs. 7.25,125. The ordinary distribution has been unchanged at 10 percent. General reserve gets Rs. 2.75 lakhs (Rs. 2.25 lakhs), leaving a carry-forward of Rs. 25.125. The directors view the future with confidence.

There is an increase of Rs. 2.72 lakhs to Rs. 4.32 lakhs in the profit of the EMPIRE JUTE COMPANY for the half-year ended last December. Allowing Rs. 1.63 lakhs (Rs. 67,000) for taxation, bringing in Rs. 56,215 and making other adjustments there is Rs. 3,30,480. General reserve gets Rs. 50,000 (nil). The ordinary dividend has been increased by 4 annas to 12 annas a share, leaving a carry-forward of Rs. 1,32,960.

The METTUR INDUSTRIES, LTD. made a profit of Rs. 37 lakhs for the year ended last March, compared with the previous year's profit of Rs. 29.24 lakhs. Providing Rs. 13½ lakhs (Rs. 9,20 lakhs) for taxation and bringing in Rs. 50,154, there is Rs. 22,43,408. The dividend has been increased from 22½ percent to 35 percent, leaving a carry-forward of Rs. 1,43,408.

Though the work completed by the BRIDGE AND ROOF COMPANY (INDIA), LTD. rose from Rs. 44.65 lakhs to Rs. 64.25 lakhs the profit was Rs. 1.52 lakhs lower at Rs. 3.10 lakhs for the half-year ended last December. This was due to increased expenses. The dividend is the same at 1½ percent. General reserve gets Rs. 1 lakh (Rs. 1 lakhs). Taxation absorbs Rs. 1.23 lakhs (Rs. 2.08 lakhs). The carry-forward is Rs. 1,07,072, against Rs. 1,09,624 brought in.

STOCK MARKETS RALLY ON TORY VICTORY

RAIL STRIKE DEPRESSES INDUSTRIALS

London, 31st May.

THE dominating influence on the stock markets over the past week has been the Conservative victory in the general election. Buyers were out in strength over most of the week and some substantial gains were recorded, especially in shares of those companies threatened by Labour's nationalisation policy. Steels were outstanding, while Imperial Chemical Industries attracted big buying both before and after the election. A certain amount of the buying came from the United States and certain other leading equities were supported from the same quarter. The rail strike had some depressing effect on sentiment on Tuesday and prices were marked down in many industrial issues, notably steels. Gilt-edged stocks were quiet and remained under the influence of money rate uncertainties with jobbers marking down prices after the week-end. The strength of German bonds was a feature of foreign bond markets, while in rails, Canadian Pacific advanced in sympathy with other dollar issues. Interest was lacking in the gold share market, although certain Free Staters attracted selective buying. Copper shares continued in favour with the high price of the metal maintained. Teas were better where changed as a result of some good company statements, while rubbers were quietly maintained.

The Money Market

Stringent conditions continued in the money market and firm rates of 3 and 3½ to 4 percent again ruled for overnight loans. The position was affected by an increased currency demand for the Whitsun holiday, with banks at the same time tending to keep a larger proportion of their cash in reserve because of the rail strike. Despite these difficulties, the market did not change its bid for treasury bills. Applications for treasury bills totalled £389,945,000 of which £250 million were allotted at an average rate of 78s 4.37d compared with 78s 4.64d in the previous week. This week £250 million are on offer. The Bank of England return for the week ended 25th Wednesday showed that notes in circulation were about £17 million higher at around £1,752 million, while bankers' de-

posits were about £17 million lower at around £240 million.

Dundee Jute Goods Improve

On the Dundee jute goods market, some improvement was in evidence and more enquiries were received for jute cloth and bags and there are indications that a good volume of business is waiting to be done once raw jute prices have been stabilised. According to trade quarters, it only requires the Pakistan Jute Board to issue new minimum prices or a statement regarding these to set both buyers' and sellers' minds at rest. Prices for jute yarns and cloth are fairly maintained.

Activity on Wall Street

Domestic corporate convertibles were mixed during the early part of the week, later tending to rally in active dealings in sympathy with the strength of the stock market. Individual gains of one to four points were scored by Colorado Fuel and Iron, Dow Chemical and Inland Steel. Rails also turned firmer under the leadership of the more speculative issues. Investment quality corporates were under light pressure, while there were few changes in Government securities. Germans returned to the limelight with some national issues rising by two points to new highs. Some inactive corporates and municipals had also good gains, with Heidelberg 7½ percents jumping by 15 points. Elsewhere, Japanese nationals and municipals were prominent moving 2 to 6 points higher, with Yokohama 6 percent nearly 12 points higher. Chileans held firm and some Brazilians were higher among South Americans.

U.S. Federal Reserve Return

The U.S. Federal Reserve return for the week ended 25th May shows gold stock \$1 million higher at \$21,674 million. Foreign deposits fell by \$1 million while foreign investments fell by \$1 million. The Federal Reserve sold \$99 million of bills. Total discounts and advances to member banks rose by \$219 million to \$543 million, while their excess reserves dropped by \$97 million to \$495 million. Their daily average of excess reserves fell by \$166 million to \$494 million, while daily average borrowings dropped by \$117 million to \$353 million. Business loans of the New York city banks fell by \$11 million to \$7,626 million compared with a fall of \$60 million to \$7,781 million a year ago.

U.K. Cotton Market

Uncertainty about the future price movements of Liverpool cotton continued to restrict demand for actual cotton but good shipment business passed in Nigeria, Uganda and Sudan, etc., while there was a fair trade in Tanganyikan and moderate sales of Brazilian. Small sales were noted in Nicaraguan and Guatemalan. Spot business comprised moderate sales in Russian with smaller off-take in U.S. Brazilian, Sao Paulo and Mexican. Futures lost 13 to 35 points on the week, mainly reflecting hedge selling against outside growths in new crops, while some American selling in these deliveries was attributed to favourable U.S. weekly weather reports. There was the end-of-month trade calling on the buying side but this was largely offset by American straddle reversals in nearer months. Dealers here expect further delay in the announcement of Washington export subsidy policy.

Vegetable Oils Firm

A strong upward boost occurred again in linseed oil encouraged by the prospects of reduced supplies for the remaining old crop period combined with heavy call from countries outside Europe for the restricted quantities available. The market closed very strong with the U.K. and Continental buyers well in evidence for positions ahead at premium prices. At the finish, up to £101 was paid for October through to December deliveries, with sellers indicating further advances. Castor oil background held firm in sympathy with the improved Bombay market. Fair trade was effected in B.S.S. for shipment at up to around £90. July-August, while Commercial was quoted at £81 a ton. Demand for groundnut oil was less active towards the close. There were sellers of Indian crude at £102 after £101½ was paid for July to Rotterdam. Some early business took place to the U.K. British West African was quoted at £96½, with sellers wanting £101 in bulk.

London Rubber Market Steadier

Further purchases of rubber on Russian account were held largely responsible for the continued improvement on the London market during the period. The extent of orders is not disclosed but the market opinion is that they are "reasonable." Home trade and Continental demand were somewhat patchy but there was enough business to maintain a gradual advance amounting to 2d a lb. on balance for forward landed positions. Slightly increased orders for sole ended and smallness of available offers gave a steadier tone and 1 in. smooth No. 1 on spot was marked up to 55d a lb.

Greater U.S. Steel Capacity Predicted

Mr. Arthur Homer, President of the Bethlehem Steel Company, predicts a 60,000,000-ton increase in U.S. steel-making capacity over the next 15 years. Addressing the American Iron and Steel Institute meeting, he said this would mean an annual ingot capacity of 185 million tons by 1970 or 50 percent over the present capacity. Mr. Homer based the need for greater capacity on several factors including the expected steady increase in population and the continuing rise in per capita steel consumption.

New Delhi

MR. T. T. KRISHNAMACHARI LEADS NEW MINISTRY OF IRON AND STEEL

COMMITTEES SET UP TO CO-ORDINATE HEAVY INDUSTRY IN THE PUBLIC SECTOR

(FROM OUR NEW DELHI CORRESPONDENT)

A DECISION has been reached to set up a Ministry of Iron and Steel to deal with the steel industry in both the public and the private sectors. The new Ministry is in charge of the Minister for Commerce and Industry, Mr. T. T. Krishnamachari. The steel industry in the private sector has been under the Ministry of Commerce and Industry from its inception. The two units in the public sector, one at Rourkela in Orissa and the other at Bhilai in Madhya Pradesh, have been under the Ministry of Production, which has negotiated the agreements with the Germans and Russians. The proposed third unit, for which the British Technical Mission visited India recently to prepare a project report, although it will also be in the public sector, has been entrusted to the Commerce and Industry Ministry. The Department of Cottage Industries and Handicraft, at present under the Ministry of Commerce and Industry is being transferred to the Ministry of Production, under Mr. K. C. Reddy.

Committees on Heavy Industry

To bring about close co-ordination at all levels in heavy industry in the public sector, it has now been decided to constitute a Cabinet Committee of Heavy Industry. A Committee of Secretaries to deal with this co-ordination is also being constituted to keep in close touch with all developments in the field of heavy industry and report progress to the Cabinet Committee of Heavy Industry. With the constitution of these two committees, it is no longer considered necessary to continue the Steel and the Production Committees of the Cabinet.

The Russian Plant

Soon after the Bhilai region of Madhya Pradesh was selected for the establishment of the Russian steel plant, a team of Russian experts visited the site. The team included experts on geology, hydrology, civil engineering, topography, transportation, plant and machinery, etc., and the task before it was to make preliminary studies so that a final selection of one of the four or five alternative sites in this locality could be made. As a result of these preliminary studies, the site which had been originally recommended by the State Government was found to be the most suitable. Thereafter, detailed investigations began. The Survey of India carried out a contour survey of approximately 25 square miles of land around the factory site. The State Government organised the boring and trenching operations to provide the necessary geological data. It also organised hydrological studies. Temporary laboratories had to be set up in order to determine the mechanical characteristics of the soils. The Engineering College at Jabalpur at the Central Laboratory at Poona carried out most of the tests. The data is now being correlated. The sampling and analyses of the essential raw materials are also nearing completion.

All this information will be necessary for drawing up the detailed report which is due next December. As soon as that report is submitted and accepted, large-scale building operations can begin early in 1956. In order that the work may not be hampered, brisk preparations will have to be made as from now. For example, hundreds of technicians should appear on the scene early next year. Accommodation for their offices and residences must be made available within the next six months or so. Lines of communication, sources of supply, mechanical equipment, etc.—all must become available in time if the work is to proceed according to plan. For these purposes the nucleus of a Project Division has been set up and its headquarters have been moved to the site. The administrative and technical machine to plan and handle all this work has to be built up. The Russian Chief Engineer, Mr. Kratenko has already arrived in this country to take up his duties. His team of six consists of Messrs. Gusev, Hohlov, Lobazkii, Boiarov, Dolnikova and Mithalevich. An Indian team, headed by the Project Officer, Mr. S. N. Mehta, I.C.S., is expected to visit Russia in a couple of months, soon after the various Indian technicians to the Project Division are appointed.

Foreign Shipping

The six-monthly meetings of the Export and Import Advisory Councils held here last week, enabled the Commerce Minister, Mr. T. T. Krishnamachari to outline the Government's views on foreign trade in general and on shipping trade in particular; especially on the question of the proposed levy of a surcharge of 35 percent on cargo booked to and from India. Mr. Krishnamachari said:—

"Foreign trade has developed in a particular way and export trade has been largely handled by big foreign firms, and a few Indians coming in between. If you take the quota lists, say, for oilseeds, you would find that, excepting one Indian firm, all the tall quotas went to foreign companies.

I do not say that there is anything wrong about it, but what has happened is that export trade in the past has been more or less the monopoly of foreign companies. All these foreign companies have had some relationship with the shipping companies, their travel agents or some other people. They were agents for foreign insurance companies, marine insurance companies, etc. It is the question of vertical organisation that existed. And when we started reviewing our own trade position, we never looked into the fact that all these impediments were there and the bottleneck still remains. The foreign shipping agent is at liberty to shut out anybody's goods. About hides and skins, there is a large demand, but I am sorry to say that the Transport Ministry is completely unable to realise the enormity of the influence that the foreign steamer agents have, the stronghold they have, on its export. Well, I am trying to educate them, but it is rather difficult to do it. They can threaten and say 'Well, we will raise the freights, we will do this or that.' My friend who is doing some engineering work says 'We cannot get shipping space.' But there might be a barrel company or a bucket company in which they might be interested, and therefore, his goods has got to be shut out. So a national shipping policy is a condition precedent for our export trade development. I know the difficulty that exists at the moment. In fact, I had proposed to urge on my colleagues to licence these steamer agents in future and ask for some kind of performance. I also told them that any steamer agent who has not any interest in any import or export business will not be permitted to be a steamer agent.

"What is the use of saving that we are being discriminated against? So far as our shipping is concerned, it is very poor. Prestige is the main thing which we want. So there should be some national policy, which is lacking, so far as shipping is concerned, and without which the development of export trade is not possible.

Freight Increases

"Appropos the question of increase in freights, the country which wants to export to this country must look to its interests. If freights rise, to that extent the value of import licences will go down because it is covered by the total amount of foreign exchange we have to give. We are not responsible for what the steamer agents do. It seems to me that there is some kind of calculated attempt on the part of some of the steamship companies to threaten the Indian Government. The matter is something which has really got out of control. Sooner or later, either we must abandon the ports altogether or we must see that the goods landed there are cleared quicker. My colleague the Minister for Transport is looking into this matter. But India happens to be a country with some importance in the scheme of world affairs and we are not going to be cowed down by the steamship companies threatening us that they would raise the surcharge freight by 35 percent and 25 percent. If it happens, we can go without these imports till the position comes to normal and we will arrange that those imports which are absolutely necessary are carried by those ships in other countries which do not want to raise the surcharge. I am quite prepared to react and say that any steamer that raises the surcharge will not be allowed to touch at the Indian ports. There is no point in their threatening us. We are not going to beg of them if they do not want business from India. Sooner or later Government will probably act and it may be that we will have to put up with some inconveniences and our imports might be restricted but we are not going to be threatened into taking any action which would comply with their demand. I do not suppose that the steamship companies say that they are going to levy a surcharge for shipment to United Kingdom, because of dock strike in the United Kingdom. I really sympathise with their troubles that the ships had to stand midstream for 15 days and 20 days without the goods being cleared. It is a matter of considerable loss to them. It is a temporary phase and it should not be made an issue to terrify the Indian Government. If something is going to happen and this country's economy is going to be put out of gear we can also act likewise."

Agricultural Plan Targets

The first five year plan provided for an additional production of 6.5 million tons of cereals and 1.1 million tons of pulses over the production of 1949-50, by the end of 1955-56. The production in 1949-50 amounted to 46.0 million tons of cereals and 8.0 million tons of pulses so that the total production to be achieved by the end of 1955-56 will be 52.5 million tons of cereals and 9.1 million tons of pulses. The target has been worked out on the basis of a consumption of 13.71 ounces of cereals and 2.4 ounces of pulses per adult per day. The food requirements during the second five-year period, it is suggested, should

be determined with reference to two main factors, namely, the increase in population anticipated and the nutritional standards to be maintained. It will also be necessary to keep in view, if not the ideal, at least what India would like to achieve during the next 15 or 20 years. Present diet, although it provides adequate intake of cereals, is very deficient in protective foods. Even the total calorie intake is inadequate. By 1971, the objective should be to increase adult consumption of food from 2,050 to 3,000 calories a day, and also to correct the unbalanced character of the diet in which carbohydrates predominate. The recommended levels of protective foods namely milk, meat, fruits, fish, etc. should also be provided.

During the second five year period, the aim should be to provide 2,600 calories a day, after meeting the requirements of an increasing population. On the basis of an annual increase of population of 1.25 percent, according to the Census report, the total population is expected to be of the order of 410 million by 1961, the adult equivalent of which, at 86 percent, will be 352.6 million. The quantity of foodgrains to be produced by the end of the second five year plan period should, therefore, be such that it will be adequate to meet the requirements of this increased population. The standard of nutrition to be provided will have to be determined with due regard to the extent to which the increased national income resulting from the implementation of the plan will lead to increased consumption of foodgrains and protective foods; also the extent to which the availability of the latter can be stepped up. It will further have to be borne in mind that any large increase in production of cereals and pulses alone is likely to create marketing and other problems.

Taking all these factors into consideration, it is proposed that the additional production to be aimed at by 1960-61 should be limited to 10 million tons in all, of which 8.5 million tons will be cereals and 1.5 million tons pulses, over the anticipated production of 35 million tons of cereals and 10 million tons of pulses in 1955-56. This represents an increase of 15 percent over 1955-56. This will provide for a slightly higher rate of consumption, namely, 13.5 ounces of cereals and 2.8 ounces of pulses compared with 14 ounces of cereals and three ounces of pulses recommended by the Nutrition Advisory Committee. The higher level of consumption of cereals is justified by the fact that the recommended levels of protective foods, namely milk, ghee, meat, eggs, etc., will not be attained by 1960-61. It will also be difficult to increase the production of pulses beyond 15 percent during this period. Only 2.8 ounces per adult is therefore being proposed as against three ounces recommended by the Nutrition Advisory Committee. It is expected that the balanced diet recommended by the Committee will be achieved during the third and fourth five year plans, leading to an adult intake of 3,000 calories a day. It will then be possible to make the necessary downward adjustments in the adult consumption of cereals.

Allocating the Increase

It is proposed that the additional production referred to above, should be distributed between the different types of schemes as under:—

Schemes	First Five Year Plan	Second Five Year Plan
Major irrigation schemes	2.01	2.9
Minor irrigation works	2.38	2.1
Land reclamation	1.51	1.5
Fertilisers and Manures	1.15	2.5
Improved seeds	0.56	1.0
	7.61	10.0

The basis of these figures is indicated below:—

i. **Major Irrigation Works.** The additional area to be irrigated by major irrigation works under-taken in the first five year plan but expected to give benefits in the second five year plan, is of the order of eight million acres. Besides this, new major irrigation projects which may be taken up in the second five year plan, may provide irrigation to seven million acres, bringing the total land to be benefited by these schemes to 15 million acres. A part of the additional irrigation facilities may be diverted to non-food crops.

ii. **Minor Irrigation Works.** Against 11 million acres expected to be benefited by minor irrigation schemes during the current plan period, including special minor irrigation programmes, the area to be benefited by these works during the second five year plan is put at 10 million acres only in view of the fact that the scope for minor productive irrigation works will be less during the second five year plan period compared with the first because of the extension in area under irrigation from the major projects. Taking the major and minor irrigation schemes together, the total area that is likely to be benefited during the second-plan period may be put at 25 million acres yielding an additional production of roughly 5.0 million tons.

iii. **Land Reclamation.** In the first five year plan period, an area of 7.3 million acres is proposed to be reclaimed as a result of the efforts of the State Tractor Organisations (CTOs) and private parties with State help. Against this figure, it is proposed that during the second plan period, the area of new waste lands to be reclaimed will be about six million acres. Besides this, it is also assumed that there will be an increase in the total cropped area to the extent of four million acres by way of double cropping as a result of the various minor and major irrigation schemes, extension activities and propaganda by various agencies. For the purpose of calculating additional production of

foodgrains, only the six million acres proposed to be reclaimed has been taken into consideration. It is estimated that about 1.5 million tons of foodgrains will be produced from this area.

iv. **Fertilizers and Manures.** In the first five year plan, the target of production for fertilizers and manures is 1.15 million tons. This target was based on the assumption that the quantity of nitrogenous fertilizers to be distributed (for all crops), in the last year of the first plan, would be of the order of 6.1 lakh tons and of phosphatic fertilizers 176,000 tons. The programme for the utilisation of fertilizers during the second-plan period provides for considerable extension of the use of nitrogenous fertilizers, particularly ammonium sulphate, the quantity estimated to be used in the last year of the plan being 3.7 lakh tons of ammonia, the equivalent of which, in terms of sulphate, would be roughly 18.5 lakh tons. The intention however is to have not only ammonium sulphate but also relatively small quantities of urea and ammonium sulphate nitrate. In the case of superphosphate the target aimed at by 1960-61 is 7.2 lakh tons. Similar targets for other types of fertilizers and for manures are under consideration. These quantities are intended to meet the requirements of all crops. So far as foodgrains are concerned, the target of additional production resulting from the application of fertilizers and manures has been put at 2.5 million tons.

v. **Improved seeds.** The target of increased production in the first five year plan from the use of improved seeds is 0.56 million tons. As a result of the implementation of the proposed scheme for establishing seed multiplication farms on a country-wide basis and popularising the distribution of improved seeds, it is expected that at least one million tons of additional production will be achieved under this head. The actual quantities of improved seeds expected to be distributed are being worked out separately.

vi. **Funds.** In the first five year plan, the total provision for Central assistance for grow more food schemes is Rs. 106 crores. This does not include: (a) the expenditure on major irrigation works; (b) rupee expenditure on the T.C.A. tube-well programme; (c) expenditure on land reclamation undertaken by the C.T.O. and the State Governments on their own; (d) provision for short term loans which is made from year to year; and (e) the provision for medium and long term loans for agricultural development. During the second five year plan, it is proposed that excluding the provision for major irrigation which will be made in the plan of the Ministry of Irrigation and Power, a provision of Rs. 150 crores be made for Central expenditure on grow more food schemes other than T.C.A. tube-well projects, land reclamation by the C.T.O. and the State Governments, soil conservation schemes falling outside the normal grow more food ones, short-term loans and special medium and long-term loans for which provision is being made by the Ministry of Food and Agriculture separately in the plan. Of this provision, it has been reckoned that a sum of Rs. 50 crores will be utilised solely for expenditure on minor irrigation schemes in the National Extension Service Blocks and the Community Project Areas. Besides this, a sum of Rs. 16 crores would be required for the new programme of setting up a network of seed multiplication centres throughout the country.

Financial assistance to States for their grow more food programmes in the second five year plan will generally follow the pattern adopted during the first five year plan, but with certain modifications particularly in regard to the quantity of financial assistance permissible for individual types of schemes. In view of the increases in the subsidy contemplated in certain categories of schemes, it is proposed that the provision of Rs. 150 crores be split up into Rs. 105 crores for loans and Rs. 45 crores for grants. There will be a matching provision of Rs. 45 crores by the State Government concerned.

Cotton Requirements

The target of cotton production in the first five year plan was 42 lakh bales. The achievement up to the year 1954-55 was 39.55 lakh bales, and indications are that the target of 42 lakh bales will be achieved in the last year of the first five year plan. It is considered that the target of cotton production during the second five year plan should be 55 lakh bales, representing an increase of 13 lakh bales or about 31 percent over 1955-56. The Indian Textile Industry will require about 10 lakh bales of the extra-long American or Egyptian varieties of cotton. India may not be able to produce this quantity, but efforts will be made to produce as much extra-long-staple cotton as possible, and to import about seven or eight lakh bales of these varieties.

The target for an additional 13 lakh bales of cotton during the second five year plan is capable of achievement, the following points being taken into account:—(1) large areas in the Punjab will come under irrigation as a result of the availability of water from the Bakhras and Nangal Dams; (2) Gujrat area will be supplied with water from the Kakrapar dam which has already started functioning; (3) areas in Hyderabad State serviced by the Tungabhadra irrigation scheme will contain large cotton-growing tracts; (4) it is possible that the Chambal dam in Madhya Bharat and Rajastan will make its presence felt in increased cotton production; and (5) in Uttar Pradesh there is a growing tendency to produce long-staple cotton of American type in the districts of Mathura, Agra, Aligarh, etc.

Apart from the deficiency in the extra-long-staple cotton which India has necessarily to import from the U.S.A. and Egypt, plans will have to provide for all the requirements of the textile indus-

try as well as for the export of 2 lakh bales of short-staple varieties of cotton. It is possible that under the second five year plan, the target for cloth consumption may be put at 20 yards per capita. On this basis, the requirements of cloth will be 8,200 million yards and after allowing for 1,500 million yards for exports, the total target for cloth production may be put at 9,700 million yards. It is estimated that this will require a supply of 60 lakh bales to be met as under:

Internal production	55
Imports	7
Exports	2
Total	60

Projects on which it is proposed India should intensify work in the second five year plan are:—

(i) Production of hybrid seed: In the United States there are commercial companies which produce the seed required by the farmers. In this country, so far, this work has not been attempted on a commercial scale. In fact, the Government has only been thinking of producing hybrid maize seed. It is time that the production of hybrid cotton seed was taken up for the areas served by the Kakrapar dam in Bombay where the cultivator is already a good cotton grower and is assured of the required water supply. India may have to spend some money on the grant of subsidies for the production of the hybrid seed for supply to the farmers in this area where at least 100,000 acres are bound to come under irrigation.

(ii) Arrangements for the multiplication and distribution of improved varieties of seed will have to be speeded up. Although in the more advanced States like Bombay a cultivator receives the seed in the fourth or the fifth generation, it is not so in places like Hyderabad, where recently a complaint was made that the Gaonani cotton seed did not reach the cultivator until it was in the eighth or the ninth generation.

(iii) Necessary facilities by way of loans for the purchase of seed will also have to be maintained as in the current five year plan.

(iv) So far very little fertilizer has been used for cotton production. This is due to the fact that most of this country's cotton is grown on barani land. With the increase in irrigation facilities there will be a spurt in the use of fertilizer for cotton production. Adequate funds should be provided by the Government to enable the farmer to get the fertilizer on credit. The amount cannot be estimated at his stage but will depend upon the area to be brought under irrigation.

(v) The Technological Laboratory at Matunga, now maintained by the Indian Central Cotton Committee, needs to be re-modelled and improved. In fact the machinery installed there has already completed its life and if the laboratories are to be models for others to follow, modern machinery must be installed. This will require an additional expenditure of at least Rs. 10 lakhs. Similarly, some buildings may have to be constructed in order to make the laboratory fit to use this machinery. A provision of Rs. 15 lakhs in the next five year plan for the improvement of the Matunga Technological Laboratory is suggested.

(vi) Research on cotton.—In the first five year plan research was not included. Research work is however being done by the Indian Central Cotton Committee. With the development of cotton the need for augmenting and intensifying research is now felt all the more. At present almost all India's requirements of cotton of more than one inch staple are met by imports from Egypt, the U.S.A. or East Africa. The value of these imports of raw cotton is estimated at about Rs. 50 crores. Experience during the last 30 years has shown that it is possible to grow such cottons in the country itself provided adequate research is conducted. There is much scope for research and other activities, such as seed distribution schemes, in order to maintain the purity of cotton seeds.

(vii) Since different varieties of cotton are grown in different parts of the country it is proposed, under the second five year plan to have four regional research stations for which Rs. 10 lakhs will be needed, in addition to the research schemes which are being sponsored by the Indian Central Cotton Committee.

Providing Finance

During the first five year plan an amount of Rs. 3.5 crores was earmarked at the rate of Rs. 70 lakhs a year. This amount of Rs. 70 lakhs roughly comprises Rs. 12 lakhs for grants and the balance for loans for the purchase of cotton seeds. These loans are interest-bearing and are refundable by the end of the financial year during which they are sanctioned. Actual expenditure for cotton extension schemes will be Rs. 60 lakhs for the entire plan period. Expenditure is being sanctioned on items such as cotton extension staff, loss on cotton seeds, etc. All these measures will have to be continued during the second five year plan period. The details of the total requirements for the second five year plan will therefore be as under:—

i. For cotton extension schemes	Rs. 60,00,000
ii. For research schemes sponsored by the Indian Central Cotton Committee, Bombay	50,00,000
iii. For Matunga Laboratory, Bombay	15,00,000
iv. For four research stations	10,00,000
v. For loans for cotton seeds at the rate of Rs. 58 lakhs a year	290,00,000
Total requirements for the plan period	425,00,000

Of this expenditure, the amounts to be spent on development and research schemes are indicated below:

Assistance to States for cotton development	350 lakhs
Direct expenditure on research	75 lakhs
	425 lakhs

Of this a sum, Rs. 33.5 lakhs will represent continuation expenditure on scheme started in the first five year plan and the balance of Rs. 391.5 lakhs will represent new development expenditure. The States are expected to contribute a sum of Rs. 10 lakhs from their funds towards the scheme.

Raw Jute Requirements

Normal requirements of raw jute for the jute industry are 72 lakh bales. When the first five year plan was started the country produced only 33 lakh bales of jute and a target of 53.9 lakh bales was fixed in the plan. The first year's performance, which was estimated at 46.9 lakh bales, was very promising but could not be sustained. The main reasons for this were bad weather and price variations, which were very steep, so much so that in the year 1953-54 the acreage under jute was reduced by 30 percent, and production went down to 31.28 lakh bales. Something, therefore will have to be done, officials think to secure a stable price for raw jute if the requirements of the industry are to be produced within the country itself. They say that this may mean the fixing of ceilings and floors for raw jute as in the case of cotton, or the establishment of a Stabilisation Fund which can be used as a cushion for meeting the losses which the Government may have to incur if it enters the market for the purchase of raw jute when prices decline to uneconomic levels.

India has so far reached a production of 31.53 lakh bales (during 1954-55) against a target for the first five year plan of 53.9 lakh bales. It may be difficult to achieve this even if all the recommendations made by the Expert Committee on the quality of jute are implemented. At the best, India may reach the figure of 40 lakh bales during the last year of the first five year plan period. It will be necessary further to increase production by intensive cultivation without bringing additional acreage under jute, and to fix a target of 10 lakh additional bales, or a total of 50 lakh bales during the next five year plan. But it is not enough to fix merely a physical target of total annual production of jute in the country. What is more important is to increase the yield, which is at present only 2.48 bales of an acre. It is also necessary to fix a target of average yield per acre. This target should be fixed at three bales, which is lower than Pakistan's average yield of 3.29 bales.

One of the methods of increasing production and yield per acre is to supply improved jute seeds to cultivators. This is a tricky business and the cultivators are not likely to produce improved seeds unless it is made worth their while. The cost of production of seed is very high and farmers are not willing to pay high prices. If it were decided to introduce the improved varieties of jute, the Government may have to subsidise the production of seed. It was suggested at one time that a scheme be evolved in which the State Government would be required to enact a Jute Seed Act and promulgate it in specified areas so as to cover the entire State within the five-year period. In these specific areas it should be the responsibility of the State Government to purchase the seed produced by the cultivators in return for the seed of improved varieties. Unless this is done there is very little hope of covering the entire area with improved varieties of jute; it will involve considerable expenditure.

It is stated that one single factor which goes a long way towards improving the quality of raw jute produced in the country is the provision of adequate retting facilities. It is here that Pakistan excels India and that is why India has to depend for its entire requirements of good quality jute on East Pakistan. A beginning has been made in the provision of retting facilities to the jute growers with a Central grant equivalent to 50 percent of the expenditure on excavation and re-excavation of new and old retting tanks. These facilities will have to be extended. It is proposed that during the next five year plan 16,040 new retting tanks be dug and 8,320 old tanks be re-excavated.

Plant protection facilities are also called for. The usual credit facilities for supply of fertilizers on a deferred-payment basis should be made available to jute cultivators. Lastly, some provision should be made for the demonstration of improved cultural practices and the use of certain implements which, it is understood, reduce the cost of cultivation of jute such as seed drills, wheel hoes, etc. One thousand seed drills and 1,000 wheel hoes, have been supplied to the State Governments at Central Government cost for use in the jute-growing areas. It is proposed to supply 7,250 each of seed drills and wheel hoes during the next five year plan. Fifty percent of the cost is proposed to be met by the Central Government, the remaining 50 percent being met either by the State Governments or by the cultivators. It is proposed to share contingent expenditure and expenditure on jute development staff, with the State Governments on a 50:50 basis in the second five year plan as against the present 100 percent aid from the Central Government.

In the current five year plan a provision of Rs. 50 lakhs was originally made for jute development schemes. Subsequently the Planning Commission accepted a further demand of Rs. 30 lakhs. It is proposed that in the second five year plan a provision of Rs. 66 lakhs be made for jute development schemes. In addition, research work will have to be strengthened by giving an additional grant of Rs. 10 lakhs to the Jute Committee which has so far not done much on account of paucity of funds. The present grant of Rs. 10 lakhs per annum to the

London

CONSERVATIVE CONFIDENCE VINDICATED

STRIKES AND THREATS LOSE VOTES FOR LABOUR

(FROM OUR LONDON CORRESPONDENT)

THE Conservative party's confidence in its record, and the City's confidence in the return of a Conservative Government at the general election, have both been justified. There has been no landslide, but the Conservatives are now favoured with an adequate working majority to ease the strain which was imposed on its backbenchers in the last Parliament and can plan policy for the next five years with greater certainty and what must be a welcome stability. The drop in the total poll was not surprising under present circumstances, and although Labour may find in it some excuse for its losses—small, but decisive—the significant fact was that on this occasion the Conservatives not only secured a majority of the seats but also of the votes, which they failed to do the last time, and can therefore claim with much greater force that they have been given the mandate which Sir Anthony Eden asked for in his first broadcast on the subject. He and his Ministers were all returned, most of them with increased majorities, whereas the Labour leaders, though re-elected, had lower majorities.

How many votes the Labour party lost as a result of the strikes and threats of strikes which colour our present outlook on life is anyone's guess, but among what are called the "floating voters" the number must have been quite considerable. In all the major ports of the country ships have lain idle, or under-manned throughout the week, and a Whitsun with a skeleton railway service has hardly been a cheerful business. Efforts to settle these disputes are going forward energetically and with some hopes of success at the time this is being written, but whatever the results, the significant fact is that more and more strikes are the outcome of union or employment issues and not disputes over wages or hours. Such disputes are always more difficult to settle, for they are less susceptible to outside negotiation.

The P. & O. Meeting

Considerable interest attached to this week's annual general meeting of the Peninsular and Oriental Steam Navigation Company, for in his earlier statement the Chairman, Sir William Currie, had promised to disclose the Board's decisions with regard to any changes in capital structure or organisation following the survey recently made with the expert help of Lazards and Deloitte. The meeting was well attended and the discussion which followed the Chairman's review of an unusually high order, but the critics of the Board's policy as being too cautious received only one concession. Another one-for-one scrip issue of deferred shares is being made by the capitalisation of nearly £14 million of reserves—which means, as Sir William pointed out, that anybody who bought £100 of deferred stock in 1938 at a cost of £108 now holds an investment worth over £1,000 at the market price, besides having received a fair income over the intervening years. No other major change is to be made, and the idea of transforming the P. & O. into a pure holding company has been rejected as the Board holds the view that it would involve "heavy additional tax burdens" which would not be justified. Some minor but interesting revisions will take place in the accounts. Depreciation will be applied to ships at the rate of 5 percent a year so that each vessel will be written off in 20 years. This is intended to leave a margin for keeping some older ships in service or selling them. There will be some reshuffling of accounts which should make the financial position of the group clearer. But the various suggestions for reorganisation have not found favour. The Chairman was careful to point out that nothing in the survey or in the proposed one-for-one scrip issue could create new assets or add to earning power.

Sir William then turned his attention to air transport and official policy in that respect, which overlooked the fact that it was a business like any other. He added: "British air transport will never make a contribution to the national purse at all comparable with the vast contribution made by British shipping so long as it is to an overwhelming extent reserved, and reserved at a period of rapid development, for one or two great corporations, and denied to those others who have the resources and the knowledge, and who might have the courage to use them wholeheartedly in this field if they were assured that the dice were not loaded against them. I am not criticising the efficiency or the enterprise of the corporations, still less their existence." He said that the rapid expansion of Japanese shipping continued to be a source of concern. He did not feel that the extensive aid being given by the Japanese Government to its shipping, without regard to the need for to pay its way, was in the best commercial interests of Japan.

Lancashire and Japan

The annual report of the Cotton and Rayon Merchants Association for 1954-55 contains, in addition to the usual mass of valuable statistical and other information, a serious survey of the present situation in the Lancashire textile industry and the policy needed to overcome its problems from the viewpoint of the Association's members. Japanese competition is regarded as a major question and some illuminating figures are quoted in support. Largely as a result of its payments

Bombay

IMPROVED WORKING AT BOMBAY PORT

SHIPPING COMPANIES URGED TO DROP PROPOSED SURCHARGE

(FROM OUR BOMBAY CORRESPONDENT)

IN the port of Bombay there were 25 ships in stream last week, each waiting for a berth. They had to wait for a fortnight before they could be received. The same unsatisfactory conditions prevailed in Calcutta and Madras. This is nothing new or peculiar to India. In 1949, when port congestion was at its worst, there were at times as many as 42 ships in stream waiting for berths. More recently the London dock strike paralysed Britain's export and import trade and held up business valued at £200 million in addition to holding up 340 ships for 26 days. Indian shipping companies have long been grumbling at the inordinate delays which occur at home ports. A leading Indian shipping concerns reports that its freight revenue for the year 1953-1954 stood at Rs. 370.28 lakhs, showing a fall of Rs. 33 lakhs from that of the previous year. Similarly, the profit, before providing for depreciation, declined from Rs. 58 lakhs to Rs. 27.8 lakhs. In addition, port charges increased by more than Rs. 8 lakhs. The drop in freight revenue and its resultant effect on the profit and loss account of the company has been attributed by the directors to "the go-slow movement adopted by dock labour at various ports and to the general attitude of dock labour in ports." It was estimated that the number of days which the ships of the company were forced to be at port, beyond the number normally required for the discharge and loading of cargo and for waiting for berths, amounted to more than 200.

It was realised that such an unsatisfactory state of affairs might result in increased freights and the Chairman of the company concerned warned: "The trade of the country will seriously be affected and indeed has already been affected to some extent, but such an attitude on the part of labour. Shippers are unable to meet their contracts and deliver the goods to their importers in time. In an extremely competitive world, where countries with the same resources as India has, wish to establish markets for their products, it can be realised that the economic consequences of delayed shipments and of shipments made at higher freight rates will be extremely serious to the normal trade of the country."

Mr. Krishnamachari's Move

Now a chronic situation has suddenly become acute and the seriousness of it has led all concerned to take up extreme positions. The Commerce Minister threatened reprisals in the form of closing Indian ports to the ships of those lines which increase their freight rates. The Government of India could not take such a step without violating the provisions of the Convention on the International Regime of Maritime Ports, 1923 to which India is committed. The relevant clause of this Convention is contained in Article 2 which reads: "Every contracting state undertakes to grant the vessels of every other Contracting State equality of treatment with its own vessels, or those of any other State whatsoever, in the maritime ports situated under its sovereignty or authority, as regards freedom of access to the port, the use of the port and the full enjoyment of the benefits as regards navigation and commercial operations which it affords to vessels, their cargoes and passengers. The equality of treatment thus established shall cover facilities of all kinds, such as allocation of berths, loading and unloading facilities, as well as dues and charges of all kinds levied in the name or for the account of the Government, public authorities, concessionaires or undertakings of any kind." This equality of treatment has not been made conditional on the level of freight rates.

Whether a breach of the Convention, with its attendant international implications, would be justified or not in the present circumstances is a matter for consideration. Equally, the shipping companies would do well to weigh carefully the loss of goodwill which a steep rise in freight rates, as contemplated, would involve against an advantage which at best might only be temporary. An interesting proposal was put forward in Bombay by Mr. Andrew Crinkley, the Far East representative of the Isbrandtsen Co. Inc., that instead of raising general freight rates on all cargo, an extra payment should be levied in case of unwarranted delays. He said that if Indian merchants could not take delivery of cargo when the company's ships arrived at Bombay, they should not expect to use the vessel as "a floating warehouse off the port for 10 days free of cost." He thought that for this expense a charge additional to the usual freight would be fair and just.

Mr. Crinkley clarified the position of his company thus: "My firm, an independent steamship line, not members of any conference, feels that between the Indian importers and ourselves we are entitled to an extra payment above the usual steamship rate on account of the long delays to our ships outside Bombay harbour. We do not propose to increase the freight rate, but merely charge an additional amount to help defray the \$2,000 a day that we lose on each vessel waiting

for a berth. This is strictly a business proposition and a contract between our civilian firm and the Indian importers. If the importer does not agree to this contract, including the added charge, then he could simply not enter into the contract. This is plain everyday business. It is only a temporary charge so long as our ships wait for a berth. When the ships can berth within a reasonable period we are naturally entirely agreeable to absorbing all costs ourselves. Our present ship in Alexandra Dock, the "Flying Arrow," waited outside 10 days which cost us a dead loss of \$20,000 calculated at \$2,000 a day. This is not an isolated incident. It has been going on for some time with all our ships losing money while waiting in the stream off Bombay. We have enjoyed good business in Bombay and we certainly are anxious to continue our good relations always."

Improvement

Meanwhile there has been an almost miraculous change in the situation. This weekend not a single ship was waiting in the stream off Bombay for a berth. During the 36 hours ending 8 a.m. on Friday last as many as 20 ships were accommodated in the docks. The labour force was quickly increased. Seventy more stevedore labour gangs of eight men each were put to work and the shore labour gangs were correspondingly increased. According to a Press report Bombay's shipping circles "were surprised at the sudden end of the congestion." As a more permanent measure to ensure a speedy turn-round of ships it is reported that the Bombay Port Trust has decided to order 18 mobile cranes of six to 10 tons capacity each. At present there are 40 mobile cranes of varying capacities ranging from six to 20 tons each. Of these, five will be discarded so that in effect the net addition will amount to 13 cranes. It is also proposed to put into service six tractors as additions to the present fleet of 18, thus adding to the gear.

Reports from Calcutta and Madras indicate that there has been a general improvement at these ports also. Under these circumstances, Bombay's commercial circles hope that the shipping companies will not press the point further and will allow freight rates to stand at their present level. It is probable that this vexatious controversy will die down, at least for the time being, but it serves to spotlight the unsatisfactory state of Indian shipping.

With a total tonnage of 471,281 tons and a fleet of 125 merchant vessels, Indian shipping accounts for only one half percent of world's shipping, which is today computed at 97,422,000 tons. Most of these vessels are engaged in coastal trade and with its present resources Indian shipping cannot handle more than five to six percent of the country's overseas trade. This does not take into account special cargoes. For instance in the years 1951 and 1952 India imported a total of 8,588,000 tons of foodgrains and paid Rs. 78 crores in sea freight. Of these imports Indian ships carried 716,000 tons and Indian shipping companies earned the comparatively modest sum of Rs. 32,350,000 in freight charges. At the beginning of this year 16 vessels with an aggregate of 68,700 tons were under construction or on order for Indian shipping companies at foreign and Indian shipyards. When these are delivered the total Indian tonnage will amount to 539,981 tons—a little short of the 600,000-ton target set under the first five year plan. But this is totally inadequate for the needs of a country with a coastline extending 3,500 miles and which is fast industrialising and rapidly developing an export and import trade.

Indian Shipping

The development of the Indian shipping industry has been very gradual. It came into existence in 1919 but really started on its career of expansion soon after world war II. An increase of 75,000 tons was achieved in 1946 but only 13,000 tons were added in 1953. Last year 13 vessels totalling 53,546 tons were acquired by Indian shipowners. Of these five were newly built, six were of post-war construction and the remaining two were just a little over ten years old. On the other hand, nine old vessels totalling 15,642 tons were sold. This year it is planned to add 68,700 tons. At first sight the progress appears to be satisfactory but it is strikingly slow when considered against the background of world tonnage and world expansion. Germany, for instance, which lost 98 percent of its merchant fleet in the second world war, hopes to have an additional 300,000 tons afloat by the end of this year. Today Western Germany has 800 vessels totalling 2,107,926 tons. Yet at the end of the war Germany was at par with India, both owning 75,000 tons each. Similarly Japan has also progressed at a pace for outstripping India's rate of development. Japan's tonnage at the end of the war amounted to 750,000 tons. At the end of last year the Japanese merchant fleet comprised 1,092 vessels of 100 tons and over, totalling 3,266,376 tons, excluding fishing vessels. Israel, a newcomer to the comity of nations, has made remarkable progress within a very few years. In 1954 Israel had 31 vessels totalling 119,000 tons. Israeli ships carried 64 percent of the total overseas passenger traffic, about 25 percent of Israel's exports and 33 percent.....of imports, besides some 500,000 tons of cargo between foreign ports. About 12 ships are now under construction or on order on Israeli account in West German yards under the Reparations Agreement.

These developments abroad, particularly in those countries which suffered heavily because of the war, underline the gigantic task which lies ahead of India if she is ever to take her place among the maritime nations of the world. The two main obstacles to a faster rate of development have been the lack of finance and the lack of patronage. Shipping is an industry which requires constant assistance and careful observation. Under the first five year plan the Government of India has allocated a sum of Rs. 22 crores to be disbursed to shipping companies for acquiring additional tonnage. Of this amount Rs. 18 crores has already been advanced. It is reported that under the second five year plan the Government of India contemplates advancing further loans to the extent of Rs. 60 crores. Although this is a step in the right direction, shipping circles feel that the rates of interest are excessive. Under the present arrangements shipping companies are called upon to pay 4½ percent interest on loans for acquiring coastal ships and 2½ percent on loans earmarked for the addition of overseas tonnage. The average rate of interest works out to 3 percent. Indian owners point to Britain as an example where the British Government advanced the sterling equivalent of \$13 million at 2½ percent interest to the Cunard line for the construction of the Mauretania and the Lusitania. This loan was for a period of 20 years and carried no interest while the vessels were under construction. On this basis Indian shipping lines claim that a fair rate of interest would be 2½ percent on loans for acquiring coastal ships and 1½ percent on loans for acquiring vessels for overseas trade. Considering the present financial structure of the industry, whose paid-up capital amounts to approximately Rs. 16 crores and the present high constructional costs, it would seem that the industry's claim for more favourable rates of interest is justified.

Development Rebate

It may be worthwhile for the Government to consider a special development rebate for the shipping industry. The present development rebate enables shipping, and other industries, to write off depreciation of these assets up to 125 percent, which in effect means exemption from tax on 25 percent of the cost of ships. This exemption is applicable to all industry, but by its very nature shipping can not be classified with other industries and therefore deserve special treatment. Shipping is a national asset in its broadest sense and the nation must always be prepared to pay for it. Obviously it is impossible for India to achieve the target at the present time, but more positive steps could be taken, shippers say, to ensure that indigenous shipping is used whenever possible. At the present stage their aim would seem to be to keep the existing merchant fleet fully occupied and to ensure that new vessels, as and when they are commissioned, are pressed into service without delay. With the development of the public sector, large quantities of equipment and heavy industrial machinery are imported on Government account and the quantum of such imports is steadily rising. The Government of India is urged to stipulate that all such stores be carried by Indian vessels whenever possible. Similar stipulations, it is said, can be incorporated in the various bilateral trade agreements which India has with foreign countries, particularly with those countries which a state-controlled economy. Such measures could not be construed as flag discrimination. The Havana Charter is clear on the point and Article of the Charter recognises "that special governmental assistance may be required to promote the establishment, development or reconstruction of particular industries and in appropriate circumstances the grant of such assistance in the form of protective measures is justified." The principle of protection to industry is conceded, then it must also apply to shipping, for it conforms to the definition of an industry. The Convention on the Inter-Governmental Maritime Consultative Organisation (Geneva 1948) goes a step further and says: "Assistance and encouragement given by a Government for the development of its national shipping and for purposes of security does not in itself constitute discrimination."

The United States has passed the Cargo Preference Act. The relevant provisions of this law read: "Whenever the United States shall procure, contract for, or otherwise obtain for its own account, or shall furnish to or for the account, of any foreign nation without the provision for re-imbusement, any equipment, materials or commodities within or without the United States, the appropriate agency or agencies shall take such steps as may be necessary and practicable to assure that at least 50 percent of the gross tonnage which may be transported on ocean vessels shall be transported on privately-owned United States flag commercial vessels." With the setting up of the oil refineries the question of tankers looms large. The refineries will import about 3,500,000 tons of crude oil annually and move more than 1,200,000 tons of refined products along the coast. As yet India does not possess a single tanker but it is reported that the it is hoped that the oil refineries will find it possible to make use of them, at least for the coastal start indeed considering that with a tonnage of 24,624,000 tons tankers represents 25 percent of the total world fleet. Apart from purely commercial consideration, an adequate merchant fleet is a necessity as a second line for the defence of India and the Commonwealth.

Uttar Pradesh

U.P. GOVERNMENT HELPLESS IN KANPUR STRIKES BOTH SIDES TRY TO CATCH PUBLIC IMAGINATION

(FROM OUR LUCKNOW CORRESPONDENT)

"LET them fight it out amongst themselves." That about sums up the U.P. Government's attitude towards the textile strike which has now been in progress in Kanpur since 2nd May. The Chief Minister of the State, Dr. Sampurnanand, said in an interview to the Press on 20th May: "I have no intention of inviting further rebuffs from any quarter." He has every reason to feel huffed because the rationalisation scheme which is now in dispute received the official imprimatur at the Naini Tal Tripartite Conference when he was the Labour Minister. Although unofficial mediators have emerged on the scene, it would appear that their ultimate objective is not so much a settlement as to prevent Kanpur from being permanently lost to Congress. Local Congress leaders headed by Pandit Balkrishna Sharma, M.P., have issued appeals to millowners to unbend, while at the same time they have made a bid to enlist workers' sympathy by condemning alleged police "atrocities" in very strong terms indeed. Even the I.N.T.U.C., which is officially opposed to the strike, has found it politic to fire a broadside at the employers for "taking advantage of the growing attendance in the mills", whatever that means. There has been a growing tendency noticeable on the part of both the strikers and their opponents to cash in on the situation by interpreting it as a struggle for civil liberties, possibly because on merits the labour dispute in itself has failed to catch the public imagination.

Dr. Ram Manohar Lohia has essayed to give philosophic justification to the workers' right to strike and do picketing peacefully. If peace in Kanpur has been maintained on the whole, the credit for it does not go wholly to the strikers, who have been throwing acid on the loyalists. The defence is, as usual, that acid throwing is the work of agents provocateurs. On 19th May, the millowners were reported to have served notices on the strikers to report for duty, failing which they would be liable for dismissal. The managements, in their notices, informed the workers that they "propose to deal leniently with such workmen who have so far absented themselves from work but who resume regular work immediately or in any case by or on 26th May." The striking workers retaliated by organising a one-day halt in the city. The figures of daily attendance in the mills have generally been encouraging, a fact which the other side seeks to explain away as the result of unfair inducement. It is alleged, for instance, that most of those who are attending are temporary hands and that the mills, in order to boost figures of attendance, have employed "jhalhualas". The Employers Association has officially rebutted these charges in a statement issued on 25th May in which it points out that work in textile mills, being of a certain technical nature, cannot be carried on by newly recruited labour, let alone "jhalhualas". The statement proceeds: "The Managing Committee of the Association have obtained percentages of attendance of difference categories of workers before the strike and at the present time the percentage of temporary workers is only 16 percent out of the total number attending at present as against 9 percent prior to the strike period."

According to the Association, which obtained figures from the different mills: "The mills are producing 31 percent of their daily average production before the strike period." Whether or not the strike eventually fizzles out, the industrialists are seriously worried that even if they win it may be a futile victory. If rationalisation is enforced without workers' co-operation little purpose is served. One industrialist has been quoted to the effect that the workers might go slow or damage the machinery or adopt other tactics to impede production. He substantiated this argument by pointing out that the wage level in the Elgin Mills where the worker has to run only two looms was better than that in the two rationalised units of Kanpur. It happened to be so because in the rationalised mills the workers refused to extend their willing co-operation.

Additional Cane Price

The Centre's formula for determining the additional price for cane supplied to sugar factories during the last three years has been disapproved of by the U. P. Co-operative Cane Unions Federation on the grounds that the value of "X" has been reduced from the figure of 65 percent to 70 percent to 53 percent to 60 percent and that the books maintained by the mills are unreliable. The Federation has suggested that the value of "X" be computed on the basis of relative price of sugarcane and sugar obtained during the period in question. The prices of sugar as quoted in the principal mandis should be the basis of computation and the percentage of recovery should be taken as 9.6 percent. In the event of the actual recovery being lower in any particular mill, the Federation is of the view that compensation should be payable by the Government out of the excise duty and cess. The cane growers in U.P. obviously wish to have the best of both worlds in as much as they are opposed at the same time to any formula for payment for cane on the basis of recovery alone.

While supporting the Sugar Development Council's proposal to send a delegation abroad to study the methods of determining cane price on the basis of recovery, the Federation would not resile from its stand that "as long as a formula acceptable to the growers is not devised, the price of cane should continue to be fixed on the basis of sugar prices." The growers are themselves apathetic towards carrying out any cultural, manual or varietal operations at their cost and hence the Government's scheme to pay compensation at the rate of Rs. 150 per acre for varietal trials and Rs. 200 for manual trials.

Jute Sowings Completed

The Jute Development Officer, U.P. has reported that jute sowing has been completed in 34,400 acres in the State, including 695 acres of line sowing, up to the end of April last. The programme drawn up for the current year to develop jute cultivation in the State includes the construction of 150 new retting tanks. The pilot survey scheme launched some time ago to investigate the economics of jute growing in the State has so far covered 35 centres. The Jute Grading Party has completed grading 203 maunds of jute and 19 maunds of mesta fibre in the last three months. Out of 10 capsularis subvention trials, nine are reported to be progressing well. Under the double-cropping experiment, jute and paddy were sown and the germination of the jute crop is said to be good. The other experiment with jute and wheat is to be launched with the first shower in this month or the next.

Motor Transport's Problem

The U.P.'s nationalised motor transport is faced with a dilemma—either it must expand or it must go broke. In terms of the Planning Commission's directive, it is not possible to go ahead with further nationalisation. But, because of the annual increments earned by the staff, the cost of running the road services jumps by as much as Rs. 4 lakhs every year. The increase on this score may be cut in due course by the retirement of a section of the staff every year, but being a young concern there is little likelihood of any retirements in the near future. Till now the Government has taken over a total of 333 routes over which 1,500 buses are plying. If further nationalisation is halted, then the overhead charges will remain high and the profits now being earned may eventually disappear.

SWEDEN OPENS TRADE COMMISSIONER'S OFFICE IN CALCUTTA

With the object of strengthening commercial relations between Sweden and Eastern India the Swedish Government has decided to open a Trade Office in Calcutta, and Mr. I. Blom, previously Swedish Vice Consul in Casablanca, French Morocco, has arrived to take charge as Trade Commissioner for Sweden. Mr. Blom served as Commercial Secretary to the Swedish Legation in New Delhi during 1949 and 1950.

Sweden already maintains a Trade Commissioner's Office in Bombay, and contacts with the Indian Market have hitherto mainly been through that centre. It was felt, however, that Swedish firms ought to pay more attention to Calcutta, particularly having in view the progressive development of industry in Eastern India. Sweden, being a highly industrialised country, would be able to make an increasing contribution to this development by supplying equipment and by providing technical know-how. A large number of Indian students and technicians have already been trained in Sweden.

Trade agreements between Sweden and India have been renewed from time to time, whereby India has assured Sweden of treatment as a soft currency country for the purpose of imports into India, and Sweden has granted to India the facilities enjoyed by member countries of the O.E.E.C. This means, at present, that practically all Indian products may be brought into Sweden without any restrictions whatsoever. In Indian shipments to Sweden tea, jute products, manganese ore, spices, mica, myrobalans, castor oil and lac have been ranking high. Sweden's largest item of export to India has been paper and board, but numerous products of the Swedish engineering industry have become well known, for instance, ball bearings, heavy electric equipment, rock-drilling machines, telephones, refrigerators, tools etc. Raw materials, such as pulp for paper making, tanning materials, rayon and staple fibre, chemicals, special steels and tea chests are also received from Sweden, as well as powdered milk. The Swedish Trade Commissioner, whose address is 7, Wellesley Place, Calcutta, will provide information on these and a large number of other Swedish products.

PLANTATION INQUIRY COMMISSION'S TERM EXTENDED

The term of the Plantation Inquiry Commission has been extended for a period of six months. The Commission was appointed in April last year for a period of one year. The Commission of which Mr. Madhava Menon, I.C.S., is Chairman, is enquiring into all aspects of three plantation industries, namely tea, rubber and coffee. It has to make recommendations to Government on measures necessary for securing a fair price to the producer as well as to the consumer, to ensure suitable marketing arrangements, to provide for necessary finance for the plantation industries and for the proper development and expansion of these industries. The Commission has toured different plantation areas in the country and is at present on a tour of the tea estates of Dooars and Darjeeling in West Bengal.

Engineering and Transport

U.K. MAKES A BID FOR DC3 REPLACEMENT MARKET

AIRCRAFT TAILORED TO OPERATORS' NEEDS

BRITISH aircraft manufacturers are making determined attempts to solve one of the biggest of current feeder-airline problems—the replacement of the DC 3. Many of the world's airlines operating short to medium routes are using DC 3's, some of which have now flown more than 40,000 hours. Above all its other qualities, the DC 3, or its Service variant the "Dakota", has been available at artificially low prices, going down after the war to a very few thousand pounds sterling. Operators nowadays do not want merely another DC 3; they want something better and more specialised, an aircraft that will fulfil their own particular requirements more exactly. Probably the only detail that every operator would like to see exactly replaced is the price—and that is unattainable. Some of the more important airline companies have found that the best "DC 3 replacement" is the "Viscount". As every operator has his own idea of precisely what form the replacement should take, successors to the DC 3 must assume many guises.

Appreciably larger than the DC 3, there is the "Herald" for which deliveries are promised in 1957. Already, state Handley Page Ltd., orders or 29 of these 44-seater, high-wing monoplanes have been placed. Its ample power (four Alvis "Leonides Major" engines of 870 h.p. each), good performance and pressurised cabin will appeal particularly to overseas operators who have to contend with high terrain and high temperatures; both these factors lengthen the take-off run. It can also be swiftly adapted for freight carrying. The Aviation Trade Association's requirements more closely to the DC 3 in size. It is designed to carry a similar load (up to 36 passengers or freight) from restricted spaces with the added advantage of cabin pressurisation, a tricycle undercarriage and twin turbo-prop engines (the well established Rolls-Royce "Darts"). Smaller than the "Herald", its provisional price is naturally lower than the "Herald" figure, and deliveries are expected to begin in 1957 from a new factory at Southend.

There are several other notable British aircraft in use and under development that come into the DC 3 sphere of operation. The Scottish Aviation Twin "Pioneer" (two 550 h.p. Alvis "Leonides") is designed to fly at 48 m.p.h. and take off, with fuel for 500 miles and 16 passengers, in approximately 100 yards in still air, yet cruise at 150 m.p.h. This performance will have great appeal, especially for bush operators. Deliveries are due to begin in December this year and the initial price is very competitive. More than 500 de Havilland "Doves" and 75 "Herons" have been sold at home and overseas in order to fulfil many of the duties performed for so long by the ubiquitous DC 3. The wide acceptance of these popular aircraft foreshadows the ascendancy of other British competitors in the race for the DC 3 succession.

ANOTHER U.S. ORDER FOR VISCOUNT AIRLINERS

Three Vickers "Viscount" turbo-prop airliners have been ordered by the United States Steel Corp. for use by its executives, it was confirmed in London on 25th May by a Vickers spokesman. The first U.S. company to order "Viscounts" was Capital Airlines, which placed an order for 60. U.S. Steel's planes will be based on Pittsburgh, and Capital will service and maintain them. This new order brings the total of Viscounts ordered to 203.

Another U.S. operator Continental Air Lines —is likely to place an order for "Viscounts" in the near future. When Continental's president, Mr. Robert Six, left London Airport after a fortnight's visit to Britain, he took with him a sheaf of facts and figures concerning the Viscount, and these are now being closely studied in New York.

Describing the record-breaking turbo-prop as a first-class aircraft, Mr. Six said: "I am very impressed. I should say there's a very good hope of us ordering 10 to 15 of the 'Viscount' 800 within 90 days." These 52-seaters, with a speed of 355 mph, would be worth over £4 million.

DC-7Bs Join Atlantic Fleet

The first two of seven Douglas turbo-compound DC-7Bs ordered by Pan American will be put into Atlantic service in June 1955. The new Clippers, especially designed for over-ocean operations, will provide daily non-stop service, New York to Paris. Flying time to Paris in the DC-7B will be 11 hours, one and a half hours less than present schedules. In July, two additional DC-7Bs will be added to the Atlantic fleet, providing daily non-stop service to London in 10 hours and 15 minutes, which is an hour and a quarter faster than current schedules.

The DC-7B is an advanced development of the DC-6, DC-6B and DC-7 series, but will have a larger fuel capacity and a higher gross weight than the earlier versions. The new Clippers will be able to fly non-stop for 4,000 miles and still will have about 1,000 miles of reserve fuel at the end of the flight. Gross weight at take-off will be 125,000 pounds and the fuel capacity will be

6,260 gallons of gasoline. Each of the DC-7Bs will be powered by four Wright turbo-compound engines yielding a total of 13,000 horsepower.

What It Does

These are the major advantages of the compound engine, as cited by the Wright Aeronautical Corporation: Approximately 20 percent increase of power during take-off and climb. At cruise, operators have the option of maintaining usual fuel consumption and increasing horsepower by 20 percent, or keeping previously-used power settings and saving 20 percent on fuel consumption. Maintenance should not increase appreciably. Although there are moving parts to the compound engine, it is also a more accessible power-plant. Turbines are directly air-cooled and should not give trouble. Noise suppression of the power recovery system is appreciable, both inside and outside the aircraft. For the passenger the increased comfort is of real benefit, especially on long hops. And pilots who have flown the aircraft say that it is noticeably smoother, a further contribution to passenger and crew comfort. Simplicity of control of the engine is stressed. The compounding requires no additional controls in the cockpit.

TASMANIAN ALUMINIUM PLANT IN PRODUCTION

AT Bell Bay, on the River Tamar, 31 miles from Launceston, Tasmania, 650 men are working hard to complete Australia's first aluminium plant, costing approximately £A10,500,000. The first stage of the conversion of the red bauxite into alumina has been in operation at Bell Bay since early in February, when the Minister for Supply, Mr. Howard Beale, pressed a button that started the ball mill grinders. In these the bauxite is crushed; then, mixed with lime and later caustic soda, it passes through a series of dissolvers, filters, washers, and dehydrators, to emerge eventually as a white flour-like powder—alumina.

The process of extracting high-grade alumina from bauxite used at the Bell Bay works is known as the Bayer process. For the second process—the reduction of the pure alumina to metallic aluminium—expected to begin in July, the Hall Herault method will be used. The alumina is reduced in electric furnaces of brick lined with carbon blocks and filled with cryolite. Operation of the aluminium works at Bell Bay will mean the handling of some 80,000 tons of materials each year through the Bell Bay port. This will mean the berthing of at least one ship there each month.

At concrete wharves, where there is a depth of 36 feet of water, ships from Malaysia tie up to discharge their cargoes of red gravel-like bauxite—the basic constituent of aluminium. Later, ships will call to take away the finished product—aluminium ingots. Some 55,000 tons of bauxite will be imported yearly, supplies coming at first from Malaysia, and later from other sources. There are extensive bauxite deposits in islands off the Northern Territory of Australia. In addition, the works will use 20,000 tons of Tasmanian coal yearly, 4,000 tons of limestone from the deposits at Beaconsfield on the other side of the River Tamar, 400 tons of coke from Launceston, soda ash from South Australia, cryolite from Greenland, and petroleum coke from California.

FOREIGN ORDERS ON FRENCH SHIP YARDS

Orders placed with French Shipyards by foreign countries since 1950 totalled 524,795 tons or 789,000 TDW corresponding to 109 ships. The following is the break-down of the total:

Country	Gross Tonnage	Description
Belgium	11,000	Liner
Burma	16,000	Large flats and barges
Brazil	24,000	Colliers, docks, dredgers, floats
Chile	28,400	Tankers, cargo-boats, colliers
Egypt	8,675	Dredger, dock, tankers
U.K.	26,600	Cargo-boats
Iran	200	Flats
Norway	100,000	Coasters, cargo-boats, tankers
Pakistan	4,000	Passenger ships
Switzerland	1,000	Barges
Turkey	7,520	Ferry-boats and flats
U.S.S.R.	30,000	Cargo-Boats
U.S.A.	264,400	Tankers
Venezuela	1,000	Staff transport ship

This list is not exhaustive. Negotiations are proceeding for fresh orders.

Production in 1954

As regards production, the results recorded in 1954 have been considered satisfactory. The following are the details:

Building ships	338,000 tons	80,000 of which for foreign countries
Launchings	250,000 tons	23,000 of which for foreign countries
Deliveries	263,000 tons	95,000 of which for foreign countries

In 1955, deliveries are expected to reach 400,000 tons, 25% of which are for foreign countries. Taking into consideration the orders already obtained, this percentage is likely to reach 50% in 1956. Among the recent orders from abroad, it is necessary to note an order for giant tankers of 52,000 tons from the U.S.A.

Jute	29	28	June	Aug.-Sept.
District	28-3	27-8	"	"
Northern	27-3	27	"	"

In the Cossipore markets this week imports have been very irregular, but improved towards the close when the accumulation of several days' wagons began to arrive. There was more Northern Bengal jute in recent arrivals than of late, but there is very little demand for local delivery jute. Rates have fallen over the week and at the close Kishanganj jute is quoted at Rs. 27-8 a maund for garsat quality. There is nothing to report from the Daisee markets, where only a very small amount of jute is left for offer. New Crop conditions are still unfavourable and are giving cause for some anxiety. In some areas farmers have not started ploughing because of the lack of rain, and it is feared that the Daisee Crop may be very late. Conditions in the Southern and Eastern Districts have improved recently and the new crop is reported to be very healthy. Latest quotations in Sheoraphuli are nominal in the absence of business and are based on Rs. 30 a maund for garsat quality.

Mofussil: There is very little business passing in the Indian upcountry markets where imports are negligible. Nearly all the Old Crop jute is now in the hands of sellers who are very keen to get rid of their stocks. Prices have fallen over the week in sympathy with the Calcutta markets, and at the close quotations in Dhubri are based on Rs. 25-8 a maund for Bottoms.

The Pakistan markets are weak in the absence of business, and quotations have dropped eight annas to Rs. 1 over the week. Old Crop imports are very small and irregular, and mainly low grade jute. There is a glut of high grade jute in all areas but no demand for this type of fibre. Lists of licence holders have now been issued, and it is reported that 138 licences have been renewed and 154 cancelled. Latest quotations in Narayanganj are based on Rs. (P) 18-8 a maund for Jat Bottoms and Rs. (P) 19-0 to Rs. (P) 20 a maund for Jat Tossa Bottoms.

INDIAN JUTE CROP REPORT

In their eleventh crop report for the current Indian season, covering the week ended 28th June, Messrs. Sinclair Murray & Co. Ltd., say that weather conditions have been mainly favourable in all districts with the exception of Murshidabad. In Assam and Bihar, sowings have now been completed and the plant condition in these provinces is very satisfactory; elsewhere further rainfall is still required to improve the growth and to allow cultivators to continue with sowing operations. River levels are normal for this time of the year with the exception of Assam where they are rising steadily and are now higher than at this time last year.

DANPUR: The weather has been hot and dry but following good rainfall over the previous week-end cultivators have made progress with further sowings, estimated to date at -/14/- as against -/7/- sowings at this time last year. Condition of young plants is now satisfactory but further rainfall is necessary to improve the condition of earlier sown plants which now range in height up to 1ft. 6in. The river level is normal for this time of the year.

JAJPUR ROAD: Very hot and dry weather conditions have been experienced which is not favour-

able and rainfall is urgently required to improve the condition of young plants and to allow cultivators to proceed freely with sowings. It is estimated that sowings to date amount to -/12/- as against -/13/- at this time last year. Plant condition is not very satisfactory; the plants range in height from seedlings to 1ft. 3in. Weeding operations are going on freely where required. The river is the same as at the corresponding date last year.

COSSIMBAZAR: With the exception of one shower in the middle of the week, the weather has been very hot and dry which is unfavourable and heavy rainfall is urgently required to benefit the standing crop and to allow cultivators to proceed freely with sowings. This year's sowings are estimated at -/4/- as against -/4/- at the same time last year. Weeding operations are going on where necessary. Plant condition is not satisfactory; the plants range in height from seedlings to 1ft. 3in. The river level is very slightly lower than at this time last year.

RANAGHAT: With the exception of one light shower in the early part of the week weather conditions have been hot and dry and further rainfall is necessary to promote the growth of young plants. sowings to date estimated at -/17/- go against -/14/- at this time last year. Weeding operations are going on where required. Plant condition is considered satisfactory and the plants range in height up to 2ft. The river level is normal for this time of the year.

NOWGONG: Sowings completed -/22/6. During the past week, alternate rain and sunshine has been experienced which has been favourable for the standing crop. Weeding operations are going on as required. Plant condition is satisfactory and the plants range in height from seedlings to 3ft. 6in. The river is rising steadily and is slightly higher than at this time last year.

PALASHBARI: Sowings completed -/24/-. Very favourable weather conditions have been experienced being mainly hot and dry with the exception of a good shower in the early part of the week; cultivators have been able to complete sowings at -/24/- as against completed sowings at the same time last year. Second weeding operations have been completed in the lowlands and are going on freely in the midland areas. Plants are reported to be healthy and their growth is satisfactory ranging in height up to 4ft. The river level is rising rapidly and is now 4ft. higher than last year at this time.

DHUBRI: Sowings completed -/20/-. Weather conditions have been mainly hot and dry. Second weeding operations have been completed in the midlands and are being carried on in the highland areas where required. Plant condition is very satisfactory and the plants range in height from 6ft. to 3ft. 6in. The river level has been steady and now stands at 2ft. higher than on the corresponding date last year.

FORBESGANJ: Sowings completed -/24/-. Favourable weather conditions have been experienced with alternate rain and sunshine which has been very beneficial for the standing crop. Weeding operation is going on freely where required. Plant condition is healthy and the plants range in height up to 3ft.

DAISEE DISTRICTS: With the exception of moderate rainfall in the early part of the week, the weather has been hot and dry and further rainfall is urgently required to allow cultivators to continue freely with sowings which are estimated to date at -/12/- as against completed sowings last year at this time. Where rainfall has been experienced plant condition is satisfactory but not so satisfactory elsewhere. Plants now range in height from seedlings to 1ft. 9in. The river level is normal for this time of the year.

Rainfall	For the week 1955	1954	Total from 1st Jan. 1955	Rainfall over the Week-end

N.B.—As a basis of comparison, last season's sowings have been taken as -/16/-.

PAKISTAN JUTE CROP REPORT

In their twelfth crop report for the current Pakistan season, covering the week ended 28th May, Messrs. Sinclair Murray (Pakistan) Ltd., say that the weather has been favourable with all areas receiving alternate rain and sunshine. Weeding operations are going on in the mid and highlands as required. Plant

condition is satisfactory everywhere. The river levels continue to be reported as irregular.

NARAYANGANJ: Sowings completed -/21/-. Weather during the past week has been very favourable with alternate rain and sunshine. Plant condition continues to be satisfactory and the plants range in height up to 4ft. The river level is the same as at this time last year.

DACCA: Sowings completed -/21/-. Favourable weather conditions have continued with good rainfall during the early part of the week. Plant condition is satisfactory and the plants range in height up to 3ft. 9in. Weeding operations are going on in the mid and highlands as required. The river level is lower than at this time last year.

CHANDPUR: Sowings completed -/21/-. Weather conditions have been favourable with alternate rain and sunshine. Plant condition is satisfactory and the plants range in height up to 5ft. The river level is higher than at this time last year.

NIKILIDAMPARA: Sowings completed -/21/-. Favourable weather conditions have been experienced with alternate rain and sunshine. Plant condition is satisfactory and the plants range in height up to 3ft. Weeding operations are proceeding freely in the highlands. The river level is higher than at this time last year.

SARISHABARI: Sowings completed -/20/-. The weather has been generally favourable but more rainfall is required. Plants are reported to be healthy and range in height up to 3ft. 6in. Weeding operations are going on as required. The river level is higher than at this time last year.

SIRAJGANJ: Sowings completed -/21/-. Weather has been favourable with alternate rain and sunshine. The condition of plants is satisfactory and they range in height up to 5ft. 3in. The river level is lower than at this time last year.

NAKALIA: Sowings completed -/21/-. Favourable weather conditions have been experienced with alternate rain and sunshine. Plant condition is reported satisfactory and the plants are progressing favourably, ranging in height up to 4ft. 9in. Weeding operations are going on as required. The river level is lower than at this time last year.

BIHANGORA: Sowings completed -/20/-. Favourable weather conditions have been experienced with alternate rain and sunshine. The condition of plants is reported to be good and the plants range in height up to 5ft. Weeding operations are going on as required. The river level is higher than at this time last year.

THE FOREIGN JUTE MARKETS

DULLNESS STILL DOMINANT

(FROM OUR DUNDEE CORRESPONDENT)

BUYERS of all jute trade commodities are awaiting further developments. They have watched raw jute prices steadily falling to the minimum level fixed by the Pakistan Jute Board last July and now they are wondering what is to happen next. Will the Pakistan Jute Board fix new minima, or will they declare that the existing minima will remain unchanged over the next twelve months? Until such time as a declaration of some sort is made, the position of the Dundee market will remain in its present uncertain and unsatisfactory state. There are arguments against prices being maintained for the coming season. Undoubtedly, there is plenty of raw jute remaining from the present crop to see the trade out till the new comes along. This can be seen from the urgency with which offers are being made and solicitations for bids which are frequently being accepted, especially if the jute is afloat or ex warehouse, at a few pounds under the rates quoted for shipment.

Mill Firsts have now come back to £90, the minimum rate, at which there are one or two sellers of not very good marks, and Mill Lightnings are quoted at from £93, crack marks of Daisee-2/3 from £92 and grade from £82, grade Tossa-2/3 from £99 and grade fours from £90, all June shipment, cif. U.K. New crop sellers have now come out in greater force and good marks of Mill Firsts are offered at £92 for July-August shipment and £90 for September-October, with Mill Lightnings at £10 less, cif. U.K. So far no sales have been reported at these levels. As a matter of fact, spinners expect to purchase at less later. Spinners and manufacturers in Dundee are not so favourably situated now that prices have fallen. The bulk of their raw material has been purchased by spinners at much higher prices than those ruling late last week. Yarn rates have fallen in sympathy with raw jute and there may be another reduction in these before long. A change in the existing rates for both yarns and cloth is certainly due, on account of the increases in wages granted. Calcutta goods were easier last week at 68s 3d for 10 oz. 40 in. and 50s 9d for 71 oz. May and June. 68s 3d and 50s 6d July-September and 66s 9d and 50s 3d October-December, with B twills at 180s. 177s 9d, 174s 0d and 164s 0d for the respective periods, all f.o.b. Calcutta. Dundee yarns are steady at 15.07d for common 8 lb. cops and 8 lb. spools, and hessians at 12.88d a yard for 10 oz. 40 in. and 10.53d for 8 oz.

Commodity Markets

WHOLESALE PRICE INDEX RISES

THE official wholesale price index (base: year ended August 1939=100) advanced by 0.1 percent to 342.2 during the week ended 14th May, 1955 as compared with 340.7 for the previous week. Relative to the corresponding weeks of the last month and a year ago, the index was lower by 0.7 and 13.8 percent respectively. The index for Foodstuffs advanced by 1.5 percent to 276.5 due to an increase in the prices of dal arhar (+5%), gram (+4%), wheat and jowar (+3% each), rice and sugar (+2% each) and bajra (+1%) despite a decrease in the price of tea for internal consumption (—5%). The index for Industrial Raw Materials, declined by 0.5 percent to 393.9 because of lower prices of raw skins (—18%), manganese ore (average export prices) and raw silk (—6% each), gingellyseed (—5%) and rapeseed (—4%) in Bombay, groundnuts (—2%) and cotton seed and castorseed (—1% each). Prices of gingellyseed at Jhansi (+9%), rapeseed at Kanpur (+8%) and in Calcutta (+5%), cottonseed and lac (+4% each), linseed (+3%) and copra (+1%) were marked up. In the case of Semi-Manufactures, items which showed significant variations were: Gingelly oil (+7%), cow hides (+6%), linseed oil (+4%), mustard oil (+3%), castor oil (+2%), gingelly cake (—5%) and copper (—3%). The group index stood at 328.3 as compared with 328.2 for the previous week. An advance in the prices of jute manufactures (+2%) raised the index for Miscellaneous group moved up by 0.5 percent to 542.9 as a result of higher prices of black pepper at Cochin and chillies (+3% each) and cashew-nuts at Mangalore (+2%). The price of turmeric in Calcutta (—3%), however, showed a fall.

WORLD SMELTER PRODUCTION OF COPPER IN 1954

World smelter production of copper (excluding secondary production) fell by approximately 9,000 tons in 1954 and totalled 2,706,400 long tons according to the British Bureau of Non-Ferrous Metal Statistics. This included an estimated production of 334,000 tons in the Soviet sphere compared with 331,500 in 1953. Production in the rest of the world totalled 2,372,449 tons compared with 2,384,235 tons in 1953. In the U. S. A., the world's largest producer, output fell by 91,000 tons but there were increases in many other countries, notably Canada and the Belgian Congo. Production in the five leading countries was as follows, in long tons, with 1953 figures in brackets:—

U.S.A.	844,553 tons	(835,545)
Northern Rhodesia	345,748 tons	(340,295)
Chile	333,750 tons	(331,915)
Canada	234,188 tons	(191,862)
Belgian Congo	216,450 tons	(205,918)

These countries account for nearly 85 percent of the free world's smelter production.

WORLD PRODUCTION OF SLAB ZINC IN 1954

According to figures published by the British Bureau of Non-Ferrous Metal Statistics, world production of slab zinc totalled 2,368,800 tons in 1954, an increase of 41,100 tons over 1953. This included an estimated production of 323,000 tons in the U.S.S.R., Poland and other Soviet-controlled territories. Production declined by approximately 90,000 tons in the U.S.A., the world's largest producer, and by over 27,000 tons in Canada. These falls were more than offset by increases in most other producing countries, notably in Belgium,

France, Germany, Japan and in the Belgian Congo where production did not start until 1953. Output in the main producing countries was as follows, in long tons, with 1953 figures for comparison:—

U.S.A.	775,216 tons	(865,161)
Belgium	209,729 tons	(190,372)
Canada	193,722 tons	(221,168)
Germany	166,664 tons	(148,240)
France	106,690 tons	(76,692)
Australia	104,522 tons	(90,178)

These countries account for over 75 percent of the free world's production of slab zinc, other leading producers being Japan, United Kingdom, Italy and Mexico.

U.K. WOOL STOCKS INCREASE

Stocks of wool in the United Kingdom at the end of March are estimated at 255,800,000 lbs. (clean weight) by the Wool Industry Bureau of Statistics. This represents an increase of 12 million lbs. on the position a year earlier. Although the March figure was only 500,000 lbs. above that at the end of February, commercial stocks were higher because stocks of British wool in the hands of the British Wool Marketing Board showed a decrease of 5 million lbs. The increase of 12 million lbs. in 12 months was accounted for by 7 million lbs. of merino wool and 5 million lbs. of other varieties. Stocks of tops in the United Kingdom on 31st March were 50 million lbs.—an increase of some 1,400,000 lbs. on the previous month's figure.

Plantation Topics

LONDON TEA SALES

At last week's London tea sales, the 38,763 packages on offer realised an average price of 3s 9.15d a lb. against 3s 9.72d in the previous week and 4s 10.80d a year ago. Plain broken pekoe was quoted at 3s 4d.

Results obtained by some of the companies are given below:

	No. of packages	Av. per lb.
Amalgamated Anglo-Ceylon Assam Co.	400	3/5 3/4

U.K. Tea Stocks

U.K. tea stocks in London and provincial bonded warehouses on 26th May totalled 157,980,460 lbs. Against 160,892,820 lbs. in the previous week. The average price realised at the auction during the week was 45.15d a lb. as against 45.72d a lb. in the previous week and 58.80d a lb. during the corresponding week last year.

TEA GARDENS WITHDRAWN FROM AUCTION

Public auctions for the sale of two tea estates of the Assam Company, Ltd. took place in Calcutta yesterday. Both were withdrawn because the highest bid in each case fell below the reserve price. The highest offer for the Tingalibam tea estate amounted to Rs. 22.10 lakhs, against the reserve price of Rs. 26 lakhs. The best bid for the Towkok tea estate was Rs. 35 lakhs. Though no reserve price for this garden was set, a price of Rs. 45 lakhs is thought to be what the owners had in mind. Both the gardens are situated in the Sibsagar district of Assam and are adjoining. Tingalibam has a total area of 2,947 acres, of which 720 acres are under tea. Towkok has a total acreage of 7,740 with 1,224 acres under tea. The estates are among the 12 gardens of the Assam Company, Ltd. The two estates produced a crop of 2 million lbs. of tea in 1953 and constituted 18 percent of the total crop of 11.4 million lbs. of the Assam Company.

SECOND ESTIMATE OF TOBACCO

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India second estimate of tobacco for 1954-55 puts the current year's area at 836,000 acres, as against the adjusted corresponding estimate of 818,000 acres for last year. Thus the current year's estimate shows an increase of 20,000 acres or 2.4 percent in area over last year. The increase in area has mainly occurred in Andhra State due to favourable weather conditions. This increase has, however, been offset to some extent by decreases reported mainly by Bihar, Bombay and Hyderabad. The information given in this estimate generally relates to the period up to the end of February, 1955. Till then, the condition of the crop was reported to be generally satisfactory. However, the crop was reported to have been attacked by aphids in the Coimbatore district of Madras and tobacco nurseries were affected by heavy rains in the Guntur district of Andhra State in September, 1954. This estimate does not cover the entire area sown to tobacco crop during 1954-55. Past experience has shown that the area at the second estimate stage forms roughly 95 percent of the area under the crop finally reported.

COLOMBO RUBBER PRICES

Calcutta Markets

FREIGHT RATES MOVE UP

SCARCITY of tonnage in the North Atlantic trades and uncertainty of discharging at the strike-bound U.K. ports forced rates up to their former peak level. Charterers in the American coal trade paid 62s 2d for three consecutive voyages to the U.K. commencing in June. River plate charterers paid the improved rate of 110s for June-July shipment to the U.K. From the Gulf, sugar charterers are seeking tonnage to the Continent and India. Sugar from Queensland to the U.K. has been fixed at 160s for July-August shipment. Australian grain charterers require tonnage but owners appear to favour sugar shipments. Good enquiry from India still continues but little business has been concluded. There are several enquiries for scrap charters. A 9,600 tonner was fixed from Bombay to Japan at £44,000 f.i.o.s. for scrap and iron ore and/or manganese ore.

The time charter section is again quiet but a Liberty type vessel was taken for two years trading at \$ (U.S.) 3.08. A newly built motorship was fixed for two years trading at \$ (U.S.) 4.50 with delivery the U.K. in June.

SUGAR MARKET

During the week ended 1st June, sugar sales in the Calcutta market averaged nearly 4,000 bags a day. Arrivals were 3,000 bags daily and stocks rose to about 500,000 bags. Rates for ready sugar ex-Kantapur delivery were Rs. 30-4 for ordinary grain and Rs. 31-4 for big grain. Forward delivery sugar sold at the same rates for ordinary and big grain varieties. Ex-mill delivery rate for D 28 grade sugar was Rs. 28-8. The market was dull with prices tending to ease.

LINSEED

Prices advanced further during the past week following improved demand for oil. Firm conditions prevailed upcountry, and although goods were arriving locally on a fair scale, supplies fell short of demand. Keen trading was reported, mainly, for forward deliveries. Prices advanced in the oil section following keen enquiries from local shippers; the availability of ready oil was poor, and sellers were reserved. Latest quotations were as follows: Ready-June Rs. 16 a maund; June-July Rs. 16-4 a maund.

HIDES AND SKINS

The market ruled quiet but steady. Stocks were higher than in the previous week.

Bazaar Sales

(Between 24th May and 30th May, 1955)

Cowhides:—Wet salted (Slaughtered) 16,100 pcs.

Goatskins:—Wet salted (Daissee, Killed) 30,010 pcs. on the basis of Rs. 230 to Rs. 380; Assam-Dinajpur-Murshidabad 19,200 pcs. on the basis of Rs. 252 to Rs. 315; Purneah-Kissengani 6,500 pcs. on the basis of Rs. 310 to Rs. 345; Pakur-Patna (Ord.) 6,500 pcs. on the basis of Rs. 217-8 to Rs. 225; Muzafferpore-Patna 3,500 pcs. on the basis of Rs. 240 to Rs. 270.

Bazaar Stocks

(30th May, 1955)

Cowhides:—Wet salted 76,900 pcs.

Goatskins:—Wet salted (Daissee, Killed) 9,000 pcs.; Assam-Dinajpur-Murshidabad 85,000 pcs.; Muzafferpore - Patna - Pakur - Purneah - Kissengani 2,92,000 pcs.

SHELLAC MARKET DULL

During the week ended 31st May, the market was steady at the beginning but became dull at the end. The range of quotations was as follows:

Pure Buttonlac	Rs. 142-142 buyers; 139-8 value.
Lemon No. 1 shellac	Rs. 147 done; 146-8 to 140-8 buyers.
Lemon No. 2 shellac	Rs. 140 done and buyers; 139 to 134-8 buyers.
F. O. Std. 1 Shellac	Rs. 138-136 done and buyers; 132 to 130 buyers.
Pure TN Shellac	Rs. 134-135 basis done and buyers; 128 done.
4% I. T. N. Shellac	Rs. 128 buyers; 125 value; 120 buyers.
No. 1 Kusmi Seedlac	Rs. 137 buyers; 138 to 134 value.
No. 2 Kusmi Seedlac	Rs. 131 done and buyers; 128 to 129 done and buyers.
Fine Bysaky Seedlac (Manbhumi)	Rs. 126 to 122 buyers.
Fine Bysaky Seedlac (C. P.)	Rs. 120 to 116 buyers.
Ordinary Bysaky Seedlac (C. P.)	Rs. 115, 110-8, 112 buyers.
Kireelac	Rs. 54 to 53 buyers.

Shipments during May until the 28th were 33,563 packages.

New Delhi

(Continued from Page 816)

Committee should be increased to Rs. 15 lakhs, it is suggested. This will mean Rs. 25 lakhs for research purposes. A provision of Rs. 10 lakhs may be made for strengthening and improving the Jute Technological Laboratory in Tollygunge and for some further construction work in the Jute Agricultural Research Institute at Barrackpore. All samples of jute have got to be tested in this laboratory and without such tests no Government certificate can be given.

The total expenditure on jute development and research is shown below:

	Rs.
Assistance to States for jute Development:	66
Research	35
Total	101
States share of expenditure:	66
Total	167

Of the Rs. 66 lakhs expenditure shown as assistance to States a sum of Rs. 15 lakhs will represent the Committee expenditure on schemes started during the first five year plan. The balance of Rs. 51 lakhs represents new development expenditure during the second five year period.

In the current five year plan the target of production was 55 lakh tons of oilseeds. The production during the year 1950 to 1954 was as follows:—

	(lakh tons)
1950-51	51
1951-52	48
1952-53	46
1953-54	56

The decline in the production of oilseeds during 1950-51 to 1952-53 years was mainly due to seasonal factors. Figures of production for 1953-54 shows an overall increase in the production of all the five major oilseeds. The production of groundnuts during 1952-53 was 37.72 lakh tons against the previous year's figure of 28.84 lakh tons. India has already achieved the target of 55 lakh tons of oilseeds fixed in the first five year plan.

The target for the next five year plan is fixed at 70 lakh tons or about 27 percent higher than the figure laid down in the first five year plan. The Indian Central Oilseeds Committee has been carrying out certain schemes of production and distribution of good quality seeds. The results of some of these schemes have been promising. The production of the Spanish varieties of groundnut was 1,081 lbs. an acre in the Punjab against the existing production of 400 lbs. an acre of old varieties. The comparative figures for linseed and castor seeds are given below:—

Linseed	400 lbs.	740 lbs.
Castor seed	3.6 maunds	8.9 maunds

It is regarded as being possible to increase production substantially even if no additional acreage were brought under oilseeds. During the next plan, therefore, India may concentrate on intensive cultivation methods for producing the additional target of 15 lakh tons of oilseeds proposed in this plan. These intensive cultivation methods will involve:—(a) Expansion of research on evolving new and better varieties of oilseeds and their distribution; (b) Application of fertilisers and manures; and (c) Controlling pests and diseases.

It is essential to make a specific mention of groundnut and castor seeds in any oilseeds scheme. The production of groundnuts during 1953-54 was 37.72 lakh tons. Since it is a very important oilseed, both from the point of view of internal consumption and exports, it is suggested that the target for groundnut be fixed at 47 lakh tons for the next five year plan. The production of castor seeds during 1953-54 was 1.07 lakh tons. Since castor seeds have become important from the viewpoint of new industrial uses it is likewise suggested that the target be fixed at 1.61 lakh tons, namely about 50 percent higher than the existing production. The increase in the yield of groundnut and castor seed as a result of the multiplication and distribution of good quality seeds has already been indicated. Production is more than double in the case of the Spanish varieties of groundnuts. The targets of 47 lakh tons of groundnuts, 1.61 lakh tons of castor seeds and 21.39 lakh tons of other oilseeds during the next five year plan, is therefore possible to achieve.

India's total exports of oilseeds and oils during 1952-53, in terms of seeds, were 380,000 tons. This included 183,000 tons of groundnut and groundnut oil in terms of seeds. Though the exports in 1953-54 were lower, it is suggested that India might aim at an export figure of 7 lakh tons of oilseeds during the next five year plan period of which about 5 lakh tons should be groundnuts. This will leave a total of 63 lakh tons of oilseeds for consumption in the country. A sum of Rs. 57½ lakhs may be provided for carrying out the programme. Out of this, a sum of Rs. 25 lakhs may be earmarked for expansion of research on evolving new and better varieties of oilseeds, if necessary by setting up a separate institute for agricultural research on oilseeds. The State Government will also be expected to find a sum of Rs. 32½ lakhs. A sum of Rs. 35 lakhs should be provided for technological research. This money will be spent mostly on the establishment of a Central Institute of Oil Technology which has been recommended by the Indian Central Oilseeds Committee.

The Indian Central Oilseeds Committee will be able to find a sum of Rs. 25 lakhs for oilseed work from its funds. A sum of Rs. 57½ lakhs will, there-

COMPANY AND PUBLIC NOTICES

IMPERIAL BANK OF INDIA

NOTICE

NOTICE is hereby given that the Principal Register and the Branch Registers of the Imperial Bank of India will be closed for transfer of shares from Thursday, the 16th June, 1955 to Thursday, the 30th June, 1955, both days inclusive.

In terms of Section 6 (1) (a) of the State Bank of India Act, 1955 all shares in the capital of the Imperial Bank of India shall be transferred to, and shall vest in, the Reserve Bank of India, free of all trusts, liabilities and encumbrances on the "appointed day" which has been fixed for the 1st July, 1955 by the Government of India Notification No. F. 8 (8)-F. 1/55 dated the 14th May, 1955. Section 9 (1) ibid provides that every person who immediately before the 1st July, 1955 is registered as a holder of shares in the Imperial Bank of India shall be entitled to compensation in accordance with the provisions contained in the First Schedule.

All purchasers of Imperial Bank of India shares are therefore advised to lodge with the Bank for registration the instruments of transfer in their favour along with the relative share certificates, not later than the 15th June, 1955.

S. K. HANDOO,
Managing Director.

Bombay, the 17th May, 1955.

THE EMPIRE JUTE COMPANY, LIMITED

NOTICE is hereby given that the Eighty-fifth Ordinary General Meeting of the Shareholders of THE EMPIRE JUTE COMPANY, LIMITED, will be held at "McLeod House", No. 3, Netaji Subhas Road, Calcutta, the Registered Office of the Company, on Tuesday, the 21st June, 1955, at 3-0 P.M., for the following purposes:—

- (1) To receive the Directors' and the Managing Agents' Report and the Auditors' Report and to pass the Accounts for the half-year ended 31st December, 1954.
- (2) To declare Dividends.
- (3) To elect a Director. Mr. J. H. Methold retires by rotation and, being eligible, offers himself for re-election.
- (4) To appoint Auditors and to fix their remuneration.

The Share Transfer Books of the Company will be closed from 7th to 21st June, 1955, both days inclusive.

By Order of the Board,

Per Pro McLEOD & CO. LTD.,

W. URE,

Managing Agents.

3, Netaji Subhas Road,

Calcutta, 31st May, 1955.

NOTE:—Payment of the proposed dividends, if declared, will be made on or after 28th June, 1955 only to those members whose names are registered in the Books of the Company on the 21st June, 1955, or to their Mandatees.

No application for Warrants will be necessary. Claims on behalf of holders of shares on blank transfer will not be entertained.

RAMPOORIA COTTON MILLS LTD.

NOTICE is hereby given that the Twelfth Annual Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company, 147, Cotton Street, Calcutta, on Monday, the 27th June, 1955 at 2 P.M.

- (a) To receive and pass the Directors' Report and Audited Accounts for the year ended 30th June, 1954.
- (b) To declare Dividend on Ordinary Shares only.
- (c) To elect Directors.
- (d) To appoint Auditors of the Company and to fix their remuneration.

—And—

- (e) To transact any other business that may be brought forward.

The Share Transfer Register will be closed from 14th June to 27th June, 1955, both days inclusive.

By Order of the Board of Directors,

NATHMULL RAMPURIA,

Director.

147, Cotton Street,

Calcutta, 30th May, 1955.

THE CALCUTTA STEAM NAVIGATION CO., LTD.

A dividend of Rs. 5/- per share for the half-year ended 31st December, 1954, has been declared payable at once in the Indian Union.

HOARE MILLER & CO., LTD.,

Managing Agents.

5, Fairlie Place,

Calcutta, the 30th May, 1955.

THE TATA IRON AND STEEL COMPANY, LIMITED

NOTICE

THE Transfer Books of the Company will be closed from Friday, the 1st July to Friday, the 29th July, 1955, both days inclusive.

The dividends for the year ended 31st March, 1955, when sanctioned, will be made payable to those shareholders whose names stand on the Share Registers of the Company, on Friday, the 29th July, 1955.

By Order of the Directors,

TATA INDUSTRIES LTD.,

Managing Agents,

J. J. GHANDY,

Director.

Bombay, 27th May, 1955.

THE UNITED PROVINCES SUGAR COMPANY, LIMITED.

THE Directors at a Board Meeting held to-day decided to recommend to the Shareholders in General Meeting the payment of a dividend of 12½ per cent for the year ended 30th September, 1954.

Notice calling the Annual General Meeting for 29th June, 1955, will be published shortly.

By Order of the Board,

JAMES FINLAY & CO., LIMITED,

Managing Agents.

Calcutta, 31st May, 1955.

THE BOKAKHAT TEA CO., LTD.

A Dividend at the rate of 10%, without any deduction for Income Tax paid by the Company, for Season 1954 has been declared payable at once.

OCTAVIUS STEEL & CO. LTD.,

Managing Agents,

Calcutta, 25th May, 1955.

CARE . . .

P. L. M. WEEK
June 1-7.

Our shocked knowledge that crores of rupees are annually paid by the railways in Claims must need be balanced by the conviction that Claims are mostly man-made and can, therefore, be almost wholly prevented. You, as a consignor, can help the railways by ensuring every time that your consignment is securely packed, properly labelled and correctly marked.

THIS IS HOW YOU CAN HELP

- ▶ Pack the goods in strong cases. Nail properly and securely.
- ▶ Line the case with shock-absorbing and airtight waterproof material.
- ▶ Enclose a spare label.
- ▶ Remove all traces of old markings.
- ▶ Address neatly, boldly and indelibly.
- ▶ Mark correctly.
- ▶ Indicate the nature of goods consigned.

H indicates that Share capital is half paid. O, C and Dd indicate Ordinary Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in 'accounts closed' column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

MR NEHRU PROMISES A "MORE REALISTIC" PLAN

MAHALANOBIS AND THE McCARHYITES

THE economic critics of the Mahalanobis plan would appear to have got home their main point, for the Prime Minister said at his Press conference last week : "All these figures are being examined with State Governments, with the Central Ministries, so that in the course of some months we should produce a plan frame which is more realistic so far as figures are concerned." Mr. Nehru, throughout that conference, showed a noticeable disinclination to defend any of Professor Mahalanobis's calculations. In response to a direct question from a journalist as to whether the Professor had calculated with any precision the resources available to attain his targets, Mr. Nehru seemed to say (seemed, for he was difficult to follow on this point) that "of course he cannot calculate resources" and that this job was being undertaken slowly and carefully by the Planning Commission. So the actual aims of the next five year plan in each individual sphere of the economy, and the estimates of resources, have yet to be settled in a series of broad discussions that are scheduled to be held over the next six to nine months; the final plan will be presented next March. During these discussions, as we said on this page three weeks ago, "the facts cannot fail to assert themselves". Meantime, the important point has been won, that Professor Mahalanobis's figures are not the facts.

This is as much as the economic critics of the Mahalanobis plan have sought, because their quarrel was with the supposed calculations that supported the magnitude of its dimensions. If more leisurely study by a variety of Central and State experts brings out the discrepancy between the costs and the available resources, we have no doubt that the plan will be modified accordingly. This line of argument is quite distinct from the ideological onslaught against the Indian Statistical Institute, which has at times recalled the conventional McCarthyite smear campaign: Professor Mahalanobis has worked with foreign economists of uncertain political standing, therefore he and they are all Communists, therefore any plan he produces will be a straight Stalinist document. This is the extraordinary theory we referred to here last month: that "the Prime Minister has become the victim of an ambitious statistician who is trying to kidnap India into Communism. We added: "India is in no danger of being kidnapped into Communism or anything else." The Prime Minister was naturally rather nettled about this tale, as his unsolicited references to it at his Press conference showed. In any event it is disposed of by the programme of discussion and full public consultation which the National Development Council has sanctioned for the rest of this year.

The just criticism of the Mahalanobis plan is that, by grossly over-estimating the revenues available to the Government for investment over the next five years, and by under-estimating the costs of the work to be done, it invites the country to overstrain itself very dangerously indeed. The Panel of Economists have admitted that the strain will be dangerous, and they are also clear on the fact that the strain will transmit itself from the economic to the political level: constitutional changes will be required. Our guess is that those changes would tend to increase the centralisation of the economy by abridging States' rights, and would favour interference with individual choice between spending and saving. Even then, these adjustments would not be sufficient to correct the great inflationary forces released by a too ambitious development programme, and the consequence would be confusion and disorganisation that would stultify all planning. The Mahalanobis plan is not a Communist document, and we can well understand that its supporters think of it precisely as a plan to save India from Communism. But by mistaking recklessness for heroism, it would bring about chaotic conditions from which Communism might well benefit, just as it benefited

elsewhere from wild inflation and economic breakdown.

Nevertheless, if the charge of Communism is unwarranted, the authors and advocates of this plan have a lot of explaining to do before they can be accepted as believers in Indian democracy. They are all plainly discontented with the present democratic polity, which they see as an obstacle to their sort of planning. They are calling for urgent and drastic changes, administrative and constitutional. We would have thought that if an influential body of advisers, who evidently retain the Prime Minister's confidence, had plans for changing India's Constitution and administration, they would have been good enough to tell the people just what these changes are. Instead, there are only dark hints and clarion calls for precipitate action. (We quoted some of them on this page a few weeks ago.) If the proposed plan is so consistent with democracy as to be free of the suspicion of Communism, then its authors should follow the customary democratic practice and announce plainly what changes they consider necessary. Loud cries for urgent but unspecified action are not symptoms of a democratic temper. Mr. Nehru himself was thoroughly ambiguous on this question. At one point in his Press conference he said: "We have got a democratic framework of structure of Constitution. We value it. We propose to adhere to it and to plan within that democratic structure". Yet a few moments later, speaking of possible (we should say certain) conflict between total planning and democracy, he said: "If there is that conflict, then we will have to think what (constitutional) structure to have because one has to make progress". Unless we quite mistake his meaning, the Prime Minister is saying that planning must be consistent with democracy, but if it is not, then democracy must be the loser. This is scarcely a clear or satisfactory position to take up on a matter of importance.

However, there is no use in debating these questions in general terms. We learn nothing from statements about the relative importance of such abstractions as "planning" and "democracy". What is needed to enlighten the public on the proposed plan is a clear confession from the planners of what political measures they regard as necessary to implement their schemes. This is not an unreasonable request to put to a cabal of experts who claim to forecast accurately how much sugar we will be consuming six years from now, how much cloth we will be buying, how much tax we will be paying. They evidently have ideas on how much freedom we will be enjoying too, but they are much less specific on this. For example, does the next plan call for increased centralisation, less autonomy for the States? The whole drift of Professor Mahalanobis's thinking suggests this will be the case, though he ends up with the pious admonition: "There must be decentralisation....." That we are not alone in considering the danger of a contrary development is shown by a statement from the Planning Minister, Mr. G. L. Nanda, over the radio last week. He said: "There is a danger ever present in planning, especially when it enters the phase of industrialisation, that there may develop an excessive degree of centralisation of resources and of decisions. This is a danger to be guarded against." India's federal Constitution does guard against it, but the planners are saying that the Constitution must be revised.

The McCarthyites have had a drubbing from Shriram Narayan, the chief editor of the Congress's official organ, the *Economic Review*. In a leading article in its latest issue he says: "The fears regarding totalitarianism and centralisation are unfounded and should not be allowed to cloud our vision". He denies that nationalisation has any large part to play in the next plan, but this assertion cannot be squared with the documents on which that plan is to be based. Professor Mahala-

nobs says on page 9 of his paper: "The Government will be prepared to enter into such activities as banking, insurance, foreign trade or internal trade in selected commodities and again: "Government would also take up the victory production of certain consumer goods which are of strategic importance....." The joint paper, prepared by the Finance Ministry, Planning Commission and Statistical Institute says rather less dogmatically: "It might be necessary for the State to enter into the field of trading or production of consumer goods. The scope for such expansion of State activity into profit-making ventures will have to be carefully examined". The Panel of Economists, less dogmatic still, is nevertheless ominous once saying that there is no objection in principle to the extension of the public sector, it adds: "State trading in exports of jute (*sic*), for example, was recommended many years ago by a representative committee consisting of administrators, business men, etc. In view of the peculiar position of these exports and the methods of trading in them, it is worth examining again whether State trading in jute should not be undertaken". In view of this impressive list of proposed nationalisations is it sufficient for Shriman Narayan to say: "At the A.I.C.C. session at Berhampur, Shri Nehru emphatically declared that the slogan of nationalisation was not going to solve India's economic problems"?

Although he conceded that the plan frame will have to be made more realistic so far as figures are concerned, the Prime Minister last week deprecated the purely financial approach to planning, saying: "You may have to proceed in physical terms which ultimately will be checked by physical resources which are, I should say, financial plus others." Precisely: it is not enough to have money, because other resources are required for economic progress. One of the main resources is administrative and technical manpower, and by greatly over-estimating this the Mahalanobis plan goes as far wrong as it does in regard to its financial calculations. Mr. Nanda stated the facts on this subject in his broadcast: "There are few fields in which any considerable increase in development does not come up against an acute shortage of trained and skilled workers... (there are) shortages in such categories as overseers and draftsmen, sub-overseers and mistries, mechanical and electrical assistants and accountants". These are serious enough for the nation as a whole, but they are much more acutely felt in the Government, because private industry pays so much better. It would be interesting to know just how many chartered accountants the Government now has in its employ, and how many actuaries. Yet the Mahalanobis plan requires the Government to launch on a vast expansion of its industrial interests. On this showing the Government of India will have to find within the next five or six years the experienced technicians and administrators to do the following jobs: provide 400 new bank managers for the State Bank; staff three million-ton steel mills; establish three new fertiliser factories the size of Sindhri; instal a 300,000-ton State synthetic petrol plant; establish "one or more" large aluminium plants in the public sector; and start a plant for the manufacture of heavy electrical equipment. In addition, the State will have to run a greatly expanded administrative and social welfare machine, even if none of the nationalisations suggested by its advisers are undertaken. Private enterprise, meantime, is supposed to expand quickly, and presumably will continue to offer better pay and prospects for trained men. One cannot prove that this picture is based on excessively sanguine estimates, because men are less readily reckoned than money, but the impression remains that the planners have a quite unrealistic notion of India's technical and human resources.

Mr. Nehru was bowling over a straw man when he suggested last week that the critics of the plan frame advocate "absolutely free play to private enterprise and no interference from the State". No educated person today advocates any such thing. It is possible to accept all the doctrinal tenets on which the plan frame is based—the socialism, the equality and all the rest—and still honestly hold the opinion that the Mahalanobis plan gravely miscalculates the possibilities of India's present situation and under-estimates the dangers of trying to do too much. Because a nation can pull itself up by its bootstraps, it does not follow that it can jump over the moon.

THE PSYCHOLOGICAL BASIS OF MODERN STRIKES

A NEW APPROACH NEEDED

THE strike of locomotive drivers and firemen on Britain's nationalised railways is now twelve days old and a settlement is barely in sight. A Whitsuntide holiday was only the first casualty; others are bound to follow because the economy cannot carry on indefinitely with over three-quarters of its railway system out of action. British industry's stocks of fuel and raw materials must eventually run down and without replenishment a shutdown on the scale of the 1947 coal crisis is inevitable. Before that time arrives it is to be hoped that commonsense prevails and the new Government's efforts to get the strikers back to work are successful. If this does not happen, the hard-won prosperity of the last three years and Britain's enhanced political and economic prestige will be threatened.

With this prospect facing the country it is interesting to consider why a few key workers, not particularly influenced by the Communists, who would indignantly deny any lack of patriotism and could produce impressive records of long hours and dangerous journeys through blitz and blackout to prove their point, are prepared to cause their country so much trouble on a matter which would seem to have little to do with the recognised aims of trade unionism. The three strikes of dangerous proportions, one last winter and the two going on now, have all been disputes on points which can be classed as of secondary importance. The first dock strike cost the country a great deal of money simply because the dockers, who demand overtime as a right and look upon it as an indispensable supplement to their incomes, did not want to feel that it was compulsory. The present dock strike was called because a small break-away union demands to be recognised as a negotiating body. The railway strike is going on because a recent wage increase for lower-paid workers has disturbed the differentials between these grades and the craftsmen who are probably not paid their true worth, but are still some way from being badly paid. All three disputes leave the impression that it is a state of mind rather than a state of pocket which is responsible. There appears to be something wrong with the way the British worker is looking at life, not just his standard of living which is rising, his working conditions which are continually improving, his security of employment which seems reasonably assured, or his prospects for the future which have never been brighter. These strikes are primarily psychological in origin. Their solution would seem to be not so much wage concessions or temporary palliatives, but a complete reorientation of points of view.

It has been clear for some time that there is a great deal wrong with British trade unionism. The huge accumulations of power which the late Ernest Bevin considered to be the only way of improving the lot of the main mass of unskilled labour have developed into impersonal bureaucracies. The fact that the worker's only chance for self-expression now lies in the unofficial strike rather than in the negotiating machinery of his own union has been responsible for many upsets since the war, and appears to be the main reason behind the present dock strike. The principle that no worker must be paid below a certain wage can only be upheld if the better-paid worker in the same industry is prepared to shoulder the subsidy. If that is unacceptable the community as a whole must foot the bill in the form of higher prices or higher taxation. That is of course what has been done, and inflation has been fed in the process. Some measure of inflation has come to be accepted as the price of trade union activity under full employment. But there are strict limits to the amount which can be tolerated in an economy dependent on foreign trade, and unable regularly to resort to the expedient of a devaluation.

Without a good deal of rethinking, a solution to this problem will be hard to find. An excellent start might be made by the larger unions themselves whose houses definitely need putting in order. The part which a democratic government can play in these disputes has for too long been accepted as strictly that of a bystander which has nevertheless to make itself accountable for essential services as well as law and order. But if it is accepted that full employment and the maintenance of a welfare State are the responsibilities of a Government, might it not also be time that they took a more active part in settling disputes which can prevent them from discharging their duties? This would be no easy matter for any one Government, especially one with the Conservative label, whose motives would inevitably be suspect. But until the day when labour crises are dealt with in the same bipartisan way as foreign policy, there is a good deal that can be done outside the realms of ordinary strike-breaking. A return to the days of the Industrial Disputes Act is certainly undesirable, but the present labour law could be more rigorously enforced if either side chooses to defy it. But the most important part a modern Govern-

ment can play is apart from the strictly legal action which can be taken; it might rather be classed as that of a national personnel officer and public relations officer rolled into one. The British worker can be persuaded that full employment is its own responsibility just as he is coming to realise that higher productivity pays better wages. Few self-respecting workers will strike if they know that only themselves and their workmates will suffer. No high degree of understanding of economic problems is necessary for these truths eventually to sink home. With perseverance they can be taught and any Government which is courageous enough to make a start with educating the worker to his true responsibilities will put the country in its debt. At the moment old prejudices and downright political cowardice stand in the way. Unless British Governments in the future are prepared to tackle this problem, they might just as well renounce responsibility for maintaining full employment and minimum living standards altogether.

CONVERTIBILITY: A CRUCIAL PHASE

THE session of the Ministerial Council of the Organisation for European Economic Co-operation on 9th and 10th June can mark a major advance towards the convertibility of currencies. But what the Ministers—with Britain's Chancellor of the Exchequer as chairman—decide in Paris will be conditioned by Britain's confidence in the medium-term future of sterling; and there are elements of uncertainty in the position. It has been assumed—perhaps more on the Continent than in Britain—that Britain can proceed immediately towards the declared objective after the Conservative Government has been confirmed in office. If the Labour Party had won the election last month convertibility would have been delayed indefinitely; for the Labour Party has made no declaration that even aspires to the objective and has, on the contrary, criticised the whole idea as a potential danger to the British economy. There was some force in last year's argument by Mr. Butler that it would be futile to conclude arrangements that another Government might soon cancel. But that it is impossible to reach a "bipartisan" policy on this matter can no longer be a reason for delay, as the present Government, with a substantial majority, is assured of five years of rule. Delay for a further year or two would, indeed, diminish the period available to make convertibility fully effective.

It cannot, however, be assumed that the British Government was deterred last year only by the thought that its authority might last only a short time longer. The Government was acting cautiously because it was not sure that financial conditions were opportune. Critics said that financial conditions would never be ideal and that if the Government was serious it should proceed at the first practicable opportunity—which, these critics still assert, presented itself last year. The raising of Bank rate in January and February this year can be seen as part of the necessary preparation for convertibility of sterling; for the absolute essentials are health and stability in the economy, which cannot exist together with inflation. Moreover, with the second rise in Bank rate in February, the British authorities announced their new policy of supporting "transferable account" sterling, thereby bringing the official and the unofficial rates close together (surely a step towards a unified rate?) and according to foreign holders of sterling some facilities for conversion into dollars at only a slight discount. This move, incidentally, has provided an additional reason to conclude the process of convertibility as soon as possible, for it has imposed some of the burden implicit in an obligation to provide dollars in exchange for sterling, with none of the benefits to London, as an international financial centre, of a freely convertible currency.

The raising of the Bank rate—which was, of course, a different and distinct operation, though it happened at the same time—was not well timed if it was intended as part of a broad plan for convertibility. The European Payments Union had been extended for a year until mid-1955; its future had therefore to be determined by the middle of June. Mr. Butler comes to these deliberations of the Ministerial Council with only 3½ months of stringent monetary control behind him—the modest rise in Bank rate in January having had no perceptible effect. He cannot be sure that stability has been restored—even if he ignores the effects of the railway strike and of other such disturbances to production. But stability could almost certainly have been restored if inflation had been checked a few months earlier. The element of uncertainty must influence the British authorities' ideas on the appropriate timing of convertibility. It may also influence their ideas on the appropriate rates for sterling. Even if they are willing to make sterling convertible soon, they may be unwilling to make it convertible at fixed rates; for supporting the currency at a specified

level could, in times of difficulty, involve substantial losses of dollars.

The experts of the European Payments Union who have studied the possible evolution of this body have recommended that its function in clearing payments between European countries should revert to the ordinary banking mechanism, while its function in providing short-term credits is assumed by the new European Fund, with an initial capital of some \$550 million. The clearing function is directly related to convertible currencies, and, more specifically, to convertible sterling. But some European countries dislike the idea of clearing through an international banking mechanism that relies on a variable currency. They would prefer that EPU's successor should continue to perform a clearing, as well as a lending, function, even though such an arrangement would stand in the way of progress to complete convertibility. It seems, too, that there is a feeling on the Continent that convertibility of sterling will be qualified by Britain's desire for protection against the effects of completely freed trade; and unless trade is completely freed (subject, of course, to the inevitable tariffs) convertibility itself will be incomplete. It is one thing to grant freedom to foreign holders of sterling to spend it on commodities traded internationally in Britain—from which position it is not a very big step to allow them to exchange their sterling directly into dollars. It is another thing to allow British holders of sterling to spend their money freely in the dollar area or western Europe.

The British negotiators enter these discussions in Paris with a clear purpose in mind: to facilitate the transfer from the Payments Union to a convertible sterling currency of the function of clearing payments multilaterally. If the other negotiators are to be persuaded that sterling can perform that function better than the Payments Union, or any successor to it, they must be satisfied with the character of the convertible currency that the British have in mind. On the eve of the talks they had reservations on that matter.

CURRENT COIN

Indian Stock Exchanges in 1954.—Last year would have been completely satisfactory from the point of view of the country's stock markets had not the events of last autumn halted the price rise and left the economic situation obscure. A number of features contributed towards making 1954 a prosperous year on the exchanges. The general economic situation improved from the levels at which the post-Korean slump had left it. Helped by two good monsoons and encouraged by deliberate Government policy, agricultural output was better, while export earnings benefited from the boom in tea. By the time September arrived many share prices had risen to the point where yields were no longer attractive. The reaction which followed last autumn's ministerial pronouncements and the fears aroused by delay in the publication of the Taxation Enquiry Commission's report, certainly improved the technical position of the market. Speaking at the seventh annual general meeting of the Indian Stock Exchange Limited, Bombay, last Saturday the President, Mr. Chuni-lal B. Mehta, gave this picture of last year's working. His conclusion on the subject of the year's price movements was that they "afforded satisfaction to investors as the general price levels showed a fairly good improvement over those of a year ago." There is no doubt that in assisting general prosperity, the facilities of the Stock Exchanges played a major part. The future of the private investor in India, Mr. Mehta maintained, would depend on the confidence which the private sector enjoyed with the Government and the useful contribution which this sector can make towards the objectives of the Plan. Any exhortation to private industry to play its part will be useless unless accompanied by an appeal to the Government to take a more rational view of liberal economies and abandon its doctrinaire socialistic theories. Mr. Mehta emphasised the services the stock exchange had done in channelling the flow of savings into the country's industries and in providing those savings with the characteristics of transferability and negotiability.

India's Cloth Exports.—The improvement in India's cloth exports recorded in recent weeks has been maintained during the past fortnight with demand from several foreign markets continuing satisfactory. Small quantities of mulls, white shirts and grey sheetings have been booked for Singapore, and Ceylon has concluded moderate business in voiles, mulls, printed goods and grey leopards. Only meagre business was possible with Hong Kong due to the difficulty in securing timely freight. Burma was not able to lift any goods, due to the non-issue of import licences there, but the export trade in Bombay is optimistic of good business with Burma because of reliable reports that the Government there will issue import licences for textiles next month. Cloth trade in Indonesia

has been active and considerable business has been reported for this destination, especially in grey and white cambrics, dyed drills and coatings. Although there were inquiries from Australia for grey sheetings, drills, wider width sheetings and flanellettes, no business worth mentioning was completed. British importers appear to be in the market for considerable grey medium cloth of usual interest, as indicated by the enquiries received in Bombay, but so far no business has been completed, and brisk demand is expected to spring up soon. Except for negligible bookings for immediate needs in grey bafts, domestic cloth, coatings and dyed poplin, demand from West Africa has tapered off. Likewise, there is still no active demand from Iraq, although moderate business is reported in bleached long-cloth, coatings and sheetings for meeting present needs. Reports of recent failures of some important importers in Iran appear to have made business with that country slightly difficult, although confirmation is still lacking. The Persian Gulf ports have bought fair quantities of grey sheetings, black mulls and permatos, while satisfactory business has been concluded for Saudi Arabia in ready goods of seasonal requirements like black mulls, rumals, white sheetings and grey sheetings.

U.S. Business Conditions.—The latest Monthly Letter of the National City Bank of New York says that reports have continued favourable. Most indices of trade and industrial activity in May, according to preliminary figures, matched or bettered April totals, which is equivalent to saying that the recovery has carried business into an all-time high. April set new records in retail sales and construction (seasonally adjusted), and employment was the highest ever reached in that month. The Federal Reserve Board's industrial production index, at 136 (1947-49 = 100), was only one point below the 1953 peak. Probably this gap was closed in May, and if that proves to be the case all the more important and inclusive measures of economic activity will have regained or exceeded their previous highs. Even without being spurred by war or inflation, which have accompanied the major business upswings in the past two decades, the economy in 1955 appears to be headed for its biggest year. The gains in the past nine months have been real and not illusory, for both wholesale and consumer prices on the average have maintained the same remarkable stability that they did during the downturn. Nor do the gains represent inventory accumulation, for there has been little to date except in automobile dealers' stocks. As business has turned in record-breaking performances, a sense of confidence and prosperity has grown. Despite talk of "soft spots", misgivings about the second half of the year have diminished. Probably it is a good thing that they have not disappeared entirely. With business moving into new high ground, it is always difficult to avoid crossing the nebulous line between confidence and over-confidence, between large-scale spending by business and consumers and over-extension of credit, and between a sound expansion and a short-lived boom. The likelihood that the pace of expansion will slow down in the second half-year does much to preserve the caution which moderates over-optimism and which has served the economy so well in recent years. On the industrial front the advance has been fairly general. Non-durable goods production in April exceeded its May 1953 peak for the first time. Minerals output, after reaching a new all-time high, has eased slightly with curtailment of crude petroleum production. Durable goods output continues to advance strongly, and in April was within 4 percent of its peak during the Korean war. In the week ended 15th May, steel mills finally surpassed the weekly production record set in 1953; operating at 97.2 percent of capacity, they turned out 2,345,000 tons of steel. Steel officials felt at the start of this year that the industry's over-all capacity of 125.8 million tons a year might not have to be boosted appreciably for several years. However, the inflow of orders and pressure for deliveries have been so persistent that plans are shaping up for another round of steel mill expansion. In such fashion, throughout the economy, rising activity is stimulating increased investment and paving the way for still further advances. Discussions of the second half of 1955 and beyond have paid a good deal of attention to so-called soft spots in the economy. These include declining farm incomes, the coming downturn in automobile sales and possibly also in housing, the rapid expansion of consumer debt, and the failure of employment to keep pace with production. All are legitimate causes of concern, providing sound reasons for expecting moderation of the upswing, and it is good to keep them in mind to offset the optimism generated by other aspects of the economy. Yet at the moment, none of these weaknesses appears sufficiently strong to cast gloom over the prospects for the second half-year.

U.N. Population Study.—The U.N. study of population growth and standard of living in under-

developed countries, published recently in pamphlet form, "stresses the rather obvious fact that the rate of population growth, whatever the annual increment, continues to strain the available economic resources. It does not, exactly uphold the arguments of the Reverend Malthus, but neither does it agree with the equally facile socialist theory that a change in the social system can, by itself, provide a cure against the ills of excessive population growth. Such obstacles to increasing production as shortage of land, and other natural resources, of capital, and of qualified man-power, make it difficult to balance rapid population growth with increasing production regardless of the social framework, though the study does not deny that in some circumstances, particularly where large reserves of natural resources remain undeveloped for lack of sufficient manpower or sufficient markets for large-scale, low-cost industry, a large increase of population may be of positive advantage for economic development. Such examples are however few and far between, and dealing with the conditions in Asia specifically, the study says: "The relation between the number of people and the quantities of resources available at their disposal is much less favourable in some parts of the world than in others. Asia (excluding the Soviet Union) has more than half the world's population, but only about one-fifth of its land area. The average amount of land in crops per person is estimated at only one-half to eight-tenths of an acre in southern and eastern Asia, by comparison with four acres in the Soviet Union. Northern America and the U.S.S.R. also have large areas of land suitable for agriculture which are not being cultivated, as well as valued forest and mineral reserves. In proportion to its population, Asia has a much smaller share of such assets."

The world's great industrial plants are concentrated largely in a few countries in either Europe or North America, while the least favoured nations are handicapped by a lack of even such simple tools as iron plough-shares and by a shortage of personnel with even elementary education. In other words, the economies of under-developed countries are characterised by an agriculture of the subsistence farming type where too many struggle on too little land to wrest a precarious living, and where as the population grows, capital scarcity increases. It has been estimated, the study points out, that an under-developed country with its population increasing at one percent a year must invest from two to five percent of its national income in order to keep a constant average amount of working equipment per worker. If the population increases at two and a half percent per year, from five to 12½ percent of the national income will be absorbed in such investments. It is not easy for any poor country to save such a large proportion of its income; those where population is now growing more rapidly must save and invest still more if they are to reach a higher living standard. Discussing the common assumption that industrialisation alone can be the answer to the population problem of undeveloped economies, the study argues that however important the benefits of industrialisation might be, it would be a mistake to dismiss the population problems on such an easy assumption. It is a formidable task to develop large-scale industries in a predominantly agricultural country even if all the natural resources and capital were available. A shortage of technical skill and managerial personnel presents a big difficulty which under-developed countries, with the deficiency in education of their populations, are unable to overcome for a long time. If this difficulty can be tackled, "there are some reasons for expecting that the birth-rates of the economically retarded nations would fall in the future, if they could industrialise and improve their standard of living to some extent." This expectation is based on the history of economically more advanced countries which, at an earlier stage of their economic development, had nearly as high birth-rates as the under-developed countries generally have today. ("Population Growth and the Standard of Living in Under-Developed Countries," Published by the U. N. Pages 9. Price As. 12. Available in India from Oxford Book and Stationery Co., New Delhi and Calcutta).

LONDON INSURANCE LETTER

EXTENDED COVER

By Air Mail.

THE Phoenix Assurance Company, 172 years old, is distinguished as the first British insurance company that did business abroad. Colonel Astor, the chairman, quoted in his annual statement in May a resolution of the board 170 years ago indicating that insurers were entitled to demand extended cover. Extended cover was exemplified last year in the big North American windstorm claims under fire policies extended to cover that hazard. In respect of those devastating hurricanes the Phoenix had been notified of some 25,000 individual American claims by the end of last year. Insurance companies cannot be protected against exceptional claims of this character but premiums can be raised, and in respect of this extended coverage they have been raised this year.

But for these claims under extended cover the results of the fire departments overseas would have been relatively satisfactory last year. It is, of course, too early to get a clear picture of the trend for the current year, but the indications are not altogether reassuring. There was another terrible manifestation of natural disturbance in the United States last month. Ordinary fire losses in the United States have not been very different from those of the same period last year, but in some other countries—notably South Africa, Australia, New Zealand—some very big fires have already been reported. No serious difficulty arises from any single loss, as the claims are in all cases widely

spread. Even so, the aggregate of such claims can mean an unsatisfactory year's experience on the business as a whole. Experience at home offers no consolation. Losses so far are at a considerably higher rate than last year's, largely because an estimated loss of £1 million involved in the destruction of a cycle-accessory warehouse in Birmingham in March brought that month's estimated losses to the highest total ever recorded—£5.1 million. Not since 1952 has a single fire of such magnitude occurred in this country.

Competing Credits

The annual conference of the Berne Union (the international association of credit-insurers) in Lugarno last month took place in circumstances somewhat changed from those of previous years. British and other European exporters have been gradually losing the advantage over American competitors that they have enjoyed in the form of better export-credit facilities. This year, for the first time, the United States was represented at the conference, as an observer, by the Export-Import Bank. The significance of this development is in the fact that since last October the Bank has made credits available to individual American exporters; whereas its operations had previously been confined to large loans to foreign governments. The U. S. Federal Reserve Banks have also, in recent months, taken a much more active interest in export credit than has been their custom.

The maximum cover of 75 percent provided by the Export-Import Bank compares with a maximum of 90 percent provided by the Export Credits Guarantee Department in Britain. But American exporters are pressing for extension of official and unofficial facilities, and, though the authorities have hitherto maintained that comprehensive export credit is unnecessary for a permanent creditor nation, it may be that in more competitive trading conditions the Europeans' advantage will disappear entirely. The Berne Union is fundamentally opposed to competitive credit-insurance, relating either to abnormally long credits or to uncommercial terms. The conference was encouraging in both respects. Members reported that pressure for long credits had diminished and their terms were mostly in harmony. But the Union's restraint will, of course, be more severely tested as competition in international trade grows keener.

Marine Market's Premium Hunger

Complaint and criticism regarding the marine market are still uttered frequently, but no action is taken to correct its defects. Mr. Rudolph de Trafford, the Atlas Assurance Company's chairman, has expressed in his annual statement the hope "that it is not asking too much to expect the leaders in all sections of the market who must surely have the remedies....in their hands, to give the lead before deterioration becomes dangerously corrosive".

