Turning now to conditions in our own country, in the post-war history of the United Kingdom the past year stands out for its record of an expanding volume of production, with a high level of employment and signs of greater flexibility in the economic system as a whole. It has been remarkable also for the buoyancy shown by our export trade, which has contributed to the enlargement of the surplus on the balance of payments, the strengthening of the gold and dollar reserves and the further restoration of confidence in the pound sterling as an international currency. The maintenance of Britain's exports illustrates the solidity of the persistent effort to ally vigorous salesmanship with advantages in quality, servicing and price. Among the most gratifying features of the home record are signs of some acceleration of plans for re-equipment and expansion in industry, to which impetus has been added by the rise in productivity resulting from earlier postwar capital investment and by the new investment allowances provided under the 1954 Finance Act. A parallel development which is most encouraging is the continued revival of personal savings notwithstanding the rise in expenditure on consumption and increased outlay and commitments fostered by the wide extension of hire-purchase facilities. This record demon-

strates the strength of progressive forces released by the relaxation and removal of government licensing and other controls over industry and trade.

It must be added, however, that the picture is not one for unqualified satisfaction. It is disappointing to find so little result accruing thus far, in terms of total output and costs of production, from the heavy new capital investment and extensive reorganisation in the coal industry. Then, too, there are signs of some weakening of the competitive power of particular industries, among which shipbuilding has often been mentioned. Labour unsettlement has had its part, particularly in the later months of the year, in weakening an otherwise more assured position for our export trade. More pervasive in its influence is the continuance of the slow diminution of the purchasing power of the pound in the home market. These symptoms are indicative, along with the continued upward trend of wage costs, of the persistent pressure of "cost-inflation"; and both the Chancellor of the Exchequer and the Governor of the Bank of England have expressed themselves as not yet wholly satisfied of the maintenance of healthy monetary conditions. The inference that inflationary forces have not been decisively overcome is supported by the course of affairs on the stock exchange. It is arguable that the reduction in Bank rate in the spring may have furthered an undue rise in prices of equity investments to a level at which they heavily discount the prospects of continued high activity in industry and trade, a further growth of business profits and larger distributions therefrom.

Balancing one thing with another, it may be said that 1954 was a good year for Britain. To assess its place in the long run, however, we need to look back over the period since the end of the war. Nearly ten years have passed since the guns ceased fire in the second world war, and it is instructive to compare the economic situation today with that which had been arrived at in 1928, ten years after the end of the first world war. In doing so we ought justly to recall a striking difference of approach to the task of postwar rehabilitation. After the first world war it was visualised as one of simple reconstruction—"back to 1914"—and was undertaken in terms of getting rid, often with unwise haste, of wartime restrictions. This time it was seen rather in terms of new construction and reshaping of the economy to drastically changed world conditions, and plans for achieving the task by an ordered process were laid well in advance. Despite setbacks and remaining difficulties and uncertainties, there can be little doubt of the superiority of achievement in the past few years.

TWO POSTWAR PERIODS

Allowing, then, for differences in the background of world politics and economics, how does the situation of the United Kingdom in 1954 compare with that in 1928? The most conspicuous contrast lies in the fact that in 1928 the country was carrying about one-and-a-half million unemployed, whereas there is now—and has been ever since the war—very little involuntary unemployment among a working population that has been substantially enlarged. Again, industry as a whole has proved itself this time to be more adaptable, and more steadily progressive, judged by expansion, re-equipment, technical improvement and the application of new invention to changing public demand, than it was at any time between the two wars. The magnitude and range of its output have far outstripped prewar production. Whereas in 1928 large sectors of industry were struggling, with enfeebled vitality, against what an expert committee

had described as increasing rigidity and ossification, there is now renewed confidence and vigour. In agriculture, too, the contrast is equally striking between relative prosperity, with an outlook that inspires confidence for the future, and the long depression that prevailed, between the two wars, in this vital home industry.

It is now recognised that the unhappy state of affairs in the later 'twenties was related in no small degree to the prevailing monetary conditions. Here again marked differences may be noted. On the domestic side, whereas in 1928 money was tight and dear, over the past few years no general shortage of money or credit has been experienced, while rates of interest, though latterly made more flexible, have on the whole been low. Many people will recall, moreover, the unhealthy boom in new capital issues which occurred in 1928. Since the second world war, as a result of regulation from the centre, combined with a reformed and strengthened company-law and more stringent stock exchange rules, the raising of capital has been more orderly and better related to real needs and to the national interest.

The adverse monetary conditions of 1928 were an inescapable result of the premature return to the gold standard, with a completely unregulated foreign exchange market, at the prewar parity between the pound and the dollar. Experience showed that in practice the process entailed heavy over-valuation of the pound, which continuous deflationary pressure was powerless to correct. This time no such course of action has been followed, and the new external valuation of the pound takes full account of the basically altered relations among national currencies. Progress still continues towards the removal of exchange controls, but official management of monetary reserves has been wisely maintained until the responsible authorities can feel satisfied that the national economy has been fully adapted to a radically altered balance of economic and financial resources among the various parts of an interlocking world. The second world war carried even further than the first a fundamental change in Britain's international position, for it turned Britain into a debtor nation, though still with a small net income from past overseas investments. It is no mean achievement to have reached a stage at which the current account surplus on Britain's balance of payments has surpassed—though in terms of depreciated pounds—that recorded for 1928. This result is to be attributed in large part to the much greater vigour and buoyancy displayed by our export trade. The newer industries in particular—such as motors and aircraft, plastics and man-made fibres—have risen to the opportunities presented by the creation of increased demands for an ever-widening range of products. As a result the volume of exports is more than half as big again as before the war—an expansion which had no parallel in the comparison between 1913 and 1928. By contrast, imports have hardly yet been expanded to their prewar volume. At that time export trade, while hindered by unregulated and changing tariff action in many countries, was flagging under the pressure of an over-valued pound—a disability from which it certainly does not suffer today.

The great achievements in our industry and export trade are the more gratifying when account is taken of the difficulties standing in the way of the provision of capital resources for improved efficiency and the development of new products. It is a familiar fact of both business and personal experience that the load of taxation is far more burdensome today than it was in the years after the first world war. Indirect taxes are heavier and more extensive—there was, for instance, no such thing as purchase tax in 1928. As for direct taxes, it needs only to

be mentioned that the standard rate of income tax was then four shillings in the pound, and that far more people are paying income tax now than in 1928. Further, at that time there was no profits tax for companies to pay, as now, over and above increased income tax. In part this is a result of the enlargement and ever-increasing cost of the social services; but it is due also to prevailing international conditions, which impose a burden of defence made all the heavier by the costliness and increasing complexity of novel weapons of war. In 1928 defence accounted for roughly one-seventh of the total budget expenditure; today it absorbs about one-third of the total. In general, then, the load of taxation is far heavier than it was. One result is a more even distribution of personal incomes and a narrowing of marked inequalities of wealth. However desirable this trend may be on some grounds, it does tend to restrict the flow of risk capital on which the healthy development of new business enterprise is dependent.

Lastly, a marked contrast is noticeable in the course of prices after the two world wars. The movements in 1918-28 were violent and erratic, but by 1928 the purchasing power of the pound in the hands of the consumer was gradually increasing. It had been hoped, at the end of the second world war, that better management of the national economy would succeed in avoiding a repetition of the unbridled inflation and brutal deflation of 1918-28. So it did; but avoidance has been achieved at the cost of an almost continuous whittling away of the value of the pound to the consumer.

THE OUTLOOK

Thus comparison between the condition of our country in 1928 and 1954 is mixed; but, allowing for differences of circumstance both domestic and external, it may be argued that the national economy has made a much smoother, more firmly grounded recovery after the second world war than after the first. The comparison is rendered all the more gratifying when we recall that the physical damage and economic dislocation sustained by this country from the second war were far greater than from the first. The main cause for encouragement lies in the fact that this time Britain has adapted itself far better to the altered world situation, and stands in a far stronger position today in relation thereto than it occupied in 1928. We are now better placed to ward off any threat of a second postwar decade comparable in any degree with the tragic depression of the 'thirties.

It would be wrong, however, to ascribe this favourable result wholly to wisdom guided by the lessons of practice and experience. The effort made by this country on its own account has been supported by two factors which cannot properly or reasonably be expected to last indefinitely, at any rate in the same strength as over the past few years. Chief is the generous help provided by the United States, first under the European recovery programme and secondly through its contribution to the building up of combined western defence. The other is the favourable balance that has ruled during the past two or three years between prices of primary commodities on the one hand and of manufactured goods on the other. For this country, with four-fifths of its imports consisting of food and raw materials and four-fifths of its exports made up of processed or fully manufactured goods, this relationship has set the terms of trade on a basis more favourable than can be presumed as likely to last for ever as a "natural" basis of exchange. To this extent Britain's external position must be regarded as still vulnerable.

Doubts as to the likelihood of continuance

of the prevailing terms of trade arise from consideration of recent world trends. Latterly the free world's production of agricultural commodities has been growing rather faster than its population, but the growth of output has been unevenly spread, being largely concentrated in North America. The United States Government has recently introduced a new policy for disposal of stocks which, even with the official assurances of avoidance of disturbance to world markets, may yet have effect on prices of comparable goods coming forward for sale in the ordinary way. The outlook is complicated by the fact that national price support or "equalisation" schemes having their origin in the world depression of the 'thirties, and reinforced by the needs of war and the fear of war, have become still more firmly entrenched by governmental commitments within the realm of social policy. Meanwhile, the world's mineral production has been growing fast.

How important these factors are may be seen still more clearly when a longer view is taken. The present production of agricultural commodities in the world this side of the Iron Curtain is about one-quarter bigger than it was before the war; but output of minerals is two-thirds greater; and factory output has doubled. Here again, world totals cover wide disparities among regions and countries; industrial production in Western Europe, for example, as might be expected from the damage inflicted upon its physical equipment, is less than one-half greater than before the war; but some increase is common to almost every country in the world. To a large extent the long-term growth and increased competitive efficiency of industrial capacity as compared with the output of primary commodities are the natural reflection of technical discovery and an ever-rising trend in standards of demand. There is a continuing tendency towards more and more processing of primary commodities before they are acceptable to the present-day consumer, towards increasing elaboration of final products for both consumption and capital purposes, and towards progressive refinement of methods of packing, presentation and delivery to the buyer.

It would thus be folly to assume that the satisfactory balance of payments achieved by Great Britain during the past three years can be maintained without the continuance of unabated effort to keep our export capacity in good order. I say "export capacity" because to say "export industries" is to take much too narrow a view of the requirements. The export industries cannot do their job properly unless they are backed up by high standards of efficiency in basic services and production for the home market. For this we need a full flow of resources in new capital and increasing skill in technical improvement and in the adaptation of products to changing demand in overseas markets. We need to put every encouragement behind inventive and managerial skill and resourceful salesmanship. We need incentives for the progressive use of manpower and for the fullest contribution from skilled workmanship. Finally, the unequal development of the world's productive capacity, to which I have referred, calls for a powerful direction of capital and imaginative planning into the opening up of the productive resources of underdeveloped territories, particularly the enlargement of their output of agricultural commodities. Not only is this needed for a steadier balance in world production as a whole; the capital development itself, and the secondary expansion of consumption that will flow therefrom, will sustain and expand the demand for manufactured goods against the time when, as all must hope, international relations will allow some relief from the heavy requirements of defence.

THE NEWCASTLE BREWERIES LIMITED

RECORD OUTPUT

The sixty-sixth annual general meeting of The Newcastle Breweries Limited was held on January 27th at the registered offices, Haymarket, Newcastle upon Tyne.

Lieutenant-Colonel J. H. Porter, DSO, chairman of directors, presided, and in the course of his speech said: It has been decided to terminate the company's financial year on September 30th. Therefore, the accounts cover a period of eleven months only. Despite the exceptionally bad summer, the output of the brewery in both draught and bottled beers, again constitutes a record, the percentage increase in bottled beer being higher than that in draught beer.

The wine and spirit department has again had a good year, despite the continuing high level of duty: the eleven months' trade compares favourably with the previous twelve months. The mineral water department had a satisfactory year. The managed houses results continue to reflect the higher wage rates and general costs, both of which are likely to increase still further.

In addition to improving the licensed houses of our subsidiary companies, we have also improved the gravity of their draught beers without increasing the price, and I am glad to say that these improvements have already begun to manifest themselves in increased sales.

TRADING RESULTS

The trading profit of £920,999 for the eleven months shows a considerable increase, but it must be remembered that a large part of this is, of course, due to the acquisition during the period of a subsidiary company—Robert Deuchar Limited. For the first three months of the current year sales show a further rise, against which must be placed the cost of increased wage rates. The charge for taxation is £417,610. After depreciation, debenture interest and taxation, the net group profit is £278,121. From the above figures it will be observed that nearly 50 per cent of the trading profit is absorbed by income tax and profits tax, which leaves lamentably little to meet the expanding needs of this company, let alone a fair return on stockholders' capital.

The final dividend of 6 7/12 per cent on the ordinary stock of £1,500,000, together with the interim dividend of 2½ per cent on the £1 million ordinary stock, makes a total rate on the increased capital equivalent to 8½ per cent for eleven months or 9 per cent for a full year.

An analysis of the disposal of the total revenue of the company works out as follows: Duties, taxes, etc., 56.1 per cent; materials and services, salaries, wages, etc., 28.3 per cent; pensions (gross), 9.6 per cent; debenture and shareholders, 3.5 per cent; reserves, 2.5 per cent.

The future success of our industry depends upon the quality of the services which it gives, the quality of the goods it produces, and the ability of the public to afford to purchase our heavily taxed commodities. I am very much perturbed about the falling output of beer. It is my firm belief that we have reached a stage when the public, after having carefully weighed up values, are beginning to be increasingly aware of the present high rate of beer duty which they are called upon to contribute at the rate of 7½d. out of every 1s. 2d. which they pay for a pint of beer. I believe that if the Chancellor could see his way to reduce the duty to a figure which would enable the present 1s. 2d. beer to sell at one shilling a pint, he would reap the benefit in revenue.

The report and accounts were adopted.

LLOYDS BANK LIMITED

HIGHER PROFIT FOR PAST YEAR

GREAT EXTENSION OF ACTIVITIES SINCE 1938

CONSTRUCTIVE LENDING POLICIES

IMPORTANCE OF STRONG RESERVES

SIR OLIVER FRANKS'S STATEMENT

The annual general meeting of Lloyds Bank Limited will be held on February 18th at the Head Office, 71 Lombard Street, London, E.C.

The following is the statement by the chairman, The Right Honourable Sir Oliver Franks, GCMG, KCB, CBE, accompanying the report of the directors and balance sheet for the year ended December 31, 1954:

My Lords, Ladies and Gentlemen,

Lord Balfour of Burleigh relinquished the chair of the bank at the end of October. He was chairman for nearly nine years, and during this period gave the bank wise and courageous leadership. He also contributed greatly to its prestige and advancement during these years of postwar reconstruction and expansion. His annual addresses have been, year by year, an important addition to contemporary economic and social thought. We are delighted that Lord Balfour of Burleigh has agreed to remain as a member of the board.

Mr A. H. Ensor, who became a chief general manager in 1946, retired in June last after a period of most distinguished service during which he was chairman of the Chief Executive Officers Committee of the Clearing Banks. He was president of the Institute of Bankers from May, 1952, to May, 1954. We are glad that Mr Ensor stays with us as a member of the board.

Major-General Sir Robert E. Laycock, KCMG, CB, DSO, resigned from the board upon his appointment as Governor and Commander-in-Chief, Malta. We are sorry to lose him but congratulate him on his appointment.

During the year Sir Ernest Lever was appointed a director. He brings to our counsels great knowledge of the steel industry and its problems.

There have been a number of changes on the local committees. I record with deep regret the loss suffered by the Salisbury committee through the death of Lord Lyle of Westbourne, who was a director of the bank for some years. There is also the resignation of General Laycock from the Newcastle-upon-Tyne committee and the Pall Mall committee; his place on the Pall Mall committee has been taken by Air Chief Marshal Sir James Robb, GCB, KBE, DSO. The Right Honourable Viscount Cobham, TD, DL, has been appointed a member of the Birmingham committee, and Lieutenant-General Sir Charles J. S. King, KBE, CB, to the Eastern Counties committee. At Newcastle-upon-Tyne, Lieutenant-Colonel T. Eustace Smith, TD, has become a member, and at Salisbury Mr. Walter Reeve, who was formerly district manager there. Sir Frederick Burrows, GCSI, GCIE, DL, a director of the bank, has been appointed to the South Wales committee.

Mr G. Y. Hinwood has been appointed a chief general manager with Mr E. J. Hill; and Mr H. B. Lawson, MC, chief legal adviser, has been appointed assistant chief general manager. Mr P. T. D. Guyer has

been appointed an additional joint general manager.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

Turning to the accounts, you will see that the profit for the year, at £2,186,072, is £102,291 higher than last year.

The down-turn in advances to which reference was made a year ago has been replaced by a gradual increase throughout the year which, together with the increase in our holdings of British Government securities, has offset to some extent the effect of the fall in interest rates following the reduction in bank rate. Business activity has remained at a very high level during the past twelve months and this has improved our earnings in other directions; on the other hand, staff and other expenses continue to increase, a factor which must make for caution in any estimate of future profits.

A year ago we were able to increase the dividend on the "A" shares by 2 per cent; we propose for 1954 a further increase of 1 per cent, making 15 per cent for the year. We also propose the capitalisation of reserves to the extent of £3,593,239 for the purpose of paying up 5s. per share on the "A" shares of £5 each £1 paid, making the shares £1 5s. paid up. The elimination of that part of the liability on the shares which could be called up at any time at the option of the bank is in line with modern practice and will, I am sure, be acceptable to shareholders.

In order to dispel any uncertainty in the minds of shareholders, we have already announced our intention to recommend in due course that the dividend on the "A" shares for the current year, subject to maintenance of the bank's profits, should be at the rate of 12 per cent per annum on the shares in their new form, being the equivalent of 15 per cent on these shares in their present form.

As you will see from the balance sheet, current, deposit and other accounts show an increase of £41 million and on the assets side loans and advances are up by £12 million and investments by £14 million.

LLOYDS BANK (FOREIGN) LIMITED

During the year, we agreed to acquire as from January 1, 1955, the one-half share in Lloyds and National Provincial Foreign Bank Limited held by the National Provincial Bank Limited. The directors of both the shareholding banks feel there are advantages to be derived from the substitution of sole ownership for the former joint proprietorship.

The name of the foreign bank has been changed to Lloyds Bank (Foreign) Limited and that of its Belgian subsidiary company to Lloyds Bank (Belgium) Société Anonyme.

CHANGES SINCE 1938

To the outside world it may seem that the great clearing banks such as our own carry out certain useful but stereotyped functions with little change from one year to another.

It has been a valuable experience for me to learn how far-reaching are some of the changes that have been going on beneath the surface of our banking life during these past years, how extensive the process of adaptation to changing conditions. I feel sure that it will interest you as shareholders if I devote my first annual statement to discussing some of the ways in which the Lloyds Bank of today differs from the Lloyds Bank of prewar days, and say something about the problems the bank has been having to face.

The sixteen-year period from 1938 to 1954 has been one of monetary upheaval. In this as in other countries, the deficit finance of the war and early postwar years started a fall in the purchasing power of our currency which even today has not been completely arrested. The clearing banks are the chief instruments of government borrowing through the banking system. From the annual balance sheets you will be familiar with the resulting expansion in our deposits: they are more than three times as large as before the war.

In this process the clearing banks have, of course, been largely passive agents. It is decisions on the part of the monetary authorities which regulate the volume of bank deposits, since deposits cannot expand unless the authorities provide the necessary scaffolding of additional cash reserves and other liquid assets.

When official policies bring about a general expansion of bank credit an individual bank will share in it only so far as it can hold its own in competition with others. I am glad to be able to point out that our share of the total deposits of the eleven London clearing banks, or of the five larger banks, is slightly higher today than just before the war. But a large expansion in our resources, when it reflects a general inflationary movement, is by no means the unmixed blessing it is often assumed to be: it can create real problems in our internal finances. I shall come back to this later.

EXPANSION IN ACTIVITIES

Let me tell you something of what has been happening to the scale and nature of our operations. Our first duty as bankers is to ensure that a supply of cash is always there at each of our 1,750 offices to meet our customers' requirements. This cash supply must be not only adequate in total but correctly distributed between the various denominations of notes and coin. That does not arrange itself automatically. A considerable feat of organisation is involved, in which head office and our score or so of "cash centres" are assisted by intelligent anticipation on the part of all our branch managers. Last year, movements of cash between our various offices totalled no less than £500 million, apart from movements of cash between our own and other banks. In silver alone we handle over our counters about £100 million (or over 11,000 tons) a year.

These are small figures compared with

those involved in the transfer of funds by means of cheques and other book-keeping entries. While our deposits have about trebled since 1938, the monetary turnover passing through our books has quadrupled; cheques drawn by customers on their current accounts now amount to some £34,000 million a year.

In our day-to-day work what matters is not only the size of the figures written on the face of a cheque but also the number of cheques and other entries to be dealt with. This in turn depends, among other things, on the number of accounts entrusted to our care. Before the war we had rather more than a million current accounts and about an equal number of deposit and saving accounts. The number of current accounts has since risen by considerably more than half. Indeed, since before the 1914 war there has not been a single year in which the number of our current accounts has failed to expand. On the other hand, the number of deposit and savings accounts has declined since 1938. The result is that we are today conducting about 2½ million accounts of all kinds, of which two-thirds are current accounts. The transactions passing through our branches have risen in slightly greater proportion than the number of current accounts, to a present figure of some 400 million a year.

STAFF TRENDS

It may surprise some to learn that in spite of this great expansion in what has been called our "ledger-keeping" activities, and the larger number employed in the specialised offices, our male staff is smaller than before the war. On the other hand, there are many more managerial posts to be filled.

At least one in three of those joining our ranks henceforth will be required for management, and many more than in previous generations will step on to the ladder of promotion at an early age. We have managers in their early thirties and members of the general management in their forties. About as many young men join us after National Service as before it; in either case they have entered their twenties before settling down seriously to a banking career. Coupled with the earlier age of promotion, this has ended the disheartening fifteen-year or twenty-year apprenticeship before the ablest newcomer could begin to acquire that experience in taking decisions which is the basis of sound banking judgment.

For our officials, these trends hold out the prospect of wider opportunity and accelerated promotion. For the bank, they emphasise the need to attract men of the right calibre and develop their technical qualifications. In this our pre-entry training college at Hindhead and the staff college at Kingswood have a great part to play. Since it was opened in 1948, about a thousand officials have passed through the Staff College, either on junior or senior courses, and getting on for half this number, having completed the senior course, have received managerial appointments. They have not only received intensive instruction in the practical art of banking but have enjoyed the invaluable experience of living side by side with a number of their colleagues from other offices of the bank. A considerable proportion of our responsible officials now possess this common background. It is of very great benefit to the bank.

We have been able to handle a substantial growth of turnover without adding to the male staff because of two closely related developments which enable us to provide first-class banking facilities in the most efficient way. The first of these is the greatly increased use of machinery. Some 500 of our branches are now fully mechanised, nearly 300 of them since 1938, and we are constantly

exploring new methods and devices. While there is a lower limit to the size of branch in which mechanical aids can be applied to full advantage, our intention is to carry this process much further.

The second trend is the expansion in our female staff, which has almost trebled over the period. In 1938 we had about four men to every woman; today the numbers are moving towards equality. I do not imply that our women staff are engaged solely on routine work. But there are comparatively few who remain in business as a career: most stay only a few years with us. To those who choose to stay with the bank and are suitably qualified we can offer a permanent career, with pension, as secretaries, cashiers or in the more specialised departments of banking, such as income-tax or securities work, or on the foreign or Executor and Trustee side.

Since joining the bank I have had the pleasure of meeting a large number of our officials: I have been deeply impressed by their loyalty, keenness and efficiency.

EXECUTOR AND TRUSTEE DEPARTMENT

The period has also seen a great expansion in the operations of our Executor and Trustee Department. In 1938 this had only ten offices, or one-third the present number. The policy of taking the service to every customer has resulted in a threefold increase in the volume of business. More than 100,000 customers have appointed the bank as executor.

BRANCHES IN INDIA, PAKISTAN AND BURMA

In spite of the far-reaching political changes in their part of the world, the Eastern branches can show a similar record of growth. Before the war a large part of their business was concerned with the accounts of British personnel in government offices and the armed forces. Most of those accounts have been closed, but a new business has been built up to take their place. The present number of accounts is almost three times as large, and deposits are more than five times as large, as in 1938. Basically, the business we conduct is that of an exchange bank, and is concerned with financing the movement of commodities in world trade. We have nevertheless taken our share in providing finance required for the industrial development of all three countries in which we operate, and have done this not only by making advances directly to private enterprise, but also by participating in government-sponsored ventures.

CREDIT EXPANSION AND COSTS

I pointed out earlier that the threefold expansion in our deposits since 1938 is not an unmixed cause for self-congratulation. An expansion of credit on that heroic scale is bound to be associated with a rise in the general price level, and this affects the bank in more than one way. It will be convenient to consider separately the implications for current earnings and for our capital account.

For the revenue account the important point is that the level of our outgoings—three-quarters of which represent staff costs—is necessarily related to the general level of prices. If prices rise, our expenses are bound to rise too, though not necessarily in exactly the same ratio. Whether an expansion in deposits will or will not benefit our earning capacity thus depends on a simple comparison: whether the earnings on the additional resources exceed or fall short of the accompanying addition to our costs.

The sixteen-year period falls into two contrasted stages. Almost the whole of the

expansion in deposits occurred during the first ten years—from 1938 to 1948. Then the rise in prices was kept down by rationing and physical controls. A great deal of additional money had been created but it could not be spent freely; so prices in 1948 were less than double those of 1938.

This combination of rapidly expanding deposits with lagging prices and costs might have been expected to bring a great increase in our earnings. But strong forces were operating in the other direction. If costs were lagging, so were the earnings on the additional deposits. One major factor was the fall in the ratio of advances—our main earning asset—from over two-fifths to little more than one-fifth of deposits. The additional deposits had their counterpart largely in Treasury deposit receipts or money market assets earning a fraction of 1 per cent.

Throughout these years, therefore, the rate of return on our assets was falling steeply, so much so that an increase in commission charges eventually became necessary. None the less, the proportion of our total earnings derived from commission charges is very much the same today as in 1938, despite the great increase in work done.

MORE RECENT TRENDS

In the second stage, our experience has been in important ways the exact opposite. There has been relatively little further expansion of credit; over the past six years the rise in our deposits has been no more than 11 per cent. Unfortunately, this brake upon credit expansion has not sufficed to ensure monetary stability, for in 1948 the volume of bank deposits was abnormally high in relation to the then current level of incomes and prices. All that was needed to permit a further rise in incomes and prices was for the bank deposits already in existence to turn over more rapidly; and that has been happening.

Since 1948 retail prices have risen by some 33 per cent, a percentage increase three times as great as that in our deposits. The combination of more or less stationary deposits with steeply rising costs was calculated to reduce our earnings. But as things have turned out, the downward pressure on earnings was mitigated by the rise in short-term interest rates which followed the return to more flexible monetary policies in 1951. This has restored the yield on our money market assets to rather more remunerative levels. Overdraft rates also moved up in sympathy with Bank rate, though there has subsequently been a marked decline from the levels touched during the period of national crisis. Throughout the latter half of 1954, Bank rate was standing at 3 per cent. Yet it is a remarkable fact that the average rate on our advances during those six months was less than ½ per cent higher than in the second half of the cheap money year 1938, when Bank rate stood at only 2 per cent.

PROBLEM OF PENSION FUNDS

With interest rates around their present levels, a more normal balance has been restored between current earnings and current outgoings. But it is not through its incidence on operating expenses alone that a rising price level affects our finances.

For example, there is the problem of pensions. The size of pensions has risen with the level of retiring salaries and in addition the bank has gone some way towards alleviating for pensioners the effect of the increases in the cost of living subsequent to retirement. But the real problem relates to the position of the pension funds. The effect of a sweeping rise in prices and incomes is to render all old-established pension funds insufficient for the purpose they were intended to perform, namely to provide a

reasonable standard of living for those who have completed a lifetime of service. Provisions based upon the lower salary levels of earlier years need to be heavily supplemented in order to meet the full cost of pensions related to the much higher retiring salaries of today.

This is just one illustration of the way in which inflation destroys a large part of the real value of past savings. It is a problem we share with most other large business undertakings in the country, but it is particularly acute in banking because staff costs form so large a proportion of our total expenditure. It is obviously desirable that the pension funds should be progressively strengthened so that they can take care of our future pensions liabilities. The bank has taken action to this end and it is an expensive matter.

CAPITAL RESOURCES

Similar problems arise in connection with the bank's capital and reserves, and for the same basic reason: that sums accumulated in earlier years have needed reinforcement because of the shrinkage in their real value, which finds its reflection in their diminishing proportion to our expanded balance sheet totals. In 1938 our paid-up capital was £15.8 million and the reserve fund £9.5 million, to give total published resources of rather more than £25 million, in addition to which we possessed adequate internal reserves. Including this year's allocation, sums totalling £7.5 million have been transferred to the reserve fund over the period, and if the capitalisation proposal is approved our total published resources will be raised to £34 million.

It is true that there is no rule-of-thumb method of deciding the size of the capital funds which a bank needs in order to carry on its business. The guiding principles are that the resources as a whole must be sufficient to provide absolute security for our depositors and the reserves sufficient to meet fluctuations in our trading from year to year.

Obviously, the great growth in our deposits since before the war does not call for a commensurate increase in our capital resources, since for the most part the additional deposits have had their counterpart in Government obligations. Upon these, the question of ultimate loss does not arise, though provision must none-the-less be made against the difficulties associated with fluctuations in the market price of gilt-edged securities.

CHANGED COMPOSITION OF ADVANCES

It is different with our lending to the public, easily the most interesting, as it is the most difficult, of our several functions. The bank has a vital role to play in the national economy and in fulfilling that role we take, as is proper, normal commercial risks.

If we compare the analysis of our advances in 1954 with that of 1938, we find some significant changes. Expressed as a percentage of our total lending, the iron and steel and engineering industries show a threefold growth, while agriculture is two-thirds more; on the other hand, the share of personal and professional advances has fallen by nearly a half. When I recall that our advances as a whole are double the 1938 total and almost three times the low point reached towards the end of the war, it is obvious that many millions of pounds are involved in these changes. Further, the swing from personal changes, where readily realisable security is lending, where readily realisable security is generally taken, to the greater hazards of lending to commerce, industry and agricul-

ture—frequently with nothing more tangible than an assessment of a balance sheet position—of necessity involves a greater measure of risk.

It is true that our bad debts in recent years have been small, an experience due at least as much to the effect of rising price levels as to any deliberate avoidance of calculated risk by the bank. Indeed, until the recent recovery in personal savings and the revival of the capital market for equity risks, the bank had willy-nilly to support industry with very large individual lines of overdraft which could not be funded through the market in the usual way and to that extent violated the banking principle that advances should be repayable on demand.

The farming community remain our largest single class of borrower and I feel we can justifiably claim some credit for the increase in their production, which has been made possible by modern equipment and mechanisation installed with our help.

In recent years, the reopening of the commodity markets and the deterioration of foodstuffs have brought fresh demands for our money. The resumption of private building, too, means a return to our traditional function of financing the builder and, if need be, the owner-occupier of the house when built. This financing is of course done on a short-term basis; we do not compete with the institutions whose place it is to provide longer-term finance.

The removal of borrowing restrictions upon hire-purchase companies in 1954 led to an increase in our lending in that field. This is our proper function as bankers; we finance the well-established companies in this very specialised business and do not directly participate in hire purchase ourselves.

It is often said that a banker helps when times are good, but withdraws that help when they are bad. In fact, nothing could be further from the truth. Unless the position is clearly beyond redemption when trouble comes, the bank will nurse the patient, and many businesses which are prosperous today might not be so but for the forbearance and constructive imagination exercised by the bank in times of difficulty.

I am satisfied, in short, that our advances make a more valuable contribution to the national economy than ever before, especially in the sphere of productive industry. But the administration of these vast sums—and the banking system as a whole is lending almost £2,000 million—calls for a high degree of knowledge and skill on the part of our officials, if undue losses are to be avoided.

NEED FOR STRONG RESERVES

The need for strong reserves to meet contingencies is thus as great as ever. Given the growth in our figures, something more has been needed than the additions to our published reserves, and throughout the period the increase of the internal reserves has continued to be a priority for us.

I hope I have shown that the bank recognises its obligations to the various sections of the community with which it has dealings and does its best to meet them. For our customers we provide a first-class banking service at a reasonable cost. In the last two years we have been able to raise the payment to our shareholders, many of whom are themselves among the worst sufferers from rising prices. Within the limits set by our earning capacity in competition with our rivals we have been able to give both to the active and to the retired staff some relief against successive increases in the cost of living. But our overriding duty is and must always be to maintain the strength and the stability of our great organisation.

THE MIDLAND BRIGHT DRAWN STEEL AND ENGINEERING COMPANY

The eighth annual general meeting of the Midland Bright Drawn Steel and Engineering Company, Limited, was held on January 27th, in Birmingham, Mr H. Hipkiss, MInstBE (chairman and managing director), presiding. The following is an extract from his circulated statement: The group trading profits have decreased by £8,658 from £224,837 to £216,179, although profits available for distribution and reserves have increased by £11,091 from £63,457 to £74,548, the sole reason being the smaller charge for taxation. After provision for a similar rate of dividend as in 1953 the reserves of the group have been increased by the addition of £47,017, bringing the total reserves to £200,792 as compared with £153,775 a year ago.

Rising costs in material, production and services without a compensating increase in selling prices have resulted in reduced profit margins, particularly in the bright drawn steel trade where there was a general decline in orders at one period of the year. We have, however, experienced a gradual but noticeable recovery in the last three months of our financial year, and this rate of recovery has been maintained in the current year. The companies' order books show cause for considerable satisfaction but for obvious reasons it would be difficult to forecast accurately trading prospects in the months that lie ahead. The improvement to which I have referred earlier, came too late to make its full impact on the past year's results, but will ensure at least a promising start to a year in which we can look forward with confidence.

The report was adopted.

KILLINGHALL (RUBBER) DEVELOPMENT SYNDICATE, LIMITED DISTRIBUTION OF 35 PER CENT

The forty-fifth annual general meeting of Killinghall (Rubber) Development Syndicate, Limited, was held on January 24th in London, Mr Jack Addinsell, chairman, presiding.

The following are extracts from his circulated statement:

The company derived very little profit from its interest in rubber, but tribute from tin mining continued at a satisfactory level, revenue from this source amounting to £19,749 compared to £21,944 from the previous year. Profit before taxation worked out at £22,772, a reduction of £5,419 on the previous year. After providing £10,477 for taxation, transferring £8,000 to replanting reserve, paying an interim dividend of 7½ per cent and adding War Damage grants received, there remains £13,398 for disposal. Your directors recommend a final dividend of 27½ per cent.

With regard to the tin company, I should warn stockholders that our income from tribute may be affected by the restriction scheme which it now appears probable will shortly be introduced.

During the year the company continued its policy of replanting its old seedling rubber, and 84 acres were completed, while a further 50 acres has been dealt with since the close of the financial year. It is intended to replant a further 100 acres during 1955-56. The first of our postwar replantings comprising 153 acres of 1947-48 rubber has reached maturity.

The report and accounts were adopted.

WESTMINSTER BANK LIMITED

CONTINUED UPWARD TREND OF BUSINESS

CONSIDERABLE INCREASE IN ADVANCES

EXPANSION OF ACTIVITIES AT HOME AND ABROAD

GREAT BRITAIN'S SATISFACTORY PROGRESS

LORD ALDENHAM ON FACTORS IN THE OUTLOOK

The annual general meeting of Westminster Bank Limited will be held on February 16th at the head office, 41 Lothbury, London, E.C.

The following is the statement by the chairman, The Right Honourable Lord Aldenham, which has been circulated with the report and accounts for the year ended December 31, 1954:—

I much regret that the board is losing the services of two most useful directors next month: Mr C. A. Campbell has served us faithfully and well for nearly 50 years, but he has decided not to allow his name to be put forward for re-election next month; Mr R. W. M. Arbuthnot has been with us for nearly 20 years and has added to his normal bank duties the special care of the bank's rowing club, but acting on medical advice he too has decided to retire. I can only say how much the whole board will miss them both.

CAPITAL STRUCTURE

I want to thank shareholders and stockholders for the support which they gave to the proposals of the board last July for alterations in our capital structure. It is clearly desirable that the way should be made open for a gradual strengthening of our published capital, and a simultaneous reduction in the amount of the uncalled liability on our shares; and this has now been begun. The plan involved some alteration in the respective rights of shareholders and stockholders, and the fact that over 99 per cent of the votes cast by both classes were in favour of our proposals seemed to show that we had held the balance true.

The figures before you in the profit and loss account and balance sheet will themselves indicate to you that our business continues its upward trend, but I am sure you would wish me to comment upon some of the features underlying the satisfactory results achieved.

During the year we have opened 28 new banking offices. The result of this further expansion has been encouraging and well justifies the careful thought and thorough investigation which precedes each project of this nature. One result of this further increase of representation, coupled with a growing volume of business generally, has been that our staff numbers have shown a modest increase.

RISING COSTS

The cost of running our business continues to rise, and whilst one might wish to see a halt in the growth of our general expenses, it has given your board satisfaction to know that our staff have had some share during 1954 in the increased prosperity of our institution, and that despite this fact we were able to show an expansion of £148,461 in our net profit compared with the previous year. This has enabled us to declare the final dividend of 2s. per share on our £4 shares,

which, as a result of our capital reorganisation, are now £1 5s. paid.

The increase in the cost of our dividend, after providing income and profits tax, has taken nearly £78,000 of our additional profits, and bearing in mind our past experience of the way in which British Government securities can so suddenly depreciate in value, we have deemed it advisable in the best interests of our shareholders to make substantial allocations towards the further strengthening of our published and inner reserves.

You, and the board, have only too clear a recollection of such happenings about three years ago; what may not be so widely realised is the not inconsiderable decline in the value of British Government securities over the last two months. This decline in value is in the main the result of the belief that if a definitely inflationary trend appears, the instrument of bank rate will be used to check it.

BALANCE SHEET FIGURES

The balance sheet total of current, deposit and other accounts has grown by over £60 million during 1954 and at the figure of £907.9 million constitutes a record for our bank.

Of our main earning assets, advances have risen by £47 million; in a period of greater industrial activity and production this was to be expected and is a most welcome outlet for our increased deposits. It has suited us also to add to our short-dated investments at the expense of our money in the market and in bills, our least remunerative assets, the yield upon which tended to become uneconomic after the reduction in Bank rate in May.

The increase of £14 million in endorsements and other engagements is evidence of the growth in our foreign business, which has again been fostered by visits abroad by senior officers of our bank; during the year our representatives have been to the United States, Central America, the West Indies, the Middle East, Austria and Germany. One of our joint general managers and a member of our foreign branch management are in the Far East at the present time.

Thus I am able to assure you, and you will in fact have gathered it from reading these remarks and our figures, that this bank is very active in the extension of its business at home and abroad. The general managers, with whom I am in daily contact, never spare themselves in furthering the interests of our bank—proprietors, customers and staff alike.

Although our auxiliary, Westminster Foreign Bank Limited, has benefited from increased business activity in France and Belgium, this has been offset by heavier staff and other expenses, so that the net profit for the year remains approximately the same as for 1953.

Our affiliate in Ireland, Ulster Bank Limited, had a successful year and has been able to declare an increased profit.

PROGRESS TOWARDS PEACE

In considering the events of the year 1954, the first thought in all our minds must of course be: What progress has been made towards achieving a lasting peace? We may well feel that a great step forward has been taken in the creation of a stronger and more united Western Europe; but it is difficult to believe that the Communist nations have yet come nearer to the idea of peaceful co-existence.

At home, our farmers will long remember 1954 as one of the worst years that they have had to endure. Some areas were lucky, but over much of the country the weather has caused woeful havoc to hay and grain crops. There is also no little anxiety about the future policy of the government in regard to agriculture.

Industrially it has been a year of good progress: the total of industrial production has again risen notably, even though not so fast as in 1953; and it is evident that we have all begun to accept again what was lately an old-fashioned idea—that in order to enjoy we must produce, whether that production is of goods for our own use or for exchange with other nations.

Two years of increased production have shown us that we can thereby export more, invest more, and spend more on ourselves; though as a result of the removal of most of the restrictions on hire-purchase finance, some part of the extra goods bought in 1954 will have to be paid for out of future income.

WAGES AND SAVINGS

Wage rates have increased by some 3 or 4 per cent on the average, and earnings have increased by more than that as, on the whole, rather longer hours have been worked. But 48.2 hours a week, the figure given for April, 1954, by the Ministry of Labour, for men employed in manufacturing industry, is too high an average. It should be possible in some industries at least—and it would certainly be most desirable—to search again for methods which would enable the wage earner to produce as much in shorter hours as he does at present and yet draw the same wage packet. Dividends have also increased, and most certainly the man who saves to provide the tools of industry or the housing of the nation is worthy of his hire.

According to the figures issued by the National Savings Committee there has been a good increase in small savings, and the total of personal savings of all kinds, including such items as life insurance premiums, again increased during 1954. During the year also the index of retail prices remained relatively stable. These two facts must surely be inter-related. It is certain that people are more inclined to save when it looks as if savings will retain their purchasing-power. At the same time savings are themselves a means by which prices may be kept steady, since they reduce the amount of money chasing such

goods as are available. But saving is only one side of the picture; the other is costs of production. After twenty years of rising prices the greatest boon which savings, combined with improved efficiency throughout industry, could bestow on us all would be a stable cost of living.

"GENTLE INFLATION"

The idea of a "gently inflationary" economy for Britain is not without its supporters. There are some people who think we ought to reconcile ourselves to a permanent condition of gradually rising prices. What this seems to me to amount to is that wage earners and profit earners would constantly be increasing their slice of the cake at the expense of pensioners, of other persons with fixed incomes, and of future savers. And the size of that cake would most likely become smaller and smaller as high costs led to the loss of overseas markets and ultimately to the depreciation of the pound sterling. A rise in bank rate would seem to me much less undesirable than inflation.

During 1954, the excess of unfilled vacancies in the labour market over the number of registered unemployed rose to 100,000 although at the same time the total number in civil employment in November was well over a quarter of a million more than a year earlier. These figures suggest that we cannot rely on much further increase in the number of workers to raise industrial production, and point clearly to the need to improve machinery and technique to enable the same labour force to produce more goods. It is therefore most cheering to read not only of the vast new development projects of the motor industry, but also of the great increase in the number of applications to the Board of Trade by many other industries for location permits for new factories.

A BUDGET HOPE

Increased industrial investment will need new saving, and it is greatly to be hoped that the next Budget may give more encouragement to those companies and individuals who do make the effort to save. The recent increase in the limit for holdings of National Savings Certificates, the interest on which is tax-free, was followed by a marked increase in purchases by the public; the Chancellor might well take note of the encouraging effect on individual savers of even so slight a concession as this.

In spite of the abolition of many wartime controls, it is not possible to record any great drop in the number engaged in national and local government service. In October, 1954, the number so employed (excluding the armed forces and the police) was 1,231,429, only 11,168 fewer than a year before. This still represents over 5 per cent of the total in civil employment. It is natural and proper that there should be much reluctance to reduce numbers when other employment is not readily available; but with productive industry clamouring for more men and women it is to be hoped that this reluctance may be partially overcome and at least a check put on recruitment for government and local government services. It is difficult to make a fair comparison between the number of public servants now and before the war, but if we consider only the non-industrial civil service, which in October last numbered 638,200, we find an increase of 70 per cent compared with 1938. Is this increase really necessary or desirable in the best interests of our productive effort?

INDUSTRIAL DISPUTES

Industrial disputes have unfortunately wasted even more of the nation's working

time than in 1953. When a dispute interrupts the flow of exports, as any important stoppage nearly always does, the harm done extends far beyond what is obvious to those concerned. It is not merely a question of an accumulation of goods to be cleared by working overtime. The dislocation of trade may last for several months, and if our overseas competitors take the opportunity to step in, some of the damage may be permanent. It can easily be understood how even the threat of an industrial dispute hampers the efforts of those who are trying to sell goods abroad.

The mounting figures of capital investment in the coal industry, together with the assurances of increased output which the National Coal Board and the miners' leaders gave in January, 1954, led the nation to hope for a substantial increase in coal production, a hope that has not been fulfilled by the extra 1,730,300 tons of deep-mined coal produced in 1954. Whilst the particular difficulties of this industry are well known, and whilst it is realised that a good deal of investment is needed even to maintain production, the results are disappointing. We are still obliged to import coal from America—a most regrettable position.

EXTERNAL AFFAIRS

Taking the year 1954 as a whole we fared well in our external affairs. In view of our experiences since the war we naturally look at the figures critically to see whether the progress they show is real or only apparent. In the first half of the year we had a surplus on our current transactions with other countries amounting to £154 million, not counting defence aid. We shall not know the result for the second half of the year for a month or two yet; but we should show a substantial surplus for the year, though it may not reach £300 million—the figure which the Chancellor has said we should aim at as an annual average in order to build up our reserves and play our part in supplying capital for development to countries badly in need of it. A surplus would not be a great cause for satisfaction if it had been obtained by a serious running-down of stocks of goods, or if it were the result of a lucky and temporary fall in the prices of our imports compared with those of our exports; but neither of these things happened in 1954.

The gold and dollar reserve, which stood at just below £900 million at the end of 1953, had increased to £986 million by the end of 1954; and this was after making three big gold payments during the year: £35 million in July in repayment of past indebtedness to the European Payments Union, £40 million in August to the International Monetary Fund in respect of dollars lent to us against sterling in 1947-48, £65 million at the end of December for service of the American and Canadian loans. The payment of £65 million has been made in each of the last four years, but that the other two payments should also have been made with a loss of reserves on the year does show that we are beginning to stand on our own feet. Direct dollar aid, which amounted to £54 million in 1954, and off-shore purchases, that is, purchases of British armaments by the United States to supply to other free nations, have helped us; without this help our reserves would hardly have been maintained.

UNITED STATES AND CANADA

For the last six months of 1953 there was a considerable decline in industrial production in the United States and Canada, and this was reflected by a drop of some 12 per cent in our exports of merchandise to these two markets during the first half of 1954. At the same time our imports from them were

reduced by 9 per cent. The fact that this most unwelcome contraction of our trade with North America has been made good by expansion in other directions during the year has been a hopeful sign.

It must be remembered however, that the fall in industrial production in the United States never brought the index figure down to the level of 1952, partly, I think, owing to the well-founded confidence of her citizens that the United States can never fail to make progress in the long run; and in fact industrial production is now well on the way up again. It is to be hoped that our ability to weather this comparatively slight American recession will not lead us into easy optimism as to the consequences for us of any future recession there. We should not be wise to count on a repetition of the fortunate combination of circumstances which this time spared the sterling area the full effects of a shrinkage of demand in America.

EUROPEAN TRADE

The activity of trade in Europe has been a great advantage to the United Kingdom and the sterling area. The continuance of the European Payments Union was in jeopardy last July because some members were too much in debt, and we were one of the worst offenders in this way. It is therefore satisfactory to note that we have started to pay off our old indebtedness, and that since July we have shown a small net surplus in the monthly settlements. The Union has served its purpose well. It has enabled its members to make the most of their scarce reserves, and the credit it has granted has helped to tide some of them over difficult times.

The hope of convertibility of the pound sterling received a set-back during 1954 when the United States Government decided to defer consideration of the recommendations of the Randall Commission for some liberalisation of trade; but the President's recent message to Congress makes it probable that the question will be reconsidered at an early date. Even if the very moderate recommendations of the Randall Commission were adopted in full, we should still be a long way from earning all the dollars we should like to use in buying American goods.

PROSPECTS FOR 1955

In considering our prospects for 1955, we should be unwise to ignore some warning signs that have recently appeared. The level of production at home depends very much on the overseas demand for our goods, and that is often a question of price levels. Whilst the up-turn of business activity in the United States offers the hope of a re-expansion of our trade with North America, we cannot feel the same confidence about our trade with some sterling countries. Some of our best customers—Australia, India and New Zealand—are showing signs of anxiety at the present trend of their overseas payments and may wish to curtail their imports during the coming year. When the detailed figures of our total exports in 1954 are available it will probably be seen that the increase in those total exports is just about equal to the increase in our exports to Australia alone. Our exporters are doubtless taking note of this position and know that they may have to redouble their efforts to expand trade in other directions.

If, then, we can look back at our progress in 1954 with a feeling of considerable satisfaction, we ought to recall that it is not long since the economic situation of our country was rightly described as precarious. It would be less than honest to suggest that we can yet afford to forget that word.

ALEXANDERS DISCOUNT COMPANY

AN EVENTFUL YEAR

SIR ERIC GORE BROWNE'S STATEMENT

The eighty-seventh annual general meeting of Alexanders Discount Company, Limited, will be held on February 17th in London.

The following is the circulated statement of the chairman, Sir Eric Gore Browne, DSO, OBE, TD:

The year 1954 was an eventful year for the London Discount Market, in which your company is privileged to play a leading part.

You will remember that on September 17, 1953, the Bank rate was reduced from 4 per cent to 3½ per cent, the commercial bill was allowed to go free, and the discount market was allowed to obtain advances from the Bank of England at the rate of 3½ per cent against all eligible securities. The result was that market competition brought the commercial bill rate down to 2½ per cent, compared with a Treasury bill rate of about 2½ per cent. In May of last year, 1954, the Bank rate was again reduced, this time to 3 per cent, and the difference between the two rates narrowed to ½ per cent, and was at times even smaller. The clearing banks continued their practice of charging different rates for loans against Treasury bills (1½ per cent), commercial bills (1½ per cent), and bonds (1½ per cent).

THREE CONVERSION OPERATIONS

During the year there have been three important conversion operations by the Government, which, in view of the company's large holding in short-dated bonds, have had a considerable influence on its affairs.

Firstly, in June, 1954, £292 million of 3 per cent Defence Bonds 1954-8 were converted into 2 per cent Conversion Loan 1958-9; in addition, £300 million of the same stock were issued for cash. Then in July an offer was made to holders of 1½ Serial Funding Stock 1954; as a result £274 million were converted into 2½ Exchequer Stock 1963-4 and £139 million into 3½ Funding Stock 1959-2004. Finally, at the end of November, the holders of 2½ Exchequer Stock 1955 were invited to convert their holdings into 2 per cent Exchequer Stock 1960 or into 3 per cent Funding Stock 1966-8; £448 million were converted to the former and £202 million to the latter. It is noteworthy that in all these three operations, involving £1590 million, only £235 million remained unconverted.

In our domestic sphere you will recall that in October, 1954, with the sanction of the High Court of Justice and with your approval, your board decided to eliminate the uncalled liability on all the ordinary shares; and, after completing the necessary legal formalities, to create 1,200,000 new ordinary shares of £1 each ranking *pari passu* with the existing ordinary shares, and to issue these new shares credited as fully paid up (by way of capitalisation of £1,200,000 of the share premium account) to holders of the existing ordinary shares in the proportion of one new share for each existing share held. The issued capital of your company is now all fully paid.

AN ELEMENT OF UNCERTAINTY

As the year approached its end, sterling showed an increasing tendency to weaken in terms of dollars; and the discount market progressively reduced the price of their tender for Treasury bills. In this action, while we hope that we made some contribution to the solution of a national problem, no doubt the

market had in mind the possibility of a rise in the Bank rate and the danger of end-of-the-year credit stringency with its resulting necessary recourse for loans from the Bank of England for at least seven days at Bank rate. This recourse did in fact prove to be necessary. In the result, an element of uncertainty was introduced into the whole structure of money rates on the London market. Time alone will show whether this technique is in fact effective either in curbing inflation or in dealing with the national problem of external balances.

I have dwelt at some length on the principal events which took place in the vicinity of Lombard Street last year because I want you to realise that each and all of them affected your company in varying degrees. The London Discount Market, as it exists today, is a sensitive instrument and subject to influences over which it has no control and which may at any moment considerably influence its current position. Strength, liquidity and vigilance are more than ever of paramount importance to a discount house in an era of a controlled economy.

DIVIDEND DECISION

My colleagues and I have given anxious thought, not only to the rate of dividend which we should ask you to approve on this occasion, but also to the amount which we should restore to our published reserves after last year's issue of capital. In regard to the dividend, we have decided to recommend to you a final dividend of 8½ per cent on the ordinary shares as they now stand. In recommending this course to you—which in effect incorporates in the dividend the bonus of 5 per cent which we paid last year—I must emphasise to you that, while we have every hope of maintaining this dividend, it must depend on the results of future years.

In regard to the published reserves, we propose to transfer £200,000 from the profit and loss account and £500,000 from the contingency reserve. The result of this action on our part is that, including the share premium account of £533,750, the published reserves as shown in the balance sheet now amount to £2 million and with the carry forward to £2,267,000.

BALANCE SHEET FEATURES

Now, if you will turn to the balance sheet you will see that our capital appears in its new form—100,000 £2 6 per cent cumulative preference shares fully paid and 2,400,000 £1 ordinary shares also fully paid, while the total published reserves now stand at £2,267,000, made up of £533,750 on share premium account, £1,466,250 on general reserve account and £267,000 in the carry forward. You will also see that the deposits are £150 million, compared with £141 million the previous year, while bills discounted are very slightly larger at £75 million and British Government securities £77 million, compared with £68 million. Our balance sheet total is £154 million, compared with £145 million. Our turnover in Treasury bills was slightly less and in commercial bills slightly more than in the previous year.

The profit and loss account shows a balance of profit of £305,100, an increase of £23,500.

You will note that we propose to transfer £18,500 to the pension fund. This is on the recommendation of the fund's actuary, who considers the fund will then be strong enough

THE ECONOMIST, JANUARY 29, 1955

to bear the increased pensions payable in the future.

It remains for me to express to Mr Macnaghten, our manager, Mr Dawkins, his deputy, to the assistant managers, and to the whole staff our sincere thanks for all they have done for your company in the year 1954. We have a happy team at 24 Lombard Street. Board, management, and staff work closely together for the continued prosperity and success of a great discount house, operating in an uncertain world.

TANGANYIKA CONCESSIONS LIMITED

SIR ULICK ALEXANDER'S REVIEW

The annual general meeting of Tanganyika Concessions Limited was held on January 20, 1955, at the head office of the company, 1, New Africa House, Union Avenue, Salisbury, Southern Rhodesia, the Right Honourable Sir Ulick Alexander, GCB, GCMG, OBE, the chairman, presiding.

The following is an extract from his circulated review:

From the accounts you will observe that the profit after taxation amounted to £2,519,282. This profit is higher than last year, which, at £2,057,914, was a record, and your directors have been pleased to propose the payment of a final dividend of 45 per cent on the ordinary stock which, if approved, will make a total dividend of 55 per cent for the year.

The increased profit is again due to the prosperity of the Union Minière du Haut-Katanga, which increased its total net dividend from Belgian francs 1,250 for the year 1952, to Belgian francs 1,450 for the year 1953.

Addressing the meeting, the chairman said that in dealing with the Benguela Railway in his review published with the annual report and accounts, he referred to the continued necessity to finance expansion of the railway to meet increasing demands for traffic, and he expressed the hope that he would be in a position to announce at the annual general meeting new arrangements for dealing with this problem. He was now glad to state that arrangements were being made for the Benguela Railway to raise an additional £2,025,000 of capital by the issue of the remaining £2,250,000 of the £4 million 5 per cent debentures already authorised. This would provide the railway company with funds to complete the remainder of the 1954-55 programme and a new programme of capital expenditure to be incurred during the years 1955-57. The board considered that this capital expenditure was required to ensure the maximum efficiency from the existing assets, and at the same time to meet the rapid and encouragingly steady development of traffic, both internal and external, on the railway. It was expected that the capacity of the line for export through traffic would thus be substantially increased.

The debentures would be subscribed by their company at a discount of 10 per cent, and the funds for the purchase would be provided by the issue by their company of £2 million of 4½ per cent unsecured loan stock, 1965-75. He said he was happy to inform stockholders that Hambros Bank Limited and Morgan Grenfell and Company Limited, through Messrs Rowe and Pitman, and the company's brokers, Messrs Greener Dreyfus and Company, had placed this loan stock at 99 per cent privately with various institutions in the United Kingdom, with whom they were in the habit of doing business. The stock was redeemable by 20 annual redemption instalments of £100,000 each, starting in 1955 with the right to re-

THE ECONOMIST, JANUARY 29, 1955

deem the whole, but not part, of the outstanding stock after ten years at varying premiums.

This increase of the traffic capacity was necessary so that the railway company, while meeting, as it had always done, all traffic demands from the Belgian Congo, might be in a position to meet the increasing demands, both inward and outward, which were arising as a result of the progressive development of Central Africa. Stockholders would be aware that the traffic at present carried by the Benguela Railway Company consisted principally of minerals from the Belgian Congo to the coast. During 1954 a considerable tonnage of coal was carried from Lobito to the Belgian Congo and to Northern Rhodesia, and he thought it was fair to say that the assistance so afforded to the copper producers in the latter area had been of very considerable importance. When this improvement of the line was completed the Lobito route should be in a position to play a full part in the future development of the Central African territories.

The chairman expressed thanks to the company's staff for their untiring services during the year.

The report and accounts were adopted, the payment of the final dividend was approved, and the retiring directors were re-elected.

FLOWERS BREWERIES LIMITED

A SATISFACTORY TRADING RESULT

The fifty-seventh annual general meeting of Flowers Breweries Limited was held at Luton on January 24, 1955, Mr Bernard Dixon, chairman, presiding.

The following are points from his statement:

The weather conditions during the summer affected the trade of practically all our attractive country properties. Sales have been good in the more thickly populated areas.

The policy of widening our range of bottled beers has made further progress. A new stout, known as "Sable Stout", has met with marked success.

The policy of amalgamating breweries, which this company has so vigorously pursued in recent years, has been effective. The widespread interests of the group have enabled us to produce a satisfactory trading result in a year when climatic conditions have been unfavourable.

AN IMPORTANT DEVELOPMENT

The most important development that took place during the year was the amalgamation between J. W. Green Limited and Flower & Sons Limited of Stratford-upon-Avon, an important aspect of which has been the change made in the name of the parent company. The profits of the Stratford-upon-Avon brewery for the last nine months only of our trading year were attributable to the parent company.

The sub-division of the ordinary shares of the company into 5s. units has been in every way successful, and has achieved its objective in making these shares a more marketable security.

The board's recommendation in regard to dividend on the ordinary shares is in accordance with that predicted by the directors at the time of the amalgamation and is, of course, after payment of the dividend on the bonus issue of preference shares.

The report and accounts were adopted.

ILLINGWORTH, MORRIS & COMPANY (Worsted Spinners)

AN EXCELLENT TRADING ACHIEVEMENT

LORD WILMOT'S REVIEW OF THE INDUSTRY

The thirty-fifth ordinary general meeting of Illingworth, Morris & Company Limited was held on January 26th in Bradford, The Right Hon Lord Wilmot of Selmeiston, PC, JP (the chairman), presiding.

The following are extracts from his circulated statement:

The profit and loss account shows a net profit before taxation of £687,500 compared with £567,500 for the previous year. After providing £377,500 for taxation there remains £310,000, which compares with £248,500 for the previous year. The directors recommend an appropriation of £162,638 to general reserve. Current assets exceed current liabilities by £4,474,000.

The past year was the first reasonably normal trading period since the war. Prices moved only within moderately narrow limits and business came along in sufficient quantities to keep us fully employed and with sufficient work ahead.

As a result of this return to more normal trading, the long delivery dates, amounting to six or seven months for spinners, have gone. Orders are now placed because the goods are wanted and not just as a speculation or to keep in the ordering queue. Manufacturers and merchants, therefore, are in the fortunate position that they no longer need to make such long or heavy commitments for their requirements; but we, as spinners who buy our wool in the primary markets, do not share in these benefits since we must buy our raw materials when available.

The high level of wool prices last season was a matter of some concern and I am sure that, in general, lower prices, which would encourage an expansion of markets, would be welcomed by the industry. So far this season we have seen lower values and let us hope that stability at these lower levels has now been reached and, the difficulties of adjustment having been overcome, there will be more capital released for necessary development.

The question of synthetic fibres continues to be of interest to every worsted spinner. While we are convinced that these synthetic fibres have come to stay, the highest class end of the trade still prefers wool and pure wool. This is particularly true in the United States where eventually a substantial proportion of the yarns we spin find their way in the form of the highest quality cloth.

In the export market the demand for our yarns continues to expand and all steps are being taken to increase our overseas sales.

Our order book continues to be healthy, and, although I am glad to say our delivery dates have greatly shortened, all our works are on full time and evening shift work is still being undertaken.

The changing conditions of trade, however welcome, may produce increased competition and perhaps lower margins of profit. Nevertheless we face the future with confidence.

We have recently acquired the controlling interest in the old-established firm of John Smith (Field Head) Limited, which is now a subsidiary. The report was adopted and the total ordinary dividend distribution of 7½ per cent for the year was approved.

THE AVON INDIA RUBBER COMPANY

PREVIOUS SALES RECORDS SURPASSED

The sixty-fifth ordinary general meeting of The Avon India Rubber Company, Limited, was held on January 26th at Melksham, Wilts, Mr C. M. Floyd, OBE (vice-chairman), presiding. The following are extracts from the circulated statement of the chairman, Major R. F. Fuller, DL:

The group profit for the year, after providing for taxation of £119,260, amounted to £95,273, compared with last year's figure of £63,395 to which was added £80,000 brought from raw materials reserve.

During the year under review there has been an increase in the price of raw materials, but the rise has not been steady and the fluctuating nature of the market has caused manufacturers in the industry to show some hesitation in increasing their selling prices. Therefore the full impact of increased costs of raw materials was not passed on to our customers during the course of the year.

Our sales beat all previous records, both in volume and value, and this is a matter for satisfaction in the light of competition now being experienced. The current year has, so far, opened with encouraging prospects.

Our factory at Bridgend has passed through the inevitable difficulties associated with a new venture; it is now at the point of consolidation into a satisfactory concern.

Our business overseas has expanded and every effort is being made to continue this development.

The report was adopted and a total distribution of 8 per cent on the increased ordinary capital was approved.

MICHAEL NAIRN AND GREENWICH, LIMITED

INCREASED PROFIT

The thirty-third annual general meeting of Michael Nairn and Greenwich, Limited, was held on January 27th at Kirkcaldy, Sir Robert Spencer-Nairn, Bt, chairman, presiding. The following are extracts from his circulated statement for the year ended September 30, 1954:

The net group profit amounts to £432,632 and shows a satisfactory increase of £105,477. The subsidiary companies have retained £237,837, leaving a balance of profit accruing to the holding company amounting to £194,795. The gratifying improvement in the results justifies the board in recommending the payment of a final dividend of 6½ per cent on the ordinary stock, as increased by the new issue of shares made to stockholders in July. Together with the interim dividend of 2½ per cent, less tax, paid prior to the issue, the total dividends paid and recommended for the year are the equivalent of 8 per cent on the capital as increased.

I referred last year to the improved trading conditions which had operated in the latter part of our financial year. These favourable conditions have continued.

Shortage of raw materials is no longer a handicap to our industry. Linseed oil can now be purchased at world prices, and during the year we have been able to make substantial purchases on favourable terms, but there are now indications that prices are hardening.

The future prospects of an organisation like ours with world-wide interests are always difficult to assess. Unless disturbing situations arise, the future outlook is encouraging. The report was adopted.

ASSOCIATED BRITISH MALTSTERS

BOARD'S FORESIGHT REWARDED

MR H. N. HUME'S NOTE OF WARNING

The thirty-third annual general meeting of Associated British Maltsters Limited will be held on February 14th in London.

The following are extracts from the statement by the chairman, Mr H. N. Hume, CBE, MC, which has been circulated with the report and accounts:

Your directors are very pleased to present accounts which show larger profits and a marked improvement in the group's financial position. When I wrote my remarks at this time last year it could not have been possible to foresee all the favourable circumstances which have led to such a pleasing increase in profits, and it is my unfortunate duty to warn you that they are unlikely to recur this year. You do not need anyone to tell you that the weather during this last harvest season has been appalling and it is an historical fact that the profits of both farmers and maltsters suffer severely in such circumstances. If we had not provided our-

selves with first-class modern drying and storage facilities this harvest would have meant disaster for us. As it is these facilities will enable us to maintain the quality of our products in this difficult year.

The 1953 harvest, which largely affects the year covered by our accounts, took place in good weather and was easily handled. As a consequence our drying and storage facilities became available for handling on profitable terms large quantities of Government owned barley—a proportion of which we subsequently bought as dried barley at prices which enabled our export company to compete in world markets. Moreover our stocks fell in both volume and value and our interest charges benefited accordingly. Our subsidiary activities in the animal food trade also turned out more profitable than we expected. The conjunction of all these favourable happenings is the explanation of the increase in our trading profits from £297,316 to £364,280.

DIVIDEND POLICY

We have held our dividend at 10 per cent for many years and been severely criticised for doing so by stockholders, who do not appear to understand our problem, despite my attempts in these annual remarks to explain it. This year, however, we are

effectively raising the distribution to 12 per cent by paying our customary dividend on the ordinary capital increased by a distribution of one share in five from the free reserves. Your board believe that this method of giving a greater reward to stockholders is more acceptable than that of increasing the rate of dividend on a static amount of capital; and we intend to repeat it as and when opportunity offers.

Although the group's liquid position and the ratio of current assets to current liabilities is much better than it was we did not succeed during last year in repaying our bank overdraft, and until we can see our way to doing so your board feel they must continue to conserve the group's resources.

We are now in the midst of a very testing year for maltsters, and I hesitate to forecast the outcome from a profit point of view. As already stated, our foresight in providing at great expense storage and drying facilities has proved a godsend, but the consumption of beer in this country is falling and under the present weight of taxation will probably continue to do so: and the English brewing trade is the backbone of our business. On the other hand, our export trade continues to grow, our ancillary activities are doing well, and overall I can only express the hope that the year's results will prove reasonably satisfactory.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF APPLIED ECONOMICS

Applications are invited for a research appointment in connection with an inquiry into the long-term economic growth of the United Kingdom. Applicants should have a first- or good second-class honours degree in economics or history and some experience of research in modern economic history. The appointment will be research in modern economic history. The appointment will be made for a period of two years in the first instance, on a salary scale starting at £500 per annum, and will qualify for membership of F.R.S.E.—Applications, which should state academic qualifications and experience, together with the names of two referees, should be addressed to the Director, University of Cambridge Department of Applied Economics, Downing Street, Cambridge, to arrive not later than February 21, 1955.