Mr. de Trafford says bluntly that it is incomprehensible that, in a market hungry for premium income, anyone's hunger can be assuaged either by cutting the rates at which premiums are calculated or by including extra perils—"some of which are far from being perils of the sea"—without charge. All who hope to continue to participate in what the market has to offer would fare much better if they were less grasping in their demands on the business available and were more willing "to leave something for the next man". This critic has added that any method of underwriting which has to rely for profit largely or wholly on reinsurance arrangements of one kind or another is fundamentally unsound. Will the accumulation of such warnings force the market to formulate a scheme to restrain the competitive instincts of its members? Or does repetition merely make the problem more familiar, so that each warning is less effective than previous ones?

Prudential's Investment Policy

The Prudential Assurance Company is probably the biggest single investor in the country, and its investment policy has economic importance beyond the confines of insurance. Expanding industry demands increasing finance; and it was in response to that demand that the Prudential, with funds expanding by £51 million last year, invested £18½ million in ordinary shares, £51 million in preference shares, £14½ million in debenture stocks, and only £7 million in Government securities.

The big appreciation of ordinary shares' value last year provided a material advantage to companies that diverted more of their resources to this form of investment. But the Prudential's chairman, Sir Frank Morgan, is at pains to emphasise that insurance funds must be invested for income, not for capital appreciation. Premiums, he points out, are calculated on the basis of an assumed rate of interest at which they will yield income throughout their duration. That ordinary dividends are intrinsically variable limits the proportion of funds that can be invested in ordinary shares; and to distribute any of the appreciation existing at a point of time "would be tantamount to taking credit for future income which might not in fact be received".

IMPROVEMENTS MADE BY THE HURRICANE LANTERN INDUSTRY IN INDIA

Among the essential consumption-goods industries set up in this country in the immediate pre- and postwar years the hurricane lantern manufacturing industry takes a place of importance. The kerosene-lit hurricane lantern, it should be noted, is the principal source of domestic illumination in India's villages and a large number of still unelectrified towns. The industry has made good progress in recent years and achieved quality comparable with that of the imported lantern. The Oriental Metal Industries, Ltd., Calcutta, a pioneer manufacturer in the line, are said to have consumed less kerosene.

EASTERN RAILWAY
TENDERS

Tender No. GM1/55/992-R(55) is invited by the General Manager, Garden Reach, Calcutta 23 for supply of **5000-Rft. Pale fencing** complete to our CE's Drg: 15889 to Ex: B. N. Section of this Railway. Tender Form is obtainable from the office of the **Controller of Stores, Garden Reach, Calcutta 23 (PG Section)** on remittance of Rs. 5/- by Money Order (not refundable) in case of Mofussil Firms and on production of Cash Receipt from the Asstt. Chief Cashier, Garden Reach, Calcutta by Local Firms. Earnest Money Rs. 500/- in cash valid Income Tax Clearance of Certificate must accompany the Tender. Closing date 24-6-55 at 12 Noon.

GENERAL MANAGER.

looking
for oil

Have you ever considered what a long, elaborate and costly business it is looking for oil? Although oil lies thousands of feet underground, the oil prospector may have to take to the air—to photograph the lie of the land and make aeromagnetic surveys. Or he may create artificial earthquakes, in what is called a seismic survey. Then the findings have to be interpreted, in geophysical laboratories, before a test well is bored perhaps to a depth of as much as three miles.

The Assam Oil Company, for many years the pioneer of oil search in India, discovered a fresh source of oil recently at Nahorkatiya in Upper Assam. Crores of rupees have been spent in the search and many more will have to be spent on the development of this discovery.

And all the time, remember, the search for more oil is going on—for further sources of this most elusive mineral are vital for India's industrial development. All the very latest scientific methods and technical equipment, including aeromagnometers and even helicopters, are being employed. No effort in fact is being spared to reduce India's dependence on oil purchases from abroad.

A DITCHER'S DIARY

tainly suggested we were wrong in an article in last week's *Spectator*. "A common-difficulty in the way of Western understanding of Mr. Nehru's domestic policies", he wrote, "is...that we cannot help looking, and indeed hoping, for the 'healthy' signs of a two-party system. Many Indians look for it also, but not enough at present to produce it". Such signs have been rare, and in so far as the Praja Socialist Party was one, it is about to liquidate itself in the manner patented by socialists all round the world. Regrettable or not, this seems quite inevitable. If there is to be a democratic opposition in present-day India, it can scarcely be on the Left. The Congress has so little difficulty in stealing the Communists' thunder that it can steal the socialists' clothes without even trying to. However uneasy strong personalities like Acharya Kripalani might feel in Mr. Nehru's Congress, there is so obviously room within the old movement for people who think like him, that it is foolish for them to stay out. If we had the power to call up "healthy" opposition parties out of the ground, we should surely choose to do it on the Right of the Congress—roughly at the position occupied by Syama Prasad Mookerjee, whose tragic death was the severest blow Indian democracy has suffered in the recent past. Not that I should have fancied a ministry chosen from the ranks of his latter-day adherents, but at least Syama Prasad represented policies that differed in substance from the Congress line, and he understood and accepted the rules of the democratic game. But we cannot call up such parties out of the ground, so we must look for healthy opposition in the places where it might reasonably arise. Perhaps that place is in the State capitals. This notion might seem curious, even unconstitutional, to Britons with their prejudice in favour of unitary government, and to Indians steeped in the British tradition. But when the temporary (though necessary) phase of nationalist centralisation is over, the States will probably provide the best—and most characteristically Indian—antidote to one-party rule from the Centre.

Some surprise has been expressed that the Malaya Government should officially distinguish between Bengalis and Indians, as though Bengalis were not Indians. I am surprised too, but the other way around—because in Malaya most Indians are called Bengalis. Certainly many North Indians are called Bengalis, and I have heard bearded and beturbaned Sikhs in Singapore described as "Bengali gentlemen". I never exactly found out why, but I suspect that migrants to the colony from Madras were called Indians while migrants reaching Malaya from Calcutta were called Bengalis. It is a very old custom, dating from John Company's time. It is very naughty of the Malaya Government not to bring their geography up to date but I am sure it is not their intention to denationalise the people of this fair delta.

Nice new names for nasty old things: I'm back on this subject because some one is always thinking up a new one. The last and most monstrous I find in a document issuing from the Massachusetts Institute of Technology. It is "ethnocentrism". It's no use looking in your dictionary for this horrid Graeco-Latin bastard, because it will not be there. Pondering on it for a few days, I have decided that it has been formed on analogy with "egocentrism"—not that there is any such word as egocentrism either, but you have to begin somewhere. Some genius has knocked off the Latin *ego* and stuck on the Greek *ethnos*—and come up with a new and more pompous

name for jingoism or racialism. So now those South Africans who are so afraid about the effect of the Cape coloured vote will be able to say that they aren't racialists: they are just respectable ethnocentrists. I regret that this word occurs in a letter to the *AICC Economic Review* from my friend Dr. Itihel de Sola Pool—not that he invented it; he was just quoting. Dr. Pool had to write to the Congress Party's official organ to defend the M.I.T.'s sociological research in India from a mean and stupid charge of espionage. This respected academic institution is supplying funds and guidance to Indian scholars to carry on research into international attitudes, specifically the attitudes of Indians and Americans to each other in an age when they are thrown more and more into contact. By misquoting from a report, the editor of the *Economic Review* hinted slyly that the object of the study was spying with the aid of American technical personnel, who come to this country to help Indians in their efforts toward a more decent life. This seems a suitable opportunity to remark on something I have often noticed before: that some of the stuff that is printed in the *AICC* paper is really very poor indeed. Wild stories that originate with the Communists and are expressly repudiated by Congress Ministers have a way of popping up later in the Congress paper. It is quite unsuitable that a journal that usually begins with some measured policy statement by Mr. Nehru or another Minister should end up with a few specimens of unpleasant "ethnocentrism".

Circumstantial reports of publicly pickled politicians are rather rare, so Reuter did very well in its account of Mr. Krushchev being helped out of one of Marshal Tito's parties last week. Without actually saying he was tight, it made plain that his invitation to all and sundry to come to Russia had something to do with his previous consumption of Yugoslav refreshment. I think none the less of him for the episode; on the contrary, I think it rather mean of the journalists to hang around waiting to entrap guests after an evening of conviviality. This is one of the most inveterate but least intelligent habits of foreign correspondents. I have watched them, grey and shuddering on a bitterly cold night stamping up and down outside the Hotel Matignon waiting to be told by Mr. John Foster Dulles that he had very much enjoyed his meal. I knew why the next day, when the menu was printed in the French newspapers; it took up about one quarter of a column, together with the wines. This is regular practice with diplomatic junketings in Paris, and next day there is no more discussion about whether France should agree to rearm Germany than about whether Dr. Adenauer should properly be offered a *vin rosé* at a State banquet. In Delhi they do not publish the menus but they let photographers into the dining room so that we can speculate whether that's a glass of port or tomato juice that the Ambassador for Ruritania is clutching so possessively. Reuter claims to know that it was caviare and vodka that had made Mr. Krushchev the friend of all the world at one o'clock in the morning. Maybe, but his behaviour would have been even more readily understandable if it was some of that Yugoslavian firewater that was available in certain quarters in Calcutta after Marshal Tito's visit here earlier this year. Anyhow, President Eisenhower must take a very dim view of the whole business, for I understand that one of the more onerous obligations attaching to the American presidency is that the occupant of the White House has to drink only Californian wines for four long years.

THE DITCHER.

Announcement

GOOD BUSINESS DONE DESPITE
RAIL STRIKEBANK RATE RUMOURS WEAKEN
GILT-EDGED

London, 7th June.

THE stock markets put up a good performance during the past week despite the serious deterioration in the labour situation, including the beginning of the rail strike. Investors have been holding on to good class shares on a long-term view. An important influence has been the increase in United States buying which in turn has prompted buying by domestic investors in shares likely to benefit from this interest. Gilt-edged were generally rather quiet on money rate fears with operators reluctant to extend commitments in view of persistent rumours of higher bank rate. A feature in the foreign section was the strength of German bonds. There was selective demand for rails. Industrials were buoyant with high class shares in good demand and Imperial Chemical Industries advanced strongly. Dollar stocks were rather uncertain early in the week but later when Wall Street rallied losses were more than made good. Business continued at a low ebb in gold shares and little interest is being shown in the forthcoming dividends. Leading oils were satisfactory. Rubbers and teas were quiet.

The Money Market

It has again been a week of hardship for borrowers in the money market. Credit supplies remained stringent, with day-to-day loans continuing at 3-3/4 to 4 percent. Bill business was again limited. The affected rate for August bills was 3-7/8 percent against 3-27/32 percent under less difficult conditions. Firm bill rates

plus uncertainties of disturbed labour situation led the market to charge 1/32 percent more for last week's offer of treasury bills. Applications for treasury bills amounted to £370,530,000 out of which £250 million were allotted at an average rate of 78s 11.80d compared with 78s 4.37d in the previous week. This week £260 million are on offer. The Bank of England return for the week ended 1st June show notes in circulation about £13 million higher at around £1,765 million, while bankers' deposits about £1 million lower at around £239 million.

U.S. Bank Advances

Loans to business by leading New York banks fell by a modest \$2 million in the week to 1st June compared with a fall of \$207 million in the corresponding week a year earlier. At the end of the week, loans totalled \$7,624 million or \$50 million more than a year earlier. Excess reserve position of banks increased from \$24 million to \$129 million over the week. Many U.S. airlines reported traffic gains of 10 to 30 percent or more. American airlines, for instance, were understood to be carrying 15 percent more traffic than last year.

Dundee Jute Goods Continue Dull

Dullness continues in the Dundee jute goods market, with manufacturers and spinners now beginning to look for fresh orders to enable them to maintain production. Consumers have been waiting for a reduction in price because of favourable reports of new Indian and Pakistani jute crops and they have been withholding orders. However, now that prices have reverted to the minima, which the Pakistan Jute Board fixed last year, it is felt that consumers may purchase more freely. There is a large business waiting to be done both in yarns and cloth whenever buyers are certain that the values of raw jute are not likely to go lower.

Post-Whitsun Rise in Rubber

As dealers were disinclined to accept offers and preferred to keep their books square over the Whitsun holiday, values in the London market sagged a little at the beginning of the period to 2nd June. After the recess, the market made a halting restart but an already steady undertone was strengthened by good orders on European and U.K. accounts with nearby rubber especially wanted. Due to the U.K. dock strikes, home manufacturers had to pay enhanced prices for material available on the spot, which position closed 5/8ths of 1d a lb. higher on balance. Forward landed deliveries closed with prices about steady. Stocks of sole-crepe having diminished, dealers were making moderate replacement purchases. Higher prices were quoted with up to 36d reported paid for superior quality and 35-1/4d for ordinary and 18 in. smooth No. 1 on spot.

Good Demand for Linseed Oil

Active demand persisted for linseed oil and higher rates were established for Indian in bulk of £101 c.i.f. for earlier shipments up to £103-1 for distant. Indian groundnut oil was higher with most sellers seeking £104. Firm but rather idle conditions prevailed for coconut oil, a seller of Ceylon wanting £95 and Straits £91-1 with buyers 10s. lower in each case. Indian castor oil eased following news of continuance of free export licensing till the end of December. Mean prices were around £1 a ton cheaper.

INDUSTRIAL DISPUTES DURING MARCH, 1955

There were 73 cases of fresh disputes during March, 1955, according to the provisional statistics of industrial disputes released by the Labour Bureau, Government of India. The number of workers involved in 34 cases was 51,703. Compared with the previous month, the number of disputes starting during the month and the number of workers involved registered a rise. The number of disputes current at any time during the month was 99. Of these 90 involved 60,337 workers and the man days lost in 89 cases were 340,000. The number of disputes current at any time during the month, the number of workers involved and the number of man-days lost increased as compared with the previous month. There were 14 lock-outs during the period involving 27,246 workers and accounting for a time-loss of 168,842 man-days. Thirteen of the lock-outs were in West Bengal and one in Uttar Pradesh.

Seventy-two disputes terminated during the month under review. Of these, 56 lasted for less than five days each and two for more than 30 days each. The main causes of dispute in 22 cases were wages and allowances. Grievances relating to personnel, bonus and other causes accounted for 20, six and 14 disputes respectively. The workers achieved complete or partial success in 21 cases. In 24 cases they were unsuccessful. The result was indefinite in 21 cases. Out of the total increase in time-loss of nearly 160,000 man-days during the month, West Bengal accounted for 70,000 being the highest. Among the other major States, Uttar Pradesh accounted for 30,000, Bihar 27,000, Bombay 23,000 and Madhya Pradesh about 13,000. Industrial relations were normal in all States except Assam, Punjab, Ajmer and Hyderabad, where they were strained in certain industries. The Labour Departments of eight States settled or investigated 2,372 complaints out of a total of 2,908 received by them during the month.

Finance in India and Abroad

TREND AND PROGRESS OF
BANKING IN INDIAA YEAR OF EXPANSION AND
ACTIVITY IN 1954

EXPANDING resources and greater activity were, according to the Reserve Bank's latest Annual Report on the Trend and Progress of Banking in India, the main features of banking in India in 1954 in contrast to the relatively quiet year that preceded it.

The higher level of banking activity arising mainly from the broadening of overall economic activity was reflected in the rising trend of bank deposits, on the one hand, and of advances and investments, on the other. The increase in advances was particularly noteworthy as it occurred in the wake of declines in the previous two years. Bank credit recorded an expansion of Rs. 57 crores in 1954, as against a fall of Rs. 66 crores in 1952 and Rs. 10 crores in 1953. The expansion of bank credit in the busy season of 1953-54 was larger at Rs. 112 crores than in the busy season of 1952-53 at Rs. 86 crores. In the slack season of 1954, which was relatively short, the contraction in bank credit was less than two-thirds of the preceding seasonal outgo and was indicative of the continuance of a measure of demand for bank credit in the slack season. Although credit demands were at a higher level in 1954 and though the credit contraction in the slack season was not commensurate with the seasonal expansion in 1953-54, there was no reason to believe, states the Report, that speculative influences were significantly at work; the expansion in bank credit is to be related to the sustained increase in production and business activity, though with a generally declining wholesale price level.

In meeting the increased credit demands, banks had to supplement their increased resources by availing themselves in substantial measure of the facilities for borrowing from the Reserve Bank and in fact, in 1954, the financial assistance provided by the Bank stood at a record level. The annual volume of the Reserve Bank's advances to scheduled banks at Rs. 148 crores under the Bill Market Scheme, whose scope was enlarged during the year, was well over double the 1953 total, while the volume of advances for general purposes was also the largest to date at Rs. 189 crores.

Improved Deposits

In 1954, deposits of scheduled banks recorded a sharp rise of Rs. 91 crores, compared with the relatively small increase of Rs. 8 crores in 1953. The rising trend of deposits, the report points out, confirms the observation made in the report for 1953 that the post-partition decline in deposits has been arrested and that, in fact, a phase of deposit expansion seems to have begun. The rise in deposits consisted of an increase of Rs. 80 crores in deposits with Indian scheduled banks and of Rs. 11 crores with exchange banks.

The trends in investments of commercial banks also indicated, as in the case of advances, a greater utilisation of bank resources in earning assets. In the first three months of the year, there was a slight decline in the level of investments in conformity with the busy seasonal trend. From April up to November, there was a steady rise in investments, the largest increases taking place during the period July to September reflecting the subscription by Indian scheduled banks to the issue of the National Plan Loan. Over the year, the rise in investments of scheduled banks in Government securities amounted to Rs. 12 crores, nearly all of which was accounted for by Indian scheduled banks. The maturity pattern of scheduled bank investments, however, hardly showed any change as compared with a year ago.

During the year, the number of offices of banks recorded a further decline of one as compared with a fall of 19 in 1953. This decline was made up of a net increase of 73 offices in the case of Indian scheduled banks and of a fall of 74 offices in the case of non-scheduled banks. The number of offices of exchange banks remained unchanged at 65. The profit and loss accounts of 18 larger Indian scheduled banks reveal that during 1954 their gross earnings increased by Rs. 2.6 crores to Rs. 31.2 crores, over two-thirds of the rise being accounted for by the rise in interest and discount earned. The rise in total expenses was somewhat lower at Rs. 2.2 crores, more than half of which was made up of an increase in interest paid on deposits and borrowings. Consequently, net profits went up by Rs. 0.4 crores to Rs. 5.3 crores, in contrast to a fall in the preceding two years.

Administration and Inspection

The various administrative measures taken by the Reserve Bank for the supervision and control over banks under the Banking Companies Act, 1949, are also briefly reviewed in the Report. In 1954, there was a substantial increase in the number of banks inspected. During the year, 227 banks were inspected of which 26 were scheduled banks. By the end of the year, the first round of inspections of practically all reporting banks was completed. A little over half of the inspections carried out during the year was for the purpose of considering the eligibility of banks for the grant of a licence to carry on banking business in India. All the inspections carried out during the year of scheduled banks and 72 of those in respect of non-scheduled banks were re-inspections conducted mainly for the purpose of reviewing the

financial position of these banks and the progress made by them in improving their affairs. In this connection, says the report: "It would be difficult to exaggerate the value of these inspections which have enabled the Reserve Bank to watch closely the working and practices of all banking companies and to apply, where necessary, timely and effective remedial measures. They have certainly been the most important factor that has contributed to the greater stability of the banking system". The Report also explains the procedure in connection with licensing of banks and mentions that the slow progress in this regard is due to the Reserve Bank's anxiety to safeguard the interests of the depositors and to give as many banks as possible a fair chance to qualify for a licence.

Extending Operations

In the concluding chapter, the Report reviews the steps being taken to extend the area of operations of banks and to introduce greater flexibility in the banking mechanism so as to enable the banking system to fulfil its obligations in a developing economy. Mention is made of the measures undertaken in pursuance of the recommendations of the Rural Banking Enquiry Committee such as the branch expansion of the Imperial Bank, the appointment of the Reserve Bank as banker to Part B States, liberalisation of remittance facilities, reorganisation of the postal savings bank system and the introduction of the postal cheque system at the General Post Offices of Bombay, Calcutta and Madras and at the New Delhi Head Post Office. A reference is also made to the major recommendations of the Committee on Finance for the Private Sector and the details of action taken by the Reserve Bank to implement such of them as come under its purview. Finally, the recommendations of the Committee of Direction of the All-India Rural Credit Survey have been briefly outlined. That Committee formulated an integrated scheme of rural credit based on three fundamental principles, viz., (a) State partnership at different levels, (b) full co-ordination between credit and other economic activities and (c) administration through adequately trained and efficient personnel responsive to the needs of the rural population. The Committee has recommended, among other things the creation of a State Bank of India, in which the major interest would be held by the Government of India and the Reserve Bank

by statutory amalgamation of the Imperial Bank and 10 State-associated banks.

The Report also makes a reference to the steps taken by the Reserve Bank in assisting co-operative credit institutions and augmenting industrial credit facilities. In conclusion, the Report draws attention to the role of banking in the process of development. While credit expansion to meet the growing needs of the economy would be permitted and encouraged, the Reserve Bank, states the Report, would necessarily have to keep the situation under observation to prevent any undue credit inflation and to ensure the goal of development with stability.

THE CALCUTTA MONEY MARKET

GOOD DEMAND FOR CREDIT

Wednesday, 8th June.

THERE is good demand for money, and although the rains have begun it is too early yet to say that the slack season is in sight. The main accounts are sugar and grains and seeds; there has not been much borrowing by jute mills, while the tea season has just begun and advances are increasing. In the Calcutta interbank market the call rate quotes 3 percent and there is a slightly easier tendency. It has been a quiet week in the exchange department, with only a few small tea bills reported. The demand for remittance has been moderate. Sterling, after weakening from the beginning of the month, recovered sharply yesterday on the expectation that the U.K. rail strike might soon be settled. The rupee-dollar rate is Rs. 479-8.

Silver was quiet on lack of support. The price dropped from the previous week's level of Rs. 162-10 to Rs. 159-12, quoted to-day. The forward rate was quoted at Rs. 153-14. The price was unchanged at 78-1/8d. in London at 91½ cents in New York.

Gold also ruled quiet in sympathy with silver and the price declined from the previous week's level of Rs. 94-10 to Rs. 94-1. The sovereign at Rs. 60-8 showed a loss of 4 annas.

Tenders for Rs. 1 crore of three month Government of India Treasury Bills, which were opened on Tuesday, 7th June, 1955, totalled Rs. 2,73,75,000. The average rate of acceptance fell from Rs. 2-9-0 to Rs. 2-8-8 percent per annum. Tenders at Rs. 99-5-9 percent were allotted approximately 52 percent. Tenders for the further Rs. 1 crore of three month Government of India Treasury Bills will be received at all centres up to the close of business on Monday, 13th June, 1955. During the week ended 3rd June, 1955 Government of India Treasury Bills for Rs. 10,18,00,000 were sold in favour of the Reserve Bank of India.

An increase of Rs. 8.86 crores in notes in circulation to Rs. 1,324.95 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 3rd June, 1955. The total note issue at Rs. 1,339.25 crores showed a fall of Rs. 87 lakhs. Notes held in the Banking Department consequently declined by Rs. 9.73 crores to Rs. 14.30 crores. Foreign Securities declined by Rs. 9.94 crores to Rs. 652.04 crores and this was done by a transfer to the Banking Department

where balances held abroad rose by Rs. 11.57 crores to Rs. 60.03 crores. Rupee securities increased by Rs. 9.94 crores to Rs. 543.65 crores. Deposits of the Government of India dropped by Rs. 2.42 crores to Rs. 52.21 crores while other Government accounts rose by Rs. 58 lakhs to stand at Rs. 14.75 crores. Balances of commercial banks at Rs. 46.72 crores were Rs. 2.74 crores lower. Investments declined by Rs. 1.05 crores to Rs. 40.74 crores. Other loans and advances fell from Rs. 35.78 crores to Rs. 29.40 crores, of which advances to scheduled banks against usance bills dropped from Rs. 25.57 crores to Rs. 19.14 crores. These advances totalled Rs. 115.81 crores since 1st January, 1955. Ways and means advances were shown at Rs. 80 lakhs (same).

The statement of the position of scheduled banks for the week ended 27th May, 1955, discloses Demand and Time liabilities at Rs. 592.68 crores (Rs. 8.84 crores on account of borrowings from banks) and Rs. 388.17 crores (Rs. 2.67 crores) compared with Rs. 587.78 crores (Rs. 9.22 crores) and Rs. 387.63 crores (Rs. 2.20 crores) respectively in the previous week. Cash has increased by Rs. 99 lakhs to aggregate Rs. 35.21 crores, while balances with the Reserve Bank have decreased by Rs. 1.05 crores to stand at Rs. 47.54 crores. There is a rise of Rs. 5 lakhs in investments to Rs. 344.34 crores. Advances and bills discounted at Rs. 619.82 crores reveal a drop of Rs. 2.78 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.4 percent and 63.2 percent against 8.5 percent and 63.8 percent.

The return of the Imperial Bank of India for the week ended 27th May, 1955, shows a fall of Rs. 1.16 crores in total deposits to Rs. 210.45 crores. Investments in Government Securities are down by Rs. 36 lakhs to Rs. 90.49 crores, while other authorised investments remain unchanged at Rs. 11.38 crores. Advances, including loans, cash credits and overdrafts, and bills discounted and purchased have declined by Rs. 1.04 crores to aggregate Rs. 121.27 crores. Cash and balances are, in consequence, shown at Rs. 16.10 crores or Rs. 2.51 crores less.

Stocks and Shares

INCREASED DISTRIBUTION BY INDIAN COPPER BOOSTS MARKET

BETTER SENTIMENT IN MORE ACTIVE DEALING: LONGER FORWARD LIST MOOTED

Wednesday Evening.

THE share market today presents a much better appearance than at the beginning of the week. The most important single stimulus was the 25 percent distribution by Indian Copper Corporation, which took its shares from Rs. 3-10 to Rs. 4-7. Dealing has been active in this scrip and there is still strong support for it. A decision is impending about the addition of two shares to the forward list and since Indian Copper is expected to be one of them, this has been an extra reason for support. The other shares mentioned in this connection have been Texmaco and Rohtas, both of which have been well supported. A decision on the expansion of the forward list may be taken tomorrow.

After this tonic, the undertone in the market has been distinctly better and rather more business has been done. Burrakur Coal have been the subject of good buying and are now quoted at Rs. 13-3. There does not appear, however, to be any corporate news justifying this sharp spurt.

Jute shares have been a shade better, thanks to the reduction in mills' stocks. Sentiment in tea shares has been uncertain and buying restricted. Securities have been dull but prices are generally steady. There is no news of the Government's loan programme.

The gilt-edged market ruled steady, but business was once again on a mediocre scale. The enquiry for short-dated and near medium-dated loans was maintained, but longer-dated issues were neglected at around last week's levels. Three percent Conversion Loan 1986 was marked down further to Rs. 80-4, but recovered at the close to Rs. 80-8. In the short-dated group, the enquiry for 3% 1957 continued at around Rs. 99-9 while 2½% 1955 had buyers at Rs. 99-11. Amongst medium-dated loans, 3% 1959-61 met with sustained enquiry to improve to Rs. 97-15 but 3½% National Plan Bonds 1961 was on offer at the lower rate of Rs. 99-13; 3½% National Plan Loan 1964 had sellers at Rs. 98-12 and 3% 1963-65 eased further to Rs. 94. In contrast, 2½% 1961 was taken higher to Rs. 92-3 as were 2½% 1960 to Rs. 95-1 and 2½% 1962 to Rs. 92-12 without attracting sellers. Longer-dated loans were unchanged with sellers rather than buyers. The enquiry for provincial loans continued unabated and once again prices were marked up with little business materialising.

Preference shares were once again difficult to obtain and in most cases prices improved further by two or three rupees per share. In jutes, Anglo-India changed hands at Rs. 122-8, Belvedere at Rs. 121-8 and Hooghly at Rs. 15-8. Hukumchand were done at Rs. 115-8 and Lothian at Rs. 116-8. Amongst miscellaneous issues, Bharat Collieries were taken at Rs. 37, British India Corporation were marked at Rs. 137-8, Bengal Chemical 7½% were wanted at Rs. 13-6, Burn 6½% at Rs. 124 and the 7½% at Rs. 144-8. Calcutta Electric had buyers at Rs. 12-9, Indian Iron & Steel were in demand at Rs. 109-8, Indian Standard Wagon were dealt in at Rs. 140 and Kesoram at Rs. 133. National Tobacco 1st were marked at Rs. 80-4, Rohtas Industries 7½% at Rs. 125 and the 'B' at Rs. 66.

In the banking section, Imperial Fully-Paid came to hand at Rs. 1702-8 and the Contributory at Rs. 416. Punjab National changed hands at Rs. 42-8 and United Bank of India (D) shares were quoted at Rs. 4-5.

Amongst railway shares, Bukhtiarpur-Bihar were dealt in at the lower rate of Rs. 20 and Dehri-Rohtas were steady at Rs. 10-14.

The feature in the cotton section was Elgins which met with keen enquiry and improved from Rs. 19 to Rs. 19-12. Bengal Nagpur were lower at Rs. 10, Bowreah were quoted at Rs. 342. Dunbar at Rs. 206 and Muir Mills at Rs. 115. Kesoram were steady at Rs. 13-8 and New Victoria were unchanged at Rs. 1-6.

The feature in the coal section was Katras Jheriah which rose from Rs. 53-8 to Rs. 54-12 with few declared sellers. Burrakur were better at Rs. 13-3, Bengal changed hands at Rs. 497, Central India at Rs. 7-5 and Equitable at Rs. 29-10. New Beerbhoom were marked at Rs. 19-13, Raneeunge at Rs. 10-10 and Western Bengal at Rs. 7-2. Standard improved from Rs. 17-12 to Rs. 18-4. As a result of interested buying North West Coal Fully-Paid spurted from Rs. 14-8 to Rs. 18.

The news of the sharp reduction in jute goods stocks with mills at the end of May by 8500 tons caused a ripple of interest in the jute section and towards the close, selected shares met with some enquiry including Agarpara, Nellimarla, Chitaval-sah and Dalhousie. Howrah fluctuated narrowly around Rs. 30. Here is a chart showing the more important price movements:—

	Opening	Closing
Agarpara	13-5	13-14
Anglo-India	208	214

HINDUSTHAN BUILDINGS
CALCUTTA

After years of research, we have just started manufacturing a new type of burner which will cut Kerosene consumption by 20%.

Money earned, is money saved, so when you buy a lantern, ask for Dipti.

This discovery has created a new history in the manufacture of hurricane lanterns.

According to the latest Government test certificate—Dipti lanterns give you clear six British candle light without any smoke.

There were good buyers of Hercules Insurance at Rs. 30 c.d. but a small lot of Triton changed hands at Rs. 160-12. New Asiatic were done at Rs. 5-14 and Ruby General at Rs. 7-4. Calcutta Landing & Shipping were marked at Rs. 15 and several transactions were reported in India Steamship at around Rs. 7-4. Alkali & Chemical were crossed at Rs. 15-8, Angelo Bros. were steady at Rs. 18-12. Assam Saw were quiet at Rs. 4-12 as were Balmer Lawrie at Rs. 160 and British Burmah Petroleum at Rs. 3-3. British India Corporation came to hand at Rs. 8-10, Dunlop Rubber were marked at Rs. 35-14 and Imperial Tobacco were shaded at Rs. 11-3. Several transactions were recorded in Indo-Burma Petroleum at Rs. 132-8. Indian Cables improved today from Rs. 26-14 to Rs. 27-8. Indian Wood Products were taken at Rs. 38-8, Jardine Henderson were subbed at Rs. 114 and Martin Burn at Rs. 23. Metal Box were quoted at Rs. 20-12. National Insulated Cables at Rs. 24 and Rohtas Industries were steady at Rs. 25. Rallis were knocked down to Rs. 35-8 while Shaw Wallace were unchanged at Rs. 14-12.

The outstanding feature in the stock exchange this week was Indian Copper Corporation shares which spurted smartly from Rs. 3-10 to Rs. 4-7 on the announcement of a 25% distribution for 1954 (15% dividend plus 10% bonus) against a 10% dividend for 1953. Burma Mines were unchanged at Rs. 1-12 as were Western Stockholders Investment Trust at Re. 1 and Orissa Minerals at Rs. 25-5.

Ship, Marine, General Engineering and Foundry work of all descriptions is undertaken at competitive rates at the RAJABAGAN DOCKYARD

In the absence of any fresh enquiry tea shares have once again been a dull and restricted market. Amongst Assam scrip, Bishnauth shaded to Rs. 45-8, Dheklakhat were easier at Rs. 19-4 as were Dibrugah at Rs. 25 and Tezpor at Rs. 30-12. On interdicted buying Basmatia improved to Rs. 41-8 and Dhunseri from Rs. 23-12 to Rs. 26-12. Of the Doctas shares, a small lot of Hantapara changed hands at Rs. 333 whilst Nagasore were easier at Rs. 312 and Ranicherra at Rs. 25-8. Of the remaining shares, Poobong had sellers at Rs. 14-12, Hat-tikhira at Rs. 28-12 and Loobah at Rs. 7-8. Jay Shree were unchanged at Rs. 11-6 whilst Tirrihan-nah lost three points to close at Rs. 41.

There is a profit of Rs. 2 lakhs of the SEEVOK TEA COMPANY for the year ended December, 1954, compared with Rs. 48,216 in the previous year. Adding Rs. 18,571 brought in there is Rs. 1,81,697. The dividend is increased from 21 percent to 15 percent. Revenue reserve absorbs Rs. 82,500 (Rs. 10,000), and buildings and machinery reserve Rs. 35,000 (Rs. 10,000), leaving Rs. 19,197 to be carried forward.

The output rose from 2,056 maunds to 2,221 maunds and the average sale price from Rs. 2-7 to Rs. 3-5 3/4 lb. Estimates for the current year provide for a crop of 2,000 maunds at a cost of Rs. 3.95 lakhs.

There is a fall of Rs. 70,000 to Rs. 2.25 lakhs in the profit of the RANEEGUNGE COAL ASSOCIATION, Ltd. for the half-year ended last September. Bringing in Rs. 72,001 there is Rs. 3,07,197. Taxation absorbs Rs. 1 lakh (same). The dividend is the same at 4 annas a share. Machinery reserve received Rs. 1 lakh (same), leaving a carry-forward of Rs. 47,200. Raisings totalled 1,72,761 tons (1,85,944 tons) and despatches 1,70,085 tons (1,58,233 tons).

The REWA COALFIELDS, LTD. earned a profit of Rs. 127 lakhs for the half-year ended last December, compared with Rs. 1.79 lakhs in the previous half-year. Bringing in Rs. 25,293 there is Rs. 1,52,350. Taxation absorbs Rs. 45,000 (Rs. 65,000). The dividend is cut from 7 1/2 percent to 6 1/2 percent leaving a carry-forward of Rs. 22,975.

Raisings totalled 1,58,272 tons (1,61,005 tons) and despatches 1,52,840 tons (1,60,064 tons).

The results of the HERCULES INSURANCE COMPANY for the year ended December, 1954, are satisfactory. Providing Rs. 5.20 lakhs (Rs. 4 lakhs) for taxation, the profit increased by Rs. 20,000 to Rs. 6.73 lakhs. The dividend is 5 percent higher at 20 percent, and the capital was meanwhile doubled by capitalisation of reserves. General reserve gets Rs. 2 lakhs (Rs. 4 lakhs), leaving a carry-forward of Rs. 3,34,700 (Rs. 3,41,550).

Revenue surpluses of fire, accident and marine departments totalled Rs. 6.87 lakhs (Rs. 6.05 lakhs). Rs. 1.31 lakhs (Rs. .85 lakhs) and Rs. 69,946 (Rs. 61,420), respectively.

The POOBONG TEA COMPANY raised its profit from Rs. 22,551 to Rs. 1.81 lakhs for the year ended last December. Bringing in Rs. 7,828 and making other adjustments there is Rs. 1,32,069. The dividend is raised from 21 percent to 15 percent. Revenue reserve gets Rs. 32,000 (Rs. 10,000), and building and machinery reserve Rs. 45,000 (Rs. 5,000), leaving a carry-forward of Rs. 10,089.

The crop rose from 1,845 maunds to 2,109 maunds and the average selling price from Rs. 2-5-9 to Rs. 3-5-4 lb. Estimates for 1955 are for a crop of 2,200 maunds at a cost of Rs. 4.07 lakhs.

The net revenue of the CALCUTTA ELECTRIC SUPPLY CORPORATION LTD. rose from £1,210,738 to £1,393,591 for the year ended last December. Notable allocations include contingency reserve fund £70,978, taxation £85,000 special reserve £192,223 and special appropriation (net revenue account) £500,000. The final dividend is the same at 3 percent, making 6 percent (same) for the year, leaving a carry-forward of £152,818 (£157,731).

Messrs. Tata Industries Limited, managing agents for the Tata Iron and Steel Company Limited, report that the total approximate production of iron and steel at the steel works at Jamshedpur during May 1955 was: Pig iron 94,200 tons; steel ingots 87,500 tons; semi-finished steel for sale 17,500 tons; and finished steel 48,100 tons.

INDUSTRIAL FINANCE CORPORATION OF INDIA

(Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948))

Authorized Capital: Rs. 10,00,00,000/-

Paid-Up Capital: Rs. 5,00,00,000/-

Loans Sanctioned: Rs. 25,21,25,000/-

The Corporation has been established to grant medium and long-term loans to industrial concerns registered in India. Only public limited companies or co-operative societies engaged in (i) manufacture or processing of goods; (ii) mining; (iii) generation or distribution of electricity or any other form of power; and (iv) shipping, are eligible for financial assistance.

Industrial concerns requiring medium and long-term advances over Rs. 10 lacs for new schemes of expansion or modernization are requested to get in touch with the Head Office of the Corporation or its Branches, as soon as they have prepared their schemes.

Keeling Road,
New Delhi.

V. R. Sonalker,
MANAGING DIRECTOR.

ALL-STEEL TRAVEL

The day draws near

when all-steel railway coaches

will roll out from the Porambur Integral Coach

Factory at the rate of one a day. This national

undertaking, situated a few miles from Madras, will

be the largest coach factory in all Asia. To

complete the project, 91,000 tons of Structural

Steel and 12 miles of Railway track will be

required and 15 miles of water supply

pipes will be laid.

STEEL FOR PROGRESS

Managing Agents **MARTIN BURN LTD.**

12 Mission Row, Calcutta-1

Branches: New Delhi, Bombay & Kanpur

nological improvements achieved in the industrially advanced countries. But it is highly desirable that Indian enterprise, engaged in producing and packing, should undertake independent measures for improving packing, especially with an eye to industrialisation of patterns and suitability to tropical and sub-tropical climates.

The schedules of packing costs are not available for all industries concerned. Some limited information is available in respect of 29 major industries. This information, compiled for the first time, under the Fourth Census of Industries (1950) published by the Directorate of Industrial Statistics, is, again, available for only one year,

Expenditure on Packing in 1950

	Rs.
1. Food Products.	
Wheat flour	62,89,027
Rice Milling	77,22,662
Biscuits	80,14,607
Preserved fruits & Vegetables	32,98,390
Sugar	2,15,88,987
Distilleries & Breweries	37,44,611
Starch	2,56,507
Vegetable oils & oil products	3,56,62,566
2. Textiles	
Cotton	3,02,61,855
Woolen	9,59,863
Jute	58,67,530
3. Chemical and Toilet Products	
Chemicals	2,98,91,567
Soaps	1,21,47,117
Paints & Varnishes	50,13,284
Tanning	2,01,660
Matches	31,01,098
4. Non-metallic Mineral Products	
Cement	2,82,02,846
Glass & Glassware	27,60,264
Ceramics	6,74,917
5. Paper & Paper Products	28,46,045
6. Metal Products	
Aluminium copper and Brass	23,49,907
Iron & Steel	13,00,818
7. Electric Appliances	
Lamps	7,97,234
Fans	5,94,923
8. Engineering Products	
Bicycles	4,80,489
Sewing Machines	3,48,828
General Engineering	59,01,844
Grand Total	22,02,79,446

Packing materials vary from industry to industry as well as from product to product. For example, jute bags are used for packing food-grains, cement, sugar, textiles; wooden and plywood boxes for loose tea, confectionery, biscuits, milk-powder, vegetable oils and oil products, paints and varnishes, tobacco and cigarettes; metal containers for paints and varnishes, petroleum products, coal-tar, chemical products; glass bottles and jars for chemical and pharmaceutical products; oils; paper and board cartons or containers for soaps, powders, tea, cigarettes, shoes, hosiery goods, electric bulbs, chemical products, and so on. The total value of packing materials, according to the nature of packs used by the larger industries in 1950, is shown below.

Value of Packing Materials in 1950	
Gunny cloth bags	8,47,95,000
Plywood and wooden boxes-cases	2,00,75,795
Tin cans and containers	2,83,14,584
Metal drums, kegs and containers	1,27,47,512
Paper wrappings and board cartons	2,06,08,081
Glass bottles and containers	1,19,62,280
Others	4,17,76,194
Total:	22,02,79,446

From the foregoing it appears that industrial packing in India has so far been limited to conventional packing materials and little effort, if any, has been made to use modern packs, particularly plastics and laminated materials. Plastics manufacture has been recently taken up in India. The development of plastic and laminated packing may open up new and vast avenues of demand for various industrial by-products and waste materials, besides a long range of forest products and other materials which are at present considered unimportant.

Scientific packing may also help in stimulating demand in the home and overseas markets for many Indian products. At present, consumers' preference for foreign over indigenous goods is based not only upon considerations of price and quality, but also, to a certain extent, on those of packing. In some cases, the competition is virtually between superior and inferior packing. So far as the home market is concerned, the effect of poor packing is somewhat offset by nationalistic feelings, protective tariffs, etc., but in overseas markets where these protective factors are absent poor packing is a source of obvious disadvantage. The policy of using cheap packing to bring down the cost of production is thus seen to be a short-sighted one, contributing to reduced demand and, at the same time, obstructing the development of modern packs and rationalisation of the cost structure.

New Delhi

GOVERNMENT TO DEVELOP ALL NEW COALFIELDS

INDIA REFUSES TO GUARANTEE U.S. INVESTMENTS:

COUNTER-MEASURES ON FREIGHTS

(FROM OUR NEW DELHI CORRESPONDENT)

THE Government of India has re-oriented its coal production policy to fit into its general industrial policy as outlined last winter. The industrial policy provided for the implementation of the Coalfields Committee's report. Since then emphasis has shifted to the enlargement of the public sector in the field of the six industries scheduled in the industrial policy. The Planning Commission, it will be recalled, has been examining the coal position in view of the industrialisation expected in the second five year plan and the stepping up of steel production to five million tons. Expansion of coal production requires considerable development, and the Planning Commission had several meetings with coal interests last month. The industrial policy, coupled with the amendment of the Constitution has, however, created apprehension in the minds of colliery owners. In the face of this hesitant attitude of the colliery owners on the one side and the clamour for enlarging the sphere of the public sector in the coal industry on the other, the Government of India has decided to develop, as far as possible, all new coalfields itself. No new leases, therefore will be given for the present. The target for new production in the public sector is placed at 12 million tons, or from three million tons at present to 15 million tons, at an estimated cost of Rs. 50 crores. The increased production of 12 million tons is also planned in the private sectors.

The Government of India has rejected the proposal of the U.S. Government for a treaty to guarantee American investments in India. The Government of India has recently amended the Constitution in order to facilitate the process of nationalisation. The amended Constitution has vested in the legislatures the power to determine the quantity and manner of payment of all compensation. The American proposal provided for arbitration to determine the quantity of compensation for an American undertaking taken over by the State. The Government of India claimed that it would not be justified in according to the American investor a right which was explicitly denied to the nationals of India. As indicated earlier, the suspended negotiations for the Indo-U.S. treaty of friendship are likely to be resumed at an early date.

Committee on Shipping

An inter-Ministerial Committee on shipping has been appointed. It consists of the Ministers for Finance, Commerce and Transport. The Committee will devise all possible measures regarded necessary to safeguard the interests of India in its dealings with non-national shipping companies. The threatened levy of a surcharge of 35 percent was the provocation provided for setting up this Committee. The Ministry of Commerce controls the foreign trade of India and the Ministry of Finance is in charge of banking and insurance companies. The two Ministries, combined with the Ministry of Transport, will devise methods of resisting the surcharge, if it is imposed on Indian imports. The Commerce Minister has given an indication of what he will do if a surcharge is levied. Under his scheme the volume of imports could be automatically reduced by the amount of the surcharge. Another plan is to ban imports from the country whose shipping companies levy the surcharge. His Ministry would refuse to grant import licences for such countries. India might also adopt the U.S. practice by insisting that a certain percentage of Indian cargo be carried in Indian bottoms. Banking and insurance facilities to assist Indian shipping are not ruled out.

The Government of India, it may be added, is not unmindful of the labour trouble in the ports, leading to delays in the loading and unloading of cargo. The Government, at an early stage, referred the Bombay dock labour dispute to arbitration, which gave its award last week, recommending piecework wage payments for the workers. In addition, the Government has appointed the Vaisit Committee, to recommend a long-term remedy for solving the labour unrest at the ports. New Delhi does not feel happy about the prevailing conditions in the management of Indian shipping lines. In several cases shipping is one of the interests which is dealt with by managing agents. A whole-time and whole-hearted effort is needed to build an Indian Mercantile Marine, it is suggested here.

Members of Sub-Committee Chosen

The Cabinet Sub-Committee on heavy industry consists of the Prime Minister as its Chairman, and the Finance Minister, Sir Chintamani Deshmukh, the Home Minister, Pandit G. B. Pant, the Commerce Minister, Mr. T. T. Krishnamachari, the Railway Minister, Mr. Lal Bahadur Shastri, the Defence Minister, Dr. K. N. Katju, the Production Minister, Mr. K. C. Reddy and the Works Minister, Sardar Swaran Singh as its members. The Committee of Secretaries on heavy industry consists of the Secretary-General

Sir Raghavan Pillai, the Cabinet Secretary, Mr. Y. N. Sukthankar, the Commerce Secretary, Mr. H. V. R. Iengar, the Defence Secretary Mr. M. K. Vellodi, the Production Secretary, Mr. S. S. Khara and the Secretary, Ministry of Iron and Steel, Mr. Bhoothalingam.

The re-organisation of the Secretariat business between the Ministries of Commerce and Industry and Production is being commented upon here. It is no secret that the creation of the Ministry of Production was an afterthought to make certain political adjustments. From its very beginning, the Ministry of Production was supposed to be in charge of State undertakings. The Government's own annual report defined the function of the Ministry as under:—

"The Production Ministry was constituted in May 1952 to contribute to the rapid industrialisation of the country by careful planning and by the active and progressive participation by the State in the creation of new industrial undertakings in certain basic industries of national importance, keeping in view the objectives of the Industrial Policy Resolution of April 1948, and the fact that rapid development of basic industries in the public sector would stimulate the simultaneous and co-ordinated development in the private sector."

Yet State undertakings, such as Hindustan Aircraft, Limited, Bharat Electronics, Ambernath Machine Tools and the Ordnance factories remained with the Ministry of Defence, the Chittaranjan Locomotive Works, with the Ministry of Railways and Indian Telephone Industries, Limited with the Ministry of Communications. The demarcation left the industries in the private sector with the Ministry of Commerce and Industry and yet the sugar industry was left with the Ministry of Food and Agriculture. It is also no longer a secret that the Prime Minister's letter to Mr. T. T. Krishnamachari, which provoked the latter's resignation, referred to the Ayadi Resolution of the Congress, which the Prime Minister claimed, had created a very good climate, and which he feared might be spoilt if the Ministry of Production were abolished.

It is, however, not explained on what principle the sections in the Commerce Ministry, dealing with village industries and handicrafts, including the two autonomous All-India Khadi and Village Industries Board and the All-India Handicrafts Board should have been transferred to the Ministry of Production. They have nothing to do with the public sector. The Congress ideology and the spectre of unemployment led to their creation and very heavy subsidy by the Central Government. One explanation could be that, on the principle of better, one autonomous unit namely, Hindustan Steel Limited and a semi-autonomous unit dealing with the Bhilai steel project were exchanged by the Ministry of Production for the two autonomous units dealing with khadi and village industries and handicrafts functioning under the Ministry of Commerce. It may also be attributed to the not very cordial relations that existed between the Gandhite leaders of the khadi and handicraft boards and the Ministry of Commerce. Or is there a possibility that the khadi and handicraft industries will be nationalised in order to fit them into the framework of the Production Ministry?

It may be added that the new Ministry of Iron and Steel will deal exclusively with that industry in the public sector, leaving the co-ordination between the two sectors to the Minister for Commerce and for Iron and Steel whom the two ministries share in common. Some tribute is needed for the officials of both Ministries. Although the deadline for the transfer of the iron and steel organisation to the new Ministry is 15th June, the Ministry of Production has already handed over the de facto control of the organisation to the Secretary designate of the new Ministry, Mr. S. Bhoothalingam. The Russian Chief Engineer to the Bhilai Steel Project, Mr. N. G. Korotenko, who arrived here during the week, was directed to meet Mr. Bhoothalingam accordingly. The Commerce Ministry, likewise, has handed the de facto charge of the khadi and handicraft organisations to the Ministry of Production.

The Durgapur Project Approved

The Government of India has approved the proposal of the West Bengal Government to set up a coke oven plant at Durgapur costing about Rs. 5.5 crores, on the lines indicated by the Coke Oven Projects Enquiry Committee. The West Bengal Government is however being asked to send to the Government of India details regarding the financial structure of the proposed project.

The Durgapur Coke Oven Scheme, as recommended by the Committee, envisages the setting up of a coke oven plant capable of handling daily 1,300 tons of coal and coke breeze (1,235 tons of coal and 65 tons of coke breeze) at Durgapur,

Railway Administration

A member of the Railway Board, Mr. P. C. Mukerji left for the U.S.A. during the week for consultations with the American railway administrations. Under the Operational Agreement with the U.S. Technical Co-operation Mission, a survey was to be made of the needs of the railway system for carrying out its function in the economic development of India. Specialists required for such a survey from outside India and requested under the Agreement were to be furnished by the U.S. Technical Co-operation Mission.

In pursuance of this agreement one Mr. Richardson came out to India last winter. It became obvious however, that one expert could not cover all the aspects of railway administration and his limited enquiry could not be a useful appraisal of the needs of the Indian railways. Since then another Operational Agreement on the same lines has been entered into with the U.S. Technical Co-operation Mission. The present Railway Board presumably felt that much useful time had already been wasted and, instead of long-drawn correspondence it has deputed one of its members to go to the U.S.A. and secure an effective team of experts to come out to India immediately to undertake the survey as provided in the Agreement.

Order for Skymasters

The Government of India has decided to place an order for the purchase of three Skymasters, in addition to five Viscounts for the internal trans-continental air services. As it will take two years for the delivery of Viscounts, Skymasters will enable Indian Airline Corporation to replace Dakotas on trans-continental routes.

Encouraging Lac Production

Lac provides a useful subsidiary occupation for the rural population and it is important, from the view point of rural economy, to increase its production. Production at the end of 1955-56 is likely to be about 12 lakh maunds and an increase of one lakh maunds a year thereafter is aimed at. The increase will be achieved in the following manner:— The establishment of 50 new brood farms which will ensure a steady supply of brood lac to all parts of the country. These farms should be located as follows:—Bihar, 20; Madhya Pradesh, 10; Uttar Pradesh, 4; Vindhya Pradesh, 4; Orissa, 4; West Bengal, 4; Assam, 4; total 50. A survey of idle host plants in different States is required for bringing them under cultivation, and for this the active co-operation of the States is essential. For imparting of technical knowledge of lac cultivation, the intensification of the public campaign to popularise cultivation of lac and other lac extension work, it is essential to undertake the following schemes of lac development:—

- Pilot work on manufacture and export of bleached lac.
- Pilot work manufacture of garnet lac.
- Provision of cold storage for seedlac and shellac. It is proposed to set up 17 godowns and warehouses for storage of lac at important marketing centres.

It is also necessary to enforce a scheme of quality control at the various points of export. For this purpose laboratories for testing shellac and seedlac will have to be established. The matter has been discussed by the Indian Lac Cess Committee where opposition was expected from the exporters who have their own standard at present. Government standards will have to be evolved and these will have to be made compulsory. This scheme will be run by the Agricultural Marketing Advisor to the Government of India. Apart from the scheme for quality control for export, it is proposed to introduce quality control for internal purposes also. In this connection it is proposed to set up six regional laboratories for analysis of lac, seedlac and shellac. The total expenditure on the schemes mentioned above is likely to be Rs. 50 lakhs. It is intended that a sum of Rs. 23.5 lakhs should be contributed by the Central Government towards this expenditure and an equal amount by the State Governments. This will leave a sum of Rs. 3 lakhs which will be found from the resources of the Indian Lac Cess Committee. This Committee has an annual income of about Rs. 6 lakhs and has to carry on its normal activities and has also to intensify research on the technology and utilisation of lac. It will not be possible for the Committee to devote any additional part of its income to the execution of the plan.

Indian Pepper

Black pepper, which has become an important article of international commerce, is produced chiefly in India and Indonesia and partly in other countries of the East Indies. Before the second world war, pepper was exported mainly from Indonesia and other countries of South East Asia and India's share in international trade in this spice was only about 20 percent of the total supplies. During the war, there was large-scale destruction of pepper plantations in Indonesia as a result of which the supply from that source declined considerably and the demand for India's black pepper grew rapidly, particularly from the U.S.A. and European countries. The price of pepper shot up from Rs. 108 a candy of 6 cwts. in 1939 to about Rs. 3,942 in 1952, namely nearly 36 times higher than the pre-war level, and the export of black pepper from India increased from about 1,000 tons

to 15,000 tons in 1951-52, valued at about Rs. 23 crores.

In view of the above facts, a committee to investigate the production and marketing of some of the important dollar-earning crops like pepper and cashewnut, was appointed in 1951. It recommended that a development fund of Rs. 1 crore for 10 years should be created for the development of the Indian pepper industry alone. The recommendations of the committee were considered by the Government of India and it was agreed, in principle, that immediate financial assistance should be given to the extent of Rs. 15.7 lakhs for research and the development of pepper during the last two years of the First National Plan period, namely 1954-55 and 1955-56 in the two States of Madras and Travancore-Cochin. An initial survey of pepper has been undertaken during the current financial year and the development work will be taken up next financial year.

Indonesia and other South East Asian countries are now rehabilitating their pepper industries and in order to retain the present position of Indian pepper in world markets it is necessary that suitable steps be taken to increase its production in India as recommended by the Spices Enquiry Committee. Accordingly, it is intended to extend the research and development programme during the second five year plan to more areas such as the States of Bombay, Coorg, Mysore, Assam, the Andamans and Nicobar Islands which are considered suitable for pepper cultivation. It was proposed to spend Rs. 15.7 lakhs during 1954-55 and 1955-56 for the research and development of pepper in the two States of Madras and Travancore-Cochin. The total amount now required to include additional States, in the research and development programme of pepper during the second five year plan period is estimated at Rs. 51 lakhs.

Self-Sufficiency in Coconuts

India is a deficit country in the matter of coconut and coconut products. There is at present a deficit of 40,000 tons in terms of coconut oil, which is made good every year by imports. It is estimated that at the end of 1960-61, this deficit will increase to 80,000 tons, on account of population increase and demand from the soap and other consuming industries. The number of nuts produced per tree in this country is only about 30, whereas in other countries nearly twice this number is obtained. This difference in the yield indicates the extent to which production can be increased without increasing the area, by intensive cultivation methods, and by adopting better plant protection measures. The bulk of coconut growers in India are small cultivators. It has been estimated that the price the primary producer gets is only 60 percent of that paid by the end consumer, the remaining 40 percent going to middle men and the exchequer. If the growers are to have a proper incentive for increasing production, improvement in the present marketing method, and a better price for the growers for their produce, are necessary. This aspect of work, however, will be taken care of by the all-India marketing organisation which it is proposed to establish. The object of the scheme is to adopt measures for stepping up the production of coconuts to wipe out the deficit at the end of 1960-61. It also includes proposals for the correct estimation of area and yield statistics and the provision of additional research facilities at the Central research stations at Kassaragod and Kayangulam.

The measures likely to be adopted for stepping up production will be both short term and long term. It has been shown that by better cultivation and manuring, the yield of coconut gardens can be increased considerably and that by adopting better plant protection measures the loss of yield through pest and disease could be mitigated. The short-term programme for stepping up production will, therefore, aim at running demonstration centres to prove the efficiency of improved methods of cultivation, intensive propaganda among growers and providing an effective and an extensive plant protection service. The long-term measures will include steps to increase the area under coconut and the supply of quality seedling to coconut growers. The area under coconut can be increased by bringing under the crop suitable waste lands and by planting coconuts on the banks of canals, irrigation channels and bunds of paddy fields. These suggestions have already been brought to the notice of the various State Governments by the Indian Central Coconut Committee.

A three-year scheme for the development of coconut cultivation in the Andamans is now being worked. It will expire in January, 1956. It is proposed to continue the scheme with increased scope during the second five year plan period. The Coconut Development Officer who is at present assisted by two field assistants may be given more assistants and he will, in conjunction with the Forest Department of the Islands, demarcate jungle land suitable for coconut cultivation and make arrangements for the marketing and processing of coconuts. Better progress can be achieved by allotting land for immigrant colonists for cultivation rather than by the Government resorting to coconut cultivation on a plantation basis. It may be possible to start a mill in the Islands for crushing copra. It is proposed to provide a sum of Rs. 299,000 for this development scheme.

The Oilseeds Specialist in Coimbatore was once deputed to make a survey of the lands suitable for coconut cultivation in Saurashtra and Kutch areas and his view is that it should be possible to bring about 10,000 acres in these areas under coconuts. A sum of Rs. 23,400 is proposed to be provided for this purpose. There are also possibilities of expanding coconut cultivation in Coorg and Hyderabad States by introducing coconut nurseries, holding

demonstrations and by surveying areas suitable for coconut growth. Total expenditure for five years is estimated at Rs. 169,000. The likely balance with the Indian Central Coconut Committee at the end of 1955-56 will be of the order of Rs. 57,000 only. The average annual income of the Committee by way of coconut cess is expected to be of the order of Rs. 8 lakhs. In view of the limited financial resources of the Committee, the entire additional expenditure of Rs. 6,375,200 required in connection with the working of the plan will have to be shared by the Central Government and the respective State Governments in the following proportions:

Central Government	Rs. 45,00,250
Coconut-growing States of Travancore-Cochin, Madras, Andhra, Mysore, Bombay, West Bengal, Coorg, Hyderabad, Assam and Orissa.	Rs. 18,74,950
	Rs. 63,75,200

Areacanut Production

The normal annual production of areacanut in India is 22 lakh maunds while requirements are about 32 lakhs maunds. The deficit at present is met by imports from Malaya, Singapore and Ceylon. Areacanut is a perennial crop and it takes about eight to 10 years to bear fruit. The question of making the country self-sufficient in her requirements of areacanut cannot then be solved within the tenure of a single five year plan, it will take longer. An increase in the production of areacanut is proposed both by intensive and extensive cultivation. It was observed that certain tracts of land were lying waste and could be utilised for areacanut cultivation. The Indian Central Areacanut Committee then appointed an officer to survey waste lands suitable for areacanut cultivation in various States. He has completed this survey. By bringing waste lands under areacanut and by intensive methods of cultivation and prevention of pests and diseases, about a 20 percent increase may be expected from the end of the third year of the second five year plan.

Areacanut is a commodity on which no research work worth mentioning has yet been done in the country. To study the fundamental problems of areacanut, the Government of India has decided to set up a Central Areacanut Research Station at Kote, near Vittal, South Kanara District, in Madras State. The station is likely to be started during 1955. Though the Committee is arranging to establish the Central Research Station for areacanut, the preliminary work as well as dissemination of knowledge gained from the studies at the Central Research Station will have to be done by the Indian Central Areacanut Committee is financing three Regional Research Stations in the State of Madras, Travancore-Cochin and Mysore, which are under the technical and administrative control of the State Governments concerned. But unless there are separate regional research stations in each areacanut-growing State, controlled completely by the Committee, steady progress cannot be anticipated. It is, therefore, proposed to establish Regional Research Stations in the States of Madras, Mysore, Travancore-Cochin, Bombay, West Bengal and Assam at an estimated cost of Rs. 16,33,200, under the control of the Indian Central Areacanut Committee.

The production of areacanut can be raised by starting new areca gardens, but there is a paucity of good areca seedlings. For this a regular supply of quality seednuts is essential. The Indian Central Areacanut Committee made a start in this direction by way of establishing areacanut nurseries in Assam and West Bengal. Since augmenting the production by increasing area under areacanut is one of the major items of the work of the Indian Central Areacanut Committee, production and distribution of good seedlings should be given all priority in the programme of work. But the seedlings should be sold at a nominal price because areacanut cultivation is mainly in the hands of poor and middle-class ryots. With a view to encouraging the growers to go in only for the good seedlings it is proposed to establish a network of areacanut nurseries, each capable of distributing at least 50,000 seedlings a year in the States of Madras, Mysore, Bombay, Travancore-Cochin, West Bengal, Assam and Coorg. The total cost involved for five years is estimated at Rs. 1,290,900. Apart from research on the agricultural aspects of areacanut, it has been suggested that a Central Technological Laboratory to find out uses for the various bye-products of areacanut should also be established. The cost of this laboratory during the period of the plan is likely to be Rs. 493,300.

It is proposed to make a provision for a subsidy of about Rs. 1,125,000 for digging wells to irrigate areca gardens in the States of Travancore-Cochin, Madras, Mysore, Bombay, West Bengal and Assam. The provision for subsidy will be utilised only if irrigation for areacanut cannot be integrated with the general irrigation schemes, whether major or minor, of the areas concerned.

Encouraging Research

There are facilities in most of the Universities in India for conducting research on various aspects of areacanuts. The Forest Research Institute, Dehra Dun, has already done some research on the bye-products. The University of Gauhati has also been entrusted with research on better utilisation of bye-products. This research is proceeding satisfactorily. If more universities and research institutes are encouraged to study various problems regarding areacanut, several ways could perhaps be discovered to make use of the bye-products which are

now being wasted. It is, therefore, proposed to make a provision of Rs. 7.5 lakhs for the award of subsidies to universities and other research institutes for research on areacanut. Recently, the Secretary of the Indian Central Areacanut Committee, went on a study tour of Malaya to find out why the yield per tree is very much higher in that country than in India. He has submitted a report which indicates that the natural conditions in Malaya and Singapore favour higher production. These areas also appear to be comparatively free from disease. The Andaman and Nicobar Islands have also been visited by the Secretary of the Indian Central Areacanut Committee. There is scope for bringing considerable areas under areacanut in the Andaman and Nicobar Islands provided good seedlings are made available to the intending planters and suitable waste lands are assigned to them. There is also need to conduct studies on the special features of the Andaman varieties of areacanut. It is, therefore, proposed to establish two areacanut nurseries and one Regional Research Station in the Islands at an estimated cost of Rs. 433,600.

It is also proposed to undertake areacanut extension work in all the areacanut-growing States. It is expected that half of the areas in all the States will be under the National Extension Service by the second year of the second five year plan and advantage will be taken of that service for furthering areacanut extension work in those areas. The estimated expenditure on extension work in the areas not under the National Extension Service will be approximately Rs. 1,724,500 to be shared equally between the Central Government and the State Governments. It will be observed that the schemes proposed to be included in the second five year plan are expected to cost Rs. 7,450,500 as detailed below, of which the share of the Central Government would be Rs. 6,586,250 and that of the State Governments Rs. 862,250.

	Rs.
1. Regional Research Stations	1,633,200
2. Areacanut nurseries	1,290,900
3. Central Technological Laboratory	493,300
4. Subsidy for wells for irrigating areacanuts	1,125,000
5. Grant to the universities and research institutes for advanced studies on areacanuts	750,000
6. Development of areacanut industry in N. & E. Andaman and Nicobar Islands	433,600
7. Areacanut extension work	1,724,500
Total	7,450,500

The average cost per year during the second five year plan would come to Rs. 1,490,100. The share of the Central Government per year would come to Rs. 1,317,650. The Indian Central Areacanut Committee now receives an annual grant of Rs. 150,000 from the Central Government to carry out its activities. On a rough estimate, it will be necessary to increase the grant by about Rs. 1,300,000 a year to enable the Committee to carry out the next five year plan in addition to its normal activities.

Sources of Cashewnuts

Though Africa and other tropical countries are important producers of raw cashewnut, the processing industry is concentrated in India. Thus, India forms the principal source of supply of cashew kernel in the world markets and accounts for more than 95 percent of the international trade in this product. With the growing demand for cashew kernels in America and Europe, this Indian industry has a bright future. In its report, the Spices Enquiry Committee has observed that out of 26,012 tons of cashew kernels produced in India during 1951-52, nearly 21,000 tons were exported and about half of this quantity, valued at Rs. 3.3 crores, was extracted from raw cashewnuts imported from East Africa. Both British and Portuguese East Africa supply this raw material to our processing factories, but by far the largest quantities are obtained from the latter territory. In order to increase the production of raw cashewnut by more than double the quantity produced at present, the Spices Enquiry Committee recommended that the cultivation of the crop should be extended, on a plantation basis, in the East Coast districts of Madras, the coastal districts of Ratnagiri and other suitable areas on the West Coast. The proposal was considered by the Government of India in January, 1954, and it was agreed, in principle, that financial assistance should be given to the extent of Rs. 5 lakhs for the remaining period of the first five year plan for the development of various aspects of the cashew nut industry. The development work will be taken up during the next financial year.

About 42,350 tons of raw cashewnuts are imported from the British and Portuguese East Africa for running the processing factories in India. With the growing world demand for cashew kernels, there is increasing realisation of the commercial importance of this crop in East Africa, particularly in the British zone where some plans are already afoot to set up processing factories and to utilise the local supplies. Moreover, India's relations with Portugal have recently deteriorated and the position regarding supplies of raw cashewnut from that source has become a matter of great concern. In spite of the large quantities imported into the country, the cashewnut processing factories in India do not have adequate supplies of raw cashewnuts to utilise their present installed capacities to the full and the local production and the imported nuts provide work only for nine to 10 months of the year; for the remaining period the factories have to remain idle.

Bombay

POLYSTYRENE PRODUCTION IN INDIA

IMPORTANCE OF NEW VENTURE TO PLASTICS INDUSTRY

(FROM OUR BOMBAY CORRESPONDENT)

A MILLION-DOLLAR plant for the production of polystyrene moulding powders—a raw material for the plastics industry—is to be set up in Bombay. The venture is being sponsored by Kilachand Devchand Co. Ltd., of Bombay in collaboration with the Dow Chemicals Co. of the United States. The American firm will contribute 25 percent of the capital and provide the necessary technical "know-how." It is reported that work on the projected plant will begin in the near future and actual production will commence within two years. In the initial stages the plant will have an annual rated capacity of 6 million lbs. On the basis of past imports of polystyrene it would seem that the rated capacity of the proposed plant is approximately 1 million lbs. in excess of the normal output. Doubtless the sponsors of this new enterprise believe that the demand for polystyrene will increase as the consuming industry expands. On the other hand, the actual users of moulding powders point out that the annual off-take of polystyrene will depend to a large extent on the competitive position of other materials which can be used as substitutes if the price differentials are appreciable. Specifically, they mention polythene and cellulose acetate which are today competitive with polystyrene.

Whether or not the domestic products will be competitive is problematical. In the first instance, the manufacture of polystyrene will amount to no more than the polymerising of imported monomer—the basic raw material. It is pointed out that the production of monomer will be an economic proposition only if the rated capacity of the proposed polystyrene plant is considerably increased. It seems, therefore, that it will take some considerable time before the complete manufacture of polystyrene can be undertaken in this country. The consuming industry is watching the developments with keen interest. Another point which is of vital concern is that at present the manufacturers of finished plastics goods are allowed a drawback of import duty at the rate of As. 7 a lb. on the export of items made of polystyrene. Assuming that the price of the locally-manufactured polystyrene is competitive with that of the imported product, exporters would still lose the seven anna a pound drawback of duty. "Will the Government consider an alternative form of subsidy? industrial circles ask. This question is pertinent, considering that India has established a sizeable export trade in finished plastics goods. The value of this trade has increased steadily. The figure for the last three years are as follows:—

1951-52	Rs. 6,44,000
1952-53	Rs. 13,02,000
1953-54	Rs. 15,88,000

Export Markets

India's main export markets are Burma, South East Asia and Africa. The main items exported are various consumer goods including combs, suitcases, tumblers and toys. Another item which is developing into a fast seller is gramophone records made of plastic materials. There seems to be a limitless market for these among the Indian community abroad. It is believed that a far greater export potential exists than is apparent at the moment. Last week the Export Promotion Council was formed with the object of developing sales abroad. The Council has 25 members of which six are drawn from various Chambers of Commerce, three are Government representatives and the remainder represent manufacturing interests. Mr. N. K. Ramchandani, representing the industry, is the first chairman of the Export Promotion Council. The budget for the current year for expenditure in India and abroad, as approved by the Government of India, is Rs. 100,000 of which two-thirds will be contributed by the Union Government and the balance by the industry. Industry circles are confident that a sales promotion campaign in foreign markets will further stimulate the demand for Indian plastics goods.

The Indian industry has made rapid progress since the war. Today it has a capital investment of approximately Rs. 7 crores. There are about 100 large and medium-scale factories, together with a number of small units which operate on a cottage industry basis. The industry gives employment to about 10,000 workers. There are at present about 200 compression moulding machines with a total pressing capacity of 10,200 tons and about 400 injection moulding machines with a total capacity of 700 ounces. The extrusion section has about 50 extruders ranging from an inch to four and a half inches in size. The productive potential is more than sufficient to meet the home demand for consumer goods and electrical accessories such as switches, ceiling roses, cutouts and lampshades. To achieve the economies of large-scale production it is now necessary for the industry to find ever-expanding export markets.

A recent outstanding development within the industry has been the manufacture of P.V.C. flexible sheetings. At present only one factory is equipped for the manufacture of this product. The

London

STRIKE-BOUND BRITAIN CARRIES ON

PARALYSIS OF INDUSTRY AND UNEMPLOYMENT THREATENED

(FROM OUR LONDON CORRESPONDENT)

ALL attempts to find solutions to the disputes leading to the strikes of the members of the National Amalgamated Stevedores and Dockers union and the Associated Society of Locomotive Engineers and Firemen having proved fruitless—and it should be emphasised that the Trades Union Congress has played the leading part in seeking these—a state of emergency has been proclaimed and the Government is now invested with wide powers for maintaining the essential life of the community. Comparatively few of these powers are being exercised yet, for the main problem this week has been that of transport, both for passengers and for freight. Fortunately, stocks of food and the materials necessary for the maintenance of essential services were fairly good when the strikes began. In the past week, therefore, their effects have not been seriously felt other than the inconvenience which has been suffered by travellers in the matter of transport facilities and congestion of traffic on the roads, and loss to the holiday resorts and to some agricultural producers in remote districts. Furthermore, each day has produced an improvement in the railway services available as emergency re-scheduling has come into operation. At the week-end vital supplies of food and fuel are being well maintained and people are being got to and from work fairly satisfactorily.

That, however, is only the short-term aspect of the situation, and although the Government has handled it with success, the first indications of the long-term aspects—the paralysis of industry and unemployment—are already evident in the closure of some steel works and the announcement of short-time working in other industries. Over 200 ships are also lying idle in various ports or are undermanned. While the slowing down or stoppage of industrial production renders the dock strike less vital, there is no doubt that the combination of the two will have serious repercussions on the economic situation. The stock markets have at last reacted to the situation, and pressure on sterling and the gold reserves will undoubtedly follow in the coming week. Both the Ministry of Labour and the T.U.C. are continuing their efforts to bring the stoppages to an early end, but failing some dramatic move by Sir Walter Monckton, and what that can be is somewhat obscure at the moment, the outlook can hardly be called bright.

Unfortunate Setback

These developments come at a most unfortunate time, for the usual economic indicators suggest that while we may not have been overcoming recent difficulties entirely, the position was at least being adequately held. Industrial production has been increasing steadily. The Treasury's interim index for March has just been revised to 140, and the figure for February increased from 138 to 139. The estimate for April is given as 130-131, compared with 124 for April, 1954. Even allowing for seasonal factors, the production index, which remained fairly steady throughout the second half of last year, has been creeping up again in the first four months of this year.

The gold and dollar reserves, at \$2,686 million, were unchanged last month. Allowing for the receipt of \$18 million of United States defence aid and of \$31 million from the April E.P.U. settlement, and payment of \$2 million to E.P.U. creditors, the sterling area had a residual deficit of \$47 million, which compares with a deficit of \$11 million in April. The April deficit showed a marked improvement on the February residual deficit of \$103 million and was therefore judged as reassuring. But the May figure looks disappointing. Unfortunately, the special influences on sterling operative in the pre-election weeks, to say nothing of the effects of the dock strikes and the rail strike, cannot be accurately measured and disentangled from the underlying factors in the balance of payments problem. Last month the sterling area earned a surplus of £8 million with the European Payments Union. This is a satisfactory outcome for a month in which seasonal influences were no longer operating favourably. The surplus in April was unusually large at £22 million, and it was hardly to be expected that it would be repeated.

Lancashire's Prospects

Other events of rather more pressing importance have for the present pushed the reactions of the Lancashire textile traders to the proposed measures to relieve their difficulties into the background. A leading article in the *Monthly Record* of the Manchester Chamber of Commerce serves as a reminder that the "anger, dismay and regret" engendered by the Government's failure to announce "a satisfying measure of protection against the impact of retained duty-free imports of cloth" has not abated, and that the threat to the domestic market remains. On the other hand, the article gives some indication that ways and means are also being considered of making the best of the new circumstances—at least for the time being and pending the further pressing of Lancashire's claims. With regard to imports, the article points out that price and suitability of cloths will determine the course of trade, and every effort should be made to ensure that both these matters receive

rated capacity of the firm is 500 tons a year. In terms of actual yardage, the manufacturing capacity is about 15 lakh square yards. The plant went into production in March, 1954 and since then has been manufacturing P.V.C. sheeting in designs and thicknesses according to consumer requirements. But manufacturers complain that they are hardly able to utilise a quarter of their productive capacity because of foreign competition. The value of the import licences issued till the end of April this year amounts to more than Rs. 12 lakhs which will purchase approximately one million square yards of P.V.C. sheetings. The country's annual requirement of P.V.C. sheetings and film has been estimated at 17 lakh yards. Since the domestic productive capacity for sheetings is adequate to meet the demand, manufacturing interests contend that imports should be banned in order to encourage the home industry. It is conceded, however, that since P.V.C. film is not produced locally, import licences for this product may be issued. Despite this satisfactory progress, the industry remains vulnerable and suffers from a fundamental weakness—that it is completely dependent on foreign sources for its raw materials. Synthetic resins and moulding powders and semi-fabricated materials have still to be imported at an annual cost of about Rs. 2 to 3 crores.

Raw Materials Problem

It would be uneconomic for the plastics industry to produce its own raw materials. This is better left to the chemicals and the intermediates industries which, if adequately developed, can serve as a feeder group for a whole range of industries and make them self-sufficient. Broadly, the industries which need developing are coal tar distillation products, including those derived from coke, tar and coal gas; alcohols and their allied products; calcium carbide and its allied products; and the cellulose industries. A nucleus for all these industries already exists. The production of caustic soda and soda ash is increasing and further expansion plans are in hand. There is already a surplus of chlorine which could profitably be used in the manufacture of intermediates and at the same time relieve the caustic soda industry of a heavy burden. India's productive capacity for ethyl alcohol is considerable. This is because molasses, which is the starting material for the production of alcohol, is in abundant supply as a by-product of the sugar industry. It is estimated that approximately 400,000 tons of molasses are available each year. On this basis, it is calculated that approximately 24 million gallons of power alcohol and spirit can be made available each year for the consuming industries. Alcohol is also a basic raw material for a number of fine chemicals including acetone, ethyl acetate and trichloroethylene.

The calcium carbide industry is still very much in its infancy. The importance of this product can be judged from the fact that during the war the German production of calcium carbide amounted to 30 million tons. This was because calcium carbide is used in the manufacture of acetylene which is a raw material for the production of a wide range of fine chemicals including ployvinyl compounds. But calcium carbide has other important uses as well including that in the production of cyanamide, which is used for agricultural purposes, and as a reducing agent in some metallurgical processes. It is clear that further development must now be concerned with the basic and intermediate industries. The immediate requirement seems to be a co-ordination of the existing industries and a consolidation of industrial achievement rather than an unwieldy growth in several unrelated directions. This is a problem which is not peculiar to the plastics industry alone but covers the entire field of the synthetic and organic chemicals industry which is today rated as an industry requiring top priority.

The Problem of Moulds

Although the proposed polystyrene plant is a welcome development, a great deal more has still to be attempted before Indian industries can look forward to self-sufficiency. Moulds present another problem for the plastics industry. There are about four engineering concerns in Bombay which make certain types of moulds. In addition there are about 16 plastics moulding concerns, mostly in Bombay, who have set up their own tool rooms for producing moulds for compression and injection moulding machines as well as dies for extrusion. But all these are of the simple and straightforward type while the complicated and intricate ones have still to be imported from abroad. It is estimated that about 150 moulds will have to be purchased from foreign sources at a cost of approximately Rs. 10 lakhs. The need for establishing a central tool room for the plastics industry as a whole has been felt since 1951. In 1953, a foreign expert visited this country and after studying the requirements of the Indian industry drew up a blueprint for a central tool room. The cost of the project was estimated at about Rs. 30 lakhs. The industry expressed its inability to invest such a large amount and consequently no further steps were taken. But now the Planning Commission has asked the industry to study the original proposal again and make concrete suggestions for the setting up of a central tool room. The report of the industry is under preparation and will soon be submitted to the Planning Commission. Finance still remains a problem and it is probable that the industry will ask for financial assistance from the Government.

the fullest consideration. Some compensation for loss of domestic trade might even be secured by increasing exports.

Against this matter, in which no change has been made, there are two in which there have been favourable changes. The reduction in Indian import duties may permit only a small increase in Lancashire's exports, but Lancashire is in no position to neglect any opportunity of this kind. The removal of the purchase tax may bring little advantage to traders in apparel cloths, but it should stimulate business in many other kinds of cloth. In his statement as chairman on the accounts for 1954-55 of Vantona Textiles, Ltd., Mr. Ronald Dunkerley says that the tax change as it affects household textiles "will undoubtedly assist us in some measure." It is indeed only reasonable to hope that a number of small improvements, each of them affecting no more than a few sections or even firms, will in the aggregate bring more satisfactory conditions over the industry as a whole.

Television Advertising Code

So far as it is possible, the Independent Television Authority is taking no chances that the fears of those who opposed its formation, that television advertising here could not avoid developing the less favourable features of what it has become in America, will be realised. In January it appointed an Advertising Advisory Committee, and on the basis of that body's recommendations the I.T.A. has now approved the rules which will govern commercial television advertising in this country when it starts functioning next September, and has published these in a shilling booklet, under the title "Principles for Television Advertising." The general principle is that it should be "legal, clean, honest and truthful"—and if it conforms to that standard it can hardly prove objectionable. Advertisements in the following categories will not be accepted: money-lenders; matrimonial agencies and correspondence clubs; fortune-tellers; undertakers; betting tipsters; unlicensed employment services; specifics for slimming or bust development not dealt with in the British Code of Standards; contraceptives; smoking cures, and products for treatment of alcoholism. No betting advertisements will be accepted in the first six months, during which the committee will reconsider the matter.

The rules covering acceptable advertisements are intended to be applied in the spirit as well as the letter, and in certain circumstances the authority may impose stricter standards. No advertisement may contain any visual or spoken presentation of the product or service advertised, or statement of its price, which deliberately or by implication misleads. Any statement intended to promote sales by unfair comparison with or reference to competitive products is forbidden. Irresponsible use of testimonials must be avoided. No product or service may be advertised and no method used, in association with a children's programme, which might harm them physically, mentally or morally. Also anything which takes advantage of the natural credulity and sense of loyalty of children is forbidden. No advertisement is allowed which leads children to believe that if they do not own the product they will be inferior to other children or liable to be held in contempt or ridicule.

Nothing dealing with the activities of a club is allowed unless the programme contractor is satisfied that it is carefully supervised. Advertising of medicines and treatments must comply with the British Code of Standards, which is generally observed in other advertising media. It must not give the impression of professional advice. Financial advertisements, it is stipulated, should be limited to British Government stocks, including National Savings certificates, stocks of public Boards, nationalised industries and municipal government in Britain; building societies and the Post Office Savings or any Trustee Savings Bank. The code is hardly revolutionary, for it is already accepted by most of the other reputable media of advertising, but television has a greater impact on the home and the task of those who will be responsible for seeing that the code is strictly observed will not be an enviable one.

Madras

MR. DESHMUKH'S VIEW ON DEFICIT FINANCING

BELIEF REPEATED IN SCOPE FOR FRESH TAXATION

(FROM OUR MADRAS CORRESPONDENT).

MR. C. D. Deshmukh, Union Finance Minister, said at a Press Conference here that it was proposed to resort to deficit financing to the extent of Rs. 400 crores in the first year of the second five year plan. He also said that if the plan expenditure should be of the order of Rs. 6,000 crores, it was necessary to find revenue from additional taxation to the extent of Rs. 500 crores during the next five years. The Finance Minister added that the additional tax revenue of Rs. 100 crores a year would include profits from State enterprises also. He thought there was further scope for taxation. The fall in agricultural prices was taken as an indication of some kind of a deflationary trend, and the taxation proposals in the last Budget were therefore varied by giving some reliefs. Mr. Deshmukh continued that development should be financed only from revenue. A distinction, he said, had to be made between developmental expenditure and investment. For investment, they could have recourse to other sources like borrowing, small savings, deficit financing, foreign aid, etc.

Discussing deficit financing, the Union Finance Minister said that so long as there were resources against which credit could be created that would not mean a rise in price levels, and care should be taken to see that the requisite quantity of goods was made available to the people. Deficit financing, he said, could be done provided there were no increase in prices; otherwise it would be risky. In this connection, Mr. Deshmukh disclosed that deficit financing for the entire second five year period would come to Rs. 1,000 crores.

Development Finance for Industries

The Committee of industrialists appointed by the Madras Government to suggest industrial schemes for the second five year plan has, it is learnt, recommended the setting up of a State Development Corporation with a capital of Rs. 4 crores or Rs. 5 crores, provided mainly by the existing major industrial units in the State. The Committee also appears to have strongly expressed the view that the private sector would feel encouraged to set up industries only if the Government came forward with loans at subsidised rates of 3 percent or less, to take shares wherever possible and to impose protective duties on imports. Another important recommendation of the Committee is that there should be established in Madras a big central workshop for manufacturing various parts now imported and which can be manufactured in India. The Committee has also expressed its views on some Government proposals for starting new industries. The proposed paper factory in the Nilgiris-Coimbatore area could have an initial capacity to produce 25 tons a day and could step up production to 100 tons a day and when enough raw materials become available. A large-scale pencil factory could be set up in the private sector with State aid, but there was no scope just at present for a tea-chest factory. A factory for utilising wood waste could be set up where there were saw mills or plywood factories; this, again, should be in the private sector with loan assistance from the Government. A wood seasoning plant has also been recommended for the private sector. A unit in the private sector for the manufacture of alloy steel could be set up in a place where there were already some engineering industries—say in Madras, Madurai or Coimbatore. The private sector would also be willing to take up steel-pressing in view of the vast scope for the manufacture and development of automobile parts in the State; here, again, the Government's financial assistance was necessary. The Committee has also suggested that a unit for the manufacture of ball-bearings should be set up in Madras City as a joint enterprise. A manufacturing unit for the production of gears could also be set up in the private sector, again with State aid. As there is vast scope for the manufacture of typewriters, the private sector should be given encouragement in this regard. On the proposal of the

Union Government to start a factory for the manufacture of electric transformers, the Committee is of the view that such a factory should be set up in South India.

Ammonium Chloride Plant

Some recent developments in the private sector of industries in Madras State are also worth noting here. The ammonium chloride plant of the Fertilisers and Chemicals, Travancore, Ltd., in which the Madras Government also has a large interest, has just started functioning. The plant, the first of its kind to be erected in India, has a capacity of 8,000 tons a year against an internal requirement of about 5,000 tons a year, entirely imported at present. As ammonium chloride is an essential chemical largely used by the battery manufacturing and galvanising industries, it might have a potentially greater demand with the proposed expansion of the steel industry. The plant was designed and supplied by a German firm; the manufacture of this chemical has been made possible by the availability of hydrochloric acid from the caustic soda plant of the E.A.C.T. factory. An industrial venture that has the near prospect of being established at Pykara in the Nilgiris is for the manufacture of synthetic gems for industrial purposes. This will be a joint enterprise of Swiss and Indian promoters. It is stated that the machinery required for the factory is being shipped from Europe and that the raw materials required for synthetic stones are available in India. It is recalled that synthetic gems are now imported from the United States, France and Switzerland. A third development is the recent opening of the extensions to the Auto Spring Division of the Canara Workshops Ltd., Mangalore which is a 35-year old pioneer concern manufacturing indigenous automobile springs; the shot-peening machine has also been simultaneously inaugurated by the Union Minister for Transport and Railways.

Another development is the building of passenger buses for transport services in Delhi, Lucknow and other North Indian cities by Messrs. Simpson & Co., on Leyland chassis assembled in Madras by Messrs. Ashok Motors. The present rate of delivery from Madras city is 20 buses a month; the bodies look very tidy and impressive. A fifth development is a concerted move by big landowners in the State to start co-operative sugar factories—one in North Arcot district, another in Cingleput district, a third in Coimbatore district and a fourth in Trichy district. The State Government's plan is to get six sugar factories started, of which the one in Tanjore district is expected to go into production next year. The Tanjore factory has purchased a large part of a 10,000-acre wet land holding of the biggest landowner in that district; the proposed co-operative sugar factories in other districts might also involve the exemption of some large holdings in the districts concerned from the possible application of a ceiling on land ownership.

Andhra Government's Plans

The Andhra Government, in a bid to industrialise the new-born State, has just drawn up its own industrial plan for inclusion in the second five year plan. The plan envisages an investment of Rs. 62 crores. The expansion of the Hindustan Shipbuilding Yard at Visakhapatnam, a fertiliser factory at Vijayawada, a soda ash factory in Visakhapatnam district, a paper mill at Kurnool, and the expansion of the Andhra Paper Mill at Rajahmundry—these five are to be in the public sector. Four sugar factories and four textile mills are to be established by the State Government in partnership with the private sector. In the private sector, the starting of ferro-manganese plants in Srikakulam district, three sugar factories, three cement factories, one phosphate factory, one bicycle factory, and the Calcutt ex-rolling mill, one bagasse paper unit, and the Calcutt ex-refinery at Visakhapatnam, besides the expansion of the existing factories, are envisaged. As regards small-scale industries, 280 main additional units are to be set up at an estimated capital cost of Rs. 4.2 crores; out of these, the State Government will run ten pilot units of new industries in the State. New industries like sericulture and ceramics are to be gradually developed; a number of emporia for handicrafts and small-scale industries are also to be started. It is proposed to train annually 500 diploma holders and 1,000 certificate holders in the field of technical and industrial education; towards this end, three new polytechnics are to be set up.

Fresh Scheme for Madras Plan

Further details on the projects likely to be included in the Madras State's second five year plan are now available. Schemes costing Rs. 10 crores in all and aiming at the production of nearly a million tons of foodgrains including cereals and pulses over and above the total production at the end of the first five year plan are proposed for the agricultural sector. The total production at the end of the first plan is expected to reach 5.5 million tons. A programme of expansion of education at all levels, costing in all Rs. 78 crores (including salary increases of Rs. 18 crores for teachers), is proposed for the second plan period. A plan for co-operative farm credit is proposed for increasing such credit from the present level of Rs. 5 crores a year to Rs. 15 crores a year, at the end of the second five year plan. Yet this latter amount will be no more than 20 percent of farm credit requirements of agriculturists. The Madras Government has at last decided to take steps to limit prize amounts to a maximum of Rs. 10,000 a month in prize-puzzle competitions.

Jute

ENCOURAGING DECLINE IN JUTE GOODS STOCKS

INCREASE IN HESSIAN UNEXPECTED: SACKING POSITION NOW HEALTHY

THE fall in the stocks of jute goods held by mills at the end of May was not altogether unexpected because shipping statistics during the month had already prepared the trade. What was not expected however was the fact that hessian stocks showed an increase of 1,600 tons, and at 40,600 tons are the highest the mills have held since August 1953. Total stocks now held amount to 94,900 tons which is 8,500 tons less than those held in April, but 8,400 tons more than stocks held a year ago. Sacking stocks showed a marked decrease and stand at 53,100 tons which is a drop of 9,800 tons from the previous month. Over the past few months the percentage ratio between sacking and hessian has undergone a considerable change, and hessian stocks now constitute 43 percent of the total. This increase can be attributed to the fact that many mills are making hessian to stock against the Argentine order, the bulk of which will be shipped in the July-September period, and so the present figures really give a false impression of the true facts; a large portion of these stocks are, in actual fact, sold but not shipped. The sacking position appears to be very healthy and it is anticipated that stocks may fall even further as it is known that much of the business that has come in recently in heavy goods has still to be covered. It is also reported that an extra steamer for the Far East may be placed this month and this should help to reduce stocks considerably.

There has been little activity in the Calcutta jute goods markets over the past week, and overseas buyers appear to be content to pick up small quantities as and when required. This is particularly true of the heavy goods section where small enquiries have been received almost daily, the business being absorbed, more often than not, by the bazaar. The market has been in a state of quietude, and prices have had daily erratic fluctuations of all proportion to the volume of business done. Foreign buyers are still looking for lower prices, but with rates in both sections of the market standing at their lowest level this year it is difficult to visualise any further large-scale reductions. One of the few satisfying features of the market over the week has been the further reduction between the near and forward delivery prices, which now stand at a little over Rs. 60 a ton for sacking. However, there is still a long way to go before the conditions that prevailed at the beginning of the year are reached, i.e. the near and the forward positions being quoted at par. In spite of the fluctuations there was very little difference between the rates at the close and the week's opening quotations, in fact the forward position was inclined to be steadier.

The hessian section tended to rule steady during the week in spite of the fluctuations of the sacking section, and prices improved slightly. Steady covering business, both shipper and speculative, for all deliveries, gave rise to a certain amount of confidence which appeared to be misguided in the light of the increase in hessian stocks announced at the end of the period. After the initial shock however steadier conditions again prevailed and operators predicted a slow but steady rise in rates. The market would appear to be in a very healthy position, as there is only a narrow margin ruling between the near and forward positions, and with good business in hand it is unlikely that these conditions will show very much change. Prices only showed minor variations over the week, and by Tuesday rates had reverted to the week's opening quotations.

In the raw jute section prices have fluctuated erratically, but here also, losses had been made up by the end of the week and sellers were looking for higher rates. The initiative still appears to be in the buyers' hands, and business is invariably done at below the quoted rates, although with the general all-round improvements in the allied jute and gunny markets sellers are offering more resistance to the buyers' monopoly.

New Crop reports from both India and Pakistan continue to be favourable. Harvesting has started in some areas in Pakistan and imports should reach the markets by the end of this month. In India, the crop is not so far advanced, as the

majority of areas require more rain, specially in the Murshidabad and Western areas, but latest reports indicate that these districts are now experiencing favourable weather conditions with alternate rain and sun.

THE JUTE MARKETS

Manufactured Goods: The heavy goods section of the gunny market opened on a very weak note last Thursday due to heavy speculative activity, and B. Twills slumped Rs. 2 a maund in the near position to be quoted at Rs. 107-8 a 100 bags, and Rs. 1-8 for October-December shipment, this period being quoted at Rs. 100. In contrast to this the hessian section ruled steady on bear covering against the Argentine order, and the near positions were unchanged, but forward delivery improved 4-8 annas. Ready 40" 10 oz. was quoted at Rs. 42-4 a 100 yds, and October-December shipment at Rs. 41-12 a 100 yards. An improvement in the shipping position brought about a corresponding improvement in the market and heavy goods advanced Re. 1 to Rs. 1-8 a 100 bags and hessian prices were pushed up 6-8 annas. These rates remained steady over Saturday and the weekend, and Monday morning brought a further addition to the sacking section of the market, and ready B. Twills reached Rs. 108-8 and forward shipment Rs. 102. The hessian section was unchanged. On Tuesday morning, after a quiet opening when rates in the hessian section lost 2 annas, and the sacking section 8 annas to Re. 1, prices began to improve due to reports of a decrease in mills' stocks, and the overnight losses were more than made up, prices in the heavy goods section closing on a very firm note at the highest levels touched this week.

At the close the market is very steady due to the drop in jute mills stock. Sacking shows an improvement of Rs. 1-8 in both the near and forward positions, and hessians have advanced 12 annas for all deliveries. Opening quotations on Wednesday morning were as follows:

	June	July	Sept	Oct/Dec
	Rs.	Rs.	Rs.	Rs.
40" 8 oz.	34-8	34-8	34-8	33-12
40" 10 oz.	43-4	43-4	43-4	42-0
B. Twills	108-2	108-12	108-8	103-0
Heavy Cees (Plain)	109-12	109-4	109-0	108-0
A. Twills	138-8	133-8	133-8	127-0
Liverpools	124-8	124-0	122-0	117-0
Corn sacks	113-8	112-0	111-4	105-0

Raw Jute: Interest in New Crop jute appeared to have dropped off during the week under review, due, possibly, to the favourable crop reports from Pakistan and the Indian Assamese areas. Mills are confident that New Crop rates have still some distance to fall, and are accordingly keeping out of this section of the market. A fair amount of interest however has been shown in the Old Crop market, and for the second week running quick delivery jute has been purchased. This has caused rates to rise, but some distressed sellers are keen for business at well below the quoted rates, being anxious to dispose of their present stocks in order to finance their New Crop obligations. It is reported that a fair quantity of Old Crop jute has still to be sold, but the main stumbling block against business being done is the question of assortment. Mills are indicating an interest in mainly bottom quality jute, being assured of ample delivery from their early New Crop purchases, but the majority of offers carry a very high percentage of Middle jute. The price of this is out of all proportion to its value when compared with New Crop jute, so unless sellers are prepared to release it at lower rates, it is probable they will be left with a fair percentage on their hands. Following the announcement of the fall in jute goods stocks, sellers became reserved and many withdrew from the market in anticipation of higher rates.

At the opening of the raw jute market on Thursday, prices were discounted 8 annas a maund, Upper Assam jute being quoted at Rs. 26-8 a maund basis Bottoms. Very little interest was shown in the opening stages, but mills came out to buy fairly large quantities over the next two days,

but rates were unchanged. After the weekend, in sympathy with the better goods market, raw jute rates advanced 8 annas a maund and the market ruled steady. More jute came out on offer at the higher levels, but mills showed very little interest and only small business was done.

New Crop quotations ruled steady throughout the week from a quiet opening, which was 8 annas lower than last week's closing rates. Upper Assam Bottoms standing at Rs. 24 for August-September shipment. Prices had advanced 8 annas by the weekend during which period small business was transacted. After the weekend rates rose to Rs. 25 a maund, and although no business was reported at the higher levels the market continued to rule steady in sympathy with the goods market.

The bulk of the business done during the week was Old Crop jute for quick delivery. Dhubri Northern jute fetching Rs. 27 to Rs. 27-8 a maund basis Bottoms for June delivery. Upper Assam jute was also done at Rs. 27 a maund on the same basis. Main interest was centred on local Northern jute and fair quantities were purchased at Rs. 26-8 to Rs. 27 for delivery in June, and local packing jute guaranteed free from jungli was also done at Rs. 26 for Bottoms and Rs. 23-8 for X. Bottoms for the same delivery. Small lots of Daissee jute were purchased at Rs. 28 to Rs. 28-8 a maund and Daissee Mesta at Rs. 25 to Rs. 25-8 a maund for one month's delivery.

Only small business was done in Pakistani Old Crop jute, and Rs. 27-8 to Rs. 28 was paid for Pakistan Northern Bottoms. In cuttings fair business was done for Pakistan N C's at Rs. 110 a bale, and T C's at Rs. 105 a bale. The same price was also paid for Pakistan Ropes.

New Crop purchases were limited this week, and small quantities of Dhubri Northern were done at Rs. 25 a maund basis Bottoms for September-October shipment, and Rs. 24-8 a maund for October-December shipment. Upper Assam jute was done at Rs. 24 for September-October shipment. Daissee White jute made its first appearance this season and business was done at Rs. 25-8 to Rs. 26 a maund basis Bottoms for July-August shipment.

The only business reported in Pakistan New Crop jute was in Pakistan Special N C's at Rs. 95 a bale for August-October shipment, and Ordinary N C's at Rs. 85 a bale for the same shipment.

At the close the market is steadier in New Crop jute but unchanged in Old Crop. Opening quotations on Wednesday morning are as follows:—

Indian Jute	Landed at Mills	Rs. a md. basis Bottoms	Shipment
	Old Crop	New Old Crop	New Old Crop
Lower Assam	27-8	26-8	June-July Aug-Sept
Upper Assam	27-0	—	—
Northern	27-8	26-8	—
Daissee (Ex-Sheoraphuli)	28-8	—	—
Daissee Mesta	26-0	—	—
Local Northern	27-8	—	—
Local Packing	27-0	—	—
Bimil	26-8	for F.A.Q.	—

Tossa is quoted at Re. 1 to Rs. 1-8 a maund above the rates for White jute.

Pakistani Jute:	Rs. a md. basis Bottoms	Shipment
	Old Crop	New Old Crop
Jat District	28-0	28-8 June-July Aug-Sept
Northern	28-0	27-8 —

In Cossipore, prices have tended to be steady this week due to the increase in the mills' interest in local delivery jute. Imports have been very irregular but the quality of recent arrivals has improved, and it is reported that fairly large stocks of high grade jute, mainly Middles, are now in sellers' hands. Mills have very little interest in this type of fibre, but sellers are not keen to sell their lower grades on their own. Quotations have followed the fortunes of the Calcutta goods markets, and at the close the market is steady with Kishengani jute being quoted at Rs. 26-8 to Rs. 27 a maund for garat quality. News from the Daissee growing areas is more encouraging this week, most districts having had a fair amount of rain, which has allowed farmers to commence their preparations for the New Crop in these districts where activity has been held up. Conditions in the Chakdaha-Ranahat-Bongaon areas have been very favourable, and prospects of an early crop are good. Business has already been done for Daissee White jute for July-August shipment, and first imports are expected about the 15th July. The ordinary Daissee Crop however will still be very far behind last year. Latest quotations in Sheoraphuli are based on Rs. 30 a maund for garat quality.

Mofussil: Indian upcountry markets are quiet with practically no business passing. Small imports are reported mainly in the Northern Bengal areas, but there are no buyers. Quotations are

INDIAN JUTE CROP REPORTS

In their twelfth crop report for the current Indian season, covering the week ended 4th June, Messrs Sinclair Murray & Co. Ltd. say that with the exception of Assam, the weather during the week has been mainly unfavourable, in that hot and dry conditions have continued in most districts. In Assam, however, favourable weather has been experienced with alternate rain and sunshine, and this has allowed weeding operations to be carried on freely and also promoted crop growth considerably. In Bihar and Assam the crop condition is healthy, but in West Bengal and Orissa it is not very satisfactory and more rainfall is required to improve plant condition. The river levels are about normal for this time of the season.

DANPUR: Hot and dry weather conditions have been experienced which is not satisfactory and good rainfall is urgently required to improve the condition of plants and to allow cultivators to continue with sowings which have remained at a standstill during last week. Sowings estimated to date amount to

-14/- as against -10/- sown at this time last year. The general condition of plants can still be considered satisfactory however, and they range in height from seedlings to 2ft. In some areas, germination is reported to be poor and these areas will have to be re-sown. The river level is normal for this time of the year.

JAIPUR ROAD: Very hot and dry weather has been experienced which has been unfavourable for the crop although one light shower was experienced. Cultivators, however, have continued sowings slowly which are estimated at -13/- as against -14/6 sown at this date last year. Plant condition is not very satisfactory but the plants range in height from seedlings to 1ft. 6in. First weeding operations have been started and are being carried on as required. The river level has fallen over the week and is slightly lower than at the same time last year.

COSSIMBAZAR: With the exception of one light shower in the middle of the week, weather conditions have been hot and dry and heavy rainfall is urgently required to facilitate sowings and to promote the growth of the standing crop. Cultivators, however, have continued with sowings slowly and these are estimated at -7/- as against -10/8 at this time last year. Plant condition is not satisfactory due to continuous unfavourable weather but they range in height from seedlings to 6in. The river level is normal for this time of the year.

RANAGHAT: With the exception of one light shower in the middle of the week weather conditions have been hot and dry and further rainfall is required to assist growth and to improve the condition of plants. Cultivators have virtually suspended sowing operations and these are estimated to date at -18/6 as against -14/- at the same time last year. Plant condition of earlier sowings is considered satisfactory but of later sowings not so satisfactory; plants range in height up to 2ft. 6in. The river level is slightly lower than at this time last year.

NOWGONG: Sowings completed -22/6. Weather conditions have been favourable with alternate rain and sunshine which has allowed cultivators to complete second weeding operations in the lowlands and to continue in the midlands. Plant condition is reported to be very healthy and the plants range in height up to 4ft. The river level is falling and is slightly lower than last year at this time.

PALASHBARI: Sowings completed -24/- Favourable weather conditions have been experienced with alternate rain and sunshine and this has allowed cultivators to complete second weeding operations in the lowlands and to continue in the midlands. First weeding operations are going on in the highlands where required. Plant condition is reported to be very satisfactory and the plants range in height up to 5ft. The river level is falling slowly but it is still 2ft. higher than at this time last year.

DHUBRI: Sowings completed -20/-. Heavy rain-fall was experienced during most of the week and this has been favourable for the growth of the standing crop but further sunshine for a few days would now be beneficial. Weeding operations are being carried out as required. Plant condition is reported to be very satisfactory and the plants range in height up to 4ft. The river is rising slowly and now stands at 6in. lower than at the same time last year.

FORBESGANJ: Sowings completed -24/- Hot and dry weather conditions were experienced earlier in the week but latterly moderate rainfall was experienced and this has improved the general condition of the standing crop. Weeding operations are still required. Weeding operations are going on freely and the condition of plants is healthy; they range in height up to 3ft. 6in.

DAISSEE DISTRICTS: Mainly hot and dry weather has been experienced with moderate rainfall in the latter part of the week. Estimated sowings amount to -14/- as against -14/- sown at this time last year. Weeding operations are going on where required. The condition of plants can still be considered satisfactory although in some areas growth is sparse; plants range in height from seedlings to 2ft. 3in. Further rainfall is required to allow cultivators to continue freely with sowings and to promote crop growth. The river level is normal for this time of the year.

N.B.—As a basis of comparison last season's sowings have been taken as -16/-.

PAKISTAN JUTE CROP REPORTS

In their thirteenth crop report for the current Pakistani season, covering the week ended 4th June, Messrs Sinclair Murray (Pakistani), Ltd. say that Jute season 1955-56, the crop continues to make satisfactory progress under the prevailing weather conditions. River levels are for the most part lower than at the time last year and register only a slight rising tendency.

NARAYANGANJ: Sowings completed -21/- With the exception of two light showers the weather has been hot and dry, but not unfavourable. The condition of plants is satisfactory and the plants range in height up to 4ft. 6in. Weeding is going on in mid and highlands as required. The river level is about 1ft. lower than at this time last year.

DACCA: Sowings completed -21/- Weather has been favourable with alternate rain and sunshine. Progress of plants is satisfactory, making good growth and they range in height up to 4ft. 6in. Weeding is going on wherever required. The river level is lower than at this time last year.

CHANDPUR: Sowings completed -21/- The weather has been hot and dry but not unfavourable for the crop. Alternate rain and sunshine is now required. The condition of plants continues satisfactory and they range in height up to 5ft. 6in. Weeding is being carried on as required in mid and highlands. The river level is 1ft. 2in. higher than at this time last year.

NIKILAMPARA: Sowings completed -21/- The weather has been hot and dry but not unfavourable, weekend rain has been beneficial for the standing crop. The condition of plants is satisfactory and they range in height up to 4ft. 3in. Weeding is going on in highland areas. The river level has risen 4in. during the week and is now 1ft. higher than at this time last year.

SARISHABARI: Sowings completed -20/- During the early part of the week the weather was hot and rain in the latter half of the week was beneficial for the standing crop. Plants are reported to be healthy and range in height up to 4ft. The river level is 1ft. 6in. lower than at this time last year.

SIRAJGANJ: Sowings completed -21/- Weather has been hot and dry; rain is now required to promote growth of plants. The condition of plants is satisfactory and they range in height up to 5ft. 9in. Weeding operations are going on where required. The river level has risen 1ft. 9in. during the past week but is 4ft. 9in. lower than at this time last year.

NAKALIA: Sowings completed -21/- Weather has been hot and dry with only one shower during the latter half; more rain will be beneficial. The condition of plants is satisfactory and they range in height up to 5ft. 3in. The river level is lower than at this time last year.

BIANGGOORA: Sowings completed -20/- The weather has been generally hot and dry with scattered rainfall; more rain will be beneficial. The condition of plants is satisfactory and they range in height up to 5ft. 6in. Weeding is going on freely as required. The river level has risen 1ft. during the past week and is now 2ft. 6in. lower than at this time last year.

	Rainfall	For the week	Total from 1st Jan. over the	Rainfall

N.B.—As a basis of comparison, last season's sowings have been taken as -16/-.

THE FOREIGN JUTE MARKETS

STALEMATE UNBROKEN

(FROM OUR DUNDEE CORRESPONDENT)

SO far as the Dundee jute industry is concerned it is a case of stalemate. The news from Pakistan that the Jute Board refuses to reduce the existing minimum prices for raw jute is received with equanimity and the general feeling is that the Board will yet be forced to make a reduction. Everything points to an excellent crop of jute during the coming season, estimates being as much as 7,000,000 bales from Pakistan, with another 4,500,000 bales from India. The main question is—will Pakistan be able to maintain the present minimum prices? This might be done for a time, until the weight of the crop is felt around September-October, but the general feeling is that demand will tell, and it cannot be seen that this will increase to such an extent as to absorb such a large crop of jute. Meantime, shippers are quoting minimum rates for all grades of new crop fibres which are £90 for Mill Firsts, £80 for Mill Lightnings, £125 for crack Firsts and £113 for crack Lightnings, with crack Daissee-2/3 at £90 and grade £80, crack Tossa-2/3 £110 and grade £99, with Tossa-4 at £100 and £89 respectively, cif. U.K., August-September shipment. There are some cases where old crop is being quoted at more than the minimum prices, viz., Mill Lightnings at £83 and crack Daissee-2/3 at £91, but buyers are not interested and they feel that if they wanted old crop jute of any grade they need only bid the minimum rates to close the deal. Occasionally a seller is found to quote less than the minimum, such as grade Tossa-2/3 at £98 and four at £88, cif. June shipment. If spinners are desirous of buying new crop jute, no doubt they will purchase the best marks at the minima. What then is to happen to those sellers who have grades as much as £8 to £8 a ton under, the best, as we have so often seen during the present season? They will not sit back and see the best shippers doing all the business, so that it is likely that shippers will risk offering the settling of the question of minimum prices has not had any effect on the jute yarn and cloth markets and these sections are so dull that spinners and manufacturers are curtailing their production. Short time is being worked in some mills and factories and some workers are being paid off. Prices for all yarns and cloth remain unchanged.

As a result of extensive modernisation of plants and rationalisation of the processes of production, raw jute consumption by the U.K. jute industry during 1954 at an estimated 800,000 bales increased by approximately 200,000 bales over the previous year, reports the Indian Central Jute Committee. It was, however, the spinning rather than the manufacturing end of the industry that reflected this higher consumption. Yarn production in 1954 amounted to 131,000 tons against 128,100 tons in the year before. Production of piecegoods, although showing a greater tonnage increase to 80,600 from the previous year's 76,200 tons, continued to lag behind. Raw jute imports into the U.K. £12,245,904, compared with 173,330 tons worth £14,309,210 in the previous year. Despite an appreciable increase in Dundee's yarn production of the British carpet manufacturers could not be fully met from internal supplies. As usual, they imported the bulk of the remainder of the yarn required from India; small quantities were also obtained from Ireland, Belgium and other countries.

Plantation Topics

BRISK BIDDING AT LONDON TEA SALES

BRISK and general bidding imparted a better undertone to the 22,296 packages of North Indian and other miscellaneous teas offered at Monday's resumption of sales. The movement was most noticeable in better liquoring types especially Fannings which advanced 1d to 2d a lb. Clean Common teas were fully firm to fractionally dearer, with Plain Broken Pekoe quoted at 40jd, compared with 40d previously. Teas of poorer appearance and very plain types, however, were irregular and generally easier.

London tea traders said on Monday afternoon, that they did not expect the cut in Ceylon export duty from one rupee to 50 cents a lb. to have any effect on prices at Tuesday's auction of Ceylon tea in London. The trade was not surprised at the move as the tea trade in Ceylon had for some time been pressing for a reduction.

TREND OF CURRENT YEAR'S TEA SALES IN U.S.A.

U.S. sales figures for the first quarter of 1955, as revealed by a quarterly tea stock survey which measures wholesale-to-retail movement (but not retail sales), show that the first three months of this year are exactly even with sales for the first quarter of 1954. This performance should be viewed in the light of the following considerations: (1) The first quarter of 1954 produced a 17 percent gain over the same period in 1953, thanks in part to high coffee prices which accelerated the trend to tea. (2) While tea has been able to do as well in the first quarter of 1955 as it did in 1954 when coffee prices gave it an extra boost, it is also true that the 1955 first quarter's sales might have been stimulated by rising tea prices which perhaps caused retailers and restaurateurs to buy more than their usual stocks as protection against further increases. (3) So, it is too early to tell whether tea has consolidated its past gains.

The last three quarters of 1954 compared with 1953, showed the following: second quarter +23 percent; third quarter -12; fourth quarter -5. The full year of 1954 was 8.4 percent ahead of 1953. What the full year of 1955 will show is still anybody's guess. It boils down to this—the position is even on the first quarter; the second quarter will be much harder to match; how well tea does in the year of 1955 will probably be settled in the third quarter. Last year unusually cool weather adversely affected sales and consumption of tea in the third quarter. A good extended hot spell this year would make a big difference.

COCHIN TEA SALES

At Dust Sale K, the 430,000 lbs of tea excited general demand. Prices advanced for Low and Low Medium types by As. 6 to 8 and Medium, and Best Mediums were As. 4 to 6 higher.

COLOMBO RUBBER PRICES

The following prices have been issued by the Indian Rubber Board from the weekly market report published by the Colombo Brokers' Association:

	Closing prices on 27-5-55 (Rupees a lb.)	Average prices on 27-5-55 (Rupees a lb.)
Sheet:		
No. 1	1.15	1.142
No. 2	1.13	1.122
No. 3	1.11	1.102
No. 4	1.07	1.062
No. 5	.99	.982
		Cts.
		Sht. Cuts. 1
		Sht. Cuts. 2
		96
		91

Crepe:		
Water White	1.25	1.25
R.M.A. No. 1X	1.24	1.221
R.M.A. No. 1	1.20/23	1.201
	Crepe 2	1.173
	Crepe 3	1.151

Scrap Crepes:		
Sc.Crepe No. 1	1.08 Nom	1.07
Sc.Crepe No. 2	1.02/05	1.031
Flat Bark	.55/99	.96
	Sc.Crepe 3X	1.00

To arrive at f.o.b. Colombo prices add 31.4 cents a lb. in respect of rubber other than scrap crepe and 25.4 cents in respect of scrap crepe to the above market prices.

Planting and Commerce, Annual Number, 1955. (Edited by V. I. Chacko and published by K. K. Kurian, Mar Thoma Memorial Printing and Publishing House Ltd., Ernakulam. Price Rs. 3; pages 97.)

The articles contained in this publication cover the whole range of the plantations industry in South India. Specially interesting are those articles that deal with the affairs of the Cochin tea market and the rubber market in 1954. A general review of the plantations industry in the past year, a diary of events in 1954 and statistical data on such important branches of the industry as tea, coffee, rubber and pepper combine to make this a useful reference book.

Engineering and Transport

NEW RIVER CRAFT FOR STANDARD-VACUUM

THE "Stanvac Lal Ghora," a push-tow boat 55 feet long and 18 feet wide, is to be launched this afternoon. This launching is of considerable significance to the personnel of the Calcutta branch of the Standard-Vacuum Oil Company. While not the first vessel of this type ever to ply in these waters, since ships similar in design were used for handling cargoes during the war, the "Lal Ghora" is nevertheless the first of its type to ply on the Hooghly river in a commercial, civilian service. Its purpose will be to push or tow barges which will ordinarily be used to transport jute batching oils for the various jute mills along the river which are regularly supplied by the Company. A contest was held among the employees of the Standard-Vacuum Oil Company to select a name for the vessel. After a preliminary selection by a committee of senior executives of the Company of a larger number of names submitted, a committee consisting of three Mobilgas dealers, the Principal of the Marine Engineering College and the Harbour Master made the final selection. This has of course created considerable interest among the employees and numbers of them are to be present at the launching ceremony. Others who will be particularly interested in this event are representatives of the jute mills who will have the "Stanvac Lal Ghora" regularly calling at their premises, people interested in operations of the harbour generally, and those who will for one reason or another have an interest in the technical aspects of this new development.

FRENCH INTERNATIONAL FAIRS AND EXHIBITIONS

The following French International Fairs and Exhibitions will be held in the second half of 1955: International Fairs at Strasbourg from 3rd to 18th September; address: 9, Rue Brulee, Strasbourg. At Marseille from 17th September to 3rd October; address: 36, La Canebiere, Marseilles. International Exhibitions: International Exhibition at Chambre de Commerce, 54, Grande Rue, Besancon. International exhibition of equipment for laundries and allied industries from 8th to 19th September, at 9, Rue des Pyramides, Paris. "Leather Week" from 9th to 14th September; at 2, Rue Edouard VII, Paris. Commercial exposition of studios of applied art from 24th September to 3rd October; at 13, Rue des Petites-Ecuries, Paris. Nautical exhibition (marine and riverine industries) from 30th September to 16th October, at 8, Rue Jean-Goujon, Paris. National exhibition of the radio, television and electronics from 1st to 11th October; at 23, Rue de Lubeck, Paris. International Exhibition of cars, motor cycles and cycles from 6th to 16th October; at Grand Palais-Port J, Paris. Exhibition of office equipment from 13th to 23rd October; at 6, Place de Valois, Paris. Exhibition of nursery and other equipment for young people and the family from 1st to 20th November; at 23, Avenue Carnot, Paris. Exhibition of packing of clocks watches, etc. from 14th November; at 40, Rue du Colisee, Paris. Exhibition of Transport and manipulation of goods from 5th to 14th November; at 40, Rue du Colisee, Paris. Exhibition of bottling and allied industries from 5th to 14th November; at 28, Rue Louis-le-Grand, Paris. Exhibition of equipment for dairies from 5th to 14 November; at 28, Rue Louis-le-Grand, Paris. Exhibition of equipment for industries and trade of foodstuffs from 5th to 14th November; at 42, Rue du Louvre, Paris. Exhibition of hotel equipment and allied industries from 10th to 21st November; at 13, Rue de Liege, Paris. International exhibition of wood from 3rd to 11th December; at 40, Rue du Colisee, Paris.

INTER-CONTINENTAL MOTOR HIGHWAY PLAN

At a Press conference in Calcutta last week Mr. Colin Wardle, one of the partners in the recent record-breaking Calcutta-London overland motor trip, gave interesting details of how they covered 8,240 miles in 12 days, thus beating the previous Swiss-held record of 14½ days. Mr. P. Chatterjee, Secretary of the Automobile Association of Bengal, who also addressed the conference said that a proposal for a 7,000-mile inter-continental highway linking the Far East and Europe would shortly be discussed at U.N. level. Several Governments are reported to have already agreed to co-operate in the plan.

STANDARDS FOR PAINT AND VARNISH BRUSHES

Three Indian standard specifications have just been published by the Indian Standards Institution. They cover a) brush paints and varnishes, flat, b) brushes, paints and varnishes, sash tool and c) brushes, paints and varnishes (oval, ferrule bound, and round, copper wire bound). The standards prescribe the shape and design, dimension materials, workmanship and finish, and the methods of test for different types of paint brushes which are extensively used in the application of paints and varnishes in various kinds of constructional work. The standards have been finalised by ISI's Paints and Allied Products Sectional Committee and can be had from the Indian Standards Institution, 19, University Road, Delhi-8.

Commodity Markets

THE PROBLEM OF A LARGE SUGAR SURPLUS

POSTPONEMENT OF IMPORTS UNTIL SEPTEMBER PROPOSED

THE production of sugar this season is expected to reach 16 lakh tons, and a further 50,000 tons will probably be added by refining raw sugar. The prospect of a carry-over are causing anxiety among sugar interest and Mr. Matadin Khaitan, chairman of the Sugar Development Council has had this to say about the situation: "Since the last meeting of the Sugar Development Council held in April last the sugar situation in the country has assumed considerable importance. The sugar industry appears to be much perturbed over the prospect of a large carry-over of about 6 lakh tons. Imports of refined sugar also continue. The industry, therefore, is reported to have suggested that further imports should be postponed or the committed quantity should be resold in the world market. It is, however, felt that it would not be desirable to re-sell the committed quantity now. No doubt the production in this season has gone up but there is hardly any certainty about the crop in the next year which would depend largely on the weather conditions. The better course would, therefore, be to postpone the imports for the present and review the situation towards the end of September when crop conditions would be known. It is of course most welcome that the country should be able to produce all its requirements of sugar and not depend on foreign imports. With this objective the industry and the growers would be given full assistance to increase production. It is always preferable that instead of putting up new factories at the present high cost the existing units should be enabled to produce more. Supply of fertilisers at concessional rates and transport facilities would go a long way in better and adequate irrigation facilities as also better production. It is a fact, as our Hon'ble Agriculture Minister has stated that even the least help rendered by the Government to the cane cultivators enable them to increase their production by 50 percent in the existing acreage. It is, therefore, almost certain that with proper assistance to the cultivators it will be possible to produce much more with the existing capacity of the industry, maybe even 20 lakh tons which is the present target.

"With the increased production of sugar and the gur prices ruling low the industry has become apprehensive about consumption. It is true that the consumption of crystal sugar is likely to be less this year and may turn out to be about 17 lakh tons as against 18 lakh tons of the last season. But if however, an account is taken of the increased production of khandasari sugar, which should be about 21 lakh tons this year against 1 lakh tons of the last year, the overall consumption of sugar would remain the same even if it does not increase. Therefore, with better prices for gur and the execution of the plan the consumption should continue to rise steadily.

"Having regard to uncertainty regarding production as also consumption it would be desirable to carry forward about four months' estimated consumption so as to maintain the prices. This fact should be kept in view while fixing up the quantum of carry-over. It has been the experience in the past that a low carry-over of 5 lakh tons turned out to be insufficient. In countries like Cuba where 90 percent of the production is meant for export, the carry-over is as high as 25 lakh tons, which is 50 percent of the annual production of 50 lakh tons. It is not my intention that the industry should be unnecessarily burdened with the excessive carry-over but at the same time I would suggest that it should be such that the prices remain normal."

COMMONWEALTH SUGAR PRODUCTION

Calcutta Markets

FAIR DEMAND AT NEW SEASON'S
FIRST TEA SALE

LACK OF EXPORT INTEREST

AT Sale No. 1, held on 6th and 7th June, export offerings amounted to 19,000 packages, mostly from Doars and Darjeeling, while there were only a few invoices from other districts. There was a fair demand which was confined to internal buyers and buyers from the Middle East, but this was rather better than had been expected. Exporters generally showed little interest. Whole Leaf grades and well made BPS's were keenly sought after and black leafy BP's sold well but other broken and Fannings grades were often easier selling at between 1 and 1½ annas below valuations. Fannings grades were the weakest feature of the sale. Well made Darjeeling teas with flavour sold well sometimes above valuations but there was a large quantity on offer and more ordinary invoices were often sold from As. 4 to 8 below valuations and withdrawals were numerous.

Quotations

Clean Black Pekoe	Rs.
Plain B.P.	2-8-0 to 2-10-0
Medium Assam B.P.	1-14-0
Best CTC Assam B.P.	Not quotable.

Internal Sale

Dust offering in the Internal Sale consisted of 6,000 packages of new season's teas together with 2,350 packages of old season's teas which were mainly reprints. There was only a fair demand and prices were generally below brokers' valuations especially for Doars Dusts. The few lines of Darjeeling and CTC Assam were keenly sought after and particularly the small CTC Assam Dusts sold over brokers' valuations.

Quotations

Medium Doars Dust 1 12	Rs.
Best Assam CTC Dust 2 10	0 (Nom).

There were 800 packages of leaf on offer of which 400 packages were of New Season's manufacture and these met with a limited demand.

U.K. STRIKES RESTRICT BUSINESS
IN FREIGHT MARKETS

THERE is still a good demand for North American coal although earlier positions are not as strong as previously due, it is understood, to stemming difficulties. The continued rail and dock strikes in U.K. has also tended to restrict business. Grain inquiries were also restricted but two cargoes were fixed from British Columbia to Japan \$11.70 and \$11.65 for July shipment. U.S.N.H. to Yugoslavia was fixed at \$13.

In Eastern trades there are numerous enquiries from Indian ore charterers but business is slow to develop although Mormugao to Rotterdam was fixed at 86/1½s for June shipment. Australian Shippers are requiring tonnage for July shipment of wheat to Japan and Queensland and shippers are in the market for August and September space but again no business was done. Two vessels were fixed from Australia to Ceylon with Flour at 100s, one being a part cargo of 3,000 tons. The time charter section remains quiet although there is a reasonable miscellaneous enquiry.

SUGAR MARKET

During the week ended 7th June, sugar sales in the Calcutta market averaged 3,000 bags daily. Average arrivals were 2,000 bags a day and stocks totalled 380,000 bags. Rates for ready sugar ex-Kantapukur delivery were Rs. 30-8 for ordinary grain and Rs. 31-4 for big grain. Forward delivery sugar sold at Rs. 30-6 for both big grain and ordinary grain varieties. Ex-mill delivery rates ranged from Rs. 28-2 to Rs. 28-12. After remaining easy during the early part of the week, the market steadied up toward the end. A further consignment of foreign sugar arrived in the port during the week.

LINSEED

The market remained firm during the last week and scarcity of supplies was the main feature. Upcountry markets were steady and despatches were limited owing to booking restrictions. There were keen enquiries from local millers but sellers were reserved and the daily turnover was small. Activity in the oil market was keen and there was a notable advance in oil prices resulting from lack of ready goods; shippers were in the market and a fair demand continued from both local and overseas buyers. Latest quotations were as follows: June-July Rs. 15-12 a maund.

HIDES AND SKINS

The market in skins was dull and prices showed a downward tendency. Stocks were higher than in the previous week.

Bazaar Sales

(Between 31st May and 6th June, 1955)

Cowhides :—Wet salted (Slaughtered) 16,850 pcs. on the basis of Rs. 14-8 to Rs. 26.
Goatskins :—Wet salted (Dassise, Killed) 43,500 pcs. on the basis of Rs. 225 to Rs. 280. Assam-Dinajpur-Murshidabad 42,500 pcs. on the basis of Rs. 285 to Rs. 315; Purneah-Kissenganj 10,500 pcs. on the basis of Rs. 200 to Rs. 310; Patna-Pakur 5,300 pcs. on the basis of Rs. 200 to Rs. 240.

COMPANY AND PUBLIC NOTICES

IMPERIAL BANK OF INDIA

NOTICE

NOTICE is hereby given that the Principal, Register and the Branch Registers of the Imperial Bank of India will be closed for transfer of shares from Thursday, the 16th June, 1955 to Thursday, the 30th June, 1955, both days inclusive.

In terms of Section 6 (1) (a) of the State Bank of India Act, 1955 all shares in the capital of the Imperial Bank of India shall be transferred to, and shall vest in, the Reserve Bank of India, free of all trusts, liabilities and encumbrances on the "appointed day" which has been fixed for the 1st July, 1955 by the Government of India Notification No. F. 8 (8)-F. 1/55 dated the 14th May, 1955. Section 9 (1) ibid provides that every person who immediately before the 1st July, 1955 is registered as a holder of shares in the Imperial Bank of India shall be entitled to compensation in accordance with the provisions contained in the First Schedule.

All purchasers of Imperial Bank of India shares are therefore advised to lodge with the Bank for registration the instruments of transfer in their favour along with the relative share certificates, not later than the 15th June, 1955.

S. K. HANDOO,
Managing Director.

Bombay, the 17th May, 1955.

ALLIANCE JUTE MILLS COMPANY, LIMITED.

NOTICE is hereby given that the One Hundred and Twentieth Ordinary General Meeting of the Shareholders of ALLIANCE JUTE MILLS COMPANY, LIMITED will be held at "McLeod House", No. 3, Netaji Subhas Road, Calcutta, the Registered Office of the Company, on Monday, the 27th June, 1955, at 3 P.M. for the following purposes :—

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends.

Year of Issue	NAMES	Amount Issued in 000's Rs.	Rate per cent.	Paid-up per Share Rs.	Market Quotations 8-6-55 A year ago Rs.	Year of Issue	NAMES	Amount Issued in 000's Rs.	Rate per cent.	Paid-up per Share Rs.	Market Quotations 8-6-55 A year ago Rs.

TEA COMPANIES

O, Po and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

THE COAL INDUSTRY'S DILEMMA

OPPRESSIVE CONTROLS AND NATIONALISATION UNCERTAINTIES DETER PROGRESS

IT is surprising in these days of "planning in physical terms" that more attention is not being paid to one obvious threat to the next five years' development projects—the physical supply of coal. Successive spokesmen of the industry have warned the Government that all is not well, and that without a radical change of policy the present output cannot be maintained, let alone the planned increases be achieved. Yet the draft of the second five year plan provides for an expansion of total coal production from the 37-million ton level of 1955-56 to 60 million tons by 1960-61. An improvement in output of 60 percent in five years would be an achievement for any well-established basic industry no matter how good its morale. Such a proposal for the coal industry, in its present state, is little more than a bad joke. If the Government is banking on atomic energy coming to the rescue before the end of the second plan period it would be as well to say so. Certainly it admits to no such wild assumptions and common sense points the conclusion that the pace of industrial development will be set by the performance of the coal industry, however inadequate, for another quarter of a century. With this fact firmly established there is no point in ignoring warnings that the industry will not be able to meet the calls upon it, or postponing the measures which are necessary to put it in better health.

Apart from the ambitious size of the target of 60 million tons of coal, perhaps the most interesting item in its break-up is the figure for coking coal which, it is estimated, will be necessary to satisfy the expanded iron and steel industry. This figure stands at 15 million tons. The present pegged production is 7.4 million tons of selected grades and 7 million tons of grades I and II, giving a total of about 14.5 million tons. But most of this coal will have to be washed and a good deal will be wasted in the process. The amount of beneficiation which will have to be employed to obtain such a quantity is known to be large; but may be even greater than at present thought because the better seams are fast being worked out. A great deal of capital outlay will have to be undertaken for this beneficiation, yet there is no sign that the Government is prepared to allow a large increase in the output of coking coals at present controlled prices, or raise the controlled prices, in such a way as to put the collieries in a better position to attract fresh capital, or that the railways could provide the necessary wagons if it did. The same is true of the prospects of the industry in general. It is at present unable to expand its production, is unable to charge higher prices for its products, cannot secure enough transport and has no prospects of attracting fresh capital. The futility of planning for a large increase in the output of steel without making sure the coal will be available was pointed out by Mr. Andrew Farquhar in an article which appeared in the issue of *Capital* dated 10th February. What is true for the steel industry is true for all Indian industries either existing or in prospect. The plan will fail if the coal industry does not play its part, and there is little chance of its being able to do so under present conditions.

imposed by the Coal Board. Sandstowing has long been recognised as necessary for conservation and for safety. The Government makes allowances towards the cost of stowing which are intended to take the burden of expense from the shoulders of the individual collieries. But the expense of stowing has considerably outgrown the allowance and the more responsible collieries are faced with another drain on their resources. The attitude of labour as encouraged by Government policy has been continually one of more pay for less work. Present claims, which are still under consideration by the Labour Tribunal, would add substantially to the price of coal and therefore to the costs of Indian industry. No doubt they would also eat further into the meagre profits of the collieries. The whole picture is one of total impasse. Some drastic change of policy is required to solve the industry's problems, and guarantee its part in the second five year plan.

Now that Government policy has brought the industry to this point, where only a complete change (and therefore a frank admission of mistakes made) is likely to be effective, nationalisation is being suggested as the way out. The position brings to mind the situation which resulted in the nationalisation of the British coal industry. That experiment, measured by the only really effective test, output of coal at declining cost, has been a complete failure. Costs have risen and output has failed to respond to the vast quantity of capital equipment which has been sunk in the mines. Britain's coal problem still exists in spite of nationalisation, and the country is now a net importer of its most plentiful raw material. Something similar may well be India's fate in the next few years of industrial development if the signs are not recognised in time; and nationalisation will be just as ineffective and expensive a solution. India cannot afford such a failure.

The prospects of nationalisation being a success will not survive a few moments' careful thought. To take one particularly important problem facing the industry at the present time—that of rail transport. Would nationalisation provide more wagons? The answer is that it would not, except at the expense of other industries; and if this is in the national interest it could be done equally effectively by a plan of priorities. It is said that the chief reason the Government is hesitating over nationalisation is the inadequacy of administrative talent. Finding the administrative ability to run an industry which is taken over as a going concern is insignificant beside the problem of finding the talent to run one which must expand its output by 60 percent within five years. That sort of achievement will require something more than the caution of civil servants or the leadership of men whose best years have already been spent in politics. Will the fact of nationalisation make it easier for mining engineers or officials to accept the neces-

sity for modernisation? And if it does, will it encourage them to watch costs and to plan carefully as they are bound to do when their own pockets take the strain? The record of Government collieries is not an impressive one, even in the comparatively easily-run quarry mines. It is unlikely to be better when the monetary incentive to better working is abolished, when the fortunes of executives depend more on their capacity to please superiors than on their ability to turn out coal, when the need for more output pushes costs into a position of secondary importance and when the labour unions need no longer be restrained in their demands by the hard facts of the collieries' individual balance sheets.

Nationalisation would be no answer to India's coal problems, but some declaration of the Government's intentions would help to dispel the uncertainty which has now put a stop to all development in the private sector of the industry. This the Government refuses to give for what would appear to be the obvious reason that it has not made up its mind. But while the industry does not know what fate has in store, it cannot be expected to under take the long-term capital outlays which will be necessary if it is to achieve the expansion planned for it, even if the return on its present capital were large enough to permit raising fresh funds from the market. The installation of washeries is perhaps the best illustration of this point. Washeries are essential if the planned output of coking coal is to be attained. But their installation costs a good deal of money and a commercial firm must be reasonably sure of amortising that cost. If the Government nationalises during the next year or so, private firms will be unable to cover their recent investments unless compensation is paid on the market value of the assets. This the Government is not obliged to do under the provisions of the recent amendment to the Constitution, and in fact, as was seen clearly during the discussions on the compensation to be paid to the shareholders of the Imperial Bank, it will in future have a great deal of difficulty in paying the market rate even if it wants to. The industry is of course prepared to spend the Government's money if that were forthcoming in the form of loans to finance washeries but the Indian Coal Board has warned that these are unlikely to be available in large quantities.

The doubts and anxieties of the coal industry represent those facing private industry in India as a whole at the present time. Expansion is required but it is impossible to attract fresh capital. If such capital is available there is no enthusiasm for putting it into equipment which will take a long time to pay for itself, and may well have been nationalised with compensation below market rates before that time has elapsed. Development in the coal industry may come to be recognised as the first casualty of the ill-devised amendment to Article 31 of the Constitution. There will be others to follow; and even in its wildest moments the Government can scarcely consider that nationalisation is the solution for them all. It now appears that little short of a clear statement of the Government's intentions towards each individual industry can be effective in encouraging the private sector to undertake the expansion desired of it. That is certainly true today of the coal industry, and is likely to be true tomorrow in the case of all industries. Uncertainty about nationalisation is worse than the reality, but worst of all is uncertainty about compensation. It is becoming clear that the Government has transferred the responsibility for determining the principles on which compensation is to be fixed from the Constitution to the changing whims of political opinion.

The coal industry will be able to play the part planned for it only if its future is assured for a reasonable time, or the principles on which any take-over price is to be fixed are declared well in advance. It is not possible to run the coal industry successfully under present conditions. The coal industry is pointing the lesson out, and with so much at stake it is one which the country cannot afford to ignore. The coal mining industry must have the ability to offer terms attractive enough to encourage new investment, better transport facilities, less controls and security of tenure. And the greatest of these is security.

REWARDS FOR SKILL NEW IMPORTANCE OF THE KEY WORKER

FEW people in Britain believed that a strike could ever happen in so vital a service as the railways, and when it happened the community was forced to notice a phenomenon that had been going on for many years until it reached a point of crisis. History will have to record that it was in 1955 that the age-old problem of appropriate relative rewards for different skills was first widely discussed. It will not, probably, be able to record that the problem was solved in the same year. The significant fact of the railway strike is that it was not a general strike of railwaymen but a particular strike of the more skilled workers—those who drive the engines. The general union, the National Union of Railwaymen, had demanded, and secured, for its members in April a wage-increase to match an increase won by the specialised union, the Associated Society of Locomotive Engineers and Firemen, in November. The ASLEF, having lost a relative gain, threatened to strike unless the Transport Commission restored the "differential" for skill. The Transport Commission, foreseeing an unending succession of alternating demands, first from the one union, then from the other, decided to break the series at this point, and the strike occurred.

This is not the first dispute on "differentials", only the most notorious. In the major categories where skilled and unskilled workers intermingle the skilled railwaymen's "differential" was not unusually narrow but unusually wide. But it was very much narrower than it had been decades earlier. The "extra" wage paid for skill, in all major industries and services, has been diminishing as a proportion of the "basic" wage throughout the present century, and rapidly (with brief interruptions) since 1914. The London Economist has made a valuable study of this trend. It has noted the relevance of inflation; when wages rise and the monetary difference between them is unchanged skilled workers may not notice that the difference is proportionally less than it was. In periods of deflation and unemployment—in the 1920s and again in the 1930s—unskilled rather than skilled workers have become redundant, and wage-differentials for skill have tended to widen. But the long-term trend has been the other way, and in the long period of inflation since 1939 the process has been accelerated. The Economist quotes figures showing skilled workers' wages as a percentage of unskilled workers' wages in building, shipbuilding, engineering, and railways. Extracting from the table the figures for 1914, 1939, and 1954, we see that the skilled workers' percentage diminished thus: in building, 150, 131, 114; in shipbuilding, 181, 136, 118; in engineering, 171, 132, 116; in railways, 184, 163, 128.

The reasons for this downward trend are not all economic; perhaps the most important is historical. Skilled workers were organised comparatively early in "craft" unions, and these unions had bargained successfully with employers. The bigger "industrial" unions, organising the unskilled workers, have won wage-increases for those workers particularly; they have, moreover, generally raised the whole wage-structure by a specified amount, so that the proportional increase has been largest in the lowest-paid categories. The industrial strife in Britain in recent months has been described as mainly a struggle between these two types of union. Of particular significance in the dispute in the railways is the skilled union's effort to reverse the trend that has for so many years favoured unskilled workers. The strike was not so much a protest against a further "encroachment" by the unskilled railway workers as a defence of an increased "differential" that the skilled workers had won.

Discussion whether economic trends favour the one group or the other involves long argument, and it must be inconclusive. It is an historical fact that in the age before production was mechanised "differentials" were wide (roughly one-half to two-thirds of "basic" wages) and approximately stable. The Economist notes that in the British building industry (which was mechanised late, and then only partly) the craftsman earned about 50 percent more than his labourer for 500 years but now earns only about 14 percent more. In other industries (more mechanised) the diminution has been greater. The "differentials" were wider than in building a few generations ago and are approximately the same as in building now. Much of the "skill" has been transferred from the worker to the machine. Does it follow that as industry becomes still more mechanised the rewards for human skill will become still less?

It is often said that we are beginning a new industrial revolution, which will reach its consummation in automatic factories working with abundant cheap power. Nobody can foresee, in detail, the social changes that this revolution will involve. If society adapts itself, the growth of production in relation to work done can benefit all humanity. But viewed conventionally, "automation" seems to imply substitution of machines for workers on

a mass scale, so that the bargaining-power of unskilled and semi-skilled workers will be steadily weakened. For, whereas many machines have hitherto replaced skilled workers and employed unskilled workers, these unskilled workers, in their turn, will be replaced by automatic transfer-machines and other new devices. We cannot see, generations ahead, but we can see that in the next few years new skills will be required to devise, to operate, and to maintain, these new machines. It may seem that "differentials" in, say, railways are irrelevant to this new tendency. But "differentials" for skill in general are certainly relevant to it, for workers are not encouraged to acquire skill as such unless they see in prospect a proper reward for it. So it may be that the railwaymen, using anti-social means, were unconsciously pursuing a principle that is of profound importance to Britain.

CURRENT COIN

Index of Industrial Activity.—Corrected for seasonal fluctuations, Capital's Index of Indian Industrial Activity shows a drop of 5.9 points during January, 1955. Contributing chiefly to the decrease were declines in cotton consumption, jute manufactures, cement, coal and electricity. Cheque clearances dropped, while notes in circulation rose.

The Value of Productivity.—When it is being seriously suggested in some circles here in India that the expansion of organised large-scale industry have absorbed all the unemployed labour it is reassuring to find the country's problems being presented rationally at international discussions. Speaking at the 38th session of the International Labour Organisation last week the Indian Employers' Delegate, Mr. B. M. Chinai, stated India's economic problems to be three in number. He placed first the need to raise living standards. The second and third were the needs to diversify the base of the Indian economy and to provide employment to the large numbers that are added to the working force every year. This is the correct order of priorities. Mr. Chinai was right in pointing out that unemployment and underemployment have been in existence in India for a long time and that the problem is now aggravated by factors such as the rapid growth of population, displacement of old rural industries, the inadequate development of the industrial sector, conditions of market recession and disorganisation of normal trade channels. The provision of more employment opportunities can only be made by large-scale investment, if India is to grow richer at the same time; that can only be done by encouraging those industries where productivity is high and the necessary saving can be secured. The picture of an economy based on village and small-scale industries, while the more productive industries are deliberately hamstrung is a self-repeating one. Once the productive industries are crippled there will be no saving to provide even the most elementary machines and equipment for the new labour which comes on to market every year. "Employment is not an end in itself," stated Mr. Chinai, "but a means to an end, the enjoyment of a higher standard of living". This fact is frequently lost sight of especially by those whose words have come to be coloured by a half-digested socialism. Mr. Chinai pointed the truth that when units of production are small, as they are with cottage industry, the problem of ensuring further savings for expansion will become more difficult. "There is always a tendency, particularly in the case of small units, for increased income to be used for increased consumption rather than for expanding the business." Those who dream of prosperous, independent and happy cottage workers could profitably ponder the following statement. "Moreover, it must be borne in mind that to the extent that small-scale and cottage industries depend on outmoded techniques, either the cost of production must be higher or the degree of drudgery and overwork involved must be greater." Mr. Chinai expressed himself with a clarity which is all too rare where the dictates of commonsense and the teachings of economics are becoming casualties of a muddled sentimentality which may yet cost the country the progress it hopes to make. But it would be a pity if the delegates to the I.L.O. Conference came away with the impression that India's problems are as well appreciated by all those in charge of her affairs as they are by Mr. Chinai.

Silver at Thirty-five Year High.—Until the end of 1954, silver had only a minor monetary importance abroad. Since the beginning of this year, many governments, influenced by convertibility discussions in Western Europe, studied the possibilities of replacing their mostly torn and used banknotes of small denominations by silver coins. Silver currency, having a more "sounding" acceptance than worthless paper, could, it was also thought, increase currency prestige as well as sales of government bonds. The apparent equilibrium in international silver markets, having to calculate with increasing industrial use of the metal, however, did not take into consideration the eventual

currency uses. When in March of this year, Saudi Arabia bought 17 million ounces from Mexico in order to mint new silver coins, the silver price in New York rose briskly to 88½ cents. And when Germany bought an important tonnage of the metal in Mexico during May, silver again jumped in its price and reached 90½ cents, its highest level since 1920. According to the June issue of Pick's World Currency Report, numerous European governments contemplate the minting of silver coins. Austria, Belgium, France, Italy, as well as a few Scandinavian countries want to replace banknotes by silver coins and such mintings will absorb considerable amounts of either newly mined metal or of existing stocks. Russia's silver production, estimated at more than 25 million ounces a year, cannot suffice to satisfy the expected monetary silver demand which, on top of industrial and chemical uses of the metal, might eventually drive the silver price to higher levels. The great question mark in the price development is the policy of the U.S. mint, owning considerable stocks of the metal that it can sell if the price goes higher than 91½ cents an ounce. Should the mint choose not to sell the metal, most interesting price developments can be expected. The ratio of silver prices versus the free market level of gold again changed in favour of silver. One fine ounce of gold in European transit was worth in troy ounces of silver:

1955*	1954	1953	1952	1951	1950	1947
38.73	41.17	41.23	45.50	44.30	44.70	54.10

(* As of May 31st)

Demand for Coal.—Consumers have for years not been able to get enough coal because of transport difficulties. Transport is being improved, but so slowly that the railways' carrying capacity is still well below production and far below the estimated potential demand of 391 million tons in 1954. This figure is expected to rise to 45 million tons in 1957, and the disturbing suspicion arises that the railways will never be able to provide the carrying capacity unless their expansion plans are themselves vastly expanded. Provisional estimates are that at the end of the second five year plan demand for coal is likely to be 56 or 57 million tons, but official circles readily accept the possibility that it might be even higher. It is felt that production can be increased to about 60 million tons by 1960, as against around 36 million tons now. This is something that the collieries would be only too glad to do in order to increase their earnings, but have not been able to so far because even the limited quantity of coal they produce cannot be moved. If output were to rise to 60 million tons by 1960, the railways' coal carrying capacity would have to be almost doubled (it is 31m. to 32m. tons a year now). Doubts are freely expressed as to whether the railways will ever be able to achieve this. They have evidently not framed their plans for expansion on so large a scale. Some think that even if they had, it is doubtful whether those plans would have materialised considering the difficulties in obtaining equipment. The view is therefore expressed in certain quarters that much greater emphasis is necessary on economy and efficiency in the use of coal. If consumers reduce their demands upon coal by improving equipment, they will be less affected by interruptions in coal supplies and will improve their chances of working in accordance with their plans.

Agricultural Price Enquiry.—The Government of India has set up a committee to enquire into the variations which exist in the prices of foodgrains and agricultural commodities throughout the country. The chairman of the committee is to be Mr. M. V. Krishnappa, Deputy Minister for Food and Agriculture, and other members are Dr. Ram Subhag Singh, M.P.; Mr. R. S. Krishnaswamy, Joint Secretary, Ministry of Food and Agriculture; Mr. Ratilal M. Gandhi; and Mr. Anand Mohan, Joint Director, Traffic (Transportation), Railway Board. The secretary of the committee will be Mr. S. C. Chaudhuri, Deputy Economic and Statistical Adviser, Directorate of Economics and Statistics, Ministry of Food and Agriculture. The committee's terms of reference cover the collection of all relevant facts relating to the variation in prices of foodgrains and other agricultural commodities in different markets. It will examine the causes of inter-State or inter-regional or inter-local disparities between these prices and between price movements over different parts of the year in the same market. It will also have to suggest ways and means of reducing these disparities. This field of enquiry should prove a profitable one although many of the reasons which the committee will investigate will probably be beyond its powers to alter. These price differences are, so far as is already known, due to such causes as transport difficulties, local weather and climatic conditions, other forms of economic activity in the area, the strength of local traders, the prosperity of growers and many others. Even in highly industrialised countries with well developed transport systems local disparities in food prices are still encountered. Large differences can perhaps be corrected by improved transport and marketing organisations. Such measures will also help to minimise the influence

of local weather and climatic conditions which will always be responsible for sudden changes in food supply. The work of the committee is likely to be difficult because statistics will not be easy to come by, and accurate ones will be even more scarce. A good deal of on-the-spot enquiry may have to be undertaken for a true picture to be obtained. Effective measures to iron out price disparities will, if they can be devised, help considerably to improve conditions throughout the country for the lower paid worker and ryot and should contribute to industrial harmony by avoiding the necessity for rapid fluctuations in wage rates.

Workers' Living Costs Down.—The working class cost of living indices have been showing a steady fall. The average index for all India fell to 97 in January this year from 103 in December 1954 and from 102 a year ago. In important centres of industrial employment, the indices have shown similar falls over the period. In Calcutta the index fell to 310 in January from 321 in December and 325 in the corresponding month of last year, in Bombay to 352 (from 358 and 363), in Madras to 333 (from 337 and 353), in Kanpur to 312 (from 369 and 442), and in Delhi to 344 (from 352 and 363). Only in Nagpur was the index the same for January as in the previous month, but was seven points down as compared with the same month in 1954. In later months this year the indices have fallen further. Workers' real incomes therefore are rising.

Conditions in Australia.—On the surface at least, the generally prosperous business conditions of the current financial year have continued with little overall change in Australia, according to the monthly summary of the National Bank of Australasia. Reports indicate that while consumer spending has been well maintained, there has not been the continued upward advance predicted by some observers. Indeed, it appears that turnovers, overall, have levelled off with occasional signs of a slightly quieter tendency. Foremost among the restraining influence is the strong adverse overseas trade balance which, perhaps, lead to a reduction for the year of as much as £150 million in overseas reserves. This represents both a net inflow of goods, and a net outflow of funds, which contracts, especially, the liquidity of the banking system. In view of this decline and of the need to restrain spending, bank credit has also been stabilised over recent months. While not exerting any marked downward pressure on business and industrial activity, this already seems to be going some way toward counteracting the risk of an unhealthy boom. For the remaining months of 1955, any great change from the present situation appears unlikely. Despite the import restrictions imposed in March, it is probable that a balance of payments deficit will continue. Some dampening effect should, therefore, be felt from this source. Bank credit is certain to be held in check in the probable absence of any marked reversal of either the outflow of overseas reserves or of the tempo of the internal spending. Government accounts for the new financial year may follow the present pattern fairly closely and additional inflationary pressure is not likely from the Government side. For a time at least, the pressure on scarce resources of labour and materials may be eased somewhat, thereby affording a welcome "breathing space" to the economy. If events shape this way, there should not be further substantial cost and price increases during the year. The long-term trend of private investment seems to be strongly expansionary. The volume of government spending, the increase in population, policies of protection for local industries, and the high standard of living, all act as powerful stimulants to business growth and industrial expansion. Although there may be temporary set-backs, such as in 1951-52, this trend in private investment might well continue for many years.

The Trade Unions' Activities.—Apart from undertaking collective bargaining and protecting the interests of workers against employers and governments, the trade union movement was originally designed to promote the wellbeing of its members in various other directions such as health, entertainment, education, culture, etc., by undertaking appropriate activities. This aspect of the movement has been increasingly neglected, especially since the recent trend of labour legislation, which lays a greater stress on the negative aspect of resolving employer-employee conflicts. Even where it does recognise the need for constructive work in order to secure improvement in the lives of workers and their families, the responsibility for this is being shifted more and more on to the shoulders of the State, i.e. the taxpayers, and the employers. In the early days of the trade union movement, the workers' organisations were keen on starting reading rooms and libraries, evening classes for illiterate workers, summer school for technical training and refresher courses, health centres, recreations and sports activities for the benefit of their members. All this is being forgotten and the trade unions have now come to expect the State and the employers to provide all such essential aids for improving the lot of their

members. Even accepting for a moment that the provision of such aid is not the responsibility of the trade unions and that both the initiative and the requisite finance for such activities should come from the other two sources, it is obvious that the funds provided for this purpose could only be put to the best use if the trade unions co-operate actively in organising such activities. How this duty is being neglected by the trade unions in general, even in an industrially advanced State like Bombay, has been brought out in the annual report on trade unions for the year 1953-54 issued recently by the State authorities. This report discloses that, with the sole exception of the Textile Labour Association of Ahmedabad, not a single union in the movement did very much in this direction. The report states that all the 812 registered unions in the State were asked to supply information regarding their activities during the year under report; but only 389 supplied any information on this subject. The report records that "a large majority of them merely refer to meetings held by them during the year for routine work". Only about five unions did some work other than carrying out their purely routine activities. One of these conducted two library classes for its members while one maintained a library. It must be said to the credit of the Textile Labour Association of Ahmedabad that its activities were varied. It ran cultural and social centres for the working classes. The Association also conducted six primary schools in working class localities and 49 reading rooms with nearly 400,000 workers taking advantage of the facilities. In addition to this, eight gymnasias were also run by the Association. Among some of the other interesting facts revealed by this interesting report is the enormous increase in the number of unions during 1953-54. Out of a total number of 812 bodies on the State register nearly a quarter came into existence during this year. Only once before in the history of the movement in the State did the number of new trade unions registered during a year exceeded this number. This was in 1949-50 when 221 new trade unions were registered in the State. The report, however, covers the activities of only 486 unions whose returns were accepted by the authorities for the purpose of the report; 462 of these were bodies with their jurisdiction confined within the limits of the State, while 24 were classified as central unions with their activities overflowing the State boundaries. The total membership of 481 unions (excluding five Federations) came to just over 400,000. Excluding the Federations, only 12 unions had a membership of 5,000 or over and of these the membership of only five exceeded 20,000 each. As many as 345 unions had a membership of less than 500 each.

Experiment in Rationalisation.—In view of the bitter struggle now going on between the textile workers on the one hand and the U.P. Government and the Kanpur textile industry on the other, over the question of rationalisation the news about the first productivity project launched last week at Baroda by the Government of India, with the assistance and active co-operation of the I.L.O., gains an added importance and interest. As explained by Prof. H. Y. Fish, who is in charge, the project is designed to achieve the maximum production with the minimum of resources through the application of techniques in the various industries such as textiles, engineering, chemicals, etc. located in this centre. It will initiate comprehensive programmes for increasing productivity through the application of industrial techniques in all these industries and will include appreciation programmes for managements and trade unions in the various industries, a series of education and training programmes for managers, technicians, supervisors and workers in selected factories in the application of industrial and engineering techniques to their specific problems, a periodical follow-up of the results for maintaining sustained interests in the programme and gradual expansion of the scope of such work. The project is the result of the joint efforts of the Central Ministry of Labour and the I.L.O. with whom are associated about 80 people representing local workers and managements, industrial research organisations and the Baroda University. The first phase of the project will consist of giving training in these improved techniques to one representative each of the managements and the workers of 10 important factories in and around Baroda and the result achieved as a result of this training will be used for demonstrating the application of these techniques to wider areas. According to Prof. Fish, the same method was tried earlier as an agricultural experiment in the community projects in U.P. This met with great success and agricultural production in the project areas showed an appreciable increase. The idea has, therefore, been extended to the field of industry and it is being worked out on an experimental basis in Baroda. From what one can see, this is another name for scientific rationalisation and if the authorities, the workers, the industries and the research institutions assisted by the I.L.O. expert can jointly make rationalisation more acceptable to all concerned and succeed in launching it smoothly, at Baroda, it would certainly constitute an important step in the industrial development of the country.

THE CURSE OF CROMWELL

GAMES OF CHANCE AND THE LAW

(FROM OUR LEGAL CORRESPONDENT)

A FEW years ago the Bombay High Court adopted rather a startling course in a criminal appeal before it for disposal. Some citizens of humble status had been engaged in playing a game of cards. They were playing for money in a very small way and the site of the game was the only one available to them, the poor man's club, in short a street pavement in the city. They were arrested by the police. Though one may think that the guardians of public order might have found something better to do than invoke the criminal law on people otherwise perfectly law-abiding and have turned a blind eye on them, they were brought before a learned city magistrate who in due course convicted and sentenced them. The malefactors, somehow or other, raised sufficient money to appeal to the High Court against the convictions and sentences. The learned judges did not like the case at all and did not hesitate to say so. But they, of course, had to administer the law as they found it, and the law in India on gambling, an almost exact counterpart of the law in England, is a particularly hard and rotten nut to crack. Some games, including all card games which are not games of skill, are illegal in themselves as tending to promote gambling. For this we have to thank, and these gentlemen of Bombay had to thank, one Oliver Cromwell and the Puritans who some three and a half centuries ago, after abolishing by statute all forms of manly sport on Sundays, went further and rendered gambling illegal and punishable by jail, any time anywhere. We have inherited this nauseating and hypocritical frame of mind and even in recent years improved upon it. Thus we find a hardheaded Yorkshireman like Mr. Asquith egged on from countless conventicles ordaining by Act of Parliament in 1906 that whereas I may back my fancy by letter, telegram or telephone, or by payment of cash in my club and receive the resultant emoluments thereof (if any) in the same way without let or hindrance, if I do the same thing in the street or in a shop or any other public place, I am liable to arrest by any policeman, and that without warrant, and on con-

viction to be fined or sent to jail and so is the unfortunate bookie who takes my bet. Of course you may pass along any back street of London or Liverpool or Cardiff or any lane in the village of Assesmlk-cum-Worter and see the Act broken every day. But the law is there all the same and if the passerby is the Reverend Mr. Stiggins he can insist on its being enforced. Accommodation in the jails is limited and you can't clutter them up exclusively with bookmakers and their clients any more than you can with prostitutes; so just as well known practitioners in the latter venerable line of business are given a run for their money and only at intervals locked up, so the street bookie or tout is given longish interludes of freedom. Nevertheless, he and I who dealt with him are criminals occupied in crime and it is an understatement to say that there seems something wrong somewhere that it should be so.

That was the set-up in which the judges of the Bombay High Court had to deal with the case of these men said to have been engaged in the nefarious crime of playing cards for money in the street. What their lordships actually did was, if one may respectfully say so, eminently sensible and humane. Sauce for the goose is sauce for the gander; and the judges ordered the police authorities to make an inquiry and to furnish a report thereon as to whether any and, if so, what games of cards were played for money in the clubs of the city. Their lordships were, of course, quite ignorant on this point themselves. Sir Marmaduke Haddock may have lost quite a packet at Contract Bridge or even Poker at his club the night before but the Hon'ble Mr. Justice Haddock the next day on the bench would be totally unaware of that fact; yet, if these street card players were criminals then Sir Marmaduke, if he paid his Poker lessons or received his winnings in cash across the table, was possibly in the same condemnation too; and probably his position would be the same if accounts were settled by cheque at the end of the month. As regards Bridge, addicts thereto claim that it is essentially a game of skill and as such is not gambling at all. It may be so theoretically. But with an experience of every variety of partner, male and female, during upwards of a quarter of a century the writer's bitter conviction, on which he would give expert evidence on oath, is that Bridge is gambling in its worst and most treacherous form. To return to our street gamblers the Court postponed their judgment until the report on the clubs was received. The ultimate result was not, it is believed, reported. But the hint was plain that if gambling in clubs was dis-

closed the Court intended to see to it that these men were not going to suffer.

* * * * *

And that brings us to the latest case on club gambling. Now, you being a Bridge victim may be able to put up some sort of a case to the effect that that game is not gambling but a matter of trained skill; and even as regards Poker it may be that as the expert will always win in the long run, being a psychologist versed in the study of the human mind, the game is one of skill and luck only plays a secondary part. But there can be no question about the game of Housie one would have thought. That is a pure gamble and nothing else. And it was Housie which got this club in Shillong into trouble. The club, known as the Evening Club, was a social club duly registered. It had some 500 members and amongst others the object of the club was to provide facilities for various indoor and outdoor games all of which, save one, were of an innocuous and commendable character. The exception was the game of Housie. It appears to have obtained a grip on the bourgeois of Shillong for it is or was "played in various other clubs in Shillong also." Too much so, as, according to the Deputy Commissioner of Shillong and the local authorities, the tribal people living in the locality got the impression that the authorities had countenanced and were encouraging gambling in the form of Housie in this club wherefore these people began to resort to the club and participate in the game. This impression got abroad because the Deputy Commissioner had, by written order, sanctioned the playing of the game in the club under certain conditions. The Honorary Secretary of the club, though he later contended that no sanction was necessary, submitted to the conditions because, as he put it, "they were wholesome." Complaints developed and the Deputy Commissioner withdrew his sanction and passed an order cancelling it. This was the order: "There is reason to believe that you are allowing non-members to participate in 'Housie' played in your Club and further you have not complied with all the conditions as laid down in this office letter ... dated You are therefore ordered to stop playing the game of 'Housie' with immediate effect." The Deputy Commissioner passed this order as District Magistrate. The Honorary Secretary and the club committee objected. They challenged the order as being entirely without any warrant in law and they applied to the Assam High Court to quash the order under Article 226 of the Constitution. Incidentally they claimed that they had obeyed all the conditions though that point is irrelevant as their real case was that the District Magistrate had no authority to impose the conditions or make his order. The point of interest and importance to all other clubs in India, was, however, not decided in this case. That point is whether Housie (and other games for that matter, where the element of luck and not skill predominates) is in itself gambling and therefore illegal. The fact is that the District Magistrate, in trying to stop what he considered an illegality, had himself acted illegally. He had a remedy open to him. Under Section 5, Public Gambling Act, if the District Magistrate ... has credible information and has reasons to believe on proper enquiry that any place or enclosure is used as a common place for gambling the officer ... may enter by force if necessary and take into custody all persons whom he ... finds there engaged in the act of gambling. There are very severe penalties. But the Section nowhere authorises the District Magistrate to pass an order of the kind he had done here stopping the game of Housie altogether with immediate effect from the date of the order. What the District Magistrate should have done was to have taken appropriate action within Section 5 of the Public Gambling Act. The order he had passed was, the Assam High Court held, absolutely unwarranted and illegal and it was accordingly quashed. But this case does not supply us with what it would have been interesting to obtain, namely, a clear-cut decision as to whether playing card games of sheer luck or chance for money in clubs is illegal or not. The writer's own guess for what it is worth would be: Bridge, auction or contract, would be held to be an innocuous and legal pastime. Nearly all the magistrates and judges play it and are wholeheartedly convinced of their own skill and expert knowledge of the same. Poker, doubtful but probably legal. Skill predominates in the form of intense concentration and an almost psychiatric knowledge of human nature. Nap, Rummy, and certainly Housie definitely illegal. No skill involved, just sheer luck. And, clubs apart, what about gambling games for money in the home? If the players are members of the householder's family and his bona fide friends therein as guests only, one would say no offence is committed. An Indian's home is his castle.

SIMON-CARVES NEW CALCUTTA OFFICE

Simon-Carves Ltd., a Company incorporated in England, builders of coke ovens, coal washeries, heavy chemical plant and coke power stations, one of the parent companies of the Simon Engineering Group of Stockport, England, have opened new offices at Standard Buildings, 32, Dalhousie Square, Calcutta 1, which will henceforth be the headquarters of the resident engineering staff which they have maintained in India for over forty years. The new office, which will be under the charge of Mr. N. A. Ross, Simon-Carves Manager in India, will enable the Company to deal more effectively with their commitments, amounting to millions of pounds for the construction of coke ovens, metallurgical plant and other heavy capital engineering equipment for India's iron, steel and coal industry. The existing Simon-Carves Office at Jamshedpur will continue to be maintained as a site office.

A DITCHER'S DIARY

important consideration is that its contents should be readily accessible to students, wherever it is situated. This consideration appears to have been under-estimated in the re-organisation of what used to be Calcutta's Imperial Library, and is now called the National Library. The system of lending books that has been introduced since this library was transferred to its new home is troublesome and complicated in the extreme. So complicated in fact that it did not make sense to me at first, until I realised that the system is based on the quaint assumption that every would-be borrower is a book-thief—and no ordinary thief but a determined and ingenious one. For example, one goes to the National Library to get a book and begins by consulting the catalogue. Then one fills in an application form giving number, title, author, signature, ticket number, hour of the day and date in duplicate. One waits fifteen or twenty minutes until the book is brought from the stacks, whereupon an official examines it minutely and then consults a publishers' index. After five minutes' research he pronounces the book to be out of print and therefore unable to be lent out. One can, however, read it on the premises. But not yet. One has first to apply de novo at a different counter, filling in a different form giving this time number, title, author, signature, home address (why? hour of the day and date, again in duplicate. The book is then handed over, but before one can take it ten feet away to open it, one must surrender the reading room card as a hostage. On leaving the premises one has to pass two watchdogs (not one) who may open any note-books to see if a stolen volume is concealed between the leaves. And of course before a reader gets into the place he has been recommended by a worthy and has paid a cash deposit which must exceed the re-purchase value of any book borrowed. There must be some less aggravating way of running a library.

The Posts and Telegraphs people are anxious to rent out teleprinters to business houses and even, I understand, have advanced plans for the manufacture of teleprinters in India. It might be a good idea if they tried to sell a few of these machines to that other Government organisation, the Indian Airlines Corporation. The Corporation is at present quite unhelpful about any matter that involves liaison between two of its offices in different parts of India. When its Calcutta office was asked last week to book a seat from Bombay for a gentleman who was due to travel to Calcutta three days later, it responded as if it had been asked to accomplish some unheard of miracle. How was it possible to book in Calcutta a seat from Bombay, its staff asked with mouths agape? How would they know in Calcutta if there was a vacancy on the plane? And if they accepted the fare in Calcutta, how would Bombay be able to issue a ticket? If the two offices had been connected by teleprinter, it would all have been very simple and should have taken no more than half an hour. As it was, telegrams were exchanged, days went by, eventually money was accepted in Calcutta and a firm reservation promised from Bombay. When the traveller concerned reached Bombay from Rome he went to the Airlines office and was informed that they had never heard of him. What was more, they had no room for him on any plane and if someone in Calcutta had paid out money in the expectation that there would be room for him, then that was their lookout. He journeyed to Calcutta by train and the last news was that the Indian Airlines Corporation was thinking about a refund. I believe the Corpora-

tion runs at a loss. A foreign airline (also State-owned), whose Calcutta office was consulted during these negotiations but too late, expressed its willingness to handle the whole matter through its Bombay office at no charge. That airline does not run at a loss.

I saw it stated casually in an article this week that "the multiplication rate of Indians in South Africa is the highest in the world". This has disturbing implications for India herself, quite apart from the worries it causes in Natal. The South Africans' problem is their own and they must resolve it in some way consistent with human decency, which they have not begun to do yet. For us in India it suggests that when Indians attain a higher standard of life, their rate of multiplication increases markedly. For however great the political disabilities of the South African Indians, however insufferable the insults they are offered by those who decline to accept them for what they are, fellow-citizens, it will be readily enough agreed that their economic status is considerably higher than is enjoyed by Indians in India. If the consequence is that they thereupon achieve the world's highest multiplication rate, will a similar result attend efforts to raise living standards in this country? The actual rate of increase of India's population is not very high today, and it is probably falling; the absolute increase from year to year is frightening because the total population is so large. If now a higher rate of increase were attained, the problem would become almost unmanageable. The most heroic efforts in economic progress would do little but bring into existence more children to under-nourish.

Even atomic research has its lighter side. In a book called *The Man in the Thick Lead Suit*, Daniel Lang has just told the story of what went on toward the end of the war, when the Americans and British were trying to find out how far the Germans had got with nuclear explosives. As soon as the Allies reached the Rhine, American soldiers waded out into the river under fire to collect samples of the water, which were rushed back to Washington to be tested for radioactivity—the idea being that the Germans might be using the Rhine to cool a uranium pile. Just before the samples went off, an officer thoughtfully inserted a bottle of French wine for his friends back in the Pentagon and wrote on the label: "Test this for radioactivity too". A few days later a Top Secret radiogram came back saying: "Water negative. Wine shows activity. Send more. Action". They assumed at the front (as you have probably assumed already) that this was a joke, and they ignored it. Soon there followed a rocket from the Pentagon, demanding to know why orders had been ignored. It turned out that some humourless reprobate in Washington had tested the wine as well as the water—and discovered that although Rhine water was not radioactive, Rhine wine was. An Army physicist was at once given a plentiful supply of confidential funds and sent out to make further investigations. Touring France he was fêted by vintners everywhere and presented with a representative collection of the French vintages. They were all radioactive. His bibulous wanderings were not interrupted until some nuclear physicist broke down and confessed that many wines, because of the composition of the soil where grapes are grown, are mildly and harmlessly radioactive. The Pentagon decided that they were not, after all, on the track of something big, but meantime one lucky gentleman had completed what must have been the cosiest job of the war.

STOCK MARKETS VERY ACTIVE
HEAVY BUYING OF INDUSTRIAL
EQUITIES

London, 15th June.

VERY active conditions prevailed in the stock markets during the past week, despite the labour troubles. Renewed heavy buying, particularly of industrial equities, brought substantial gains in places. Profit-taking brought some prices back from their best levels but rising hopes of a settlement of the rail strike over the week-end induced renewed buying and prices went ahead again. Steel shares were outstanding in the advance and substantial gains were scored, but there were many good rises elsewhere, particularly in the better class issues. Good dividend and profit figures contributed to the advance, and Metal Box in particular soared following their preliminary statement. Dearer money fears kept business in gilt-edged down to a low level but prices held fairly steady. In foreigners, German and Japanese went strongly ahead and Peruvians were supported. Dollar stocks advanced in sympathy with Wall Street. Free Staters and Rands were supported in Kaffirs and were generally higher on the period. Diamonds also gained ground. Coppers were in demand and other base metals were higher where changed. Despite bouts of profit-taking, oils recorded appreciable rises, particularly in the leaders. Rubbers advanced, aided by the improvement in the commodity. Teas also advanced, helped by

the reduction in the North Indian crop return, but activity here was limited.

European Jute Congress

The Association of European Jute Industries announced on Monday that about 200 representatives of jute manufacturers from Western Germany, Austria, Belgium, Spain, France, Italy, the Netherlands, Portugal and Switzerland, as well as observers from Britain, Denmark, and Sweden, will attend the first congress in Brussels of the European Jute Industries. The Congress starts on 30th June and will last for six days.

The Money Market

There was again barely enough credit in the banking system to supply the requirements of the money market during the past week. While the authorities were ready to step in and inject funds during the most acute periods, their action made it appear that difficult conditions would prevail for some time. Day-to-day loans held firm at 4 percent and there was a further hardening of bill rates. This resulted in the average rate for the week's offer of Treasury bills being advanced to 3.5 percent. Applications for Treasury bills totalled £378,640,000, of which £260 million was allotted at an average rate of 79s 7.53d compared with 68s 11.8d in the previous week. This week £260 million will be offered. The Bank of England return for the week ended 8th June showed notes in circulation about £13 million higher at around £1,778 million, while bankers' deposits were about £7 million higher at around £248 million.

U.K. Steel Production

U.K. steel production in May ran at an annual rate of 20,884,000 tons, compared with 20,454,000 tons in April and 19,476,000 tons in May 1954. These figures were issued by the Iron and Steel Board. Pig iron production was 12,574,000, 12,401,000 and 12,033,000 tons respectively. The Board says that output in June will inevitably show a reduction from these high rates as a result of the British rail strike. The precise effect of the strike cannot yet be assessed as conditions vary from works to works and from day to day.

U.S. Federal Reserve Return

The U.S. Federal Reserve return for the week ended 8th June shows gold stocks \$1 million higher at \$21,675 million. Foreign deposits rose by \$4 million, while foreign investments rose by \$39 million. Fed sold \$79 million worth of bills. Total discounts and advances fell by \$176 million to \$391 million, while excess reserves of member banks fell by \$38 million to \$463 million. Their daily average of excess reserves rose by \$192 million to \$620 million. Business loans of the New York City banks fell by \$7 million to \$7,617 million, compared with a fall of \$29 million to \$7,546 million a year ago.

Activity on Wall Street

In the foreign sector of the bond market, German Nationals initially extended their recent advance in the past week by a point or two to sell at new highs, but eventually backed away fractionally with dealings slowing down. A number of municipals and corporates recorded sizeable gains on small turnover. Italian and Greeks were firm, advancing as much as one point, while Serbs were lower by fractions. Denmark 4½ percent improved slightly, with Norwegians mixed. Moderate demand pushed Japanese issues higher by fractions to more than one point. Chile 3 percent of 1993 featured a quiet South American list, advancing more than two points to 45½ for a new high. The domestic market was featured by strength and activity in convertible issues, particularly steels and oils. The market's action reflected the recent upsurge in industrial share values on the stock exchange. Rails also advanced, led by speculative issues, with a number of selling at the best levels for the year. Top quality corporates developed firmness in fairly good turnover. U.S. Government securities edged higher following some slight easiness, with the long end of the list attracting investment support. World Banks were neglected.

Vegetable Oil Market

There was a period of profit-taking in linseed oil after the recent persistent rise in prices and quotations latterly slipped back to some extent. At the same time, buyers remained well in evidence particularly in the U.K. for the forward positions. Indian June-July shipment was sold down to £299½ but most sellers for this and July-August wanted £100 at the close. November-December could be had at £102½ after earlier sellers at £103½ in bulk. A steady tone still governs the market for groundnut oil with moderate business reported. Indian crude to Rotterdam realised up to £103½ in bulk for June-July or 10s better than previously. A much quieter tone developed in castor oil although early shipments were well held at a slight premium. July-August B.S.S. was reported to have been dealt in at £96 but mostly shippers were wanting £88 for this position. Commercial held steady at £80 c.i.f. in drums. Spot Indian was inclined to be firmer and supplies were more difficult to obtain. A firmer undertone developed for coconut oil, helped by generally improved demand. Ceylon afloat was dealt in at £91½ and in one instance £92½ was paid for shipment.

RELIEF FOR DOUBLE TAXATION OF INCOME
AGREEMENT WITH U.K. SIGNED

An Agreement between Pakistan and the United Kingdom providing relief for the double taxation of income was signed here today. The Agreement, which is dated to take effect from 1st April 1955, follows the general lines of similar agreements concluded by the United Kingdom since the war, with other Commonwealth and Foreign countries.

Finance in India and Abroad

THE CALCUTTA MONEY MARKET

EASIER INTERBANK TREND

Wednesday, 15th June.

MONEY is still in good demand though there are signs that the prolonged busy season may be drawing to a close. Sugar advances have slackened off and there is now a downward trend as stocks begin to move. Jute advances are considerably lower. Demand for accommodation against grains is still strong. In the Calcutta interbank market the call rate still quotes 3 percent, but there is an easier trend and an early reduction of this rate would not be unexpected.

The exchange department has been quiet with few bills passing. Remittance has been moderate. The principal exchange rates are unchanged from last week.

As from today Indian banks are free to quote their own exchange rates for all foreign currencies, except sterling, the Pakistani rupee, and Canadian and U.S. dollars. So far, however, there are no reports of business done on these lines.

Silver ruled quiet in the absence of support. The price dropped from the previous week's level of Rs. 159-12 to Rs. 157-1, quoted to-day. The forward rate was Rs. 155-3. The London silver market ruled quiet and the price fell from 78, 10 to 77, 7/8d. The price of foreign silver in New York also declined from 97½ to 89½ cents.

Gold was steady and the price advanced from the previous week's level of Rs. 94-1 to Rs. 94-8. The sovereign at Rs. 60-14 showed a gain of 6 annas.

Tenders for Rs. 1 crore of three month Government of India Treasury Bills, which were opened on Tuesday, 14th June, 1955, totalled Rs. 2,48,75,000. The average rate of acceptance declined from Rs. 2-8-8 to Rs. 2-8-5 percent per annum. Tenders at Rs. 99-6-0 percent and above were accepted in full and those at Rs. 99-5-9 percent were allotted approximately 55 percent. Tenders for a further Rs. 1 crore of three month Government of India Treasury Bills will be received at all centres up to the close of business on Monday, 20th June, 1955. During the week ended 10th June, 1955 Government of India Treasury Bills for Rs. 8,39,25,000 were sold in favour of the Reserve Bank of India.

The 4½ percent 1955-60 loan will be repaid at par on 15th September, says a Press communique issued on 9th June by the Finance Ministry. Interest will not accrue on the loan after that date. The 4½ percent 1955-60 loan was issued in 1928 for a sum of Rs. 35 crores. The issue price was Rs. 94. In October 1954 it was estimated that the balance still outstanding on this loan was only Rs. 9 crores, the rest having been absorbed in other conversion loans.

A further rise of Rs. 6.33 crores in notes in circulation to Rs. 1,331.28 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 10th June, 1955. The total note issue was also up by Rs. 25 lakhs to Rs. 1,339.50 crores. Notes held in the Banking Department consequently fell by Rs. 6.07 crores to stand at Rs. 8.23 crores. Deposits of the Government of India increased by Rs. 3.14 crores to Rs. 55.35 crores but other Government accounts fell by Rs. 3.17 crores to total Rs. 11.58 crores. Balances of commercial banks at Rs. 48.95 crores were Rs. 2.23 crores higher. Balances held abroad rose by Rs. 6.08 crores to Rs. 66.11 crores. Investments at Rs. 40.52 crores showed a decline of Rs. 22 lakhs. Other loans and advances increased from Rs. 29.49 crores to Rs. 29.63 crores, of which advances to scheduled banks against usance bills amounted to Rs. 19.57 crores (Rs. 19.14 crores). These advances totalled Rs. 121.01 crores since 1st January, 1955. Ways and means advances were shown at Rs. 1.36 crores (Rs. 80 lakhs).

The return of the Imperial Bank of India for the week ended 3rd June, 1955, shows a fall of Rs. 11 lakhs in total deposits to Rs. 210.34 crores. Investments in Government Securities and other authorised investments are down by Rs. 20 lakhs and Rs. 17 lakhs to Rs. 90.29 crores and Rs. 11.21 crores, respectively. Advances, including loans, cash credits and overdrafts, and bills discounted and purchased have increased by Rs. 7 lakhs to aggregate Rs. 121.34 crores. Cash and balances are, in consequence, shown at Rs. 12.01 crores or Rs. 4.09 crores less.

Accountants tell me -

"You're
welcome
on all
accounts"

Here is the

Powers-Samas

punched-card,

part of the system

that makes all other accounting methods out of
date, keeps figures really up to date.

Powers-Samas speed and efficiency keeps pace
with figures and events as they occur;

indicates trends as they start to develop. For
large combines and small concerns Powers-Samas

methods handle invoicing, statements,
stock-records, payroll, costing and statistics

of all kinds with unequalled speed, neatness,
accuracy and economy.

There is a range of Powers-Samas punched-card
equipment for every type of application.

Stocks and Shares

CHEERFUL SENTIMENT MAINTAINED.

SPECULATIVE ISSUES ADVANCE FURTHER: NEW LOAN EXPECTED SOON

Wednesday Evening.

THE cheerful sentiment has been maintained in the share market, although the revival of confidence among professionals has not yet succeeded in attracting outside support. Encouraging corporate news has been a stimulant, and the prospects are that this will continue to be the case. There has been much speculative anticipation of the Stock Exchange Committee's decision on which two shares should be added to the forward list; this will be announced tomorrow.

An early announcement is also expected of the Government's loan programme. Operators are forecasting that a 3½% 1967 loan will be offered at an issue price of Rs. 98.

Details of the week's trading follow.

The gilt-edged market continued steady but once again business was on a restricted scale. During the week, the Reserve Bank increased their selling prices for 3½% 1966/69 and 3½% National Plan Loan 1964 and this imparted strength to the market and there was a sympathetic improvement in prices of other loans. Three percent Conversion Loan was initially marked up to Rs. 80-11, but met with selling pressure at this price and in the absence of any real support, declined to close at Rs. 80-8. In short-dated loans, 2½% 1955 was better at Rs. 99-11 while both 3½% 1957 and 1958 continued in demand at Rs. 99-9 and Rs. 99-7 respectively. Amongst medium-dated issues, 3½% 1959/61 was marked up further to Rs. 98 at this price. Three and a half percent National Plan Loan 1964 was quoted two annas higher at Rs. 98-14, while 3½% 1963/65 improved to Rs. 94-3 and 3½% 1964 was marked at Rs. 94-3 C.V. and later at Rs. 94-1x.v.; 2½% 1961 was taken higher at Rs. 92-4 as was 2½% 1962 to Rs. 92-13 while 2½% 1960 was fully steady at Rs. 95-1. In long-dated loans 3½% 1966-68 was marked up to Rs. 91-2 while 3½% 1970-75 was unchanged at Rs. 87-2. The enquiry for State Loans was stronger than ever and once again prices have been marked up without any business materialising.

Selected jute and miscellaneous preference shares are still in short supply. Amongst jutes, Bally were placed at Rs. 117-3, Hooghly at Rs. 15-8 and Hukumchand at Rs. 114. Anglo India were crossed at Rs. 121, Auckland 1st at Rs. 96-8 and Ganges at Rs. 128-12. In the miscellaneous group, Bengal Chemical 2nd were taken at Rs. 84, Burn 7½% at Rs. 145 and Calcutta Electric at Rs. 12-10. Godfrey Phillips changed hands at Rs. 64-12 and there were buyers of Indian Iron & Steel at Rs. 109-8. Orient Paper 2nd were done at Rs. 76, Ramnugger Cane at Rs. 106, Rohas Industries 7½% at Rs. 125 and a small lot of Titagur Paper 2nd at Rs. 92.

At a meeting of the Committee of the Calcutta Stock Exchange Association held last Thursday, it was decided to discontinue dealings in Imperial Bank of India shares with immediate effect in view of the fact that the Bank will be nationalised on and from 1st July 1955. Allahabad Bank Fully-Paid shares were placed at Rs. 359, Punjab National were done at Rs. 42-8, United Commercial changed hands at 42-10 and United Bank of India 'D' shares at 4-5.

In the railway section, Dehri-Rohas were steady at Rs. 11-2 and a small lot of Kalighat-Falta were marked at Rs. 63.

Kesoram featured in the cotton section improving from Rs. 14-1 to Rs. 14-14 while Cawnpore Textiles were unchanged at Rs. 8-10. Elgins were steady at Rs. 19-4, Muir Mills changed hands at Rs. 113-8 and New Victoria were done at Rs. 1-7.

Selected coal shares met with keen enquiry including Katras Jheriah, New Beerbhoom and Western Bengal. Bengal Coal were marked at Rs. 498, Burrakur fluctuated around Rs. 13-4 while Central India were steady at Rs. 7-9. East Indian were quoted at Rs. 29 and Equitable at Rs. 30. Katras Jheriah were scarce at Rs. 55-10 and New Beerbhoom met with strong enquiry to improve sharply from Rs. 17-12 to Rs. 20-12. Western Bengal on publication of a satisfactory report rose from Rs. 7-4 to Rs. 7-10.

Business in jute shares was on a small scale and a handful of shares met with enquiry. Howrah provided the outstanding feature and large parcels of shares changed hands between Rs. 31-4 and Rs. 32; tonight's closing quotation is Rs. 31-12. Here is a chart showing the more important price movements:—

	Opening	Closing
Anglo India	216	218
Birla	19-4	20
Caledonian	246	250
Kinnison	192	190
Lansdowne	141	140
National	33	33-4

Although prices of electric supply shares were fairly steady, little business was reported. Cal-

cutta were done at Rs. 15 and United Provinces at Rs. 159.

In the sugar section Balrampur were steady at Rs. 9-13 and Belsund were enquired for at Rs. 10-6. Carews were easier at Rs. 11-5, Cawnpore were unchanged at Rs. 20-4, Ramnugger were done at Rs. 23-12 and Shri Krishna Gyanoday were a shade better at Rs. 17-5. U. P. were steady today at Rs. 24.

Although there was less activity in the engineering section this week, prices remained fairly steady. Indian Iron met with bull support and improved steadily from Rs. 33-2 to Rs. 33-15 to close a shade easier at Rs. 33-10. Bhartia Electric Steel were marked at Rs. 14-14. Hooghly Docking at Rs. 127, Indian Galvanizing at Rs. 23 and Indian Standard Wagon at Rs. 128. Jessops were easier at Rs. 36-4. Kumardhubi Engineering were re-sorted at Rs. 12-4 and Marshalls at Rs. 6-9. Richard-son & Cruddas were well maintained at Rs. 18-2. Balmer Lawrie provided an outstanding feature improving from Rs. 18-7 to Rs. 19-4.

Paper shares were keenly supported and some useful gains were recorded. Bengal rose to Rs. 64-12, India Paper Pulp to Rs. 274, Titagur to Rs. 44-14 and Orient to Rs. 27-15. Dalmia Cement were steady at Rs. 14-4 as were Sone Valley at Rs. 7-14. Concord Insurance were taken at Rs. 12-7 and Ruby General at Rs. 7-6. Angelo Brothers met with some enquiry at Rs. 19 while Assam Saws were easier at Rs. 4-14. Bengal Flour changed hands at Rs. 24 and Birds Investments at Rs. 18-1. British Burnmah Petroleum were a bright spot spurring from Rs. 3-4 to Rs. 3-14. British India Corporation were steady at Rs. 8-13 as were Dunlop Rubber at Rs. 37. Gillanders Arbuthnot came to hand at Rs. 11-8 and Imperial Tobacco were easier at Rs. 11-1. Indian Aluminium were marked at Rs. 151, Indian Cables at Rs. 27-8 and Indian Wood Products were scarce at Rs. 38-6. Indo-Burma Petroleum were better at Rs. 135, Martin Burn were done at Rs. 23-4 and Metal Box

'ENGLISH ELECTRIC'

hydro-electric plant

Harnessing India's Water Power

The English Electric Company has specialised in the development of water power projects for many years and has installed hydro-electric plant in countries throughout the world.

The Company specialises in the production of complete turbine generator units, together with all the necessary transformers and switchgear for installations of any head and output.

Some recent installations in India:

HIRAKUD (Orissa) under construction	SENGULAM (Tamil Nadu) partly commissioned
Two 52,000 h.p. Vertical Feathering Propeller Turbines.	Four 18,000 h.p. Impulse Water Turbines
Two 37,500 kW, 11 kV Alternators.	Four 12,500 kW, 11 kV Alternators.
KHATIMA (Sarda Hydel Project, U.P.) under construction	NIZAMSAGAR (Hyderabad State) under construction
Three 19,200 h.p. Vertical Feathering Propeller Turbines.	Three 7050 h.p. Vertical Feathering Propeller Turbines.
Three 13,800 kW, 11 kV Alternators.	Three 5,000 kW, 11 kV Alternators.
RADHANAGARI (Karnataka, Bombay State)	
Four 2,150 h.p. Vertical Feathering Propeller Turbines.	Four 1,500 kW, 6.6 kV Alternators. (completed, 1952)
THE ENGLISH ELECTRIC COMPANY LIMITED CALCUTTA BOMBAY NEW DELHI LUCKNOW	
MADRAS: Agents: Binay & Co. (Madras) Ltd., P.O. Box 66. Telephone: 2714	

on the announcement of a higher final dividend rose from Rs. 21 to Rs. 22. National Insulated Cables were quoted at Rs. 23.14 and Rohtas Industries moved up smartly from Rs. 25.9 to Rs. 27. Shaw Wallace were fairly steady at Rs. 15.4 c.d.

Once again there was a large turnover in Indian Copper shares with the price improving further to Rs. 4.10. Burma Mines improved from Rs. 1.13 to Rs. 2.4 while Western Stockholders Investment were unchanged at Re. 1. Consolidation tin were better today at Rs. 2.3. Orissa Minerals were steady at Rs. 25.6.

It would appear that a certain amount of confidence has returned to the tea section and as a result of selective enquiry some good price gains were recorded as can be seen from the following table:—

	Opening 9-6-55 Rs. As.	Closing 15-6-55 Rs. As.
Assam :		
Baghmari	27 4	29 4

Hansqua	26 8	29 4

The profit of SHAW WALLACE & COMPANY rose by Rs. 17.30 lakhs to Rs. 39.33 lakhs. Bringing in Rs. 3,67,879 there is Rs. 40,00,000. Taxation absorbs Rs. 20.18 lakhs (Rs. 7.60 lakhs). General reserve gets Rs. 4 lakhs (Rs. 2 lakhs) and invest-

ment reserve Rs. 21 lakhs (Rs. 1½ lakhs). The ordinary dividend has been raised by 2½% to 12%, leaving a carry-forward of Rs. 3,63,651.

The directors say that since the close of the year under report business continues at a satisfactory level, although it is anticipated that the final profit, during the current year, will not be as high as last year.

THE WEEK'S TRANSACTIONS

(In the following list of stocks and shares in which transactions have taken place during the past week the figures indicate: Opening Quotations—Highest for the week—Lowest for the week—Closing Quotations—Quotation for the Corresponding Closing Date a Year Ago the last named being shown in parenthesis and will not be given where such a quotation is not available.)

"CAPITAL" INDEX OF INDIAN INDUSTRIAL ACTIVITY **

The Capital Index of Indian Industrial Activity (Base: 1935) has now been brought up to January, 1955. Compared with the preceding month there were decreases in cotton consumption 8.0 points, jute manufactures 12.5 points, pig iron 2.7 points,

cement 16.6 points, paper 11.1 points, coal 19.0 points, and electricity 5.2 points, while steel ingots and wagons loaded increased by 3.8 points and 2.7 points, respectively.

The index for notes in circulation revealed a

rise of 2.4 points, while that for cheque clearances showed a drop of 8.7 points.

Correlating all the factors the Capital Index of Indian Industrial Activity declined by 5.9 points during January, 1955.

New Delhi

LABOUR MINISTER'S VIEWS ON THE SECOND PLAN

CAPITAL TAX AND LIMITATION ON INCOMES SUGGESTED

(FROM OUR NEW DELHI CORRESPONDENT)

THE Union Labour Minister, Mr. Khandubhai Desai, has expressed his views on the draft proposals for the second five year plan. At the outset he asserts that "on the question of social justice and equality our stand must be firm and unambiguous. The following propositions must be unequivocally accepted:

(1) "Large incomes and conspicuous consumption will be heavily taxed. The possibility of some taxation of wealth (as distinct from incomes) should be examined.

(2) "No salaried earner shall have a post-tax income of larger than Rs. 2,500 or so.

(3) "Minimum wage and social security measures will be greatly extended.

(4) "There will be a ceiling on the unit of individual cultivation.

(5) "Legislative measures to break and prevent concentration of economic power (managing agency, interlocking, etc.) will be undertaken.

(6) "Austerity for all in the interests of development will be accepted, but taxes on necessities should, as far as possible, follow and not precede increases in income.

"It is not my intention to impose any absolute ceiling on incomes, but this does not mean that there should be no effective curb on post-tax income. The machinery of taxation should be such as not to leave with individuals a larger sum than, say, Rs. 2,500 a month. Even if the accrual of a higher rate of net income is allowed, the rate of accrual should be small. Steeply rising income tax should ensure that.

The Public Sector

"In regard to the question of extension of the public sector, the economists' memorandum states at one place that it envisages 'a society composed chiefly of small decentralised units of economic activity in which the increase in scale required in any activity is brought about chiefly through mutual co-operation, horizontal and vertical, and in which centralisation and very large-scale operations are resorted to only to the extent necessary to derive appropriate advantage from modern technology'. Later, in the same section, it is stated that 'while we do not recommend any significant extension of the public sector beyond the terms of the 1948 policy accepted by Government, we must make it clear that there is no objection in principle to such extension. In fact, the limiting factor is one of being able to cope with the administrative burden that would result from such extensions'.

"While there is some inconsistency in the two statements quoted above, I feel that the respective roles of large-scale and cottage industries and of the public and private sectors can be settled on the basis of our two immediate objectives, namely the need to provide employment to a large number of the unemployed and the need to take concrete steps to implement the principle of socialism. The first objective requires that the large bulk of consumption industries should be entrusted to the cottage and small-scale industries sector. There should be careful demarcation of the fields of production, the guiding principle being that whatever can speedily and reasonably efficiently be produced by the cottage and small-scale industries sector should be assigned to it. In making this division of spheres, regard must be had to the additional employment required and the physical possibilities of the cottage and small-scale industries sector. A bold plan of expansion of this sector is indispensable. The problem will have to be tackled with the same vigour and enthusiasm with which we have made Community Projects and National Extension Services a success.

"As regards the apportionment of large-scale industries between the public sector and the private sector, a measure of immediate nationalisation is inescapable. Though complete nationalisation of banking should be our goal, I do not press for this immediately in view of the recent measure of converting the Imperial Bank of India into a State Bank. As the Imperial Bank deals with about 40 per cent of the business of the country, it can be expected to wield a wholesome influence on the rest of banking in support of the State's financial policy. Insurance should, however, immediately be nationalised so that the State will get strategic control over a vast amount of resources. Mining is another sector, the early nationalisation of which is called for. The mineral assets of the nation are now being worked by methods which involve considerable national loss. Coal, manganese and mica can profitably be nationalised for a start. The export trade in jute, tea and mica should be a State monopoly as that will give substantial resources for the second five year plan.

Need for Expanded Shipping

"Expansion of Indian-owned shipping is an urgent necessity. Merchant shipping borne on the Indian register accounts for a very small percentage of the total tonnage that we require. As the second five year plan makes headway, our requirements in the matter of shipping will substantially increase. It is, therefore, of great urgency that we do everything possible to expand the volume of Indian-owned shipping. However, our resources

will be wholly inadequate for the purpose and we shall not be able to acquire more than a limited number of ships. I suggest that we evolve a regular system of chartering ships so that we shall invariably be in command of a reasonable volume of merchant shipping for our foreign trade. If we do not have control over a sufficient volume of foreign lines in regard to freight rates. This will also help to build up the necessary managerial experience which will be needed when we have got our own ships.

"Nationalisation of other units in the private sector is not necessary, but what is necessary is that the working of all such units should reflect socialism in action. The private sector must fully realise that it must accept a substantial measure of control at the hand of the State. The days of unfettered freedom for the employer are gone. So long as the private employer remains a responsible trustee of his assets, there will be no interference with his activities, but exploitation in any form with a view to his personal aggrandisement will have to be put down. It is, therefore, necessary that control over industry must be made close and effective. The Industries (Development and Regulation) Act, in its present form, is not equal to the task. It should be suitably amended. Provision should, in particular, be made for periodical inspections of units through technically qualified persons.

Managerial Choices

"For the operation of the public sector I would like to make one suggestion. If State-sponsored activities are to be run (as is necessary) on business lines, it would be necessary to entrust them to persons outside the civilian administrative service, preferably to those drawn from business and industry. If any one hundred such persons, known for their business acumen and put in charge of these activities and allowed to function without encumbrances from the inevitable checks and balances of the governmental machinery, the working of the public sector will meet the test of efficiency as well as of its social objectives. The question, of course, needs to be examined more fully.

"Our experience with the first plan has not been satisfactory in this respect. On present estimates, not more than Rs. 1,800-Rs. 1,900 crores will be spent during the first five years in the public sector. In the light of this, it is particularly necessary to ensure that we will be able to achieve an average expenditure of over Rs. 800 crores during the second five year plan. The story of large budgetary provisions and large-scale lapsing of amounts sanctioned should not be repeated.

"Lately, I have been going through some of the four reports of advisers to the Planning Commission. These reports are replete with instances of the failure or inadequacy of the administrative machinery to achieve even the modest financial and physical targets of the first five year plan. I would urge that these reports be studied intensively and the causes of shortfalls analysed thoroughly. Before we launch upon a bolder plan, we must make sure that the causes responsible for inadequate performance on the first five year plan have been taken note of and eliminated. Though it may sound retrograde, it is better to go slow than to create false hopes and invite disappointment. For, after all, we will be judged by what we have accomplished. The example of land reforms illustrates the point."

Resources for Second Plan

The Government of India has decided to set up a Committee to appraise the resources that would be available for the second five year plan and the possibility of augmenting these resources. Its personnel and terms of reference would be available shortly.

The Auction Committee Report

The decision of the Government of India on the Tea Auction Committee's report is expected shortly. It will be published in the form of a resolution along with the report. The Commerce Secretary, Mr. S. Bhoothalingam, will visit Calcutta on 27th June to discuss the Government's proposals with tea interests before they are published.

shipping in the larger and long-term interests of the country; and

(iv) the possibility of extending through booking arrangements between railways and shipping for movement by combined rail-sea route, wherever possible.

To advise whether any standing machinery should be set up for considering all problems concerning rail-shipping co-ordination or allocation of traffic between the two forms of transport.

Railway Signalling Equipment

The Railway Board proposes to include in the second five year plan a project to manufacture railway signalling equipment, all of which at present is imported from abroad. The possibility of the manufacture of electric railway coaches is also envisaged here. A contract to supply 100 electric coaches has recently been placed with a Calcutta firm, which, it is expected, may have a phased programme for their manufacture in India. A great deal will depend on the establishment of a heavy electric equipment plant, which is necessary for the integrated manufacture of an electric coach.

Assam Oil Company

Negotiations with the Assam Oil Company on an agreement to prospect for oil in Assam are nearing successful completion. As against the recent amendment of the rules, which provide a 30-year lease period renewable for a further period of 30 years, at Government's option, the Company is likely to secure a 40-year lease to be renewable for a similar period. Suggestions to convert the existing holding into a rupee company are also being discussed.

Aero-Engine Factory Project

A technical team sponsored by the British aero-engine manufacture, Bristol, is here preparing a project report for the establishment of an aero-engine factory in India.

A project report for a jet aero-engine factory was prepared by Rolls Royce last year. Later, a technical mission to select the aircraft best suited for Indian conditions was sent to Britain by the Indian Air Force. The Mission selected the Folland Light Fighter Gnat for the Indian Air Force. The Gnat "is fast enough to make surprise attack possible, small enough to be a difficult target, manoeuvrable enough to get itself quickly out of the target area and equipped with heavy enough armament to do a great deal of damage". It is fitted with 4,850 lb. Bristol Orpheus axial flow turbo-jets. It is however too small to take the Rolls engine, the project report for which is being put aside. The Government is also examining a proposal for purchasing 80 French Mystere fighters.

Manufacturing Armoured Vehicles

Two project reports, one by Leylands and the other by Mercedes Benz, for setting up a factory for the manufacture of armoured vehicles in India are also under examination here. The type of tank most suitable for India will determine the selection of the project report, it is explained.

Plan for Education

The members of the Planning Commission have been having discussions with the representatives of the Union Ministries during the week. The Union Education Ministry, it will be recalled, has worked out an incomplete plan, estimated to cost Rs. 1,080 crores, with the following tentative breakdown:—

Elementary education	500
Social education	85
Secondary education	300
Technical education	80
University education	75
Miscellaneous	40
	1,080

It is explained that in this plan, the Central and State schemes were regarded as parts of the one integrated plan. "Formulation of a unified national plan is essential, if the plan is to be effective."

tively carried out. In the first plan, the Central and States' proposals were formulated and approved, more or less independently. Most of the States had committed all their resources to their own projects and did not have the necessary resources to carry out the Central plans. This meant that Central projects were slowed down and there was lack of overall co-ordination between the Centre and the States."

Firstly, in the context of the availability of resources, the demand of the Education Ministry would take over one-third of the finances, the total availability of funds being Rs. 5,600 crores of which Rs. 2,200 crores is being earmarked for the private sector. The plan, furthermore, does not indicate whether the consent of the States has been secured to mortgaging almost one-third of their developmental resources to education. It does not throw any light on the allocation of expenditure between the Centre and the States. Then again, education having been a State subject since 1921, the import of the words "Central plans" was not clearly understood. The present Union Ministers are responsible for the Constitution of India. They, at any rate, should know what are the duties and functions of the Union Government in dealing with State subjects.

Furthermore, the availability of resources for the second five year plan has been a matter of common knowledge for ten weeks, if not more. The Finance Minister, the economists and the Planning Commission have been working on the basis of Rs. 5,600 crores as the maximum limit of the resources, including Rs. 1,000 crores of deficit financing and Rs. 2,200 crores for the private sector. It is therefore difficult to understand the basis of the Education Ministry's demand. Did it really imagine that the Planning Commission would dole out money to finance dance and drama academies in preference say to the financing of a steel plant? Reference should be made to the Finance Ministry's appraisal of the financial sources, which places additional finances from the States at a negligible figure of Rs. 5 crores. It would, therefore, mean that almost all the development outlay on education would have to be financed by the Centre. The question is therefore whether it would be constitutionally right to subsidise primary and secondary teachers' salaries from the Central Exchequer. It should not be a matter of surprise that the planning member in charge of Education, according to Press reports, has cut the Education Ministry's demand to Rs. 300 crores, inclusive of everything.

New Ministry for Cottage and Village Industries

The Planning Commission has set up yet another Committee, this time to prepare a blueprint for the cottage and the village industries. Professor D. G. Karve will be the Chairman of the Committee, which among others, will include Professor D. R. Gadgil, Mr. V. L. Mehta, Dr. Mahotra, Mr. V. Nanjappa and Mr. Chakravarty of the West Bengal Government. The term of reference for the Committee refers to the provision made in the draft plan frame for the village and small-scale industries and to the recommendations made in the memorandum of the panel of economists, in the light of which the Committee has been asked to prepare a scheme, industry-wise and whenever possible, State-wise, for the utilisation of resources to be earmarked for the purpose of development of these industries as an integral part of the plan. The scheme, it is directed, should be prepared with reference, in particular to the following, namely:—(1) that the bulk of increased production during the plan-period of consumer goods in common demand has to be provided by village and small-scale industries; (2) that, employment provided by these industries should be progressively increased and (3) that production and marketing in these industries be organised, in the main, on co-operative lines.

Fertilizer Plant

The Fertilizer Mission has made its report to the Government of India.

The Government of India has already decided to set up a fertilizer plant at Nangal. The Mission has recommended that this plant should have the installed capacity of 70,000 tons of nitrogen a year along with 7.5 tons of heavy water and that the end product should be ammonium nitrate diluted with clay and chalk in the following proportions:—

Ammonium nitrate	60 percent
Clay	26 percent
Chalk	14 percent

The nitrogen content of the end-product, it would be seen, would be 21 per cent and its total production of 340,000 tons. The Mission has linked its proposals with the Food and Agriculture Ministry's target demand for 250,000 tons of nitrogen a year by 1961. It has provided several alternative schemes to meet this demand. A unit at Trombay designed to produce 140 tons of ammonia a day by processing the available gas and 138,000 tons of double salt a year as the end product, having a nitrogen content of 36,000 tons a year, is recommended. Another unit designed to produce 46,000 tons of urea and 200,000 tons of double salt a year at Neyveli in Madras State or alternatively at Vijaywada in Andhra, is recommended. A unit to produce 250,000 tons of double salt a year at Itarsi in Madhya Pradesh is also suggested.

Should the Government decide to increase the production target to 250,000 tons of nitrogen a year, the Mission has suggested the production of 80,000 tons of extra nitrogen a year by setting up plants for which sites at Raunkela in Orissa, Mirzapur in Uttar Pradesh and Bhadravati in Mysore are recommended. The Mission has suggested that, whenever possible, ammonia synthesis plants should in future be associated with new steel plants and the availability of at least the hydrogen fraction of steel plant coke oven gas should be secured for ammonia production.

In regard to organisation, the Mission has suggested that a common Fertilizer Board, to direct and control all State-owned fertilizer units, old and new, should be established as the first step towards the implementation of the Committee's recommendations. The Board should have a whole-time executive and should consist, among others, of the administrative and technical heads of the different production units. An effort should be made to ensure that the Board functions as a policy Board; and that the responsibility for day-to-day management at each unit should be vested in a Committee of management consisting of (i) the administrative head of the unit; (ii) its technical chief; (iii) the production manager; (iv) the chief engineer; (v) the commercial and accounts chief; and (vi) the personnel manager.

A competent firm of consulting engineers should be engaged for the Nangal plant. For other units a Standing Technical Committee should be formed to fulfil to a large extent the functions of Technical Consultants. The Committee should consist of (i) three expert consultants to be recruited from abroad on three-year contracts, one of them being an expert on technique of heavy water manufacture, another an expert on technique of urea production and the third an expert on technique of double salt production; (ii) the production managers and chief engineers of all the new units; and (iii) a few selected technicians drawn from Sindri and elsewhere. Three central institutions should be set up under the auspices of the common Fertilizer Board namely—(1) a central research and development bureau; (ii) a central drawing and designing office; (iii) a central fabrication workshop.

Centralisation or at any rate co-ordination of training arrangements should also be considered. The Standing Technical Committee should study the question of standardisation of plant and equipment and recommend—(a) the particular categories of equipment which can be usefully standardised, and (b) the sizes and specifications to be laid down for the selected categories. Railway freight charges on gypsum should be reduced and brought down if possible to the level of freight on coal.

Meeting of Metric System Body

The Standing Committee for the metric system of weights and measures will hold its first meeting here on 22nd June, 1955. It is expected to hold exploratory discussions on ways and means of bringing about a smooth change-over to the metric system with the co-operation of State Governments. The framing of legislation for introducing the metric system and publicity measures will be considered. The response from State Governments has been encouraging. Most of them have nominated Secretaries in charge of Development Departments or other Departments as liaison officers for work in connection with the introduction of the metric system.

The Standing Committee, of which the Deputy Minister for Commerce and Industry, Mr. Nityananda Kanungo, is Chairman, consists of the following members: Mr. C. S. Krishnamoorthy, Ministry of Finance; Mr. G. K. Chandiraman, Ministry of Education; Mr. R. S. Sarkar, Ministry of Law; Mr. S. L. Kumar, Ministry of Railways; Mr. N. N. Wanchoo, Ministry of Defence; Mr. R. S. Krishnaswamy, Ministry of Food and Agriculture; Mr. Pitambar Pant, Planning Commission; Dr. A. Nagaraja Rao and Dr. Lal C. Verman, Ministry of Commerce and Industry. Representatives of the Ministries of Communications and Natural Resources and Scientific Research will also serve on the Committee; it has powers to co-opt more members.

GROWING CONCERN IN WESTERN INDIA

(FROM OUR BOMBAY CORRESPONDENT)

AMONGST other handicaps experienced by commerce and industry in Western India during recent months, lack of transport facilities and the increasing difficulties of securing railway booking has come to attract some bitter comments from various directions. While the business community is naturally the most vocal in this respect, as it is more immediately affected, the general public too has come to suffer rather heavily from deficiencies in goods transport by sea, rail and road. In spite of plenty in the production centres, this has come to create artificial scarcities and to give rise to violent fluctuations in prices of food-grains and consumer goods following the vagaries of the railway authorities.

The difficulties of commercial houses and industry have increased to such an extent that industrial production and even agricultural production might suffer unless some way is found for transporting goods, fuel and raw materials more energetically. There is hardly a week when some important public man or Minister does not rebuke industrialists for their lukewarm attitude in respect of industrial development or when he does not urge them to increase production. Yet, he is silent about the piling up of production in important commodities such as sugar, cement, textiles, coal, salt, foodgrains, fruits and vegetables. This has come to create difficulties with regard to finance both for industry and for commercial interests because there is no turnover of goods and their valuable liquid resources are locked up in goods accumulated either in their godown or at the railway booking yards. Factories are experiencing similar difficulties with regard to receipts of requisite raw materials and fuel. This upsets their whole programme of production and goes to add to the cost of production.

Congestion of Goods

Some enterprising newspapers in Bombay have published photographs showing the congestion of goods at the booking offices of the goods yards of the two important railway termini. Some time ago there was a similar chaotic situation at the docks. The steamers were in stream for days before they could secure a berth and sometimes they even left the port without taking cargo already booked and lying at the docks. While this situation has eased in many respects so far as shipping is concerned, the position at the Railway goods yards has been even worse than this for some weeks. Business men are heard to remark that even during the worst days of the war when the whole effort of the railways was concentrated on the transport of war materials, the position with regard to goods booking for commerce and industry was not as bad as it has been for the last two months, without there being any state of emergency in the country. This is the more surprising because the busy season, both for agricultural products, for imports and for industrial production could be considered to be almost over. The congestion on the railways was never so great during the busiest part of the season when agricultural commodities in great bulk had to be hauled over long distances. While admitting shortage of wagons, the business community is not prepared, in view of what is said above, to accept this as the sole reason for the great difficulties experienced by them at present. It is inclined to view very critically the closing of bookings for weeks on end for various important centres by the railway administration and has even come to suspect that artificial difficulties and bottlenecks are created from area to area by petty officials for motives which would not bear strict scrutiny. Apart from this, there is apparent inefficiency in the way in which this whole question of allocating wagons for various regions and important trade and industrial centres is being managed by the Administration.

Monsoon Anxieties

The anxiety of the business community in this respect has increased recently because of the commencement of the rainy season. Business men are naturally in a hurry to despatch goods before the rains start in right earnest, lest they should damage perishable goods. There has been no booking of goods from here for Madhya Pradesh via Nagpur and Bhusawal for over three weeks. Booking via Poona has been closed for almost two months. Booking to Saurashtra is open for a few days after intervals of six to seven weeks. Some of the worst sufferers are the areas which require transshipment of goods owing to break of gauge at Sabarnati, Viramgam as long as three weeks. Delhi remained closed for as long as three weeks. Even small (goods not sent in wagon loads but as loose packages) remain undespached for as long as two weeks at the railway yards and valuable material is damaged both by mishandling and lack of storage accommodation. This also encourages pilferage. Even when wagons are allotted, intimidation is given late in the afternoon and merchants find it very difficult to complete loading of the wagons during the allotted time. As if all this were not enough, some change in the loading and unloading contract at both the goods depots in Bombay recently and the employment of inexperienced workers by contractors as well as some dissatisfaction amongst workers engaged for this

purpose have added to the slowing down of activities at both the railway termini.

There is a shrewd suspicion amongst business men that a large number of wagons are being directed for the use of the public sector. For instance, there is a complaint that some of the difficulties with regard to booking on the metre gauge sections of the Southern Railways have been due to the preference given during recent weeks to the transport of ammonium sulphate. There is growing apprehension in the private sector that with the greater emphasis on the public sector in the second five year plan and the easy accessibility of officials in charge of Government enterprise to the railway authorities for obtaining special concessions would make the position of the private sector in this respect even worse than it is. They fear that development in railway transport facilities will not be able to keep pace with the economic development of the country in general. Whether justified or not, both the Government and especially the railway authorities have to do something to remove his suspicion from the minds of industrialists, if rapid development is to be expected in the private sector. One cannot deny that there is no point in producing more goods in factories or fields if they cannot be transported to the consumers within a reasonable time.

Rayon Interests Complain

What has been said above can well be illustrated by the deep concern voiced by two important leaders of industry during the last week. At the general meeting of the National Rayon Corporation Ltd., Mr. Kasturbhai Lalbhai, who is never guilty of exaggeration, referred in his speech as late as Thursday last to the unsatisfactory supply of wagons by the railways for carrying coal, important raw materials and finished products as one of the bottlenecks from which industries were suffering. Mr. Kasturbhai said, "As regards wagons allocated for coal alone, the company has been losing about 30 percent of its quota in view of the inability of the railways to supply the necessary wagons. Though in this matter the Commissioners of Coal both for the State and at the Centre have been helping us out by granting special ad hoc quotas and allowing us to build up reasonable stocks, we cannot help expressing our concern at the transport situation as it is developing in this country. I am afraid unless some drastic steps are taken to improve the transport problem, the country will come to a standstill as far as industrial expansion programme is concerned. Guaranteed and adequate supply of power and transport arrangements are essential pre-requisites before any one can think of industrial expansions. I am afraid failing provision of these facilities quite ahead of industrialisation, the country will witness a phenomenon where an industrial plant would be lying idle for want of either power or transport facilities."

Mr. Kasturbhai was not alone in expressing his dissatisfaction with the transport facilities provided for the private sector. Mr. G. D. Somani, M.P., in the course of his speech as Chairman at the annual meeting of Shree Digvijay Cement Co. Ltd. said: "I would like to draw the attention of the Railway Board to the difficulties that your Company still continues to face in the matter of securing adequate railway wagons for the transport of raw materials, coal and cement. I must acknowledge that the position has shown gradual improvement throughout but the fact remains that the railway transport facilities are still far from satisfactory. We accepted some time ago on the initiative of the Railway Board an arrangement to store our coal stocks at Viramgam dump, but even this arrangement has not worked satisfactorily. Apart from the present tight position of the supply of railway wagons, I am more worried about the future, when with the second extension plant expected to go into production some time during the middle of next year, our requirements of railway wagons will be almost doubled. When we have to struggle so hard even for meeting our present requirements, we are naturally apprehensive of the tremendous difficulties that we may have to face when our second expansion plant goes into production. We are continuously making representations and I hope the Railway Board will take suitable measures promptly to improve railway facilities in the Saurashtra region so that the increasing needs of the expanding industrial sector of Saurashtra may be adequately met. In this connection, I would strongly urge the Railway Board to link this area with broad gauge system so that there may be permanent improvement."

New Rates Structure

Another important point connected with railway transport, which Mr. Somani brought out in the course of his speech was with regard to the question of introducing a scientific and rational rates structure as being of vital importance to the industrial development of the country. Mr. Somani observed that railway freight charges unfortunately had been going up year by year and no attention had so far been paid by the Railway Board to the series of representations made by various industrial organisations from time to time in this matter. Mr. Somani added that "cement distribution is controlled by the Government and factories are required generally to sell their product within their own economic zone which mostly lies within 300 miles from the factory. Therefore, while the small relief given to the long-distance traffic will not in any way benefit the cement industry, it has to bear the additional burden imposed on the traffic moving between 150 to 300 miles. I, therefore, welcome the decision of the Railway Minister to appoint a committee to ex-

amine the present freight rate structure and I hope the whole structure will be carefully examined so that the same may be scientifically revised to suit the developmental needs of our expanding economy."

On the other hand, the rayon industry being more intimately affected by shipping, Mr. Kasturbhai had a word to say about the possibility of an increase in freight rates which the principal shipping companies of the world, including Indian shipping, still appeared to have in mind. Mr. Kasturbhai stated that the rayon industry depended largely on imported raw materials. Any additional freight that this industry might be called upon to pay as was being threatened from time to time would add considerably to the manufacturing cost of the yarn. At the same time, Mr. Kasturbhai agreed that the threatened increase in freight rates was stated to be due to the difficulties experienced by steamer companies in getting timely turn-round of their ships at the principal docks where sometimes delays in discharging or loading of cargoes were very great and suggested: "This state of affairs is really very regrettable. It is however gratifying that following this threat the Port Trust authorities have endeavoured to clear the docks and the Government have also intervened and are endeavouring their utmost to persuade the steamer companies to refrain from imposing any such surcharge which if done is bound to disrupt the import and export trade of this country."

Building Activity Suffers

The shortage of railway wagons had its repercussions in some of the important markets here. For instance, the whole of Western India has been suffering severely from an acute shortage of cement just at a time when the building industry is ready to undertake large-scale construction of houses. In this connection, it is being stated openly that this position has arisen as a result of the priority given to the requirements of the Central and State Governments with disastrous effect on private construction activities, especially as many of the unfinished houses will now not be completed for want of cement before the monsoon sets in in earnest. Shipping delays have also been responsible, apart from paucity of railway wagons, for the shortage of supplies in the case of cement. The clearance at the docks is still very unsatisfactory in spite of recent improvements with the result that some of the shipping companies are reluctant to undertake transport of cement from producing centres of Saurashtra or other parts to Bombay. But more serious than the shortage of cement, where there has been at least some improvement during the last few days, is the artificial scarcity being created in the supply of sugar in many parts of Western India because it would be impossible to obtain their requirements for the next three months, owing to the absence of road transport in the rainy season. On the one hand, the sugar factories still have large stocks in their godowns, even of stocks released for sale and actually sold; on the other, prices have been going up not only in Bombay but in several up-country centres because sugar which has been purchased in large quantities by retailers and wholesalers cannot be transported to the consuming centres for want of transport facilities. There is always a heavy demand from the coastal areas in the south and other distant rural areas during this time so as to have adequate stocks for the wet season, and if stocks are not transported now, it would not be possible to do so during the next three months.

Saurashtra, which has several important centres for salt manufacture and where this industry gives employment to a large number of people, is reported to have 200,000 tons of salt accumulated in port and near salt pans owing to wagon shortage, amongst other causes. There has been a heavy slump in salt prices and unless something is done quickly to market these stocks at economic rates, many of the smaller concerns might be forced to close down. This would result in a large number of men being thrown out of work in a State, which is not noted for its industrial development.

London

U.K. RAIL STRIKE SETTLED

LEGISLATION ON ANTI-DUMPING DUTIES PROPOSED

(FROM OUR LONDON CORRESPONDENT)

AFTER long negotiations the strike of locomotive drivers and firemen on the British Railways has ended. A continuation of the stoppages for any further length of time would inevitably have had most serious repercussions on the country's economy as a whole. The railways are losing something like £1 million a day in revenue, while with almost 300 ships either idle or undermanned there is considerable restriction in the handling of both imports and exports, and just what this can mean is evident when one remembers that London alone deals with £16 million worth of the former and £20 million worth of the latter each week. Basic production figures have been well maintained. May steel output set up another record to reach an annual rate of 20,900,000 tons. Pig iron production was also up and coal output is still about average.

Not surprisingly, the strike situation dominated the Parliamentary scene and robbed the State opening on Thursday of much of its pageantry. The Queen's speech outlined a substantial programme of legislation for a session which is likely to last until October of next year. No less than 14 measures are foreshadowed, of which four are revivals of measure introduced in the last Parliament but were uncompleted at the dissolution. Most of these are of purely domestic interest, and many more or less non-controversial, but there will be rather wider interest in the proposal that the Government will take power to levy countervailing and anti-dumping duties on imported goods under the provisions of the General Agreement on Tariffs and Trade so as to protect home industries where such goods are offered at prices less than those prevailing in the country of origin. One controversial subject will be the action to be taken against monopolies and restrictive practices, though it is likely that the Government will be able to postpone detailed exposition pending publication of the Monopolies Commission's report on the subject next month.

E.C.E.'s Warning

The quarterly bulletin of the Economic Commission for Europe takes a far from rosy view of

British economic prospects and issues a warning that the pressure on wages may make it difficult to maintain stable selling prices. Even a moderate increase in export prices might entail a further deterioration in the balance of payments. Some of Britain's traditional customers in the Commonwealth, Scandinavia and Latin America are already cutting down imports. Recent Australian restrictions will cost Britain 15,000 cars and £25 million worth of textiles exports a year. She must, therefore, strengthen her position in other markets, where competition is fiercer. Unfortunately, according to the U.N. experts, Britain is already in a less favourable competitive position than the Continental countries, Germany in particular. Germans work on an average three hours a week more than their counterparts in Britain, their wages have risen less, and their output far more.

The bulletin records that in almost all West European countries the economic upswing continued without pause in the early months of 1955. The fears current in many quarters that this was passing into an inflationary phase appeared to be premature. It goes on to say, however, that "the situation is somewhat less reassuring in the case of Britain." The Government's recent restrictive measures are described as "rather modest" and a lot less comprehensive than those adopted in Scandinavian countries experiencing similar difficulties.

Convertibility and E.P.U.

That the views of the E.C.E. experts are at least partially shared by those of the British Treasury and the Bank of England may be assumed from the concern which has been evident in these circles of late at the failure of the 4½ percent Bank rate and the imposition of a minimum 15 percent deposit on hire-purchase to hold the advance of bank loans and advances. These have continued to rise steadily and are £206 million higher than at the beginning of the year, when the dear money policy was launched. Hire-purchase credit, particularly on cars and agricultural machinery, continues at a high level, while the nationalised industries do not appear to have made any alteration in the rate of their borrowings from the banks. It would not be at all surprising if the Bank of England asked the banks to apply further restrictions on the amounts lent to hire-purchase finance companies, or for the Treasury to decide that the electricity and gas boards should be treated like any other industrial customers in having to borrow the money they need from the public in the open market.

Against this background, the expectation of bankers and traders on the Continent and in the United States that Mr. Butler will be persuaded at the O.E.E.C. Ministerial Council meeting now proceeding in Paris to fix a date for the convertibility of the pound sterling seems somewhat unreal. It seems from the belief that an announcement would have been made much earlier but for the approach of a general election, and now that that is out of the way the road is clear. But that overlooks the change in the economic outlook in Britain in recent months—the balance of payments setback, and the effect thereon of the strikes. The main purpose of the Paris meeting is to resolve the technical details relating to the renewal of the European Payments Union for a further year after 30th June. That may well be the only outcome, though there may be some alterations in the rules, for instance to replace the present 50-50 ratio of gold to credit to 75 percent in gold and 25 percent in credit. That would represent one further step towards convertibility, but it seems unlikely that agreement will be reached about the way in which the E.P.U. is to be altered, dissolved, or replaced if and when the major countries want to make their currencies convertible, since that would at least suggest that some such move might be expected before 30th June, 1956.

Taxation of Profits and Income

For rather more than four years the Royal Commission on the Taxation of Profits and Income has carried out an exhaustive investigation into the country's taxation structure. Interim reports were published in 1953 and 1954, but the final report has only just made an appearance. The majority report is signed by ten members, seven of whom add small reservations; the minority report by the three Socialist members, Mr. Woodcock of the T.U.C., Mr. Bullock, another trade unionist, and Mr. Kaldor, the Reader in Economics in the University of Cambridge, who expressed "a fundamental difference of view" as to the basic requirements of an equitable system of income tax. In general, the majority report finds the tax law "complicated and elaborate" but nevertheless recommends only some minor alterations and adjustments, important enough in themselves but hardly representing the complete overhaul which was expected. There are, nevertheless, 116 recommendations, of which the most important are probably the rejection of a capital gains tax and various proposals for imposing additional taxation on gambling earnings; the suggestion that people carrying on a trade, profession, or vocation should be obliged to keep records of their business; the simplification of the taxation of business profits by imposing a flat-rate tax on total profits instead of the present system of subjecting profits to two rates of profits tax, depending on whether business income is distributed to shareholders or not; that, if necessary, taxpayers should be forced to produce bank pass-books and other documents to the Inland Revenue; that trading profits and income should be assessed on a current year basis and not on the preceding year as at present; that special relief be granted for fluctuating incomes; that a capital allowance be granted for commercial buildings; that a scheme should be introduced recognising a special category of overseas trading concerns which would be exempt from tax so long as profits remained undistributed and whose tax position should be judged strictly according to their function; and that tax schedules should be amended to allow deduction of expenses "reasonably incurred for the appropriate performance of the duties of the office or employment."

The main point of issue between the majority and minority reports is with regard to capital gains, which the latter feel should be subject to income tax in the case of individuals and be charged to profits tax in the case of companies. Also, whereas on balance the former's recommendations are likely to reduce rather than increase revenue, the latter would definitely increase it, but goes on to add: "If these reforms were adopted, and the basis of taxation were thus brought into closer conformity with the true taxable capacity of different classes of taxpayers, there would be a strong case for adopting a more moderate scale of progression into the schedule of tax rates."

Changing Trends in India

Mr. E. A. Midgley, a U.K. Trade Commissioner in Delhi, has been having informal talks in Manchester with members of the Chamber of Commerce there who are interested in the Indian market. The recent reductions in Indian import duty should create better opportunities for trade generally, but Mr. Midgley has pointed out that Indian mills are now producing quite good high-quality cotton goods. "With or without duties," he has told them, "one would have to compete fairly hard to get into that market." Furthermore, Indian firms are also beginning to make "a fair range of textile machinery," although a good deal of this development is associated with British enterprise, as is that of India's growing chemical industry. Although the first five year plan was primarily concerned with increasing agricultural production, its repercussion on industry may be gauged from the fact that India's production index has risen from 100 in 1946 to 160 at the present time. The next five year plan will concentrate increasingly on industrial expansion. Britain's present share of India's import trade amounts to between £130 million and £150 million worth of goods each year, and this might well rise if standards of living and purchasing power are increased by general development. Though German and Japanese competition was severe, so far their increased sales to India had not significantly been at Britain's expense.

Uttar Pradesh

SHAPE OF U.P.'S SECOND FIVE YEAR PLAN

EMPHASIS ON LARGE-SCALE INDUSTRIES

(FROM OUR LUCKNOW CORRESPONDENT)

THE U. P. Planning and Industries Minister, Mr. C. B. Gupta, gave an outline in Naini Tal last week of the State Government's blueprints for the promotion of large-scale industries under the second five year plan. Out of a total plan expenditure of Rs. 664 crores, an amount of Rs. 125 crores is to be devoted to industrial expansion. The industries proposed to be started as State enterprises, Mr. Gupta said, included a cement factory, an insulators factory and a factory for making tissue and cigarette paper from hemp. Proposals for starting a raw film manufacturing unit are also under examination. During the plan period, the Government proposes to undertake the exploitation of the Sangrauli coalfields. At present, the State depends for its coal supplies on Bihar. In the private sector, the scheme provides for a paper and chemical pulp factory, a rayon factory, spinning units of 20,000 spindles each, steel processing plants, a cardboard factory, a thermos flask factory, and a tile and marble factory. A plant for manufacturing tin containers and a textile mill with 3,100 spindles and 516 looms would also be set up.

In the past, Uttar Pradesh has concentrated mostly on the development of small-scale and village industries but in the second plan, according to Mr. Gupta, the emphasis would be on large-scale industries. This emphasis is justified by the need for bringing about an occupational shift in the State whose population is engaged primarily in agriculture. The Planning Minister thinks that the single most serious obstacle to the implementation of the Plan, so far as Uttar Pradesh is concerned, is the lack of skilled personnel. But even if the personnel were found, there is a feeling in industrial circles that the industrial future of the State is bound to be prejudiced by the lack of public confidence in two of the major industries that already exist here, namely sugar and textiles. Both are problem industries and until they put their houses in order the necessary psychological atmosphere for launching big schemes of expansion may not, it is feared, be created.

Educational Schemes

In the field of education, it would appear from the draft proposals that the State Government is aiming at a target of 15,000 new primary schools and 1,000 junior high schools in the second plan. An increase of about 20 percent in the basic pay of primary school teachers is also contemplated. If the draft proposals are accepted, the Plan expenditure on education alone would increase to Rs. 134 crores. The State Government is counting heavily on the Centre to meet the bulk of this expenditure. The Centre's education budget in the second plan is about Rs. 881 crores, and the State planners argue that if the Centre's scheme gets through there is every hope that the U.P. which has one-sixth of the population of the Indian Union, should get something in the neighbourhood of Rs. 130 crores. Lack of conviction in their own arguments, however, is indicated by an alternative plan costing Rs. 64 crores which the State Government is keeping ready as a stand-by.

Whereas the expenditure on medical and health services in the first plan formed only six percent of the total expenditure, it is proposed to raise it to 12 percent in the second plan. The accent in the health plan seems to be on milk. The Government would give one pound of fresh milk to every expectant and nursing mother in the State belonging to any family with an income of Rs. 100 or less. Free milk would also be given in the form of mid-day meals to all students up to the sixth and seventh classes. Besides various proposals to maximise hospital facilities—one hospital within a radius of five miles—there is a scheme for starting the manufacture of anti-rabic vaccine at Patwadhagar in District Naini Tal which already has one of the largest small-pox vaccine producing institutes in the country. Nearly half the needs of the country for this vaccine are met by this institute.

Move Against Cow Slaughter Ban

A meeting of the representatives of various industries using animal by-products met in conference early this month at the U. P. Chamber of Commerce, Kanpur, to plead with the State Government not to ban completely the slaughter of cows in Uttar Pradesh. Delegates had come from all parts of the country including Bombay, Ahmedabad and Calcutta. The conference, which was presided over by Mr. Alfred Butz of the All-India Guts Exporters and Manufacturers' Association, Bombay, passed a resolution that the proposed legislation "is disastrous to the economic interests of the State and the country as it will result in the ruination of industries dependent on the supply of hides and animal by-products." The resolution urged the Government to exempt from the ban at least the "uneconomic and unuseful cattle." The U.P. itself will be a great sufferer by the decline of the tanning industry which is concentrated in Kanpur and of the shoe-making industry in Agra. But the State's Chief Minister, Dr. Sampurnanand, who recently refused to withdraw the measure

even to oblige Prime Minister Nehru who described it as "completely wrong" is not likely to give any more favourable answer to the hide and skin industry.

Textile Strike Continues

The Kanpur textile strike, which started on 2nd May still shows no sign of fizzling out. Kanpur's Congress leaders, who waited in deputation on the Chief Minister, have been told firmly that there is no question of the Government intervening unless and until labour agrees to rationalisation first. In a long letter setting forth the genesis of the rationalisation move in Kanpur, the Chief Minister has laid the blame on quarters which are out to make political capital. Labour's weakness lies in the fact that it gave no chance for the seven-man committee, appointed by the tripartite conference to function at all. "Those who are now opposed to rationalisation," says the Chief Minister, "should actually have permitted this committee to function and then given their judgment on whether the schemes formulated by it would have resulted in intensification of workload without corresponding increase in wages. To give a verdict before the Committee could do any work is an index of the prejudice with which the whole thing is being looked at by some people in Kanpur."

Labour leaders, for the most part however have shifted their ground and do not seem to be concerned with the merits of rationalisation any more. They are asking: why rationalisation? They try to see a flaw in the argument of mill-owners that rationalisation is needed to place the U.P. mills on a par with Ahmedabad and Bombay mills. Now, the Kanpur mills mostly produce coarse cloth whereas the Bombay and Ahmedabad mills

produce mostly medium and fine cloth. Therefore labour spokesmen maintain, there is no possibility of the Bombay mills competing with the Kanpur mills and doing them out of business. The real reason, it is claimed, is that Kanpur mills want to compete with the Bombay mills and crash into the export market. Whether or not rationalisation in itself is a good thing seems scarcely to enter their consideration.

PROSPERITY THROUGH THE COTTON MILL INDUSTRY

FACT 2

The mill industry is the mainstay of millions of cotton growers in the country. It buys the bulk of the cotton produced by them. On an average, it consumes annually about 38 lakh bales of Indian cotton besides some 7½ lakh bales of imported cotton. The value of all cottons, Indian and foreign, consumed by the industry in one year is estimated at Rs. 200 crores. It is also a large consumer of fuel, electricity and lubricants, valued at Rs. 11 crores.

A number of ancillary industries, producing dyes and chemicals, mill stores, sizing and packing materials, are

also supported by it. The value of such goods consumed by the industry is estimated at Rs. 26 crores. The industry also gives employment to a vast army of men engaged in cotton, yarn and cloth trades and in the transport services. It supplies all the yarn required by the handlooms which produce annually 1,200 to 1,500 million yards of cloth. In short, the number of the industry's beneficiaries is so large and its influence on the Indian economy is so all-pervasive that any precise assessment of its importance to the country is almost impossible.

THE MILLOWNERS' ASSOCIATION, BOMBAY

Engineering and Transport

INDIAN AIRLINES SHOW DEFICIT FOR 1954-55

ENQUIRY ON FREIGHTS AND FARES PROPOSED

THE accounts of the Indian Airlines Corporation for 1954-55 show a deficit of Rs. 116.59 lakhs; compared to the previous record the performance during the year appears to have been better, because details suggest that these losses have been due primarily not to the operational activities of the Corporation as such, but to factors which are incidental to nationalisation. In the first eight months after nationalisation, that is from August 1953 to March 1954—a loss of Rs. 80.42 lakhs was incurred, and the pro rata for 1954-55 based on this figure comes to Rs. 120.63 lakhs. Against this the actual loss incurred was only Rs. 116.59 lakhs, recording a reduction of working costs by 8 percent. A scrutiny of the accounts of the integrating companies reveals that their losses have been considerably under-estimated by about Rs. 2,793,000—because against an actual total loss of Rs. 40 lakhs, the loss put out is only Rs. 12.07 lakhs. If the subsidy, which totalled Rs. 35 lakhs that year, is added to this figure, the total loss would be in the neighbourhood of Rs. 75 lakhs. Besides, it is now realised that the provision for depreciation made by many of the integrating units was not adequate. A sum of Rs. 26 lakhs provided by the various companies is altogether omitted.

Compensation

The Government of India has accepted the accounts of the integrating companies for the fixation of compensation. Bonds and borrowings total

Rs. 13.86 lakhs and interest has now to be provided on these. The companies did not show any amount on account of interest on capital although they have paid an interest of Rs. 2.40 lakhs on borrowings during 1952, and their losses were met by reducing their capital.

The Corporation had to spend a considerable sum after nationalisation. Certain airlines had not overhauled their aircraft for a long time, and this, coupled with repairs, cabin furnishing, renewal and upholstery cost the Corporation about Rs. 3 lakhs. A sum of Rs. 2 lakhs had to be spent for insuring the fleet. Besides these, the normal increase in the wage bill since 1952, due to annual increments in scales of pay, cost the Corporation another Rs. 10 lakhs, and better facilities for the training of pilots and technical personnel cost another Rs. 7 lakhs. Thus, in spite of the additional expenditure of Rs. 53.36 lakhs which included the increased wage demand, the Corporation lost only Rs. 40 lakhs in addition to what was lost by the integrating companies. This is attributed to the fact that the Corporation could not escape certain responsibilities which were directly the result of the manner in which the former airlines conducted the business.

Future Outlook

Although the future outlook may appear gloomy it is not altogether discouraging. The Corporation now operates on certain routes which are not remunerative but these services are continued as a measure of "social service" in pursuance of the national policy that as many towns and States as possible should be connected by air. Obviously the fundamental differences between the concept of public and private sectors cannot be ignored when comparing the financial results of the two. In order to increase revenue, the Corporation is examining the possibilities of developing foreign charter services. Several measures are proposed

to improve efficiency and provide better comforts for passenger. These include the opening of feeder lines connecting important towns with the country, overhauling and renovation of aircraft, and improvements in catering and cabin services. A committee is being appointed to rationalise freight and fare structures, and proposals for raising freight traffic by the maximum use of aircraft and flying crew are also being finalised.

DEVELOPMENT OF BUCKINGHAM CANAL

PROPOSALS to develop the Buckingham Canal, particularly in the north of Madras, and link it with Madras port, are being examined by the authorities. The Madras Government will soon undertake a detailed investigation. A conference was held in Madras by the Secretary of the Union Ministry of Transport, Mr. N. M. Iyer, at which officials from Madras, Andhra and Travancore-Cochin discussed the possibilities of developing inland waterways in the light of the industrial development that might take place under the second five year plan. At present the Buckingham Canal cuts across the Cooum river near the Madras penitentiary and proceeds south. The conference discussed the economic and technical possibilities of connecting it with Madras port and the proposal is to put up a canal to connect the Cooum with the port so that the freight carried by boats on the Buckingham Canal, which are now being unloaded near the Basin Bridge wharf and then taken to the port, could be transported direct to the harbour.

Informed sources indicate that the utility of the Buckingham Canal would be considerably increased if it is connected to Madras port at a point between Ennore and Madras Boat Wharf, north of Elephant Gate Bridge, so that boats of higher capacity could handle steamer traffic; quite apart from the other aspects of developing the entire canal leading up to Cocanada through traffic from Madras, such as widening and deepening the canal and the possibility of propulsion of boats by power or as trailers to a power unit.

Buckingham Canal is linked to the Krishna-Godavari delta canal system, at a point near Chinnaganj railway station near Bezvada and Madras is thus connected with a canal system up to Cocanada Port—otherwise more than 400 miles distant by rail. According to the report of Mr. Otto Popper the E.C.A.F.E. consultant, "the North Canal of 196 miles is navigable for boats of up to 30 tons carrying capacity (three feet draft) and the South Canal is navigable for 10 tons boats (two feet). The size of the boats is limited not only by the shallow draft and moderate width of the waterway, but also by the clearance under the bridges, which under the railway bridge at Elephant Gate is only seven feet above water level." Further, at present insurance firms are not inclined to cover the transport risk on goods moving by this canal, and the development of the canal with greater safeguards will justify the Transport Ministry asking insurers to under-write these risks as well.

NEW U.K. FIRM FOR ATOMIC PLANT CONSTRUCTION

A GROUP of firms which either has had close association with the U.K. Atomic Energy Authority in the design and construction of the Calder Hall Atomic Power Station, or in experimental reactors for Harwell, or which has special experience and facilities for such work, is associated with a recently incorporated separate company which will concentrate on the research, design and construction of nuclear power stations. Registered with an authorised capital of £1 million, the Nuclear Power Plant Co. Ltd., has its registered office at Heaton Works, Newcastle-upon-Tyne. The design headquarters is Booths Hall, Knutsford, Cheshire. The associated companies are, C. A. Parsons & Co. Ltd., Newcastle-upon-Tyne; A. Reyrolle & Co. Ltd., Hebburn-on-Tyne; Head, Wrightson & Co. Ltd., Thornaby-on-Tees; Sir Robert McAlpine & Sons, Ltd., London; Whessoe Limited, Darlington; Strachan & Henshaw Ltd., Bristol; Alex. Findlay & Co. Ltd., Motherwell; and Clarke, Chapman & Co. Ltd., Gateshead-on-Tyne.

Parsons, Reyrolle, Whessoe, Strachan & Henshaw and Alex. Findlay have gained valuable experience in the development of the Calder Hall Power Station. Head, Wrightson have had wide experience in the design and manufacture of modern heat exchange equipment. They have been engaged for some time in the design and construction of various types of reactors at home and abroad. They are also designing and building the large heavy water plant in New Zealand. Clarke, Chapman have wide experience in steam raising and allied equipment. McAlpines have been outstandingly successful in the civil engineering field, particularly in the construction of power stations for the Central Electricity Authority.

The combination of these eight firms will enable the Nuclear Power Plant Co. Ltd., to design and construct atomic power stations in any part of the world.

The Parolle Electrical Plant Co. Ltd. (joint proprietors—Parsons Reyrolle) who have been associated with the Atomic Energy Authority in the design and construction of the Calder Hall Power Project will co-ordinate the activities of the eight co-operating companies in design and construction. They also will be responsible for site services.

FOREIGN BUYERS HOLD OUT OF GUNNIES MARKET

HEAVY GOODS RECORD NEW LOW LEVELS

THE goods market this week has been dominated by speculators who have caused violent fluctuations to take place in all sections. Overseas buyers have shown little or no interest, which has left fatka operators with a clear field. There appears to be no holding power in the market these days as there used to be, and two larger groups are easily influenced by the one or weak holders are operating. This gives rise to conditions which bear no relation to the true state of the market. This was borne out at the end of last week when B Twill rates fell Rs. 3 a 100 bags for no apparent reason except excited and nervous selling by holders. This brought heavy goods prices down to their lowest levels since August last year. Foreign buyers still continued to sit out of the market and the stage appeared to be set for further large-scale reductions. Speculators, however, having achieved their aim, indulged in covering business at the lower levels over the weekend, and the collapse was arrested, following which prices slowly recovered to near opening levels. The unstable fluctuations give very little encouragement to buyers or mills to do business, and it is most unlikely that any of the large consumers will take very much interest under present conditions. Towards the close operators appeared to be pausing in their activities awaiting the announcement of the American burlap consumption and stock figures before making the next move.

The business done during the week in both sections of the market has been on a small scale and not calculated to have any great effect on prices. The hessian section still tends to be steady, but it has not been given a chance to settle down due to the continual fluctuations in sacking. Shipping statistics so far this month have been average, but once again the accent has been on sacking, and operators are looking for a further reduction in mill stocks.

The raw jute market has had mixed fortunes during the week, the old crop section ruling very firm, whilst new crop quotations have followed the speculative B Twill market. Sellers of local delivery jute have been very reserved, and towards the close withdrew from the market completely when reports of flooding in Assam became prevalent. Sellers are still having difficulty in disposing of their high-grade jute, and are now pinning their hopes on the floods delaying new crop deliveries which would enable them to cash in on the temporary shortage. New crop reports from both India and Pakistan have been favourable over the week, and in Pakistan small sample parcels have appeared on the market with favourable comment. In India, sowings have been completed in the areas held up by unfavourable weather, and reports from other districts indicate that the crop is very healthy. If present conditions continue mills should be receiving their first deliveries of new crop jute in the month of July as contracted for.

THE JUTE MARKETS

Manufactured Goods: There was very little change at the opening of the goods market on Thursday last, ready B Twills dropping two annas to Rs. 109 a 100 bags, and October-December shipment losing two annas to Rs. 102-8. Similar conditions prevailed in the hessian section, all deliveries showing a reduction of two to four annas. Quotations for 40" 10 oz. hessians stood at Rs. 43-2 for June delivery and Rs. 41-12 for October-December shipment. After this fairly steady opening, speculators got busy and heavy bull unloading caused prices to decline sharply in sacking. Mills' selling pressure also contributed to the slump, and by Friday morning B Twills had lost Rs. 2-4 in the near positions and Rs. 1-8 for forward delivery. There was still no overseas interest even at these lower levels, and speculators continued to hammer the market down until by Saturday morning near delivery B Twills dropped to Rs. 106 a 100 bags, the lowest price recorded for 10 months. Thus in two days heavy goods prices had lost Rs. 3 a 100 bags due to nervous selling by weak fatka operators, and conditions were not very encouraging. During this time a steady tendency had been prevailing in the hessian section where small business had been reported; 40" 10 oz. hessian quotations however eventually succumbed to the manipulations of speculators, and in sympathy with sacking, this fabric lost six to 10 annas over the two days. The ready position was quoted at Rs. 42-8 a 100 yards, and October-December shipment at Rs. 41-8. Over the weekend speculators had a change of face, and they now became buyers at the lower levels, indulging in a fair amount of covering business. This put an immediate stop to the downward trend of the market, and under speculative pressure rates slowly recovered. Opening quotations on Monday showed an improvement of eight annas for all deliveries, the ready B Twill position standing at Rs. 106-8. The hessian section ruled steady and prices remained constant. Encouraged by their initial success operators forced up prices still further, and helped by small overseas enquiries sacking gained a further Rs. 1-8 a 100 bags, by Tuesday morning. The hessian section was thus duplicated every

rise in heavy goods and rates advanced four to eight annas. Minor fluctuations were the order of the day during Tuesday but towards evening, due to heavy speculative selling, prices began to fall.

At the close the market has again collapsed under speculative manipulations and heavy goods are down by about Rs. 1-8 a 100 bags and hessians have lost four to eight annas a 100 yards. Opening quotations on Wednesday morning were as follows:—

	June	July	July-Sept.	Oct.-Dec.
Rs.	Rs.	Rs.	Rs.	Rs.
40" 8 oz.	34-8	34-8	34-6	33-6
40" 10 oz.	42-10	42-10	42-12	41-4
B. Twills	106-6	106-4	105-8	101
Heavy Cees				
(Plain)	107-8	107	106-8	101-8
A. Twills	136	133	131-8	126
Liverpools	124	123-8	122	115-8
Cornesacks	113	110-8	109	103

Raw Jute: The old crop section of the jute market has ruled very steady throughout the week being completely indifferent to the unsteady influences of the goods market. There still appears to be a fair quantity of jute to be offered, but many transactions have been held up due to buyers and sellers being unable to reach an amicable agreement on the question of assortment. Buyers are only interested in low quality jute, but the majority of jute offered them contains a very large percentage of middles and, in some cases, a fair quantity of tops. Sellers appear to be prepared to hold on to their stocks and the position at the present moment is developing into stalemate. The position of new crop jute has also undergone a change over the week and buyers are showing no interest in offers for delivery after the August-September period. Most indications have been on the basis of half July-half August shipment, but sellers are reluctant to commit themselves now for early shipment due to the possibility of recurring flooding in the Assam districts. Quotations in this section have fluctuated in sympathy with the speculative goods markets, but the general trend has been downwards and prices have dropped about Rs. 1-8 a maund over the week.

At the opening of the raw jute markets last Thursday old crop quotations were unchanged. Upper Assam Bottoms being quoted at Rs. 27 a maund. There was no alteration to these rates over the week until Tuesday when rates were advanced eight annas a maund due to rumours of flooding in the jute-growing districts. The majority of sellers withdrew from the market at this stage and very steady conditions prevailed.

The new crop section of the raw jute markets fell under the influence of speculation during the week, and quotations fluctuated accordingly. At the opening rates were cut eight annas a maund and Upper Assam Bottoms were quoted at Rs. 25-8, but prices fell eight annas a day over the next few days and by the weekend quotations were on the basis of Rs. 24-8 a maund. Small business was done at each price level, although less interest has been paid to forward delivery up to the end of the year than before.

Once again mills have shown a great deal of interest in old crop jute, and business was done for Dhubri Bottoms only for guaranteed June shipment at Rs. 28 a maund, and Dhubri-Northern assortment at Rs. 27-8 a maund for June-July shipment. Upper Assam jute was done at Rs. 26-8 to Rs. 27 a maund basis Bottoms for one month's shipment, and Northern, ex-local Godown at Rs. 27-8 a maund for guaranteed June delivery. Small lots of Daissee were done at Rs. 28 a maund. In Pakistani old crop jute business was done for Northern ex-Agency at Rs. 27-8 a maund for June-July shipment, and Northern Ex-Local Godown at Rs. 26-8 to Rs. 27 a maund for the same delivery. Pakistan Mill Hearts, ex-Calcutta Godown were done at Rs. 150 a bale, and Pakistan Ropes at Rs. 110 a bale for one month's shipment.

In the new crop section prices varied from Rs. 27 a maund for Dhubri-Northern guaranteed half July-half August shipment, to Rs. 25-8 to Rs. 26 for August-September shipment. Small business was also done at Rs. 25 a maund for Dhubri-Northern for equal deliveries in August-September-October.

There were no reports of any business in Pakistani new crop jute.

At the close both old and new crop quotations have dropped eight annas a maund in sympathy with the goods market. Sellers are still inclined to be reserved however, especially for old crop jute, and are indicating above the quoted rates. Opening quotations on Wednesday morning were as follows:—

	Landed at Mills	Rs a md. basis Bottoms	Shipment
	Old Crop	New Crop	Aug.-Sept.
Lower Assam	27-8	25-8	25
Upper Assam	27-8	25-8	25
Northern	27-8	25-8	25
Murshidabad Tossa	27-8	25-8	25
Local Northern	27	25-8	25
Local Packing	26-8	25-8	25
Daissee Ex Sheoraphuli	29	25-8	25
Bimil	26 for F.A.Q.		

Tossa is quoted at Re. 1 to Rs. 1-8 a maund above the rates for White Jute.

Pakistani Jute:	Rs. a md. basis Bottoms	Shipment
	Old Crop	New Crop
Jat	28-8	27-8
District	28	27
Northern	27-8	26-8

The Cossipore markets this week have ruled very steady, due to mills' continued interest for local supplies. Imports have been on the small side, and in the main have consisted of grades other than bottom jute. Consequently buyers have had to pay premium prices for low grade assortments. Towards the close sellers withdrew from the market completely in view of the rumours of flooding in some jute growing areas, and quotations were advanced by eight annas a maund, and Kishanganj jute stood at Rs. 27-4 a maund for garbat quality. News from the Daissee-growing areas continues to be encouraging, as most areas have had a fair amount of rainfall. There are still many areas however where large tracts of land are only now coming under the plough, and other areas where germination is very poor. In the Sheoraphuli markets there is very little doing as there are only small quantities on offer. Quotations are based on Rs. 30 a maund for garbat quality.

Mofussil: Indian upcountry markets are very steady and only small quantities of jute are on offer. Imports are negligible and the balance of the crop would appear to be in sellers' hands. Business has been done with Calcutta mills, but quotations still tend to be above the par of those quoted in Calcutta. Reports of flooding in the jute-growing areas has caused most of the offers to be withdrawn, and the market at the close is steady with Dhubri jute quoted at Rs. 25-8 a maund for Bottoms.

The Pakistan markets are quiet and only small business has been reported over the past week. Imports into Narayanjanj have dropped to about 2,000 maunds old crop jute a day, and in the absence of business quotations are nominal at Rs. (P) 18 to Rs. (P) 18-8 for Jat Bottoms. Some small imports of new crop jute have appeared in the market in sample lots, and these are being offered at about Rs. (P) 15 to Rs. (P) 15-8 a maund for Jat Bottoms. Prospects of early delivery new crop jute are good and the market is easy.

Raw Jute Consumption

During May, 1955, mills reporting to the I.J.M.A. consumed 476,000 bales of raw jute as compared with 415,000 bales in May, 1954. The total for July, 1954 to May, 1955 is now 5,351,000 bales as compared with 4,610,000 bales in the same period last season.

INDIAN JUTE CROP REPORT

In their thirteenth crop report for the Indian season, covering the week ended 11th June, Messrs. Sinclair Murray & Co., Ltd., say that weather conditions during the past week have been more favourable with fairly general rainfall in all districts with the exception of Murshidabad. The condition of the crop in Assam and Bihar is considered very healthy and in most districts of West Bengal, Orissa and Madhya Pradesh, the crop is improving with current rainfall. Week-end river levels are generally normal although in lower Assam rivers are falling while in Upper Assam reports indicate that rivers are on the rise.

DANPUR: During the early part of the week weather conditions have been hot and dry but latterly good rainfall was experienced and this has encouraged cultivators to carry on freely with sowings now estimated at -20/- as against -13/- sowings at this time last year. Weeding operations are going on where required. Plant condition has improved and the plants are now healthy and range in height up to 2ft. 9in. The river level is normal for this time of the year.

TEPUR ROAD: Weather during the past week has been mainly hot and dry but scattered rainfall was experienced latterly. More rainfall is still required however, to allow cultivators to carry on freely with sowings and to improve the growth of the plants. Estimated sowings amount to -715/6 as against completed sowings at this time last year. So far little improvement has been noticed in the health of the standing plants which now range in height from seedlings to 1ft. 9in. Weeding operations are going on where possible. The river level is slightly lower than at this time last year.

COSSIMBAZAR: During the past week the weather has been mostly dry with the exception of one good shower of rain. More rain is urgently required, however, to allow cultivators to continue with sowings and to promote plant growth. Cultivators have continued sowings and these are estimated at -12/- as against completed sowings at this time last year. First weeding operations have been completed in the low and midlands and are going on in the highlands. Plant condition is not very satisfactory, particularly in the midlands but the plants range in height from seedlings to 2ft. The river is normal for this time of the year.

RAJAGHAT: During the past week, the weather has been mainly cloudy with light scattered showers. More rain is still required to promote the growth of plants and to improve their condition. Sowing operations have been curtailed to some extent although these are now estimated at -20/- as against -15/- sowings at the same time last year. Division of sowings so far are estimated as follows: White jute -4/-, Daissee -7/- and Mesta -9/-. Weeding operations are going on where required. Plant condition of earlier sowings is quite satisfactory and of later sowings is improving. Plants range in height up to 3ft. The river level is a little lower than last year at this time.

NOWGONG: Sowings completed -22/6. Crop report not received.

PALASHBARI: Sowings completed -24/-. During the past week weather conditions have been very favourable with alternate rain and sunshine. Weeding operations in the lowlands have been completed and are now nearing completion in the midland. First weeding operations in the highlands

are going on where possible. Plant condition is most satisfactory and the plants range in height up to 5ft. 6in. The river level is falling slowly and is now at the same level as last year at this time.

DHUBRI: Sowings completed -/20/-. During the past week weather conditions have been very favourable with alternate rain and sunshine. First weeding operations in the highlands have been completed. Plant condition is very healthy and the plants range in height up to 5ft. 3in. The lowland crop is almost mature and it is expected that harvesting operations will commence shortly. The river level has fallen steadily and still stands at 2ft. 3in. higher than on the corresponding date last year.

FORBESGANJ: Sowings completed -/24/-. Weather conditions during the past week have been favourable with alternate rain and sunshine. Weeding operations are going on freely and the condition of plants is reported to be healthy. They range in height up to 4ft.

DAISEE DISTRICTS: Alternate rain and sunshine was experienced during the past week and this is very favourable for the standing crop. Sowings are estimated to date at -/16/- as against completed sowings at this time last year. The condition of young plants is now considered satisfactory and they range in height from seedlings to 3ft. Weeding operations are going on where required.

PAKISTAN JUTE CROP REPORT

In their fourteenth crop report for the current Pakistani season, covering the week ended 11th June, Messrs Sinclair Murray (Pakistan) Ltd., say that the crop has continued to make satisfactory progress and weather conditions everywhere are favourable. Harvesting of the lowland crop has commenced in some districts and is now likely to go on apace. River levels continue to rise slowly and are generally about normal for this time of the year.

NARAYANGANJ: Sowings completed -/21/-. The weather has been favourable with two light showers. Condition of plants is very satisfactory and they range in height up to 5ft. Weeding is going on in mid and highlands as required. The river level is about 6in. lower than at this time last year.

DACCA: Sowings completed -/21/-. The weather has been mainly hot and dry with a little scattered rainfall. The condition of plants is satisfactory and they range in height up to 4ft. 9in. but more rain is required to promote growth. Weeding is going on where required. The river level is 1ft. lower than at this time last year.

CHANDPUR: Sowings completed -/21/-. The weather has been seasonable with rainfall almost every day which has been favourable for the crop. The condition of plants continues to be very satisfactory and they range in height up to 6ft. Weeding is going on as required. The river level is 2ft. 9in. higher than at this time last year.

NIKILAMPARA: Sowings completed -/21/-. The weather has been wet and mainly cloudy with a little sunshine. The condition of plants is satisfactory and they range in height up to 5ft. Weeding

operations have been stopped due to rain. Harvesting of the lowlands has commenced and it is estimated that up to date -/1/6 has been cut. During the past week the river level has risen 1ft. 6in. but is 9in. lower than at this time last year.

SARISHABARI: Sowings completed -/20/-. The weather has been favourable with alternate rain and sunshine which has enabled the crop to make satisfactory progress. The condition of plants is satisfactory and they range in height up to 4ft. 9in. Weeding is being carried on as required. Harvesting of the lowland crop has commenced. The river level has risen 1ft. during the past week and is now 1ft. 3in. higher than at this time last year.

SIRAJGANJ: Sowings completed -/21/-. The weather has been generally hot and dry with scattered rainfall. The condition of plants continues satisfactory but more rain would be beneficial. Plants range in height up to 6ft. 3in. Weeding is going on where required. The river level has risen 3ft. 9in. during the past week and is now 1ft. 3in. higher than at this time last year.