UNIVERSITY OF CAMBRIDGE

Applications are invited for one post of Agricultural Economist and two posts of Assistant Agricultural Economist. Qualifications should include an honours degree in Economics or a degree in Agriculture. Duties may include investigations (for the senior post) into the operation of agricultural policy and (for the junior posts) into either livestock production or advisory work. Salary scales (at present under consideration) in the range: Agricultural Economist, £676 to £949; Assistant Agricultural Economist, £396 to £676. Further details can be obtained from the Secretary, School of Agriculture, Cambridge. Closing date for applications, March 4, 1955.

UNIVERSITY OF EDINBURGH

RESIDENT COURSE FOR BUSINESS MANAGERS

A short Resident Course for Business Managers will be held in the University from July 16 to August 6, 1955. The aim is to provide the executive with a broader understanding of business problems and of the context in which business operates, and thus to assist in the transition from specialised to general management.

PROGRAMME OF STUDY

There will be three principal fields of study:—(i) Business in a Changing World (ii) Determination of Business Policy; (iii) Aspects of Internal Administration. Actual case problems will be studied and seminars will be led by practising business and professional men as well as University teachers drawn from several departments, including Commerce, Political Economy, Accounting, Psychology and Law.

ADMISSION

To encourage the exchange of knowledge and experience among members of the course, the number admitted will be strictly limited. There are no formal educational requirements. The fee for the course, including residence, is 75 guineas.—Further particulars and nomination forms may be obtained from Professor N. C. Hunt, University of Edinburgh. Early application should be made. The closing date is March 31, 1955.

CHARLES H. STEWART,
Secretary to the University.

WHITE FISH AUTHORITY

The White Fish Authority (which was set up under the Sea Fish Industry Act, 1951, to reorganise, develop and regulate the white fish industry) requires a professional economist with statistical qualifications for work on economic research, preferably with experience in marketing surveys. First- or good second-class honours degree essential. Minimum age limit 26. Starting salary according to qualifications and experience, but not less than £800 with regular increments. Successful candidate will be required to enter a Staff Superannuation Scheme and to work at the Authority's Headquarters which will shortly be moving to London. Applications from men or women stating age, education, qualifications, and full details of experience, should be sent to reach the Secretary, Conyngham Hall, Knarborough, not later than fourteen days from the date of this advertisement.

INVESTMENT MANAGER required for London group of Trusts. Knowledge of French an asset. Should be available to travel abroad when required. Would be eligible for pension.—Box 818.

RESEARCH FELLOWSHIPS

The Council of Europe and the High Authority of the European Coal and Steel Community will award jointly a number of Fellowships in 1955 for research into problems of European interest. Each Fellowship will carry a stipend of 300,000 French francs.

(a) Candidates for the Council of Europe Fellowships are invited to submit subjects for research in connection with:

- (1) European economic integration.
- (2) European political integration.
- (3) European history and philosophy in relation to contemporary problems.

(b) Candidates for the High Authority Fellowships are invited to submit subjects for research into economic, legal and social problems relating to the European Coal and Steel Community and its institutions.

A candidate may, if he so wishes, apply for both Fellowships. Further particulars, and forms of application, to be returned before March 15, 1955, may be obtained from The Controller, Education Division, The British Council, 65 Davies Street, London, W.1.

SENIOR EXECUTIVE

Shannon Duty Free International Airport requires a Senior Executive to control and develop its rapidly expanding retail, wholesale and mail-order activities. The position offers wide scope for a man interested in international trade, particularly with the United States. A record of successful modern management experience essential. A progressive four-figure salary will be paid and there will be an additional annual bonus based on results. The successful applicant will have an Irish background and a sound education. Applicants should write in confidence to: Office 61, Shannon Free Airport, Ireland.

THE TRAINING OF TECHNICAL TEACHERS

Applications are invited from men and women of approximately 25 years of age and over, for admission to a one-year course of training as full-time Teachers of General Commercial and Professional Subjects, and/or Office Arts (Shorthand, Typewriting and other Secretarial work), in technical colleges and similar institutions. Applicants who wish to teach general commercial and professional subjects should have a University Degree, or professional qualification, or a Higher National Certificate in Commerce. Applicants who wish to teach Office Arts should possess higher certificates of some recognised examining body in shorthand and typewriting, and should show evidence of a good general education. In all cases applicants will be expected to show evidence of good business and other clerical experience. The courses will begin in September, 1955. Recognised students will pay no fees, and they will be eligible for maintenance grants for the period of the course.

Further particulars and application forms may be obtained from the following Colleges on receipt of a stamped addressed foolscap envelope:

Bolton.—The Principal (S/1/4), Bolton Training College, Manchester Road, Bolton.
Huddersfield.—The Director (S/1/4), Huddersfield Training College, Queen Street South, Huddersfield, Yorks.
London.—The Principal (S/1/4), Garnett College, 83, New Kent Road, London, S.E.1.

OPERATIONAL RESEARCH

British European Airways require a Senior Methods Officer to apply operational research techniques to the study of a variety of managerial and operating problems throughout B.E.A. This is a managerial and progressive appointment offering wide scope for ability, new and progressive appointment offering wide scope for ability. Applicants should have a University Degree in Science or Mathematics, with a qualification in statistics, and some years in a position of responsibility, preferably in industry. Experience of conducting investigations involving statistical analysis essential. Starting salary within the range £1,075-£1,375 per annum, according to qualifications and experience. Pension scheme. Travel concessions.—Details of qualifications and experience to Chief Personnel Officer, B.E.A., Keyline House, Ruislip, Middlesex, quoting Reference B7.

THE B.Sc.ECON. DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretarialship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for the three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall students have passed London B.Sc.Econ. (Final) exams. since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P17, WOLSEY HALL, OXFORD.

LEADING firm of Chartered Accountants with good experience. Chartered or Incorporated Accountants with excellent prospects and Salary not less than £1,700 per annum, with excellent prospects and local income tax at low rates. Free furnished accommodation, provident fund, car and kit allowances, medical expenses. Passages paid, including family.—Write Box R. 935, c/o Streets, 110 Old Broad Street, E.C.2

ASSISTANT STATISTICIAN, with degree in mathematics and/or statistics (or equivalent), required for work in connection with development—and production—investigations. He/she will be directly responsible to the Company's Industrial Statistician. Previous experience not essential. The post offers excellent prospects and carries senior staff status. Contributory Pension Scheme.—Applications, giving details of age, education, qualifications, etc., and quoting Reference T/AS, to Personnel Manager, Ferodo Limited, Chapel-en-le-Frith, via Stockport.

A JOINT PARTNERSHIP that is bound to please is cold lamb with A Rayner's delicious Indian Mango Chutney.

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences. This term is used in a wide sense to include not only Economics, Government, etc., but equally fields such as Education, Jurisprudence and Social Medicine. Values within the range £700-£1,100 per annum (Simon Research Fellowships) or within the range of £1,150-£1,500 per annum (Simon Senior Research Fellowships) according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience. Applications should be sent by March 1, 1955, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

PREPARATION FOR EXAMINATIONS

UNIVERSITY CORRESPONDENCE COLLEGE

provides home study courses for General Certificate of Education (all Examining Bodies), London University Entrance, and Inter, and Degree exams. for B.A., B.Sc., B.Sc. (Econ.), B.Sc. (Sociology), LL.B., Professional Prelim., Teachers' Diplomas, Law. The College, founded 1887, is an Educational Trust. Highly qualified Tutors, low fees. —Prospectus free from Registrar, 60 Burlington House, Cambridge.

MANAGEMENT CONSULTANCY. A well-known company is prepared to train a limited number of suitable applicants for ultimate appointments as executives in management consultancy.

Applications are invited from men between the ages of 25 and 30 years who wish to take up a career in consultancy. They must be University Graduates in Economics or Engineering, preferably with some industrial or commercial experience; willing to travel home and overseas.

Salary paid during training appropriate to qualifications and experience. Please send details and indications of present salary level, in confidence, to Box No. 105, R. Anderson and Co., 14 William IV Street, London, W.C.2.

THOMAS HEDLEY & CO. LIMITED, Newcastle-upon-Tyne,

is seeking a man for its advertising department who has had some years' experience in the planning, choice and use of all kinds of media and who is looking for a post of important responsibility. He is likely to be a man of about 30. He should be of good education, preferably with a University degree. He will be working closely with advertising agencies and their media departments and would very quickly become responsible for the planning and choice of printed word media over a wide field. He would be expected to initiate and interpret research in all forms of media and to contribute to the formulation of policy in media buying. The salary is a good one and will be subject to material increases as the man demonstrates his ability. The post is permanent and pensionable and there is a non-contributory life assurance scheme. Letters of application should contain details of age, education and career, including H.M. Forces, and will be treated in complete confidence.—Please write to Personnel Department, Thomas Hedley & Co. Limited, Gosforth, Newcastle-upon-Tyne, 3, and mark envelope "M."

EXECUTIVE TRAINEE required for London Publishing House. Man aged preferably 22-25, British nationality, and either B.Com. with minimum two years' business experience or passed ACIS Final. This opening offers scope for interesting career with first-rate opportunities. Sound educational background, administrative ability and training in Accountancy, Commercial Law and presentation of statistical data essential.—Write, giving details of age, experience, qualifications and salary required, to Box 815.

The Proportions of the Human Figure
Leonardo da Vinci

Man is the measure of all things—

PROTAGORAS (B.C. 481-411)

We live in an age of great organisations; can we also live in one of great individuals? To reconcile the technical achievement of modern society with the dignity of the men and women who compose it is the problem of our time. To reach a solution we must first be certain of the aim we set our mammoth communities and world-wide corporations; when the last superlative has been uttered, the test must be the same—how far they contribute to the happiness, understanding and liberty of the ordinary man.

The real measure of a modern industry is its power to preserve our human values while adding to our material heritage. Man is not just another factor in the productive chain—he is the reason for its existence.

"Concertos can be costly..."

After all, it's not merely the cost of a good seat, but a trip to town and supper after the concert can soon knock holes in a budget—mine, at least. With the Black Box, I sit in the best seat in the house (my favourite chair). Listening with my eyes closed, the orchestra seems to fill the room. With my pipe going nicely, I want nothing more."

The Pye Black Box Record Player is the first instrument of its kind to be marketed in Great Britain. Never before has so compact a unit provided this high fidelity reproduction with such room-filling quality of sound. It plays all speeds of records. Automatic changer or single player models are available.

BLACK BOX RECORD REPRODUCER

AUTO CHANGERS 63 Gns. Luxury Model, and 39 gns.

SINGLE PLAYERS 61 Gns. Luxury Model, and 37 gns.

PERSONAL MESSAGE
FROM
LORD MACKINTOSH:—

“As Chairman of the National Savings Committee there’s no need to tell you I’m right behind this grand NEW SAVERS Campaign. It’s working up to something really big, but — we’re not home yet. So let’s keep at it until we reach our goal!”

ALL JOIN IN!

You can find out how to become a New Saver from your Bank, Post Office or Trustee Savings Bank, where full information will gladly be given to you.

You’ll probably find in your factory, street, school or club, a Savings Group you can join. Whether you decide to join this Group, or start saving on your own, the Voluntary Worker who runs the Group will gladly give you helpful advice about the different methods of

saving — by buying National Savings Certificates, Defence Bonds, and by opening an account in the Post Office or a Trustee Savings Bank. In any case you can start saving right away.

Another way to become a New Saver is by using some of your Savings Stamps to buy a 15/- Certificate or to open an account in the Post Office or Trustee Savings Bank with 5/-

BECOME A NEW SAVER TODAY!

“I pay people to know these things”

You may not have studied refractories. “Technical details?” you may say. “I pay people to know these things.”

Well, it is true that refractories are technically complex: their selection is a specialist’s job. It is also true that there are people who know all about them — only, they ask nothing for their advice.

Morgans are refractory specialists: their co-operation is worth having. They manufacture a range of the finest refractories ever made. They designed and they operate the most up-to-date refractories plant in Europe. Their advice may be free, but it is completely authoritative.

You may never have seen a refractory, but refractories may be in your balance sheet, unseen. Refractories are the materials of which furnaces are built. A change in the refractories of a batch furnace can increase the output by 50%. You see?

Growth and Stagnation in the European Economy

By INGVAR SVENNILSON

360 pages. Cloth 32s. 6d. (By Post: 33s. 9d.)

This major study, prepared under the auspices of the United Nations Economic Commission for Europe, surveys the economic growth of individual European countries and industries from the beginning of the First World War until the outbreak of the Second. The data which is included permits an appraisal of the progress of each European country in a variety of economic sectors, such as agricultural and manufacturing output, investment, trade, energy consumption, population, industrialization and urban settlement, as well as in a number of specific industries, including those of steel, coal, cotton, transport, motor, shipbuilding, cement and chemicals.

Well up in textiles, Mrs. Buchan?

In recent times many new methods have reinforced the traditional skill of the textile manufacturer and aided his search for greater efficiency and better materials. Many improvements have come from the use of phosphates manufactured by Albright & Wilson. In the dyeing and processing of textiles, Calgon and other phosphates have helped to give the bright and colourful fabrics of today.

"And the next few years?" asks the watching world

THE FORD FACTORY AT DAGENHAM, the largest in Europe, continues to make over 1400 cars, trucks and tractors a day. Yet even this record number is not enough. The growing demand for Ford could become embarrassing in the near future. What is being done about it? During the next five years Ford of Dagenham will be spending £65 million on new developments which will include factories giving a total increase of floor space equal to some fifty football fields! The object is to provide more cars for the ever-

growing number of motorists at home and abroad; more trucks for better transport; more tractors for better farming. Ford's success, which has made possible this great step forward, stems from Ford Leadership, which is correct anticipation of the needs of the many who, to a growing extent, depend upon cars, trucks and tractors for earning a living—and living. One result of the latest example of Ford Leadership will be that their famous slogan, 'The Best at Lowest Cost' will mean even more to more people.

"Here we come!" say

Formosa by Stages

THE difficulty and the danger in the Far East is that the Americans are out on a limb. There are plenty of reasons why the fate of Formosa should be in dispute. Even the strictly legal position is open to various interpretations. The Chinese Communists are trying to enforce a claim which no one but a Communist or a fellow traveller could accept in its entirety. But—as the American Administration is beginning to realise—in standing up to Communist pressure on this particular question the United States runs an unpleasant risk of impairing the full support of its main allies. This wider issue is quite as important as the hour to hour development of events in the China Seas. To back down on Formosa at this stage could send a shock wave of defeat round the rest of Asia, including Japan; but to leave America to face the music alone would create exactly the situation at which the Russians have long been aiming, and its attendant mischief would sweep across the whole world.

The one encouraging feature in a week of bad news has been the firmness shown by the Security Council, which on Monday voted by 9 to 1—with Nationalist China opposing, and Russia abstaining—to invite Chinese Communist representatives to come to New York, and by 10 to 1—Russia opposing—to postpone the Soviet counter proposal condemning "American aggression." The risk remains that the war over Formosa may spread to the scale of that in Indo-China, or Korea, or even wider; so far it has been regarded with surprising coolness on both sides of the Atlantic.

China's determination to get Formosa has been well known since the end of the civil war in 1949. But there have been two recent developments. The drawing up of a formal defence pact covering America's relations with the Chiang Kai-shek regime was a blow to the Chinese in Peking, which they felt they could not ignore. The news last summer that such a pact was in the offing stirred them to action and marked the beginning of the present crisis. There is no reason to doubt that the Chinese Communist government meant exactly what it said in the Peking *People's Daily* when the pact was signed in Washington: the Chinese people "will never stop till Taiwan (Formosa) is liberated and will never forget the date of December 2nd."

The other development was for the Chinese to obtain firmer Russian backing. Until Mr Khrushchev, Marshal Bulganin and Mr Mikoyan visited Peking last October, the Russians had never committed themselves unequivocally in support of Chinese claims to Formosa. But in the communique after the October visit, the Russians declared jointly with the Chinese: "the direct acts of aggression committed by the USA towards the Chinese People's Republic (CPR) and the continued occupation by the USA of a part of the CPR's territory, in particular the island of Taiwan . . . all the above is incompatible with the task of maintaining peace in the Far East." This was followed on December 15th by a downright and unilateral statement from the Soviet Foreign Ministry denouncing the American Formosa treaty. In

it, the Soviet government "shares" the Chinese view that the treaty "is an interference in the internal affairs of China"; "fully supports the demands" of the Chinese "for the withdrawal of American troops"; and "declares that the responsibility for the consequences . . . is entirely placed upon" the United States. With this support the Chinese have now turned on the heat.

Apart from the danger of a wider war, the present complex and confusing situation gives rise to anxiety on four main points. The first is the military position on the spot. Without prejudice to the form of any ultimate settlement, could the existing Chinese Nationalist and American forces hold their present ground? On the whole the answer seems reassuring. If Peking could have readily driven the Nationalists from their outlying strongholds off the coast of the mainland, it would probably have done so before now. As matters stand, the Communists have taken only one of the Tachen group, Yi Kiang-shan; and although an orderly evacuation of the rest has been planned, it has not yet been fully carried out. Meanwhile, the political decks in Washington have been cleared for action by the vote in both houses of Congress, empowering President Eisenhower to deploy such American forces as may be necessary to defend Formosa. Provided he uses this power with the discretion that has come to be associated with him, at least a breathing space will be gained in which negotiations for a cease-fire can start.

★

The second cause for anxiety may soon be resolved: will the Chinese Communists accept the Security Council's invitation to come to New York to negotiate? The fact that Russia did not actively oppose the invitation is mildly encouraging, though the Communists will hardly take kindly to dealing with a tribunal on which the Nationalists have a seat. If, thirdly, the Chinese do come to New York but subsequently refuse to accept any UN terms for a cease-fire, there could be no escaping an invidious dilemma. So far no clearly defined aggression has yet taken place in the China Seas, despite all the bubble and froth. But it should be a constant anxiety in both Washington and London to avoid unnecessarily putting the United Nations in a position where much of the good done by the stand in Korea might be undone by an embarrassed weakness over Formosa.

There remains the puzzle of finding a permanent solution for Formosa that could be made to look even remotely consistent with present political realities in both the United States and China. When Mr Attlee and others get up and say that the Chiang Kai-shek regime must go, they are talking irresponsibly and in terms that they must know are unacceptable. It would have been far wiser to refrain from public statement about final solutions. The best that can be hoped for is to move in stages from a very dangerous position of explosive deadlock to one in which two utterly incompatible points of view can at least be discussed out of

the shadow of the guns. That move must now be the main object of the United Nations and of America's allies. The present concern should be the pace at which it is made rather than the final point it is going to reach.

Three possible stages in arriving at a solution are now becoming clearer and there is some chance that they may in time prove acceptable. The first must be a cease-fire. That is the prime task of the Security Council. If the Council fails to stop the present shooting, then attempts must be made to do so outside it. The second stage is to deal with the coastal islands—that is, with the Nationalist possessions, other than Formosa itself and the nearby Pescadores. The Communist claim to these islands cannot be refuted and in the long run there is no realistic alternative to evacuation by the Nationalists of all these islands, including the Tachens, the Matsus and Quemoy. The difficulty, however, is not only to get this recognised by the Nationalists and by those in America who urge a tough policy; it is also to persuade the Chinese Communist forces not to interfere while evacuation is taking place. Such an operation cannot be undertaken without the extensive use of American ships and covering forces. And perhaps the greatest danger to peace at present comes from the Communists' possible interference with a movement that, in the case of the Tachens, is already proceeding in their favour. For an attack would mean bombing American ships and putting Washington in an impossible situation with its own public.

★

Only at a third and much later stage can there be any question of trying to reach a solution for Formosa itself. When that time comes, several vital points will be relevant. The only road to Nationalist acquiescence will lie through Washington. And the Americans will have to have made up their minds how important Formosa really is strategically. Moreover, even to discuss the future of the island on its own merits involves acceptance by both the Chinese Communists and the Americans of the idea that there can be both a China and an entity called Formosa. At present the essence of both cases is that China and Formosa are one. If the Far East is not to dissolve into war, the task of the Russians on the one side and of America's allies on the other is to insist that this fundamental shift of ground takes place. Without it nothing else is possible. There are already signs that the Russians, whose own prestige is not directly involved, may be urging caution. For the allies the vital need is to make their feelings clear not only to Washington but to the American public as well. They have full sympathy for the extremely difficult position that the Americans are in; but they could also wish that the terms on which the United States has chosen to stand appealed more clearly to their sense of purpose and right.

Price Rings in the Corner

THE Opposition has found one of its better issues in the current campaign against restrictive practices in British industry, and not merely because this rubs some of the Tories' businessmen backbenchers on the raw. Some time before midsummer the Monopolies Commission will publish what will be by far the most important of its reports to date, a report on such general restrictive practices as "collective boycotts" and "exclusive dealings." It will be very useful to heat up public opinion on this matter; so that whatever government is in power next autumn will come to believe that there is a clear cut demand for action on this front.

What form should the action take? Labour's proposals have already been laid down. Mr Gaitskell reiterated the four things that it would like to do to weaken monopolies in a speech at Battersea last weekend. First, Labour wants to increase the staff and membership of the Monopolies Commission, so that it could proceed with more inquiries more rapidly. Secondly, it wants to take new steps to ensure that the recommendations of the commission should be more effectively carried out, and that details of its negotiations with individual industries should be made public. Thirdly, it wants to ban "the really vicious restrictive practices" like stop lists and boycotts. Fourthly, it wants agreements of all trade associations and cartels to be published. Any comment on these points will have to be broad, and it is also bound to be controversial. Very broadly, however, in his first two points, Mr Gaitskell seems to be barking up the wrong tree; in his second two, he seems to be barking right.

Labour's first point—that the commission could be made better by becoming bigger—seems to be based on a common misconception. It is true that it usually takes about two years for the commission to produce any report, and that this seems—at first sight—to be an inordinately long time to those who think that a Court of Inquiry can produce a document in a fortnight; but the closer one gets to any particular investigation, the greater seems to be the evidence that present procedure—by which each case is considered individually and judicially, but without the aid of a general body of case law—demands a time interval of this sort. If the staff of the commission were further extended, that would enable more investigations to be set afoot concurrently, but it would not enable those that are set afoot to be more speedily carried through. Moreover, the collective judgment of the commission has already been cut up into separate "panels"; to sub-divide the members even further might mean that in practice decisions came from not one Monopoly Commission, but several. Any increase in the number of inquiries, too, might tend to clog the Ministerial bottleneck at the top.

Nor is there very much profit to be gained from flogging the Government for the way in which it has

operated the present system, from saying that the investigations should be tougher and brought into daylight. The only case where the Government clearly has been dilatory is that Mr Thorneycroft has sat for the last nine months on the Calico Printers' report. This report threw a lurid light on the tangle of restrictive practices in Lancashire's declining cotton industry; it is a very hot political potato in that part of the world. In view of the attitude of the trade unions, it is a fair guess that Labour politicians themselves would have been just as dilatory as Mr Thorneycroft. Most of the other reports from the commission—to both postwar Governments—have resulted in effective, if not always dramatic, action; indeed, some of the trade associations investigated have hastened to clean out their cupboards before the reports upon their activities could see the light of day. If the proceedings at these investigations were made public, there would be an even greater tendency for those under scrutiny to waste time and to strike propagandist attitudes than now; and it would be much more difficult for monopolies quietly to throw away their most obnoxious teeth without also losing face. It would be a pity to introduce "reforms" which were designed to make the present system tougher and rougher—but, in fact, would merely make it less efficient and sleek.

★

The fairest conclusion about the work of the commission so far, in short, is that it is doing the limited task it has set out to do remarkably well. It has begun to clear away the worst examples of groups of manufacturers combining to stifle competition between themselves, by means of quotas or other artificial practices agreed upon for the common ill. If anti-monopoly legislation is to be tightened further, it must advance beyond this primary problem—to tackle one out of two others. One possible line of advance would be to extend the attack to those trade associations that stifle competition between manufacturers by means of gentlemen's agreements rather than by artificial sanctions; the difficulty about this, as American experience has shown, is that gentlemen's agreements are extraordinarily difficult to batten down. The second possible line of attack is against those trade associations that do not—or normally do not—stifle competition between manufacturers, but do not combine to prevent it altogether among retailers; these are the associations in which each manufacturer is allowed to decide his retail selling price—without reference to his competitors—and then joins with those competitors to block all supplies to the retailer who sells to the public below that stated price.

The Lloyd Jacobs Committee, which enquired into this practice of collective resale price maintenance

nearly six years ago, found that it was extraordinarily widespread; it stretches across a great part of the trade in toilet preparations, groceries, tobacco and sweets, books and stationery, hardware, motor accessories, and electrical goods. The main arguments in favour of these practices are that they enable small retailers to keep alive, to hold sufficient stocks and to provide additional services after sale. The main argument against them is not that sanctions are enforced by snooping and secret trade courts—although these exist, and can be made to look very shocking—but that they lead towards ossification of Britain's retail trade.

At the moment, there are several reasons why so many manufacturers do not cut their prices, even when a cut would clearly be as advantageous to their own profits as it would be to their customers. The first is that sales research, the estimation of how far a cut in price would lead to an increase in demand, is an extraordinarily neglected art in this country. The second is that when a British manufacturer contemplates undercutting his competitors he too often feels slightly hangdog, instead of evincing holy glee. The third—and the evidence before the Lloyd Jacobs Committee suggested that it is probably very important—is that retailers often work to a fixed percentage margin, and may act as a pressure group against any reduction in price which would cause the return from that fixed percentage margin to be cut; and it is becoming increasingly dangerous for any manufacturer to annoy his distributors in a semi-cartellised state. The fourth—or maybe the first—is that the British consumer has forgotten how to consume; if an article is cheaper he thinks there is something wrong with it. A ban on the sanctions used by groups of manufacturers to please their distributors at the moment would almost certainly be a boon to the consumer, and to the manufacturers themselves it might be a blessing in disguise.

It was at least partly for these reasons that the

Lloyd Jacobs Committee recommended legislation against collective resale price maintenance. In practice, the easiest way to effect this would be to ban the collective boycotts and other restrictions that are now being investigated by the Monopolies Commission—the “really vicious practices” of which Mr Gaitskell spoke. The Government is justified in saying that it cannot do this until the commission has reported. Once it has reported, however—and if certain practices are banned as a result—it will be important to watch that new and equally undesirable forms of sanction do not spring up in their place. The best weapon would seem to be publicity. Labour's argument that agreements of trade associations and cartels should be published—as they have to be in Scandinavia, Holland and some other European countries—deserves the strongest backing. If it is right that the names of shareholders in any concern should be open to inspection at Bush House, it is no less right that the agreements by which manufacturers may rig the market should be open to inspection by consumers' interests in the same way.

These suggested reforms—that certain collective restrictive practices should be banned and that all restrictive agreements should be published—constitute a very moderate programme. There are many people who would like to go further, to ban resale price maintenance by individual manufacturers as well as by collective groups and to launch some attack on price rigging by means of gentlemen's agreements as well as by artificial sanctions. But—especially as any reforms might affect trade unions more than they realise at the moment—“hurry slowly” is probably the only practical rule. But not too slowly; if the coming report of the Monopolies Commission is an effective one, and if it is not to be allowed to moulder on the shelf like so many reports on resale price maintenance before, it will be wise to keep up the flow of propaganda against these practices and their secret courts.

More for the Colonies

UNDER the new Colonial Development and Welfare Act the rate of colonial development, at least so far as government plans are concerned, is being stepped up fast. It took ten years to spend about £100 million of the £140 million provided under the original Acts. In the next five years both the unspent balance of £40 million and an additional £80 million now to be approved by Parliament are to be spent. This will be an increase of £10 million a year in the rate of outlay of British taxpayers' money. Colonial capital expenditure as a whole is fully keeping up. When all the original £140 million had been allocated, the colonies were asked to prepare new development plans for 1955-60; the total of these is in the region of £600 million, compared with an actual expenditure of about

£527 million in the past ten years. It is thus fair to say that government-financed capital expenditure in the colonies is to be doubled to a rate of around £120 million a year, the development and welfare proportion being kept constant at between a fifth and a sixth.

These figures should be impressive testimony of Britain's goodwill and desire that colonial economic progress should not lag behind the smart pace of political advance. But is this money effectively expanding colonial economies and introducing a dynamic element into the many large areas of purely subsistence economy which still surround the active areas where export crops are produced or where industrial activity is growing? And how far are production and local consumption keeping ahead of the increase

in populations, which in some colonies are doubling every twenty-five or thirty years?

Such deductions as can be drawn from the figures given in this week's White Paper (Cmd 9375) on the use of Development and Welfare funds under the previous Acts are encouraging. Colonial trade statistics return a plain tale of rising living standards, in terms of imports of cloth or bicycles per head of population and of everything else. Nor is this simply the result of high commodity prices in recent years. Thanks to private investment, as well as to investment under the official development plans, capital formation is accelerating; the White Paper estimates that it rose from some £190 million (for all the colonies) in 1948 to well over £400 million in 1953. These figures are necessarily very rough, and they include consumers' durables; but the probability is that they are conservative since they make almost no allowance for extensions

of cultivated areas under non-plantation crops, or for capital improvements in indigenous subsistence farming. What these are, if they could be assessed, is anybody's guess; but they are certainly far from negligible, and they are growing rapidly under the impulse of agricultural development, especially in training and research. If the aggregate of the national incomes of the colonies is put at £2,500 million (among the big colonies that have fair—but conservative—estimates, Malaya's is calculated to be £750 million, Nigeria's £590 million, Hong Kong's £250 million, Kenya's £107 million, and Uganda's £100 million), it seems that the proportion devoted to investment may be as high as 12 to 15 per cent; for some territories it is known to be higher. This would not be far below the proportion in Britain itself; it would be above that in India and in most other undeveloped countries down the course of history.

This is a picture of a startling—and so far barely recognised—boom. It would be entirely wrong to

assume that colonial development was insupportably slow before the war—the transformation wrought in African territories that were jungles interspersed with patches of shifting cultivation barely 50 years ago will not fit any such politically-coloured estimation—but undoubtedly development planning since the war has been a shot in the arm. Money has been spent at critical points; the system whereby development and welfare funds are for many colonies a very important part of their development expenditure, and are settled in London, helps to ensure that it shall be productively spent in setting local resources to work. The contrast between this approach and that of the Colonial Development Corporation is marked. Since 1945 the CDC has spent nearly half as much as the total outlay of development and welfare funds; and has almost nothing to show for it. The permanent achievements of development and welfare spending are too many to catalogue (the White Paper summarises them) but outstanding among them are, for example, three universities and four university colleges with 4,000 students in 1955—compared with two universities, both badly damaged, in 1945.

On the whole, economic development has been given priority in the plans. This principle has not always been pushed as far as some economists would like; the relative allocation to social and welfare objects, compared with such directly productive ends as agriculture or roads, has sometimes drawn adverse comment. It is possible that the £9.2 million spent on medical services between 1945 and 1954 may have increased the number of mouths to be fed more than the £8.9 million spent on agriculture and veterinary services increased the output of food. The results of aerial spraying against malarial mosquitoes in British Guiana or Cyprus suggest that a very modest investment in bringing medical science to bear can be balanced only by a far heavier outlay in raising agricultural productivity by modern technology. Science may have temporarily given greater power to curb tropical diseases than to raise the fertility of tropical soils (though the elimination of a single pest may raise the yield of a tropical crop by 20 per cent in a few seasons). But though population presses on resources in Malta, Mauritius or Barbados, the general picture does not suggest that a population crisis impends—or that investment in colonial agriculture is grossly inadequate.

Many colonies, moreover, prefer to concentrate development and welfare funds on social and educational objects and develop revenue-earning projects from local funds or loans; and, in any event, it is impossible to achieve economic progress and higher technical standards from an uneducated community. Nor is it possible to get useful results from the efforts of imported technicians and specialists—in whatever field—unless they are supported by an adequate local cadre

of trained assistants and unless their ideas can be interpreted to and understood by a still wider cadre of farmers, officials, clerks and industrial workers. The energies supposedly released by health expenditure must be set to work, through training, by educational expenditure in the broadest sense.

The allocation of development and welfare funds as between territories rather than between purposes perhaps needs reconsideration. Many small colonies depend for development entirely upon these funds (Seychelles, Somaliland, St. Helena) or very heavily upon them (Gambia, the Leewards, British Honduras). These territories will have to be subsidised indefinitely. Indeed, they might with advantage receive more, were it not for the difficulty that some of them face in preparing development plans at all. But a number of territories have received a great deal of money in the past ten years, which is, nevertheless, a small part of their capital expenditure—and a part that might easily be covered by drawing on their large London balances. Thus the Gold Coast has had £3 million from development and welfare funds, against a ten-year expenditure of £81 million, and Uganda £2.5 million against £28.5 million. Meanwhile, colonial balances in London have continued to rise. They now aggregate £1,400 million, of which a high proportion is attributable to the marketing and currency board reserves of the richer territories. Development and welfare funds have been allocated for many reasons, and politics has no doubt played a part. But a glance at the allocation of money since 1945 strongly suggests that, while the decision is one for themselves, some colonies would find it advantageous to finance more development out of their own resources. It is often said that the pace of development is slowed by

the impossibility of getting enough expatriate specialists; the short answer to this is that these colonies could spend their balances on paying them more to come.

There are the widest variations both in capital expenditure and development and welfare allocations per head as between colonies; this is, presumably, an expression of differences in need, though the contrast between British Guiana which got £10 a head (and even then Dr Jagan won the election), Jamaica which got £4 and Nigeria with about 15s. seem to call for some realignment. Economic considerations should certainly be overriding, and the objective should always be to generate enterprise rather than supply it in packaged lots. Beyond that, there seem to be two other criteria in bringing these funds to bear: the neediness of very poor countries, and the need of money for the solution of urgent colonial problems. Development and welfare funds can here have all the effectiveness of a mobile reserve, whether to deal with pests, with mineral surveys, with experimental crops or even with the lack of statistical information.

It may be doubted whether all the colonies will find it possible to spend up to their new plans in five years. Their difficulties will mainly lie in provision of specialist services—which the new Act, on its more generous scale, should help to overcome; and beyond that, in the expansion of their economies as a whole, which partly depends on such factors as world prices and internal economic policies. But the fact that development plans on such a scale can be worked out realistically, and that so far such plans have been perhaps no more than a quarter of the colonies' total capital expansion, is a hopeful sign. Britain does well to stimulate the energies of these 80 million friends and customers.

Nato's Next Five Years

THE high mortality rate of military alliances is a historical truism that has led to much anxiety about the ability of the North Atlantic Treaty Organisation to hold together once international tension is relaxed, or apparently relaxed. Both to governments and to private persons the answer has sometimes seemed to lie in what is called, according to the degree of expertise on hand, either "building up the non-military side of Nato" or "implementing Article Two." Article Two is an unexceptionable but somewhat woolly passage in the North Atlantic Treaty encouraging economic collaboration and the development of friendly international relations by strengthening free institutions and by promoting conditions of stability and well-being. As it stands it reflects the intention of the drafters that the alliance should be more than military; it also reflects the difficulty they had in defining what they meant. It is a peg on which almost anything could be hung. But

does the way to an enduring alliance lie in hanging things on this peg? Is Nato, after all the developments of the past five years, still simply a military alliance—and if not, what is it?

These are questions which every so often should be thought about afresh, both by those who instinctively believe that Nato must become something more than a military alliance and by those who wish it could, but fear it cannot. Until now, however, the tools for thought have been largely missing. It has not been easy for the intelligent layman and the would-be supporter of Nato to find out the facts about the organisation—the way it operates, how it reaches decisions, the problems that make up the Atlantic Council's daily grist. These mysteries have now been set forth clearly and comprehensively in a book * which gives anyone

* "Nato: The First Five Years, 1949-1954." By Lord Ismay. Obtainable from HM Stationery Office. 280 pages. 9s. 6d.

who is prepared to make the effort to read it some real sense of how the alliance works. What emerges most strongly from the Secretary-General's account is that Nato is indeed something different from military alliances as they have been known in the past. In these differences may lie the real hope for its survival.

During the last five years Nato has been steadily evolving new patterns of common action. The Nato "shield" today is a highly integrated fourteen-country defence system, not simply a linked chain of fourteen separate defence plans. Unlike more conventional alliances, Nato's strength no longer rests on the kind of national decisions that can be easily reversed under strong domestic pressures or after changes of government. Today, the eggs of the member countries are not merely all in the same basket; they are in the same omelette. For any member now to break away would be a formidable task of disentanglement, and extremely costly for it in terms of alternative defence arrangements, unless it chose to run the risks of lonely neutrality.

★

This has not always been the case. In its early days, Nato relied on sporadic consultations among its members rather than on a continuous combined planning operation. There was no unified command structure. As late as May, 1950, the Nato countries had only 14 divisions of uneven quality and strength on the continent, and the chances of holding Western Europe against any kind of an attack were remote. The alliance was shocked into action by Korea. General Eisenhower's supreme headquarters (Shape) began to function in the spring of 1951, and by the autumn, with the naming of the "Three Wise Men" as a temporary committee of the Atlantic Council to see how much defence national budgets could be stretched to buy, and what to do about the gap, Nato was well on its way to becoming more than an old-style military alliance.

Nato today, through the fourteen-country Military Committee, the three-country Standing Group, and in co-operation with the allied headquarters, plans the defence of the North Atlantic area on the assumption that all forces earmarked for Nato would form part of a fully integrated command. Frequent combined manoeuvres are already conducted by Nato commanders, and a start is being made on Nato training of reserves. In addition, even in time of peace, Shape is directly responsible for the maintenance, training and location of certain troops, among whom will be the West German troops once the Paris agreements are in effect. The Nato forces are supported by a network of "common infra-structure," the unlovely term which Nato uses to describe fixed installations such as headquarters, airfields, pipelines, and port facilities. Infra-structure is constructed at Nato's request, according to its specifications, on contracts for which any firm in the

Nato area can bid, and paid for by the member countries according to an agreed formula. Today a pilot of one country may fly a plane built by a second country, financed by a third, using as his base an airfield constructed on the territory of a fourth by a firm from a fifth, drawing his fuel from a Nato pipeline. By the end of 1955 as many as 165 such airfields should be ready for use, and by the end of 1956 there should be 3,800 miles of common pipeline.

Although this degree of combined military planning and common use of resources is unprecedented in time of peace, it is not as new in conception, nor in some ways as far reaching in its effect on the normal conduct of the business of government, as the "annual review." The annual review is a continuous process and the core of the work of the Council. It is the means by which the Nato programme, within which the commanders must plan and operate, is evolved. It is a year-long process by which the fourteen governments first assess the nature of the external threat; then, on purely military grounds, agree on what is required in terms of forces and equipment; then analyse together how these requirements can best be met, or how far they must be scaled down owing to other economic and political pressures on national budgets; and calculate the contribution of each country in terms of men, money and material. Although only the "force goals" become the subject of binding council decisions, from the time a pound, franc or guilder is first tentatively budgeted for the defence of the Nato area it becomes the concern not of one country but of fourteen. By the time an annual review is completed and the Council is setting the goals for the next year, inefficiencies and inadequacies in national planning, production, and training, if not cured, have at least been thoroughly exposed.

★

There is still much room for improvement. Nato is in some respects cumbersome and in others still reluctant to step on national toes. More could be done to standardise equipment, to rationalise production and to bring up to a common standard the training of reserves. But enough joint effort is under way to give Nato a cohesion that other military alliances have lacked. The combined effect of the habit of co-operation, the logic of strategy, and the heavy investment already made in a joint operation, itself provides a powerful adhesive. But there seemed to be something more that made Mr Dulles speak of an "agonising" reappraisal and that led M. Mendès-France to use the need to maintain the Atlantic Alliance as his compelling argument in favour of the Paris agreements. This "something more" is the same elusive "community of interest" that led the drafters of the treaty to compose Article Two. It is something that is clearly worth strengthening; but can anything so ill-defined be made more solid?

The solution certainly does not lie in the economic clause of Article Two or in trying to substitute Nato for the other organisations that already work in the economic field. Nato can make no contribution to the world's economic problems that cannot be made equally well by OEEC, Gatt, the World Bank and the International Monetary Fund. The North Atlantic area is not a natural economic unit. What, then, is the Atlantic community? It is a group of countries that share certain ideas of what is important in western civilisation, and are prepared to organise themselves to see that these ideas survive. It is an organisation which, although based on the concept that Luxemburg and Iceland have as much right to be heard in its councils as the United States, has gone a long way towards recognising the economic and military facts of life. It is a partnership in which each country pulls its own weight and in which each carries the weight to which it is entitled.

In the next five years, the most important long-term task for Nato will be to build up, mainly through day-

to-day contact, a sense of confidence in the member countries' conduct of foreign policy. This means confidence both in the decisions which must be made in the light of discussions in Nato—for example, decisions about negotiating with Russia—and decisions like those relating to Formosa, which lie outside the Nato framework. The fear of "blundering" or "backing" into war has to be overcome; and both the fear and the necessity for overcoming it become more important as the new atomic weapons take their place in the world's arsenals.

The greatest disintegrating influence in Nato today does not arise from the fact that Article Two has no clothes, but from the fact that the problems of mutual understanding between member countries have not been examined as searchingly as their defence budgets. This does not mean that the United States and Britain must give Portugal or Greece a power of veto over their foreign policy. But it does mean taking the time and making the effort to create a new degree of common understanding.

Notes of the Week

Round Table in London

FORMOSA hung, Damocles fashion, over the heads of the Commonwealth prime ministers throughout this week. If China rejects the Security Council's invitation to take part in its debates, an obvious duty to attempt some less formal approach to a cease-fire will devolve on the Commonwealth leaders, who jointly constitute a unique task force for such purposes. The Indians at least have an *entrée* in Peking, and their words ought to carry more weight there if they present a united Commonwealth opinion. Meanwhile, however, the Security Council's prompt action and China's hesitation before replying to it provided the prime ministers with time for a *tour d'horizon* of remarkable scope. They look like fitting into one crowded week, topics as various as the peaceful use of atomic energy, the Middle East, the Antarctic, Australian anxieties about trade, Pakistani republicanism and the defence of Malaya. The discussion on atomic energy was in itself impressive enough; with the talk ranging from Canada's Chalk River plant to Australia's uranium at Rum Jungle, there were indications that the peaceful atom may be becoming a new and strong bond of Commonwealth.

In the meetings devoted to regional defence there was evidently both more urgency and more doubt. The trans-

formation of the Middle East defence picture by the British withdrawal from the Suez Canal zone and by Pakistan's new link with Turkey affect not only that area itself but also South-East Asia. Australia and New Zealand, in particular, are now alive to their own close interest in the defence of Malaya to a degree that must mean a reinvigoration of the existing "Anzam" machinery, in which they are working partners with Britain. The two South Pacific nations can be expected to react to any threat to Malaya quite as sharply as they have reacted to dangers in the Middle East on some past occasions; but their difficulties when it comes to stationing any sizeable forces permanently overseas are well known, and any decisions taken at the present conference are bound to remain conditional on future developments in the whole Far Eastern scene.

A "New Left" for France?

FOR a French government which came into office by a near miracle, seven months is already quite a long life-span. Logic and arithmetic would both seem to point to disaster for M. Mendès-France in the present debate on North Africa in the French Assembly. His forensic

skill may win over some expected support, or some of his opponents may hold back at the last moment, anxious as ever that the prime minister should survive long enough to see the Paris agreements on Western Union finally ratified; but the hunters are clearly closing in for the kill. The government's two defeats earlier in the week, while unimportant in themselves, were symptoms that all could read.

It has always been plain that the present government had no coherent majority behind it. It lives on the skill, the prestige and the popularity of its leader. These are not cards that can be played endlessly in the parliamentary game, and some supporters of M. Mendès-France, looking to the future, have launched the idea of a "new left." This idea has been set out in rather vague terms in the weekly *L'Express* by two famous writers, the Catholic Mauriac and the Gaullist Malraux. It at once drew from the neutralist *L'Observateur* the retort that many left-wing groups would not back a man who had accepted German rearmament, and the Communists, headed by M. Thorez in person, poured scorn over the new intruders into their favourite field. But France is fond of verbal radicalism—it is an old tradition, honoured under the name of *sinistrisme*, that political parties adopt titles well to the left of their programmes—and the slogan of "*la nouvelle gauche*" has already become fashionable.

Yet it is far too early to speak of any real rebirth of the left. Politicians of many colours have linked their fortunes with that of the prime minister. Last week the motley character of his backing was symbolised by the threat of a duel between his new foreign minister and his most ardent supporter, the youthful editor of *L'Express*. On the other hand, a more conservative government might well encourage a regrouping of the forces of the left, including the Communists. That of M. Laniel nearly did so; eight months ago France seemed on the eve of a revival of the "*front populaire*." How long will there be a Mendès-France to prevent the Communists from exploiting such a mood?

Transports of Planning

FOR a party which was once so allergic to planning, the Tories are showing remarkable faith in it as the answer to their transport problems. Having acquiesced and even encouraged the railway wage settlement, which settled nothing, the Government is now busy trying to pretend that all the short-term problems that remain will vanish with the smoke of the condemned steam engines and at the first flutter of its plans for the roads. As *The Economist* goes to press, MPs are debating last month's rail crisis, but the broad lines of their discussion were obvious in advance. The Government put down a motion welcoming last month's settlement and looking to the steps proposed by the Transport Commission to establish "a modern and economic railway system." On what is to happen in the fifteen to twenty years before that happy stage is reached the motion says nothing. Nor, to judge by its amendments, has Labour found any constructive answer. It harks back to "the constructive policy of transport co-ordination and integration

pursued by the Labour Government," and laments that denationalisation of road haulage has robbed the Transport Commission of "a profitable source of revenue." So Labour's solution to the railway problem is to hide it under the cloak of a monopoly, and the Government's is to divert all eyes from it towards the horizon of 1974.

Labour's official reaction to the new road programme is still to be formulated; but there has been an immediate unofficial jibbing at the idea of tolls (why must Socialists always demand that public enterprises should be shackled by inability to use the price system?), and there will be delighted expressions of pained surprise at the more obvious omissions like the Severn Bridge. This may provide Labour with some election points in the areas omitted, but the Tories will clearly derive the greater part of the electoral advantage from these plans. Preparations for both rail and road development are so lengthy that the two new programmes will not start elbowing other investors and consumers out of the queue until some time in the next Parliament, and the Government can step forward at election time to receive applause for a performance which it has promised that future Governments will carry out. There are already signs that Labour's retort will be "anything they can plan we can plan bigger." Since investment in transport has for long needed a shot in the arm, this new atmosphere is mostly to the good; the same cannot be said for the factors that have caused this atmosphere to come about.

Seven in the Wilderness

THE seven MPs expelled from the Parliamentary Labour Party before Christmas are developing into a problem group. The peculiarity of their position was shown this week, when they put in a claim for a place on the all-party Select Committee on Estimates. They pointed out, quite fairly, that one of their number, Mr Yates, had served on the committee for a number of years, and would undoubtedly have been on it again but for his vote against "German rearmament" and consequent tiff with the party Whips. At first sight, their claim might seem strong. If the Liberal Party, with only six MPs, is entitled to a place, why not the Independent Socialists, with seven? Nor was the Government's answer—that all nominations must be made through the party Whips—necessarily convincing. It could well be argued that the party machines are quite powerful enough, without their having a monopoly on the right of appointment to select committees.

In practice the Whips usually see that all sections of opinion within their parties are fairly represented on the committees; but the issue could still become a serious one if either the Whips ignored minorities within their parties or a genuine body of Independents re-emerged outside the party system. In the case of the expelled seven, however, their independence is considerably qualified. When they were ejected from the Parliamentary Party before Christmas, it was widely assumed that they would be allowed back into the fold early in the New Year. No action was taken, therefore, to expel them from the Labour Party outside

Parliament, and they remain under the jurisdiction of Transport House.

The rebels themselves, having begun by rather flaunting their independence, are now showing a little more circumspection. No doubt they are beginning to realise the perils of their position. If they cannot work themselves back into the Parliamentary Party before the election, it is probable that Transport House will refuse to recognise them as official Labour candidates. Judging by past experience, that would involve them in almost certain extinction at the polls. The Parliamentary Party is still inclined to take most of the seven back, but the temptation not to do so grows on every occasion that Mr Silverman jumps up to put a point of order. And he is jumping up a lot.

A Jolt for Egypt

THE quarrel between Egypt and Iraq over the Turco-Iraqi pact has lapsed into temporary stalemate. When the Cairo meeting of Arab premiers found Iraq's envoys immovable as regards Nuri Pasha's intention to sign the pact, it agreed that Mahometans would have to go to the mountain, and despatched a delegation to Baghdad. Here its emissaries were courteously informed that Iraq's vulnerability was such that it must stick to its guns, and as courteously shown that Egypt's (and Moscow's) tales about Nuri Pasha's isolation from the Royal House and from all other Iraqi political parties were untrue. They were confronted with a statement issued after a meeting of Nuri and six leading politicians with the King and Crown Prince, and were enabled to see for themselves that he has the support of political adversaries who possess large followings, notably the ex-prime ministers Salih Jabr and Tewfik Es-Suwaidi. Certainly there exists in Iraq a very large bloc of neutralist opinion, but its mouthpieces are not men who have ever yet held office or national responsibility.

So what is Egypt to do? Junta members talk of expelling Iraq from the Arab security pact, or of Egyptian secession from it. But it is doubtful whether either process would gain Egypt ground in the long run; other Arab states, and notably Syria, may not be keen on cleaving to some smaller group formed merely in order that Cairo may be its unquestioned boss.

The whole tactful handling of the matter by the Iraqis, set against the petulant propaganda of the Egyptians, suggests some interesting differences between the two states. Besides the difference that Nuri Pasha is 67 and rich in diplomatic experience, whereas Colonel Nasser and Major Salem are relatively inexperienced and both under forty, there is a marked difference of temperament between the two nations. The Iraqis are by Arab standards phlegmatic, the Egyptians proverbially excitable and volatile. This weakness in his countrymen could stampede Colonel Nasser into some hasty act; but he would be more statesmanlike if he postponed action on impulse, and made the quarrel an occasion for some new thinking about Arab alignments. The Arab League has grown to be like the garden fence that is taken for granted until it blows down. When that happens, a wise landlord thinks about wholesale reconstruction.

Moscow's Bristling Budget

ALMOST as soon as the hastily convened Supreme Soviet had met in Moscow on Thursday, it was confronted with a budget whose principal feature was a sharp increase in military expenditure. The finance minister, Mr Zverev, introduced this with the somewhat restrained explanation that "the international situation has not changed for the better." It seemed safe to assume that later speeches to the Supreme Soviet would develop this theme in stronger language; and equally predictable that the docile deputies would accept the new burden of armaments without a murmur.

In all this there was nothing unexpected for the West. The convening of the Supreme Soviet and the presentation of a bristling budget so early in the year were always likely moves in the Russian campaign to scare western parliaments away from the Paris agreements on European defence. Indeed, the timing of the whole operation emphasised its propaganda aspect. If the Soviet rulers were solely concerned to reinforce their armed strength they need hardly have acted so precipitately.

Yet the internal effects of an increase in admitted military expenditure from 100 to 112 billion roubles, in a total budget that remains virtually unchanged at just under 563 billion, must also be treated as significant. On the eve of the Supreme Soviet meeting, the Communist party's central committee had held a week-long session in which Mr Khrushchev once again played the star role. He presented a new five-year plan for agriculture, with much more modest targets than its precursor, and with a strong emphasis on livestock and dairy products. Taken together with the current insistence on heavy industry's priority over consumer goods, this suggests that the Russian public can now expect more guns, a little more butter, and a good deal of disappointment on everything else.

Bidding for Japan

THE Communist propaganda offensive in Japan goes on apace. In the middle of January the caretaker Japanese Foreign Minister, Mr Shigemitsu, gave the Soviet Union the cue by saying that the initiative for ending the state of war must come from the Russians. Although Mr Shigemitsu re-emphasised that, in any peace treaty with the Communist bloc, Japan would lay strong claim to the return of the Kurile islands "and other former Japanese territories," no one in Tokyo expects to hold out for more than a partial restoration, notably Habomai and Shikotan; other Japanese conditions are reported to be the release of all so-called war criminals, Russian support for Japan's entry into Uno, and unrestricted trade. In reply, it has just been revealed, Moscow sent a message to Tokyo on January 25th declaring that "normalisation" of relations "would not be out of place."

Mr Shigemitsu has again repeated that alliance with the United States remains the basis of Japanese policy; and there seems little likelihood that any immediate recognition of Communist China is contemplated. Nor has Tokyo apparently yet decided what line it will take

at the Afro-Asian conference, to which Japan has been invited and at which it could act as a counterweight to Communist China. But the growing Japanese desire to run with the hare and hunt with the hounds is already being exploited to the full by both Peking and Moscow. There has been a spate of new suggestions for cultural and other kindred exchanges in 1955. The Chinese in particular are sending writers, painters, musicians, actors, playwrights, a circus, teams for basket ball, swimming and table tennis, films on land reform and on the emancipation of women, a fine arts exhibition, and even an exchange zoological troupe which would swap Siberian wolves and Bactrian camels for Japanese monkeys and long-tailed cocks.

The Communists are playing a dangerously promising game with Japan's two Socialist parties. Split into left and right factions after the war, these are now to fight the elections this spring in alliance, and the Communist radio station "Free Japan" is urging a merger after the elections are over. The basis of it would be a common policy of friendship with the Soviet Union and China. Some blame for these developments certainly lies on the leadership of the British Labour party. The party is widely respected in Japan and Mr Attlee should never have let Mr Bevan steal the show with his anti-American talk in Tokyo last year.

Fuss Over Free Travel

BIRMINGHAM CORPORATION has run into more trouble in its scheme, first decided on two years ago, to allow old age pensioners to travel free on its buses between 10 a.m. and 4 p.m. That decision, which would have been financed by transferring £90,000 from the general rate fund to the transport undertaking, was first challenged by a ratepayer, Mr G. V. Prescott, and was declared illegal by the Chancery Court. The Court of Appeal confirmed the ruling, on the ground that the council's general power to charge differential fares did not allow it to make what amounted to money gifts to one section of the community at the expense of the general body of ratepayers: the undertaking, according to existing legislation, was to be run as a business venture and should not go out of its way to make losses.

Following this judgment Birmingham Corporation decided to try to relegalise its scheme by introducing a private Bill into Parliament. It had to go to the expense of a town poll, and gained the approval by three to one of the (as usual, exiguous) number of electors who bothered to vote. Almost simultaneously, Mr Short, a Labour backbencher, announced that he would introduce a private member's Bill, which would allow this practice—which had been adopted by several other corporations besides Birmingham, in the blissful belief that it was legal—to be followed generally, without such fusses as town polls. Now that these two Bills are due to come before Parliament, however, the British Transport Commission has lodged an objection. It argues that these schemes might put an impossible burden on ordinary travellers, and will create unfair competition for the railways—which will lose the custom of the old people.

There are two principles at stake here. First, although the argument about the railways is rather silly, the practice of discriminatory and piecemeal subsidies for special groups is economically pernicious, as the history of the tobacco concession to old age pensioners has shown; it would be much better to give the £14 million a year which that concession now costs to all old age pensioners—or, still better, to all recipients of national assistance—indiscriminately, instead of only to those who say they smoke. Secondly, however, as the Birmingham ratepayers have been so economically foolish and so personally generous as to vote at a town poll that they want to give their old people free travel, they should surely be allowed to take the legal power to do so. The proper course for Parliament is to allow the Birmingham Bill to go through, but to oppose Mr Short's to the end.

Battle of the Boroughs

THREE towns—Ilford, Luton and Poole—have submitted Bills to Parliament which would give them county borough status. Their aspirations are very natural and, within the framework of the present system, logically irrefutable. Of the present 83 county boroughs, 66 have a smaller population than Ilford, 41 are smaller than Luton, and 26 are smaller than Poole. All three are tolerably wealthy. It is obviously unfair that they (and others similarly placed) should possess only a fraction of the powers enjoyed by the many smaller authorities who do have county borough status. Ilford and Luton in particular, who are now petitioning Parliament for the fifth time, cannot (as the Government has recognised) be fobbed off again with talk of general reform.

Yet the effect on other local authorities of giving these towns their way would be to open the gates to a flood. At present there are only three county boroughs in Greater London (East Ham, West Ham, and Croydon); they got that status before the metropolis sprawled outwards to its present dimensions. If Ilford is added to this select list, many other populous suburbs will have a logical case for inclusion in it too; and while Essex, which is Ilford's county authority, is large and populous enough to endure

this process, the final effect on the metropolitan structure of local government would be both curious and unsatisfactory. Again, the elevation of Luton and Poole would reduce their respective counties (Bedford and Dorset) to mainly rural rumps, of only 200,000 population each.

Mr Sandys has promised to make his long-awaited statement on local government reform very shortly. The half-loaf which is all that he can be expected to produce under present circumstances will have to be very carefully baked if it is to reduce—rather than add to—the glaring inconsistencies of the present system. However, as an interim measure, an amalgamation of some of the smaller counties would both improve the efficiency of the system and enable one or two worthy towns to be created county boroughs. At the same time, the Minister should institute an inquiry into the special and pressing problems of local government in Greater London and the other big conurbations, which have never been properly investigated. These steps would represent the best comfort that can reasonably be offered to Ilford, Luton, and Poole.

Half Measure for the Crofts

THE Crofters (Scotland) Bill, which had its second reading in the Commons last week, closely follows the majority recommendations of the Taylor report. The Bill re-establishes a Crofters Commission, which will be empowered to make loans and grants to Scottish crofters, to control the letting of vacant crofts, to remove absentee crofters, and to prepare schemes of reorganisation so long as these do not injure existing rights. When the Taylor report was published last May, *The Economist* suggested that, although there is a good case for aid to the Highlands and Islands, it will be a mistake if “doles and special privileges are dribbled out to these people, without giving them any incentive to grasp the commercial possibilities open to them”; and sided with those who believed that if the state is to provide the capital and credit for any energetic new schemes of reorganisation, there seems to be no real alternative to an extension of public ownership of the land concerned, which already operates in a large part of Skye. Those criticisms stand.

The Neutrals' Unhappy Lot

AN almost unnoticed event last week ought to give pause to those who assume that any problem like that of Formosa can be solved in a flash by merely bringing in neutral supervisors or controllers. The Swiss Ministers in Washington and Peking delivered diplomatic Notes asking the United States and China to agree to drastic cuts in the size of the four missions that are still kept in Korea to supervise the armistice of July, 1953. For Switzerland, which alone has a mission about a hundred strong in Korea, the proposed cuts are only a second best. The Swiss would prefer to abolish the supervision machinery altogether; they

expressed their wish to do so as long ago as last April. In brief, they regard the whole thing as a tragic farce.

The Swiss public were recently given an authoritative account of their mission's experiences in Korea by its former head, Colonel Wacker. He confirmed and enlarged on earlier reports that in North Korea the Communists systematically frustrated even the most elementary attempts to check the scale and direction of their troop movements. At the few railway stations where they were allowed to operate, they had to give several hours' advance notice before making a check. If, by mismanagement, a train entered the station while they were there, the Polish and Czech “supervisors” usually refused to agree to its being inspected; and almost as soon as the missions were back in their quarters, they would hear in the distance the sound of new trains moving through. Whenever it was proposed to send out a roving team to investigate alleged violations of the armistice in North Korea, the Poles and Czechs vetoed the idea. No pretence was made of permitting any control over movement by sea or air in and out of North Korea. And, while the Swiss and Swedes did their best to behave as genuine neutrals, the Poles and Czechs hardly bothered to disguise the obvious fact that they were dogmatically partisan. This lesson from Korea needs to be learnt. In Communist eyes, no non-Communist is neutral; and if a “neutral commission” is made up by balancing equal numbers of Communist and non-Communist representatives, it can and will easily be paralysed by the former. The quiet, regretful verdict passed by the Swiss should not go unnoticed.

German Labour Prospects

LABOUR troubles have been so rare in Germany that they tend to be exaggerated when they do occur. This year, however, there may be more labour unrest than in 1954. The trade union federation, bound by the decisions of last year's congress, has announced that 1955 will be a year of struggle for its various demands. These are for a larger share in the national income, an extension of “co-determination” and a new social welfare scheme. Some unions, but not the union executive as a body, are also demanding political action against the Paris treaties.

The German unions are campaigning for a five-day week, but it was admitted at the 1954 congress that progress towards it must be gradual. Direct wage increases are also on the programme. The first individual union to stake its claim this year is the mineworkers' organisation, which is asking for a 12½ per cent increase. The cost of living is not made the basis of wage demands. The federation flatly declares that it demands more of the national cake; and it is justified by the fact that productivity has increased more than wages.

The heads of both the employers' and the unions' organisations agreed last autumn to submit future disputes to arbitration; compromises will probably be reached in most cases. The effect of wage increases is hard to forecast. Only a few months ago, German economists were pointing out that there should be a moderate increase in wages in order to offset a deflationary tendency. Now, however, the pros-

pect of rearmament has made everyone concerned to avoid inflation. Germans in all spheres are determined that nothing shall upset their unbroken march to prosperity, and all the signs indicate that they will adjust their defence programme in order that there shall be no serious setback. If the union claims are met in part, there should be some increase in Germany's imports, in order to meet the greater demand for consumer goods. But this result should not be over-estimated. The average German is inclined to spend his bigger pay-packet on better housing and to put more by in the savings banks. Moreover, exports may also expand further. As the *Handelsblatt* has pointed out, the need to combine a defence programme with a continued rise in the standard of living presupposes that Germany continues to increase its sales abroad.

State of the Union

ULSTER members argued in the House of Commons last week that they ought to be discussing Ulster's unemployment rate (now 7 per cent) and its relations with England, not the Governor's salary and allowances, and proceeded, with no little dexterity, to discuss the larger matter. Scottish members in another debate argued that the Royal Commission, briefed to make proposals for improving Scottish administration, ought to have made them about a separate Scottish Parliament in a federal union, and proceeded to discuss the larger question also—though with less opposition from the Chair. There are forces in Ulster working for the abolition of the Ulster parliament, and there are forces in Scotland working for the creation of a Scottish parliament—but the arguments in either case were fatally attracted, as usual, to the fact that English standards of living are slightly higher than those of the other two countries (or of Wales). Nobody indicated how the suppression of the one, or the creation of the other, parliament would rectify the hard facts of economic life. Nor did any member make reference to at least one colony in which a school of thought is convinced that it can raise its standards to British levels if only it can send members to Westminster.

Despite these gestures towards nationalist constituents, most Scottish and Ulster members clearly believe that, on the whole, things are best as they are, intolerably complacent as the conclusion must be. The recommendations of the Scottish commission will be accepted, and the changes in ministerial responsibility will probably be made; Scottish local affairs will continue to be discussed mainly in Westminster, and Northern Irish affairs mainly in Belfast. Scots and Ulstermen will continue to be driven by hardship to England for opportunities, there to compete with talented men from the richer countries of Australia and Canada, driven to England by a sense that money is not, after all, everything. A case can be made for a Royal Commission on the advisability of a federal constitution for Great Britain. There are many attractive arguments for it, one of which is that Britain ought to taste the medicine she prescribes so freely for others, and which Nigerians, Pakistanis and even Indians do not always find easy to swallow or followed by a markedly increased sense of wellbeing.

Another is that the Celtic fringes of Britain should be allowed devolution if a majority of their populations want it—but nobody has yet found that out. But if any such body is to discuss the argument that constitutions raise national incomes, it will do useful service by exploding it.

Redefining the Obscene

RECENT prosecutions having spread alarm and despondency among authors and publishers, a committee appointed on the initiative of the Society of Authors—and originally under the chairmanship of Sir Alan Herbert—set to work last autumn to examine the law relating to obscenity. It has produced results quickly, in the shape of a draft Bill to amend and consolidate the existing law, and has submitted this to the Home Secretary.

Under the proposed Bill, the courts would be required to consider the intention (and even the general character)

Ministerial Crisis

There are few men who have any solicitude for the honour of their country who would not be glad that the transactions of the past week should be obliterated from its annals. A Ministerial crisis at any time is an inconvenient affair; but at such a moment as this it may prove a national calamity. But even the serious character of this danger has occupied a second-rate place in the public mind compared with the grave questions of personal character which have arisen out of the resignation of Lord John Russell. . . . First, there was Mr Gladstone's speech on Monday night, by which it appeared that not only had Lord John relinquished his proposal regarding the substitution of Lord Palmerston for the Duke of Newcastle on the 3rd of December, but that when the subject was again referred to on the 16th by Lord Aberdeen, with the view of ascertaining Lord John's wishes, he distinctly stated that . . . he had changed his . . . views. . . . Then on Thursday evening came the speech of the Duke of Newcastle, distinguished by a degree of manly frankness, and containing a vindication of himself so complete, that it told upon his audience with extraordinary effect. . . . Before the Duke concluded there was not a person present who had not an instinctive feeling that an able and valuable public servant was being sacrificed to passion or intrigue, or both. . . . It is impossible not to observe that already the tide of opinion is turning in his favour, as the efforts which he has made for the public service, amid the extraordinary difficulties of a wretched system for which he is no way responsible, become better known. So far as the Ministerial arrangements are concerned, they remain nearly in the same position as they did on Tuesday, when Lord Aberdeen's resignation was accepted. . . . There appears to be but one possible solution to the matter—but one arrangement which will secure the services of men who are absolutely essential at the present moment to the formation of a strong Government:—that Lord Palmerston should form a Government, with Lord Grey as War Minister; Lord Clarendon, Sir James Graham, and Mr Gladstone remaining in their respective offices.

The Economist

February 3, 1855

of persons accused of publishing an obscene libel, and the "dominant effect" of the publication, as opposed to isolated passages. They would have to consider, as they do now, the type of people among whom the publication will circulate, and—as they cannot do now—expert evidence, if any, about its literary, artistic or technical merits. The common law misdemeanour, with an undefined penalty, would be replaced by a new statutory offence, with penalties on summary conviction of a fine not exceeding £50 or four months' imprisonment (and on indictment of a fine of up to £100 or imprisonment for a maximum of six months). More controversially, the words "obscene" and "corrupt" would be extended to cover "matter . . . which unduly exploits horror, cruelty and violence, whether pictorially or otherwise." Something of the sort no doubt had to go into the Bill, since public opinion is obviously more worked up about horror comics than about the plight of authors and publishers; and the danger that such a clause will catch literature which merely reflects a cruel and violent world is admittedly lessened by the court's obligation to consider the intention of the accused. Even so, however, action aimed at the horror comics will have to be in narrower and more specific terms than that vague "unduly exploits."