NAKALIA: Sowings completed -/21/-. The weather has been mainly hot and dry with scattered rainfall. Under present conditions plants are progressing favourably and range in height up to 5ft. 6in. The river level is rising but is still lower than at this time last year.

BHANGORA: Sowings completed -/20/-. The weather during the past week has been favourable with alternate rain and sunshine. The condition of plants continues satisfactory and they range in height up to 6ft. Weeding is going on where required. The river level has risen 2ft. during the past week and is now 1ft. higher than at this time last year.

LJMA PRODUCTION FIGURES FOR MAY

The Indian Jute Mills Association reports the total production of manufactured goods exclusive of all Government Orders for the month of May 1955:

Description	Quantity
1. Twist and Yarn	
(a) For sale	1,997 tons
(b) All other including that used in sewing bags	951 tons
2. Canvas	156 tons
	3.9 lakh yds.
3. Gunny Bags (Tonnage exclude sewing twist)	
(a) Hessian	3,049 tons
	122.3 lakh yds.
(b) Sacking	43,713 tons
	10,34.2 lakh yds.
4. Gunny Cloth	
(a) Hessian	29,026 tons
	11,50.8 lakh yds.
(b) Sacking	2,390 tons
	52.0 lakh yds.

5. Other manufactures (including ropes) 339 tons	
6. Total production (above figures combined)	
(a) All kinds	81,621 tons
(b) Hessian	
(c) Sacking	12,73.1 lakh yds.
(d) Canvas	10,86.2 lakh yds.
(b) Total reported production of goods manufactured on Government account.	
	3.9 lakh yds.
Description	Quantity
7. Sandbags	Nil
8. Scrim Cloth	3 tons
	0.1 lakh yds.
9. Hessian bags and cloth and canvas	14 tons
	0.5 lakh yds.
10. Sacking bags and cloth	130 tons
	3.0 lakh yds.
11. Rope, Rope, Twine etc.	Nil

Summary				
		(00,000 yds) Average production (all looms working)	May 1955	(000 tons) Average production (all looms working)
	May 1955			
Hessian				
Civil	12.77	13.40	32.2	34.3
Government	0	1.71	0.0	4.6
	12.77	15.11	32.2	38.9
Sacking				
Civil	10.86	10.92	46.1	45.7
Government	0	44	0.1	1.8
	10.86	11.36	46.2	47.5
Other Manu- factures				
Civil			3.3	2.4
Government			0.0	0.0
			3.3	2.4
Grand Total			81.7	88.8

* Based on production figures from July, 1948 to April, 1949 (full working months excepting March with full complement working 48 hours a week). At present 12½% of looms are sealed.

N.B.—These statistics are based on replies received and represent all members of the Association and Gageibhat.

MINIMUM JUTE PRICE IN PAKISTAN

Attention of the Jute Board has been drawn to certain misconceptions that have arisen amongst the shippers and foreign buyers of jute that there is not likely to be any minimum price for the next jute season. Such an impression is entirely incorrect. The Jute Board reiterates that the Pakistan Central Government is determined to ensure that export prices are not allowed to go below the minimum prices indicated last year.

MR. C. D. WHEELER

Last week saw the departure from India of one of our best known gunny brokers in the person of Mr. C. D. Wheeler. "Chas" came to India with the Army in World War I and served in the Persian Gulf, the Waziristan Campaign and the Afghan War of 1919. Coming to Calcutta he joined the firm of Innes Watson & Co. of which he was a Director at the time of his retirement. Between the wars he was one of Calcutta's leading tennis players but had to give up because of ill-health. Always of a cheerful disposition he was very popular with all in the jute trade.

THE FOREIGN JUTE MARKETS

YARN AND CLOTH PRICES REDUCED

(FROM OUR DUNDEE CORRESPONDENT)

THE jute trade in the U.K. has been looking for lower prices, but with not much hope since the Pakistani Jute Association intimated that there would be no reduction in the minimum prices for raw jute. Some surprise was felt, therefore, when it was intimated on the morning of 9th June that prices for all yarns and cloth in the U.K., including imported goods, would be reduced immediately. The fall is the usual £5 a ton.

There has been a good deal of talk in the market lately about allowances being granted to spinners and manufacturers against the past two advances in wages of 6½ percent to workers, and also to compensate for increased charges for coal and other commodities used in the spinning and weaving of jute. Railway freights are up and this factor increases expenses all round. It looks, therefore, as if the next change in prices here will require to be in an upward direction, though it may not be of much extent.

Shippers are offering raw jute of the new crop quite freely, but there are fewer offers of old crop and most sellers have raised their terms. Spinners here are not interested unless they are able to buy at the same rates as those ruling for new crop. At the same rates as those ruling for new crop, Mill Firsts are obtained in either old or new crop at £90, but Mill Lightnings are at £84 for old and £80 for new, Mill Lightnings are at £84 for old and £80 for new, Mill Hearts at from £75 to £78 for old and £70 for new, while old or new crop crack Daisies can be bought at £90 and go down to £80.

Commodity Markets

INDIA'S WOOL EXPORTS RISE IN 1954

U.S. IMPORTS MORE THAN DOUBLE THOSE IN 1953

DURING the calendar year 1954, exports of home-grown raw wool from India totalled just over 29 million lbs., actual weight, which was 25 percent more than the 23 million lbs. exported in the previous year. Between the two years shipments to the U. K. rose by less than a million lbs. from 16½ to 17½ million lbs. but those to the United States more than doubled, rising from 4½ to 9½ million lbs. It will be recalled that exports of raw wool from India have been subject to official control throughout the period under review. Re-exports during the year amounted to 5.1 million lbs. which represented a drop of about 5 percent compared with 1953. The quantity going to the U. K., however, rose by over 50 percent to nearly 2.0 million lbs. The greater part of the remainder went to Belgium, Czechoslovakia and Hungary.

Imports of Raw Wool, Tops and Yarn

Seaborne imports of raw wool during 1954 totalled 3.0 million lbs. actual weight, against 4.5 million lbs. in the previous year or a reduction of one-third. Reductions were recorded in receipts from each of the chief supplying countries. Australia, New Zealand, and the U. K. Imports of wool tops during the year came to 11.0 million lbs. or 17 percent more than in 1953. Of the total, 10½ million lbs. came from the U. K. and the balance from Australia and France. Imports of wool yarn totalled 4.0 million lbs. in 1954, more than twice as much as in the previous year. The main increases were in supplies from Italy, which more than trebled, and Japan. On the other hand, those from the U. K. declined slightly.

Imports of Tissues

In the fourth quarter of 1954 there was a further increase in the quantity of wool tissue imports into India. This was largely the result of the higher import quotas permitted at that time, for it should be recalled that from the beginning of 1955 importers' quotas were for the most part reduced from 50 to 33-1/3 percent of their "base year" amounts. Total imports during the quarter came to 1,280,000 linear yards against 580,000 yards in the previous three months; imports from the U. K. rose, from 117,000 to 228,000 yards, but those from Italy increased more sharply from 444,000 to 995,000 yards. Total tissue imports during the year 1954 came to 2.57 million linear yards, of which the U. K. supplied 495,000 yards and Italy about 1,950,000 yards. It is not possible to make an exact comparison with the previous year, since figures for the first quarter of 1953 are entirely complete, but there would appear to have been a reduction of at least 5 percent between imports in 1953 and 1954. Imports of blankets in 1954 came to 735,000 lbs. or 80 percent more than in the preceding year. By contrast, imports of carpets and rugs at 18,000 lbs. were only half those of the earlier year.

BRITISH TEXTILE REVIEW

ADVANCING TECHNIQUE OF PRODUCTION

RESEARCH has been emphasised in the past month. The Duke of Edinburgh opened new premises of the British Rayon Research Association at Manchester, where he inspected such equipment as an instrument for timing looms, developed from a naval radar set, and an electronic device showing how faults in yarn would appear in cloth. These new laboratories, concerned with all man-made fibres, cost £500,000. A few days later, Courtaulds exclusively with viscose, which cost £400,000. It is the largest of six Courtaulds laboratories. Its output, though experimental, will be considerable in quantity—up to 15,000 lbs. a week of high-tensile industrial yarns, for instance, from a continuous spinning machine. Instrumentation at this laboratory, at Coventry, as at the Association's premises at Manchester, is very elaborate. Courtaulds has begun deliveries in commercial quantities of a new high-tensile viscose (especially tyre cords)—it was that "strong" rayon that enabled the rayon industry to move beyond the confines of the rayon industry to move into competition with Egyptian-type cotton yarns in industrial uses. The new "strong" staple can be spun in counts of 80s to 120s, whereas staple used hitherto has rarely exceeded 47s. It will thus be applicable to hosiery, lace, glove fabric, etc., and, as fine doubled yarns, for dress goods, sports shirts, etc.

New Technique in Spinning

Spinning of yarns direct from tow is another significant development here—somewhat tardy by comparison with progress in France. The tow, generally viscose, is broken into staples and drafted into spun yarn in a single operation. The special interest of this method is that it is the first ever designed specifically for man-made fibres. There are only a few of the machines on trial in this country at present. The tows being used are

SCINDIA HOUSE

NEW DELHI

Sound Basis in Yorkshire

Whereas rayon largely replaced cotton, the new synthetics such as Terylene and Ardil will largely supplement wool. The outlook for the wool industry is not, therefore, identical with the outlook for wool as a fibre. "The use of man-made fibres in conjunction with wool" says Mr. James Ewing, chairman of Bradford Dyers' Association, "has opened a field which gives enormous scope to the designer of today"; and wool benefits, because "it is not so much a battle of the fibres, but rather an opportunity to display the well-proved characteristics of wool with the more modern attributes of man-made fibres". That the consumption of man-made fibres in the Yorkshire wool industry is still only about 7 percent of total fibres consumed does not mean that such statements as Mr. Ewing's exaggerate the scope. Terylene alone can appreciably alter the proportion, for about half of the 11 million lbs. of that fibre that I.C.T.'s new Wilton plant will produce annually will be staple fibre, and most of the latter will probably be consumed in the wool industry. Increasing quantities of both nylon and rayon staple are being used, in a variety of blends that is constantly developing. Hitherto

the man-made fibres have been suited to the woollen rather than the worsted side of the industry, but the range is widening.

The industry is still perturbed by the disparity between raw wool values and the prices obtainable for intermediate and finished products: medium and low crossbreds have been favoured in preference to botanics, to evade the high prices of the latter. But trade has been on the whole more active since Easter, and the industry is worried almost as much by shortage of labour as by the keenest competition experienced since the war—although in the past year this industry (employing about 160,000) has lost only about 2,000 workers, whereas the cotton industry (employing about 280,000) has lost about 15,000. The industry's exports have been recovering this year: the dollar markets—the most important—have been taking more cloth, and big shipments of tops have been made to China. But from Yorkshire (as well as Australia) have come complaints that the withdrawal of purchase-tax from non-wool cloths puts the wool industry at a relative disadvantage, and the goods that are subject to purchase-tax are of the kind that have made Yorkshire wool goods famous abroad; so their production should, surely, be encouraged by a healthy demand at home. The industry is also troubled by imports of cloth, especially from Italy: it says that it is threatened as much by these imports as is the cotton industry by imports from India. But its demand for protection is rather risky when it is so apprehensive of reaction against its own successes, in Canada and elsewhere.

Co-existing with Japan

One of the side-effects of the general election campaign was a prominent advertisement in the daily press on behalf of F. W. Woolworth & Co. stating that a picture published in an election pamphlet by a political candidate in the Darwin Division of Lancashire purporting to show Japanese textiles in the window of the company's Darwin branch was misleading. This American-controlled company made the proud announcement: "No Japanese textiles are on sale in any Woolworth store in Great Britain." The delegation that visited Osaka to discuss Japanese "piracy" of British designs returned with some hope of a settlement of this long-standing grievance. The Japanese agreed to forward for study—though not to recommend a British proposal that authenticity of a design should be supported by a declaration by the original printer, certifying its ownership. The British delegation regarded this pro-

cedure as absolutely vital to the control of copying.

REVISED LAC CROP ESTIMATES FOR 1955

According to the revised estimates issued by the Indian Lac Cess Committee, the Bysakhi lac crop in India for the year 1955 is expected to be 7,94,000 maunds, as against the preliminary estimates of 7,49,000 maunds and the previous year's final estimates of 6,00,000 maunds. The normal yield for this crop, based on the average of ten years preceding 1955, is 7,10,000 maunds. In Bihar State, the arrivals have been much better than expected, especially in the districts of Ranchi, Hazaribagh and Gaya. The preliminary estimate of 5,12,000 maunds for this State has, therefore, been increased to 5,75,000 maunds. In the Murshidabad district of West Bengal, the crop has turned out to be poor due to shortage of brood lac at the time of infection. In the areas round about Gondia in Madhya Pradesh also, the crop is poor.

WORLD WOOL CONSUMPTION TRENDS IN CURRENT YEAR

World wool consumption during the first quarter of the year is estimated to have been about 3 percent higher than in the previous three months, states the Commonwealth Economic Committee. The outstanding feature was the sharp improvement in consumption in the United States, which rose by 13 percent to reach its highest level for 18 months. The quantity of wool used in Canada rose by about 16 percent and was more than 30 percent higher than in the corresponding period of last year. U.K. consumption also rose—by seven percent—and was the largest for two years, but in a number of the important Western European countries, particularly Germany and Italy, there were substantial declines. In Belgium and the Netherlands there was a slight increase. Japanese consumption showed a fall of two percent and was seven percent lower than a year earlier. Australia used about 4 percent less wool, the lowest for 12 months. Aggregate consumption in 11 major consuming countries amounted provisionally to 427 million lbs. (clean), compared with 416 million lbs. in October-December 1954. Comparing January-March with the corresponding period of last year, wool consumption showed an increase of about two percent, but whereas January-March of last year showed a declining consumption compared with the preceding quarter, consumption in January-March this year showed a slight increase.

WHOLESALE PRICE INDEX FALLS

THE official wholesale price index (base: year ended August 1939=100) declined by 0.5 percent to 341.0 during the week ended 28th May, 1955 as compared with 343.9 (revised) for the previous week. Relative to the corresponding weeks of the last month and a year ago, the index was lower by 0.1 and 12.7 percent respectively. The average for the month of May, 1955 stood at 342.9 as compared with 345.4 (revised) for the previous month and 396.1 for May, 1954. The index for Foodstuffs declined by 1.1 percent to 276.2 due to a fall in the prices of jowar (-8%), gram at Patna (-4%), bajra (-2%) and wheat at Hapur, gur at Muzaffarnagar and sugar (-1% each); however, the prices of wheat at Amritsar and dal arhar (+1% each), showed advances. The index for Industrial Raw Materials moved down by 2.5 percent to 389.6 as a result of decreases in the prices of raw jute (-9%), Karungani, raw cotton at Tirunur (-6%), cottonseed (-5%), gingellyseed (-3%), Jarilla raw cotton in Bombay, castorseed, rapeseed at Kanpur and manganese ore (average export prices) (-2% each) although prices of raw wool (+4%), rapeseed in Calcutta (+3%) groundnuts, linseed and lac (+2% each) and Punjab-American raw cotton in Bombay and copra (+1% each) were marked up. The index for Semi-Manufactures, however, advanced by 0.2 percent to 331.4. Items which witnessed significant variations were: gingelly cake (+9%), mustard oil in Calcutta (+7%), gingelly oil (+4%), coconut oil, groundnut oil and linseed oil (+2% each), coconut cake (-5%) and mustard oil at Kanpur (-2%). Lower prices of jute manufactures (-3%) brought down the index for Manufactures by 0.3 percent to 373.6 as compared with 374.7 (revised) for the previous week. Black pepper at Cochin (+9%) and cashewnuts at Mangalore (+5%) showed advances while chillies in Calcutta (-3%) declined and in consequence, the index for the Miscellaneous group rose by 0.5 percent to 548.8.

Calcutta Markets

DEMAND STRONG IN TEA EXPORT SALE

FANNINGS AND BLACK BROKENS SELL AT DEARER RATES

AT Sale No. 2, held on 13th June, export offerings consisted of 18,345 packages out of which 85 were of old season's manufacture. The bulk of the sale was again from the Dooars and Darjeeling although there were more of Assams and Cachars on offer than in Sale No. 1. The sale opened with a strong demand which increased as the sale progressed. At the close, Clean Black Brokens were 1 and sometimes 1 anna dearer while Fannings were from 1 anna to 1½ annas dearer. Whole Leaf grades and the few lines of Assam BOP and OF with tip met with a keen demand, whilst stylish BPS were once again in very strong demand. Well made Darjeeling Leaf grades and any flavoury teas from this district sold well and often above valuations but plain sorts sold generally from 1 anna to 3 annas below last week's rates. There was only a fair demand for the few CTC teas on offer which were all of first flush manufacture.

Quotations

Plain Black Pekoe	Rs. 2 8 0 to 2 10 0 (Nominal)
Plain Broken Pekoe	1 14 6
Medium Assam B.P.	Not quotable.
Best CTC Assam B.P.	Not quotable.

There was no Dust sale this week. Offerings of other grades consisted of 1,449 packages of new season's tea and 178 packages of old season's tea. The new season's offerings, which were mostly first flush CTC Assams and Dooars were only in fair demand, and there were heavy withdrawals of the CTC teas. No quotations can be given this week.

FIRM TREND IN FREIGHT MARKETS

THERE has not been a great amount of business concluded over the last week but the market is still very firm with American coal still predominating, but coal charterers are having difficulty in procuring all the tonnage they require. 60s was paid for June and July loading the U.S. to the U.K. and it is reported that contract business for 20 24 consecutive voyages to the Continent at 45s 6d commencing late this year has been concluded. With the loss of coal in the U.K. due to the recent strike, it seems likely that this market should continue firm for some time. Tonnage is required for grain from Pacific Coast and also from Australia to Mediterranean and South African destinations. East Coast Australia to the U.K. was fixed at 122s 6d bulk wheat for August loading. India ore trade was fairly active with Mormugao to the U.S. being fixed at \$12.50 and Mormugao to Genoa at 75s f.i.o. There are a number of enquiries circulating for ore to Japan and a vessel was fixed from Masulipatam to Kamaishi at 87s 6d. A cargo of coal was fixed from Calcutta to Alexandria at 80s for end-June shipment. Time Charter rates were well maintained with a Liberty vessel being fixed at 28s for six months' trading with delivery in the U.K. whilst a similar vessel obtained \$U.S.33.50 for one year's trading.

Postponement of Surcharge Levy

The Chairman of the U.K./Continent-Bombay and Calcutta Conferences, announces: "On 24th March last, the above Conferences announced that, because of the delays to vessels at Bombay and Calcutta, there was every justification for the imposition of a surcharge on freights, but that a decision would be deferred until early June in the hope that, in the meantime there would be a substantial improvement in conditions which would justify reconsideration. The warning given by the Lines has served to focus attention on this problem and they are satisfied that the Government and Port Authorities in India are now fully alive to the gravity of the situation and that they intend to take vigorous remedial measures without delay. Conditions at Bombay and Calcutta show some slight improvement compared with recent months. In these circumstances and in the full expectation that there will be no slackening of effort on the part of the Government and Port Authorities to improve the turnaround of ships, the Lines have decided to defer this question and will only reconsider it if and when conditions necessitate."

SUGAR MARKET

During the week ended 14th June, sugar sales in the Calcutta market averaged 4,000 bags a day. Arrivals were 2,000 bags daily and stocks totalled 400,000 bags. Rates for ready sugar ex-Kantapur delivery were Rs. 30-8 for ordinary grain and Rs. 31-8 for big grain. Forward delivery sugar sold at Rs. 30-8 and Rs. 31-8 a maund for ordinary and big grain varieties respectively. Ex-mill delivery for standard grades of sugar varied between Rs. 28-4 and Rs. 29-8. The market was quiet.

LINSEED

Firm conditions prevailed during the past week and trading was small. Sellers were reserved owing to poor arrivals and lack of selling orders from upcountry. There were fairly keen enquiries from crushers both for ready and forward delivery but only small lots changed hands daily. The oil market was fairly active.

When completed in 1955, the project will have consumed more than 1,40,000 tons of A.C.C. cement.

LONDON TEA SALES

At the tea sale held on 14th June, 24,042 packages of North Indian and other miscellaneous teas were on offer. Bidding for good quality teas was brisk and it gained 1d to 1½d a lb. Clean Common and Low Medium kinds were generally fully steady, with Plain Broken Pekoe unchanged at 40½d a lb. Stalky types and teas of poor appearance, however, were irregular and generally lower.

Results obtained by some of the companies at the previous sale are given below.

	No. of packages	Average per lb
Assam Co.	458	3/8½
Assam Frontier	848	4/0½
Attaree Khat	684	3/5½
Bargacote	183	2/11
Bargang	462	3/7½
Borhat	360	3/8
Budla Beta	396	4/2
Chulsa	801	2/11½
Cons. Estates	394	4/1
Cons. Tea and Lands	1,816	3/4½

United Planters	705	4/4
Upper Assam	288	3/8½

U.K. Tea Stocks

U. K. tea stocks in London and provincial bonded warehouses on 10th June, were 158,814,040 lbs. against 152,647,660 lbs. in the previous week. Total amount to be landed was 10,159,050 lbs. Deliveries during the week amounted to 7,341,180 lbs. landings 3,348,510 lbs. total afloat 16,959,142 lbs.

COLOMBO RUBBER PRICES

The following prices have been issued by the Indian Rubber Board from the weekly market report published by the Colombo Brokers' Association:

Closing prices Average prices on 3-6-55 (Rupees a lb.) (Rupees a lb.)

Sheet:	No. 1	No. 2	No. 3	No. 4	No. 5
	1.16	1.13	1.10	1.03	1.02½
	Cts.97	Cts.97	Cts.97	Cts.97	Cts.96½

Crepe:	Water White	R.M.A. No.1X	R.M.A. No. 1	Crepe 2	Crepe 3
	1.26	1.26/27	1.24/25	1.20-1/2	1.17-1/2
	1.26	1.25½	1.23½		

Scrap Crepes:	S.Crepe No. 1	S.Crepe No. 2	Flat Bark
	1.08 nom.	1.03/06	Cts.98/1.02
	1.07	1.03½	Cts.97½
			Sc.Crepe 3X 1.00

To arrive at f.o.b. Colombo prices add 31½ cents a lb. in respect of rubber other than scrap crepe and 25½ cents in respect of scrap crepe to the above market prices.

NORTH INDIAN TEA CROP REPORTS

The following summary of crop and weather telegrams has been received from different districts for the month of May, 1955:

Upper Assam: Weather generally seasonable; red spider blight prevalent in North Lakhimpur; outturn last month about normal to good but considerably under last year in North Lakhimpur; immediate prospects fair to good.

Central Assam: Weather favourable; outturn last month about normal; red spider blight in Jorhat; immediate prospects fair to good.

Lower Assam: Weather seasonable; red spider blight severe in Tezpur; outturn last month poor to about normal; immediate prospects fair to good.

North Cachar: Rainfall in Lakhimpur much above normal for the season to date; red spider blight prevalent and severe in some districts; outturn last month poor to about normal; immediate prospects fair.

South Cachar: Weather generally very hot and dry and is interfering with outturn; red spider blight severe but lifting in Haikandi; outturn last month generally poor; immediate prospects fair but bad in Chutla Bheel and Chargola.

Eastern Doars: Outturn last month about normal; outturn to date is slightly under last year; good rain has fallen generally and prospects are now brighter; red spider blight severe; immediate prospects good.

Western Doars: Immediate prospects good; weather hot; red spider blight prevalent in some districts.

Darjeeling: Outturn last month about normal; immediate prospects fair; weather seasonable, thrips prevalent; red spider blight severe.

Teral: Weather seasonable; crop prospects improving; outturn to date much below normal; red spider blight prevalent.

COMPANY AND PUBLIC NOTICES

THE HURRILADIH COAL CO., LTD.

NOTICE.

NOTICE is hereby given that the Eighty-eighth Ordinary General Meeting of Shareholders of the above Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Wednesday, the 29th June, 1955, at 3-00 P.M., for the following purposes:—

1. To receive and consider the Directors' Report and the Accounts for the half-year ended 31st December, 1954.
2. To declare a Dividend.
3. To elect Directors.
4. To appoint Auditors and fix their remuneration.
5. To transact any other competent business that may be brought forward.

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends.

Year of Issue	NAMES	Amount Issued in 000's Rs.	Rate per cent.	Paid-up per Share Rs.	Market Quotations		Year of Issue	NAMES	Amount Issued in 000's Rs.	Rate per cent.	Paid-up per Share Rs.	Market Quotations

COAL COMPANIES

O, Po, F and Dd indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

A TIME FOR FRESH THINKING
ABOUT ROADSOLD PREJUDICES PREVENT APPRECIATION
OF PRESENT NEEDS

THERE is no subject of importance to the future progress of India which is at present so much in need of a positive approach as that of road development. A policy for roads, which can steer between the impracticable dreams of the engineers and the planners' reluctance to tackle a vexed problem, is becoming an urgent necessity. The country's need for a road system will grow more obvious as the second five year plan progresses; its inability to find the funds for anything more than the bare necessities of such a system will be even clearer. Now is the best time for deciding what will be required and how it can be provided. During a period when the scarcest of all resources will be money to spend, there is little point in dreams of a complete road network covering the whole country and able to offer an alternative to the railways for all forms of haulage. Whatever the advantages of such a project, commonsense indicates that for a long time to come the road system can only be regarded as an auxiliary to the railways. But within these set limits there is much thinking still to be done on the form the future road system can take, on the measures which must be adopted to allow it to work properly, and the extent to which the dreams of a future national high-speed network, providing the competition the railways sorely need, must be surrendered to the needs of the present.

It is not surprising that there is marked reluctance to tackle the problem in India. Modern roads are expensive assets and their building and renewal usually has to be paid for out of much-needed national revenue and not from the reserves or borrowings of a commercial company which can equate outlay to prospective earnings. Road systems throughout the world have become casualties to their own characteristics as assets on which the return is indirect and often intangible. It was strategic considerations which gave Nazi Germany its autobahns in spite of these drawbacks; the United States is avoiding this difficulty by re-introducing the long discredited turnpike system; Britain has not yet found a way round it and this lack of vision may develop into the biggest obstacle to Mr. Butler's hopes of doubling the country's income in the next twenty-five years. If the pressure on capital resources is being allowed to interfere with obvious priorities in a marked reluctance to work out a policy towards road development in India where the present need is less obvious. But the need is there all the same and some hard thinking now might save a great deal of heartache later. Modern industrial nations need efficient road systems, not only to feed their railways, but to reach regions of commercial importance which are economically prohibitive to railways, to provide competitive forms of transportation, to relieve railways in time of emergency, and, as has been shown during the last two months in Britain, to substitute for them during strikes. Such a fully developed road system in India will remain a hoped-for goal for many years yet, but that is no reason why the way in which it can ultimately be attained should not receive some attention now.

rities, nor does it work out the part the roads are to play, with the railways, in the national transport system. While these remain the real necessities, projects such as the Nagpur Plan are as useless pieces of paper as are some of the statistical plans at present being put forward as blueprints for economic development. When the Nagpur Plan appeared the expenditure contemplated was about Rs. 372 crores of which Rs. 66.5 crores related to national highways and Rs. 305.5 crores to other roads at a price level 50 percent above pre-war costs. Taking an estimate of 200 percent as being nearer to present-day price levels the expenditure target for the programme would be Rs. 744 crores of which Rs. 133 crores will be for national highways and Rs. 611 crores for other roads. The total expenditure for the first five year plan may well be in the region of Rs. 150 crores; for the second, the Finance Minister's estimates show a figure of about Rs. 350 crores. The total then for the period ended March 1961 will possibly be in the neighbourhood of Rs. 500 crores, a figure which is short of the inflated Nagpur target by some Rs. 244 crores. It is unlikely that the targets were so hopelessly ambitious that such a huge gap is justified. The Government may do well to consider if the roads are getting their full share of the resources available.

The fact that the proposed expenditure on roads is so small is probably due to a number of things, not all of them connected with the place of the road system having not yet been carefully thought out. The allocations available for transport are, rightly or wrongly, being hogged by the railways. The railways' claims are not only strong because of economic considerations, which in themselves are formidable, but also owe a great deal to the fact that the railways themselves are already a completely nationalised industry, are easy to control, are already well entrenched in the Government's regard, supplement the revenue to a most useful extent and are doing an efficient job in a relatively inefficient economy. But these excellent reasons need not obscure the obvious advantages which a growing industrial economy could reap by paying more attention to its roads. In the light of future needs the expenditure target of the Nagpur Plan may not be so fantastic after all. That is a point to decide after considerable and careful thought on the problem, and up to the present that has been lacking. There seems no reason why, in a developing economy, constructive thinking on roads should be left to engineers. As things are the engineers are deserting of the country's gratitude for attempting something for which their outlook and training does not fit them, but which nevertheless is badly in need of doing.

Speaking at the nineteenth session of the Indian Roads Congress in Srinagar last Sunday,

the president of the congress, Mr. H. P. Mathrani, gave some idea of the difficulties, and therefore the expense, involved in building national highways. Much of the terrain of India is ideal for roadworks, but a good deal is difficult, especially in mountainous regions, or areas subject to periodic flooding. One factor which adds to the expense involved is the number of wide rivers with uncertain courses and widely fluctuating levels. Highway building must wait on bridge building possibilities and techniques, if on nothing else. All-weather roads also present a materials problem which would not only have to be allowed for in industrial planning but might put extra strain on existing transport facilities. The one encouraging feature of these problems is that the engineers are already working on them, and there is no reason to believe they are insuperable. But projects for national highways above all other types of road are bound to be up against the worst problem of all—expense. The solution to this is a plan of priorities. Certainly strategic roads must come first, together with routes into areas which are inaccessible by rail, or where it is economically desirable to rely on road transport. Large modern highways linking centres already well served by railways are on a more doubtful level of priority; their building or first-class maintenance may have to wait until it is financially possible to have two transport systems working side by side. The smaller highways, those which were classified in the first five year plan as State roads and which depend for their existence on State initiative and efficiency, will become progressively more indispensable as development proceeds. There will not only be the free flow of a growing volume of inter-regional trade to be considered, there is also a need for the spread of progressive ideas into regions which the less flexible railways cannot hope to serve. If the railways, and a few main highways, are to be the country's transport arteries, they will depend for their efficiency on the pattern of their State-road capillaries. Up to now the States have shown eagerness to provide themselves with an efficient road system. But as the conflicting calls of development accumulate and the failure of nationalised road transport becomes more expensive, enthusiasm is likely to melt away. If India is ever to have an efficient road system that should be avoided.

Local and village roads are such an obvious necessity as to need no comment. Fortunately they are also the least expensive to build. Voluntary work is the key to the labour problem and this can often be provided quite easily within the framework of existing community projects and extension schemes. Materials sometimes present difficulties, but several successful methods of hard-surfacing dirt roads are at present available and an all-weather road is now a practicable proposition for every village. The difference which this will make to village life and prosperity will be well worth the effort and expense involved. Roads will also do a great deal to break down the insularity of the village dweller which may prove to be a genuine obstacle in the path of progress in future years. Mr. Nehru has recently lent his support to the need for an efficient State and local road system to provide for the genuine needs of the tribes of the North East Frontier Agency. The same might well be advocated for the vast majority of India's villages.

But a large and efficient road network would be of little more than ornamental value without a progressive policy for the transport which is to run on it. So much of the thinking of the last quarter-century on the subject of roads has been confused by the conflicting interests of the railways and the road transport hauliers. Now that the railways are unlikely to meet with severe competition in the foreseeable future, and could in fact do with more competition than they are getting, there seems little point in allowing this old bogey to hinder genuine development needs. Little positive encouragement would be needed to ensure the rapid growth of a national road transport industry, but a great many of the present discouragements would certainly have to be removed. Apart from the obvious deterrent effects of licensing procedure and high taxation, which in themselves serve to offset the competitive advantage which road transport usually possesses over rail, there are unfortunate and unnecessary doubts about nationalisation. transport does not lend itself easily to State management. In most cases nationalisation is only resorted to so that road and rail transport can be integrated. Such experiments are rarely successful, as was shown in the case of the British motor-transport industry.

The present behaviour of State Governments, acting frequently without any regard to the problems of the industry, is only calculated to make haulage operators feel even less secure than in fact they are. Unless the Central Government decides that it is going to permit a motor-transport industry to exist and gives the hauliers suitable assurances, there is little point in discussing road problems at all. At the moment the Government does not seem to have made up its mind, and while it is doing so the State Governments are cheerfully wrecking what is left of the industry. Rational thinking would be easier if it were appreciated that the problem goes deeper than the straightforward conflict between the nationalised railways and privately-owned road haulage companies. It is a question of what will serve the future of the country. Both commonsense and expediency point to an efficient road transport industry. That is something which the States are unlikely to provide, if only because they will be unable to operate effectively on a scale larger than their individual territories.

ADMINISTRATION OF IMPORT CONTROLS

DEFECTS IN CUSTOMS PROCEDURES

ONE of Mr. T. T. Krishnamachari's most notable successes as Minister for Commerce and Industry has been in regard to import policy. In the earlier postwar years, there was hardly any policy at all. The Government merely stumbled along from one expedient to the next, controlled by, rather than controlling, events. The move toward generous liberalisation was encouraged by the fact that large sterling balances had accumulated in Britain while the domestic economy was suffering from high prices and an acute shortage of capital and consumer goods. But liberalisation was invariably discovered to have been carried too far, and was therefore invariably succeeded by drastic restriction. Not until two or three years ago was some sort of stability in import policy reached. The credit for this is not of course wholly due to Mr. Krishnamachari. Circumstances helped him, as they did his predecessors. He nevertheless deserves praise for exercising firmness when firmness was possible; even more so for streamlining the control machinery and making it more efficient in order to eliminate delays. Applications for licences, which until not so long ago had to wait months for official attention, are now promptly handled; as a result, better bargains can be concluded, opportunities for graft and corruption are reduced, and imports get a fairer deal. Mr. F. C. Kidd, chairman, was able to tell the Calcutta Import Trade Association last week that complaints against the import trade control policy "are becoming fewer as the years go by, at least as far as procedural matters are concerned, and latterly the policy has been working well."

The trend now appears to be to liberalise imports gradually, in keeping with three main requirements. First, foreign exchange must be conserved. Second, consumer needs must be satisfied to as generous an extent as possible. Third, the interests of domestic industry must be safeguarded where, because of its youth or for other reasons, it is not yet in a position to compete with foreign manufacturers. It is on the last point that controversies concerning import policy nowadays usually centre. Mr. Kidd made a useful point when he re-emphasised that import policy should not be used to protect industries. Protection should be based not on administrative decision, but on careful investigation by the Tariff Commission, otherwise the consumer is liable to suffer. The whole question is complicated by the fact that a certain measure of protection is implicit in any regulation of import. When the Government, for instance, draws up its estimates of demand and supply for a particular commodity, and proposes to cover the shortage by allowing in only a limited amount of foreign goods, it is restricting competition in favour of domestic industry. The restriction may be in the national interests. But, as Mr. Kidd pointed out, the consumer should not be forgotten. The claims of indigenous manufacturers in regard to both output and quality should be closely scrutinised before they are accepted, otherwise shortages are liable to develop.

Any consolation that may be derived from the better administration of import controls is mitigated by the fact that customs procedures continue to create serious difficulties. Mr. Kidd mentioned, for instance, that early last year the Central Board of Revenue issued a ruling to the effect that when an assessment was made on the basis of real value determined under section 30 (b)

of the Sea Customs Act, an import licence should be debited with the real value accepted for the purpose of assessment; and when goods were assessed to duty on the basis of real value under section 30 (a) of the Sea Customs Act, a licence should be debited with the invoice value where the invoice value represented the cost of delivery to an independent importer. This meant that importers never knew whether they would infringe import control regulations by exceeding the value of their licences because they had no accurate knowledge of the amount which would be debited to those licences until the goods had been imported. Fortunately, the Government has since decided that licences will be debited with the c.i.f. value if the customs authorities accept this as a basis for arriving at the real value; otherwise they will be debited with the value which denotes the cost of delivery to independent importers.

A problem which has not yet been solved is how the real value of a commodity can be determined for assessment purposes. Appraisers seem to have no comprehensive price statistics to go by; they often assess goods at the highest price known to them, which obviously does serious injustice to the importer. The Government has done nothing about this, despite repeated representations from the trade. Mr. Kidd also mentioned that customs appraisers, presumably under instructions from higher authorities, have adopted the practice of classifying goods at the highest possible assessment duty under the customs tariff schedule, irrespective of the special purpose for which an import licence is being granted. As a result, widely differing rates of duty are levied on identical goods imported through different ports, because appraisers classify the same goods under different items in the customs tariff schedule. The examination of agency agreements by the customs is another cause for complaint. During the last two years, a number of these agreements have been examined and it seems that commissions and discounts are in the main being totally disallowed, which is a departure from previous practice. Piecemeal decisions are made on individual agency agreements, and these give an unfair price advantage to importers whose agreements remain to be examined. Importers are also unable to tender for forward business as long as there is uncertainty regarding the value at which their goods will be assessed.

The many ambiguities of customs procedure create confusion not only among importers but among local customs authorities as well. Several representations have been made from time to time, but little seems to have been done. The problem is not as baffling as this inactivity might suggest. The framing of clear and detailed instructions would help importers immeasurably by enabling them to know exactly where they stand; it would also greatly increase the efficiency and integrity of the customs services.

COMMERCIAL ATOMS IN GENEVA

U.S. DEVELOPING HUGE ATOMIC INDUSTRY

THE atomic energy conference in Geneva in August was intended to be scientific, but when its scope was broadened to include an exhibition it assumed, despite itself, a partly commercial character. Of the many countries participating, Britain and America especially will have an eye on the export markets, whose potentialities are vast. Booking of space is completed; exhibits are being prepared. Britain will show models of Calder Hall, the world's first big atomic power station. It would be a happy coincidence for Britain if this station began operating during the conference, but in fact the conference ends on 20th August, whereas Calder Hall's first operations are scheduled for September. Britain will emphasise not only power but also various experimental equipment and the use of radioisotopes. The American display will include a small zero-energy reactor, using the kind of fuel that the American authorities intend to supply to other countries. This exhibit will certainly be a focus of interest, at a time when American policy is noticeably shifting, if not away from lethal purposes, at least towards industrial uses. American industry is now receiving information hitherto secret, and the Americans' wholehearted participation in the conference, whose purpose is entirely peaceful and which recognises no political "curtains", is evidence of the same trend.

Quantitatively, the United States has much more atomic industry than Britain. There are at present more than 20 major reactors and as many minor ones operating in that country, which can thus claim a nuclear industry five or six times as big as Britain's. *Business Week* has stated recently that already production of reactors on a private-enterprise basis "promises to challenge the motor-car industry's claim to top place among buyers of capital goods and in the volume of sales." America's first "mobile" reactor was designed for the submarine, Nautilus, but the Federal Gov-

ernment has already planned an atomic-powered merchant ship, and work on atomic-powered locomotives is developing rapidly in America. Britain is not so well advanced in such applications. (She is, indeed, sceptical of the whole idea of applying nuclear power directly to transport on land.) On the other hand, the chairman of the U.S. Atomic Energy Commission, Admiral Lewis Strauss, had to report after investigations last April that Britain was at least three years ahead of America in applying nuclear energy to generating electricity. America's development has been tardy in this respect because America has abundant other sources of power, and nuclear power, which will be competitive in cost with other modes of power in Britain from the start, will be uneconomic in America for many years. Russia was a little ahead of Britain in operating an atomic power-station. Its capacity is only 5,000 kilowatts (compared with Calder Hall's 60,000 kilowatts), but another with a capacity of 100,000 kilowatts is evidently well advanced. And Russia, like Britain and America, is using isotopes extensively in medicine and (especially for measuring and control) in industry, and exporting them. Russia's section at the exhibition will be studied closely, for she has not been backward recently in publicising her achievements in nuclear development. It is not always easy to distinguish between what Soviet scientists calculate as feasible and what is actually being done, but at least the Russians do not lack ideas. Stories of atomic-powered motor cars and locomotives are not particularly interesting to those who believe that the best way to apply nuclear power to land transport is by electricity from the mains, but calculations that an atomic-powered liner could travel round the world on less than 1½ pounds of fuel suggest that Soviet ideas on the application of the new power to shipping are in line with those of the West.

The idea of applying nuclear power to motor cars is by no means ruled out, for it could, presumably, be done by means of electricity, using electric-battery traction in place of petrol engines. The system would evidently require large-capacity batteries more compact than those at present available, which could be readily changed on the road at service stations corresponding with our petrol-filling stations, but such batteries could, no doubt, be developed if abundant and cheap electricity provided a strong incentive. On the other hand, American experiments suggest possibilities of a battery that not merely stores power but generates it, by converting the energy of radioactive isotopes into electrical energy. It may be that the most important uses of atomic energy in the coming decades will be in areas far distant from sources of conventional power. In such areas not only power stations but also individual units of transport that need only very small quantities of fuel will be of great benefit in the next stage of economic development. Preliminary information on the equipment that will be shown in Geneva suggests that the commercial possibilities of such requirements are well appreciated. Countries with big engineering and constructional industries have an obvious advantage in this new industry, and grouping of big companies that specialise in particular departments of the industry—electrical, thermal, chemical, etc.—provides a strong basis for exports. But the range of countries participating at Geneva shows that the big countries will not be able to monopolise the new export trade. There may be few organisations that can yet offer to build complete atomic power stations, as Britain's new Nuclear Power Plant Company (composed of eight established companies) can offer; but scientific technique is not a matter of size, and the smaller countries will probably take a big share of the trade in special equipment for the new industry, special materials for its processes, and special instruments using radioisotopes.

CURRENT COIN

Encouragement for Lac.—Dr. Panjabrao Deshmukh, the Union Minister for Agriculture, addressed the Lac Conference at Simla about the important part played by this commodity in the country's volume of exports. The average annual income from this source during the last nine years has been about Rs. 10 crores. It is now experiencing increasing competition from other countries. More recently it had also to contend with competition from substitute synthetic products. In spite of these adverse factors, it is worthy of note that the overall demand for Indian lac has not fallen appreciably even though the pattern of this demand has changed in some respects. India's exports of lac during 1954-55 amounted to 7,26,300 maunds, roughly valued at about Rs. 10.5 crores, against 7,32,000 maunds which fetched only Rs. 6.7 crores during the preceding year. Exports of lac soared to as much as 9,70,000 maunds, and earned about Rs. 15 crores, during the stock-piling days of the Korean war. As pointed out by the Union Agriculture Minister, lac is an example of nature's bounty and constitutes an important source of

subsidiary income to a large number of cultivators in Chota Nagpur, the hill tracts of Madhya Pradesh, Orissa, Vindhya Pradesh and Assam as well as parts of Western India. In many of these areas cultivation and collection of lac contribute appreciably to the family income of the various forest tribes. It is a complex product resulting from the biological interaction between the sap of trees and the lac insect. It is not generally known how much it has contributed to the progress of science and industry. But for it, the manufacture of gramophone records would not have been possible as early as 1897. Dr. Deshmukh also revealed that before the advent of synthetic dyes, lac was a very important source of natural dye which, along with lac itself, brightened many a hearth and home. The electrical industry owed a debt to this natural insulating material. The beauty of furniture was dependent to a large extent on the coating of shellac. Thus lac and its processed goods, seedlac and shellac, are still considered to be the most valuable resin judging from its multifarious uses. It seems that the boom during the period of the Korean war gave rise to reckless speculative activity. This brought about heavy fluctuations in prices and became one of the impediments in the way of increased production of lac. The Government of India has now completely banned forward trading and speculation in lac under the Forward Markets Regulation Act. Among the other reasons for the decrease in production given by Dr. Deshmukh were the failure of the crop due to seasonal factors and shortage of stick-lac. During recent years it appears the fall in the production of kumum-lac, which is the best commercial variety, has been of a pronounced nature. The target for production of this commodity by the end of the second five year plan has been provisionally fixed by the Planning Commission at 1.7 million maunds and Dr. Deshmukh announced at this conference that the Government of India had recently taken an important decision about the agency for the execution of development plans regarding various commodities. During the second five year plan, while research work would continue to be done by the Commodity Committees, the development work would be carried out by the State Governments in direct consultation with the Central Government and not through the agency of the Commodity Committees, because the Commodity Committees met hardly twice a year. The Government of India also feels that the tempo of development work in the second five year plan would not justify execution of the development plans through these Committees. Pointing out the entire dependence of shellac on the export market Dr. Deshmukh said that the Government of India proposed to set up an Export Promotion Council for shellac and the Indian Lac Cess Committee was constantly in touch with the possible users of lac (both the Departments of Government and commercial concerns) and that it was hoped that the efforts of the Committee would lead to increased consumption of lac in this country.

Increase in Indo-British Trade.—The increase in overall trade between India and the United Kingdom noted in the first quarter of this year was maintained up to the end of April, when the total stood some 23 percent above the figure for the first four months of 1954. During the four months India sent Britain goods valued at £66,871,000 compared with £50,316,000 in the corresponding period of last year, and Britain sent in return products worth £43,856,000 compared with £39,015,000. Together with a small amount of British re-exports, the total for this two-way trade to the end of April was £110,915,000 compared with £89,442,000. Tea accounted for almost 60 percent of India's export trade with the U.K. during the four months when she sent 1,172,728 cwt. valued at £40,114,000. The next largest group of U.K. imports from India consisted of miscellaneous textile manufactures—including jute piecegoods, etc.—to the value of £6,465,000. This was followed by £4,305,000 worth of leather manufactures and dressed furs. Non-electric machinery headed the products of British heavy engineering industry that made up the bulk of India's imports from the U.K. up to the end of April. During the four months these imports reached a total of \$32,999 cwt. valued at £10,391,000. Electrical machinery, apparatus and appliances sent to India by the U.K. reached a total value of £5,510,000. Next came vehicles—5,910 tons of railway stock worth £1,560,000, and road vehicles and aircraft to the value of £3,465,000. Britain sent India 48,140 tons of iron and steel (£2,832,000) compared with 30,357 tons in the first four months of last year. She also sent £1,837,000 worth of the wide range of products listed as manufactures of metals, including £317,000 worth of implements and tools, and non-ferrous base metals valued at £794,000. The next largest group of Britain's exports to India during the four months under review was chemicals, totalling £5,504,000. Britain sent £736,000 worth of petroleum and petroleum products, the largest item being 5,124,000 gallons of lubricating oils (£671,000) compared with 788,900

gallons. Non-metallic mineral manufactures sent by the U.K. totalled £593,000.

Textile Export Delegation.—Considering the importance of the export trade in textiles in the country's economy and the fall in its volume during recent months, the newly-formed Cotton Textiles Export Promotion Council is to be congratulated on its decision to send a trade delegation consisting of leading representatives of the textile industry and the textile export trade, on a study tour and goodwill mission to Burma, Thailand, Malaya, Indonesia and Ceylon. South East Asia offers the nearest outlet for Indian textiles, Trade relations on a fairly firm basis have already been established by Indian shippers since Japan's exit from this area after the last war. This position has changed lately and the competition in the world textile markets is growing apace. It is, therefore, a good idea that a representative delegation of both the trade and the industry should make an on-the-spot study of the markets in these South East Asian countries, to assess the extent of their requirements of cotton textiles, to ascertain the nature of consumer preferences as a result of recent changes in the tastes and habits of the people regarding dress and to investigate other relevant aspects of this trade in each of these areas. To enable them to do so correctly, it has been rightly decided that the members of the delegation should hold discussions with the various Chambers of Commerce and textile trade organisations as well as Government officials and visit local textile markets. It is also proposed that the delegation should do its utmost to bring home to the importers in South-East Asia India's vast productive capacity in textiles, the technical advances attained by the industry, and its ability to cater to the varying tastes of overseas buyers. As a vital part of its preparations for a successful mission, the members of the delegation are at present engaged in being suitably briefed on all aspects of the textile export trade of this country by the shippers' organisations and other trade bodies in Bombay. It must be said that the delegation, as a body, is both represen-

SURVEY OF ENGINEERING INDUSTRIES IN INDIA

With next week's edition of CAPITAL, dated 30th June, will be published an 84-page survey of the Indian Engineering Industry. This Supplement will be supplied free to registered subscribers and will be available to others at Rs. 5 a copy. Enquiries may be addressed to the Manager, CAPITAL, 5, Mission Row, Calcutta 1.

tative and well balanced and its personnel has been chosen with care. It is to be led by Mr. Chinoobhai C. Javeri, President of the All-India Exporters' Association, Bombay and will include Mr. Arvind Narotam, Director, Ashok Mills, Ahmedabad, Mr. M. N. Savani, Vice-President, Africa and Overseas Exporters' Chamber, Mr. T. P. Barat, Director, Bombay Dyeing and Manufacturing Co. Ltd., and former Textile Commissioner to the Government of India and Mr. P. K. Nagesheth, Secretary, Cotton Textiles Export Promotion Council.

Re-grouping the Railways.—If change were a sign of progress, India's Railway Ministry would be the most progressive of departments. But progress implies change for the better, and by this criterion the Ministry does not always qualify. Far-reaching adjustments are ordained under one ministerial set-up; time passes, a new Minister arrives and the adjustments are promptly reversed. The progress of the railways thus comes to resemble that of a rocking horse: they move vigorously backwards and forwards but ultimately come to rest where they began. This nursery game has been played to ridiculous lengths in reclassifying passenger accommodation; it has occurred also in the sphere of zonal grouping. When the original railway regrouping scheme was introduced, there was much misgiving over the proposal to join the East Indian Railway with the Bengal Nagpur Railway to constitute the Eastern zone. Trade, industry and others (including senior railway officials) warned that the unit would be too large to be administered efficiently, but these criticisms were ignored. The force of these criticisms has now come to be realised, though it is still not clearly acknowledged, and the Eastern zone is to be split back roughly into its original components. The move is not the less welcome for being a reversal of a basically thoughtless measure; Mr. Shastri admits that the administrative machinery on the Eastern Railway is already considerably strained, and would become unmanageable with the developments envisaged under the second five year plan. But the course of events suggests that if the Ministry were more sensitive to responsible opinion, it could avoid many of the pitfalls into which it is attracted by false preconceptions.

Without Prejudice

MURDER IN THE EXECUTION OF DUTY

THE LIMITATIONS OF THE ARMED POLICEMAN

(FROM OUR LEGAL CORRESPONDENT)

THE charge is murder; and you are invited to imagine yourself on the jury, sworn in a very perplexing case indeed. The accused man was a policeman, and the tragic event occurred round about midnight on 28th and 29th July 1953. A mixed train, when going from Banaras Cantonment Station to Allahabad, stopped at Handia Khas railway station at 10.59 p.m. On the train were the Railway Protection Police consisting of Kashi Singh Havildar Guard and three constables Chingham Ram, Deomani Singh, and Dukhi Singh the accused. Emphasising the obvious, you will note that these three policemen were under the orders of their superior officer the Havildar. Deomani got down at Katka station to obtain water leaving his rifle and cartridges behind in the compartment meant for the Railway Protection Police. The train left Katka and Deomani was accidentally left behind. At Handia Khas station, constable Dukhi Singh observed that a man named Nanka was loitering near a goods wagon in suspicious circumstances. The man was in fact the servant of a contractor holding a contract for the collection and removal of burning cinders and he may have been there on his lawful occasions. But the policeman considered him to be a thief. He had cause for suspicion as there had been recent complaints of theft at Handia Khas station and one of the railway staff there had been suspended. So in the bona fide belief that Nanka was a thief, P.C. Dukhi Singh arrested him and took him to the police compartment. The engine driver and one fireman Ram Monohar interceded for the man explaining that he was not a thief but an employee of the contractor. "He can satisfy the magistrate about that," said the constable in effect and marched the man off to the station just after midnight and it had proceeded only a few feet when the arrested man made a jump for freedom out of the train from its off side, that is the left side and ran off into the darkness. The policeman followed him with the rifle. The Havildar fired a shot from a very-light

pistol which produced a temporary flood of light. Aided by this the policeman chased the man who ran round the front of the engine to the right side of the train. It may here be mentioned that P.C. Dukhi Singh later claimed that the Havildar ordered him to shoot at the alleged thief. The Havildar admitted this before the magistrate but later at the trial denied it. But whether he did so or not, though a police officer may under Section 45, Criminal Procedure Code, use all necessary means to effect an arrest, that would not excuse him for taking the life of the offender unless the latter is accused of an offence punishable with death or transportation for life. Anyway the constable did not shoot the alleged thief who got clean away. What he did was to fire at the absconder and shoot and kill the unfortunate fireman who had got down from his engine and was standing by the footboard. At the subsequent prosecution it was contended that P. C. Dukhi Singh, in a flaming rage and believing that the engine driver and the fireman were concealing the alleged thief, intentionally fired at and murdered the fireman. The constable's contention on the other hand was that having been given orders to shoot he did shoot, as he thought, at the alleged thief and by accident shot the fireman.

Well, there you have the case on which this young policeman was charged with murder and if, as the writer's guess is, you are going to find him not guilty out of hand without leaving the jury box you are on the wrong track. In fact he was found guilty and sentenced to death and it is with his appeal to the Allahabad High Court that we are now concerned. The reader, if any such there be, who does one the honour of reading these random legal reflections regularly, may remember a not altogether dissimilar case on which one commented a few years ago. It was the case not of a young policeman but of a young Indian soldier hardly more than a recruit. A military guard was keeping watch and ward over a refugees' camp. Some refugees were, in the small hours, noisily playing cards in a tent. They became quarrelsome and started fighting. A military picket came on the scene and a foolish N.C.O. ordered the nervous youngman to fire on the disputants. This he did and killed a poor woman onlooker who had had nothing to do with the fracas. There was no real dispute about the facts and the accused's defence was that he was under orders to shoot and did so, having no alternative but to obey his superior officer. The defence did not avail him. He was charged with murder, convicted and sentenced to

death. The High Court (Bombay, writing from memory) confirmed the conviction and sentence, though it concluded its judgment with a broad hint that the prerogative of mercy lay in other hands. That case fairly took the writer's breath away at the time. With every sympathy for a poor woman killed through a panic-stricken youth, who had been ordered to fire by a fool of a superior, missing his aim or firing at no one in particular, it seemed unthinkable that this could be wilful murder with malice aforethought; and much perturbed one turned to that safe guide *Dicey on Constitutional Law*. This is what the Professor has to say about it.* His observations relate to British law, but we may with safety assume that they apply equally to the law in India.

"The fixed doctrine of law is that a soldier, though a member of a standing army is.....subject to all the duties and liabilities of an ordinary citizen.....A soldier is bound to obey any lawful order he receives from his military superior. But a soldier cannot, any more than a civilian, avoid responsibility for breach of the law by pleading that he broke the law in bona fide obedience (say) of the commander-in-chief. Hence the position of a soldier is in theory and may be in practice a difficult one. He may, as it has been well said, be liable to be shot by a court martial if he disobeys an order, and to be hanged by a judge and jury if he obeys it." The eminent author goes on to give an example. "An officer orders his soldiers in a time of political excitement to arrest and shoot without trial a popular leader.....suspected of treasonable designs. In such a case the soldiers who obey, no less than the officer who gives the commands, are guilty of murder, and liable to be hanged for it when convicted in due course of law. In such an extreme instance as this the duty of soldiers is, even at the risk of disobeying their superior, to obey the law of the land."

That this is the law as regards the military. It is also, it is submitted, substantially the law with regard to the police and certainly the armed police. The fact that a man is a policeman and of his acting strictly under orders, does not exempt him from criminal liability for acts which would be crimes if done by a civilian. Nevertheless, granted that P.C. Dukhi Singh, even if he fired under orders, committed a crime by obeying them, one fancies that you in your capacity of a jurymen would be shocked at being directed that the crime was murder. Personally, if on a jury, the writer, whatever the learned judge's directions on the law were, would never have assented to such a verdict. Murder is the unlawful killing of a person with malice aforethought. Malice and intention are of the essence of the crime. Assuming the constable shot with intent to kill and not to lame and thus effect an arrest he certainly had no malice against and no intention of injuring, let alone killing, the innocent fireman standing by his engine. But the jury did convict of murder and the judge sentenced the policeman not to the lesser penalty of transportation for life but to death. The condemned man appealed and the appeal was partly successful.

Said Roy J. in the Allahabad High Court: ".....After the arrested man had escaped from the running train the appellant pursued him with a view to effect his re-arrest and when he was not in a position to apprehend him he fired at him and in that process he hit the fireman.....the case would be covered by Exception 3 to Section 300 of the Indian Penal Code. That Exception provides that culpable homicide is not murder, if the offender, being a public servant or aiding a public servant acting for the advancement of public justice, exceeds the powers given to him by law and causes death by doing an act which he in good faith thinks to be lawful and necessary for the due discharge of his duty.....without ill will towards the person whose death he was caused.....There was no ill will between the appellant and the deceased. The appellant was a public servant and his object was the advancement of public justice. He, no doubt, exceeded the powers given to him by law and he caused the death of the fireman by doing an act which he, in good faith, believed to be lawful and necessary for the due discharge of his duty."

Their lordships held that the offence was not murder and set aside the death sentence. What offence was it then? It was culpable homicide not amounting to murder, i.e. manslaughter. And when one visualises this zealous keen policeman after a man, whom he believed to be a thief and whom he had arrested, had escaped from his custody, chasing him in the dark of midnight; then the flash of the Very-light and consequent deeper darkness; the pursuit round the engine with the absconder lost sight of; the shot fired apparently under orders, and the wrong man hit in the gloom and killed—well with every sympathy for the innocent victim of the tragedy, one finds the sentence depressing reading. It was seven years' rigorous imprisonment.

[Dukhi Singh v The State. A.I.R. 1955. (June). Vol. 498 (Allahabad). 379.]
*Law of the Constitution, by A. V. Dicey, K.C., D.C.L., p. 299 and 300.

At a meeting held by the Coal Commissioner and Chairman, Coal Board, with the representatives of the Indian Mining Association, the Indian Mining Federation and the Indian Colliery Owners' Association on 15th June, it was agreed in principle that amalgamation of small collieries, where necessary in the national interest, into up-to-date collieries capable of fulfilling the demands and attaining the standards of the Second Five Year Plan should be taken in hand. A committee will be set up immediately to study the position in the Ranigunge and Jharia fields and work out definite proposals.

A DITCHER'S DIARY

Russians will come and get them, but that Russian mothers when similarly placed threaten their offspring, not with the Americans, but with the Swedes!

Is it a sound instinct, or mere prejudice, that makes us mistrust a movement that seeks to accomplish its ends by sending around the world a team of has-been politicians accompanied by "a musical revue with a chorus of 60"? The whole idea sounds so ridiculous that I suppose we should just laugh at it and forget it. But when we see people doing something quite ridiculous and at the same time drawing on large financial resources to do it with, we begin to suspect that there are sinister elements in the case although we cannot quite put our finger on what they are. This, at any rate, is my own puzzled reaction to Moral Re-Armament. I do not know what MRA is up to, though this is not for want of trying, because all their literature consists of fatuous generalities with nothing that a critic can get his teeth into. I have watched the spread of their influence in India in the last few years with some dismay, although I have never heard of them doing anything of which I actually disapprove—apart of course from Dr. Buchman's famous admiration for Hitler. Like the Salvation Army they seem to specialise in collecting repentant sinners, who proceed to magnify the extent of their past wickedness in order to add to the lustre of their present redemption. For example, the politicians who will be visiting this city shortly on the MRA mission referred to above have issued statements to the effect that they used to be thoroughly bad eggs but have now seen the light. They are all people of no importance whatsoever, but their imminent tour of India is being heralded under the extravagant title "World Mission of Statesmen". As I have mentioned, they will be accompanied by a musical revue and altogether will make up a travelling circus of 160 souls. Their ambition, it appears, is to "answer the deepest longings of millions and set them talking and living ideologically". This sounds like harmless buncombe, but when purveyors of bunk can raise the cash to send 160 people around the world, one cannot help wondering.

What do Indian working men do with their money? Or, more specifically, what would they do with any extra money they received over and above their present income? These questions have an obvious human interest, but they are also of the first importance for economists and business men. After all, national development is now being undertaken on the theory that extra money pumped into the economy by Government spending will show up in increased demand for the produce of industry. This is a hopeful theory as applied to India and many of our local Keynesians have come to grief calculating "multipliers" that never seem to work. For some years past, the Government has been pumping money into the economy at a merry old rate, yet the country still shows signs (even Mr. Deshmukh admitted this last month) of deflation and inadequate demand. An explanation I have often heard canvassed in this office, and which has been offered I think in some *Capital* editorials, is that so large a part of the working population is permanently in debt that extra money goes toward the repayment of loans and thus has very little effect on the demand for consumer goods. An enquiry has just been carried out among Bombay Port Trust workers and although it refers to too small a group to allow deductions valid for the whole country, it

does suggest that there is much in this argument. Under the Minimum Wages Act, the Port workers received a windfall in the shape of arrears of wages going back almost two years. So someone very intelligently set out to discover what they did with it. The enquiry shows that out of every Rs. 1,000 received, Rs. 422—by far the largest single allocation—went to repayment of debt. This is an astonishingly high percentage, by international standards, and it is no wonder that in these circumstances business men are disappointed that money does not flow back in increased demand for their goods. Every individual worker remitted home the sum of Rs. 71, and for all we know some part of this went toward debt repayment in the village—or toward the purchase of a bit of land. Only Rs. 179 out of every Rs. 1,000 was spent on consumer goods. Ornaments for the wife (Rs. 248 per worker) and expenses on marriages (the average cost of a marriage ceremony being Rs. 660) absorbed most of the rest. The slice of the market economy, as business men understand it, is plainly very small, and maybe this is why Mr. Deshmukh can go on producing budgets that should be inflationary but which in fact do not have uniformly stimulating effects. Someone will say that the creditors who had their outstanding obligations repaid—the moneylenders, temple priests, old widows, Pathans and the rest—must have done something with the money they got back. I am not so sure. Presumably they regarded their good loans as assets and still regarded the money when it came back as an asset; they didn't feel any richer and may have felt less rich (although more "liquid") because the money was no longer earning interest. So they would not rush out and buy themselves a refrigerator, as the worker just might have done if he had had no debts to pay off. India, it seems, is a great monetary sponge that can go on absorbing a lot more cash yet before any of it begins to leak out in the form of increased demand for industrial goods.

The story that when Maulana Azad negotiates with the British Government during his present visit to London he will speak only in Urdu, using Mr. Humayun Kabir as an interpreter, is so far out of accord with the renowned good sense of both these gentlemen that it must surely be untrue. The Maulana is probably the wisest old man in this country, and Mr. Kabir is certainly one of the cleverest. The idea of them playing a sort of party game, with the Maulana pretending not to understand what the Earl of Home says to him until Mr. Kabir has translated it into Urdu, savours strongly of the ridiculous. True, the Maulana speaks only in Urdu on public occasions in India because he seeks to convert his countrymen to speaking a national language (though even then he should use Hindi), but he can scarcely be seeking to convert Whitehall to the use of Pakistan's national language. Lloyd George said the last word on the use of English by people who also have their own native tongue when de Valera came to London to negotiate with the British Government about Eire's future. De Valera, in nationalistic mood, began by addressing his remarks to the British ministerial team, which included Churchill, purely in Gaelic. Jaws dropped because no one had the faintest idea what he was talking about. Lloyd George thereupon replied to de Valera purely in Welsh. The Irishman's jaw dropped for he was in no better case. Switching to English, Lloyd George said, "You see, if we are going to get anything done here we may as well speak the language of these Englishmen, which everybody understands."

Company Meeting

INDIAN TRADE & GENERAL INSURANCE COMPANY LIMITED

In his statement accompanying the Report, Accounts and Balance Sheet of the Indian Trade & General Insurance Co. Ltd. for the year ended 31st December 1954, the Managing Director, Lalit Karam Chand Thapar reports that the Net Premium Income of the Company has reached a fresh record of Rs. 57,10,597, an increase of Rs. 5,52,451 over the figure for the previous year.

The Fire Department had a very good year, the Net Premiums totalling Rs. 27,67,331 as against Rs. 25,97,027 in the previous year, and the Claims Ratio showing a reduction from 46.4% to 39.5%. Commissions and Expenses of Management at 45.6% compare favourably with the average expense ratio of the British Tariff Offices conducting worldwide business. After increasing the Reserve for Unexpired Risks by Rs. 1,10,667 to Rs. 13,58,015, a sum of Rs. 3,25,415 has been transferred to the Profit & Loss Account.

The Marine Department came through a difficult year creditably, the Net Premiums amounting to Rs. 18,80,133 as compared to Rs. 16,57,458 in the previous year. An exceptionally large number of total losses and general average losses resulted in an increase in the Claims Ratio from 53.6% in 1953 to 60.1% in 1954, but Commissions and Expenses of Management came down from 29.4% to 26.9%. The Reserve for Unexpired Risks has been further strengthened by Rs. 3,66,153 and now stands at Rs. 16,92,120, more than double the Reserve maintained two years ago.

In the Miscellaneous Department, although the Net Premiums went up from Rs. 9,03,662 in 1953 to Rs. 10,63,133 in 1954, the Claims Ratio rose from 45.3% to 63.9%, mainly due to heavy Motor claims in certain Overseas territories where the Company has started writing direct business. On the other hand, Commissions and Expenses of Management at 39.9% showed a reduction compared to the figure of 42.8% in the previous year. The Reserve for Unexpired Risks has been increased by Rs. 79,736 to Rs. 5,31,567.

The Balance Sheet position has again been strengthened, the Reserve for Unexpired Liabilities now amounting to Rs. 35,81,702 and the Book Value of Investments totalling Rs. 43,79,139, an increase of Rs. 2,69,875 over the figure for the previous year. The Funds of the Company now stand at Rs. 66,37,298 and the Total Assets at Rs. 87,18,937. The Company has therefore emerged from a year, which has not been without its difficulties, with strengthened resources, and has definitely established itself in the very forefront of the leading Indian Companies.

It is proposed to maintain the same Dividend as in the previous year (Rs. 1/8 per Share) and the amount provided for this purpose is more than doubly covered by the Investment income of the Company.

ABRIDGED BALANCE SHEET AS AT 31ST DECEMBER, 1954

Finance in India and Abroad

THE CALCUTTA MONEY MARKET

LESS STRINGENT CONDITIONS

Wednesday, 22nd June. CONDITIONS in the money markets are becoming less stringent and it would appear that we are entering the slack season gradually. There has been no fresh demand for extra funds from any major industry. In the Calcutta inter-bank market funds are in very easy supply. The call rate quotes 3 percent, with lenders over, and the rate may be reduced shortly.

The bill of exchange department has been dull, with few gunny bills and fewer tea bills reported. The demand for remittance has been moderate. Sterling has been very weak against the dollar, apparently for technical reasons, and the rupee-dollar exchange rate now stands at Rs. 480.4. Very little business has been reported in other foreign currencies.

Bullion was steady on bear-covering. Silver advanced from the previous week's level of Rs. 157.1 to Rs. 157.15. The rate for forward delivery was quoted at Rs. 156.4. The price was unchanged at 76-7/8d. in London and at 89½ cents in New York.

Gold also ruled steady in sympathy with silver and the price rose from Rs. 94.9 to Rs. 95.7. The sovereign at Rs. 61 showed a gain of 2 annas.

Tenders for Rs. 1 crore of three month Government of India Treasury Bills, which were opened on Tuesday, 21st June, 1955, totalled Rs. 2,77,00,000. The average rate of acceptance declined further from Rs. 2.8-5 to Rs. 2.8-2 percent per annum. Tenders at Rs. 99-6-0 percent were accepted in full and those at Rs. 99-5-9 percent were allotted approximately 15 percent. Tenders for a further Rs. 1 crore of three months Government of India Treasury Bills will be received at all centres up to the close of business on Monday, 27th June, 1955. During the week ended 17th June, 1955, Government of India Treasury Bills for Rs. 57,27,25,000 were sold in favour of the Reserve Bank of India.

A fall of Rs. 10.05 crores in notes in circulation to Rs. 1,321.23 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 17th June, 1955. The total note issue was up by Rs. 78 lakhs to Rs. 1,340.27 crores. Notes held in the Banking Department consequently rose by Rs. 10.82 crores to Rs. 19.05 crores. Deposits showed an all-round increase. Deposits of the Government of India and other Government accounts rose by Rs. 1.80 crores and Rs. 21 lakhs to stand at Rs. 57.15 crores and Rs. 11.79 crores, respectively. Balances of commercial banks at Rs. 49.88 crores disclosed an increase of Rs. 93 lakhs. Balances held abroad fell by Rs. 1.51 crores to total Rs. 64.60 crores. Investments at Rs. 39.04 crores were Rs. 1.48 crores lower. Other loans and advanced declined from Rs. 29.63 crores to Rs. 28.61 crores, against usance bills advanced to Rs. 18.39 crores against Rs. 19.57 crores. These advances aggregated Rs. 124.71 crores since 1st January, 1955. Ways and means advances were shown at Rs. 1.05 crores (Rs. 1.50 crores).

The return of the Imperial Bank of India for the week ended 10th June, 1955, shows a fall of Rs. 1.73 crores in total deposits to Rs. 208.61 crores. Investments in Government securities are down by Rs. 60 lakhs to Rs. 89.69 crores, while other authorised investments remain unchanged at Rs. 11.21 crores. Advances, including loans, cash credits and overdrafts, and bills discounted and purchased have decreased by Rs. 1.87 crores to Rs. 119.47 crores. Cash and balances are, in consequence, shown at Rs. 15.54 crores or Rs. 3.53 crores higher.

The statement of the position of scheduled banks for the week ended 10th June, 1955, discloses Demand and Time liabilities at Rs. 592.19 crores (Rs. 9.55 crores on account of borrowings from banks) and Rs. 393.06 crores (Rs. 3.26 crores) compared with Rs. 591.01 crores (Rs. 9.58 crores) and Rs. 391.40 crores (Rs. 3.11 crores), respectively in the previous week. Cash and balances with the Reserve Bank have decreased by Rs. 41 lakhs and Rs. 60 lakhs to Rs. 34.61 crores and Rs. 48.64 crores, respectively. There is a rise of Rs. 38 lakhs in investments to Rs. 344.87 crores. Advances and bills discounted at Rs. 617.87 crores reveal a drop of Rs. 2.39 crores. The ratios to total liabilities of cash and balances and of advances and discounts are, in consequence, shown at 8.4 percent and 62.7 percent against 8.6 percent and 63.1 percent.

Provisional figures of foreign sea and air-borne trade of India on private and Government accounts during May, 1955, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: Merchandise: excluding transit trade of Pakistan but including that of other land frontier countries: Exports Rs. 43.52 lakhs; Re-exports (transit trade—Rs. 2 lakhs) Rs. 41 lakhs; Imports (transit trade negligible) Rs. 49.06 lakhs. Total trade Rs. 92.99 lakhs; Treasury: Export of currency notes Rs. 22 lakhs; Export of others nil or negligible; Import of Government of India coins Rs. 2 lakhs; Import of currency notes Rs. 1.09 lakhs; Import of others nil or negligible.

Balance of trade: The merchandise import figures are exclusive of the value of certain con-

LONDON FINANCIAL LETTER

EFFECT OF THE RAILWAY STRIKE

By Air Mail

THE railway strike began at the end of the month of May, for which the trade returns were subsequently to reveal the smallest visible payments deficit of the year. The strike lasted rather more than two weeks—and it had been said that if it lasted more than one week industry would be largely paralysed. Improvisation was in fact much more successful than most people dared to hope, and it seems that no lasting damage has been done. But there were dock strikes at the same time. It must be assumed that the two disturbances together have temporarily checked the trend towards stability shown in the trade returns. The feature of the trade returns was a sharp reduction, from £318 million in April to £290 million in May, in imports. (There had been an even larger reduction in March, but mainly because that was a much longer working month.) It is unwise to make firm conclusions, but the reduction of imports, occurring just when the experts said it should occur, two or three months after the major rise in Bank rate, is strong evidence that the rise in Bank rate is having the desired effect. Presumably, the main element in the reduction of imports was a reduction of demand for stocking. The Treasury has subsequently pointed out, in its *Bulletin for Industry*, that stocks and work in progress are equivalent to about half of the value of all work done in a year. Much of them is not, of course, directly relevant to imports, but there is evidently some margin for further reduction. (It was mainly by living on stocks that industry kept going during the railway strike.) Even so, this element in the reduction of imports is by nature temporary.

Even more encouraging, perhaps, was the continued expansion of exports, from £253 million in April to £258 million in May. It was not a remarkable expansion in itself, but it confirmed an upward trend which many people believed was failing months ago. Now the question arises whether this change, too, is temporary. The effects of the strikes will not last indefinitely, but the effects of the wage-increases associated with them, or granted without strikes, may be permanent. However, in that mood of post-electoral confidence that car-

*It's a BIG job....
running an oilfield*

Many special kinds of skill are required to keep India supplied with oil, from the study of fossils to the operation of complicated plant in refineries—and not excluding the care of elephants.

Consider the complexity of the Assam Oil Company's operations at Digboi, in north-east India. Here, at India's first and hitherto only oilfield, nearly a thousand wells have been drilled into the earth's rocks—a total of over 300 miles of hole. More than 600 of these wells still yield oil regularly, modern production techniques ensuring that the maximum amount of crude is recovered from the field. Science and engineering skills guide every phase of the company's work, nowhere less than in Digboi refinery which in a single day supplies the Indian market with over 250,000 gallons of high-quality petroleum products. In all branches of this full-scale industry the Assam Oil Company employs nearly 9,000 persons, while many hundreds more are engaged in serving the consumer.

Yes, the day-to-day running of the oil industry is a big job. To keep it running the Assam Oil Company has to spend crores of rupees just in "looking ahead". For no oilfield lasts for ever, and in order that India's vital flow of oil may be supplied to an increasing extent from India's own resources, the company is constantly exploring for new sources of petroleum.

Burmah Group of Oil Companies

PROSPECTING · DRILLING · PRODUCING · REFINING

ried ordinary share prices on the Stock Exchange to new peaks, even while the railway strike was on, there is less apprehension—regarding the balance of payments, production, and almost anything else—than was noticeable a month or two ago.

Progress, but no Haste

After the meeting of the OEEC Ministerial Council in Paris this month the British Chancellor of the Exchequer, who had presided over the meeting, said that the prospects for convertibility were good, but there was no question of rushing into it, as the time was not ripe. Despite this rather cautious reaction to the talks, it appears that material progress towards convertibility was made in Paris—mainly in the negative but important matter of disposing of the EPU. The British Treasury would have liked a decision that the Payments Union should be completely disbanded and not replaced when the currencies became convertible, believing that the international banking system could deal with clearings while the new European Fund provided needed credits. In the event it was decided that some modified clearing system would continue, but it seems to be of little practical importance, and it can be said that the British idea prevailed. Britain could conscientiously propose a "body of high-level officials" to supervise trade and payments, because she has long experience of such loose but influential bodies in the Commonwealth and the sterling area.

That the British negotiators were not quite so successful in persuading their continental colleagues of the virtues of fluctuating exchanges does not distress the banking community here where those virtues are doubted. Some latitude in exchange-rates was agreed, but it will be determined by specific limits, stated monthly. It is unlikely that the British Treasury ever contemplated wide fluctuations, but as banking becomes confused in a regime of "floating" rates, the City approves their formal restriction. The general belief is that the economy should first be stabilised so effectively that convertibility of sterling can be safely undertaken at virtually fixed rates. The effect of these decisions in Paris is that, in a technical sense, all will soon be ready for convertibility, so that it will only remain for the leading countries—Britain, Germany, Holland, Belgium—to decide among themselves that the time, is, at last, ripe for that long-awaited move.

Controlling Inflation

The official statistics of personal consumption in the first quarter of this year cover the period when consumption appeared to be assuming dangerous proportions and action was taken to restrain it. The main danger, some economists believe, was on the industrial, not the personal, side, but almost any form of consumption is relevant. In that quarter, spending increased about 10 percent. The figure appears, at a glance, disturbing, but closer study reveals that much of the increase was in the category of food and that much of the increase, in known (though, understandably, the point was not stressed in the general election campaign) that the Government relies on price-increases to "syphon off" some surplus spending-power, and that policy can work, if it does not defeat its own purpose by aggravating wage-claims.

There was no sign before the election, and there has been no sign since, that anyone intends to stop inflation: the policy is to "control" it. If the community continues to save as it has been saving in the past year or so the authorities may be content; but the test, of course, is the balance of payments. The stock market is again attracting saving in substantial volume, and conditions are now appropriate for a corresponding volume of new issues. However, most savings are going into equity shares, whereas the main claimants are the national utility boards, whose borrowings are of gilt-edged character. The Treasury, moreover, must soon begin preparing to convert maturing short-term debt, requiring, also, more vitality in the gilt-edged market than has existed for many months past. The inflationary character of investment through the stock market is not helping to restore normal conditions.

THE KANPUR INTERIM WORKING CLASS COST OF LIVING INDEX

The Kanpur Working Class Cost of Living Index Number (Base, August, 1939=100), for the month of May, 1955, has again shown a significant fall of 17 points to 335 as against the preceding month and is also lower by 80 points as compared with the index in the corresponding month of the last year. The table given below shows the comparative group indices for the months of April and May, 1955.

Groups	April, 1955	May, 1955
(i) Food	337	308
(ii) Fuel and light	335	339
(iii) Clothing	481	480
(iv) House rent	235	235
(v) Miscellaneous	444	448
Cost of living index no.	352	335

The index for the "food" group registered a fall of 29 points to 308 on account of a fall in the prices of wheat, birra, gram, dal arhar, meat mutton, sugar, ghee and mustard oil. Only the price of potatoes has shown a slight rise. A rise in the price of firewood has been responsible for a rise of four points to 339 in the index for "fuel and light" group.

The index for "clothing" group declined by one point to 480 as a decrease in the price of dhotee-sarees. The index for the "miscellaneous" group exhibited a rise of four points to 448 owing to a rise in the prices of supari. The index for house rent remained stationary.

INDUSTRIAL DISPUTES (APPELLATE TRIBUNAL) ACT AMENDED

An Ordinance has been promulgated on 21st June, 1955 to amend the Industrial Disputes (Appellate Tribunal) Act, 1950, so as to empower the Chairman, Labour Appellate Tribunal to transfer, at his discretion, applications filed under sections 22 and 23 of the said Act, to such industrial tribunals constituted under the Industrial Disputes Act, 1947, as may be designated by the Central Government for the purpose or to hear such applications himself or to authorise any other member of the Appellate Tribunal to hear them. This step has been necessitated by the large accumulation of which seriously interferes with the more important part of its work, viz., the hearing of appeals. The Ordinance also provides that no appeal will lie to the Appellate Tribunal from the decisions of the industrial tribunals with regard to such applications.

Stocks and Shares

NEW LOAN EXPECTED AT WEEKEND

FORWARD LIST EXTENDED: GOOD BALANCE SHEETS
PUBLISHED: STRENGTH IN TEA SHARES

Wednesday, Evening.

THE share market is steady with only a fair amount of business passing. Tea shares are in the van of the advance, supported by encouraging dividend announcements, with better expected to follow soon. Reports from the tea garden companies, fortified with ample reserves ploughed back from last year's profits, will be able to report favourable working during the current campaign. Three shares in this section for which there has been persistent and informed support are Dhunseri, Betjan and Jutibari.

Since our last report the Stock Exchange Committee have decided to extend the forward list by the addition of Texmaco and Indian Coppers, the latter depending on satisfactory clearing house arrangements which may take some time. Texmaco have moved up smartly on this news, quoting today Rs. 20-14; Indian Coppers are fully steady at Rs. 4-11.

It is confidently expected that the Reserve Bank will announce over the coming week-end flotation of a new loan, of which the terms are thought likely to be 3½%, 1965 issued at Rs. 98-8. Securities meanwhile are steady.

A series of excellent balance sheets are being published. The notable ones analysed below are Metal Box, Balmer Lawrie, Equitable Coal, Fort Gloster Jute and Huldibari Tea.

Details of the week's trading follows.

The gilt-edged market ruled steady throughout and the demand for short and medium-dated loans was well maintained. Once again, however, the volume of business was restricted and owing to the continued absence of sellers, prices were marked up further. Three percent Conversion Loan 1966 was initially easier at Rs. 80-7 but later improved to close at Rs. 80-9. In short-dated loans, 2½% 1955 was marked up to Rs. 99-12 while both 3½% 1957 and 1958 were better at Rs. 99-10 and Rs. 99-8 respectively. Amongst medium-dated issues, 2½% 1961 firmed up to Rs. 92-5 and there were good buyers of 3½% 1960 and 1962 at Rs. 95-1 and Rs. 92-14 respectively; 3½% 1959-61 was taken at Rs. 98 but 3½% National Plan Bonds 1961 were on offer at Rs. 99-14 as were 3½% National Plan Loan 1964 at Rs. 98-14; 3½% 1963-65 was traded at Rs. 94-3 and 3½% 1964 was taken higher to Rs. 94-2 with few declared sellers. Amongst long-dated Loans, 3½% 1966-68 gained one anna at Rs. 91-3 as a result of the withdrawal of the Reserve Bank as a seller of this loan while 3½% 1970-75 was unchanged at Rs. 87-2.

State loans continued firm with buyers over and prices improved further with negligible business passing. Four percent U.P. State Loans were taken at Rs. 100-10 while 4½% Madras issues had buyers at Rs. 101-2 with no declared sellers. Four percent Bombay issues were better at Rs. 101-6 and 4½% Hyderabad 1963 and Madhya Pradesh 1963 were both asked for at Rs. 100-4. There was an all round enquiry for 3½% State issues but no business was reported.

Prices of preference shares hardened further in the absence of sellers. Amongst Jutes, Anglo-India were done at Rs. 121. Fort Gloster 2nd at Rs. 85 and Alliance at Rs. 103-6. Birla were quoted at Rs. 104-8 and Gouropore at Rs. 106. Hukumchand at Rs. 10-8. In the miscellaneous group, Aluminium Corporation 6½% were taken at Rs. 106. British India Corporation were marked at Rs. 138. Burrakur 7½% at Rs. 123 and Dunlop 2nd at Rs. 101. Burn 6½% were crossed at Rs. 124. Indian Iron & Steel changed hands at Rs. 109-8. Jardine Henderson at Rs. 78-8 and Martin Burn at Rs. 104-8. Rohtas Industries 7½% were dealt in at Rs. 124-12 and the 'B' Preference at Rs. 66-4. Titagur Paper 1st were wanted at Rs. 153 and the 2nd at Rs. 93.

In the banking section, United Commercial changed hands at Rs. 43-4 and United Bank of India 'D' shares issued at Rs. 4-6. Hind Bank were reported at Rs. 23-4.

Amongst railway shares, Arrah-Sasaram were crossed at Rs. 72 and Dehri-Rohtas were steady at Rs. 11.

With the exception of Kesoram, which were steady at Rs. 14-7, shares in the cotton section were neglected. Basanti came to hand at Rs. 5, Cawnpore Textiles at Rs. 8-9, New Victoria Preferred Ord. at Rs. 1-5 and Swadeshi Preferred Ord. at Rs. 9-4. Elgins after being enquired for at Rs. 19-4 turned sellers at Rs. 18-8.

In the coal section enquiry was confined to a few selected shares like Burrakur, Katras Jheriah, Central India, Western Bengal and New Beerbhoom. Burrakur closed steady at Rs. 13-6. Amalgamated were done at Rs. 22-11. Central India were taken at Rs. 7-14 and East Indian at Rs. 29. Katras Jheriah were scarce at Rs. 55-8. New Beerbhoom were steady at Rs. 21 and Western Bengal at Rs. 7. West Jamuria were marked at Rs. 14 and Talcher were dealt in freely at around Rs. 3-15. Huriladih jumped Rs. 2 today to Rs. 21.

Quiet conditions returned to the jute section with Howrah receding from Rs. 32-4 to Rs. 31-4; tonight's closing quotation is Rs. 31-5.

Here is a table of representative price movements:—

	Opening	Closing
15-6-55.	22-6-55.	
Anglo India	218	218
Birla	20	20-8
Chitavalah	14-2	14-4
Lansdowne	140	143
National	33-5	33-13
Standard	150	150

Although little business was transacted in electric supply shares, prices were well maintained. Calcutta were done at Rs. 15, Cuttack at Rs. 19 and a small lot of Dishegarh Power at Rs. 106. United Provinces came to hand at Rs. 158-8.

With the exception of United Provinces Sugar which had buyers at Rs. 25 but few declared sellers as a result of the dividend being stepped up from 5% to 12½% other shares were unchanged. Belsund were quoted at Rs. 10-6. Carew at Rs. 11-10 and Durbhanga at Rs. 15-8. Samastipur were crossed at Rs. 14 and Shri Krishna Gyanodaya at Rs. 17-5.

Indian Iron & Steel fluctuated between Rs. 33-6 and Rs. 34 to close at Rs. 33-10. There was a good enquiry for Braithwaites at Rs. 24-14 and Bhartia Steel improved to Rs. 15-6. Indian Galvanizing were steady at Rs. 23 and a small lot of Burn changed hands at Rs. 270. Indian Standard Wagon were done at Rs. 129-8. Jessop were easier at

THE SASOL COAL-OIL PLANT OF SOUTH AFRICA

INDIA TO BUILD SIMILAR PLANT SOON

The Indian Government has accepted in principle the report of a committee set up last year which recommends the construction in India of an oil-from-coal plant capable of producing annually 300,000 long tons of petroleum products, including aviation fuel. The estimated cost of the project is £39-£43 million. The Government is having a project report prepared before finally deciding on the allocation of funds. The following is an article dealing with a similar project in South Africa.

THE total demand of the Union of South Africa for petroleum products for inland consumption in 1954 was of the order of 40,000 barrels a day. And lacking indigenous oil production, coupled with unattractive geological prospects, the State has invested nearly \$90 million in the construction of a major synthetic oil plant to produce liquid hydrocarbons and chemicals from coal. This coal-oil plant is the largest of its kind in the world. It entailed an integrated facility on a 5,000-acre site at Coalbrook, some 50 miles south of Johannesburg. The project included the opening and mechanised mining of adjacent coal deposits to provide 7,500 tons a day of this solid fuel for the gasification and reforming units to transform it into synthesis gas and by-product chemicals, and the complete synthesis plant, incorporating the latest American and German techniques, to yield liquid hydrocarbons, oxygenated hydrocarbon chemicals and waxes.

It is worth recalling that the South African Torbanite & Refining Company (Satar) refines crude shale oil produced at Ermelo, 140 miles east of Johannesburg. Its processing at Boksburg accounts for 300 barrels a day of petrol. Secondly, the Stanvac Durban plant, commissioned in early 1954, incorporating the most modern integrated refinery design and with a daily throughput of 17,300 barrels, imports its crude oil from the Persian Gulf region. The justification for building the Sasol plant is primarily strategic, reinforced, however, by economic reasons. From a security angle this installation is based on indigenous raw material. The economic justification for the undertaking rests mainly on two factors:—(1) availability of thick seams of cheap coal at shallow depth, and (2) prevailing heavy freight charge for transported refined petroleum products from coastal points to the Johannesburg area. The cost of transporting petrol from the Sasol plant to Johannesburg is less than one-fourth that for moving it from the coast. The plant site also enjoys other advantages. It is on top of a vast coal field adjoining the banks of the Vaal River (the Union's major source of water supply), and is within easy distance of the concentrated market of Witwatersrand.

Sasol's mineral rights cover an area of 6,500 morgen with 655 million tons of coal, of which 300 million tons are extractable. Local mining costs are of the order of 5s. a short ton, compared with a minimum of 63s. in Britain and 30s. in the United States. The average proximate analysis of this coal is:

Calorific value	9,400 B.T.U./lb. (gross)
Ash content	27 to 30 percent
Volatile matter	23 percent
Fixed carbon	44 percent
Moisture	6 to 8 percent

Process of Production

The process employed by Sasol for the production of oil-from-coal consists of (1) the gasification of coal, to produce a gas of standard composition and purity and (2) conversion of the gas into petrol and other liquid products with the aid of a catalyst utilising improved American and German versions of the original Fischer-Tropsch technique. The gasification process is reasonably flexible in regard to raw materials, and the low-grade coal used by the plant is well suited for the purpose. The production of gas takes place under a pressure of approximately 350 lb./sq. in., and is effected by passing a mixture of oxygen and steam over the coal, screened to sizes ranging from ½-in. to 1½-in.

The combustible substance in the solid is separated from the ash. The purified synthesis gas consists principally of CO and H in a ratio suitable for the subsequent catalytic reaction conditions. Apart from the intermediate production of synthesis gas and the final synthesis of petrol and diesel oil from two series of by-products emerge. The first stems from the coal gasification unit, and in this sense they are not by-products of petrol synthesis but of coal distillation. The principal items are ammonia liquor (converted to ammonium sulphate), tar prime and pitch crude tar acids and aromatic solvents. The second results from petrol synthesis. A whole range of organic solvents of the oxygenated type is obtained, mainly alcohols and ketones. Other materials in this category are liquid petroleum gas and paraffin waxes of various types.

The company's own coal mine—the Sigma colliery—extracts 7,600 short tons a day by employing the most modern mechanised mining methods and with a labour force of only 350 surface and underground African workers and a total European staff of 40, or less than one-sixth and one-third respectively of the numbers of Africans and Europeans attached to a conventional South African colliery. Here extensive use is made of mobile power cutters, mechanical loaders, shuttle cars, belt feeders and conveyor belt systems. The hydraulically operated coal cutters are fitted with 9 ft. cutter bars, each of which can cut a 30×9 ft. block of coal in one operation. Included in the conveyor system carrying the coal after primary underground crushing to the surface are two of the longest conveyors in the Union. Each is 3 ft. wide 3,200 ft. from centre to centre and is designed to move coal at an hourly rate of 400 tons. The coal staithe with a capacity of 29,000 tons is the largest of its kind in the southern hemisphere. The coal is eventually screened into three sizes—the two largest 1½-in. × ½-in. and ¾-in. × ¾-in. being fed to the gasification plant and the third of ¼-in. × 0 fed to pulverisers which reduce it to powdered coal before being introduced into the steam generating plant at the power station.

The Sasol plant and township account for 8,000,000 imperial gallons of water a day drawn from the Vaal River. Two-thirds of this intake go into the cooling water system as make-up for the fluid which is evaporated in the cooling process. The rest is used as process water inside the works and a minor amount is taken through a purification plant for providing the township with potable water.

Main Sections

The Sasol plant consists of a dozen main sections: (1) steam and power generating plant, (2) tonnage oxygen plant, (3) gas producing and purification plant, (4) catalyst preparation unit, (5) Kellogg synthesis plant with refining and working-up units, (6) Arge synthesis plant with refining and working-up units, (7) methane gas reforming unit, (8) by-products plant, (9) control house, (10) tank farm and despatch facilities, (11) cooling water plant, and (12) other ancillary facilities. The power plant comprises four 360,000 lb./hr. boilers, three 13,500 kw. turbo-generators capable of meeting all the electricity needs of the power station auxiliaries, the plant, the mine and the river pump station. The outdoor type boilers are fired with pulverised coal, and operate at a pressure of 575 lb./sq. in. and outlet steam temperature of 820°F. This high pressure steam is fed to the gasification of the coal, to the three turbines driving the generators for electricity generation, and to the several plant sections where it is used as process steam to propel numerous auxiliary equipment, such as compressors and pumps. The oxygen plant, consisting of six identical Linde units, processing 9,000 tons of air and producing 1,800 tons of oxygen daily, is one of the largest tonnage installations of its kind in the world. The six turbine-driven centrifugal air compressors deliver close on 1,500,000 cubic ft./hr. of air at 75 lb./sq. in. to the Linde units, while three oxygen compressors deliver this gas to the gasification unit at a pressure of 426 lb./sq. in. The gas producing and purification plant consists of nine Lurgi gas generators, where coal is gasified under a pressure of 350 lb./sq. in. by passing oxygen and steam over it. This German Rectisol low temperatures in one step what formerly entailed these five stages—dry oil scrubbing, pressure absorption of CO₂, removal of H₂S, activated carbonyl scrubbing and final hot purification over alkaline iron oxide to remove organic sulphur. The aggregate output of purified gas with eight gasifiers operating is 120,000 cubic metres an hour, calling for 3,200,000 cubic metres of steam an hour. The steam and removed from the gas by water slicing is pump-fication process are taken to the appropriate section where ammonia, phenols, tar, etc. are recovered of CO and H₂ is of a composition suitable for subsequent catalytic reaction. Two streams emerge

from this installation: one of these is fed to the larger Kellogg synthesis plant and the other to the Arge synthesis plant, where the liquid products are made in accordance with the U. S. and German versions of the Fischer-Tropsch synthesis respectively.

The powdered catalyst for the Kellogg process is manufactured in the catalyst preparation section. Here magnetic iron ore is fused and compounded with certain promoters, crushed to a fine powder and reduced with hydrogen to yield the activated catalyst. In the Kellogg plant the synthesis gas is converted to hydrocarbons and oxygenated products by bringing the powdered catalyst into contact with pure gas in two large reactors. Then the catalyst is separated from the products of reaction, which pass to the product recovery plants, where they are condensed to liquid, and separated out into the various products by more or less standard oil refinery techniques. The main product of this plant is motor spirit, and important by-products include several alcohols and ketones. The recovery and separation of the products of reaction of this plant take place in the refining and working-up plant.

The Fischer-Tropsch process development in Germany has deviated from the American practice in that a fixed bed catalyst is preferred to a fluidised one, but iron has replaced the original cobalt catalyst. The catalyst life, cooling surface and reactor size have been improved substantially since the end of the second world war. Also, yield of high melting waxes is obtained. The price obtainable for waxes. In the Sasol Arge plant synthesis gas is converted to hydrocarbons in accordance with the latest development of the Fischer-Tropsch process in fixed bed reactors, with the catalyst consisting of small pellets. This plant Kellogg unit. Its products are similarly recovered and separated in the refining and working-up section. Light hydrocarbons from the synthesis gas and re-circulated in the methane gas reforming plant. This operation is carried out in the presence of steam and oxygen over a nickel catalyst. In the by-products sections ammonia, phenols and other materials are extracted from effluent liquors from the gas generating plant, and the effluent liquors are rendered suitable for biological treatment in a normal type sewage works.

Control System

There are a dozen houses at Sasol to control plant operations with the most modern instruments and automatic controls available, to reduce and instruments to control temperature, pressure, flow, level, etc., as also gas analyzers for recording the composition of the gas stream continuously. In the product shortage and despatch section, total capacity of shortage tanks is 8,880,000 imperial gallons for the various liquid products, tankers, and for the filling and loading of drums. The cooling water system incorporates four batteries of induced draught cooling towers, constructed wholly of Canadian red cedar wood above fitted with twelve 14-ft. diameter towers is ing air through them. A cooling water pump station, consisting of six large turbine-driven pumps, circulates upwards of 150,000 gallons of cooling water every minute through 4-ft. diameter underground pipes to various points throughout the works. Other auxiliary units include a large double-story laboratory, main store building, principal machine shops, garage, and ancillary workshops for electricians, carpenters and instrument makers.

The Plant's Construction

The M. W. Kellogg Corporation engineered and supervised the construction of the Sasol plant. Work on the project was started in mid-1952. Sigma colliery, providing the basic raw material, station had been operating satisfactorily for the several months. Also, the completed sections of the oxygen plant have now been in continuous operation for several weeks on end. The first Production of gasoline was scheduled to start a month earlier (i.e., in November, 1954), to unavoidable circumstances the testing and installation of equipment took a longer time than schedule. According to present plans the gasification plant is to be commissioned before April, 1955.

For its construction the Sasol plant called for 56,000 cubic yards of concrete. Nearly 32,000 tons of equipment and machinery were imported, some 25,000 tons from the United States. An equivalent of structural and reinforcing steel. Most of the pipes, prior to erection on the actual plant, were prefabricated in two shops on the site. For placing in position some of the heavy equipment use was made of a 230-ft. high tower derrick, with a capacity of 70 tons with its boom 80 feet played with capacities ranging from 13 to 60 tons. Save time mobile concrete mixers were utilised. More than 1,300 Europeans and some 2,000 Africans were engaged on the construction job. Sasol's total labour complement including men hired on the provision of housing and on the mine totals 2,000 Europeans and twice as many Africans. Following the local scarcity of skilled labour in certain trades the company recruited labour in Europe, and around 250 persons and their

families were brought to South Africa. A small number of plant operators were also recruited from the Western countries.

The sewage from the towns, the plant and the colliery, together with the industrial effluent from the factory, is dealt with in a combined works including primary sedimentation tanks, sludge digesters, biological filters, rapid gravity filters, sludge drying beds and humus tanks. A total of 1,250,000 imperial gallons of industrial effluent and 800,000 gallons of domestic sewage is treated daily to ensure that the resulting product is entirely harmless and usable for agricultural purposes. The treated effluent goes to a large earth dam from where it is pumped away through a 24-inch pipeline discharging below the barrage by the Vaal River. The Sasol works are served by a 2½ mile railway from Coalbrook Station, some 2½ miles long, and a total of 6½ miles of track have been laid. Also, Sasolburg is linked by a new road to the main Vereeniging-Heilbron road, and with Vanderbijl Park. The 5½ miles from main streets within the township have been tarred, and 12 miles of internal streets gravelled.

Financial Implications and Products

When in full operation the Sasol plant is reckoned to effect a saving in foreign exchange of \$19,600,000, from an annual production of approximately 50 million gallons of petrol and 16 million gallons of other products produced at a yearly value of \$25,200,000. Petrol is planned to be produced at around 1s. 2d. a gallon (equivalent to the landed cost of imported gasoline) while the refinery selling price would be of the order of 1s. 9½d., giving Sasol a profit of 7½d. a gallon. No provision has been made in this calculation for profits on by-products sales which are presumably taken at cost value.

Here is a provisional list of products and chemicals the Sasol plant is planned to produce annually: petrol 55 million (imperial) gallons, diesel oil 4.3 million gallons, fuel oil 2.3 million gallons, paraffin waxes (with melting points from 105 to 240°F.) 18,000 short tons, ethanol 4 million gallons, propanol 2 million gallons, butanol 525,000 gallons, acetone 210,000 gallons, methyl ethyl ketone 260,000 gallons, mixed solvents 60,000 gallons, benzole 500,000 gallons, toluene 250,000 gallons, xylene and solvent naphtha 500,000 gallons, cresote wood preservative 1,000,000 gallons, pitch and tar road primer 980,000 gallons, crude phenols (tar acids) 6,000 short tons, ammonium sulphate 35,000 short tons and liquefied petroleum gas 300,000 gallons. It is not intended to sell all of Sasol's petrol as a separate product but to market about two-thirds of the total through existing channels under agreement with the four oil importing companies—Atlantic (whose marketing facilities in this region were bought by British Petroleum in 1954), Caltex, Shell and Stanvac. The balance, together with Satar's production, is to be sold as high quality Sasol blend. Turning to chemicals it is the company's policy not to extend their output beyond the immediately saleable by products. It hopes that private enterprise will undertake the establishment of an organic chemical industry in the Union.

Financial Structure

The South African Coal, Oil and Gas Corporation—Sasol—derived from the Company's Afrikaans name (Suid-Afrikaanse Steenkool-Olie- en Gaskorporasie Beperk) was set up in September, 1950. It is financed through the medium of the Industrial Development Corporation to whom the Union Government advanced adequate funds from time to time. As of 30th June, 1954, the company's share capital, which stood at £12 million (\$33.6 million) a year before, was increased to the full amount of the Authorised share capital of £25 million (\$70 million) following allotment of 13 million ordinary shares of £1 each for cash to the Industrial Development Corporation. Capital expenditure for the year ended June, 1954 rose to £26.8 million (\$75 million). The financing formula for the assessing of wage rates, labour disturbances appear to be part of the immediate prospect, no profound setback to the national economy as a whole should be experienced—always assuming that protracted strikes by key-workers are avoided. Whatever labour agitations occur, the over-riding consideration will still be that a Government favourably disposed to capitalism will be in power for the next five years, and that, under such circumstances, an expansionist policy on the part of private enterprise is certain.

THE LOCKHEED "ELECTRA"

The Lockheed Aircraft Corporation has recently announced the "long-awaited answer to Britain's dollar-earning Viscount air liner." It is a four-engine turboprop aircraft which can seat between 64 and 90 passengers and is called the Lockheed Electra. Lockheed describes the Electra as the fastest turboprop air liner ever built and, according to American Airlines, who have ordered 35 Electras in a 65-seat version, it will have a cruising speed of well over 400 m.p.h., 100 m.p.h. faster than the Viscount. The Electra, it is claimed, can take off and land in less than 5,000 feet and can climb at nearly 3,000 feet a minute. It can fly 1,850-mile ranges against 50 m.p.h. headwinds and retain a two-hour fuel reserve. The Viscount, meantime, continues to attract orders from an increasing number of operators, the latest being Air India, K.L.M., and B.O.A.C. to bring the total to over 200. The Viscount has just been granted an airworthiness certificate from America, which was for the first time presented outside that country. The ceremony took place in England.

INDUSTRIAL TRENDS IN THE UNITED KINGDOM

WAGE "DIFFERENTIALS" FOR SKILLED LABOUR

(FROM A SPECIAL CORRESPONDENT IN THE U.K.)

AMONG the questions that have been brought into prominence by the strike of railway locomotive drivers and firemen, one, namely that of a payment in recognition of the existence of "differentials", is of far-reaching importance, and has a bearing upon future production costs of British industry. It is commonly agreed that the rates of payment for skilled labour have not advanced during the last decade in anything like the proportion that those for semi or unskilled work have. As a consequence, much skilled labour finds itself at a serious financial disadvantage. Since, however, in most cases, neither practicable nor fair to reduce the rates of pay of unskilled workers (and the skilled workers would oppose any such proposal as much as would the unskilled), it would appear that there is no other course than to raise, by means of a special allowance, the wages of those who can claim to be "craftsmen." This allowance would constitute the so-called "differential."

It is obvious that the term "craftsman" would have to be more broadly conceived than it was in former days, and would have to be regarded as denoting the possession of a certain skill, aptitude or exercise of responsibility, and not necessarily indicating the maker of a product conforming to outstanding standards of excellence. The broadening of the implications of the term, in order to accord with the changed conditions of a machine age, whilst it is unavoidable, brings into existence many difficulties. Not the least of the problems is to prevent the term being brought into too general use, with the result of numerous workers claiming extra payment in recognition of differentials which really have no existence in their case.

So far as the railway drivers and firemen are concerned, although they are engaged in transport, their right to be treated as having a special status is undeniable, however much may be deplored the manner of presenting their claim. Not only do they undergo a long and exacting training, but they are expected to observe an unusually strict standard of personal habits. Moreover, there are few occupations of a more responsible nature. To pay these men only as much as a typist now receives, and half as much as some semi-skilled building operatives are obtaining—to mention but two of the unfavourable comparisons which could be invoked—is indefensible. It is not, however, the intention to pursue here either the clear cut issues or the complexities of the railway dispute in Britain. But it is desired to emphasise that the demand of skilled workers for higher wages in comparison with the unskilled, brought to a head by the action of the Associated Society of Locomotive Engineers and Firemen, is bound to have reverberations in many sections of British industry, and over a long period.

Industrial Exhibitions

There are few industries where large or small groups of workers could not, with some degree of justification, make claims for extra payment on the ground that they possess or should possess a special status. It is probably not too much to say that a virtually nation-wide alteration of the wage structure will have to take place, in practical acknowledgment of a factor that can no longer be ignored. How these allowances are to be calculated is not plain as yet and it will be surprising if the acceptance by the Government and employers of the general principle involved does not cause unrest among lower grades of workers. But, if, failing the discovery of a new, magical and all-encompassing formula for the assessing of wage rates, labour disturbances appear to be part of the immediate prospect, no profound setback to the national economy as a whole should be experienced—always assuming that protracted strikes by key-workers are avoided. Whatever labour agitations occur, the over-riding consideration will still be that a Government favourably disposed to capitalism will be in power for the next five years, and that, under such circumstances, an expansionist policy on the part of private enterprise is certain.

The few industrial exhibitions that have been held have been marred by the lack of transport facilities. Electronic machines were more in evidence at the Business Efficiency Exhibition than on any previous occasion. No striking novelty was to be seen, but a steady advance was shown in both the mobility and rapidity of operation of office equipment for counting purposes. In other directions, the science of electronics has entered another spell of development and along a broad front. The financing of electronic machinery and equipment is now attracting considerable capital; for the indicated demand for these products is beyond present capacity to fulfil, with only a fringe of the field of use touched and with substantial Government contracts forming a sure foundation on which to build. All the hospitals that deal with malignant disease are being fitted with machines for providing electronic treatment, and there is an increasing medical reliance upon electronic instruments in other directions as, for example, in following the progress of anaesthesia. The whole electronic movement is now, of course, closely related to some aspects of the study of nuclear physics. Meteorology, too, is turning increasingly to

these aids. Whilst the scope for expansion of the electronics industry is very great, the rate of advance is governed by the adequacy of design to meet unfamiliar demands. That being so, preliminaries cannot be unduly hurried, since the observance of an exceptionally high standard of accuracy in the instruments used is essential. It will be understood that every notable advance in design helps to make the achievement of advance in electronics a more flexible proposition. The reports of new and more fruitful approaches to design problems may therefore prove to be of significance in giving an additional impetus to the electronics movement.

Fire-Retardant Textiles

The chief matter of industrial interest in British textiles has been the formation by the Bradford Dyers' Association and the well known chemical firm of Albright and Wilson Ltd. of a joint company to develop and promote processes by which certain textiles can be made fire-retardant. The United States Government, by reason of the many disasters which have occurred in America during recent years through the use of inflammable fabrics, has introduced legislation which requires that fabrics for specified uses must be rendered flame retardant. This is required both of fabrics produced in the United States and of those imported. Cotton, being highly inflammable, is particularly affected by this regulation—hence the preparations being made by Lancashire for the extensive use of fire-retardant processes. Most of these treatments depend upon the use of phosphorus or titanium. No process so far as been completely successful, as is conveyed by the description fire or flame "retarding" and not preventing. What is induced, in fact, is a very slow rate of smouldering. Several new processes have been announced of late in the United States. It is not clear whether the British venture has some modification of these in view; but as Albright and Wilson Ltd. are the largest British manufacturers of phosphorus, it is a reasonable inference that this material will continue to play a part in the processes and whatever else they have in mind.

Leather Research

Not much has been heard with regard to British leather research for some time, the last report stressing long-term aspects, and also mentioning that direct contact with tanners in India, Pakistan and Ceylon was proving valuable. American research workers claim that as a result of their studies a new insight into the structure and behaviour of leather should result and the tentative conclusions they have reached are attracting a good deal of interest in Britain. Their investigations relate chiefly to pore-size distribution in collagen and leather, and the very latest apparatus was used, including a mercury pressure porosimeter and an electron microscope. Their starting point was the belief that many of the unique properties of collagen and the tanned product, leather, result directly from the character of the collagen that is formed in nature as a fibrous network. Fresh light is thrown upon the problems of swelling and shrinkage and also upon the ability of leather to absorb tannings, etc. It is rather curious that kangaroo tail tendon was used for many of the experiments, but this choice was apparently because of advantages in the microstructure. The experimenters think it probable that, as a result of their discoveries, better commercial use of leather will be possible and this seems indicated also by the new processes which have been developed already for impregnating leather with rubber and other polymers.

Progress of Rayon

The opening of the new Research Station by the British Rayon Research Association at Wythenshawe, Manchester, makes the British rayon industry extremely well equipped. The total amount spent on buildings and equipment over the past nine years is £500,000, the latest buildings occupying half of a 25-acre site. A rather provocative note was struck by the chairman at the opening, the declaration being made that Britain "having lost most of the old markets for cotton, we must find new markets, and rayon (we use the word in its widest significance, as meaning any form of man-made fibre) offers us the opportunity to do so." Rayons, it was averred, are still in their infancy, and, it seemed to be implied, cottons are in their dotage. British cotton manufacturers are hardly likely to agree with this, and, as a matter of fact, some notable gains have been recently made in design. On the other hand, it has to be recorded that Courtaulds have put on the market a wide range of fabrics demonstrating new heights reached in the versatility and colouring of rayon yarns. All of these fabrics are blends of various kinds of rayon, so that, in this important instance the familiar argument that blended fabrics necessarily mean an increased use of cotton has no application. The programme of activities laid down by the British Rayon Research Association embodies in no uncertain manner the determination to leave little room for it to be charged with over-concern with the academic. It is definitely out to help rayon to enter new markets by attacking the technical difficulties involved. It constructs prototype machines and assesses their potentialities, and it has already made several important machinery developments. A number of physical techniques are available for the study of various aspects of the structure of textile materials. These include X-ray and electron diffraction, spectroscopy in the visible, ultra-violet and infra-red ranges, and ultrasonic irradiation. Nothing is lacking on the instrumentation side.

Our City Cable

INDUSTRIALS STRONGER IN
SPITE OF STRIKESENGINEERING AND STEELS LEAD
THE WAY

London, 22nd June.

THE feature of the stock markets over the past week has been the renewed strength of industrial equities and oil shares. The fresh advance followed favourable week-end Press comment and further good company news. Sentiment was also aided by the statement on the economic situation by the Chancellor of the Exchequer and hopes of an early settlement of the dock and shipping strikes. Industrial leaders advanced strongly with engineering and steels prominent. Some of the buying in the industrial market was attributed to the United States. Gilt-edged stocks were subdued on talk of new issues but the tone was not unsatisfactory. In foreign bonds, Japanese gained ground while Germans receded. Rails improved in places and dollar stocks were higher in response to Wall Street. Gold shares relapsed into inactivity and prices moved within narrow limits. Rubbers gained ground in response to the higher commodity price. Teas advanced under selective demand and activity was at a rather higher level than recently.

The Money Market

For much of the week, money remained in keen demand, with supplies continuing on a very restricted scale. Some easiness developed towards the end of the period and on Friday there was unaccountable inflow of funds with money becoming abundant and cheapening to 2½ percent in some quarters. The better trend caused some easing in bill rates. Applications for Treasury Bills totalled £365,555,000, of which £260 million were allotted at an average rate of 7½s 5.17d compared with 7½s 7.53d in the previous week. This week £250 million are offered. The Bank of England return for the week ended 15th June showed notes in circulation about £9 million higher at around £1,787 million, while bankers' deposits were about £3 million higher at around £251 million.

Activity on Wall Street

In the foreign section of the bond market, trading was much slower than in the past few weeks, with German Nationals declining from the recent peaks though individual corporates and municipal loans scored sizeable gains. German General Electric 7 percent rose considerably. Italians also improved with Government 7 percent 1951 and some 6½ percent advancing. Norwegians were mixed and there was little interest in other Europeans. Australians showed only minor changes each way, while some Japanese issues rose one point or more. Chileans were firm among South Americans, with

3 percent of 1993 establishing a new high and some inactive issues advancing. In the domestic section, convertibles were outstanding with a broad buying movement in share privilege issues, resulting from the continued strength of the stock market. The Lockheed Aircraft Corporation's new 3½ percent were a feature with General Dynamics, Bethlehem Steels, Sinclair Oils, Phillips Petroleum and Standard Oils of Indiana. Rails were generally mixed. U.S. Government obligations fluctuated irregularly until late on Thursday when prices weakened on reports that the Treasury was considering the resumption of some long-term financing in connection with the Government borrowing in July and August. Top quality corporates were little affected by the sales of Treasury bonds. World Bank issues were neglected.

Federal Reserve Return

The U.S. Federal Reserve return for the week ended 15th June shows gold stocks \$1 million higher at \$21,676 million. Foreign deposits fell by \$1 million, while foreign investments rose by \$15 million. The Federal Reserve sold another \$61 million worth of bills. Total discounts and advances rose by \$446 million to \$837 million, while excess reserves of member banks rose by \$500 million to \$963 million. Their daily average of excess reserves fell by \$14 million to \$606 million, while their daily average borrowings rose by \$26 million to \$489 million. Business loans of New York City banks rose by \$431 million to \$8,048 million, compared with a rise of \$161 million to \$7,707 million a year ago.

U.S. Steel's Wage Offer

The U.S. Steel Corporation is to make a wage offer this week to C.I.O. Steel Workers Union which it hopes will result in a "speedy mutually acceptable settlement of negotiations," the Corporation announced. The Union has asked at the labour contract negotiations in progress for a "substantial" wage increase.

Sale of U.S. Commodity Surpluses

The U.S. Foreign Operations Administration issued a \$5,600,000 authorisation to France for the purchase of U.S. maize and \$1,200,000 for cottonseed oil. The contract period for maize is from 20th June to 31st January and for cottonseed oil from 13th June to 30th September. The authorisations were made under the Government's programme for the sale of surplus farm commodities abroad for foreign currencies.

L.E.T.F.C.'s Debenture Redemption

The British Transport Commission is issuing a £42-million British Transport 4 percent guaranteed stock 1972-77 at 296½ percent to redeem the London Electricity Transport Finance Corporation's 2½ percent debenture stock 1950-55 which is due for repayment on 1st August. Any resultant balance will be offered for cash.

Rubber Fluctuations

In face of the sound statistical position, as evidenced by the Study Group estimates of the excess

of consumption over production, rubber prices last week again moved sharply each way, but mostly upwards. Trading was very difficult owing to wide variations of buyers' and sellers' ideas. The labour disturbance in Singapore caused a further hardening of an already firm market, especially nearby rubber and early shipment from the East. Orders from factories were only moderate but precautionary covering and some profit-taking accounted for the fairly large turnover. Towards the close of the period, buyers were reluctant to follow the higher Eastern level but sellers were reserved and quotations of near positions were up to 3d higher on balance, while distants were about three farthings higher. The market for sole crepe hardened in sympathy with sheet. Although there was not much demand, sellers asked for the full quoted rates, which were on the higher basis of 38d a lb. for 1 1/8 inch smooth No. 1 on spot.

Linseed Oil

Linseed oil was in quieter demand although most sellers were asking around 10s a ton above Friday's rates. Groundnut oil admitted little change with Indian holding for £103½ c.i.f. June to U.S. buying with sellers of BSS reported talking as high as £98, although an isolated seller was reported in the market at £89 for lesser quality oil. Coconut oil was largely nominal with resellers of Ceylon around £103 and Straits indicated at £91½. U.S. cotton oil advanced \$1 a ton, while Sudanese around £2 a ton up.

Good Business in Jute Yarns

Good business has been done in many kinds of jute yarns since the reduction in U.K. prices and the position now appears to be much improved. The reduction was made at an opportune time, as most spinners were beginning to feel the continued lack of orders for yarns. Now there is more confidence in purchasing for delivery further ahead, especially as prices are at their lowest for many months. Good business was done in the past few days in jessan yarns for weaving and much more enquiry is being received for jute cloth.

E.F.A.C. Arbitrage Facilities

The French Office des Changes today extended until further notice its permission for the arbitrage of E.F.A.C. accounts issued in currencies of European Payments Union members against dollar granted on 21st May, 1955 and is due to expire on 25th June. E.F.A.C. accounts are foreign exchange holdings which French exporters are allowed to use for their own purposes. Under the arbitrage scheme, financial institutions can debit an E.F.A.C. account with an E.P.U. currency and credit it with the United States or Canadian dollars or with "free convertible francs."

New Delhi

STATE BANK ACT TO BE AMENDED
BY ORDINANCEINADEQUATE PROVISION FOR TRANSFER OF
IMPERIAL'S OVERSEA BRANCHES

(FROM OUR NEW DELHI CORRESPONDENT)

THE State Bank of India Act is to be amended soon by an ordinance which will be enacted into law by Parliament during its summer session commencing here on 2nd July. The State Bank Act as it stands today liquidates the Imperial Bank of India at midnight on 30th June. The framers of the Act overlooked the fact that the Imperial Bank had 13 branches in foreign countries, the assets of which had to be transferred to the State Bank and that such transfer was unlikely to be completed within the statutory period ending on 30th June. The ordinance will seek to remove this lacuna and to keep alive the legal identity of the Imperial Bank to enable the transfer of its assets in foreign countries to the State Bank.

The Bill to amalgamate with the State Bank certain associate provincial banks will also be brought up for enactment by Parliament during its summer session.

State Governments' Plans

The Planning Commission, in a letter to the State Governments, has indicated its programme for preparing the second five year plan. The four months ended September will be devoted to discussions between the Union Ministries and the State Governments, of the basis of the draft "plan-frame," the memorandum of the panel of Economists and other associated papers. Discussions relating to draft State plans will fall into four distinct stages, namely:—

- (1) Assessment of the States' financial resources.
- (2) Consideration of the general aspects of State Plans as a whole.
- (3) Consideration of the more important aspects of different sectors of State plans and of the principal development schemes included in them.
- (4) Proposals for modifying the draft State plans in the light of the discussions under the above.

Exchange of views with the State Ministers will be followed by an examination of the programme in different sectors in working groups which will include officials from the State Governments, officials from the Central Ministry concerned and officials from the Division concerned in the Planning Commission. These discussions will be co-ordinated by the Planning Commission's Programme Administration Adviser. As a rule, the Secretary, or another senior officer from a Ministry, will serve as chairman of the appropriate group and will keep the member of the Planning Commission concerned in touch with the subject. It is so arranged that the report of the groups will come before the Planning Commission and the State Ministers at the afternoon session on the second day of the discussions when the main lines on which the draft State plans should be revised will be agreed between the Planning Commission and the State Ministers. Within about two weeks of the final discussions, State Governments will send to the Planning Commission their revised plans in outline with a view to their incorporation in the national plan.

Following the general discussion it is proposed that more detailed discussions should take place through working groups for the following subjects:

- (1) Agriculture and community development
- (2) Irrigation and power
- (3) Village and small industries
- (4) Roads and road transport
- (5) Education
- (6) Health
- (7) Housing
- (8) Welfare of backward classes, social welfare and labour welfare.

For facilitating the consideration of their draft plans State Governments have been requested to provide a general appreciation bringing out the salient feature and drawing special attention to the following:

- (1) level of development estimated for 1955-56.
- (2) phasing of development expenditure year by year, distinguishing foreign exchange expenditure, non-recurring and recurring expenditure and expenditure in the form of recoverable loans other than short-term.
- (3) the principal targets to be achieved.
- (4) distinguishing the expenditure and targets relating to—(a) development schemes carried over from the first plan to the second plan and (b) new development schemes proposed for the second five year plan.

(5) explaining how programmes in different sectors within the State plan are co-ordinated with one another, namely, agriculture and community development and irrigation, power and industry, rôle of communications, etc.

(6) a summary statement showing break-up of that part of the State plan in different sectors

which represents district plans and plans of local bodies.

(7) requirements of personnel and the training programme envisaged.

(8) employment potential.

(9) requirements of principal material resources namely, coal, cement, steel and timber and of machinery and equipment for the larger projects.

(10) list of schemes costing more than Rs. 50 lakhs included in the draft State plan.

As at present arranged, the draft outline of the second five year plan will be published by October-November and the final plan by March 1956.

Planning for Industry

The Central Advisory Council of Industries and the Steering Committee for Industrial Planning are expected to meet here during the third week of July, say, from 21st. The Steering Committee, as its name should imply, has been set up by the Planning Commission to prepare the second five year plan, for which purpose distinction has been drawn between those industries for whose development some concrete measures are necessary and those whose development can be left to normal market forces. Thirty-eight industries have been grouped together in category "A" and targets of production and the manner and method of assistance for them will be recommended by the Steering Committee. Iron and steel, ferro alloys, aluminium, automobiles, railway rolling stock, shipbuilding, machine tools, agricultural machinery, textile machinery, aircraft, including aero engines, electronics, fertilisers, heavy chemicals, coal tar distillation, dyestuffs, plastics, newsprint, cotton, woollen and rayon textiles, sugar industrial machinery, air-conditioning plants and bicycles are included in the list.

Eight Development Councils have been set up so far to prepare blueprints for the development of bicycles, sugar, heavy chemicals (acids and fertilisers), heavy chemicals (alkalis), light electrical industries, heavy electrical engineering industries, pharmaceuticals and drugs, internal combustion engines and power driven pumps. A Panel for electronics and wireless equipment has also been set up.

Some explanation of the distinction between Development Councils and Panels is probably necessary. Although both are expert bodies entrusted with the responsibility of formulating development programmes, Panels are *ad hoc* bodies while Development Councils are statutory and are constituted under the provisions of the Industries (Development and Regulation) Act. It therefore follows that while Panels will be confining their work to the planning of industrial programmes in connection with the second five year plan, Development Council have wider scope, as envisaged by the Industries Development and Regulation Act. Unlike Panels, Development Councils are representative of the consumers and work as laid down in the Act. In "B" category are included 25 industries which are largely consumer goods industries. As already reported, Member of Planning Commission, Mr. K. C. Neogy, has been having discussions with representatives of these industries since his return to New Delhi last week.

Health Plans

The proposals of the Union Health Ministry for inclusion in the second five year plan are estimated to cost Rs. 208 crores including Rs. 52 crores for the schemes carried over from the first five year plan. The Ministry has evolved a pattern of Central aid to the States as under:—

First year	...	100 percent
Second year	...	80 percent
Third year	...	60 percent
Fourth year	...	40 percent
Fifth year	...	20 percent

Twenty-six schemes, at an estimated cost of Rs. 17.87 crores were originally included in the first five year plan. Twenty-one new schemes at an estimated cost of Rs. 311 crores were added in 1953, raising the total outlay to Rs. 2030 crores. A second review in July, 1954 disclosed possible savings to the extent of Rs. 140 crores, of which Rs. 34 lakhs were re-allocated to the expansion of certain schemes and the balance of Rs. 106 crores was allocated to some new schemes, which were added to the plan. The reasons for the shortfall in the progress of schemes were (1) procedural delays, (2) inability of participating States to utilise fully the assistance offered under the centrally-aided schemes, (3) lack of certain categories of trained personnel and the inability, very often, of the States to absorb the trained personnel even when available (4) Delay in the availability of plant and equipment from abroad and (5) inadequate staff at the Centre for field visits and personal contacts with administrative staff in the States. Some of

the schemes proposed to be included in the second five year plan are as under:—

Schemes	Estimated cost (in lakhs of rupees)
India Medical Institute	473.50
Expansion of Safdarjung Hospital at New Delhi	66.00
Expansion of Willingdon Hospital	66.70
Taking over of the Tata Memorial Hospital at Bombay	44.50
After-care and rehabilitation of T.B. patients	150.00
Isolation of advanced cases of T.B.	250.00
Homes for the incurable	500.00
Expansion of Lady Hardinge College	95.00
Training of 50,000 dais	187.50
Model villages	50.00
Holiday and Convalescent Homes for Central Government employees	12.00
T.B. Clinics	802.50
T.B. demonstration centres	102.00
V.D. Clinics	151.00
Opening and expansion of medical colleges	1190.00
New dental colleges	216.00
Dental clinics	123.00
Public Health Service laboratories	151.00
Centres for training auxiliary health workers	37.00
5,000 school feeding centres	703.00
285 blocks of school health, national water and sanitation schemes	90.00

Some comments are needed. The plan is largely devoted to the training of health services and of providing health facilities in the urban areas. The schemes exclusively related to the countryside are the provision of Rs. 50 lakhs for model villages and of Rs. 30 lakhs for rural water supply and sanitation. This is against the background that India is a land of villages which, generally speaking, lack medical facilities. Due to the unattractive nature of the villages, trained medical men prefer to live on scanty earnings in the cities rather than to build a practice in the rural areas. The socialistic pattern envisaged in the second five year plan has largely left the rural population to their existing unsatisfactory state of medical and health facilities. The first plan, as admitted by the Government, disclosed a large shortfall for which explanations have been advanced. The proposals do not indicate the steps proposed to be taken to show better results in the second plan period.

Drug Manufacture

The Ministry of Production has suggested a provision of Rs. 2.06 crores for the expansion schemes to be taken up by the Hindustan Antibiotics Limited. The expansion schemes under consideration are:—

Total cost, including building service and plant equipment.	(Lakhs of Rupees)
Increasing the production of penicillin from 3.6 million mega units to 9 million mega units	46.73
Streptomycin	60.25
Chloromycetin	14.00
Insulin	14.05
Anti-malarials and Sulpha drugs	36.0
Raw materials development	14.5
Water supply schemes	5.0
Staff quarters and other amenities	15.0
	206.0 lakhs

In the first five year plan a provision of Rs. 50 lakhs was made for the development of existing salt works and another provision of Rs. 100 lakhs for the development of the Mandi Salt Mines. It is now expected that Rs. 25 lakhs will be spent on the first item during the present plan period and that no expenditure is likely to be incurred on the Mandi Salt project since a decision can be taken on the latter only after the results of the core drilling in progress are known. The Ministry of Production has proposed that a provision of Rs. 100 lakhs should be made for the Mandi Salt development scheme and of another Rs. 100 lakhs for the development of existing salt works during the second five year plan. As regards the development of existing salt works, detailed lists of works to be executed in the first year of the second five year plan have shown that a sum of Rs. 29 lakhs will be required for them. In arriving at the estimate of the total financial requirements for development of existing salt works, the Ministry of Production has assumed that the expenditure from 1957 onwards will be on nearly the same scale as in 1947-57. The expenditure on these projects will be met from the fund being created out of the receipts from the salt cess.