The Home Secretary, as long ago as October, promised to look into the problem of the law relating to obscenity, and his experts are now considering the committee's draft Bill. If this is not precisely the answer, it is to be hoped that he will shortly produce one of his own. A Bill on these lines would have the merit, from his point of view, not only of being useful but also of being popular. The law should not be left much longer looking for the wrong sort of dirt.

Partners in the North

THIS week's quiet deliberations between the Scandinavian countries were overshadowed by two events, one sadly unexpected and the other safely predictable. It was predictable that the Soviet press should herald the third session of the Nordic Council with a refurbished edition of the old charge that the council is an instrument of Atlantic aggression. This is one of Moscow's routine operations. It is presumably a Pavlov reaction to the periodic suggestion by right-wing politicians in Finland that their country ought to join its Scandinavian friends in innocuous debate on topics which do not include defence.

The sudden death of Hr Hedtoft, the Danish prime minister, at the Stockholm hotel where he was staying during the council's session was a distressing shock for all the assembled ministers and parliamentarians. Hr Hedtoft was only 51, and although lately in indifferent health he had not been seriously ill. His warm humanity had endeared him even to opponents of his Social Democratic government, and he leaves an obvious gap in the ranks of his own party. His successor, Hr H. C. Hansen, has decided to remain foreign minister while assuming the premiership, at least until the Danish parliament has debated the Paris agreements; some difficulty is anticipated here, not only owing to dissatisfaction with the present position

of the Danish minority in German Schleswig, but also because the government has hitherto been kept in office only thanks to the support of the neutralist Radical party. There has, indeed, been some speculation about a formal coalition with the Radicals; but as Hr Hansen is as firm a supporter of Nato as Hr Hedtoft, who brought Denmark into it, these rumours can probably be discounted.

Gardens or Farms?

IN recent years the Government has urged local authorities to build at higher densities in order to conserve agricultural land. The effect is to reduce or eliminate private gardens. And the effect of that—according to two research studies, sponsored by the Ministries concerned but still not published—may be actually to cut down the total value of the country's food production; the studies show that in public housing schemes, at any rate, the average family, if allowed to do so, digs its little plot most industriously. The first study shows that an acre of land containing 12 houses with gardens (the prewar standard) produced foodstuffs of a higher retail value (about £67 10s.) than the yield of an average agricultural acre in the same year. The second survey, covering 2,000 gardens in five cities, shows that back-garden production is a great deal higher still where houses are built at eight to the acre. If, however, the Ministry of Housing's present prescription of about 18 dwellings to the acre for "open development" is followed, the back garden dwindles to mainly ornamental proportions.

The reply of conservationists to these figures is that the retail value of most garden crops is misleadingly high, and that amateur gardeners do not put land to its optimum agricultural use. But in an acute national emergency—the only contingency to which this argument could apply—it would be much better to have a supply of fresh produce on the doorstep than to depend on its transport from some "optimum" place of production. Whatever other arguments there may be for higher housing densities, there is none at all on agricultural or nutritional grounds. To deprive 3,000 families of their kitchen-gardens in order to save one medium-sized farm, and to do it in the name of food production, is a strange procedure under any circumstances. In a country where the desire to garden is close to a national passion, and where thousands of agricultural acres still lie beneath thistles, the policy surely verges as closely on madness as any other the Ministries of Agriculture and Housing between them have yet contrived.

Hungary Changing Course?

HUNGARY seems to be something of a guinea pig for Communist planners. Eighteen months ago it was the first Soviet satellite to be treated, with a flourish of trumpets, to the "new course" economic policy; now it

Does Life Assurance serve the Community?

Here are the facts to help you form a judgment:—

British Life Assurance compares well with any in the World: its integrity is taken for granted.

Life Assurance safeguards millions of families, and ensures a comfortable retirement for many people. It encourages thrift, discourages inflation.

Bonuses worth tens of millions of pounds are added every year to with-profits policies.

Life Assurance Offices could not offer favourable rates and favourable bonuses if the money received as premiums were not skilfully invested. The money is well spread over a wide field of investments; nearly a third in industry and commerce, building up Britain's economy and the national prosperity. The rest goes into British Government Stocks, Commonwealth and other Government Stocks, mortgages and investments in properties . . .

The guiding principle behind Life Assurance investment is the security and benefit of the policyholder.

Keen competition between the Life Offices keeps them on their toes: ensures that premium rates are kept at their minimum—bonuses at their maximum.

LIFE ASSURANCE

is in tried and trusted hands.

Let's leave it there!

All the answers

With this most modern and versatile accounting machine

NO OTHER single accounting machine gives you the various answers you need quite so efficiently, quite so economically as the Burroughs Sensimatic. At each quick flick of the selector knob, the Sensimatic is ready for a different accounting job, and it does each one as automatically and accurately as a specialized machine.

It's today's finest, most versatile accounting machine. The exclusive Burroughs sensing panel is tailored to any combination of accounting procedures you wish... guides the Sensimatic faultlessly through any posting routine.

It's tomorrow's accounting machine, too. To alter an accounting procedure, you change the panel, not the machine. Any Burroughs branch will arrange a demonstration of the Sensimatic model that best suits your needs. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

Burroughs
Sensimatic

is the first to be moving ostentatiously away from it. In the intervening period it seems to have embraced the new policy more wholeheartedly than any of its fellow satellites, and, as a result, has probably got itself into a more chaotic muddle.

It is a sign of the times that Mr Rakosi, who has never taken kindly to a policy of more bread and circuses and has for some time been lurking in the background, is coming to the fore again. Last week, at a meeting of miners, he announced that "considerations of defence policy compel us powerfully to develop heavy industry and to force its development." This is the bluntest and most categorical statement so far that a switch of policy is contemplated. For some time the importance of heavy industry has been carefully stressed—but so has the need for more consumer goods and a higher standard of living.

It is too soon to say whether Mr Rakosi is finally going to be allowed to have his way. The present year is, in any case, a period of marking time between the completion of one five-year plan and the beginning of a new one in 1956 in company with the rest of the Communist bloc. What is clear is that the Hungarian economy is in poor shape to step up the production of either heavy industry or of consumer goods. *Szabad Nep* has bluntly referred to the stagnation of industry and with a welcome dose of realism has pointed out that "we can consume only what we produce." Costs continue to go up and productivity to go down. According to the report of the 1954 plan results, production in heavy industry actually declined by 3.1 per cent. And on top of everything else, industry is being asked to accept much heavier export commitments this year, in order to obtain vital imports, not only of industrial raw materials, but also—because of last year's bad harvest—of foodstuffs as well. Whether the Hungarian people are wooed with promises of better times ahead or frightened with the "war threat from the West," their immediate future is hard work and short commons.

Children in Hospital

IT is a happy omen that lack of demand for its present services is persuading the board of governors to convert to adult use the Princess Louise Hospital for Children in West London. For a variety of reasons, fewer children are admitted to hospital now than used to be. Chief among them is the outstanding improvement in children's health since before the war. Then comes the virtual elimination of diphtheria, which before the immunisation campaign started in 1940 used to be a frequent cause of a child's removal to hospital; and scarlet fever is now much more often treated at home by the general practitioner. Indeed, a free general practitioner service since 1948, coupled with the growth of home care and nursing services by local authorities, has bolstered up the modern policy of keeping children out of hospital except where it is strictly necessary.

Writing in the *Lancet* last year, the late Sir James Spence estimated the number of children's beds needed in New-

castle, which has a high standard of child care and of co-operation between all branches of the health services, at 50 per 100,000 of the population. In London, there are ten children's hospitals with a total of rather more than 1,000 beds, and about 1,500 children's beds scattered among the general hospitals. This gives a proportion of about 75 per 100,000. On the face of it, therefore, London as a whole has too many children's beds. At the same time there is extreme pressure of demand on its beds for adults. While the occupancy rate for beds at the Princess Louise is 76 per cent, that at St. Mary's—its parent teaching hospital—is 92 per cent. It is because of this, and because it has another children's hospital associated with it, that the board of governors of St. Mary's wants to close the Princess Louise.

Before a final decision is made, however, one would like to feel satisfied that the question has been studied from a wider aspect than that of a single hospital group. Are there any special needs of children that are still not provided for? Is there not, for instance, a shortage of beds for children suffering from mental illness? In any case, if a total reduction in children's beds is to be made, there are strong arguments for concentrating those that remain in special children's hospitals, where all the staff are experienced in treating and nursing children. The extra beds needed for adults could be met—and much less drastically—by converting those reserved for children in general hospitals.

China's Backdoor Trade

A MONTH ago a delegation of British businessmen organised by the Sino-British Trade Committee, returned from Peking well satisfied. They had been able to reopen trade contacts, clear up questions of credit terms, and arrange a second visit later in the year. Most important of all, they managed to steer completely clear of propaganda. Now, however, comes the news that these promising achievements might be undone by the arrival in Peking of another party of businessmen from this country.

The question of trade channels with Communist China has had an unfortunate history. The Communists soon made clear their intention of cutting out the old established British firms. They welcomed, however, an unofficial trade mission which went to Peking under the wing of the British Council for the Promotion of International Trade, a body set up after a conference in Moscow. It was to break this monopoly that the Sino-British Trade Committee was brought into being. The party now in Peking, though not sponsored by the BCPIT, has links with it; and the Chinese cannot but profit by playing one group off against the other.

Communist monopolies are at an obvious advantage in dealing with individual businessmen, and there is no sense in having two competing groups in making successive visits to Peking. The reputable firms on the present mission may hope for privileged treatment owing to their connection with the BCPIT; but clearly British interests are better served by a straightforward approach through the front door.

Books & Publications

Even the reader who agrees with some of Mr Aldington's points is forced into defending Lawrence by the sourness and immoderation of his language. If Lawrence is destroying enemy lines of communication: "one does not altogether visualise Sir Sagramors le Desirous and Sir Gawain upsetting an enemy market cart in a ditch and leaving the wreck of humanity and goods to the tender mercy of local villains"; if he displays knowledge of military history: "Unfortunately in spite of this unique fund of military learning, Lawrence in 1914 could not apply for the only appropriate post of Field Marshal with any hopes of success." Even his talent as a writer is written off as "no creative

The aim of the book derives from its place in "The New American Nation

Series": it is to give a picture of the England from which the first North American settlers came—its society, religion and government. Thus its limitations in time are fairly precisely drawn; it confines itself to the generation that immediately precedes the Massachusetts migration of 1629-30, the generation which at least to some degree established the American tradition. Here however it is studied, mercifully, without benefit of hindsight, as a period of English history that possesses its own interest and whose study is its own justification. This gives the book an objectivity and freshness rarely to be encountered in studies of "origins" and "backgrounds." Mr Notestein's gentry and churchwardens, physicians and yeomen exist in their own right, as real as characters in the contemporary drama from which he so often quotes or as the matter-of-fact diarists from whose daily jottings he has reconstructed the relationships of a whole social or economic group.

Objectivity and affection do not always co-exist in a historian. But Wallace Notestein's partiality for his century, a partiality which suffuses every page of his book with a warming glow, is not incompatible with a strict realism in his depiction of it. Thus he can admit, at the end of all his intimacy with the John Smiths of Nibley or the Lord Herberts of Cherbury, that "about all these Seventeenth Century figures there is a kind of greyness." They were less in-

dividualised and less interested in the individual than the men of a later day. They were more serious too; these denizens of a legendary Merrie England appear in his pages as "sober and serious-minded even in their good fellowship." At the same time Mr Notestein cautions us against the fashionable disparagement of the Puritans—"it is the fate of causes which become unpopular with posterity that they are judged by their extreme protagonists"—and in keeping with his own warning he seeks always to find the broadest possible basis for his own generalisations.

In less practised hands a picture so cautiously drawn might appear formless and hesitant, a patchwork of "maybes" and "on the wholes." But so sure is the historical imagination that guides Wallace Notestein's pen that even in the dark places of his story we feel that our ignorance is, so to speak, an ignorance from within. And when we lay down this fascinating book we are left, not with the illusion that we know all about this England of 1603 to 1630, but with the infinitely more reassuring conviction that we know how to take the next steps towards finding out.

Barrie the Enigma

PORTRAIT OF BARRIE.

By Cynthia Asquith.

James Barrie. 237 pages. 15s.

FEW people can have had such opportunity for observing Barrie in all his moods as Cynthia Asquith, who was his secretary for twenty years. Few people so placed are wise enough to resist a display of omniscience, but this biographer disarms us with her first sentence: "What was Barrie really like?"

It is this curiosity about her complex subject that gives to her book an astringent persuasiveness that inveigles a carper at Barrie the whimsical into a sympathiser with Barrie the man. And how easy it is to be beguiled into fellow feeling for one caught in the web of his own affability and later reproaching himself for having raised false hopes of intimacy in casually met strangers; or speeding the reluctantly parting guest with a surge of gratitude that is mistaken for interest; wriggling out of mortgaging his time on long distant social engagements, but delighting in the unexpected appearance of a friend; curdled by Margot Asquith's confidences, or appalled at the necessity of laughing at yet another joke about "McConnachie."

It would be unrealistic to expect that a man who attained to such fabulous success from such confined beginnings should not, in amazement at his own luck, make something of a cult of himself, and this, of course, Barrie did, transforming even his woeful lack of inches into something "tremendously wee." But he never deceived himself, however much his idiosyncratic charm might have swept his "fans" off their feet, and his secretary never subscribed to the cult. She regards him with a mixture of

discerning affection, admiration and pity, and maintains a middle course between blind infatuation and purblind prejudice, both of which attitudes she deplors.

Her book is an honest attempt to interpret for his admirers, and to defend loyally against his detractors, this gay, saturnine, sentimental realist; at times so bored and moody that he "couldn't conscript a smile," and at times so infectiously gay that his company was entranced. She suggests that Barrie's preoccupation with youth was due not to arrested, but precipitated, development, and that the unnaturally grave responsibilities of his own early days made him nostalgically appreciative of the gaiety of carefree childhood. But the final summing up is left for the quiet judgment of friends of many years' standing, and nothing could be more touching or convincing than the letter that Scott wrote to Barrie just before he died, which was found long afterwards in the tent with his body: "I never met a man in my life whom I admired and loved more than you, but I could never show how much your friendship meant to me; you had so much to give, and I had nothing."

The French Union

THE PUBLIC LAW OF OVERSEAS FRANCE SINCE THE WAR.

By Kenneth Robinson.

Oxford University Institute of Colonial Studies. Reprint Series No. 1a. Reprinted from the *Journal of Comparative Legislation*.

POLITIQUE ETRANGERE.

Numéro Spécial: La République Française et les Problèmes de L'Océan Mer. Paris, Centre d'Etudes de Politique Etrangère. 330 francs.

THE British student of the French Union may be pardoned for confusion of mind about its pattern. When it was first conceived in the flush of respect for the war record of former colonies, there were books and articles galore about its hierarchy of councils and assemblies, "associates" and "territories." But events have since distorted a pattern that was never simple, and writings that clarify the present confusing scene are badly needed. It is opportune, therefore, to draw attention to two publications which fill the bill.

Mr Robinson explains in 32 pages and with admirable clarity the shapes and relationships of 1939, and how far the plans put into effect since the war have worked in some territories but have been abortive in Indo China and the North African Protectorates. He lays bare the contradiction that time has exposed in a constitution that simultaneously provided, on the one hand, for assimilation to France and, on the other, for education towards "freedom of self-administration," and he reaches the conclusion that the future hangs on greater elasticity about assimilation and on "a shift towards a somewhat more federal relationship" than has hitherto prevailed between France and its dependencies.

SINCE MID-VICTORIAN TIMES

QUITE UNIMPORTANT

Thompson: (interrogatively, to Beauteous but Haughty Damsel, whom he has just helped to alight): "I BEG YOUR PARDON?"

Haughty Damsel: "I DID NOT SPEAK!"

Thompson: "OH, I THOUGHT YOU SAID 'THANKS'!"

[Thompson thereupon installed himself within the first-class compartment so lately vacated by the ill-graced Young Miss. Fortunately, the delight engendered from his Three Castles cigarette—that cigarette without peer—did much to restore a better humour toward the Fairer Sex.]

YOU'RE AN AIRY GODMOTHER, MR. PAGET

We've just caught Mr. Paget hogging the bathroom... today in a Milan hotel; a week today it's Madrid; and the week after, Geneva and Zurich. Mr. Paget travels as far and fast as any fairy godmother. And he is one, too! Because Mr. Paget (like nearly a million others last year) flies BEA. And his fare money helps keep British Civil Aviation on top. It enables BEA, for example, to put more Viscounts and Elizabethans in the air; to lend their advice (as major operators) to the aircraft manufacturers... and to give the passenger's point of view. Though he may not realize it, Mr. Paget is doing a pretty big job. And the more there are like him the brighter the future for British flying.

Many Frenchmen—with the French settlers in North Africa in their front rank—will reckon his reasoning to be reprehensibly “British.” But not all Frenchmen. Early last year, M. Laniel’s Minister for Overseas France, M. Jaquinot, proclaimed to a doubting National Assembly that old style assimilation was out of date, and several important members of M. Mendès-France’s team have long held the same view. The topic has been much debated in circles that are rated not only advanced but dangerous by French conservatives, but which are in fact making a brave attempt to keep up with the march of time in Asia and Africa. One outcome of their thinking is the periodical reviewed here—a special number of the magazine produced by Paris’s equivalent of Chatham House. This body has for more than a year been sponsoring a study group on the problems of the French Union, and has now published the result of its efforts.

An admirable introduction by M. René Sersoise sets the limits imposed by the facts of modern life on the old, centripetal assimilationist system. Metropolitan France, he argues, cannot afford it in terms either of men or of money, and French Africa will also suffer if so spoonfed, since it will never generate the kind of self-help that leads to viability. He leads logically to the group’s conclusions, which are, broadly speaking, that once Africans are educated in the image of Frenchmen, metropolitan France is bound to swim with the stream of their thought, but that, if it swims strongly enough, it can remain in touch with them within some form of twentieth century federation. By 1970, or even 1965, this reasoning will surely appear reasonable, logical and normal to a majority of Frenchmen, instead of freakish, as it does today.

The Law and Persian Oil

THE ANGLO-IRANIAN OIL DISPUTE OF 1951-1952.

By Alan W. Ford.
University of California Press. London:
Cambridge University Press. 360 pages.
30s.

MR FORD, who held a research fellowship at the University of California, has found a good subject of study in the long-drawn dispute of the Anglo-Iranian Oil Company with the Government of Iran about the nationalisation of the oil enterprise. He has produced a thorough piece of work, and gives a lucid exposition of the international law concerning the denial of justice to aliens. He examines the British attempts, after the diplomatic failure, to get a legal settlement in the International Court of Justice; their first successful effort to obtain an interim judgment of the court; and the rejection of their substantive claim on the ground of lack of jurisdiction. That is followed by the story of the ineffective diplomatic efforts of the United States to find some reconciliation. Finally, he analyses the law of expropriation in its international aspects.

He is scrupulously fair between the two parties; and he recognises that the conduct of the British Government in every way complied with the letter and the spirit of the law. The Iran Government’s reliance on the rule of law was “less impressive. It seems to have acted first, and looked for legal justification second.” He is critical, too, of the cautiousness of the International Court in declining the opportunity to formulate afresh the “international norm” about compensation for expropriated property in a manner that would provide workable solutions. The old rule that the property of aliens may only be taken against prompt, adequate and effective compensation cannot stand in present circumstances; and the court’s decline of jurisdiction appears to confirm the contention that the administration of international justice is not concerned with the position of the investor, who operates under contractual arrangements. He concludes that “faith in the Court and in International Law by the community of nations will do much to increase the stability and concord of their relations.”

The story does not take account of the settlement that has since been reached, or of the actions brought by the company against tankers exporting the oil from Iran. Both later developments give hope that international law is not altogether impotent.

Useful appendices contain the 1933 concession, the nationalisation law, a timetable of events, and nearly fifty pages of notes with many references to law books and the press.

Injuries and Damages

THE QUANTUM OF DAMAGES IN PERSONAL INJURY CLAIMS.

By David A. McL. Kemp and Margaret Sylvia Kemp.
Sweet and Maxwell. 480 pages. 35s.

AN experienced judge once said that to make up one’s mind in a criminal trial on the prisoner’s guilt or innocence is generally as easy as falling off a log; but to decide what sentence to give him is almost always difficult. In the same way, in civil actions for personal injury it is often fairly easy to decide whether somebody’s negligence caused the accident. But it is extremely difficult to know what damages should be awarded. Principles for guidance have been laid down and expressed with admirable lucidity; but most of them get one nowhere. We know that damages must be arrived at by a reasonable consideration of the plaintiff’s circumstances and by making allowance for the ordinary chances of life. But apply that rule to a small boy who has had a crack on the head and may or may not, as a result of it, develop traumatic epilepsy in ten years’ time—and see what help you get from it.

The difficulty in recent years has been increased by the fall in the value of money. The courts’ adjustment of awards to inflation has not been uniform; but it has been estimated by insurance claim settlers that damages for personal injury

are about three times as high as they were twenty years ago. Claims on employers, too, are far more common since the defence of common employment was abolished, and the premium to insure the employer’s common law liability (which used to be nominal) is now in some trades as high as 12½ per cent of the wages bill. To judge from Lloyd’s List the legal work on injury claims from docks and shipbuilding and shiprepairing yards must be maintaining an unusually large number of lawyers and lawyers’ clerks.

Mr and Mrs Kemp—he a barrister and she a solicitor—have together written this text book, designed to lighten the darkness of lawyers’ claim settlers and others whose job it is to guess at the probable damages for various types of injury. They deal with a large number of recent cases and classify them according to the part of the body on which plaintiffs’ claims were based. There are separate chapters for the brain, the spine and neck, the eye, the legs and feet, the nerves, the arms, hands and fingers, and one chapter on pain, suffering and shock. And they give some very interesting examples of how the appeal court has raised (or, less often, lowered) the awards of the first court. Lawyers and third-party claim settlers should find the book very useful. But a philosopher may speculate on how much more profitable it is (even, in a welfare state) to suffer from the negligence of man than from the act of God. Pray that you may not be injured. But if it needs must be that injury comes may the injury be tortious and sustained in the presence of witnesses.

Shorter Notice

THE UMBRELLA GARDEN: A picture of student life in Red China.

By Maria Yen.
The Macmillan Company of New York.
274 pages. 28s.

This extremely interesting autobiographical account of life in Communist China is the work of a woman who was a student at the Peking National University when the Communists captured the city at the beginning of 1949, and whose sympathies, along with those of most of her fellow-students, were at that time on the side of the “People’s Liberation Army.” Her subsequent experience with the new regime so disillusioned her that she finally, after much hesitation, decided to go into exile in Hongkong.

The book is particularly valuable as evidence because so little of it is directly political; a large part of it is concerned with living conditions from an essentially feminine point of view. It is the record of an individual who was not greatly interested in politics, but wanted to be free to think for herself and to choose her own job without being perpetually brainwashed, nagged and supervised by party zealots. Perhaps she was rather exceptional, a product of Western democratic influence, and the next generation of students will be more docile. But it is important that there is today an emigration from Communist China which is comparable to that from the Soviet Union and the European Communist countries. As this young woman writes: “We stayed to see what it was like, and we found out.”

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Spotlight on the Civil Service

Washington, DC.

THE hearings just opened by Senator Olin Johnston's Post Office and Civil Service Committee themselves also open a series of productions which will place the spotlight on the United States government's performance as an employer. Senator Johnston, a brusque right-wing Democrat who presides over the committee in South Carolinian accents that many of his fellow-Americans find difficult to follow, is first staging the President's proposals on the subject; they include pay rises and welfare insurance schemes on fairly orthodox lines. But the strong committee staff assembled by Mr Johnston is already preparing more explosive scripts: the promised investigation into the supposed Republican rape of the merit system and into the Administration's so-called security programme, which has done more than anything else to impair the external stature and internal morale of the civil service. At the same time, ex-President Hoover's second commission on the reorganisation of the government is polishing up a report that will go farther into some of the more fundamental questions raised by its predecessor.

The Republicans, coming into office after a long period of Democratic rule and at a time when the total number of government jobs available for distribution had to be cut down to fulfil election pledges, have been accused of laying irreverent hands on the civil service by two methods. They "stripped" civil service protection from a number of posts that had been "blanketed in" by the Democrats; the incumbents, who had been Democratic political nominees, had been given security of status and tenure while only their successors would have had to take the competitive examinations which are also an integral part of the merit system. This has, for instance, enabled the Secretary of Agriculture to instal supporters of his ideas about flexible crop subsidies as area directors of the Commodity Stabilisation Service, in place of long-standing enthusiasts for the previous system of high and rigid price supports.

Secondly, the Administration has created a special Schedule C, which is supposed to segregate jobs of a policy making and confidential nature, to which political appointments should be made, from those of a purely administrative nature, which should be filled in so far as possible from the career service. Mr Philip Young, who serves in the Cabinet as the President's adviser on matters of personnel as well as being chairman of the bipartisan Civil Service Commission which polices the merit system, claims that, so far from undermining the service, Schedule C buttresses it by drawing a clear and logical line. This obviously raises a highly important matter of principle, since the ultimate goal of the

campaign waged by civil service reformers in the last seventy-five years, with the vociferous support of large sections of the press, has been, at least by implication, a British-type system in which a politically-appointed Secretary and Under Secretary preside over a politically neutral department.

So long as this goal was a long way off it was liable to receive uncritical acceptance, together with an envious tribute to British standards of administration. Now that it is coming much nearer—even when the Republicans had done their worst, eighty-six per cent of the two-and-a-quarter million jobs in the civil service were still recruited by competitive examination—the desirability of carrying a good thing quite so far is being widely questioned.

★

On the whole it seems doubtful whether the British system either can or ought to be adopted in its entirety in American conditions. It implies an elite corps of politically neutral administrators, a political Minister willing and able to take sole responsibility for decisions of policy and great forbearance on the part of the legislature from meddling with the inner workings of the executive. Americans, on the other hand, are far too realistic to accept the fiction that only the Secretary and Under Secretary make policy. The idea of a senior civil servant completely switching sides on a highly controversial issue after an election provokes strong scepticism or distaste. It is felt either that the policy of the incoming Administration will be thwarted by the ingrained convictions of "hold-over" officials or that the kind of official who genuinely can switch sides must lack the capacity for enthusiasm that will give him administrative drive.

There is, moreover, a natural reluctance to sacrifice, for the sake of building up a closed shop of higher civil servants, the advantages that are thought to result from easy interchange between jobs in industry, university and government. In addition there is in the United States so much fragmentation of power, politically into states (only about ten per cent of American civil servants work in Washington), legislatively into committees and administratively into agencies, many of them with their own charters from Congress and only loosely grouped together within the departments, that it would be quite impractical for the Secretary to be the sole overt source and defender of policy.

Is there then a place for anything equivalent to the British higher civil service? In certain of the politically less sensitive fields there already is such a thing, but the

first Hoover commission clearly did not feel that this was enough; it complained strongly of the lack of "generalists" within the civil service from whom the government could build "a corps of administrators of the highest level of ability with an interest in the programme of the government as a whole." The famous merit system is chiefly to blame for this state of affairs, since its competitive examinations are designed more to fill jobs than to start careers, and the specialisation that begins with the test papers tends to stick with the successful candidates. However, a modest start has been made since the war with more broadly conceived competitions for "junior management assistantships" which are intended to snare some of the brighter university graduates away from a career in industry.

But here a real dilemma appears. Without something like the British administrative class, the higher positions in the government cannot be staffed through the merit system. Unless enough of the more exciting of these positions can be kept non-political and be filled by promotion, candidates of the right calibre will not be tempted into the civil service. From this viewpoint Mr Young's Schedule C does not seem an entirely happy device, with its too dogmatic distinction between policy makers and administrators, and its clear implication that civil servants can only hope to be the latter.

There is, however, one distinction which does urgently need to be made, though it can only be enforced by a combination of presidential firmness and congressional restraint. This is the distinction between officials who should be asked questions on policy by a congressional committee as opposed to those who should merely be required to supply facts. The first category, once rigorously defined, would not normally contain career civil servants. At the same time it would be exceedingly helpful to the cause of good government if eager officials at public hearings were no longer given invitations, which they are often happy to accept, to express their personal opinions of the policy that has reached them from above.

Issue of Confidence

THE Administration's confidence that the present economic revival will be sustained has taken the practical form of a new long-term bond. Holders of a \$2.6 billion 1935 issue being redeemed in March are offered in exchange a 40-year 3 per cent bond, the longest term issue since 1911. As recently as November it was felt that a long-term bond would stunt the nascent recovery and the sharp change in the economic atmosphere is shown even more clearly by the fact that the Secretary of the Treasury is now said to be smelling inflation in the air. The odour comes particularly from the expansion in easy housing credit; the new issue should do something to check this, since it will compete with the mortgage market for institutional funds.

But care has been taken to counterbalance any deflationary tendency of the new bond by offering holders of the maturing security an alternative exchange into a short-term issue, a 13-month note at 1½ per cent, while holders of over \$12 billion worth of other government securities maturing soon have a choice only of this note or

of a 2½-year 2 per cent note. The Republicans have certainly not allowed their desire to stretch out the term of the national debt, in order to give the Treasury greater freedom to manoeuvre, to wipe out the unfortunate memory of their only other substantial effort in that direction. The 30-year bond they offered so ineptly early in 1953, in the first flush of taking office, will always be blamed, however unjustifiably, for the subsequent recession. But this week's issue has been carefully tailored to the requirements of the market, which seems ready to welcome it, and it has the added safeguard that there are no cash subscriptions.

This cautious move is certainly not a squeeze on credit; at the most it is an admonitory pat, from the other agency responsible for government monetary policy, to match the warning which the Federal Reserve Board gave to the stock market when it raised margin requirements a few weeks ago. This is far from a reversal of last year's easy money policy, but it leaves no room for doubt that the Treasury is in accord with the changing attitude of the Federal Reserve System, now openly acknowledged. For some time, reacting to the improvement in the economic outlook, the system has been ceasing to pump funds into the money market, and as a result short-term interest rates have gone up. But neither the Federal Reserve nor the Treasury think there is any need as yet for active credit restriction.

Better Health

IN the President's recommendations for reducing "the impact of disease," first place is given to the reinsurance programme which would help the many Americans who cannot afford to pay for the medical care they need. This is a revival of the very moderate plan which was squeezed to death in Congress last year between the fears of the American Medical Association and some insurance companies that it would lead to "socialised medicine" and the belief of many liberals that it did not go far enough in that direction. The idea is to enable private insurance undertakings to extend their coverage in ways now considered too risky, by giving them government-backed guarantees against loss.

The President emphasised both that the essential part would still be played by private interests and also that every effort had been made this time to work out a scheme that did not suggest government interference to either insurance companies or doctors. But he has asked for a revolving fund, to finance the plan, which will eventually amount to \$100 million, four times the sum mentioned last year. The congressional future of the proposal is difficult to judge as yet, but it seems likely that, if the President gets any health insurance legislation at all this year, it will go farther than he has requested. For the Democratic leader in the House, Mr Rayburn, condemned the reinsurance scheme as inadequate last year and three Republican Senators have already introduced a Bill to provide complete voluntary health insurance at state levels backed with federal funds.

Most of the other proposals in the President's message are more novel, although less important and probably less controversial. Among them are government guarantees for loans for building more hospitals and other health facilities,

on the lines of the guarantees for housing mortgages which have proved so effective; federal grants to agencies which train nurses, and to help the states give better medical care to recipients of public assistance and to mothers and children; strengthened drives against mental illness and juvenile delinquency; increased government funds for research into air pollution and an increased American contribution to the World Health Organisation.

Steel Up-to-Date

New York

THE recent speculative flutters in steel shares and the favourable dividends being declared by the big steel companies show that investors and producers alike are optimistic about the future earnings of the industry. Six months ago, when customers were feeding off their stocks, steel output was running as low as 60 per cent of capacity. But in August the automobile industry began to replenish its depleted supplies, and by the end of the year order books for most grades of steel were filling rapidly. Now the motor and construction industries, which together use nearly half of all the steel produced, are predicting that their demands will increase this year, and estimates of steel output in 1955 by the industry's own leaders range from a conservative 95 million tons, an increase of seven million tons over last year, to an optimistic 112 million tons.

American capacity for the production of steel ingots has in the meantime risen to 126 million tons, an expansion of 38 per cent since the beginning of 1945. Probably a quarter of the industry's facilities are now completely new, but the emphasis in the huge post-war investment programme, costing \$6 billion, has been on modernisation, especially since 1949. With most of the older plants now thoroughly modernised, about 80 per cent of all steel-making facilities are in first-class shape. Providing their equipment is flexible enough, most steel producers can now operate at well below last year's average of 71 per cent of capacity and still make money. The predicted output for 1955, at between 80 and 85 per cent of capacity, is in fact considered by many firms to be the most desirable operating rate; they argue that it permits them to retire their high cost equipment, gives an adequate margin for maintenance and repair and for meeting any national emergency, and is in the range of output at which unit production costs are at a minimum.

Within the steel plants, modernisation has gone farthest in the rolling mills and in other facilities for producing finished steel, where the greatest savings in labour can be achieved. Continuous finishing processes, once the exception, are now the rule, and in each of the new mills electronic "push-button" controls make the entire operation progressively automatic. Some of the most dramatic reductions in costs have been achieved by improved handling facilities and by the better lay-out of plants. Among the most recent technological developments, keenest interest has been aroused by the possibilities of continuous casting, which allows billets to be cast direct from molten metal, cutting out the whole ingot stage, and of extrusion, whereby difficult steel shapes and sections are produced by thrusting the hot steel through shaped dies as is done with plastics.

But technological innovations have by no means been confined to the finishing mills. In an early stage in the process, the conversion of iron ore to pig iron in blast furnaces, several devices have for some time been used to increase yields. The most important are the use of controls to increase the gas pressure at the top of the furnace—a device which, it is claimed, can increase the yield of pig iron by as much as 20 per cent—and the use of more air, enriched by oxygen, to speed up combustion. For the conversion of pig iron and scrap steel into molten steel, the

open hearth furnace, which permits close quality control and is much more flexible in its use of pig iron or scrap, now accounts for 88 per cent of total capacity; the Bessemer converter, a different type of furnace, is now used in very few plants. A more recent introduction is the electric furnace, an open hearth using electric current, rather than oil or gas for heat. Oxygen can be used in most methods of steel making; European ways of using it in the Bessemer converter were taken up in the United States last year. Both the electric and the oxygen-enriched Bessemer processes permit the economic production of steel in small quantities—a great attraction to small producers, or to those who wish to expand capacity by less than the addition of a new open hearth furnace.

These are only a few of the new techniques with which the steel companies are experimenting. By using them they can make more steel, and make it faster. The big question is whether, under present operating conditions, they can also make it more cheaply. For example, in periods of heavy demand, the increased use of oxygen to raise yields in blast and open hearth furnaces is easy to justify. But when the industry has surplus capacity, the use of oxygen is still very expensive. An important factor governing the economics of steel-making is flexibility—the ability to expand or cut back output by relatively small amounts, without a marked increase in costs. It is in facilitating flexibility that the new technology promises to provide the greatest economies. For instance, one company is experimenting with a "turbo-hearth," a method of heating an open hearth furnace which will permit economic operation at less than capacity.

Let's talk refrigerators...

Into a refrigerator goes food. And drink. And also steel sheet. For refrigerators are made of steel sheet. So are cookers, and cars, and prams. A surprising number of everyday necessities are made of steel sheet or by steel sheet.

Who then makes this vital product, this product with an obvious future? One firm makes a very great deal of steel sheet — the

firm of John Summers. The works at Shotton — an immense concentration of industry — have more than doubled since 1939, and grow apace. And from these works steel sheet, thick, thin, pliable, flows unceasingly; mile upon mile of it.

Little wonder that this great 100-year-old family firm looks forward to a bright and busy future.

John Summers & Sons Ltd.

THE STEEL SHEET MAKERS

SHOTTON, CHESTER

FOR HIGH OUTPUT

DROTT
beats the lot!

Drott Skid-Shovels

WITH INTERNATIONAL
TRACTORS

4 MODELS

- 6-K3 (Tractor BYD-6) $\frac{1}{2}$ yds. 3,000 lb. lift
9-K3 (Tractor TD-9) $1\frac{1}{2}$ yds. 4,000 lb. lift
14-K3 (Tractor TD-14A) 2 yds. 6,000 lb. lift
18-K3 (Tractor TD-18A) 3 yds. 9,000 lb. lift

Drott Skid-Shovels are built to do a tremendous day's work. They dig deeper into rougher materials, break out with a full bucket every time, carry without spillage, lift faster, reach farther. Only Drotts give you such bumper bonus payloads so consistently, because only Drotts have all these special features —

PRY-ACTION BREAK-OUT — produces a digging force greater, pound for pound, than the tractor's maximum drawbar pull!

BUCKET ROLL-BACK ACTION — retains a full bucket on every load!

SKID-SHOE TRANSPORTATION — maintains balance, eliminates 'carry strain' on tractor!

REVERSE CYLINDER ACTION — gives greater power for digging, higher speed for lifting!

HYDRO-SPRING SHOCK ABSORBER — cuts hydraulic shocks to $\frac{1}{3}$ the normal force!

International INDUSTRIAL POWER

INTERNATIONAL HARVESTER COMPANY OF GREAT BRITAIN LIMITED, HARVESTER HOUSE, 255 CITY ROAD, LONDON, E.C.1

Moreover, it may eventually be possible to build a semi-integrated plant to produce steel in much smaller quantities at a competitive cost and with an initial investment of as little as a fifth of that required by an integrated mill. Such a plant, which would have no blast furnace for making its own pig iron, would use scrap steel or taconite "pellets" directly in an electric or oxygen furnace, and would be employed in combination with a continuous casting machine. One advantage of these and other new types of furnaces is their ability to use efficiently these taconite pellets, which are now being refined from the lean iron ores contained in the abundant taconite and jasper rocks of the Great Lakes region as one alternative to the diminishing supplies from the Mesabi range, the traditional American source of ore.

Because of the high cost of entry and the big economies of large-scale operation, the steel industry has always been highly concentrated, both financially and geographically. Any major reduction in the size of plant required for economic operation could permit substantial savings in transport costs by the location of small plants in market areas distant from the main steel centres. The smaller producers and fabricators alike thrive in the field of high-priced, high-quality alloys and other "speciality steels." But to their general difficulties has been added the tendency of the major companies to integrate forward into fabricating capacity, where the richest profits are to be made. Some of the smaller producers have met the consequent reduction in the market supply of semi-finished steel by integrating backwards into steel-making capacity; others have been strengthened by the financial support of large consumers, who have provided loans to enable them to expand their capacity in return for a prior call on their output. It is, indeed, with the smaller concerns that many of the latest innovations in metallurgy and production processes have originated.

The industry's growing research departments are equally concerned with expanding and diversifying sales—the quest for new properties, new products and completely new markets. New outlets are being sought, for example, in the use of steel panels to clothe skyscrapers, in soft drink and milk tinning, in the production of plastic tubing and in the growing popularity of products in which steel is used together with a variety of other materials. With its new technology, its new markets, its changing structure and, it is hoped, its greater resistance to business recessions, the stagnant heavy industry of the 1930s can justifiably claim a place among America's "growth industries."

Warming Up Dixon-Yates

THE Democrats in Congress are losing no time in trying to make the Dixon-Yates contract too hot for the Administration to hold. This is the controversial arrangement made with the encouragement of the President himself, under which a private combine will build a generator to feed electric power into the Tennessee Valley Authority's transmission system to replace power which that public agency is to supply to the Atomic Energy Commission. Democratic distrust of what they regard as an attack on the whole principle of public electricity development has

been sharpened by the very substantial cuts in the money allowed for the TVA in the new Budget and the repetition of the recommendation that the authority should finance its necessary expansion by funds from sources other than federal appropriations; last year's similar proposal led to the Dixon-Yates contract being forced on the TVA.

One of the fires under the contract, and one which is likely to be kept burning, has been lit by the Senate's anti-monopoly subcommittee. It has reported that monopolies are once more spreading over the country, that they are particularly evident in attempts to destroy public competition in the electricity business, and that the Dixon-Yates affair demonstrates the recrudescence of holding companies dominated by Wall Street which Congress thought it had suppressed long ago. Responsibility for deciding whether this last allegation is true and whether the financing of the arrangement is satisfactory rests with the Securities and Exchange Commission, which is expected to issue its ruling soon—and favourably.

Meanwhile, however, the Joint Congressional Committee on Atomic Energy has built a more immediately dangerous blaze under the contract. Its new Democratic majority has recommended that the contract be cancelled and has rescinded the waiver which the old Republican majority granted before Christmas so that the contract did not have to be held up until Congress had been in full session for thirty days. Whether this rescission is itself legal is doubtful, but it opens the way for months of court argument over the contract if the AEC goes on with it, as Mr Eisenhower insists it should. Democrats also plan to back up this delaying action by refusing to appropriate funds for connecting up the Dixon-Yates generator with the TVA's transmission lines. But, unless one side or the other drops the matter, it is the consumers of electricity in the Tennessee Valley who are likely to get burnt, in 1958, when the TVA will no longer have enough electric power available to meet its obligations to the atomic energy installations and to supply its private customers.

Panama in Hand

FIFTEEN months of negotiations with the Republic of Panama for a new treaty covering the Canal Zone have at last been successfully concluded and the pact now awaits the approval of the Panamanian Congress and the United States Senate. The new agreement has survived both the assassination last month of its chief negotiator, the late President Remón, and the dramatic political moves which followed this unexpected disaster. The original treaty, covering the 10-mile strip of land on either side of the Canal, was drafted in 1903 and its most recent revision was in 1936. The new agreement consists in the main of concessions made by the United States to meet a number of long-standing grievances which have aroused strong resentment in Panama and other Latin American countries. These concessions do not fully measure up to the original Panamanian demands, which in the view of American officials covered "both a wide range of subjects, and a wide range of reasonability," but they should prove far-reaching enough to satisfy national pride.

The new treaty abolishes what has been the greatest source of friction between the two countries—the differential rates of pay for employees from the United States and the Panamanians and West Indians who make up the local labour force. In the past, United States workers have been paid three to four times as much as other employees doing equivalent work, as well as receiving a variety of other benefits; a single basic wage is now guaranteed with equal pension rights. In the second place, Panama's claim to a larger financial stake in the Canal—its one great economic asset—has to a large extent been recognised. The annual payment to the Panama government for the use of the Canal Zone is to be more than quadrupled, from \$430,000 to \$1,930,000; compared with this, tolls on all commercial vessels passing through the Canal amount to some \$33 million a year. Among other economic concessions Panama has gained the right to tax some 17,000 non-American employees of the Canal Zone who live beyond its boundaries.

Against this, the United States has doggedly insisted—against strong protest—on a 75 per cent reduction in the Panamanian tax on alcoholic drinks sold in the Zone. Other concrete advantages to the United States include the right to build a bridge at Balboa and land concessions for military training purposes. But the main asset which the United States hopes to derive from the new treaty is the good will of this small but strategically important republic. The treaty has the support of the new President, Senor Ricardo Arias, but the lack of Colonel Remón's stabilising influence makes its future somewhat uncertain.

Guaranteed Wage in Sight?

New York

ONE of the reservations qualifying the present optimistic forecasts of sustained economic growth in 1955 is that they do not allow for strikes in the steel and automobile industries; wage negotiations are coming in both this spring, and already the demands of the automobile union are having an effect on that industry. First target of the United Automobile Workers is the General Motors Corporation, whose contract with the union expires on May 31st. Negotiations should open by the end of March and the giant corporation is already trying to improve its position at the bargaining table. Faced, in any case, with expenditures of \$500 million this year on plant improvements, and with continually increasing demands for working capital, the

corporation has taken the precaution of strengthening its cash reserves while market conditions are favourable. The company is also producing at record rates to build up stocks of new cars as an insurance against a strike, an example being followed by the rest of the industry.

The automobile union's big demand this year, which, it insists, it is not prepared to see postponed again, is for a guaranteed annual wage. Whatever form this may take, its object is to reduce seasonal unemployment by making fluctuations in output and employment costly to the employer; it is an object which has been given immediate relevance by the course of the motor business last summer and autumn. And the chances are that the union will get such a wage, without pressing matters to a strike. For to General Motors, whose size alone should enable it to maintain fairly steady production rates over the year, such an agreement would probably seem less expensive than would the certain loss of market position to the Ford and Chrysler companies, which would result from a tactical strike by the union against General Motors alone.

If General Motors settles for the guaranteed annual wage, Ford, Chrysler, and the "little three" independent motor manufacturers can hardly avoid following suit. But to the small company, which has neither the resources nor the opportunity to smooth out fluctuations in output and employment as effectively as its larger competitors, a guaranteed annual wage agreement could prove a damaging addition to production costs which are already far from competitive. Moreover, if the union's demands are granted without a strike, there will still remain the strike funds of new cars overhanging the market during the second half of the year, at a time when all companies, with newly signed guaranteed annual wage agreements to consider, will be under strong compulsion to maintain output. The prospect is therefore one of a greater drive for volume than ever before, in which the bait of larger margins to dealers to underwrite retail price cutting, and even more favourable hire purchase terms to customers, will be held out by those companies that can afford it—and in which the "independents" will be under more pressure to go to the wall than ever before.

Census of Public Enterprise

"RE-PRIVATIZE public enterprise" is the slogan coined by the US Chamber of Commerce in its effort to keep the Administration moving forward on its avowed course of progressively extricating the government from its business operations. Other private groups, such as National Associated Businessmen, Inc., are similarly exerting their lobbying strength, and two Bills on the subject have already been offered since the new session of Congress opened: the first would encourage businessmen to notify the Secretary of Commerce in cases where they suffer from government competition; the second would give the Director of the Budget a veto over any new competitive activity on the part of the federal government.

But the Director of the Budget, Mr Hughes, has already taken the matter into his own hands. Partly in an attempt to ascertain for the first time the exact extent of the government's business operations, Mr Hughes has ordered

all government agencies to furnish him, by mid-April, with a list of their industrial and commercial activities, and to inform him, by mid-July, which of their manufacturing functions could be discontinued. Subsequently, the bureau will want details and suggestions about such commercial undertakings as repair services, transportation, communications and wholesale and retail trading. And in the meantime the departments have been told not to start any new enterprise which would compete with private business. The directive excludes what it calls "direct services to the public," such as loans, insurance and the generation of electric power—all of which are already under close scrutiny.

This new line of attack is partly designed to administer a jolt to agencies which persist in keeping their business activities to themselves. For instance, the armed services, ordered last March to submit reports of a similar nature, have so far released no comprehensive information, though in certain cases they have cut down some of their business operations. The decision whether to hand government activities over to private enterprise will rest partly on a study of comparative costs, but "fair" allowance will be made for taxation, interest and other charges borne by private enterprise.

SHORTER NOTES

Hopes of a much shorter presidential election campaign next year have been somewhat dashed by the discovery that under some state election laws the names of candidates cannot be certified before the end of August. However, both parties still hope to hold their nominating conventions in August rather than in the usual June or July.

The Administration, after failing to obtain any acceptable bids for the butter which it recently offered to sell for export at cut prices, is now hoping to get rid of it by converting it into ghee, the liquid part of the butter, left after it has been melted. It is thought that the already big demand for it in Asia could be readily expanded. This would have the added advantage of opening a permanent new market for dairy supplies from all over the world, which might make up for the loss, of about 40 cents a pound, which the government would have to bear if it sells its surplus butter at a price the average Asian could pay.

For the first time a Communist has been convicted for actually belonging to an organisation advocating the overthrow of the government. Previous convictions under the Smith Act have been for conspiring to promote Communist doctrines, not for membership in the party.

The New York Stock Exchange's scheme for buying investments on the instalment plan, after a year in operation, now has over 28,000 individual plans in effect and is gaining new investors at the rate of 100 a day. Such investors are now putting an average of \$65 a month each into shares.

Uneasy Calm in Central Africa

BY A SPECIAL CORRESPONDENT

WITHIN a few hours of reaching Salisbury, a visitor to the Federation of the Rhodesias and Nyasaland is likely to be told that the prophets have been confounded; federation has gone through with no disturbances to speak of; everything is settling down; the natives have never been so quiet. Can this be taken at its face value? Gunpowder can be quiet too.

It is probably nearer the truth in Southern Rhodesia than in the other territories. Here, as everywhere else, every African—when he thinks about the subject at all—wants an end of segregation and a share of political power. But here some Africans saw in federation less a danger than a racial reinforcement, an end to the pioneer's dream of permanent white domination. Many Africans here have learnt to be moderate; some are aware of trends in their favour and are prepared to move slowly. But few—perhaps none—at heart wish to go slowly enough to please European voters; it is hardly possible for an African politician to be what Europeans call reasonable and to retain the confidence of his own people. The two African Federal MPs from this territory are able, sincere and moderate men; both are regarded by most Africans as lost leaders.

In Nyasaland there are two and a half million Africans, more than a third of the total population of the Federation. It is not hard to find among them today men who think they must try to make the best of what has happened; it is extremely hard to find even one who does not feel that federation was in some degree a betrayal. Among many fears that are irrational, they come back to one basic point that is valid. "We were a protected people," they say, "and brought up under the Colonial Office to believe that African interests were paramount and that we were moving towards self-government." Though few will define this term precisely, all agree that it has receded indefinitely

and that they have lost political status. That Africans should sit in Parliament and be asked to Government House may be a concession in Southern Rhodesia, they say, but not in Nyasaland; here "Government House belongs to us." Only one African of many interviewed—and he emphasised that he was alone in his opinions—stressed the economic advantages of federation and saw that they could not be had for nothing; he did not yet know whether they would be worth the price paid in political retardment.

"But why," the enquirer would ask, "are you so frightened of Southern Rhodesia? You all go there; wages are higher than here, more people are prosperous."

The pass laws, says one; the liquor laws, says another. A feeling that was clearly difficult to analyse was summed up by one schoolteacher: "We go there to earn money but deposit our freedom on the frontier. And we are afraid we may soon be unable to reclaim it when we come back." The fear is not confined to the educated; in a white dominion, the chief fears loss of power, the peasant loss of land. And their doubts of the value of safeguards written into a constitution are not confined to the unlettered.

The African Congress has at the moment suffered a set-

back in Nyasaland; its protests have been ignored, its demonstrations suppressed; those who have taken the brunt of clashes with the police look with suspicion at leaders who have gone scot-free. But African and European, planter, missionary and official, all agree that if a suitable grievance presented itself the Congress could recover its prestige and renew the struggle lost so decisively in the riots of 1953. In a country overcrowded by African standards, and where, even by African standards, cash wages are low, here is gunpowder.

With modifications, much of what has been said of Nyasaland is true of Northern Rhodesia. Few Africans

are interested in "advancement," in the sense used by the management of the Selection Trust Mines on the copper belt. There is less concern that a few Africans should have more responsible skilled jobs than that a great many should be paid for an unskilled job something more like a European unskilled wage. The African is not much impressed by the fair talk of partnership or such definitions of it as the Moffat Resolutions supply. He shares the Nyasalanders' distrust of the south.

Put this distrust to a Southern Rhodesian of European stock and he may well be puzzled and a little hurt. "Haven't we been generous?" he will ask. And it is true that the south has recognised, by its housing policy and otherwise, that Africans do come to the towns to work and are likely to be more responsible workers if they have wives and children with them; it is true that in consolidation of holdings and agricultural improvement, the settler's colony is twenty years ahead of the Colonial Office territories. But all this—and the higher wages, the common roll for voters, the growing opportunities in secondary industry—are discounted by something intangible, an attitude of mind. This attitude, a remnant from an age that has passed, but one already showing signs of fresh life, is expressed in the division of the country by law into African land and European land and is constantly restated in the correspondence columns of the press and in *Hansard*.

In Search of a Prophet

The Europeans who voted for federation signified thereby their confidence in Sir Godfrey Huggins. The preamble to the Federal Constitution speaks of "the advancement and welfare of all the inhabitants" and of "fostering their partnership and co-operation." These terms were not clearly defined at the time of the referendum—and perhaps it was as well. Many Europeans are now for the first time becoming aware of the implications of their vote; some do not like what they see and would be glad to give up partnership and go back to segregation and the "two pyramid" policy. This, the official policy of the government party a decade ago, means a division of the territory into black and white areas and differs from *apartheid* (in the theoretical form advocated by the South African Bureau of Race Affairs) mainly in offering a much bigger share of territory to the African states and a less inhospitable welcome to the African in white territory. It has been revived recently by Mr van Eeden; it has an immediate appeal to a strong element in the electorate which may be vocal out of proportion to its numbers. It was decisively defeated eighteen months ago, but is certainly stronger now than it was then.

At the other end of the scale, too, opinion is beginning to crystallise. There are some who believe that it is suicide for Europeans to remain a distinct political element and to rely on any form of counting heads, however disguised. Europeans muster one to twelve Africans in the south, one to forty in the north, one to four thousand in Nyasaland. They can only survive—this argument runs—if they abandon exclusiveness and use, not numbers, but persuasion, not restrictive practices based on skin-colour, but brains, influence, integrity and perseverance—working with Africans instead of for them or against them. Two years ago only a few individuals preached this doctrine; today there are groups—as yet small—in all three territories and of all races seriously considering it. By a secular reckoning based only on humanity's deplorable past, it

would seem probable that distrust has gone too far for it ever to become more than a doctrine. But a prophet's voice might—it is just conceivable—unite these groups and draw in the groping majority of all races who are wondering what in fact partnership does mean.

Storm Over Schoerner

THE case of Field-Marshal Schoerner is proving as interesting in its way as that of Dr John. The field-marshal was released by the Soviet Army after signing a letter in which he expressed thanks for his treatment and promised to work for a united, independent, "democratic" Germany and mutual understanding with the Soviet Union. He was then allowed to return to the West. There, instead of receiving the usual sympathetic treatment accorded to "late homecomers," or the public welcome that released war criminals are sometimes given when they come from British prisons, the field-marshal met with a storm. Accusations have been made against him by former soldiers, in the Bonn government, in the headquarters of the trade union federation and elsewhere.

The burden of their charges is that the field-marshal was brutal to his own men during the last desperate stand that he forced them to make when he was commander of the Central Army Group in Czechoslovakia. It is also held against him that he escaped in civilian clothes in an aeroplane, allegedly to organise the "Alpine redoubt," about which Hitler dreamed. The Bavarian Ministry of Justice has been ordered by the Federal Minister of the Interior to see if there are grounds for these charges, but has said, in an interim statement, that his name does not appear in any cases that have come before the courts since 1945. The Bavarian authorities are also under pressure to find a reason why they should refuse Schoerner's application for the substantial pension and back pay which he would normally be due to receive. Dr Adenauer, to whom the field-marshal has appealed to protect him from "defamation," has refused to intervene while the case is being investigated.

The theory has been put forward that the Russians deliberately threw their prisoner back into the German cockpit because they knew his case would embarrass the government and help their propaganda against returning power to "Nazi generals." This may be so, but it is hard to believe that the Russians would have released Schoerner with his widely publicised letter if they had not calculated that he would also help them in their campaign to win over former officers—Nazis included. This campaign is in full swing. The latest move by its organisers has been to gather together in East Berlin 87 officers, about half of whom came from the Federal Republic. Under the supervision of Field-Marshal Paulus the group has issued a manifesto against "serving under a foreign flag" and for an armed, independent Germany.

It is possible that the Russians did not realise how unpopular Schoerner is with the military men. German officers forgive Field-Marshal Paulus for serving the Russians, but blame him for sacrificing his army at Stalingrad. They condemn everyone who did not think first of his duty to his comrades, whether in battle or in the prisoner-of-war camps. This is the reason why Germany is showing yet another example of reversed fronts, the Russians releasing a last-ditch fighter for Hitler as a new

friend, and the Germans crying for him to stand trial as a war criminal. The German attitude is a sign that generals are no longer sacrosanct. If a new army comes into being, its leaders will be scrutinised by the public; and that will be good for all concerned.

Revolt in the Spice Islands

BY A CORRESPONDENT

THE state of war declared in the South Moluccas during January was, in effect, an admission by the Indonesian government that it had never succeeded in fully subduing these islands. Indonesia obtained its independence from the Dutch at the end of 1949. In April, 1950, a secessionist "South Moluccas Republic" was proclaimed at Amboina, and when this historic port was recaptured by Indonesian government forces in November of that year many of the rebels escaped to Ceram and other neighbouring islands, where they have continued to resist. Centuries of history lie behind this conflict.

When the Dutch first came to the East Indies their interest was mainly directed not to Java but to the Moluccas or Spice Islands, where they contended first with the Portuguese and later with the English; and their activities there left a lasting mark. The Moluccas comprise two groups of islands. When the first Europeans appeared, most of the inhabitants of the northern group had been converted to Islam and were organised in four sultanates, the small island of Ternate being the chief centre of the valuable spice trade. The southern islands retained a pagan culture, with no strong political authority. The Dutch found the south the easier to subdue, and they sought to control the spice trade by restricting production. They concentrated the growing of cloves in the Amboina group by destroying the trees in every other island within reach, and similarly concentrated nutmeg production in the Banda islands, which are still the world's most important source.

Amboina became the centre of Dutch power in the Malay archipelago, and only later, when the spice trade was overshadowed by coffee, sugar and other plantation products, did the centre shift to Java. Meanwhile, most of the inhabitants of the South Moluccas were converted to Christianity; in Indonesia, as elsewhere in Asia, it was the more primitive pagans who provided most converts. Hence the Ambonese, together with the Menadonese of north-eastern Celebes, were regarded by the Dutch as particularly loyal and were preferred in the recruitment of local troops.

Modern Indonesian nationalism was essentially a Javanese movement in its early stages, and closely connected with the Moslem religion. Indeed, a manifesto of the revolutionary Indonesian government in 1945 declared that: "We do not harbour any hate towards other groups; neither the Dutch nor the Indo-Europeans, nor the Ambonese nor the Menadonese, who in reality belong to our people." The nationalists' attempts to win over these minority groups had some success, particularly when it became clear that the Dutch would no longer be able to protect their friends, but opposition to the new regime has often and easily been aroused in Celebes and the Moluccas, and discontent has increased as Indonesia's economic conditions have declined.

THE ECONOMIST, FEBRUARY 5, 1955

The leadership of the new Indonesia remains almost wholly Javanese, so that for the "Outer Islands" national independence has meant, in effect, a substitution of Javanese for Dutch rule. Moreover, Java is over-populated and the Outer Islands under-populated; and Javanese emigration, the obvious remedy, tends to produce local conflicts wherever the emigrants go. Antipathy to Javanese ascendancy is at its sharpest among the Christian minorities, and the Ambonese are the most militant of these; many of them, ex-soldiers of the Dutch East Indies army, chose to make new homes in the Netherlands after 1949.

Both the Indonesian government's sponsorship of the forthcoming Afro-Asian conference, and its propaganda campaign for the cession of West New Guinea ("Irian")

by the Dutch indicate that it seeks a way out of its domestic difficulties through the stepping up of "anti-colonial" agitation. The obstinate Ambonese present it with a double problem, and it is probably anxious to break their resistance finally before the Afro-Asian delegates arrive in Java. An unquelled five-year-old revolt is not a good advertisement for any government, and some of Indonesia's guests may not show much enthusiasm for its claims on Irian if it cannot even pacify the islands that lie so near. Moreover, if Indonesia's verbal campaign against the Dutch leads to any kind of conflict along the coasts of New Guinea, the Moluccan rebellion, if still alive, might easily become merged in the new clash.

The Togliatti Line

FROM OUR ROME CORRESPONDENT

PALMIRO TOGLIATTI, the Italian Communist leader spares no effort to present himself as a moderate, liberal politician. The better to reassure the timorous bourgeois, he operates behind the respectable façade of a natty double breasted jacket and metal rimmed spectacles. In action, he has consistently stuck to the irreproachable slogans of progress within the Constitution (in the drafting of which

he had a hand), victory by electoral methods with, if possible, popular front tactics, and a careful avoidance of any step which might frighten the Catholic voter. In pursuing this line, he is in the triply strong position of enjoying unusual latitude from the Kremlin in the adaption of its directives to the western mentality, a fairly firm alliance with the Nenni Socialists, and very wide scope for obtaining reforms, long since regarded as innocuous in more advanced countries. Togliatti's efforts must be admitted to have borne fruit. The Communist Party in Italy is the largest outside the Iron Curtain. In 1953, 44 per cent of young voters between the ages of 21 and 25 plumped for the extreme Left, and the total Left poll is still increasing in the south.

At the recent National Conference, the leader's strategy was, of course, endorsed. Delegates were urged to place more stress on the campaign for "peace" and the banning of the hydrogen bomb and to launch a fresh campaign against the power of industrial monopolies and for workers' freedom from political discrimination in the factories. These issues largely reflect Moscow's instructions, but they also offer a good platform for the Communists to press forward with their old tactics of joint action on concrete issues. And it was in the importance attached to this approach that the significance of the Conference is to be found. Be careful, so ran the advice, to distinguish between foe and possible ally. Do not despise the Social Democrats, however much we may condemn their leaders and spare no trouble to find a pretext in everyday life on which you can make common cause with Catholics. Avoid being merely matey.

Watered Down Bolshevism

There is nothing very new in all this. What is significant is the gathering strength of an opposition current (not allowed to speak in the debates) which asserts that this watered down form of Bolshevism is undermining the party's vigour. Fuel has been provided for the critics' fire by the abrupt downfall of Sotgiu, one of Togliatti's bright upper class protégés, whose private behaviour turned out to be inappropriate to the fierce moral crusade he was conducting as defence counsel in the Montesi case. The opposition felt that much too much fuss had been made about this scandal and that it had distracted energy and attention from more orthodox Marxist issues. (Hence the defence of the party's emphasis on the Montesi case by Ingrao, the editor of *Unità*.) And the opposition's accusation of lax morals was aimed, not just at the brilliant young lawyer but at a whole string of Party leaders, who have circumvented the absence of divorce facilities in Italy by recourse to San Marino and Iron Curtain countries. A good deal was also made of the careerism, bootlicking and opportunism of the circle round the Leader.

But the essence of the opposition's case is that the policy of the popular front is lowering militancy among the veterans, is sacrificing quality for quantity and is getting the Party nowhere. The importance of choosing sound cadres was in fact stressed discreetly by Pietro Secchia at the conference and not by accident. He is the figure round which the opposition has crystallised; he is definitely one of the *duri*. Rumours of his defenestration have been current for some time and they have now been confirmed. Not that there was a brutal expulsion. Secchia has merely, as a first step, been eased out of his position of vice-secretary responsible for organisation and relegated to

the post of provincial secretary of Lombardy, a tough red stronghold. But not before Togliatti had himself taken over the organisation committee at the conference and had arranged a headquarters commissar to keep a check on each party provincial leader. Secchia's probable successor in the national Secretariat is a Togliatti man, Amendola, the son of the Liberal politician of the twenties; but the spoils are being disputed by D'Onofrio and Scoccimarro. Togliatti has also strengthened his hold on the machine by arranging that the party secretariat should be elected not, as hitherto, by the central committee of a hundred and twenty members but by the more select "direction," numbering twenty.

Togliatti far outshines his rivals as a tactician. He has so far succeeded in his tightrope act of keeping the hard core more or less intact while preserving the support of the sympathisers. If there is a slight recession in the north, the Communists are still advancing in the south. His policy ensures the maintenance of the alliance with the Nenni party and the move of the government to the Right is brightening the prospects of success in the biggest stakes for which Togliatti is playing—a split from the centre by some of the liberal elements, who would, whatever their basic intentions, be forced into a policy of virtual co-operation with the Left. Whatever the next move in Italy, it would be dangerous to overrate, at this stage, the likelihood of a marked decline in Communist strength.

Norwegian General Post

FROM OUR SCANDINAVIAN CORRESPONDENT

THE latest reshuffle of Norway's Labour government, although more far-reaching than usual, is still reminiscent of a cosy family game of "general post." Hr Einar Gerhardsen, lately president of the *Storting*, whose resignation from the premiership in 1951 was occasioned by overwork and ill-health after long confinement in German prisons, and Hr Oscar Torp, the outgoing prime minister, have simply swapped offices. Hr Halvard Lange, the stoutest champion of the Nato concept in Norway, remains at the foreign office, where he has served since 1946, thus assuring the continuity of Norway's foreign policy. Six ministers besides Hr Torp have relinquished their portfolios, the severest loss being Hr Nils Langhelle, who commanded universal esteem as defence minister and, later, minister of commerce.

The exact reasons for the reshuffle are partly shrouded in the mystery that habitually surrounds the internal workings of the Labour party, which has now ruled Norway for two decades. Differences over economics and defence, personal rivalries, and incipient labour troubles probably provide the answer. Last year the foreign trade deficit was 1,100 million kroner (£55 million). Norwegian wages are linked to a cost-of-living index, and despite the rigorous price controls in the "Lex Targaard," prices have been rising; in December the index stood at 144 (1949=100). Observers predict a general inflationary rise in wages next month, with the attendant danger of Norway being priced out of world markets, unless the government acts promptly.

Hr Torp's efforts to secure lower prices through negotiation had failed, and his successor's attempt to induce Hr Nohrdahl, the president of the powerful trade unions, to join the government was equally unsuccessful. The programme announced by Hr Gerhardsen was scarcely illuminating, but the inclusion of two leading exponents of *dirigisme*—Hr Sjaastad and Hr Meisdalshagen—in the government points to even more drastic economic controls.

Yet Norway may justifiably regard 1954 as a year of achievement. Full employment and a high living standard were maintained, and misgivings about the proposed Scandinavian common market were allayed. The annual OEEC report criticised the ambitious investment programme (total capital formation in 1954 amounted to over 30 per cent of the gross national product); but it pronounced the Norwegian economy fundamentally sound, and recorded a 16 per cent increase in export trade during the first half of the year. The new state-owned steelworks at Mo i Rana, north of the Arctic Circle, should produce 200,000 tons of rolled steel this year.

Progress has been made in defence, and this year a further 300 million kroner will be spent on "infrastructure." An oil pipeline costing 40 million kroner will eventually link western and eastern Norway. Two-thirds of the American equipment expected has been delivered. One active brigade is already stationed in northern Norway, and the second will be in position in the south next month. Army recruitment has improved, and the largest manoeuvres in Norwegian history were successfully held in 1954. The air force now has seven operational fighter squadrons and wastage is low. The small navy has been strengthened by the loan of two British submarine-chasers. One-fifth of the current budget is devoted to defence. Finally, the Paris agreements, ably piloted by Hr Lange, have secured ratification in the *Storting* with only seven dissentient votes.

Two important fiftieth anniversaries—of Norway's separation from Sweden and of King Haakon's accession—fall this year. To outsiders it may seem paradoxical that Norway combines the most inflexible social planning this side of the Iron Curtain with such deep affection and respect for the monarchy. Yet this blend of austerity and romanticism perhaps provides a key to the Norwegian character.

Crusader Against French Taxes

THOUSANDS of disgruntled provincial shopkeepers flocked into Paris last month to hear their leader, M. Pierre Poujade, vituperate against the iniquities of the French fiscal system. It seems strange that this poignant outcry should come not from those who pay-as-they-earn, but from a group already notorious for fiscal frauds. To parry the accusation of "squeezing the trader" the French Ministry of Finance recently published statistics showing that four-fifths of them declare a revenue substantially lower than that of workers or employees. Indeed, one of the first promises of the present government was to see to it that the burden should be shared more equally.

But there are in France many traders and artisans for whom escape through the fiscal net is the only chance of survival. A strict application of the tax laws would spell their doom, and it would be of little consolation to them to know that their elimination fits well into the pattern of economic laws and progress. These "marginal units" are the target of the government's "reconversion" plan; they are to be adapted so as to be able to face more competitive conditions.

The fear of elimination is strongest in the poor areas of central and south-eastern France, and it is, therefore, natural that the birthplace and the stronghold of M. Poujade's anti-fiscal movement should be there. Since these regions tend to vote "left," it was at first assumed that the Communists were behind it. But the whole campaign, with its xenophobic and anti-semitic undertones, soon revealed another tradition—that of the semi-fascist leagues which flourished in France before the war and have now apparently revived. These leagues often proved ephemeral, and there is little likelihood of a Poujade *putsch*. The French parliamentary parties, however, are quite genuinely worried by his tremendous popularity.

Transatlantic Investment

THERE have been many studies of the extent and obstacles to American private investment abroad, but the report recently published by the OEEC is of more than ordinary interest. It deals with both the OEEC member countries and their overseas territories. The total net outflow of private long-term capital from the United States to member countries in 1947-53 comes out at the depressingly low figure of \$688 million. And when allowance is made for the flow back of interest and dividends, which in this area is virtually uninhibited, there is over the whole period an actual shortfall, representing a net loss of dollars on this account, of \$322 million. But this pessimistic conclusion must be qualified in two ways. First, though there is no quantitative means of measuring it, the many new American investments have played an important role in reducing dollar expenditure or in adding to Europe's dollar-earning power; the American-financed oil refinery programme comes immediately to mind. Second, there are the reinvested earnings of American corporations in Europe, which over the seven years add up to \$904 million.

American private investment in the overseas territories

COMMODITY REPORTS

Special and regular reports on the supply and demand position and on the price and market prospects for most commodities can be prepared for individual clients by our Commodities Department. Scope, length, frequency and cost are determined by clients' needs.

Further information from:

The Economist Intelligence Unit
22 Ryder Street, London, S.W.1.
WHITEHALL 1511, Extension 12.

has been little more encouraging. The net outflow was only about \$350 million, although reinvested earnings in the territories totalled \$195 million. In the overseas territories, American private investments have been evenly spread over the area, but they have been heavily concentrated on the petroleum industry.

The OEEC points out, rather obviously, that "the main responsibility for taking action designed to stimulate private investment rests upon those countries who wish to attract such investment." (Measures to be taken by the United States government itself were outside the scope of the report.) But, as the report shows, so much progress has been made by the OEEC countries in facilitating by specific administrative and legal actions the inflow of foreign capital, that little more can be done to woo the American investor by these means. Clearly the greatest incentives now are the maintenance of prosperous business conditions, the removal of currency restrictions, and the creation of an environment of political safety and stability. As a handbook describing the situation and status of foreign investment in member countries and their overseas territories the OEEC report should be of real use to the interested businessman. One shortcoming, however, is the scanty treatment of the prospects of American portfolio investment—the sale in the United States of foreign issues. The report shows that, whereas in the 1920s more than two-thirds of the private long-term capital exported from the United States went into portfolio investments, since the war only about a fifth has taken this form. Recently a trend towards this type of investment has appeared, and the OEEC could usefully have devoted a part of the report to the prospects and the machinery of this type of investment.

Sulphur out of Mexico

FROM A CORRESPONDENT IN MEXICO CITY

HOPEFUL Mexicans are expecting their country to become the world's second largest producer of sulphur by the end of this year. Even if that goal is not reached, the swift development that is now in hand will make a big difference to the country's earnings of dollars. It will also considerably change the picture of world trade in sulphur, which is at present almost wholly dominated by American production; and as the great Louisiana and Texas domes dwindle, the United States itself seems bound to turn increasingly to Mexico to supply its mounting demand.

Twenty years ago, Mexico produced barely 3,000 tons of sulphur a year, which was obtained from San Luis Potosi, in the northern half of the republic. The scene of the big new boom is the Tehuantepec isthmus in the south-east, where exploration and preliminary work, initiated before the war, has been greatly speeded up in the past five years. Of the three main companies at work in the isthmus, all of them backed by United States capital, the Texas Gulf company holds concessions that embrace deposits of over 20 million tons, Panamerican Sulphur has located what is claimed to be the larger salt dome in the world near Acayucan with reserves of 30 million tons, and Mexican Gulf Sulphur, with proven reserves of over 11 million tons, is reported to have made a new strike that may place it

ahead of Panamerican. Mexican Gulf, the first of the "big three" to start active production in the Tehuantepec area, produced about 100,000 tons of sulphur in 1954. Its plant capacity is 200,000 tons, which is to be raised to 500,000 a year. Its sales manager predicts that total Mexican production will exceed a million tons by the end of 1955—which, at current prices, would mean a gross value of \$28 million. More conservative observers, however, estimate 1955 exports at something like 500,000 tons.

The three chief companies, whose investment in preliminary investment and construction is well over \$16 million, have agreed to pay production taxes amounting to 15 per cent of the product's value and to provide for local needs before exporting any. According to the Department of National Economy, the consumption of sulphur in Mexico is now about 51,000 tons; it is used chiefly in the production of insecticides, fertilizers, chemical products, sugar and paper. The official estimates indicate that industrial and agricultural requirements will increase present consumption by 300 per cent during the next few years.

Argument over Export Policy

There are already strongly conflicting views on the advisability of exporting sulphur on a large scale. Those in favour stoutly insist that sulphur exports could be a major source of foreign exchange. Their opponents, on the other hand, maintain that Mexico should conserve its sulphur reserves against the threat of exhaustion in the United States and elsewhere. Walking a diplomatic tight-rope between the warring groups, the Secretary of Economy, Sr Loyo, said that domestic needs will be given priority over exports. Even if Mexico's internal consumption should rise to 250,000 tons within the next five years, it is estimated that the production of the Tehuantepec domes will by that time fully supply the domestic market, with more than a million tons exportable surplus each year as well. For the moment Mexico's needs are small, and the Poza Rica sulphur extraction plant of *Petroleos Mexicanos* (the government oil monopoly) built at a cost of 90 million pesos (\$7,200,000), is in fact producing almost enough for domestic needs. Its daily production is now around 140 tons, and this will be increased to 200 tons by the middle of the year.

The sulphur in the Tehuantepec area is being extracted by the Frasch process which pipes steam into the ground to melt the yellow mineral and force it to the surface in liquid form. This is the first time the Frasch process has been used outside the United States. Coatzacoalcos, the port of Veracruz, is being developed as a major seaport for Tehuantepec sulphur. A huge dock and a large power plant are under construction, and a building boom is under way. The entire isthmus should enjoy the period of progress and prosperity which it did not achieve half a century ago when the nation's first oil wells were drilled in this same region. Incidentally, some oil wells in the area have begun flowing again as a result of the sulphur extraction, and technical crews of *Petroleos Mexicanos* are exploring the possibilities of starting up commercial production again.

★

Correction: On page 373 of *The Economist* of last week some planned figures for 1954 were erroneously given instead of actual, production figures. Output for 1954 should read: watches and clocks 15,745,000; sewing machines 1,275,000; bicycles 2,415,000.

THE THINGS WE DO FOR YOU - I

We don't know

whether you
yourself ever give us orders (we may not be in

your line of country at all) but directly or indirectly we
nevertheless do quite a lot for you.

what we do

is to
design and build engineering equipment for many essential industries on which you depend for this and that. You would have less gas and smokeless fuel, for instance, without Simon-Carves coke ovens, and more dirt in your coal without Simon-Carves washeries. Some of the things you buy would cost a little more but for the economies derived from Simon mechanised materials-handling installations. If all the machinery driven through Turbine Gears were suddenly stopped, it would hurt you somewhere, somehow, some time. And Simon-Carves power station boilers help to generate the current that runs the electric railways and your television set.

coal washeries . coke ovens . power stations . heavy chemical
and gasworks plants . metallurgical plants . materials
handling plants . industrial gears . flour and provender mills
and many other specialities.

DEAR MR. NU-SWIFT,

Of course, we've some fire extinguishers, but are they up-to-date? Please ask your man to call and check them—ahead of that Fire Fiend!

Name.....

Address.....

MAIL NOW to Nu-Swift Ltd., Elland, Yorks.

*Aluminium
Alloy for
Lightweight
Passenger
Coach
Construction*

This pioneer South London line train, originally fitted with pantograph power pick-up was in service from 1910 to 1954.

A notable feature of its construction was the use of aluminium panels.

Aluminium alloys are now used in many countries for railway application where light weight and strength can lead to operating economies.

THE BUSINESS WORLD

Hire Purchase Gallops On

AS the Governor of the Bank of England took a gentle tug at the credit reins last Thursday he may well have thought that hire purchase was one of the over-exuberant horses in the team. Two of the bank chairmen had earlier pointed to the growth of instalment trading as a probable sign of inflation. Its growth during 1954 was certainly exceedingly rapid. It now dominates the market in furniture and television, claims half the market in radio and is beginning to spread into fields where hitherto it had no footing in this country, such as airline tickets and holiday expenses. All these types of instalment trading can pass as "hire purchase," though in law they are not. In hire purchase, title to the goods does not pass until the buyer completes his instalments; if he defaults he can be sued for return of the goods. But no one is going to sue for the return of a used aircraft ticket or a half-worn suit. The air travel plan, holiday plans, and some of the clothing schemes are simply extended credit transactions. But they all shared in the expansion of 1954—an expansion known to be great, but difficult to measure.

Restraint of instalment trading was by no means the first object of the Bank rate increase. Its first service was to reinforce the pound and the curbing of specific inflationary excesses was a means to that end. Hire purchase is inflationary if it diverts resources towards consumer goods, and in recent months, when the productive machine has been at full stretch, hire purchase must have had some influence in diverting into home consumption goods that could be better exported to earn currency.

Against such tendencies, a $3\frac{1}{2}$ per cent Bank rate offers some kind of brake. Hire purchase finance houses will have to pay a higher rate on bank money. Recently they have been paying about $4\frac{1}{2}$ per cent; now they will pay $4\frac{3}{4}$ per cent. It is easy to exaggerate the specific

effect of such a minor deterrent. Few houses use bank money and nothing else in their business. Unless the cost of deposits obtained from non-banking sources also rises the effect of a half per cent rise in Bank rate will be small. The companies that advertise for deposits from the public continue to offer 5 and 6 per cent.

The effect of higher interest rates where the hire purchase contracts are carried by the trader and not discounted with a finance house is less easy to assess. If the trader is using a bank overdraft raised on the general assets of his business he may feel inclined to pass over a greater proportion to finance houses and retain less for himself. If he is using money that was surplus to his other requirements he will no doubt still find hire purchase good paying business. When he manages in effect to use his suppliers' money by paying for his goods on a bill instead of cash the suppliers may dislike the proceeding even more than they already do. But often, for one reason or another, they will have no option. In the bicycle trade, for instance, the three main manufacturers are related to specialised hire purchase finance houses financing their own makes.

The general view of the trade is that an increase of only $\frac{1}{2}$ per cent in Bank rate will have only a minor and delayed effect on the growth of hire purchase: it will certainly not reverse that growth. The charges made for hire purchase finance are high, but not so much because of interest as because they contain a large factor for administration and collection. A minor change in the interest factor will usually be small in relation to the total charge.

It is impossible to make more than an informed guess of the size of hire purchase indebtedness in this country. The statistical material is deplorably thin: HP Information produces good figures for numbers (not values) of cars and other vehicles sold by hire-purchase

and some much less good figures for a limited range of other durables. The Radio and Television Retailers' Association publishes a figure, based on a sample, of hire purchase sales per shop, expressed as a percentage of total sales. For furniture and bedding—probably the largest single item in the hire purchase account the material is still thinner, nor is there any guide for the substantial business done in agricultural, industrial and

public works machinery. A rough guess puts the total outstanding debt at the end of 1954 in the range of £350 million to £450 million. There is a strong preference for the higher figure because there are no figures from the Gas and Electricity boards later than March. Even so, it excludes all machinery; the total hire purchase debt must exceed—perhaps substantially—£450 million. It must have grown during 1954 by a sum of the order of £100 million.

Last year was indeed a time of formidable—and to some, frightening—expansion. But that expansion did not result purely from the removal of the Board of Trade control orders, the Treasury instructions to the Capital Issues Committee and the Treasury request to the banks. The expansion was already in progress before they disappeared. Removal of the controls merely threw open a sluice gate through which more than a trickle of increased business was already leaking: hire purchase of new motor cars jumped from 9.1 per cent of the home sales in 1953 to about 14 per cent in 1954, but, controlled though it was, the hire purchase

share of the new car market had been rising every year since the war.

But big, new resources have been laid open to the hire purchase finance houses, and those resources have been rapidly absorbed. The doors of the clearing banks swung open to the strong finance houses. Nearly all the finance companies that are quoted went either to the market or to their own shareholders for extra capital. Big deposits, private and institutional, also continued to flow towards the hire purchase finance houses attracted by more favourable rates than the banks' deposit rate. The mass of small finance companies continued to grow. It was widely expected that with the restrictions removed competition would grow more severe, that some of the smaller finance houses would feel the pinch.

To an extent competition has grown; there are at least just a few small finance houses that could do with more business, but there are far more than could still use more money if they had it. Competition has not become acute. It has shown itself not in rate cutting nor in willingness to do more business without recourse to the trader, but in longer credits, smaller initial deposits and, above all, in the new ability of the hire purchase financiers to "help their customers." Under the old Board of Trade regulations, minimum initial deposits for a group of commodities (not including furniture) were fixed (usually at 33½ per cent) and lengths of contract were controlled. Now contracts are growing longer. With the nationalised boards they run up to several years and with good motor cars up to 3 years. Hire purchase finance houses can, moreover, extend the term for a customer who is in difficulty. The bald statement—itsself true—that the rate of default is as low as about ½ per cent in general and barely ¼ per cent on cars needs qualification. The percentage in arrear is higher.

Hire purchase finance is still a booming business earning rates of interest good enough to make any financier's mouth water. The quoted rate on aircraft

SAMPLE HIRE PURCHASE TERMS

The charge is normally quoted per cent per annum on the amount outstanding after payment of the initial deposit (if that is substantial). One formula for converting to a percentage of the actual debt outstanding is:—
Quoted charge $\times 2 \times$ number of instalments $\div$ (number of instalments + 1).

Item	Deposit	Contract	Quoted charge	Actual rate per annum
Motors new	25-33½%	up to 3 years	7½-9	up to 17½
Motors Old, Second-hand	high	up to 2 years	7½-9	up to 17½

tickets for example is 11 per cent over a maximum of 21 months and equal to about 21 per cent per annum on the average debt. Powerful financial interests are still crowding into it. The purchase of Scottish Midland Guarantee Trust by the Commercial Bank of Scotland and the purchase of a controlling interest in Mutual Finance by Thomas Tilling are recent examples. The hire purchase shares quoted on the Stock Exchange have also prospered.

It is unlikely that saturation or even stability has yet been reached. The evidence points rather to a big social change being copied from the other side of the Atlantic. It has its undoubted risks. To spend current income up to the hilt and then pay for a holiday by instalments long afterwards offers a hostage to fortune. But hire purchase also has its advantages in a vigorous expanding economy. If refrigerators and television sets, for example, had to remain articles of luxury with restricted markets in this country, it is

probable that costs of production would be higher and British competitive power in world markets less. Mass demand for mass-produced durable goods implies some development of consumer credit. But the safe expansion of hire purchase also implies that individual commitments are kept within the individual's means, and that the terms should be known to the hirer.

If it is true that acts of policy like changes in the Bank rate can retard or accelerate a major trend, but cannot make or break one, then the growth of hire purchase should become healthier and a little more restrained with slightly dearer money, but hire purchase houses have still a bright future before them. Certainly it has been wise of the authorities to accept hire purchase as an economic fact and (within reason) as an economic incentive. They have not sought to rebuild the ramshackle edifice of specific restrictions against this type of trading. Control will be much better effected by competition and monetary policy.

Cottons to Lancashire

NOT many years ago India was still Britain's best customer for cotton textiles. That status was swept away on the tide of nationalism following self-government, but Lancashire had seen that happen in so many countries before that it bore the loss with resignation. What Lancashire did not foresee was that one day its own home market would be threatened by imports of Indian cloth, and that India would become a serious competitor in British Colonial markets. Since India abolished the export duty on medium qualities of cloth late in 1953, its exports to Britain have risen sharply, and Britain now ranks with the Colonies as India's best customers. The boot is now on the other foot, and the other foot firmly on Lancashire's anatomy.

Lancashire naturally resents that invasion, though it has apparently thought it pointless to demand govern-

ment action to limit Indian penetration into Colonial markets. With all the vigour it can command, it is pressing for restrictions against Indian imports into Britain. The argument rests on two main grounds. Firstly, that India, while enjoying the right of duty-free entry into Britain, imposes high—albeit preferential—duties against British cloth; secondly, that exports of Indian cloth are in effect subsidised.

Until last September the Indian government severely restricted imports of cloth by quota; imports from Britain were kept down to a trickle of some 5 million yards a year, a figure which looks ludicrous against the 130 million yards of Indian cloth—mainly in the grey unfinished state—sent to Britain last year. Then, partly perhaps in response to the request of the British government, India relaxed quantitative restrictions against

British cotton piece goods, but it maintained the preferential tariff at the punitive level of 60 to 80 per cent *ad valorem*, which compares with the standard rate of 100 per cent on foreign goods. There is no evidence so far to suggest that any significant volume of British textiles can vault that tariff wall. Plainly such a policy falls far short of reciprocal trading. If, as the Indian government maintains, the tariff is now simply a revenue duty, then revenue should gain rather than suffer from a reduction in the scale. And it is hard to believe that India's overseas balance of payments now precludes a more liberal attitude to imported cotton goods.

The second charge arises because India has long controlled the domestic price of its raw cotton and prohibits the export of all but a small proportion of the crop. Prices are free to fluctuate between a floor and a ceiling, but the range is well below prices of similar cotton on the world market. The result is that Indian mills enjoy a cheaper raw material than their competitors in other countries—an advantage equal to about 3d. a yard on a standard cloth that would normally cost about 15d. a yard. The purpose of that control is to ensure adequate supplies of cheap cloth to the Indian public, but the incidental effect is to give a powerful shove to India's export trade. It is difficult to bring that control within the normal meaning of subsidy: it is open to India to price its raw cotton at a low level just as it is open to America—which is the dominant influence in the world market—to hold its cotton prices at a high one. But it is understandable that Lancashire's spinners and weavers should feel that the Indian mills have an unfair advantage over them.

Imports of grey cloth are nothing new in Britain. The output of Lancashire's mills is normally inadequate for the needs of the merchants, and has to be supplemented by imports for finishing here and re-sale at home and abroad. In times of booming demand, such as 1951, imports of grey cloth rose sharply to 340 million square yards; that brought no yelps from Lancashire mills, then fully employed with long order books. The picture is different now. While home sales are fairly satisfactory, exports are falling and order books are contracting. Imports of foreign grey cloth, particularly from India, are squeezing profit margins and "undermining confidence"—always a frail plant in Lancashire. Instead of supplementing home production, imports are now competing with it.

But before Lancashire's plea for the restriction of Indian imports is accepted, two things should be considered. Roughly half the total imports of grey cloth appear to be reaching the home market after finish-

ing; the other half is re-exported. If imports from India were reduced home-produced goods would probably fill most of the resulting "gap" in home supplies. In the export markets it is harder to assess where the balance of advantage would lie. Some Indian cloth, after suitable finishing, meets requirements in overseas markets that Lancashire might well find it difficult to supply; to that extent Britain's total exports would suffer. But a bigger proportion of overseas requirements could probably be supplied by the home mills if they were prepared to quote more competitive prices.

The second consideration is that the benefits of restriction have to be weighed against the possible repercussions on the Anglo-Indian trade agreement and therefore on all British exports to India. That agreement may already be strained by the government's decision to protect the jute industry in Dundee against competition from cheap Indian goods. (Lancashire is entitled to ask how the government can grant protection within the Commonwealth to a small industry like jute and refuse it to a great one like cotton.) Restriction of imports of Indian cloth might, however, lead India to seek the re-negotiation of the trade agreement, and the British government would dislike that at a time when Britain and India are not moving closer together politically or commercially.

Lancashire's particular complaint against Indian cloth reflects a more general fear: that while struggling to hold on to its overseas markets it will not be able to rely upon a home market protected against substantial imports from India or any other country. That fear may be exaggerated, but it is more than a little sad. A bare generation ago Lancashire's great industry clothed the world; its exports dominated the British trade returns, and the home market took but a tithe of its production. It would have laughed at the idea that it could be taken to task on its home ground.

Today it is shouting for protection in the home market, and the government may be hard put to refuse it. It will move reluctantly and only if Lancashire is faced with serious unemployment. Protection against India is a gift that is inconvenient to make—costly to Anglo-Indian trade relations and contrary to British policy of seeking to maintain minimum tariffs within the Commonwealth. Nor would protection provide

any solution of Lancashire's main problem—the problem of a big but contracting industry that has lost its bulk markets for cheap goods. The solution—if there is one—is more likely to be found in vigorous innovation and specialisation, rather than trying to cling to the cheaper end of the trade.

Business Notes

Taking the Highroad

How much more does the Government really intend to spend on the road system? It is not easy to disentangle the answer from the broad outlines of the programme that Mr Boyd-Carpenter announced this week and the overlapping sub-divisions of annual commitments and expenditure by central and local government. Some figures, assembled or inferred from official estimates and statements this week, are brought together in the accompanying table with the most recent actual figures available; they are of most varying quality, largely because the official statements are so contrived as to make comparisons difficult. This is the third increase in spending on the roads made by the present government, and by far the largest; it roughly implements, and fills in the details of, the promise to double or treble former plans made by Sir Anthony Eden in the debate on the Queen's Speech.

ESTIMATES OF ROAD EXPENDITURE
(£ million)

	Actual 1952-53	Estimates				
		54-55	55-56	56-57	57-58	58-59
Major improvements and new construction:—						
Government:—						
Authorise	3.5	19.3	27		120	42
Pay	2.8	5.0	8.25	17	30	
Local authorities pay	2.6	4	4	5	6	8
Maintenance, minor improvement, cleaning and administration:—						
Government pay	27.8	30	30	30	30	30
Local authorities pay	51.8	50	50	50	50	50
TOTAL	85	90	90-95	100-105	110-120	125-135

The central government is responsible for the whole cost of trunk roads, and for half or more (the percentage varies) of the expenditure on first, second, and third class roads. In the present financial year, under the slightly increased programme announced in December, 1953, rather more "major improvements and new construction" (a high-sounding label that may mean no more than the buying of a scrap of land to widen a road) seems to have been authorised by the Government; but the actual amount spent by it and local authorities is probably still well under £10 million.

Four Years' Journey

At the end of this financial year, the Government expects to have about £23 million of outstanding commitments "authorised but not spent" on major improvements and new roads. During 1955-56, under the new programme announced this week, projects involving £27 million of central government expenditure will be authorised; but only £8½ million of this—implying perhaps £12 million in all, counting in the local authorities' spending—will actually be spent. In the three following years, authorisations for £120 million more on such work (including £15 million for the first part of the London-Yorkshire motorway that has now been decided on) will be made by the central government: its spending will rise to about £42 million in the financial year 1958-59. It was suggested that by that year expenditure by local authorities "under the new plan," in addition, would reach £30-£40 million; but this clearly includes the grants from the central government to these authorities, and in fact over the whole four-year period the extra amount provided from the rates for major improvements and new roads is not likely to exceed £25 million. This is, of course, not all that either group of authorities spend; minor improvement and maintenance, in addition to the above, is now costing the Government about £30 million a year and the ratepayers about another £30 million (which the local authorities might reasonably be tempted to reduce). Road cleaning and administration, almost entirely paid for by the local authorities, cost roughly £20 million a year more.

By early 1959, therefore, the Government intends to have spent about £100 million on major improvements and new major roads, and local authorities may have added about £25 million to this. It will by then have authorised the expenditure of £75 million more than it expects to have spent, and is committed to a further £50-60 million on its new motorways and the subway or bridge across the Firth of Forth. More vaguely, it is committed to a level of actual expenditure on better and new roads "at least on the scale [Mr Boyd-Carpenter] indicated—until the roads of this country are adequate for the traffic they have to bear." This is a sizeable beginning; more time is required to arrive at even an approximate assessment of its adequacy.

Sterling Unaffected

THE sterling exchange rate has made no measurable response yet to the rise in Bank rate and to the accompanying movement in open market discount rates. A modest

volume of additional Dutch, Swiss and American money has been attracted to London for short term investment by the higher bill rates, but the spot rate for sterling in terms of dollars remains at around \$2.78½. This inflow of foreign money has, in the normal course, been covered by appropriate forward sales of sterling and the evidence of these operations is the appearance of a slight discount on three months' sterling against dollars, whereas at the beginning of this week the three months' rate hovered on either side at par.

What is more serious is the fact that transferable sterling has shown no sign of recovery from the level of around \$2.72 at which it stood before the Bank rate move. The persistence of a substantial discount on transferable sterling is itself the main reason why the sterling rate in the official market has not recovered. It makes possible the steady stream of commodity shunting operations that deprives Britain of a corresponding flow of dollars from sales of sterling commodities to North America. The use of transferable sterling shows signs of spreading rapidly and ominously. It is now not only a question of commodity shunting by private merchants on the Continent; even European central banks are helping themselves to sterling when they need it, not through official channels but through the transferable sterling market. That market has, in effect, become the principal source of commercial sterling. If there is a big demand for transferable sterling why does the substantial discount below the official rate persist? The answer must be a substantial leak of sterling from sterling area to transferable account countries. The obvious channel would be excessive current expenditure by sterling area countries in the non-sterling and non-dollar world. If the countries in which this expenditure is being incurred are those of Western Europe, the ultimate settlement should be made through the European Payments Union. Some of the recipients of this sterling, however, may not be prepared to hand it over to their central banks, but may be "flogging" it against dollars in the transferable sterling market. Whatever the explanation may be, it is evident that all non-resident sterling is in effect convertible into dollars at a floating rate. In fact, it can be said that the exchange market's response to the advance in Bank rate has not yet conformed with tradition and precedent.

Investors March On

IT is not true to say that the rise in Bank rate has had no effect at all on investment markets, for just before the increase the gilt-edged section was unhappy, and had it been left guessing, it would doubtless have guessed itself downwards. But it is true that the traditional deterrent to commercial and financial exuberance has not even slowed down the general market advance. A week after the event equities are scaling new peaks: the *Financial Times* index jumped 2.8 to a record point of 196.7 on Wednesday, the first day of the new account, and moved still higher to 197.5 on Thursday. Gilt-edged stocks at first behaved as though a reduction instead of an increase in Bank rate had been announced. Until Thursday evening this week they were moving upward, and the big institutional buyers were

in the market, though not on a big scale. What is significant in their operations is that more of them appeared to be switching from the shorter to the longer dated stocks than in the reverse direction. The rise was not however maintained on Thursday.

The gilt-edged market drew encouragement from a wide variety of facts—that the banks in London were buying bills at about 2½ per cent, which was a lower rate than some dealers had expected, and that the gold and dollar figures, poor as they were, could have been worse among them. Significantly the short-dated gilt-edged stocks, though universally tipped for a further fall when Bank rate moved, shared in the general recovery.

So it is business not as before, but better than before Bank rate was moved: industrials at least are rising fast with the "blue chips" in the lead; long-term fixed interest money is not so noticeably altered in price; commodity prices continue to show more advances than falls. On that basis it is hardly surprising that the repercussions of the change outside the narrow confines of the markets are not—at least not yet—perceptible. The flow of new issues continues unabated. The Public Works Loans Board has given no indication so far of any intention to alter its lending rates to the local authorities, nor do its rates regularly move with Bank rate. It was a near shave, but not impossible, for City houses to float public local authority issues in competition with the Board's 3½ per cent long-term rate before the change. Presumably it is still possible. The building societies as a whole are making no change in rates either paid or charged for money. The one possible exception, the Halifax, had rates under discussion at its normal board meeting on Wednesday, but did not disclose the result.

The New Money Rates

THE discount market responded rather more vigorously to last week's increase in Bank rate than many people had expected. Since the Treasury bill rate had risen by roughly ½ per cent in the preceding two months, it has been thought that the market might make only a small further adjustment, but in fact it raised the discount basis of its tenders for last week's Treasury bills by almost ½ per cent. It is questionable whether discussion about the possibility of yet another rise in Bank rate played any part in this decision. A more material consideration may have been that at that stage the market was still not able to gauge clearly the likely effect upon its borrowing costs of the changes that had been made in the pattern of short money rates. It then seemed possible that the cost of Treasury bill money might rise by more than the ½ per cent increase that has been made in the clearing banks' minimum charge, because the recent practice of the banks of trying to lend a larger proportion of their money at rates above the minimum now seems to have been generally established. This week it appears that only the so-called "good" money has been lent at the new discount rate of 1½ per cent, while renewals of other money have been charged at 2½ per cent, and floating "fresh" money has commanded the rate of the day. This tendency to increase the average cost of Treasury bill money is, however, coupled with a much smaller rise in the cost of loans secured by short bonds or commercial bills, the

UNITHERMITY

Thermal uniformity is an important factor in assessing the true cost of your fuel. The heating value of gas is constant, predictable and guaranteed by law. It makes possible precise budgeting, reduced spoilage and better quality goods. Gas saves in other ways. Your bill shows precisely what you use. You do not have the space-and-labour problems of

storage and handling because gas comes direct to the point of use, clean, flexible and easily controlled. To the time-honoured advantages of gas are now added the benefits of modern research—new methods, more efficient appliances. The Gas Industry would welcome the opportunity of bringing the latest thinking on gas to bear on your fuel problem.

Course with effect

THE first step towards best results is to consult your Area Gas Board. The services of the Boards' Industrial Gas Engineers are free and are backed by the full resources of the Gas Industry through the Gas Council's Industrial Gas Development Committee. To get things moving, you may like to have this coupon completed and sent to your Area Gas Board or to the Gas Council, 1 Grosvenor Place, London, S.W.1.

WE NEED HEAT FOR 87

The Gas Industry makes the fullest use of the nation's coal

basic clearing bank charges for which have been raised by only $\frac{1}{4}$ per cent and $\frac{1}{2}$ per cent respectively.

The new bill rates have proved attractive to "outside" competitors of the market. At the Treasury bill tender itself non-market applicants cut their tender price less sharply than did the discount houses, with the result that the average discount rate for the whole allotment rose by only a little more than $\frac{1}{2}$ per cent to £2 6s. 7½d. per cent, and the discount houses secured a much smaller proportion of the allotment than usual. This has made them reluctant sellers, and enquirers for bills from Canada and some continental sources are understood to have offered rates down to 2½ per cent. Some easing of the Treasury bill rate, therefore, now seems probable—even though the behaviour of sterling in the exchange market is still causing discussion about a further rise in Bank rate eventually.

The Boom in Profile

INDUSTRIAL output in Britain has now been rising without interruption for two and a half years. Between mid-1952 and mid-1953 the rise was as high as 9 per cent; in each of the calendar years 1953 and 1954 the increase was about 6 per cent; in the last quarter of 1954 output was only about 4 per cent higher than a year before. This slackening in the momentum of increase was inevitable; it is perhaps remarkable that it took so long. In the middle of 1952, British industry was at the bottom of what it has become fashionable in America to call a saucer of recession, and the point on the subsequent upward curve where one stops talking about recovery and starts talking about boom, even in hindsight, is a matter of taste. But for a year or more men and capacity, in most industries, have been fairly fully employed.

Capacity is an elastic term; how much overtime, how many shifts, and how long is a rate of output to be maintained? Moreover, investment is coming to fruition all the time; and moderate spending here and there can enable much more to be squeezed from unchanged plant than its former conventional "capacity" would suggest. It may be that large expenditures incurred after the Chancellor introduced the investment allowance cannot be expected to contribute to output for a year or so; but much of this short-term improvement will continue to accrue in the meantime. Several of the industries that bulk large in the index of total production—steel, motors, and chemicals—are talking of further major increases this year, not merely of plans to expand. On the demand side there is no sign of hesitation in the home market, nor any real reason to work up too much anxiety about exports. As ever, the economy is under vigilant scrutiny for shadowy signs that "it can't last"; so far, they can't easily be identified.

Coal In and Out

ABOUT 3 million tons of coal have been imported into Britain so far this winter, but the country's stocks in hand are still 3½ million tons lower than they were a year ago. Officially, it has been announced only that Britain

intended to buy 4 million tons during the winter; in fact, the National Coal Board has ordered much more, and hopes to land 200,000 tons a week or more from now until the "coal winter" ends in April. With these supplies arriving, the absolute level of stocks loses some of its significance. Barring exceptionally bad weather lasting exceptionally long (and it is worth noting that a fortnight of very cold weather brought the average temperature for the first three weeks of 1955 no less than 6 degrees below the figure in 1954) there will be enough coal for the rest of the winter. Stocks today are significant perhaps mainly as an omen for 1955-56.

No decision has been officially announced to allow the Coal Board to cut exports, but reports from abroad suggest that importers have been offered less coal this year. The loss on each ton of imported coal is mounting with freight rates, and pricing American coal out of the European market. This may fortify the Government against shipowners' criticism of its decision to buy Mr Stassen's coal, half of which must "travel American," for sterling. The price of this coal, which will have to be paid later in exports to such countries as America decides to aid, rises with international freights, but at least it does not take dollars.

The two-handed operation of buying expensive coal abroad and selling it at a loss which considerably exceeds the premium earned by selling British coal overseas is obviously financially embarrassing for a board that is legally bound at least to break even "on an average of good and bad years." The accumulated deficit of the Coal Board, indeed, is roughly equal to the amount it has lost on imported coal. This effect upon the board's finances, however, is hardly the most powerful argument for a cut in exports, since both the loss and the premium are determined by an artificially low level of coal prices in Britain. The decision whether Britain should hang on to its goodwill in the international coal market depends much more upon assessment of demand for coal here, and probable supplies; will this country ever have enough coal to spare to become a significant exporter again?

Whitehead Iron

A NEW chapter in the unscrambling of steel nationalisation opens next week with the offer for sale by the Iron and Steel Holding and Realisation Agency of 1,250,000 £1 ordinary shares in the Whitehead Iron and Steel Company at 55s. per share. The consortium of eight leading issuing houses and six leading stockbrokers has been put into cold storage; a single issuing house (Baring Brothers) is employed with three stockbroking firms. The device attributed to Sir George Erskine, of Morgan Grenfell and Co., of requiring underwriters to make firm applications equal to the amount of their underwriting has also been dropped in favour of conventional underwriting. The Bank of England no longer appears on the offer for sale. These changes recognise the fact that the Whitehead offer is much the smallest public offer that the agency has yet made; it involves £3.4 million; the consortium with full regalia only swings into action at the £5 million level.

But as a straightforward offer on conventional lines the Whitehead Steel offer deserves, and will receive, an adequate response. The company is not strictly a steel producer; it

is a leading re-roller with an excellent record. There is no heavy development programme. The agency has not had to put money in; it is on the contrary taking cash out. The estimated profit allowing for some recession from recent high achievements is £800,000, and the estimated annual dividend rate of 17½ per cent is well covered. The issuing house has naturally to accept Treasury 3½ per cent stock, 1979-81, in payment, and therefore for a moment to perform one of the normal functions of the Bank of England;

it has also to offer preferential allotment to former shareholders. But there has been no obvious attempt to encourage either the stag or the small applicant. Application money is 20s. per share; all the balance is payable on March 7th.

This, in point of size the most humble of the steel offers, has two features of interest. The shares are offered at the lowest initial yield that the agency has yet attempted, namely, £6 7s. 3d. per cent; this is quite in line with yields now obtainable from the giants in the steel share market. Secondly, the agency openly takes a substantial profit above the price at which the Whitehead company was nationalised. The company was nationalised for £4.8 million. The offer will yield gross £3.4 million; the agency retains £1¼ million of 4½ per cent debenture stock 1970-85 that it will presumably be able to sell in due course for not less than par, and it has drawn out £500,000 tax free in cash. The prospective return to the agency is thus of the order of £5½ million.

The Unseasonal Deficit

THE sustained weakness of sterling through January did not, after all, cause an actual loss of gold by the sterling area. Thanks to a receipt of \$13 million in defence aid during the month the central reserves rose by just \$1 million. The market's worst fears have not been realised. But justifiable relief should not be allowed to obscure the considerable deterioration in the trend of the dollar accounts that has developed over recent months. This season, in which sales of sterling commodities are in full swing, should be marked by substantial surpluses both with Europe and with the dollar area; yet in November, December and January together there has been a net dollar deficit of \$9 million—compared with surpluses of \$135 million in the twelve months before and \$109 million in the corresponding

three months of 1952-53. The unseasonal deficit probably reflects in part an expansion of dollar imports—into both Britain and overseas sterling countries; it may also be a direct result of sterling's weakness, since the "commodity shunting" (described in the previous note) deflects dollar earnings on sterling area produce into foreign hands. Possibly because more sterling was being held in Europe on this account Britain's balance with the European Pay-

† After taking account of payments totalling \$99 million in mid-July direct to creditor countries in EPU in initial settlement of part of the UK's overdraft with the Union.

‡ After payment of \$112 million to IMF for "repurchase" of sterling.

§ EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

ments Union last month showed a surplus of £4 million in contrast with a deficit of £7 million in December. But monthly balances with EPU are settled only in the following month. The December deficit settled in January involved a gold payment of \$10 million, and was responsible for the whole of the dollar deficit on commercial account that month.

INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXXIII (October to December, 1954) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1.

Official Support for Gilt?

THE volume of credit has fallen less steeply at the start of the period of heavy income tax payments this year than in early 1954 or 1953—and analysis of the causes of this difference seems to lend a little colour to market suspicions that at times last month the Government broker was taking some of the strain of the pressure on gilt-edged. "Net" deposits of the eleven London clearing banks fell by £84 million in the first nineteen days of January (compared with a fall of £138 million in the first twenty days of January, 1954); but the true extent of the credit contraction is as usual exaggerated in these figures by the exceptional volume of intra-bank clearings (which cannot be separated from "net" deposits) at the year-end. If this factor is ignored, the private sector appears to have borrowed from the banks on commercial bills little more than it repaid on advances. In effect, therefore, the fall in deposits was wholly accounted for by repayments by the Government from the proceeds of its flush tax receipts. But the indicated repayments fell substantially short of the apparent net surplus on the Exchequer's domestic finances in the nearest comparable period, and only a moderate part of the difference is likely to have been attributable to the financing of the surplus on the external balance of payments. is indeed known to have given support to sterling in this period; and the fact that the Exchequer returns cover three days more than the banking period must account for some further part of the discrepancy. But there seems still to be an unexplained portion—which would imply that funds were being employed in the gilt-edged market.

Business at the Base

ONLY a sketchy outline of the arrangements under which British industrial companies will take over and manage the military base on the Suez Canal, as laid down in the Anglo-Egyptian Treaty signed last October, was dis-

closed in the official announcement this week. Five new companies are being formed to handle particular activities at the base:

Suez Contractors (Engineers) has already been formed by Vickers-Armstrong with a nominal capital of £10,000. It will look after the base workshops, which handle tanks and armaments.

Suez Contractors (Vehicles) will be formed by A. C. V. Sales Ltd., Austin and Rootes to handle the Ordnance Depot and Workshops for vehicles.

Suez Contractors (Ammunition) is being formed by ICI to manage the ammunition depot.

Suez Contractors (Electricity), formed by Balfour Beatty and Co., will handle water and power at the base.

Suez Contractors (Maintenance), formed by George Wimpey, John Laing, and Holloway Brothers, will handle general repairs and maintenance of the base installations.

These companies will be responsible to a Government Committee in London, known as the Suez Contractors Management Company. In addition to the new companies, the Shell Company of Egypt will continue to manage certain military oil installations there; while certain services at the airfield and flying base in the Canal Zone will be handled by International Aeradio.

The job these companies have to do is a large one. Under the Treaty the stores to be maintained may include 50,000 tons of ammunition, 300,000 tons of ordnance stores, 2,000 vehicles, 30 locomotives and 100 railway wagons. There is no limitation on the movement of stores from the base and their replacement, within these limits, and though the military stores brought in will be subject to surveillance by Egyptian customs authorities, they will be exempt from duty. The financial structure of the firms and the method of financing the base under civilian management, have not been disclosed. The industrial companies have agreed to work on a non-commercial basis; they will presumably be paid a fixed fee by the War Office. The question of taxation appears still to be under discussion.

The new companies are to be rather strictly separated from their parent companies, other commercial undertakings or representatives in Egypt. They will be exempt from the Egyptian labour laws; in addition to a considerable Egyptian labour force, the base is expected to employ about 600 to 800 British civilians, which means about 1,500 British people including wives and families. Whether men already doing these jobs in the Canal Zone can be transferred from the army to the civilian companies does not seem to have been settled.

Tea Prices Ease

AT long last the persistent rise in tea prices has been checked. Most grades of tea auctioned in London have recently fallen by 2d. or 3d. a lb; the Calcutta market has also weakened, though prices there are still somewhat higher than in London. The decline started when one or two of the big British blenders dug in their heels and cut their purchases. That prompted other buyers to operate more cautiously and prices fell. But it would be premature for consumers to raise a cheer. Blenders have only a small margin of manoeuvre, for they must buy enough tea in the

HULL ENGLAND

Lord Luke of Pavenham, T.D., D.L., J.P. As Chairman of Bovril Ltd. and also of the National Playing Fields Association, his time is at a premium. So, on his desk, always ready, you will notice his Dictaphone Time-Master dictating machine.

Dictaphone goes to work for Lord Luke

TO MEN of Lord Luke's calibre, time is perhaps the most valuable commodity of all. And it is for men whose time is precious that the Dictaphone Time-Master is made. This high-quality precision dictating machine is the most efficient office time-saver ever devised. By cutting routine in half, it makes possible astonishing increases in executive accomplishment. The executive—and his secretary—gets far more done, in far less time, with far less effort. The Dictaphone Time-Master dictating machine can save time in your office, too. For a demonstration and a free trial, write to Dictaphone Company Ltd., 17-19 Stratford Place, London, W.1.

Some features of the Time-Master

- ★ Only 4½" high, and scarcely larger than a sheet of typing paper.
- ★ Completely portable—and you can mail Dictabelt recordings in an ordinary envelope.
- ★ Amazingly simple—just pick up the microphone and talk.
- ★ Quick play back by simply pressing a button on the microphone.
- ★ Secretary can see corrections, letter lengths.

Revolutionary plastic Dictabelt records give permanent, visible recording; are the "inside secret" of the Time-Master.

THE ECONOMIST, FEBRUARY 5, 1955

next two months to tide over the gap in shipments from North India, the largest producer, from April to September. Last Wednesday's auction in London showed how small that margin is.

Competition increased again; prices were firm, and common tea rose by $\frac{1}{2}$ d. to 6s. 8 $\frac{1}{2}$ d. a lb. Moreover, the influence of Britain—as the largest buyer—in tea markets is less strong in times of shortage, for other countries are often willing to bid higher prices. No radical weakening seems likely unless production this season shows a significant increase, or consumers buy less tea. The prospective rise of another 1s. a lb in retail prices in Britain will test consumer resistance, but blenders will have to wait until the summer for an indication of the probable size of the North Indian crop.

Assam Contra Mundhra

THE tea shares recently so heavily bought by interests associated with Mr Haridas Mundhra, the Indian merchant reputed to be seeking control, came crashing down on the Stock Exchange on Wednesday. The Assam Company's £1 ordinary shares recently standing at 57s. were quoted 42s. 6d. to 45s. and were unsaleable at the price. The £1 shares of Jorehaut Tea Company in which his group has, it is believed, taken only a minor interest fell from 42s. 3d. to 40s., although tea shares as a whole were not falling. The decline coincides with the journey of Mr Mundhra to this country and the statement by one of his associates in Calcutta that it is desired to negotiate with the Assam Company's directors, but that an outright takeover bid was unlikely.

Recent speculative buyers of Assam shares tried to scramble out as they read into the reports that the struggle for control might come to an abrupt end, that Mr Mundhra and his associates, reputed to hold something in the region of 40 per cent of the Assam company, wanted no more than representation on the board and would not seek to move the domicile to India. The fall in the shares may well affect the voting at Monday's meeting when the company's scheme for loading the voting rights against any buyer who happened to obtain a majority of the shares, comes up for discussion. The board is reported to be happy at the number of proxies it is receiving, but it would be surprising if a determined buyer accepted defeat so meekly.

35 Year Mortgages

WITH houses, so with other types of merchandise, fashion favours long credits and easy payments. It is a habit of mind that divides the building society movement. In the advance guard of the easy payment party the Co-operative Permanent Building Society takes the lead; it has long made advances extending up to 30 years while

the general body of the movement makes 25 years its maximum and when a few of the extreme conservatives still try not to extend beyond 20 years. Now the Co-operative Permanent announces a further relaxation. It will make 35 year loans, and supported by a proper insurance will lend up to 95 per cent of the value of the house.

The scheme is not part of the joint arrangement for lending up to 90 or 95 per cent of certain house values, in which the risk is shared by the building society, the local authority and the Treasury. It is an arrangement solely between the Co-operative Permanent Building Society and the Co-operative Insurance Society. The building society advances its usual proportion of cost or valuation of the house whichever is lower. This is frequently in the region of 80 per cent and it extends the maximum duration of the loan from 30 to 35 years. The balance of the advance is insured with a single premium of 10 per cent on the excess. For example if the valuation of the house is £2,000 and the normal advance is £1,600, the prospective customer can obtain an advance of £1,900 by an additional once only premium payment of £30.

Is it a good idea? It certainly makes house buying easier, reduces the initial amount of capital that the occupier needs to put down and the amount of each monthly repayment. It fits neatly into the Government's pattern of bigger advances and less expenditure on housing subsidies. It is also the extreme limit of the building society mortgage range, not an example of an average advance. Allowing for resale of houses and consequent early repayment of mortgages the average life of a building society mortgage today is between 12 and 13 years. That life was down to 11 years just after the war when rocketing prices set owners chasing capital profits. But 35 years is a long mortgage and 95 per cent is a heavy advance. The building societies are booming ahead; need they compete in easier and still easier terms?

Lord Kennet on Dividend Increases

A REFRESHING exposition of dividend policy enlivens this year's report of the Union Discount Company—and it is the more refreshing since it comes from a company chairman who is also chairman of the Capital Issues Committee. Explaining the Union's "moderate" increase in dividend (from 10 to 12 $\frac{1}{2}$ per cent), Lord Kennet remarks: "There is an optimum of the amount of capital which can usefully be employed [in the discount market]. So long as that optimum . . . is maintained, it is to the advantage of the national economy that profits should be released as dividends, to add to the supply of capital available for useful investment elsewhere." This argument drives a strong nail into the coffin of dividend limitation. And Lord Kennet bangs it home with his further remark that "We believe that our shareholders, amongst whom are many institutional investors, are well qualified to make such reinvestments." After this enlightened defence of free enterprise in the capital market, it is tempting to ask: Is there really any further need for the CIC mechanism itself? That, of course, is not for its chairman to say; but his wisdom or dividends deserves study at the Treasury.

The Union Discount's balance sheet completes the record of the "Big Three" discount houses for 1954. As the accompanying table shows, the Union alone reduced its

bond portfolio over the year, but its bill portfolio rose sharply, partly reflecting, no doubt, the recent big expansion in the supply of commercial paper. The company's rediscounts at the year-end reached the record figure of £31.8 million, compared with under £20 million at end 1953.

Brand Name v. Kite Mark

GUERRILLA activities are being conducted in the textile industries against the British Standards Institution's latest efforts to promote standards for consumer goods. This week, a group of manufacturers of branded textiles announced that it was launching a "new consumer campaign" and had sent letters to the women's organisations inviting them to discuss means of "giving the public the fullest information about textile products and at the same time receiving at first hand their views and constructive criticism."

It is difficult to interpret this as anything but a counter move to the recent formation by the BSI of a special council on which consumers and distributors only are represented. What is it likely to gain? The BSI standards—especially those for textiles—are open to criticism, but the Branded Textile Group do not in fact appear to be offering any alternative safeguards, such as agreed methods of describing their goods, common guarantees of performance or of replacement, or even using a common mark so that the public can identify the members of this association.

Some members of the public may feel that if manufacturers are concerned about quality safeguards they could assist the BSI committees to improve the effectiveness of BSI standards. There ought to be no cause for antagonism between a good brand name and a respected BSI mark.

Sharp Rise in Tungsten

THAT volatile commodity tungsten ore has jumped in price by 25 per cent in a month, and wolfram is now quoted at about 250s. a unit (of 22.4 lb) cif Europe. The increase in demand has not been as sharp as the rise in price suggests, for on a narrow market—with some supplies still under long-term contracts—the re-entry of a few buyers can have an exaggerated effect. Consumption of high-speed steel and other cutting tools, which use tungsten in concentrated form, is certainly increasing in Britain and other countries, and some consumers have evidently allowed their stocks to fall too low. The increased demand for these steels has now passed back through the refiners of tungsten and on to the market for ore. The fact that the first sale from the Korean government's stock of tungsten failed to weaken the market may be less significant than it seems. The 250 tons on offer was sold to a New York firm, and it is not certain that it will all pass into consumers' hands. The stock accumulated after the United States government failed to renew its long-term contract with the Korean mines, and the market suspects that for political reasons the American authorities may take up any metal from this and subsequent sales that does not find a home.

Meanwhile, it is understood that British consumers have been informed that from the end of March they will no longer be required to take at least 25 per cent of their requirements from the stock held by the Board of Trade. The trading stock remaining after March will simply be on tap to consumers at the market price.

Debenhams Debenture

UNDISTURBED by the increase in Bank rate, the directors of Debenhams have gone ahead with their plans for raising fresh capital on a debenture. At the most the Bank rate change may involve a slight trimming of the terms of the issue, which have still to be announced. The Debenhams group of department stores needs about £6 million to cover the cost of a three years' programme of development and reconstruction. About £2 million will come from retained profits.

In finding the other £4 million the board had several choices. Piecemeal mortgages could have been created on some of the shop properties, but that method has been rejected. The main choice was between a debenture that will be a cost against earnings over a specified and limited period and a permanent, heavy rent roll. The directors could have taken a leaf from the share bidder's book, by selling some of the shop freeholds, turning into cash the hidden

reserves created by the difference between current property values and book values, and taken back those shops on long leases—but also at current rentals. The Debenhams board have chosen a redeemable debenture stock of £4 million, secured on a floating charge on the undertaking and its assets, as being less expensive and in the better long term interests of the company and its stockholders. Their choice is wise, if only because a temporary charge is better than a permanent burden. This new debenture will require some alterations in the articles of association, so as to set a new borrowing limit, which on the basis of the last balance sheet would be about £16½ million. Linked with this alteration are proposals to give the rights of preference shareholders a more modern look by establishing an average market premium (if any) over par as the value for repayment. The debenture should commend itself to all classes of stockholders—not least to ordinary stockholders, for it raises the gearing of an already highly geared equity.

Free Scrip from Ford

INVESTORS have grown accustomed to frequent free scrip issues from companies whose boards are more market-conscious than their fellows. They know what a scrip issue from such companies implies and discount it quickly in the stock market. But they are surprised when a company of the first water, both in industry and in the "House," waits less than twelve months to hand round a second free issue. They were certainly surprised when Ford Motor proposed another 100 per cent free issue, bringing the ordinary capital up to £39,024,248; it follows the similar 100 per cent distribution of last May. The new shares will not rank for the 1954 ordinary dividend. The £1 stock units in the four days after the announcement gained 7s. 10½d. to stand at 90s. 3d.

The Ford directors give the usual warning that the issue "contains no bonus element" and is merely a book-keeping transaction designed to bring issued capital in line with employed capital. But an issue of this size, requiring the capitalisation of £19,512,124 from reserves, clearly indicates a substantial broadening in the company's capital basis. The growth, past and prospective, amply justifies this. At the end of 1953 reserves amounted to about £22½ million. Investors will not fail to notice that the Ford company is taking this step at an early stage of its £36 million development programme, a programme which is to be financed entirely by ploughed back profits. The directors could hardly have decided upon this issue without believing that the capital to be ploughed back will quickly earn its keep. The "bulls" have a reason for looking for an effective increase in dividend payments—if not at once at least before long. Another thought must also have crossed their minds. It is that the ploughing back of at least £36 million in the next five years may ultimately result in yet another free scrip issue.

Olympus and Orpheus

AERO-ENGINE development has suffered fewer hold-ups than has that of the aircraft that they power. The engine division of the Bristol Aeroplane Company has

passed a major landmark in winning an official rating of 11,000 pounds thrust for the big Olympus engine that powers the Vulcan delta bomber. More powerful engines than this are running, both at Bristol and elsewhere, but they have yet to sustain the 150 hours uninterrupted running that are needed to pass a type-test.

The Olympus is among the heavy-weights designed to give the maximum power of which engineering techniques are capable. At the other end of the scale is Bristol's Orpheus, as important in its way as the Olympus. This is a small engine, in size and in power, but its output of power in relation to its size is remarkable; the power-weight ratio is claimed to be in the order of 6 to 1. Such an engine makes it possible to scale down the size and weight of aircraft and scale up their performance. The Orpheus was started as a private venture as a power unit for the Folland Gnat light fighter; equipped with the Orpheus engine this fighter is expected to reach supersonic speeds in level flight. The engine began its bench trials a few weeks ago, roughly a year after design work had been started, is now giving about 3,500 pounds thrust and the first engines should be delivered to Folland by mid-summer. This is quick work. A government contract for the Orpheus is about to be signed, so that after a year of uncertainty its future now seems secure. This is not necessarily the forerunner of official support for the Gnat, for there is the prospect of a wide demand for an engine of this power and weight. Of the nine light fighter designs suggested to Nato, all but one specified the Orpheus engine. Largely because of this, dollar funds voted under the Mutual Security Act for the development of special equipment for Nato have been allotted to the Ministry of Supply for the Orpheus engine; the future of the Gnat fighter is still under discussion.

Bancroft Doubles Up

ON the same day that the price of copper reached a new peak of £322 a ton on the London Metal Exchange—it has risen still higher since then—the directors of Bancroft Mines made known their plans for doubling production. Current prices, however high, could have had no effect on their decision, for the mine will not operate at its newly planned capacity until 1960. But the board must have been convinced that the demand for copper and the price will remain strong in the more distant future—even though production is being increased elsewhere in Rhodesia and, indeed, in the rest of the world.

The original plan was to bring Bancroft into production at the beginning of 1957 at a rate of 42,800 long tons of copper a year. That programme, which is expected to be completed on time, will cost £12 million. The decision to double capacity to 85,600 tons a year by 1960 will cost an extra £5 million. So far, Bancroft has secured £9 million, leaving £8 million to be found to complete the revised programme. Up to £5 million will be provided by loans from the Anglo American Corporation and the British South Africa Company. These companies will lend the money at 3½ per cent on the amounts drawn and will

charge 1 per cent on any undrawn balances. The loans have to be repaid before the end of 1960. But Bancroft can at any time before then call upon the two companies to subscribe, or find subscribers, for £5 million in notes, having a life of between 15 and 20 years and a coupon of not more than 6 per cent.

The remaining £3 million should come from exercise of options granted to Anglo American and the "Chartered" Company to subscribe for 2 million Bancroft 5s. ordinary shares at 37s. 6d. each (against the current market price of 44s. 9d.). The option can be exercised at any time before June 30, 1958. The full exercise of these options, which looks probable since the option price is already below the market price, would bring in £3½ million; the scheme therefore promises Bancroft a margin of £750,000 above the estimated cost of development. The initial—and, hence, the heaviest—costs of developing the new mine are met in the first stage of the programme and output is being doubled without doubling total capital costs.

SHORTER NOTES

The change in the accounting period of the Royal Bank of Scotland has allowed it to issue for the first time a consolidated balance sheet of the bank and its two clearing bank subsidiaries, Glyn Mills and Williams Deacons; the total resources of the three banks is shown at £414.4 million. The accounts for the Royal Bank itself—for the period October 10, 1953, to December 31, 1954—show that net deposits increased only slightly; an expansion of £4.7 million in advances was offset by a fall of £5.1 million in the investment portfolio. The net profit for the period is put at £733,735 (compared with £531,256 in the twelve-month period of 1952-53); the dividend totals 19½ per cent, against the equivalent of slightly over 18 per cent in the previous year.

The leasehold of Bush House, which was purchased from American interests by S. G. Warburg and Company last December, has been sold to the representative body of the Church in Wales. The purchase price is believed to be in the region of £2½ million. From the property the net annual yield is expected to be about £45,000 more than the money that the representative body was receiving from the investments it has realised to make the new purchase. About 65 per cent of the purchase price will be met from a mortgage loan.

The American group has withdrawn its bid for the equity of Borax, a bid that would, the bidders say, have been "appreciably higher" in price than any market price at which Borax deferred have yet been sold. The offer has been withdrawn, says the group, because the Borax directors would not give the potential purchasers certain information they required to set a price on the stock and because the Borax directors refused to apply for Treasury consent for a transfer of the company's domicile to the United States. The £1 Borax deferred units dropped from 101s. 3d. to 96s. 10½d. before recovering to 99s. 4½d. on this announcement.

Talks will begin in London next week between a Roumanian delegation and the British government on trade and the settlement of all British debts and claims against Roumania.

A British trade mission has left for a tour of Egypt, the Sudan and Ethiopia. The mission is led by Mr. G. C. R. Eley, deputy chairman of the British Bank of the Middle East.

ticularly sharp. And the net profit attributable to the parent company (which presumably includes none of the profits earned in Argentina) at £740,613 provides an adequate cover on the tax-free ordinary dividend, which is maintained at 10 per cent.

BROOM AND WADE. Broom and Wade's pneumatic drills tear up the London streets; they also tear out the rock and the ore of the Orange Free State and the Far West Rand. One way or the other this enterprising company usually presents a good showing, and its growing share capital has an unspectacular but highly creditable record in Throgmorton Street. The profit and dividend record has been good—though not very lively—since the stock units were offered to the public in 1935. And recently, as profits have been expanding, the directors have paid out a little more to ordinary stockholders. With no heavy capital commitments outstanding, with strong liquid reserves and with handsome equity earnings Broom and

Wade, which has the stamp of a family business about it, has the ability to pay more. The 100 per cent free scrip issue last August hinted at the directors' willingness to do so.

In the event, the directors have raised the effective ordinary dividend from 7 to 10

per cent. Commenting on the year's results, the chairman, Mr. Harry Broom, blames a slight fall in sales (occasioned apparently by import restrictions abroad and the "closing of the South American market through the lack of exchange") for the decline in gross profits from £619,897 to £595,110. But sales have picked up again and orders in hand, despite keener competition, are described as "satisfactory." Indeed, Mr. Broom's only worry about the immediate future is the high rate of labour turnover. But stockholders need have few worries, for Broom and Wade is one of the companies which should benefit from the development programmes for the roads and railways.

R. A. LISTER. Another engineering concern with a solid if unspectacular record is R. A. Lister. A bigger concern than Broom and Wade, the group manufactures petrol and diesel engines and agricultural machinery. The business is still growing. In the year to September

30th sales were higher than ever, the increase being reflected in the growth of stocks and debtors. Profits also established a new record, the group's total income jumping from £891,525 to £1,159,037. Last August's 40 per cent free scrip issue implicitly recognised the expansion that had already occurred. A final ordinary dividend of 7½ per cent has been declared on the enlarged capital of £3,640,000. On the new capital the full year's dividends are equivalent to 9.3 per cent, against 8.6 per cent in 1952-53.

The chairman, Sir Percy Lister—there are five Listers on the board—tells stockholders that since the end of the financial year the group has added substantially to its capital commitments for machine tools and has planned additional accommodation for a growing labour force. Output is still rising and Sir Percy speaks of "the increasing demand in the domestic

market" and the "steady expansion of the group's activities overseas." One sidelight on the growth of the business is the joint arrangements with Rootes Motors to form a new company, R.L. Engineers, with an authorised capital of £100,000; the new company will be concerned with the construction of engines for purposes ranging widely from aviation to railways. The least that stockholders can expect after such a report is that the ordinary dividend will be pushed up to a round figure of, say, 10 per cent. And many of them will expect more.

LONDON STOCK EXCHANGE

Next Account begins: February 16th
Next Contango Day: February 16th
Next Settlement Day: February 8th

THE stock markets took the increase in Bank rate in their stride. The market was a little uneasy just before and after the week-end and prices were lowered, but later both gilt-edged stocks and equities rallied. The rally in the industrial market was so strong on the first day of the new account that the *Financial Times* ordinary share index rose 2.8 points to stand at a new peak of 196.7. When the gilt-edged market opened on Monday the "shorts" made a further rally from the lower levels touched immediately after the Bank rate change but the long and medium dated issues made losses. Later in the week, cheered up partly by a further cut in the United States Treasury bill rate and partly by the gold and dollar figures, the undated and long dated stocks began to improve. On Thursday, however, gilt-edged prices turned easier. In the foreign market, German issues were weak after the weekend but began to rally when the new account opened. Japanese issues, which had been dull, also took a turn for the better on the first day of the new account. On that day Rumanian bonds were marked up on the news of the trade and debt talks.

The leading equities, which had faltered just before and after the weekend led the rally in the industrial market. The most prominent movements were recorded in the store, engineering and tobacco groups. Interest later broadened so as to include electrical equipment and road-making shares. The biggest individual movements were in Imperial Tobacco on dividend hopes, P and O, Ford (on the capitalisation proposals) and Montague Burton (which lost heavily on denials of take-over rumours).

Oil shares mirrored the fluctuations in other equities, advancing quite strongly on the first day of the new account. Rubber shares were steady and, apart from Assam, tea shares were firm. The feature of the mining market was the strong advance in copper shares on the high price of the metal. Kaffirs turned just a little better when the new account opened but when dealings began on Thursday the OFS issues were again dull.

Company Notes

LIEBIG'S EXTRACT OF MEAT. The two stories that the chairman of Liebig's, Mr. Kenneth Carlisle, always has to tell are symbolised in the distinction between sterling and non-sterling assets. The group manufactures Oxo; most, but not the whole, of its non-sterling assets are invested in Argentina. It is now four years since any remittance of current dividends and profits has been received from there. But though Mr. Carlisle's statement does not contain one shred of hope that remittances will begin to flow again, his remarks are a little more reassuring than those he made in 1952-53. Since August 31st last it has been possible to ship from Argentina most of the large stocks of finished products which had been piling up in warehouses.

The shipment of these stocks, particularly of corned beef, was already re-

flected in the parent company's balance sheet by the rise in inventories from £2,746,111 to £2,979,946. But—the familiar note creeps back again—debtors are also up because of the delay in collecting sums owed by the Argentine authorities. Since the end of the financial year the company has placed privately a £500,000 unsecured loan stock to help to finance corned beef stocks in this country. Since derationing sales of corned beef have been brisk, but Mr. Carlisle is doubtful whether it will command as large a market as it did before the war. But unlike the story that Mr. Carlisle has to tell about the Argentine—and about France, where tiny profit margins are handicapping the development of the business—his comments on the groups sterling assets are moderately reassuring. The group's trading profits have fallen—from £2,432,397 to £2,371,324—but the decline is not par-

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (*) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxembourg. (2) Average of second quarter.

EXCHEQUER RETURNS

For the week ended January 29th there was an "above-line" surplus (after allowing for Sinking Funds) of £118,890,000 compared with a surplus of £144,323,000 in the previous week and a surplus of £123,130,000 in the corresponding period of last year. This brought the cumulative account to a surplus of £201,358,000 (compared with a surplus of £2,617,000 in 1953-54). Net expenditure "below-line" last week reached £12,137,000, bringing the total cumulative deficit to £134,278,000 (£320,758,000 in 1953-54).

THE MONEY MARKET

THE discount market responded to the increase in Bank rate by reducing its bid at the Treasury bill tender on Friday of last week by the unexpectedly large margin of 1s. 8d. per cent, to £99 8s. 3d. per cent; the average rate of allotment rose by 1/8 per cent to £2 6s. 7.33d. per cent. This move, and other important adjustments are discussed on page 476. As the bill offer had been reduced by £10 million and applications were up by £25.7 million, the immediate effect of the steep fall in the market's bid was to reduce its allotment from 51 per cent to the low level of 32 per cent.

Dealings in Lombard Street in the past week have accordingly been strongly influenced by the shortage of bills in the market; demand has been swollen from American and Continental sources, attracted by the relatively high rates (the US Treasury bill rate fell from 1.349 to 1.134 this week). The upshot has been an unusually wide spread in dealing rates. April maturities have changed hands almost simultaneously at 2 1/2 per cent, 2 1/8 per cent and 2 1/4 per cent. On Tuesday conditions were comfortable, and on Monday and Wednesday the authorities gave adequate special aid, mainly indirectly through the banks.

The Bank return shows a further reflux of notes of £5.1 million. As "other accounts" dropped from £85.9 million to £65.8 million, bankers' deposits rose from their eight-year low of £251.9 million to the still low level of £261.2 million.