New Iron and Steel Ministry

The long-awaited Ministry of Iron and Steel came into being during the past week with Mr. T. T. Krishnamachari as its Minister and Mr. S. Bhoothalingam as its Secretary. It is likely to de-

velop into a Ministry for Minerals, taking under its umbrella, in due course, the production and processing of iron, copper, zinc, manganese, aluminium, etc. In its initial stage the Ministry will deal with the iron and steel undertakings in the public sector, leaving the co-ordination of the two wings of the industry to the Ministry of Commerce and Industry. The two wings of the iron and steel industry may be brought under the new Ministry by transferring to it supervision of the units in the private sector. Proposals are already under examination for the setting up of an Iron and Steel Board, to manage the units in the public sector. The member in charge of the Ministry will be the Chairman of the Board.

Mr. T. T. Krishnamachari proposes to pay a visit to the Rourkela site of the Hindustan Steel Limited by 15th July, in order to set up a small office for himself. He and his Deputy Minister, Mr. Kanungo, propose to spend a part of their time at the sites of the works in order to guide the erection of the plant and machinery and the building of the township. As already reported the Production Secretary, Mr. S. S. Khara, has been selected to lead the Indian Steel Mission to Russia. The Industrial Adviser, Mr. B. D. Kalekar, will be the Deputy Leader of the Mission which will include nine other experts. The Mission leaves for Russia by the middle of next month.

Railway Freight Structure

Sir Ramaswamy Mudaliar will be chairman of the Committee which is to enquire into the freight structure of the Indian Railways. The other members will be: Mr. T. N. Singh, M.P.; Mr. D. K. Borooah, M.P.; Mr. I. S. Puri, ex-Financial Commissioner for Railways; Mr. V. P. Bhandarkar, ex-Member for Transportation, Railway Board; Mr. L. K. Jha, Joint Secretary, Ministry of Commerce and Industry; and Mr. A. K. Basu, General Manager, Eastern Railway. The terms of reference of the Committee will be:

- To review the present railway freight rate structure in all its aspects and to suggest what modifications should be made, bearing in mind the needs of a developmental economy and the necessity for maintaining the financial stability of the railways;
- To examine whether the statutory provisions dealing with the responsibility of the railways as carriers need any and, if so, what modification, and in the light of the modification proposed whether any adjustment in freight rates is warranted; and
- To examine what changes, if any, are needed in the existing constitution, jurisdiction and rules of procedure of the Railway Rates Tribunal, so that the Tribunal might be a more effective and expeditious instrument for adjudication of railway freight matters at a reasonable cost to the litigant.

The Committee will be expected to make recommendations on the above matters. With reference to item (i); while it is not intended to burden the Committee with the task of going into the classification of individual items unless the interests concerned allege anomalies and ask for adjustment, it will be expected to review generally the principles of classification, suggest such changes in the overall structure as may be considered necessary in view of the developments which have taken place and are expected in the field of trade, commerce and industry and to suggest appropriate methods for dealing with such questions as may arise later in regard to classification.

The present freight-rates structure of the Indian Railways was introduced with effect from 1st October, 1948, after protracted investigation for over four years by a departmental committee. This investigation was undertaken in response to a public demand for the simplification and rationalisation of the previous rates structure which had been

rendered very complicated under multiple ownership of the railways. The scale of charges, under the previous rates structure, varied from railway to railway, not only for conveyance, but also for services at terminals and transhipment points. Even when the same scale was applicable on two contiguous railways, the charges had to be calculated separately for the distance over each. Against 16 standard class rates, exceptional rates ran into hundreds of thousands. Some of these rates were quoted by individual railways to attract traffic to their respective routes and involved uneconomic haulage over circuitous routes. The 1948 revision mainly aimed at simplification and rationalisation of the rates structure by standardisation of charges over the newly nationalised Indian railways. Routing of traffic by the shortest route to the maximum extent possible was enforced. Telescopic rates on a continuous mileage basis irrespective of railway boundaries were introduced for the first time, the unit charge declining with an increase in distance.

The Railway Freight Structure Committee has also been asked to examine the question whether the statutory provisions dealing with the responsibility of railways as carriers need any modification and whether any adjustment in freight rates is warranted by these modifications. At present the responsibility of the Indian railways for loss, destruction or deterioration of goods tendered for carriage by rail is that of a "bailee" as against the responsibility of a common carrier imposed on railways in the United Kingdom and certain other industrially advanced countries. It has been examination of the question and industry that a change in the responsibility of the railways as carriers of goods so as to approximate it to that of a common carrier.

Complaints have also been made that a change in the provisions of Section 77 of the Indian Railways Act is necessary as the Section is unnecessarily restrictive. Under this Section a claim for compensation for loss, destruction or deterioration of goods in writing within six months from the date of delivery of the goods for carriage by rail. Railway administrations already have instructions not to provisions of this Section under certain circumstances, but possibly a change in the statutory provisions would provide a more satisfactory solution of the problem.

A separate term of reference of the Committee relates to the Railway Rates Tribunal. The examination has been entrusted to the Committee in view of the persistent demands made by trade and industry for simplification of the procedure and conduct of cases before the Tribunal so as to ensure more expeditious disposal of such cases and also to reduce the cost to the parties involved. The recent decisions of the Tribunal have also revealed certain ambiguities in the provisions of the Railway Act in regard to the jurisdiction of the Tribunal in respect of certain rates matters, so that Courts on written petitions. For example, there was the question whether the Tribunal has or has not the power to order the provision of a wagon at present. There was also the question from take effect and whether retrospective effect was contemplated by the statute. Such lacunae or ambiguities involve unnecessary litigation between the railways and the interests concerned so that it will be a definite advantage if the Committee provisions of the Railway Act is called for to simplify matters and to make the intentions of Parliament clear beyond doubt.

Railway Electrification Plans

Eighteen hundred miles of the Indian railways are proposed to be electrified in the second five year plan. Calcutta to Mughalsarai, Igatpuri to Bhusaval, Ahmedabad, the steel districts, including Asansol to Jersagod, and some portions in South India are included in the plan. In addition of electric current are the determining factors in the plan, the Government has approved a phased programme for the manufacture of integrated electric coaches within five years in India, through Jessop and Company of Calcutta. The establishment of a heavy electrical equipment industry will enable India to manufacture complete coaches.

Oil Prospecting Licence

The Government of India has agreed to grant a prospecting licence to the Assam Oil Company, a subsidiary of Burmah-Shell, to be granted for a period of 20 years, renewable for further a period of 20 years, at the option of an Indian rupee company to be incorporated in India, to which all the unworked licences at present held, and in which the Government of India will hold one-third equity capital.

Expansion of Rourkela Project

An agreement has been reached with the German combine, Krupp-Demag, to revise the State-Rourkela in Orissa, by expanding its installed capacity to 1.2 million tons of ingots. The plant was originally designed for half a million tons of ingots to produce sheets, strips and plates. It is expected to go into production by October, 1958.

Bombay

LABOUR COURT'S RULINGS IN DOCK WORKERS' CASE

PIECE RATE PAYMENT ORDERED AGAINST TIME RATE SYSTEM

(FROM OUR BOMBAY CORRESPONDENT)

SEVERAL important awards in industrial disputes in western India were notable events of the week. The most important amongst them and the one that has attracted considerable comment and is likely to have far-reaching repercussions in the future, not only on the ports but on the labour situation in general is the award of the Industrial Court in the outstanding disputes between the Bombay dock workers and the Port Trust authorities on the one hand and the stevedores on the other. These disputes were referred for adjudication to the Industrial Court of Mr. M. R. Meher by the Government of India, after a "go-slow" strike of some duration, organised by the Transport and Dock Workers' Union which almost paralysed work at the port a little over a year ago. The awards are being published in parts.

It may be recalled that long before this crisis in the docks, and the reference of the dispute for adjudication, a system for wage and incentive bonus for securing a fair output and quick turnaround of ships in the Port had been devised and was in operation. The Tribunal has held that the factors responsible for the failure of this scheme were "the indifference of labour towards its duties, the unauthorised absence of workmen for an hour or so during the shift, the tendency of a part of the workmen to work for two shifts or excessive overtime instead of turning out adequate work in one shift and the system of paying 'speed money' to certain workers." In support of this finding, the Tribunal observes that "there was strong evidence that workmen had been going slow and, at times, an intensified 'go-slow' policy was adopted by them." The award rejects the contention of the stevedores that the fall in labour efficiency was due to such factors as congestion in the sheds, defective cranes, changes in the tally system and delays in customs examination, as having little substance in view of the fact that new sheds had been erected and the equipment of ships had been improved to facilitate the quick discharge and loading of cargo. Similarly, it also rejects another contention of the workers that "lower production and unauthorised absence of workmen during the shift was due to the absence of adequate amenities such as canteens." The Court has agreed with the Bombay Port Trust that the time rate system of payment had resulted in slowing down the work.

Payment of Wages

After rejecting the demand of the dock workers for an increase in the time rate, the award lays down piece rates on the basis of an increase in time rate and has fixed these rates for various categories of workers in the hope that under a piece rate system workers would be reasonably efficient and punctual. However, it has been ruled that payment should be made at the time rate in all cases where labour is rendered idle on account of circumstances beyond its control. The award stipulates that workers reaching 90 percent or more of the datum line should be entitled to not less than the time rate and for production in excess of the datum line, payment should be at double the usual rates, besides providing certain minimum wages at rates higher than those provided by the Minimum Wages Act. In all cases where the output of workers does not lend itself to accurate measurement, payment is to be made at the time rate. With the increase in wages by this time rates.

With the increase in wages by this time rates, the opportunities created for earning additional income under the piece work system, the Tribunal hopes that the present system of paying 'speed money' to crane drivers and others would eventually disappear. Detailing the manner of wage payment, the award lays down that the difference between the lowest time wage and the actual wage at the time rate, and between the basic dearness allowance and the actual dearness allowance, will in each workman's case, be credited to his account by way of an allowance. The piece rate for the eight-hour shift would be Rs. 47-15 for 40 tons, that is Rs. 0-15-8 a ton a gang. The time rate has been increased to Rs. 4 in the case of B. P. T. workers and Rs. 4-6 for stevedore workers, as against Rs. 3-11 and Rs. 3-14 previously. The Tribunal has also granted a guaranteed minimum wage without work for a stevedore worker, shore worker and Rs. 3-3 for a stevedore worker, even if the output is 90 percent or less of the datum line. The Tribunal has also brought crane drivers within the purview of the piece rate system, though it has increased their wage by Rs. 12½ a month.

Regarding the monthly paid workers, the Tribunal has decided that they should be paid on the same basis as pool workers when engaged in loading operations. When not employed that way, they will be paid daily rates calculated at one-thirtieth of their existing basic wage and dearness allowance and for Sundays and holidays as well as for days on which there is no work they will get one-thirtieth of the basic wage and dearness allowance.

Guaranteed Minimum Wage

The award has fixed the basic wage of a junior worker at Rs. 2-10 plus dearness allowance of Rs. 1-12 on a piece rate basis. The guaranteed minimum wage for a stevedore worker will be Rs. 3-3 and for a Port Trust shore worker Rs. 3-1. If the piece work earnings plus idle time payment and allowance earned by a workman on any work-

ing day fall short of the above minimum, the employer will make up the difference for that day, provided the output on any such day has been not less than 90 percent of the datum line during the period or periods of work. Allowance will be paid at annas eight and nine paise an hour in the case of eight-hour shifts and 11 annas and eight paise for six-hour shifts for the period that labour is rendered idle due to no fault of its own and on account of certain specified reasons. The Tribunal has also directed the appointment of a committee consisting of an equal number of representatives of employers and employees, with an independent chairman, for the proper administration of the piece rate system and for the settlement of disputes. It has recommended that the Port Trust Act should be amended to provide for such a committee. Until the Act is amended, disputes are to be settled mutually or by referring them to the Central Conciliation Officer. At the same time, the Tribunal has rejected the demand of the Transport and Dock Workers' Union for a scheme for the decasualisation of workers on the lines of the Bombay Dock Workers' (Regulations of Employment) Scheme which is at present applicable to stevedore workers only and has suggested that the matter should be examined by the committee appointed by the Central Government for the purpose. The Tribunal proposes to deal with the question of providing amenities for dock workers in Part 2 of the award.

Labour Relations

While the Port Trust authorities, the stevedores and the shipping companies in Bombay have so far not expressed any opinion on the award, there has been some sharp reaction from the dock workers' organisations. Mr. H. N. Trivedi, president of the Bombay Stevedores and Dock Workers' Union, which is affiliated to the Indian National Trade Union Congress, characterised the award as unfavourable to labour and declared that his union had decided to appeal against the Tribunal's decision on the issue of the piece rate system. A cordiality to him, the piece rate system is detrimental to the workers' interests and it should have been discarded entirely because of its possible deleterious effect on the health of dock workers, who were naturally tempted to work beyond their strength in order to earn more under a system which made wages proportionate to their output. Mr. Trivedi disagreed with the finding in the award that the dock workers were to be held responsible for the slowing down of work at the docks and stated that his union could not accept this. The general secretary of the Dock Mazdoor Union went further. While describing the award as "reactionary and anti-labour", he warned that industrial peace in the docks would be disturbed seriously if it was forced on the dock and stevedore workers. In a statement, he declared that the award, if implemented, would make working in the docks "lousy-turvy."

Labour Problems for Indian Shipping

The position of Indian shipping, because of the unsatisfactory working of dockers at important ports, has been rendered very precarious. How serious this has proved financially for the infant Indian shipping enterprise which is being continuously urged to expand, was well brought out with facts and figures by Mr. C. R. Srinivasan, in his address as chairman of the Bharat Line Ltd., at the time of the general meeting of the Company. Mr. Srinivasan said that apart from labour, legislation of a general character, which equally affected shipping and other industries, the recent introduction of the labour decasualisation scheme involving payment without work to dockyard workers not only imposed a direct burden on the industry but indirectly had exposed it to a vicious train of reactions of infinite consequence to the community as a whole. If pay could be had without work, it was bound to provoke demands for more and more pay for less and less work, and the go-slow movement had already gathered a new momentum. To illustrate his point, Mr. Srinivasan gave some important figures for the year 1951 to 1954 for the Port of Bombay, which are worth reproducing:

STATISTICS OF CARGO HANDLED AT BOMBAY.

Year	Cargo handled	Gangs employed	No. of days
1951	1,24,295	2,584	374
1952	96,338	2,193	384
1953	82,134	2,619	405
1954	90,519	2,874	442

Proportionately for handling 1,000 tons the statistics would be:

Year	Gangs employed	No. of days	Cost per gang... Rs. As. P.
1951	20.79	3.01	52 0 0
1952	22.76	3.98	57 10 0
1953	31.88	4.93	72 0 0
1954	31.74	4.88	72 0 0

Taking 1951 as 100 the above figures work out to:

Year	100.00	100.00
1952	109.47	132.22
1953	153.34	163.78
1954	152.67	162.12

Mr. Srinivasan therefore deduced that whereas for handling 1,000 tons of cargo 20.79 gangs were employed at a cost of Rs. 52 a gang and the work was completed in 3.01 days in 1951, the same workload required 31.74 gangs costing Rs. 72 a gang in 1954 and was completed in 4.88 days. He added that this was only part of the penalty that the shipping industry had to bear as a result of these new tactics. The greater loss came from the needless detention of ships at ports due to slackness

of labour. The standing charges of a medium size ship covering wages, fuel, maintenance, insurance, etc. averaged between Rs. 4,000 and 5,000 a day, and every day's detention not merely added to expenses but denied opportunities for further earnings. "I have had statements prepared to estimate the loss sustained by us on our fleet on this account and you will be amazed to hear that the total detention cost equals in value the full time operation of an 8,000 D.W.T. ship for a period of 179 days, or nearly six months. The maintenance cost of the ship for this period would be between Rs. 8 and Rs. 9 lakhs. This represents the direct loss. The indirect loss is that during this period what might normally have been earned on freight is also lost. Does labour stand to gain anything by imposing this loss on the shipping company?"

Mr. Srinivasan further said: "Detention of ships at ports leads in turn to congestion with ships waiting outside for berths. The gravity of the situation as it has developed in the major ports of India may be gathered from the fact that foreign shipping interests had notified shippers that a charge of 35 percent would be levied with effect from 1st June if conditions did not substantially improve. Naturally, this has provoked a storm of protest from the interests affected and the Government's hands have been forced to meet a threat with a counter-threat. Howsoever the position finally resolves itself, the point I desire to stress in this context is the price that the community may be called upon to pay for pampering a small section of labour, unconscious and unmindful of their own long term interests." Mr. Srinivasan deplored that some of those who claimed to speak for workers had shown no appreciation of the broader implications of the claims they advanced. He reminded them that a short-sighted attempt to hold industry to ransom was not in the interests of either labour or the community as a whole, and as in the last analysis it was the community that paid for goods and services, the assertion of rights without acceptance of obligations was bound progressively to deplete the goodwill of the community. In the preparation of the second five year plan, with its emphasis on industry rather than agriculture, the concept of creating a national labour force was being canvassed. He presumed that this suggestion owed its origin not to any lack of labour but to a lack of discipline and responsibility among organised industrial workers today and advised workers' leaders to take an unbiased view of the present situation. At the same time Mr. Srinivasan suggested that it was time the Government realised its larger responsibility to the country and took proper and necessary steps by legislation or otherwise to undo the present mischief before it damaged the economy grievously. Workers' wage should be related to their output with an incentive bonus for extra work; otherwise with labour costs rising and stevedoring charges keeping pace with them, the outlook for the shipping industry would be bleak.

Declaring a Strike Illegal

Another important award affecting the Labour Court Practice and Procedure Rules in the case of declaring a strike illegal was occasioned by an application, made by the Bombay Electric Supply and Tramway Undertaking of the Bombay Municipal Corporation, praying for a declaration to the effect that the strike sponsored by the BEST Unity Front on 18th April was illegal. Relying on the present rules of Labour Court Practice and Procedure, the BEST Undertaking selected only two out of the nearly 6,000 conductors and drivers involved in the strike to represent themselves and other striking workers at the hearing of the application. On the other hand, nearly all the striking workers sought to be made parties to the hearing of the application in the absence of the appearance of a representative Union. Referring to this claim of the workers in his ruling, the Judge of the First Labour Court observed that with so many people individually joined as parties, the adjudication of the dispute was bound to be immensely delayed, besides creating a few more occasions for the complete cessation of work of this public utility concern, as all the opponents to the application were supposed to be present in the Court. In view of this impossible situation which would be created, the Judge, in exercise of the discretion vested in him regarding joining of the parties, directed the BEST Workers' Union to appear for and act on behalf of the affected employees, in spite of the contention that the appearance of this Union, which was not in favour of the strike, would be inadequate in the interest of striking workers. Rejecting this contention, the Court observed that it was possible that the Union and the affected employees might not be in agreement regarding the views and the actions of the strikers, but the BEST Workers' Union was a statutory representative Union and as such had not only a right but also a liability to represent the employees whose representative it claimed to be.

In a similar context, the Madhya Pradesh State Industrial Court, during the same week, went a step further and held that a strike would be illegal even without a declaration to that effect by an Industrial Court, if circumstances rendering it illegal under the law existed. In this case the management of the Model Mills, Nagpur, had discharged some workers for striking illegally. Three of the discharged workers went on appeal to the Industrial Court on the ground that no action could be taken before the management obtained a declaration from the Court that the strike was illegal. Dismissing these appeals the Chairman of the Industrial Court observed that it was not the decision of the Industrial Court which rendered the strike illegal but the existence of circumstances recognised by law rendering it so.

Progress Is Our Most Important Product

These people are explorers. At General Electric research centres, they probe the unknown... seeking and finding precious new facts. Other men will apply this knowledge and products will be improved, new ones developed. Like the new, more convenient refrigerator... an improved turbine... a more efficient locomotive. Products of continuous research. Products that make life easier for you.

In a word... Progress.

RECENT DEVELOPMENTS IN LIFE INSURANCE

REGULATION BY THE COUNCIL

By N. T. Raju

DURING recent years life insurance has been the subject of much public discussion and its day-to-day activities have been receiving considerable publicity. The last Insurance Amendment Act, in 1950, extended State interference in the business in many new directions. The interests of insurance agents were better protected, expenses of management limited and investment of funds subjected to severe restrictions. A Life Insurance Council was created to aid, advise and assist insurers in establishing sound standards of business practice. This body formulated a Code of Conduct early in 1953 for observance by all offices. Unfortunately the code contained many details, such as a slab for agents' commission, which were not of much practical utility in raising the standards of business practice. The most useful content of the Code was the prohibition of dual rates of premium for identical insurance benefits.

Dual Premium Rates

Life insurance for Europeans is cheaper than for Indians because of lower mortality and for certain other secondary reasons, so some life offices had a separate set of premium rates for Europeans. The Code of Conduct recognised the appropriateness of this distinction. With increasing competition for life business, the lower rates of premium were extended to highly placed officers in the Government and mercantile offices and gradually the benefit of the special rates seeped through to anyone who cared to buy a life policy for a fairly large amount. Some offices allowed the lower rates under the guise of Staff Insurance Schemes, outwardly supposed to cover a substantial portion of the staff under an employer. It was a development about which no life office was happy but which no office of any importance could avoid. With the introduction of the Code of Conduct these undesirable developments have been greatly checked. While the prohibition of dual rates of premium should be welcomed as a wise move on the part of the Life Insurance Council, provision to quote lower premium rates for Staff Insurance Schemes approved by the Controller of Insurance subsequently proved to be a thorn in the flesh.

Intermediaries

Another important feature of the Code of Conduct was the restriction of the number of intermediaries between the agent and life office to one. The limitation was designed to curtail the new business expenses of offices. When the Code was introduced, it was common practice to employ more than one intermediary and the innovation naturally caused serious inconvenience to companies. It is difficult to say how far it was wise to disturb existing and established practices in this respect. Though the offices technically conformed to the principle it is doubtful whether there was any substantial saving in expenses under this head. The business had hardly adjusted itself to changes introduced by the Amendment

Act and the Code of Conduct when it was confronted with a drastic reduction in premium rates.

The Rate-Cut

During the war and since, the economic scene has undergone a radical transformation. The rate of interest earned on life funds has been steadily declining. It touched a peak of 6.26 in 1923. By 1940 it was only 4.37 and in 1948 it slid down to the all-time low of 3.02. The increase in working expenses and staff salaries during the 'forties added to the burden of the offices. In consequence, premium rates were raised many times by offices till 1948.

After 1948 the rate of interest improved considerably and by 1953 had recovered to 3.50 percent. The decade centring on 1948 witnessed a phenomenal growth in life business. The bulk of this business was written by offices on rates of premium which were based on a low rate of interest. With the improvement in interest earnings, the gradually declining mortality of the insured lives and stabilisation of the expenses of management, the financial position of most companies reached a satisfactory state. The burden of the very old business on what are now uneconomical rates of premium became progressively less, partly with the running off of such business from the books and partly due to an improvement in the rates of interest and mortality. Also, what still remained of such business was small when compared to the more recent business at higher premium rates and the losses were largely overcome by the increasing favourable margins in subsequent business.

In the circumstances the life premium rates prevailing in 1953 and 1954 admitted of some reduction. But New India chose to impose a sudden and drastic rate-cut early in 1954, being followed by Oriental. Feeling that Government intervention was uncertain and that in any event it would be belated, other offices were left with no choice owing to the force of competition in the new business field.

The rate-cut has been widely discussed. Some took the view that a substantial reduction was not fully in the interests of the healthy growth of the business. Many small companies could not afford similar reductions as larger offices and the consequent disadvantage at which they would have to conduct their operations had many sympathisers.

But the fundamental fact remained that the new rates put in force by the larger offices were technically sound, and opposition to them, being based on slender foundations, had necessarily to wane with time. To develop the habit of life insurance and to accelerate capital formation through insurance, the policies have to be attractive and appealing and the surest way lies in making them cheap consistent with safety.

The powers of the Government under the Insurance Act to prevent a rate-cut are not very clear but as a working arrangement the Life Insurance Council has advised offices that any rate-cut hereafter should secure their prior ap-

proval so that similar occurrences in future may be avoided.

The Bonus War

Soon after the rate-cut and the controversies it started came high bonus declarations by offices which made their valuations as at the end of 1953. They were again the subject of severe criticism. Motives of new business considerations were attributed to declaration of high bonuses. Some even went to the extent of asserting that the offices could not afford such bonuses. The propriety of declaring the same rates of bonus for policies on different premium scales naturally came up for consideration. As the recent low rates declared up to end of 1953 were not much affected by any such propriety. It would arise in valuations made as at end of 1954 and later. The Government some time ago elicited the professional opinion of actuaries regarding the declaration of uniform rates of bonuses for policies on different scales of premium and regarding the maintenance in future of the level of present bonuses. It has all along been accepted that equity between different batches of policyholders is the practice of some companies to declare differential rates of bonuses for various premium scales. But the matter lends itself to considerable legitimate difference of opinion and so much depends upon the particular circumstances of individual offices that it would not be proper to express a general opinion.

It cannot be denied that prospective clients may be guided by the current levels of bonus in choosing a life office to insure with, expecting that similar bonuses will be maintained in future. If such hopes do not materialise due to a faulty system of determining bonus rates, the offices concerned cannot be absolved of responsibility for before the eyes of their prospects. But in practice it is customary to keep in view the probable level of future bonuses while making a valuation and the matter is best left to the judgement of the valuing actuary.

After all these happenings, the rate-cut, higher bonus rates and the more recent developments staff insurance schemes, it would appear that the Life Insurance Council has not served a very useful purpose in properly regulating practices in life insurance business. The machinery cannot forestall any of these developments and prevent their occurrence. Every time only a post-mortem examination of the situation became left undisturbed. Such a state of affairs cannot but lead to a weakening of confidence in the efficacy of the machinery. When the machinery does not prove very effective in important matters such as agents' commission and enticing of workers of one company by another, it will only usefulness.

Books and Publications

CO-OPERATION IN INDIA

Theory and Practice of Co-operation in India and Abroad. Vol. I. By K. R. Kulkarni (Co-operators' Book Depot, Bombay. Price Rs. 15. Pages 398).

Professor K. R. Kulkarni's book is timely. Though he has written it as a text-book meant for students of the Co-operative Training College, conducted by the Bombay Provincial Co-operative Institute, the book will have value for all those interested in the co-operative movement. In his clear exposition of the principles of co-operation differentiates it sharply from Socialism as essentially standing for the expansion of private property for social ownership of the means of production. Co-operation does not choke individual resourcefulness, initiative and enterprise, as Socialism with its rigid State, co-operation becomes a misnomer since the machine. Extending this logic to the question of State participation in the co-operative movement, the author says: "Objections to State help are certainly based on valid grounds. It is undeniable and demoralising in its influence, if it is extended for prolonged periods or if it is indiscriminate or agencies. There are many instances also on record in which the Governments have been over liberal a disservice to the co-operative movement as the fundamental principle underlying co-operation is self-reliance." The author does not examine the elaborate schemes formulated recently by the Government in accordance with the recommendations of the Committee of Direction of the Reserve Bank's rural credit survey as the book is devoted chiefly to an abstract or academic treatment of the forms in which it is practised in India and abroad coming third volume. In his forthright history of co-operation of India and its practical aspects, a thorough and critical examination of the now accepted principle of elaborate State participation in the movement should be made.

Jute

THE NEED FOR RESEARCH IN JUTE GROWING

IN a letter published in the May issue of the Indian Central Jute Committee's Bulletin, Mr. C. R. Nodder of the Institute of Jute Technology, has drawn attention to the neglect of research directed towards the development of strains of jute giving a higher yield of fibre per plant. This is a matter to which this paper has drawn frequent attention in the weekly articles on jute, but without succeeding in stimulating the interest of those engaged in research on jute-growing. All their efforts appear to be concentrated on producing bigger plants which will give a greater green weight per acre. In fact, one of the articles published in *Capital* some years ago drew forth disparaging comment from the Agricultural Research Department of the Indian Central Jute Committee. Even as recently as when India was suffering from a great scarcity of food grains it was pointed out that, if jute strains giving a higher yield of fibre per green plant could be produced, many thousands of acres could be set free for the growing of food crops without interfering with jute, the main cash crop of the ryots. The subject was again referred to after Partition when some people deprecated the idea of trying to make India self-sufficient in jute because that might cause rice land to be diverted to jute-growing.

We have pointed out how much has been done in other countries in regard to other crops such as grain and potatoes in the way of developing plants giving a higher yield in relation to the weight of the plant. In the case of oats in the U.K., for instance, the yield of grain per plant is nowadays about eight times what it was at the beginning of the last century. We do not suggest that anything like that could be done with the fibre yield of the jute plant but, if the yield could be even doubled, it would make an enormous difference to the agricultural economy of Bengal. We are also aware that years of experimentation will be necessary before strains giving higher fibre yields can be developed, for nature cannot be hurried—not to any great extent, anyhow—but it is certainly worth trying and, in our opinion, more worthwhile than some of the research being carried on at present.

That research on these lines would benefit the country will be appreciated if the following points are borne in mind:—

- (1) the reduced acreage required to produce the same quantity of jute;
- (2) the food crops which would be produced on the land set free from jute-growing;
- (3) reduction in the water required for retting;
- (4) reduction in labour in carrying the plants to the retting water;
- (5) reduction of labour in retting;
- (6) reduction of the enormous quantity of waste matter at present produced (94 per cent of the crop);
- (7) soil economy because of there being less strain on the land in producing useless vegetation;
- (8) fertiliser economy resulting from (7).

Research on these lines in regard to kenaf (mesta) is already being done in America and has met with some success. We are facing competition in the jute industry in many other ways and we must not lag behind in the development of our jute plant. What we need is someone of the calibre of Burbank the American "plant wizard" or Biffen of Cambridge. Can we find one in India?

INCREASE IN U.S. BURLAP CONSUMPTION

STOCKS ALSO HIGHER

THE increase in the consumption of hessian in America during the month of May came as no surprise to operators on the Calcutta markets, although few expected the high figure of 73 million yards to be recorded. This is extremely high for this time of the year when consumption normally drops off, and not only is it 10 million yards more than the April figure but is 16 million yards more than in May, 1954 and 14 million yards more than for the same month in 1953. Consumption so far this year, which up to this month had been lower than in former years, has now been given a considerable boost and the monthly average has jumped up to nearly 67 million yards. This encouraging news was somewhat marred by the simultaneous announcement that American burlap stocks had gone up to the unprecedented figure of 261 million yards. This figure has been on the increase since September last year, as the table published elsewhere in this Jute section shows. In nine months stocks have increased by 86 million yards, which is nearly 14 months' consumption. Unfortunately the increase in consumption has not been commensurate with the increase in stocks which has increased last month in Calcutta markets, and the increase last month in Calcutta markets is made up of 154 million yards spot, which is an increase of 27 million yards on the previous month, but this is offset by a drop of 24 million yards in the float stocks, from 131 to 127 million yards, a total availability of exactly four months' consumption based on last year's monthly average of 65.25 million yards.

These facts and figures appeared to put a damper on activity in the goods market at the begin-

ning of the period, and although prices remained steady in the heavy goods section, there followed a series of dull sessions in hessian when business was at a minimum and rates tended to fall. At the lower levels some small interest was shown from North America but mills were not sellers at these rates and interest waned. In the absence of business however speculators had a clear field, and towards the close market manipulations caused prices in both sections of the market to fluctuate. An improvement in shipping figures and small overseas enquiries once again had a steady influence, and rates rose temporarily only to be pulled back by the fatka operators, who spread rumours that hessian stocks are liable to show a large increase this month due to the possibility of Argentine shipments being extended on account of trouble in that country. This see-sawing of prices gave the market little opportunity of settling down, and overseas buyers are again holding off until more stable conditions return.

The Raw Jute Position

Calcutta mills have been showing an increasing interest in the purchase of raw jute over the past few weeks, and business concluded during the week under review has been on the heavy side. In spite of the fact that all mills are reporting that their stock position is adequate to tide them over until their new crop purchases arrive, buyers have been showing more than a passing interest in old crop quick delivery jute. In some cases it is reported that mills' stocks of sacking quality jute are at a very low ebb, and several purchases have been made for bottoms only at premium rates. New crop reports continue to be very favourable, and indeed, in Dhubri, new crop jute has been arriving at the rate of about 500 maunds a day. This is much earlier than last year but it is not surprising as conditions in this area have been better than for many years past, and a bumper crop has been predicted. Initial reports are conflicting as regards the condition of the jute, but all agree that the quality is above average.

The recommendations of the expert committee on raw jute set up by the Government in 1952 as part of the five year plan are now beginning to bear fruit. When the plan was launched India's production of raw jute was a little over three million bales, and the yield per acre about 2.25 bales, but with the improved farming methods, retting facilities, better fertilisers and agricultural implements, this season's crop is expected to reach four million bales and the yield per acre 2.5 bales. Under the second five year plan it is understood that the target set for the 1960-61 season is five million bales with a yield of three bales per acre. The Government also proposes to set up a nucleus jute seed farm, with a chain of eight seed multiplication farms in the various jute-growing States. Distribution of these seeds and the supply of fertilisers on a deferred payment basis, will it is hoped improve the quality of the jute and step up production. India's normal annual requirements of raw jute are in the region of seven million bales, so there is still a long road ahead before self-sufficiency is obtained.

THE JUTE MARKETS

Manufactured Goods: The depression in the goods market recorded at the end of the last session continued into the week under review, and prices were again marked down, though to a lesser degree than on the previous day. Ready B. Twills lost four annas to open at Rs. 106-4 a 100 bags while October-December shipment was unchanged at Rs. 101. Hessians, following the announcement of the American burlap consumption and stocks, recorded a small loss of two annas in the near positions, June shipment 40" 10 oz. being quoted at Rs. 42-8 a 100 yards, while October-December shipment remained constant at Rs. 41-4. Shipper and speculative covering took place at the lower levels, but the only alteration in prices was in the hessian section which continued to rule easier, and the near positions lost four annas. At this stage speculators indulged in heavy bear covering, pushing prices up so that by the opening on Saturday morning the losses so far incurred during the week had been more than made up in both sacking and hessian. B. Twills rates jumped up Rs. 1-8 in all deliveries, the near and forward positions were verified and the near and forward positions were quoted at Rs. 107-12 and Rs. 102-8 a 100 bags respectively. June delivery 40" 10 oz. reverted to last week's closing rate of Rs. 42-10 and the forward position was altered for the first time this week, advancing two annas to Rs. 41-6 a 100 yards. Overseas buyers withdrew at the higher levels, but a steadier tendency was apparent under speculative operations. On Monday the market was officially closed because of the solar eclipse and it opened on Tuesday on a quieter note due to the lack of business, heavy goods falling eight—12 annas and hessians six to eight annas.

At the close the market is unchanged with no business reported. Opening quotations on Wednesday morning were as follows:—

	Ready	July	July-Sept.	Oct.-Dec.
40" 8 oz.	Rs. 34-2	34	34	33-4
40" 10 oz.	42-6	42-6	42-8	41-2
B. Twills	107	106-8	106	102
Heavy Coes	108-8	108	107	102-4
A. Twills	135	134	132	126
Liverpools	122	122-8	121-8	116
Cornsacks	113-12	110-8	109-4	104

Raw Jute: Good business was reported from the raw jute markets this week, the bulk of trans-

actions being done before the weekend. Once again old crop jute for quick delivery came in for a great deal of interest, and under buying pressure from mills sellers became ressed and withdrew most of their offers. Low quality jute for sacking purposes was in good demand, but mills had to pay high prices for any purchases in this category. Consequently the old crop market has ruled very firm throughout the week, and quotations have risen from an opening of Rs. 27 a maund for Upper Assam Bottoms, to Rs. 28-8 a maund for the same fibre towards the close.

New crop offers have changed in appearance this week, the majority being for the July-September period, as against shipment up to the end of the year in last week's indications. Small business has actually been done for guaranteed June shipment, so it would appear that the buyers hold the whip hand as far as this section of the market is concerned. The buyers are not willing to do business for deliveries after September, as the trade in general visualises a substantial reduction in rates towards the end of the year providing crop conditions remain as favourable as at present. Quotations opened the week on the basis of Rs. 25-8 a maund for Upper Assam Bottoms for August-September shipment, and these rates were unchanged until Saturday when they advanced eight annas a maund. A further eight annas was added on Tuesday morning, but rates soon fell back again in the absence of business, and in sympathy with the finished goods market.

During the week business was done in old crop Dhubri-Northern jute at Rs. 29 a maund for Bottoms only for June delivery, and at Rs. 27-8 to Rs. 28-8 a maund basis Bottoms for June-July shipment. Rs. 27-8 was also paid for Upper Assam assortment for June-July shipment, and Local Northern jute changed hands at between Rs. 27 and Rs. 27-8 a maund. Small lots of Daissee and Daissee Mesta were purchased at Rs. 28 to Rs. 28-8 a maund basis bottoms for the former, and Rs. 28-8 to Rs. 28 a maund for the latter.

The only business reported in old crop Pakistani jute was in Pakistani Northern at Rs. 27 a maund for Bottoms, with a Rs. 3-8 difference between Middles and Bottoms, for June-July shipment.

Business in the new crop section was confined, in all cases, to jute for shipment before September. Some small business was done in Dhubri jute at Rs. 27-8 a maund basis Bottoms for guaranteed jute shipment, and the same fibre was also done at Rs. 26-8 a maund basis Bottoms for July-August shipment. Indian Northern jute was done at Rs. 26 to Rs. 26-8 a maund for August-September, and Daissee white made its first appearance this year to record Rs. 26-8 to Rs. 27 a maund basis Bottoms for half July-half August shipment.

At the close the market is unchanged with sellers reserved and mills showing no interest. Opening quotations on Wednesday morning were as follows:—

	Landed at Mills.	Shipment.
	Rs. a md. basis Bottoms.	
	Old Crop.	New Crop.
Lower Assam	29 June-July	26-8 Aug.-Sep
Upper Assam	28-8 "	26 "

Jat	29	June-July	28-8	Aug.-Sep.
District	28-8	"	28	"
Northern	28-8	"	28	"

Demand from Calcutta mills for quick delivery local jute has kept the Cossipore market firm throughout the week, and sellers of old crop jute are very reserved. Imports have again been very irregular but over the week have averaged about 25 wagons a day most of which contain high assortment jute. Stocks in Cossipore are reported to be very high at the present time, but holders and stockists are asking premium prices for all grades. Quotations are steady and at the close Kishenganj jute stood at Rs. 28-4 a maund for garsat quality. There is nothing doing in the Sheoraphuli Daissee markets and quotations are nominal in the absence of business. In the Daissee growing areas, especially in the Chakdah-Ranaghat-Bongaon districts the new crop is in a very healthy state and imports of Daissee white from these areas are expected by the end of this month. The first imports of ordinary Daissee however are not expected much before September. In some of the western areas, where germination has been very poor, many farmers have ploughed up their lands and are planting alternative crops. It would appear that once again the Mesta crop will be very large, and first imports are expected about September.

Mofussil: Indian upcountry old crop markets continue to rule steady and quantities of jute on offer are negligible. Reports from Dhubri indicate that imports of new crop jute have started, and towards the end of the week were arriving regularly at about 50 maunds a day. Business has been done at between Rs. 23 to Rs. 24 a maund for garsat quality and the demand is keen. In some Northern areas also, new crop imports have started but on a very small scale, and so far no business has been reported. At the close quotations in Dhubri are based on Rs. 25-8 to Rs. 26 a maund for old crop garsat quality and a maund for new crop garsat quality.

There is very little business passing in the Pakistan markets as a result of which all quotations are nominal. Old crop imports into Narayan ganj have remained steady over the week at about

3,000 maunds a day, two-thirds of which is loose jute from outside agencies. The market is quiet and quotations are based on Rs. (P) 18 a maund for Jat Bottoms, with Tossa Re. 1 higher. New Crop imports are increasing slowly and over the past few days have averaged about 3,000-4,000 maunds a day in Narayanganj, and business has been done for July delivery on the basis of Rs. (P) 14-8 to Rs. 15 a maund for Jat B. Bottoms.

INDIAN JUTE CROP REPORT

In their fourteenth crop report for the current Indian season, covering the week ended 18th June, Messrs Sinclair Murray & Co. Ltd., say that weather conditions during the past week have been favourable with general rainfall in all districts and spells of good sunshine. The condition of the crop has improved all round particularly in Orissa and West Bengal, and in Assam and Bihar is considered very healthy. Cultivators have been able to proceed with sowings freely and these are now completed in all districts with the exception of some sections of West Bengal. Harvesting in the extreme lowlands has been started in some areas of Assam. River levels generally are normal.

DANPUR: Sowings completed -/22/- In the earlier part of the week the weather has been hot and dry but latterly good rainfall was experienced and this has been most favourable. Cultivators have been able to complete sowings at -/22/- as against completed sowings at the same time last year. Weeding operations are going on where necessary. Plant condition has improved and the plants are healthy, ranging in height up to 3ft. 6in. The river level is normal for this time of the year.

JAIPUR ROAD: Sowings completed -/20/- Very favourable weather conditions have been experienced with alternate rain and sunshine. Cultivators have been able to complete sowings at -/20/- as against completed sowings at this time last year. Lowland weeding operations are now completed and are going on freely in the midland areas. Plant condition is satisfactory and the plants range in height from seedlings to 2ft. 3 in. The river level is normal for this time of the year.

COSIMBAZAR: Sowings completed -/16/- Good rainfall was experienced in the earlier part of the week and this has been most beneficial for the growth of plants and has allowed cultivators to complete sowings which we estimate at -/16/- as against completed sowings at this time last year. We estimated division of sowings is jute -/9/-, Mesta -/7/-, Plant condition is improving and of later sowings is reported to be very satisfactory; the plants range in height up to 2ft. 6in. Second weeding operations in the lowlands have been completed and are going on as required in the midlands. First weeding operations have started in highland areas. The river is normal for this time of the year.

RANAGHAT: Sowings completed -/20/- During the past week weather conditions have been very favourable with alternate rain and sunshine. Cultivators have been able to complete sowings estimated at -/20/- as against completed sowings at this time last year. Estimated division of sowings is: White -/3/-, Daisee -/7/- and Mesta -/10/- Weeding operations are going on where required and plant condition is satisfactory ranging in height up to 3ft. 6in. The river level is slightly lower than at this time last year.

NOWGONG: Sowings completed -/22/- Earlier in the week some scattered rainfall was experienced but latterly conditions have been hot and dry and this has been favourable for the standing crop. Plant condition is reported to be healthy and the plants range in height up to 5ft. Weeding operations are going on where required. Harvesting has been started on a small scale in the extreme lowlands. The river level has risen steadily but is still slightly lower than at this time last year.

PALASHBARI: Sowings completed -/24/- With the exception of scattered rainfall in the latter part of the week, weather conditions have been mainly hot and dry and this has been very favourable for the promotion of plant growth. Second weeding operations have been completed in low and midlands and first weeding operations are being carried out freely in highland areas. Plant condition is very satisfactory and the plants range in height up to 5ft. 9in. Earlier in the week the river level rose rapidly but latterly subsided to some extent and is now 2ft. 6in. higher than last year at the same time.

DHUBRI: Sowings completed -/20/- Alternate rain and sunshine has been experienced which is most favourable for the standing crop. Weeding operations are being carried out steadily and it is reported that some early weeding is now being marketed in interior "hats". Plant condition is very satisfactory ranging in height up to 6ft. Harvesting has been started on a small scale in the lowlands. During the earlier part of the week, the river rose steadily but latterly subsided and now stands at 2ft. 3in. lower than at this time last year.

FORBESGANJ: Sowings completed -/24/- Very favourable weather has been experienced with alternate rain and sunshine. Low and midland weeding operations have been completed and are going on as

required in the highlands. Plant condition is reported to be healthy and the plants range in height up to 4ft. 6in.

DAISEE DISTRICTS: Weather conditions have been favourable with alternate rain and sunshine. This has improved the condition of the standing crop. Plants now range in height from seedlings to 3ft. 6in. Weeding operations are going on where necessary. Sowings estimated to date are -/18/- as against completed sowings at this time last year. Estimated division of sowings is: White -/2/-, Daisee -/8/- and Mesta -/8/- The river level is normal for this time of the year.

N.B.—As a basis of comparison last season's sowings have been taken as -/16/-.

PAKISTAN JUTE CROP REPORT

In their fifteenth crop report for the current Pakistani season, covering the week ended 18th June, Messrs. Sinclair Murray (Pakistan) Ltd., say that the weather in areas has remained favourable and the crop continues to make satisfactory progress. Harvesting of the lowland crop is in progress and it is estimated that -/1/- has been cut to date. River levels continue to rise slowly and are generally about normal for the time of the year.

NARAYANGANJ: Sowings completed -/21/- The weather has been favourable with alternate rain and sunshine which has enabled the crop to make satisfactory progress. Condition of plant is satisfactory and the plants range in height up to 5ft. 6in. Weeding of midlands has been completed and highlands are expected to be completed in the next week. The river level is 9in. lower than at this time last year.

DACCA: Sowings completed -/21/- The weather has been favourable with alternate rain and sunshine. Condition of plants continues to be satisfactory and they range in height up to 5ft. Weeding is going on where required. The river level has risen 1ft. during the week, but is still 2ft. 6in. lower than at this time last year.

CHANDPUR: Sowings completed -/21/- The weather has been favourable with alternate rain and sunshine. Condition of plants continues to be satisfactory and they range in height up to 6ft. 6in. Weeding of midlands is complete and weeding of highlands is being carried on where required. The river level is 3ft. higher than at this time last year.

NIKILAMPARA: Sowings completed -/21/- The weather has been favourable with alternate rain and sunshine. Condition of plants is satisfactory and they range in height up to 5ft. 9in. Weeding operations have been completed. The river level has risen 1ft. 9in. during the week and is now 1ft. lower than at this time last year.

SARISHBARI: Sowings completed -/20/- The weather has been favourable with alternate rain and sunshine. Condition of plants is satisfactory and they range in height up to 5ft. 6in. Weeding is going on in mid and highlands as required. The river level has risen 2ft. 3in. during the past week, but is still 2ft. lower than at this time last year.

SIRAJGANJ: Sowings completed -/21/- The weather has been favourable with alternate rain and sunshine. Condition of plants is satisfactory and they range in height up to 6ft. 9in. Weeding is going on where required. The river level has risen 1ft. during the week, but is still 3ft. lower than at this time last year.

NAKALIA: Sowings completed -/21/- The weather has been cloudy with one shower of rain. Condition of plants continues to be satisfactory and they range in height up to 6ft. The river level continues to rise but the present level is much lower than at this time last year.

BHANGAORA: Sowings completed -/20/- The weather has been hot and dry and more rain is required to promote growth of the crop. Condition of plants is generally satisfactory and they range in height up to 6ft. 6in. Weeding is going on in the lowlands. The river level has risen 1ft. during the week and is now the same as at this time last year.

GUNNY SHIPMENT STATISTICS DURING JUNE 1955

The following figures include coastal shipment relating to manufactured jute goods for shipment from the port of Calcutta. These are gross figures based on shipping bills presented.

	Hessian	Cloth	Total
	Bags (Tons)	(Tons)	(Tons)
1st to 15th June, 1955	812.0	10,143.0	10,955.0
1st to 15th May, 1955	868.7	16,790.9	17,659.6
1st to 15th June, 1955	12,071.3	437.4	12,508.7
1st to 15th May, 1955	27,056.3	822.8	27,879.1

U.S. CONSUMPTION AND STOCKS

U.S. burlap consumption during May increased sharply. The estimated total industry consumption of 73 million yds. compared with only 57 million yds. for May a year ago and brings to 334 million yds.—20 million yds. (commercial use) higher than for the same period last year. U.S. burlap stocks at the end of May again increased slightly notwithstanding the improved consumption. At an estimated 261 million yds., 154 million yds. were spots and 107 million yds. were floats. Appearing below are two tables which include the May figures—(1) based on member reports to the Textile Bag Manufacturers Association and the Burlap & Jute Association, and (2) projected to represent the estimated consumption and stocks for the entire industry:

JUTE CULTIVATION IN THE USSR

MANY bast and fiber plants are grown in the USSR which has large cotton, flax, hemp and kenaf plantations, but jute is a "naturalised" widely cultivated in India, China, Korea, Egypt and Viet-Nam. It is known that jute is and Viet-Nam. There was no earthly reason why places in the USSR with long spells of hot weather and irrigation farming. Soviet scientists selected one of the warmest spots in Tajikistan for experimental jute plantations, a short distance from the Voroshilovabad. The climate in that area has something in common with the climate of India or Egypt. The summers are hot and dry. Good fruits of cotton, melons, southern fruits and citrus are raised in the irrigated areas.

The cultivation of jute was started at the experimental station of Voroshilovabad soon after the war. New, high yielding varieties of jute have been developed there thanks to the experiments conducted for many years by Soviet plantations, to cultivation by means of machinery and abundant fertilisation. The new varieties have been adopted for all the jute plantations in Tajikistan. Jute is most widely cultivated in the Kirovabad and Moscow districts of Southern Tajikistan. The Kuibyshev and Budyonny Collective Farms find jute cultivation very profitable; these farms sell to the State annually hundreds of tons of excellent jute.

Barat Ergashev, a member of the Kuibyshev Collective Farm, is considered the pioneer of jute cultivation on the collective farms of Tajikistan. For many years he was a herdsman in the high Valley was launched, he came down from the mountains to assist in building the irrigation canals and later joined the collective farm. When the new crop, Barat Ergashev took the cultivation of his industry and inquisitive mind, was sent to the zonal experimental station to learn the methods of jute cultivation and receive the consultation of research workers. In the first year Barat Ergashev yielded only two tons of stalks per hectare, but the seven tons per hectare in 1952. Making other crops give way, the "native of India" has been winning increasing elbow-room in the collective

farm fields. Barat Ergashev's record was soon beaten by Safarali Guseinov, a team leader on the Budyonny Collective Farm who picked 10 tons of stalks per hectare. The methods employed by these experts in jute cultivation are now being popularised at other collective farms of Tajikistan.

Expansion of the jute plantations pressed to the foreground the question of mechanising the main processes involved in its cultivation. As a rule, the area allocated for jute is ploughed with tractors in the autumn and well fertilised. Tractors are also used for cultivating the plantations. It required much effort to organise jute harvesting by machinery. The use of hand labour in jute harvesting is irrational. Horse-drawn hay-mowers were tried, but without success, and then tractor-drawn mowers were adopted for this purpose. Jute mills were built in the Kirovabad and Moscow districts for primary jute processing. And thus has jute, a native of India, found a new home in the USSR.

THE FOREIGN JUTE MARKETS

SOME BUSINESS IN OLD CROP

(FROM OUR DUNDEE CORRESPONDENT)

OLD Crop jute appears to be firm in the Pakistani market, due to some interest being taken by the Continent, which has still some further supplies to purchase before the new crop becomes available. The position was rather quiet, late last week, however, and it was said that sellers were not so firm in their ideas. So far as old crop is concerned, all grades are obtainable here at the fixed minimum rates, though there are, of course, sellers asking a pound or two more for the best marks. Until these are offered at a few pounds a ton above the minima, sellers of native marks may not get much chance of doing business. Earlier this season, there was as much as £8 a ton difference between the highest and lowest prices quoted for the various grades of jute, yet some of the native marks that were sold to spinners were reported to be equally as good as European jute, though purchased at a few pounds less. Those natives who shipped good quality will be pretty sure of support from spinners again. There is business being done here in old and new crop daily, the former usually at spot or float, and in new crop at £90 for Mill Firsts, £80 to £82 for Mill Lightnings, £90 for good Daisee-2/3 and £80 for grade, £110 for crack Tossa-2/3 and £99 for grade, with fours at £100 and £89 respectively, all cif. U.K., August-September for the white jute and September-November for Daisee and Tossa. The Calcutta goods market is irregular, with 10 oz. 40 in. hessians at 68s 6d and 51s 9d, 34 October-December, and B twills at 17s and 16s 6d respectively, all f.o.b. Calcutta. The Jute Control has been buying quietly but steadily lately.

After a spell of activity for a few days after last week's reduction in prices, business in jute yarns and cloth has subsided and there is really little further doing. Buyers have shown little interest in securing their wants after the end of July, but this is usually a quiet time in the trade and there is never much doing until August-September. Members of the industry cannot forget the large jute crop in view for next season, but this is no guarantee that prices will be cheaper. A gloom has been cast over the Dundee jute industry by the sudden death on 16th June of the Public Relations Officer of the British Jute Trade Federal Council, Mr. Stanley W. Smith, who was only 42 years of age, and has done much to put the jute trade on the map in the U.K. since his appointment four years ago. He was a popular figure in the industry and always ready to serve the members. It will be difficult to fill his place.

NEWLY REGISTERED COMPANIES

Commodity Markets

WHOLESALE PRICE INDEX FALLS

THE official wholesale price index (base: year ended August 1939=100) recorded a further fall of 0.1 percent to 340.6 during the week ended 4th June, 1955 as compared with 341.0 for the previous week. In the corresponding week of the last month, the index stood at the same level but relative to the corresponding week of a year ago, the index was lower by 11.5 percent. The items which showed significant fluctuations in the Food group were: Rice at Calcutta (+2%), wheat at Jabalpur (+3%), Amritsar (-3%) and Hapur (-1%), gur at Ahmednagar (+7%), dal arhar (-3%), gram at Hapur and sugar (-2% each), jowar (+1%) and coffee (-1%). On the whole, the index for the group advanced by 0.2 percent to 276.7. In the case of Industrial Raw Materials, the prices of lac (-7%), silk (-3%), jute and cotton at Amravati (-4% each), and groundnuts in Bombay (-3%) witnessed declines while gingelly-seed (+3%), Bengal cotton in Bombay, groundnuts at Cuddalore and copra (+3% each) were marked up, and as a result the group index fell by 0.8 percent to 386.6. The index for Semi-Manufactures also recorded a fall of 0.3 percent to 230.4 because of declines in the prices of cowhides, goatskins and groundnut oil (-3% each), mustard oil at Calcutta (-6%), coconut cake (-5%), castor oil and copper (-2% each) although the prices of linseed oil (+3%), mustard oil at Patna, coconut oil, gingelly oil, zinc and coir yarn (+2% each) showed advances. The Manufactures group moved down further by 0.7 percent to 371.0 due to a fall in the prices of jute manufactures (-2%), rayon and silk manufactures (-5%) and woollen manufactures (-8%). The index for the Miscellaneous group witnessed a sharp rise of 4.7 percent to 574.8 mainly on account of the reappearance of price quotations for tobacco leaf in Calcutta at 14% above the last price quoted at the end of April 1955. Black pepper at Calcutta (+4%), betelnuts at Calcutta (+5%) and cashewnuts at Quilon (+2%) also supported the advance in the group index. The prices of chillies at Patna (-2%), betelnuts at Bangalore (-4%) and cashewnuts at Mangalore (-2%), however showed declines.

PAKISTAN'S POWER RESOURCES

A nation's progress in modern times hinges in great part on the volume of the country's electricity production. With this in mind, the Government of Pakistan has enlisted the technical aid of the United Nations in the large scale development of the nation's power generating industry. In response to Pakistan's request, the United Nations Technical Assistance Administration has sent one of Yugoslavia's top experts in hydraulics and water power engineering, Mr. Martin Dragan Caric, for a year's assignment in Pakistan. In addition, UNTAA has made arrangements to send the President of the Swedish State Power Board, Mr. Ake Rusek, on a month's mission to Pakistan. Shortly thereafter UNTAA will send out two more experts to Pakistan, one a specialist in power transmission and the other in thermo-power. United Nations technical assistance has been requested by Pakistan as part of a far-reaching development plan which the Government intends to carry out. Mr. Rusek and Mr. Caric will engage in discussions with Pakistan top officials regarding the integration of this plan with a Central Electricity Commission which is expected to direct a nation-wide programme of electricity development.

Pakistan has considerable water resources and the Government is creating mountain reservoirs to retain the flood waters of the Indus and its tributaries, so that these waters be released during the critical irrigation periods. It is also planned to make further use of available underground water for irrigation purposes. Mr. Caric will assist the authorities of Pakistan in the design and construction of hydro-electric plants, some of which are already being built. The Government of Pakistan is building five hydro-electric plants with a capacity of 50,000 to 100,000 kW. Two more plants are under consideration, while the Kunhar River in the North-West Frontier Province may also be used for power development. The hydro-electric plants now under construction or planned will serve both for irrigation through an extensive canal system and to supplement the industrial power already provided by the existing power plant at Rasul.

NEW DIRECT TELEPHONE LINK

The British telegraphic ship *Monarch* on 22nd June started paying out the first direct telephone link between Britain and North America. The service, which will make possible a direct call from the American Pacific coast to India, will be in operation by late next year. It will provide a weather-proof voice communications system, capable of carrying 36 simultaneous conversations, unhampered by the atmospheric conditions which affect the 14 transatlantic radio-telephone circuits now in operation. Although telegraph cables have spanned the Atlantic since 1866, it was not until scientists solved the problem of the great pressures of the ocean bottom that the direct telephone line became feasible. The *Monarch*, the world's largest cable-laying vessel, will this year lay a cable stretching 2,250 miles from Clarendville, in Newfoundland, to Oban, Scotland. She will lay about six nautical miles of cable an hour, ending the task by the autumn, when weather conditions make further cable-laying impossible. In June 1955, the *Monarch* will lay the other section of the twin cable, about 20 miles away from the first. The three partners in the project, the cost of which is estimated at \$40 million, are the British General Post Office, the Canadian Overseas Telecommunications Corporation and the American Telephone and Telegraph Company. Officials of the American company said that the new cable should make it possible for a person in San Francisco or Vancouver to converse with a person in Bombay directly by wire for the first time. By linking the transatlantic cable with landlines, they added, such a call would be as distinct as if within a single city.

"VISCOUNT" INVASION OF U.S.A.

The possibility that Vickers Viscount air liners with Rolls-Royce Dart turboprop engines will invade the United States domestic routes was suggested by Mr. J. H. Carmichael, President of Capital Airlines, in an interview in London. He thought that a world total of 600 Viscounts might in the end be ordered. (Up to the present the total order is 200.) Capital Airlines took delivery of its first Viscount at Wisley. This aircraft will be used for a demonstration tour in the United States and when the second and third aircraft have been delivered, which is expected to be by mid-July, the first route between Washington and Chicago will be operated. By February, 1957, Mr. Carmichael said, the company would have received all its 60 Viscount aircrafts, and they might place orders for others. He could not see that any United States manufacturer could produce a competitive machine before 1960. When asked whether there had been delay in deliveries from Vickers, Mr. Carmichael said that the machines had had to be modified in some respects to incorporate passenger-comfort features which were considered desirable, and if this fact was taken into account the aircraft could be said to be "on schedule." He believed that other United States domestic operators might soon purchase Viscounts. All reports of the Viscount in operation had been encouraging, and he was particularly pleased with the high utilisation rates obtained by the Australians. He thought that his own company, by the end of the present year, might be obtaining 8½ hours a day utilisation from these machines. He believed that the impact of these new turboprop air liners on the United States would be "tremendous".

Calcutta Markets

STRONG DEMAND IN TEA EXPORT SALE

PRICES OF DUSTS ALSO RISE

AT Sale No. 3, held on 20th and 21st June, offerings in the Export auction consisted of 19,500 packages and comprised a fair selection of teas from all districts. There was a strong and active demand for all kinds except brown leafed Doora teas which were little more than steady on last rates. All other sorts sold from 2 to 4 annas above last rates, while the strongest features of the sale were BOP'S with tip, small CTC Fan-nings, both of which were sometimes as much as 8 annas dearer and stylish BPS'. There was again a fair quantity of Darjeeling tea on offer, which sold readily at or about valuations, stylish Leaf grades being keenly sought after and often selling up to 4 annas above valuations.

Quotations	
Clean Black Pekoe	Rs. 2 11 0 to 2 12 0 (Nominal)
Plain B.P.	" 2 0 0
Medium Assam B.P.	" 2 0 0 to 2 1 0 (Nominal)
Best CTC Assam B.P.	" 2 6 0 to 2 7 0 (Nominal)

At the Internal Sale, there were 6,100 packages of Dusts on offer, of which 568 were Old Season's teas. There was a strong and active general demand for all sorts and prices advanced by 2 to 3 annas a lb. CTC Assams and black leaf Middle East types were the strongest feature of the sale and were from 3 to 5 annas dearer, while the few flavoured Darjeelings on offer were also in very good demand.

Quotations	
Medium Doora Dust	Rs. 1 15 0 to 1 15 6
Medium Assam Dust	" 2 0 0 to 2 1 0
Best Assam CTC Dust	" 2 12 0 to 2 14 0

About 900 packages of other grades were on offer, 300 of which were Old Season's teas. All teas sold at about last rates.

FREIGHT MARKETS IN STEADY FORM

MAJOR PORTION OF BUSINESS IN AMERICAN TRADES

THE major portion of business over the last few days was in the American trades and a number of ships have been fixed from the U.S. to the Continent with coal at a better rate of 6½s for June and July loading. Steady enquiries for grain from the U.S. Gulf, U.S. Pacific and St. Lawrence were maintained and several fixtures were concluded to various destinations at prevailing rates. The Plate and Australian grain trades were quiet although one fixture was concluded from East Coast Australia to Japan at 8½s 6d for a bulk cargo which showed a rise of 5s over previous business.

Ore and coal orders are available from East Coast India and Mormugao, but at present owners are holding off expecting this market to improve. In the Time Charter section, activity remained at a steady level and an oil burner was fixed from South Korea to South Africa via U.S. Pacific at \$40.50. Another oil burner was taken for a trip Japan-U.K. at 29s 6d.

SUGAR MARKET

During the week ended 21st June, sugar sales in the Calcutta market averaged 4,000 bags daily. Arrivals were 2,000 bags a day and stocks totalled 400,000 bags. Rates for ready and forward sugar ex-Kantapur delivery were Rs. 30-8 for ordinary grain and Rs. 31-8 for big grain. Ex-mill delivery prices of some standard grades of sugar ranged from Rs. 28 to Rs. 29-8 a maund. The market was quietly steady.

LINSEED

Firm conditions prevailed during the past week and activity was scarce. Sellers were very reserved owing to poor arrivals and scanty offering from the centres. There were keen enquiries from crushers for both ready and forward delivery but the turnover was small. The oil market was very firm and activity was brisk with fair enquiries from overseas; sellers were rather reserved. Latest quotations were as follows: June-July Rs. 16-8 a maund; August Rs. 16-12 a maund.

HIDES AND SKINS

The market in hides ruled firm. Stocks were higher than in the previous week.

Bazar Sales

(Between 14th and 20th June, 1955)

Cowhides:—Wet salted (Ord) 3,000 pcs. on the basis of Rs. 10 to Rs. 12; Wet salted (Slaughtered) 13,200 pcs. on the basis of Rs. 14-8 to Rs. 26.

Goatskins:—Wet salted (Daissee, Killed) 45,160 pcs. on the basis of Rs. 200 to Rs. 375; Assam-Dinajpur-Murshidabad 35,400 pcs. on the basis of Rs. 260 to Rs. 315; Purneah-Kissenganj 6,000 pcs. (Ord) 14,100 pcs. on the basis of Rs. 160 to Rs. 215; Pakur-Patna Muzafferpore 13,750 pcs. on the basis of Rs. 245 to Rs. 250.

Bazar Stocks

(20th June, 1955)

Cowhides:—Wet salted 95,200 pcs.

Goatskins:—Wet salted (Daissee, Killed) 34,500 pcs.; Assam-Dinajpur-Murshidabad 81,000 pcs.; Muzafferpore - Patna - Pakur - Purneah - Kissenganj 3,82,000 pcs.

MYSORE																			

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends.

Year of Issue	NAMES	Amount issued in 1000's Rs.	Rate per cent	Paid-up per Share Rs.	Market Quotations 22-6-55	A year ago Rs.	Year of Issue	NAMES	Amount issued in 1000's Rs.	Rate per cent	Paid-up per Share Rs.	Market Quotations 22-6-55	A year ago Rs.

INFLATION AS A TECHNIQUE IN NATIONAL PLANNING

DR. ROY REPEATS HIS WARNING

DR. ROY, the Chief Minister of West Bengal, has now published as a pamphlet the criticisms he offered of the draft five year plan in May. The point that becomes clear in reading this pamphlet is that the West Bengal Government is not simply disagreeing with the Central planning experts about what ought to be done—it is in fact doing something different. Dr. Roy's criticisms are not theoretical; they are a statement of the methods which his Government is actually following in drawing up its part of the next plan. Thus, one of the most important States in the Union is planning in a radically different fashion from the Central experts, although the State plans have to be integrated into the whole Central scheme. This contradiction is not necessarily fatal, though of course it would be if India were trying to apply strict Leninist planning, where it would be impossible for one major unit to go off on a path of its own. The Indian conception of planning leaves considerable freedom to the States to decide their own planning and budgeting techniques, provided only that the various claims on national resources are harmonised. Under these conditions, planning can never become "total", as complete, as some of the Centre's advisers would like to see it, but what is lost in slickness is more than compensated for by the retention of democratic methods. For it is the States, with their closer contact with popular feeling, that will and must provide the antidote to the hasty and unrealistic temper of the planners in their ivory towers.

The States are entitled to take a more modest view of the economic possibilities without being accused of faint-heartedness, because a recent Reserve Bank study shows that they have on the whole done their part in the first five year plan and are likely to attain the expenditure targets set for them. These findings came as a shock to the public, because for almost the whole of last year the "Delhi line" was that the States were falling down on the job, and that this was responsible for the disappointing results of the plan, especially as regards investment and employment. With the fuller information now available to us, the suspicion arises that there has been a concerted attempt to discredit the States as a method of planning, in favour of a more heavily centralised method of economic management. This suspicion is reinforced by a study of the drafts of the next plan, which posit a scale of action that would ultimately demand total, central control of the nation's economic life. It is proper that one of the most forceful attacks on the draft plan has issued from a State Government.

Precisely because they are in daily and intimate contact with the people's life, State politicians could never make the mistake of the isolated experts, the mistake of imagining that planning is a matter of figures. One of the principal authors of the draft plan described at a Press conference recently how the draft came to be written: at a meeting of the Planning Commission, the Prime Minister asked how they could organise the economy in order to provide about ten million extra jobs by 1960. The expert in question told journalists that he accepted this "as a challenge" and set out to write a plan that would have as its conclusion: "Therefore, we will have provided ten million new jobs". The draft plan provided ten million new jobs. How different is this frame of mind from the more humane criterion set out by Dr. Roy: "The objective of social planning can be only...the conscious promotion of human growth. Such an organic growth postulates a balanced development of all aspects of human life, not only of the material base through steel plants, hydro-electric power, locomotives and machinery, but also of better nutrition, medical care and living comfort as well as mental stimulation and well-being through educational expansion.

A mere statistical-mechanical approach is basically unwise and unsuitable, perhaps dangerous."

It might be objected that Dr. Roy's criteria as here described are too loose, general, vague, while the "statistical-mechanical approach"—how to juggle with the figures until we produce ten million jobs on paper—is at least directed toward a clear, sharply defined objective. The answer to that objection is simply that life is like that. A nation's life, and especially perhaps the life of a huge and varied confederation of peoples such as the Indian Union, simply cannot be comprehended under one pretty statistical equation. A plan that takes one element out of the vast complex of the Indian economy and tries to twist everything else until that one element has been multiplied by some previously decided figure is nothing but a short cut to confusion. Besides, the very notion that such arbitrary procedures are possible soon leads to day-dreaming of the oddest sort—for example, the suggestion put forward in all seriousness by Professor Mahalanobis that during the 1960's India can build one million-ton steel plant per year! How this would be done, or why it should be done, or what would happen to the rest of the economy while it was being done, all these are questions that apparently never occur to the planner once he is launched on his statistical extravaganza.

At the same Press conference referred to above, a journalist asked the professor what would happen if the offtake of handloom cloth were too slow, if stocks of cloth began to accumulate. The extraordinary reply was: "Then, we'll build another steel mill". Obviously, the planners have become so bemused by their neat equations about increased investment stimulating consumer demand that they have lost touch with the real world. Dr. Roy in his pamphlet is quite clear on the fact that the crude produce of the cottage industries is not the sort of thing that the industrial labour wants to buy. He says: "The excess from small-scale and hand industries will be poor in quality and small in quantity; it won't be poor in quality and small in quantity; it won't satisfy the demands of the wage earners." The assumption that an extra steel mill means better offtake of handloom cloth is of course completely unwarranted. If the wages paid out in constructing a steel mill were spent, as they very likely would be, on more rice, more bids and more seats at the movies, the end result would be just

proceeds to argue that the peasants will want to buy A, B and C, and the A, B and C will require for their production D, E and F. This makes sense, while the planners who talk about Rs. 100 crores of cash pumped in at some unspecified point generating so many crores of demand for, oh, things in general, end up talking nonsense. These shrapnel methods are no substitute for rational planning, but they are a sure way of spreading confusion and disorder.

ECONOMIC PROGRESS IN BACKWARD AREAS

FINDINGS OF U.N. STUDY

THE U.N. World Economic Report is an interesting document. It covers economic developments in all parts of the world—or at least in all those that are of economic importance. The report is not simply a recital of facts but contains a good deal of interpretation as well. The more significant portions from the Indian point of view are those dealing with the progress of the underdeveloped countries. It is pointed out that the process of deflationary adjustment to the raw material slump through which most of these countries went in 1953 was generally checked in 1954. Exports and imports, on the whole, remained at about the 1953 level. There were no major changes in investment. Real consumption was generally maintained and in some cases slightly increased.

The report notes that the prices of raw materials and foodstuffs, apart from petroleum and rice, which fell sharply in 1952, continued to decline in the following year. But demand improved in 1954 for most of these commodities, and the decline was therefore halted or reversed. Since import prices fell only slightly, the terms of trade generally deteriorated further in 1953. This trend was arrested and, in some countries, reversed during 1954 in line with the changes in export prices. As a result of balance of payments difficulties, new import restrictions were introduced in most of the countries. It is disappointing to observe that investment in fixed capital tended to fall in 1953. According to the report, this reflected the effect of the restrictions on imports of capital goods and the decline in public and private revenue from foreign trade. It probably reflected in addition the general lack of business confidence following the post-Korean slump.

Food prices in general rose in all the countries during 1953. Since expenditure on food is the main item in the cost of living in these countries, the latter also inevitably rose. The main reasons for the increase were the reduction in the volume of consumer goods and the rise in the import price of rice. Prices rose only moderately, in most cases, and in some even declined during 1954.

* * * *

The dominating feature of the Indian situation in the past couple of years was the improvement in food supplies. This was at the root of all the progress that was made; it allowed attention to be diverted from the troublesome shortages which recurred in earlier years to other important aspects of development. Achievements in other spheres of agriculture were substantial but not uniformly so. The output of cotton rose sharply in 1953-54, but less raw jute and sugar were produced, partly for climatic reasons. Industrial production in large-scale industry rose by 5 percent in 1953 and 8 percent in 1954. The report asserts that this increase resulted in the main from higher productivity, and adds that employment of labour in large-scale industry did not change appreciably during this period. It is not wholly accurate to suggest that production increased because labour productivity was higher. The increase could probably be attributed more accurately to the fact that unutilised capacity was brought into operation; it was not necessary to employ a bigger labour force to work this extra capacity because many industries, for legal or other reasons, already carried a deadweight surplus of workers.

Investment in fixed capital remained unchanged in 1953 because business confidence had not recovered from the severe shock it received in the earlier slump. The return of stability in 1954 was marked by greater confidence among private investors, and investment consequently rose substantially in 1954. Public investment rose steadily, as indeed was intended under the five year plan. It is stated that in both 1953 and 1954, real consumption rose substantially mainly because the output of foodgrains increased. The cost of living in the main urban centres suffered at first from the abolition of food subsidies, but conditions improved later as the supply of foodgrains increased. The picture presented by the World Economic Report is on the whole an encouraging one. It is encouraging not only in relation to India, but also in relation to the world generally. Despite wide differences in the experiences of individual economies, 1954 seems to have been a year of greater stability than any other since the war.

CURRENT COIN

Anxieties of an Industrialist.—The "consumption approach" to economic development is fast becoming established as the alternative to the Government's "investment approach". Speaking at the first quarterly general meeting of the Indian Chamber of Commerce last Friday, the Chamber's President, Mr. N. L. Kanoria, outlined this more conventional method of tackling the economic problem in a democratic community. His opinion that the object of a dynamic economy "should be to make the volume of spending to some extent independent of the volume of income and the effort should be that incomes are determined more by expenditures than expenditures by incomes" may sound to be totally opposed to the present course of the Government. In fact the difference is one of emphasis because in an economy designed to serve a democratic community, yet achieve development at the same time, both public and Government demand will play their parts. This Mr. Kanoria would not deny, but that does not prevent any industrialist with a claim to a realistic point of view from warning against the Government's accepting the tempting suggestions which are being offered to it as solutions for some of the evils to which its present policies will lead. Mr. Kanoria attacked the suggested freeze on the production of large-scale consumer goods industries, so that investment resources can be diverted to large-scale industries and the gaps left in consumption filled by cottage industry, as being alien to the entire basis of modern industrial development and progress. He might have added that it would require a measure of control and direction which can scarcely be reconciled with democratic Government. He did however point out that emphasis on uneconomic industry would inevitably affect the competitive ability of Indian products in foreign markets and that the community's reduced earning power would cut the quantity of resources which could be used for creating employment opportunities in the future. These two reasons in themselves should be quite sufficient to influence the Government to reject such a retrogressive and impracticable suggestion. Mr. Kanoria warned against the influence of nationalisation as a popular slogan. There is no doubt that this single ugly word has become endowed with magical qualities among idealists in India today. This is unfortunate because the lesson to be learned from other nations' experience is that nationalisation solves few problems and is apt to create many. In a totalitarian country criticism against the working of nationalisation is easily stifled; in India there are so many other things to think about that it is apt to go unheard. Mr. Kanoria pointed to the recommendations of the Taxation Enquiry Commission that detailed enquiries should be made into public expenditure both at the Centre and in the States. Such enquiry was also needed, Mr. Kanoria pointed out, into the nationalised industries on which public money is being spent. Shareholders in private industry had certain rights to information on the way their property was being used; the same should be true of the public. Mr. Kanoria deplored the trend of present legislation towards dismantling the managing agency system, which could claim to be the mainstay of the Indian economy. He also pointed to the uncertainty which now existed on the Government's intentions and the damage it is doing to development plans in the private sector. This doubt is at present to be seen at work in the coal industry and will in time spread throughout the whole of private industry; Mr. Kanoria will not be the last industrialist to draw the Government's attention to it.

Mr. Shroff Speaks Out.—The President of the Bombay Stock Exchange, Mr. K. R. P. Shroff, speaking at the annual general meeting last week, attacked the suggestion of the Taxation Enquiry Commission that consumption be cut "so that larger increments of production may be diverted to saving and investment." Mr. Shroff went for the fallacies involved in this rather specious assumption and the whole structure built up on it. He admitted that at a given point of time, income would be equal to consumption plus saving, but he questioned the somewhat facile conclusion drawn from this by the Matthal Commission that "over a period of time, if consumption is restricted, there will be a greater saving and larger investment." Mr. Shroff pointed out that "reduced consumption by slowing down the productive process, may work to reduce the real national income and as a result, diminish the rate and quantum of savings and investments." Going a step further, he asserted that a real increase in national income could give rise simultaneously to both saving and consumption over a period of time. Clinching his argument, Mr. Shroff observed: "In an underdeveloped country particularly, the utilisation of the self-renewing impulse which augments both the sources of investment and the capacity to consume of consumption, as recommended by the Taxation Enquiry Commission, may initiate a contracting cycle dragging down the economy to a lower level of output and efficiency, an increase

in consumption can proceed *pari passu* with and be even an essential condition of, an increase in investment so long as the economy is sufficiently dynamic in terms of the elements of capital formation and consumption expenditure and the real national income continues to rise, as it has done in India in recent times." It was an easy step from this thesis to championing the middle class. Mr. Shroff attributed the helplessness of this class to the fact that in this country, the population paying direct taxation being as microscopic as one-third of one percent, unlike other countries such as Canada, Australia, the U.S.A. and the U.K., where it ranged from 36 percent to 63 percent, it was not surprising that the middle classes here are without a friend. He stated that the Taxation Enquiry Commission had recognised that heavy taxation of this class would reduce both consumption and investment but had sought to justify this on the ground that as taxation would increase the resources available to the public sector, there would be no reduction in aggregate investment. But he pointed out that while the public sector could, up to a point, help itself by deficit financing, the private sector has to rely solely on middle class investment. Mr. Shroff went on: "The surpassing record of production and achievement to the credit of private enterprise in recent years is ample proof that it is well fitted to undertake the tasks of investment and production and fully capable of giving good work. But the private sector can do the job only if it is not denuded of its savings and resources, which are its life-blood, and not tied up hand and foot under a programme passing fair under the euphemism of a 'socialistic pattern of society.' In the progressive elimination of the private sector and its replacement by the public sector, there are the makings of a regimented and totalitarian State.... Was it not Mahatma Gandhi who said: 'I look upon an increase in the power of State, the greatest fear because, while apparently doing good by minimising exploitation, it does the greatest harm to mankind by destroying individuality which lies at the root of all progress'?"

* * * *

The Law on Depreciation Allowances.—Those who are confused by the recently amended Income-tax Law as it affects depreciation allowances will be interested in a pamphlet just published by the Secretary of the Indian Chamber of Commerce entitled *Depreciation Allowances under the Indian Income Tax Law*. (50 pages. Obtainable from the Netaji Subhas Road, Calcutta. Price Re. 1.) The first section of the pamphlet is an explanatory note on principles which govern the calculation of depreciation allowance in general, the initial rebate, the extra allowance for the first year and the normal allowance. The law governing the development rebate, which was introduced by Mr. Deshmukh in the last Budget, is of special importance to the industrialist and a grasp of its fundamentals as laid out in this pamphlet is essential before its usefulness for any particular firm or instance, to understand the difference between the initial allowance and the development rebate in order to appreciate what extra advantages are bestowed by the latter. The initial allowance applied to buildings or plant newly erected or installed between 31st March, 1945 and 31st March, 1954. The development rebate is in lieu of the initial allowance, which it now supersedes for all machinery or plant installed after 31st March, 1954. The initial allowance is 20 percent, the development rebate is 25 percent. The development rebate does not apply to buildings. Including the initial allowance, the aggregate of the depreciation allowances should not exceed 100 percent, but including the development rebate the aggregate of the depreciation allowances will be 125 percent. The development rebate is in addition to the extra allowance and the normal allowance. A table is provided in the pamphlet for the calculation of the actual depreciation allowance. A number of appendices are included covering such matters as the rate of depreciation on second-hand ocean-going ships, additions which might be made to ocean-going ships, and the recommendations of the Taxation Enquiry Commission on depreciation allowances. Other appendices deal with these allowances in other countries, including Canada, Australia, Japan, Britain and the United States.

Finance for Industry.—The provision of adequate finance for private industrial enterprise is a problem which is not peculiar to developing countries. For rather different reasons, it has been as acute in industrialised Britain as it is at present in transitional India. Heavy taxation, especially death duties, has helped to restrict the once ready flow of private risk capital into British industry. There has also been a need to attract capital into enterprises which, though possibly handicapped by bad situation or uncertain markets but were important nevertheless for social reasons, could not be expected to make profits within the first few years of operation. It has been necessary to encourage export industries during the post-war period, and the need for research facilities, which

do not normally appeal to the private investor, is still growing. The answer to these needs has been given through three separate organisations. One, the Charterhouse Industrial Development Company, was set up in 1934, the other two, the Finance Corporation for Industry (FCI) and the Industrial and Commercial Finance Corporation (ICFC), were formed in 1945. The last two bodies are both sponsored by the Bank of England. The ICFC has attracted the interest of a number of other banks which have subscribed in proportion to their deposits; its function is chiefly to help smaller enterprises. The FCI has been subscribed to by a large number of trust and insurance companies and loan capital up to £100 million has been provided by a consortium of British banks, in a way similar to that in which a good deal of the capital of India's Industrial Finance Corporation has been provided. The annual reports of these two latter British companies have recently been issued. The progress they have been able to make in carrying out their set task contrasts sharply with the admittedly shorter experience of India's State Financial Corporations, which was discussed in a recent leading article in *Capital*. The ICFC has examined some 5,000 propositions and has advanced a gross total of almost £43,750,000 on 612 different accounts in the first nine years of its existence. After allowing for repayment and provision for losses, the net amount invested is over £28,500,000. Of the 502 accounts open, 74 represent investments up to £10,000 and 323 are for sums of not more than £50,000. These figures show the predominantly small-lending character of the organisation. In a country where the last 30 years have seen great changes in the supply of risk capital, and where the major part of capital to finance new enterprise is provided out of the undistributed profits of companies to be used for their own purposes, the value of this achievement is immense. Although representation on the board of borrowing companies is not the usual policy of the ICFC, regular contact is maintained with clients. These clients have the advantage of being able to call on the accounting and technical advisory services of the corporation. The enterprises supported have included agriculture and forestry, shipbuilding, fishing, pottery, watches and jewellery, plastics, and hotels and catering. A recent development has been the running of a special company which helps to meet the needs of those faced with the problem of raising funds for death duties without draining away the resources of the business. The FCI has played its part in modernising and expanding the steel industry, has put up funds for an oil venture in Venezuela, for chemical companies, diesel-engine production and other essential large-scale projects. In the corporation's annual report loans approved are seen to have exceeded £105 million, including £53 million to steel companies, during the first nine years of its existence. Interest has been kept to the lowest possible commercial level, and wherever possible is supplemented by taking options to acquire shares.

* * * *

Malayan Latex Exports.—Malayan latex exports in the period January-April of this year accounted for 11½ percent of total rubber exports, compared with 10 percent for the year 1954 and 5 percent for 1951. The absolute figures for exports are, however, even more impressive than these relative figures. In 1951 latex exports were just over 60,000 tons. By 1954 the figure had risen to over 90,000 tons—an increase of more than 50 percent. But even these figures for 1954 may be dwarfed if exports continue at the rate suggested by the figures for the first four months of 1955. In the period January-April of this year latex exports were more than 38,000 tons, 4,000 tons more than for the previous four months and about 11,000 tons more than in the first four months of 1954. Naturally, it is of interest to ask whether the present boom in these exports can be maintained, especially as it appears that the boom is entirely dependent upon the exceptional American demand. Is this substantial increase in exports of latex to America a temporary phenomenon or not? It is certainly a remarkable increase, for whereas in the period 1951 to 1954 exports to the U.S.A. were around 27,000 tons, if the present demand is maintained it will reach 50,000 tons in 1955. Even in the period September-December, 1954, latex exports to the U.S.A. only reached just over 10,000 tons, as compared with nearly 16,000 tons from January to April of this year. Although Malaya's hopes are that the U.S. demand will continue, it is of interest to speculate whether other markets it would be able to absorb her latex production if the U.S.A. failed to maintain her present demand. It seems unlikely that the U.K. will be increasing her imports from the Federation. The increase in the bank rate and the more stringent terms laid down by Government for hire furniture and therefore for foam latex. Thus, although the exports to the U.K. in January-April, 1955, were at the high level of nearly 12,000 tons, this figure was nearly 300 tons less than the quarterly exports in the four months September to December, 1954. The most remarkable increase in demand for Malayan latex over the period 1951 to 1954 has taken place in those countries shown under "Rest of the World" comprising mainly Germany, France,

Italy, the Netherlands, Australia and Japan as the largest buyers, with all other countries together aggregating about a quarter of the total. In 1951 latex exports to this area were only 14,000 tons, or 23 percent of total exports; in 1954 the figure had risen to nearly 35,000 tons or 38 percent. Can this area, then, continue to absorb more and more; has it still a large unsatisfied demand? This is not easy to answer. Certainly the area failed in the first four months of this year to continue the upward trend shown since 1951. In fact, in the period January-April, 1955, exports were lower than in the corresponding period for 1954 and much lower than in the four-month periods May to August and September to December, 1954. The decline is, however, almost entirely due to two countries, Germany and the Netherlands. Exports to the Netherlands were only 240 tons in January-April this year compared with nearly 1,700 tons in May-August last year and 1,600 tons in January-April. The Department of Statistics at Kuala Lumpur, from whose statistics these figures are quoted, refuses to speculate about the future but suggests that it will be of interest to see in a few months' time whether Malaya is maintaining or increasing her share of the American and European latex markets.

Industrial Disputes in April.—The number of industrial disputes in April fell by five to 68, compared with the total for March. The number of workers involved in 62 cases was 19,525. Compared with the previous month, the number of disputes starting during the month and the number of workers involved registered an appreciable fall. The number of disputes current at any one time was 97. Of these, 90 involved 29,398 workers and the man-days lost in 88 cases were 299,035. The number of disputes current at any time during the month, the number of workers involved and the number of man-days lost considerably declined as compared with the previous month. There were eleven lock-outs during the period involving 7,473 workers and accounting for a time-loss of 137,118 man-days. Among the industries, the time-loss in plantations declined further. In mining and quarrying, the time-loss was slightly more than in

SURVEY OF ENGINEERING INDUSTRIES IN INDIA

With this week's edition of *CAPITAL* is published an 84-page survey of the Indian Engineering Industry. This Supplement is supplied free to registered subscribers and is available to others at Rs. 5 a copy. Enquiries may be addressed to the Manager, *CAPITAL*, 5, Mission Row, Calcutta-1.

the previous month. In the manufacturing industries and in the individual industries, namely, bidi, cigarette and others, the time-loss decreased. Sugar mills, cotton mills, silk mills, leather and leather products, engineering and iron and steel industries recorded higher time-losses. In the electricity gas, water and sanitary services, the time-loss appreciably declined as compared with the previous month, whereas in transport, storage and communications it increased slightly. Commerce did not record any time-loss during the month. In the case of the construction and services groups, the time-loss was negligible, whereas in the miscellaneous group it was higher.

New Fibres for the Carpet Industry.—Carpet manufacturing has undergone many technical improvements in recent years, and not the least of these has been the provision of new fibres designed specifically for this purpose. The latest of these is "Fibro," a viscose staple, with a chemical crimp. This feature, although it adds a bit to the cost—3d. more than the regular qualities—is said to make it particularly good for spinning as well as adding resilience in the finished carpet. It is particularly useful for the new high-speed "tufting" process, the adoption of which is spreading rapidly in the British carpet industry as machines, both imported and of British manufacture, are becoming available. "Fibro" is now coming into full-scale production in staple lengths of 4 in. and 8 in., the former being of interest to the woollen spinning trade and the latter to the jute spinning trade, both of which are interested in the provision of twofold yarns for the "tufted" carpet trade. The first "tufted" carpet made on a British-built machine was made in a yarn spun on the woollen system which was a blend of viscose staple and "Fibrolane" regenerated protein staple in equal proportion. The high output of the "tufting" machine, which is many times as fast as the conventional carpet loom, would seem to ensure a low production cost, and in the United States, where these types of carpet were first developed, stress is laid on the wide colour ranges readily obtainable. Moreover, as rayon is the normal raw material "tufted" carpets are mothproof, and it is also claimed by American manufacturers that there is virtually no shedding of loose fibres after the first time the carpet has been cleaned with a vacuum cleaner. The introduction of regenerated protein fibres and viscose in blends makes for a warmth and resilience unlikely to be found in viscose staple alone, and to the ordinary consumer this blend is virtually indistinguishable from wool to the touch.

WORLD EXPERIENCE IN COKE OVEN CONSTRUCTION

Since building England's first by-product coke ovens in 1881 Simon-Carves have gained over 70 years' experience in both hemispheres. In the last ten years alone Simon-Carves have received thirty-seven contracts (nineteen of them repeat orders) for coke ovens in Britain, India, the United States, South Africa, France, Spain, Switzerland, Denmark and Finland. These plants comprise over 1680 ovens with a total throughput of 29,000 tons of coal per day, and amongst them are the latest and finest plants for India's great steelworks. In India more than 3 million tons of coal are carbonised every year in Simon-Carves coke ovens.

Simon-Carves maintain a resident engineering staff in India, and in the execution of contracts materials of Indian origin are used to the maximum extent, which may represent up to 60 per cent of the contract value.

AUTOMATION IN PRACTICE PREPARING FOR THE SECOND INDUSTRIAL REVOLUTION

A conference on automatic production, organised by the Institution of Production Engineers, at Margate in mid-June, was attended by more than 1,000 scientists, engineers, and managers. It was a major event, because it demonstrated that, at last, "automation" meant something serious in Britain. That many of the people attending had little knowledge of automatic control, and that the papers presented to the conference revealed nothing sensationally new, are not reasons to belittle its importance. What matters is that the whole subject has been brought to industry's attention, and that its application has been discussed in practical terms since the conference.

At that conference at Margate it was plainly said that "automation", powered by nuclear energy and controlled by electronic computers, represented another industrial revolution. It was emphasised, however, that the second industrial revolution could not be clearly distinguished from the first one. It was implied—indeed, some speakers stated—that no social upheaval would result from "automation". Extensive replacement of workers by machines was not envisaged. Yet there exist already, in the United States and in the Soviet Union, factories which are entirely mechanical, where the human function is simply to maintain and to supervise the machines. Whether the new machines will make workers "redundant" is a problem for both sociologists and economists. They will probably agree, in principle, that work for its own sake has little to commend it and that the purpose of the new techniques is to increase output without increasing work. Organised labour is apprehensive of the new techniques because it foresees that they will cause unemployment; yet, in a country which relies on international trade, unemployment would more certainly result from failure to keep costs in line with competitors', and automatic equipment is a proved means of reducing costs.

Need For Higher Productivity

The President of the Institution of Production Engineers, Sir Walter Puckey, said that Britain's population would have increased by about 24 million, but the working element in that population by only about 1 million, by 1984. It follows that the productive power of each worker must be increased considerably, only to maintain the present average standard of living, and that not merely a quantitative but a qualitative change in production is needed to achieve the declared hope of the Chancellor of the Exchequer that the standard of living will be doubled in 25 years. It should be unnecessary to discuss whether automatic production is desirable; the question should be, rather, what can it achieve? It has, of course, economic limitations; it would be absurd to install a costly high-productivity machine to produce goods in small numbers. There, however, we have to distinguish between goods, such as special-purpose machines, which are produced in small numbers because only few of them are needed and goods, such as, formerly, motor-cars, which are produced in small numbers because production is laborious. The motor industry has been using for more than 30 years automatic devices to transfer parts from one process of manufacture to another; it was a pioneer and is now one of the major developers of "automation".

Such devices constitute "automation", as defined by Sir Walter Puckey—"the automatic handling of materials and parts in and out of machines". But to many minds the word means something more—a process, or a whole factory, that is not merely operated but also controlled automatically. The essence of "automation", in this sense, is the substitution of the mental as well as the physical functions of men by machines. The electronic computer—a machine with a "nerve-system", capable of reacting to its own experience and to outside stimuli—has changed the express the design of a product in the form of tape. When appropriate machines are linked in series, the tape can be "fed" into the computer and the product will emerge—suitably packed, if need be, ready for dispatch—at the end of the process. Putting the specifications into the proper form is, of course, a skilled task, but preparing instructions for a machine is not necessarily more laborious than preparing instructions for men. When that task is done, the machine works out in precise detail the procedure to be followed and, assisted by other electronic machines, controls the actual process.

Fireless Workers

Such equipment can not only operate production but also plan it, making quickly calculations that would take so long if left to the human brain that they would be more impediment than help. And these machines are never tired, never irritable; they never hesitate. One of the problems, quickly enough to move the mechanical operations; but these superhuman instruments can be economically employed controlling several processes at once. One cannot foresee that these new processes will transform all production, but they will certainly transform an important part of it. Re-emphasising mass-production, they will make big firms bigger still and intensify competition. They will bring problems with their benefits. But, in a competitive world, no manufacturing nation can ignore them.

THE English are the jute industry's depressed class, so Mr. Geoff. Gardner's two-year occupancy of its highest post, the chairmanship of the Indian Jute Mills Association, would have been remarkable for his nationality were it not even more remarkable for his talents as an industrial leader. Though the hard work is usually left to Scotsmen and Marwaris, jute is of such vital concern to almost everyone in India that its affairs are regarded, not unreasonably I suppose, as everybody's business. So the IJMA chairman's job is to put the industry's case while at the same time taking fair account of a host of other conflicting interests. This sort of thing came naturally to Mr. Gardner, and since I can think of nothing to prepare him for it even in his long experience of the manufacture of cotton and jute textiles, I can only suppose it was a native gift. His colleagues in the industry certainly appreciated it and they have been very loath to part with his counsel as he completes the normal working span that even a strong constitution allows us in Bengal. The decay of his health in the later months of his service caused genuine dismay among his friends and there was relief when it was learned that he will continue to serve the jute industry henceforward in a more equable climate. He left a few days ago to take over the IJMA office in New York from Mr. Sandy Low, whose own connection with the industry dates back more years than he would care to have me recall here. Mr. Low is now retiring and although it is quite some time since he was seen in these parts, he will take with him as many good wishes as his successor brings from the capital of the jute world.

There have perhaps been other Englishmen who came to India for six months and stayed for thirty years, but surely none besides Philip Spratt who came from Cambridge as emissaries of the Comintern and stayed to become vigorous defenders of Indian democracy. He gives some account of his extraordinary, in fact unique, career in a little book he has just published called *Blowing Up India: Reminiscences and Reflections of a Former Comintern Emissary*, which can be had from Prachi Prakashan, 12, Chowringhee Square, for two rupees. I had hoped when I began to read it that he would do what ex-Communists find hard to do, namely, give a straight personal story without disquisitions on the stale theoretical disputes and without denunciations of those who are still unregenerate. He starts out well enough with an unpretentious recital of his drift into Communism: the Baptist family home in Deptford, the brilliant circle at Cambridge, the feeling of shyness, of being "out of things," and then the discovery of a consuming purpose in Leninism. In 1926 Spratt was offered what must have appeared to such a man a romantic assignment: six months in India as a Comintern messenger and reporter, complete with ciphers and invisible inks, helping the then infant CPI. He knew nothing of the country except a warning that "under imperialism the sanitation was terrible and I must be very careful about infection". Within three years, of course, he was the central figure in the famous Meerut Conspiracy Trial which dragged on for four years and in which he was defended by Motilal Nehru and Dr. Katju. (Names such as these pop up throughout the story in what now seem the oddest contexts.) He got 12 years, appealed, was convicted on another charge and eventually left gaol in 1936. By this time his gaol reading had shaken his Communism, and the combined influence of M. N. Roy and the Nazi-Soviet Pact finished the job. He married an Indian girl and has lived here since, a pamphleteer, journalist and anti-Communist. By this stage of his book, however, the personal element is lost and he ends with a passionate exposure of Mr. Nehru's foreign policy—and some remarks

A DITCHER'S DIARY

about Mr. Krishna Menon and Communism which I dare not repeat for they are probably libellous. Not that his reflections on these subjects lack cogency. Indeed I would like to think that every literate Indian could read *Blowing Up India* before Mr. Nehru gets back from his current Potemkin tour of Russia and her satellites.

Apparently more of the inhabitants of this city acquire some of the elementary comforts of life each year. This is a process that you and I cannot observe, but the people who sell electricity very soon notice it, in the increased consumption of power. Externally, the city within the ditch seems to be as crowded and uncomfortable as ever, but within a growing number of individual houses, life can be transformed by the acquisition of electric light, a fan, perhaps a refrigerator. I suppose those who have such things and take them for granted forget that most people around them must manage without—I spoke to a man lately who had never realised that a proportion of Bengali middle-class houses do not have a single fan. For them, the installation of electricity and the purchase of a few appliances mark a jump in living standards that they cannot hope to equal again inside a generation. Sir Harry Burn, the new chairman of the Calcutta Electric Supply Corporation, sees in this process some of the explanation of the expanded sale of power last year—86 million units more than in 1953. Sir Harry said of 1954, "There was an expansion in the demand for current for electric appliances, air-conditioning and refrigeration. Local manufacture of electrical goods has improved in quality and these are now freely available at lower prices than before. The use of such appliances has gained further popularity among the middle class consumers for reasons of economy and comfort." Of course, industrial and municipal consumption of power absorbed most of the Corporation's higher sales, but some of this too is at once reflected in more comfortable living conditions: more public lighting, new roads, more frequent tram services. The moral of all this is that no single industry is so closely connected with those higher living standards we are always talking about, than the electric supply industry. This is what Lenin meant when he defined the revolution as "Soviets plus electricity", which I suppose we would translate in India today as community development schemes plus electricity. All the stranger, then, that Government policy should be impeding development of the industry. I should guess that, if the connection were widely understood, no piece of official obstruction and inaction would be so completely unpopular with the electorate as Delhi's delay in amending the Electricity Supply Act.

* * * * *

Sir Robert Heatlie Scott, who is succeeding Mr. Malcolm MacDonald as British Commissioner-General in South-East Asia, has experience and knowledge of Far Eastern affairs which must be scarcely inferior to Mr. MacDonald's own. Sir Robert, after being called to the Bar in 1927, joined the Consular Service in China in the same year, serving in Peking, Shanghai, Canton, Hongkong, and later in Singapore. He was chief representative of the Ministry of Information in Singapore at the outbreak of war and was taken prisoner by the Japanese. After the war he returned to Singapore as Counsellor on the staff of Lord Killaren, who was then Special Commissioner for South-East Asia, but returned to the Foreign Office in 1948, for two years as head of the South-East Asia Department and the next three as Under-Secretary in charge of all Far Eastern departments while

Sir Anthony Eden was Foreign Secretary. In 1953 Sir Robert went to Washington, so that he is now able to take to his new appointment not only his vast experience of the Far East and the handling of its affairs in the Foreign Office but also first-hand knowledge of American reactions thereto. At the same time, a new relationship is to be established between the new Commissioner-General for South-East Asia and the United Kingdom Government. He is to be responsible to the Prime Minister, only reporting through the Foreign Secretary and the Colonial Secretary on matters of concern to each of them instead of being responsible jointly to them both as Mr. MacDonald has been.

* * * * *

"Production is highly mechanised. Indeed the monotonous noise of this electrically driven machinery, the tools and spare parts for such machines lying round in the premises give them the feature of a factory. This picture is particularly displayed by the employees. Standing or walking around the machines tended by them they offer the typical spectacle of factory workers; sitting is denied them while they work. They have to do their job standing. For years experts have pointed out the disadvantages and even dangers of standing jobs. Lack of sitting facilities during the work is bound to increase fatigue, and hence susceptibility to errors and even accidents, apart from the danger to health because of feet and other diseases."

This sad little note is struck not in some engineering magazine but in the last issue of *Sankhya*, the statistical journal edited by P. C. Mahalanobis, and it describes working conditions in a statistical institute. It brings back to me the following scene from a little known drama called *He Sits to Calculate*.

"How's the figure factory?"

"Awful. We were just stepping up production when one of our Lithuanian statisticians got tired and fell into the five year plan mixer. Bits of him are still coming out in the national sample survey. Such samples!"

"Did he fall or was he pushed? I mean, was it sabotage?"

"Very probable. The editor of *Capital* was seen fiddling with the national income conveyor belt not five minutes before it happened. Said the Litho was a queer card and deserved to be punished."

"Suspicious. I say, who's the chap over there with a piece of cotton waste, and grease up to his elbow? The one with the fallen arches, I mean."

"That's the deputy statistical adviser to the planning sub-committee of the economic affairs board's panel of economists. He's feeding raw figures into the Health Ministry's target-fixer to determine a provisional draft of a draft target frame for feet and other diseases. Clever chap. Just built a machine with a free-moving fellow-travelling governor that produces statistics on the cottage industries' installed capacity for making seating facilities—chairs, you probably call them. It's a model of the Perpetual Inflator, modified for India. The original runs on vodka plus ICA, but we're changing that."

"Must be clever. How was he appointed—competition—wallah, no doubt?"

"No, no. Random sampling. Purely random."

"Lord! I'm tired already, let's sit down."

"Whoops! Not there, that's a nuclear computer. Sit on that and you'd be distributed in a rising curve over the next five years."

Exeunt. Iron curtain descends slowly.

How banking serves the RUBBER INDUSTRY

RUBBER was first planted commercially in India in 1902. Today Indian rubber plantations, concentrated in Travancore-Cochin and Malabar, produce 20,000 tons of rubber every year, valued at four and a half crores of rupees. More than 250 Indian factories depend on this output for their production of finished goods.

Without banking, this growth could never have taken place. The facilities and guidance offered by a good bank, such as the availability of ready funds when needed and the collection of dues in any part of the country, have become part of the structure of the rubber industry.

We at Palai are proud that so many important rubber producers, and indeed leading firms in every field of business and industry in South India, employ the complete banking service we offer.

Current Accounts—Demand Drafts—
Telegraphic Transfers—Bill Collection
—Letters of Credit—Deposits—Investments—
—Loans & Overdrafts—Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

STOCK MARKETS REACT ON PROFIT-TAKING

AMERICAN DEMAND CONTRACTS

London, 29th June. THE stock markets continued to advance strongly until the middle of last week but later profit-taking produced a considerable reaction. American buying was a major factor in the earlier advance and it was the sharp contraction in American demand which touched off the decline. This was associated with the persistent weakness of sterling in recent weeks. The continuing dock strikes also adversely influenced sentiment, while buyers became cautious following comment on the steep rise in prices of industrials since the general election. Gilt-edged stocks suffered widespread but modest declines on limited selling. Talk of new issues, notably by the nationalised industries, was a dampening influence. The strength of the German Young loan was the main feature in foreign bonds which generally moved within narrow limits. Rails were mostly featureless. A fair amount of profit-taking developed in the industrials market prior and subsequent to the week-end and most of the previous week's gains were lost. Business contracted sharply and more normal conditions prevailed compared with the high activity of a week ago. Interest revived in South African gold shares, which advanced under the lead of West Rand issues although the best levels were not held. Coppers also lost part of their earlier good gains. Other base metal shares eased after initial firmness, while profit-taking brought oils back from their peak levels. Rubbers found support and tea shares attracted small selective demand.

The Money Market

Credit conditions were more comfortable over the past week in the money market. Supplies were adequate throughout, and the level of money rates eased to around 3½ percent, with loans occasionally obtained down to 2½ percent. With an improvement in their liquidity position, the banks were eager to increase their bill holdings and a large turnover was effected in September bills at 3.29/32 percent. The money market made no change in its bid for Treasury bills but outside competition was keener. Applications for Treasury Bills total-

led £380,505,000, of which £250 million were allotted at an average rate of 79s 4.53d compared with 79s 5.17d in the previous week. This week, £290 million are offered. The Bank of England return for the week ended 22nd June showed notes in circulation £2 million lower at £1,785 million, and bankers' deposits £6 million lower at £245 million.

Stock Market Prospects

The Investor's Chronicle newsletter writes: "At the moment there is little to suggest any check to the uptrend on the London stock exchange. The attractions of equities are enhanced by the general realisation that some sort of inflation is necessary to maintain full employment in a welfare State and the favour of the electorate. No Government can afford deflation and one cannot deny the prudence of retaining good industrial shares. Imposed on the background of selective buying, the absence of selling are the bursts of American buying. For American investors, the favoured British stocks still seem to have much scope. Wall Street's bull market is now in its seventh year. Significantly, the British company reports published during the first five months of this year show that net ordinary dividends took a slightly smaller proportion of earnings than last year. Perhaps even more encouraging are the week's substantial increase in London's turnover and Tuesday's firmness at the end of the account."

Activity on Wall Street

Corporate convertibles developed an easier tendency in domestic bond dealings last week, but activity was slower than in previous weeks. The declines were mostly held to fractions and were attributed largely to profit-taking attracted by the recent sharp rise which carried many issues to new highs. Included among the losers were Phillips Petroleum, Bethlehem Steel, General Dynamics and Lockheed Aircraft. In the foreign department, trading was rather slow with interest centered on a handful of issues. German Nationals started to work higher at the outset but eventually turned irregular. Italians were lower, mainly by fractions, but Italian 7 percents were about three points down on a few sales.

U.S. Federal Reserve Return

The U.S. Federal Reserve Return for the week ended 22nd June shows gold stocks \$1 million higher at \$21,677 million. Foreign deposits rose by \$17 million and foreign investments by \$15 million. The Federal Reserve holding of Government securities remained unchanged. Total discounts and advances fell by \$444 million to \$393 million, while excess reserves of member banks dropped by \$198 million to \$765 million. The daily average of excess reserves rose by \$103 million to \$709 million, while the daily average borrowing fell by \$206 million to \$283 million. Business loans of the New York City Banks rose by \$26 million to \$8,074 million, compared with a fall of \$33 million to \$7,074 million a year ago. This continued rise was attributed to the fact that Government tax notes, on which many corporations relied to pay off their bank loans, did not mature until 22nd June.

Mid-Year Company Reports

From the end of this month, most companies listed on the United States Stock Exchange must start filing mid-year reports with the Securities Exchange Commission. The reports will be due 45 days after the end of the first half of a firm's fiscal year, the Commission said.

Fluctuations in Rubber

The rubber market fluctuated widely last week, responding quickly to buying orders but also easing rapidly on profit-taking. Interest was largely confined to nearby rubber, and despite prospects of an early settlement of the U.K. dock labour dispute, No. 1 R.S.S. spot closed 1½d higher. Occasional fair sized trade orders and covering against forward sales provided a good deal of the trading. Prices frequently were purely nominal assessments owing to the lack of bids and offers. Forward positions closed dull but were about 3/8ths higher on balance. There was a small trade in sole crepe, although some demand was noted for 1/8th inch No. 1, which was scarce. Top grade No. 1 smooth 1/8th inch was quoted at 38d, but later holders were unwilling to accept less than 39d. Up to 40d was reported to have been paid for 1½ inch cross wide.

Quicksilver Uncertain

An uncertain tone continues to characterise the quicksilver market in London, according to trade sources. Spanish and Italian producers still hold an f.o.b. level equivalent to £108 a flask, ex-warehouse, London. Second-hand parcels of the metal, other than Spanish and Italian, are reported to be available on spot at between £104 and £105, and for arrival within a few weeks well below £100 has been paid for Mexican. Though the available quantities of non-Spanish and Italian are limited, they are sufficient to cause unsettlement owing to the smallness of demand, dealers say. Sentiment downtowned in the United States. In view of indifferent demand, a certain amount of Spanish and Italian production is said to be going into stock.

Less Business in Linseed Oil

Although business in linseed oil was quite useful last week, the volume of preceding weeks was lacking. There was a tendency for prices to be shaded at the close, but this was mostly seen in forward shipments. The net rise of 40s a ton was retained, with Indian June-August shipments offered at £103 in bulk, August-September at £104 and November-December at £105. Castor oil shippers' ideas were a further £2 a ton higher than a week B.S.S. July-August, but in some quarters a bid of £95 would have been considered at the close. Groundnut oil advanced further on renewed demand. Indian crude to Rotterdam realised up to £104½ for June-July and £104-5/8 to Hamburg, with sellers to the usual ports wanting £105.

Without Prejudice

COMMONSENSE AND SOUND LAW

A COURT DEFECTIVELY CONSTITUTED

(FROM OUR LEGAL CORRESPONDENT)

THIS is a case which one presents with some hesitation because the writer has found and believes that the business reader will possibly also conclude that though, doubtless, sound law it is extremely difficult to reconcile with sound commonsense. The decision largely turned on the meaning and interpretation of one simple English word; the word "any" used as an adjective. The case was an application to declare void and set aside an award of the Bengal Chamber of Commerce. The dispute related to a contract containing an arbitration clause in the usual form providing for reference to the arbitration of the Chamber under the rules of its Tribunal of Arbitration. The particular rules relative to the decision in this case were VII, X and XXV. The two former rules must be quoted in full. Thus VII: "If the Court, (that is the two arbitrators), have allowed the time, or extended time, to expire without making any award and without having signified to the Registrar that they cannot agree, the Registrar shall, in manner aforesaid another Court which shall proceed with the arbitration and shall be at liberty to act upon the record of the proceedings as then existing, and on the evidence then taken in the arbitration or to commence the arbitration *de novo*." Rule X reads: "If any appointed arbitrator or umpire neglects or refuses to act, or dies or becomes incapable of acting the Registrar shall substitute and appoint a new arbitrator or umpire as the case may be in manner aforesaid and the Court so reconstituted shall proceed with the arbitration with liberty to act on the record of the proceedings as then existing and on the evidence, if any, then taken in the arbitration or to commence the proceedings *de novo*." Rule XXV provides for the making of the award within four months from entering on the reference or by an extended date agreed upon by the parties or within any extended period granted by the High Court.

The reader will have to interpret on the following facts, the words and expressions, "another Court," "any appointed arbitrator," "a new arbitrator," and in doing so he will bear in mind that every one of these expressions is in the singular and not the plural number, implying as he may think and as the writer would have thought that if one arbitrator defaults, dies or becomes incapable, one further substitutional arbitrator and not a new couple of arbitrators should be appointed. That surely seems commonsense.

What happened was this. On 6th June 1952 the Registrar, acting under rule 5, constituted a Court consisting of Mr. J. I. Jamieson and Mr. I. D. C. Buist, and that Court entered on the reference the same day. The four months' time limit expired on 6th October 1952. But correspondence between the parties and the Registrar of the Bengal Chamber still went on until July 1953. Mr. Buist then went on leave and the Registrar, on 4th August 1953, appointed Mr. H. A. Luke in place of Mr. Buist. The Registrar did this under rule 10, not under rule 7. The endorsements made on the appointment sheet by the Registrar and signed by him were: "I propose to appoint Messrs. J. I. Jamieson and I. D. C. Buist, as arbitrators and will be glad to know if you have any suggestions to offer." This was signed by the Registrar on 6th June 1952 with the further signed endorsement: "Court appointed as above."

Then on 4th August 1953 came the following endorsement made and signed by the Registrar: "Mr. Buist having proceeded on leave, I appoint Mr. H. A. Luke in his place under rule 10."

On 8th October 1953 the Court consisting of Mr. Jamieson and Mr. Luke made its award. One of the parties objected and as has been said applied to the Calcutta High Court to have the award set aside.

The High Court held that as the four months' time limit, within which the award had to be made, had expired, the Registrar's proper course would have been to constitute "another Court" under rule 7 and not to have reconstituted it under rule 10. Accepting that view as undoubtedly correct, the fact remains that, whether under rule 7 or rule 10, the Registrar did appoint a different Court and in any event the distinction does not appear very material since the High Court decided that whether constituted under either or both rules the award was invalid and would have to be set aside.

Now let us stop here and consider the position. What was wrong about the Registrar's decision? Personally, everyone being entitled to his own opinion, the writer and he believes, also the experienced commercial reader would have thought that it was eminently practical and sensible. What he had done wrong was to have allowed Mr. Jamieson who was still available, and who had not neglected or refused to act or died or become incapable to remain on the new panel of arbitrators. No doubt the Registrar did this to secure expedition in the making of an already overdue award and believing that Mr. Jamieson being familiar with all the facts and circumstances of the case, and there being no suggestion against his impartiality or ability, would contribute to a

speedy decision. But the High Court decided that Mr. Jamieson could not lawfully be appointed to the new panel and that his having been appointed nullified the subsequent award. The High Court was bound by prior authority and one, of course, with due acknowledgement of its superior wisdom, accepts its decision unreservedly. But that is not to say that one understands it. Consider rules 7 and 10 carefully and especially the words "another Court," "any appointed arbitrator," "another arbitrator." Note that they are all in the singular number. Any one, according to the Oxford Dictionary means "whatever individual is chosen," so it would appear that "any arbitrator" means any arbitrator who is chosen. True it is that the word "any" would be applicable also to all the arbitrators in default, but the use of the singular seems to indicate that it would apply to them separately, individually and not en masse. When the Court, made up of Messrs. Jamieson and Buist, was dissolved, it became *functus officio*; it was finished for all purposes. And one finds it difficult to comprehend why the body comprising Messrs. Jamieson and Luke was not "another Court" in every sense of that expression. There is not a word in rules 7 or 10 under which the Registrar seems to indicate that it would apply to them separately, individually and not en masse. When the Court, made up of Messrs. This is an advertisement and not a Prospectus. A formal Prospectus dated 28th June, 1955 has been prepared and filed with the Registrar of Companies, Bombay. Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent, the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence (No. L/116/54) has been obtained from the Central Government for effecting a substantial expansion to this industrial undertaking of which a copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this Licence, the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

APPLICATION WILL BE MADE TO THE STOCK EXCHANGES FOR PERMISSION TO DEAL IN THE SHARES.

The Subscription List will open on the 11th July, 1955, and, in accordance with the requirements of the Bombay Stock Exchange, will remain open till 13th July, 1955 (inclusive).

MAHINDRA & MAHINDRA LIMITED

(Incorporated under the Indian Companies Act VII of 1913)

AUTHORISED CAPITAL

Divided into:—12,50,000 Ordinary Shares of Rs. 10/- each	Rs. 1,25,00,000/-
25,000 Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 2,50,00,000/-
ISSUED CAPITAL:—3,33,618 Ordinary Shares of Rs. 10/- each	Rs. 33,36,180/-
PRESENT ISSUE:—2,16,382 Ordinary Shares of Rs. 10/- each	Rs. 21,63,820/-
25,000 Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 25,00,000/-

Out of the above issue the Directors and their friends have agreed to take up 60,000 Ordinary Shares and 12,000 Redeemable Cumulative Preference Shares and the same will be allotted to them against payment in cash. After deducting the abovementioned shares from the said present issue the capital to be offered to the public is:—

1,56,382 Ordinary Shares of Rs. 10/- each	Rs. 15,63,820/-
13,000 Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 13,00,000/-
	Total Rs. 28,63,820/-

The Shares to be issued will qualify proportionately for dividends for the year ending 31st October, 1955.

The Shares are payable as follows:—

ORDINARY SHARES	
On application	Rs. 2/8/- per share
On allotment	Rs. 7/8/- per share
PREFERENCE SHARES	
On application	Rs. 25/- per share
On allotment	Rs. 75/- per share

The Company is advised that the Redeemable Cumulative Preference Shares are Approved Investments within Section 27A of the Insurance Act, 1938. The Redeemable Cumulative Preference Shares, as provided in the Articles of Association of the Company, carry a fixed cumulative preference dividend at the rate of 6% per annum without deduction of income tax, on the capital for the time being paid up thereon, and the right in a winding-up to or at any time after the 1st day of November, 1965 to redeem the whole or any part of the said Preference Shares for the time being issued and outstanding out of any monies which may lawfully be applied for the purpose at par plus a premium of Rs. 5/- per share upon giving to the holder of the shares to be redeemed not less than three months' previous notice in writing.

TECHNICAL CONSULTANTS

WILLIS-OVERLAND EXPORT CORPORATION, Toledo 1, Ohio, (U.S.A.).
JOHN INGLIS CO., Toronto, (CANADA).
MR. CECIL JOHNSON, JOHNSON ASSOCIATES, Toledo, Ohio, (U.S.A.).

MANUFACTURE OF JEEPS IN INDIA

The Company has acted as the sole representative of the Willis Overland Motors Inc. of Toledo (Ohio), U.S.A. since 1945. Steps were taken early in 1948 to organise an Assembly Plant in Bombay, thereby introducing knowledge of assembly operations as well as affording opportunity for studying progressive manufacturing possibilities. This Assembly Plant located in the Mazagon Dock area is today one of the most efficient and economic Assembly units in the worldwide Willis organisation. After exhaustive investigations ranging over three years by several teams, comprised of engineers from Willis and the Company, a detailed plan was developed for the manufacture of Jeeps in India.

The Company's proposals do not envisage the establishment of a single, self-contained and integrated factory on a large scale. Our technical experts came to the conclusion that by drawing upon spare resources in the engineering industries, a co-ordinated manufacturing organisation can be set up and the Jeep progressively built in India without large capital investment initially.

Willis-Overland Export Corporation have entered into a 10 year licence arrangement providing for the grant of exclusive right to the Company to manufacture and sell in India the 4-wheel drive Jeep and other vehicles, furnishing the requisite technical assistance and also giving the Company full benefit of their research and development.

Willis have further agreed to extend a long term loan to the Company to the extent of \$230,000.00 or 10% of the total subscribed capital of the Company. It is contemplated that in course of time the Company will be able to negotiate the export of Indian-built Jeeps to countries, adjoining India.

HISTORY AND BUSINESS

The Company was incorporated at Bombay on the 2nd of October, 1945, as a private company for the purposes set forth in its Memorandum of Association. The main objective before the

Company was to participate in the building of a sound industrial and agricultural economy in the country. What has been concretely achieved in these fields is briefly summarised below.

1. JEEPS—As sole representatives of the manufacturers, the Company has established a sound reputation for service and sales in respect of this famous vehicle and its allied range of utility models, namely, the Utility Wagon, the 4-wheel drive truck, Cargo Personnel Carrier, Jeep Fire Engine, Jeep Aircraft Tender and ambulance unit.

Hitherto the import quotas have been restricted to about 900/1000 Jeeps a year and it was only in the year 1954, after Government approved the Company's manufacturing plans, that the import quota was liberalised. During the manufacturing period of three years, 1955-58 Government has agreed to permit imports up to 2500 units a year and sanctions for even larger numbers, it is hoped, will be forthcoming on request. In 1953-54 the Company successfully built about 1650 units. During the six months of the current year (1st November, 1954—30th April, 1955) the Company has sold over 1100 Jeeps and it is expected that this rate of turnover will be sustained during the following period. The Assembly Plant today has facilities, not only for meeting the requirements of the initial out-turn of 2000/2500 units, but it can handle almost double this number.

As part of the programme of progressive manufacture of Jeeps in India and in the ordinary course of business the Company has recently purchased a factory at Bhandun in Greater Bombay consisting of Plant, machinery and equipment suitable for manufacture of automobile parts. The owner of the premises has granted a lease of the premises and an option to the Company for an extension of the lease for a further period. The Company has already commenced operations in this factory.

2. TRACTORS: The Company has linked up with the famous firm of David Brown of United Kingdom. Experience in the short period of two years has proved both the reliability and

suitability of the David Brown range of tractors for most of the soils in India and the Company has arranged with David Brown the question of progressive manufacture of their tractors and implements in India.

3. TEXTILE MACHINERY—The Company sponsored the flotation in November 1946 of MACHINERY MANUFACTURERS CORPORATION LIMITED for the specific purpose of manufacturing medium light industrial equipment in particular textile machinery. Arrangements were successfully concluded with two American firms of repute for technical collaboration. The Company is the Managing Agent of this Corporation.

The M.M.C. Carding Engine has been very exhaustively tested at a number of critical installations throughout the country and it is a source of gratification that it has proved not only equal in performance and efficiency to any imported product, but that it is being retailed in the market at prices lower than the cost of a British Carding Engine of equivalent specifications.

4. DIESEL ENGINES—The Company has in collaboration with National Oil & Gas Co., Ltd. of Ashton (U.K.) and Turner, Hoare & Co., Ltd. (a subsidiary of the Company) floated the INDIAN NATIONAL DIESEL ENGINE COMPANY LIMITED (INDEC) with a substantial financial participation of the British Group INDEC has undertaken to manufacture diesel engines to "National" design and it is hoped that the first Indian made horizontal diesel engine will be on the market by end of July 1955.

5. TRAILERS—The Company possesses a separate well-equipped trailer manufacturing shop at Worli (Bombay) where trailers ranging from 10 Cwt. to 10 tons are manufactured, including the well-known Jeep trailer. A close technical collaboration has been agreed upon with the British Trailer Company, one of the leading trailer manufacturers in Europe.

6. STEEL—The Company, by virtue of special arrangements with manufacturers, has established a premier position in the import of Steel. The Company represents the renowned British firm of Richard Thomas & Baldwin on an exclusive basis and also holds exclusive representation from VALOR, one of the three French Steel Groups, for Plates, Bars, Sheets and Structural, as well as from SIDELOR for Rails and Sleepers. From Japan the Company has received exclusive offers of Plates and has succeeded in securing large tonnages for the Iron & Steel Controller. The Company has also interested itself in quoting for the steel coming to India under the T.C.A. from New York to handle our quotations as well as secure, where possible, offers from U.S. Steel Companies.

7. GENERAL SALES & SERVICE—The increasing volume of sales in the many branches of Steel, has been achieved by a consistent endeavour to improve the marketing channels and by strengthening the after sales service facilities. In addition to having branch offices in Calcutta, Delhi and Madras the Company has a very efficient chain of distributors, dealers and sub-dealers throughout the country. Regional field officers and inspectors are constantly on tour providing sales and technical guidance as well as check on tractor school is in operation throughout the year provided through distributors as well as by direct field inspectors. Stockist arrangements for steel supplies have been completed for Bombay and Calcutta.

MAHINDRA & MAHINDRA LIMITED—Cont'd.

FINANCIAL INFORMATION

AUDITORS' REPORT:—

The following are extracts from the report of the Company's Auditors, A. F. Ferguson & Co.:
 "The profits of the Company for the three years were as set out hereunder and have been arrived at after charging all expenses of working and management and after making such adjustments as are, in our opinion, necessary:—

	Year ended 31st October:		
	1952	1953	1954
Income:			
Sales	1,51,50,411	2,66,99,841	3,61,95,802
Commissions	1,48,276	1,10,044	1,22,583
Managing Agency Commission & Allowances	39,406	37,304	36,000
Income from Investments	2,52,011	1,17,282	58,594
Interest	9,584	1,912	534
Miscellaneous	36,102	29,489	67,193
	Rs. 1,58,35,790	2,69,95,872	3,64,80,706
Expenditure:			
Cost of Sales	1,32,55,635	2,37,40,866	3,13,37,359
Salaries & Wages	9,92,423	13,47,347	18,15,422
Expenses	10,03,746	14,56,009	20,07,494
Depn. as charged by the Coy.	92,520	1,04,733	1,03,959
	Rs. 1,53,44,324	2,66,48,954	3,52,64,234
Profit before Taxation	Rs. 2,91,466	3,46,918	12,16,472
Appropriation:			
Provision for taxes	1,00,000	1,30,000	5,30,000
Investment Reserve	2,650	—	—
Special Reserve	23,355	45,281	75,000
General Reserve	—	83,900	1,50,000

We further report that the dividends paid by Mahindra & Mahindra Limited in respect of the three years ended 31st October, 1954, on its issued share capital were as follows:—

Year Ended.	Share Capital.	Dividends.	
		Rate	Amount
31-10-1952	2,400 Ordinary Shares of Rs. 500/- each	13%	1,56,000
31-10-1953	2,400 Ordinary Shares of Rs. 500/- each	14%	1,68,000
31-10-1954	3,000 Ordinary Shares of Rs. 500/- each	28.6%	4,29,000

The above dividends were paid free of tax and were paid out of current profits.

PROSPECTS

The trading results of Mahindra & Mahindra Ltd. for the last three years ended 31st October, 1954, reflect the increase in the volume of sales, particularly of Jeeps, Steel and Trailers:—

TURNOVER:—

	1951-1952	1952-1953	1953-1954	six months 1-11-1954—30-4-1955
Jeeps & Spares	Rs. 99,53,759	1,02,46,712	1,54,63,023	1,43,42,620 appr.
Tractors & Spares	—	1,37,759	14,96,110	7,71,714 "
Trailers	2,27,094	6,23,676	11,09,833	7,54,662 "
Steel	29,43,087	1,22,55,852	1,20,87,232	84,47,991 "

On the basis of the Auditors' report the earnings also show a steady increase over the last three years. It should be added that dividend policy in the past has been confined strictly to the declaration of the minimum distribution permissible under Section 23A of the Income Tax Act. Projects for development and expansion now in hand should on completion, prove of benefit to the Company hereafter. While the progressive manufacture of Jeeps to be completed by 1958 is geared to the initial production output of 2500 units annually, it is probable that the market in India will expand to a level demanding more than 2500 units a year. As Government has agreed to issue import licences to the Company up to 2500 units a year during the three-year manufacturing period, it is hoped that the offtake of Jeeps will from 1955 show an increase every year. Profits & Loss account for the six months ended 30th April, 1955 has been prepared and is summarised as follows:—

"Statement of Profits for 6 months to 30th April, 1955.

INCOME		EXPENDITURE	
Sales	2,45,67,317	Cost of Sales	2,16,51,524
Commissions	1,50,550	Salaries & Wages	9,47,263
Managing Agency Allowances	18,000	Expenses	10,48,417
From Investment	12,458	Depreciation	51,980
Interest	278		
Miscellaneous	70,813		
Total	Rs. 2,48,19,416	Total	Rs. 2,32,99,184
Profit before taxation	Rs. 11,20,232		

During the six months of the current year (November 1954—April 1955) about 1100 Jeeps have been sold as against 1600 units in the whole year (Nov. 1953—31st Oct., 1954). For the year ended 31st October 1954, the net profit amounted to Rs. 6,73,346 after providing for depreciation and taxation. Allowing for a dividend of Rs. 1,50,000/- on cumulative preference shares of the value of Rs. 25 lakhs, the balance net of Rs. 5,23,346/- of results of earning from sales of larger number of Jeeps and increase in turnover of Trailers, Steel, Tractors, etc., would be sufficient to pay a dividend of over 9% free of tax on the proposed ordinary share capital of Rs. 55 lakhs. The preliminary accounts for the six months ended 30th April, 1955, reveal even a better position and if the rest of the Company's current year yields similar results there would be sufficient to pay a dividend of more than 10% free of tax on the

ordinary share capital for the current year. It is accordingly anticipated that the Company will be able to distribute a dividend of 10% free of tax on the ordinary share capital of the Company. This rate of return is specifically referred to here-in for ready reference and should not be construed as a definite indication that such a dividend will in fact be declared as it is obvious that the Company's dividend paying capacity hereafter must be contingent on the profits actually made which, in their turn, are naturally liable to be affected by conditions ruling at the time.