What Vulcan say about it . . . The most innocent-looking boiler plant can still be a potential danger. From boiler house to baker's oven, it should always be safety first, not second. That means regular and competent inspection by specialist engineers. And for that exacting job, there's Vulcan.

Vulcan's Engineer-Surveyors know all there is to know about boiler plants. If there's a flaw in the flue they'll find it. If there's a defect, they'll detect it. If there's anything wrong whatsoever, they'll point it out. And not just boilers: lifts, hoists, cranes — if there's an accident coming up for any of them, their job is to spot it before it starts. Safety first is Vulcan first.

VULCAN INSPECTS—AND PROTECTS

THIS BROUGHT THE HOUSE DOWN!

Before it blew up, taking 51 feet of chimney with it, this devastating object was a vertical cross-tube boiler supplying steam-heat for a dyeing works. Post-explosion investigations revealed three main causes of failure: shortage of water, which caused overheating and collapse of heating surface; excessive pressure brought about by a defective safety valve; and latent flaws in the boiler plates.

Perhaps you
didn't know that
BASLE

held its first Trade Fair in 1471, where products of mediæval handicraft were displayed to admiring visitors from France and Germany. This was the forerunner of the great trade fairs of modern times.

But everybody
knows

that Basle is famous for its chemical and pharmaceutical products, its industry manufacturing ribbons for the fashion trade and heavy metal goods. It is also a centre of international banking and insurance. Needless to say, the Basle Branch of the Union Bank of Switzerland plays an important part in the financial life of this prosperous city. Its vast experience is, at all times, at your disposal.

BAY HALL TRUST LIMITED.

Summary of Directors' Report for the year
ended 31st December, 1954, and of the
accompanying Statement by the Chairman,
Sir Charles Hambro, K.B.E., M.C.

The gross revenue amounted to £210,162 compared with £204,222 in 1953. After charging Debenture Interest, Taxation, Directors' Fees, Management and General Expenses amounting to £106,337 the net profit is £103,825 which is the highest in the Company's history. Adding £118,712 brought forward, the total available for appropriation is £222,537. The Directors have placed £25,000 to General Reserve and recommend a dividend of 15 per cent. less tax, which will absorb £83,638, leaving £113,899 to be carried forward.

Full provision has been made in the Profit and Loss Account for United Kingdom taxation in respect of all income to 31st December, 1954. Double taxation relief allowable to the Company amounting to 4/3d. in the £, has been taken into account in arriving at this provision.

At market prices on 31st December, 1954 (or where no market price existed at the valuations by the Directors at that date amounting to £288,143) the Share and Debenture Holdings and British and Foreign Government Securities had an aggregate value of £3,392,060 as compared with their book value of £2,470,018. There is thus an indicated appreciation of £922,042 over book cost.

At the valuations taken at 31st December last, over 83 per cent. of the investments are situated in the United Kingdom, Union of South Africa and other parts of the British Commonwealth. About 79 per cent. of the investments are in ordinary stocks and shares and the balance in fixed-interest bearing securities.

The affairs of men . . .

When it comes to appointing an Executor or Trustee you cannot do better than place your affairs in the hands of National Provincial Bank. The Trustee Department is staffed by specialists in the administration of Wills and Trusts and has the benefit of all the Bank's experience in financial and business matters.

No matter how complex your affairs may be, you may be sure that they will be handled courteously, sympathetically and efficiently.

Enquiries will be welcomed at any Branch without obligation.

HAMPERING EFFECT OF PRICE CONTROL

MR G. WILTON LEE ON URGENT NECESSITY
FOR TAXATION REDUCTION

The sixty-first annual general meeting of Arthur Lee & Sons Limited was held on January 28th at Sheffield, Mr G. Wilton Lee, TD, JP (chairman and managing director), presiding.

The following is his circulated statement:

Before proceeding with the factual details of the past year's trading, may I refer briefly to the history of our company. This is our diamond jubilee year. The present company was incorporated on June 12, 1894, in succession to a business acquired by my grandfather in 1874. From very small beginnings as wire manufacturers, by wise planning, enterprise and careful husbandry, the business has grown into one of the most important cold workers of steel in the United Kingdom. My co-directors and I are proud to have the honour of directing such an enterprise, and will endeavour to continue this progressive course.

You will have seen from Press announcements that the company on June 2, 1954, acquired from the Iron & Steel Holding & Realisation Agency the whole of the share capital of Arthur Lee & Sons (Hot Rolling Mills) Limited and Arthur Lee & Sons (Cold Strip) Limited, so that those companies again form part of the group as they did before Nationalisation. Details are given in the report of the directors, and I am satisfied that we took the right course in the interests of the members in making this re-purchase. As I indicated in my last statement, it was necessary to make arrangements for additional finance for these companies, and this was raised by issuing £500,000 4½ per cent debenture stock of Arthur Lee & Sons (Hot Rolling Mills) Limited which had been created before the re-purchase.

THE YEAR'S RESULTS

The consolidated profit and loss account shows that the trading profit for the year is £640,330, and income from investments and interest £51,775. Taxation takes £378,784 and the consolidated net profit is £314,788. This includes the net profit of the re-purchased companies for the whole of the financial year, but £85,532 of this is required to be set aside as their net pre-acquisition profits. Because of the desire to conserve their resources, no dividends have been declared by these companies in respect of the year ended September 30, 1954, so that the balance of their profit is also retained by them. Therefore, in arriving at the net profit of Arthur Lee & Sons Limited, £172,225, no credit has been taken for any of these profits of the re-purchased companies. The consolidated balance sheet exhibits the strong position of the group, current assets exceeding current liabilities by over two and a quarter million pounds, including very considerable bank balances. As you will see from the report of the directors, we have decided to round off the ordinary dividend to a total of 9 per cent less tax for the year, and to increase the special bonus, not subject to income tax, to 1½ per cent.

Last year I commented on the changing conditions of trade and reduced demand as compared with circumstances of maximum demand which operated almost continuously in the earlier post-war years. The reduced demand and buyers' discrimination continued in the first half of the year under review, but conditions changed rapidly in the spring of this year and demand increased continually, so that now we have full order books and great pressure on every department.

HEAVY BURDEN OF INFLEXIBLE CHARGES

Price control under the Iron and Steel Board is severe and tends to be arbitrary and doctrinaire. It is theoretical rather than practical, so that we have to work near to full capacity in order to earn a normal profit. Below this point the earning of profit is made impossible by the heavy burden of almost inflexible charges such as the guaranteed week, National Insurance contributions, holidays with pay, pension schemes, etc. We can bear these charges under rigid price control only so long as demand is maintained and we are able to operate at a high proportion of capacity. In the event of a recession the effect would be very serious, for the charges mentioned above would continue to operate but would become a heavier burden relative to the reduced sales. Plant replacement and new development should be provided out of earnings and good times should be made to provide for bad. That, as I understand it, is how this and many other fine businesses have been built up in the past. With such a high level of taxation as operates at present, high earnings are essential if industry is to be maintained in a state of efficiency and new developments made possible.

URGENT NECESSITY FOR TAXATION REDUCTION

Our record of development achieved by consistent ploughing back of earnings is one of which we can be proud. During the past twelve years we have incurred capital expenditure of over two million pounds, and in the same period we have paid over three and a quarter million pounds in taxation. This not only shows that we have devoted a large portion of our resources to renewing and improving capital equipment, but surely emphasises the urgent necessity of a reduction in the taxation burden on industry. I can only hope that price control will not continue to be operated in such an arbitrary and doctrinaire way as to frustrate our efforts to continue to develop and improve our plant and equipment and so maintain the prosperity of the business.

Our products, as is well known, cover a wide field ranging over almost every type of cold worked steel product in stainless, straight carbon and alloy steels. In consequence, we are important suppliers to the motor and motor accessory trades, the cycle

industry, precision chain and countless other specialised industries. I can say without hesitation that the products of this company are essential to the prosperity of many of these industries. Our stainless steel department, which has been progressively developed over many years, is now in a very healthy state and I look forward to continued progress in this important field.

THE CURRENT YEAR

Progress continues to be made with the development of Shipmans (Sheffield) Limited and Steel & Strip Platers Limited. Our association with Glover Brothers (Mossley) Limited and its subsidiaries is being maintained to the mutual benefit of all concerned. As mentioned earlier, our order books are full in every department and new orders are coming in at a rate which inevitably means disappointment for many of our customers in the matter of delivery. It is my view, however, that the present improvement in demand is on a sound basis and that we can look forward to full work continuously for at least the next year. In the export market we have developed a type of trade which we believe to be well founded and much goodwill is accruing.

I would close with an expression of appreciation of the efforts of all our employees for the way in which they have supported us in what has been a rather difficult year. They have done this, I am sure, because they realise that our interests are mutual and the progress of each individual is dependent upon the progress of all.

The report and accounts were adopted.

STERLING ESTATES, LIMITED

INCREASED REVENUE

The twenty-seventh annual general meeting of Sterling Estates, Limited, was held on January 26th in London, Mr Douglas Overall, JP, FAI, chairman, presiding.

The following are extracts from his circulated statement for the year ended September 30, 1954:

The parent company's rental revenue of £144,504 shows an increase of £11,617 over that of the previous year: income from subsidiary companies is somewhat reduced at £11,739 by reason of provisions made by those companies for future repairs and that from the associated company is maintained at last year's increased figure. Surpluses arising from the sale of a property and the compulsory acquisition of two sites bring the total receipts for the year to £223,820.

Taxation absorbs £85,344 of which £31,350 arises in respect of the surpluses on disposal of property. Full provision has been made for taxation on the surplus arising from the compulsory acquisition referred to above, but the principle of taxation on such transactions is being discussed by your company with the Inland Revenue.

Your directors recommend the transfer of £6,000 to subsidiary companies to provide for future repairs, the transfer to general reserve of £30,000 and the payment of a final dividend of 7 per cent, making a total of 10 per cent for the year.

Treasury consent has been obtained for the capitalisation of £58,442 of the capital reserve and it is proposed to issue shares in the proportion of one share for every 10 held.

It is felt that in the absence of untoward circumstances the company can continue to look forward to a steady improvement in its income.

The report and accounts were adopted.

WEST RIDING WORSTED AND WOOLLEN MILLS

SIR JOHN KEELING'S REVIEW

The twenty-sixth annual general meeting of West Riding Worsted and Woollen Mills Limited was held on February 3rd in Bradford, Sir John Keeling (the chairman) presiding.

The following is an extract from his circulated statement: You will have observed from the report and accounts that the results for the year ended August 31st are again satisfactory. The profit of the group before taxation amounted to £1,381,340, which is somewhat lower than that for the previous year during which we had the benefit of certain favourable factors to which I referred in my statement last year. After deducting the amount required for taxation the net profit of the group was £652,078, which compares with £762,455 for the previous year.

An interim dividend of 8 per cent was paid on the issued ordinary capital of £1,214,916 as then outstanding, since when the issued ordinary capital has been increased to £1,700,883 by a capitalisation of reserves. Your board now recommend a final dividend for the year on the increased ordinary capital of 12 per cent.

The consolidated balance sheet again shows a strong position. Capital and reserves at £4,926,392 exceeded the corresponding figure for the previous year by £424,704.

In this connection it is interesting to recall that six years ago the issued ordinary capital was £462,000. Since then reserves, almost wholly consisting of profits ploughed back into the business, have been capitalised in the form of ordinary shares to the extent of £1,238,883, which has resulted in bringing up the issued ordinary capital to the present figure of £1,700,883. In addition capital and revenue reserves have increased by £1,406,717 to £2,600,509.

Stock on hand and work in progress have as usual been conservatively valued in accordance with accepted commercial principles and practice. In addition the stock reserve which remains at the figure of £310,000 represents an additional "cushion" equivalent, after allowing for taxation, to rather more than 12 per cent of the balance sheet value of the stock.

A year ago I referred to the fact that we were considering enlarging our existing scheme to embrace all employees who have been with us for a given number of years, and to give them some measure of life assurance.

The details have now been very largely worked out, and we hope to bring what is proposed into operation in the course of the next few months. In view of this we have made a provision of £50,000 in these accounts towards the initial cost of providing for back service.

Towards the end of our financial year we acquired the entire issued share capital of John Murgatroyd and Son, Limited, worsted spinners and manufacturers. This business has been in existence and in the Murgatroyd family for well over two hundred years. My colleagues and I cordially welcome to our group Mr Ronald H. Murgatroyd, who remains the managing director of the company. We feel that this purchase, which has been financed out of the group's own resources, will add still further to its strength.

During the year under review our operating companies maintained a high level of activity, but they had to contend with some marked movements in the value of wool; merino wool over the year declined in value by some 12½ per cent. Profit margins

narrowed, and this tendency seems likely to continue during the current year.

Since the close of the financial year on August 31st last, fluctuations in the price of wool have continued, resulting in a general lower level of values; sales, however, have been well maintained.

It is too early to forecast what the results of the present year may be, but I trust that you will not be disappointed with the results that I hope to be able to place before you next year. The report was adopted.

THE UNION DISCOUNT COMPANY OF LONDON

JUSTIFIED DIVIDEND INCREASE

LORD KENNET'S STATEMENT

The annual general meeting of The Union Discount Company of London, Limited, will be held on February 24th at 39, Cornhill, London, E.C. The following is the statement by the chairman, The Right Honourable Lord Kennet of The Dene, PC, GBE, DSO, which has been circulated with the report and accounts for the year ended December 31, 1954:

During an active and eventful year in the discount market we have gained further experience of the conditions which began in the market in November, 1951, that is, a variable bank rate, with the convertibility of the pound discussed and anticipated, but not achieved, and with progress in the removal of rationing and controls, including those in the commodity market on gold in March, and on cotton in May, and on finance for hire-purchase. In our own sphere we welcome the new era. It emphasises and increases the utility of a discount market; and it is satisfactory to find that the use made of the services of the market enables your company, with prudent and skilful management, to earn a reasonable return on its capital under the new conditions.

No agitated use of bank rate has been made to deal with mere eddies in the money market. There has been one change only, from 3½ per cent to 3 per cent on May 13th. Bill rates which had been steady for the first four months at 2½ per cent to 2½ per cent for Treasury bills by tender and 2½ per cent to 2½ per cent for fine bank bills thereafter settled down at about 1½ per cent until November. There then began a steady increase in the rate, and at the end of the year it had increased to nearly 2 per cent, an increase which had an adverse effect on prices in the bond market. There was at that time pressure against sterling. Delay in exports caused by the dock-strike probably aggravated the seasonal condition.

In any event, there was a large increase in the commercial bills to be dealt with towards the end of the year. For the whole year the total of commercial bills passing through our hands was 16 per cent more than the year before. Our liability on bills sold but not matured, which in the balance sheet is £31,769,594, is higher than it has ever been.

The revival of the interest taken in the London money market by foreign bankers is a good feature of the new conditions here. With more flexibility, more use is made of the services of London banks and discount houses. That, but more particularly also industrial activity here, and the large amount of borrowing for short terms by the government, made the deposits of the clearing banks higher in November than ever before.

The increase in our balance sheet total of £31,654,322 to £285,526,361 is mainly accounted for by our larger holding of bills.

Our profit of £505,308 is an increase of £137,456, and is higher than ever. We have

announced a final dividend which increases that for the year by 2½ per cent, from 10 per cent to 12½ per cent, a moderate increase, justified by our company's earning capacity, as shown by its accounts for a number of years and by the strength of its reserves.

About this I would make two observations: (1) In an inflationary economy the profit, expressed as a percentage of its capital, earned by a business which gives necessary services to the community, must have a natural tendency to increase; but the increase in the percentage, and any attendant increase in distribution of dividend, is no direct measure of increase in real advantage to the recipients. (2) Such a distribution appears to your board to be in the interest of the public as well as that of our shareholders. The discount market has limited functions and little plant. There is an optimum of the amount of capital which can usefully be employed in it. So long as that optimum, which must of course include ample reserves, is maintained, it is to the advantage of the national economy that profits should be released as dividends, to add to the supply of capital available for useful investment elsewhere. We believe that our shareholders, amongst whom are many institutional investors, are well qualified to make such re-investments. The distributed-profits-tax determines the share of any increase in distribution required for public expenditure, and thus authorises the receipt of the remainder by shareholders.

To the banks and financial institutions which give us their co-operation unchanged in changing times we tender our thanks, and to the management and staff we say "Thank you for being always as good as your best, which is always an example of the highest standard of industry and ability in the service of the company."

TRINIDAD SUGAR ESTATES

FACTORS AFFECTING RESULTS

The thirty-second annual ordinary general meeting of Trinidad Sugar Estates, Limited, was held on January 27th in London.

Mr E. Cassleton Elliott, CBE, FSA (the chairman), in the course of his circulated speech, said:

The year under review was a very disappointing one for us because, as a result of damage by Froghoppers and Moth Borer to the canes, the production of sugar fell by 1,764 tons compared with 1953. As a result of the damage, the average yield per acre of Estate canes dropped from 37 tons 9 cwt to 27 tons 18 cwt, and the juice also suffered. Farmers' canes, however, despite Froghopper damage, showed a welcome increase of 6,254 tons compared with last year. The average price per ton realised for sugar, including by-products, after deducting the levies of £2 15s. per ton made under the Trinidad Sugar Industry Special Funds Ordinance, 1948, was £43 13s. 2d., compared with £42 1s. 5d. in 1953.

Owing to the poor crop, the profit for the year shows a substantial reduction compared with last year, but as a conservative policy has been adopted in the past with regard to dividends, the directors consider they are justified in recommending a dividend of 5 per cent for the year.

As regards the prospects for 1955 crop, present indications are that we shall have a good tonnage of Estate canes. You will appreciate, however, that so much depends on juice and other conditions during the crop period, but if these are normal and there is no labour trouble I think we shall have a good crop. The report was adopted.

KOLOK MANUFACTURING COMPANY, LIMITED

(Manufacturers of Carbon Papers, Type-writer Ribbons, Stamp Pads and Inks)

INCREASED PROFITS

The forty-sixth annual general meeting of Kolok Manufacturing Company, Limited, was held on January 28th at Tottenham, N.17, Mr E. S. Dumont, chairman and managing director, presiding. The following is an extract from his circulated statement:

Volume of output and net profit are only slightly below the record in your company's history.

The net profit of the company for the year is £126,017 and the net profit of the group is £144,003, compared with £111,677 and £122,760 for the previous year.

The increase in the group net profit before taxation is £21,243.

Competition in export markets continues, but we are endeavouring to combat this by increasing and improving our manufacturing and technical resources.

Business on hand encourages me to believe that the current year should be equally satisfactory.

We have sold a separate plot of land, surplus to our requirements, at a profit of £17,546, which we are carrying to capital reserve.

The financial position of the group is excellent, surplus current assets over current liabilities amounting to £358,893, compared with £294,276 for the preceding year. Part of this increase is accounted for by the sale of land referred to, but against this is a capital commitment of £14,400 for the purpose of a factory previously rented.

I draw attention to the transfer of £5,000 to the superannuation reserve. It is intended during the current year to supplement past service pensions and dispose of the greater part of this obligation by making a lump sum payment to the insurers from the superannuation reserve.

In view of the continued level of profits your directors recommend a final dividend of 20 per cent, making 30 per cent for the year.

I cannot speak too highly of the excellent services rendered by our executives and those in our service and, on your behalf, I express my thanks to them, as I do to all my colleagues on the board.

The report and accounts were adopted.

UNIVERSITY OF QUEENSLAND

AUSTRALIA

Applications are invited for the position of PROFESSOR OF MATHEMATICS. Salary £A2,500 per annum. Applicants should hold a higher degree, have taught at University level, and have carried out substantial research in the field of Mathematics.

Further particulars are obtainable from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. Applications close with the undersigned on March 31, 1955.

C. PAGE HANIFY, Registrar.

BRITISH FILM INSTITUTE—APPOINTMENT OF DIRECTOR.

The Governors of The British Film Institute invite applications for the Post of Director, the principal executive officer of the Institute, responsible for the whole of its work, including the National Film Library and the National Film Theatre. Salary scale £1,700-£2,200 per annum. Candidates with exceptional qualifications may be appointed at a salary higher than the starting rate. Since the Institute's main purpose is to further public appreciation of the film, the primary quality sought in its chief officer is a genuine interest in films combined with administrative ability.—Applications, with the names of two referees, should be addressed to the Chairman of the Institute, 164 Shaftesbury Avenue, London, W.C.2, not later than March 5, 1955.

FOR SALE, Economic Journal, June, 1949-December, 1954.—Offers to Box 823.

LIEBIG'S EXTRACT OF MEAT COMPANY

RESTORATION OF TRADING FREEDOM

The ninetieth annual general meeting of Liebig's Extract of Meat Company, Limited, will be held on February 24th, in London.

The following is an extract from the statement by Mr Kenneth M. Carlisle, chairman and managing director, which has been circulated with the report and accounts:

The profit brought into the accounts of the parent company amounts to £260,984, as compared with the previous year's figure of £288,003. After deducting the preference dividends and the interim ordinary dividend paid in July last, there remains a balance of £168,734, which it is proposed to allocate as follows: Final ordinary dividend of 8 per cent, tax free, £160,000, leaving a carry forward of £8,734.

OXO LIMITED

An outstanding event towards the close of our trading year was the termination in this country of meat rationing and the restoration of free and unhampered dealing in virtually all food lines. It is yet too early to assess the market effects on the sale of our main proprietary products, the Oxo cube and corned beef, and the full pattern of a return to normality has still to evolve.

The Oxo cube, which during the war and early postwar years became such a boon to millions of housewives in supplementing the monotonous and meagre diet of the home, now has to stand against the full competition of an ever-widening range of attractive foods and beverages. In price alone, at 1½d., it is more competitive now than when it retailed at 1d. before the war. It is our policy, however, notwithstanding rising costs, to keep the price at the lowest level possible commensurate with a reasonable profit margin.

Sales of corned beef have been brisk following the derationing of meat, but once the pipeline to the consumer has been filled, it seems doubtful whether corned beef will find as large a market as it enjoyed before the war, until such time as costs in producing countries, particularly in the Argentine, can be reduced to a level which will once more warrant a price that will appeal to the housewife.

EUROPE: The subsidiaries in France and Belgium both reported increased turnover, and satisfactory profits were made in Belgium and Italy. In France, however, profits on established proprietary articles are severely regulated by government through the operation of price controls, and the margins now

allowed, after taking into account increased costs, fall far short of what is necessary for a healthy business. Other countries in Europe, particularly those in Scandinavia, maintain closed economies and we have been unable, since the end of the second world war, to make headway with the reintroduction of our products.

RIVER PLATE: It is now four years since any remittance of current dividends or profits has been received from the Argentine and one is led to wonder how much longer this state of affairs can continue without irreparably impairing the good name that Argentina used to enjoy in the financial world for the prompt settlement of her obligations.

The statement then gave a detailed review of the group's other world-wide activities.

THE HOLLINS MILL COMPANY

(Cotton Spinners and Manufacturers)

INCREASED TURNOVER

The fifty-second ordinary general meeting of The Hollins Mill Company Limited was held on February 3rd in Manchester.

Mr J. Manning (chairman and managing director), in the course of his speech, said:

The consolidated profit and loss shows an increase of £26,000 in trading profit over that of the previous year and after deducting depreciation, directors' emoluments, etc., and taxation, the net profit is £54,414, being some £4,000 increase over last year. The incidence of taxation is rather heavier this year than last year, otherwise the net balance would have been further increased.

As you are aware, last year we disposed of the assets of the Australian company very satisfactorily under the circumstances and this has resulted in a surplus of £42,557, which has been carried to the appropriation account.

I think you will agree that the balance sheet shows a very sound position.

During the year our selling organisation has been strengthened and this is reflected in the increased turnover, and although business is now more difficult than it has been for some time, trading should continue to be reasonably profitable.

The directors do not feel justified in recommending any increase in the total dividend distribution for the year in view of the uncertainty of trade and increased competition which may have the effect of restricting the profits, and accordingly they propose a final dividend on the preference shares of 3 per cent less tax and a final ordinary dividend of 7½ per cent less tax. The report was adopted.

AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

RESEARCH SCHOOL OF SOCIAL SCIENCES

Applications are invited for appointment as RESEARCH FELLOW IN THE DEPARTMENT OF DEMOGRAPHY.

The appointment is for three years with a possible extension to five years, at a salary within the range £1,100-£1,650 per annum. Reasonable removal expenses will be paid and superannuation on the F.S.S.U. pattern is provided.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications is March 31, 1955, but intending applicants in the United Kingdom may arrange interviews before February 14th with Mr W. D. Borrie, the Head of the Department, through the office of the Association of Universities (Tel.: MUSEum 4578).

LEADING professional organisation practising in London, Africa and the Far East possess an immediate vacancy for a General Business Manager. Principal tasks would cover promotion of its interests both at home and abroad, and also to take charge of its non-technical administration. Age group 28-40. Public school education essential, and for preference some business and social contacts. Occasional overseas visits will be necessary. Most valuable opportunity for the individual who can combine drive and initiative with a sound commercial understanding. Excellent financial prospects.—Box 824.

AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

RESEARCH SCHOOL OF SOCIAL SCIENCES

Applications are invited for appointment to the Chair of Political Science. Salary £A3,000. Reasonable travel and removal expenses are payable. One year's study leave, with travel allowance, will be granted after each three years' service.

The Department of Political Science is included in the Research School of Social Sciences, and is at present in charge of a Reader.

It will be the duty of the Professor to conduct and organise research into political movements and institutions and to supervise the work of a small number of post-graduate students, most of whom will be proceeding to the Ph.D. degree.

Notwithstanding this notification, the University retains the right to fill the chair by invitation at any stage.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications in Australia and London is April 30, 1955.

UGANDA CHAMBER OF COMMERCE

The Uganda Chamber of Commerce, Uganda Cotton Association and Uganda Planters' Association invite applications from suitably qualified candidates for the appointment of Secretary to these three bodies. Residence would be in Kampala, the commercial centre of the Uganda Protectorate. Applicants should have had first-class and extensive experience and a keen interest in Public Affairs—a knowledge of law and legal proceedings is desirable but not essential. The appointment would be of a permanent nature, following a six months' probationary period. Remuneration would be substantial and would provide for housing and overseas leave facilities with provision for passages every three years.

Applications, stating age, personal details, including education and past experience, together with copies of references and a recent photograph, should be submitted, in the first instance, to J. L. Leyden, CBE, c/o Uganda Development Corporation, Ltd., 27, Regent Street, London, S.W.1.

B.S.C.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE

Provides postal tuition for the above Degree (open to all), which is a valuable qualification for men and women seeking executive appointments in commerce or industry, government or municipal posts. The College, founded 1887, is an Educational Trust. Highly qualified Tutors. Low fees; instalments.—Write for Prospectus of U.C.C. Courses to Registrar, 60 Burlington House, Cambridge.

BUSINESS EXECUTIVE AVAILABLE

Senior Business Executive, with Accountancy and Company Secretarial experience, available shortly, requires responsible position at home or abroad. Age 47. Highest references.—Box 817.

MARKETING RESEARCH.—The expanding activities of this Company have given rise to an extension of the marketing research organisation. There will be very good opportunities for graduate economists in work which will involve a stimulating variety of economic research and as the new positions will carry varying degrees of responsibility applications will be welcome from both new graduates and those with several years' experience in market and/or consumer research. The appointments are pensionable and carry good salaries and prospects. All applications will be acknowledged and the fullest information will be given to those invited for interview.—Apply to the Personnel Manager, British Nylon Spinners Limited, Pontypool, Mon.

CONSULTANT (Senior) required by American International Management Consultants with established and expanding connections in Britain and Europe. Candidates should be qualified Production Engineers or Accountants with extensive factory experience who have demonstrated their ability to earn at least £2,000 p.a. in responsible senior appointments in industry or consultancy. Please give full details of experience, qualifications, age and salary.—Box 821.

ATTWOOD STATISTICS require market research executive to take full charge of the Consumer Surveys Division. Applicants must have statistical training and wide experience of questionnaire design, field work and control, tabulation and presentation. Write, giving experience, qualifications and age and salary required, to Attwood Statistics, Limited, Chantrey House, Eccleston Street, London, S.W.1.

DEATH DUTIES can be drastically reduced if you plan and act now.—Write, in confidence, to Robert A. Thomson, 11 Duke Street, St. James's, S.W.1.

ACCOUNTANT (qualified), age about 30, required by the Beecham Group. Initial appointment as assistant accountant in Head Office (London). The successful candidate can expect to find ample scope for promotion within the Group. Previous commercial experience desirable but not essential, and candidates with a leaning towards general management or administration preferred. Good commencing salary dependent upon age, experience and suitability. Pension and profit-sharing schemes in operation.—Applications, setting out age, education, professional and commercial experience and other relevant details, should be forwarded to the Secretary, Beecham Group Limited, 68 Pall Mall, S.W.1.

MARKETING EXECUTIVE required by Young and Rubicam Limited. Advertising. Responsibilities include analysis of sales figures and consumer research data and preparation of agency recommendations to clients. Essential qualifications are some previous experience in marketing or market research, report writing ability and knowledge of statistical method. Salary in accordance with experience and qualifications.—Apply Marketing Manager, Young and Rubicam Limited, 285 Regent Street, W.1.

UNIVERSITY OF LONDON

A lecture entitled "The Recruitment and Training of the Higher Civil Servants in the United Kingdom and in France: a comparative study" will be given by Professor A. Bertrand (Ecole Nationale d'Administration, Paris), at 5 p.m. on February 11th, at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2.

Admission free, without ticket.

JAMES HENDERSON, Academic Registrar.

THE UNIVERSITY OF MANCHESTER

RESEARCH FELLOWSHIP IN ECONOMIC STATISTICS

Applications are invited for the above Fellowship, tenable for one year, with a possible extension to two years. The Fellowship is of a value within the range £900-£1,200 per annum, together with approved expenses involved in the research. Regulations governing the award of the Fellowship may be obtained from the Registrar, the University, Manchester, 13, to whom all applications should be sent, not later than March 8, 1955.

NATIONAL COAL BOARD

NORTHERN (N. & C.) DIVISION

Applications are invited for a Senior Appointment in the Supplies Organisation. Applicants must have a wide experience in Supplies work and in buying all types of materials and equipment, together with experience in the principles and practice of stock control, stores management and office organisation. Experience in the mining industry or in other engineering would be an advantage.

Applications to the Divisional Establishment Officer, National Coal Board, Northern (N. & C.) Division, Ellison Buildings, Ellison Place, Newcastle-upon-Tyne, 1, not later than February 21, 1955.

THOMAS HEDLEY & CO. LIMITED, Newcastle-upon-Tyne.

Is seeking a man for its advertising department who has had some years' experience in the planning, choice and use of all kinds of media and who is looking for a post of important responsibility. He is likely to be a man of about 30. He should be of good education, preferably with a University degree. He will be working closely with advertising agencies and their media departments and would very quickly become responsible for the planning and choice of printed word media over a wide field. He would be expected to initiate and interpret research in all forms of media and to contribute to the formulation of policy in media buying. The salary is a good one and will be subject to material increases as the man demonstrates his ability. The post is permanent and pensionable and there is a non-contributory life assurance scheme. Letters of application should contain details of age, education and career, including H.M. Forces, and will be treated in complete confidence.—Please write to Personnel Department, Thomas Hedley & Co. Limited, Gosforth, Newcastle-upon-Tyne, 3, and mark envelope "M."

MARKET ANALYSIS. Young graduate (economics or commerce) required by Ford Motor Company Ltd., of Dagenham, Essex, to train for export work. Business experience and knowledge of motor vehicles advantageous. Good starting salary. Non-contributory pension. Reply to Salaried Personnel Department, quoting reference FMA.

ZINC*from one of Europe's largest smelters*

Chilean Mills through which a mixture of sintered zinc concentrate, crushed coal and binding additives are pulverised together in the process for producing zinc

THE AVONMOUTH works of Imperial Smelting cover approximately one square mile and in addition to the aerial ropeway there are 15 miles of railway sidings within the area. Here for many years Consolidated Zinc have been enlarging and modernizing their various processing methods to keep pace with the increasing demand for zinc and its by-products.

Extensive modernization on the most modern lines has

resulted in higher efficiency and increased production. Although the primary production at Avonmouth centres on that of zinc, many other activities concerned with its by-products occupy a large part of this busy community. Here at one of Europe's largest smelters is the vital link between the many centres of production controlled by Consolidated Zinc in the United Kingdom.

Zinc, Pigments, Chemicals

The formation of The Consolidated Zinc Corporation Limited in 1949 united the bond of common interest between Imperial Smelting Corporation Limited of Great Britain and The Zinc Corporation Limited of Australia. Both companies have for many years been associated in the development of the non-ferrous metal production of the Common-

wealth. Their activities are the production of zinc metal, sulphuric acid and fluorine chemicals in the United Kingdom, the main centre being at Avonmouth, with other works at Swansea, Widnes, Bloxwich, Newport and Seaton Carew. At the Broken Hill mines of Australia are mined the ores of lead, silver and zinc.

110 in the Boiler Shop

IN MATTERS OF sound measurement the word 'phon' will crop up very often, because this is the unit of measurement which acoustic engineers use to assess the loudness of sounds.

Let's look at a few examples of noises expressed in terms of phons. A pneumatic tool nearby would have a phon value of about 105, whilst a quiet street gives only 45; in an express train the reading would be about 80, compared with 20 for a rustle of leaves. In a boiler-making shop, the high rating of 110 makes the noise almost unbearable.

The human ear compares noises on a logarithmic scale so that a noise of 70 phons sounds 50% below one of 80 phons.

Those examples are perhaps sufficient to show the extent to which noise is with us most of the time. But sound, like heat, must be kept in its place, and much can be done in factories and offices to ensure that excessive and unwarranted noise is reduced to a rea-

sonable level. The best way to do this is by sound absorbing treatment of the walls and ceilings because these surfaces intensify noise by reflection. By way of example, the normal painted plaster wall to be found in many offices absorbs only 2% of the sound impinging on it.

Compare this with a modern acoustic tile which has an infinitely higher sound absorption.

Newalls (Reg'd Brand) Paxtile is such a product and has a 75% sound absorption and combines an extremely pleasing appearance with the added virtue of being incombustible and vermin-proof; it also affords effective heat insulation. Our skill and experience and our well equipped Sound Laboratory are entirely at your service to investigate any noise or acoustic problem on which you may need help. *We invite correspondence on this subject and will be pleased to submit suggestions, designs and estimates based on a careful appraisal of your particular problem.*

EUCLIDS *in* AUSTRALIA

A fleet of 20 EUCLID Rear Dump Wagons is speeding the construction of the 11,000,000 cu. yd. earth fill dam at Adaminaby—a major undertaking in the great Snowy Mountains Scheme.

EUCLID Wagons are also consolidating the prosperity of Australia by building dams in the Far North of Queensland, in South Australia, on other sites in New South Wales and, on one job alone in Victoria, 48 EUCLID units are showing how earth is moved faster at less cost per yard.

In the Australian Copper Mines, the Tungsten Mines, the Uranium Mines, the Coal Fields and other sites, the EUCLIDS work in the sweltering heat and dust, to snow and ice. Unaffected by these climatic conditions, hundreds of EUCLIDS are playing a notable part in Australian plans for the future.

VEHICLE CONTROL PLAN

saves

TIME, EFFORT, PERSONNEL, MONEY.

Every detail concerning your vehicles is instantly available on a sheet measuring but a few square inches . . . and, what's more, a system of coloured signals thrusts important information to your notice, such as when urgent attention is needed, or the date for the next routine servicing or any change in fuel or tyre consumption and so on.

Records at a glance

The record's visible edge identifies each vehicle at a glance; a finger-flick and full information about it is immediately visible. Year of make. Date of purchase. H.P. engine and chassis No. Unladen weight. Cost. Value. Capacity. Type of fuel. Oil fuel consumption. Tyre mileage and all other necessary details. Month by month servicing is provided for, including actual details of work done, under headings which provide for almost anything.

Simple—Compact—Easy-to-use

This amazingly efficient vehicle record system is housed in strong and very compact binders, or in small, portable panel form. Either way, a large number of vehicle records can be contained in a negligible space. Any record can be inserted or removed in a second, retaining correct order.

MAINTENANCE CANNOT BE MISSED.

RISING FUEL, OIL and TYRE CONSUMPTION
CAN BE CHECKED BEFORE THEY COST
YOU MONEY.

RÉPAIRS CAN BE DONE WHEN IT SUITS YOU—
NOT WHEN YOU MUST

And remember, this system has been devised with the advice of some of the largest operators in Britain. Many others tell us that the ability to keep a correct maintenance schedule saves far more than the modest cost of the system, and in addition they enjoy the advantages of the most rapid, simple and comprehensive method of keeping vehicle records.

Just jot "Vehicle Record" on your letter-head for full details by return. There is also a special Stock Record for spares. If interested, please ask for "Stock Record" as well.

Economy, speed and comfort—the three travel essentials for business men—are assured to all who step aboard French Railways. Half-fare cards are typical of the many economies that can be made. New and comfortable high-speed railcars make light of long journeys between major centres. More electrified lines are being introduced throughout the system. Luxury wagon-lits, with cheaper supplements, or couchettes ensure a good over-night sleep.

DAY TRIPS. You can leave in the morning, travel from 350 to 500 Km., have several hours in which to conduct your business and return the same evening, in comfort. Examples: Day return trips from PARIS include La Rochelle, Lyon, Antwerp or Sarrebruck.

HALF-FARE CARDS which entitle the holder to unlimited travel between two particular stations or in a particular zone at half the standard fare can now be purchased without deduction from the basic travel allowance.

OVER-NIGHT TRIPS. You can leave in the evening, travel from 500 to 600 Km., stay the night at an hotel, devote most of the following day to your affairs and return to your headquarters that night. Examples: Over-night return trips from PARIS include Bordeaux, Grenoble, St. Nazaire or Zurich.

SPEED AND PUNCTUALITY. You can be sure of arriving on time for your appointments, for French Railways have an unrivalled reputation for speed and punctuality.

HOLLYWOOD goes to Leicester

THERE'S a little old man in Leicester who never misses his Saturday evening at the pictures. He has a very personal interest in most of the films he sees. For every weekday he sits at a bench, skilfully assembling lenses—the very lenses that the vast motion-picture industry cannot do without. He works at Taylor, Taylor and Hobson, whose factory sells £750,000-worth of goods each year, a substantial proportion of them in dollar

areas; whose lenses are used in 8 out of every 10 cameras in Hollywood—and in cameras throughout the rest of the world. This company is only one of those which form the British Optical and Precision Engineers Group (B.O.P.E.), itself a subsidiary of the Rank Organisation. And last year B.O.P.E. obtained more than 50 per cent. of Britain's export turnover in the varied products which it handles.

STUDIO TO CINEMA

EVERY member company of B.O.P.E. is a specialist in its own sphere. British Acoustic Films produce recording and sound equipment as well as 8 mm. and 16 mm. cine cameras and projectors; Kershaws of Leeds are famous for their cinema projectors, arc lamps and scientific and optical instruments; Gaumont-Kalee Seating add to their

U.K. sales by exporting to all parts of the world, including the United States; Kalee send their curtains and draperies to cinemas as far apart as Jordan and Jamaica.

B.O.P.E. can indeed be proud of an impressive list of achievements through the years. The Everest and North Greenland Expeditions were equipped with B.O.P.E. cameras. B.O.P.E. has equipped between 800 and 1,000 film stages outside Britain. B.O.P.E. supplied a special zoom lens used by the BBC for their Coronation Day TV programme.

WORLD-WIDE PROJECTION

Winning prestige and earning currency (including those valuable dollars) all over the world, B.O.P.E. is constantly engaged in vigorous research to improve existing products and to introduce new lines. It has played a vital part too as one of the many companies on which the Rank Group is widely based—and which have greatly helped this section of the British Film Industry to make so successful a recovery during the last five years.

THE J. ARTHUR RANK

ORGANISATION LIMITED

A clean soft dry towel for every pair of hands

How does the Towelmaster work?
A pull. Here's a length of laundry-fresh towel, enough and to spare for a really good dry. And as you pull, the used portion automatically winds into a separate compartment of the gleaming white Towelmaster cabinet. Nothing more efficient. Nothing more hygienic.

How much does the Towelmaster cost? 5/- per roll of towelling. Minimum usage only one roll per week. Installation is free. Maintenance is free. No replacement charges. In fact there are no other charges whatsoever.

How much is the Towelmaster worth? Those few shillings give 180 pairs of hands an honest-to-goodness dry. Benefit staff and visitors alike. Give you 45 yards of goodwill. And what an infinitesimal price to pay for a clean bill of health!

What are your particular needs?
We'll be glad to discuss them—without obligation.

Beauty that's good for business

WALLSPAN

The use of Wallspan for Outer Walls offers your architect greater scope and opportunity in the design of any new building you contemplate. Wallspan can give you an impressive, colourful building that will retain its beauty—and its value—through the smoke and grime of the years.

Why Wallspan gives you a Building you'll be proud of. Nowadays the weight of a building is borne by the structural frame. The outer walls, which provide the setting for windows and doors, are essentially protective and decorative, keeping the weather out and the warmth in and giving the building a suitable facade.

With Wallspan, the facade can be far more colourful and graceful, far more imaginative in design. For Wallspan outer walls consist of a grid of aluminium alloy which is bolted to the frame of the building. Into it are fixed windows and doors and the grid is completed with any of a wide variety of beautiful panelling materials, which can be faced in glass, stone, metal, wood and so on, each in a choice of colours. So the use of Wallspan gives your architect completely new opportunities to design not only a building you'll be proud of, but one that will keep its beautiful appearance and its value.

No maintenance. Wallspan walls need neither pointing nor painting. They can be kept clean by an occasional wash-down by the window cleaners.

More Floor Space and More Warmth. Wallspan grid members can be as little as 5 inches thick, carrying panelling about 2 inches thick, compared with the 11 inch thickness of traditional walls. Thus you get extra rentable floor space all round every floor. The walls, moreover, are not only weather-proof and durable, but can easily be constructed to offer 50 per cent more heat-retention than cavity brick.

Walls up in DAYS, too. Finally, Wallspan walls are so simple to erect, they can be put up in a matter of days.

It will be worth your while to discuss with your architect the use of Wallspan in any new building you are planning—office, factory, shop, store, warehouse, school...

Do you know modern OIL-FIRED heating?

The "HOME-FIRE" with its thermostatically controlled heat and absence of dirt is an essential luxury in the modern residence.

Why not convert your small independent boiler to oil firing and banish for ever the drudgery of carrying fuel buckets and clearing ashes? The "HOME-FIRE" offers the cheapest form of clean, labour-free heat for hot water and central heating.

Send now for full details and name of nearest dealer.

Nu-way "HOME-FIRE"

OIL BURNER

Installed in your small independent boiler with 150 gal. storage tank from under £100 complete.

The Fall of Malenkov

THE countless unfortunates who have undergone Communist methods of interrogation must often have wondered how their tormentors would stand up to the relentless pressure for a confession if the roles were reversed. On Tuesday they learnt that even the head of a Soviet government could be reduced to public recantation. Georgi Malenkov was not merely stripped of his power under the eyes of the whole Supreme Soviet, the Moscow diplomatic corps and a fair number of press correspondents. Under the same startled gaze, this master-manager listened to the reading of a confession in which he accused himself of failure in management; and his abject humiliation was completed when he admitted "guilt and responsibility for the unsatisfactory position in agriculture." The man on whom that responsibility really lay, Nikita Khrushchev, promptly nominated a new prime minister; and this turned out to be not the veteran with agricultural experience for whom Malenkov had seemed to be making way, but the "political marshal" and defence minister, Nikolai Bulganin. Next day the fallen premier gratefully accepted the obscurity of a new role as minister for power stations.

Malenkov's confession included a warning to all good Communists that they must ignore the "slandorous speculation" in the West which his fall was bound to provoke. Undoubtedly, for all who live under Communist rule, the only safe attitude to adopt until the dust has settled will be that of the three wise monkeys. In the free world, however, the technique of seeing and hearing nothing is less developed, and speculation is already universal. From a welter of questions, three must be selected for immediate consideration. First, is this the end of the struggle for power that began nearly two years ago, when Stalin was brought to his deathbed? Second, what does the new palace revolution mean for the Soviet peoples? Third, what are its implications for the world at large? Only a very bold man would offer definitive answers at this moment; but it is already possible to suggest a tentative reply to each of the three questions.

The first can fairly safely be answered in the negative. The air is, of course, full of protestations that there will now be an end to all divisions in the Soviet leadership. Malenkov himself was made to say on Tuesday that the Communist Party's central committee was "monolithic in its unity and solidarity." These hard-worked phrases are employed whenever the Kremlin is at loggerheads; they mean no more than they did on the eve of Beria's fall, or when Khrushchev assured western correspondents, just twenty-four hours before Tuesday's abrupt events, that all reports of rivalry between him and Malenkov were mere wishful thinking.

Khrushchev himself seems a most unlikely personality to remain at the top of the Soviet hierarchy for long. Ebullient and incautious in speech, meddlesome in action, and lacking the theoretical equipment that is the pride of every high-ranking Communist, he has also earned a deal of unpopularity in circles ranging from the peasants

whom he once tried to force into "agro-towns" to the bureaucrats whom he is now exiling to the steppes. Moreover, it is unsafe to assume that Bulganin will serve him as a mere figurehead. The two men may well work together successfully for some time, as they have done in the past. But the point must be made that it is no mere clash of personalities that torments Soviet political life; it is a clash of factions and of rival hierarchies.

The fact that less blood is shed nowadays does not mean that the Byzantine intrigues and secret shifts of power between groups have become any less acute. The Soviet system looks more civilised when a prime minister and a trade minister "resign" and later appear, tamed but intact, at public functions. But it is doubtful whether their position now differs much from that of persons who, under Communist law, receive "suspended" death sentences and can hope to survive only if they work a frantic passage back into favour. And it will be astonishing if no changes at lower levels follow Malenkov's fall. This week a victory was marked not only for Khrushchev's personal adherents but for all the Party stalwarts who have come to regard Malenkov as the champion of their natural rivals, the technicians, factory managers, and governmental bureaucrats. Malenkov had inclined towards business efficiency and the freeing of the managerial class from the paralysing grip of their Party watchdogs. Now Stalinist orthodoxy is reasserted, and Khrushchev is herding the bureaucrats off to a bleak pioneering life on the steppes. The Party must evidently lean heavily on the support of the army; Bulganin is the instrument and Zhukov the symbol of this partnership. But at present the army seems content to play sleeping partner, while the once powerful police corps is no longer a challenger for power. This, then, is the hour of the Party diehards of the most orthodox Stalinist stamp.

★

For the peoples of the Soviet Union that is a cheerless fact. They now face disappointments both in the economic field and in the psychological and political atmosphere in which they must live. Before the Supreme Soviet met, the press campaign against light industry, Khrushchev's speech to the Party central committee and the removal of Mikoyan had all served warning that the high hopes encouraged in 1953 were dead. Priority for heavy industry, and specifically for defence, is resoundingly reasserted; the pledges of plentiful consumer goods by 1955-56 are scrapped; and forced saving through state bonds is restored to the scale of two years ago.

It is equally clear that Ehrenburg's "thaw" in the sphere of personal and psychological relations was premature. Social and mental discipline is not going to be relaxed; if anything, it is to be tightened, and it would not be surprising if a new "vigilance" cam-

paign, like that which was staged in Stalin's last days on the basis of the fictitious "doctors' plot," is soon arranged. And will even the provision of scapegoats suffice to work off the spleen of a nation which, since 1953, has lived largely on promises? There are those who claim that "the Russian loves the whip"; but the past two years have revealed the extent of his long muted discontents. How quietly will he accept the postponement of the better times that were promised him for this year or the next? Not even his new masters can tell.

★

They will, indeed, have to steer their way very cautiously along the new economic course they have charted. The problem of feeding a rising population remains acute. It will not be made easier if the peasant is denied the inducement of more and better manufactured goods for which to exchange his produce. The drift to the towns has been on a massive scale, as Khrushchev has revealed; and neither the zealous young Communist nor the uprooted bureaucrat is a good substitute for the peasant when dumped in inhospitable Western Siberia. Again, however threatening the increase in Soviet spending on arms may look, it must be conditioned by the planners' painful awareness of their subjects' impatience for more peaceful benefits. It is still far from clear whether the shift to higher defence expenditure in last week's budget was much more than an unveiling of an existing reality; Soviet budgets traditionally show a large percentage of unidentifiable expenditure. The Red Army marshals may now be staking their claims, but the economic planners face a more difficult problem which, bluntly put, amounts to this: can Russia secure any dramatic increase in its armed strength without overstraining its economy and the forbearance of its docile people?

It is remarkable, in the light of these and other considerations, that so many commentators have hastened to conclude that Malenkov's fall must mean a "tougher" Soviet line in international affairs. Already a myth is being built up around the fallen premier; it is said that Sir Winston Churchill has lost his opportunity of doing business round a table with a reasonable man, that western intransigence has forced Russia on to a new and probably fatal path, that the door is no longer open for negotiation. Yet there is ample evidence against this argument.

First, for all Malenkov's "soft" words, he never at any point offered any real concession to the free world; when negotiation got down to brass tacks he proved as unyielding as any Party diehard could wish. "Soft" talk was a vital gambit for any man who had to step into Stalin's shoes at a moment when Russia faced the possibility of "panic and disarray"; and Khrushchev uttered as much of it as Malenkov. But the only actual Soviet moves in the post-Stalin period that could be

called "soft" were calculated attempts to break up the unity of the free nations, and in particular to isolate America. It is significant that the only alluring Soviet offers lately made were to the Japanese and the West Germans; and they were undoubtedly made with Khrushchev's blessing.

Secondly, the new regime has lost no time in showing that it has not closed any doors that were open in Malenkov's time. Khrushchev told western correspondents on Monday that Russia had "no points of issue with America that cannot be solved." He spoke at length of co-existence, and even added, with characteristic boldness, that he favoured the release by China of the imprisoned American airmen. Next day Molotov, in a speech that was certainly blunt and brutal in its general tone, took care to say that the improvement of relations with the United States was "fully possible," and specifically held out once more the idea of a four-power conference on Germany. There may, indeed, be good tactical reasons for the new government to make a show of more "softness" than its predecessor, if only to remove the impression of Byzantine absolutism left by Tuesday's charades. The "tough" elements in Molotov's speech to the Supreme Soviet may have been primarily intended for domestic consumption; if the Russian people are to be disappointed of their hopes, it will obviously be necessary to show them that the fatherland is in danger—and Khrushchev seems to find no difficulty in combining such warnings with friendly chats to visiting journalists from the West.

Leader of the Left

WHAT is Mr Attlee up to? In the last few weeks he has made what many outsiders have interpreted as deliberate attempts to bring disagreements about Formosa, defence, and general foreign policy into the centre of the electoral stage. There is nothing necessarily wrong in this. If he made quite sure that the ripples that run out from his statements were kept within the limits of what he himself believes, if he were merely trying to out-act Sir Winston Churchill in the role of peacemaker within the framework of the strong policy to which both are committed, one could sit back and applaud his art—although with the necessary comment that this week's news from Moscow may make the art more difficult. Mr Attlee no doubt believes that he is fulfilling both conditions. From the touchlines, and at a moment when bipartisanism in British foreign policy has again become more than usually important, it can only be said that fulfilment seems a very close thing.

It should be admitted at once that anxiety has arisen not so much from Mr Attlee's own statements, as from the interpretation that he has allowed to be given to

For the free nations, the most important lesson to draw from Malenkov's fall is surely not that the age of "co-existence" is now over, but something far more fundamental—a lesson about the essential nature of the Communist system itself. On Tuesday, two cherished illusions were destroyed in one blow. The idea that there is any kind of democratic element in the Soviet political system was disproved in blindingly clear fashion when the 1,300 members of the Supreme Soviet meekly and unhesitatingly accepted a change of government forced upon them by backstage intriguers who did not even trouble to make out a convincing explanation. And the idea that Communism offers an easy road to economic plenty for any backward country vanished in the same puff of smoke. The fall of Malenkov and Mikoyan was a portent for all of Asia and Africa; and it is to be hoped that the record of the past few months will be studied carefully enough for all to see that in Communist practice the well-being of the people is at the mercy of the arbitrary and doctrinaire decisions of the men at the top. On Tuesday the Soviet rulers revealed in melodramatic manner that their promises of quick progress towards a better life ought not to be believed even by the most gullible; and they presented a glimpse of intrigue and absolutism that must give pause to anybody who imagines that a firm and lasting settlement can be reached merely by sitting down at a table with the current occupant of Stalin's throne. While so vast a power can pass in so abrupt and furtive a manner into such impulsive hands, what justification have the free nations for relaxing their vigilance?

them. This was very evident in the first of his recent *démarches*—the interview that he gave to the *Daily Herald* on the Formosan problem at the beginning of last week. He declared then that Chiang Kai-shek should be exiled, Formosa neutralised, and a plebiscite held to determine what sort of government the Formosans want. Although there was a certain anti-American, and electorally orientated, bravado in this utterance, it is undoubtedly an expression of the policy that Mr Attlee believes to be the best that could be achieved. But—quite apart from doubts about the moment at which he chose to expound it—Mr Attlee should surely take very seriously the fact that there has already been misunderstanding, even in the circles that are closest to him, about what he actually said.

In a speech at Lancing last week end, Dr Edith Summerskill is reported to have interpreted Labour's policy as meaning that "the workers of this country will not support the claims of a discredited dictator against the workers of the recognised government of the People's Republic of China"; this isolated comment comes very close to a claim that the British people

believes that Formosans should be handed over to Communism, whether they want it or not. Dr Summerskill is admittedly about as much in touch with the temper of this country as she is with the traditions of Druse communities in Israel; but the point is that she is not a Bevanite, and that she undoubtedly thought she was expounding the new Attleeite line. Mr Attlee should ponder on these and similar utterances of his closest supporters. At the very least, they suggest some failure in public relations within his most intimate ring.

★

The second occasion on which Mr Attlee has been advertised as taking the initiative—the speech he made to a private Labour party meeting last week—was an even more peculiar affair. The main lines of this widely misquoted speech now seem to be clear. Mr Attlee started from the premise that it would be folly for Britain to expect the next war to be anything short of total. From this he argued that, as the only defence against the H-bomb is the threat of retaliation in kind, Britain must have its own stockpile and its own strategic bombers; it should not rely solely on the Americans. He apparently criticised the Government for not moving in this direction more quickly, and he is reported to have developed a number of detailed suggestions, such as the abolition of aircraft carriers and the reduction of the army to smaller, more mobile units.

Much of this is arguable; even the main thesis could be said to take too little account of possible local wars. But it was little more than a claim that the man who fought at the Dardanelles, like the man who fought at Omdurman, recognised the dominance of the H-bomb. As such, it was a gloomy speech; and it duly horrified the pacifists and Left wingers, who started plying Mr Attlee with questions. What about disarmament, he was asked? Certainly disarmament was vital, he answered, but nothing short of total disarmament would do. He did not think it possible to have disarmament only in atomic and thermo-nuclear weapons. Thankfully the Left grasped at this utterance; and, on the basis of these brief answers to questions, largely ignoring the thoughtful half hour speech which went before, the world has been given to believe that Mr Attlee has launched a new disarmament drive. In the present stage of election planning, it is not altogether surprising that the weaker-nerved Labour members have seized on this interpretation; but it is surprising, and disturbing, that Mr Attlee has done nothing to refute the attitude, or the emphasis, which they have so blithely invented for him.

The third doubt that he has allowed to arise concerns his attitude to European defence. For some time now, the Bevanites have been fighting a rearguard action, trying to swing the party over to a policy of calling for a delay in the ratification of the Paris agreements in order that four-power talks on German unity can be

held. Mr Attlee himself, they claim, virtually embraced their policy in his speech on November 18th, when he suggested that if ratification took a long time—and provided that the West made clear that it was determined to ratify in the end—there would be no harm in starting talks before ratification was actually completed. Sir Anthony Eden was duly horrified by this—and so were some of the moderates in the Labour party. The Bevanite proposal for immediate talks came before a meeting of the Parliamentary Labour party on Wednesday; it was duly defeated by 93 votes to 70, although apparently with remarkably little help from the platform. Both Mr Bevan and the platform are said to have emphasised that their difference was only about the right tactics, which the news from Moscow made more than ever obscure. Mr Attlee himself is reported to have dealt with his speech of November 18th by simply ignoring it.

★

When these various incidents are analysed in detail, they do not suffice to prove the charge that Mr Attlee is being deliberately irresponsible; they do suffice to raise the suspicion that he is not showing any great strength. He cannot justly be accused of aggressively inventing slick, sensational and dishonest formulæ in order to cement the party; he can be accused of allowing them to be attributed to him. And this is likely to involve him in a danger that he may not at present realise. This danger is not the obvious one that his present attitude is much less electorally propitious than left-wing newspapers are leading him to suppose: voluble bleating about universal disarmament will not win many uncommitted votes. Nor is Mr Attlee's principal danger simply that of annoying the Americans. If he should come back to power, this annoyance would be temporarily inconvenient; but, as any Labour government that returned to office within the next twelve months would follow a bipartisan foreign policy, he would get over the inconvenience in time. Instead, the real danger lies in the situation that would face him in the contingency that now seems most likely to arise.

That contingency is that Labour may face another five years of Opposition after the next election. In that case, the party is almost certain to swing left in domestic policy; and it may well be that the main task of most of the remaining years of Mr Attlee's and Mr Morrison's political lives will be to try to prevent it from swinging left in foreign policy as well. This means that Mr Attlee must be an active leader, and not a ventriloquist's dummy who allows himself to be widely saddled with statements which—on close analysis—he turns out not in fact to have made. In the last few weeks he has come very close to this latter role; now that world opinion is swinging like a weathercock in response to the news from Moscow, it is to be hoped that he will seize the opportunity for a fresh start.

Visitors from Italy

PERIPATETIC prime ministers are becoming the fashion. In Italy's two neighbour countries, M. Mendès-France and Marshal Tito have each set recent examples that might have been expected to look attractive in Rome. But next week's visit to London by Signor Scelba and his Foreign Minister, Signor Martino, is being made at Britain's specific invitation rather than Italy's request, and it will in fact be Signor Scelba's first major trip abroad for many years; he came to power a year ago, having made his name from 1947 to 1953 as Minister of the Interior under De Gasperi. And, although the visit takes place at a moment of quiet improvement in Italy's domestic situation as well as in Anglo-Italian relations, there are plenty of heavy clouds in the background which the British and Italian ministers will do well to consider together.

★

One is certainly the present European situation and the possible collapse of Western European Union (WEU) following the fall of M. Mendès-France. Italy took a lesser but effective part in helping to draw up the London and Paris agreements last autumn, and Italian opinion has been as realistic about their necessity and the possible outcome of their repudiation as any in Europe. Those Italians—and they have been many—who believed sincerely in European integration under some form of increasingly supranational authority have temporarily sunk their ideals and accepted the WEU as the best of a bad job. Those who are criticised on other grounds for being right wing and nationalistic have equally accepted it, and the upshot has been that the Italian lower house is among the first in Europe to have ratified the new agreements.

Compared with the French, the role that has so far fallen to the Italians in postwar Europe has been a minor one. Admittedly, their country ended the war in the confused and confusing position of ex-ally as well as ex-enemy. Admittedly, Italy does not lie athwart the strategic axis of Western European defence—though its importance in the Mediterranean is as vital as it was in the last war. But it cannot be said that, in spite of the long wrangle with Yugoslavia over Trieste, the Italians have so consistently blocked the path to western unity as have the French. It is not Italy's quarrel with Germany that has defied solution and still holds the whole Atlantic community up to ransom; Italian political neuroses have played no part in encouraging Mr Molotov to think up a new conjuring trick every weekend; no Italian has assumed since the war that, whatever he does, the world automatically owes his country the status of a great power. And while the Italians have perforce accepted their lot in the new world of the last few years, Signor Scelba, when he

arrives in London, will in no sense come cap in hand. He will represent, so far as British policy in Europe is concerned, a country with which the continuance of French instability and the growing influence of western Germany make a closer relationship more and more politically desirable.

A surprising feature of the present international scene is the failure of the West European powers to speak as a team. It might have been supposed that the emergence of the two giants, Russia and Germany, would have forced the Europeans to sink their differences and to think as one. But in spite of much postwar idealism in what, for want of a better word, may be called the European movement, they have remained divided, as much on the old problem of Germany as on the new one of relations with Russia. To a considerable body of opinion on the continent, including many Italians, no small part of the blame rests on the British. They, it is felt, have clung to their lifeline to Washington with a jealousy which, although it may be understood, is regarded as having sacrificed the interests of Europe to those of Britain. To the British, on the other hand, the boot often seems to be on the other foot; without a firm Anglo-American alliance, the chances of making Nato work look slim. Now, the arrival in London of the Italian ministers represents a new opportunity to bury some of this past, and to lay useful foundations for a period in which, if the Paris agreements may not after all be ratified, the cohesion of Western Europe will again be severely tested.

★

British relations with postwar Italy have by no means always been smooth. They made a bad start over the question of the African colonies. But since the settlement of the Trieste dispute last autumn, there has been a considerable thaw. And at the moment the governments in London and Rome see moderately eye to eye on the most immediate of the general items they will discuss next week. These include acceptance of the principle of an arms pool in order to humour French opinion, even if little can at present be done to implement it; the need to complete ratification of Western European Union before there can be any question of reopening talks with the Russians about German elections; and the scale and scope of the German military contribution when it comes to be made. On the broader front, and arising out of German rearmament, Signor Scelba and Signor Martino may be expected to sound the British on their latest views about the use and deployment of atomic and thermo-nuclear weapons; on the effects of this week's electrifying changes in Russia; on the wide series of current diplomatic negotiations about Formosa; and on British reactions to the situation in the Middle

East, following the Anglo-Egyptian agreement on the Suez Canal zone and Iraq's proposed treaty with Turkey.

On the narrow front of direct British and Italian common interests, one of the main subjects is likely to be a review of events in the former Italian colonies in Africa—Libya, Eritrea and Somaliland. In independent Libya there are still 40,000 Italians, whose economic position, while at present good, could at any time become a political issue. In Eritrea, the safeguarding of local Italian interests under the federal arrangement with Ethiopia, while working adequately, cannot be taken for granted. In Somaliland, where the Italians are to give up their UN trusteeship by 1960, there is already some question of a greater Somaliland movement involving the neighbouring British territories, one of which is Kenya. On all these questions, the Italians feel an understandable need to seek British goodwill and, if necessary, support.

For those in Britain who may pause to wonder what their two visitors really represent in terms of Italian politics, both present and future, the answer is mixed, but moderately reassuring. Signor Scelba's government has given the country a year of greater stability than at one time seemed possible after the elections of 1953 and the fall of De Gasperi. And, compared with the past, Italy is at present more prosperous than it has ever been. Moreover, in the recently published ten-year Vanoni Plan a clear effort is being made to tackle the country's long-term problem of over-population and under-employment. Although the Communists polled six million votes at the elections, they have since lost a little ground in the industrial north and the party is patently split with serious internal dissensions; this

week's events in Moscow are reported to have stunned Signor Togliatti, and they may well strengthen a new challenge to his leadership.

Signor Scelba cannot, on the other hand, count on more than some three months of power. Under the constitution he will have to resign when a new President of the Republic is elected in the early summer; and the choice of the next prime minister is wide open. The recently elected leader of the Christian Democrat party, Signor Fanfani, recognising that to the left he inevitably comes up against the ramparts of Signor Nenni's Socialism, is reputedly seeking to buttress the centre's slender majority by support not so much of the leaders but of the voters from the right—a course which is not, however, popular with the Saragat Socialists and the Republicans. Meanwhile, the present government is accused of *immobilisme* in internal affairs, and Italy's basic political dilemma remains. While the Right is too strong to permit real social reforms, the opposition to a frankly reactionary policy is far too powerful to let in an effective right-wing coalition.

These circumstances certainly lead to criticism of Italy in Britain, just as there are always elements hostile to Britain in Italy. But the removal of the Trieste dispute from the political calendar has made the task of any moderate government in Rome much easier, not only in its relations with Belgrade — and these have lately blossomed surprisingly—but also in dealing with London. The opportunity of Signor Scelba's visit should provide a new measure of understanding with Italy. In the last resort it should never be forgotten that absence of such an understanding played havoc with the western alliance in the last world war.

Esteem for Modern Schools

“WHAT school do you go to?” “Oh, just a school, not a grammar or anything like that.” So answered a fifteen-year-old on being interviewed for a job. If she had been readier with her educational jargon she would have said that she went to a secondary modern school. But implicit in her deprecating answer is a very commonly held opinion about the way in which British secondary education is organised: that grammar and technical schools take all the children who are worth bothering about at the age of eleven, while secondary modern schools are a wastepaper basket for the rest. Vigorous efforts have been made by Ministers of Education and by some local authorities to counteract this view. Sometimes they talk as if pupils were “selected” for the modern school as being best suited to their particular gifts; more often they plead for time before judgment is passed. But after ten years it is surely not too early to inquire whether these schools are turning out to be mere wastepaper baskets, or whether

the absence of preconceived standards, forms and purposes is a challenge that is being triumphantly met.

The secondary modern school was brought to birth by the Education Act of 1944; that Act said nothing about the organisation of secondary schools into three types—grammar, technical and modern—but it in fact set it up. Today the secondary modern schools are three times as numerous as the grammar schools and twelve times as numerous as the technical schools. They have 48,000 teachers and over a million pupils—seven out of every ten children in secondary schools. The lines on which they were to be run were suggested in a Ministry of Education pamphlet, *The New Secondary Education*, published in 1947. According to this they were to provide “a good all-round education not focused primarily on the traditional subjects of the school curriculum, but developing out of the interests of the children.” Subjects, the pamphlet suggested, should not be taught in watertight compartments, but

in relation to each other and to the interests and experience of the children: to take a simple example, arithmetic should be related to shopping and the keeping of accounts. Practical subjects such as handicrafts, housecraft, music and art were conceded an important place; and external examinations were firmly declared to be unsuitable for the modern schools, because of their cramping effect on the curriculum.

★

On this agreeable road, towards a destination obscured in a pleasant haze, the modern schools started out, and at first they had little idea where they were going. Their task was not made easier by the fact that many had inherited dismal old elementary school premises, where the overcrowding and the absence of libraries, craft and science rooms and playgrounds made a mockery of the new ideals. Critics were not slow to say that they merely prolonged elementary schooling without any visible benefit to the children. They were blamed for everything from illiteracy among national servicemen to juvenile delinquency.