GENERAL INFORMATION

The minimum amount upon which the Directors will proceed to allotment is Rs. 40 lakhs. Until the 15th day of June, 1955 the Company was a private Company with its issued capital consisting of Ordinary Shares of Rs. 500/- each and employee Ordinary Shares (Series "B") of Rs. 10/-

each. The Company had by that date an issued capital of the face value of Rs. 16,68,090/- all of which had been paid for in cash. On that date the Ordinary Shares of Rs. 500/- each were subdivided into shares of Rs. 10/- and the entire issued capital was thus made up of shares of Rs. 10/- each. The Company also by then had reserves which were on that date capitalised and 1,66,809 fully paid up Ordinary Shares of Rs. 10/- each of the total value of Rs. 16,68,090 were issued to the then existing shareholders pursuant to the agreement dated 25th April, 1955. The said fully paid up Ordinary Shares were issued as capital distribution and in consideration inter alia of the shareholders agreeing to the conversion into a public company. It is intended to replace a minimum of Rs. 3,50,000/- of the reserves so capitalised out of the profits of the current year. The physical assets and stocks of the Company have been conservatively valued.

COMMISSION AND DISCOUNT:—

Apart from brokerage hereinafter mentioned, no amount has been paid by the Company at any time or is payable as commission for subscribing or agreeing to subscribe or procuring or agreeing to procure subscription for any shares in or debentures of the Company or as discount in respect of the Shares issued. No amount has at any time been paid by the Company or is intended to be paid by the Company to any promoter.

DIRECTORS AND MANAGEMENT:—

There are to be no Managing Agents. There is also no contract as to the appointment of Managing Agents. The Company has not issued any founders or management or deferred shares with any special interest in the property or profits of the Company. No restrictions are imposed by the Articles of Association on the Directors' powers of management and the control of the Company's affairs is vested in the Directors.

Hitherto approximately 90% of the issued share capital of the Company has been held by the Directors.

The Chairman of the Company, Mr. K. C. Mahindra is under an agreement dated 11th day of August, 1954 to serve the Company in an honorary capacity for five years during which he is to receive no salary and the Company has only to meet his travelling and other expenses while on business as therein provided. Messrs. Keshub Mahindra, Harish Mahindra and Alope Mitra act as executive Directors, under five years service agreements entered into by them with the Company.

The Company has no Manager as defined in the Indian Companies Act.

VOTING RIGHTS:—

The Redeemable Cumulative Preference Shares confer the right to attend and speak at General Meeting of the Company but not any right to vote except when—

- the Preference Dividend is passed over in any year or has remained in arrears for more than six months from the date it is declared; or
- any Resolution affecting the rights, privileges or interests of the Preference Shareholders is proposed; or
- any resolution for the winding-up of the Company is proposed.

No member entitled to be present or vote either personally or by proxy or as proxy for another member at any general meeting or upon a poll or to be reckoned in a quorum whilst any call or other sum is due and payable to the Company in respect of any of the shares of such member.

Upon a show of hands every member entitled to vote and present in person, or being a Company present by a representative duly authorised as provided in Article 90 has one vote. Upon a poll every member entitled to vote and present in person (including a Company present by a duly authorised representative) or by proxy has—

- One vote in respect of every Ordinary Share.
- Ten votes in respect of every Redeemable Cumulative Preference Share.

RESTRICTIONS ON RIGHT TO TRANSFER:—

The Directors without assigning any reason for such refusal, may decline to register any transfer of shares.

UNDERWRITING:—

The issue is not being underwritten.

BROKERAGE:—

A brokerage of 1% on Preference Shares and four annas per share on Ordinary Shares will be paid on receipt of allotment money in respect of applications from the public bearing the stamp of a recognised Stock Broker.

APPLICATION FOR SHARES:—

Application for shares from the public will only be received on the footing of the formal Prospectus and on forms issued therewith by the Company and these may be obtained from the Registered Office of the Company at Gateway Building, Apollo Bunder, Bombay, or from its branch offices at Calcutta, New Delhi and Madras; or from Batlivala & Karani, New Union Bank Building, Dalal Street, Bombay; Lewis & Jones, Bank of Baroda Building, Apollo Street, Bombay; Place, Siddons & Gough, 6, Lyons Range, Calcutta; Dalal & Co., National Insurance Building, P.B. 149, Madras. Application forms can also be obtained from Branches of Lloyds Bank Ltd. at Bombay, Calcutta, Delhi & Madras.

Company Meeting

THE CALCUTTA ELECTRIC SUPPLY CORPORATION,
LIMITED

RECORD TURNOVER

SIR HARRY BURN'S STATEMENT

The Fifty-eighth Annual General Meeting of The Calcutta Electric Supply Corporation, Limited was held on the 23rd June at Victoria House, Vernon Place, Bloomsbury Square, London, W.C.

Sir Harry Burn, K.B.E., A.C.A., the chairman presided.

The following is his statement which had been circulated with the report and accounts:—

In January of this present year Sir James Donald expressed the desire to relinquish his position as chairman and the board elected me to succeed him—an honour which I deeply appreciate. I welcome this opportunity of paying our tribute to Sir James for the outstanding services he has rendered to the company since he joined the board in 1929 and succeeded the late Lord Meston as chairman in 1943. Sir James had a distinguished career in the Indian Civil Service in Bengal and Assam and was Finance Member of the Government of Bengal when he joined the company. Among other high appointments which he held during his service was that of chairman of the Calcutta Corporation, and when he joined the board he was already possessed of an intimate knowledge of Calcutta civic and industrial life and activities in every aspect—a knowledge kept up-to-date by his many visits to Calcutta on the company's business. It was within the space of a few years of his joining the board that a decision had to be made to instal much new plant involving a very high outlay. Other cities in India and also where in the world have seen and felt the result of incision at this vital period but not Calcutta. That this city did not suffer a serious power shortage during the war and also in the difficult years which followed on the war—a period which was marked by disturbed conditions and an increasing demand for power—is due in no small measure to Sir James's foresight in the timely ordering of generating plant sufficient to meet the pressing needs of the city's many industries. I have taken the liberty of quoting Sir Francis Simon, C.B.E., F.R.S. who stated in a recent article in *Lloyd's Bank Review* that "Power consumption and productivity go hand in hand and it is no exaggeration to say that standards of living are mainly determined by the level of power consumption." That Sir James realized this is evident. I am glad to say that he retains his seat on the board

and thus we have available to us his sage counsel and wide knowledge of the affairs of the company.

Year's Operations

The operations of the year 1954 have conformed to the pattern of those of the previous year and marked a continuation of the process of normal development and expansion to which reference was made in the review of 1953. The number of units sold was 1,099 million, an increase of 86 million units over the sales in 1953. The ordinary domestic and commercial load at the flat rate increased from 166.5 million units in 1953 to 170.8 million units in 1954. There was an expansion in the demand for current for electric appliances, air-conditioning, and refrigeration. Local manufacture of electrical goods has improved in quality and these are now freely available at lower prices than before. The use of such appliances has gained further popularity among the middle class consumers for reasons of economy and comfort. Advantage continues to be taken of the special tariff under which we made available to owners of large buildings current at high voltage for conversion by them to low tension which has had the desired effect of relieving the congestion on our D.C. network. Sales under this tariff amounted to 31.9 million units, an increase of 8.5 million units over the 1953 figure. This accounts for the somewhat lower rate of increase in the ordinary domestic and commercial load at the flat rate during 1954. The city of Calcutta continues to be in a state of congestion with all available accommodation fully occupied and the tendency is for over crowded families to separate and move to the suburban areas where new residential houses are being constructed in large numbers.

On the industrial side served by high tension power there was an expansion in the demand for current. The sales for 1954 were 699.6 million units as against 641.2 million units in 1953. Working conditions generally during the year were conducive to greater production, labour unrest being much less marked than in the previous year. The jute mills, cotton and other textile mills, steel works and rolling mills, engineering and aluminium workshops and also chemical works accounted for the major part of this increased demand for industrial high tension power. The jute mills increased their working hours from 42 to 45 hours per week from July, 1954, and to 48 hours per week in October, 1954, with 87.3 per cent. of the looms in commission, as was the case prior to the increases in working hours. The number of mills now taking power is 54 and on present indications it would appear that in the course of the next four years a further 13 mills will come on to our supply and an extension of power will be required by three of our existing consumers.

Public lighting shows an increase in consumption following on the opening of many new roads in the city and development in adjoining municipalities. Three new municipalities and five land developments were connected up during the year 1953. In the field of traction there has been a marked improvement in demand. Happily in 1954 the Calcutta tramways did not experience the suspension of services which occurred in 1953. The tramways have also during the past year improved the frequency in service on some of their routes and have increased the number of cars in commission. There has also been a greater demand in bulk supplies to mainly from the North Calcutta grid of the West Bengal Government which has been expanding its area of supply with an increase in the number of consumers.

Company's Revenues

The course of development and expansion to which I have already referred is reflected in our revenues, as may be seen from the figures for the three preceding years which are set out in the directors' report. Receipts show an increase of £296,000 over those of the previous year and are derived mainly from higher sales of current for domestic and industrial purposes. Expenditure of a normal nature—taking into account a higher depreciation charge—rose by £220,000 from £3,668,000 (including depreciation £711,000) in 1953 to £3,898,000 (including depreciation £748,000) in 1954. Consequently the net revenue account contains a transfer of £192,000 to a special reserve—as directed by the Government of West Bengal—the second of the annual appropriations of this nature which fall to be made from net revenue. The circumstances which gave rise to these appropriations were explained in the chairman's annual review for 1953 and I refer to the reference which was made in this connection.

The net revenue account contains a transfer of £192,000 to a special reserve—as directed by the Government of West Bengal—the second of the annual appropriations of this nature which fall to be made from net revenue. The circumstances which gave rise to these appropriations were explained in the chairman's annual review for 1953 and I refer to the reference which was made in this connection.

The creation of a special reserve of £192,000 follows on the conditions laid down by the State Government in connection with the special appropriations permitted to them under Section XVII (2) (c) of the Schedule to the Electricity (Supply) Act. As I explained in my review of 1951, these special appropriations have to be brought back from general revenues over a period of five years to be reasonable return, or, if not required for that purpose, for the benefit of consumers in such manner transferred to the special reserve as one-fifth of the total of the permitted appropriations at the end of 1952.

From the clear profit available for 1954—which is within the reasonable return permitted by the Electricity (Supply) Act, 1948—we have made the usual allocation for the contingency reserve fund as required by the Act and propose to make the normal contribution to the retiring gratuity fund. Provision has also been made for the interest and sinking fund charges in connection with the debentures. In view of the considerable capital expenditure on distribution which will be incurred during the next two years in the augmentation of our supply within our licensed area with current from the Damodar Valley Corporation we have deemed it advisable to allocate a sum of £300,000 to net revenue—special appropriation to strengthen our internal finances. The dividend on the Preference stock and an interim dividend on the Ordinary stock have been paid and we propose to pay a final dividend of 3 per cent. (free of tax) on the Ordinary stock, making 6 per cent. (free of tax) for the year. This leaves a carry-forward on the net revenue account of £152,818.

The balance-sheet shows a considerable reduction in the bank overdraft. Expenditure on capital account during the year amounted to £907,700, almost the whole of which was for extensions and improvements to our distribution system. The new test house is now in full operation and during 1954 the number of meters which passed through this department was 118,000.

Continued Representations

The Federation of Electricity Undertakings of India, of which this corporation is a member, has continued with its representations to the Central Government to amend the Electricity (Supply) Act 1948 in certain essential respects. First in importance are the needs for an enhancement of the standard rate of return and provision for deferred tax reserve in the ascertainment of the Act. The problem of deferred tax in the electric supply industry came in for special mention by the Indian Taxation Enquiry Commission and their report states—"We believe that the best way out of the difficulty would be to allow the concerns to put into reserve any extra surplus that they get as a tax relief on account of the initial and extra depreciation allowances. We recommend that the Electricity (Supply) Act be amended so as to permit the creation of such a reserve." The question of deferred taxation and the action we have taken in that respect have been the subject of comment in the chairman's annual review and the directors' reports since 1949. A step forward was made in the holding of an interstate conference, which took place in Delhi in February of this year, to consider amendments to the Act and allied matters. A delegation from the Federation of Electricity Undertakings was then given an opportunity of elaborating the industry's views on the main problems and it was felt that it was generally realized that some measure of relief should be granted to the industry soon. There are hopes that the Bill to amend the Act may be placed before Parliament by August.

The Government of India's budget proposals for the year 1955-56 provide for a grant termed a "development rebate" at the rate of 25 per cent. on the cost of new plant and machinery. This allowance is admissible as a charge against taxable income and replaces the 20 per cent. initial depreciation allowances which have been in force for several years.

Sir William Lamond and Mr. Hobson visited Calcutta in January of this year. Everything was found in good order. Cordial relations are maintained with the authorities. The Chief Minister and his officers continue to take a great interest in the affairs of the company and are aware and appreciative of our problems regarding the maintenance of commerce and industry in Calcutta and discussed future development. In connection with the Damodar Valley Corporation which were outlined in last year's review, Mr. Hobson visited the territory of the Bokaro steam generating station and inspected the factory operation and which will in the first instance be the main source of the bulk supply to be taken hydro-electric stations in various stages of construction. The integrated form part of that discussed with the chairman of the Damodar Valley Corporation and with his senior officers the progress receiving substations at Howrah to deal with the bulk supply and was satisfied that the work was progressing in accordance with plans designed to make the supply available in the early months of 1957.

Training Scheme

At present we have four young Indian graduates in this country undergoing training prior to joining our staff in Calcutta as provided for by our technical training scheme. The number of graduates already trained under this scheme is 18. In addition we give special training to men in our employ in order to accelerate promotion and fit them for the higher posts in our service and several of them already hold responsible positions at our generating stations. We continue indebted to the Central Electricity Authority and to the various manufacturing companies in this country for the facilities they give us for training.

Our thanks are due to the staff in Calcutta for another satisfactory year. Their high standard of efficiency, zeal and energy in the interests of the company have again been evident. Mr. Macpherson, our agent in Calcutta has handled the company's affairs with marked ability and has in all respects justified the confidence we repose in him. To him and all the staff we express our high appreciation of the services rendered during the year. I would also express the board's appreciation of the able manner in which Mr. Colley has carried out his responsible duties as secretary.

The report and accounts were adopted and the payment of a final dividend, as recommended, was approved.

The retiring directors, Mr. W. H. Thompson, C.S.I. and Mr. Harold Hobson, were re-elected and the remuneration of the auditors, Messrs. D. J. Lewis, Caesar Duncan & Co., having been fixed, the proceedings terminated.

Finance in India and Abroad

THE CALCUTTA MONEY MARKET
MUCH EASIER CONDITIONS

Wednesday, 29th June.

MONEY is now much less stringent all over the country. In the local interbank market funds are in plentiful supply, and although the call rate has fallen to 2½ percent, there are still lenders over. The issue of the second series of National Plan Bonds is not expected to upset the money markets.

There have been very few export bills reported and the demand for remittance has been moderate. Sterling is still weak against the dollar and the local rupee-dollar rate has risen to Rs. 480-12 T.T. selling.

It is notified for general information that the Government of India Treasury Bills to be issued on or after the 1st July 1955 will be of 91 days currency instead of three months as at present. The change has been made with a view to having maturities in an even number of weeks so as to avoid the oddities of the calendar. Under the new arrangement, a bill will run for an exact number of 13 weeks and will mature on the same week day as that of its issue.

Bullion was steady on fresh support. Silver advanced from the previous week's level of Rs. 157-15 to Rs. 158-12 quoted to-day. The rate for forward delivery stood at Rs. 158-6-0. The price rose from 76½d. to 78d. in London. The price of foreign silver in New York also advanced from 89½ to 90 cents.

Gold improved in sympathy with silver. The price rose from the previous week's level of Rs. 95-7 to Rs. 95-12. The sovereign at Rs. 61-4 showed a gain of 4 annas.

Tenders for Rs. 1 crore of 91 days Government of India Treasury Bills, which were opened on Tuesday, 28th June, 1955, totalled Rs. 1,12,50,000. The average rate of acceptance decreased from Rs. 2-8-2 to Rs. 2-8-0 percent per annum. Tenders at Rs. 99-6-0 percent were allotted approximately 89 percent. Tenders for a further Rs. 1 crore of 91 days Government of India Treasury Bills will be received at all centres up to the close of business on Monday, 4th July, 1955. During the week ended 24th June, 1955 Government of India Treasury Bills for Rs. 10,58,25,000 were sold in favour of the Reserve Bank of India.

The return of the Imperial Bank of India for the week ended 17th June, 1955, shows a drop of Rs. 95 lakhs in total deposits to Rs. 207.66 crores. Investments in Government Securities and other authorised investments are down Rs. 9 lakhs and Rs. 14 lakhs to Rs. 89.60 crores and Rs. 11.07 crores, respectively. Advances, including loans, cash credits and overdrafts, and bills discounted and purchased have decreased by Rs. 2.89 crores to aggregate Rs. 116.58 crores. Cash and balances are, in consequence, shown at Rs. 17.27 crores or Rs. 1.73 crores higher.

The statement of the position of scheduled banks for the week ended 17th June, 1955, discloses Demand and Time liabilities at Rs. 894.23 crores (Rs. 13.02 crores on account of borrowings from banks) and Rs. 383.97 crores (Rs. 3.32 crores) compared with Rs. 592.19 crores (Rs. 9.95 crores) and Rs. 393.06 crores (Rs. 3.26 crores), respectively in the previous week. Cash and balances with the Reserve Bank have declined by Rs. 53 lakhs and Rs. 56 lakhs to Rs. 34.08 crores and Rs. 48.08 crores, respectively. There is a rise of Rs. 1.08 crores in investments to Rs. 345.95 crores. Advances and bills discounted at Rs. 612.51 crores reveal a decrease of Rs. 5.36 crores. The ratio of total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.3 percent and 62.0 percent against 8.4 percent and 62.7 percent.

According to the land-borne trade returns received in the Department of Commercial Intelligence and Statistics, provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during May, 1955, are as follows (in lakhs of rupees):

Exports to Imports from	
East Pakistan	23 184
West Pakistan	19 1
Others	3 17
	45 202

Total trade amounted to Rs. 247 lakhs. Re-exports were nil and trade in treasure negligible. There was thus an adverse balance of trade amounting to Rs. 157 lakhs.

The following is a statement of the cash balances of the Central Government on the last day of March, 1955:—

(1) At the Reserve Bank of India in India	33,33,19,000
(2) At treasuries in India	12,26,000
(3) In England (Sterling converted at 18d. the Rupee)	1,07,49,000
Total	34,52,94,000

ISSUE OF NATIONAL PLAN BONDS

THE Government of India has announced the issue of a new loan for a sum of Rs. 100 crores. The loan will be called the National Plan Bond, Second Series, and will bear interest at 3½ per annum which will be subject to income tax. The loan will be issued at Rs. 98-8 percent. It will be repaid on 1st July, 1965.

Subscriptions will be received from 1st July, 1955, to 5th July, 1955, in the form of cash or of 2½% loan 1955 or 4½% loan 1955-60, at the following offices:—1. Public Debt Offices of the Reserve Bank of India at Bombay, Calcutta, Delhi, Madras and Bangalore; 2. Branches of the Imperial Bank of India at other places in India except in the States of Hyderabad and Mysore; 3. Branches of the Hyderabad State Bank in Hyderabad State; 4. Branches of the Bank of Mysore Limited, in Mysore State.

Interest on the new loan is payable half yearly on 1st January and 1st July.

INTEREST ON GOVERNMENT LOANS

To enable bond-holders to get interest on their bonds at their residences, the Government of India, in consultation with the Reserve Bank, have approved a procedure whereby such interest could be remitted to the holders by money order. The present practice is to pay such interests only through the treasuries. The remittance facilities by money order can, however, be provided only in the case of those who have taken their securities in the form of stock certificates and not promissory notes. For the promissory notes interest will continue to be paid from the treasuries as at present.

The stock certificates which are particularly suitable for the bond-holders who live in remote areas can be sent direct to the subscriber by registered post, free of cost. In case the subscriber wishes to sell the security he can do so by signing the transfer form printed on the back of the certificate in the manner prescribed therein. The subscriber can also get a G.P. note in exchange for the stock certificate by applying to the Public Debt Office on payment of a nominal fee. The half-yearly interest for these stock certificates will be remitted to the subscribers direct by interest warrant drawn at par on any treasury or a branch of the State Bank of India named by him and can also be remitted by money order if the subscriber so desires after deducting commission charges.

TREASURY BILL MATURITIES

Details of 3 months bills outstanding with the public on 1-7-55

EXPANDING U.K. PLASTICS INDUSTRY

RAPID DEVELOPMENT OF NEW PRODUCTION

THE U.K. plastics industry which, in 1954 achieved a record output 25 percent above that of 1953, is likely to maintain this rapid rate of advance throughout 1955. The demand for plastic materials, particularly for polythene, polyvinyl chloride and polystyrene—the three most successful thermoplastics—has never been higher. Supplies, especially of thermoplastics, are in many cases insufficient to meet the demand and there is little doubt that exports could be considerably higher than last year's record of 70,000 tons valued at over £20 million if there were less pressure in the home market. Total production of plastics in the U.K. in 1954 approached a quarter of a million tons.

For some time past the major development in the plastics industry has taken place in the thermoplastics field. The research work on these materials shows this quite definitely by the number of technical papers and patents which have been produced during the past few years. On the moulding side the number of injection moulding machines in the industry increased in 1953 compared with 1952 by approximately 10 percent, representing an increase in capacity of about 13 percent. In spite of this increase in the production of thermoplastics materials, the demand has continued to exceed the supply. On the thermosetting side of the industry, recovery has taken place from the recession of 1952 and although cresol, one of the raw materials needed, may be in short supply, phenol is available as an alternative.

Growth of P.V.C. output

Total U.K. output of p.v.c. in 1955 is expected to be between 50,000 and 60,000 tons compared with about 40,000 tons last year and 30,000 in 1953. Even so, it will probably not be possible to dispense entirely with imports, which were raised last year to approximately 8,000 tons in order to meet the huge Coal Board contract of 10,000 tons a year for the next 13 years to replace rubber for conveyor belting in the mines. I.C.I. is the largest producer of p.v.c. in the U.K. with an annual capacity at present of 30,000 tons. Work has now started on new plant at Hillhouse which will increase this figure by stages to 40,000-45,000 tons over a period of about 18 months.

There are two other producers of p.v.c. in the United Kingdom—British Gaon, a subsidiary of the Distillers Company, and Bakelite in which Union Carbide and Carbon, the U.S. Chemical group has a substantial shareholding. British Gaon's development programme will raise the company's p.v.c. capacity from 15,000 to 27,000 tons per annum very shortly and Bakelite has increased its capacity to 5,000 tons annually.

Polythene

Demand for polythene, particularly in the form of domestic mouldings, continues to exceed the most optimistic expectations which even I.C.I., the sole U.K. producer, has entertained for it. Rather less than half the output of polythene granules is exported. One third of polythene production goes into cables. The biggest single contract of 1954, for 1,350 tons, worth £600,000 was for the new transatlantic telephone cable. Packaging requirements alone, either as paper-carried or totally unsupported film, will no doubt increase the current demand which, in the United Kingdom, is assessed at 30 percent of the total polythene production compared with 40 percent in the United States. Extensions to the I.C.I. Wilton plant will make some 30,000 to 35,000 tons of polythene available in 1955, rising to an annual rate of over 55,000 tons in two years' time.

By the time present building programmes have been completed some 15 plants in various countries—nine of them in the U.S.A.—will have been licensed by I.C.I. to make polythene and by the end of the year world production will have reached an annual rate of 220,000 tons. A German professor in Essen, Professor K. Ziegler, has recently applied for several British and foreign patents for a new method of producing polythene under low pressure. Petrochemicals Ltd., recently acquired by Shell Chemicals for £5 millions, has secured an exclusive licence for exploiting this process in the U.K.

Polystyrene

Output of polystyrene is also expected to rise sharply again this year to around 30,000 tons, compared with 20,000 tons last year and 16,000 tons in 1953. The biggest single increase in final consumption of polystyrene this year has probably come from the refrigeration industry, where the good low-temperature properties of this material have led to its widespread employment for interior linings and ice-trays etc. Monsanto and Distillers are in the position of having between them two-thirds in the only styrene monomer plant in the U.K., that of Forth Chemicals, at Grangemouth. The capacity of this plant is being doubled to about 20,000 tons a year, it is believed.

Other Products

Polymethyl methacrylate, which is made by I.C.I. has enjoyed a very satisfactory period. Total production is nevertheless not more than about

one-fifth of the p.v.c. level. Production of other older materials such as cellulose acetate and casein is holding firm, the variations on 1953 being not more than a few hundred tons.

Within the next two years there will be three synthetic rubber plants operating in the U.K. I.C.I. will have a 10,000 tons a year plant and Monsanto and Dunlop a 4,000 tons a year plant each. The two chief materials for synthetic rubber are styrene and butadiene. At present I.C.I. produces butadiene from its oil-cracking plant at Wilton, and Monsanto, styrene monomer at the Forth Chemicals plant at Grangemouth. I.C.I. produces no styrene and Monsanto no butadiene, while Dunlop has neither. In this situation, the plastics industry is awaiting developments with the keenest interest.

Another plastic material which is still in its infancy, but on which much development work is being done is polyethylene terephthalate film. I.C.I. is at present the only company producing this film in development quantities. It is very strong, having twice the tensile strength of the strongest plastic material yet discovered and has been produced experimentally at one-tenth of the thickness of polythene film. As film sells by area rather than by weight, this is an important factor. I.C.I. has recently started work on a plant for the production of polytetrafluorethylene (p.t.f.e.) at Hillhouse—the first in the U.K. This p.t.f.e. is a plastic material of considerable technical importance in that it is the most chemically inert organic material known. It has a number of specialised uses, particularly in the radio industry and for rocket projectiles. The I.C.I. plant should produce 100 tons in 1956 and 200 tons in 1957. These are relatively small figures but p.t.f.e. is an extremely high-grade material and is very expensive to produce.

A new class of plastic materials, Shell's 'Epikote' resins, are now being produced in the U.K. These products are based partially on petroleum chemicals, as are also the polyester types of resins, which employ petroleum-based glycols in their manufacture. British Oxygen Co. operate the only plant in Great Britain at the moment capable of producing polyvinyl acetate from its raw materials acetylene and acetic acid—at the Chester-le-Street plant of their Chemicals Division. However, Hedon Chemicals—a new company formed by Distillers and Shawinigan Chemicals—are to undertake the manufacture of vinyl acetate and work has started on the construction of the plant at Salt End, Hull.

U. K. : Value of Plastics Exports.

Stocks and Shares

SHARES STEADIER ON PROFESSIONAL SUPPORT

NEWS OF GOVERNMENT LOAN WELL RECEIVED

Wednesday Evening.

THE firmer trend reported last week from the share market has gathered momentum, but it is still purely professional and has found no support from outside investors. Investors indeed seem more disposed to await Mr. Nehru's return from his tour of Communist countries, and to await news of the Government's reported intention to nationalise life insurance. Meantime market operators have taken prices higher over a wide front, with gains in jute, coal, engineering and miscellaneous shares. After a period of dullness, tea shares are once again responding to announcements of substantial dividends.

Details of the week's trading follow.

The highlight of trading in the Government Securities market this week was the announcement of the 3½% National Plan Bonds (second series) 1965. The terms of the loan were generally known in advance, but the announcement was favourably received by the market as application lists are to remain open for only five days and, moreover, the amount of the issue is only Rs. 100 crores which is considerably less than was anticipated.

On the whole, Government Security prices have remained steady and the only Loans which reacted were the 3½% National Plan Bonds 1961 and 3½% National Plan Loan 1964, which eased on selling pressure. The 3% Conversion Loan 1946 moved narrowly between Rs. 80.5 and Rs. 80.9 while 3% Non-terminable Paper were stagnant at Rs. 80.3. In short-dated Loans 2½% 1955 was marked up at Rs. 99.14 while 3% 1957 was traded at around Rs. 99.11 and 3% 1958 was unchanged at Rs. 99.8. In the medium-dated group, 3% 1959-61 showed no change at Rs. 98 and, as already mentioned earlier, both 3½% National Plan Bonds 1961 and 3½% National Plan Loan 1964 were marked back to Rs. 99.12 and Rs. 99.11 respectively. The 3% 1963-65 loan was steady at Rs. 94.3 and 3% 1964 had buyers at Rs. 94.2; 2½% 1962 met with enquiry at around Rs. 92.14 and 4% 1960-70 had buyers at Rs. 101.14. Long-dated loans were unchanged. State loans recorded a further improvement with 4% Bombay and Madras issues hardening to Rs. 101.7 and Rs. 101.4 respectively; 4% West Bengal Loans were also better at Rs. 100.7, while 4% U. P. issues continued in demand at Rs. 100-10.

Scarcity of sellers resulted in very little business in preference shares. Amongst jutes, Birta changed hands at Rs. 105, New Central at Rs. 116, and Rameshwara at Rs. 12.8. In the miscellaneous group, Bengal Assam Steamship were taken at Rs. 86, British India Corporation at Rs. 138, Calcutta Landing at Rs. 12.8 and Dalmia Cement at Rs. 97. Several deals were reported in New Victoria at around Rs. 3, Orient Paper 2nd were done at Rs. 78, Rohtas Industries 'A' were wanted at Rs. 125 and 'B' at Rs. 66.8.

In the banking section, Hind Bank were steady at Rs. 24.8 as were Punjab National at Rs. 24. United Bank of India 'D' shares changed hands at Rs. 4.6.

Enquiry continued for Dehri-Rohtas railway shares at Rs. 11.8. Small lots of Howrah-Amra and Burdwan-Katwa changed hands at Rs. 79 and Rs. 53 respectively.

Coal shares came in for some enquiry during the week particularly Amalgamated, Burrakur, Central India, Equitable and New Ter. Burrakur improved steadily from Rs. 13.6 to Rs. 13.14 to close at the latter rate. Amalgamated were steady at Rs. 23.8, Bengal rose today to Rs. 51.8 and Central India were taken at Rs. 7.14. Equitable had buyers at Rs. 31. New Beerbhoom were steady at Rs. 21.5 as were South Karanpura at Rs. 11.12. Western Bengal were done at Rs. 7.2.

As usual, there was little activity in the jute section and business was of a retail nature. Today however conditions were slightly better. With the approach of dividend time, Howrah were steady at Rs. 31.14 but later the price eased to Rs. 31.8. Agarpara were done at Rs. 13.8, Anglo-India were better at Rs. 220, Bally changed hands at Rs. 190, Barnagore at Rs. 180 and Birla at Rs. 20.3. There was a small enquiry for Budge Budge at Rs. 180. Rs. 99 to Rs. 102 and India from Rs. 177 to Rs. 180. Chitavalah were quoted at Rs. 14.11. Kamarhaty were steady at Rs. 204 and Megna were done at Rs. 96. National improved from Rs. 34 to Rs. 34.8 to close at Rs. 34.7. Nellimaria had buyers at Rs. 12.2, Presidency were steady at Rs. 7.1 as were Reliance at Rs. 14.14. Union were quoted at Rs. 199.

Little business was reported in electric supply shares. Calcutta Electric were easier at Rs. 14.14 and United Provinces were marked at Rs. 158.6.

With the exception of Shri Krishna Gyanodaya Sugar which were better at Rs. 17-10, sugar shares were neglected. Champaran changed hands at Rs. 30-12 and business was reported in a large parcel of Dyer Meakin Breweries at Rs. 6.4.

In the engineering section, Indian Iron & Steel shares met with powerful bull support and were lifted from Rs. 33-12 to Rs. 34-14; tonight's closing quotation is Rs. 34-13. Bhartia Electric Steel on the announcement of a higher dividend of Re. 1 per share rose from Rs. 15-8 to Rs. 16-3. Indian Galvanizing were steady at Rs. 23-14, Burn were taken at Rs. 265, Braithwaite at Rs. 25, Indian Steel & Wire were marked at Rs. 83.4. Kumardhubi Engineering were better at Rs. 12-8 and Marshalls at

Rs. 7-2. Jessops improved from Rs. 36-12 to Rs. 38 and Richardson & Cruddas rose from Rs. 18-2 to Rs. 18-14. Textile Machinery were firm at Rs. 22-8.

There was a good demand for paper shares with buyers of Bengal at Rs. 66-8 and India Paper Pulp (recently converted into Rs. 10 paid-up shares) rose from Rs. 27-8 to Rs. 29-8 with sellers scarce. Orient Paper on rumours of a higher dividend improved from Rs. 28-8 to Rs. 29-6. Shree Gopal were steady at Rs. 16 as were Titagur at Rs. 45-4. Dalmia Cement were unchanged at Rs. 14-12 and Sone Valley were done at Rs. 7-14. Concord of India Insurance were better at Rs. 15. New Asiatic were done at Rs. 6-1 and Triton were crossed at a higher rate of Rs. 170. India Steamship were steady at Rs. 7-12 as were Angelo Bros. at Rs. 19-6 and Assam Saws at Rs. 5-3. Alkali & Chemical rose from Rs. 15-7 to Rs. 17. Bengal Flour spurted from Rs. 24-6 to Rs. 28-4 without much business passing. Birds Investments were steady at Rs. 18-12 as were British Burma Petroleum at Rs. 3-14. British India Corporation were taken at Rs. 9, Gillanders Arbuthnot changed hands at Rs. 12 and Imperial Tobacco closed 8 annas higher at Rs. 11-10. There were buyers of Indian Aluminium at Rs. 152 and Indo-Burma Petroleum were firm at Rs. 147.8. Jardine Henderson changed hands at Rs. 115 and Martin Burn were better at Rs. 23.6. Metal Box were steady at Rs. 23 x.d. as were Rohtas Industries at Rs. 25-14.

In the mining section, Indian Copper changed hands in large quantities with the price rising steadily to Rs. 4-14-6 c.d.; tonight's closing quotation is Rs. 4-9 x.d. Burma Mines were steady at Rs. 2-4 while Non-Ferrous Metals were unchanged at Re. 1.

In the absence of enquiry, the first part of the week under review was rather dull for tea shares but towards the close, on firmer auction advices, there was a marked improvement in sentiment. Among Assam shares, Baghmari were unchanged

a comprehensive Telecommunication Engineering Enterprise

One of the largest telecommunication engineering organisations in the British Commonwealth **Standard Telephones and Cables Limited** is engaged in the research, development, manufacture and installation of all types of communication and control systems.

Concerned with every aspect of telecommunication engineering, the Company is in an unrivalled position to undertake, within its own organisation, the co-ordinated systems-planning of complete communication projects involving interdependent systems of various types.

Standard Products Include:

Systems—	Equipment—
Telecommunications Line Transmission	SeaTerCel Selenium rectifier equipment
Radio Broadcasting, Communication and Navigation	Power Factor Correction
Railway Communication and Control	Heat Treatment
Telephone and Telegraph	Broadcast Studio equipment
Supervisory and Remote Indication and Control	Transmission Testing apparatus
Sound Reproduction	Cable Testing equipment
Municipal and Industrial Fire Alarms	Loading Coils
Street and Airfield Lighting Control	
Signalling Office and Factory	
Communication Cable	

Components—

Quartz Crystals	Magnetic Materials
Transistors	Thermistors
Capacitors and Interference Suppressors	Relays
Germanium Rectifiers and Photoelectric Cells	SeaTerCel Selenium Rectifiers
Thermionic Valves	Rubber, Plastic and Textile insulated cables and wires

Standard Telephones and Cables Limited

Plantation Topics

MARKETING OF TOBACCO
IN INDIA

NOTABLE INCREASE IN EXPORTS

INDIAN exports of unmanufactured tobacco have risen from 57.6 million lbs., valued at Rs. 1.8 crores, in 1939-40 to 93 million lbs., valued at over Rs. 13 crores, in 1950-51. Among the Commonwealth countries, India has the largest acreage under tobacco. This information is contained in a report *Marketing of Tobacco in India* just brought out by the Agricultural Marketing Adviser to the Government of India.

The consumption of cigarettes in the world, the report says, has more than doubled since before World War II and the Virginia type has steadily increased in popularity at the expense of oriental types. The differences in the taste of consumers determine the areas from which cigarette manufacturers draw their supplies of tobacco. The British markets favour for all the cigarette trade a light-coloured, fine-textured, flue-cured Virginia type leaf and Commonwealth countries, including India, which look for a market in the U.K., concentrate on the production of leaf of this character for export.

Grading under Agmark

The introduction of Central excise on tobacco in 1943, the rapid rise in the production of high-quality cigarette tobacco in the country, the setting up of an Inspectorate at Guntur for the compulsory grading of certain varieties of tobacco in 1945, and the constitution of the Indian Central Tobacco Committee for promoting research and developmental work in 1945 have resulted in marked changes in the production and marketing of tobacco in India during the past decade. The grading of tobacco under "Agmark" has given complete confidence to buyers abroad, improved India's competitive position in London and continental markets and benefited growers who now receive prices in parity with those prevailing in foreign markets. The production during 1949-50 was 675 million lbs., of which cigarette types comprised nearly a fourth. Chewing and hookah types also each accounted for a fourth of the production. Bidi tobacco was about 19.0 percent, the rest being cigar, cheroot and snuff tobacco, the last accounting for only 0.8 percent of the production.

Madras and Andhra States produce nearly 42 percent of the tobacco, cigarette types being al-

most wholly in Andhra State. Bombay accounts for 29 percent, all being bidi tobacco. Except Uttar Pradesh, which produces another 12 percent of the total, the other States in India have only small acreages. The largest proportion of the tobacco grown in India is unsuited for commercial manufacture of standardised tobacco products and is consumed locally. These are the chewing, hookah and chilum tobaccos. Apart from the cigarette factories, which are 22 in number, and one or two manufacturers of cigars, the manufacture of tobacco products in India is essentially a local industry. The production of manufactured products in 1950-51 was 26,000 million cigarettes, valued at Rs. 52 crores, 50 million cigars (Rs. 37.5 lakhs), 4,696 million cheroots (Rs. 5.8 crores), over 110,000 million bidis (Rs. 53.5 crores), 144 million lbs. of hookah tobacco (Rs. 7.5 crores), 143 million lbs. of chewing tobacco (Rs. 20.5 crores) and 5.29 million lbs. of snuff (Rs. 2.0 crores).

Smoking and Chewing

Cigarette and bidi smoking is popular all over the country, and so is chewing common everywhere. In regard to other forms of consumption, there are regional peculiarities, e.g. cheroot smoking is confined to Andhra, Hyderabad and parts of Madras and Mysore States, hookah to the northern and north-eastern parts of India and snuff to Madras State. The report deals with all aspects of tobacco cultivation, curing, storage, research, utilisation in India and abroad, and manufacture and distribution of products. It contains a general description of the organisation set up by the Central Excise Department for administering tobacco excise. It sets out in detail how better prices can be secured for growers by economies in distribution, by the production of high-quality tobacco, by establishing regulated markets in the main producing areas and by the adoption of uniform standard quality grades.

LONDON TEA SALES

At last week's London tea sales, the 68,827 packages on offer realised an average price of 3s 7.70d, a lb against 3s 9.02d in the previous week and 4s 9.49d a year ago. Plain broken pekoe was quoted at 3s 4½d. Results obtained by some of the companies are given below:

	No. of Packages	Average per lb
Amalgamated	396	3/8
Anglo-Ceylon	471	4/1½
Assam Frontier	960	3/1½
Aitarae Khat	576	3/7
Bagracote	527	2/10½

Budla Beta	414	4/3½
Central Provinces	996	4/0½
Chulsa	534	2/1½
Cons. Estates	570	3/1½
Cons. Tea and Lands	1,953	3/3½
Darjeeling Co.	124	3/4½
Dekhari	474	3/7
Doom Dooma	1,365	4/1½
Eastern Assam	638	3/10½
Eastern Produce	947	4/3½
Imperial Ceylon	216	4/2½
Jetinga	269	3/3½
Jhanzie	834	3/9½
Jokai	2,113	3/8½
Jorehaut	689	4/1½
Lunuva	1,026	3/10½
Majuli	818	3/10½
Malayalam	576	3/5½
Moabund	504	3/10½
Needeem	618	3/0½
Nuwara Eliya	168	4/4½
Pabbojan	515	3/10½
Rajawella	697	4/3½
Scottish Ceylon	282	3/9½
Scottish Tea and Lands	786	4/2½
Standard	640	4/7½
United Planters	789	4/3½

COLOMBO RUBBER PRICES

The following prices have been issued by the Indian Rubber Board from the weekly market report published by the Colombo Brokers' Association:

	(closing prices on 17-6-55)	(average prices)
	(Rupees a lb.)	(Rupees a lb.)
Sheet:		
No. 1	1.12	1.12
" 2	1.09	1.09
" 3	1.06	1.06
" 4	1.04	1.04
" 5	1.00	1.00
	Sheet Cuttings 1	1.08
	do 2	1.03
Creepe:		
Whaler White	—	—
R.M.A. No. 1X	1.42/45	1.46½
R.M.A. No. 1	1.39/42	1.43½
	Creepe No. 2	1.40½
	Creepe No. 3	1.38½
Scrap Crepes:		
Sc. Creepe No. 1	1.22 Nom.	1.24½
Sc. Creepe No. 2	1.15/18	1.18
Flat Bark	1.05/10	1.10½
	Sc. Creepe 3X	1.14

To arrive at f.o.b. Colombo prices add 31.4 cents a lb. in respect of rubber other than scrap creepe and 25.4 cents in respect of scrap creepe to the above market prices.

New Delhi

COAL INDUSTRY CONFERENCE
OPENSDEMANDS FOR ASSURANCES
EXPECTED

(FROM OUR NEW DELHI CORRESPONDENT.)

COAL and railway transport are the two vital keys to India's development under the second five year plan. Targets of production may be assigned under the plan; they might even be reached. Their real value, however, will depend on the railway's plan to expand the transport facilities of the country to meet development requirements. In other words, the railway plan will largely determine the second five year plan. The Planning Commission is expected to discuss the railway plan in the middle of July. Coal is still important to any development. On coal supplies will depend the functioning of the new industries and the expansion of existing ones. On coal also largely depends the functioning of the railways.

A three-day conference of coal interests opened here last Monday to formulate a development programme for coal under the second five year plan. Mr. K. C. Neogy presided. The present assessed demand for coal is placed at 36.7 million tons against a total production of 36.7 million tons and average despatches of 32 million tons a year. The Coal Commissioner has assessed the 1960-61 demand for coal at 56.50 million tons, including the following:—

	(million tons)
Railways	14.00
Iron and steel	12.00
Electricity	4.00
Textiles	2.20
Cement	4.00
Brick burning	4.00
Bunker and export	2.30

Making an allowance of three million tons for consumption at the collieries, a production of 60 million tons of coal should be the target for 1960-61; or an increase of 23 million tons of coal. The plan is to step up production in the public sector by 12 million tons; from three million tons at present to 15 million tons by 1960-61. The tentative plan for this increased production is as under:—

	(million tons)
Korba coalfield	4
Karanpura coalfield	4
Central India coalfields	2 to 2.5
Others	1 to 1.5

The plan, it will be seen, leaves out the production of 11 million tons of additional coal from the private sector, which is being called upon to step up its production to 45 million tons by 1960-61. A up its production to 45 million tons by the coking-conference of the representatives of the coal producers in May this year demanded of the Government an early declaration of its future policy on nationalisation to enable the private sector to increase production according to plan targets. Since then, the Constitution Amendment Act has been passed. Such a declaration is necessary because of the large investments involved in the proper layout, mechanisation, stowing and installation of washing plants. The demand for a declaration is likely to be reiterated at the conference.

U.S. Investment Guarantees

A proposal of the U.S. Government for guaranteeing American investment in India is at present under consideration by the Government of India. This American "Investment Guarantee Scheme" provides for the issue of insurance policies, on payment of small premiums by the U.S. Government, to Americans investing capital in foreign countries. Under the scheme the U.S. Government pays the amount of the insurance policy against claims from such investors arising as a result of action taken by foreign governments where such capital has been invested. The U.S. Government, in its turn, is authorised under the scheme to approach the foreign governments concerned for recovery of the amount to be paid to their own investors. The scheme further provides that it will apply only to such projects of foreign investment which the Government concerned (namely, the receiving country) will specifically declare to be of benefit to the country and to be eligible for compensation. The scheme is an exclusive U.S. Government idea, but already a number of European and South American countries have entered into agreements with the U.S. on this reciprocal arrangement. Recently the U.S. Government approached the Government of India and the scheme is now under consideration. This scheme is quite different from the proposals contained in the proposed treaty on friendship, commerce, trade and navigation between the Government of India and the United States of America.

In order to encourage the participation of private enterprise "in achieving increased economic and defensive strength in free countries, the U.S. Government offers to new American investments abroad insurance protection against risk of inability to convert foreign currency receipts into dollars and against the risk of loss through confiscation or expropriation." It is explained that the U.S. Government, in the guarantee programme, acts solely as an insurer. It does not insure against failure to make a profit nor does it protect against devaluation of foreign currencies, nor

against physical damage to property from war, revolution or other causes. The insurance is not available to existing investment. It is, however, available for new additions to established investment. In the case of equity capital, loans and royalty agreements, the guarantee contracts may be written for a maximum term of 20 years. The annual fee for an expropriation guarantee is usually one percent of the total dollar amount of protection. The issue of compensation has been one of the principal hurdles in the successful conclusion of the Indo-U.S. treaty of friendship. From the beginning of negotiations, the U.S. Government has insisted that there should be a guarantee in the treaty that the compensation to be paid for acquisition of an American enterprise should be prompt, just and in an effectively realisable form and should represent the full equivalent of the property taken. Such a provision would require arbitration in the case of dispute as to whether compensation was just and represented the full equivalent of the property taken. As already reported, such a demand was unacceptable to the Government of India. The proposal now under discussion has a similar provision for a sole arbitrator to be appointed by mutual agreement failing which by the Chairman of the International Court of Justice.

Advice to Mr. Nehru

The great debate on the plan frame for the second five year plan still continues. Reference has been made to the famous pamphlet: *The Economic consequences of Mr. Winston Churchill* in which the author, Mr. John Maynard Keynes, criticising the return to gold standard at the old parity, gave a reply to his own question: "why did Mr. Churchill do such a silly thing?" His answer was that it was because Mr. Churchill had no instinctive judgment to prevent him from making mistakes and because he was misled by "experts". A similar question is being asked about the Prime Minister of India with regard to the second five year plan. Has he the instinctive judgment to save him from making mistakes? Is he being misled by the experts?

Dr. A. E. Morgan, a former Chairman of the Tennessee Valley Authority was a member of the Indian University Education Commission. Before leaving India, he wrote a letter to the Prime Minister on 1st October, 1953, from which the following has been taken:

"I shall begin with the chapter in the Planning Commission's Report on Community Development and Rural Extension. Page 223 calls for 'a network of extension workers throughout the country'. In the effort to spread the work rapidly there will be an almost inevitable loss of quality. I might illustrate from the American public school system, as it developed a century ago. That system was started on a high level. Sincere and hardworking young men and women underwent training and became teachers. But the demand for teachers far outran the supply of those who were trained. The result was that teaching standards were reduced and often the teacher was scarcely more literate than the child being taught. All America has suffered from that deterioration of teaching quality, but how could it be avoided?"

"Wherever a large body of public employees are in contact with the people, some of the politicians will soon discover that here is a source of political power, and they will try to see that their own followers are appointed. In some of our more backward States the extension workers tend to become a part of the political party machine. In others of our States they are wholly non-political, and are a fine body of men and women. One way to help the selection is to have such village workers chosen by the least political parts of your social structure. In America, on the whole, our colleges and universities are non-political, and are a good source of selection.

"Here I might say that while I believe that planning, often on a very wide scale, is necessary and important, I believe that 'a national Plan' is highly undesirable. I think it is a mistake to try to put a living, growing people into the framework of a plan. Planning should consist of removing the incongruities of a social order and of bringing out the possibilities of existing situations. The TVA of the United States, of which I was the first Chairman, was a case of eliminating the incongruities of a situation and of realising its possibilities, but there was a very minimum of directing the life of the people from above. I think that plans should grow out of the aspirations and the will of the people, and not be imposed. So far as technical plans are concerned, the general public seldom can understand them, and must necessarily follow the advice of specialists. But the direction of general, overall purposes should arise from the people, and should be a gradual evolution.

"Every dictatorship, benevolent or otherwise, holds its plan to be 'an expression of a basic unity of purpose in the community'. When we read 'care will have to be taken to see that the plan is implemented throughout the country as a single co-ordinated whole' we have what is in contrast to the gradual emergence from within of a growing social structure. Except where the need for unity of technical design makes necessary large-scale unified planning, I believe that overall social design should be the result of gradual emergence of public conviction, not of the development of an overall plan by any planning commission.

"Now turning to page 315 we read: 'Village industries are concerned in the main, with the processing of local raw materials for local markets and with simple techniques'. I am not greatly surprised to read this, but I am disappointed,

India may crawl along in its industrial development of village life, in which case mass industry will take over most industrial development. It is entirely possible to develop highly efficient industry on a small scale suitable for village life, and in which a man-hour of work will be many times as productive as the process mentioned. I recall a machine shop in the little hill town of Nahar perhaps fifty miles south-east of Simla, with all Indian management and staff. Here about 500 men were making sugar mills and irrigation pumps which were sold all over India; and as far away as Egypt. This plant was very badly located, as both coal and iron had to be shipped about 1,000 miles from Calcutta, the last 50 miles by oxcart; and the finished product had to be taken out in the same way. Yet, under even these greatly adverse conditions, this industry was successful. Far down in Southern India I saw similar evidence that small-scale, technical industry could be highly successful. India is importing or is going without many necessary products which would be fully feasible if plans were made in that direction. I should by no means suppress the local semi-handicraft work, but only by modern technology can India, with its present dense population, reach a reasonably high level of living. It would take more time than I have available to deal with this subject adequately.

"Here again I shall revert to planning. On page 318 there is recommendation of 'reservation of spheres of production'. It is indicated that without controls small industries cannot survive. 'What is certain is that unless the planning and development of village industries and many small-scale industries is conceived as part of the process of formulating policies and programmes for related large-scale industries, it will be extremely difficult to promote the smaller industries and almost every technical and economic factor will weigh against them.' This statement represents a common but false idea. A programme of modern, technical industries, on the scale of village or small-town units, is fully feasible. In the face of similar statements concerning our own villages we have been able to develop a dozen or more modern little industries which altogether employ 500 or 600 persons in a wide variety of occupations. A certain amount of outside technical and administrative help would be desirable in your case, so that the century and a half which the western world has spent in fumbling its way into industrial competence might be very greatly shortened for India. In short, however, I think that the effort spent in getting modern technical industries established on a small scale would be a very much better move than the 'reservations of spheres of production'. Your Government should check unfair competition by big industry, such as by under selling a small industry until it is killed, and then raising prices; but beyond that, well planned little industry, with co-operative technical services such as have been developed in Finland and Denmark, would enable small industry to hold its own and to grow, in competition with big industry. Trying to regulate industry by handicapping large industry and by subsidising small industry will, I think, not lead to the most efficient or beneficial industrial production. I hope India may get along with a minimum of big industry, as I think it often has bad social results.

"The United States had all the locomotive factories it needed. Those in existence could build perhaps twice as many locomotives as were wanted. One would assume that a big company with able leadership, and with money enough to carry on extensive research, would know whether more capacity was needed. With such a law as you describe, a government agency would probably not have licensed a new plant for building locomotives. But there was an engineering genius who thought otherwise. The expert engineers he employed told him he was wrong, and they feared they might be disgraced by working for such an impracticable person. But this man kept on. When his first locomotive was built, no railroad would buy it. This man had to lend his locomotive to a railroad company without charge to get them to try it. He broke new ground and produced locomotives so much superior to the old that manufacture of the old type has practically ceased. He made a profound revolution in the railroad industry. Probably no government commission would have licensed him when the locomotive companies and the railroad officials said the new locomotive was not good. He achieved his purpose because of his freedom from restraint.

"During the early part of Franklin D. Roosevelt's administration in 1933 and 1934, we had just such a law as you quote. It proved to be pernicious. Manufacturers do not like competition, and are always ready to hold that the existing production capacity is enough. So long as the law was in effect there was a strong tendency to exploit it for the profit of existing companies. In one case my own organisation needed a very large amount of crushed rock, and we were planning to build a plant to crush it ourselves. The plant nearest to us which was already supplying that product had abundant capacity, and demanded that we buy its product and not build our own plant. When we refused, that organisation used all the personal and political pressure it could to prevent us from building a plant. They even employed an ex-mayor of New York City as an agent and lobbyist for this purpose. The place we wanted to use the crushed rock was so inconveniently located that even if we had been given the product of this other company without charge, the cost of transporting it to our job would have been greater than the cost to us of producing our own. In that case the issue was clear enough so that we won out, but in many cases

Whatever may be the position with regard to the expansion of Indian shipping in the near future as a factor of the innumerable difficulties it has to face today, the authorities as well as other interests are alive to the need for undertaking substantial preparations for this expansion when it comes. One of the latest of such ventures was the formal opening of a merchant yacht ratings training establishment, the first of its kind in Western India at Navlakhi, a port in the Gulf of Cutch in the north-east part of Saurashtra, by Mr. Rasiklal Parikh, the Chief Minister of this maritime State. It is proposed to train 600 young men at this centre every year in four batches, as the training period is limited to three months. Young recruits up to the age of 21 from the coastal areas from Cutch to the North to Ratnagiri in the South or from the Arabian Sea will be given training in the deck and engine room departments of merchant shipping. While there will be no fees for training, those joining the class will receive free board, lodging and uniform in addition to a stipend of Rs. 10 a month as pocket money. The State Government of Saurashtra, because of its long traditional association with shipping and overseas trade, has been taking keen interest in the successful launching of this project and has so far contributed Rs. 3 lakhs to its establishment. In his speech declaring it open the Chief Minister said that his Government would give all possible help to the State and popularise this training. Mr. C. S. Pandey, Deputy Director-General of Shipping, who was present at this ceremony said that the school would have to be expanded in coming years as the demand for ratings for Indian ships would rise with the expected increase in tonnage. Mr. Srivastava also announced that a steamship donated by the Scindia Steam Navigation Co. would arrive at the establishment after the monsoon to facilitate training.

Uttar Pradesh

P.S.P. LEADER'S FORMULA FOR
ENDING TEXTILE STRIKEU.P. GOVERNMENT'S CONDITIONS
FOR INTERVENTION

(FROM OUR LUCKNOW CORRESPONDENT)

HOPES of a settlement of the six-week Old Kanpur textile strike appear to have brightened with the Chief Minister, Dr. Sampurnanand's, "favourable reaction" to the suggestion of the P.S.P. leader, Acharya Narendra Dev. The latter's formula for ending the strike requires the appointment of a committee consisting of representatives of textile employers at Ahmedabad, Bombay and Kanpur and representatives of the central labour organisations at these places. The Suti Mill Mazdoor Sabha, which sponsored the strike, has approved of this formula. Acharya Narendra Deva has assured the Government that labour leaders now accept rationalisation in principle but Dr. Sampurnanand has reiterated that a pre-condition of Government intervention is the calling off of the strike. As against these hopeful signs of a settlement, there are other indications which point in a contrary direction.

The official stand taken by the Employers' Association of Northern India on labour's demand for the appointment of a tribunal or the convening of a round table conference is that only valuable time will be wasted by going over the old ground. A Press note issued by the Employers' Association on 23rd June says: "With a two-fold guarantee given by the employers as well as the Government that in future retrenchment and unemployment would not take place as a result of rationalisation with the Nimbkar Committee proposals on wage structure and with a reasonable workload as a basis for further discussions; with schemes prepared by a firm of industrial consultants of international standing (and on which the employers have spent lakhs of rupees) for scrutiny and finalisation after any modifications which the seven-man committee may have found necessary, what remains for a tribunal to examine or for a round table conference to achieve?"

Labour's demand at the moment appears to be that before expecting Kanpur workers to do as much as the workers in Ahmedabad and Bombay, the working conditions in the Kanpur mills should also be brought on a par with those in Bombay and Ahmedabad. Thus, in the case of spinning the main factor in determining the workload is the number of breaks per 100 spindles an hour. Similarly in the case of weaving, the determining factor should be the number of warp breaks a loom an hour and the number of shuttle changes a loom an hour, whatever the quality or the count. This is the obvious answer to labour spokesmen who argue that the better performance of the workers in Bombay and Ahmedabad is due to the mills in these places being equipped for the manufacture of fine cloth, and not as in Kanpur mills which concentrate on coarse cloth.

Case for Rationalisation

The case for rationalisation in Kanpur has been argued by Mr. Sitaram Jaipuria in an article as follows: "Out of a total of 866,880 spindles installed in the textile mills of U.P. no less than 214,462 are reported to be idle, and of the installed capacity of 13,529 looms in U.P., 1,794 looms are reported to be idle. Turning to Kanpur, we find that five of the 10 textile mills are reported to be running at a loss, two mills have made negligible profits and the profits of the remaining have been progressively declining in the last three years. Even in the case of the powerful British India Corporation, there is the significant fact to remember that it allowed one of its spinning mills to close down at a cost of Rs. 7 lakhs paid out in compensation rather than let it continue running on an uneconomic basis." Mr. Jaipuria also cites figures of production and consumption for 1953 to show that Kanpur faces heavy competition from Bombay and Ahmedabad mills even now. These figures show that U.P.'s textile output is only a little more than 50 percent of its consumption demand; that after allowing for exports to neighbouring States, U.P.'s consumption of U.P. cloth is much less than 50 percent of its demand; that more than one-half of U.P.'s demand is met by mills outside U.P.

New Hydel Projects

Three hydel projects to generate over 200,000 kilowatts of electricity, harnessing the Jumna, the Ramganga and the Sarda, are proposed to be taken up by the U.P. Government under their second five year plan. The two-phased one-lakh kilowatt Jumna Valley Project which was begun some years ago but was later abandoned, is being revived. The Ramganga project will produce 50,000 kilowatts of electricity and the Sarda project, utilising three more falls in the river below the Khatima power house, will generate 45,000 kilowatts. Generation of power from the multi-purpose Matatila dam project is not proposed to be taken up in the second plan period but a pilot power project will be started. The State Government has decided to allot Rs. 125 crores to power schemes in the second plan. The financial outlay for the irrigation projects in the second plan would be of the order of Rs. 70 crores. The Ramganga project involves an expenditure of Rs. 25 crores. The second phase of the Chuka reservoir project on the Sarda which envisages the raising of the height of the dam by another 12 feet to 625 feet also figures in the plan. The controversial Hindaun project has also been provisionally included in the plan. The flood protection schemes in the plan period are estimated to cost Rs. 3 crores.

London

FOOTING THE BILL FOR
RECENT STRIKESGOVERNMENT TACKLES PROBLEM
OF INDUSTRIAL UNREST

(FROM OUR LONDON CORRESPONDENT)

WITH the end of the locomotive men's strike and a substantial return to normal in the case of most activities, and despite the fact that the partial strikes of dockers and seamen at various ports still drag on, attention has been switched from the immediate problems to the future of industrial relations in this country. The most momentous debate in the present Parliament so far was devoted to this subject last Thursday. Sir Walter Monckton, the Minister of Labour, made a valuable contribution in a careful assessment of recent strikes and the lessons to be learnt from them, an outline of the various lines along which action might be taken to prevent unnecessary stoppages in future and refuted all suggestions that the Government had any intention of introducing legislation to deal with this problem by stating that he would be no party to any measures that did not carry the full approval of the trade unions and the Employers' Confederation. It was a national problem, he said, and he was not going to deal with it on a party basis. Mr. Robens, the principal Opposition speaker, was with Sir Walter almost all the way, but neither he nor his colleagues could overlook party considerations and their main emphasis was devoted to placing responsibility for all strikes on the Government and its unwillingness to promote a fair distribution of wealth. As Mr. Callaghan put it, it was not trade unionism that was on trial "but your acquisitive society."

Most of the trade union leaders, however, or so one must judge from their recent actions and speeches, do not quite see eye-to-eye with the politicians. Mr. Justice Morris's award in connection with the locomotive strike must have given them food for thought. The strike cost the locomotive £1 million in loss of wages and their union £350,000 in strike pay. It cost British Railways £15 million in lost revenue. The award gives increases of 1s., 2s. and 3s. to first, second and third-year drivers, respectively, and nothing to firemen, and only a shilling to engine-men. The A.S.L.E.F. accepted the Transport Commission's original offer, and many locomotive men are in fact worse off. Moreover, the N.U.R. having negotiated "consequential" rises for guards and signallers, the differentials which A.S.L.E.F. went on strike to maintain will in fact be cut, and this time they have accepted the condition that there will be no "leap-frogging." The futility of this particular stoppage—and it certainly looks as though the dockers and seamen will find themselves similarly placed in the end—justifies the efforts now being made in Government, trade union and employer circles to investigate both the constitutional and economic aspects of industrial relations to see whether some more effective means of ensuring co-operation in the general interests of all parties cannot be found. The discussions must necessarily take time, and meantime great reticence is being observed by everyone, but there is no doubt that all are agreed that it is a step in the right direction.

Are Trade Trends Improving?

Leaving aside any setbacks occasioned by strikes and the like, what everyone is now looking for is unequivocal evidence that the Government's economic policies are achieving some effects. The detailed trade figures for May have therefore some in for close scrutiny, particularly to find out if the drop in imports is really a trend rather than just a flash in the pan. A table of the main categories of imports for March, April and May provides at least some encouragement, if not a complete answer. Here it is:—

	U.K. Imports £ million		
	March	April	May
Total	365.4	318.0	290.3
Meat	28.7	20.9	19.2
Cereals	24.0	19.1	21.5
Tea, coffee, cocoa	26.0	16.2	9.9
Coal	7.2	6.2	6.0
Petroleum	28.5	28.4	26.7
Wood and cork	11.5	9.5	12.1
Wool	21.0	16.8	17.7
Rubber	7.4	5.9	4.8
Chemicals	11.5	8.5	9.9
Iron and Steel	7.7	7.6	7.5
Non-ferrous metals	20.1	17.4	12.9

On the export side, the most striking feature is the continued high level of engineering exports, despite increasing competition. Last month these were worth over £98 million, almost the same as in April, and about 4½ percent above the average for the first three months of the year. Sales of engineering goods abroad in the last two months have been running at about 12 percent above the level of the corresponding period in 1954. Part of this expansion is seasonal, as for instance in the case of cars, but other engineering products are also selling well. Aircraft exports are increasing and sales of non-electrical machinery are some 31 percent above the rate of the first three months of the year. Exports of boats and

ships in the last two months show a remarkable expansion of as much as 29 percent over the first three months.

Further encouragement is available from the fact that the cost of living in May remained the same as in April, the official index of the average level of retail prices standing at 147, compared with 141 in May, 1954. The downward trend in the prices of basic materials used in industry continues. The Board of Trade index, based on mid-1949, fell from 149.4 in April to 149.0 in May, 3.2 points below the February peak, but still 4 points higher than in May last year. The mechanical engineering, electrical machinery and textile industries' materials followed the general trend. In contrast, building requirements tended to be firm. Higher prices for raw rubber and tungsten ore were more than offset by the lower cost of copper, raw jute, hides and skins. Brass ingots too, although rising in price towards the end of the month, cost less on the average during May. On the other hand, after moving slightly in favour of this country in April, the terms of trade—i.e., the ratio of import to export prices—held steady in May. Both the import price index at 103 and the index of export prices at 101 showed no change, leaving the terms of trade (basis 1954 = 100) at 102. On the export side the index for metal prices was up another point to 103, bringing the rise since January, mainly under the influence of higher copper prices, to 5 points. Higher metal prices were offset by slightly lower export prices for engineering products and textiles. On the import side the index of manufactured goods prices was down one point to 107. In the food, beverages and tobacco group a further fall in tea prices was matched by a seasonal rise in the price of tomatoes. At 102 the May terms of trade index shows an improvement of nearly 2 percent compared with the January figure.

Incidentally, the drop in tea prices is at last finding its way to the consumer. All the leading firms have announced reductions averaging about 4d. a pound effective within a fortnight. The blends available will then range from 4s. to 7s.8d. a pound, or a shilling less than earlier in the year.

Anxiety Regarding Coal

The Government's anxiety with regard to coal supplies is spreading—even to some of the more realistically-minded trade union leaders. It seems fairly certain that we must face up to the prospect of having to import foreign coal for a number of years. In itself that is not too disquieting, for industrial demand is expanding more rapidly than domestic coal output, but what does give cause for reflection is that we may soon be importing more coal than we export, and that would mean that the National Coal Board would not be able to finance the extra £2 a ton which imported coal costs from the profit it makes on its exports. There would then be a steady and increasing drain on the gold and dollar reserves which would add to balance of payments difficulties. The Board's report for 1954 has just been issued and discloses that imports cost no less than £5 million, into a deficit of £3.8 million. Imports are still coming in at the rate of about a million tons a month, and current cost is higher than in 1954.

According to Sir Hubert Houldsworth, Chairman of the N.C.B., the main problem is manpower. Industrial demand is increasing at a rate of about five million tons a year and the mines are losing about 5,000 men each year, and the mines are losing industries. Mechanisation is not adequate to make up the deficiency in manpower. The 1954 report shows that the Coal Board was left with a surplus of £18.7 million after meeting taxation, but before finding interest on capital. Interest payments to the Ministry of Fuel and Power took £17.5 million, leaving a surplus of £1.2 million on operations in this country, but the loss of £5 million on imported coal turned this into a deficit of £3.8 million. This increased the Board's cumulative deficit to date to £17.4 million. The cost of producing deep-mined coal continued to rise in 1954 and the average cost increased by 2s. 9d. a ton, or by 4.6 percent. The report gives three reasons for this: higher wages, increased capital and maintenance charges, and additional expenditure on safety and other measures.

Cotton "Straddle" Deals

Cotton "straddle" dealings between Liverpool and Alexandria will be possible when the latter market re-opens on 26th September. This is the result of a decision reached on Thursday between the Liverpool cotton market delegation and the Egyptian Government in Cairo. Egypt is to facilitate currency transfers and provide adequate means for "covering" and relax restrictions on the cotton export trade to provide the British market with sufficient reserves of cotton to strengthen trade relations. Reciprocal tax exemptions are also likely. Britain is to guarantee freedom of operations between the two centres. Details of the Liverpool contract have still to be settled and for the time being there is to be only a long-stapled cotton contract based on Karnak type cotton.

Breivites

An order worth £22.5 million for railway wagons has been placed with the Pressed Steel Company, Ltd., Oxford, by Indian Railways. The wagons will be made at the company's works at Linwood, near Paisley. Production will start by the end of the year and the order will take a year to complete. It has been secured in face of strong home and foreign competition and is the first order the firm has received from the Indian Railways. The wagons are to be sent out "knocked down", in crates for assembly in India.

Jute

THE OUTLOOK FOR RAW JUTE

ITS IMPACT ON THE GUNNY MARKET

APART from the fact that there is an absence of strong holders in the gunny bazar, the main reason for the present weakness in the market for manufactured goods is the prospect of large crops in both India and Pakistan. The speculative element in the bazar looks on this as a very bearish feature and there is talk in the gunny market of raw jute prices falling even below Rs. 20 a maund for Assam Bottoms. This opinion seems to find more favour in the gunny market than among jute merchants and it may be worthwhile to examine the position to find out what justification there is for such extreme views.

It is generally accepted that the 1955 crop in Pakistan will yield 70 to 75 lakh bales while it is expected that the Indian crop, including mesta, will be about 55 lakh bales. Taking the higher figures this gives an expectancy of 130 lakh bales, which may be taken as an extreme figure. The crop is not yet fully grown and, as was experienced last year, much may still happen to reduce the output. Let us take the extreme figure and see whether it is so much in excess of probable demand to justify an extremely bearish outlook.

Indian consumption for 1955-56 is estimated at 63 lakh bales, including domestic consumption. Exports from Pakistan in 1955-56, excluding those to India, are estimated at 35 lakh bales, while Pakistani mill and domestic consumption is expected to account for 10 lakh bales. There is then a probable demand in 1955-56 of 108 lakh bales out of new crop supplies of 130 lakh bales, leaving a surplus of 22 lakh bales. The carry-over in India at the end of the current season is negligible while that in Pakistan is smaller than it has been for years. Besides this, it has to be borne in mind that Indian mill stocks at present are not large—not more than enough to enable them to carry on until they are getting in supplies of new crop. Moreover, these stocks are mainly of the higher qualities. It is a fair assumption, therefore, that there will continue to be active demand for the lower grades for some considerable time until the mill stock position is more comfortable. It may also be assumed that mills will endeavour when prices are suitable, gradually to increase their stocks during the season so that they do not again get into the somewhat anxious, if not precarious, position some of them are in at present. In these circumstances it seems probable that the Indian demand out of the new crop will be more than the 63 lakh bales we have estimated and that the carry-over at the end of the season 1955-56 will be less than has been estimated above.

Admittedly there is a great deal of assumption in these figures but they certainly do not err on the side of underestimating supplies or exaggerating consumption and, in these circumstances, there does not appear to be any justification for the very bearish sentiment which prevails in the gunny market—not at least on the basis of the raw jute supply outlook.

THE JUTE MARKETS

NEW LOW LEVELS IN HESSIAN

The lack of interest shown by overseas buyers recently was reflected in the hessian markets this week. Quotations, which for some time past have varied a few annas either way, lost about Rs. 35 a ton over the period, reaching new low levels, and the general tendency towards the close was still downwards. American hessian consumers have restricted their purchases to replacement lots, which they have procured from the very large spot and affloat stocks in preference to entering the Calcutta markets. The main inducement towards this policy has been the fact that these stocks have been offered at a considerably lower rate than Calcutta shipment prices, and is not subject to delays in shipment, etc. that often beset goods from the Indian markets. Calcutta operators were confident at the opening that the week would bring forth fairly good business, and their theory was based on the knowledge that shippers still have a fairly large bear account to cover. It was thought that with the approach of June due date shippers would be active in this sphere, but although mills and bazaar parties were keen sellers, there were no buyers, and the resultant anti-climax brought about a rapid change in the outlook. One of the major factors arising out of the dearth of business is the possibility of a further increase in mills' stocks of hessian goods and prices have fallen on this account possibly more than any other.

There has been very little relationship between the hessian and sacking sections of the market over the past week, and although rates for heavy goods have fallen, a speculation has again predominated, and prices have varied within narrow limits in accordance with fatka manipulations. Very little real goods business has been reported in spite of mills being keen sellers for forward shipment, but buyers are resisting the present price levels, and are looking for lower rates.

Favourable weather conditions continue to be reported from nearly all the New Crop jute growing areas. Alternate rain and sun has advanced germination, and although in some districts the

rapid rise in river levels is causing some concern, it is thought that the standing crop is too far advanced for any serious damage to be inflicted. Imports into the main Dhubri and Northern agencies are increasing rapidly, and for this reason many buyers have withdrawn from the market except for early shipment jute. They have completely scorned other delivery periods, except at a large discount which is well below the sellers' workable ideas. On the other hand sellers are not too keen to sell for the July position alone, especially as the majority of buyers are asking for guaranteed delivery for that month. Mills are still showing an interest in quick delivery Old Crop jute, and business has been done although in most cases the assortment is higher than what mills require.

Manufactured Goods: On Thursday last, the goods market opened unchanged from the previous day, ready B Twills being quoted at Rs. 107 a 100 bags and 40in. 100z. hessians at Rs. 42-6 a 100 yards for the same delivery. Continued selling pressure from mills, mainly for forward shipment, caused prices to ease after the opening, and with local shippers and overseas interests staying completely out of the market prices shortened. On Friday, hessians lost 2 annas in all deliveries and heavy goods 4 annas in the near positions and 8 annas for forward shipment. The market was very dull at this stage, and minor fluctuations were the order of the day, heavy goods B Twills eventually reverting to the week's opening price of Rs. 107 by Saturday morning with the October-December period unchanged at Rs. 101-8. Once again the hessian section was weaker, and prices dropped a further 2 annas in all deliveries. The weakness in the hessian section is due to the poor shipping figures this month which will naturally lead to an increase in mills' stocks of hessian goods. Over the weekend speculators came out in strength and dominated the market, and prices on Monday morning showed a general tendency to decline. B Twills lost 8 annas in both the near and forward positions, quotations standing at Rs. 106-8 for ready delivery and Rs. 101 for October-December shipment. The hessian section was particularly weak and ready 40in. 100z. dropped 5 annas to Rs. 41-13 a 100 yards and the October-December shipment 4 annas to Rs. 40-12. This is a new low level for hessians and demonstrates the present weak position of this section of the market. Speculative activity continued to depress prices, and in the absence of any real goods business either from local consumers or overseas interests, rates continued to drop and hessians again lost 5 annas in the near position and 2 annas for forward shipment. The 40in. 100z. ready hessians dropped to Rs. 41-8 and October-December shipment to Rs. 40-10 a 100 yards. Heavy goods also lost ground and B Twills dropped 8 annas in all deliveries, the ready position standing at Rs. 106 and October shipment at Rs. 100-8 a 100 bags. Mills were still keen sellers, even at the lower prices, and under heavy selling pressure prices continued to fall throughout the day and weak conditions prevailed.

At the close the market is unchanged in heavy goods, but hessians have again fallen 2 annas for all deliveries. Opening quotations on Wednesday morning were as follows:

	Ready	July	July-Sept	Oct-Dec.
40 in. 8 oz.	33-12	33-10	33-10	32-10
40 in. 10 oz.	41-6	41-8	41-10	40-8
B. Twills	106-0	105-0	104-8	100-8
Heavy Ceers (Plain)	107-0	106-0	105-8	101-0
A. Twills	134-8	132-8	130-8	125-0
Liverpools	119-8	119-8	119-0	114-0
Corn sacks	112-8	109-4	107-8	102-8

Raw Jute: Although a fair amount of business has been concluded over the period under review, it has not been on such a heavy scale as in previous weeks. This is possibly due to mills being more selective in their buying policies, which shows a reluctance to enter into any commitments for forward delivery. Mills' main interest is for either July delivery New Crop jute or quick delivery low quality Old Crop jute, and as offers for both these categories are on a limited scale, business has been restricted. Mills have been guided in this policy by the favourable New Crop reports, and the prospects of a bumper crop, and are confident that rates for forward shipment will soon be much lower than present quotations. This has caused the New Crop prices to fall over the week, and a certain weakness is apparent as sellers cut their rates in an effort to induce mills to buy. Mills have indicated that they will only be interested in forward shipment at a discount of Rs. 3 to Rs. 4, which price the sellers are unwilling to meet. The Old Crop section is steady, and although prices have fallen slightly over the week the undertone is firm.

Quotations for New Crop jute opened the week on the basis of Rs. 26 a maund for Upper Assam Bottoms for August-September shipment, this being unchanged from last week's closing rates. In the absence of mill interest, prices dropped 8 annas a maund on each of the successive days, but even this brought little response from buyers. Upper Assam jute was now quoted at Rs. 25 a maund, and some sellers offered at below these rates, but business reported at these levels was negligible. Old Crop jute tended to be steady throughout the week on account of mills' buying interest for quick delivery. Quotations opened at Rs. 28 a maund for Upper Assam Bottoms for June-July delivery and

remained unchanged all week, although business was done at below these rates.

During the week business was done in Old Crop Dhubri-Northern jute at Rs. 27 to 28 a maund basis Bottoms for June-July delivery, both from Agency and ex Local Godown, and Local Northern at Rs. 27 a maund for the same delivery. Local packing jute, free from jungli, was done at Rs. 26 basis Bottoms, and Daissee Mesta was also done at this price for one month's delivery. Good business was done in Pakistani Northern jute at Rs. 27 to Rs. 28 a maund basis Bottoms for June-July shipment.

In the New Crop section business was done for Dhubri Northern jute at Rs. 27 a maund for July shipment, Rs. 26-8 for July-August and Rs. 25-8 to Rs. 24 a maund for October-November shipment. Daissee White jute was done at Rs. 26-8 a maund basis Bottoms for August shipment.

At the close the market is unchanged for both Old and New Crop jute, and opening quotations on Wednesday morning were as follows:

	Landed at Mills Rs. a maund basis		Bottoms	New Crop	Shipment
	Old Crop	July			
Lower Assam	28-0	25-8	25-8	25-8	Aug-Sept
Upper Assam	27-8	"	25-0	"	"
Northern	28-0	"	25-8	"	"
Local Northern	27-8	"	"	"	"
Local Packing	27-0	"	"	"	"
Daissee ex Sheoraphuli	29-0	"	"	"	"
Daissee White	26-0 F.A.Q.	"	26-8	26-8	July-Aug.
Bimil	26-0 F.A.Q.	"	22-0 F.A.Q.	22-0	Oct.-Nov.

Tossa is quoted at Re. 1 to Rs. 1-8 a maund above the rates for white jute.

	Rs. a maund basis		Bottoms	New Crop
	Old Crop	July		
Pakistani Jute:	28-8	28-0	28-0	28-0
Jute	28-0	27-8	27-8	27-8
District	28-0	27-8	27-8	27-8
Northern	28-0	27-8	27-8	27-8

Local markets have been fairly steady this week on account of mill interest and business done. Imports have fallen off to about 15 to 20 wagons a day in Cossipore and sellers are reserved, seeking higher prices. Quotations at the close are based on Kishanganj jute at Rs. 28 a maund for gars at quality. Sheoraphuli Daissee markets are quiet in the absence of business, and quotations are nominal. Recent rains in the Daissee areas have promoted the growth of the young plants, and the crop is reported to be in a healthy condition. In the New Crop section, harvesting has commenced on a small scale following the recent rains which have provided much needed steeping water in tanks and streams. Initial samples of Daissee white jute have aroused more interest in this fibre and demand is expected to be heavy. Quotations are on the basis of Rs. 26-8 for Bottoms.

Mofussil: The Old Crop markets upcountry are at a standstill with no imports and very little business passing. There is a fair amount of activity for New Crop, and imports on a small scale are reported from many agencies in the New Crop areas and Dhubri. Demand for New Crop jute is being paid, but is keen and fairly good prices are being offered, although forward delivery jute is being offered freely, there are very few buyers. River levels in some areas are rising rapidly, but it is thought that very little damage can be done to the standing crop at this stage. At the close quotations in Dhubri are based on Rs. 25 a maund for New Crop gars at quality jute.

There is very little to report from the Pakistan markets, where Old Crop imports, have stopped completely. New Crop imports have increased over the week however and in Narayanganj averaged about 2-3,000 maunds a day, but nearly half of this amount is weedings. Harvesting is proceeding slowly in the lowland areas, and imports are expected to increase sharply early next month. Up to date demand has been slow, but business has been done in selected weedings at Rs. (P) 16 to Rs. (P) 14-8 a maund and in low weedings at Rs. (P) 14-8 a maund. Business has also been done in small quantities of cut jute suitable for Export Firsts and Export Lightnings at Rs. (P) 15-8 for B Bottoms and Rs. (P) 14-8 for C Bottoms, both for July delivery.

INDIAN JUTE CROP REPORT

In their fifteenth crop report for the current Indian season covering the week ended 25th June, Messrs. Sinclair Murray & Co. Ltd., say that favourable weather conditions have been experienced in all areas with good general rainfall and spells of sunshine. Lowland harvesting operations in Assam are proceeding and weeding operations elsewhere as required. Sowings have now been completed in the Daissee districts and the crop condition is generally most satisfactory. River levels are higher than normal in Assam but normal elsewhere.

DANPUR: Favourable weather conditions have been experienced with alternate rain and sunshine. Weeding operations are going on slowly as required. Plant condition is reported to be healthy and they range in height from seedlings to 4ft. The river level is normal for this time of the year.

JAIPUR ROAD: Weather conditions have been mainly hot and dry with the exception of scattered rainfall and this has been favourable for the standing crop. Second weedings on lowlands and first weedings on midlands have been completed. The condition of plants is reported to be healthy and they range in height from seedlings to 3ft. The river level is normal for this time of the year.

COSSIMBAZAR: Weather conditions have been very favourable with alternate rain and sunshine and plant condition has improved as also their progress in growth. The condition of plant is very satisfactory and range in height from 6in. to 3ft. 6in. Weeding operations have been completed in the lowland areas and second weedings and first weedings have been

completed in the midland and highland areas respectively. The river level is normal for this time of the year.

RANAGHAT: Weather conditions have been very favourable with alternate rain and sunshine. Weeding operations are going on where necessary. The condition of plants is very satisfactory and they range in height up to 6 ft. The river level is normal for this time of the year.

NOWGONG: Favourable weather conditions have been experienced with alternate rain and sunshine. Weeding operations have now been completed in the midland areas and are going on as required in the highland areas. Plant condition is reported to be healthy and they range in height up to 6 ft. 6 in. Harvesting of lowland areas has commenced but the river level is rising steadily and although higher than normal for this time of the year is slightly lower than last year's level at this time.

PALASHBARI: Favourable weather conditions have been experienced with spells of hot and dry weather and scattered showers. Third weeding operations are going on in the midlands while first weeding operations have been completed in the highlands. Plant condition is reported to be very satisfactory and they range in height up to 6 ft. Harvesting in the extreme lowlands has commenced but the quantity so far cut is negligible. Towards the end of the week the river level rose rapidly and at the weekend was 4 ft. higher than last year at this time and is 15 ft. higher than normal for this time of the year.

DHUBRI: Wet and cloudy weather was experienced and this is favourable although a spell of dry sunny weather would be beneficial to promote growth. Second weeding operations in the highlands have been completed. Plant condition is very satisfactory and they range in height up to 6 ft. 6 in. Harvesting operations are going on steadily in the lowlands. The river level is rising steadily and now stands slightly lower than at the same time last year but this is well above normal for this time of the season.

DAISSEE DISTRICTS: Sowings completed -20/-, Alternate rain and sunshine has been experienced which has been very favourable for the standing crop. Cultivators have been able to complete sowings at -20/- as against completed sowings at this time last year. It is estimated that division of sowings are White -12/-, Daisee -9/-, and Mesta -9/-, The condition plants is very satisfactory and they range in height up to 4 ft. 6 in. Weeding operations are proceeding where necessary. The river level is normal for this time of the year.

Rainfall	For the week 1955	1954	Total from 1st Jan. over the 1954 Week-end
Danpur	1.45"	0.39"	8.08" 14.33"
Jajpur Road	0.13"	0.41"	9.86" 15.61"
Cossimbazar	3.13"	7.20"	11.89" 17.42"
Ranaghat	2.06"	3.35"	13.30" 26.75"
Nowgong	2.68"	1.40"	27.68" 23.70"
Palashbari	3.36"	1.59"	35.10" 23.48"
Dhubri	14.88"	6.31"	44.00" 38.41"

N.B.—As a basis of comparison last season's sowings have been taken as -16/-.

PAKISTAN JUTE CROP REPORT

In their sixteenth crop report for the current Pakistani season covering the week ended 25th June Messrs Sinclair Murray (Pakistan) Ltd., say that weather conditions have continued favourable with alternate rain and sunshine, and the crop is progressing satisfactorily. Harvesting of the lowland crop is going on slowly in most districts and it is estimated that about -3/- has been cut to date. River levels are rising slowly and if they continue to do so, it will in all probability increase the rate of cutting as steeping water should be ample.

NARAYANGANJ: The weather has continued favourable with alternate rain and sunshine which has enabled the crop to make satisfactory progress. Condition of plants is satisfactory and they range in height up to 6 ft. Weeding operations have been completed. The river level is 1 ft. 19 in. lower than at this time last year.

DACC: The weather has continued favourable with alternate rain and sunshine. The condition of plants continues satisfactory and they range in height up to 5 ft. 6 in. Weeding is going on in mid and highlands where necessary. Harvesting of the lowland crop continues and it is estimated that -2/- has been cut to date. The river level has risen during the past week but is still 3 ft. lower than at this time last year.

CHANDPUR: The weather has continued favourable with alternate rain and sunshine which has been beneficial for the crop. Condition of plants continues to be satisfactory and they range in height up to 7 ft. Harvesting of the lowland crop was continued slowly during the week and it is estimated that -3/- has been cut up to date. The river level is 4 ft. 3 in. higher than at this time last year.

NIKLIDAMPARA: During the first half of the week the weather was mainly wet, but in the latter part, the weather has been sunny which has been favourable for the crop. Condition of the standing crop is satisfactory and plants range in height up to 6 ft. 6 in. The river has risen 4 ft. during the past week and is now 1 ft. 11 in. higher than at this time last year. Due to the rapid rise in the river level, cutting has gone on freely and it is estimated that -4/- of the lowland crop has been cut to date.

SARISHABARI: The weather has continued favourable with alternate rain and sunshine. Plants continue to make satisfactory progress and they range in height up to 6 ft. 6 in. Weeding was suspended in the early part of the week due to rainfall, but has since been resumed. Harvesting of the lowland crop continues and it is estimated that -2/- has already been cut. The river level has risen 3 ft. during the past week and is now 1 ft. lower than at this time last year.

SERAJGANJ: Heavy rainfall was experienced during the first half of the week which was followed by two days of very strong sunshine which has been beneficial for the crop. The condition of plants continues satisfactory and they range in height up to 7 ft. Harvesting of the lowland crop is going on freely. The river level has risen 2 ft. during the past week and is now 2 ft. 6 in. lower than at this time last year.

NAKALIA: During the week the weather was very hot and dry and generally unsuitable, but rainfall towards the end of the week has been beneficial for the crop. The condition of plants continues satisfactory and they range in height up to 6 ft. 3 in. Harvesting of the lowland crop continues freely and it is estimated that -1/- has been cut to date. The river level continues to rise, but is lower than at this time last year.

BHANGORA: The weather has been favourable during the week with one very good shower of rain. The condition of plants continues satisfactory and they range in height up to 7 ft. Harvesting of the lowland crop is going on slowly. The river level has risen 1 ft. 6 in. during the past week and is now 1 ft. lower than at this time last year.

Rainfall	For the week 1955	1954	Total from 1st Jan. over the 1954 Week-end

Bhangora	2.23"	9.20"	10.47" 35.64"

N.B.—As a basis of comparison, last season's crops have been taken as -16/-.

MR. KANORIA APPROVES POLICY OF EXPANDING MARKETS

A SUMMARY is given below of the speech made by Mr. N. Kanoria, President of the Gunny Trades Association, at the 30th annual general meeting held in Calcutta last week.

Mr. Kanoria opened his remarks with a comment on the increased production which the industry achieved last year: "The year 1954-55 has been a comfortable year for the jute goods trade and industry. It is a matter of satisfaction that those responsible for managing the affairs of the jute industry took quick and courageous steps in successively increasing production from 42½ hours to 45 and from 45 to 48 hours per week. The fears entertained by some that this increase in production may lead to a drastic fall in prices and a heavy increase in stocks have been totally belied. The jute industry of Calcutta is not finding any difficulty in disposing of its production at the increased rate. In the past jute mills adjusted production on the profit-basis, that is to say, whenever demand for jute goods fell and prices came down, the mills cut down working hours and created artificial scarcity conditions which pushed up the prices. I am glad to state that the old policy has been abandoned, and the policy of expanding markets and lowering down cost of production by increasing production and rationalisation and modernisation of jute mills equipments has been adopted.

"Essentially bound up with the issue of production is the question of exports. Exports are the mainstay of the jute industry. There was a slight fall in the quantity of hessian export but the export of sacking registered an appreciable rise in 1954 as compared to exports in 1953. There was on the whole an improvement in the value and on the volume of jute goods exports. As a consequence of higher exports the position of stocks of jute goods remained satisfactory throughout the year. From all accounts to hand, it appears to me that the present demand for jute goods would continue."

Discussing the question of a futures market for jute and jute goods Mr. Kanoria went on: "The question of having a well-regulated and properly constituted futures markets has been before the trade and industry for a long time. This question, however, assumed special significance after the cessation of the futures operations in the East India Jute and Hessian Exchange Ltd. in December 1952. The jute and jute goods trades have been feeling the want of proper hedging facilities which are not available at present. The Jute Enquiry Commission appointed by the Government of India went into this question and have recommended the bringing into existence of a well regulated futures market. The Government of India have also accepted this suggestion.

"The Indian Jute Mills Association on the suggestion of the Government of India have taken initiative in the matter and a sub-committee, which includes a representative of our Association, has been appointed to draft a definite scheme and put it before the Government for approval."

Mr. Kanoria said about the dealers in the trade: "I am sorry to say that there is at present a tendency to concentrate the various branches of this important trade under a single control. After carefully examining the question, I feel that the elimination of established channels of business, apart from creating unemployment and disconcert with the services of dealers or middlemen. The all a useful function to perform. These middlemen not only invest their money, but also help in diffusing the risks attendant on business and place at the disposal of the parties concerned, their accumulated experience and the organisation that they have built up over a number of years. The prosperity of the jute industry and the trade as a whole has been due to the mutual co-operation of the various sections of the trade and the industry."

Turning to the problem of grouping Mr. Kanoria said: "Our Association has started the system of grouping the sacking production of jute mills.

This is done on the basis of the reports received by the Association as well as through the shippers from consumers all over the world. It is a matter of satisfaction to find that the important users in the world in making their purchases are now relying on the grouping done by this Association. The Association has in mind the application of mechanical test also to determine the quality of bags."

Mr. Kanoria commented on the future of the jute industry: "I feel that in spite of the fact that due to the partition, the production of raw jute is no longer a monopoly of the country, and that our industry has now to face competition from various sources, there is no reason to adopt a pessimistic attitude about the future of this industry and the jute goods trade."

THE FOREIGN JUTE MARKETS

DEPRESSION CONTINUES

(FROM OUR DUNDEE CORRESPONDENT)

BUSINESS in the jute markets here has continued quiet and the volume of orders that have been placed with both spinners and manufacturers since the reduction in prices on 9th June is rather disappointing. Though buyers are quite well aware that values are under revision and likely to be increased to compensate producers for the additional costs of spinning and weaving, they are very reluctant to place business for delivery any distance ahead. Those spinners and manufacturers who had been compelled to curtail output by paying off workers have been unable to take them on again and those who were on short time have not increased their working hours again. The recent business done has only prevented any extension of the curtailment movement. Continental spinners have now been more or less satisfied with their purchases of old crop jute, for which they were paying a few pounds a ton over the minima. Now that the position is quieter there are free sellers offering both old and new crop jute, and good marks at that, at the minimum prices ruling in Pakistan. Mill Firsts are quoted at £90 and Mill Lightnings at £80, crack Daissee-2/3 at £90 and grade at £80, crack Tossa-2/3 at £110 and grade at £99, with fours at £100 and £89 respectively, all cif. U.K. Dundee spinners are doing very little, apart from picking up an off parcel or two ex-warehouse at prices usually under the shipment quotations.

Calcutta goods are fluctuating more meantime due to speculative operations and the market is firmer again at 69s 6d for 10oz 40in. Hessians and 51s 9d for 7½oz. June and also July-September, and 67s 9d and 51s 3d October-December, with "B" twills 175s 9d, 175s and 168s 6d for the various positions of shipment, and Liverpool at 20s for July, all f.o.b. Calcutta. The general opinion of the industry is that prices will show little or no change over the next several months. It all depends upon Pakistan's ability to finance the crop when arrivals are at their heaviest around October-November. Dundee and district engineers have booked large orders for jute machinery for the new Platinum Jubilee jute mills in Pakistan and Government sponsored jute works in Turkey. Urquhart Lindsay & Robertson Orchar, Ltd., Thos. C. Keay, Ltd., Dundee, James F. Low & Co., Ltd., Monifeth, and Douglas Fraser & Sons, Ltd., Arboath, all of Angus, will supply the looms and ancillary machinery, and James Mackie & Sons, Ltd., Belfast, will give the preparing and spinning machinery.

WHOLESALE PRICE INDEX RISES

THE Official wholesale price index (base: year ended August, 1939=100) showed a slight advance of 0.1 percent to 341.0 during the week ended 11th June 1955 as compared with 340.6 for the previous week. Relative to the corresponding weeks of the last month and a year ago, the index was lower by 0.4 and 10.8 percent respectively. The index for Foodstuffs rose by 0.2 percent to 277.3 due to advances in the prices of dal arhar (+7%), gram (+6%), jowar and salt (+4% each), wheat (+3%), gur at Muzaffarnagar and bajra (+2% each) and rice at Calcutta, coffee and sugar (+1% each). Quotations for tea for internal consumption, however, reappeared at a lower level (-20%). The Industrial Raw Materials index also advanced by 1.6 percent to 392.2 as against 386.2 (revised) for the earlier week. The noticeable fluctuations in this group were in respect of prices of gingellyseed at Jhansi (+15%), manganese ore (average export prices) (+6%), castorseed at Bombay (+5%), cottonseed at Amravati (+4%), raw jute—Firsts and Lightnings—and rapeseed (+3% each), raw cotton groundnuts, linseed and lac (+2% each), raw jute, Jat Middles (-2%) and copra (-1%). In the case of Semi-Manufactures the prices of cowhides and gingelly oil (-11% each) mustard oil at Patna (-2%) and sheep skins, mustard oil at Calcutta and copper at Calcutta (-1% each) showed declines while coconut oil at Bombay (+5%), castor oil at Madras (+4%) mustard oil at Kanpur and linseed oil (+3% each) and groundnut oil (+1%) were marked up and as a result the group index receded by 0.5 percent to 329.1 as compared with 330.9 (revised) a week ago. The Manufactures group moved down further by 0.2 percent to 370.3 due to decreases in the price of cotton manufactures and glass (-1% each) despite an increase in the prices of jute manufactures by 2 percent. Declines in the prices of betelnuts (-7%), chillies at Patna (-6%), turmeric at Calcutta and bricks and tiles (-3% each) and black pepper at Cochin (-2%) brought down the Miscellaneous group index by 1.5 percent to 566.2.

PACKING CHARGES FOR CEMENT

On 27th March, 1954, the Government of India announced that packing charges for cement would be fixed every quarter on the basis of the average of the maximum and minimum market price for packing material during each week of the immediately preceding nine months plus Rs. 1-4 a ton to cover incidental charges. On this basis, packing charges for the current quarter were fixed at Rs. 1-4 1/4 a ton. The packing charges for the next quarter commencing from 1st July 1955 work out at Rs. 14-4 a ton. The Government of the revised formed all the State Governments of the revised packing charges. The above packing charges are applicable to cement packed in new bags only. Packing charges for cement packed in old bags will be a matter for settlement between the buyer and the seller subject to the maximum indicated above.

A Bombay section of the Chartered Institute of Secretaries India Association was unanimously formed at a general meeting of members and registered students on 27th May, 1955. The Chartered Institute of Secretaries India Association was founded in Calcutta in 1951. Although nominally intended to cover the whole country, in practice its activities were largely restricted to Calcutta. Now a Bombay section has been formed and in due course it is hoped that other sections will be formed in Madras and Delhi so that the India Association will indeed have an all India coverage.

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA

(Base: August, 1939)

THE Middle Class Cost of Living Indices, by groups, have now been brought up to May, 1955. As compared with April, the May Index for Food reveals a rise of 3 points, while those for Clothing, Miscellaneous and Fuel and Lighting remain unchanged at 494, 282 and 239 points, respectively. Combining all the factors, the Middle Class Cost of Living Index for Calcutta shows that the cost of living rose by 2 points during May, 1955.

GOVERNMENT OF INDIA

NATIONAL PLAN BONDS—SECOND SERIES

(3½% 1965).

LIMITED TO Rs. 100 CRORES (Approximately)

Rate of Interest 3½ per cent. per annum payable half-yearly on 1st January and 1st July.

Repayable on 1st July, 1965. Opening on 1st July, 1955 and Closing on 5th July, 1955 or earlier without notice.

Issue Price Rs. 98-8-0 per Rs. 100 (Nominal). Subscriptions will be received in the form of (i) Cash or (ii) 2½ per cent. Loan 1955, or (iii) 4½ per cent. Loan 1955-60 which will be accepted at Rs. 100 for every Rs. 100 (Nominal) tendered for conversion.

Interest will be paid on the 2½ per cent. Loan 1955 and 4½ per cent. Loan 1955-60 tendered for conversion up to and including 30th June, 1955.

Applications will be received at the offices of the Reserve Bank of India at Bombay, Calcutta, Delhi, Madras and Bangalore, at the branches of the Imperial Bank of India at other places in India except in the States of Hyderabad and Mysore, at the branches of the Hyderabad State Bank in Hyderabad State and at the branches of the Bank of Mysore Ltd. in Mysore State.

For full particulars apply to any of these offices, branches or treasuries.

Company Meeting

THE GANGA SUGAR CORPORATION LIMITED

Speech of R. B. Lala Isher Das Sawhney, Chairman, The Ganga Sugar Corporation Ltd., delivered at the 22nd Annual Ordinary General Meeting of the Shareholders of the Company held on 13th June, 1955 at its Registered Office.

Gentlemen,

I have great pleasure in offering you a hearty welcome to this meeting. I presume you have studied the annual accounts and the Profit and Loss statement submitted to you for the year ended 31st March, 1955. It is my privilege to point out to you that the Company has, ever since its inception, shown very satisfactory results. Since 1939, the Company has paid at an average, about 15.25% as dividend per annum. This is in spite of the fact that dividends were controlled for six years during the last great war and for those six years, our average declaration amounted to only 10% a year. In addition, we have been able to make substantial grants of bonus shares. The General Reserve of the Company now stands at Rs. 16 lacs against the paid up Capital of Rs. 30 lacs. This is a record of which any Public Company may well be proud.

The phenomenal success of the Company has not induced your Directors to rest on their oars. Instead, they have tried for and succeeded in securing the permission of the Government of India to increase the capacity of the Mills. Negotiations for the additional machinery required for the purpose have been completed. This will entail expenditure of a large amount of money about which your Directors are making suitable arrangements. One of the measures to be adopted will be the issue of fresh capital which will be offered in the first instance, to the present shareholders. It would be open to a shareholder to adjust the dividend that would be declared today to which he may be entitled towards calls for share allotted to him. The increase in dividend should enable the members to contribute liberally to the new issue. It is hoped that there would be good response from the shareholders and the Public to the proposed capital which will be issued shortly by the Directors.

These extensions have been necessitated by the large increase in cultivation of sugarcane in the reserved areas of the Mills and it is hoped that we shall have more than sufficient cane for increased capacity in the future. Increase in production will reduce the cost of production by lowering the overhead charges.

I am glad to bring it to the notice of the shareholders that recovery of sugar from cane in our case has almost invariably been higher than that of other mills in the Meerut division, and we hope to maintain our lead in this respect in future also.

Ship, Marine, General Engineering and Foundry work of all descriptions is undertaken at competitive rates at the RAJABAGAN DOCKYARD

S. T. SADASIVAN
General Manager

The production of sugar in the country in the current season has beaten all past records, being 16 lac tons. The target for the second Five Year Plan is twenty lac tons which I believe will be reached well ahead of the time fixed. Whether consumption also keeps pace with increased production is a matter on which I am reluctant to express any opinion. Much depends on the price of gur which is a serious competitor with the Mill-produced sugar. Whenever there is much disparity between the price of gur and that of sugar, gur beats down sugar in consumption, leading to very dull conditions for sugar in the market. It, therefore, seems necessary that the price of factory-made sugar should be fixed on a competitive basis. This can be done only if the price of cane which represents about 66% of the cost of production of sugar is not unreasonably high. Unfortunately, considerations other than economical have, in recent years, influenced Government to fix a disproportionately high price for cane. This must not be in the future, if the objective is that there should be greater consumption of sugar to cover increased production.

I venture to suggest that the policy of the Government should be directed not only to make the country self-sufficient in the matter of production of sugar but also to take measures for reducing its cost of production with a view not only to help its increased consumption in the country but also to facilitate export. This is practicable if adequate measures are adopted for development of the right varieties of cane in the country to increase the yield per acre as also the recovery from cane. Concessional freight to ports and the grant of a suitable subsidy on exported sugar are obviously indicated. Government has recently increased the excise duty by 50%. If the increased revenue from enhanced excise duty is utilised in subsidising exports there is no reason why India should be able to sell sugar on a competitive basis at least in our neighbouring countries.

Licences have recently been granted for the setting up of new factories in the country in case of which, especially those to be located in the North, the cost of production will unfortunately be positively high even if only normal depreciation is written off in the Profit and Loss account. It is very doubtful if these newly licensed factories will, in a majority of cases, be able to distribute any dividends for quite a number of years. This might have a depressing effect on the industry. The right course for the Government to adopt for a rational development of the industry seems to be to adopt measures for increasing the yield per acre, propagation of varieties with higher sucrose contents and reduction in the price of sugarcane so as to bring down the cost of production. Instead of granting licenses for installation of new factories, the policy should be to encourage existing factories to expand their capacity wherever it is possible, to the fullest extent. These measures are urgently called for in the interest of the country.

Excise duty on sugar has been raised by 50% in the last budget. Circumstances did not, in my opinion, justify this heavy increase, but if increased receipt from excise imposition are utilised in subsidising export, the industry can then have no legitimate grievance.

Gentlemen, you know that fundamental changes have been made in the new Company's Bill which will come up for discussion before the Parliament during its next session. This bill has given rise to great controversy. As far as its provisions are meant to restrict malpractices on the part of those who, as trustees, have to manage the funds invested by shareholders, there can be no legitimate grievance against the limitations proposed; but to condemn wholesale a system of management under which large industrial development has taken place, is neither fair nor in the best interests of the country. What effect these fundamental changes, if finally adopted, will have on the industrial development of the country is yet to be seen. I, however, hope that the law as it is finally passed, will not be such as will retard rapid industrialisation of the country which is the aim of us all. To say that private enterprise has still got a large part to play in organising the industrial development of the Country and at the same time to deal with it in a spirit of utter lack of confidence will naturally have the effect opposite to that which is intended.

Now I shall call upon the shareholders to put any questions in regard to the working of the factory that they may like to do.

I once more thank you all for taking the trouble of attending this meeting.

Calcutta Markets

VERY STRONG DEMAND IN TEA EXPORT AUCTION

PRICES OF MOST GRADES HIGHER

AT Sale No. 4, held on 27th and 28th June, offerings in the Export auction consisted of 19,800 packages and included a number of bright liquoring Assam and some fair Darjeelings. There was a very strong and general demand and prices for most teas advanced by 3 to 4 annas a lb. Medium Assam Broken were from 3 to 6 annas dearer according to quality, while stylish BPS' were keenly sought after and were from 6 to 8 annas above last rates. Tippy BOP's met with particularly good demand and sold at high rates. Flavoury Darjeelings with attractive leaf appearance sold well but the more ordinary kinds were rather irregular and demand for these was not very strong. CTC's were in strong demand but brown-leaved Doars teas met with only fair competition.

Quotations.	1955 Rs.	1954 Rs.
Clean Black Pekoe	2 12 0 to 2 14 0	
Plain Broken Pekoe	2 1 6 to 2 2 6	2 7 3
Medium Assam B.P.	2 5 0 to 2 6 0	
Best C.T.C. Assam B.P.	2 12 0 to 2 13 0	

As regards the Internal auction, due to insufficient quantities no Dust Sale was held this week. The next Sale will be No. 5 which will be held on 5th July, 1955.

Offerings of other grades consisted of 700 packages of new season's teas and 100 packages of old season's teas. There was a strong general demand and prices advanced by about 2 to 4 annas a lb. No quotations can be given.

FIRM TONE IN FREIGHT MARKETS

THE market remains firm with a good all-round enquiry. American coal orders continue and fixtures are reported from Hampton Roads to Japan, South America, Mediterranean and Continental destinations and further orders are still available. The grain trades were on the whole quiet but tonnage was reported fixed from St. Lawrence to Belfast at 75s and from Northern Range to the same port at 78s 9d. There are enquiries from the Gulf to Japan and Brazil but no fixtures reported so far. Australian charterers are in the market for tonnage to the U.K. for all positions up to September end. There have been two fixtures of ore from India to Japan. Masulipatam was fixed at 90s 6d for a 9,000 tonner for July shipment and the other fixture was from Kakinada at 87s 6d for a 9,500 tonner also July shipment. There are still some enquiries outstanding for ore shipment to Japan. The Time Charter market remains quiet although rates are well maintained.

SUGAR MARKET

During the week ended 29th June, sales in the Calcutta sugar market averaged 2,500 bags a day. Arrivals were 2,000 bags daily and stocks totalled 400,000 bags. Rates for ready sugar ex-Kantapur delivery were Rs. 30-2 for ordinary grain and Rs. 31-12 for big grain. The same rates were quoted for both the grades of forward delivery sugar. Ex-mill delivery rates for standard grades of sugar ranged from Rs. 28-2 to Rs. 29-14 a maund. The market business was small.

LINSEED

Very firm conditions prevailed throughout the past week, and there was an appreciable advance in prices whilst supplies fell short of demand. Upcountry centres firmed up and supplies were not forthcoming as expected; forward delivery was at a premium and ready goods were changing hands daily at increased rates. Crushers were showing a keen interest, but activity was limited. Trading in the oil section was fairly keen with buyers interested mainly in early delivery; crushers, with export sales on hand mostly up to July delivery, were reserved except at attractive prices. Latest quotations were as follows: June-July Rs. 17-12 a maund; August Rs. 18 a maund.

SHELLAC MARKET QUIET

During the week ended 28th June, the Market was steady at the beginning, firm at midweek, and quiet at the end. The range of quotations was as follows.

Pure Buttonlac	Rs. 138; 141 buyers; 140 value.
Lemon No. 1 Shellac	Rs. 143-8; 146; 142 buyers.
Lemon No. 2 Shellac	Rs. 140 done; 140-8; 136 buyers.
F. O. Std. 1 Shellac	Rs. 132; 135 done; 131 buyers.
Pure TN Shellac	Rs. 125; 128 basis done and buyers; 126 buyers.
4% I. T. N. Shellac	Rs. 118-8 to 120 buyers.
No. 1 Kusmi Seedlac	Rs. 137 value; 138 buyers; 137-8 value.
No. 2 Kusmi Seedlac	Rs. 129; 132-8 buyers; 131 value.
Fine Bysaky Seedlac (Manbhum)	Rs. 127; 130 done and buyers; 127 buyers.
Fine Bysaky Seedlac (C. P.)	Rs. 122-8; 125; 124 buyers.
Ordinary Bysaky Seedlac (C. P.) under 5%	Rs. 118-8; 121; 119 buyers.
Ordinary Bysaky Seedlac (C. P.)	Rs. 56 to 58 buyers.
Kireelac	Rs. 113-8; 115-8; 114 buyers.

COMPANY AND PUBLIC NOTICES

THE BIRLA JUTE MANUFACTURING CO., LIMITED.

NOTICE is hereby given that the Annual Ordinary General Meeting of the Shareholders of the Company will be held at the Principal Office of the Company, No. 8, Royal Exchange Place, Calcutta, on Wednesday, the 27th July, 1955 at 3-30 p.m. for the following purposes:—

- (1) To receive and consider the Report of the Directors and to pass the audited accounts of the Company for the year ended 31st March, 1955
- (2) To declare dividends on Preference and Ordinary Shares.
- (3) To elect Directors in place of those retiring by rotation.

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends.

In the vast and growing electrification of India Nicco's part has indeed been a vital one. Today Nicco Wires & Cables are at work in every corner of our country, carrying power and still more power for her diverse needs. Proved best by every technical test Nicco products are eagerly sought after everywhere by discriminating engineers, builders and architects.

NICCO PRODUCES

Bare Copper Conductors—Solid & Stranded.
Annealed Tinned Copper Binding and Fuse Wires.
A. C. S. R. and All Aluminium Conductors.
V. I. R. Insulated Cables and Flexibles. Motor Car Ignition Cables. Bell and Telephone Wires. Aerial Cables. Enamelled Copper Wires (Oil-base and Synthetic base) etc. etc.

JESSOP & CO. LTD.
ENGINEERS

CALCUTTA-I.

One of an order for 250 Broad Gauge Petrol Tank Wagons for the Railway Board, Government of India, 1954-55 Programme.

Jessop Sluice Gates in the course of erection at the Durgapur Barrage of the Damodar Valley Corporation. On the left are five under sluices each 60x18 ft., followed by six of the twenty-four weir gates each 60x16 ft. At the further end there will be five under sluices each 60x19 ft. The 10 ton Erection Crane designed and built specially for this contract can be seen at the right.

Jessop
Electric
Level
Luffing
Wharf
Cranes

One of twenty-four cranes for Alexandra Dock, Bombay. Capacity 3 tons at 63 ft. radius shown erected for test in our Dum Dum Works.

One of four cranes erected at Ballard Pier, Bombay. Capacity 3 tons at 75 ft. radius.

Operating Speeds: Hoist—275 ft./min. Luff—150 ft./min.

Travel—50 ft./min. Slew—1.25 revs./min.

The contract also includes six 6 ton cranes for Alexandra Dock.

ACC Cement
helps to build a better India

MASSIVE dams, huge housing projects, trunk roads, factories, hospitals, hygienic dairies and community development schemes... all these are of national importance and are built with cement concrete, the building material of today. Every year millions of bags of ACC Cement help to build a better India. In its 13 factories spread all over India, the ACC's expert chemists carefully check every stage of production. This uniformly high quality product is made available to you through a network of sales offices, stockists and dealers. And the ACC's technical organisation, The Concrete Association of India, is always ready to offer you expert advice FREE of any charge or obligation.

★ The A.C.C.'s new Sindri Factory which will go into production in the third quarter of this year will be a long step forward in meeting the growing demand for cement in Bengal and Bihar.

EXPANDING STEEL MAKING IN INDIA

• By R. N. KAPUR •

ONE of the momentous decisions recently taken by the Government of India, which will have far fetched effects on the industrial advancement of the country, is that to raise India's steel production capacity to six million ingot tons per annum by the end of the second five year plan. It is undoubtedly an ambitious target for a country whose progress in steel production has not been galloping in the past. The foundation of this industry was laid down, as far back as in 1907 when the Tata Iron & Steel Co. Ltd. was formed. The first Indian steel ingot was cast in 1912 and after 42 years' growth it has only been able to achieve a record output of 1.26 million tons of finished steel equivalent to approximately 1.65 million ingot tons in 1954. The real progress has in fact been made during the 15-year period commencing in 1939 when the output of finished steel was recorded at 0.84 million tons, equivalent to approximately 1.1 million ingot tons. In other words, steel production in 1954 increased to about 150 percent of what it was in 1939, the average increase over the period being only 26.2 percent. This slow but steady progress may give rise to various misgivings regarding the fulfilment of the target set by the Indian Government within the stipulated period and in fact many have denounced the second steel plan as completely impracticable, too optimistic and one born out of over enthusiasm to produce spectacular results. It is asserted that steel production is not an end in itself. There are many more important factors geared to it and until a comprehensive overall plan is drawn up which takes into consideration the many facets of development, natural and basic, not only for the manufacture of steel but also for its utilisation and consumption, it may prove to be an abortive attempt in the rapid industrialisation of the country.

Survey of the Existing Industry

The position at present is that India does not produce sufficient steel to meet her needs. There are three major producers of steel of which the Tata Iron & Steel Company is the largest, indeed until 1936 the history of the growth of the steel industry in India was largely the history of the Tata Iron & Steel Co. The Steel Corporation of Bengal, the second large steel producing unit, was formed in 1936 and started production of steel in 1939. This company has now been merged with the Indian Iron & Steel Co. Ltd. The third plant, which also produces steel from the ore stage, is the Mysore Iron and Steel Works, which started the production of pig iron in 1923; a small steel plant was added in 1936 for an output of 25,000 tons of finished steel per annum.

The present annual capacity of each of the three integrated plant is as follows:—

	Crude Steel (ingot)	Finished Steel.
Tata Iron & Steel Co. Ltd.	1,100,000	780,000
Indian Iron & Steel Co. Ltd.	500,000	350,000
Mysore Iron & Steel Wks.	34,500	27,000
Total	1,634,500	1,157,000

Both the Indian Iron & Steel Company Ltd., and the Mysore Iron & Steel Works have further unutilised mill capacity which has not been taken into account in the above figures.

The Need for Expansion

The need for the expansion of India's steel industry had long been recognised and the plant of the Steel Corporation of Bengal was designed and laid out for a planned expansion to one million ingot tons capacity. Tata's plan was also to expand the capacity of the plant along with a scheme for rehabilitation and modernisation necessitated due to heavy wear and tear during World War II. The Government of India was also alive to the importance of the rapid development of the steel industry in the country, and with this end in view a Major Panel for the Iron and Steel Industry was set up in 1946. Later three firms of foreign consultants were invited to report upon the establishment of two integrated steel works as recommended by the Major Panel and to examine the expansion schemes of the existing major producers. The recommendations made by the

three firms of consultants formed the basis for the expansion schemes now under contemplation and execution, with modifications considered necessary in the light of the various studies and reports submitted by several other foreign teams of experts visiting India at the invitation of the Government from time to time. The last visit was that of the British Steel Mission in April 1955.

Although the Government had high hopes of rapidly expanding steel capacity, no material progress could be made in this direction due to paucity of finance and this necessitated the side-tracking of the major expansion of the steel industry even in the first five year plan as prepared by the Planning Commission in 1951. Only the execution of the development plans of the existing producers was taken into consideration and provision was made for the establishment of a State-owned integrated unit within the period of the first plan as, according to the policy of the Government of India enunciated in 1948, any new undertakings in the Iron & Steel industry must be state owned. According to the first five year plan the finished steel output should reach 1,650,000 tons by 1957-58. Since then a second five year plan has been formulated incorporating the Government's decision to raise the finished steel output to 4.5 million tons—equivalent to six million ingot tons per annum—by the end of the second plan in 1960-61, and targets of 10, 15 and 20 million tons by the end of the successive five year plans.

Events of 1954

The year 1953 will come to be considered an epoch-making one in the history of the steel industry in India because of the feverish activity and major decisions concerning the expansion of the steel industry both in the private and the public sectors. The Steel Corporation of Bengal was merged with the Indian Iron and Steel Company as from 1st January, 1953. The Company's Morgan continuous sheet bar and billet mill and a new boiler plant came into operation in that year as a part of the expansion programme. Loan arrangements with the International Bank for Reconstruction and Development and the Government of India to finance the Rs. 35-crore expansions were finalised. Tata Company's Rs. 42-crore programme of modernisation and expansion progressed considerably and a new coke oven battery was brought into operation.

The Government of India invited two experts from the World Bank to bring the calculations submitted by the three firms of consultants up to date. The major decision in the public sector was the Government of India signing an agreement with the German combine Krupp-Demag A.G. in August 1953, to plan a steel work at Rourkela in Orissa. A company—the Hindustan Steel Company—has been formed to implement the agreement. The programme of this company will be confined to the manufacture of flat products, mainly plates and strip, both hot and cold rolled. Originally the capacity was to have been 500,000 tons of ingots but it has now been definitely decided to raise it to one million ingot tons.

It is only recently that the existing units have been encouraged to undertake expansion to the fullest extent and to this end assistance in financial and other forms has been promised to enable them to implement their schemes. The Government is also believed to have accepted the principle of assisting the development programme of the steel manufacturers through the ploughing back of the extra profits accruing to them from the increase recently given in the retention prices fixed by the Tariff Commission in 1953. The producers will have to enter into agreements giving unequivocal guarantees that such profits will not be distributed to the shareholders or to the managing agents, but will be used exclusively for financing development plans. A special element of depreciation earmarked for rehabilitation and modernisation of the plant and machinery employed in the steel industry has, since 1952, been allowed by the Tariff Commission, which recommends to the Government the level of retention prices of steel to be paid to the producers.

Planned Capacity

The present extension programmes undertaken by the three major producers of steel will step up their installed capacity before 1958 to targets given below:—

	Annual ingot tonnage	Annual finished Steel tonnage.
Tata Iron & Steel Co. Ltd.	4,344,000	931,000
Indian Iron & Steel Co. Ltd.	870,000	700,000
Mysore Iron & Steel Wks.	34,500	27,000
Total	2,248,500	1,658,000

A melting shop in operation

yes, it is my plan !

Lights will be switched on in a thousand villages. Handlooms, lathes will hum and spin. Every small community will become the hub of a growing village industry. There will be work for everyone. The Five Year Plan provides for Rs. 127 crores to be spent on developing and adding to our power resources. Multi-purpose hydro-electric schemes will supply cheap power to industry. Here is proof of a nation's determination to take its place amongst the leaders of the world.

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

THE TATA IRON AND STEEL COMPANY LIMITED

WALCHANDNAGAR INDUSTRIES LIMITED

ARE THE SOLE LICENSEES IN INDIA FOR THE MANUFACTURE OF

WEBRE CIRCULATORS

These Circulators manufactured by us in India are now operating on all massecuites.

OUTSTANDING ADVANTAGES:

- (1) SIMPLE AND ACCURATE CONTROL
- (2) FASTER OPERATION
- (3) LESS HEAT INJURY
- (4) BETTER SUGAR
- (5) LOWER MOLASSES

We also manufacture other special and improved type of Sugar Machinery as Webre Pans, Webre Evaporators, Magma Pumps, Jet Condensers, Sulphur Burners, High Velocity Juice Heaters, Car Spotters.

For particulars write to :

WALCHANDNAGAR INDUSTRIES LTD.,
POST WALCHANDNAGAR, DIST. POONA.

The total steel available in the country for consumption during the last 16 years has been as follows:

	From indigenous Production.	From Imports	Total
1939 Tons	842,905	—	—
1940	1,033,784	—	—
1941	1,137,650	—	—
1942	1,070,636	179,982	1,250,618
1943	1,166,204	320,063	1,486,267
1944	1,084,717	334,084	1,418,801
1945	1,141,363	326,327	1,467,690
1946	997,453	118,144	1,115,597
1947	974,536	124,272	1,098,808
1948	953,876	194,085	1,147,961
1949	1,029,131	396,244	1,425,375
1950	1,042,709	283,053	1,325,762
1951	1,112,333	177,420	1,289,753
1952	1,134,191	196,261	1,330,452
1953	1,053,565	247,511	1,301,076
1954	1,255,580	387,401	1,642,981

Steel has never been considered a surplus commodity in India, and it has not been possible to assess the demand accurately. On general grounds, however, it may be assumed that a saturation point will not be reached within any reasonably foreseeable future. The shortage of steel has always been a deterrent to the establishment and growth of a large number of light and heavy engineering industries which are considered not only desirable but vitally essential to the development of the country. There is thus an ever-expanding unsatisfied demand for steel in India.

The steel industry at present covers a range of rolled products. But hot rolled strip, cold rolled strip, skelp and tubes, broad and parallel flange beams, stainless steel sheets and bars and certain other categories of tool and alloy steels, have to be imported. Our imports are, however, not restricted to categories we do not produce at present, as can be seen from the table marked (XX).

The statistics quoted in the attached table (XX) do not include the tonnages of steel coming into the country in forms other than rolled-steel products. They constitute the bulk of the merchandise imported under the category of plant and machinery, tools and implements, fittings and appliances, ships, locomotives, wagons, coaches, motor cars, bicycles and a number of other miscellaneous articles down to pins and needles. Lack of steel of the proper quality and in adequate quantity has been one of the reasons preventing the establishment of industries to manufacture these goods.

Two more Steel Plants

In order to achieve the objective of the production of six million tons of ingot steel the Government has planned to establish, in addition to the Rourkela plant, two more plants of one million ingot ton capacity each. One of these is to be built at Bhilai in Madhya Pradesh and the other, it is believed, at either Durgapur in West Bengal or Bermo in Bihar. In all probability it will be Durgapur. The Bhilai plant is being established with the technical and financial support of the Russian Government and the Durgapur plant will be set up under British patronage—technical and financial. It has also been decided to raise the Tata Company's capacity to two

million tons, and that of the Indian Iron & Steel Company to one million tons. The Mysore plant's steel production has to be stepped up to 100,000 tons of finished steel. The position in short will be:—

	1.5 million tons finished Steel
Tatas	0.8
IISCO.	0.1
Mysore	0.72
Rourkela	0.75
Bhilai	0.75
Durgapur	0.75
Total	4.62

The above figures include semis to the extent of 700,000 tons to be supplied to the re-rollers to roll into about 560,000 tons of finished steel products.

As already stated, it is well-nigh impossible accurately to assess and forecast the pattern of demand in the country during the next ten years, but taking the trend of the present and future requirements of the consuming interests, the break-up has been worked out to be approximately as shown in the table marked (YY) in comparison with the total steel available in the country in 1954. In planning the products for the new plants, the established capacity, or the capacity now being installed at the existing works, will have to be taken into consideration so that there is no overlapping. Gigantic though it looks, it is not utterly impossible to complete the erection of all the new units and enlarge the existing ones within the stipulated period so as to start production in 1960-61 at the six million

TABLE NO. (YY)

Products.	Estimated Demand in 1962	By Production	Available in 1954. By Imports	Total
Heavy Rails & Fish Plates & Heavy Structural	750,000	206,261	42,883	249,144

*Not available.

ingot ton rate, if certain conditions are fulfilled. These conditions relate to the supply of raw materials, refractories, technical personnel, and capacity to fabricate the plant components in India for erection.

Raw Materials

Enormous reserves of exceedingly high grade iron ore and adequate reserves of coking coal are factors very much in favour of the development of India's steel industry to a level ranking high in the world. If Japan can establish a huge steel industry (eight million ingot tons) with very few raw materials of her own and dependent on imports even from India and the U.S.A., it is only natural to conclude that it is possible and worthwhile for India to develop and have as large an industry as Japan. But many difficulties lie in way. The necessary mines have to be surveyed and developed, mechanised where necessary, washeries for coking coal have to be installed, townships have to be built, water supplies have to be ensured and last but not least the communication and transport systems have to be improved. Even the land acquisition takes time and months are wasted in legal formalities. Then it is the question of the mining machinery which is neither manufactured in India nor otherwise easily available locally. The estimated requirement of raw materials for an output of six million tons of steel would be approximately as per details given below:—

	10-11 million tons.
Iron ore	8.35
Coking coal	1.35
Steam coal	3.5
Limestone	0.5
Dolomite	0.3
Manganese ore	0.1
Ferro alloys, etc.	—

Total 24-25

With the probable exception of the Bhilai plant, the rest of the steel works will draw their supplies of raw materials practically from the same sources. The danger of a scramble for supplies is to be foreseen and provided against. An important point for consideration in this connection is the necessity of revising the railway-freight structure so that the essential raw materials such as limestone and coal can be brought to the centres of consumption from distant places and alternate sources of supply can be developed.

Refractories

For any expansion in steel capacity a simultaneous expansion in the refractory manufacturing capacity is extremely vital. There is dearth of suitable raw materials for the manufacture of refractories because India is as fortunate in this respect, as she is with other raw materials for the steel industry. But here again the problem is how soon can these resources be mobilised, as possession of raw materials is only half the battle. The replacement requirements of the steel works, for the main items of refractories, namely, silica, magnesite, chrome magnesite and fire bricks is estimated at about 155 lbs. an ingot ton of steel, or about 210 lbs. a ton of finished steel. The constructional requirements of refractories are of the order of 0.15 million ton for each one

PUT **DRIVE** INTO YOUR INDUSTRY...

WITH **DUNLOP** BELTING

THE DUNLOP RUBBER CO. (INDIA) LTD.

DRAX 11

Conveyor Belting: Frictioned with highest grade rubber compound, jacket-ply skim-coated for high cover adhesion; covers of a rubber compound giving high tensile strength.

V-Belt: With its continuous spiral cable cord construction, the Dunlop V-Belt ensures a long and trouble free life even under the most arduous service conditions.

Transmission Belting: 'Square Edge': specially constructed from hard type closely woven fabric (silver-duck) and skim-coated between the plies. Hence Dunlop Transmission Belting is practically immune from edge wear, ideal both for high-speed drives subject to severe flexing and heavy drives requiring shock load resistance.

NATIONAL PROSPERITY NEEDS...

more dams for power and irrigation, more schools and colleges for education, more hospitals and clinics to maintain better health, more buildings, both private and public for better living. We make a basic contribution to National prosperity by supplying Cement—a vital need in the Five-Year Plan.

million ingot ton plant. Besides providing for the construction needs of the steel industry, the refractory industry would have to have sufficient capacity developed in respect of the replacement requirements of steel works alone to the extent of 400,000 tons per annum. Replacement requirements of the steel works may be taken to represent 70-75 percent of the total requirement of the country and on this basis the country's potential refractory capacity would have to be stepped up to approximately 600,000 tons per annum by the year 1961-62. Meanwhile, constructional requirements of the order of 600,000 tons would be needed over a period of about three years from 1956-57 onwards if the expansion schemes are to materialise according to schedule. Special attention would have to be given to the manufacture of silica and magnesite bricks which are indispensable requisites for the metallurgy of iron and steel. The present installed capacity of the refractory industry is in the neighbourhood of 325,000 tons per annum, most of which is utilised for the manufacture of fire bricks.

Adequate transport facilities will have to be developed to cope with the movement of constructional requirements of the steel works' expansion schemes in the first instance and later on for the raw materials and the finished products of the steel works. Each ton of finished steel requires the movement of about six tons of raw materials including fuel and other ancillary stores. This would mean the employment of approximately 1,000 wagons a day. The exact total requirement of rolling stock would depend upon the locations of the plants in relation to the sources of supply of raw materials and the destinations of the finished materials which would influence the turn round of wagons and would require a very close study. The line capacity would have to be augmented specially in the area from which three or more steel plants would procure their requirements of raw materials such as iron ore, limestone and coal.

Technical Personnel

Technical personnel of the superior type so vitally necessary for the efficient working of steel plants has always been in short supply in India. There is no dearth of qualified engineers and metallurgists, but they are without the necessary experience. The existing steel plants solved their problem of technical personnel partly by recruitment in foreign countries and further, by instituting their own schemes of training over a long period. It takes a long time even for the qualified technical men to gain the experience to rank amongst experts. It would be, therefore, necessary for the Government to embark upon a steel works' staff trainees' scheme straight away rather than denude the present steel plants of their experienced technical personnel, even of their works' staff trainees' scheme should be planned from the lower ranks. Recruitment for the steel works' staff trainees' scheme should be planned on the regular service lines and each year a batch

Coke ovens at IISCO works

of 50 to 60 qualified young men, selected on merit, should be deputed to the existing works under the guidance of experienced supervisors for general and specialised training. They should later on be sent abroad, preferably to the countries of the suppliers of the plant and machinery, for further intensive specialised training on their own plants or those belonging to their associates. These persons would be employed after their training under the foreign technicians in charge of the Indian plants. After a reasonable time, the foreign experts would hand over their responsibility to their trained Indian assistants. Indian technicians have done well in the existing steel works and they can be counted on to rise to the occasion when necessary. This training scheme need not wait until the formation of the companies to manage the new steel works.

The existing fabricating capacity in the country is not very large and can hardly cope with the requirements of the plan. It needs expansion from the present 26,000 tons (approximately) per annum to nearly four or five times the existing capacity.

Stepping Up the Demand

Although the demand for steel products in India is increasing with growing industrial development, it is doubtful whether the country would be in a position to absorb at the rate of 4.5 million tons of steel per annum in the year 1962 or even in 1963, unless of course conditions are created in advance for it. To achieve this the Government should import large quantities of such of the steel products as are included in the future expansion programme, during the years the plants are under construction to enable

the new steel consuming industries to be set up in the country, and the existing ones to step up their production. Such industries are to be given the encouragement and facilities they need by the Central and State Governments. Imports are to be gradually reduced as the indigenous production rises. Although the economic selling prices of the new steel plants are bound to be considerably higher than those of the existing units, they may still be lower than those of other exporting countries of the world. The export of Indian steel, therefore, is a practical proposition. India was a large exporter of pig iron for a long time before the World War II. She can be a large exporter of steel after the second five year plan period unless, in the meanwhile, there is a serious decline in the export prices of foreign steel. The cotton textile industry is a good example of how India can have a share in foreign markets.

Benefiting Industries

Apart from the fabricating and the steel processing industries likely to grow with the increased availability of steel in the country there should be a general development of industries catering for the "stores and spares" requirements of the steel industry on which nearly Rs. 20 to Rs. 25 crores will be spent annually when the six million ton target is achieved. The spares include mechanical replacement parts, electrical replacements, wire ropes, rolls, lubricants, ferro-alloys, iron, steel and non-ferrous castings, chemicals and sundry store items. There are great possibilities for the development of the roll manufacturing industry in the country. The other industry which is bound to be established with the growth of the steel industry is the tool alloy and special steel manufacture. Manufacture of tubes and pipes, stainless steel sheets and bars, spring steels and cold and hot rolled strip, both in the narrow and wide range, are items already included in the steel expansion schemes. The manufacture of ferro-manganese is also being established and that of ferro-silicon being expanded. Provision has been made in the steel plan for 700,000 tons of semis to be supplied to the re-rolling industry which will amply cover their planned requirements. The railways are planning for a production of 15,000 wagons and the addition of 4,000 miles of new track per annum by 1960-61.

The execution of the steel expansion plan alone will need a capital expenditure of nearly Rs. 450 crores to Rs. 500 crores, besides the finance necessary for the development of ancillary facilities such as ore mines, collieries, refractories and transport. It is no doubt an ambitious plan and its fulfilment will open a new chapter in the industrial development of India. Successful execution of this plan will also facilitate and accelerate the third and fourth five year plans which will see the steel industry's capacity raised to ten and perhaps 20 million tons of ingot steel.

A PLACE IN THE NATION'S ECONOMY

TATA-MERCEDES-BENZ TRUCKS AND BUS CHASSIS

Designed and built to cut operating and maintenance costs, and withstand the most rugged road and weather conditions, the Tata-Mercedes-Benz trucks and bus chassis are the first choice of the discriminating transport operator.

If the railway and road systems of India are the arteries of our national economy, the locomotives and vehicles required to operate them are the bloodstream which feeds and regenerates it. The Tata Locomotive and Engineering Company produces locomotives and carriage underframes for our railways, as well as Diesel trucks and bus chassis for our roads.

TELCO LOCOMOTIVES

Over 100 locomotives, more than 300 additional boilers and 1,700 underframes for railway coaches made in the Telco Works are now operating on the Indian railways. The Company's output of railway rolling stock alone has saved foreign exchange expenditure to the value of almost Rs. 9 crores in the last six years.

AGENCY LINES

Steam, diesel-hydraulic and electric locomotives for main line and shunting service;

Diesel rail cars, electric-multiple units, coaches, freight cars, including refrigerator-cars; Earth-moving equipment;

Centrifugals and driers for the chemical, sugar and oil industries and research requirements.

THE MANUFACTURE OF IRON AND STEEL IN ASIA AND THE FAR EAST

THE IMPACT OF NEW PROCESSES

• V. M. SUBRAMANIAN * •

A blast furnace at work

THE combined iron and steel production of the countries of Asia and the Far East is very small, amounting to less than 5 percent of the world total. Present Asian consumption, though larger than production, is also very low. However, steel consumption potentialities of the Asian countries are very considerable. The per capita consumption of steel is about 545 kilograms in the United States, 300 kilograms in the United Kingdom, and about 130 kilograms in Western Europe, while in Asia and the Far East it is less than 5 kilograms. The region abounds in resources of essential raw materials. Some of these are favourably located (e.g. India and China), while others are available in substantial quantities but require further preparation and treatment before they can be utilised. In a number of the under-developed countries the known iron ore deposits are richer than those of some of the industrial countries of Europe.

It will be observed that the distinguishing feature of the industrialised countries is not the extent of their iron ores, but the degree to which they are able to utilise the iron ores which are available to them. The ratio of pig iron production in most of the industrialised countries to the world production exceeds the corresponding ratio of iron ore reserves, whereas the reverse is true in under-developed countries of the ECAFE region. The United Kingdom has about 2.5 percent of the probable iron ore reserves (iron content) of the world, whereas it produces about 8.3 percent of the world production of pig iron. The United States has about 6.4 percent of the world probable ore reserves, whereas it produces about 49.6 percent of the world production of pig iron. India has about 21.0 percent of the probable world iron ore reserves but its production of pig iron is only about 1.3 percent of the world production. The corresponding figures for iron ore for the Philippines and Indonesia are 1.8 percent and 0.2 percent respectively, whereas the production of pig iron is respectively, whereas the production of pig iron is nil. It will also be interesting to note that France has to import over half its metallurgical fuel and that Germany has always been dependent upon imported ore. Before the war when Germany was producing 20 million tons of steel, more than two-thirds of its ore was imported. Belgium relies almost entirely on imports for its ore supplies. Luxembourg produces neither coking coal nor coke. Italy is entirely dependent on imported coal. Sweden also depends upon imported coal. Large imports of iron ore are a feature of the United Kingdom's raw material supplies. It will thus be seen that, while some countries have more than enough coal and others have more than sufficient iron ore, there is no country which is independent in respect of both of these key materials.

The most heavily populated under-developed countries, China and India, which account for almost two-fifths of the world population, are endowed with enough iron ore for large-scale modern iron and steel industries. Most of the other countries of the region have adequate iron ores to support a modern steel industry. A number of these have more iron ore than they are likely to use domestically within the foreseeable future, and are thus in a position to export

* V.M. Subramanian is chief of the iron and steel section of the United Nations Economic Commission for Asia and the Far East (ECAFE) in Bangkok, Thailand. He recently visited France, Belgium, Britain, Sweden, West Germany and Austria, to study some of the latest iron and steel manufacturing techniques.

iron ores without impairing their own steel-making potentialities. In Asia, three quarters of the known coal reserves (outside the USSR) are in China, and the bulk of the remainder is in India. If these reserves of iron ore and coking coal could be fully utilised both these countries may plan for an iron and steel production five times the existing capacity thus paving the way for an all-round industrial development. Both the Philippines and the Republic of Indonesia have deposits of iron ores with 45 percent to 50 percent of iron content, totalling about a thousand million tons in each country. Both of these countries possess coal deposits but probably only relatively small quantities of coking coal. The Philippines also has petroleum coke and Indonesia, oil. Indochina has large high quality coal deposits and anthracite and reserves of possibly 100 million tons of good grade iron ores. South Korea has large reserves of ores with 40 percent iron content and smaller reserves with 55 percent iron content. It has huge reserves of anthracite. Burma has deposits of iron ore and coal. Further surveys are likely to indicate larger and better reserves. Thailand has reserves of several million tons of good iron ore. Pakistan has reserves of iron ore and coal but coking coals have not yet been found. Reserves of natural gas have been recently discovered. Oil also is available.

Room for Expansion

It is apparent, therefore, that the iron and steel making capacity of Asia and the Far East might be very much expanded and might be extended to countries otherwise lacking the prerequisite complement of raw materials, by the development of trade in iron ore and coal within the region, even assuming that only the well established coke blast furnace method of iron making will be adopted. The total transportation requirements for steel produced on such a basis and delivered to markets in Asia and the Far East would be less than those involved in steel delivered from the United States or Europe. The cost of transporting finished steel produced in industrialised countries to markets in the ECAFE region is a very substantial part of the total cost of the delivered steel. The foregoing facts are, of course, based on the assumption that pig iron would be manufactured by the coke-blast-furnace method.

Recent technical developments have opened up a number of important possibilities for iron and steel production in the under-developed areas of the ECAFE region substituting for high grade coking coal other fuels and energy sources which may be available to them, such as inferior coking coals, non-coking coals, hydro-electric power, petroleum, charcoal and natural gas. Other technological developments also permit the creation of iron and steel works in locations where large-scale markets do not at present exist, where adequate transportation facilities are absent or where iron ore deposits, fuel and energy sources are available but not on a scale sufficient to support large scale operations. With an alternative smelting process, capital requirements may be substantially reduced because a smaller plant is feasible.

New Processes

Many processes which do not require coking coal have now been developed, among which may be mentioned the Krupp-Renn process, the Sturzelberg process, the Basset process, the Wiberg process, the Hoganas process, the Tysland-Holz furnace, and the low-shaft furnace, operated with or without oxygen, using briquetted carbon and ore fines. In addition to economical considerations, investigations will have to be made in every case on the chemical as well as the physical characteristics of the ore and tests on pilot plants done before a definite choice of method or combination of methods can be made. The low-shaft furnace at Liege has a great future as recent experiments have revealed the possibility of its use with or without oxygen and with a wide variety of raw materials and fuels, even including lignites. The main advantages are a smaller capital and production cost and the possibility of using a more plentiful and less costly fuel and of the smelting of ore-fines and the production of a rich gas. Many countries in the ECAFE region including Burma, the Philippines, Indonesia, Pakistan and Thailand may find this method eminently suitable.

The Sturzelberg process was developed in Germany to process the purple ore, obtained during the process of producing sulphuric acid from pyrites. The purple ore is a ferric oxide with about 42 percent iron and a high quantity of zinc

NBC BEARINGS PLAY A VITAL ROLE IN INDIA'S INDUSTRIES

In India's march towards industrialisation, NBC bearings are playing an increasingly prominent role because engineers all over this country have learned from experience that to reduce machinery breakdowns, increase production and cut costs, NBC bearings are indispensable.

Manufactured in India to the same exacting specifications of the world-renowned Hoffmann bearings, NBC bearings are today being used in factories and machinery, both big and small, all over India.

When you specify NBC bearings for your machinery, you are getting all that the best bearing must possess: precision, smooth running and long life.

NBC - SECOND TO NONE

and sulphur. The process yields iron of a very high quality and valuable metal oxides as by-products. Any type of coal can be used, even lignite. The process is not affected by the sulphur content of ore and coal. The Basset process operating in Denmark produces pig iron in a rotary kiln with a highly basic slag with a basicity of about 3.0. This slag remains solid during the process and forms nodules which can be used for cement production. High sulphur raw materials including pyrite cinders and ore fines can be used. The silica content of the ore must be low and the ore must be fairly rich. The high sulphur coals and the fairly rich ores with low silica content of Pakistan, Thailand and the Philippines could possibly be worked in the basic rotary kiln of the Sturzelberg type or the Basset type. Though the Sturzelberg process produces pig iron of an excellent quality, it should be borne in mind that the cost of production is rather high.

The high sulphur South Arcot lignites and the Salem ores of South India can be utilised for production of pig iron in a basic rotary kiln. In the Philippines, the high phosphorus high grade iron ores in Camarines Norte and the bituminous non-coking coals of nearby Linguan coal mines in Bataan Island offer a suitable combination for the Sturzelberg process. The high phosphorus pig iron may be blown directly into steel in the basic Bessemer. The Wiberg process uses carbon monoxide and a little hydrogen for the gaseous reduction of iron ore. Low grade fuels may be used without the sulphur and phosphorus in the fuel getting into the sponge iron. The ores must have a sufficient mechanical strength and should be fairly rich with an iron content above 60 percent.

A miner at work

The Hognas sponge-iron process uses a very rich concentrate which is packed in layers with coal in ceramic containers. These are fired in a furnace in a manner similar to that used for firing refractory bricks. The iron is exceedingly pure and can be used for the production of high quality steel. The Wiberg process and the Hognas process may find application in countries with fairly rich iron ores but no coking coal and with small markets for iron. It is claimed that the Wiberg process can be used even without electrical energy. The German Humboldt low-shaft furnace process is based on the direct smelting of fine ore, fluxes and non-coking coal in the form of briquettes for the production of pig iron. Any type of fuel can be used. The capital cost and operation cost are lower than those for a corresponding blast furnace. The ore-coal briquette method may find application in certain locations of Burma, the Philippines, and Indonesia. The low-shaft furnace will form an ideal combination with the open hearth furnace as the rich gas from the former can be utilised in the latter. The high phosphorus laterites of Jubbulpore, India, with a high content of fines, when reduced with the coal from South Rewa by the ore-coal briquettes smelting method, would yield a pig iron suitable for conversion in the basic Bessemer.

Choice of Process

As there is a great shortage of good foundry iron in India, the ore-coal briquettes process could be very profitably adopted for utilising the huge surplus of cheap ore fines and non-coking coals and cheap slack. Non-coking coals in India are generally lower in phosphorus whereas the Indian coking coals are characterised by a high phosphorus content, which excludes their application for the making of standard grade ferro-manganese with phosphorus below 0.35 and hematite pig iron. The high grade low phosphorus and low sulphur iron ores of the Tavoy district in Burma and the medium to high volatile Theindaw coals of the nearby Mergui district may offer a suitable

Pouring the ingots

combination for the Humboldt process or the Liege low-shaft process. The high phosphorus hematites of Camarines Norte, in the Philippines when reduced with the coal from nearby Linguan mines in Bataan Island in the Humboldt low shaft furnace or the Liege international furnace will yield a pig iron suitable for conversion into steel in the basic Bessemer.

The Bukit Rangal iron ores of South Sumatra in Indonesia, and the coals of South Sumatra, offer a combination for the Humboldt process for the Hognas or the Wiberg process. Malaya has very large reserves of high grade iron ores in Pahang, Trengganu, Perak, Johore and Kelantan. These can be smelted in the Humboldt low-shaft furnace or the Liege type furnace with the Batu Arang coals. The Hognas and Wiberg processes also may be found suitable. The Krupp-Renn process can utilise highly siliceous ores as well as ores with a high titanium content. Low-grade iron ores in powdery form and a low content of sulphur and phosphorus in the ore and fuel are desirable for the acid Renn process. Any type of solid fuel can be used even those of inferior quality and with a high ash content. High sulphur raw materials necessitate further treatment. This process may be employed for the utilisation of some of the low-grade ores found in Thailand, Pakistan, Burma and Indonesia, where the quality of coal available is also poor.

The Salem magnetites and South Arcot lignites of South India offer a favourable combination. The magnetites require preliminary treatment. The fuel with a rather high sulphur content yields

on low temperature carbonisation a coke with more than 1.0 percent sulphur. The lumps obtained with this fuel would require several slag flushings and renewals in the electric steel furnace or desulphurisation in a special pre-melting furnace followed by finishing in the open hearth furnace. This would also permit finishing in a basic converter if the iron is high enough in phosphorus. The low iron and high phosphorus laterites and the clay iron stones of Bengal-Bihar could be converted into high phosphorus lumps by using coal from Raniganj. The medium grade, low sulphur iron ores of Ceylon may possibly be reduced in an acid Renn furnace with coconut shell charcoal or the coke available from the local gas works. The South Coast of Central Java, Indonesia, has large reserves of iron ores of high titanium content. Lumps free from titanium can be produced from these ores in an acid Krupp Renn furnace with the anthracites available in South Sumatra or with the Ombilin coals of West Sumatra. The Kukusan (Sebuku) deposits of Borneo and the South and East Borneo coals form a good combination for the acid Renn process.

The medium grade Kalabagh ores of Pakistan and the high ash, high sulphur coals of Baluchistan or West Punjab may be utilised for the production of lumps by the acid Krupp Renn process. For use in the Renn process, the high sulphur lignitic coals of Baluchistan may be converted first into low-temperature coke. The high sulphur content of the product will certainly necessitate additional desulphurisation processing unless of course a fuel low in sulphur is used for making iron. CEMENT a vital factor in the Five-Year Plan.

CEMENT is a basic material of universal use. Cement comes first in the building of a house or the building of a great dam. But today cement like steel is twice as precious because under the Five-Year Plan India is at war.....war against poverty, disease and hunger. Great dams have to be built to prove water to a thirsty soil; millions of houses have to be built to give shelter to the homeless, thousands of schools and colleges have to be built to educate our brethren.

For all this Cement is a vital factor and we are proud to say that we contribute our mite towards this National Goal by producing more cement to hasten National Building work of constructing more houses, dams, schools and colleges to uplift the standard of our living, thus changing the face of this country from poverty to prosperity.

steel making, another view

electric arc furnace for steel making offer an excellent combination. The medium grade iron ores of Kanchanaburi in Thailand can be treated in the Renn kiln utilising the local lignites as fuel. Thailand, the Philippines, Indonesia and Burma with their large forest reserves may establish small charcoal blast furnaces of 50 to 100 tons capacity in suitable locations. Absence of coking coals and facility for rapid reafforestation are important considerations.

The electric low-shaft furnace of the Tysland Hole or Electro-metal type will be found suitable only in places where relatively cheap electric power is available. The Philippines, Indonesia and Burma may consider this possibility with their hydro-electric schemes. Korea and Indo-China with their large resources of anthracite and good iron ores may use small anthracite-fired blast furnaces for the production of iron. A low-shaft furnace also may be quite suitable. The German hot-blast cupola may be found applicable for the production of pig iron from scrap in a country like Indonesia which has plenty of scrap but no coking coal.

Plans for the Future

It will be noted that although some ECAFE countries have already taken into consideration some of the above techniques of iron production, there is a wider scope for the inclusion of the more recently developed methods, and for the development of intra-regional trade in raw materials in their future plans of development. Absence of coking coals is no longer an obstacle to the development of an iron and steel industry.

An outline of the present and future plans of production of some of the countries of the ECAFE region is given in the following paragraphs.

The estimated current or future annual demands for iron and steel in some of the countries of the region are as follows:

	Tons
Burma	100,000
Ceylon	100,000
Hong Kong	102,800
India	946,000—3,000,000 (future demand)
Indonesia	265,000
South Korea	30,000
Malaya	150,000
Pakistan	465,000—530,000 (future demand)
Philippines	271,000
Thailand	100,000
Viet-Nam	135,000
Laos	
Cambodia	

Burma. About 20,000 tons of steel products per annum will be made in the first stage by remelting scrap in electric furnaces and partly by re-rolling scrap. In the second stage pig iron would be made without coking coal.

India. The present annual capacity is 2 million tons of pig iron and 1.5 million tons of steel ingots. The existing producers plan to increase output by 500,000 tons of finished steel. The new steel plant for flat products, i.e. plates and sheets, to be built by Krupp Demag will have a capacity of 500,000 tons of ingots and be capable of expansion

and 60,000 tons of rolled steel and 10,000 tons of tool steels. About 10,000 tons of ferro-alloys had also been planned.

Indonesia. Re-rolling of scrap will be done in the first phase and about 40,000 tons of steel will be made from scrap and rolled into shapes in the second phase. The manufacture of iron without coking coal has been planned for the third phase.

Japan. Iron ore imports of 4,930,000 tons had been planned for the year ending 31st March 1955. Five million tons of rolled steel and 4.5 million tons of pig iron also had been planned.

South Korea. Production had been planned on the eight small 20-ton blast furnaces, the 50-ton open hearth furnaces, the 10 electric furnaces, and the 6 small rolling mills.

Pakistan. The existing re-rolling mills capacity is 80,000 tons. Fried Krupp are consultants for detailed prospecting and for setting up a Renn kiln of 50 tons capacity with two 10-ton electric arc furnaces in the first stage. The aim is to produce 350,000 tons of steel ultimately.

Philippines. Existing re-rolling mills produce 20,000 tons annually. The electric arc furnaces steel plant of first stage will produce about 1,900 tons a month, the second stage will produce 2,000 tons of electric pig iron, 2,760 tons of sheet bars and billets and 1,800 tons of sheets a month. The third stage will produce 120,000 tons of electric pig iron, 140,000 tons of electric furnace steel ingots, 10,000 tons of plates, 70,000 tons of billets and other products and 30,000 tons of sheets annually.

Thailand. The present production is only 350 tons of bars a month. Plans under consideration include production of 35,000 tons of pig iron, 40,000 tons of open hearth steel and 30,000 tons of plates, sheets and bars and structurals.

China (mainland). The pig iron production in 1954 was three million tons and steel 2.2 million tons. There are plans for increasing production further.

China (Taiwan). Upon completion of the expansions planned and under execution, the following annual productions will be achieved:

Pig iron	35,000 tons
Steel	70,000 tons
Rolled products	60,000 tons

EQUIPMENT FOR
 TEA ESTATE FACTORIES

The collection and disposal of dust is a problem common to practically every industry. The dust created during many manufacturing processes is not only injurious to the health of the operatives, but militates against efficient production. Modern "Sirocco" Dust Removal and Collection Equipment is the outcome of many years of experience in dealing with problems of this nature. Fully illustrated descriptive literature available on request.

The range of "Sirocco" Tea Preparing Machinery comprises complete equipment for the Tea Factory—equipment with a high reputation throughout the Tea Producing World for design, craftsmanship and operation, resulting from almost seventy years' service to the Industry and "Sirocco" After Sales Service is Second to None.

The Tower of the Institute

THE Indian Institute of Technology at Kharagpur was founded on the basis of the recommendations made by the Sarkar Committee. The report submitted by that Committee underlined the inadequacy, both in quality and quantity, of the existing facilities for technical education in India and recommended the setting up of four higher technological institutes to cope with the needs of post-war industrial development. The paradox of the Indian situation lies in the fact that the lack of high-grade technical personnel is both the cause and effect of India's industrial backwardness. This has led to the popular criticism that it is foolhardy to embark upon new technological institutions until gainful avenues of employment have been found for those who have already passed out at the existing engineering institutes. It is argued that the present turn-out of engineers is already ahead of the pace of industrial development and hence that the producing of more engineers should be stopped and the problem of industrial expansion should be concentrated on. This line of argument ignores the obvious truth that one of the major factors holding up industrial development is the lack of qualified technical personnel. To speed up industrial progress we need more and more technologists and, what is not sufficiently recognised, we need a different new kind of technologist to help the planners lay the foundations of a new society. It was felt by the sponsors of the I. I. T. that the need for providing high-grade technologists equipped with new ideas and ideals is the *raison d'être* of such an institution. The I. I. T. is thus a unique experiment in the field of higher technical education in India.

A New Outlook

The old pattern of engineering education is admittedly inadequate to meet the requirements of post-war India. The proverbial strait-jacket outlook of old-fashioned engineers is incompatible with the tone set by the extensive development projects launched by the two five year plans. We require an army of engineers and technologists trained in a different manner, who will provide the necessary human material to "live-wire" these projects. The main objective of I. I. T. is thus to combine and correlate fundamental scientific training with a broad human outlook. The guiding principles in the design of undergraduate course of study are—

- to teach the fundamental theories and principles of engineering,
- to inspire in a student a desire to carry on, at the end of his formal training, an independent study of practical processes and technical principles,
- to bring him in close touch with the problems of engineering practice so that he may relate his theoretical studies to practical problems.
- to help him grow into a useful citizen.

The system of instruction is based on the most modern methods as practised in Europe and America. The syllabi have been carefully framed under the guidance of recognised experts who form the Departmental Advisory Committees. A large number of foreign experts have lent their experience to the common pool; besides organising research programmes they also take part in the teaching routine.

Instruction at all levels is less formal, thus ensuring a closer contact between the teacher and the pupil. Greater emphasis is laid on seminars, tutorials and guided studies which stimulate a spirit of independent enquiry and encourage stu-

THE INDIAN INSTITUTE OF TECHNOLOGY AT KHARAGPUR

A CONTRIBUTION TO TECHNICAL EDUCATION IN INDIA

● By SUNIL KANTI SEN ●

dents to attack their problems with fresh and alert minds. At the first-year stage the size of lecture classes is limited to 40 students which makes for greater efficiency in teaching. One of the most refreshing features of this Institute is its rejection of the time-honoured practice of burdening teachers with heavy teaching loads and thus turning them into automata. In accordance with the recommendations of the Sarkar Committee the teaching load on different categories of teachers is reasonably distributed so as to leave them free for independent study and research.

System of Examination

In tune with the informal method of instruction the examination system has been rationalised. In assessing a student greater value is attached to his day-to-day work. Besides formal examinations at the end of each term, periodic check-ups in the form of "quiz" tests are held to keep the students on their toes. And there is evidence that the students enjoy and look forward to these surprise tests. The examination questions are so framed as to test a student's real grasp of a subject. And finally, a student is judged not merely by how he fares at the end-session and final examinations but to a greater extent by his total work throughout his stay at the Institute.

The Institute offers the following undergraduate courses:—

- Agricultural Engineering
- Civil Engineering
- Electrical Engineering
- Mechanical Engineering
- Metallurgical Engineering
- Naval Architecture & Marine Engineering
- Geology & Geophysics
- Architecture & Regional Planning.

The undergraduate programme includes—

(a) Basic Sciences, e.g., Mathematics, Physics, Chemistry;

(b) Applied Engineering Science;

(c) Applied Technology;

(d) Humanities.

The course in Humanities, which includes English, Civics, Modern European Languages, History, Economics, Industrial Psychology and Philosophy, is spread over the entire undergraduate programme. The emphasis laid on the study of Humanities is one of the special features of this Institute. Both at the M.I.T. and the California Institute of Technology extensive courses in Humanities are offered, and experts are almost unanimous in their opinion that for the development of a well-rounded and integrated personality technological education should be balanced by an adequate general education. This view was also expressed by the University Education Commission. The teaching of Humanities at a technological institution is a pointed reminder that all engineering and technological problems are at some level human problems. This is worth emphasising since the old notion of liberal education demoralising efficiency still persists. The Department of Humanities offers special courses in Advanced Literature, Advanced Economics, Current Affairs, National Planning, Rural & Community Development, History of Culture, Art Appreciation, etc. These courses are optional and they are intended to induce students to cultivate some special interests. The Department is also building up a Psychological Laboratory where research projects and surveys concerning the engineering profession in India will be taken up. A few preliminary surveys have already been published.

Post-Graduate Study and Research

Of far-reaching importance is the post-graduate and research programme undertaken by the Institute. It is well known that facilities for post-graduate study and research in engineering and technology are almost non-existent in India. The

Patel Hall, a residential building

**We know ours is
a long name...**

but it does at least describe fairly accurately the type of business in which we specialize. We supply industry and transport with technical products which probably mean very little to the layman, but which materially assist the manufacturer, the transport contractor and others in their day to day operations. All these products have one thing in common—they contain that very valuable raw material, asbestos.

In the past, most of these products have had to be imported. But we are now considerably expanding our manufacturing capacity and a large, new factory is being built at Vikhroli, Bombay.

With the technical co-operation of our associated companies in England, we shall be producing in this factory asbestos yarn, packing and rope lagging, compressed asbestos fibre jointing, FERODO brake and clutch linings, and 85% magnesia. We are happy to be able to make this contribution to the industrialisation of India.

Sarkar Committee observed that any scheme of higher technical education would be incomplete without an adequate provision for post-graduate training and research. The Indian Institute of Technology has accordingly worked out a comprehensive programme for research and post-graduate training. It was suggested by the Sarkar Committee that the proportion of undergraduate to post-graduate and research students should be 2:1. The great efforts the Institute is making towards correlating researches in technology and applied sciences are likely to yield fruitful results in the field of technical education in India. Almost every department has already been or is in the process of being adequately staffed and equipped for this purpose. The big stride the Institute has taken in this direction will be indicated by the number of post-graduate courses (listed below) offered for the session 1955-56.

Department of Mechanical Engineering

1. Foundry Engineering
2. Mechanical Handling
3. Mechanism and Vibrations
4. Production Technology

Department of Civil & Sanitary Engineering

1. Structural Engineering
2. Transportation Engineering
3. Soil Mechanics and Foundations
4. Building Engineering and Construction
5. Sanitary Engineering
6. Hydraulics and Water Power Engineering

Department of Architecture & Regional Planning

Regional Planning

Department of Chemical Engineering

Combustion Engineering and Fuel Economy

Department of Geology & Geophysics

1. Applied Geology
2. Exploration Geophysics

Department of Electrical Engineering

Design of Electrical Machinery

Department of Agricultural Engineering

Applied Botany

Department of Applied Mathematics

Non-linear Mechanics

Department of Applied Chemistry

1. Technical Gas Reaction and High Pressure Technology
2. High Polymer and Rubber Technology
3. Synthetic Drugs and Fine Chemicals/Pharmaceuticals

Department of Physics

Industrial Physics

The Applied Science departments, e.g., Physics, Chemistry and Mathematics are also going ahead with their research programmes with commendable vigour. The post-graduate and research activities and the Institute will in course of time imperceptibly influence the undergraduate who will be inspired to regard his education as an intrinsically worthwhile pursuit and not merely a means to a professional career.

Refresher Courses

Another interesting feature of the I.I.T. is the introduction of short-term refresher courses for the benefit of technical personnel already employed in Government and industry. It is difficult to overstate the usefulness of such courses. For one thing, by bringing trained and experienced personnel in touch with new ideas it helps revive their interest in advanced theories and practices which they are apt to lose sight of in their pre-occupation with professional work. It serves another useful purpose by establishing a link between industry, Government and technological institutions. The need for such contacts is emphasised by the Government's policy of co-ordinating its activities with the private sector. The Institute has already organised a number of such short-term residential courses, e.g., in Management Practice, Production Management and Works Management. Senior executives from Government and industry have attended and judging from their enthusiastic response it may be confidently asserted that these refresher courses are really fulfilling a long-felt need. Stated briefly, they provide a splendid opportunity for Government executives to learn from the experience of industry, for industrial personnel to learn about Government

projects and for both to gain a fresh outlook from their contacts with a higher technological institution.

Training and Placement

Although an engineer is not a craftsman, nor is he expected to possess the manual skill of an artisan, he must have an intimate knowledge of workshop processes and methods. The system of providing basic workshop training as an integral part of an undergraduate course is not without defects, but in the existing conditions this appears to be the only workable course to be adopted. The Sarkar Committee made specific suggestions for providing workshop and practical training but owing to initial difficulties it has not so far been possible to implement in full the programme laid down in the Report. The Institute has, however, set up a Department of Training and Placement for the purpose of providing practical training to the undergraduates in workshops and industrial sites.

The Department will also function as liaison between industries and the graduates passing out of the Institute—helping industries get the right kind of men and the graduates the right kind of jobs. This has a salutary psychological effect on the students for it is a bad thing for a young undergraduate to be haunted by a lurking fear of unemployment. And secondly the young graduate may feel frustrated and bewildered after passing out, since it is always difficult to find on one's own the right kind of job, although the growing industrial expansion of India is opening up diverse avenues of employment to choose from. Hence the Department of Training and Placement is designed to serve a very useful purpose for the graduates of the Institute.

A survey of I.I.T. will be incomplete without a reference to the community life which the students and teachers together are striving to build up. The Institute, it should be emphasised, is wholly residential. The idea is nothing new in India but the fact that students speaking different languages and belonging to diverse social and cultural groups are living together lends an altogether new character to this Institute. To watch the Travancorians and Kashmiris, Punjabis and Maharashtrians queuing up at the counter of the dining hall is an exciting experience. A truly remarkable camaraderie has grown up, building different sections of students into a wholesome corporate life. And the teachers too are irresistibly affected by this spirit. The old sense of apartness dividing teachers from students is fast disappearing and everybody is beginning to feel that he has a small but significant share in the growing corporate life of the campus. The students have an alert and highly vigorous organisation known as the Technology Students' Gymkhana which organises sports and games, holds study circles, debates and seminars, brings out a magazine and thus plays the most vital part in the corporate life of the campus. A number of Social Service Schemes have been introduced to lend purpose to the community life. Although participation in

Relevant Facts and Figures

The following figures will convey an idea of the big scale on which the Institute has been planned and the magnitude of the task undertaken.

The expenditure already incurred on buildings and equipment is, building—Rs. 2.29 lakhs, equipment—Rs. 1.32 lakhs. The following further expenditure will be involved according to the present plan buildings—Rs. 1.74 lakhs, equipment—Rs. 1.14 lakhs. The present operating cost is Rs. 45 lakhs which is expected to rise to Rs. 67 lakhs with the completion of the plan.

The number of students is at present 1,100 which will rise to 1,800 according to the present target. The estimated strength of teaching staff is 300. The agencies of T.C.M., Colombo Plan, and UNESCO have greatly helped in the task of building up and equipping this Institute.

The land extending over 1,200 acres was donated by the Government of West Bengal.

Conclusion

To sum up. The I.I.T. has set the pace of higher technical education in India. Its teaching programme is designed to produce high-grade technologists grounded in the fundamental theories of engineering and equipped with a broad outlook; engineers inspired by a sense of high endeavour ready to shoulder the responsibilities of planning and execution. Its research programme is designed to correlate researches in applied sciences and technology. The courses of study and the method of instruction are designed to create a suitable climate for stimulating a spirit of independent enquiry. Some of its special features like the introduction of short-term refresher courses and the setting up of a Department of Training and Placement have already proved their usefulness. And the vigorous community life growing in the campus serves as a suitable milieu for study and research. The tower of I.I.T. stands as a symbol of the spirit of daring and enterprise which animates all aspects of life at the Indian Institute of Technology.

OIL REFINING IN INDIA

• By A CORRESPONDENT •

Intermediate tankage in the foreground

Hydro-carbon gas analysis apparatus

THE official opening of the Rs. 30-crore Burmah-Shell Refinery, the largest in India, by Dr. S. Radhakrishnan on 17th March this year, was an occasion which marked the achievement of a significant milestone in the country's industrial development. The investment by the oil industry of some Rs. 50 to Rs. 60 crores in the construction of three new refineries with a total refining capacity of 3,875,000 tons a year is an outstanding example of large scale investment of foreign capital in India. Two refineries were to be built in the Bombay area and the third at Vishakapatnam. The first to be completed, owned by the Standard Vacuum Oil Company of India Ltd., went into operation in the second half of 1954, with a refining capacity of 1.2 million tons a year. The Burmah-Shell refinery, the largest of the three, with a refining capacity of two million tons a year, has now been brought into operation, and the third refinery now being built by Caltex (India) at Vishakapatnam, will have a refining capacity of 675,000 tons a year and is expected to be in operation in 1957.

Oil refining started in India in 1920 when the Assam Oil Company, a subsidiary of the Burmah Oil Company, built a refinery at Digboi for the refining of Assam crude; but whereas Digboi meets only 7 percent of India's petroleum requirements, these three new refineries will account for about 80 percent of India's needs which stand at nearly 80 million tons a year. A change in the industrial pattern which will have far-reaching effects on the country's welfare is there being witnessed. India's decision to establish a home refining industry is in line with the policies adopted by many other countries in the post-war period. Instead of refining oil in the areas of production, crude oil is now shipped close to large consumer areas for refining. Apart from the obvious merits of this transition, namely savings in foreign currency freedom from reliance on one or two overseas refining areas and the increased ability to meet variations in market demands brings many advantages to the home country. For instance, the example of the oil industry will most likely stimulate further large-scale overseas investments in India's basic industries, thus creating further employment opportunities in diverse trades and professions and to take one more example, the refineries will aid other industries by purchasing chemicals, engineering materials, etc.

Turning from the broad picture of the industry to consider its latest and largest unit, the Burmah-Shell refinery, it is of interest to recall the reasons for locating the refinery in the Bombay area. These are that Bombay is the nearest main port from the oil producing areas of the Persian Gulf; that Bombay has a good road and rail system connecting the refinery to all parts of the country and that Bombay itself is the largest fuel oil market in India. The 450-acre site was acquired in 1953, but before construction work could go ahead a village had to be evacuated and the displaced villagers had to be accommodated in two new villages provided by the Burmah-Shell Refineries Ltd. Construction work went forward very quickly—site clearing and levelling, foundations and drainage; in all, 1,600,000 cubic yards of earth were moved, 40,000 cubic yards of concrete were poured, 12 miles of road built and 60,000 tons of steel used. And then, in January this year, the

first unit came on stream and finished products were delivered to the local markets in the first week of February.

All the progress accomplished by the petroleum industry during the last two decades is reflected in the equipment installed and in the quality of the products turned out. The refinery is, in fact, the product of research, knowledge and experience gained during these years by the Royal Dutch-Shell Group of Oil Companies throughout the world. The associated companies of the Group are currently spending about Rs. 8 crores on research on such diverse subjects as jet fuels, insecticides, lubricants, fungicides, synthetic detergents, glycerol and a whole range of solvents. The design worked out by the Royal Dutch engineers for the Burmah-Shell refinery is similar to that evolved for other expansion programmes in Europe and elsewhere. Indeed, notwithstanding the progress

Refinery Yields		Percent by weight
Gasoline	...	25
Kerosine	...	14
Diesel Oils	...	14
Fuels	...	37
Loss and own fuel	...	10

of research and technological effort, the design of refineries seems to have settled into a conventional

pattern in the post-war period involving crude distillation, feed preparation and catalytic cracking and added treating facilities for kerosine and gasoline. Different types of crude oil will naturally yield varying quantities of products. The figures below give some indication of what can be expected from Middle East crude upon which India's new refineries rely.

Additionally, some refineries produce lubricating oils and others bitumen: in these cases, it will be realised that the yields given in the table will alter somewhat. As already mentioned, the Burmah-Shell refinery is designed for a nominal throughput of 2,000,000 tons of crude oil a year and for the production of 475,000,000 gallons a year of gasoline, kerosine, diesel and fuel oils together with 150,000 tons a year of bitumen.

Processes Employed

Reference has been made above to a number of the processes employed in the modern refinery, namely, distillation, catalytic cracking, feed preparation and so forth. It is neither possible within the scope of the present article, nor is it necessary for the purpose of this survey to discuss the technical details of these processes. It will be recalled that crude oil is a mixture of gas and liquid and that the liquid part comprises substances of different boiling ranges so that by distillation it is possible to recover light volatile hydrocarbons such as gasoline and then, as the temperature of the distillation is raised, successive quantities of kerosine and heavier oils are recovered leaving a bitumen residue. This, in effect, is the function of the dis-

tillation and feed preparation units and, apart from advances in techniques, the objective is essentially the same as it was at the beginning of the century. But since then there have been changes in the relative demands for products and marked changes in product quality or specification. It is well known that these changes arose from the development of automotive engines and that instead of lamp kerosine being the primary product, gasoline and diesel oils became pre-eminent. The transition in demand was finally realised during the world war of 1914-1918 and from that time improvements, especially in gasoline quality, have proceeded apace with advances in engine design. High compression ratios yield increased power: high compression ratios call for gasoline of high "anti-knock" or of high "octane number". Nowadays, gasoline found naturally in crude oil, otherwise of quite satisfactory quality, is not of high enough octane number for modern engines so that other means have to be adopted to enhance its quality. These targets—more gasoline, better gasoline—set the stage for a considerable amount of research during the late twenties and the thirties and culminated in the development of the fluid catalytic cracking process.

This survey of the refining plants would be incomplete without a cursory mention of the treating plants. It is found that not all products obtained straight from the main units are suitable for marketing but that some need further refining, which is carried out by chemical methods, to improve colour, odour, storage, stability, etc. But the cost of the process plants, which epitomise the complexity of present day technology, represents only 30-40% of the total capital construction costs.

Auxiliary Facilities

Some mention must be made therefore of the auxiliary facilities on the Burmah-Shell refinery. Storage tank capacity amounts to nearly 5,00,000 million tons and intricate pipeline systems connect plant with plant, permit the pumping of finished products to railcar loading, direct to marketing installation and to tankers. A drum factory has been constructed for the outturn of 10,00,000 drums of bitumen products annually. An engineering organisation with workshops has been built up to cope with the maintenance work of the refinery. Three large water-tube boilers, each capable of generating 25 tons of high pressure steam, an hour are in operation as also are pumps for delivering 7,000 tons an hour of salt water through the coolers to the plants. Integral parts of any refinery are its fire services and laboratory: these facilities at the Burmah-Shell refinery are of modern design. Additionally, an office, a medical centre and canteen accommodation is provided and a 10 acre recreation and sports ground is set aside for staff and labour. The company, recognising the importance of accommodating its employees close to the refinery, has contributed Rs. 40 lakhs to the Bombay Government for housing 500 refinery workers and their families at nearby Nehru Nagar. Competition and progress are characteristics of the industry; improvements in technology, great and small, are applied continually in efforts to increase the efficiency of the refinery and to improve the quality of products.

UNIQUE OIL LABORATORY IN INDIA

One of the most comprehensive and well-equipped oil laboratories in India has been built by Burmah-Shell Refineries Ltd., in Trombay to undertake work of testing products manufactured by the Refinery. In many respects the oil laboratory is unique in the sense that it contains a variety of instruments hitherto unknown in India, such as the low-temperature distillation apparatus for light hydrocarbons, the flame photometer to analyse the catalyst used in the Catalytic Cracker, etc. The Laboratory consists of four main sections—the Routine Laboratory, the Finished Products Laboratory, the Technological Laboratory and the Engine Laboratory.

The Routine Laboratory is working on a 24-hour basis to carry out testing necessary for checking the operation and products of the various processing units. The Finished Products Laboratory determines whether the finished products such as kerosine, motor spirit, diesel oils and furnace oils are up to specification. The Technological Laboratory carries out various experiments and tests for the improvement in quality of the manufactured products. The Engine Laboratory tests petrol on its so-called "Octane Rating." In all these departments, qualified Indians are using their experience gained during a period of extensive training in the Shell Laboratories in the U.K. and Europe.

OVER 50 YEARS OF PROVED 'CATERPILLAR' PERFORMANCE

In 1904 Benjamin Holt introduced his 'Caterpillar' track type Tractor, the first commercially successful machine of its kind ever built..... 1931 heralded the entry of the 'Caterpillar' Diesel Tractor, a distinctive mile post on the long trail of agricultural history..... In 1954 the latest model of 'Caterpillar' track-type tractor is bigger and better than ever before, a dynamic symbol of industrial progress.

TODAY in addition to five sizes of track type tractors, Caterpillar Tractor Co. manufactures Wheel-type tractors, Diesel Engines, Motor Graders and Earthmoving Equipment. 'Caterpillar' products can be found in all parts of the world working on deserts and forests and ice-lands, on private and government projects laying vital concrete roads, building bridges and dams, tiling and terracing out farms, etc.

IN INDIA 'Caterpillar' equipment is being largely used in major land reclamation and irrigation projects and is contributing to the country's industrial progress.

MODERN EARTHMOVING EQUIPMENT IN INDIA

• By J. GASCOIGNÉ •

INDIA is one of the few places in the world today, where ancient and modern methods of earthmoving are being used side by side. In the past, great feats have been accomplished with hand and animal labour. In India an extensive network of irrigation canals stands out as a major achievement of these methods. At the present time a number of big projects is nearing completion, some smaller ones up and down the country have been completed and others, such as Rihand Dam and Kosi Sewage, are in the initial stages. Much work has been done during the last five years involving the movement of millions of cubic feet of earth. The completion of the projects concerned within a limited time has only been made possible by the use of modern, mechanical earthmoving equipment and resourceful Indian technicians and operators. But in spite of modern earthmoving equipment being used on schemes such as Hirakud and Bhakra, manual labour has had its place, and can still be used profitably, apart from providing employment to labour which would otherwise be unemployed.

During and before the war plans were made for future development throughout the world. With the arrival of peace attention was immediately given to these programmes and the result was a terrific demand for earthmoving machinery. Due to steel shortages, such equipment was scarce and the demand could not be met. War surplus equipment was snapped up and put to work. Government Departments and contractors purchased any equipment which was available, and in many cases ill-suited machines were snapped up and put to work. Standardisation was impossible and in India particularly, many and varied were the tractors, scrapers, etc. found on the different projects. If this could have been avoided even better progress might have been made, and with considerable saving in production costs. Today most equipment is available and the project engineers concerned can make their plans, knowing that they can be implemented with equipment of their choice, supplied by dealers who can provide the essential after-sales service in the field backed by an adequate supply of parts.

Achievements in India

In this country the progress made is all the more praiseworthy because, before the war, Indian engineers with practical experience on modern earth-moving equipment were few and far between. It is to their credit that they got down to the task in hand and thoroughly familiarised themselves with the equipment in their charge and in record time produced first class operators to control and look after the machines available. Unfortunately there is still too great a scarcity of experienced and trained engineers who can take over from the more senior officers; so much so.

that in many cases chief and superintending engineers due to retire are continuing to work on for a number of years after their retirement date. Because the supply position is so much better nowadays, it is the responsibility of the authorities concerned to ensure that orders placed are for the equipment best suited to the individual jobs. This can only be done after a thorough study of the job requirements and the past history of the performance of the products of the makers and suppliers concerned. The Indian Army and Air Force have already had valuable experience of many types of equipment as also have some Central Government organisations. Their findings regarding the economic use of such equipment are available and should be of assistance to all State Governments which care to avail themselves.

Types in Use

Earthmoving equipment, including excavating machinery, can be divided into four main types and the following is a general outline of their job applications. Unfortunately space does not permit all specific applications to be dealt with. Usually the length of haul from the digging area decides the type of machinery which should be selected. The shortest haul type of work is probably the excavation of an irrigation canal, and within, say, width limits of 150 feet the most suitable unit would be a dragline. In India such units found on this work are of 2½ to 3 cu. yds. capacity with booms from 80 feet to 90 feet in length. The most suitable method of operating is to work from the centre line of the proposed canal digging behind and side casting to both banks at a radius equivalent to the length of the boom. This type of work involves only one man and one machine. Such a combination can excavate something like 180 cu. yds. an hour using a 3 cu. yds. dragline. Allied equipment working with this unit to provide the lowest cost per cu. yd. of earth moved would be machines such as bulldozers and motor graders used for shaping the bunds to the finished job requirements.

Under conditions where the required movement of earth is greater than the length of the dragline boom other types of equipment must be considered and for short hauls of, say, up to 200 feet, the most economical output would result from the use of crawler tractors fitted with bulldozer blades. A track-type tractor of 130-150 drawbar horse-power, employed on a 200-foot haul, would give an output in the region of 120 cu. yds. an hour under average digging conditions. The bulldozer excavates material and at the same time pushes it along the surface of the ground so that, within an approximate distance of 200 feet, the blade is moving earth to its full capacity. Naturally at this stage there is no point or advantage in trying to cover more ground because additional material

cannot be gathered. Therefore any attempt would result in spillage round the edges and over the blade. Consequently, time is wasted with uneconomical results if bulldozers are applied to jobs where the haul distance is greater than 200 feet.

American Practice

The present-day tendency in America, (the manufacturers in that country being the acknowledged leaders in the manufacture of earthmoving equipment) is to build heavier and larger-sized crawler-type tractors with corresponding increases in horse-power up to and around 200 at the drawbar; such machines will become available in the foreseeable future. Where distances over 200 feet are involved the customary choice is of crawler-tractor drawn scraper combination units. The scraper is fitted with large low-pressure pneumatic tyres resulting in low ground pressure and low rolling resistance and is therefore suitable for operating on uneven or soft ground.

Control of the scrapers is normally achieved by means of steel-wire ropes regulated by a cable control unit conveniently mounted on the rear of the tractor. In actual working the cable unit control levers are operated from the driving seat by lowering of the scraper blade during the forward movement of the machine. The cutting edge into the earth which is then pushed back into the bowl of the scraper. Still moving, the cutting edge is raised and the bowl closed. The unit moves off to the fill where the contents are ejected. The material can be unloaded and spread in layers of between four inches and six inches. This unit, even under adverse conditions, can travel with its load at approximately six m.p.h. On this work a track-laying tractor of 130 to 150 d.b.h.p. can easily handle a scraper of 15-16 cu. yds. capacity. An incidental advantage with this unit is that whilst traversing the fill area it helps to achieve the desired compaction.

Higher Speeds

So far we have dealt with the slow-speed zone. We now come to faster-moving equipment for use on haul lengths over 1,200 feet. In this zone high-speed pneumatic rubber-tyred tractors, with wagons or scrapers are called for. Such units are in common use on the various projects in India today and they are proving very successful. On this work it is sometimes necessary to travel as far as four miles to obtain suitable earth for earthfilled dams, and in such instances rubber-tyred equipment gives the most economical results. Scrapers used are of the self-loading type as in the case of the track-type tractor scraper unit. It should be noted that the crawler tractor often has to be used in combination with the rubber-tyred tractor scraper unit for pushing. This helps in achieving a full load quickly. Rubber-tyred units can travel at

speeds—roads on the site permitting—up to about 30 m.p.h.

Normally it is found on projects in India that top speeds cannot be used, because site conditions do not permit. Therefore careful consideration has

size is one capable of producing 315 cu. ft. a minute. There is, of course, other equipment used on earthmoving projects but unfortunately a full description is impossible in one article and the most important have now been covered.

The Need for Care

In conclusion a word to engineers in charge of earthmoving equipment. If accurate records are kept they will help in the task of evaluating the equipment used and providing a guide to the elimination of machines which do not give full value. Records should be kept for each piece of equipment, showing daily performance and cost of fuel and maintenance. Manufacturers of earthmoving equipment make many claims and counter claims about the relative merits, performance, and operating costs of their products. But all manufacturers do not use the same method of computing estimated owning and operating costs, therefore it is important when making comparisons that the same basis is used for all makes. It is also a good plan to calculate and compare several different ways.

The most important cost to any user of earthmoving is the cost of each cubic yard of dirt moved over the entire life of the machine. Short period costs are of little use, as endurance is a big factor. Equipment may perform well with low costs for a short period of time, subsequently spending most of its time in the repair shop. The total cost is, what is paid for it, what is made with it, what is spent on it, and what is obtained for it when it is finished with. Records should be checked to see how fast low-priced machines can turn into high-cost produces. Having bought the equipment suitable to the work it should be looked after carefully by adhering rigidly to the manufacturer's

instructions and the advice received from the dealer. Standardisation wherever possible simplifies maintenance and the training of maintenance and operating personnel. It also simplifies the stocking of parts and service problems. It should also

A "Caterpillar" DW21 spreads its load

be remembered in connection with standardisation that track-type rubber-tyred tractors, motor graders, excavators, compressors, diesel pumps, diesel electric sets, power plants, etc. can be obtained all fitted with the same make, and quite often the same model, diesel-engine power unit thus enabling one stock of parts to give adequate protection for all types of equipment, and also ensuring familiarity by service personnel.

to be given to the actual loading and carrying capacity of the rubber-tyred tractor scraper units to ensure that the most suitable equipment is obtained. Units of say 15 cu. yds. capacity will give an output of approximately 100 cu. yds. on a one mile one way haul. Generally speaking scraper units are only used when the material being excavated is earth. In the case of rock material excavators or shovels should be considered. The ones normally seen in India are around 24 cu. yds. capacity capable of excavating rock from quarries and loading it into rubber-tyred hauling units of bottom, side or rear dump types.

Auxiliary Equipment

Apart from the main types of earthmoving equipment mentioned so far there are other machines essential to ensure that the other units work to optimum output. To this end it is necessary for all haul and site roads to be kept in good condition to allow the scraper unit to travel as fast as possible, and also to reduce wear and tear on equipment. It is worthwhile to remember that on bumpy roads impose great strain on operators resulting in fatigue with lower efficiency. For construction and maintenance of the roads concerned, diesel motor graders are normally used. They patrol the roads continuously keeping them in good condition, therefore motor graders must also be regarded as essential pieces of excavation equipment.

One of the great enemies of machinery on excavation sites is dust, which must be kept under control if efficient work is to be maintained. Diesel engines breathe vast quantities of air. If unfiltered air is allowed to enter the engines rapid wear will take place. A high standard of maintenance is therefore essential. Apart from this, dust causes accidents, and to date a number of very expensive units have had to be written off as a result of accidents directly attributable to and caused by dust. This has been due simply to the fact that the driver involved could not see what he was doing. To avoid such occurrences large quantities of water must be used to keep the dust down, and to help compaction. To handle this water portable diesel pumping sets are a necessity for contractors or government departments. On earthmoving jobs other pieces of equipment are also needed. Usually considerable quantities of rock are required, calling for the use of pneumatic drills of one kind or another. This means that portable diesel engine-operated compressors are required to provide the air for the operation of pneumatic equipment. A normal compressor

THE STRUCTURAL ENGINEERING INDUSTRY IN INDIA

A REVIEW OF THE PROBLEMS BEING FACED

• By K. J. CLEETUS •

THE importance of the structural engineering industry to the economy of a fast-developing country like India is not in need of elaboration. The Indian structural engineering industry owes its establishment to the enterprise of a few British firms. Many of them were associated with or were subsidiaries of parent firms operating in England. Originally a large proportion of the work they handled was on account of the Indian Railways or the Government. However, as Indian industries began to expand the demands upon the Indian engineering industry grew in volume and importance. It has many achievements to its credit and has demonstrated its technical competence to handle the biggest of jobs.

A well-organised structural engineering industry is perhaps the most important auxiliary to the steel industry. In fact, if we look at the growth of the structural engineering industry, we will find that it has kept pace with the developments in the Indian steel industry and that as more and more Indian steel became available, the structural engineering shops were capable of utilising it to an ever greater extent. The close relationship and liaison between the steel industry and the big structural engineering firms in India have always been a very remarkable feature and of great

mutual benefit. In view of the great industrial development that is being planned, the Indian engineering industry, and particularly the structural engineering section of it, will assume a greater importance and play a rôle of increasing prominence in future. Any examination or appraisal of the structural engineering industry in India must start with an estimate of its capacity. The best available estimate puts the capacity at about 100,000 tons a year for the organised sector with modern equipment. In addition to this there is a large number of comparatively small units scattered all over the country whose capacity could at best be only guessed. One would not put it above 30,000 tons a year. Some capacity is also available in the Government-owned fabricating shops whose capacity is engaged in providing a small part of the Government's own requirements. For our purpose, the capacity of commercially organised structural engineering industry is what really matters and 130,000 tons a year would be a fairly reliable estimate.

Anticipated Demand

We may also assume that the entire capacity of the structural engineering industry is more or less fully occupied today. In view of the projected development of industries under the second five

year plan, there is likely to be a much greater pressure on the capacity of the structural engineering industry. The expansion and modernisation of the Tata Iron & Steel Co. and the Indian Iron & Steel Co. and the construction of the two projected State-owned steel works (to be followed by others) will constitute an immense increase in the demand for fabricated structural steel. The latest target for steel production has been fixed at 4½ million tons of finished steel which marks an increase of over 3 million tons. It has been estimated that nearly 200,000 tons of structural materials will be required for construction purposes before we can achieve this target. Obviously priority must be given to the structural engineering requirements of the expansion programme of the two main steel producers—Tatas and Indian Iron—because thereby an early augmentation of steel supply will be assured. To the extent that the production of the existing steel plants is increased, more steel will become available to the structural engineering industry itself, which will enable it to meet the ever increasing demand from Indian industries. All these facts indicate that a tremendous pressure is going to be exerted on the available structural fabricating capacity and that wise and early planning alone could help us to avoid the dislocation and confusion that might other-

wise result. The first and obvious course is to persuade and encourage the existing fabricating concerns to expand their capacity, because this would give quicker and more economical results.

Obstacles

There are, however, some obstacles and these must be removed. The structural engineering industry does not believe that the attitude of the Government has been very helpful. What should be a fair return on capital and what should be considered a fair rate of profit are subjects which have been agitating the minds of the people who are running this industry. The industry feels that the Government is still unable to appreciate the real difficulties and problems that confront a highly technical section of the country's industrial economy. Disturbed labour conditions, high taxation and pegged prices for Government work are some of the most serious impediments. Ideas of a fair return on issued capital and reserves upon which the Labour Arbitration Tribunals have based their recommendations and decisions are also acting as strong deterrents to progress and expansion.

Ultimately everyone is forced to admit that the wages that an industry can afford to pay are determined by the production of the worker and that it is very largely conditioned by the amount of capital that has been sunk in plant and machinery. Any hasty or ill-considered decisions which restrict the flow of capital will not help the worker or the industry, nor will it serve the country. On the other hand it is likely to retard progress and react adversely upon the pace of industrial development envisaged in the second five

year plan, which has rightly laid strong emphasis upon the development of industries in the private sector. The special development allowance of 25 percent announced by the Finance Minister is perhaps the first big step taken by the Government in this direction and the first helpful indication of a correct appreciation on the part of the Government of the problems of modernisation and expansion that are facing almost every industry in the country. This is particularly important for the structural engineering industry which must employ the most modern machinery and the latest techniques if it is to remain efficient and keep down costs. A considerable part of the equipment of the Indian structural engineering industry is in urgent need of renewal and it should be replaced with the most modern equipment available. In view of the key position occupied by this industry in the scheme of India's industrial development, the Government would be well-advised to view its problems with greater understanding and give it all the assistance necessary to achieve that measure of efficiency and economy of operation which alone could enable it to play its proper role in the second five year plan.

Government to Enter the Field

Recently there have been reports about the Government entering the field of steel fabrication. The pressure on the inadequate steel fabricating capacity in the country and the consequent delays may be the reason. If so, one would like to state that it is not the real remedy. The Government must first find out why private investors are not willing to come forward to expand the present

capacity or to instal new plants even with an assured market. There is no lack of enterprise or initiative; but the steel fabricating industry and people who are likely to invest money in such enterprises are not confident that they will be permitted to make a fair return on their investments. Much of the work handled by them will be on Government account and unless the Government simplifies their procedure, minimise interference and speeds up payments, expansion of the structural fabricating industry will be slow.

Labour laws, uncertainty of labour conditions and the bewildering medley of awards and decisions given by the Labour Tribunals are also having a most chilling effect on schemes of expansion. Industrialists are feeling apprehensive that the Government's attitudes and decisions may become more and more coloured by political considerations and that the insistence of employers on adequate output and proper quality from the worker may not receive much support from the authorities. In such circumstances costs always tend to rise. The employers' attention is constantly distracted by the imminence of industrial disputes and incipient strikes. The amount of time that executives in the steel fabricating industry are now obliged to spend on protracted arguments, negotiations and disputes is appalling. Although there has been some improvement in the general atmosphere in recent months, no one can confidently assert that a period of sustained industrial production, free from major disputes and difficulties, has dawned; and unless stability of functioning is guaranteed to an industry plans for modernisation and expansion will remain largely infructuous.

THE MANUFACTURE OF JUTE MACHINERY IN INDIA

• FROM A CORRESPONDENT •

Jute sliver machinery in a Calcutta mill

THE controversial question of the manufacture of jute mill machinery in India is no new one. Thirty-five years ago two firms came to India to manufacture jute machinery for supply to the then rapidly developing Indian jute industry. A slump hit the jute industry, one machine-making company went into liquidation, while the other limped along on engineering jobbing and maintenance work. One would imagine that such an unfortunate history would have precluded any further attempts at the manufacture of jute machinery in this country but it has not proved so. At the time of writing one firm has commenced the manufacture of jute spinning frames in Calcutta, while two other firms have declared their intention of starting manufacture in the near future.

At this stage it is interesting to pause and consider existing world jute machinery manufacturing capacity and the potential market for that type of equipment. It is generally not realised that the entire world demand, not only for jute machinery but also for machinery for the processing of flax, ramie, hemp and the hard fibres used for rope-making, is fulfilled by three comparatively small but specialised engineering firms established in the United Kingdom, employing between them a total of some 10,000 workpeople. On the production of jute machinery alone, probably not more than 3,000 workpeople are continuously employed fulfilling world demand; therefore as a world-scale industry the jute machinery manufacturing industry is minute. This tiny industry exists in the United Kingdom simply because it is highly specialised and competitive, catering for the world market not only in jute but the other bast fibre industries as well. For example, if the jute industry is depressed and jute mills throughout the world from Calcutta to Sao Paulo and from Dundee to Durban are not buying machinery, then the hard fibre industry may be passing through a period of prosperity with ropeworks from Glasgow to Chicago buying their requirements of machinery as fast as capacity will allow. The demand for bast fibre textile machinery from any one particular country fluctuates violently from year to year, and it is of particular interest to realise that the largest United Kingdom manufacturer of jute machinery has supplied to India since the end of the last war from as little $\frac{1}{2}$ percent to as much as 20 percent of its production of machinery in a particular year.

Present Equipment Obsolete

It is well known that the Indian jute industry is the largest in the world comprising some 55 per-

cent of the world's total installed jute loomage. However, it is not so well known that the Indian jute industry is 70 percent obsolete. In the majority of Indian jute mills machinery is between 30 and 40 years old, and after hard working, particularly during the last war when long hours were in force and spares and replacement parts for proper maintenance were very difficult to obtain, the present condition of the machinery in most Calcutta mills is such that the managements have either to face complete renovation of the existing equipment in order to keep it in production, or purchase new machinery. Furthermore, in Europe and the Americas since the 1914-18 war, rising costs, particularly wages, forced millowners in those countries to search for techniques to reduce manufacturing costs. The United Kingdom jute machinery manufacturers responded by producing machinery which lowered production costs through reduction in labour. At present it can be broadly considered that three techniques of manufacturing process are in use in the world's jute industry.

The first of these three techniques can be termed "production by old type machinery." Old type machinery is that which has been in use for some 80 odd years now for the processing of jute fibre to produce hessian cloth and gunny bags. The machinery used is a development of that formerly employed in Dundee for the processing of flax consisting of the basic processes of carding, drawing, roving and spinning on slow running hand-drafted spinning frames of a simple construction. This process is extremely wasteful of labour in relation to the output of finished goods, since many functions are performed by hand, such as the packing and tramping of silver into cans which could be achieved mechanically. This old type machinery amounts to approximately 70 percent of that at present installed in the Calcutta mills. The second technique which can be called "automatic high-speed roving spinning" was a development in the early 1920's of the old type machinery. Mechanical devices were introduced to economise labour costs as far as possible and a new type of spinning frame was designed capable of automatic doffing and high operating speeds. A great number of the European mills before the last war installed this type of equipment, but only a negligible quantity amounting to not more than one percent was installed by the Indian jute mills.

The third technique which is that in use today known as "sliver spinning" was developed about 1932 by the leading United Kingdom manufacturers of jute machinery. It may well be said that the introduction of this technique revolutionised the whole concept of the art of jute spinning, eliminating one previous process and introducing a special device for the control of fibre during drafting on the spinning frame which made it possible to utilise lower cost fibre for the production of yarn of great regularity and strength compared with that produced on the two previous systems. This type of machinery was first marketed by the Northern Ireland firm about 1936 and since that date jute mills on the Continent of Europe have installed sliver spinning equipment in such quantities that to-day it can safely be said that they are modernised to the extent of 85 percent.

Offsetting Higher Wages

With the installation of sliver spinning machinery in Continental mills their manufacturing costs achieved parity with manufacturing costs of Indian mills despite the high differential in industrial wages paid to European workers as opposed to Indian workers. It took a long time for this fact to be appreciated by the Indian jute mill

A modern jute sliver spinning frame

An installation of jute carding machinery

industry, and it was not until 1949 that the first two completely modernised mills came into operation in India.

The working results of those two mills were watched quietly, carefully and, it must be admitted, somewhat sceptically, by the rest of the industry. Modernisation being expensive, few Indian millowners about that time wished to embark on heavy capital outlay and very few orders were placed for modern sliver spinning machinery between 1949 and 1951. However, by 1951 rumours of the success of modernisation with sliver spinning equipment were gaining strength, and the Indian jute industry as a whole began to appreciate

the dangers of obsolescence—particularly as India's neighbour Pakistan started to develop a rival jute industry of her own, planned along the most modern lines. Since then, orders for modern sliver spinning machinery have been trickling through in increasing volume, as more and more jute mill owners appreciated the necessity for re-equipping themselves with modern machinery and managed to find the finance to do so.

With a re-equipment programme for some 70 percent of the Calcutta jute mills still outstanding and mills genuinely wishing to purchase equipment as and when finance can be made available to them, there appears to be a considerable short-

term market for jute machinery in India. However, the accent should be placed on the words "short-term." There is no doubt that circumstances prevailing in the Indian jute industry today are quite extraordinary in that a considerable quantity of machinery is required over a comparatively short period of time, but when that immediate demand is fulfilled, the market for jute machinery in India will dwindle to a size which could probably be supplied by a small manufacturing concern employing not much more than 300 or 400 workers. The short-term implications of manufacturing machinery in India are therefore good, but in the long term with three firms competing in the market the future is very hazy. It is understood that in addition to the firm which has already begun to manufacture jute spinning frames in India, the other two firms who have expressed their intention of manufacturing in the near future will commence with the production of spinning frames. The season for choosing spinning frames is because there is more demand for this particular machine than for any other in the complete range of jute machinery. It is not an easy machine to manufacture, entailing construction of a rigid steel and cast iron framework 40' long x 5' high x 3' broad. Rollers and steel shafting run the entire length of the framework, being driven from trains of gearing mounted at the ends of the framework in what are termed "gable ends." Distributed along the length of the frame are 100 individual units which, through the medium of the rollers and shafting, each process jute sliver into yarn, winding that yarn on to bobbins at a rate of approximately 900 inches a minute. Approximately 1,000 different items entailing a total of 16,000 parts are required to construct one sliver spinning frame which weighs eight tons and markets in the region of Rs. 40,000. Absolute accuracy is required in the construction of the machine if rigidity and precision are to be preserved throughout its length.

Complicated Construction

The particular problems of manufacturing jute sliver spinning frames are unique; one might imagine that the design, manufacture, and construction of—for example—cotton ring spinning frames constitute a close parallel, but this is far from true. The jute spinning frame, on account of the nature of the material it is designed to process, is very much larger and heavier than a cotton spinning frame. In addition, the spinning technique employed is different entailing an entirely different basic frame structure. The combination of these two factors renders the construction of jute spinning frames a considerably more complex and skilled operation than the construction of other types of spinning frame, with the possible exception of specialised hemp and hard-fibre gillspinners.

It has been mentioned above that manufacture of jute machinery is a small but highly specialised industry in the United Kingdom, and it must be obvious that the successful manufacture of jute machinery in India could only be contemplated provided the traditional skills and specialist knowledge of the United Kingdom manufacturers are made fully available to the prospective firms in India adventuring into this industry. Furthermore, since the design of jute machinery is by no means static, with new developments being introduced from year to year, if the Indian jute industry is to benefit there must be an exceptionally close link between the established jute machinery manufacturers, who with their larger turnover can support research and development departments within their organisations, and their necessarily smaller Indian counterparts. One good augury for the future not only of jute machinery manufacture in India but also for the jute industry itself, is the fact that generally it is expected such a link between established manufacturers and their Indian counterparts will be formed. The firm which has just begun manufacturing jute spinning machinery in India has had a long and very close connection with the Indian jute industry and is associated with a well-established firm of machine makers in the United Kingdom. The first of the two firms which have declared their intention to manufacture jute machinery in India developed and has supplied the bulk of modern sliver spinning equipment. It is understood this firm intends to manufacture its equipment in India under its own direct management and consequently it is expected that the quality of the product will be the equal of that produced in the United Kingdom works. The third firm has also had a long and close connection not only with the Indian jute industry but with Indian industry and commerce generally. It is believed to have made arrangements for the supply of technical knowledge from a reputed firm of United Kingdom jute machinery makers who have supplied some sliver spinning machinery to India in recent years. Thus in general, technical knowledge, and certainly in one instance, traditional skills will be available to the new jute machinery manufacturing industry of India.

BUILDING LOCOMOTIVES AT CHITTARANJAN

• By RAJ KOCHAR •

THE story of Chittaranjan is mixed up inextricably with the history of the Indian railways—a history which began over 100 years ago in 1853 when the first Indian train steamed out of Bombay. Chittaranjan can be said to have been born of the expansion of the Indian railways, and their requirements, that took place over the course of the years. Today the country's railway system comprises roughly 38,000 miles of running track and to move the constant stream of traffic on these lines 8,500 locomotives have to be maintained in running order. Based on the experience of the past 100 years, the life of a steam locomotive has been assessed at 40 years. It is therefore apparent that we require at least 200 locomotives every year on replacement account only. The approximate cost of a standard locomotive delivered in India being Rs. 4.5 lakhs, an annual expenditure of Rs. 9 crores is required just to meet the power requirements of the railways and this sum has in the past, gone almost in its entirety into the pockets of foreign locomotive builders. There was thus a crying need for a home industry in this field on economic considerations alone.

Historical Background

Attempts had been made in the past to build locomotives in the repair workshops at Ajmer, on the old Bombay Baroda & Central India Railway and at Jamalpur on the old East Indian Railway but those efforts were largely spasmodic and a substantial number of components had to be imported to complete the locomotives. Production was never established and the locomotives did not even meet the overall requirements of the railway concerned, let alone of the country. The importance of having an indigenous source of regular replacement, even apart from considerations of economy, was brought home to the Government during the first world war, when locomotive imports, on which depended the normal operation of the railways, became difficult. In 1921, the Peninsular Locomotive Co. was incorporated and works laid out in Singbhum, near Jamshedpur, but due to insufficient encouragement from the Government the factory never went into production and the company was dissolved in 1924. The partly constructed workshop was, for a time, used for the construction of carriage and wagon underframes and during world war II was taken over by the Defence Department. Later in 1945, Tata entered into an agreement with the Government to take over the Singbhum workshop and float a limited company for the manufacture of locomotives. Thus Tata Engineering and Locomotive Co. Ltd. was incorporated in September, 1945 and started producing locomotives in 1951.

Selection of Site

The setting up of a locomotive manufacturing concern was demanded repeatedly in the legislature in the thirties. In January, 1940, a Committee was appointed by the Government to examine in detail a scheme for locomotive manufacture in one of the existing railway workshops. The Committee in its report confirmed the possibility of establishing an economic locomotive building industry in the country. The second world war was responsible for the postponement of further consideration of the scheme, but on the cessation of hostilities detailed investigations were again carried out and it was decided to establish a new workshop at Chandmari, a place near Kanchrapara. But due to the partition, the Chandmari site had to be rejected as it was close to the border. The Railway Board finally gave its approval in favour of Mihijam in December, 1947.

Approximately 20 miles by road or rail from Asansol junction, situated in the Bengal-Bihar coal belt and readily accessible from the steel mills of Jamshedpur, Burnpur and Kulti, the village of Mihijam appeared to be an ideal location for a heavy manufacturing industry. The rocky soil was an advantage in erecting foundations for heavy structural work. The undulating terrain solved the problem of water drainage for the township while the schemes of the D.V.C., which envisaged hydro-electric and thermal power stations in the vicinity, assured cheap power.

Once the decision was taken, development progressed apace. In March, 1948, a railway siding was laid down linking the proposed factory site with the main line of the Eastern Railway and materials and labour started moving in. The first sod was turned at the site in September, 1948 and heavy construction work commenced soon after. The speed at which work progressed can be easily imagined from the fact that the first machine was installed towards the end of 1949 and Srimati Basanti Devi, after whose illustrious husband the township has been named pulled a lever and set it revolving on 26th January, 1950—an appropriate date indeed.

Meanwhile, construction was progressing smoothly. The completed workshops and offices having a total covered area of over a 1,000,000 sq. feet were put up in record time. Some 11,000 tons of riveted and welded steel were used in the construction of the shops alone while 20 million cu. ft. of earth had to be moved before the site was levelled for construction to start, and approximately 475,000 cu. ft. of cement concrete went into the foundations of the buildings and machines. At the same time, the construction of the colony was being pushed steadily. Over 5,000 buildings, 70 miles of roads, about 200 miles of water and drainage pipes and 75 miles of electric high and low tension wires all went up over the next two years—in itself a striking achievement.

Anatomy of the Workshop

By the end of 1950, Chittaranjan Locomotive Works had taken shape. The shops as they stand, are located in three groups, south, centre and north. The first group consists of the pattern shop and the brass and iron foundries, the centre group comprises the forge and smithy and the heavy and light machine units; whilst the boiler shop and two assembly bays running parallel with a finished parts stores bay make up the north group which by itself is 1,560 ft. x 220 ft. The shops, as well as sections within the shops have been laid out to permit uni-directional flow of material. Facilities like overhead travelling cranes, jib cranes, tractors and power trucks have been provided lavishly to make movement easy and efficient. Built on the long experience of Indian railway engineers and the further knowledge acquired by some specially deputed to visit foreign manufacturers to study workshop layout and general trends in locomotive building, the Chittaranjan Locomotive Works are considered to be among the most modern in the world.

Entering by the main time office gate, the first building we come to is the pattern shop. Wooden patterns are made here for all the castings required. Patterns for steel castings are sent to other works (at present Chittaranjan has no steel foundry) whilst those for brass and iron castings are taken to their respective foundries. The brass foundry turns out an average of 40 tons of castings every month. The outturn of the iron foundry is in the region of 165 tons and includes the cylinder, an intricate casting weighing three and a half tons. In the forge and smithy which comes next, coupling and connecting rods, etc. are forged to shape by electro-pneumatic hammers while smaller components are die-forged under batteries of drop stamps. The forge and smithy shop also includes a spring section where all coil and helical springs are made. The boiler construction shop handles all the sheet metal work for the boilers, ashtrays, sand boxes, boiler laggings, etc., in addition to all flanging work. Plates of boiler quality steel 9 ft. x 8 ft. x 7/8 in. are hot-pressed to shape under a 650 ton hydraulic press while a 250 ton press handles smaller pressings such as dome covers.

From these basic processing shops we pass on to the machine shops. In the heavy machine shop, 247 machines including borers, drills, grinders, millers and some special purpose machines, finish the rough castings and forgings to sizes with an accuracy of within as much as 2,000th of an inch. Special heavy duty machines such as vertical duplex borers for motion rods, horizontal cylinder borers, hydraulic plano mills and contour grinders have been provided. Minor assemblies are also completed before all the parts are despatched to the main assembly section. Housed in the unit but self-contained is the wheel shop. Wheel centres, tyres and axles are purchased rough from steel rolling mills and foundries and are machined and assembled here. Tyres are heated by electric induction heaters to a temperature of 480°F in seven to eight minutes and are shrunk on to wheel centres. They are then rivetted over for additional security. The axles and crank pins are pressed in by a 650 ton hydraulic press at a pressure of 10 tons an inch of diameter.

The light machine shop is equipped to handle smaller components such as bar work items, non-ferrous castings and certain minor ferrous castings. Approximately 80,000 fully machined components are turned out every month. A separate shop under the same roof is the tool room which supplies cutting tools of all types to machining

The Burmah-Shell Refinery, the largest in India, was formally opened by Dr. S. Radhakrishnan, the Vice President of India, on March 17th, 1955.

In the course of his address, Mr. J. F. Sinclair, Chairman of the Board of Directors, Burmah-Shell Refineries Ltd. said, "I see, then, the value of this refinery, first of all, as a real contribution to what our Prime Minister has described as 'the exciting adventure of building the new India.'"

"Capital formation on a grand scale, new skills technical and administrative, the possibility of new ancillary industries, opportunities of employment, all these have an absolute value not to be underestimated. But then I see it again, within the wider vision of the new India, as an outstanding example of what *private enterprise*, backed and encouraged by an enlightened democratic Government, can achieve.

"And consider what the building of this refinery, and its friendly American sister across the way, involved for others. The greatness of the conception of Trombay's refineries was matched at once by the vision of Bombay as a petroleum port equal in facilities to any in the world.

"Here in this small island and its adjoining sea we have some fulfilment of great plans for the great future of a very great country. Free Enterprise and an understanding liberal government have achieved something which I believe is a vindication of a principle, which any country rejects at its peril. Quite simply, it is that we, the business men and the State, have complementary—not conflicting—roles to play in the development of the country. And that the more clearly this is recognised, the quicker will be the inspiring type of progress we see around us to-day."

MANUFACTURE AND ASSEMBLY OF ELECTRICAL PLANT IN INDIA

• By A CORRESPONDENT •

Electric motor assembly

SHORTLY before the commencement of the second world war, it became apparent that industrialisation would spread rapidly in India, and consideration was then given by a number of companies to the possibility of manufacturing electrical plant within the country, and not unnaturally the articles in common use were selected first. For some time before the war, fans, lamps and cables were manufactured in India, and these industries were expanded. At the same time the quantity manufacture of electric motors, transformers, and the simpler types of switchgear was taken in hand. The initial expansion was naturally severely limited during the war years as all kinds of machine tools were difficult to obtain and deliveries were very long, but after the war development was rapid and indigenous production of the above types of electrical equipment is now expanding rapidly. A summary of the development of the main lines of production may be of interest.

Fans: The electric fan industry is probably the oldest electrical industry in India, manufacture commencing as far back as 1924. The present range of manufacture includes ceiling, table and pedestal fans for domestic use, railway coach fans, and various types of air circulators; in addition, a number of large fans for air-conditioning plants and other purposes are produced. At present the total requirements of domestic fans for the whole country are met by indigenous manufacture, and the export market is also being explored. The industry is now working at about three-quarters of its installed capacity of 304,000 units, the total production during 1954 being a little over 235,000 fans of all types.

Cables and Wires: Manufacture of cables and wires in India commenced on a very small scale about 1923, and since that time the industry has expanded until today, with the exception of paper insulated cables, all classes of wires and cables are being produced in large quantities. For example in 1954 indigenous production totalled about 8,600 tons of copper conductor, 5,900 tons of aluminium conductor, 60 million yards of rubber and plastic-insulated flexible wires and cables, and 319 tons of winding wires.

It is expected that within a relatively short time the manufacture of paper-insulated power and multicore cables of at least the more common sizes and voltage grades will be started in India. In addition of course, plans are in hand for the expansion of the existing factories to cope with the greatly increased demand which is expected during the second five year plan.

Lamps: Manufacture of lamps in India began in the early thirties, and nearly all grades of electric lamps used in the country are now indigenously produced. Manufacture started with vacuum filament lamps of low wattage, and now extend upwards to the 1,500-watt range of filament lamps, and also includes tubular fluorescent lamps. The total production of filament lamps in 1954 was some 22,840,000 and that of fluorescent lamps about 214,000. The demand for filament lamps showed a relatively small increase over the twelve-month period whereas the production of fluorescent lamps during the last quarter of 1954 was nearly double that of the first quarter, and the output for January 1955 showed a further marked increase. It is expected that the industry will keep pace with the requirements of the country and continue to supply all the nation's needs. In fact an almost immediate increase in output could be achieved by stepping up production to the full rated factory capacity, as at present the actual production is about three-fourths of capacity.

Heavy Electrical Equipment

Electric Motors: A few electric motors were manufactured in India as far back as 1935, but

production on any considerable scale commenced only after the last war. The range of production now covers A.C. three-phase, squirrel-cage and slip-ring motors, including special types such as loom motors, high-torque motors, hollow-shaft vertical-spindle motors, and many other diverse types of specialised application. Motors up to a rating of 300 h.p. could be manufactured at the moment, but to date the largest size produced is 225 h.p.; the output of motors of this size has so far been small, as by far the greater proportion of manufacture is of motors up to 35-40 h.p., as this range covers the majority of the motors required for small industrial and textile drives, and for irrigation purposes. For the second five year plan the industry proposes to extend its range of manufacture to include motors up to 1,000 h.p. rating.

The present installed capacity of the Indian electric motor industry on a single-shift basis is about 340,000 h.p. per annum. Plans for expansion of this output are already in hand and it is expected that the total net addition to the existing capacity of the industry will be of the order of 200,000 h.p., giving by the year 1960-61 a total installed capacity in excess of 500,000 h.p. per annum. The target for installed capacity envisaged in the first five year plan was 300,000 h.p., and this capacity is therefore likely to be well exceeded; the second five year plan target of 800,000 h.p. per annum can be met by the future installed capacity of 500,000 h.p. without difficulty by the introduction of multiple-shift working.

Some difficulties hampering the actual production output of the motor industry have been caused by the necessity for importing a large proportion of the basic materials (such as ball and roller bearings, insulation, winding wires, etc.), since the indigenous production of these is at the moment insufficient and in certain cases non-existent. In 1952 approximately 60 percent (on a cost basis) of the basic materials for the manufacture of electric motors had to be imported; however it is hoped that by 1960-61 this figure will be reduced to about 40 percent by the indigenous manufacture of more of the basic materials, for which purpose several schemes are already under active consideration.

The industry employed in 1952 some 1,600 persons and the total production output in the same year was about 150,000 h.p.; by the year 1960-61 it is estimated that approximately 6,000 persons will be employed in the actual manufacture of motors,

and of course more employment will be created by the proposed basic materials industries.

Transformer: The Indian transformer industry was begun before the second world war, but as in the case of the motor industry, wide progress has been made only in the post-war years. The transformer industry has also been handicapped by the difficulties caused by the necessity of importing basic materials such as winding wires, stampings, insulation materials and cooling tubes; in 1952 as much as 62 percent in value of the total basic materials were imported. In the future, however, it should be possible to meet by indigenous manufacture the requirements of electrical steel sheet, insulated copper wires and strips, electrolytic copper of heavy section, and mild steel components; it is therefore expected that by 1960-61 the proportion of imported materials will have been reduced to about 25 percent. The refining of transformer oil in the country will by that time be well established.

Production of transformers has increased from 178,000 kva in the year 1950-51 to 327,000 kva in the first six months of 1953-54. During the period 1954-55 there has also been a considerable increase in demand, the chief reason for this being the recent sanction of increased generating capacity which has resulted in the placing of large orders for transformers by several State Governments (for example the Madras Government requires 2,000 units, and the Government of Bihar 800). Plans for expansion of the transformer industry are already in hand, and it is expected that the present installed capacity available in the country of 304,000 kva per annum will have been increased by 1955-56 to more than 650,000 kva; the target capacity for 1960-61 is 1,200,000 kva per annum, and to achieve this a sum of approximately Rs. 24 crores will be required for the development and expansion of the industry.

It is at present possible to manufacture in India transformers up to 4,000 kva and 37.5 kva, although to date the largest size produced has been 3,000 kva. For the second five year plan the range of production is to be extended up to 10,000 kva. The transformer industry employed in 1951 some 1,200 persons; by 1956 the employment will be over 2,000 and at the end of the second plan it is expected that about 5,000 persons will be employed by the industry.

Switchgear: The assembly and manufacture of switchgear in India is of comparatively recent origin; the industry covers a wide range of products

Cable manufacture in a factory in India.

from simple knife switches, fuses, iron-clad switches, starters, etc. to industrial and medium power switchgear, mainly utilising imported circuit breakers in switch units manufactured in India.

There is also a very considerable production of isolators and air-break switches in various voltage ranges up to 132 kv. These high-voltage isolators and switches have been manufactured by one company in Calcutta for the last ten years, and are in use in large quantities on practically every grid transmission scheme in the country. Over one thousand three-phase units for voltage of 66 kv and above, and over twelve hundred three-phase units in the range 3.3 kv to 37.5 kv have been produced to date, a considerable contribution to India's transmission and distribution systems. In this section of the industry also plans for expansion are being put in hand.

House Service Meters: Although the house service meter industry in India is of recent origin, there are now four factories in the country, all associated with foreign companies, with a total installed capacity (according to the rather varied assessments of different authorities) of the order of 250,000 meters per annum: the majority of the manufacture is limited to the A.C. single-phase house service meters up to about 10 amperes capacity. According to official figures, the production of meters during 1954 was a little over 150,000. Since this represents about 60 percent of the installed capacity, it is evident that the existing factories are in a position to keep pace with the rising requirements of the country.

The Industry and the Five Year Plans

As already indicated above, the very large expansion in electrical generating capacity proposed under the first and second five year plans is certain to result in a considerable increase in demand for motors, switchgear, transformers, etc., and the proposed expansions of the various sections of the industry are based more or less on the increase in electrical power to be provided by the various projects now under construction, or shortly to be commenced. However in addition to this direct stimulus, the electrical industry is bound to receive great impetus from the fact that more and more of the basic materials will become available from indigenous manufacture as the proposed industries begin production. An important contribution towards completely indigenous manufacture will be made by the new steel plants, as supplies of mild steel plates, angles, rods, strips, etc. should be readily available. It is to be hoped that the steel produced will be almost entirely of the grade known as "tested quality", since one of the present headaches of manufacturers, namely, the insistence of Government inspectors on inspection of raw steel, would thereby be eliminated.

Factories for the production of various types of insulating materials are being planned, while the range of production of ball and roller bearings is to be considerably extended. The contribution of the electrical industry towards the prosperity of India is thus assured, and the benefits will be manifold, as not only will the country eventually become self-sufficient in medium-sized electrical plant with the consequent enormous saving in foreign exchange, but also the industry will provide employment for large numbers of persons and help to increase living standards.

CAR DEALERS TO MAINTAIN COMPLAINT BOOK

The Ministry of Commerce and Industry has asked manufacturers of cars and trucks, whose programmes have been approved by the Government, to issue instructions to all authorised dealers and sub-dealers to maintain a complaints book. The book, in which car-owners can enter their complaints, will be prominently displayed at the premises of the service station. The action taken by the service station to remedy any complaint entered in the book will be recorded there. Dealers and sub-dealers will also be asked by the manufacturers to maintain blank "Vehicle Defect Report" cards to be given free of charge to every buyer at the time of sale of a vehicle. A specimen card, prepared by the Ministry of Commerce and Industry for the purpose, has been supplied to the manufacturers.

TECHNIQUES OF CONSTRUCTION IN INDIA TODAY

CHANGING METHODS TO SUIT MODERN NEEDS

● FROM A CORRESPONDENT ●

THE start of the constructional engineering industry, as it is known to-day, was probably in 1783 when a patent was taken out for the use of cast iron sheets in the covering of houses. Little has been recorded about the use to which this patent was put and it appears probable that these cast iron sheets proved too costly, not to say unsightly, to have ever been popular. Cast iron was not a revolutionary material for the structural engineer even in those days because it has similar properties to the then existing building materials such as masonry and concrete. Cast iron will carry a greater load in compression than masonry, but it is very little stronger in tension. In other words if a bar of cast iron were held at either end and pulled, it would break easily. Thus the structural designer in cast iron had to make the use of arches in the same way as the masonry designer, so that his material would always be in compression. Despite this lack of tensile strength, cast iron was in use by 1808 for bridge decks and floors in fireproof buildings. Shortly after this the manufacture of wrought iron reached the stage where it could be used economically for constructing building frameworks and making ships' masts. The forerunners of the New York skyscrapers were constructed in the 1860's. They were houses of only four or five stories with iron frameworks and iron sub-panels to carry the windows.

Indian Building Conditions

Buildings in India in those days were of massive masonry construction, particularly in places such

as Calcutta where, due to the clay soil, the buildings usually settled, and the walls were therefore liable to cracking. There were some iron buildings in the country of course, but these were mostly ornamental pavilions in the gardens of the rich. It was not until modern methods of piling had been developed, that it was possible to erect tall structures in the areas where the soil was mainly clay. With modern piling methods, there is really no limit, except that of cost, to the heights which can be chosen for flats and office buildings. It is of course desirable to make the buildings as light as possible and this can be achieved by using a light-weight steel frame composed of rolled steel joists and channels. The walls usually consist of light hollow tiles or hollow concrete blocks. These latter may, in the future, be replaced by prefabricated aluminium panels supplied complete with all windows and doors. This type of construction lends itself to phenomenally rapid erection. Recently in America a large office building of some 40 floors was completely encased by this method in a matter of days. In many parts of India, such as Calcutta, where the soil conditions are bad for supporting heavy loads, this lightweight construction is most desirable.

Factory Building

A large part of the constructional engineer's work is the manufacture and erection of factory buildings. The earliest of these date back to about 1834 and were more or less portable sheds. Since those days the industry has had many changes—

first from cast iron to wrought iron and then from wrought iron to steel. Now electric arc welding is gradually superseding rivetting, and modern design methods are making great savings in weight for a given size of building. Modern factories usually demand large areas without stanchions or pillars. This can be secured by using the old conventional types of roof trusses, but it is often desirable not to have a forest of steelwork overhead. The way to avoid this is to use "portal frames". These consist in their simplest form of two vertical columns on each side and a flat beam across the top, with the joints between the vertical columns and beams at least as rigid as the beams and columns themselves. It is only since the advent of welding that these rigid joints between the columns and beams have become a practical and economic proposition. The rigid joints give the buildings lateral stability and reduce the stress in the beam, thus permitting the use of a smaller section than would otherwise be required. The shape can always be changed to give a pitched roof and the design is particularly suitable where corrosive fumes find their way up into the roof because in this type of construction there is a minimum of steelwork exposed to corrosive action. The design of these frames is very complex and is based on the "elastic theory"—that is in which steel is treated as an elastic material. A good example of this elasticity is the spring of a weighing machine which stretches proportionally to the load applied. The theory is true for a certain range of stresses in

RAILWAY BRIDGE CENTRAL RAILWAYS

**STEEL
RAILWAY
BRIDGES**

**BRAITHWAITE & CO.,

HIDE ROAD, KIDDERPORE, CALCUTTA.

steel, but once the stress exceeds a certain value known as the "elastic limit", it behaves more like plasticine or clay and assumes the so-called "plastic state".

Simple Design

Design by the plastic theory is relatively simple even for complex rigid multiple frames because, as each part of the cross-section of a given number yields, the stress is transferred across the section giving even stress distribution. To illustrate the point consider a simple example such as a desk ruler resting on two match boxes, one supporting each end. Pressing down on the centre of the ruler causes it to bend—or as the structural engineer would say—deflect. Clearly, in order that it may deflect the top of the ruler must have been shortened and the bottom lengthened. That is the top of the ruler is in compression and the bottom in tension. At the point mid-way between the top and the bottom there is a thin layer of ruler neither in compression nor tension. Providing the stresses in the ruler are within the elastic range the stress is proportional to the strain. That is to say that the amount of shortening at the top of the ruler is proportional to the vertical force applied. From this it can be deduced that the stress at the top of the ruler is maximum compression and gradually falls to zero in the centre of the ruler and then rises to maximum tension at the bottom.

With the plastic theory however it is assumed that the steel yields or gives way, so that the maximum stress in compression appears across the whole cross-section of the top part of the ruler, and similarly maximum stress in tension over the whole of the bottom half of the ruler. From this it can be seen that the plastic theory gives a considerable simplification over the elastic theory. An interesting example of plastic design was the "Morrison" air raid shelter developed in the United Kingdom during the war. It consisted of a simple table constructed of sheet steel on a relatively light angle framework. The table was designed so that it would buckle under the load of masonry when a house collapsed on top of it. This buckling which is really plastic deformation would absorb a considerable part of the kinetic energy of the falling masonry. The table would be badly damaged, but would have withstood loads very much in excess of the failure load for the steel. In this particular case the fact that the table was buckled beyond repair obviously did not matter as it would have

served its purpose by holding the collapsed building off the people sheltering underneath.

Another interesting development is the composite method of combining concrete and structural steel. These are both used to the best advantage in that concrete is used for the part of the member in compression and a steel section for the part in tension. This type of structure is now being used extensively for roadway bridge decks. For this the bridge stringers are arranged in the conventional way, and anchors are welded to the top of the stringers to transfer the shear stress from them to the concrete deck above. Reference to the illustration of the ruler above will show that for this construction the concrete is taking the compression load and the steel the tensile load. In this way no steel is wasted in the compression area and no concrete wasted in the tension area.

Bridge Building

Bridges form a large and interesting section of the constructional engineer's work. The type of bridge is dependent on the nature of the soil which must be used for the foundations in just the same way as the choice of building. Where there is a hard soil that will support a heavy load, little difficulty is encountered. In poor soil conditions, a special type of foundation must be used. One simple form of bridge pier foundation for bad soils is the well or caisson. This is a large box with no top or bottom which is sunk by taking out the material inside and adding extra side plates at the top as it sinks down. Where the water is deep, or for other reasons the soil tends to push up in the bottom of the caisson, a roof is provided and the caisson sunk under compressed air. That is, the air pressure within the caisson is kept sufficiently high to keep out the water and sand. (For most work, pressures up to 20 lbs. per sq. inch are sufficient.)

A good example of bridge building 100 years ago is one of the bridges at Bassein in the Bombay Presidency, which was designed for carriage and foot traffic and has three spans with a total length of 160 ft. Only 15 tons of ironwork were used in the superstructure, which cost approximately Rs. 4,000. A bridge of this nature built to carry modern loads, would now cost many lakhs of rupees. It is interesting to note that the piers of this bridge that were founded in the river were supported by screw

piles. This method of piling, has been, and still is, very popular in India. It consists of a long round bar with a screw, similar to that of a wood screw, at one end. The main difference between this and a wood screw is that the pile screw is usually about 5 ft. in diameter, while the pile bar itself is from 4 inches to 6 inches in diameter. The screws are usually what engineers term "two start", because with this arrangement there are two cutting edges opposite to each other. These serve to balance the torque and prevent the pile from getting out of line as it is screwed down. Incidentally a good example of a multi-start screw, is that usually used to secure the cap of a fountain pen. It may be observed by experimenting that it is possible to start screwing the cap of a fountain pen in not one, but several positions of the cap.

This form of foundation has been developed so that hollow cylinders may be used in place of the pile bars. With this method the cylinders are usually 3 ft. in diameter and the screws up to 10 ft. This enables fewer piles to be used and gives a greater area to resist horizontal loads. A further development is to screw down a casing by this method and then withdraw the cylinders, place some reinforcement and fill the casing with concrete. This method of piling has been extensively used for jetties in many parts of the world. The early screw piles, which were usually the steel bar types, were screwed by using simple hand capstans or even, in the very earliest days, harnessing bullocks to a cross bar and driving them round in a circle on a staging. Modern piles are screwed with electric capstans.

The Industry in India

The Howrah Bridge, one of the largest single spans in the world, was almost entirely fabricated in India. The Ganga Bridge, which will be built at Mokameh, will be over a mile long with 14 main spans of about 400 ft. each. It will require about 14,000 tons of steel and will have a lower deck to carry rail traffic with a roadway deck above. It is scheduled to be completed in 1959. Even prior to the construction of the new oil refineries, the constructional industries were making large welded oil storage tanks up to 120 ft. in diameter in accordance with the latest American practice. This work, and the construction of water tanks and railway wagons, is a small but important section of the activities of the constructional industry.

WELDING AND OXYGEN CUTTING IN ENGINEERING NEW METHODS TO SUIT DEVELOPING NEEDS

• By C. D. MORPETH •

THE world today requires speed in all fields of activity. In transport we are moving at speeds twenty times greater than was possible only a century ago, and in fact in every method of transport, we move at greater and greater speeds every year. The tempo of our life is quicker, we earn more and we spend it more quickly; so too industry develops more quickly and is ever looking for methods by which the speed of manufacture or fabrication can be increased. Where metals are used in industry, welding and oxygen cutting have been the principal means of achieving speedier and more economical methods of fabrication. There are many processes covered by the title of this article, all of which in their own way play their part in industry, and we shall review briefly some of them and their rôle in industrial progress. Generally speaking, the cutting of steel comes before welding in any manufacturing procedure; to review this process first would seem to be the logical way of dealing with the subject.

Oxygen Cutting

More oxygen gas is used in this process than in any other in India today though the actual manufacture of steel now absorbs the greater part of the world production of oxygen. That steel could be cut by oxygen was discovered in 1885 by Thomas Fletcher, and, to begin with, this had an interesting albeit disturbing, consequence. Well-to-do people, especially bankers, started to worry about the contents of their safes and demanded prohibition by law of its use. Fortunately, however, there were people with wider vision and ever, there were people with wider vision and today oxygen hand cutting is used in many spheres of industry. Hand blowpipes are used mainly for cutting scrap metal and for demolition purposes, but are also used for trimming and sizing sections of metal. Oxygen cutting is also used for the demolition of sunken wrecks and for underwater repair of damaged ships. For this purpose a special blowpipe has been developed in which the high pressure air surrounds the flame to keep the water away from it. In this mechanical age, the natural evolution from hand cutting was to fix a cutting blowpipe to a machine in order to obtain steadiness and a controlled rate of travel, variable according to conditions. Today by using one of the many types of machine cutters, a finish within an accuracy of as low as 1/32" can be achieved, which, for all normal fabrication work, is perfectly satisfactory. The speed with which steel can be cut by this process is many times greater than by any other process, and the saving to industry must amount in a year to many lakhs of rupees.

Ships' plates are trimmed to size in Visakhapatnam's shipyard by straight-line cutters; side plates and boiler plates are cut in the locomotive works of Chittaranjan by other cutting machines; thousands of small parts in general engineering workshops are cut to shape by profile cutting machines; billets are cut to size in steel works either in a cold state, or sometimes while they are still hot, by the process known as hot cropping. At present, unfortunately, there is in this country some opposition to the use of flame cut surfaces as a preparation for welding, but overseas the use of oxygen machine cutting is now everywhere accepted as the most efficient and economical method of shaping steel. The normal profile cutting machines cut steel only up to a thickness of 12", but with the latest designs of heavy cutting blowpipes, up to 60" of steel can be cut with reasonable accuracy, while by means of oxygen lances even greater depths can, in fact, be roughly cut. Further developments have made it possible to cut alloy steels and some non-ferrous metals by injecting iron particles into the oxygen stream, causing exceptionally high temperatures. There have been many other developments from the original oxygen cutting process all of which assist industry to produce economically: gouging, powder gouging and drossing are all useful particularly in the steel industry where defects in

billets or blooms must be removed before rolling or other processing.

Oxy-Acetylene and Arc Welding

Almost all metals known to industry can be welded by the oxy-acetylene process, but it is used mainly for the welding of light sheet metal, repair or maintenance work and for welding many non-ferrous metals and alloys; it is particularly useful for delicate operations where arc welding is more difficult to control. It is used extensively in a modified form for the hardfacing of machine parts subject to wear. Due to the very low initial cost of the equipment necessary for using this process, it is particularly popular with the small manufacturer or repair worker and throughout the world today one sees the familiar cylinders and welding blowpipes in garages, maintenance workshops, farms and in fact wherever steel or metals are used. Electric arc welding has superseded the oxy-acetylene process for most steel constructional work. This process is very much quicker than oxy-acetylene welding and has made possible the welding of steel in most constructional jobs where rivetting was the former method of fabrication. Today entire ships are fabricated by

this method and the familiar noise of rivets being hammered into plate is no longer heard in many of the world's shipyards. At present, in the Hindustan Shipyard at Visakhapatnam, rivetting is still used to a large extent, but gradually more and more part of the ships sliding down the slipways are being welded and eventually they too will produce all-welded ships. Boilers, structural steelwork, and pipes of all sorts and sizes are welded together in all parts of the country. In locomotive manufacture, the first Indian locomotive bar frame has been welded and is now in service, while fireboxes and many other parts of the locomotives turned out from the locomotive works at Chittaranjan and Jamshedpur are fabricated by electric arc welding.

As a general maintenance process arc welding is not so versatile nor so widely used as oxy-acetylene welding; but many fractured cast iron components are repaired by arc welding and some non-ferrous metals and alloys can be successfully welded. It is however in the field of hardfacing that arc welding plays its chief part in maintenance. Hardfacing involves the deposition of a wear-resistant alloy where severe abrasion, impact

or corrosion or a combination of these will lead to excessive wear in service. Hardfacing may be conveniently applied either in the reclamation of worn parts or in the construction of new equipment, because here a wear-resistant alloy can be applied just where it is wanted instead of having to fabricate the whole unit from an expensive alloy. There is available a wide range of arc welding electrodes depositing different wear-resisting alloys to meet and overcome different service conditions, so that expensive equipment is kept in use longer and it is in this specialised field that the arc welding set is so important as a maintenance tool.

As with oxygen cutting, so with arc welding, mechanisation has now come into increasing vogue and arc welding is carried out by machines. Although at the present time in India this method is not used on a large scale, more and more engineers are realising the advantages of mechanical over manual work, especially in point of economy and automatic arc welding machines using continuous electrodes are installed in many of the larger structural works. Large diameter pipes are being automatically welded in Bombay; in the shipyard at Visakhapatnam new automatic machines are being installed; at Chittaranjan automatic equipment is already in use; penstock pipes for the D.V.C.'s Maithon project are to be fabricated by this method and many engineering firms are turning to this process for greater economy and production accompanied by unfailing quality. In order to obtain the greatest benefit from automatic welding, a high production rate is necessary and machines must be kept at work for the longest possible time during any shift. This requires the use of jigs, and the capital cost of an automatic arc welding installation will usually be higher than that of the equivalent manual arc welding equipment. Where a high production rate is required and a good utilisation factor is possible the economy in time and labour more than compensates for the greater initial outlay and the standard of welding is considerably higher than that achieved by manual operators.

"Argonarc" Welding

Although in India at the present time aluminium is not fabricated to a great extent, the latest method for welding this metal has been widely introduced. When welding stainless steel and non-ferrous metals it is normally necessary to use a flux which is difficult to remove after welding and in some cases causes damage to structures subsequently. The use of a shield of inert gas round the molten metal enables aluminium, stainless steel and other metals to be welded without flux, with a consequent saving either in removing residual flux, or in the life of the structure so fabricated. The standard which can be achieved in "Argonarc" welding is very high and it has been accepted throughout the world as the most satisfactory means of fabricating many metals and alloys. It is particularly applicable to the chemical plant manufacturing industry where many vessels must be made out of stainless steel or aluminium and there are a number of firms in India engaged in producing such equipment by this process. Prior to the discovery of this process aircraft were fabricated largely by rivetting because the danger of corrosion from flux deposits was too great. Now, however, an increasing number of aircraft structures are being welded by the inert gas shielded process.

The manufacture of jet engines is greatly assisted by the use of Argonarc welding in a large number of components many of which are exceedingly intricate in design, and as more and more of the world's aircraft are powered by jet engines, this process will play an increasingly greater part in keeping down costs of manufacture in the aircraft industry. The Argonarc process uses a tungsten electrode and where it is necessary to reinforce the weld a filler rod must be used; it has been possible to achieve a certain degree of mechanisation by mounting the electrode holder on a tractor and feeding a continuous electrode into the welding pool by automatic means. The latest development, however, is a process using a continuous electrode shielded by inert gas whereby speeds of welding far in excess of those attainable in the past can now be achieved, making possible the welding of thicker sections of non-ferrous metals and making economical the fabrication by welding of a very much wider range of products. The inert gas shielded arc is now also being used for the welding of mild steel abroad, and the speeds which can be achieved are considerably faster than those obtained even by automatic metallic arc welding. There are a number of other welding processes which are not covered by this article, all of which play their part in building industry in India, but these have their own restricted applications and so have not been dealt with in this general review of welding in industry. Some other processes have also been developed from oxy-acetylene welding such as, flame cleaning, flame hardening, metal spraying and the various uses of oxygen in the manufacture of steel.

Conclusion

India has not yet reached the same standard of mechanisation as obtains in the more advanced parts of the world due to the hitherto restricted scope of the manufacturing projects at present operating in the country. Mechanisation can be of use only where production is large enough to carry the high initial capital cost, but the fast-developing pace of industrialisation will very rapidly make possible the mechanisation which is so necessary to enable India to compete on an equal basis with foreign manufacturers. Those firms who put their capital into automatic equipment will reap the

Gas welding of joints on bus body.

benefit of many years of research and practical experience in other countries, and in this respect India is particularly fortunate. All the latest developments in welding and cutting equipment are available at any time to the engineering industry, although its size could not as yet justify the manufacture of such equipment in the country itself. Not only is the equipment available, but the latest techniques and a vast accumulation of knowledge based on practical experience can be obtained, and in this as in many other industries, technicians go abroad regularly to bring back details of this knowledge. As the second five year plan gets into its stride, there will be an even greater call on the engineering industry to produce more machines, to build more factories and to undertake more projects; the suppliers to the welding and cutting industry are fully alive to their needs and are doing everything possible to help in the industrialisation of modern India.

MARINE ENGINEERING IN INDIA

ITS STRENGTH AND IMPORTANCE: THE PROGRESS OF A GROWING INDUSTRY

• By J. M. SWEET •

ENGINEERING to do with the sea—the literal translation—a profession of great national and international importance and a subject of great interest to the young and old alike. It is the service that builds ships, large ships and small ships, that supervises their safe passage to distant ports, and repairs and maintains and protects them from the rigours of the elements.

Nine centuries ago India had already attained pre-eminence in the building of ships, and until the advent of the machine age and the industrial revolution, the natural materials and the inherent skill of her peoples allowed her to maintain that position. The discovery of steel, the invention of the steam engine and the rapid development of metal-working techniques in the West produced new and vital conditions that transferred this pre-eminence to the industrialised countries, and with it went the ability to carry the nation's trade abroad. The gradual industrialisation of India has enabled this skill to be reborn, and at the beginning of the second world war the Scindias took a pioneering lead in the re-establishment in India of a shipbuilding industry, as the modern world knows it. The growth of trade, the emergence of nationalism and the increasing part that this great country has played in world affairs have produced together circumstances conducive to the development of this profession and industry, and the first wholly built Indian ship was launched at Vizagapatnam in 1948.

India's planners took cognisance of the importance of marine engineering in their first five year plan. They needed ships for their overseas and coastal trade, they needed men to operate and care for these ships, and they needed facilities to build and maintain them, and all aspects received attention. They set a target of 275,000 tons as the additional tonnage of ships to be acquired to produce a total for overseas and coastal shipping of 600,000 tons. Important and effective steps were taken to train the men so badly needed to man these ships. Using the Training ship "Dufferin" as a basis, colleges for marine engineering training were established in Bombay and Calcutta, and additional training ships were commissioned, and already these schemes have produced the necessary personnel. Time only can give the other essential experience. Establishments for the repair and maintenance of these ships at the major ports also played their part in providing practical training, and are growing in size and importance with the nation's merchant fleet. The plan provided for an extra berth at the Vizagapatnam Yard for the construction of ships, for Government financial assistance for expansion and modernisation, and for the use of expert consultants to assist in establishing modern methods and technique, and the Hindustan Shipyard is now capable of building ships up to 15,000 tons dwt. and has a capacity of 50,000 tons dwt. a year.

Support from Indian Shipping and the Navy

No plans, however well and wisely conceived, can succeed without the support of the industry they serve. There has been welcome, though not whole-hearted, support by the Indian shipping industry, and the Government has wisely made financial provision to assist the infant industry in building ships to owners at a price competitive with that offered by overseas builders with long standing and many years of experience. This cannot continue indefinitely, but the industry is grateful, and will use the development period so provided wisely and well. The Indian Navy too have recently shown welcome signs of offering their support. In countries where marine engineering and shipbuilding have reached a high standard of development, the Navy has played an essential part in fostering both research and development, and it has been with Navy support that many of the more specialised aspects of marine engineering production have been founded and nurtured. The Indian Navy quite justifiably demands the highest standards, but to attain these it must help in the development stages, and encourage and support the infant industry.

Marine engineering and shipbuilding, particularly the latter, are essentially assembly industries. Of primary importance is the design of a ship for its specific duty, and in this the naval architect and

the marine engineer must combine their efforts. Thereafter, the production of the components for assembly is very largely dependant upon the general industrial development of the country. It

Stone's TRAIN-LIGHTING DYNAMOS AND SWITCHGEAR

NOW MADE IN INDIA

Since the introduction of the first electrically illuminated carriage on the South Indian Railway in the year 1897, Stone's have supplied thousands of train-lighting equipments to the Indian Railways and its name today has become a by-word in the field of train-lighting. Behind this is a story of years of research, of pioneering effort and achievement.

The first major step in India was taken in the year 1931 when a workshop was opened by J. Stone & Company (India) Limited, in Calcutta, to manufacture the more simple items of train-lighting such as inter-vehicle couplings, junction boxes, light fittings and fans.

These manufacturing facilities have gradually been expanded. NOW, for the first time in India, and as a fitting climax to over 60 years of service to the Indian Railways, STONES have pleasure in announcing the opening of their modern factory at Behala, Calcutta, for the complete manufacture of train-lighting dynamos and switchgear.

AIR-CONDITIONING ON THE INDIAN RAILWAYS.

In the year 1937, some 40 years after the introduction of electric lighting for Railway carriages, the Great Indian Peninsular Railway built 5 fully air-conditioned coaches for use on the Bombay-Calcutta Mail Service. The War retarded progress in air-conditioned travel. Nevertheless, during these years, the Railways were able to build 32 fully air-conditioned Ambulance Trains for the Army.

Since the end of the War, progress has been enormous. 97 Coaches have been put into service, and these will be followed with a further 84 to be built in the ensuing years.

It is a matter of pride to us that all these coaches have been fitted with Stone's electro mechanical system of air-conditioning, providing trouble free service under rigorous conditions and a standard of comfort unmatched in any other mode of travel.

STONE'S RAILWAY SPECIALITIES

Include equipments for Carriage Lighting, Locomotive Lighting, Fluorescent Lighting, Air-conditioning, Refrigeration, Carriage Heating, Steam or Electric Ventilation, Water Heating, Water Raising, Gear Drives.

The Experience of this Company in the provision of equipment to suit the requirements of the world's railways has shown that operating conditions are never exactly duplicated. The Stone policy is, therefore, to keep abreast of all modern developments and recommend to each individual Railway the type of equipment which, on the basis of practical experience, is known to best suit the circumstances. It is upon the ability to produce the best system for each individual Railway that the world-wide reputation of J. STONE & COMPANY LIMITED, has been maintained.

J. STONE AND CO. (INDIA), LTD.

A large marine crank shaft being finish-turned.

is not possible in these early stages of development, to found such a complete industry on the limited offtake that Indian shipping at present requires, nor could it be economic to do so. Fortunately, however, with few exceptions, such components are seldom specialised, and there is no doubt that, having established a shipyard or assembly point, the present demand can be met by Indian industry, and as the demand grows, so will the capacity to meet it.

Capacity Analysis

An analysis of capacity for shipbuilding and marine engineering therefore becomes an analysis of the country's industrial capacity of certain categories. Primarily, design is the essential. Design involves not only a mathematical or scientific ability to solve an equation of particular sets of con-

ditions, but also the collected experience of having solved such a problem many times previously. This experience in design can be purchased, and in these early days of development it is wise to purchase such international experience for what is essentially an international industry. There are many firms of design consultants that have, over many years, designed ships for almost every purpose and to run under almost all conditions. It has been their business to produce designs for customers who desire economy and efficiency, and the current practice whereby India is using such consultants is a wise one. With this assistance from abroad, and the growth of interest in this profession, and the important steps taken recently by the Kharagpur Institute of Technology, it will not be many years before India too will be producing designs and designers. The Central Government has included Naval Architecture and Marine Engineering Faculties in their newly-established Technical University at Kharagpur. With adequate staff and equipment, it will not be many years before young men emerge theoretically equipped and ready to play their full part in the development of the industry, and who, with added experience, will form the nucleus of India's design team.

Next in importance comes steel plate. There is insufficient capacity from India's existing single plate mill, though the required quality can be produced. The expansion plans for the steel industry include an increase in plate-rolling capacity sufficient both for shipbuilding and for other industries. Steel for shipbuilding is not difficult to produce, but must be closely controlled at all stages of procession, and adequate testing must be carried out to ensure that quality is maintained. In countries where a lot of shipbuilding is carried out, ship yards are able to order steel to exact sizes, and this represents a considerable economy and reduction of material wastage. Hull construction technique has, however, made tremendous advances in recent years. There was a time when each plate and each member was individually assembled on the shipway. Now, with the advent

of heavy craneage and prefabrication, the actual time that a vessel takes to assemble on a shipway has been drastically cut, and lifts of 25 to 30 tons are not unusual. In turn, this increases the output of vessels from a given number of ways.

The machinery to propel ships may be of three main types, namely, steam reciprocating, steam turbine or diesel engine, and of the last named there is a further refinement, namely diesel-electric. Recent developments in the gas-turbine field also indicate that this form of propulsion may have excellent specialised application to ships. The choice propelling machinery must be based on the country's own fuel resources for coastal shipping, and on world fuel prices for overseas shipping, and on the specific carriage requirements for her commerce. India's cargoes do not require especially first transport, so that the choice lies between steam reciprocating and diesel-engined vessels. India's choice for some years must be coal as a basic fuel, for good quality steam coal is raised in India, and the railways can make it available at all major ports. The construction of the three new oil refineries gives Indian shipping a second, though less strategic, alternative fuel, and some Indian Shipping Companies are, therefore, taking advantage of the very great weight-saving and cost of operation factors of diesel propulsion. Ship machinery may be broken down into major component parts such as castings, forgings, and pressings, most of which require subsequent machining. Steam engines particularly present normal engineering problems, and India is equipped to deal with most of them. The casting and machining capacity to construct steam engines already exists, or can be arranged with minor modification. The Planning Commission have in hand the establishment of a very necessary heavy steel forging plant. Boilers either are being, or will very shortly be made in India, and with completion of the necessary licensee arrangements, India could very shortly build steam reciprocating engines of the horse-power required for her merchant navy. Large Lathes, horizontal boring machines, and foundry cranes capable of lifting 15 to 20 tons are all essential, but none of these problems are new and they apply to a greater or lesser degree to the country's general industrial expansion. With a heavy forging plant will come the most obvious assistance, and the ability to prepare crankshafts, tailshafts and stern frames.

Diesel engines however are a very different problem, and until the general demand for diesel power increases, no engine producing until could possibly attempt the economic construction of large marine units in India. However, the small horse-power diesel engine industry is already well established, and with the growth of industry and power requirements, and the additional manufacturing capacity that will go with it, consideration can be given to this problem in some five years from now. For the present, India would well depend on manufacturers who have a world-wide reputation, world sales, and hence a reasonable price basis. There are countless items of auxiliary machinery and equipment that go into a ship, and almost of these are within the capacity of Indian industry. Many are already being made, though there is as yet little specialisation, due to the very limited demand. Winches, windlasses, pumps, steering engines, fans, heaters, propellers, radios, lifeboats, and telephones are but a few of the items, and with intelligent planning and co-ordination of existing capacity, the numbers will grow as the demand increases. It is a fair criticism that Vizagapatnam and the other building yards have not yet really tested the capacity of Indian industry to meet their requirements. Should they do so, the test will be met.

The Future

Nothing can now halt the growth of India's merchant fleet, and with it, the strengthening of her marine engineering and shipbuilding industry. Strategically, it has been necessary for the industry to be set up, and now to consolidate it and make it economic. The raw materials are available, and the necessary quality can be produced. The general industrial development in both public and private sectors under the second plan will strengthen materially the resources on which the industry can call for assistance. The men are slowly becoming available to man and develop the industry. Whether India is ever to become an internationally famous shipbuilding and marine engineering country remains to be seen, and much will depend on the progress of the country under the plan. Unlike other countries, India does not need to export to ensure full employment for her people, for there is still so much to be done at home, and logically, therefore, many other industries can claim priority of development once strategic needs have been met. In common with other industries and professions, development progresses steadily, and India's planners may be confident that Indian shipping and the Hindustan Shipyard's essential requirements can and will be met from the country's own industrial resources.

WIRE ROPE MAKING IN INDIA

CONSTRUCTING AN INTRICATE MACHINE

• By F. C. FOREMAN •

ONE of the commonest machines in use—so much taken for granted, but of a very intricate mechanism; so well designed that it appears to be simplicity itself, until it is carefully studied. Then it is found to be unique. This describes a steel wire rope.

When wire ropes were first made they were made of iron. This was thought to be a great improvement upon the ropes made of various fibres which had served from time immemorial. As advances in metallurgy took place, which introduced steel in place of iron, this material was used primarily because of its great strength, in relation to size and as an improvement over earlier materials. Ropes fabricated from steel wire originally followed the same pattern as those made of the earlier materials, but as experience was gained and the science of metallurgy advanced it was found that steel could be treated by heat, to give greater and more reliable physical properties. It could be drawn to finer wires and its fabrication

into a rope could be attained in a vast number of designs to set and special purposes, to suit in the closest detail all the specified requirements of the user.

Manufacturing Processes

In fact, a wire rope is a complex mechanical appliance. It is a machine, composed of a number of precise moving parts, which are designed and manufactured to bear a very definite relation to one another. It is a fact that some steel wire ropes have more moving parts than many other more apparent so-called machines. This is explained when one examines a flexible 6-strand rope with, say, 61 wires in each strand. It contains 366 wires all of which must be able to move in respect of one another if the rope is to function as a flexible rope, flexibility being the chief feature of the design. To describe the mechanism of a steel wire rope, we have a number of component parts, e.g., wires, strands, core, lubricant, etc. Therefore, the basic component of the rope is the wire. This is manufactured by being carefully drawn through dies; it is patented (heat treated) at various stages in the drawing operation so as to arrange the structure, metallurgically, of the material into its required condition to produce that degree of strength which is the tensile strength, in tons per square inch, required by the rope maker, to produce this rope. The size and tensile strength of these wires are pre-determined by using a grade of steel specially selected for the purpose. Each wire is carefully tested to strict specification and undergoes rigorous tests for tensile strength, bend, torsion, etc. These tests are conducted under laboratory conditions by a metallurgist.

rope making, must be of exceptionally fine quality. The whole function of the rope depends upon the quality of the steel. Since steel is a product of the metallurgist in this modern era of industry, full recognition must be given to the role played by this branch of science. Steel in itself is a simple material, yet it is so complex in its nature that its final utilisation is the determining factor in the selection of steel for wire drawing. Metallurgical control is therefore one of the most important factors in the drawing of high tensile steel wire to be used for the manufacture of steel ropes. Steel for ropes is usually melted under carefully controlled conditions, either in an "acid" lined furnace or a "basic" lined furnace. Some advantages are claimed for the "acid" process because of its believed superior purity. However, "basic" steel is considered by some manufacturers to be the equal of "acid" steel, although many of the pre-war specifications which specified "acid" steel have not yet been revised accordingly. Steel for wire drawing is usually supplied to the wire drawing workshop in the form of coiled rods, about 4½ cwt. a coil. The gauge of the rod may vary according to the size of the wire to be drawn and the high tensile

India is Proud to Produce the Finest STEEL WIRE ROPES

N. R. S. R. Steel Wire Ropes are India's first and only ropes and have also proved to be the finest of their kind. They are second to none in soundness of construction and inherent strength and flexibility. Only the best steel and other pre-tested materials go into the making of N. R. S. R. Ropes—in a factory fully equipped with the latest plant—and they are made to conform strictly to standard specification.

requirements of the finished wire. Rods may vary from .375" dia to 5 S.W.G. (.212" dia.) and are metallurgically composed so as to contain from .35 percent up to .85 percent of carbon, with phosphorus and sulphur not exceeding .04 percent in each case; less is preferred.

Dies

These rods are drawn through very hard dies, usually of tungsten carbide. The dies are accurately made, with a fine smooth polished finish. The design of the die is carefully prepared. The die is in the form of a circular block, with the tungsten carbide pellet interested to form the working part. A section of a drawing die is shown in Fig. 1.

The die is fitted into a box which contains the lubricant for drawing. Many draws through the dies are required to reduce the steel rod from its original size to the size or gauge of the desired wire. Herein lies the technique of wire drawing. It is highly skilled and requires a wide knowledge and experience on the part of the operator to perform the exact operations to produce the predetermined result. During the drawing operations the surface of the wire is prepared with a coating, usually of a phosphate nature, which facilitates a smooth passage through the die resulting in a very fine surface to the wire, at the same time controlling heat from friction. Between the

rope is composed of six strands, each strand having seven wires and laid over a core of fibre, which may be jute or sisal or the like, having a strength of 100-110 tons tensile per sq. inch. Fig. 2 illustrates a section of such a rope.

The number and types of construction of steel wire ropes are many and varied and depend upon the nature of the task for which the rope may be employed. The type and construction are determined by the purpose or function to be performed and great care is required in selecting the type of rope for a specific purpose so as to obtain the highest efficiency and safety in use. It is obvious that a rope which has to pass over many and small pulleys in hauling or lifting as in a crane or lift, must be of a very flexible yet strong construction, whereas a rope which forms the path of travel and suspension as in a ropeway or suspension bridge needs to be more rigid as well as strong.

Varieties of Lay

In the fabrication of the steel rope the wires are first wound on to bobbins or reels which are then fitted or loaded into a stranding machine, being spun from the bobbins by the revolving machine into a strand and again, in turn, wound on to a bobbin or reel, to be fitted or loaded into a larger type of stranding machine known as the closing machine. In this closing or laying opera-

Both these types of lays may be either left or right handed. Langs lay has an advantage over ordinary lay inasmuch as a rope, so constructed, offers a better wearing surface when in use and therefore can reasonably be expected to give a longer life in service than a rope made in ordinary lay. However, ropes made in Langs lay require considerable experience in manipulating and should only be used in circumstances where both ends of the rope are anchored; another type of construction much favoured is known as pre-formed construction. In this type the wires and strands which go to make the rope have been given the exact helix that they will take up in the completed rope before being laid. Pre-forming the wires and strands prevents the ends of the rope, viz. the individual wires and strands from flying apart when the rope is cut.

Advantages

The pre-formed type of rope also has a number of advantages which are as follows: The rope does not lie, when unreel, in a series of coils but lies quite straight and flat completely dead; consequently it does not have a tendency to "kink" and is less likely to receive bad treatment to which ordinary ropes are subjected. Because of the pre-forming, this type of construction shows no tendency to "high strand", taking as it does the load more evenly under the hardest conditions.

Fig. 5 Sections of round ropes of different constructions

6/24 (15-9 fibre)

6/16

various draws, of which there may be many, depending upon the final gauge or size of the required wire, the structure of the steel is carefully controlled by a process of heat treatment termed "patenting". Patenting may be described as the controlled transformation of the austenite element of steel, isothermally by equal distribution of heat, so as to produce a structure of the steel suitable for further reduction in the process of drawing, without seriously disturbing the properties of the material.

Varied Constructions

It will be seen from the brief description given that the process, carefully carried out, will eventually produce steel wires of very fine gauges or sizes and of very great tensile strength. These are the wires which the rope maker requires for the construction of the mechanical device which is so commonly known as a steel rope. There are a number of different constructions. A rope can be constructed from a number of strands, each one containing a large number of individual wires of various gauges or sizes and of a given tensile strength. The construction of a rope is usually expressed in terms of the number of strands laid over the core of the rope and the number of wires in the strand and the type of core used. For example, a rope described as 6/7 construction, fibre core, 7/8" dia., 100/110 tons tensile means that the

strands are laid, or closed, over a core strand. This is the centre or heart of the rope. The core is well soaked in a lubricant before the strands are closed over it. Similarly, as the laying process proceeds, lubricants in the form of greases are worked into the interstices of the wires which not only lubricate the movement of the strands but also preserve them against corrosion. The lay

Half locked coil

Fig. 6 Full locked coil

of the rope can be either ordinary lay, where the wire of the strands are twisted in one direction and the completed strands are laid in the opposite direction, or Langs lay which differs from ordinary lay by reason of its strands being laid to form the rope in the same direction as its wires are twisted to make the strand as shown in Figs. 3 and 4.