Lately, however, some of them have been rising in the world. For one thing, about one in four are now housed in glittering new buildings—and by 1960 about a third of the secondary modern children will be in schools built since the war. But even more important is the change in their outlook. They have begun to find for themselves the sense of purpose that was lacking in those first admirable but nebulous notions about free personal development. For the most part this purpose is frankly vocational. Taking a leaf from the book of the secondary technical schools, a number of modern schools have begun to offer to their older children “biased” courses, in which vocational instruction occupies anything up to a third of the teaching time; and traditional subjects, in order to stimulate interest, are linked to vocational study as far as possible.

Some schools run only one or two of these biased courses related to the type of industry that is found in the neighbourhood; in large towns, such as Southampton, this system works well because each school can have its own specialities and a pupil can easily be transferred to one that offers the particular course he wants to take. London, too, has different specialities in different schools, and is issuing prospectuses to parents so that they may have some element of choice. Typical courses for boys are in engineering, building and printing; in some of the rural schools they can take agriculture, horticulture and market gardening. For girls there are courses in catering, dressmaking, housecraft, nursing—and even shorthand and typing, although this is usually looked upon with less favour because to do it effectively takes up so much school time.

Some of these courses last until the age of sixteen and culminate (in spite of those earlier warnings) in an external examination, such as the Royal Society of Arts' or Pitman's diplomas in shorthand and typing, those of

the British Red Cross and General Nursing Council, and qualifying examinations for apprenticeships in HM Forces and Dockyards. At present the only public examination which can be taken in state schools by children of under sixteen is the General Certificate of Education; but the National Union of Teachers and some local authorities are pressing to be allowed complete freedom in this matter. That proposal has its attractions, for examinations are the linch-pin of school-days—to a greater extent than those who are not directly concerned with teaching usually care to admit. But it also has its dangers. It is one thing to use a little vocational instruction as a means of stimulating children's interest in other subjects; it is quite another to have fourteen-year-olds concentrating on some narrow qualification in time that should be spent on a broader education. And to allow them to take such examinations before they reach the school leaving age would encourage them to leave as soon as they reach it. As it is, more and more children are finding it worth while to stay on at school. In 1954 24,000 pupils in modern schools were over the leaving age, 2,000 more than in 1953.

★

The question of whether children should be allowed to take certain external examinations before the age of sixteen needs to be handled flexibly. But there is one other examination proposal that should be treated with less sympathy. This is the idea that the modern schools should have a leaving certificate—a piece of paper that employers would accept as being more “objective” than head teachers' reports. Local experiments with leaving certificates related to the actual courses in the schools are to be welcomed. (South-west Hertfordshire has one for modern school children in general, Harrow one for those over sixteen who have done advanced courses.) But to introduce such a system on a national scale—or to start a junior GCE, as the Cambridge Syndicate has suggested—would be rash at this stage. It is far more important to seek an increase in the growing number of modern school children who take courses leading to the GCE at ordinary level. The modern schools have so far (contrary to British educational tradition) been attending mainly to the needs of the less intellectual—and there was certainly a balance here to redress. It is time to make better provision for the average or above-average child—whom, be it remembered, no school outside the state system would allow in the craft rooms for more than a small fraction of his time.

This is the more urgent now that it has been proved beyond doubt that the selection tests operate in an arbitrary way on the borderline. About a quarter of those who win through to grammar schools turn out to be unsuited to that type of education, and equally children are left in the modern schools who would have done

well at a grammar school. It is essential that modern school children who show unexpected promise should have followed a curriculum that makes transfer to a grammar school a good deal easier than, for the most part, it is now. It is essential, too, that intelligent children who are not transferred should be able to get the kind of education that they would have got at a grammar school. This overlap in curriculum is particularly badly needed in those areas where the proportion of grammar school places is low; and it is becoming more necessary everywhere because, as the "bulge" in the school population moves into the secondary schools, the proportion taken by the grammar schools may well fall from its present 20 per cent to something like 17 per cent of all places in secondary schools.

To blur the distinction between themselves and the grammar schools, and to give their pupils something—whether it be vocational or academic—that they can get their teeth into, is now the aim of the best secondary modern schools. But so far only about one in three or four of the modern schools are offering these opportunities. Too often they plod along the path of the old elementary school, sweetening the "extra year" with courses in civics and visits to this and that. The wide variation in quality is due to the varying attitudes of local authorities. Some are so conservative

that their thoughts can hardly rise above the three R's. Some are so progressive that they cannot leave the cloudland of free personal development for *terra firma* such as the GCE. Some are loth to shoulder the expense of the extra teachers needed to provide a variety of courses in modern schools, and perhaps lack the administrative ingenuity to do so economically.

The Minister of Education, unfortunately, is not in a position to put a bomb under councils such as these, but he might at least spur them on. This could be done in two ways. First, his school inspectors could help to spread enlightenment if they were less inhibited about making odious comparisons, and less wedded to the notion that each school must work out its own salvation according to its own particular circumstances. Secondly, his department could produce a pamphlet, like the 1947 pamphlet on secondary education, describing what was being done in the modern schools by the more energetic and successful authorities. The advantage of this would be that it would teach not only the local authorities, but some of the public too. And thus the modern schools would benefit from a rather better understanding of their purpose and a greater confidence in their work; while those that are still mere wastepaper baskets might have the salutary experience of facing angry ratepayers and outraged parents. There are some parents who should be very outraged indeed.

Notes of the Week

No Cease-Fire Yet

As the Formosa treaty clears its first hurdles through the American Senate this week, the US Seventh Fleet is helping to evacuate the Tachen islands. These two events symbolise a process of consolidation in Formosa, which continues in spite of the absence of any clear American policy; in spite of the uncertainties of the Russian hold over China; and in spite of the obvious difficulties of Sir Anthony Eden and the Commonwealth prime ministers in knowing whether it is worth attempting to organise a conference outside the United Nations or not. Formosa itself and the Pescadores unquestionably remain under the American shield. By embarking on a complete evacuation of the Tachens within fourteen days, however, Washington has clearly started a movement which, even if it is not at present intended to do so, may end by clearing the Nationalist forces out of the other coastal islands as well. Can this consolidation be completed without either trigger-

happy Communists starting a war, or without Nationalist morale collapsing? Even if it can, are there any chances that China will then accept the *status quo*? And, if not, should a conference be called now to deal with the situation before it gets any worse?

There can be no cut and dried answers to any of these questions. The most that can be said is that the chances of avoiding any sudden or violent change in the balance of forces in the China Seas seem to be growing. If so, it would be unwise to rush into a conference merely for the sake of showing activity. Having given the free world a fright and having tied America's relations with the Nationalists into knots, the Communists' obvious gambit would now be to exploit the position by proposing a conference on unacceptable terms. Indeed, if Russian pressure or other reasons have dissuaded the Chinese for the time being from hotting up the actual shooting in the Formosa Straits, they might well be expected to enlist Moscow's help in trying to push their refusal to talk to the Security Council a stage further. They could let it be known that, while they might talk outside the UN, they would still do so only as long

as the Nationalists were not present. For the free world to fall for a bait of that kind would not only be to admit much of the Communist case; it would also put the Administration in Washington in an impossible political position with both American and Nationalist public opinion.

Dilemma over Talks

ALTHOUGH an immediate conference on Formosa could well do more harm than good, at least an informal and confidential meeting of representatives from both sides seems bound to be necessary sooner or later if the present deadlock is to be resolved without wider fighting. For the Chinese show no sign of giving up their propaganda about Formosa, even though they have so far avoided interfering with the American forces off the Tachens; Chou En-lai, indeed, has gone to the extent of claiming publicly that the island will fall this year. Nor are the Americans likely to stage a Dunkirk from Quemoy or the Matsus, unless the situation sharply disintegrates further. Although the truth appears to be that Washington has genuinely not yet made up its mind, there is known to be real alarm that the Nationalists' morale might suddenly collapse if they were forced to retreat any further. And for the Americans any abandonment of Formosa itself is not to be contemplated.

For the British, the continuing risk that the dispute may explode into a more serious conflict contains its own dangers. Probably at no time since the war has a British Foreign Secretary been confronted with such a frightening gap between the path of enlightened self-interest and the mood of the country. The essential need to stand by America has never been more unpopular than it is on the question of backing Chiang Kai-shek, and the Government cannot afford to ignore the fact. While it is true, therefore, that a conference with the Russians and Chinese would need careful preparation and handling, a genuine effort to bring about a cease-fire would rally much needed political support to the Government's side. Admittedly a conference with the Communists on the lines of Panmunjom or Geneva is impracticable if Peking will not talk to the Nationalists, and is to be positively avoided if London and Washington cannot enter it united. But the Commonwealth's role is certainly to promote informal negotiations along the lines which, it seems, are already being followed.

No Railway Inquiry

OF the two principal Government speakers in the first of the Parliamentary debates on transport policy, one deserved sympathy and one was irritating in the extreme. The one who deserved sympathy was Mr Harold Watkinson. Faced by organised interruptions from the Opposition—which had been riled by the nice things some trade union leaders had said about Sir Walter Monckton, and which had decided that this new boy should be subjected to skilled bullying by the school—he presented a bad case remarkably well. Although he emphasised that the railways have cut

down their redundant staff by 17,000 this financial year, he said the House would agree that there is "much that can yet be done."

The Government does not intend to hold a public inquiry on this point, but will leave the task of further cutting to the Transport Commission and the unions, "provided only that the industry shows itself able to put its own affairs in order. That is a very important qualification." This is certainly the right policy, and the right qualification. The only trouble is that the qualification is unlikely to be fulfilled so long as the Government still believes—as Mr Watkinson indicated that he does still believe—that the most politic course in the face of any threatened railway strike is to scuttle behind the skirts of some *ad hoc* body of conciliators. There is not much point in having an able team at the Ministry of Labour if labour policy itself is always to be delegated—at moments of real crisis—to any lawyers, industrialists and trade unionists who happen to be free for a few days, and who are willing to come under fire.

Subsidy Up the Sleeve

IN contrast to Mr Watkinson's performance, the most annoying feature of the transport debate was the way in which Mr Butler was allowed to display an extraordinary sleight of hand. With great solemnity, and amid loud Tory cheers, he announced that there will be no Exchequer subsidy for the railways. Instead, the Government believes that the Transport Commission will be able to balance its books by the time the fifteen-year modernisation programme is completed. In the meantime the commission will have no difficulty in finding the cash to cover its capital outlay and current deficits, because it will be able to borrow on the market—the Chancellor said he wanted "to stress the words 'on the market'—subject to the normal Treasury guarantees and with the "normal Government support and encouragement."

This is semantic juggling. If the Transport Commission is to consume more resources than it earns—in other words if it is to run a current deficit—for fifteen years, then of course it will be getting at least a temporary subsidy from the taxpayer. The principle is not changed by the fact that the money actually handed to the commission will come from a gilt-edged issue, which will be largely taken up "in the normal way" through switches by the Bank of England and the National Debt Commissioners out of current lending to the Treasury—so that the Treasury will have to make up for the money thus denied to it either by inflationary credit creation or (eventually) by tougher budgetary policies than it would otherwise pursue.

In present circumstances, this traditional method of aiding the nationalised industries is probably the wisest way of financing the railways' capital outlay; it may even be sensible to agree that such borrowing should also cover a short-term current deficit, although the Chancellor's suggested time interval of fifteen years shows remarkably little faith in the probable progress of staffing economies and the efficacy of the new charges scheme. But Mr Butler should not be allowed to get away with the claim that a subsidy is not a subsidy because it is called by some other name.

Neither Mendès nor Pinay

A FULL two years ago, when the "third force" experiment in France was clearly failing, an attempt was made to cut through the tangle of party politics with the suggestion that the real Left and the real Right should coalesce each around one moderate leader, and confront the country with the simple choice, "*Mendès ou Pinay?*". The past week has demonstrated the parties' inability to shake off their habits and inhibitions so successfully. M. Mendès-France has fallen; M. Pinay has tried to assemble an alternative coalition, but on Thursday he was forced to abandon the attempt. His failure proved the proposition that M. Mendès-France had not been brought down because he had carried his radical policies too far for the taste of an Assembly still inclined towards the right. In fact, the late prime minister was turned out of office by an unsavoury coalition of Communists, diehard spokesmen for the settlers in North Africa, unforgiving devotees of the EDC, and individuals embittered by the sharp personal conflicts of recent months. His defeat revealed no sign that an alternative government existed, and M. Pinay has now confirmed the extent of the vacuum.

France is thus again left without a government at a moment when the international situation as well as the critical state of affairs in North Africa urgently requires one. It also faces the possibility of a drift back into the condition of *immobilisme* out of which M. Mendès-France wrenched it last June. As an article on page 545 shows, it was the very dynamism of the late prime minister's policies that raised up such a variety of hostile groups against him. A stopgap ministry may well be formed without much further delay; but what prospect does that hold out that France can continue to play on the international stage the vigorous role to which it began to be accustomed during M. Mendès-France's rule? The outlook for the final ratification of the Paris agreements on Western Union is darkly overcast; and it seems at present that France's friends cannot even hope that last week's events have worked off the political spleen accumulated in the past seven months.

Pakistan Uncrowned

PAKISTAN'S decision to become a republic has been known too long for the announcement in the Commonwealth Prime Ministers' communiqué to be anything more than a formality; the importance of their statement rather resides in the warmth with which they have all welcomed Pakistan's continued association with the Commonwealth and the fact that they thought it worthwhile at this juncture to re-emphasise the Commonwealth's "unique" significance. "Among its members are countries of importance in all quarters of the globe. Its strength and influence in the world today are derived from this and from a common outlook which, in spite of differences of geography, religion and race, evokes a broadly similar response to most international problems of the day." Pakistan clearly desires to share the benefit of the day-to-day inter-Commonwealth exchanges on policy, which is evidently none the less tangible for being hard to define.

It is true that Pakistan's decision will thus make little difference to the Commonwealth as it is; but Pakistan's experience as a "crowned republic" over the past six or seven years has nevertheless helped to define the Commonwealth relationship. Pakistan deliberately remained a dominion after India had become a republic, and evidently expected some preferential treatment to accompany this "closer" relationship with Britain and other countries, especially in regard to the Kashmir dispute. In fact, Pakistan received exactly the same consideration as India, and the Commonwealth judged the dispute on its merits strictly and unofficially, no attempt being made to interfere on Pakistan's side. There followed a period in which Pakistan began to feel more self-consciously a Moslem

power. Religious influences gained the upper hand at Karachi at a time when Britain and Egypt were on bad terms. Though a more secular view is now in the ascendant in Karachi, and Anglo-Egyptian relations are far better, in the blueprint for an Islamic republic which has meanwhile emerged from the Constituent Assembly there is now no place for a British and Christian monarch as head of state. But the Queen remains for Pakistan, as for India, Head of the Commonwealth and therefore a figure of great, and probably growing, constitutional importance. In Mr Gordon Walker's phrase, the Commonwealth is becoming an association of realms and republics—and there may be more states in both categories before its evolution is complete.

Not with a Bang?

IN the matter of newspaper headlines, the Commonwealth prime ministers were almost as eclipsed as Mr Malenkov on Wednesday. But their final communiqués were hardly the stuff of which banner headlines are made, and they would not have aroused much excitement even if the news from Moscow had not been so overshadowing. Apart from the more obvious Churchillian touches, the phrase that caught the eye most quickly was the reference to "the overwhelming superiority of the western powers in nuclear weapons" as being the world's best assurance of peace at present. But, just as the communiqué was being published, Mr Molotov was telling the Supreme Soviet that "with respect to hydrogen weapons, the United States and not the Soviet Union is among those who are lagging behind," and that in atomic armament generally Russia was level with the United States. It was pure coincidence that

these two claims should be made simultaneously; but that certainly does not make the contrast any the less thought-provoking.

Molotov did not touch upon the problem of delivering Russia's hydrogen bombs upon their essential targets; and it may be assumed that it is in this respect that the western world's confidence is best founded. However, the West's gravest cause for alarm may well be identified in Soviet psychology rather than in Soviet technique. Molotov's speech also contained a passage in which he boasted that in the event of a third world war "it will not be world civilisation which will perish" but only "the already rotten imperialistic social system." In recent months there have been signs that the Russian rulers were awakening to the universal peril which world war with the new weapons would bring in its wake; while parts of the Soviet press have continued to assure the public that it had nothing to fear, other organs have struck a more sober and realistic note by introducing the implications of thermo-nuclear destructive power to their readers. Yet the words uttered on Tuesday by the man who had served Stalin and Malenkov as foreign minister, and who will now presumably serve Bulganin and Khrushchev, imply that the grim truth has not yet been brought home in Moscow as fully as it needs to be.

Smog in the House

THE Government has promised to introduce a Clean Air Bill this session, and MPs seemed ready to undertake last Friday that they will delay it as little as possible—for example by questioning whether or not it is a good one.

Marginal Lancashire

IN last week's by-election in the Cheshire constituency of Stockport South both parties polled almost exactly the same proportion of votes as in the general election of 1951. At almost every meeting there were questions about the "threat of Indian competition" to the cotton industry, and the Indians' tariff barriers against taking British textiles in return. Although Stockport is not really a cotton district, there is some reason to suppose that this "threat" may have done something to prevent the swing towards the Conservatives that has occurred in most recent urban by-elections. In Lancashire itself, some Labour members believe, the current swing may be to the left.

The economic background to this invasion of Indian textiles into Lancashire was discussed in *The Economist* last week. The political background is shown in the accompanying table. Of the sixty-odd Conservative seats that could have been lost by a three per cent swing to Labour at the last election, seven are in Lancashire; another dozen depend heavily on that other source of Tory

uneasiness—the agricultural vote. Of the sixty-odd Labour seats that could have been won by the Conservatives with a three per cent swing in 1951, nine are in Lancashire (and one in a textile area in Cheshire); while another two or three depend largely upon the agricultural vote. These estimates are based on the old constituency boundaries, but the recent boundary changes do not seem likely to change the broad picture much.

It is not quite true to say that the cotton workers and the farmers hold the fate of the Government in their hands. But it is not surprising that Mr Gaitskell hastened to proclaim in the House this week that Indian competition with Lancashire was "very unfair"; and that Mr Low, speaking for the Government, agreed that it "appears to be" so—with the apparent implication that the Board of Trade will take action soon, if the Indians do not lower their tariffs.

MARGINAL SEATS IN LANCASHIRE

Labour seats that could be lost by a swing of:					
1 per cent		2 per cent		3 per cent	
Preston South		Droylesden		Ashton-under-Lyne	
Chorley		Huyton		Eccles	
Liverpool, Kirkdale		Rossendale		Accrington	
Stalybridge & Hyde*					
Conservative seats that could be lost by a swing of:					
1 per cent		2 per cent		3 per cent	
Rochdale		Preston North		Manchester, Blackley	
Bolton East		Bury, Radcliffe		Oldham East	
		Liverpool, West Derby			

* Cheshire seat, but in area affected by textiles.

When the Bill comes, it will almost certainly seek to enact the two principal legislative changes proposed by the Beaver Committee. First, the emission of industrial smoke—which, at present, can be dealt with only if it causes a nuisance—will become an offence, probably within three years of the Bill's passage. There can be little objection to this, especially as Mr Sandys is fortunately to be given time to hold a few more hurried conversations with the interests particularly affected. Moreover, the most welcome feature of last week's debate was that members seemed ready to agree that the cost of removing this nuisance should be placed on the industries themselves—and through them on the consumer—not on what the Beaver Committee tended to regard as the bottomless purse of the Exchequer.

Secondly, the Bill will strike at the ordinary householder—by generalising the power to set up smokeless zones (which local authorities have hitherto only been able to declare by passing separate private Acts) and by establishing partially smokeless zones, which are to be called "smoke control areas." It is this impact upon the householder that is going to cause much more controversy than MPs realise. Although the fuel efficiency experts, who were largely responsible for writing the Beaver report and priming MPs for last week's debate, know how to make fires without smoke, there is remarkably little evidence—from the rather unhappy experience in trying to set up smokeless zones to date—that they know how to force other people to make them. It seems probable that the principal emphasis in any controls will have to be on diverting supplies of smokeless fuels to the chosen areas (which, initially, will have to be few in number), with consequent strains and annoyances for those whose equipment is fitted to burn nothing else but smokeless fuel in other parts of the country. Moreover, if supplies become really short, it will be very difficult—in the new circumstances—to correct the shortage by a rise in

price; some of these fuels are too cheap at the moment, but politicians will not like telling people in the smokeless zones—at one and the same time—that they have got to burn these fuels and that they will have to be made more expensive.

The Ministry of Housing and Local Government has already had experience—in the Town and Country Planning Acts—with legislation that is excellent in theory but incredibly difficult to implement in practice. It is to be hoped that it recognises exactly how complicated this new legislation will have to be; at the moment the pressure of politics upon it is merely to introduce some sort of legislation, and in a very great hurry.

Federation or Apartheid?

KENYA settlers have long been accused of being critical of the Colonial Office and their own administration without ever putting forward constructive alternative proposals for Kenya's political future. This charge can no longer be levelled, if the blueprint for linking Kenya through Tanganyika with the Central African Federation put out by the committee set up by the "Truce Conference" (between the European parties) is held to be constructive. Uganda will be thankful to be left out of it, and this omission represents a considerable modification of the Kenya settlers' dream of an East African Federation; but Tanganyika will not relish being made the link in a Nairobi-Salisbury Axis.

Something can perhaps be said for breaking up entities like "Kenya" and "Tanganyika" into federated states more closely associated with regional and ethnic interests; there is certainly much to be said in general for federations of more than three or four large units. The trouble with the settlers' plan is that it reveals too nakedly the motives behind it. While its authors concede that in African provinces the provincial legislature should be dominated by Africans, it insists that there must be European guidance for the time being; and though Africans would be the majority in the one white province, it is clear that this would be run entirely in the settlers' own way. The committee concedes that the central government would have to have representatives of all races—but no doubt prefers an enlarged version of the Central African federal legislature to the Kenyan legislature where, under the Lyttelton settlement, there are Asian and African ministers. The plan, it appears, is for European control at the centre, European domination in any white province, and European "guidance" in the black provinces. This is a very different thing from trying honestly to work out a harmonious pattern of race relations in the one country for which the settlers have real responsibility and in which they face a challenge to prove their qualities of leadership—Kenya.

It was for this purpose that the United Country Party was formed, some of whose members however have endorsed this escapist federal plan. Mr Blundell did not endorse it; and it is to be hoped that he and his followers will hammer out something more sensible and liberal to put before the European electorate at the election in 1956. His difficulties are great. He is assailed for backing the

amnesty offer to Mau Mau, and he may face a new uproar when the Royal Commission's views on the White Highlands are published next month. But the task of white leadership in Kenya is unflinchingly to educate a well-off, privileged, individualistic, class and colour-conscious but frightened white community to present-day African—and global—political realities.

Househunting in the Welfare State

THE Requisitioned Houses Bill, published last week, will bring some relief to long-suffering landlords, but very little and very late. It will free all requisitioned houses by 1960, about five years earlier than seemed likely at the existing rate of progress—but still fifteen years after the end of the war. It will make local authorities less inclined to hold on to such property in the meantime—by transferring to them, after April 1, 1956, 25 per cent of the cost, which hitherto has been borne wholly by the Exchequer; but it will not provide much incentive, because the councils will still find this a cheap and easy way of housing their people.

Moreover, while the Bill gives only a gentle spur to local authorities, it provides no inducement whatever to sitting tenants to find themselves other places in which to live. Their rents are usually uneconomically low, and the local authority will not be able to move them until it has found them somewhere else to live, just as nice and at the same sort of rent. If they hang on, they may get one of the new council houses that are being reserved to rehouse the occupants of requisitioned houses. If, at the end of five years after this Bill becomes law, the council has failed to find them a suitable home, or to persuade the landlord to accept them as statutory tenants, or to lease the house itself, they will still have nothing to fear. When all else fails the council will be empowered by the new Bill to purchase the house at the market price for vacant possession.

The pious hope is expressed that compulsion will not be necessary, since many owners are known to want to sell.

Perhaps the most important part of the Bill is that the owner who wants his house back in order to live in it himself—or even to sell it if he badly needs the money—will now be able to go to court, just as the owner of a rent-controlled house can do. If the court decides that his hardship is greater than that of the dispossessed occupant would be, it may grant him vacant possession. But how utterly inappropriate today is this criterion of greater hardship. What of the rights of property, and of the need to encourage better utilisation of house space by resort to the market mechanism? The Government boasts of its achievements in housing, of a record number of 348,000 houses built in 1954, and of a stock of houses greater per head than it was before the war. This last statistic shows why the waiting lists remain: they remain because rent control and requisitioning ensure that the supply of houses goes less far than it could, because the displeasure of sitting tenants would be more costly in votes than is the present inconvenience of those without a house—and of landlords.

Polish Policemen Reproved

IF this week's changes in the Kremlin herald a switch in Soviet policy, it goes without saying that eventually the satellites will tag along behind. But they will not be in a hurry to do so. Whatever happens in Russia it will not be easy for them to carry out immediately any sharp reversal of the softer domestic line, especially in the security field. It is only in recent months that a milder security policy has been put into effect in most of the satellites. In particular, it was only last December that the Poles carried out a reorganisation of their security services closely modelled on the one carried out by Malenkov nearly two years ago. General Radkiewicz, for ten years head of the Ministry of State Security, was transferred to a minor post, and the ministry was divided into a Ministry of Internal Affairs and a Committee of Public Security which was put in charge of a member of the party politburo and made directly responsible to the Cabinet.

The purge of the Polish security services that inevitably accompanies these changes is still under way, and the ideas on which the changes are based, which have already been set out in the party press, were reaffirmed only the other week by Mr Bierut in a report to the central committee of the party. Briefly his case was that the security organs had grown above themselves; they had perpetrated "glaring violations of the rule of law" (which had now been put right), avoided party control, and behaved as if they were superior to everyone else. In future they are to be strictly controlled by the party and are to concentrate on genuine enemies of the regime instead of occupying themselves, as in the past, with party deviationists "who display temporary wavering or distrust"; it is known that, as in Hungary and to a lesser extent elsewhere, many of these culprits have now been released from gaol and rehabilitated. Mr Bierut suggested that with the gradual political and social transformation of the country, the scope for repressive action was smaller than it used to be. This line obviously redounds

to the credit of the regime, which will not hasten to make nonsense of it. How true it is is another matter; but the Communists are doubtless reckoning that the skilful propaganda use of the danger of a rearmament Germany will help to strengthen their position at home.

Boomerang in Algeria

LAST week's Communist vote against M. Mendès-France may turn out to be a mixed blessing for Moscow—an asset in Europe but a liability in Africa. The vote was cast in order to overthrow an advocate of German rearmament, but it also threw over the man whose name has since June become a byword among Africans. M. Mendès-France has come to be regarded by them as the only Frenchman capable of taking action to promote the kind of French Africa in which they wish to live.

The chief Algerian nationalist party, which is the *Mouvement pour le Triomphe des Libertés Démocratiques* (MTLD), approached the Communists before the vote and asked them to abstain in order that M. Mendès-France might survive. This request, though reasonable in that the Communists endorsed M. Mendès-France's North African policy, could not be met because it was overridden by a contrary instruction from Moscow. Since then, Moslems in Algiers have been passing round word that no good nationalist buys *Alger Républicain*, which is the local Communist newspaper. The wave of emotion that produced this gesture is unlikely to last, but the incident is one that Africans may well recall at moments of stress, not only in Algeria but farther south.

Communists and the ILO

ONE of the latest victims of the cold war is the International Labour Organisation. The reappearance of Communist delegates at its conference last June gave rise to some stormy debates; and the same thing, only more so, marred the proceedings of its recent European regional conference. Although many workers' delegates were loth to accept the presence of Communist delegates from trade unions that are notoriously neither free nor independent, the latest difficulties arose out of the employers' opposition to the admission of Communist "employers" delegates on the conference's technical committees. The conference eventually accepted a compromise by which these delegates should be allowed to sit on the technical committees with the right to speak but not to vote. The employers thereupon decided to boycott these committees, while continuing to join in the other work of the conference.

The employers' uncompromising stand makes the outlook for the ILO a troubled one. Admittedly the presence of Communist employers' (and workers') delegates, who are, in effect, just extra mouthpieces of their governments, threatens to undermine the ILO's tripartite organisation.

Admittedly, too, the influence of the employers' group may be weakened if some of its members line up with the workers' group—as the Communist employers' delegates may well do. (The employers, however, will weaken their own influence even more effectively if they continue to absent themselves from the technical committees.) But if Communist states are accepted as members of the ILO, it is absurd and illogical to expect that they will remain content with what amounts to second-class membership.

Many delegates, however, feel that no good will come of the Russians' return to the ILO fold, and that in a divided world the organisation had better abandon its aspirations to universality. But it is far-fetched to say that the Communists can disrupt and destroy the ILO even if they wanted to, which is by no means certain. Their speeches and behaviour so far suggest that they have realised, rather belatedly, that in the ILO conference hall they have an excellent platform for their propaganda, and that in the ILO corridors they have many splendid opportunities of preaching the Marxist gospel to gullible dele-

Matthew Arnold's Poetry

POEMS. By MATTHEW ARNOLD. *Second Series.* Longmans, Paternoster row.

All writing now is necessarily ephemeral. Words, whether used by poets or philosophers, are but the signs of things, and things now change so fast, or events succeed each other so rapidly, modern knowledge extends over such a wide field, in every part of which new products are continually rising into sight and compelling attention, that the words used, or the notices taken to-day, must necessarily be swept away by the words we must use to-morrow or the day after. The ephemeral nature of literature of which some persons complain is, therefore, the necessary consequence of the present enlarged condition and rapid progress of society; and it is likely to become so more and more, day after day, till we have nothing else than periodical and ephemeral writing. Hence the most stirring of our poetry now relates to passing events, and is published in newspapers. Mr Matthew Arnold, however, who has obtained somehow a considerable reputation, seems to imagine that his words, which have no relation whatever to the events of the day, are to live. He writes poetry on theory, and as his theory of nature and man happens not to be ours, we can only condemn his poetry as meaningless and worthless words. To us it is worse than meaningless and worthless; it is false and disgusting. We open this new series of his songs, and we find in it stories of gods, charms, and old sayings, that may possibly be historical, but are very doubtful. In spite, therefore, of Mr Matthew Arnold's hereditary claim to distinction, and in spite of the praise he has obtained, we decide, without further investigation, on putting aside his book, as merely adding to the worthless books of the same kind with which the world is already encumbered. That he has a great command of language nobody can doubt, but so have fishwives, spouters at public meetings, and most writers; and it is not the command of language which can recommend them to our notice, but the use they put it to... and so we bid... Mr Arnold adieu till he writes about something we can comprehend and believe.

The Economist

February 10, 1855

gates from underdeveloped Asian and African countries. Yet to turn them out of the organisation, at any rate at this stage, is to set up another barrier to east-west understanding, and to deny that the Communists might possibly benefit from their contact with western ideas. This is a very slender hope, but to stifle it at birth is a counsel of despair.

At its meeting later this month, the ILO's governing body is to consider a proposal that there should be an inquiry into the advisability of amending the organisation's constitution so that workers' and employers' delegates who are not free and independent should be excluded. But if such an amendment were fully and fairly applied, it might do far more to disrupt the organisation than the presence of Communists within it. Before it is considered seriously, it might be just as well to make a careful inquiry into what exactly its effect would be.

Off the Runway

IT is hardly surprising that engineering workers at London Airport have resolved to strike unless Mr J. R. Peters, a dismissed shop steward, is reinstated by next Monday. When the Peters affair started just before Christmas, it seemed that British European Airways acted with exemplary speed and firmness. They dismissed 317 maintenance engineers who, in defiance of the management's instructions, had held a meeting in working hours; but they allowed the men to re-apply for work, provided they signed a document accepting the constitutional agreements.

Doubt about BEA's wisdom crept in when Mr Peter Masefield, the Chief Executive, repeated day after day, by loudspeaker and in person, his exhortations and explanations to the men. It was strengthened when it became known that Mr Peters was to be the only applicant not to get his job back. This seemed to be asking for trouble, since the unions are highly sensitive to the victimisation of shop stewards; but BEA was certainly entitled to judge whether it was worth taking the risk. At this point, however, the management began to abrogate its function. Mr Peters's first three appeals against his dismissal had been rejected. Then the chairman, Lord Douglas of Kirtleside, issued a honeyed statement about the need for impartiality, and appointed an independent tribunal. This, he announced later, declared that "BEA was justified both constitutionally and morally in issuing the notice to Mr Peters among others"—as if it confirmed his decision. But what else had the tribunal said? The point at issue was not whether Mr Peters was rightly dismissed in the first place, but whether it was right that he should be the only one not to get his job back.

Belatedly Lord Douglas published the report—and there in the final paragraph was a recommendation that Mr Peters should be re-engaged. The tribunal had been uneasy that he should be the only exception, particularly as all the other shop stewards were re-engaged; it was not even sure that he was "the sole or even the primary cause of the events which led to the calling of the unauthorised meeting on December 17th." To call for an impartial view and then reject it is to confirm the belief, which the tribunal was rightly anxious to scotch, that Mr Peters is being victimised. Faced by this storm, Lord Douglas has had one

Quebracho

Glance down the list of Britain's imports from Latin America and you will find quebracho extract. The quebracho itself is a tall hardwood tree which grows in the northern forests of Argentina, taking a full century to reach maturity. Its extract, a valuable tanning agent, is shipped to world markets from Buenos Aires, where the Bank of London and South America has long been established. You will find quebracho mentioned from time to time in the

Argentine section of the Bank's *Fortnightly Review*.

This publication is an invaluable guide for all who wish to enter Latin American markets, whether as buyers or as sellers, for it summarizes the latest reports on trading trends, import regulations and exchange control received from our 51 branches in South and Central America.

We shall be glad to send you a specimen copy, on application to:—

suggestion to offer: that there should be yet another impartial inquiry. This is how not to manage industrial relations.

Indo-China's Refugees

THE proportions of the humanitarian problem arising from the resettlement of anti-Communist refugees in Indo-China are now becoming apparent. By the beginning of this month their number had reached 613,000, and it was expected to grow until the final evacuation of the Haiphong enclave by the French in May. Although most of them are Roman Catholics from the bishoprics of Phat Diem and Bui Chu in the Red River Delta, many are Buddhists and others still of no particular denomination, united only by a common determination not to live under Viet Minh rule.

Despite generous aid from the United States, France, Australia and other countries, the problem of resettling so vast a number of refugees has not unnaturally proved overwhelming. Fewer than one third of the refugees have been resettled so far, the majority in the rice villages of the Mekong delta, although a few thousands have been sent to the potentially rich but undeveloped lands in the hills of southern Annam. The remainder are still herded in camps in the Saigon region.

The difficulties largely arise from a shortage of agricultural implements and, above all, of trained technicians and medical personnel. A quarter of the refugees are suffering from various diseases, including beri-beri and malaria, and there is an immediate need for doctors or surgeons with teams of competent nurses. The nursing teams already sent by the International Red Cross and by the Red Cross of twenty countries are more than fully occupied, and the need for further help appears urgent.

Copperbelt Compromise?

THE way to agreement on African advancement on the Rhodesian copperbelt has now been opened: the secret and compulsory ballot, held among European mineworkers by their union, has shown a majority in favour of opening some European jobs to Africans. The Rhodesian Selection Trust companies have responded by withdrawing their notice to the European Mineworkers Union to terminate the agreement under which Africans were effectively debarred from advancement "having regard . . . to the stage which negotiations on the Rhodesian Selection Trust plan for African advancement have now reached." In fact two plans are under discussion, and the European Union has asked the companies to combine them. The plan to set aside one per cent of European jobs for Africans for five years has been put forward by the Anglo American Corporation; the Rhodesian Selection Trust's plan starts from the premise that such a rigid numerical limitation of the jobs to be opened to Africans

fails to remove the colour bar. Instead it proposes to create a ladder of "diluted" jobs between the unskilled African level and the skilled European level; and that when an African shows himself capable of doing a European job as well as a European he will get European pay and allowances (other than housing). This is the meaning of the phrase "equal pay for equal basic work." On the other hand, the Selection Trust would guarantee to find other work for Europeans whose jobs were "diluted."

Whether the European Mineworkers would prefer this plan, which does away with the colour bar, decides advancement strictly on individual merit, and judges the African sternly by European standards of productivity, may be doubtful. The Rhodesian Selection Trust plan offers the African most, though the Belgian method of paying both Europeans and Africans proportionately to an assessment of productivity on a Belgian home "norm" would offer far more. Meanwhile, the African strike for higher pay for all Africans continues, and has so far been sustained by remarkable discipline. It is, perhaps, a crucial exercise in black solidarity. Africans will be glad enough of either advancement plan; but their leaders' objective is a powerful and possibly politically-minded union, and higher pay that will force the companies to a more productive use of—and therefore training of—Africans in industry.

Bargains in Books

THE week after next will see the beginning of an event hitherto unknown in Britain—a nationwide book sale, in which about 700 bookshops, and book departments of stores, will be taking part. Books that have been in retailers' stocks for more than a year will be reduced in price by at least a third, and publishers' stocks will be on sale at half price or less.

The first reaction to the book trade's announcement of the sale may be surprise that one has not taken place before. Yet the trade itself is not altogether convinced about the merits of a sale. Booksellers and publishers alike regard it rather as a desperate expedient to meet a desperate situation: the overstocking that has resulted from the end of the wartime boom in book sales and the steady rise in the output of new books. Quite apart from the amount of booksellers' capital that is thus tied up, this huge unsold stock presents physical difficulties because it takes up space that might be given to books that are readily saleable.

The hesitation that is felt in some quarters about the sale—which the trade is careful to call experimental—is provoked by the suspicion that it does not go to the root of the matter. It may stimulate an artificial increase in demand for the ten days of the sale, but it seems at least as likely that this will be followed by a period of stagnation as by the inculcation of a book buying habit in the general public; and stocks will rapidly rise again as long as the inexorable increase in book production continues—there is every sign that the coming spring publishing season will be as heavy as its predecessors. There is some force in the view that greater discrimination by publishers would do more to meet the book trade's long-term difficulties than ten days of hothouse sales.

Letters to the Editor

Millions for Cinderella

SIR—Should we not think twice before accepting the conclusion that new capital for the railways should be raised at a fixed rate of interest with a Treasury guarantee? We are always being told that the nationalised industries must be conducted as commercial enterprises. What commercial enterprise raises all its capital by prior fixed charges? (Incidentally, what degree of competition can there be between industries, some of which do not have to compete for capital?)

The success of the Transport Commission's plans must be highly speculative. Already one of the railways' difficulties is the payment of interest on their stock. Is it wise to tie another obligation round their necks which has to be met, profit or no profit? There seem to me to be two alternatives; either to let the Transport Commission go to the market without a Treasury guarantee; or for the Exchequer, i.e. the nation, to subscribe for an equity issue by the railways.

The first alternative is almost certainly impossible, especially as the railways are already saddled with their fixed obligations under the initial Nationalisation Act. It would, however, be most interesting to see how the market, with all its experience, rated the chances of the railways. It might also mean that if the railways were freed of their remaining "common carrier" obligations and subsidised for such lines or services as are required for other than strictly economic reasons, we should get a railway system reformed and reduced to a scale at which it would pay. The second alternative seems, however, much more realistic than the provision of money at a fixed rate of interest. If the nation wants to take over the ownership of the railways it should take the risks (and benefits) of ownership.—Yours faithfully, J. GRIMOND
House of Commons

Brand Names v Kite Mark

SIR—This Group went on record last week as welcoming wholeheartedly all manifestations of consumer interest and desire for knowledge regarding textiles. It publicly offered to co-operate with responsible consumer organisations on the basis of investigating with them ways to increase the knowledge of the public, coupled with a readiness to give the fullest information about the members' products.

It is amazing that in your issue of February 5th you brush aside this posi-

tive attitude by describing it as "guerrilla warfare" and "a counter move" against the British Standards Institution Advisory Council on Standards for Consumer Goods.

I here state categorically that this project by the Group is not conceived in any way as an act of hostility towards the new BSI Council. As we understand it, the BSI Council is concerned with standards for consumer goods; it does not contain manufacturers' representatives but its views will be considered by the BSI Industry Standards Committees.

This Group seeks to undertake quite a different task. It wants to make full information available to consumers, to receive at first hand constructive criticisms from them, and to encourage face to face discussions between manufacturers and consumers. By this means, we hope to bring about both mutual understanding of problems and rapid action to deal with them. This, we believe, is a job which needs to be done and we believe that our Group is a suitable body to embark on the task. It comprises the "household names" in the textile world; it does not fix or enforce prices; members, as a condition of membership, accept an obligation to replace faulty goods. We hope our example will be followed in industry generally.

We want to extend the modern practice of "joint consultation" into the consumer field. In a free economy, an informed and discriminating body of consumers, exercising a wide and intelligent freedom of choice, is the greatest incentive to manufacturers to maintain and raise the quality of their goods.—Yours faithfully, HOLLENDEN
The Branded Textiles Group

Resentment on the Farm

SIR—I often wonder why we should continue to favour the British farmer and the reasons you give in your issue of January 29th do little to enlighten me. "Partly," you say, "it is a matter of honour"; but how much money would the farmers have made if they had been allowed to exploit food scarcities when they could, and for how long are we going to go on making it up to them? "Partly," you say, "it is a matter of sentiment"; but "the most lovely countryside in the world" would be still lovelier if our agriculture were pastoral rather than mechanical.

"More basically," you say, "agriculture is subsidised as an insurance"; but in 1939, when a claim was made on the land, the stored-up fertility was of

immense value and one wonders whether, in another emergency, we should not miss this reserve grievously. It may be said that between the wars farmers lost the "know-how" and may do so again if they are not encouraged by subsidy to produce anything and everything; but surely it would be more sensible to spend the insurance premium on a scheme specifically designed to preserve the know-how. For example, units of high farming could be maintained by the Government throughout the country and from these propaganda could be spread if we should again have to depend abnormally on our own production. Such units would be much less expensive and would perhaps give better benefits than our present insurance policy.—Yours faithfully, Kingussie T. G. STOBIE

Cottons for Lancashire

SIR—You diagnose Lancashire's difficulties as "the problem of the big but contracting industry that has lost its bulk markets for cheap goods." I disagree. A decade has elapsed since these markets were lost, largely as a result of tariffs being raised, notably by India. Since the 1920s, when 50 per cent of the total export value of cotton goods was accounted for by grey and bleached cloths, the trend has been towards the export of goods with a higher conversion value. At the moment a further movement in this direction is severely hampered by the operation of the iniquitous purchase tax. This was reflected in the Christmas and New Year stoppages, which were more marked amongst the firms in the fine section of the trade.

A second difficulty is the big fluctuations in home demand. The home market now absorbs between 70 and 80 per cent of production. These fluctuations are the result of the growth of large buying units whose orders inevitably have a substantial influence on general activity. Some progressive firms, however, have taken these difficulties in their stride. One famous Lancashire concern exports 75 per cent of its output and rations its customers.

On the other hand, the picture is not so black as many managers and union leaders paint it. Man-made and synthetic fibres are growing in importance, and in price and technical know-how the scales are weighted in Lancashire's favour. Furthermore, there is a marked growth in the industrial uses of cotton, which now account for more than one-quarter of the total output of cotton goods. If Mr Butler's target of a doubled standard of living in twenty-five years is to be attained, the distant future could be bright.

That rests with the cotton leaders; they must be prepared to adopt twentieth-century methods of industrial organisation. At present only 10 per cent of the operatives in spinning and weaving are re-deployed, and only 6 spinning mills out of 500, and 43 weaving sheds out of 1,200, are on double-shift working. Simultaneously, the

price-fixing arrangements with which Lancashire is riddled must go; they are not stabilisers, but built-in rigidities.

One is forcibly reminded of the speech made by John Bright over one hundred years ago to the members of the Manchester Exchange: "I have come here and attended 'Change for the last two years, and I have asked myself, 'What kind of men are these that I see here week after week on the Manchester Exchange, crawling about, grumbling at bad trade, and yet not daring to lift their hands against the cause?'"—Yours faithfully,
Bolton

LYNDON H. JONES

Control in Central Africa

SIR—The overriding reason for European control in Central Africa is the wise development of natural resources and the prevention of their waste. It will be a long time before Africans can be trusted not to squander the soil. In Central Africa the prestige of political participation counts for more than wise control of land. By forcing our own ideas of democratic education down the throats of Africans we have created pseudo-European social and political ambitions amongst them. By introducing a low-level cash economy in place of unadulterated subsistence we have created insecurity and discontent.

A supreme effort is now required to connect the African sense of security with the security of the soil—a love of the land as land, which he has never possessed, and which the example of the European's planter-mentality has done little to further. Soil-conservation is suspected by many Africans as a surreptitious method of stealing the land for the European's future extractive benefit. An atmosphere of trust must be created in which white leadership in landscape control and development is willingly and obediently respected. In return Africans must have settled homes and security of tenure through forms of freehold or life-hold.

In densely populated areas such as the Southern Province of Nyasaland it will be impossible to continue the present policy of employing thousands of low-paid casual workers, who stave off hunger by maize-growing on adjoining treeless Trust Land. The result of this will be landscape destruction and revolt. The aim must be to settle much smaller, better paid, well-fed, full-time workers in cottage-garden villages on European mixed estates; to evacuate the surplus population to farm settlement areas and decentralised industries in other parts of the Federal territory; and to retire the exhausted steep Trust lands to forest. Supreme statesmanship will be needed to carry out such sweeping measures. They can only become possible by engendering in Africans a confidence that the whole vast Federal area is their potential homeland, the soil and water resources of which can only be safeguarded and intensified by willing collaboration under European leadership.

—Yours faithfully,
Shaftesbury, Dorset

ROLF GARDINER

Books & Publications

Independent Economist

THE INTER-WAR YEARS AND OTHER PAPERS.

By Hubert Douglas Henderson.
Oxford University Press. 473 pages. 42s.

FEW economists of equal standing are as difficult to place as Sir Hubert Henderson. Few economists, for that matter, have achieved so high a reputation while publishing (in book form) so little. The parenthesis is important, for Henderson was in fact a prolific writer whose output looks small in the bibliographies only because so much of it took an ephemeral form. The present volume, in which the late Sir Henry Clay gathered with great editorial skill a selection of these ephemera, both explains his reputation and records qualities of sense, wisdom and penetration which would otherwise have become merely an oral legend. Selections from the *Nation's* leader columns, memoranda to the Economic Advisory Council of the 1930s, addresses and reviews dating from Henderson's period at All Souls, Treasury papers, lectures and articles, document a development that reflects at once the preoccupations of economic theory over three difficult decades and the reaction to events of a keen and strategically placed intellect.

Henderson was a thoroughly independent and thoroughly unfashionable economist; an inveterate cross-bencher. He was an internationalist to the core, but he maintained, both in the early 1930s and the postwar 1940s, the necessity and expediency of tariffs and discriminatory trade agreements. "The idea," he wrote in 1949

of forming an effective Free Trade area, with a uniform treatment of imports from countries outside it, is only really feasible between countries that are prepared to unite politically, and to unite not in a loose federation but under a highly centralised form of government.

He was a liberal, distrusting centralised power and respecting market forces; yet his famous address to Section F of the British Association in 1950 is the classic statement of the case against the "dash for freedom." Indeed, a connecting thread uniting the greater number of the themes here treated—structural unemployment in the 1920s, international economic breakdown in the 1930s, the foreign exchanges, fiscal policy, postwar reconstruction, inflationary pressure—is a recognition of the market's limitations, its "fair-weather" characteristics. Market forces can cope with, or smoothly bring about, small

changes; they work admirably at the margin; they are indeed essential allies of deliberate policy. But they are wasteful, even actively perverse, instruments to which to entrust the cure of major disequilibria. This is the moral drawn, in particular, from the history of the 1931 crisis, and applicable to the postwar world with which Henderson's later essays are concerned.

The Keynesian moral, on the other hand, is uncompromisingly rejected; rejected, indeed, with puzzling vehemence. Reading nearly twenty years later Henderson's essay on the "General Theory," one is paradoxically struck both by the keen judgment which pinpoints weaknesses later revealed (the unrealistic working assumption of the closed economy, the over-rigid emphasis on mathematical identities, the neglect of the time factor, the ignoring of all specific transfer problems) and by the perversity with which the critic misses the whole central point of the savings-investment relation. In 1944 he returns to the attack, dealing with questions of policy rather than of theory, attacking the use of deficit financing as a stabilising measure: "If the state is spending as much as it is collecting, it is not withdrawing purchasing power; and if productive resources are none the less being unused, that indicates a defect of economic organisation, not of financial policy." (One need not be by any means a committed Keynesian to wonder at this piece of question-begging.) The way to stability is through particular adjustments, especially through mutual adjustment to the postwar realities of foreign trade; look after relative prices, including the rate of interest and the foreign exchanges, use quantitative and other controls to supplement the forces of the market in expediting adjustment, get rid of inflation, balance (but do not over-balance) the Budget, and aggregate supply and demand will look after themselves.

It is always refreshing to find an economist who, unsustained by any childlike faith in the Hidden Hand, boldly stands up to the Keynesian bulldozer. Nevertheless, if postwar history has amply justified Henderson's criticisms, it has justified their object even more thoroughly. It is primarily because of the success (even if merely incidental to the excess) of Keynesian policies that such adversaries as Henderson have been in a position to say "I told you so."

High Table Talk

HISTORICAL INEVITABILITY.

By Isaiah Berlin.
Oxford University Press. 78 pages. 6s.

MR ISAIAH Berlin is the Coleridge of our day. His conversation pours out in multitudinous splendour, racing through all fields of knowledge, taking each of a dozen languages in tow and gathering itself to a torrential monologue. To listen to Mr Berlin, as he darts back and forth in his tower rooms at All Souls, is to hear a bright march of ideas, images, doctrines, convictions and shafts of wit. All too rarely does Mr Berlin allow his words to be held fast in print; his complete works are tape-recordings. But when he does publish them, the page comes to life with his voice and even the footnotes have the sudden pause, the sense of other vistas left regretfully to one side: "The 'logic' of various human studies has been insufficiently examined, and convincing accounts of its varieties with an adequate range of concrete examples drawn from actual practice, are much to be desired." Who, save Coleridge or Mr Berlin, would have written that footnote?

The present pamphlet, an expanded version of a lecture delivered at the London School of Economics, is the finest thing Mr Berlin has produced so far. The thought is incredibly dense and the long sentences only gradually yield their accumulation of insight. The object of this essay is to show that relativism and determinism are "conspicuously fallacious interpretations" of historical experience. Mr Berlin is combating the *reductio ad absurdum* in relativist argument and the arrogance that lies at the root of determinism. He challenges all those vast abstractions that certain historians, from Hegel to Spengler and Toynbee, have thought to force on the live fabric of history.

But Mr Berlin is addressing himself to a wider end. His essay is a magnificent assertion of the reality of human freedom, of the role of free choice in history. He scorns those who would impose on man the myth of necessity and social law "that will absorb and integrate us into its limitless, bleak, neutral texture, which it is senseless to evaluate or criticise, and which we resist to our certain doom." One can only hope that Mr Berlin will, in future, go on to demonstrate in actual practice that liberal, empiric and yet profoundly spiritual conception of history at which he hints in his present sally.

Down with State Schools

THE EDUCATIONAL REVOLUTION.

By Colm Brogan.
Frederick Muller. 192 pages. 10s. 6d.

MR BROGAN is against all this education. He is even a bit dubious about the value of literacy—which "may be used for or against freedom, for or against decency." He is extremely dubious about the raising of the school-leaving age to fifteen. "By

the age of eighteen Nelson was an experienced and battle-hardened seaman, Pascal had invented a calculating machine, and Chatterton [this will settle it] was dead." That children should be selected for the grammar school regardless of class disrupts the working-class family, he says; besides, it wastes grammar school places on children who leave early because they cannot face the hatred that the stupid and uneducated feel for their intellectual superiors. Here at least the facts are on Mr Brogan's side, and many will echo his wonder that whereas no man is considered antisocial if he buys his boy a bicycle, he must on no account buy him a place at a grammar school. But just as one is catching up with Mr Brogan he is off again—this time with the proposal that "the bottom 20 per cent" of grammar school entrants should have to pay fees, on the theory that people value only what they have to pay for.

As for the secondary modern schools, Mr Brogan seems to think that they have succeeded only in giving the children better manners and worse morals than they used to have. And who is responsible for all this chaos? Why, the teachers' training colleges as much as anyone, and the Ministry's inspectorate—where heads are stuffed with rubbish about "projects" and free activities, to the detriment, in Mr Brogan's view, of reading, writing and counting. He thanks God that the independent schools at least—the small private schools as well as the public schools—are able to carry on without any nonsense about compulsory registration, since this part of the "authoritarian" Education Act has not yet come into force. When he writes of comprehensive schools Mr Brogan disappears for a moment right round the bend. Kidbrooke's assembly hall reminds him of the Supreme Council of Soviets. "To the enthusiasts of this blighted experiment the Red Flag might seem an inspiring introductory tune, but for the spirit and secret purpose of the place, Horst Wessel might be more appropriate."

Reading Mr Brogan is like listening to a favourite uncle, whose discourse is rich, provocative and blimpish, yet seasoned here and there by common sense; but with whom it is a mistake to stay too long, since the dear old boy says everything at least twice, and amusement at his forthrightness may finally give way to exasperation at his excesses.

Germany in the Round

MODERN GERMANY: Its History and Civilisation.

By Koppel S. Pinson.
The Macmillan Company of New York. 652 pages. 35s.

THIS volume by an American historian attempts to trace the internal history of Germany, including economic and intellectual developments, from the late eighteenth century to the present day. It thus covers a wider field than

earlier works by Anglo-American historians, who have concentrated on the course of political history. It also compares favourably with these by giving copious and interesting extracts from political and other writers of the time, and by balanced judgments on such controversial issues as the revolution of 1848, the policy of Prussia and the Prussian Junkers, the influences of Wagner and Nietzsche, the role of Ebert and the Social Democrats.

The *Leitmotiv* of the book is the theme of German unity and liberty; the author warns us that, having to choose between liberty and unity, "most Germans always decided in favour of unity," and that "the problem of German unity transcends and overshadows all other issues." He clearly tries to avoid the bias of earlier writers. There is a wealth of detail on the industrial and intellectual changes, on population movements, on trade unions and political parties, on literature and philosophy. In all this the author has been more successful in reviewing the nineteenth than the twentieth century. The few pages on the internal history of the Weimar Republic are especially thin and biased. It is, for instance, quite incorrect to say that "in not a single school text of republican Germany were there any readings to indicate the responsibility of General von Ludendorff and the General Staff for the acceptance of the armistice terms"; this ignores, for example, the very widely used textbook by Franz Schnabel.

THE ECONOMIST, FEBRUARY 12, 1955

It is equally wrong to assert that, in the field of foreign policy, "in terms of aspirations and ends there were, apart from the Communists, no appreciable differences among the various parties and groups in Weimar Germany," a statement which appears elsewhere in the still more absurd form of "the ever present unity on foreign policy among all political groups in Germany." It further seems strange that a historian should maintain that "we learned a great deal about the origins of World War I from those of World War II," or that "the burning of books by political opponents harked back . . . ultimately to Luther's burning of the papal bull in 1520." It is a pity that hardly any historian dealing with modern Germany can free himself from such sweeping generalisations. These and other errors mar a work which has many merits and which avoids many of the pitfalls of the pro-German and anti-German schools.

Literary History

ILLUSTRATED HISTORY OF
ENGLISH LITERATURE: Volume II,
Ben Jonson to Samuel Johnson.
By A. C. Ward.
Longmans. 270 pages. 25s.

IT is impossible to consider the second volume of this book alone, because it awakens a continual urge to delve back into the first and the kind of appreciation which is a lively anticipation of the third. It covers a period of almost two hundred years, during which writing and publishing became established professions; journalism and the novel were born; the art of satire perfected; and Boswell and Gibbon produced their masterpieces.

One of the satisfying things about Mr Ward's judgments is that they are never isolated. He ensconces his subjects three dimensionally amid the political and social exigencies of their times, leaving the assessment of their work, in terms of its intention and possibilities, to the critical fair play of the reader. The chapter on "The Pursuit of Urbanity" shows, in miniature, the excellence of this method. It would be difficult to find, in equal compass, a better or more human analysis of satire. Avoiding that simplification of the past which draws hard and fast lines between "periods," he treats the development of poetry and prose as a continual flux of action and reaction. Jonson's aim is shown to be the restoration of the inviolability of the three unities against the encroachment of the wide ranging Elizabethan dramatists, and his method the use of comedy as a corrective of human follies. His Comedy of Humours, an extension of the old Moralities and a forerunner of the novel, leads, through Congreve, to the Comedy of Manners of Goldsmith and Sheridan.

Similarly, the descent is traced, from the *Ars Poetica* of Horace, through the *Ars Poétique* of Boileau, to Pope's "Essay on Criticism," not as a mere exercise in literary genealogy, but in order to peg attention to the salient pur-

pose of the writers, who considered poetry as an art in which the content must submit to the form. Mr Ward then shows how this intellectualised method fails in emotional tragedy, where the heroic couplet is "not capable of enlargement to the full scale of the human spirit's need for communication."

The author uses his gift for graphic simile in a way which opens fresh possibilities for discussion, while his quotations are enticing and exactly applicable. It is his conviction that the permanent benefits of reading come through enjoyment. This, then, should be a beneficial book indeed.

Commune of Wood Ants

THE EVOLUTION OF AN INSECT SOCIETY.

By Derek Wragge Morley.
Allen and Unwin. 215 pages. 18s.

THE popularity of ants as a topic for books on natural history is due in part to the ease with which slick parallels between ant and human societies can be drawn. There have been books using aspects of ant behaviour to justify Fascism, Communism, Capitalism, Individualism, and a host of others, their writers apparently quite content to straddle the gap between superficial generalisations about ant behaviour and the tentative hypotheses of human sociology. Here is a book about ants whose author resists this temptation and is content to write about ants for their own sake—at any rate until the last few pages.

It begins, and concludes, with a commune of five separate but friendly nests of wood ants in Surrey. The intervening chapters give an account both of these ants and of the evolution of their society. The ramifying effects of caste-differentiation on the economy of the nest, the development of the young, the relations with other species, and the internal organisation of the community are traced—and the result is an absorbing picture of this universe on a Surrey heath set against its long-forgotten but still influential evolutionary origins.

In drawing this picture, Mr Morley uses three main sources of evidence. First, the fossil record: ants have, for instance, been preserved in an extraordinary state of perfection in drops of resin which cozed from Baltic conifers over fifty million years ago. Second, comparisons with other present-day species which have evolved either a less complex or a slightly different type of society from the wood ants; these permit hypotheses about the stages the wood ant community could have passed through (though the author too often writes about how it did). And third, least dramatic but most fascinating, Mr Morley's own observations on the wood ant commune itself. These combine to give a story well worth pondering on—a story which, although it may bear no lessons for our own society, does add to it a little perspective.

Seller's Market in Scotland?

UP AND UP goes Scotland's purchasing power in Scotland—faster than in the rest of Great Britain. Up goes employment: 2,228,000 in 1953. Up goes production: total Scottish production in 1953 was 18% higher than in 1948. Up goes the demand for all kinds of consumer goods. And up goes the number of new customers won by advertisers in the Daily Record.

Success through Scottish national media

For the success of any promotion in Scotland, intensive advertising is essential. This is owing to the relative thinness of readership in Scotland of the English national newspapers. Readership of English morning papers in Scotland is only 61% as against an average of 83% in England and Wales. Obviously, the difference must be made up. No less than 1,370,000 Scottish adults never read an English morning newspaper. (This figure is taken from the I.I.P.A. readership survey.) The Daily Record, Scotland's largest circulating, completely Scottish morning paper, offers advertisers the most rewarding means of reaching the Scottish customer.

Increased effort in Scotland wins big sales. You reach an assured and profitable market when you advertise in the . . .

The Basis of European Union

EUROPEAN UNION AND UNITED STATES FOREIGN POLICY.
By F. S. C. Northrop.
The Macmillan Company of New York.
239 pages. \$4.75, 33s.

PROFESSOR NORTHROP is interested in the movement towards European Union as an experiment in sociological jurisprudence. He holds that the treaties establishing the Council of Europe and the economic, military and political institutions of the six-power European Community are designed to introduce a supranational positive law. However, no supranational law is likely to be effective where the component nations do not possess what Mr Northrop calls "common living-law norms." The living-law, or inner order of European national societies, can best be determined by examining the quantitative statistics "which specify how these peoples group themselves with respect to their personal, religious, political and economic beliefs." Living-law is illustrated in political life by the complexion of parliamentary parties, which on the European Continent derive from certain transnational religious and secular philosophical traditions. It is the new role of creative statesmanship to discover "latent living-law resources" and express them in new supranational political forms.

Mr Northrop believes that six-power European Continental Union is realistic policy because the political living-law of the proposed Continental European Community is in fact dominated by Christian-Democratic, Socialist, Roman Catholic Liberal and Protestant Liberal philosophies, in which one and all share a belief in political pluralism and in the rule of law and a predisposition towards supranational sovereignty, attributable to Stoic Roman legal mentality reinforced by continental Rationalism. The nations that are members of the Council of Europe, on the other hand, possess no such common living-law. The group of fourteen powers exhibits no less than four kinds of Christianity as well as the religion of Islam. Moreover, there are in it twenty-three normative political groupings, including such "foreign bodies" as British Socialism, the Irish Fianna Fail and the Greek Rally. No supranational positive law, Mr Northrop asserts, can possibly come out of such a mixed bag. In the event the only sphere in which the Council of Europe has been able to secure some transfer of sovereignty from the member nations is that of human rights. This rather insignificant transfer does, however, at least show, as the preamble to the statute stated, that the fourteen member nations subscribe to the principles of individual liberty, political freedom and the rule of law.

Justice cannot be done to Mr Northrop's argument within the space of the present review. His book is most valuable and important because it adds another dimension to the current rather

poverty-stricken debate on the need for European Union. The author's insistence on the necessity of the new association of peoples is the more impressive because he attributes it not to economic and military necessities (which, he states, never in themselves constitute the potentiality of union), but to an immanent historical predisposition. Here the contention that the German Federal Republic is at present blessed by its separation from the living-law of Prussia has special weight, however awkward its public admission may be for diplomats. Mr Northrop's argument for European Union could be reinforced by the psychological theory of nihilism, which holds that European societies are invaded by revolutionary beliefs only when existing institutional forms no longer express their creative and conative energy. In this sense France's predicament is the most dramatic, for this prototype of the nationalistic society remains unhappily poised between the European future dictated by its own universal idealism and nostalgia for its heyday as a nation-state. However, it must be said that Mr Northrop is unfair to General de Gaulle, whom he describes as being "for a strong one-party chauvinistic France and opposed to Franco-German collaboration generally." The General's argument against European Union has been that a France disintegrated into lifeless political sects cannot muster enough strength to have a real voice in the Union. General de Gaulle is perhaps mistaken, but he cannot justly be lumped together, as a political monist, with German neo-Nazis and Italian neo-Fascists.

Mr Northrop writes also of the philosophical deficiencies of American foreign policy which has been prone to emphasise short-term military and economic desiderata at the expense of Europe's political "living-law potential." The result has been a decrease in European confidence in the Republican administration. This is one of the most telling sections in a subtle and persuasive book.

Shorter Notices

ALL ABOUT AIRCRAFT.

By D. M. Desoutter.
Faber. 483 pages. 25s.

This book probably comes as near as one can get to an exposition of aerodynamics and air matters for the non-technical; which is approximately three-quarters of the distance to absolute clarity. It is not Mr Desoutter's fault that "the general reader who seriously wants to gain an understanding of this rapidly expanding human activity" may have to work extremely hard to do so. Not that there is anything in this book that could not be followed by a sixth former; it is their parents, with less mental resilience, who might be tempted to skip the opening chapters and concentrate on the reference sections. These include an illustrated directory of modern aircraft of the type that aviation journals do so well.

A "popular" reference book on a subject of this kind is dangerously close to a contradiction in terms. A technically less

knowledgeable author might have written a more easily readable book—but those who do persevere with Mr Desoutter, or who make judicious use of the index to inform themselves about the more willfully obscure topics of aviation small talk, can be confident that what they do learn will be accurate.

★

A HISTORY OF THE UNITED STATES. Second Edition.

By D. C. Somervell.
Heinemann. 332 pages. 15s.

The author of Professor Toynbee's famous abridgement is a historian justly known for his wide-ranging knowledge and curiosity, and it was only to be expected that Mr Somervell's versatile pen would sooner or later be drawn to the history of the United States. "Sooner and later" would perhaps be a more accurate way of putting it, because the present history was in fact originally issued in 1941 and now reappears "revised, reset and re-illustrated" in a format considerably more attractive than its original battle-dress. Mr Somervell has not felt that his original book called for any re-writing and, understandably, though perhaps regretably, has "resisted the temptation to bring it up to date." Nevertheless the book retains its pristine virtues undimmed by the lapse of thirteen crowded American years. It is eminently readable; it makes the rough places plain; and it conveys to the reader much of the charm and fascination which the theme obviously has for the author.

One is sometimes impelled to take issue with some of his judgments. Is Yankee-doodle a "feeble and well-forgotten" tune? Was Joseph Smith, the Mormon, just an "absurd character"? Certainly Franklin Roosevelt was never a "senator." And perhaps when the Chief Engineer of the United States army calls the government of the District of Columbia "uniformly excellent" that is neither news nor evidence. But these are trivia. What is more important is that Mr Somervell has written a book which will introduce many people to American history in a pleasant, winning and sensible way.

★

THE HISTORY OF KIRKSTALL FORGE

By R. F. Butler. Distributed by Kirkstall Forge Engineering, Ltd., Leeds.
William Sessions. 278 pages. 63s.

This second edition of the story of Britain's oldest ironworks, the forge founded by the Cistercian monks of Kirkstall Abbey about 750 years ago, contains new material amplifying the history of the ironworks under some of the earlier families that controlled its development. Its authors, the late Hugh Butler and Rodney Butler, the present managing director, were members of the latest of these owning families, whose association with the forge dates from 1779; in 1949 the concern became a public company, although the controlling interest was retained by the Butler family. The largest section of the book, as before, deals with the development of the works—and of the industry, with the gradual shift of balance from the iron trade to steel—during the nineteenth century; the elaborate documentation that has been provided from the company's records makes this section in particular a valuable exercise in what the Americans have come to call "entrepreneurial history."