Should any individual wire in the rope break it tends to lie flat and is, therefore, less dangerous because of the tendency not to twist open when cut. It is very much easier to splice and, also because of the special method of laying it is considered to be the only wire rope that evenly balances the load on all the individual wires and strands. Tests carried out under the auspices of the Institution of Mechanical Engineers, Research, showed that on pulleys of corresponding diameters, ropes made in the pre-formed manner were definitely superior when used under the particularly severe conditions imposed by the use of small pulleys, the difference being very marked in the case of the 6/7 construction pre-formed rope. Where wet conditions prevail, it is customary to use steel ropes manufactured from galvanised high tensile wire; the protection given by galvanising being considerable.

Manifold Uses

The utility of steel ropes covers a very wide field indeed. Steel wire ropes are used extensively in the mining industry, engineering, shipping, agricultural, aircraft and many other subsidiary industries. It is therefore evident that the designs of steel wire ropes are as manifold as the purposes they are required to serve. The common round

METAL BOX MAKING IN INDIA

A STRUGGLE TO KEEP DOWN COSTS IN A SMALL HIGH-COST MARKET

• By A SPECIAL CORRESPONDENT •

TO many people in India the words metal-box making suggest the manufacture of the useful and gaily-painted travelling trunks that abound in any bazaar in this country. In fact it is a generic term applied to the production of the great variety of tin cans that one sees in every shop proclaiming the names of countless manufacturers, but observing a strict anonymity concerning the tin-box maker and the fascinating process of manufacture. Tin-box making is a part, and a major part, of the packaging industry and while for the purposes of this article it will be taken to refer to the manufacture of containers made from metal, it is worth observing that in the highly industrialised countries of the world a major stake in the manufacture of packages and allied products made from paper, cardboard, cork and plastics. This very breadth of interest of the overseas tin-box maker, correctly suggests that the experience in the advanced industrial nations has led to the tin-box industry being concentrated in the hands of a few large concerns. The modern automatic can plant is indeed a far cry from the old travelling tinker and the tinsmith's shop.

This growth of the large tin-box manufacturer with his wide interests dominating the field of packaging in the overseas countries has in many ways been the product of experience. During the past thirty or forty years the increasing tempo of life and the absence of household servants in the western world led to an increasing demand from the consuming public for more packaged consumer goods, particularly ready-to-serve food prepara-

tions. Arising out of this demand came the great opportunity to the package manufacturer provided he could offer not only a cheaper container but one which was attractive and functionally perfect enough to encourage housewives to purchase it. However, this opportunity demanded heavy expenditure of technical and other resources and it was in the interest of the tin-box maker to carry out research so that he could offer an increasing range of specifications of container which would be suitable for containing and preserving an increasing range of foodstuffs and other products. It was these conditions that led to the formation of units which are large industrial units in their own right, offering wide customer service, including scaling equipment, research and design facilities, and offering quality containers at low prices. The pioneering work is now done by the large units, but the smaller manufacturers have been quick to seize the opportunities opened in the new fields by creating a picture of expansion and progress. It is against this background of conditions in the rest of the world that the tin-box industry in India must be viewed.

Problems in India

The tin-box maker in India has many problems individual to this country. The fundamental problem is that although the purchasing power of the people is extremely low and the cheapest possible containers are required, the rigours of the Indian climate demand the highest standard of material and workmanship while the very fact of low purchasing power means that even the cheapest pack cannot sell in sufficiently large quantities to justify

the manufacturer's introducing more automatic methods to cut costs. This position is aggravated by the fact that tinplate costs more in India than in almost any other country. Although tinplate is manufactured in the country, the Central Government levies a contribution to the Steel Equalisation Fund on the steel forming the base of tinplate sheets and this levy accounts for approximately 20 percent of the price of tinplate. Another important factor is that whereas in the rest of the world the tin container is expected to be thrown away when the contents are exhausted, in India it is usually employed for some useful after purpose. Moreover, the extremely widespread and clever efforts of the dealer in spurious goods makes it essential that the closure used should be made tamperproof in some manner. All this adds to the price of the container and it is therefore not surprising that in India packaging costs are among the highest in the world.

One of the main items of tin-box manufacture is the production of the familiar round open-top cans used for packaging processed foods. In India the manufacture of this type of container is confined at the moment to the largest tin-box manufacturer in the country who operates one automatic line for this purpose. But even the total demand for open-top cans in India is insufficient to provide a 50 percent level of activity for this line, itself slow when compared with the latest equipment used in the United Kingdom and the United States. In India, demand from consumers for open-top cans since partition has not exceeded seven million a year, whereas the annual demand in the United Kingdom stands at the moment at approximately

Metal Box supplies new industries with INDUSTRIAL COMPONENTS

A considerable increase in tool and die making capacity and the opening of their Technical Development Section in Alipore has enabled Metal Box to embark upon manufacture of light industrial components. Superior know-how in the field of tool making ensures perfect finish and accuracy within fine limits. Large or small, simple or complex, Metal Box industrial components are better because they are backed by the technical skill and engineering efficiency achieved through long experience and ceaseless research.

2,000 million with every indication that this will continue to increase in the future. In spite of this, the tin-box industry in India can be proud of its performance with regard to open-top cans since the standards of quality are as high as elsewhere in the world and within the limitations of high-priced tinplate and low activity they are most reasonably priced.

Various Types Produced

The other types of tins produced are classified by the trade as general line containers. In India

these form the bulk of the tin-box fabricator's business and the progress made with these particular products during the past few years is considerable. Most general line containers are decorated in comparatively few colours to line designs and these are equal in every respect to their counterparts manufactured overseas in spite of the local difficulties encountered by tin printers. These are considerable, for tinplate is printed by the lithographic process and the variations in humidity make it extremely difficult to obtain consistent results. However, these problems, with persistent research and technical skill, have been overcome and using locally-made inks some of the recent work incorporating half-tone photographic reproduction of various subjects has been of an extremely high standard.

In many ways a self-contained section of the tin-box business is the production of screw caps and other closures such as the crown cork to various specifications both from tinplate and aluminium. The most significant development has been the recent introduction of the rolled-on pilferproof closure which is now being made in large quantities in India and which are in no way inferior to similar closures made overseas. Apart from the very close limits to which the screw cap manufacturer has to work, the increasing use of this cap in India has meant that the bottle manufacturers are to work to much closer bottle specifications. This has led to the increasing realisation by the bottle manufacturers that it is important for them to co-operate with the screw-cap manufacturers in laying down standards of neck dimensions and the introduction of the rolled-on closure might well be responsible for closer liaison between the cap manufacturer and the bottle manufacturer in India, and the acceptance of bottle-neck and screw-cap standards not only for the rolled-on closure but also for the traditional type of pre-screwed cap. This is important since, as the demand for package goods increases in India, packers will wish to use faster filling and closing equipment, which by virtue of the high speeds involved, demand much closer tolerances on both bottles and caps.

Collapsible-Tube Making

Allied to the tin-box making industry is the manufacture of a somewhat different type of metal package; the collapsible tube. During the past five

years most manufacturers of toothpaste in this country have gradually changed over from using imported collapsible tubes to similar products made in India, until today almost every toothpaste tube used in the country is manufactured here. The progress made and the standards of quality achieved can be judged by the fact that the consuming public, which might well have been using a particular brand for many years, have been unconscious of this change. To more interested people the big development in the manufacture of collapsible tubes in India during the past few years has been the introduction of the aluminium tube. The advantages of the aluminium tube are that it is cheaper than pure tin; it can be used for packaging many products for which lead and lead alloy are unsuitable. It is more robust and it also provides a better printing surface, giving the package a more attractive appearance. It is however more difficult to manufacture than the tubes made from the softer metals. Equipment is now installed in India for internally coating aluminium tubes with the new protective lacquers developed, so that a larger range of products can be packed in them.

Mention must also be made of two recent developments in the tin-box industry. The first is the decision by one of the largest concerns to assist the new industries commencing operations in India by supplying component parts and stampings. The tin-box maker's experience and skill in the manufacture of dies and light stampings to fine tolerances is considerable and this is therefore a very welcome addition to the resources available in the country. Secondly, the same company is now commencing the manufacture of some of the more simple closing machinery required to seal bottles and other containers. Furthermore, it is expected that a research laboratory, initially confined to improving the standard of raw materials available to the tin-box manufacturer, will shortly be opened. In considering these developments, the introductory remarks concerning the organisation of the packaging industry in other countries should be borne in mind. It would seem that the future development of the Indian tin-box industry will follow the pattern elsewhere which has proved beneficial in every way to the national economy concerned. It does not mean monopoly; far from it, but the existence of at least one unit capable of providing specialised research and introducing new manufacturing processes which act as a stimulus to the whole industry.

PUNCH CARD ACCOUNTING IN MODERN INDUSTRY

AIDS TO MORE EFFICIENT MANAGEMENT AND PRODUCTION CONTROL

• By A CORRESPONDENT •

WHATEVER the industry, be it engineering, chemical or steel, the fundamental processes of "punched-card" accounting remain unchanged, and the equipment used does not considerably differ except perhaps for certain additional specifications to suit specialised jobs and the use of auxiliary machines. It is, therefore, the method of application of punched cards or the technique of that use that makes all the difference—applying the right methods to the right jobs. That is why punched card accounting companies employ scores of highly-paid and specially qualified technical personnel who know how to get the best out of the accounting machines, and whose job it is to solve the various intricate problems that confront managements in the day-to-day routine.

Punched card accounting has been of late so much in the news, especially on account of its phenomenal progress in the realm of electronics, that many readers are already more or less familiar with it. But for the benefit of the reader who is as yet uninitiated into the mysteries of punched cards, it will be necessary to explain briefly what punched card accounting is and how it works. There is, as we know, no machine on the market yet which can handle and produce results directly from batches of original accounting or statistical documents. It is, however, possible to translate information contained in original documents into a form in which it can be readily handled by machines. This is exactly what punched card accounting does. In this system of accounting, original data is recorded in cards of uniform size and shape by the punching of holes in predetermined positions. These cards, which are, in effect, facsimiles of the original documents, themselves operate the various machines. There are only four fundamental processes:—(1) The punching of the holes in cards; (2) The verifying of the holes created in cards; (3) The sorting of punched cards into the desired sequences; (4) The selection from the sorted cards of the required data and its presentation in the finally desired form.

There are four machines corresponding to these four processes. The first is the "punch", which makes the holes or perforations in the cards. The second is the "verifier" which checks the accuracy of the holes in the cards. The third is the "sorter" which arranges the cards in the desired groups or sequences, and the fourth is the "Tabulator" which produces the final results in the form of a printed statement as desired.

Production Control

"Production control" embraces the preparation of manufacturing plans, the sequential issue of orders for their execution and the collection and recording of all relevant data to enable products to be monitored through every stage of manufacture and assembly. Production control is an essential part of management control. It cannot function efficiently unless it is fed with continuous, up-to-date and accurate statistical information, expressed in terms which allow it to measure the progress, individual and relative, of each of the many units in modern factory production. Present-day production calls for more men, more machines, more departments and imposes more responsibilities. There can be nothing haphazard about management; control must be constant and immediate; facts and figures must be obtained in the greatest detail, with accuracy and with speed.

It will, of course, be realised that an article of this nature cannot deal with production control in all its intricate details but can only cover its more important aspects. In general terms the requirements of Production control are:—(a) Established manufacturing standards of material and labour times, (b) Detailed procurement and stock records, together with allocation of raw material and components, (c) Planning and plant loading schedules, designed to achieve balance in production, (d) Progressive flow of parts and sub-assemblies to final assembly, including planning internal transport, (e) Progressing and maintenance records.

Control of Stocks and Stores Allocations

In any production programme, the adequate control of stocks and stores allocations is of vital importance. The even flow of production can be seriously impeded or disrupted by the non-arrival of parts at the due time. Capital is needlessly locked up and the danger of obsolescence is increased whenever excess stocks are carried. A punched card stock and stores control system will effectively and accurately compute the up-to-date position taking all relevant factors into consideration. Factors of significance are:—(a) Commencing stock, (b) Orders placed, (c) Deliveries from suppliers, (d) Returns to suppliers, (e) Stock allocations, (f) Issues to production, (g) Returns from shop to stores. The establishment of minimum quantity stock figures which stores control considers prudent to hold is often recommended.

In the first instance the balance forward cards would be produced automatically when tabulating the last statement. During the current period cards would be punched from copies of orders placed, from invoices or delivery notes from suppliers and from debit notes, for returns. Stock allocation cards would have been created representing the purchasing commitment outstanding up to a given period. Lastly, cards would be punched from stores requisitions, requisition schedules, and movement notes of shop returns to stores. During the tabulating process, the machine automatically establishes and prints: (a) Remaining physical stock, (b) Balance on order from suppliers, (c) Unsatisfied allocations, (d) Supply position to satisfy allocations, after bringing into calculation the balance of goods on order and the following comparisons would be made:—(e) Physical stock with minimum approved, (f) Physical stock, plus goods on order, after providing for allocations, with minimum allowed. Wherever special emphasis is placed upon any of these factors they can be signalled out on the tabulation for immediate attention or the cards concerned can be used to prepare separate action lists.

Flow of Sub-Assemblies

The regular flow of sub-assemblies to final assembly is the aim of every production executive and his main effort is directed to this goal. The maintenance of this constant flow is assured to some degree by other controls. These provide that sufficient raw materials and components are available to produce sub-assemblies in time for correct synchronising with final assembly. It is as impossible, of course, to maintain larger buffer stocks of sub-assemblies as it is for components. There is, therefore, a constant need for close appraisal of the current position in regard to flow.

It is sound practice when preparing sets of punched cards for recording and controlling labour operations to include a final card to indicate the actual delivery of parts or sub-assemblies to store or their availability for further assembly. These cards can be "dual-purpose" cards with provision for "marking" the actual quantity of goods produced. The pencil marks are automatically converted to punched holes by the "Mark-sensing Reproduced". The cards can then be merged with a similar set of cards recording the quantities originally scheduled for production and they can then be tabulated as often as required to produce statements showing the position in regard to the main assembly lines. Scientific control at every stage reduces considerably the risk of failure or shortages. The even flow of material to machine line or other processes at the right moment, does much to ensure that the supply of finished parts gently pushes the sub-assembly sections, which in turn maintains a regular supply of units to the main assembly.

It would not be inappropriate to mention here that the cards used for production control may be used for many other purposes. Records of orders placed and of incoming material can be applied to financial budgets and to purchase accounting. Records of labour expenditure on operative work can be allied to costing and analysis. Stock control, with a running audit by physical count, may replace annual stocktaking. These data, when associated with overall expenditure on maintenance together with distribution costs and revenue records can be woven into a completely integrated presentation of factory and financial accounting.

Punched Cards and Electronics

The advent of electronics into the field of punched card accounting marks a turning point in its history and augurs changes of a far-reaching and revolutionary nature in the office of the future. Two new machines, the "Electronic Calculator", the "Hec Electronic Computer"—both evolved by the British Tabulating Machine Co. Ltd.—are known more popularly to the layman as "Electronic Brains". The performance of these machines is almost beyond the realm of belief. Capable of comprehending all four divisions of arithmetic; of operating in accordance with programmes which they can modify themselves whenever necessary; equipped with "memories"; able to translate data automatically into a language more suited to their own requirements and finally to calculate at speeds reckoned in milli-seconds, they are obviously destined to make history. Electronic machines are ideally suited to the requirements of production management. Among other advantages, such as reduction of labour, staff economies, operation at speeds unattainable by human labour, greater degree of accuracy, they make it possible for production management to obtain not just more information than is already available—not just more rapid results—but information which would otherwise be unobtainable.

That is for the present. But what of the future? What does it hold for us? Whatever that may be, one thing is certain. The days of Bob Cratchitt and his kind appear to be over. The scratching of his pen, repeating figures over and over again in bulky books, will be heard no more, when the era of the "Automatic Electronic Office" is ushered in.

Costing...

Costing may be only one process in accounting but it is always necessary wherever labour is employed and materials consumed. Hollerith takes the whole of accountancy in its stride—but costing is an admirable starting point for an enquiry. It costs nothing to find out what Hollerith might save you.

- ★ expenditure controlled
- ★ waste eliminated
- ★ current facts—not past history
- ★ more detail in less time

the very job for

Developing India's Future

Just as a photographic image emerges in the developing dish, so the future of India is developing under the stimulus of many different factors. Among these factors are the industrial and agricultural machinery selected from world-famous manufacturers, which Voltas Limited make available in India, and the engineering service which Voltas offer to plan, install and service these tools of ever-increasing production.

AIR-CONDITIONING IN INDUSTRY AND DAILY LIFE

AN INNOVATION OF GREAT IMPORTANCE TO THE FUTURE OF INDIA

● BY Y. A. FAZALBHOY ●

AIR-CONDITIONING—a development of the refrigeration industry—had its origin in the United States of America. At first, it was used mostly in processing and its uses in the beginning were chiefly in industry. The development and the advance of air-conditioning during the twentieth century has been phenomenal and its applications today are numerous and widespread. There is hardly any phase of industry, whether it is the cotton textile, the food preservation, the pharmaceutical, the machine-tool and a host of such key activities, where air-conditioning has not played its part and made its contribution. Air-conditioning has its application also in agriculture. In fact, considerable research has been going on in recent years in various directions. A typical process is the “vernalisation of wheat”, for the preservation of the wheat seed, “bulb storage”, by which big bulb growers store their bulbs under refrigerated conditions to prevent them from shooting prematurely and in the preservation of vegetables, fruits and seeds.

Air-conditioning for human comfort is a later development and in recent times its utility has been enormous. The home, the office, the theatre, the restaurant and any other place which is frequented by large numbers of people can be air-conditioned. When people travel by road, sea and air, the respective carriers can be air-conditioned. The latest of all is the air-conditioning of automobiles. It is quite logical and natural that people will tolerate discomfort only until the means are available to relieve it. Almost everybody would like to have air-conditioning although today only a few can afford it. With the advance of refrigeration, the science of air-conditioning also kept pace. Natural temperatures in summer can be so high that they must be reduced artificially in order to cool the body rapidly enough to provide comfort. In the tropics, where humidity is also high, air-conditioning has found ready favour.

Progress in India

In India at present air-conditioning has been more for public utility. Shops, restaurants, offices and commercial establishments have all taken up air-conditioning. The adverse weather experienced during most seasons of the year—adverse in the sense that in shops, business establishments and so on people are working under trying conditions—air-conditioning makes the working room very pleasant and comfortable with the result that the efficiency of the worker improves. Shops would benefit by the clean atmosphere so that articles can be displayed in an attractive manner without accumulating the layers of dust which can form in a few minutes. Even hotels and restaurants have found that the installation of air-conditioning in the rooms greatly increases business; therefore a great many hotels have thought it worthwhile to fit many conditioners. Even hair cutting saloons are being air-conditioned and people do not mind paying a few annas more for the comfort. Air-conditioning is spreading in India.

This country is a huge potential market for the use of air-conditioning and refrigeration units. The tropical climate in itself is sufficient inducement to warrant considerable expenditure for cooling, ventilating, and de-humidifying the interiors of theatres, shops, residences, offices, hospitals, etc. and the demand continues unabated as time advances. Many important installations have been carried out over the past years in India. To mention a few, there has been air-conditioning for, (1) rayon factories; (2) dairies; (3) electric lamp manufacture; (4) operating theatres; (5) storage of blood, vaccines and drugs; (6) storage of leaf tobacco; (7) the pilot plant of the Indian penicillin factory incorporating special germ and bacteria

destroying units; (8) glue drying; (9) fish storage on deep sea cutters; (10) preservation of seeds, particularly of potatoes; (11) storage of perishables such as oranges, mangoes, Kashmir fruits, etc.

Installation and servicing are like twins and to a great extent the sale and installation of equipment will be restricted to the size of the service facilities available. If purchasers are to be fully satisfied and sales volume is to be increased, it is essential that installation and service arrangements be established which will ensure confidence not only in the minds of the purchasers, but in the product itself and in the manufacturer's ability to keep his equipment in good running order. At the same time, service must be both dependable and quick in operation and carried out at the most economical charges.

Manufacture

The manufacture of air-conditioners in India is a fairly recent innovation and development in this line has taken place mainly in the post-war period. At present there are about 12 major air-conditioning and refrigeration-machinery manufacturers represented in India and nine of these are American, representing in the main, firms whose names are already identified readily with air-conditioning equipment. There is no doubt that there is a considerable market for air-conditioning equipment in India, but equipment has to be designed or adapted to meet the varying temperatures and humidity conditions experienced in various parts of the country.

In General the requirement of the Indian market is for the air-conditioning which for offices will maintain a temperature of 78 degrees—plus or minus 2 degrees—with 55 percent of relative humidity. It is not possible to get any comprehensive idea of the industrial requirements of air-conditioning as these vary from industry to industry. The manufacture of air-conditioning and refrigeration equipment in India is on a restricted scale at the moment. Under the vast all-round development of industries in the country this industry will also develop and no doubt mass-production methods will be adopted. At present it is at the stage of assembling the various components imported from abroad. Most of these components are of U.S.A. origin but some are from the U.K. The "remote" type of air-conditioner, which is thought to be more efficient and therefore more successful, is assembled with mixed components. With the right type of backing and with a more generous import policy for obtaining the right types of components, which cannot be easily manufactured in the country due to plant and raw material limitations, there is every possibility that these undertakings will develop into large-scale industries and will prove a success in catering for the complete requirements of the equipment in the country.

The refrigeration and air-conditioning industry is closely linked with the expansion of the manufacturing potential of the country. Like the automobile industry, the refrigeration industry also should more correctly be described as an "assembly industry" as the various component parts that go to make up the complete machine are manufactured by ancillary concerns.

A recent survey conducted in the United States has proved that "air-conditioning pays for itself" and the facts show that it often costs more not to have air-conditioning. Increased production is a direct result of many elements and they are: fewer accidents and errors, better health and morale, reduced absenteeism and fatigue and increased employee efficiency, both in regard to the quantity and quality of work. It has been reported that employees even return from lunch earlier on hot days. From the data available it has been concluded that the installation and operating cost of air-conditioning in office and factory will be

completely paid in about two and one half cooling seasons.

Conclusion

Thus we find the application of refrigeration and air-conditioning science would appear to be almost unlimited for, apart from the human comfort and health category, one encounters almost new fields where industrial processes can be improved, accelerated and carried out more economically by the installation of air-conditioning equipment. This industry calls for a complete planning under the development schemes and the backing and encouragement of the Government. Certain obvious handicaps are coming in the way of full development, these being the shortage of electricity in the country, a shortage of building materials, paucity of trained technicians and foreign exchange restrictions which hamper the import of refrigeration plant and machinery particularly from the dollar areas. After the completion of the multi-river projects that are being carried on in India at present, it is expected that the power shortage will be ended. The training of suitable technicians is already being carried out by some of the major industries but it is urged that the Government, with the help of the universities, should start giving adequate training in this branch of engineering. A beginning has already been made by the Governments of Bombay, West Bengal and Bihar in this direction. The post-war development gave a good fillip to every industry and also to refrigeration. Today, if the United States, where high temperatures are generally experienced for only a few months in a year, has found such a tremendous use for air-conditioning for human comfort, it can develop on a similar scale in our country too where high humidity and heat is experienced practically all the year round.

Announcement

A fully equipped PROCESS DEPT. is being set up staffed by FACTORY TECHNICIANS

Multilith

The "MULTILITH" is a completely automatic offset machine, specially designed for use in the office by non-technical operators. It produces the highest quality stationery and sales literature, in monochrome or multi-colour. Paper or metal masters, easily prepared by hand or typewriter, provide for the faithful reproduction of manuscript, typing, pencil, pen-and-ink and brush work, carbon-paper tracings, etc. Photographically-prepared metal masters are used for the production of half-tone and line illustrations, text matter in standard type faces and all classes of work within the scope of offset lithography.

MMC REVOLVING FLAT CARDS

are now being extensively used
in Textile Mills in India.
Their efficiency is undisputed,
their reliability guaranteed.

OUTSTANDING FEATURES

1. Five distinct setting points, used singly or in combination, to control setting to .001 inch.
2. Johnson bronze bearings for cylinders and doffers. Roller bearings to cylinder; ball bearings to doffer and ball bearing comb box also provided as optional equipment.
3. Ball bearings to lick-in pedestals.
4. Self-lubricating 'Olive' bearings at several locations.
5. William's patent stripping motion for flats.
6. Drop lever with new disengaging handle.
7. Fluted lap roller with positive gear drive from feed roll helps uniform feed of lap at the back with minimum possible stretching.
8. Cards can be geared for any production in a mill organization.

MACHINERY MANUFACTURERS CORPORATION LTD.

Factory: Sonai Works, Kidderpore, Calcutta 23.

Managing Agents:

MAHINDRA & MAHINDRA LIMITED

Head Office: Gateway Building, Apollo Bunder, Bombay.

Calcutta Office: Hall & Anderson Building, Park Street.

LOPULCO mills

Designed for
Economical grinding
Minimum wear
Graded output

Most economical grinding of non-abrasives such as coal, phosphate etc. Compensated spring-loaded rollers. Revolving grinding table. Built-in whizzer type separator ensures correct output size. Low power consumption and no wear of grinding parts when feed is shut off.

ROVAC ENDFLOW FILTERS

For efficient filtering of
slimes and concentrates
from metal ores. Designed
to save filter cloth,
labour, maintenance and
transport costs.

HUMMER ELECTRIC SCREENS

Specially designed for protection and rapid change of screen cloth. Suitable for closed-circuit work with crushers and grinding mills. High capacity ensures increased efficiency and a tensioning device ensures controlled grading. Low consumption and maintenance. Needs no specially trained operator.

INTERNATIONAL COMBUSTION (INDIA) LTD.

ALUMINIUM VERSUS STEEL IN INDIA

HEAVY COMPETITION BETWEEN TWO METALS FOR SUPPLYING DEVELOPMENT NEEDS

• By A. L. SABHARWAL •

WITH the publication in 1953 of a report on *Competition between Steel and Aluminium* by the United Nations, formal notice was served that the aluminium industry has come of age. At the turn of the century world production of aluminium totalled only 7,500 tons per annum; by 1939 this had grown to 700,000 tons and today it exceeds 24 million tons. The increase in output has been particularly striking in recent years, the average annual rate of growth being 16 percent over the previous year's figure during 1946-1953, or expressed in another way, output has doubled every 4½ years. Aluminium production now ranks second only to steel on a volumetric basis, and the metal has assumed such importance that it was found necessary to write a report on the competition that it provided to the colossus steel. World output of aluminium in 1953 was 2.5 million tons and by 1960 it is expected to mount to between 4 and 4.5 million tons which, on an equivalent volume basis, will be equivalent to 4 percent to 5 percent of estimated steel production expressed in terms of volume. A large portion of the consumption of aluminium is in replacement of other non-ferrous metals (for example, copper in electric cables) rather than as a replacement for steel. Nevertheless, about half the aluminium consumed throughout the world is in direct competition with steel. Most of this competition arises in the fields of construction and buildings, mechanical engineering, road transport, household equipment and packaging.

Let us therefore assess the problem in the background of Indian conditions. With a few outstanding exceptions such as in aircraft and cable manufacture, the major development of the use of aluminium in this country is going to be at the cost of steel. The consumption of aluminium at present totals approximately 20,000 tons per annum made up as follows:

	tons
Household equipment	10,000
Electrical industry	4,700
Packaging	1,800
Transportation	2,000
Building and construction	500
Miscellaneous	1,000
	20,000

The first two—household equipment and electrical industry—do not threaten the market for steel. In India utensils form 95 percent of the household equipment industry. Competition is therefore rather with brass than with steel. In this respect India differs from the rest of the world where over 75 percent of consumption in this field is at the expense of steel. This is on account of the fact that, in addition to utensils, a whole range of other items such as interior panelling, light-weight furniture, sinks, lighting fixtures, etc., are made in aluminium. This is not the case yet in India. In the electrical industry, the metal to suffer is copper. In point of fact, aluminium combines with steel to provide A.C.S.R. conductors which are gradually ousting copper cables from the market.

World Competition with Steel

We come now to the remaining areas of consumption in which aluminium competes directly with steel in India. First of all, it is necessary to examine some of the overall conditions relevant to such an enquiry in order to obtain a correct perspective. In Europe and North America the average ratio of the price of aluminium to that of steel is 2:1 on an equal-volume basis, whereas pre-war it used to be in the neighbourhood of 6:1. In some countries, the ratio is even more favourable. In Italy, in one particular year, it was actually as low as 1:1. In India the ratio is about 2.5:1. With the expansion of the aluminium in-

dustry in the country the price is expected to fall significantly. Furthermore, the price of steel may register an upward trend as a result of the high cost of capital equipment required for the new plants under construction or contemplation.

In many countries, such as Norway, Switzerland and Italy, to name a few, there is little or no indigenous production of steel while the aluminium industry is considerably developed. In such countries, aluminium is used with advantage in place of steel for numerous consumer goods and industrial applications. In the U.S.A., however, the largest consumer of aluminium, this does not hold good, and the use of the metal has gained acceptance in the face of competition from steel

and other non-ferrous metals. In India where steel capacity is being greatly increased, aluminium will face keen competition. Finally, in Western countries, the light engineering industry is highly developed, consuming large quantities of aluminium. In India we have yet to see a pronounced development in this quarter before the same can be said. Accordingly present indications lead to the conclusion that aluminium will have a rougher passage in this country than in other parts of the world in so far as displacement of steel is concerned.

The main advantages of aluminium in competition with steel are provided by the following properties of aluminium.

INDAL EXTRUSIONS for every job

INDAL Extruded Aluminium Sections

are used in every department of industry. As India's first and only Aluminium extrusion plant has now gone into production, a great variety of cross-sectional shapes will be available to meet the requirements of the most imaginative designer.

Let us aid you in the selection of the best alloy for your application.

Eliminate expensive fabrication methods, reduce the weight of your product by substituting aluminium for conventional metals now in use.

(1) On an equal volume basis it is one-third the weight of steel.

(2) Aluminium is very resistant to corrosive influences even under the most unfavourable conditions due to the thin layer of oxide that is rapidly formed on the surface. It has therefore a very much longer life than steel.

(3) Aluminium reflects 90 percent of the heat due to its bright surface thus making it a good insulating material.

(4) The high scrap value of aluminium which ranges between 40 percent to 50 percent of the original price.

Aluminium has many other properties such as being non-toxic, a good conductor of electricity, having an attractive appearance etc., which recommend its use, but the three properties mentioned above, singly or severally, provide the spear-head of the attack on steel. We shall now deal with each of the several spheres of competition. Shortage of space precludes a comprehensive treatment and it is intended only to trace the subject in its broad outlines.

Transport

Aluminium has been employed by the motor-vehicle industry right from its inception. Its use in the form of sheet and extrusions is largely confined to commercial vehicle bodies such as buses, lorries, vans, etc., and in the form of castings in parts of the engine. It is conspicuous by its absence in the field of mass-produced private car bodies, the sole exception being the French Dyna Panhard six-seater saloon which has an all-aluminium body.

Commercial Vehicles: The reduction in weight in the construction of commercial vehicles is most important for two reasons: first, any saving of dead weight increases the payload; secondly, a variety of fiscal taxes are based on the unladen weight of the vehicle. Aluminium is used in the form of sheet for panels and flooring and as extrusion for the framework thus greatly lowering the weight of the completed vehicle compared with a similar body in steel. The cost of an aluminium body is roughly 10 percent to 15 percent more than its steel counterpart. Operating efficiency however is so greatly enhanced as a result that the extra cost repays itself several times over. Consequently in the near future it is expected that more bodies will be turned out in aluminium at the expense of its cheaper steel counterpart. In India already large bus operators like the Bombay and West Bengal State Transport Authorities are gradually switching over to aluminium and other States are expected to fall in line. Aluminium is also being considered for the manufacture of postal vans, trucks, lorries and trailers by the various Central and State Departments concerned. The demand for aluminium in this field is around 1,500 tons per annum and is likely to double in the next few years substituting about 9,000 to 10,000 tons of steel.

Engines: Aluminium in the form of castings is used widely in motor-car engines. It is especially suited for pistons and cylinder heads, owing to its lightness and high heat conductivity. In Europe the high price of petrol, heavy fixed duties, etc., have encouraged a wide use of aluminium in the engine for such parts as crank cases, gear boxes and differential casings. One other important consideration is the fact that it is not possible to pour cast iron with walls thin enough to be economical. Aluminium is accordingly preferred as it brings down machining costs appreciably. In India the production of private cars is very restricted and consequently the demand for aluminium is small, not exceeding 100 tons a year. With the rise in the volume of manufacture of private cars this figure will be augmented but even on the outside it will not displace more than 1,000 tons of cast iron annually.

Railways: The use of aluminium for mobile stock has developed much more slowly in this field. In most countries the railways not only enjoyed a monopoly for many years, but were also subject to strict control and liable to public enquiries in the event of an accident. Great emphasis therefore was laid on safety which inclined railway engineers into a very conservative frame of mind. It was at first thought that aluminium was not strong enough to stand up to shocks, stresses and rough usage thus affecting the safety factor. The development of high strength alloys in aluminium led to diminishing prejudice and many railways experimented with its use. Their low weight, high strength and corrosion resistance offered great advantages over steel. Gradually the light metal has found increasing popularity for a variety of purposes. As a spectacular culmination, recently an all-aluminium train of radically new design constructed by the A.C.F. Talgo Company has been operating in Spain. It has been such a success that further orders for similar

trains for the U.S.A. have been received by the manufacturers.

In respect of passenger coaches it has been found necessary to use aluminium for all luxury models such as air-conditioned and tourist coaches as the underframe cannot stand the heavy weight of the superstructure without expensive stiffening. This is obviated by using aluminium panels, fittings, etc. Even in ordinary passenger coaches it can be used to advantage. While panels in aluminium are initially more expensive than steel their long life makes them ultimately a more economic proposition and particularly so for coaches running on coastal routes. Due to heavy corrosion, steel panels have to be changed every four to six years whereas aluminium lasts almost indefinitely. An outstanding example of the long life of aluminium panels is provided by the coaches running on the Kalka-Simla run which were panelled over 20 years ago in the metal and have still not been changed. For similar reasons as also its attractive appearance, aluminium is being extensively employed for fittings in passenger coaches such as windows, water tanks, lavatory chutes and bathroom floors. In India the steel coaches to be turned out by the Perambur Factory will have aluminium windows and water tanks. Another big potential outlet for the metal is in the panelling of wagons. Its great resistance to corrosion makes it an ideal material for wagons used for transporting corrosive materials such as refuse, sulphurous coals, etc. In Calcutta, the Port Commissioners have used aluminium in their refuse wagons and after 18 months service the panels are still in perfect condition. Previously it had been found necessary to change the steel panels every year or so. Due to its lightness, aluminium can also solve the problem of overloading of wagons which occurs continually, particularly in the coalfields. This diminishes both the time and expense required for repairs and maintenance thereby increasing their earning capacity. Space does not permit an adequate account of the advantages of the metal in the production of cabs and tenders for locomotives, electric rolling stock and many other important items.

In India the use of aluminium in the railways is still in its infancy and at present not more than 300-400 tons of it are consumed annually for this purpose. Within a short space of time the tonnage should rise to at least a thousand tons, displacing 3,000 tons of steel. The transport industry in India therefore, taken as a whole, will only be consuming 4,000 tons of aluminium by say 1957, conserving about 13,000-14,000 tons of steel. The tremendous growth of communications envisaged in the second five year plan should result in a far more pronounced growth in the following decade.

Building and Construction

This is a field which has come to the fore in the aluminium industry since the second world war. In 1952 it took up 21 percent of world production thus outstripping the transport industry to become the biggest solitary consumer. About 75 percent of the total consumption was in direct competition with steel. Aluminium corrugated roofing and siding sheets have found an ever-expanding market on account of their lightness, corrosion resistance, heat insulating characteristics and attractive appearance. In India, to date, the use of aluminium for this purpose has been limited and is largely a by-product of steel shortages. Latterly, it is being increasingly used for its inherent merits which make it the cheapest of all quality roofing material. Tea gardens, factories and hospitals among others have gone in for this kind of roofing. At present the annual demand is only 200 to 300 tons but this should rise to at least 1,000 tons in the next few years. As at least 50 percent of this amount replaces asbestos cement sheet, the competition with iron will be limited to 500 tons of aluminium, i.e. the equivalent of 1,500 tons of galvanised steel.

Aluminium is widely used abroad for pre-fabricated structures, windows, scaffolding tubes, louvres, curtain walls, glazing bars, window awnings, wall cladding and a host of other applications. The same cannot be said for India. Already however the new bigger buildings in the country are specifying aluminium louvres for windows. The Indian Telephone Building in Calcutta and the New Reserve Bank Building in Bombay are two good examples. Windows made from aluminium, which form 25 percent of all sales in this line in the U.S.A. have yet to make their debut in the country. The pleasing appearance of aluminium, its long life, freedom from corrosion and lightweight renders it an ideal choice for their manufacture. It is expected that they will come into much greater prominence in this country in the near future. The demand for aluminium in all these various lines totals 250 to 300 tons annually and should increase to at least 800

to 1,000 tons in the near future. Some of the competition is with other building materials, such as cement, brick, etc., but at least half may be said to be in direct competition with steel, involving only around 1,500 tons. Altogether, therefore, the building industry, say by 1957, will not displace more than 3,000 tons of steel annually in favour of aluminium.

Packaging

Out of the 1,800 tons consumed annually in this sphere, about 1,500 tons is in the form of foil which usurps the market for lead and tin. The other 300 tons rivals tinsplate in the production of expandable and collapsible containers. Its light weight and non toxic nature make it most suitable for use in the manufacture of bottle and vial caps for various foods, soft drinks, medicines such as penicillin, etc. In the next few years the demand should increase to around 3,000 tons annually thus replacing 9,000 tons of steel.

Miscellaneous

Aluminium is being used extensively for many other applications and this tendency is bound to increase in the next few years. A good example is the rapidly growing popularity of aluminium bins for storing grain. Exhaustive experiments recently carried out in conjunction with the Indian Standards Institute have proved its suitability for this purpose in even the most vigorous conditions. The use of aluminium for coal tubs in the coalmines and aerial ropeway buckets is also being investigated and may cause a large displacement of steel. By 1957 therefore, 21,000 tons of steel will be displaced by aluminium composed of the following items:—

	Steel Displaced Tons.
Transport	14,000
Building and construction	3,000
Packaging	9,000
Miscellaneous	1,500
	28,000

As production of steel will be around 3 million tons by then, not more than 0.7 percent of steel will be replaced by aluminium compared to 2 percent to 3 percent for the rest of the world. The steel industry therefore has little to fear from the growing encroachment of this lighter metal.

Before closing it should be emphasised that the foregoing discussion does not in any way imply that a low ceiling is set to the future of aluminium consumption in the country. Important areas of consumption, it is seen, are in fields where competition was with other materials, such as brass, copper, asbestos cement, etc. The consumption of utensils, the biggest single item, is not likely to register any spectacular growth unless encouraged by a Government policy of deliberately restraining the production of brass and stainless steel vessels so as to reduce the country's dependence on imports. The cumulative effect of rising national income, growth of population and improved standards of living will slowly but surely increase the demand for utensils at the rate of about 2 percent to 3 percent annually. Over a period of time this adds up to a very respectable sum. In the field of electrical conductors, the position is quite different. Present demand is around 4,700 tons annually and by 1957, with the economic betterment of the country, this should rise to between 8,000 to 10,000 tons, an expansion of over 100 percent. In the field of packaging, the demand for foil should at least double in the near future to reach an annual rate of 3,000 tons. The impending development of the aviation industry to meet civil and military requirements will further provide a vast expansion of the market.

The aluminium industry will therefore continue to expand mostly at the expense of other established materials, one of them being steel. This is as it should be. Technological progress inevitably results in the replacement of many traditional products. Often a new product having displaced its older, more conventional competitors is itself subsequently discarded in favour of an even more recent entrant. Aluminium for instance has already suffered from the depredations of magnesium and plastics and is now being threatened by titanium and fibre glass, to name only two. In general terms however it can be said that most progress is accomplished by each material, old or new, finding its proper place alongside all the others and progress is more of a complementary nature than otherwise. Such is the case with aluminium. It is joining hard, for example, with steel to give aluminised steel, and with copper to give aluminium plated copper. In this country whether aluminium replaces brass, bricks or buttons, its increasing use will contribute to the ultimate benefit of that most important of all persons—the consumer.

THE WEIGHING MACHINE INDUSTRY IN INDIA

AN INDISPENSABLE AID TO ACCURACY IN MODERN ENGINEERING

● By R. G. FOSS ●

HAS it ever occurred to you that the weighing machine is an indispensable part of your life? It has, did you say? Then, you must be a rather ordinary mortal, for herein lies a paradox. A paradox, you remark with pardonable curiosity. Yes, the scientist, the engineer, the merchant, even the small shop-keeper reaches for his balance or his scales without giving them a further thought; but it is the ordinary person—the memsahib—for instance, excitedly exploring the New Market, to whom the weighing machine represents a symbol of honesty, and fair play, the essential of the business on which she embarks in spite of Petticoat Lane tactics.

Here in India, where we live, there is progress all round except, it always seems to me, in those little shops which we and our wives frequent where the proprietors still depends on his primeval and indigenous weighing apparatus with its wooden beam, from which are suspended two metal pans by means of string (sometimes not very clean) into which are placed, firstly your purchase and secondly a progression of brass, lead weights or stones until the two are on an even keel. The desired weight is at last achieved, but the whole is supported by a clenched fist and the clever manipulation of the fingers may produce results to the venders' advantage.

This has possibly been realised, but it may be that that was the underlying reason for the evolution of the beam scale and, more recently, the dial scale. The former has rendered splendid service but is going out of favour with the development and distribution of the more modern types of machines with their precision knife-edges and carefully adjusted mechanism. It is difficult, nevertheless, to assess the impact of the modern weighing machine on mankind in general, but that it has been profound seems to be indicated by the instance of the gentleman who having dined well, if not a trifle unwisely, observed whilst slipping an anna into a pillar box, and reading the time of collection, "Dash it, gone up five pounds".

Most people, however, do not realise that almost all their activities are, somehow, bound up with weight and scales. For example a small baby must be weighed and its early feeding strictly controlled by intake of weight; even as the child grows, a constant watch is kept upon its development. Let us again think of the growing child. Weight is a very important factor, starting at the bottom, even in the manufacture of leather for children's shoes. The wool or cotton in the child's socks is similarly processed by weight, and as one grows older, there is little need to stress how much attention is paid to personal weight by the weaker sex!

As Old as Civilisation

The need for weighing in trade and commerce was established in the very early period of civilisation and scales, in one crude form or another, are known to have existed as long ago as 5,000 B.C. Improvement upon them was almost negligible for many centuries and it is only in the last 100 years or so that progress has been made in developing machines that indicate weight to a very correct degree with greater speed and consequently, less labour. Whilst beam scales are still often used, the present-day trend as has been mentioned, is towards self indicating or dial scales. On these the weight is indicated on a dial like a clock instantaneously, the operation requires no effort on the part of the person weighing the material, but automatically the correct balance is shown on the dial. The dial scale has many advantages over the 'Beam' or 'Steelyard' scale, a few of these advantages being: (a) saving of time, as the weigh clerk does not have to place weights in a pan, or put poises in position, (b) reduction of errors by decreasing the human element; (c) less wear of working parts and; (d) greater accuracy

resulting from widely-spread and easily-read divisions on the clock face. Materials of a great variety and of many uses are the principal concern of manufacturers and business houses, but before these materials become the property of the ultimate consumer, there is often a chain of many intermediate owners, each one adding his part towards the production of the finished article, and in modern business there must be some means of assessing the value of the materials, acceptable both to seller and buyer. This is generally done by measurement. Material quantities can be measured in one of four basic ways, by weight, by count, by volume and by length. All methods have their place in industry, but for the majority of materials handled daily, weighing directly or counting by weight, greatly exceeds the others as the most reliable and practical means of measurement. Scales, in short, are the basic instrument for measurement and have an unrivalled and indispensable position in processing and manufacture. The correct and careful use of scales, directly or indirectly, decreases costs, increases production and improves quality, control and uniformity of product. The needs of some industrial weighing and counting operations are so well understood that, nowadays, they are taken for granted. On the other hand, in more complex processes, the needs may not be so readily discernible. In nearly all cases, however, the purpose of a scale is to achieve one of the following results and accomplish something which is of vital importance to the industrialist.

Cost-Control and Accounting

The method of recording or analysing the cost of materials, labour (payment by piece rate) and power (consumption by weight of fuel) required for carrying out a process and for manufacturing a commodity, including transportation costs is as follows. In the production of certain industrial items, the cost of raw material is relatively great. When this condition exists there is no question that close accounting throughout the process of manufacture is of prime importance. Even when the cost of raw material is comparatively small, the efficient manufacturer cannot afford to ignore extremely accurate material accounting. In this respect, the weighing machine manufacturer plays a great, in fact a paramount part in that his products supply the figures that form the basis of cost accounting. Some of the major weighing operations which aid

cost control include "receiving" or the weighing of counting of material as it is received at the plant. This weighing provides the basis for paying the supplier of the material and the start of the materials and cost-accounting system for that particular plant or product.

Process Control: This means the correct balancing of materials to ensure a constant and even flow. A typical example is the careful weighing of coke, limestone and iron ore that goes into a cupola to produce a given quality of cast iron.

Production Control: The checking of a product during the course of, and at the completion of manufacture, to assure compliance with a given or set standard.

Inter-Departmental Transfers: The weighing or counting of material produced in one section of a manufacturing plant before it is transferred to another. By doing this a measure of individual departmental labour and production capacity or mechanical efficiency is obtained. Such weighings are frequently used as the basis for paying the worker.

The weight of material in reserve must be known accurately from day to day to prevent sudden and serious shortages which would lead to a stoppage of manufacture or process slow-downs. Modern scales are used for literally thousands of different industrial applications and purposes. As a result of this wide demand there are innumerable designs, each developed for a given purpose or type of weighing. A few of the not so well known types are:

Locomotive Balancing Scales: Balancing of locomotives is essential for their safe and smooth running. The individual wheel and axle weights must be correctly and evenly distributed; if this is not done, the locomotive will ride unsteadily and may cause damage to the permanent way. In addition, there is the grave danger of derailment. This is usually the result of what is called "hunting" which is, again, the result of unequal distribution of weight throughout the wheels. It is a remarkable motion, the locomotive, instead of going straight along the track, tending to sway or zig-zag, making for discomfort and possible derailment. The installation depicted on this page was designed to accommodate all classes of steam locomotives. India now has this modern equipment which is aiding the safety of travel by rail. The unit shown consists of seven pairs of weighing

Locomotive balancing scales in use

machines, each seven feet in length, spaced half an inch apart, giving 14 individual wheel-weighing units each of which has a capacity of 20 tons registered on a dial indicator. The immediate indication of all wheel-weights is shown instantaneously on the dials, thus enabling the operator to observe weight variations as spring adjustments are made.

Automatic Weighing: Raw sugar is, of course, a most difficult material to weigh automatically but the function of the scale shown here, is not only to weigh that commodity but also to supply a printed record of the quantity of raw sugar handled by it. The scale is started by pressing a push button and it is fully automatic until the supply of material is exhausted. The recorder mechanism prints tare weight as soon as the start button is pressed. When this recording is completed the feed gates are automatically opened and material is supplied to the weigh hopper until the pre-set load contact closes the feed gates. The recorder then prints the weight of the full load and, with that accomplished, the hopper doors open and the load is discharged. The doors then close, the tare weight is again printed and thus a record of the amount of residue left in the weigh hopper is easily obtained. This residue is permitted to build up to approximately 100 lbs. at which stage a signal light reveals this condition and the working of the scale automatically ceases. The residue is then removed and the cycle of operations recommences.

Check Weigher: Real weighing efficiency plus speed with accuracy, has been achieved and loss through overweight almost entirely eliminated on the type of scale shown in the accompanying photograph. It has been particularly effective in the tobacco, bristle, spice and chemical trades, especially where chemicals may cost as much as Rs. 1,300 a gramme.

It is not possible in the space of this short article to mention the many types of weighing machines that have been developed for different industrial purposes. What can be said is that there is hardly any place where the manufacture, distribution or scale of any known commodity takes place that is without a weighing machine of some sort. It should be remembered that weighing equipment used for trade purposes are precision instruments and that to obtain the best results, should be regularly serviced by reputable scale manufacturers who maintain highly qualified staff for this special purpose.

WIRE ROPE MAKING IN INDIA

(Continued from page 54)

strand wire ropes are manufactured in more than wire rope core. This particular rope is very flexible and strong. In addition to ordinary round strand wire ropes, there are "non-rotating" multi-round strand wire ropes; such ropes may contain as many as 34 strands, each strand composed of seven wires. Fig. 5 shows some different constructions.

Another variety of special design is the flattened strand wire rope. In such ropes the wires composing the strand are so arranged as to form a "flat" on the strand and the strands are so laid, or closed, as to present the "flat" on the exterior of the rope to act as the working surface. There are more than ten such designs of "flattened" dozen varieties each with its special features to meet a specific use. The technique of these designs is very complicated and covers a range of ropes with a variety of strands. Although all of the round construction, the strands may contain anything from six to 61 wires apiece and in the same strand may be found three or more different sizes or gauges of steel wire. For instance, a "Warrington" round strand wire rope carries in its strands two distinct gauges of wire; a "Seale" may carry three distinct sizes of wire. These features can, in turn, be combined with a variation of cores. Thus, a rope made of six strands of 19 wires has for each strand one large size wire in the centre surrounded by nine smaller wires which, in turn, are surrounded by nine large wires. The core of such a rope would be an independent strand" ropes in common use. Locked coil steel ropes are a variety used commonly as guides. These ropes are of special construction, the wires of the rope upon the surface being of a special section so that when "laid" or closed they interlock with each other forming a very smooth finish of a good rigid construction. These locked coil types may be found in full or half lock wires over a spiral. Fig. 6 shows some locked coil construction.

Specifications

Such being the varied uses to which steel wire ropes are put, it follows that there must be specifications to ensure that ropes are used for the correct purpose to avoid danger to human lives. The specifications governing the manufacture of steel wire ropes are standardised by the Government in all industrial countries. These standards

follow one another very closely throughout the world. They are all based upon the fundamental idea of ensuring that if the right materials are used, construction correctly carried out and the specified tests performed a safe and suitable rope will result. It follows therefore that specifications are drawn up most carefully to cover each particular application. In the mining industry for example, where large numbers of workers are employed very special and exacting conditions obtain and lifting gear, haulage, guide, ropeway, each needs special consideration. This is taken care of in the specifications. Industrial inspectors, whose duty it is to inspect and ensure that safety precautions are rigidly imposed, also pay great attention to ropes in use in industries and equipment where danger may arise, such as in collieries, elevators, etc. It is customary for steel wire rope users who are systematic and careful to maintain a history sheet for each rope which they have in service, specially if its operation is of importance. This ensures a systematic examination and test of ropes against excessive wear, corrosion or misuse. Slings used for cargo or heavy lifts in heavy industry should be specially cared for in this manner.

Ropes Deserve Care

Steel wire ropes should receive care and attention not only when in use but also when stored. They should invariably be kept under cover when stored, raised above the ground so that moisture cannot attack them. Great care must be exercised in uncoiling steel wire ropes to prevent kinking. A kink usually damages the rope beyond repair. There is only one correct manner in which to uncoil ropes and is to place the reel or coil of rope so that it will rotate readily while it unwinds. When ropes are used in conjunction with pulleys, it should be ensured that these are quite free and revolve easily and that groove is of the correct size and shape; otherwise the rope may be subjected to undue bending or chafing. When it is necessary to cut a steel rope, particularly of ordinary construction, the strands on both sides of the rope must be bound tightly where it is to be cut, to prevent their springing open at the point of severance. In coiling steel wire rope on to their working drums, great care must be taken to ensure that the coils lie evenly over one another upon the drum; if layers of coils cross one another damage to the under layer is likely to occur.

Built in Meehanite Metal, the machine is extremely durable, special grades being used to meet specific requirements. It is specially designed for Indian conditions and has become very popular in a very short time. For details write to us direct.

INDIA'S DIESEL OIL ENGINE INDUSTRY

STEADY PROGRESS TO SELF-SUFFICIENCY

By HITINDRA MALIK

IN less than a quarter of a century, India has achieved self-sufficiency in the smaller type of diesel oil engine. In 1932, a factory was established in the Satara District of Bombay for the manufacture of diesel oil engines and with it India's internal combustion engine industry came into existence on an organised basis. The initial capital investment amounted to Rs. 200,200 and the factory had 300 workers on its payroll.

The intention was to manufacture diesel oil engines based on British designs ranging from 7 B.H.P. to 30 B.H.P. Various difficulties were experienced in the initial stage of manufacture. The proper types of raw materials and component parts were not available while skilled labour was scarce. In the first year, production amounted to no more than two engines of 15 B.H.P. These were of the horizontal, single cylinder, four stroke open bed solid injection cold starting type. Even these were not preferred by the consumer. There was a marked prejudice against the local product.

It was the war which gave the industry its first major stimulus. With imports from abroad reduced to the bare minimum, new enterprise came forward and the Government of India encouraged the manufacture of diesel oil engines and their component parts. Steady progress was made which continued well into the post-war years. At the end of last year, 12 units were in operation with an aggregate capital investment of Rs. 16,494,000. Production in 1954 amounted to 8,652 engines as compared with 3,716 in the previous year—an increase of over 100 percent. In addition, seven new projects were sanctioned which are expected to be in production within the next two years. The industry has so far concentrated on the manufacture of engines mainly required for agricultural purposes. All except two firms manufacture single cylinder, slow speed horizontal engines ranging from five to 15 h.p. The other two firms are equipped to manufacture engines of 30 h.p. capacity while one of them claims that it can manufacture engines with a capacity of 200 h.p. if called upon to do so.

Unassessed Internal Demand

It is difficult to assess the internal demand for diesel oil engines accurately. The pre-war figure is estimated at 20,000 pieces a year. But in 1951, when imports were allowed under Open General Licence, actual purchases by the trade from foreign sources were far in excess of this figure. In 1951-52 sources were 17,614 engines respectively. These heavy imports can perhaps be attributed to speculative buying in the case of the smaller engines and to the acute power scarcity then prevailing in Bombay in the case of engines with a higher capacity. The immediate result was that the market was over-stocked and the Indian industry was hard hit by the slump that followed. Since then import trade control has been restored and a progressive ban covering an increasingly wider range of diesel oil engines has been imposed. No import licences are issued for engines of 30 B.H.P. and below, while engines with a higher horse-power are allowed to be imported on an ad hoc basis.

It is estimated that under normal circumstances the demand is in the neighbourhood of 15,000 diesel engines a year. The bulk of the demand relates to the smaller type of engine which is required in the rural areas for driving pumps, chaff cutters and threshing machines. It therefore follows that the demand for the smaller types of engine varies with the prosperity of the agricultural sector from year to year. Closely allied with the diesel oil engine industry, and very often subsidiary to it, is the power driven pump industry. Power driven pumps are used extensively for industrial and agricultural purposes. They are used for feeding boilers, pumping sewage and for irrigation in rural areas. The demand for pumps and engines is complementary and one influences the sales of the other. The most popular type of pump is the centrifugal pump—the horizontal spindle type—because of its low cost, light weight, simplicity, durability and efficiency. The vertical

Engine complete with centrifugal pump

type of centrifugal pump has only recently been introduced into India and its suitability for Indian conditions has yet to be established.

Power Pump Industry

The power pump industry has developed in proportion to the diesel oil industry and today has a capital investment of Rs. 21,030,000. Production in 1954 amounted to 8,650 pumps as compared with 3,700 in the previous year. This industry is now well established and is in a position to meet the entire internal demand except for specialised chemical pumps, large pumps for water supply undertakings and boiler feed pumps. In spite of this satisfactory development, there are a few factors which hinder the economic working of the industry.

The manufacture of diesel oil engines and their components is too widely dispersed. Although there are 12 recognised units which function on an organised basis, there are at least 40 other small-

scale concerns who claim to be manufacturers. In their case, manufacture amounts to no more than assembling component parts purchased from odd sources. Assembling is done in a haphazard manner without attempting to conform to any particular specification. Perhaps this is a legacy from an earlier period when the organised industry had not come into existence, a number of mechanics set up small shops to manufacture spare parts for imported engines. Such assembly shops, manufacturers claim, harm the organised industry inasmuch as they bring the Indian product into disrepute. Even among the organised manufacturers there is a wide dispersal of effort which if consolidated could result in the economies of large scale production.

Overall Engineering Problem

Then there is the overall engineering problem of India. There is a serious lack of ancillary in-

A row of diesel oil engines.

Another engine and pumping set.

dustries and manufacturers are compelled to fabricate the required component parts themselves. For instance, manufacturers have to produce their own pistons, piston rings, piston pins, fuel injection equipment and thin-walled bearings. Although some of these ancillary industries are now making progress, there is room for considerable expansion in this direction.

In a country like India where the industrial tendency is towards several medium scale manufacturing units instead of a few really large scale units, the adequate development of ancillary industries is of even greater importance than it is in the more highly industrialised countries. Obviously the economics of large scale production are lost if each manufacturer of diesel oil engines has to make his own components. This involves a duplication of effort and increases the cost of production of the complete article. The development of a feeder group of industries is essential if the heavy

engineering industry is to be put on a sound economic footing.

The same problem arises because of a lack of central forging capacity. All jobs have to be executed by the manufacturers themselves which again leads to increased costs. The installation of component manufacturing equipment by individual diesel oil engine factories involves gross over capitalisation. Such equipment inevitably remains idle for the major part of the year having produced the limited supply required by a single manufacturing unit within a short time. Raw materials present another problem. Manufacturers complain that the price of good quality steel scrap has increased considerably and supplies are restricted because of the export demand. Special alloy steel and limit bar are not readily available. Black bar is available but what the industry requires is bright bar drawn to limits. It is hoped

that when the new steel plants come into operation, the situation will ease.

Hard coke required for foundry use is also not easily available and Indian collieries find it difficult to maintain regular and adequate supplies. Transport problems add to the difficulties of the diesel oil engine industry which is located mostly in Bombay State. Pig iron, to meet the industry's specifications has to be imported from West Bengal. Because of a lack of adequate transport facilities, supplies are irregular. Moreover, transportation charges are heavy which add considerably to the cost of production. Fears have been expressed about the future of the industry. It is contended that with the development of the hydro-electric projects under India's five year plan, the demand for diesel oil engines will diminish. But it is difficult to follow this argument. Even in a country like the United States the trend is to integrate large scale hydro-electric projects with thermal power stations. One reason for this may be the freezing which occurs in the winter. But India has a similar problem where a failure of the monsoon could seriously affect some hydro-electric schemes. A notable example of this is Bombay. When the monsoon failed a few years ago, electric power was severely restricted which cost the State of Bombay several crores of rupees in terms of industrial output. The new power schemes in Trombay—an island off Bombay—relate to thermal units.

It is difficult to visualise the whole of rural India being served by hydro-electric power schemes within the foreseeable future. With rural uplift and the development of small scale industries in the villages there will be a greater demand for power for electrification, for operating pumps and running small machines. This vast potential still lies ahead and the diesel oil engine will have a great part to play.

Then there is the whole field of road transport for which internal combustion engines will be required while no effort has yet been made to manufacture marine diesel oil engines. With the development of Indian shipping marine engines will be required in increasing numbers. The neighbouring countries of the Middle East are potential export markets. Their agricultural pattern is similar to India's and with the uplift of the Arab peasant there will be a demand for small diesel oil engines and pumps. The industry undoubtedly has a future but the development of the ancillary industries is essential if the diesel oil engine industry is to be placed on a sound economic footing.

THE STORAGE BATTERY INDUSTRY IN INDIA

NEW PROCESSES AND GROWING NEEDS

• By H. V. ROSSELL •

THE key importance of the battery industry was first brought home to India during the second world war. Before the war there were a few small factories for the production of motor vehicle batteries, but their output was limited and India was almost entirely dependent on imports for her supplies. With the outbreak of the war, imports were severely restricted due to a sharp increase in demand in other theatres which meant that vital means of transport in India was threatened with dislocation. The need for good quality storage batteries, produced locally and in sufficient quantities, was keenly felt. The progress of the industry was naturally accelerated during the war years and three new factories came into existence. It was not until 1946, however, that batteries of Indian manufacture became available in appreciable quantities and since 1948 the growth of the industry has been fostered by a protective import duty. Against the background of the nation's aim to achieve self-sufficiency, the development of the Indian storage battery industry must be viewed with satisfaction. The rapid development of the industry is shown by the following table:

Year.	Production of Registered Manufacturers in Units
1946	27,600
1947	69,000
1948	1,06,800
1949	1,10,400
1950	1,87,200
1951	2,12,400
1952	1,58,400
1953	1,76,400
1954	1,80,000

The installed capacity of the organised industry has now reached the region of 600,000 units per annum plus the potential of the innumerable small unregistered manufacturers whose annual production is estimated at 80,000 units. The total annual demand for motor vehicle batteries in the country is placed at 280,000-300,000 units and this estimate includes the motorcar type batteries that are utilised on 6 volt radio sets which enjoy such popularity in the rural districts of India where electric supply is not available.

Fewer Car Registrations

From the foregoing figures it will readily be seen that only just over half the capacity of the industry is required to meet the total consumption of the Indian market. The considerable unused capacity could be absorbed by exporting; but so far the export of batteries from India has been on a very limited scale. The Government's export policy with regard to batteries has never been very clearly defined; but even so the Indian manufacturers would have difficulty in competing with the very keen prices in the markets of neighbouring countries. The position has been aggravated further by the decline in the number of new vehicles that have been registered in India during recent years. The effect of this has been that new registrations have hardly offset the number of old vehicles taken off the road at the end of life and the market has consequently become somewhat static for suppliers of motor vehicle accessories. Incidentally, India is almost the only country in the world where annual registrations of new vehicles have declined over the last few years. However, it is hoped that when the Indian automobile industry has become more firmly established, vehicle sales will follow a rising curve in keeping with the country's general development.

Marketing batteries in India has its own peculiar problems, not the least of which is the keen competition that the reputable manufacturers feel from the many small unregistered assemblers. Lacking proper manufacturing and testing facilities these small concerns frequently utilise components of dubious quality and generally produce an unreliable and inferior battery. Working on very low overheads they are able to offer their products at attractive prices and find a ready market with consumers whose main concern is low initial outlay. It is these inferior products which have given rise to the complaints made by many consumers regarding the quality of indigenous batteries.

Raw Materials and Excise Duty

In common with most of the newer industries in India there is a dependence on outside sources

Moulding hard rubber battery containers

for certain basic raw materials, and this problem can only be answered by the development of indigenous materials when available and experimentation to ascertain the suitability of what alternative material is available. The lead and antimony used for making battery plates, connectors and terminals are chiefly imported, as only very limited quantities are available from indigenous sources. The oxides used in pasting the plate grids are also produced from lead; but the actual manufacture of the oxides is carried out in India. The sulphur that is used in the manufacture of hard rubber battery containers has to be imported, but the rubber itself is from indigenous supplies. The only other imported raw material used in the industry is the special wood or alternative material used for the manufacture of separators. In order to be as independent as possible of outside supplies, certain establishments have installed modern machinery for the recovery of scrap lead.

These plants are of great assistance to India's economy and would become invaluable in time of international crises when overseas supplies of lead may be interrupted.

Included in the recent budget proposals announced by the Finance Minister and accepted by the Central Government was a 10 percent excise duty on all motor vehicle batteries and component parts produced in India. However, small establishments which employ five persons or less are exempt from payment of the new excise duty, the Government apparently taking the view that such producers utilise components manufactured by and purchased from one of the large registered organisations on which the duty will already have been paid. In actual practice, however, many of the small assemblers procure their supplies of battery plates from unregistered manufacturers who will probably enjoy the privilege of exemption from duty. Further, the battery containers, plate straps, connectors, etc. they utilise are frequently second-hand components which are renovated to give a new appearance. As indicated above the small battery manufacturers already produce about 30 percent of the country's total off-take and as for the most part many of them will now have an unfair advantage, this figure may well be expected to show a substantial increase. The general effect of the new Finance Act will be, as far as the battery industry is concerned, the encouragement of an inferior product, and it is anticipated that most of the 25 registered manufacturers in the country will find it increasingly difficult to meet "bazar" competition.

Standardisation

It is encouraging to note that the Indian Standards Institution has now finalised standard specifications for motor vehicle batteries and specifications have been prepared regarding several aspects of battery manufacture, including capacity rating and testing. The industry hopes that the Government will insist that all batteries manufactured in this country are up to the requisite specification and that the marketing of sub-standard products will not be permitted, although the difficulties are fully appreciated.

With regard to quality, the few large manufacturers in this country who have established reputations in the industry are now producing motor vehicle batteries that are in no respect inferior to the imported product. Until very recent batteries was impeded as no matter what type of containers were developed or what improvements

An aerial view of the Exide Battery factory, Shamnagar, West Bengal

PORVIC has eliminated the commonest cause of premature battery failure

This battery is something new

★ The separators, which formerly limited battery life by slowly wearing out and finally 'killing' the plates, are now made of *PORVIC*—the microporous plastic that *does not wear* in battery service.

★ The special long-life Exide plates, with C. B. 95 alloy are freed from dependence on separator life and can now show their full lasting capabilities.

★ The tough, shock-resistant container, designed to outlast even the long-life plates it holds, is built of *hard rubber*.

A PRODUCT OF CHLORIDE & EXIDE BATTERIES (EASTERN) LTD.

EB5X-2

were made in the design and manufacture of plates, the performance and the life of the battery was confined to the limitation of the separators that are fitted between the plates. The requisites of a separator for an electric accumulator are a high degree of microporosity and the necessary strength of toughness for handling, and to maintain shape when wet. In addition the separator should be reasonably inert to sulphuric acid and have a good degree of flexibility.

Until recently sheets of ribbed wood were commonly used for battery separators. Machined to shape and treated to remove resinous ingredients, they proved suitable as far as microporosity was concerned but were subject to chemical attack and thus greatly deteriorated before the battery plates had reached the end of their useful life. Experiments were made with many materials in the hope that they would satisfactorily overcome the shortcomings of the wood separator. Porous threaded rubber, fibrous glass and miscellaneous types made from celluloid, fibrous or vitreous materials were tried by various manufacturers but each has limitations as all are subject to oxidation and wear. It was not until very recently that the introduction of a new plastic material made from microporous polyvinyl chloride was found to be the complete answer to the separator problem. Marketed in this country under the trade name *PORVIC* this new plastic material is just as highly porous as a treated wood separator and its pores are so small that no particles of active material from the plates can enter them. Unlike the wood separator, however, it retains these valuable properties throughout the service life of the battery and is quite unaffected by chemical attack even under conditions of severe abuse. It has the same low electrical resistance as the best grade of wood and permits equally free diffusion of the electrolyte. It allows a closer assembly which lowers the internal resistance of the battery and greatly improves performance. Its strength in composition restrains any buckling of the plates. The introduction of the microporous plastic separator permits a completely dry assembly and due to the inertness of the separator material batteries can be sealed and stored for a period of years before being filled with acid and put into service. This was not possible with the conventional wood separators which have a tendency to warp and deteriorate during dry storage. Now that a virtually indestructible separator has been discovered, the benefits of new lead alloys and active materials used in the manufacture of plates, and improvements in container manufacture, will become fully effective. The young and active battery industry in this country is fully abreast of the times and considerable capital has recently been invested in order that all the latest improvements are incorporated in the indigenous product.

Heavy Storage Batteries

This brief resume has mainly been concerned with the motor vehicle type of battery. There is, however, today a demand for heavy storage batteries of widely carrying types for duties too numerous to mention in detail. The Indian industry is already manufacturing or planning the production of practically all these different types of batteries. The specially constructed batteries used by the Indian Railways for train lighting and air-conditioning are now largely manufactured in India. It is difficult to visualise any conditions of operation more arduous for a storage battery than those encountered in railway service where vibration and dust, etc. are added to the uncertainties created by variable intermittent charging and discharging conditions caused by the frequency and duration of halts and the number of lights and fans that are in use. It will be appreciated that to stand up to such conditions a battery produced with only the highest quality material and with the greatest care in design can be used with satisfactory results. Since the extension of railway facilities and passenger amenities has been given a major place in the five year plan, the importance of the development of train lighting batteries in India cannot be over-emphasised. The five year plan envisages a substantial growth in transport and communication in India, by rail, road and air. This means a consequent increase in the demand for various types of storage batteries. In the sphere of communications, the new projects, such as the extension of the telephone system and of telegraph facilities, require specially constructed, heavy, stationary type of batteries the largest of which may weigh two or three hundred tons. Similar batteries are also required in electric generating stations for operating high-voltage oil-filled switches and as an auxiliary source of power in emergencies. The Indian industry is planning to increase its production of these giant batteries.

All this goes to show that the Indian battery industry, though young in years, has already made rapid progress. It has before it possibilities of further development. Although a light industry, it is the type of enterprise which can be of tremendous value to India's economy, particularly during the present stage of rapid industrial development, and should therefore receive every encouragement.

Plate training and finishing department

A REVIEW OF RECENT TEXTILE MACHINERY DEVELOPMENTS

SINCE the International Textile Machinery Exhibition at Belle Vue, Manchester, in October, 1953, most British textile machinery makers have been fully occupied consolidating their achievements rather than introducing any radically new developments. This is, of course, only to be expected, as most mechanists make a special effort to bring out "something new" for Belle Vue, and it would not be possible, even if it were desirable, for new machines to be introduced continuously. Breathing spaces are needed, as well as continuous production of established machines if costs are to be kept down. This has been realised by the exhibition authorities at Basle and Hanover. An annual effort by Swiss and German machinery makers to produce novelties to attract visitors to these two fairs was proving too much of a strain, and very expensive, so that the decision was taken by these Continental textile mechanists to exhibit only every second year. In 1955 there will be no textile machinery shown at Basle or Hanover, the International Textiles Exhibition at Brussels being the main event of the year.

One of the most interesting developments on the spinning side during the year under review was the news that the cotton opener developed by the Southern Regional Research Laboratory in the United States was to be made in Britain. The claim for the SRRL Opener, as it is called, is that it opens cotton without damage to a degree never before possible. It does this by having a large revolving mass of fibre contained within a hopper, from which tufts of cotton are gently plucked and then removed pneumatically. Simple in conception and construction, more is expected to be heard of this machine. Fibre blends remain as important as ever, and much work continues to be done on the requirements of blends and the production of blends. Mixtures of man-made fibres, both alone and with wool, for spinning on the worsted system are catered for on the American Proctor synthetic card, which with coarse counts, is said to be capable of reducing the total number of operations involved from the bale to the finished yarn to four. The machine can deal with wide ranges of staple lengths and fibre deniers and 84-inch wide models are being constructed.

Spinning frame design continues to stimulate Continental mechanists. At Hanover this year, Messrs. Hagenuk, of Kiel, showed a ring frame in which the motion of the ring rail was hydraulically operated, claiming to give simpler control of the bobbin build. A new Ingolstadt draw frame shown was of streamlined design, all drives being by chain or helical gear. A Hispano-Suiza ring frame shown at the Basle Exhibition had a frame whose working width was only 8 inches. This was made possible by the unique Hispano-Suiza gear drive to the spindles, giving a positive and silent control over spindle movement, as well as considerable savings in floor space.

Electronic Mule

The electronic mule developed at Leeds University continues to interest the trade, and it is understood that a commercial version is under construction. The various "texturising" processes for treating filament nylon yarns that have been introduced during 1954, operating as continuous processes, are of the greatest importance, but unfortunately no concrete details of the machines on which these notable yarns are made have been released. Licenses have been issued to make some of the yarns in this country, and it is to be hoped that information about the machines will soon become available.

The discontinuous methods of producing the very extensible texturised nylon yarns at the moment principally utilise upstewers. During the year, S. and E. Scragg's introduced their new JV heavy duty upstewer incorporating the special Sescroflex spindle. The double-deck machine is capable of spindle speeds of up to 18,000 r.p.m., maintained for long periods. Large packages can be used on the spindles, adaptors making the same spindle serve for double-flanged bobbins, bottle-bobbins or spinning tubes. A very novel upstewer from across the Atlantic was introduced by the U.S. Textile Machine Co. Two-for-one twist spindles are used, arranged in three decks. The spindles are inclined at about 45 de-

grees to the horizontal, and the yarn passes through the hollow spindle.

Winding

The American Textile Machinery Exhibition held during 1954 at Atlantic City was on an impressive scale, though the accent seems to have been on modifications of existing designs rather than on radically new machines, and the exhibition, as yet, does not appear to have had any marked influence elsewhere. Reversing the commonly prevailing direction of the flow of ideas, the Foster-Muschamp 66 automatic pirn winder shown at the exhibition was a British machine which has successfully entered the American market. Developed from the Muschamp SS 100 winder, the machine's original individual hopper had been removed, to be replaced by a large capacity hopper situated at the end of a row of winders, serving the whole row. Another novel feature was the automatic pirn-board filling attachment, placing eight pirns to a board. It is reported that the machine was running at a maximum spindle speed of 15,400 r.p.m. during the exhibition—surely one of the highest speeds ever reported for a machine with a cam-traversed guide eye.

Another new Foster automatic machine shown was the automatic cone winder, based on the

famous Foster 102 Model. The automatic version has a travelling servicing unit which rides round the machine, passing by spindles which are running and knotting-on yarn from the next supply bobbin to cones which are stopped. The machine is claimed to be the first automatic winder of hosiery cones.

A new cone winder shown at Hanover by Georg Sahn was especially designed to wind precision packages of continuous filament material. Known as the "Micromat," the linear yarn speed of each spindle was kept constant electrically, in spite of the increasing diameter of the cone. An additional feature was the coil pitch corrector, claimed to give an exactly uniform yarn density throughout the package. Another new cone winder, the Brugger "Giroconer," has been introduced for the winding of the finest filament yarns at tensions approximately half those usually found on cone winders. In spite of the low tension, firm cones of uniform density are ensured by the traverse motion incorporating a positive layer-locking movement. The cones produced are said to be ideal for pressure dyeing.

Sectional Warpers

producing perfect warps by removing from the operative's control many manual functions where mistakes can arise. A machine which has attracted considerable attention in this connection is the Benninger sectional warper, models of which are made for all classes of yarn for both weaving and knitting warps. The most recent development to the machine has been the introduction of moveable warping drums, which can be rolled away from the main warping headstock and placed directly behind the sizing machine. On the removal of one drum, a second is placed in position, so that warping can proceed without the usual time lost for beaming.

The year has seen fewer new yarn tension control devices than other recent years. Among those that have been publicised have been the Rawson tension governor, and the Mellor Bromley "Neversnarl" unit. The latter is principally intended for use on knitting machines, where lively yarns are apt to snarl when withdrawn overend from cones. The unit has a series of nylon monofilament threads which press lightly against the sides of the cone, holding the yarn to the package until the final moment for removal. A development worthy of note is a package transfer machine which passes mill-wound packages from their tube on to the dyeing springs, eliminating the need for winding. If successful, the development of machines of this type could have far-reaching effects.

Looms

Few changes in loom design have been seen, although the trend towards looms without superstructure is becoming even more firmly established. Increasing attention is being paid to loom drives, and to accurate stopping of the loom in a position ready for immediate attention by the operative. On the latest Northrop looms, the loom stops in a different position according to which stop motion operates, considerably reducing weavers' attention time. The success of this type of motion depends upon good brake maintenance. The American Hunt Loom Co. reports that its use of the Warner electro-magnetic clutch brake unit for loom driving has met with great success, and that the unit is being fitted to an increasing number of models. Of unconventional machines, the Sulzer loom continues to make progress, and it is reported that some of the machines are to be supplied to manufacturers in Britain. Development continues in Sweden on the Maxbo shuttleless loom in which the weft is introduced by air blasts, and speeds of 300 picks a minute are claimed.

Jacquard machines are being re-designed in the light of modern needs and methods of construction. At Hanover, several German firms were showing streamlined jacquards designed for high speed work. In Britain, Rutherford's have introduced a cylinderless machine with a specially designed card presentation motion which is unaffected by warped and distorted cards. Devog's latest jacquard has been demonstrated running at high speeds in forward and reverse directions, and is very suitable for automatic looms equipped with sley reversing motions. John F. Hardaker's have continued to recognise the need for cutting down weaving costs while maintaining high standards of quality in jacquard productions, and their latest machine for upholstery fabric has been designed to that end. This is true, of course, of all contemporary jacquard machine makers. Samuel Dracup's and Peter Walker's, for example, have introduced further refinements designed to meet the exacting needs of jacquard users in the new competitive times.

Dyeing and Finishing

First shown to the public in Milan, Sanderson and Company's refined HW Type Vacuum Steaming Machine has been fitted with a new quick-lock door facilitating opening of the pressure vessel. The Sanderson machines have been widely adopted for the setting of nylon and "Terylene" yarns and fabrics, and are used for the texturised yarns mentioned previously. The various stages of processing which occur in the pressure vessel are automatically controlled by a pre-set timing mechanism. A notable cloth drying machine recently introduced is the Haas short loop dryer, in which the fabric hangs in short loops over rotating rods inside the drying chamber. By means of an ingenious transfer mechanism, the cloth is passed from one tier to another of these rotating rods without the introduction of tension. While particularly applicable to the more delicate fabrics, whether knitted or woven, the machine is equally suited to materials at present dried by other methods.

High pressure dyeing machines continue to progress, dyeing temperatures being higher than ever before possible. In this field it would be invidious to single out any particular machine

maker for attention, for there are several British, Continental and American machines available. The high pressures and temperatures were primarily introduced for the synthetic textiles, but new applications to the older fibres have also been found possible.

Knitting

The year 1954 saw increases in machine speed and patterning scope on many varieties of knitting machine, as well as some novelties. The new German Liba/Saupe LSZ 36 Warp Knitting Machine, built in widths from 90 to 180 inches (Saxon) is an originally-designed machine which, it is claimed, can produce fabric at 750 courses a minute completely without vibration. Yarn tensions can be kept extremely low, making the machine very suitable for synthetic yarns. From America, the Kidde Model E High Speed Raschel Loom is reported to have aroused interest at the Atlantic City Exhibition. The new machine is capable of speeds from 300 to 600 courses a minute, depending upon the number of guide bars which may vary from 6 to 2. An outstanding development in the warp knitting field has been the completion of the F.N.F. model "PC." To the speed and reliability of the original F.N.F. machine have now been added a chain link patterning mechanism, an improved let-off system and a wider choice of needle gauges.

New Rib Machine

Among the new British machines whose manufacture was announced during the year were the Bentley-Blackburn RUMF Automatic Multi-feed

Rib Machines for plain and fancy fabrics for underwear and outerwear. Of interest to the same sections of the industry is the firm's new eyelet machines, on which increased numbers of feeds have considerably increased the machine's scope, compared with its predecessors. The Mellor Bromley 5/RLG/8 machine was a new development in the evolution of latch needle circular machinery for the production of women's stitch shaped tuck rib underwear. For pile fabrics was a new American Wildman machine with carding attachment, whereby carded fibre fed in sliver form was incorporated in a circular-knitted fabric during knitting. The possibilities of this machine seem almost endless, and will be watched with interest.

It is, however, in the field of full-fashioned underwear and underwear machinery (Cotton's patents) that the most spectacular progress has been made in the last year or two. Co-operation with machine users, particularly in the famous cashmere producing district of Hawick, has undoubtedly been a big factor in recent developments. Following the introduction of the improved Bentley/Cotton machine in 1953 with its high output and simplification of operations there came news of a new machine by S. A. Monk which is reported to have attained a knitting speed of 100 courses a minute. Actually, the machine has been set for 90 courses on average width garments, compared with a considered maximum of 70 on earlier models.

The above article has been reprinted from the March issue of the *Textile Mercury and Argus*.

The new SW 14 engine

A completely new line of power engines has been announced by the Worthington Corporation of America. According to W. E. Wechter, manager of the corporation's Engine Division, the new engines, known as the SW 14 line, are a high pressure turbo-supercharged, four-cycle design, rated from 1,350 to 5,000 horse-power at 450 revolutions a minute. Largest of the new line is a 16-cylinder V-engine which will develop twice as much power as present diesels of the same weight and dimensions which have been previously built for similar services.

According to Mr. Wechter, the new SW 14 engines have special features, which are based on many years of field experience, research, and testing. The SW 14 line was developed as a result of more than ten years' study of market requirements for both direct drive and electric power generation, particularly for applications in private and public electric central stations; water works; sewage disposal plants; petroleum and chemical plants; mining, quarry and cement plants; gas and oil pipelines; irrigation and drainage projects; industrial power plants; dredges; radio and radar stations.

The tri-power arrangements permit use of the new engines as oil diesel, dual fuel diesel, or spark ignition gas. The new SW 14 engine is the only low-speed, heavy duty, high pressure turbo-supercharged engine in the United States designed and built for a capacity exceeding 200 pounds per square inch brake mean effective cylinder pressures. It is extremely simple and devoid of complicated turbo-charging control systems. One of the unique features built into the new SW 14 line is interchangeability of major parts between the in-line and the V-engines, such as cylinders, heads, rods, pistons, bearings, fuel injection equipment,

etc. When an in-line engine is installed today, for example, with a view toward adding a V-engine at a later date, the user is not confronted with stocking many different spare parts to service both engines during periodic overhaul.

Other major features are: Combustion chamber designed to burn most efficiently the larger quantities of fuel required for the higher power output. Four valves (2 inlet and 2 exhaust) mounted in the cylinder head, for less flow friction and higher volumetric efficiency. Symmetrical Dished Piston Design, flood cooled—for maximum strength and uniform cooling.

For an air supply to support complete combustion and to provide for perfect scavenging, the engine is equipped with a high pressure turbo-charger. Discharge pressure at only 8-10 psig, permits using comparatively small air after-cooler and reduces cooling water requirements considerably below that of engines using much higher charging pressures. Exhaust and air manifolds are on opposite sides of the engine. On the V-engine, this places exhaust manifold between cylinder banks and the air manifolds on the outside, along the coolest part of the frame. Cast-in water jackets are baffled for even distribution of circulating water and for high velocity cooling. Circulating water is entirely outside of the engine frame, preventing electrolysis and frame corrosion and eliminating possibility of contaminating the lubricating oil. The lubricating oil system is the well-known Worthington positive pressure type with main header cast in the base and drilled passages to main bearing seatings. Rugged, compact, and handsome in appearance, the new SW 14 line is modern in every respect.

Voltage testing of cells after ageing

IN a predominantly agricultural country like India, where a very large part of the population lives and works in areas far from any central electric supply system, some means of portable artificial lighting is a necessity. It is not surprising therefore to find that electric hand torches and lanterns are widely used, not only as a stand-by light source for occasional use in cities and towns, but also as a regular source of light by the villager working in his field after dark. Although the price of the dry cell is relatively low,—of the order of six annas a piece—the quantity used is so large that the turnover amounts to several crores of rupees a year for all of India. The manufacture of dry cells is thus quite a large and thriving industry in India today.

The manufacture of dry cells on a practical commercial scale began in 1926, when a plant was opened in Calcutta by the Ever Ready Company India Ltd. This was followed in 1934 by another firm which established a plant in Western India. By 1940 the original facilities had been expanded and World War II found India with a modernised dry-cell industry having an annual capacity of over 40 million cells. With the outbreak of the war, and the consequent curtailment of shipments of batteries from Europe and elsewhere, the Indian battery industry had to meet unprecedented demands, with the added handicap that very little new machinery could be imported. The opening of the Far-Eastern phase of the war placed a still greater burden on the industry, by calling for large numbers of cells for telephone and telegraph communications in such undeveloped areas as the jungles of Assam and Burma. It is doubly creditable, therefore, that the industry was able to meet the challenge and produce the necessary quantity and quality of cells and batteries.

Pakistan had, until recently, no indigenous manufacture of dry cells, and even after partition India supplied a large part of Pakistan's requirements. Then came the currency devaluation tangle of 1949, and the subsequent curtailment of trade put a stop to large-scale exports of dry batteries to Pakistan. The growth of the domestic market continued, however, and even with the loss of the Pakistan business the sales of dry cells increased in India. New firms and new factories came into operation to augment the manufacturing capacity of the long established companies, and at the present time the installed capacity of the dry battery industry in India stands at 221.5 million cells a year, according to the figures published by the Ministry of Commerce and Industry.

New Type of Dry Battery

In recent years a special class of dry batteries has come into increasing prominence in India, namely, radio dry batteries. Ever since the outbreak of the war, the radio has played an increasingly important rôle in Indian life, and in recognition of this influence the new Government launched an extensive campaign for setting up a network of radio transmitters all over India. This in turn has led to increased sales of radio sets, and the indigenous production of radios has gone up very sharply. Because of the restricted electrification in the country, a large proportion of these sets were, and are, run off dry batteries. Ten years ago the number of sets in use, as measured by the number of licences in force, amounted to one or two hundred thousand; to-day the figure stands at 800,000. The increase in dry battery sets is even more impressive. The number of radio dry batteries sold in India in 1954

THE DRY BATTERY INDUSTRY IN INDIA

NEW METHODS TO SUIT NEW NEEDS

• By W. R. CORREA, Ph.D. •

was more than ten times the corresponding figure for 1945.

The dry cells manufactured in India may be grouped in three major categories, according to their general application. These three categories are, flashlight-C cells, radio batteries and special cells for tele-communications, signalling and general purposes. The requirements of each of these three applications differ from the others and the cells developed for each also differ markedly in size, shape, composition and characteristics. By far the biggest demand is for the flashlight cells, of which over 120 million were sold in 1954 to power the estimated 20-30 million flashlights and electric lanterns in use in India. It is fitting therefore that the flashlight cell be used to illustrate the construction of the dry cell.

The precise chemical reactions which take place in the dry cell, to produce the electricity to light the bulb, are extremely complex, and whole books have been written on the subject. A simple and essentially correct description of the reactions may however be given as follows. The zinc is dissolved in the electrolyte to produce an electric current, and the "depolariser mix" serves to dispose of the waste products of the reaction in such a form as not to impede the continued functioning of the cell. The function of the carbon electrode is simply to conduct the electricity to the outside of the cell, and it is chemically quite inert in the dry cell. The illustration shows a cross-section through a typical flashlight cell. Cells using this type of construction are called "round-cells" or "can-type cells".

The major materials used in the manufacture of dry cells are manganese ore, zinc and carbon (as electrode rods, graphite and carbon or acetylene black). Besides these major items, there is a host of smaller items such as brass for caps, asphalt for the seal, paper for sundry washers, tubes, jackets, etc., wheat flour, corn starch, and chemicals such as chlorides of ammonia, zinc and mercury. In the manufacture of the conventional round-cell these materials are processed as follows. The zinc is formed into a water-tight cylindrical "can" open at one end, either with a soldered side seam and bottom piece, or by extruding or drawing the desired shape from a pellet or "slug" of zinc. Meanwhile, the "depolariser mix" is processed in an independent operation. The composition of the "depolariser mix" varies from one manufacturer to the next, and indeed between different types of cells, made by the same company. However, in general the mix comprises ground manganese ore, graphite, carbon or acetylene black, and a percentage of the chlorides, made into a moist powder, and then tamped into cylindrical "bobbins" or "dollies" of suitable size and shape, with the carbon electrode rod standing out of the centre of the bobbin.

In a third operation, the electrolyte paste, containing the rest of the chlorides, wheat flour, corn starch and other materials, is mixed in vats and kept agitated until required. In the assembly of the three active components of the cell, the bobbin is inserted into the can, in which the appropriate amount of paste has previously been poured. On insertion of the bobbin, the paste is squeezed up around the bobbin and stands between the outer surface of the mix bobbin and the wall of the zinc can. This paste then sets, either by the application of heat (cooking), or, in the case of "cold setting" pastes, by the chemical action of the constituents in the paste. When set, the paste forms an unspillable tough gel, thus serving the additional purpose of preventing direct contact, and hence "short-circuit," between the mix and the zinc. The top of the cell is next closed off, either by means of a composition seal, or by crimping on a metal disc seal, leaving only the familiar brass cap projecting from the top. After suitable aging and testing, the cell is "finished" by inserting it into a colourful jacket of paper and board. It is then ready for sale.

Radio Batteries

The most popular radio dry battery in India today is the "A-B pack battery" for domestic receivers, featuring a $1\frac{1}{2}$ volt 'A' section and a 90 volt 'B' section. This pack battery may be considered as consisting of a suitable number of unit

cells connected in series or in parallel to supply the required voltage or current capacity to operate the radio receiver. Until recently the unit cells used in radio batteries in India were in fact similar in size and construction to the standard flashlight cell, differing only in the details of the chemical formulation used in the cell. Within the last two years a completely new type of dry cell has been introduced on the Indian market. This cell, the "Eveready", "Mini Max" flat-cell, is specially designed for use in radio batteries and is a radical departure from the conventional "can" type of cell. As shown in the accompanying illustrations of this new type of flat cell, the mix, the paste and the zinc are disposed in flat rectangular layers, so that the appropriate number of cells can be stacked up to give the required voltage, eliminating not only the need for interconnecting wires between cells, but also a large part of the air spaces and miscellaneous paper, asphalt and brass components required in radio batteries assembled from can type cells. The flat-cell type of radio battery is therefore more dependable, more compact and more economical than the batteries previously available to the Indian public, and should do much to encourage radio listening among the rural and suburban sections of the population.

Among the Government departments using large quantities of dry cells are the Defence Services, the Posts and Telegraphs, and the Indian Railways. The Defence Services require for the most part special batteries, which are, however, essentially similar in construction to the general trade batteries, but differ in respect of performance requirements, shape and size. The Posts and Telegraphs and the railways use sac elements, inert cells and a large dry cell, six inches high, known as the No. 6 Cell. The "sac element" is just the depolariser and carbon electrode part of the dry cell, of larger size even than the No. 6 cell, and is

Cells passing through a temperature-controlled bath

THE CAN TYPE CELL

Seal
Expansion Chamber
Carbon Electrode
Bottom Washer
Tube
Zinc
Separator (Containing the Electrolyte Paste)
Mix Bobbin

30 can-type cells assembled in a rectangular box and connected in series with soldered wire connectors make a conventional 45-volt "B" unit. Two such units make up the 90-volt "B" section of the conventional round-cell radio pack battery.

How a typical flat-cell battery is built.

1 The elements in a typical flat-cell are the same as in a dry cell—carbon, depolarising mix, separator and zinc—but they are shaped differently.

2 These four basic materials are brought together like this. The projection on the mix cake is for contact with the zinc of the next cell above it.

3 An elastic seal is snapped around the entire assembly, protecting the cell against loss of moisture and preventing creepage of solution from one cell to the next.

4 15 cells are assembled into a stack and bound tightly together between stiff end plates with strong tape. Four such stacks connected in series deliver 90-volts.

...spelled by the products we make or sell

PROGRESS is born of Need...the need for greater efficiency...the need for products that will do a job better than it has been done before. Which explains the tremendous popularity of National Carbon Products.

Today the name "Eveready" stands for the best in Dry Batteries—for flashlights, radios, tele-communications, photoflash units, hearing aids and many other applications. The "Eveready" "Minimax" Radio Batteries, introduced a little over a year ago, mark a revolutionary departure in battery design and have already

won wide acceptance because of their economy and dependability.

And elsewhere...

India's industries are extensively using the organic chemicals, plastics, carbon and graphite equipment supplied by our Company...on farms all over the country the fumigants, fungicides, weedicides and auxiliaries we supply are helping to grow healthier crops.

Making better products—and helping to make them—is our contribution to India's progress.

NATIONAL CARBON COMPANY (INDIA) LTD.

18A, Brabourne Road, Calcutta-1.

Components and sub-assemblies on conveyor belt

formance and dimensional specifications, and are helpful to the manufacturer and consumer alike.

The Government of India has long recognised the importance of the dry battery industry in the Indian economy and in fact this industry is listed among the so-called "scheduled" industries. The movement of batteries from factory to consumer has been considered vital enough to have been accorded equal priority with the shipment of food, in certain times of transport difficulties. To promote the growth of the indigenous industry, the imports of certain classes of dry batteries were restricted through the licensing policy and the imposition of Customs duties. For their part, Indian manufacturers developed the local supply of raw materials wherever possible and in fact at the present time a large percentage of the materials used in the manufacture of dry batteries is of local origin. The largest manufacturer of dry batteries in India recently spent a very large sum of money on a detailed survey of India's manganese ore deposits, to locate ores that would be suitable for battery making. The problem is not a simple one, as only very few of the scores of naturally-occurring ore forms are suitable for use in dry cells. India is soon to have also a new zinc mill, to be owned and operated by one of the battery manufacturing firms. This mill will make India substantially independent of overseas supplies of certain types of processed zinc for the dry battery industry, and will help conserve foreign exchange.

Industry's Problems

Much remains, however, to be done to improve the economic climate for development of the Indian dry battery industry, and to remove some of the handicaps which at present retard the full expansion of the industry. One of the disabilities under which the Indian dry battery industry labours is the anomalous position in regard to import duties on dry batteries and battery components. At this time there remain several processed and semi-processed components and materials required in the manufacture of dry batteries which must still be imported due to the non-availability of suitable indigenous substitutes. The average duty applicable on these materials prior to 1st March, 1955, was of the order of 40 percent *ad valorem*. However, complete dry batteries incorporating these components could be imported on behalf of the Indian Railways at a special import duty rate of only 19-17/32 percent. These gave the importer a decided price advantage over the local manufacturer when tendering against the requirements of the Indian Railways. Following the imposition of the new Excise Tax on 1st March, 1955, these percentages have changed, but a large disparity still exists.

The most recent example of the burden placed on the Indian dry battery industry is the new Excise Tax of 10 percent on dry batteries. Over the last three years, the Indian dry battery industry had succeeded in reducing the price of the flash-light cell by some 10 percent, and this reduction was particularly welcomed by the villager for whom dry batteries are a necessity. With the imposition of the Excise Tax, this price reduction is completely nullified and the price of the flash-light cell is back up to where it was in January, 1952. In regard to radio dry batteries, the new Excise Tax is a particularly retrograde step since the incidence is felt exclusively by the rural listener, in most cases a villager who can least afford the increase in his cost of listening. Assuming that the average dry battery set owner uses three batteries a year, the Excise Tax amounts to a further Government levy of Rs. 8 to Rs. 9 a year, in addition to the Rs. 15 a year paid for the radio

licence. In view of the repeated insistence on lower-priced radio sets by the Hon'ble Minister for Broadcasting and Information, the increase in direct Government taxation from Rs. 15 a year to almost Rs. 24 a year is definitely not a step in the right direction. Under the new Excise Tax scheme, hearing-aid batteries are also taxable. This is particularly unfortunate, since it levies a tax on the person who is already at a disadvantage due to his physical handicap, and in effect is a tax on this very handicap. The cost of dry batteries in a hearing-aid appliance is already high, due to the special requirements of the appliance; any increase in this cost places a severe burden on the user of the hearing-aid, and must necessarily restrict the contribution which this device can make towards pleasant living for the handicapped.

In spite of these difficulties, however, the Indian dry battery industry looks forward to an era of considerably increased demand for both flashlight cells and radio batteries. One of the factors which will make for increased sales of batteries, is the imminent establishment of a large flashlight-case plant in India, which is expected to be in full production by 1958, and which will make available a very large number of good quality flashlights at relatively low prices. For the first time, therefore, the trade will be in a position to go out and promote the sales of flashlights by an aggressive sales campaign. An indication of what this can do to the sales of dry cells, is seen from the sales figures for 1949, the last year when imports of flashlights were freely available. The sales of dry cells in 1949 was 33 percent over 1948 and 75 percent over 1947. It is reasonable to expect, therefore, that a really energetic effort to popularise the flashlight for the masses in India, backed up by a modern high-capacity plant to produce them in quantity and quality at low cost, will give a tremendous boost to the sales of dry cells. Radio batteries, too, will be in increasing demand as time and the laws

of economics enlarge the number of those who are willing and able to own a dry battery receiver. We in India are only just entering on the "Radio Age", and in spite of the progress in the last 5 years (0.7 radio sets per 1,000 inhabitants in 1948, 2.3 sets per 1,000 in 1954), we have a long way to go before we catch up with the "giants" (1,070 radio and television sets per 1,000 persons in the U.S.A., 370 sets per 1,000 in the U.K.). The progressive establishment of new AIR transmitters and the increasing availability of good quality dry battery radio sets at economical prices, coupled with the reduction of up to 30 percent in cost per hour of listening afforded by the new layer-built batteries, are contributing to the spread of the radio listening habit among the rural population, and cannot but have a profound effect on battery sales.

Besides these major applications, dry cells are finding increasing use in other fields, where hitherto little demand existed. For example, in the miniature-battery field, the growing popularity of the so-called "Battery-Capacitor Photoflash System" has led to a three-fold increase in demand for the miniature 22½ volt layer-built battery in the past year alone. Indian made dry batteries are also being increasingly used for radiation detection instruments, cosmic ray research, and other applications requiring stable voltages of the order of 500-1,200 volts, for which the batteries had previously to be imported at considerable expenditure of time and money. The availability of suitable batteries from a local source will greatly increase the usage of this type of equipment. We are on the threshold of an "Electronic Age"—a period of great expansion in the demand for dry batteries—and the achievements and growth of the Indian dry battery industry so far are but a foretaste of what is to come. The performance of the Indian dry battery industry in the past, is the best possible guarantee of its ability to meet the challenge of the future.

perfect design precisely made

When we say it is a perfect design we mean that it is designed to look beautiful and its working is perfect. USHA DeLuxe Fans are designed by experts and are made under ideal conditions with the latest manufacturing and testing machines. USHA DeLuxe Fans ensure silent trouble-free service at low cost.

USHA Fans add beauty and comfort to all places.

FACTS OF FLUORESCENT LIGHTING : Number One in a Series

Blueprint for Lamps...

From the drawing board to the final stage of production Philips Fluorescent Lamps undergo rigid quality control and reliability tests. These lamps maintain an even strength of luminosity throughout their effective life—guaranteed to the established International Standards. The light output of Philips Fluorescent Lamps is three times as great as that of an ordinary incandescent lamp—for the same current consumption.

In different wattages ranging from 20 watt to 80 watt. Either straight or circular. Available in all the normal shades—from daylight to the equivalent colour of incandescent light. Philips, who have done much for the development of fluorescent lighting, also manufacture essential lighting accessories: Control Gear, Lamp Holders, Trough Fittings—all carrying forward the tradition of Philips *dependability*.

THE LIGHTING ENGINEERING INDUSTRY IN INDIA

● By F. W. MOUNTER ●

ALTHOUGH there is an enormous market potential for all articles used in the production of light in India, nevertheless, at the present day the lack of knowledge with regard to illumination technique and desirability is such that the industries employed in the production of light sources and accessories are unable to work to anything like their installed capacity. It is for this reason that the light source and accessories manufacturers and importers in India are combining together with a slogan "Make India Light Conscious". By light consciousness we imply that it is our task to bring to the notice not only of the specialists in lighting but of the general public also the recognition of the fact that the practice of illuminating engineering can produce measured illumination intensities which are needed for any particular task. However, we have to bring about a knowledge that modern light sources should be used in a manner which ensures that their full efficiency is directed towards the production of light. It is no sweeping statement for us to make that at the present moment in India, crores of rupees are being wasted, every year, in the dissipation of electricity in non-utilised light and also in heat and other accessory losses much of which could be saved. This wastage of electrical energy is due to three main factors:—(i) unplanned and inefficient lighting schemes, (ii) inefficient light sources and accessories, (iii) inefficient lighting fittings.

In clarification of the above statement, we would point out the following:—The difference between natural daylight and finest artificial illumination is so wide that it is very difficult for anyone to realise how great the gap really is. In normal daylight, values up to 10,000 foot-candles can be experienced in the open, whereas the finest general illumination scheme for artificial light rarely, if ever, exceeds 100 foot-candles. The eye is very adaptable but, nevertheless, requires more light to see fine detail than for the perception of large articles. Each industrial, commercial, or even domestic task requires a certain amount and type of light to produce efficiency in the worker and this can be planned beforehand by a competent lighting engineer. The quality of the light, i.e. glare-free, no harsh shadows, etc. plays an important part. By inefficient light source, we do not necessarily refer to a badly made or non-standard lamp but, in the main, refer to any lamp not specifically made for the purpose for which it is being used as an inefficient light source.

Lighting Fittings

Lighting fittings are designed for particular purposes in order to control the emission of luminous flux from the light source and to direct it, in the most efficient manner, towards the point where the illumination is required. It is no doubt obvious that with a bare lamp which emits light in almost all directions the utilisation of light on the working plain will amount possibly to only 20 percent of the luminous flux emitted by the lamp. In the case of, for instance, a "direct lighting fitting," its task is to concentrate the light which emission of the lamp and to reflect the light which normally would dissipate in all the directions—downwards,—towards the area requiring illumination. In order not to lose too much of this light

One of the "special" group of incandescent lamps.

flux, the surface of the reflector of the fittings must, therefore, be able to reflect the highest possible amount of light falling upon it. The finest fittings of the "direct" type of reflective surface are capable of returning up to 94 percent of the light falling upon them, whereas we find on the market hundreds of types of fittings which although quite pleasing in appearance and having what appears to be a good white reflector are found in practice to reflect only between 48 and 55 percent of the light falling upon them.

Until these facts are generally known among the users of artificial lighting apparatus, there will be a very limited scope for the increase in good quality light producing equipment. So much for the task. Now what actually is in existence in India for the manufacture and distribution of lighting equipment? Until 1935, all electric light sources in India had to be imported, but during the year 1935, two incandescent lamp manufacturing units came in being, both in Calcutta. The first in this field was the Bengal Electric Lamp Works followed closely by Philips Electrical Co. (India) Ltd. Their factories produced incandescent lamps of the normal domestic type ranging from 15 to 100 watts.

In course of time other factories were set up for the production of incandescent lamps, some of which produced lamps up to and including 500 watts but all these consisted of tungsten filament, gasfilled and vacuum types.

Limited Market

At present 11 companies manufacture incandescent lamps with a total installed capacity of 30 to 35 million lamps a year. This capacity has never yet been fully utilised and for the past three years, the Government of India has been forced to restrict the production and sale to approximately 19 million incandescent lamps a year in this country. This means of course that, as things stand at present, it is impossible for the 11 manufacturers to exist solely on lamp production if they brought down the price of the incandescent lamps to the figure comparable to that of many other countries, where the capacity lags behind the demand. The remedy for this is obvious—either some of the 11 manufacturers go out of business or the sales organisations and dealers throughout the length and breadth of India concentrate on bringing this "light conscious" feeling to the people and create a demand for an increased market. The offtake at present is so low in comparison with other countries that we are convinced that

the market demand not only could but should be far in excess of its present level. By way of comparison, we would point out that both the U.K. and India have each approximately 50 million people served by electric lines—but in India, the incandescent lamp market is limited to 19 million a year, as against the U.K. consumption of approximately 200 million.

Comparatively recently, a number of firms are now manufacturing not only incandescent lamps but also fluorescent lamps of 20, 40 and 80 watts with their various colour renderings. The fluorescent lamp is of course to the world of light what the motor-car was to transport in the days of the horse-drawn vehicles. The difference in efficiency is approximately 3:1. The physical shape of the fluorescent tube lends itself much more easily to the planning of glare-free, shadowless and efficient lighting schemes. It is estimated that in India to-day there is an offtake of approximately 1,200,000 fluorescent tubes of which, in 1953, some 800,000 will be manufactured in this country. The market for fluorescent lighting equipment shows a steady upward trend but we feel that at the moment this is due not so much to any light conscious feeling for a more efficient light source, but possibly to the novelty value of something which is fairly new in this market.

Ancillary Production

With the advent of fluorescent lighting, new equipment for both electronic control and the light flux distribution has become a necessity. Therefore, in the past few years, the production of fluorescent lighting fittings and electronic control gear has sprung up, unfortunately, very often in what we would term "back street and garage manufactories". Some of the control-gears are so badly made as to cause early failure of the fluorescent lamp itself—there is very low efficiency of light emission, very high consumption of electrical energy and in some cases even the risk of fire is always present. Reputable manufacturers, however, are now producing in India control-gear and lighting fittings of a standard not only comparable to but in some cases even higher than the same type of articles hitherto imported from Europe and America.

Summing up, therefore, there is no doubt that the market for lighting equipment of all types has a very rosy outlook but, nevertheless, a great deal of further effort and research will be necessary. At present 95% of the research results and the know-how utilised in this country comes from abroad, but there are so many problems in the illuminating engineering field which are peculiar to India that it is high time that organisations to cover such research were established in this country. The recent formation of the Illuminating Engineering Society of India will do much towards the making of India "light conscious" and to raise the standard of illuminating technique and practice, but it is not equipped for technical research into more efficient light sources and production of special lighting fittings for tasks peculiar to India, which would have to be done either by a department of the Government or an association of the lighting equipment manufacturers or a combination of both.

The assembly of high quality lighting fittings.

SOME SAVINGS' IN AIR-CONDITIONING THE ECONOMICS OF A STORAGE PLANT

● FROM A CORRESPONDENT ●

UNTIL quite recently, most large air-conditioning plants in tropical and sub-tropical areas consisted of a bank of evaporator coils cooled to a predetermined temperature as a result of the compression of freon gas or other refrigerants. The evaporator coils were usually well finned and air was blown through them by high velocity fans and distributed by means of G. I. ducting. Usually, in order to reduce the operating cost, the whole, or a proportion of the return air from the space to be cooled was re-introduced to the blowers behind the evaporator coils and re-circulated. This technique was quite satisfactory for certain applications but there were some where it was not entirely suitable. For instance, in a block of flats where one tenant was addicted to cooking with garlic, the aroma of this vegetable might, in a relatively short time, be distributed generously to the tenants of the remainder of the flats air-conditioned by the same plant—a feature which was by no means always appreciated.

Another application where the orthodox type of installation is at a disadvantage is a church or a meeting hall, and some say that the problem posed by such buildings was the forerunner of the installation which is described in this article. Probably, repetition has embellished the tale surrounding the first storage installation but the story goes something like this. There was a church in one of the small towns in the States near Washington where very unpleasant summer conditions were experienced frequently. The Pastor of one of the local churches, it is recounted, was left a certain sum in a Will which, it was laid down, was to be spent on plant to air-condition the building and so increase attendance during the summer months. Although the church was not a particularly large one, when its capacity was assessed for air-conditioning purposes, the representative of the firm consulted stated that to cool the building properly would require a plant of about 50 tons. This did not convey very much to the Pastor until he heard how much the 50 ton air-conditioning plant was going to cost and when in due course this was communicated to him he was somewhat at a loss, because the amount involved far exceeded that which he had to spend. However, one of his flock was a young ventilating engineer and he explained to the Pastor that he did not really need a large plant like this because the hours in the week when the church needed to be cooled were really very few indeed—in fact they

Water pumps of the air conditioning plant.

would surely be quite happy if the cooling could be restricted to the Sunday morning service.

The young engineer said that he believed that with careful design a 2-ton plant would be adequate if it were employed to build up a specially shaped block of ice inside a collapsible insulated container during the rest of the week. An hour or so before the service, he explained, a battery of fans would be switched on which would blow at, under and over this ice and, if his calculations were correct, the block would last until the end of the service. The Pastor was quite impressed and the youngster was told to go ahead. Everyone, it is alleged, was pleased with the results, and although history does not relate the date of this achievement, if it was some years ago then it rather looks

as if it has taken a long time for air-conditioning engineers to take full advantage of the lesson then learned. The Orient, at least, had heard little of the technique until very recently and, in consequence, comfort air-conditioning of large blocks of offices was regarded by supply authorities as a highly undesirable load, since the full demand inevitably coincided with system peaks and did nothing whatever to help fill up the valleys. It was only in 1954, in fact, that the largest city in the Orient was to be blessed with an air-conditioning installation of the storage type.

Chilled Water Technique

The first step taken towards the achievement of storage air-conditioning was the transmission of chilled water rather than cooled air. It occurred to someone that it would often be much cheaper to transmit pre-cooled water directly into the space to be air-conditioned than to force cooled air through long and large insulated ducts. The former principle has been employed in the U.S.A. for a fairly long time now, but it is only recently that buildings in the Orient have been air-conditioned by it. Conditions in the tropics are, of course, much more severe than in most parts of the U.S.A. but even so, the chilled-water technique has been found to be very effective and it is reasonable to assume that it has sounded the death-knell of orthodox distribution for all but the smallest schemes. In the case of a large and imposing new building recently erected, the architects made provision for the air-conditioning plant in a spacious basement. The fact that the contractors were informed by the architects that they could have almost as much space as they wanted, led them to do some hard thinking. The air-conditioning plant capacity require to cool the building adequately had been assessed at approximately 200 tons which called for the use of three 70-ton compressors working for approximately nine hours a day. They then studied the tariff of the supply authority which read as follows:

Load Factor	percent		Annas per unit (Incl Coal Surcharge)
	percent	percent	
Over	0	upto 20	1.19
"	20	" 25	1.12
"	25	" 30	1.05
"	30	" 35	1.00
"	35	" 40	.96

USING ALUMINIUM IN ELECTRICAL ENGINEERING

● FROM A CORRESPONDENT ●

WORLD production of primary aluminium has increased from a mere 10,000 tons at the turn of the century to close on three million tons at present. The demand justifying this phenomenal increase in aluminium production has been brought about by a combination of properties and low cost which make aluminium admirably suited for use in fields such as transportation, architecture, canning and packing, hollow ware, and the electrical industry, to mention a few. In the electrical industry aluminium is finding ever-increasing uses and it is the purpose of this article to set forth briefly some of its applications in this field. The increasing use of aluminium in the electrical industry is of particular significance to electrical engineers in India be they engaged in the generation, transmission, or distribution of electrical energy, or in the manufacture of electrical equipment, since aluminium ore (bauxite) is available in abundance in India whereas other metals conventionally used in this field are not. Known deposits of bauxite in India amount to over 200 million tons of which 28 million tons are known to have an alumina (Al₂O₃) content of over 50 percent and are classified as workable deposits. These workable deposits alone can yield 50,000 tons of aluminium annually for over 100 years.

In recent years aluminium has been applied to many duties which were formerly performed by other metals; for instance copper in the case of conductors and lead in the case of cable sheathing. Aluminium has very different properties from the metals it is replacing and consequently its adoption means that some change has to be made in conventional designs to make use of aluminium efficiently and economically. The properties of aluminium are compared with those of copper as a conducting material in Table I. Table II compares average properties of aluminium with lead when used in cable sheathing.

TABLE I

	Hard-drawn aluminium	Hard-drawn copper
Density at 20°C (gm/c.c.)	2.703	8.89
Melting point °C	659	1083
Coefficient of linear expansion per degree C	0.000023	0.000017
Electrical conductivity at 20°C as percent of International Annealed Copper Standard	61.00	97.00
Resistivity in microhms per c.c. at 20°C	2.828	1.774
Constant mass temperature coefficient of resistance per °C at 20°C	0.00403	0.00381

TABLE II

	Aluminium	Lead
Density at 20°C (gm/c.c.)	2.703	11.37
Coefficient of linear expansion 1°C × 10 ⁶	23	29
Melting point °C	659	327
Electrical Conductivity at 20°C as percent of I.A.C.S.	61	8.68
Thermal Conductivity (Cal/cm/sec./°C)	0.54	0.082
Ultimate tensile strength lbs./sq. in.	13000-16000	2000-4000
Elongation % on 2 in.	7-45	25-40
Hardness (Diamond pyramid hardness number)	20-40	4

An important chemical property of aluminium is its affinity for oxygen. A transparent and relatively inert (chemically) film of oxide forms spontaneously on any aluminium surface exposed to the air. It is this protective film that aluminium owes its high resistance to chemical and atmospheric corrosion. The oxide film has a very high electrical resistance. When making electrical connections it is very essential that the oxide film be removed and its re-formation prevented. This is accomplished by smearing the portion of the aluminium conductor forming the joint with an oxide inhibitor, abrading the conductor through the oxide inhibitor with a wire scratch brush and completing the joint without removing the oxide inhibitor.

Aluminium Cables and Conductors

For high voltage transmission lines running across open country where span lengths are not restricted, the high strength to weight ratio of ACSR (Aluminium Cable Steel Reinforced) gives ACSR a distinct advantage over other conductor

materials. Because of its high strength to weight ratio ACSR can be strung to longer spans with savings in poles, insulators, etc. which are in addition to the initial lower cost of ACSR. This ACSR was used in India as long ago as 1926 in Mysore where an 18-mile, 35-KV transmission line using a 6 × 2109" al./7 × .0703" st. ACSR was strung from Bangalore to Theppagondana-Halli. In the same year another line known as the Kolar transmission line, rated at 75 KV, 34 miles long, was built of 3/0 AWG 6/1 × .1672" ACSR. The advantages in using ACSR for high voltage transmission lines are now so well known that it is used almost exclusively on the nation's high voltage system.

For the distribution of power at low voltages as in urban and rural areas, where span lengths of the order of 150 ft. to 220 ft. are normally employed, the relatively higher strength of ACSR cannot be used to advantage, and aluminium stranded conductor (popularly known as all-aluminium conductor, and differing from ACSR in the absence of a steel core) which is characterised by cheapness and lightness, proves the most economical choice. Aluminium wire of conductor use is rolled and hard-drawn from aluminium of 99.5 percent minimum purity. These aluminium conductors have high electrical conductivity ratings. The conductivity of conductor-grade aluminium wires used in aluminium conductors is 61 percent of the International Annealed Copper Standard at 20°C on an equal volume basis. Since aluminium is much lighter than copper, an aluminium wire weighing the same as copper wire per unit length has more than twice the electrical conductivity. For equal conductivity an aluminium conductor must have a cross-sectional area 59 percent greater than the equivalent copper conductor.

From the point of view of long life with low maintenance, aluminium conductors have proved highly satisfactory. Extensive use of aluminium stranded conductor is now being made on low voltage distribution systems all over India, and in all instances where aluminium conductors are in use the lines are performing satisfactorily. Performance records such as these are the best indication that aluminium conductors give long service with a minimum of maintenance. The inherent lightness of aluminium conductors is one of their more important advantages. This light weight, as compared to other common conductor materials, contributes materially to easier and faster handling with resultant savings in transportation and erection costs.

Telephone Lines and Railway Electrification

Two uses to which aluminium conductors have been applied extensively abroad, and which are only now receiving attention in India, are as conductors for overhead telephone lines and as the feeder or catenary in railway electrification. Communication lines built of ACSR have been in use since 1926 in many countries. An ACSR for use on a communication line must have the same loss per loop mile in decibels as the copper conductor it is replacing. At carrier frequencies 6/1 × .0743 ACSR "Thrush" will be found a satisfactory substitute for the normally-used 200 lb.-mile copper conductor.

Aluminium conductor has often been used for the overhead feeder on electric railway systems. Since span lengths on such systems are short, aluminium stranded conductor is usually preferred. On systems where it is desired to combine the feeder and the catenary wire an ACSR is found suitable since its steel core acts as the catenary and the outer aluminium section as the current-carrying feeder.

Readers of this article are probably well acquainted with the advantages of aluminium conductors for transmission and distribution of electrical energy. However, the application of aluminium in bus conductors, though well established abroad, seems to have been overlooked in India till a few years ago. In 1951 a large multipurpose undertaking in the country started using aluminium bus-bars in their high voltage switching stations and being satisfied with its performance have standardised on aluminium.

Aluminium bus-bars are available in sections normally used such as rectangular, tubular or channel, each having its particular field of application. Rectangular aluminium bus-bars are

normally used for low-current installations. Where it is necessary to transfer large blocks of A.C. current, the tubular cross-section is found to be the most economical, since it reduces the skin effect resistance ratio (ratio of A. C. resistance to D. C. resistance) to a minimum and thereby permits the optimum use of the metal. Aluminium channel is extremely rigid and permits the use of long spans even when heavy short circuit currents are expected.

Aluminium offers many advantages over other commonly used bus-bar materials. With a conductivity of 60 percent of the International Annealed Copper standard an aluminium bus-bar will weigh only half as much as a copper bus-bar having the same resistance. The economies to be had by using aluminium can readily be appreciated when it is realised that aluminium costs much less a pound than copper. Due to its lower conductivity, an aluminium bus having the same resistance as a copper bus will have to have a larger cross-sectional area. However, the aluminium bus-bar will have a higher current-carrying capacity based on equal temperature rise since its larger surface area permits faster dissipation of heat. This current carrying capacity can be further increased by painting the aluminium bus-bar a dull black.

It is often wrongly assumed that because aluminium is not as strong as copper an aluminium bus-bar will be less rigid than a copper one. All bus-bar conductors are essentially beams; the

deflection in a beam is expressed by formulae of the following type:—

$$\text{Deflection} = \frac{K \times WL^3}{EI}$$

wherein W is the weight of the beam, L the span length, E the modulus of elasticity, I the moment of inertia and K a constant which is equal to 5/384 for a uniformly distributed load. The relative density of copper compared with aluminium is 3.29 and copper has a modulus of elasticity of 16 X 10⁶ psi compared with 10 X 10⁶ psi for aluminium. Hence the ratio $\frac{W}{E}$ for copper is twice as great as for aluminium so that the static deflection of an aluminium bus-bar is only half that of a copper bus-bar of the same section and on the same span. When bars of equal current rating are considered the aluminium bar will be the stiffer; consequently longer spans can be used for a given deflection resulting in savings because of the need for fewer supports.

Ease of Handling

"Because of its light weight aluminium is easier to handle and consequently speeds up erection work, can be bent and shaped with great facility, and is easily drilled and sawn. Where a great deal of bus work is involved an aluminium bus-bar installation can be made very economically by welding. Welding shows to greatest advantage in heavy current installations, eliminating drilling, splice plates and bolts with consequent savings in weight and affords a neat appearance. On smaller installations, joints are made by bolting or clamping. Bolted joints in rectangular aluminium bus-bar are made in essentially the same way as with copper, a lap equal to the width of the bar being generally sufficient. Galvanized or cadmium-plated nuts and bolts are satisfactory and these should be equipped with washers of generous size. Where severe variations in temperature are expected spring washers are to be preferred to plain washers. In making aluminium to aluminium connections the joint surfaces must be thoroughly cleaned with emery cloth and liberally coated with an oxide-inhibitor. After coating with the oxide-inhibitor the surface should be abraded through the film of oxide-inhibitor with a wire scratch brush or steel wool to remove the oxide film from the contact surface. The presence of the oxide-inhibitor will prevent the reformation of the oxide film. The joint can now be assembled without removing the oxide-inhibitor.

For aluminium to copper connections in-doors the procedure described above should be followed. However, for an aluminium to copper connection made out-doors it is strongly recommended that in addition to following the procedure described above, the finished joint assembly be smeared with an oxide-inhibitor to exclude moisture from the joint. Since the first installation of aluminium bus-bar in one of the industry's own reduction plants as far back as 1895, aluminium has gained popularity and its satisfactory performance is borne out by the fact that it is now being used in installations calling for a high degree of reliability as for instance in telephone exchanges, aboard ship, in generating and sub-stations, in chemical and electro-plating plants, in steel mills and in large office buildings.

Aluminium Insulated Electric Cables

Aluminium is being increasingly used in insulated electric cables both for the sheathing and the conductor and in some instances for the armouring. Aluminium sheathed cable has been used in several installations in India both for overhead and underground use. The properties of aluminium and lead are compared in Table II. It will be seen that aluminium as a cable sheath material is much lighter than lead, is considerably stronger and harder than lead and has a far superior resistance to vibration fatigue. These properties of aluminium indicate that it is not as a substitute that aluminium is being used for sheathing cables. As do all new practices, the use of aluminium in cable sheathing had its teething troubles. Some of the first samples of aluminium sheath cable, which had been served in the same way as is standard for lead, corroded when buried underground after a relatively short period of time. The problem has been solved by serving the aluminium sheath with an impervious plastic tape in addition to the normal serving. Aluminium sheathing is now being employed in cables operating at voltages up to 301 KV.

The high strength of aluminium makes its application as sheathing material particularly attractive in the case of high voltage oil filled and gas-pressure cables and makes the need for armouring unnecessary in most instances. Aluminium's light weight is of particular advantage in aerial cables. In addition to the above the use of aluminium in insulated electric cables cuts the cost of such cables considerably, the savings being greatest when aluminium is used both as the con-

ductor and the sheath. Jointing procedures with aluminium are only slightly different from those used with conventional metals and can be mastered readily.

Insulated aluminium conductors are now available in India for house service connections in sizes equivalent to the normally used insulated copper conductors. Insulated aluminium conductors apart from being cheap and light offer an additional advantage when used in areas where aluminium stranded conductor is being used for low voltage distribution in that their use transfers the bimetallic connection from an exposed position on the pole top to the meter terminal which is in a dry location and thereby eliminates the danger of corrosion.

Aluminium in Electrical Equipment

Aluminium has been used in the past to a small extent in electrical equipment because of its high conductivity, light weight, resistance to corrosion and non-magnetic properties. With the increase in price of other metals the cost advantage is swinging in favour of aluminium and a great deal of research is being carried on by leading manufacturers of electrical equipment to introduce aluminium into their products wherever its properties and low cost justify. Nothing more than a reference can be made to such applications here since detailed information is not yet generally available. In rotating machinery of large size the light weight of aluminium is taken advantage of by using it for rotor windings where centrifugal forces are of importance. For squirrel-cage rotors of small induction motors it is now standard practice among several manufacturers in India and abroad to die-cast the cages in aluminium. Earlier reference was made to the fact that a film of non-conducting oxide forms spontaneously on the surface of an aluminium wire placed in air. The thickness of this film can be increased artificially by a chemical process known as anodizing. Such a film forms an excellent insulation. Motors have been wound using anodized aluminium wires and it is claimed that with such insulation better cooling properties are afforded than with ordinary insulation and that anodized wire can carry heavy overloads since its insulation value is not affected by temperature. On smaller motors aluminium die castings are being used for casings, end frames and ventilating fans.

Aluminium has been used in transformers both in the windings and in the tank though not to any great extent. In larger transformers keeping the weight down is an important consideration and it is likely that aluminium will find increasing application in this field. In current-limiting reactors aluminium is being used extensively now, its use resulting in a considerable weight and corresponding cost saving over equivalent equipment using copper.

Aluminium Structures

As mentioned earlier aluminium has a high resistance to chemical and atmospheric corrosion. In areas where structures of conventional structural material require periodical painting to prevent corrosion an aluminium structure can often prove more economical over a number of years since it requires no painting. Aluminium alloy substation structures are known to exist and its use in the top hamper of high voltage transmission line towers is being considered since this will obviate costly shut-downs on the transmission line while painting the tower. In inaccessible areas involving high costs for transportation to site and erection aluminium will often prove the economical structural material. On one circuit of a section of their 300-KV transmission line from Kemano to Kitimat in British Columbia, Canada, the Aluminium Co. of Canada decided to use aluminium transmission line towers for just this reason.

Conclusion

The above has been an attempt to set forth briefly the more important uses of aluminium in the electrical industry and to make readers aware of the importance aluminium has acquired in this industry. The advent of aluminium as a major metal in the electrical industry is of particular significance to us in this country since, as pointed out earlier, aluminium is the only metal of its kind deposits of which are abundant in India. Already we have an aluminium industry with a capacity of approximately 7,000 tons of aluminium a year and an aluminium conductor manufacturing industry capable of meeting the conductor requirements of the country. Although at present it is necessary for us to import aluminium for certain uses we can look forward, as industrialisation gains momentum, to an era of self-sufficiency in this important metal. It is therefore in our interest to develop to the maximum extent the use of aluminium in fields, such as the electrical industry, to which its properties are admirably suited.

ABOUT ALUMINIUM

DID YOU KNOW ?

That Aluminium due to a combination of electrical and mechanical properties and low cost is being used in ever increasing quantities in the electrical industry.

That Aluminium Cable Steel Reinforced, commonly known as ACSR, is used almost exclusively on high voltage transmission lines round the globe. ACSR was first used in India in 1926 on the 35 kV Bangalore to Theppagondana-Halli transmission line.

That Aluminium Stranded Conductor is now accepted as the most economical conductor for short span low voltage distribution lines. Savings up to 40% are to be had by using Aluminium Stranded Conductor for low voltage distribution.

That low cost insulated aluminium conductor is ideal for service connections tapped-off from Aluminium Stranded low voltage lines.

That aluminium bus conductor costs less than bus conductor made of other metals. It is strong yet light and consequently easier to install.

That aluminium is now being used to sheath insulated cables. An aluminium sheath is cheap, light and strong.

That aluminium is now being used in the electrical manufacturing industry to wind motors, transformers and current limiting reactors.

That aluminium rod for conversion into aluminium conductors—bare and insulated—is available from indigenous sources of supply.