JOHN LAING AND SON LIMITED

Building and Civil Engineering Contractors

COUNTING THE COST

Message for Chief Engineers and Executives responsible for new construction

WHEN YOU CONSIDER A TENDER do you know what the job will really cost? Will the work be finished on time? How much will the delay cost your Company if your new works goes into production six months late? Will there be heavy maintenance costs and production hold ups after completion of the work? Plainly, the lowest tender is not necessarily the cheapest; reliability, efficiency and quality have, in the long run, a value to be taken into account.

The time to evaluate these questions is before the contract is placed. A tender's worth is not shown by price alone. What is behind it in reputation, in experience and skill, in plant capacity? Pre-planning, method study, targetting, the right use of heavy

plant and small tools, all these have an important part in the scientific approach to the problem of construction.

John Laing and Son Limited are always pleased to be called in during the initial stages of design, when experience and advice can often effect the greatest saving in time and money. In this way they can bring their full capacity to bear on a job right from the start. Behind their tender is a reputation valued far higher than the price of any contract—a reputation which the Company intends to maintain by giving complete satisfaction, not only when the contract is signed, not only on completion, but for the years to come.

Great Britain, Canada, Union of South Africa, Rhodesia

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Narrowing the Far Eastern Gap

Washington, D.C.

IF the evacuation of Nationalist Chinese troops and civilians from the Tachen islands is completed without mishap, the intricate policy initiated by the President in his message nearly three weeks ago will have achieved its most immediate purpose. The Administration decided to force the pace over Formosa in order to avoid drifting into an even more dangerous situation, one in which the Seventh Fleet would have found itself watching with arms folded while General Chiang Kai-shek's men on the Tachens went down fighting gallantly against overwhelming odds. The pressure for American intervention might then easily have overborne the sound strategic arguments against tying the Seventh Fleet to a prolonged engagement with strongly defended Communist bases remote from Formosa itself.

But, having decided to be bold, the President and Mr Dulles are trying to make the gamble more worthwhile by playing for multiple stakes. One of the most important of these is the narrowing of the gap between American and British policies in the Far East. Formosa is the one place in the world which the Americans are obliged to fight for without the guarantee of help from their principal allies, who might not even treat a Communist attack as aggression. This therefore made Formosa an obvious target for an adventurous Communist attempt to isolate the United States. On the other hand the United States could not possibly retreat from its obligation.

For this two reasons are normally given. The first is that, while the Americans do not need Formosa as a base for themselves, Communist possession of it would pierce the "great island barrier" on which the American defence system in the Pacific relies. The second is that, while few now think, so it is said, that General Chiang could reconquer the mainland, many think that it would be useful to have an alternative Chinese government in being for use if and when the Chinese rebel against the Communists. But there remains a third, and more profound, reason. The United States is in a deeply pacific mood, but at the same time many people are worried at the moral implications of this mood. Americans naturally feel some sense of shame whenever free people are relinquished to Communist rule, but the peculiar significance of Formosa lies in its being the one place in the Far East threatened by the Communists which it is clearly within the power of the United States to defend. However pacifically inclined they may be, Americans cannot make excuses to themselves for any dereliction in this case.

Three features of the President's message to Congress, however, provide signposts to the route which the Administration is trying to keep open. It leads to a closer alignment with British policy, a temporary relaxation of relations with the Communists, and an ultimate settlement. In the first place the American case was presented in terms of "national interest" rather than in the "moralistic-legalistic" fashion so much deplored by Mr George Kennan and others as an impediment to sensible bargaining. Secondly, the message contained several references to the United Nations, including an invitation to it to assume jurisdiction—a procedure which would shift on to other members of the world organisation the burden of suggesting the terms of a bargain that could not very well originate from the United States. Thirdly, the message explicitly declined to extend the area of the American guarantee beyond Formosa and the Pescadores, which are in any case covered by the defence treaty with General Chiang's government that in practice "releases" that sagging Prometheus to his rock. Quemoy and Matsu were therefore left as bargaining counters in case the United Nations or other mediators made progress with negotiations for a cease-fire.

One of the main objectives of the American manoeuvre was that the determination and ability of the United States to deny Formosa to the Communists should be accepted as one of the realities of the situation by America's allies and the neutrals as well as by the Communists. After that it would be much easier for American opinion to achieve a corresponding access of reality regarding Communist China. The solution of "two Chinas," with China and Formosa both recognised and both members of the United Nations, while obviously at present unacceptable to large sections of American opinion, is already being actively canvassed in inspired articles in the American press.

★

The reaction of American public opinion to a situation that might bring the country rapidly into war has been surprisingly slight. While trusting the President, people generally seem confused by the complicated manner in which the policy was launched, in three related stages.

First, there was the presidential message; although this emphasised the precision of the American commitment, which was intended to keep the Communists from drawing false conclusions from the abandonment of the Tachens and so blundering into war, the message yet remained vague

about American intentions in Quemoy and Matsu. It mentioned the United Nations favourably and referred to "positions and actions" that were "related" to an attack on Formosa that might involve an American military reaction.

Secondly, there was the official briefing of the congressional leaders and the press, which underplayed the role of the United Nations; it made it clear that, so long as the Communists were keeping up their propaganda for the forcible "liberation" of Formosa, Quemoy and Matsu would be "related positions" which the Americans would defend. It also strongly inferred that the United States might even strike first at mainland ports and jet airstrips if

"Could I See You Alone a Minute?"

Herblock in the Washington Post

preparations were obviously far advanced for an attack on the remaining offshore islands.

Thirdly, there was the extremely active canvassing, in advance of the message, of allied and neutral governments, emphasising the references to the United Nations, the exclusion of Matsu and Quemoy from the permanent American perimeter and the willingness of the United States to make concessions for the sake of a cease-fire, provided the Communists damped down their "hate campaign" against Formosa and refrained from molesting the coast-trailing Seventh Fleet during its delicate mission to the Tachens.

The wholehearted support of Senator Knowland, which was achieved by the tough talk in the private sessions, was needed not only to give the Communists the impression of national unity behind the President but also to induce General Chiang to agree to be rescued from the Tachens

without a specific guarantee for Matsu and Quemoy. To the Nationalists the offshore islands are much more invasion routes to the mainland than advance guards of their own defence; to give them up would symbolise the abandonment of any hope of return, something which the Nationalists, unlike Washington, are as yet very far from doing.

The greatest risk that is being taken, apart from the Tachen evacuation itself, is that the Chinese Communists may be set on involving the United States in an embarrassing war. In that case the President's message and its inspired interpretations are telling them that they need not go to the trouble and expense of an expedition against Formosa. Quemoy will do, provided the propaganda about Formosa is kept up, and the Americans might even be manoeuvred into striking the first blow on the mainland ports before the junks actually sail for the island.

On the other hand if it is possible, through London, Moscow or Delhi, to induce the Communists to negotiate, the Americans have shown by their advanced diplomatic preparations that they are much more ready than they were at Geneva to make creative use of the traditional differences in Far Eastern policy between them and their allies. Despite the boorishness of the initial Chinese response, the loosening up which President Eisenhower is trying to achieve in the Formosan situation may still provide an opportunity for a further experiment in the art of British negotiation from American strength.

Disjointed Chiefs of Staff

BY 394 votes to four, the House of Representatives voted this week to extend military conscription for a further four years. In the face of the Far Eastern crisis, the Senate is expected to follow suit rapidly. But the bare fact that voluntary enlistments will not suffice to maintain America's armed strength in the coming years is the only point on which all strategic planners and government agencies are in agreement. When it comes to determining the size of the armed forces, the relative strength of the different services or the role of new weapons, Congress, the Chiefs of Staff and President Eisenhower have different, and often contradictory, views. This great debate has been going on since 1949, when admirals clashed bitterly with airmen over their respective responsibilities in a future war. In the last few weeks, with President Eisenhower's decision to reduce the size of the army and with the developments around Formosa, fundamental disagreements have again become of urgent significance.

President Eisenhower, taking "the over-all responsibility that is borne by the Commander-in-Chief, and by him alone," has decided to cut the army by 140,000 men, reducing it to a total of 1,027,000 by July, 1956. The President based his decision on budgetary considerations, on an evaluation of new weapons and on the view that a long period of cold war called for a flexible reserve programme rather than a vast standing army. Testifying before the House Armed Services Committee, General Ridgway, the Army Chief of Staff, dissented strongly. In answer to congress-

AT NO EXTRA COST

Fly to Bermuda

ON YOUR TRIP TO NEW YORK

At no extra cost you can fly to Bermuda, via any international airline, on your first class fare to New York.

So when business is over in New York, enjoy a holiday in Bermuda. You can travel light—buy clothes, even rent or buy sports equipment in Bermuda. Remember, you'll be in the sterling area. Bermuda is only three hours from New York, and there are frequent daily flights. Bermuda's sunny days, sandy beaches for loafing, sports and pleasant social life will do wonders for you.

Econometrics points the way!

American economic activity for 1954
accurately predicted by means of
econometric models . . .

. . . models based on principles developed in

A TEXTBOOK OF ECONOMETRICS

by Lawrence R. Klein

Remember how, early in 1954, many economists and businessmen were jittery about a major slump in the American economy? From "severe recession" to "perhaps a depression". Predictions in many cases based on hunches, intuition, personal judgment. At the same time a forecast was made based entirely on econometric methods.* The one who made the forecast, Dr. Lawrence R. Klein, used as his tool econometric models developed in his *Textbook of Econometrics*—the first self-contained text on the subject. Now it can be told how, in the face of doubts from newspapers and other sources, Dr. Klein's forecast of a "mild downturn" was the one that proved correct. This accuracy points up once again the effectiveness of the truly scientific approach to forecasting the one that proved correct. This textbook, designed for both graduate and undergraduate courses in economics, made possible in *A Textbook of Econometrics*. This textbook, designed for both graduate and undergraduate courses in economics, shows how to build and measure relationships among economic variables and noneconomic factors which influence human behaviour. It covers econometric models of the economy as a whole and of individual sectors, and is unique in showing how to use time series, sample survey, and other cross section data for the treatment of econometric problems.

By TCA Super Constellation,
the last word in luxury,
I'm told."**

Direct service to Montreal and Toronto
TCA Super Constellations offer the most frequent service from London and Glasgow overnight to Montreal and Toronto, with same-day TCA connections to take you across Canada and to major U.S. cities. Only by TCA can you travel from Britain to Canada in these magnificent Super Constellations in which you have the choice of either luxurious First Class or exceptionally comfortable Tourist accommodation.

TCA Viscount Services within Canada
Early in 1955 TCA are introducing the famous Viscount turbo-prop aircraft on selected inter-city routes. This service will soon be extended to some important U.S. cities as well.

FIRST CLASS
Fully-reclining Siesta Seats, superb cuisine, fine wines, attentive staff.

RETURN FARES*
London to Montreal £220.18.0.
London to Toronto £236.19.0.

TOURIST
Spacious cabins, specially-designed seats, complimentary meals.

RETURN FARES*
London to Montreal £149.1.0.
London to Toronto £162.13.0.
* Approved IATA off-season fares.

If you travel before the end of March you can get the benefit of TCA's low off-season fares. Your Travel Agent will tell you how much you save.

sional questioning, he stated that the proposed cut would jeopardise the defensive position of the United States and not that nuclear weapons required more ground forces and not less. The President promptly retorted that General Ridgway's views and scope of command were "in a sense, parochial." Open disagreement between a top-ranking military figure and the President is, since the days of General Pershing, a recurrent feature in American politics, but it is paradoxical that it should be so wide at a time when the President is himself a former Army Chief of Staff.

During subsequent testimony, it became clear that President Eisenhower had prepared his military programme in consultation with his Director of the Budget and the Secretary of the Treasury, rather than with the Joint Chiefs of Staff. Owing to internal differences, the latter body has lost influence. Its chairman, Admiral Radford, has long advocated a much tougher military line towards Communist China, whereas General Ridgway has argued that all local wars are, ultimately, land wars and that the Army is not ready for one. Increasingly, President Eisenhower has had to make decisions in person and there is little doubt that Congress will accept his views after a period of heated debate. But at a time when America is staking so much of its prestige in the Far East, revelations of unpreparedness and indecision in Washington can be costly.

The Informer

ALTHOUGH he is only twenty-eight, Mr Harvey Matusow has led a busy life. He joined the Communist party in 1947 and began informing the Federal Bureau of Investigation on its activities in 1950. A year later he was expelled from the party and became a star witness before numerous congressional committees and government agencies. Altogether, he testified against about 180 persons and was instrumental in the conviction of a labour leader in Texas and of thirteen leading Communists in New York. At one time, he was attached to Senator McCarthy's staff. Last week, Mr Matusow entered the literary field. In a pre-publication conference about his forthcoming book, "False Witness," he declared that he had frequently given false testimony and that, in one instance, Senator McCarthy's celebrated assistant, Mr Roy Cohn, had coached him. He also charged the Senator himself with supplying information that both knew to be spurious. Mr Matusow admitted that he had been well paid for his work but thought that, on balance, his book would also earn well.

This whole shoddy business underlines the role of the professional informer in the work of Congress and the Department of Justice. It is distasteful but true that informers are a necessary part of any judicial machinery, but it is quite another matter when they become salaried and acclaimed adjuncts to the law. As Mr Matusow candidly admits, being an ex-Communist is a highly organised and profitable business in present-day America. In an atmosphere of suspicion, moreover, testimony of the kind he has manufactured is often accepted without adequate corroboration.

Mr Matusow has now been summoned before the Senate Internal Security subcommittee and the Department of

Justice is re-checking every case in which he gave evidence. The possibility that he is a double agent now working for the Communists to discredit the machinery of justice cannot be excluded completely. It does look, however, as if the reddest faces in the next few months are not going to be among accused leftists. One of the men whom Mr Matusow admits having lied about is Professor Owen Lattimore. This offered the Department of Justice a graceful and expedient excuse for dropping the perjury charges against Mr Lattimore that have been dragging on since 1951. Neglecting this opportunity, the department has announced that it will appeal against the latest dismissal of much of the indictment by Federal Judge Youngdhal. He has twice dismissed the indictment against Mr Lattimore because it failed to confront the accused with definable charges. If the matter ever comes to trial, Mr Matusow may display his latest version of a double somersault.

State of the Judiciary

THE Chief Justice, Mr Warren, was not responsible for the suggestion that the holder of his office should make a regular report to Congress, in person, on the State of the Judiciary, as the President does on the State of the Union. He has now, however, announced his willingness to co-operate if Congress passes the necessary resolution. But the removal of doubts about his attitude does not remove doubts about the resolution's fate; while it is sponsored by members of both parties, the opposition, strong even in the judiciary committees themselves, is also bipartisan. It would hardly be suitable to proceed with the resolution were it to involve the judiciary in an open dispute on the floor of the legislative chamber.

Indeed, one of the objections to the resolution is that it would bring the Chief Justice into the political limelight and would foster any presidential ambitions he might have. This suspicion is encouraged at the moment by Mr Warren's political past, although his friends insist that he has now no interest in a political future. The other objection to the resolution is that it would transgress the separation of powers; it is argued that if the founding fathers had wished to provide a bridge between the judiciary and the legislature, they would have built it into the Constitution, as they did the links between the executive and the legislature.

But the founding fathers would certainly not have approved the present congestion in the federal courts, so serious as to amount in some cities to a denial of justice. There were over 78,000 cases left pending on July 1, 1954, nearly as many as had been dealt with during the previous legal year. This scandalous situation could be brought home to Congress and to the public by a Message on the State of the Judiciary in a dramatic way that is impossible under the present system. Now the judiciary can explain its problems directly only to the congressional subcommittees responsible for providing funds for the courts—and always only too ready to cut them. In 1953 Congress authorised thirty new federal judgeships but appropriated funds to staff only fifteen new courts. Nevertheless lack of judges and legal clerks is not the only reason why in southern New York—admittedly the worst district—a period of almost four years

on an average elapses between the filing of a suit and a decision. This is one of the places where some judges treat themselves to annual holidays of three or four months; elsewhere there are worse examples of slackness. However, it should at least be possible to find more competent candidates for the federal bench if Congress raises judicial salaries, as it seems likely to do at this session, for the first time in nine years.

Banking Giants in the West

FROM A CORRESPONDENT IN CALIFORNIA

TRADITIONALLY, the United States has relied for its banking facilities on single units. National banking laws confine branch operations within state boundaries and most states impose restrictions on multi-office banking. Ten states, of which Illinois and Texas are the most important, forbid the establishment of any branches at all. The fear that branch banking on a large scale would allow huge monopolistic aggregations of capital has found expression in continuous opposition to branch banking by legislators and by many bankers.

Nevertheless, branch operations have continued to gain. Since 1910, the number of separate banking firms in the nation has dropped by one-half while the number of banking offices has kept pace with the growing population. In the last two years there has been a spreading rash of mergers between chains, of which the one proposed between the Chase and Manhattan Banks in New York is the most recent example. Large banking chains have also been swallowing up small single-office banks and converting them into branches and now many large single-office banks have begun to branch out in self-defence. In the year ended last June, the number of banking firms in the country declined by 83, compared with an average annual decrease of 41 in the preceding 13 years, while the number of branch offices increased by 450, compared with a previous average gain of 166 a year.

The recent rush to branch out is most pronounced in the Far West, where state-wide banking is permitted, and where the success of large-scale branch banking has been spectacular. In California, where the Bank of America has established the world's largest private financial institution on a branch-banking base, the trend is especially strong. Within the last year, every major bank in San Francisco has set about acquiring new branches—including several institutions which had formerly been vigorous critics of branch banking. The whole movement has been sparked by competition between two former affiliates, the Bank of America and the Transamerica Corporation.

This intense rivalry between the two Californian giants is ironic. Originally, the Transamerica Corporation was formed solely for the purpose of acquiring banks for integration into the Bank of America. The latter's founder, the late A. P. Giannini, had dreams of a private banking empire to span the world and Transamerica was to be its nucleus. When hostility from government agencies made

THE ECONOMIST, FEBRUARY 12, 1955

it seem prudent to arrange a formal separation between the two banks, Transamerica's holdings of Bank of America shares were distributed to its own shareholders so that a close community of interest continued.

In March, 1952, the Federal Reserve Board ordered Transamerica to sell all its holdings in 47 independent commercial banks in the Far West. This order, founded on the Clayton Anti-Trust Act, was set aside by the courts in November, 1953. In the midst of the Federal Reserve Board's proceedings against Transamerica, the Bank of America had bought 23 banks controlled by its affiliate, and the indignant Federal Reserve Board forced a temporary halt in the transactions. Once the suit was dropped, however, it was expected that Transamerica would stick to the original sale. Instead, it has retained the 23 banks and made them the core of its new First Western Bank and Trust Company.

The Bank of America, cloaked in outraged decency, has appealed to the emotions of shareholders by relating that the ruthless directors of Transamerica brushed aside a personal plea from Mrs Claire Giannini Hoffmann, the sole surviving child of Mr Giannini. But his mantle is actually being assumed by Mr Frank N. Belgrano, Jr, the aggressive head of Transamerica. He is a former commander of the American Legion and is obviously on the warpath for as many bank scalps as possible. Under his leadership, Transamerica seems to be pacing the nationwide drive for bigger and better bank chains.

In November, Transamerica consolidated all the California banks under its control—plus several newly-acquired ones—into a single statewide system. Although still dwarfed by the Bank of America's 458 branches and more than \$9 billion in assets, the new institution ranks as one of the twenty-five largest banks in the nation and is the only one besides the Bank of America with branches in both northern and southern California. Earlier, Transamerica had consolidated all of its smaller banks in Oregon into branches of its First National Bank of Portland, thereby launching a three-way race, with the Seattle First National Bank and the United States National Bank in Portland, to become the largest bank in the Pacific Northwest. Since then, all three have been buying and building new branches.

In California, single office banks are becoming a rarity. In 1954, their total number declined by more than 40, leaving only about 114 which have neither been absorbed by branch systems nor opened branch offices of their own. There are some 1,100 branch bank offices in California, more than in any other state and over one-sixth of the nation's total. Most of the state's small banks have had for open competitive bidding. It was acquired for a handsome price by the American Trust Company of San Francisco, whose officials frankly admit their chief concern was that Transamerica might swallow it instead.

In the past single-office banks in large cities have maintained "branch systems" of their own by forming correspondent relationships with a number of banks in other towns. The large bank provides its correspondents with advice and assistance on loans, investments and other management matters, and they in turn keep sizeable deposits in the large bank. Many of today's mergers are taking place

THE ECONOMIST, FEBRUARY 12, 1955

between correspondents, both because close ties have been formed and because formal absorption is the best way to insure against loss of valuable business to acquisitive rivals.

The spread of branch-banking is by no means without opposition. The wholesale failures of holding companies and banks in the late nineteen-twenties and early nineteen-thirties are still remembered. Proponents of smaller scale "community banking" maintain that massive branch institutions are not flexible enough to respond, responsibly, to local economic circumstances. But most independent bankers now realise that they will have to adapt themselves to the new era of multiple-office operation and so the remaining number of small independent banks dwindles.

The success of such pioneers of branch banking as the Bank of America has convinced many metropolitan bankers that branch operations are an inevitable consequence of the growth of the American population and economy. Urban congestion and the growth of suburbs demands the establishment of outlying offices where the public can conveniently deposit the reservoir of funds a bank must maintain in order to provide the large-scale loans and investments needed by booming industries.

Capitol Hill Irregulars

SINCE 1792, when a special committee was appointed to investigate the failure of an expedition against the Red Indians, members of Congress have always sought to combine the functions of Solon with those of Sherlock Holmes. The process of investigation into any aspect of national life, and of open hearings, is in fact an essential part of government in America. But even by the standards of a busy detective, the last Congress went too far. It "sniffed and snooped" to the tune of seven and one half million dollars and Senator McCarthy's techniques turned congressional hearings into a mixture of inquisition and soap opera. As the new chairman of the powerful Rules Committee, Representative Howard Smith of Virginia, has made clear, the Eighty-fourth Congress will be more careful about what it investigates and how it goes about it. The Rules Committee will turn down, for example, proposed investigations into "the actual amount of gold bullion at Fort Knox."

The most important fact-finding study approved so far is one proposed by Senator Fulbright, chairman of the Senate Banking and Currency Committee. Senator Fulbright wishes to find out more about the stock market, how it operates, who can determine its fluctuations and what its role is in the general business cycle. The Fulbright inquiry is being conducted in a tone of friendly diffidence and with every assurance that traditional congressional suspicions about Wall Street will not come into play. Nevertheless, it is difficult not to wonder at the disingenuousness of a committee which has sent stockbrokers a questionnaire asking: "To what extent do fluctuations in the stock market bring about changes in general business conditions?" When Senator Fulbright and his colleagues insist that they merely wish to "learn" about the market, there is no option but to take them at their word.

Another important line of investigation is being initiated

by Representative Celler of New York, chairman of the House Judiciary Committee. Representative Celler is interested in monopolies, price maintenance of every kind, fair-trade practices and the struggle of small business in the face of mergers. The fact that Wall Street and big business are among the first objects of congressional scrutiny illustrates neatly the change from a Republican to a Democratic Congress.

Welfare Funds in Trouble

AT the end of last month Mr David Beck, the head of the huge Teamsters' Union, recommended that a presidential commission should inquire into abuses of trade union welfare funds. In thus trying to take them out of politics, he was presumably attempting to delay the legislation that even he must now realise is becoming inevitable, and to stifle the adverse publicity that has done more harm to his union than to any other. The two big labour organisations, which this week seem at last to have decided on a merger, have both for some time been trying to deal with cases of misuse and mismanagement of welfare funds belonging to their member unions. The immediate danger, from the labour point of view, is that the many State Legislatures meeting this year may act while Congress is still investigating. The New York Legislature has already been recommended to require government supervision of all welfare funds and full publication of their financial details, and to regulate the commissions paid by insurance companies on such business. There is little that can be objected to in these proposals, but in other states legislation might follow lines less satisfactory to labour.

Neither of the interim reports recently issued by House and Senate committees pins the blame for the mishandling of welfare funds solely on the trade unions concerned; employers, insurance companies and their agents, and in some cases administrators of trust funds, are all given their share of responsibility. Few of the schemes examined were found completely well run. The ways in which they are set up vary widely: some cover whole industries, some (on which the investigators have so far been concentrating) only individual companies; they provide pensions and various other benefits, such as death and accident payments, to supplement the government's social security programme. Most of the schemes are financed entirely by employers, as part of their contract with their workers. The congressional reports criticise some employers for having left the management of the funds to the union and for failing to exercise their legal responsibility to protect the interests of the future recipients of the benefits. Insurance companies, and more especially insurance brokers, are also accused of having sometimes taken advantage of the inexperience of those in charge of the funds, while trade union officials are said to have made personal profits at the expense of their members' welfare.

The trouble arises because these funds have grown too fast for the necessary safeguards to keep up with them. Almost unheard-of ten years ago, the "fringe benefits" which they finance are now an accepted feature of wage

negotiations. Over 11 million workers are covered by these plans; estimates of accumulated reserves vary widely, but the figure of \$17 billion is frequently given and contributions from employers are now thought to be running at a rate of \$5 billion a year.

Conserving Oil at a Price

New York.

WHEN the temperature drops to zero, as it did in New York City last week, there is a compensating warmth deep in the heart of Texas. For to domestic petroleum producers, the first cold winter for several years means an increased demand for heating oil, and consequently an easing of the restrictions on the production of crude oil in Texas. These restrictions are enforced by the Texas Railroad Commission, which owes its powers over the state's oil and natural gas industry to the producers' desire to prevent a repetition of the wasteful and unprofitable overproduction of the Texas oilfields in the early nineteen-thirties.

It is the concern of the commission's engineers to ensure that the underground gas pressure, which lifts the oil to the surface, is properly conserved so that the maximum amount of petroleum is recovered from each field. This is done by controlling the spacing of wells; by determining the proportion of gas that may be produced along with the oil; by limiting the wasteful "flaring" of gas and forcing producers to re-cycle it underground to maintain pressures in the reservoir; and by setting maximum efficient production rates, that is, the highest rate at which a given field can produce without reducing the amount of oil ultimately to be recovered from it. Similar regulations apply to natural gas producers. As a conservation authority the commission deserves the highest praise. Its success in preventing waste is impaired only by its inability to force the many small producers found in each oil field to join together and develop their field more economically as a unit.

But the commission does not confine itself to the enforcement of good petroleum engineering practice. The Texas Legislature also gave it explicit authority, which was subsequently confirmed by a federal court, to adjust the output of crude oil in Texas to the market demand for it. Texas is responsible for over 40 per cent of all the crude petroleum produced in the United States, and the commission has not interpreted its powers narrowly. It adjusts Texas output, after allowing for expected imports and for production in other states, so that the supply of crude equals the demand for it, not only in Texas, but in the country as a whole. The adjustment is made by setting, at a monthly state-wide hearing concerning market demands, the "allowable" production for each field for the succeeding month, and then "pro-rating" the allowables between the individual wells.

Thus, however much the commission may justify its actions as the "avoidance of above-ground waste" and deny any intention of influencing prices, it is in effect, by matching supply with demand at existing prices, fixing the price of crude oil in the United States (and, while the Texas Gulf remains the basing point, affecting the price of petroleum products outside of the United States as well).

THE ECONOMIST, FEBRUARY 12, 1955

It is only when the commission occasionally fails in its objectives that the market can force a change in the price of Texas crude. The second significant result of the commission's activities is that the Texas producers, much to the annoyance and to the chagrin of the Texas State Treasury, bear the brunt of any cuts in petroleum production needed to offset a decline in demand, an increase in imports, or a rise in the output of other states. These have their conservation authorities, but there is no effective machinery to pro-rate cuts in domestic production between the various producing states. Consequently Texas, although the leading producer, actually produces less in proportion to its proven reserves of oil than do many other states. There is therefore strong pressure in Texas, especially from the smaller independent producers, for measures to control imports more strictly and to ensure that other states bear their share of the restrictions on output.

SHORTER NOTES

The Compulsory Testimony Act, passed by Congress last year to prevent witnesses from refusing to answer questions about Communism by claiming the protection of the Fifth Amendment against self-incrimination, has been invoked for the first time by the government. The Justice Department obtained from a federal court an order compelling a witness in an espionage inquiry to testify before a grand jury, with immunity from prosecution, or face imprisonment on charges of contempt of court. However, the witness has the alternative of appealing to the Supreme Court against the constitutionality of the Act.

The National Press Club in Washington, after taking a secret vote on a candidate for membership for the first time in its history, has elected its first Negro member, Mr Louis B. Lautier, a correspondent of the *Atlanta Daily World* and of the National Negro Press Association, by 377 votes to 281. Mr Lautier, who was proposed by Mr Drew Pearson and Mr Marquis Childs, already belongs to the congressional press galleries and the White House correspondents' association.

The process of bringing orange juice up to date has now come almost full circle and fresh orange juice is invading the market that it was thought had been cornered by the frozen concentrated product. This "new" discovery is taken from Florida in refrigerated lorries and distributed in cartons with the morning milk in places as far away as New York and Wisconsin. It is more expensive than the frozen variety, but the housewife does not have to open a tin and add water before she can serve the family breakfast. Fresh fruit, of course, would have to be squeezed and in any case is more expensive.

As part of the drive to induce Americans to take a greater interest in foreign trade, the Commerce Department has created an international trade fairs division which is planning to participate in at least twenty international trade exhibits in 1955, extending from Western Europe to the Near and Far East. This joint project of industry and government will put American representation at trade fairs on an organised basis for the first time.

THE ECONOMIST, FEBRUARY 12, 1955

The World Overseas

France Without Mendès

FROM OUR SPECIAL CORRESPONDENT IN PARIS

POLITICAL arithmetic has reasserted its rights. The Mendès-France experiment, begun in exceptional, quasi-miraculous circumstances last June, is over, at least for the moment. The sad merry-go-round restarts. Even if M. Pinay had managed to form a government, in spite of Socialist opposition and MRP reluctance, he was unlikely to last long. Well-known names are now again produced from the premiers' bag by the expert cabinet tipsters in Paris: René Mayer, Edgar Faure, Robert Schuman, and so on. Though a simple majority is now sufficient to form a new cabinet, governmental instability will probably be greater after M. Mendès-France's fall than it was before his advent to power. Will that be the only effect of his seven and a half months in office?

The ardent backers of the outgoing premier now speak of a return to the *ancien régime*; they echo Rimbaud's poignant outcry "*Société, tout est retabli.*" Yet how much did M. Mendès-France, in fact, change in French society? The paradox is that the man thought to be destined to regenerate France's economy won almost all his laurels on the battlefield of foreign affairs. Indeed, he only came to power after Diem Bien Phu when the country suddenly woke up to the war in Indo-China. Indignation at the débâcle in Indo-China, at France's indecision in the face of German rearmament, at the general *immobilisme* of the "rich man's government" of M. Laniel, created a mood that the Assembly could not ignore. The deputies, therefore, accepted a new man, whom many of them disliked and mistrusted. It is an open secret that M. Mendès-France was offered the job merely to prove that there was no alternative centre-left majority in the Assembly. In the exceptional circumstances he got the investiture.

At once he set to work at unwonted speed. Though his first success was a negative one, it gained him public support. For years successive French governments had not been able to make up their mind between war and peace in Indo-China; they wanted to win painlessly. M. Mendès-France brought back from Geneva "peace without dishonour." But his successful removal of the Indo-China honour gave the impression that he was the man to pre-empt a similar growth nearer France's heart. His triumphant visit to Tunisia, with Marshal Juin as a guarantor of his patriotism, raised hopes that French North Africa would be spared the fate of Indo-China. The indefatigable, fast-moving premier seemed to dominate the recalcitrant Assembly, which did not dare to oppose the wave of popular feeling he had engendered. Yet even at

the time it was argued in these columns that the diehard lobbies would not forgive M. Mendès-France his reformist zeal, that the scope for brilliant coups was narrowing and, above all, that he was approaching the worst pitfall that faces all French governments—German rearmament.

German rearmament thus claims yet another French government as its victim. M. Mendès-France, who at least decided to act, suffered the fate often reserved to conciliators: he antagonised both sides in the divided Assembly. The rejection of the EDC reinforced the antagonism of the MRP and other "Europeans"; the salvaging of the Paris agreements from its wreckage cost the government the sympathy of many opponents of German rearmament. It can be said that last week's defeat was, above all, the after-effect of the two European debates. To get his compromise project through, M. Mendès-France had to become a permanent envoy travelling between the western capitals, he had to wage deadly struggles in the Assembly, with little time left for other matters. For all his efforts, he hands over to his successors a weakling baby quite likely to die in its cradle.

Preoccupation with Germany and to a lesser extent with North Africa, a tougher nut to crack than it seemed at first, kept M. Mendès-France off what was claimed to be his real vocation—economic problems. In this domain it would probably be unfair to judge his plans by his achievements. His reforms for the beet and wine industries, his first steps on the road towards reconversion, were sufficient to provoke the wrath of powerful lobbies (which prefer to act before it is too late), but were certainly not enough to form the basis of a bold economic programme. It was symbolic that M. Edgar Faure, a relic of the Laniel government, was moved from the Ministry of Finance only a few days before the government's fall.

The move was heralded by many as the premier's return to his proper job, but there was no time for a test. The partisans of M. Mendès-France claim that, having prepared the men and the framework, he was ready to launch his programme, and if in the last stages he seemed to cling to power in a manner reminiscent of his predecessors, it was partly to get an opportunity to show his paces at home. The sceptics reply that in reality he had nothing up his sleeve or was wise enough to realise that since the French economy was outwardly improving, a surgeon succeeding a general practitioner would run into trouble.

It would have been preferable, however, to go down as France's potential economic saviour. However vital it may

be, a fair deal for North Africa is not the best rallying cry for the French home public, at least not yet. Will the country take M. Mendès-France on trust as the man who, given the necessary majority, will put France's internal affairs in order? Will the outgoing premier emerge from the next elections with the solid coalition on which he could never count in the present Chamber?

The answer will largely depend on the performance of his successors and it will not be an easy task to govern after so dashing a man. He raised great hopes in the country and caught the public's fancy as a man of action. Blunders by his successors may revive his great popularity. Besides, the majority which brought him down was at least as motley as the one which put him in power. The Socialists for one have made it plain that they will not back a right-wing government. The Christian Democrats (MRP) to whom one talks are worried at the prospect of their party being branded as thoroughly conservative. Leftism is now fashionable, but the ultra-conservative elements in a future coalition are unlikely to allow any such coalition to outbid M. Mendès-France as "progressive."

France now faces vital issues with an ungovernable Assembly. In Africa, to put it bluntly, the choice is between the Indian and the Indo-Chinese solution. In Europe the problem of Germany and that of negotiation with the Russians are still on the agenda. Important economic decisions will also have to be taken—in particular, the workers have been promised a review of their wages in April. Events in Russia may speed up the formation of a government, but almost everybody in Paris is sceptical about its future chances. Fresh antics are expected from this *chambre introuvable*. Will M. Mendès-France be the chief beneficiary? Frenchmen, M. Malraux has just remarked, are both anti-parliamentarian and anti-Caesarian. Can they remain both for ever?

Year of the Sheep in Japan

FROM OUR TOKYO CORRESPONDENT

THE bewildered Japanese voter, badgered on all sides by threats that this is the most important election since the war, must be pitted as he contemplates the confused and confusing democratic scene. He has the choice of two conservative parties—the Democrats and the Liberals—whose main preoccupation is an attempt to make their policies look different. Or he has the choice of two Socialist parties—the right and left wings—whose main preoccupation is to make their policies look the same.

The Democrats, riding high under the ailing but exuberant Mr Ichiro Hatoyama, caretaker Prime Minister, seem to have copied their foreign policy from the irreproachable credo of Moral Rearmament. Mr Hatoyama and his Foreign Minister, Mr Mamoru Shigemitsu—who is gnawed by continual doubts over whether he or the excessively articulate Mr Hatoyama is Foreign Minister—are emphatic in their laudable desire to be friends with all the world, and both appear to be satisfied that closer ties with the Chinese Communists and Soviet Russia will in no way impair their ties with Washington and the West—and *vice versa*.

Mr Taketora Ogata, uneasily leading the shaken Liberals

THE ECONOMIST, FEBRUARY 12, 1955

after the resignation of the embittered Mr Yoshida, seeks to deride the Democrats' trust in the Communists. But there is something hollow and forced about his warnings, and there is a vague but general mood of resentment and frustration in his dispirited party, which feels that it has been manoeuvred into a position of apparent opposition to friendship with Asia—which implies, of course, continued deference to Washington. As the dullest Liberal knows, this line will win no one any votes in Japan today.

Both the Liberals and the Democrats are in favour of rearmament, although the Democrats will bargain harder with the Americans, and are thinking more specifically in terms of rebuilding a heavy arms industry than of training infantrymen. Mr Hatoyama is also adroitly exploiting the former aloofness and personal unpopularity of the dogmatic Mr Yoshida by giving unprecedented radio and television chats, demanding economy in the public service and purity in political life, warning government officials against the dangers of playing golf and mah jong, or going to geisha houses with strange—or familiar—businessmen, and appealing, above all, to "the burning patriotism of the new and independent Japan."

Report to the Sun-Goddess

Mr Hatoyama's secretary has also explained urbanely that the Prime Minister is not now a practising Christian (although he still likes to sing Christian hymns to raise his spirits), after angry criticism by the Japan Bible Society and some ill-advised Socialist party leaders of Mr Hatoyama's shrewd revival of the pre-war practice of visiting the Grand Shrines of Ise to report to the Sun-Goddess the accession of his new government. The Socialist leaders complained that this action was a breach of the MacArthur Constitution; the Bible Society complained that it was a breach of the second commandment. To this, Mr Nobosuke Kishi, secretary-general and driving force of the Democratic party, is said to have responded, first, that the Constitution must be revised anyway, and, second, that Mr Hatoyama was observing the first commandment of practical politics: "Thou shalt get thyself elected." Certainly, Mr Hatoyama, in Japan's new mood, will lose no votes, but gain plenty, by reviving the old feudalistic pilgrimage to Ise.

The Socialists are muddling along with demands for repeal of the American security pact and conflicting and grotesque policies on rearmament; the left-wing wants no army at all, and the right-wing wants only a "sukoshi" or small, army, without, it would seem, any arms of any usefulness. The Left also wants to repeal the peace treaty with the West and sign a non-aggression pact with benevolent Peking. The last touch of fantasy in the whole election scene is that the more rabidly and openly anti-American the party, the greater and blinder its loyalty to the American-inspired Constitution. The Communist party, which is coming into the open again, threatens to fight in the streets to defend to the death the reforms of its pet aversion, General MacArthur.

Is it surprising then, in these circumstances, that approximately 20 per cent of the Japanese interviewed in the most recent poll of the earnest Asahi Shimbun could not answer the question, "What political party do you support?" And what, in fact, can be reasonably expected from this coming election—precipitated as it was in the most unworthy circumstances by the most cynical alliance of extreme right-

THE ECONOMIST, FEBRUARY 12, 1955

wing conservative and extreme left-wing socialists, united only in common detestation of Yoshida-san?

The Socialist blocs have agreed, in warm comradeship, to unite—no one yet knows how—after they have secured a theoretical election majority, which is most unlikely. They do not trust each other well enough to unite before the election. The Conservatives, for their part, have insisted stoutly that they will not unite in coalition even after the election, if either bloc lacks a democratic mandate to serve the people and the nation. This, of course, is dishonourable poppycock. One forecast is that the precarious and accessible Mr Ogata, the new Liberal "leader," may be acceptable as a stopgap prime minister of the combined Liberal-Democratic forces, so long as he will do what he is told by the Democrats, who command the vital financial support of the doubting and angry industrialists. The other possibility is so brazen that it is only being whispered behind fans in the deepest armchair recesses of the Industry Club in Tokyo: that the Socialists, wisely not wishing office at the moment, may expediently continue to support Mr Hatoyama so long as it suits them and while they try to forge a working agreement between new and more realistic leaders of their right and left wings.

As a scientific footnote, 1955 is under the ancient lunar calendar the Year of the Sheep in Japan—a period when apparently meek, but insidious and deceptive minds prevail, to the benefit, in theory, of docile, unthinking, but blindly loyal flocks. Next year is the Year of the Monkey, when the crafty and powerful take command, exploiting the advantages which the disarmingly mild sheep have prepared for them.

Budget for Khrushchev

THE toughening of the Soviet line found its first concrete economic expression in the budget presented by Mr Arseni Zverev, the Finance Minister, to the Supreme Soviet last week. Not only did he announce a 12 per cent increase in direct military expenditure, but he also revealed a substantial shift in investment from light to heavy industry. This obviously was not Russia's last word; if the Kremlin takes the ratification of the Paris agreements as a real challenge it can carry the switch much further than that. On the other hand, the budget already marked a clear victory for the tougher group in the "heavy versus light industry" controversy. On the face of it, this was merely an ideological dispute in which the orthodox Marxists asserted the theoretical truth that progress with consumer goods can only be achieved by a rapid increase in the output of capital goods. Yet there was more to it than this theoretical struggle. Khrushchev's insistence on "the indestructible defensive strength of the country" and his call for a return to policies followed under Stalin, the "faithful continuator" of Lenin, revealed that the struggle was really over Russia's basic strategy at home and abroad. After the dramatic changes in Moscow the new premier, Marshal Bulganin, announced a higher industrial target for the five-year-plan ending this year; the increment is to be due mainly to heavy industry. He also revealed that a new plan—for 1956-60—will be proclaimed within the year. This should show the extent of the switch.

In the budget, as finally accepted, revenue for 1955 is estimated at 590.2 billion roubles against an expenditure of 563.5 billion roubles, leaving a surplus of 26.7 billion roubles. The rising surplus is not the only element of "austerity" as compared with the previous year. The semi-compulsory state loans, used to mop up surplus purchasing power, were halved after Stalin's death; they are now being restored to their previous position. The revenue from the chief source—the turnover tax levied mainly on consumer goods—is almost unchanged, so that the planned increase in the level of consumption cannot be estimated until Moscow has announced its annual price reduction. The biggest rise in revenue is expected from the tax on the profits of state enterprises, which now accounts for nearly one-fifth of the total. It is on higher productivity and lower costs that the planners rely to balance their accounts.

Estimated expenditure for the current year is slightly higher than last year's actual expenditure, though roughly the same as the original estimates. Since not only defence but all the other specified items are being increased, the necessary funds must be obtained by a switch from the unknown "other expenditure." The slight cut in the cost of the administration is certainly insufficient to account for this reshuffle.

Grants to national defence now absorb nearly two-fifths of total expenditure, and most of it goes to heavy industry. There is renewed emphasis on fuel and power, metallurgy and the other branches, both in budgetary and extra-budgetary financing. Total allocations to heavy industry

are being stepped up from 133.2 billion roubles last year to 163 billion roubles (101.2 billion from the budget and 62.4 from self-financing); the funds for light and food industries, on the other hand, are reduced from 36.6 to 26 billion roubles. Financial aid to agriculture is also apparently being reduced from 74 billion roubles to about 65 billion. This may seem paradoxical in view of Mr Khrushchev's intense publicity on the need for agricultural development. Finances in this field are so complicated, however, that it is safer to draw no firm conclusion from this reduction.

Social and cultural services, it is claimed, continue to take over a quarter of total expenditure, and nearly half of this

amount is earmarked for education. Thus, on the face of it, welfare expenditure is not yet squeezed out by the pincers of defence and heavy industry. Once again the funds seem to be found through a cut in the mystery items of the budget. Should one, therefore, attach much real importance to the climb in open defence expenditure? It is known that not all military expenditure is included under this item in the budget and the Russians have thus a good deal of room for manipulation. At the same time, taken in conjunction with the new stress on heavy industry, this Soviet warning cannot be dismissed as mere bluff.

Things should be kept in proportion. This is a quickening of the Red Army's step, not its supreme effort. True, the present defence estimates are higher than actual expenditure ever was in peace time. Yet even in absolute terms the outlay is only slightly greater than in the year of Stalin's death. Each year, however, Soviet national income is growing, and with it grows the budget, so that the relative share of the arms bill is still less than in all recent years except the last. The table below shows that, when Moscow considered itself on the eve of war in 1940, it managed to cut for defence nearly one third of a much smaller national cake.

SOVIET DEFENCE EXPENDITURE

	Percentage	Billion Roubles
1932	3.4	1.3
1940	32.5	56.7
1950	20.1	82.9
1952	23.6	108.6
1953 (estimate)	20.8	110.2
1954 (estimate)	17.8	100.3
1955 (estimate)	19.9	112.1

The real brakes on the Soviet arms drive are political rather than economic—they are the promises made to the consumer by the post-Stalin regime, promises which it may be difficult to ignore. There is Khrushchev's agricultural programme intended to step up the supply of foodstuffs and raw materials, which, though scaled down, will need quite a lot of investment. There are the industrial consumer goods which cannot be supplied at the rate originally promised but which cannot be neglected altogether. The memory of the pledges made to the Soviet peoples in 1953 cannot easily be exorcised, and a complete return to the Stalinist pattern of production would not be an easy task. This is the dilemma of the new masters.

Education for the African

NO recent action of the South African government has aroused more indignation than the passing last year of the Bantu Education Act. Already the first step towards transferring the control of African education to the government's Native Affairs Department has been taken. Mr Strydom's government is proceeding deliberately and systematically to remove ultimately the church missionary societies from their historic role in African education in the Union. It is no wonder, therefore, that the churches—in particular the Anglican church—have reacted most

THE ECONOMIST, FEBRUARY 12, 1955

strenuously. But before passing judgment it is only fair to examine the facts objectively.

There are in South Africa about 900,000 African children attending schools. The great majority of them, however, do not go beyond the second standard, by which time they can have scarcely mastered the "three r's." Until now most of the African schools have been owned and controlled by a number of separate denominational church missions. It is estimated that 4,500 mission schools employing 12,000 teachers were educating 500,000 children. The church missions played an integral role in the Union's education system until the passing of the Bantu Education Act. The government paid a subsidy equal to 100 per cent of teachers' salaries plus a substantial proportion of the cost of school equipment. This partnership has worked satisfactorily, but successive governments, advised by a string of reports, have been persuaded that it was outdated. In 1939 General Smuts's government had a Bill ready which would have transferred control over African education to the central government, but the war halted its progress. The measure of Dr Verwoerd, Minister of Native Affairs, is not therefore in principle a new departure. Moreover, it was based on the findings of the Eiselen Report of 1951, which, though its conclusions were disputed, is recognised to be the result of a sincere and thorough investigation.

Arbitrary Methods

Less, however, can be said in defence of Dr Verwoerd's methods. The churches were notified that, as from April 1, 1955, their state subsidy would be cut from 100 to 75 per cent. Furthermore they were required to declare themselves in favour of one of five alternatives open to them: first, to turn their schools into private schools financed entirely out of their own funds; second, to transfer their schools against compensation to the state or to lease their premises to the state; third, to transfer control over their schools but to retain control over their hostels; fourth, to carry on as they are but with reduced financial aid from the state, following a syllabus laid down by the state; and fifth, to close down.

Since few of the churches could afford to run their schools entirely out of their own funds, the alternatives were in fact to co-operate with the government in keeping the schools open or to close down. The Catholic Church is attempting to run its schools entirely at its own cost; some, notably the seventeen schools under the diocese of Johannesburg, have been closed down; but the majority are co-operating to the extent of either selling or leasing their property to the government and carrying on with the aid of the reduced subsidy. By gradual steps, however, the subsidy will be reduced until finally the government will have full control over all African schools. The churches undoubtedly have a grievance arising from the arbitrary termination of their education activities. But the substitution of state for church control is not directly an argument against the wisdom of the government's African education policy. Moreover the government plans to give the Africans themselves more say in the running of the schools, although it is rather late in the day to expect willing co-operation from them.

The problem of African education in the Union is so great—there are nearly 9 million Africans, only a small fraction

THE ECONOMIST, FEBRUARY 12, 1955

The Happiest Days of Their Lives

Picnics in the country... lazy hours by the river... sunlight sparkling on a cobalt blue sea... the moorland aflame with gorse... glorious, memorable moments to be recaptured when the summer days come round again, thanks to their Standard Ten. Winter or summer, on business or for pleasure it is ready to take them there and back, smoothly, speedily, economically.

- ★ 4 forward hinged, fully opening doors ★ 4 cylinder, 948 c.c. engine
- ★ 40/50 miles per gallon ★ Maximum speed 68 miles per hour
- ★ Girling hydraulic brakes ★ Triplex toughened glass
- ★ Spacious luggage boot with separate compartment for spare wheel
- ★ Adjustable front seats ★ Steel panelled body, rustproofed by Bonderixing process and fully dustproofed.

Price £409 (P.T. £171.10.10)

of whom receive any kind of education—that it is difficult to resist the conclusion that only the state has the financial and administrative means to solve it. On the other hand it is a damaging criticism of the government's policy that it has deliberately chosen to exclude the churches altogether when it would have been quite possible to continue the long-standing partnership between churches and state, while working gradually towards greater state participation as educational facilities for the Africans are made more general. Furthermore, it is doubtful whether the Minister of Native Affairs has correctly judged the extra strain that the huge responsibility of African education will impose on his department. Finally there is the matter of timing. No one knowing the government's *apartheid* intentions and seeing the simultaneous development of this policy in other directions will be persuaded that the Bantu Education Act is not part and parcel of the same policy, as indeed it is. A more discreet man than Dr Verwoerd would have postponed his plans until a more favourable climate existed.

Teaching Them Their Place

But the Nationalist government has not tried to hide the fact that the new law fits neatly into its wider conceptions of *apartheid*. Dr Verwoerd, defending his policy in parliament, said quite bluntly that the purpose of the new educational policy was to teach the Africans that equality "was not for them." But he has not discovered the means of halting the thirst for knowledge and education once that taste has been cultivated. Moreover, the government has no intention—at least not so far—of putting an upward limit on African educational advancement. The present measures aim at giving a minimum of four years' basic education; they give the individual African no less than he gets at present, and they will give more African children the opportunity of having some education. Those with the desire and the ability will be able to go on to higher standards, and a few will go on to university as at present. For this reason it is not easy to agree with Bishop Reeves, Anglican Bishop of Johannesburg, who, because he feels morally bound to reject the government's proposals root and branch, has decided to close his schools, thus depriving African children of educational opportunities.

The financial side of the Bantu education policy has also drawn criticism. Under the new arrangement the central exchequer will provide a fixed sum of £6.5 million annually for African education. To this will be added four-fifths of the product of the African poll tax together with certain hut taxes. The present yield of these taxes is about £2.5 million; there should therefore be at least £8.5 million available for African education. The amount spent on education per head of African population in South Africa is substantially greater than in other African territories, including the British colonies; but so it should be in an economically well advanced country. The present government contribution, financed almost wholly from the purses of the white taxpayers, is not ungenerous.

Many aspects of the South African government's African education policy deserve nothing but censure. The principle of *apartheid* that underlies it is offensive to all people of a liberal mind. But there is a danger that in their anger even the best-intentioned people might forget whose interests they are trying to serve. In this case it is that of the African himself. Will he get an inferior education compared with what he previously had? It is certainly possible

that lower standards will be forced upon the African schools, though it must be admitted that the first syllabus prepared by the Department of Native Affairs does not bear this out. On the other hand, however, it seems fair to say that a rapid expansion of the number of school places available to Africans is likely to result from the government's action. And the Minister, in accepting full responsibility for African education, will have to bear the brunt of criticism of any shortcomings.

Costa Rican Post-Mortem

FROM A CORRESPONDENT IN CENTRAL AMERICA

ALTHOUGH the revolt against the government of President José Figueres of Costa Rica last month was successfully suppressed, it left several unsolved problems behind it; and the renewed outbreak of fighting last week-end showed that the situation along the Costa Rican-Nicaraguan frontier is not yet stable.

A day before the invasion and revolt, Costa Rica had alleged to the Organisation of American States that an invasion was being planned and organised in Nicaragua, with the co-operation of Venezuela. An OAS investigating commission came hastily to San José to investigate. From the evidence it obtained from captured rebel materials and from the interrogation of prisoners, it now appears that more than one member of the OAS may have been involved in the attempted overthrow of President Figueres's regime by his political opponents. And Central America's political intrigues being what they are, many observers agree that the OAS will have to ponder Costa Rica's charges long and hard before deciding whether only Nicaragua was involved in a violation of the Rio mutual defence pact.

The evidence dug up by foreign correspondents suggests that the Costa Rican rebels had not been training for only two or three months in Nicaragua. Some prisoners stated that they had been enlisted and had received training in military tactics under the direction of a Guatemalan major in Guatemala; others testified that they had been trained in groups in Honduras. There was evidence to indicate that some had spent a considerable time in El Salvador; while others stated that they had seen both Venezuelan and Dominican Republic army and air force officers conferring with the rebel leaders. Moreover, some of the captured rebel weapons undoubtedly came from Guatemala.

It looks as if two basic facts saved President Figueres from being overthrown last month. One was the prompt action by the United States in sending fighter aircraft to Costa Rica which gave the government forces air superiority. The other was the fact that a general armed uprising against President Figueres did not take place within Costa Rica. This cannot necessarily be interpreted as meaning that most of the Costa Ricans are in favour of the Figueres regime, but it does suggest that the rebels had failed to prepare the ground and stir up internal opposition forces through prior planning and propaganda.

As far as the United States is concerned, the State Department obviously threw its weight entirely behind the Figueres regime, although it was careful to use the OAS as

a shield in order to avoid Latin American criticism of unilateral "intervention." This stand on behalf of the democratically elected Figueres administration has been greeted with approval by several liberal Latin American governments such as Chile, Ecuador and Uruguay. But whether or not the OAS, in its formal report, alleges that other states besides Nicaragua were involved in the invasion of Costa Rica, it is fairly clear that more than one of Costa Rica's neighbours was in fact aware of the revolutionary plot and did nothing either to betray it or to hinder it. The Americans, therefore, find themselves in what may be a rather awkward situation; in their effort to maintain a democratic government in power in Costa Rica, they may have severely strained and weakened the reasonably united support of the Latin American bloc in the United Nations as well as the support they have enjoyed in the Organisation of American States.

Problems for the High Authority

THE second anniversary of the opening of the common market for coal, last Thursday, was also the date on which M. Monnet's term of office as president of the High Authority should have ended. But one of the by-products of the fall of M. Mendès-France has been to delay the appointment of a new French member of the High Authority. M. Ramadier (Socialist) had been put forward by the Mendès-France government, but whether he will still be the candidate of the new French government remains to be seen. M. Monnet will continue until his successor is appointed so that there will not be an interregnum; but continued uncertainty about the future is bound to affect the efficiency of the organisation.

And the problems continue to roll in. Two recent developments illustrate the complexity of the problems and the diversity of the pressures to which the Community and particularly the High Authority are subject. The first was the request of the German mine-owners for an increase in the price of coal, which was quickly followed by a strong recommendation from Dr Erhard, the German Minister of Economics, that the High Authority should not authorise a price increase. It is a measure of the change that two years of the common market have brought, that both sides to a dispute which would formerly have been a matter for internal national decision now appeal to the High Authority.

The second development was the lengthy discussion recently concluded by Gatt on the Community's annual report to the Contracting Parties. This report is required by the terms of the waiver granted by Gatt to the member countries of the Community in November, 1952, to enable them to eliminate tariffs on coal and steel products among themselves without having to extend these concessions to the other members of Gatt. Although it concludes that the Community had not infringed the terms of the waiver, the Gatt appraisal reflects the views of a number of Gatt countries, particularly the Scandinavians, that the interests of third countries have been ignored by the High Authority and the Community countries contrary, at the least, to the spirit of both the waiver and the Schuman plan treaty. The basic complaint was that export prices fixed by the Brussels

steel export cartel, of which all the Community countries are members, were too high and that manufacturing industries in the principal steel importing countries were having to pay prices for steel that were far out of line with those paid by their competitors within the Community. At the time the original waiver was granted a number of countries were worried lest the formation of the Community would lead to a worsening in their own positions and, accordingly, one of the "considerations" included in the preamble of the formal waiver was "that the Community has undertaken to take account of the interests of third countries both as consumers and as suppliers of coal and steel products, to further the development of international trade, and to ensure that equitable prices are charged by its producers on markets outside the Community."

In the recent discussions in Geneva there appears to have been considerable difference of opinion on the scope and legal effect of the general undertakings in the preamble, and in particular sharp disagreement on what is meant by an "equitable" price, a concept which occurs in the treaty as well as the waiver. The consuming countries claimed that the test should be a comparison of export prices with prices within the Community; the High Authority spokesman on the other hand felt that the important relationship was between the prices charged by Community exporters and other exporters. To this the consuming countries replied, with considerable justification, that the steel exports of the countries of the Community are so large a proportion of the total that they tend to set, rather than to follow, other prices, particularly in Western Europe.

Criticism from Gatt

The discussion was also complicated by differences of view (which have existed for a long time both within and outside the Community) as to the competence of the High Authority to take action against the export cartel. The treaty is clear that the High Authority has jurisdiction if the export cartel has a disturbing influence on competition within the Community and it also authorises the High Authority, after consultation with governments and enterprises, to fix maximum prices in order to ensure that equitable limits are observed in prices charged on external markets. What is less clear is how far beyond a narrow interpretation of these two provisions other language in the Treaty permits or requires the High Authority to go.

Although both the waiver and the Coal-Steel treaty give plenty of room for differences of interpretation and for the most intricate kind of somewhat unreal argument, the Gatt review emphasised more forcefully than has yet been done the fact that the Community, and in particular the High Authority, have constantly to test their actions by their results on the countries outside the Community as well as by the standard of whether they strengthen or weaken the common market. Legal quibbles aside, it is clear that Gatt granted its waiver with some misgivings but a great deal of hope that the six countries would steer clear of the temptation to use their new unity to the disadvantage of their neighbours. And the six countries who make up the Community encouraged the other Gatt countries in the belief that the economic advantages which the common market is designed to bring in its train would not be exclusive in their effect, but would enable the countries of the Community to contribute more effectively to a general improvement in the wider European community.

"Now we know all the answers"

commented the Chairman.

'I get them with our Powers-Samas machines' purred the Chief Accountant.

'These digests would have taken weeks by hand. With punched cards we produce them in a matter of hours.'

"Very contemporary" approved the Chairman. "What a pleasure to know what's happening while a campaign is still going on instead of when it's over. Electronic methods no doubt?"

'Yes. Powers-Samas is the most up-to-date system of keeping business up-to-date, with the latest electronic developments where they are most useful.'

There is a range of Powers-Samas punched card equipment for every type of application.

Office Efficiency: Powers-Samas supply a complete range of the latest office furniture. Write for illustrated catalogue.

Pastures Green

GRASSLAND is one of Britain's greatest national resources, for grass is the natural food of cattle and sheep, and upon its abundance and quality depends the production of more meat and milk. To-day—in a world seriously short of these things—the improvement and development of grassland is recognised as the foundation of our agricultural expansion. It has not always been so, and it is largely due to the vision and patient researches of a few pioneers that the essential knowledge and techniques are now available to the British farmer. I.C.I. was among the first to apply scientific methods to the many problems connected with growing grass, raising its nutritional value and ensuring that the most efficient use is made of it. As long ago as 1928, an I.C.I. experimental farm was established at Jealott's Hill in Berkshire where practical research in grassland management was undertaken.

The benefits of this and other work have been far-reaching—from the development of new methods for controlling the grazing of cattle to the production of improved fertilisers. I.C.I.'s "Nitro-Chalk" for example, has shown remarkable results as a grassland fertiliser. Its use not only raises the food value of grass, but makes it grow more abundantly and for a longer period, thus extending the grazing season and helping to save imports of cattle feeding-stuffs. Another I.C.I. development is the drying of grass by machines, a method which makes it possible to preserve its full nutritive value almost indefinitely. I.C.I. is still pioneering, and the new knowledge of grassland problems that it is gaining will help the British farmer to produce still more from British acres.

Imperial Chemical Industries Limited

Spanning the East

Branches of The Chartered Bank of India, Australia and China under British management directed from London are established in most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents.

In London and Singapore the Bank is prepared to act as executor or trustee.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

The Corporation is ready to consider applications for capital to purchase additional buildings, plant and machinery, or to provide increased working capital to further the expansion of business. Consideration will also be given to new ventures which are soundly conceived and adequately sponsored.

THE BUSINESS WORLD

Slow: Road Works Ahead

THE roads that have captured a major share of Britain's movement of people and goods during the last 40 years are at least as decrepit as the railways that have yielded their primacy. Modernisation of the railways would make nonsense without also beginning the job of giving this country roads fit for the second half of the twentieth century: and the Government has to guarantee much of the capital for the one task, and provide all of it for the other. The new programme of road development announced in somewhat vague detail last week, therefore, needs first to be considered in perspective as part of total investment in British transport.

That net total, since the war, tells of disinvestment, not investment. On a realistic measure of depreciation and replacement, capital expenditure on British transport as a whole has been much less than sufficient to maintain the system intact. The accompanying table contains estimates of real capital expenditure on the transport system, and of the net value of the system at the end of 1938 and of 1953, derived from Mr Philip Redfern's recent paper to the Royal Statistical Society on "Net Investment in Fixed Assets in the United Kingdom, 1938-53."* By Mr Redfern's measure, only in commercial vehicles and air transport was there any net investment in inland transport between 1938 and 1953, i.e., any growth in the written-down value of transport assets. This does not imply a reduction in physical numbers of vehicles or in the length of roadways or track. It means that the average age of these surviving transport assets is much greater than before the war—that they are older and more obsolescent to carry their heavier burden of traffic.

* The investment shown in private cars is based upon estimates of total spending by private and business owners, not upon business spending alone, as in Mr Redfern's original paper

As Mr Butler pointed out last week, the major road improvement and construction that the Government intends to begin by early 1959—about £200 million worth—should perhaps properly be compared with the £200 million that the Transport Commission aims to spend on railway track by 1970. The total railway investment of £1,200 million at 1953 prices, or £80 million a year gross, might be compared with the £280 million gross invested in road transport, commercial and private, in 1953. But pitifully little of that—£10 million at 1953 prices, by Mr Redfern's generous estimate—was on the roads themselves. Each of these investment programmes is, in reality, so modest that there need be no invidious comparisons between them. The main doubt is whether in terms of net capital value either of them holds out much hope of restoring the capital that has been consumed in railways and roads since 1938.

From the sketchy details of the programme it is not

GROSS INVESTMENT IN TRANSPORT IN BRITAIN

1953	341	987	405	466	548	40	49	2,836

easy to gauge the balance that the Ministry intends to hold between trunk and other main roads, and between arterial and urban road development. The £100 million to be spent between now and early 1959 from Government funds is to be complemented by no more than £20-25 million of expenditure by local authorities on classified roads, for which they share financial responsibility with the Ministry. This implies, as do the lists of specific major projects that have been published, that the bulk of major improvements and new construction will be on the trunk roads. The trunk roads on which "major improvements" are due to take place under this plan are shown in the map.

For roads through the country, this emphasis is no doubt right. But sufficient emphasis needs to be put upon the major improvement of roads in urban areas if better trunk roads are to be used to full advantage. On the great arterial routes, the mileage is easily chalked up and the advantages look spectacular; but the dice are loaded against major improvements inside towns by the huge cost of acquiring land. The physical resources required for major improvement or new roads inside a city might perhaps be twice those for the same work on a rural trunk road; but site values may make the cost in money several million pounds a mile against a hundred thousand or so.

Of the £147 million of major improvements and new construction to be authorised in the next four years, it is said that only £18 million will be for work in the London area. If that is any indication of the relative share to be given to urban road improvements in general, this programme seems liable to be out of balance. The Minister deserves credit for a few of the specific London items that crop up sparsely in his lists, such as the Hanger Lane flyover junction; and his delay on the Hyde Park boulevard scheme will be well worth while if he is thinking of giving Hyde Park Corner, which carries the heaviest traffic in the world, modern underpass systems instead of the gigantic roundabouts now proposed for it. But it remains to be seen whether the urban road development will get enough attention under this plan.

The only motorway to be authorised in the next four years is the new 90-mile road from London to Birmingham; of the several plans that have long been gathering dust, this might generally be counted first in priority. This road, for motor traffic only and with restricted access from side roads, will use flyover systems to cross existing highways, and should be up to international standards of motorway design. One illustration of a crude type of flyover crossing issued by the Ministry has caused some concern on the score of design; but the Ministry several years ago issued a handbook on road construction standards that included wholly efficient and economical designs for flyovers, and it ought to do as well in practice. Even so, during a period in which road building techniques have changed out of all recognition, Britain has built no new major roads and it is as well to be watchful.

It cannot be said that this programme represents a road development in a hurry. The actual work completed during the next four financial years on major improvements and new roads may rise from perhaps £12 million a year in 1955-56 (in expenditure by central and local government) to perhaps £50 million in the year 1958-59. This has to be set beside expenditure of some £80 million from the taxpayer and the ratepayer on maintenance and minor improvement of all roads, with cleaning and administration. After 1958-59, expenditure on major improvements and new construction is likely to continue "at least on the scale indicated," or some £50 million a year.

Particularly where they involve the purchase of land, major improvement and road-building incur considerable statutory delays, and there have been the expected proposals for placing the work under some new single authority empowered to "cut red tape and get on with the job." These proposals are apt to come from the same people who are most justifiably incensed by such affairs as Criche Down or the working of land for opencast coal; and little is likely to be gained by the creation of more vast and vague bodies with administrative powers. It is perhaps justifiable to hope that the road construction industry's confidence in its ample capacity is fully borne out, and that it proves possible

to make a start upon a larger proportion of the work in the next two years than the Ministry now expects.

Is the whole programme adequate? The Ministry has not disclosed the volume of traffic for which these improved roads are being planned, nor does it relate the increase of expenditure on the roads to the current rate of increase of traffic on them. In fact, it seems to be telling road authorities to plan their roads for "the 1938 volume of traffic plus 75 per cent," as a fairly general rule. It is not easy to measure volume of traffic; but counts taken at a number of check points on the highway system suggest that by 1953 traffic throughout the country was already 28-30 per cent higher than in 1938, while on the major trunk roads and in certain urban areas there may have been a 40 per cent increase. After very sharp postwar increases, the rate of increase in traffic seems to have settled down at about 4 per cent a year, and the indications are that this is continuing. If it does, the simplest of comparisons with the Ministry's standard of "1938 plus 75 per cent"—suggests that the capacity now proposed for some parts only of the highway system might be filled within five or ten years—as soon as some of them are completed.

Similarly, it is difficult to gauge whether the projects that the Ministry has selected for action are the right ones. It is true that some of the estimates that are occasionally plucked out of the air for "annual savings

on such-and-such a trunk road" may be dubious; but that does not justify the steadfast reluctance of the Ministry to concern itself with estimates of the real rate of return on investment in highways. Generally, the growth of demand during a period of net disinvestment implies that this rate of return must be high; but intelligent selection of priorities in this process of social and industrial investment is hardly really possible without closer assessment. The civil servant wondering which dusty plan to take out of which pigeonhole inevitably engages in some form of marginal calculation—how many Parliamentary questions that one will save; whether the MP who can be placated by A is more actively obnoxious than the one devoted to B; perhaps most of all, how many accidents have happened on this road and that one? It is the economic return, however, that finally matters. This is the first time that a British Minister of Transport, in talking of new roads, has put "relieving of traffic, particularly industrial traffic" ahead of "promoting road safety." That is the right order. But until a clearer measure can be gained of the real economic return upon speeding up road transport—and rail transport—and restoring to Britain the inherent advantages of one of the most concentrated industrial communities in the world, transport in this country will never obtain the full share of investment that it deserves—and which, under today's enlarged plans, it still does not get.

Business Notes

Shunting Backwards

THE Bank of England is plainly worried by the renewed loss of dollar income to the sterling area through commodity shunting operations—more worried indeed than was at first apparent when the discount on transferable sterling widened to around 3 per cent and shunting operations increased. An inquiry has been made among the commodity trade associations to discover the extent of these shunting operations and for one commodity—tin—the contract has been tightened by a new clause requiring payment in dollars if the tin ultimately finds its way to America. In the typical shunting operation a sterling commodity is sold by a Continental merchant to the United States. He wins the business in competition with a British merchant because he uses a cheaper type of sterling and can therefore offer a lower price. The dollars he gains are lost to the sterling area; they are reconverted into sterling in the transferable market.

But the reverse process has recently been gaining in importance. Now that a substantial proportion of purchases from dollar sources can be made freely, there is no difficulty about the import into this country of many dollar commodities which are then re-exported to the Continent against payment in sterling. The ultimate buyers—the Continental consumers—are paying in transferable sterling and making a gain of about 3 per cent by putting the business through London instead of direct with the dollar source. The goods do not necessarily physically pass through Britain at all. These are traditional third party transactions, normally welcome because they increase the use of sterling and increase this country's invisible income; but with a widening discount on transferable sterling, they involve a drain on dollar reserves compensated by a corresponding increase in earnings of sterling.

No easy solution is in sight. There is a basic contradiction between controlled exchange on the one hand and free commodity markets on the other. Attempts to police the whole range of merchanting activities of British agents and

principals are almost doomed to failure, and are a retrograde departure from the freedom so laboriously built up. The choice lies between an advance to greater freedom on the exchange front be the risks never so great, or a retreat towards bi-lateralism which would shackle markets with greater restrictions and involve a wider measure of licensing control. It is possible to go forward or to go back, but not to stand still.

When transferable sterling is used instead of official sterling the sterling area loses foreign exchange, but it extinguishes debt because the transferable sterling so employed is used up. Why then is the end of this drain not in sight? The answer seems to be that transferable sterling remains plentiful and its rate weak—just below 2.72 dollars—because its supplies are being replenished. They are being replenished in part by the heavy expenditure of the rest of the sterling area (notably Australia) in transferable area countries. London is also creating credits which go to swell the total and the European Payments Union adds to the supply. To that extent the sterling area monetary controls are leaking, and supplies of cheap sterling are not being exhausted.

Malenkov's Markets

MARKETS have a standard pattern that nearly always shows through whenever wars and fears of wars are around, often even when something big in international affairs is happening that people fear yet do not understand. Commodities go up as traders scurry to cover more ample stocks and speculators jog along with them. Fixed interest

securities go down as confidence wanes and thoughts of inflation grow. Often if confidence is really shaken fixed interest stocks drag a large section of the equity market with them, leaving the commodity shares, rubber, copper, tin and the shipping shares to rise with the commodities. A

little—but only a little—of that picture has begun to appear in the last few days. The Formosa crisis did not at once produce it. The Malenkov resignation did produce a marked though possibly transitory effect.

No general scurry into commodities has developed; a few of them—notably tea—show declines over the last few days; the general tendency, however, has been upwards. On the Stock Exchange gilt-edged stocks had until Thursday been moving downwards for over a week. On Wednesday that weakness broadened out into a poor day for most stock exchange groups. Nervousness and a moderate volume of selling, probably mostly by recent speculators, produced some sharp falls in industrial shares. The exceptions are significant: copper shares and gold shares advanced; tin and rubber shares roughly held their own.

The picture is complex and no close parallel can be found with the pattern of markets when the Korea crisis broke. Neither the industrialist nor his government is caught this time with a cupboard bare of essential commodity stocks. Nor is the tension in the Far East a sudden unforeseen development. Still less are these external events the only influence at work in shaping markets. The sterling exchange rate, scraping uneasily along just above its lower limit, remained a powerful influence, suggesting the possibility—if it is no more—that the half per cent rise in bank rate may not prove to have been sufficient to restore its strength. That has as much to do with the fall in gilt-edged as have Formosa and Malenkov together, and the unexpected rise in gold shares is the converse of sterling's weakness.

£10½ Million for General Electric

ONE of the consequences of the adverse turn in markets and the uncertainty about money rates has been to complicate life for the long queue of would-be borrowers in the capital market. In the gilt-edged market this is proving a real and effective deterrent and must presumably remain so until the market finds a new level. It says much for the buoyancy of industrial investment markets that there it has been possible for refinancing to go steadily ahead. This week's issues include £1,960,000 6 per cent unsecured sterling loan stock and 650,000 share options in Messina (Transvaal) Development Company. The issue is being made to shareholders in units at £4 each, each unit consisting of £3 of loan stock at par and one share option priced at £1 entitling the holder to subscribe at £2 for one 5s. share in 1959. It also includes the offer to stockholders and noteholders of Electric and Musical Industries of 3 million 5½ per cent second preference shares at 20s. 6d. and £2 million of 4½ per cent unsecured loan stock at par in the company.

But the big operation this week is the launching of plans to raise £10½ million for the General Electric Company. That issue, to provide additional working capital, carries the implication that order books and turnover are still expanding in the electrical manufacturing industry. It consists of £6 million 4 per cent unsecured loan stock at £97 10s. per cent dated 1975/80 and 1,959,240 £1 ordinary shares at 48s. with rights to the final dividend for the year ending March 31, 1955, expected to be 8 per cent. The ordinary shares are a one-for-six rights issue. It should go

well. Against a market price of 60s. for the ordinary stock, the rights are worth 1s. 9d. per share. The loan stock is not offered generally to the public but to the company's stockholders and loan stockholders, not as rights. The company is obviously working on narrower margins than with its ordinary share issue. The redemption yield to the last date is about £4 3s. 6d. per cent. But the stock should certainly appeal to the institutions in the period up to July while it remains free of 2 per cent stamp duty. Many of the big potential investors will doubtless also be on Morgan Grenfell and Co.'s subunderwriting list and will have obtained part of their requirements 1 per cent cheaper. Success is not in doubt.

The Budget Surplus

THE Exchequer finances, at this crest in the tax-gathering season, are running about £300 million better than the budget estimates, and by the end of last week the Treasury had actually succeeded in getting out of the Exchequer accounts as a whole. The above-line surplus, originally expected to decline in the full year from £94 million in 1953-54 to under £11 million this year, had by February 5th reached £369 million compared with only £152 million at the corresponding date last year. At this point it just surpassed the below-line deficit, despite the fact that this has risen by twice as much as it was originally expected to do in the full year—it is up by £32 million, at £368 million. Hence there is now a tiny "overall" surplus instead of the "overall" deficit of £184 million shown at this time last year.

Nearly all the deterioration in the below-line account has occurred in the past few months, because rising interest rates in the market have induced a substantial increase in borrowings by local authorities from the Public Works Loans Board. The gain in the above-line account has, however, just offset this deterioration—because an additional £36 million of "miscellaneous" revenue has been credited in recent weeks—evidently from sales of food stocks. Little more, it seems, is likely to accrue from this source in the current year, since the Ministry of Food has now revised its estimate of the year's credits (paid direct to the Exchequer) from £109.6 million to £70 million.

The final out-turn of the year will be much more favourable than the original estimates, but it will not match the present overall balance. Over the remaining 7½ weeks of the year the cumulative above-line surplus is likely to decline (it declined by £58 million in the corresponding period last year) while the below-line deficit will rise further. But, despite the fact that total above-line expenditure to date is now almost exactly the same as in the similar period of 1953-54 (whereas for the full year it was originally expected to rise by £248 million), it is most unlikely that the acceleration of payments towards the end of the year will this time produce such a great change in the general appearance of the accounts as it has done in several recent years. The supplementary estimates for civil departments, published this week, are, by those standards, only moderate. They call for an additional £37.8 million—principally for Education including Universities (£6.2 million), Health (£6.1 million), War

Pensions (£6.6 million) and the Post Office (£6.4 million). In addition, the Ministry of Food requirements under the fat stock deficiency payments scheme of last July and the national milk scheme call for a further £18 million, but this sum is expected to be provided by roughly corresponding savings on payments for cereals and on the milk-in-schools scheme.

Money Rates Without Tiers?

THE pattern of money rates, though not their future trend, has become a little clearer in this past week—and can now be made a good deal clearer to readers of *The Economist*, which last week unhappily misprinted a 2 per cent rate as "22 per cent," provoking some bankers to point out that they had not yet entered the hire-purchase business. The new practice of the clearing banks in dealing with their short loans to the discount market is to treat approximately two-thirds of their available money as "good" money to be lent at the agreed minimum rate, fixed at 1½ per cent after the recent change in Bank rate, and to charge a higher rate for the remainder. Floating supplies of "night" money, usually a small proportion of the whole, naturally command the rate of the day, subject to the minimum; but on the question whether the renewal rate for the remainder of the "one-third" should also vary according to market conditions, there are differences of view. The general rate for this money this week, like last, has been 2 per cent, but on one day one of the banks raised its charge to 2½ per cent. Some other banks also regard the rate as variable in principle, though they saw no need to raise it on that occasion. Though a new tier has been erected above the minimum rate, it is not necessarily a rigid one, and it is much to be hoped that it will not become so.

As expected, the discount market last Friday raised its bid for the offering of Treasury bills, and the average discount basis of allotment eased from 46s. 7.33d. to 46s. 3.17d. per cent. Early in the week the tendency in the market and the further fall in the American Treasury bill rate pointed to a further easing, but the accentuation of sterling's weakness may arrest or even reverse this drift.

Extra Recruits for Industry

REVISION of the Ministry of Labour's manpower figures in accordance with the annual count of insurance cards last May makes the unexpected increase in Britain's labour force during 1954, which has already been noted in these columns, bulk even larger. The figure for the total working population at the end of November has been revised upward by 135,000, to the record number of 23,910,000 people; during December, as usual, this figure declined, and at the end of the year it was 23,818,000.

That figure represents an increase of 270,000 people during last year, against the increase of 200,000 that formerly appeared to have taken place. Since the numbers unemployed and in the defence services both fell, this

made possible a net increase in the civil labour force of 350,000 people—about 160,000 of the extra employees being men, and nearly 200,000 women.

These extra workers went into manufacturing industry, particularly into the vehicles and engineering industries, which alone had a net increase of nearly 170,000 in their total labour force, and into distribution and other service industries. The numbers employed in distribution rose by about 75,000 during the year; building gained roughly 20,000 men, and "professional financial and miscellaneous services" an extra 46,000 people. The central and local government services continued to squeeze out bureaucrats; but within civic industry the basic industries were the main losers—agriculture, transport and coal showed varying decreases in their labour force as employment throughout the economy became fuller.

Rio Tinto's New World

WHEN the Rio Tinto Company sold the bulk of its pyrites and copper properties in Spain for about £8 million last summer, an old and often struggling British mining venture came to an end. There was a prospect of cash coming into the kitty and there remained the valuable portfolio of investments in the Rhodesian copper mines that had carried the burden in the bleak years of Spanish disappointment. With the announcement this week that Rio Tinto is taking a leading role in bringing the Algom uranium mines in Northern Ontario into production, Rio Tinto shareholders find themselves partners in something possibly much better, certainly much more exciting—a new mining finance house, with a bias towards uranium. That new look sent the price of the £5 ordinary stock flying up by £2 to £48½ in a poor market.

At least \$41 million, and possibly a further \$16½ million, will be provided for the Algom mines by a group, headed by Rio Tinto; that group includes the Commonwealth Development Finance Company, N. M. Rothschild, Robert Benson Lonsdale, Groupe Lambert, Sogemines and Amsterdam Overseas Corporation. It is believed to be the largest single investment of British capital in any Canadian mining enterprise. Production is expected to run at 3,000 tons of ore a day each from Algom's Quirke Lake and Nordic Lake properties, making the company one of the largest uranium producers in the world. The financial details are as follows:

- Rio Tinto will buy 100,000 common shares in Algom at \$11 each: \$1,100,000.
- A Canadian bank will advance \$15 million, secured as a first charge on the properties.
- A 5 per cent debenture loan from the group headed by Rio Tinto will bring in \$25 million.
- Each \$1,000 debenture will carry an option to buy 40 Algom common stocks at \$11 each: \$11,000,000.
- Rio Tinto will receive options to buy an additional 500,000 Algom common stocks at \$11 each: \$5,500,000.
- As the debentures can be tendered in taking up the options, the notional figure of \$16½ million arising from their exercise may not necessarily be all new money.

How much of the debenture loan will be taken up by each

THE ECONOMIST, FEBRUARY 12, 1955

participant and whether or not the whole of that loan will be provided in this country is not yet certain, but it is clear from the current Canadian quotation of 15½-16½ on the Algom stock that the option holders stand to make a good profit.

What will be the new shape of Rio Tinto after this investment? That company will provide the management, including the right to negotiate sale contracts, and through a ten year voting trust and the nomination of directors will effectively control Algom's operations. But this is only one of the directions in which the rejuvenated Rio Tinto is branching out. It is also actively concerned with uranium development in Australia. Nor is it looking only towards uranium. The block of Rhodesian copper investments continues to provide a backbone for the enterprise, and there are other pebbles on the African and Canadian beaches that it may one day pick up.

London Calls the Copper Tune

THE London Metal Exchange may not dominate international trade in metals as it did before the war, but it is still a force that even the United States must reckon with. For nearly a year—through the time of surplus and then of shortage—the American copper producers stuck to a price of 30 cents a lb (£240 a ton) in the home market, and paid the same price for copper produced by American owned mines in Chile. Last month the Chilean government could no longer resist the bait of much higher prices ruling in London, and threatened to send all its copper to Europe. That put the American producers—who could not do without Chilean metal—in a flurry. The stable price policy began to crumble when the Anaconda company decided to raise its domestic price to 33 cents a lb (£264 a ton); the custom smelters at once followed suit and last week the other producers came into line. If the Chilean government insists on receiving for shipments to America a price not far short of the London quotation the Americans may have to raise the domestic price still higher.

Last week copper soared to new peaks in London, with cash at £356 a ton and three months at £331. On top of the strike of African labour on the Rhodesian copperbelt and the troubles in Formosa came the rumour—later confirmed—that the American government would restrict exports of copper. London dealers who have bought American copper for shipment in the first half of the year are now trying to discover how much they will get. Spot prices have since touched a new peak of £360. Even if the Rhodesian strike soon peters out a substantial tonnage has already been lost, and Chile is believed to be fully sold forward until June. Though the Rhodesian producers have suffered severely from the strike, their results for the last quarter of 1954 may be some compensation. The figures published this week for the Roan Antelope and Mufulira companies show a sharp increase in sales and a much sharper increase in profits, thanks to the high prices realised in that quarter: Roan's profit before tax was £1,176,000 higher than in the third quarter, at £2,754,000, and Mufulira's was £1,375,000 higher at £3,299,000.

We write
Electricity
Electricity
Electricity
Electricity
Electricity
Electricity
Electricity
in many ways

but our spelling is invariable

Every day of the year we write or type the word *electricity* many thousand times. On paper, the word may always look the same but, in fact, electricity appears to us as twelve different entities. The twelve sections of the Crompton Parkinson organisation

each have a specialist job to do. Between them they cover every aspect of electrical equipment and installation. United they provide the customers of Crompton Parkinson with the finest electrical service in the world.

When it comes to electrical equipment . . .

you've got to hand it to

Yankees on Tap

THE spectacle of the government broker sedately starting to peddle a mixed bag of American equity and fixed interest stocks is unusual; it has been on view this week, following the decision of the Treasury to sell in London \$15 million worth of dollar securities. These stocks are a fraction, unknown but presumably small, of the residue of the \$335 million of marketable securities that were taken over from British holders during the war and used as collateral for the Reconstruction Finance Corporation loan, repaid in 1951. Only part of the holdings was retained by the Treasury; some were subsequently returned to their original owners, but since 1949 the size of the Treasury's holding has remained secret. Switches have been made within it but in total amount the holding has been retained intact largely in deference to American fears that a block of British Government selling might adversely affect the Wall Street market.

A fraction of that secret hoard is now being transferred from official to private hands: the sales are being made in London against sterling so that no dollar transfer is involved nor is there any loss of dollar income to the country. The Government broker is not a pressing seller; he collects every penny of the premium that dollar stocks command in London. He started selling at a premium of 3½ per cent over Wall Street while the average London premium was about 3 per cent and waited for the jobbers in American stocks to come and bid. At a 3½ per cent pre-

mium, arbitrage was ruled out. A buyer who wants, for example, Chrysler common which happens to be on the list, can get it at about the right London price, but a buyer who wants US Steel (not on the list), cannot afford to buy Chrysler and switch it in New York for US Steel. Had the Government broker fixed his premium at 3 per cent instead of 3½ per cent, arbitrage might just have been possible. The premium has since declined to 2½-3 per cent. That premium marks the fact that the volume of American stocks available to British residents for sale against sterling is limited to the total of dollar securities already in British resident hands augmented by such occasional capital accretions as the proceeds of the Manilla Railway sale. An addition of \$15 million to the limited pool of security dollars should in the long run tend to press the premium in dollar stocks in London still further downwards. That partly explains why the government is such a careful seller, nursing the dollar premium as it goes. The policy of selling, but of selling gradually, is sound.

Self-Service at Woolworths

WOOLWORTH is to try out a self-service store. Announcing this experiment, the chairman, Mr S. V. Swash, told shareholders that a "very small store" would be opened at Cobham, Surrey, next month. Mr Swash does not believe that self-service leads to any saving in staff but that the increase in turnover and the convenience of cus-

Property Boom Subsiding

WHAT happens to the thousands of reports on house values that surveyors prepare for the building societies? The mortgage borrowers who pay for them are not allowed to see them. Even the local authority, when it is asked to share the risk of a 90 per cent or 95 per cent mortgage, does not get a peep. But it is encouraging that some societies are putting these top secret documents to useful purpose. The Halifax and the Co-operative societies have long been supplying their valuation figures to the London and Cambridge Economic Service. Now the Co-operative Permanent Society is issuing its own index.

This shows that the peak of house prices was reached in 1951. Through 1954 the decline continued though at a reduced rate. The fall was most obvious outside London and in the older and less well-conditioned houses. With building costs for new houses the story is different; they are still rising. Thus the enormous difference between the cost of building a new house and the cost of buying an existing one is being squeezed out. When restrictive licences go, the capital profits and vested interests that restrictions create go too.

* Houses built between the wars to satisfactory standards and other good class property.

tomers, who pay once at the door and not many times across different counters, make the experiment worth while.

Experiments of this kind and the modernisation of existing stores go hand in hand, now that Woolworth has to compete more vigorously for the consumer's shilling, and, as Mr Swash points out, to compete with hire purchase business for those shillings. But Woolworth, sticking to cash and its "well tried policy of endeavouring to ensure rapid turnover by large volume of sales at small monetary profit margins," experienced another advance in turnover last year, which partly explains the increase in stocks from £11.2 million to nearly £12.7 million. Such a policy requires very close ties, sometimes involving strict controls on prices and quality, with manufacturers. Last year Woolworth was able to secure the stocks it needed, and for the first time since the war Mr Swash and his associates were unable to detect any "significant gaps in the availability of merchandise in one department or another."

Tyre Prices Up

IN raising tyre prices during the very week in which unfavourable publicity has been given to the Price Protection Committee of the British Motor Trade Association and in which the best part of one Parliamentary question hour was taken up with monopoly practices in general and price-fixing in particular, tyre manufacturers have challenged public sentiment. There is a case for the latest increase in tyre prices; however, it is the method the industry uses to change its prices, and the way the motor trade maintains them, that is questionable.

The increase announced last week—which follows a 5 per cent rise last October—adds a further 7½ per cent to car tyre prices, with slightly higher increments for tubes and giant tubes that consume more rubber. Just on half the weight of a car tyre—about 10 to 12 lb—is rubber; and, with rubber prices so volatile, a certain amount of averaging by manufacturers is inevitable. Spot rubber prices are now around 30d. per lb compared with about 16d. a year ago. But tyre firms do not have much room to manoeuvre. Stocks are never very large—the smaller firms work almost from

hand to mouth; and contract prices reflect market changes fairly closely. Most firms are heavy buyers on the market.

The motorist is probably correct in suspecting that tyres are carrying the main burden of the sharp rise in rubber prices during the last fifteen months for the bulk of rubber consumption goes into transport uses. Whereas tyre sales have been booming, the market for other rubber goods, apart from cables and cellular rubber, has been poor, and prices have moved downwards where they have moved at all. Rubber footwear sales, for example, appear to have fallen sharply, despite two price cuts. This comparison is, of course, blurred by the lower rubber content of most types of rubber shoes and boots; there is also competition from footwear made of other materials.

Canadian Dollar Weakens

THE eyes of the foreign exchange market and indeed of a far wider circle including the money market, the Stock Exchange and the Old Lady of Threadneedle Street herself, may be glued to sterling. Uneasily they have watched the rate against the American dollar fall further this week, from \$2.78½ to \$2.78¼. But though sterling absorbs their attention, it is not alone in its fall.

The Canadian dollar (loosely called the world's hardest currency) has been weakening too. On the last three days of January its premium over the US dollar ran down from 3½ per cent to slightly over 3 per cent, with a corresponding fall in relation to sterling. During the past ten days the losses against the US dollar have not been made good—though there has been a slight recovery in its rate on sterling. The Canadian dollar was quoted at around \$2.70 to the pound, against \$2.70½ at the beginning of the month and \$2.69 on January 28th.

Canadians in their citadel of currency strength can welcome the slight depreciation of their currency. The premium on the US dollar hinders the flow of Canadian exports to the American market—and the flow of American tourists to Canada. The causes of that weakening are not, however, to be found in Canada's trade figures. An influence has probably been some outflow of funds from the Canadian money market—where rates were falling through the late autumn and the turn of year, while money rates in New York and London were hardening; there have also been signs of exchange speculation.

Talks are believed to have taken place between the Canadian and United States authorities on plans to restore a fixed—and presumably lower—rate for the Canadian dollar against the US dollar. The Canadian dollar was freed in 1950 on the ground mainly that a fixed rate imposed too much rigidity on Canada's dynamic economy; it would be surprising if the Government abandons that view now.

Brazil Retreats Again on Coffee

THE path of governments that interfere with free markets is strewn with pitfalls. Often the going is so hard that it is to be wondered they persist. Brazil's troubles started when it tried to exploit the boom in coffee early last year by

introducing a new minimum price of 87 cents a lb fob. Coffee was scarce. Brazil produces half the world's supply—what simpler than to hold up the market? But coffee was not quite as short as that. The Americans, who drink two-thirds of the world's coffee, have a marked aversion to paying high prices for the things they import. American roasters bought from hand-to-mouth and ran down stocks, and the public bought less coffee. Brazil held out until August, and then lowered the minimum price to about 64 cents a lb. That retreat simply prolonged buyers' distrust of the market. Recently the Brazilian minimum has also come under fire from Colombian and Central American producers, who have been selling their new crops at less than 64 cents a lb and Brazil has been forced to beat another retreat.

The bonus payable over the official rate of exchange to exporters has now been raised from 13.14 to 18.70 cruzeiros to the dollar, or the equivalent in other convertible currencies and sterling. That is an effective devaluation of the "coffee" cruzeiro from 31.50 to 37.06 to the dollar, in line with the effective rate for exporters of raw cotton and cocoa, and it brings the minimum export price for coffee down to about 56 cents a lb. To try to restore confidence in the market the Brazilian authorities have offered to compensate buyers for any further change in the exchange rate within 45 days of the date of sale.

In the New York market the spot price of Brazilian Santos 4 grade has fallen by 6 cents to about 58 cents a lb nominal, but futures are no longer at such a large discount on spot prices. Whether the new minimum can be held depends on how far the new measures encourage importers to buy more coffee from Brazil, and on the selling policy of other producers. There are signs that the violent upsets in the market over the past year have prompted some producers to conclude that co-operation, not competition, is the answer. A recent meeting of the special coffee commission of the Organisation of American States set up a committee, which included a delegate from the United States, to study the possibility of stabilising prices within limits "satisfactory to producers and consumers."

South Africa's Gold Sales

THE South African Minister of Finance confirmed at the end of last week the news that South Africa was no longer bound by the agreement to sell in the United Kingdom a minimum guaranteed quantity of 4 million ounces of gold per year. In practice South Africa has sold appreciably more than this guaranteed minimum, equal to about £50 million. In 1953 the total sales of South African gold to Great Britain amounted to £78 million. In 1954 they rose to close on £100 million—an increase that was significant first because it was in that year that the London gold market reopened and South African gold sales to Great Britain were canalised through this free market, and secondly because it was during 1954 that all discrimination against dollar imports into South Africa disappeared.

Provided there is no change in the competitive efficiency of British and other sterling area goods in the South African market, there is no reason why the termination of guaranteed

minimum gold sales should have any effect on the future direction of South African gold exports. During the Commonwealth Conference the South African representative, Mr Swart, promised that all restrictions on imports into the Union would be removed by the end of this year. That decision reflects an improvement in the South African reserve, which itself springs from rising gold and uranium production. With discrimination already buried and the remnants of quantitative restrictions about to disappear the amount of South African gold which the United Kingdom can attract will more than ever be an expression of British competitive efficiency.

France Repays

BEFORE the fall of the Mendès-France Government its Finance Minister, M. Edgar Faure, had announced to the Council of OEEC Ministers that France would forthwith repay the \$80 million still owing to the European Payments Union after allowing for the bilateral repayment and amortisation agreements concluded last June. That repayment has now been approved by the OEEC Council and presumably will take place despite the change of scene in Paris. The money is to be distributed immediately to EPU creditors in proportion to their claims at the end of 1954. Germany is the main prospective beneficiary ranking for \$36.7 million, followed by the Netherlands, Switzerland and Belgium in that order.

France will not lose the right to recover gold paid by it in full settlement of its deficits up to June 30, 1954. Therefore if France now secures surpluses with EPU it will receive settlement wholly in gold up to that ceiling. For example in December last France earned a surplus of \$15.3 million; it had to pay in gold or dollars \$3.9 million for interest for the second half of 1954, but it took the whole of the balance (\$11.4 million) in gold. The French decision to clean up the debt to EPU by this substantial repayment marks an improvement in the French reserve due in part to the fact that the Bank of France has recently acquired much gold dishoarded by French nationals who have found more profitable opportunities of using their resources on the booming Bourse. But for the political news from Paris the repayment would have been counted as an impressive bull point for the franc.

Ladies and Gentlemen . . .

A YEAR ago only one chairman of the major steel companies, Sir Walter Benton Jones of United Steel, began his statement with the words "Ladies and Gentlemen." The other chairmen had to address their remarks to one shareholder—the Iron and Steel Realisation Agency. Since then, the equities of six more steel companies have been offered to the public and Mr. A. G. Stewart of Stewarts and Lloyds and Sir John James of Lancashire Steel have now joined Sir Walter in making their statements to fully fledged annual general meetings of shareholders.

Are you

PLOUGHING BACK ENOUGH

to keep pace with changing
capital replacement costs?

Our indices for nearly twenty
types of equipment are the
most economical way of measuring
the rise in costs over the last fifteen years

The Economist Intelligence Unit

22 Ryder Street, London, S.W.1.
Whitehall 1511 Extension 114

Mr Stewart speaks to over 12,000 shareholders and Sir Walter to more than 30,000.

All three chairmen have reported earnings that were better than was expected when the ordinary shares were offered to the public. Both Sir Walter and Mr Stewart point out that export prices remained more stable than had been anticipated while Sir John and Mr Stewart comment on the resurgence in demand which took place after the 1953-54 financial year had been under way for some time. All three of them point to a high level of production in the last months of 1954 and they expect that production will continue to run at this high level in the next few months.

The spokesmen of the steel industry seem to have few immediate worries and, looking further ahead, they think, reasonably rather than wishfully, that the demand for steel will be there to absorb the substantial increase in production that can be expected in the next few years. It is, of course, upon that expectation that the industry's development plans (to which all three chairmen devote most of their remarks) are based. But they warn shareholders that development is costly. Sir Walter, for instance, estimates that it would need £96 million on the basis of current prices to replace the £64 million of fixed assets owned by United Steel. The support of ploughed back profits is essential for the success of these schemes but all three chairmen are conscious—Mr Stewart explicitly so—of the need to give their new shareholders a fair return.

Pause in Coarse Grains

THE burst of activity in coarse grains, particularly barley, has now died away. Most consumers appear to have covered the bulk of their requirements and prices are high enough to deter avoidable purchases. Canadian No. 2 feed barley is now about £30 a ton cif for March shipment, and Iraq barley is about £26 a ton. This makes Canadian barley almost as dear as Canadian wheat, and dearer than soft wheats, so that some compounders are buying milling, as well as feed, wheats for their mixtures. British farmers who have been able to store feed barley until now are also getting about £30 a ton, nearly £9 more than at the beginning of the season.

The ban on shipments of old crop maize from Argentina has had little effect on prices of maize from the United States, the only major alternative source of supply. American maize is being offered freely, for many farmers, having exceeded their allotted acreage, cannot put the surplus under the loan. Prices of both coarse grains should remain firm for some time. The only surplus is that of American maize, and that is unlikely to press on the market now that Argentina has withdrawn.

Trading in coarse grains on the London futures market has also become slack; it has never been really active. More traders would use the futures market if they could be sure of doing business without moving prices sharply against them; it is a vicious circle, for the market must remain narrow until more people use it. But that circle can in time be broken, as slowly traders here and abroad take an interest in London futures. Whether it will ever grow into a thriving handmaiden of the shipment market

is an open question. Postwar conditions are not helpful. The grain trade—and the compounding industry—is now in fewer hands, the cost of transacting futures business seems high, and speculation is lacking.

Take Your Partners

THE recent bid by English Electric for the shares of Vulcan Foundry and its 50 per cent subsidiary Robert Stephenson and Hawthorns is only part of a process of re-deployment in the industries that make British diesel locomotives, which are preparing to make more diesel units for overseas railways and some of the components for British Railways' new locomotive programme. Few firms, at present, are equipped to make and assemble complete units in their own factories, as steam locomotives are generally built. Locomotive builders, diesel engine firms, and electrical manufacturers are gradually coming together in loose *ad hoc* groupings that shift and alter in successive contracts. But some of these associations have now been made more permanent and others may follow. English Electric, which already has the largest capacity of any British firm making diesel electric locomotives, is one of the few firms that can make and assemble complete units. From time to time, however, it has bought mechanical parts from outside, particularly from Vulcan Foundry. If the present offer is taken up, it will make more intimate the long-standing agreement between the two firms and, incidentally, add still further to the capacity of English Electric.

Altogether there are some 25 main contractors in the diesel locomotive business, but most of them specialise in industrial and plantation units. North British is one of the two firms making diesel hydraulic locomotives; improved transmission and last year's agreement with the makers of the German MAN diesel engine now enable it to build locomotives up to 2,000 b.h.p. The Brush Group has ventured further into the diesel-electric business through Brush Bagnall Traction, a company formed a few years ago in conjunction with Mirrlees and W. G. Bagnall, a subsidiary of Heenan and Froude.

Metropolitan-Vickers, in the AEI group, assembles locomotives with Beyer, Peacock at the factory they own jointly at Stockton-on-Tees. But this plant is fully occupied, and the 94 diesel-electric locomotives to be built for the Irish State Railways will be assembled at workshops at Dukinfield leased from British Railways, with electrical equipment supplied from the Metropolitan-Vickers works at Manchester, mechanical parts from Metropolitan-Cammell at Birmingham, and diesel engines made by Crossley Brothers. This order is a great success for AEI; it is one of a number that British firms have recently secured in the face of strong competition. The redoubtable Electromotive Division of General Motors Corporation, which pioneered quantity production of a standard diesel locomotive and took a major hand in the "dieselisation" of American railroads, was one of the competitors, having made an elaborate operating study of the Irish system. Like other American locomotive builders, it had a lean time last year with home demand largely saturated; and Britain's increased concentration on the diesel is securing a much larger share of the export market.

FROM PAKISTAN

A New Airline...

KARACHI VIA CAIRO
UNDER 16 HRS

—Fastest Time Ever!

Business men! Here's a new, faster, more luxurious air service to the East—at no extra cost. By applying the latest advances in airline servicing and management technique to the most reliable commercial aircraft in the world, new Pakistan International Airlines bring to East-West air travel a trans-Atlantic standard of luxury aloft. Every Friday P.I.A.'s specially fitted Super-Constellations fly *above the weather* from London to Karachi via Cairo in just 15:50 hours flying time*—substantially less time than ever before. The return flight, leaving Karachi on Tuesday, takes only 17:50 hours in the air—still the fastest West. Moreover, P.I.A.'s domestic network serves both West and East Pakistan, India and Burma; its booking facilities cover all points East. P.I.A. flies faster—you fly more comfortably. For full details see your local Travel Agent.

The Midwife of Invention

THE National Research Development Corporation was created in 1949 mainly to assist the development of inventions that could not find a market in industry. In reviewing its first five years' work, the NRDC comments that it found few examples of inventive inspiration that lacked support. The NRDC has concluded that "outside the field of light engineering and instrument manufacture the isolated individual rarely appears to have any serious contribution to make to the advancement of technology," but it might be equally true that industry is much quicker to recognise promising ideas, and outside financial assistance for development more easy to obtain, than was supposed after the war. The terms on which the NRDC can grant assistance are, equally, not to every inventor's taste; in giving help, the Corporation acquires rights over whatever process is being developed. The real field for the NRDC is proving to be in the development of inventions and discoveries made in government or semi-official research organisations that lack facilities for developing them further and in licensing these discoveries to industry.

Assam Gets the Vote

BY large majorities the shareholders of Assam Company on Monday approved the four resolutions that will create a special class of 1s. shares to be held by the trustees of the pension fund and thus in effect vest in these trustees (who are appointed by the directors) one third of the votes. Mr Haridas Mundhra, who is reported to have been recently buying Assam shares for control, did not attend the meeting and the argument against the resolutions was put by a lawyer. It was also disclosed that the opposition is to seek a Board of Trade inquiry and a court injunction. The opposition vote against the four resolutions was less than had been generally expected; it varied between 114,000 and 127,000 shares, so that Mr Mundhra and his associates can have voted little more than one tenth of the capital even though their present holding may be larger. Over 500,000 votes, representing more than half the capital, were cast in favour of each of the board's resolutions. The chairman, Mr Peter Remnant, made one small concession to the critics of his proposals; the new 1s. shares to be held by the pension fund may be consolidated into £1 shares with consequent reduction of their voting rights at the end of seven years.

Gold in 1954

"To fix in London the centre of gravity of the European free market which up to then (March 22, 1954) had operated loosely within the limits of the continental telephone system." That is the summary by Mocatta and Gold-

smid, the bullion brokers, of the main achievements of the London gold market since it was restarted last spring. They deny that the free market itself has substantially broadened. No fresh buyers of free gold have been attracted since payment can be made only in registered sterling. On the supply side, though some South African gold has come to London under the new arrangements, the London price has not been high enough to attract sales from Australia. They point out that the effect of reopening the London market has been to quieten activity and narrow the range of price fluctuation. Expressed in US dollars, the free market in 1954 varied only between \$34.90 and \$35.15, a negligible margin compared with any previous postwar year. Incidentally, freedom to deal in gold coins has established a substantial premium and a fluctuation in the sovereign, which was previously fixed at 58s. It has fluctuated in the free market between 62s. and 70s., and the higher price reflected a premium of 19½ per cent of the value of its gold content, an indication of the hoarding demand that has continued to come mainly from the Continent.

In their *Bullion Review* for 1954, Messrs S. Japhet and Company confirm the view that the reopened gold market in London has been far from a lush pasture for the participants, who "found it hard to make even a modest turn." The company reports that during February last year three tons of Russian gold were sold in Paris, twenty tons or more were sold on the Continent early in March against payment in transferable account sterling, and a further quantity was sold to the United Kingdom. This flow of Russian gold stopped as suddenly as it had started. But the stoppage was not due to lack of available gold—a fact which seems to be confirmed by more recent reports of a conditional undertaking by the USSR to deliver eleven tons of gold to Persia at short notice. Japhet and Company hint that sales of Russian gold to the international markets may be resumed in 1955. They also discuss the vexed question of the "counterfeiting" of sovereigns on the Continent. They point out that the British Government has vigorously affirmed that under the Coinage Act of 1870 the sovereign is current coin and legal tender in the United Kingdom, and that it has the sole right of coinage. That contention was not upheld by an Italian court last November, but "the British Government is understood to be taking active steps to have the question put beyond doubt."

Bilateralism in Colombia

DOCTRINAIRE bilateralism in trade can often lead a country dangerously close to cutting off its nose to spite its face. The latest disheartening case history comes from Colombia, which is one of the more rapidly developing South American republics. Colombia rode the coffee boom last year in rather too carefree a spirit, and when the boom collapsed in August the country belatedly realised that it had been on a spending spree, with imports running 30 per cent above 1953 levels. The state bank's reserves fell from \$256 million in July to \$197 million in September, and the Bogotá government hastily sought means of checking the drain of imports. The remedy that came most easily to hand was evidently to stiffen the bilateralist methods to which Colombia has for some time been addicted.

One of these methods is to refuse all licences for non-essential imports from any country whose visible trade with Colombia is not in balance, unless it has a bilateral trade agreement with the republic. Any such country is also barred from offering to supply material, however essential, to official or semi-official organisations—which, in Colombia, play the lion's role among importers. Several European countries now suffer these serious disqualifications, and among them is Britain, whose trade agreement expired early in December. In terms of visible trade, Britain buys from Colombia only a fraction of what it sells—its export surplus last year was £8 million—and the decidedly arbitrary Colombian regulations take no account of the fact that invisible items, and international merchandising of Colombian produce, can usually be relied on to bring the true accounts roughly into balance.

On the one hand, a sizeable dollar market is thus largely closed to British and European exporters (the lucky exception being the Germans, who got their trade agreement in operation just before the break in coffee prices). On the other, these measures bar Colombia itself from obtaining in the cheapest market certain supplies of obvious importance to its development. It is clearly questionable whether Colombia is wise to discourage so many suppliers by its drastic action against them, when it is already dependent on its trade with one country, the United States, to a degree that perennially disturbs the more thoughtful minds in Bogotá.

Top Dogs

DOG breeders are building up a respectable export trade in pedigree animals. They sell principally through the medium of the dog shows and in particular the annual

two-day Crufts show that was held in London last week-end; this with more than 6,000 dogs on show, is big enough to attract the overseas buyers. Last year, 3,218 dogs were sold abroad, more than half of them going to the United States where they earned an estimated \$1 million. Canada was the second biggest market. About half a dozen prize dogs are sold every year to foreign breeders for sums of the order of £1,500. Some of the small dogs have literally proved worth their weight in Fort Knox gold. The rest probably average £100 each.

These are respectable figures for a cottage industry run largely by amateurs. At present, a quarter of the dogs exported are miniature poodles, followed by pekes and cocker spaniels. But the real strength of the British dog breeding industry probably lies in its unquenchable enthusiasm for new breeds. Crufts has classes for such relatively new imports as Rhodesian Ridgebacks, Tibetan Spaniels, Lhasa Apsos, Chihuahuas and the topaz-eyed Weimaraners and a special section for "any other variety" where breeders show dogs too new to have any Kennel Club classification.

SHORTER NOTES

The Council of Foreign Bondholders has issued its eighty-first annual report (available from its office at 17 Moorgate, E.C.2, at 7s. 6d.). As usual the report reviews the present status and state of negotiations on the bonded debt of all Britain's chief debtors.

★

Colombia has bought \$25 million (American) from the International Monetary Fund against Colombian pesos. This, which is Colombia's first transaction with the fund, exhausts half the country's quota. The fund has granted a waiver allowing Colombia to draw 25 per cent in excess of its quota.

benefit" from double tax relief. But shareholders will remember that such payments, notably from the South American subsidiaries, have to find their way through the barbed wire entanglements of exchange regulations.

In view of the fall in profits and the rather small cover that net equity earnings give to dividend payments, it is not surprising that the directors have again left the year's ordinary dividends unchanged at 15 per cent. What is a little surprising is the decision to make a 100 per cent free scrip issue, especially as a year ago the board decided that the "earnings outlook, particularly in the USA, is too uncertain to justify such an action at the present time." The reversal of this decision can be taken to mean either that the board has decided that a free scrip issue is only a book-keeping transaction, not affected in any way by the prospect for earnings, or that trading in the United States has taken a turn for the better. The explanation might well have been given. In its absence investors should pay more heed than with some scrip issues to the directors' warning that it is available earnings, and not scrip issues, that determine dividends.

the United States, where, as long ago as last February, the chairman warned shareholders that sales were falling off and the outlook was "not so encouraging."

cover any liability on profits retained by foreign subsidiaries. Such profits can be brought into charge only if they are paid over in the form of dividends to the parent company. If they were so paid over, there would be a "substantial

BRITISH HOME STORES.

Cash trading in the chain stores paid handsomely last year. Woolworth has already produced excellent results, including a bigger dividend. It will surprise most people if Marks and Spencer cannot do likewise. The good results from the much smaller concern, British Home Stores, must therefore gratify those investors who have put their faith and their capital in chain stores. Last year the trading profits of British Home Stores went up again, this time from £1,293,797 to £1,414,088. That increase must have come from an expansion in turnover. Income tax and profits tax on these earnings have risen, but there is no EPL charge (compared with one of £95,000 in 1953) and the total tax provision is down from £775,000 to £750,000. Hence, there is a bigger bound in net earnings

	Years to Jan. 1,

1s. ordinary stock at 13s. 9d. yields £4 5s. per cent.		

(from £428,406 to £560,496) than in the trading surplus. Higher dividends are the order of the day. The directors have declared a full year's dividend of 7d. on each 1s. share (or 58½ per cent), compared with 5d. (or 41½ per cent) for 1953.

That dividend was accompanied by the announcement of a 100 per cent free scrip issue in "A" non-voting ordinary stock. The free issue matches the capital programme of modernisation and development out of retained profits that British Home Stores has been and still is pursuing. It was welcomed in Throgmorton Street, as most scrip issues are these days, with a marking up of the price of

the stock. The 1s. stock units gained 4½d. to stand at 13s. 9d.

★

BRITISH SOUTH AFRICA COMPANY.

The "Chartered" Company, the Stock Exchange's nickname for the British South Africa Company, draws most of its income from its mining royalties. The "Chartered" Company is the landlord of the Rhodesian Copperbelt. In the year to September 30th the company experienced a slight fall in total income from about £9 million to £8.4 million. But there must have been a considerable decline in the charge for EPL, and the total tax bill dropped from nearly £6 million to just over £5.1 million, and the company's net income went up from £2,988,143 to £3,295,898. As the company has been eager to retain profits and build up its portfolio of investments against the day in 1986 when it loses its ownership of the mineral rights in Northern Rhodesia, the directors' decision to leave the ordinary dividend unchanged at 50 per cent did not surprise the Stock Exchange.

Nor did the 100 per cent free scrip issue of ordinary shares cause any stir. A writing up of the 15s. ordinary stock had been in the air for some time and the only odd feature of the capitalisation proposals is the failure to convert the nominal value of the stock to a rounder figure than 15s. After the announcement, the stocks units improved—in line with the Rhodesian copper shares—to 115s. (to yield 6½ per cent). In the future, the "Chartered" Company's ordinary stock must have its ups and downs as copper fluctuates, but the plans to increase production in the Copperbelt should ultimately benefit the owner of the mineral rights.

LONDON STOCK EXCHANGE

Next Account begins: February 16th
Next Contango Day: February 16th
Next Settlement Day: February 22nd

MALENKOV and Formosa were the dominant influences on Throgmorton Street this week. The Formosa crisis had sent industrial equity prices sliding down from the peak of February 3rd, when the *Financial Times* ordinary share index stood at the new "high" of 197.5, and then on the news of the changes in the Russian Government the ordinary share index fell from 196.0 to 193.8 on Wednesday. But, then, a rally was staged on Wall Street and when the London Stock Exchange opened on Thursday prices were a little better all round. Gilt-edged stocks were unsettled, partly by the international situation and partly by the weakness of sterling. Selling was not heavy but quite heavy losses were the order of the day until Thursday, when prices began to move up. On that day, too, German bonds rallied after losing quite a lot of ground just after the week-end. Rumanian issues were marked up on the news of the debt talks but then lost part of these gains later.

The most significant movements took place in the industrial market, where almost all sectors reported losses. Engineering and aircraft issues moved against the falling market at first but they, too, were marked down on Wednesday. The strongest resistance to the tendency for prices to fall was provided by steel issues; as a whole their prices remained firm on the rush to participate in the Whitehead issue. The lists closed for that issue immediately after a very heavy over-subscription. Among the shares that were most affected by the international tension were oil shares, which closed very flat on Wednesday. But they were looking a little brighter along with other equities when dealings began on Thursday.

In the commodity share market, rubber shares, having slipped back a little at the beginning of the week, began to improve later. Tea shares were marked down on the forecast of a fall in tea prices. Copper shares advanced strongly on the new record price for the metal. Tin shares and other base metal issues were also strong. Kaffir shares were also moving up.

(1) Petroleum production in Canada in 1938 includes natural gasoline. 1938 figure of electricity production in Australia was for 12 months ended June 30th; figures for New Zealand represent about 87 per cent of total generation. (2) Copper and tin refer to metal production. (3) General trade are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ended June 30th.

Financial Statistics

EXCHEQUER RETURNS

For the week ended February 5th there was an "above-line" surplus (after allowing for Sinking Funds) of £168,176,000 compared with a surplus of £118,890,000 in the previous week and a surplus of £149,287,000 in the corresponding period of last year. This brought the cumulative account to a surplus of £369,534,000 (compared with a surplus of £151,904,000 in 1953-54). Net expenditure "below-line" last week reached £32,166,000, bringing the total cumulative surplus to £1,732,000 (compared with a deficit of £184,246,000 in 1953-54).

THE MONEY MARKET

At last week's Treasury bill tender, the allotment rate showed its first decline since the sharp advance that began in mid-November. The discount houses raised their bid for the £220 million of bills on offer by 2d. per cent, to £99 8s. 5d. per cent, and the average rate of discount fell by 1/64 per cent, to 2 1/4 per cent. The market's allotment rose from 32 to 39 per cent despite the increase of £10.6 million in total applications.

Money has been markedly shorter in Lombard Street in the past week, and demands for bills have abated somewhat. The range of dealing rates in two and three month bills narrowed after the Treasury bill tender. This week a moderate volume of business has been done in April maturities at 2 1/2 per cent and, at moments of stringency, at 2 1/4 per cent. Overnight loans have been taken at rates up to 2 1/2 per cent.

The price of gold at the London fixing reached a new record of 251s. 11d. on Thursday. The rise was principally in sympathy with the decline in sterling—to a low point of \$2.78 1/2 on Wednesday and Thursday—but it also reflected nervousness about the international situation.

The Bank return shows a further reflux of notes of £500,000. The post-Christmas decline in the active note circulation has thus lasted for two weeks more than in recent years, but the total reflux is still, at £99.4 million, smaller by £5.7 million than last year's.

Have at you!

It would be over-dramatic to suggest that Insurance experts fling down the gloves to one another, and fight out duels to the death. But there are duels of other kinds.

Each Insurance Company is, in fact, the rival of all others. They are in constant competition—not only to obtain business, but to make the best use of the funds entrusted to them. That is as it should be—for competition fosters enterprise.

The Insurance expert has the delicate task of investing *your* money—and in doing so he tempers enterprise with caution. Thus he maintains the world-wide reputation of British Insurance—the absolute certainty that the contract will be fulfilled when the claim arises.

The conclusion is clear. Insurance is being responsibly, resourcefully—yes, even creatively—handled by practical people with *your* interests in the forefront of their minds.

I accept the appointment...

can the Company
help me to buy
a house, sir?

The problem of the executive or key worker who is unable to find the deposit to purchase a house can be solved without cost to the Company.

The Guarantee House Purchase Plan of the Wesleyan & General Assurance Society has been specially designed to meet this problem, and, in addition, provides for cancellation of the mortgage in the event of the employee's death.

Information regarding this plan will be given, in confidence, upon application to:

STEWARTS AND LLOYDS, LIMITED

EVENTS SINCE DENATIONALISATION

PROSPECTUS ESTIMATE EXCEEDED

CONSERVATION OF RESOURCES ESSENTIAL FOR COMPETITIVE STRENGTH

MR A. G. STEWART ON MAJOR DEVELOPMENTS

The sixty-fifth annual general meeting of Stewarts and Lloyds, Limited, was held on February 8th in the Merchants' Hall, 30 George Square, Glasgow.

Mr A. G. Stewart (the chairman), who presided, said:

Ladies and Gentlemen,—When I addressed the stockholders in 1949 and again in 1950 I referred fully to nationalisation, which was then impending. The vesting date was finally fixed for February 15, 1951, on which date all the shares and stock of the company became the property of The Iron and Steel Corporation of Great Britain. A final communication was sent subsequently to the former stockholders, accompanied by the accounts for the year 1950.

As you know, and as is stated in the directors' report, the ordinary shares of the company were offered back to the public on June 18, 1954. There are now over 12,000 shareholders.

It gives me the greatest pleasure to address you today, and I will try to give you a broad picture of what has happened in the company, not only during the past financial year but also in the years when we were nationalised.

CAPITAL STRUCTURE

I would like first of all to explain two substantial changes in the capital structure of the company which have taken place since we were nationalised.

At the request of The Iron and Steel Corporation, the three classes of preference stock then existing were converted into ordinary stock and the deferred stock consequently became ordinary stock. The debentures of Stewarts and Lloyds, Limited, and of its subsidiary, The Stanton Ironworks Company, Limited, were redeemed for cash. The issued capital of Stewarts and Lloyds thereupon consisted of £11,786,025 ordinary stock.

Immediately prior to denationalisation the capital was again re-organised as shown in detail in the accounts. The issued capital now consists of:

10 million ordinary shares of £1 each, held by the public;

10 million 5½ per cent preference shares of £1 each, half of which are redeemable. All these preference shares are held by The Iron and Steel Agency of Great Britain; and in addition,

£10 million 4½ per cent unsecured loan stock, also held by The Iron and Steel Agency of Great Britain.

There are also 10 million ordinary shares of £1 each authorised, but not issued.

It should be understood that the Agency put no new money into the company when we were denationalised nor did we receive anything other than short term loans from The Iron and Steel Corporation while we were nationalised.

THE ACCOUNTS

A further effort has been made to present the accounts to you in as simple a form as possible. As you will notice, the consolidated profit and loss account and the consolidated balance sheet, which are both presented in narrative form, show separately the figures for Stewarts and Lloyds, Limited, and its subsidiaries; the overseas subsidiaries; and the total group. Your directors felt that the creation or retention of subsidiary companies, especially in the United Kingdom, was largely a matter of management and that the accounts for the United Kingdom companies should be presented as if they were a single entity. You will also notice that all amounts in the accounts are to the nearest £1,000. After careful consideration your directors thought that this change, which obscures nothing of importance, would make the accounts easier to read and appreciate.

In the offer for sale issued in June, 1954, the directors estimated that the consolidated trading profit for the year would be in the neighbourhood of £10 million. This estimate was based on the gross group profit after deducting outside shareholders' interests and overseas taxation. The group profit of £12,180,000 as shown in the accounts, if adjusted on a similar basis, would become £11,497,000. The excess of this figure over the £10 million envisaged in the offer for sale is due mainly to export prices having remained more stable than was anticipated and to there having been an improvement in general trade in the second half of the financial year.

It is widely recognised nowadays that an adequate amount must be charged against profits for depreciation. The consistent rise in prices since the war means that depreciation based on original cost will not provide anything like replacement values. This year a figure of depreciation was calculated to take account approximately of the increase in general prices since the UK assets were acquired or installed. The £2 million allocated to obsolescence covers the difference between the depreciation charged and the greater figure thus calculated, and also provides a margin for the reduction in taxation due to investment allowances.

The accounts have been annotated and there seems nothing else which requires special comment.

The statement which accompanies the accounts shows the outputs for 1954 with comparative figures for the years back to 1946 and also for the year 1938. I think you will agree that these figures are satisfactory, although the output of steel tubes measured in tons for the 52 weeks ended October 2, 1954, was some 60,000 tons less than for the previous 53 weeks, due to a reduced Stanton's output of spun iron pipes and castings was, on the other hand, slightly increased as compared with the previous period and constituted a record production for that company.

INTERIM DIVIDEND

As indicated in the offer for sale, it is the intention of the directors, provided profits permit, to pay interim dividends in future. The present intention is to pay an interim dividend at the rate of 5 per cent per annum, less tax, on account of the current year. The actual decision will be taken early in June and payment will be made in July. I would ask shareholders to appreciate that our profits are subject to a wide variety of changing conditions which are difficult to predict, and it is not possible to draw any firm conclusion as to the final dividend when the interim is announced. In our industry it is necessary, as you must realise from reading the accounts, to pursue a conservative financial policy. It is only by so doing that we can preserve our competitive strength and play our proper part in the national effort.

Whilst today there may be a general tendency for dividends to be increased, and whilst it is understandable that shareholders may expect to receive increased dividends, a responsible board must always regard themselves not only as managers of the company's affairs but also to some extent as trustees of the shareholders' invested funds.

In addition, they must always be mindful to ensure, so far as they can, continuity and security of employment for their employees, and to satisfy the needs and interests of their consumers.

Nevertheless, and subject to these general but important considerations, the board must always consider carefully what is the shareholders' fair reward.

IRON AND STEEL BOARD

You will all know that under the Iron and Steel Act, 1953, the Iron and Steel Board was appointed. This board has the duty of exercising a general supervision over the iron and steel industry with a view to promoting the efficient, economic and adequate supply under competitive conditions of iron and steel products, and a particular duty, among others, to review the capacity of the industry from time to time so as to ensure that the overall developments carried out by the companies in the industry are in line with future possible demands.

We welcomed the appointment of this board and believe that it will provide a great service both to the industry and to the country as a whole.

DEVELOPMENT

By the end of the year 1954 we had spent since the war some £38 million on modernisation, development and extension of our works in this country. All this has been done without recourse to permanent borrowing. The cash position of the company has, however, benefited to the extent of just over £2 million, being the amount received consequent upon the nationalisation of the collieries formerly owned by Stanton. Your directors are anxious to qualify their state-

ment in the offer for sale that to complete the schemes now envisaged temporary borrowings should not exceed £10 million and that this money will be available to the extent required.

I would like to refer to some of the major developments which have taken place in the United Kingdom since 1951.

We are in the process of installing at Clydesdale works a second rotary forge tube mill primarily for the production of pipe for the oil companies. The steelmaking plant has been rebuilt and a further open hearth furnace is in course of construction to make these steelworks fully capable of meeting the requirements of the two tube mills.

At Tollcross we have built a new steel foundry which will replace the Sun Foundry at Coatbridge. The latter is now out of date, incapable of further expansion and can no longer supply our own requirements of tools, rolls, and other castings.

At Bilston a new high top pressure blast furnace has recently come into production which will provide the additional pig iron required for our increase in steelmaking capacity.

At Corby we have installed a new mill for producing seamless tubes, which is now in production. We have increased the capacity of our continuous weld mills which produce in the main screwed and socketed tubes. There are now also two modern electric weld tube mills in operation at Corby for the supply of high-grade tubes in the lower range of sizes. The Corby steelworks capacity has been increased to supply the additional steel required by these developments.

The new tube plants will to some extent replace existing mills which have become out of date.

We are satisfied that these changes must be made. It will be our endeavour to carry them out with the least possible hardship to our men, and alternative employment will be offered to the fullest possible extent.

Plant installed for the production of welding fittings, primarily for the oil industry, has been extended and our capacity for producing manipulated pipework for high pressure steam and oil installations has been approximately doubled.

Through our subsidiary, Tubewrights, Limited, we have continued the development of the fabrication of tubes into structures and other products. A new works to deal with this class of business has been built near Liverpool.

Stanton have carried out extensive modernisation to their blast furnaces and have built additional coke ovens. Many of the foundries have been re-equipped. As a result there has been a substantial increase in their iron-making and pipe-making capacity.

I would now like to refer to some of our activities abroad.

In India, in conjunction with The Tata Iron and Steel Company Limited, a continuous weld tubemaking plant of the type operated by us at Corby is being erected at Jamshedpur. This plant will be owned and operated by The Indian Tube Company (1953) Limited, in which Stewarts and Lloyds have a 40 per cent interest and Tata the remaining 60 per cent. This plant is expected to come into operation towards the end of 1955.

The Indian Tube Company has also decided to add an electric weld tube plant for the manufacture of boiler tubes and other high grade categories. We are confident that formal approval from the Government of India to erect this plant will shortly be obtained. Arrangements have been made to commence construction, and the scheme should be completed early in 1957. We shall

continue to export to India categories of tubing not made by the Indian Tube Company.

In Australia we have a 44 per cent interest in Tubemakers of Australia, Limited. This company has continuously extended its capacity and now manufactures, in its various works, almost every type of steel tube required in Australia. In addition it has a large warehousing and merchanting business. Its progress has been remarkable in meeting the requirements of this fast expanding country.

Stewarts and Lloyds of New Zealand, Limited, was merged with two other New Zealand companies to form the Steel and Tube Company of New Zealand, Limited, in which Stewarts and Lloyds, Limited, obtained a 60 per cent interest. The new company is concerned in merchanting tubes, steel and certain other products.

Stewarts and Lloyds of South Africa, Limited, has continued its manifold and successful activities in that country.

Subsidiary companies have been formed in Canada by both Stewarts and Lloyds and Stanton, each of which carries on a considerable export business there. The formation of these Canadian companies will introduce better customer service. The desirability of extending our activities in Canada further is being carefully considered.

Stewarts and Lloyds of Ireland, Limited, has been formed and a warehouse and finishing plant is being installed to provide a better service in Eire.

TRADING PROSPECTS

No doubt you will expect me to give some indication of our trading prospects for the current year.

It is satisfactory to be able to report that the improvement in general trade which took place in the second half of the last financial year has been fully maintained. This is particularly noticeable in the home market where demand for our main categories of tubes is high at the present time.

With regard to export trade, I should point out that we are largely dependent on the requirements of the oil companies, which now account for the greater part of our exports, the figure for last year showing that of our total tube sales approximately 23 per cent were exported to oil companies and 20 per cent to other customers abroad.

With regard to other classes of export business, demand continues at the high levels reached in the latter part of last year. Although competition is becoming keen, the general level of prices has been maintained.

So far as Stanton is concerned, whilst there has been some slackening in the amount of new business at home for spun iron pipes compared with the unduly heavy demand of recent years, it is expected that production will continue at a high level during the current financial year. Export business has been maintained and the prospects are good.

Overall, therefore, I can say that if demand remains at the present level, and I have no reason to think that it will not, this year's turnover will exceed that of last year.

So far as the future in more general terms is concerned, there are, of course, many factors quite outside our control which may affect us. Whilst we do control very largely our own iron and steel supplies, we are dependent on others for many of our important raw materials, including coal. These and also freight charges are very important items in our cost.

Nevertheless, within these considerations, we feel that we are well equipped from the point of view of plant, experience and morale to take our share in what the future may offer.

THE BOARD

As you will see from the directors' report, certain changes have taken place in the composition of the board. Mr McLay resigned from the board after many years of great service to the company; he played a large part in much of the development which we have undertaken, and he rendered outstanding services to the country during the last war.

Mr Bell, Mr Saunders and Mr Alexander were elected to the board during last year. They are all men holding high executive posts who have served the company well for many years, and I know that their appointment to the board will add to our strength.

STAFF AND EMPLOYEES

Our relations with all our employees continue to be good, and we acknowledge the help which we receive from the trade unions.

We have advanced still further in the field of training and education, and I believe that in this respect we are in the forefront of industry. All our schemes are, of course, in addition to the facilities provided by the State and we believe that both the company and the employees who use them will reap great benefit. I should say, however, that it may take some years before the results are fully shown, and we must take pains to ensure that all who accept the opportunity of such training realise their own responsibilities. In the long run it is up to the individual to make use of his chances and to prove himself.

With all these aids, however, we could not hope to advance as we do without the splendid spirit of service and sense of duty shown by so many.

It gives me pleasure and satisfaction to acknowledge these great services and on your behalf, ladies and gentlemen, to thank all our employees most sincerely.

The report and accounts were adopted and the dividend recommendations were approved.

The retiring directors, Sir Walter Benton Jones, Mr J. R. Menzies-Wilson, Mr W. C. Bell, Mr E. G. Saunders and Mr J. N. B. Alexander were re-elected.

The remuneration of the auditors (Messrs Cooper Brothers and Company) having been approved, the proceedings terminated.

At the extraordinary general meeting which followed, a special resolution was passed making a minor adjustment to the articles of association.

MARTINS BANK LIMITED

ANNUAL GENERAL MEETING

EXTRAORDINARY GENERAL MEETING

The one hundred and twenty-fourth annual general meeting of Martins Bank Limited was held yesterday at the head office, Liverpool. Mr T. H. Naylor, a deputy chairman, presided.

The notice convening the meeting and auditors' report were read.

The report and accounts for 1954 were adopted.

Resolutions were passed re-electing the retiring directors and fixing the auditors' remuneration.

At the succeeding extraordinary general meeting, a special resolution adopting new Articles of Association was passed.

A vote of thanks was unanimously accorded to Mr Naylor for presiding.

The chief general manager, Mr C. J. Verity, JP, replied to the tribute to the staff.

THE DECCA RECORD COMPANY

FINANCE FOR FURTHER EXPANSION

SIR CYRIL F. ENTWISTLE ON THE SOLID PROGRESS

The twenty-fifth annual general meeting of The Decca Record Company, Limited, was held on February 8th, in London.

Sir Cyril F. Entwistle, QC, MC (the chairman), who presided, said: The balance from the consolidated trading account which amounts to £1,701,206 shows an increase over that of the previous year of £379,274. I feel sure you will regard this result as extremely satisfactory. This is our twenty-fifth annual meeting and the excellent results achieved can fairly be ascribed to the combined efforts of all concerned during the year under review, based on the foundations established during a quarter of a century of perseverance. The net profit for the year of £415,908 shows an increase of £27,014 over the previous year. We are recommending a final dividend on the ordinary shares of 1s. 8d. per share, less tax, making a total for the year of 2s. 3d. per share, less tax, compared with 1s. 9d. per share for the previous year.

CAPITAL PROPOSALS

In order to provide finance for various capital commitments made necessary through the increase in the company's scale of operations and to provide additional working capital, we are making an issue to the ordinary shareholders of one share for every four held at 15s. per share. We also offered the unissued balance of £250,000 4s. per cent notes to noteholders and shareholders at 98½ per cent. This latter issue was well supported, applications totalling over £1,700,000. It is also proposed to capitalise £350,201 4s. of the share premium account resulting from the new issue of ordinary shares and distribute one "A" ordinary share free in respect of each two existing ordinary shares. The amounts raised from these two issues will be allocated approximately as to £130,000 for works in connection with the gramophone record factory, £170,000 in respect of Decca Navigator operations and £100,000 for the purchase of machine tools, alteration and extension of buildings to accommodate increased production for Decca Navigator and Radar principally for government work, the balance being available for additional working capital.

Revenue and capital reserves totalling £1,246,891 are very nearly equal to the total issued capital of the company.

REVIEW OF OPERATIONS

At the last annual general meeting I was able to give you an extensive review of the progress of the business for the year to March 31st last. The increase in profits has been achieved as the result of much greater activity in the record business and a substantial improvement in the Decca Navigator operations. The system has proved a great technical achievement for many years past and everyone concerned will feel gratified that past efforts are now being repaid.

At the end of March, 1954, your company purchased the share capital of Reid and Sigrist Limited, Leicester, who are well known as manufacturers of specialised aircraft instruments, high precision cameras and gyros, the latter being particularly interesting in view of the future for projected missiles.

THE CURRENT YEAR

Our record business has shown a substantial increase to date over the same period of

the previous year, both in the home and overseas markets and we have reason to believe that the production from our plants in this country has been greater than that of any other company or group of companies.

"RECORD" PROGRESS IN USA

Despite the fact that import restrictions in many of the major overseas markets necessitated local production, our exports are fully maintained representing over 50 per cent of exports of those of the whole industry. Sales of our American subsidiary, London Records Inc., have forged ahead during the current year, and those of our Canadian subsidiary have been maintained despite some slackening in the general level of trade in that country. Our exports to the USA subsidiary in the month of January, 1955, were the largest of any single month.

We have a fine range of television and radiogramophone models, the demand for which has exceeded our capacity to supply. We have been handicapped through delays in rebuilding and extending the factory but with the recent completion of this work we look forward to a considerable increase in our production facilities.

THE NAVIGATOR FOR SWEDEN

The Decca Navigator business has made striking progress during the current year. The flow of contracts for new hirings and the sale of equipment have been fully maintained and the number of fittings and contracts now covers equipment for more than 2,600 ships and aircraft.

The Royal Swedish Navy is announcing today its decision to place a contract for the construction of a permanent navigational chain of Decca transmitting stations in the area of Stockholm. This will provide a link with the Danish chain and will extend the Decca coverage from South Sweden well into the Gulf of Bothnia, and the new facilities provided will be valuable on the important shipping and air routes in these areas. A chain is being installed in the South of France which will extend the Decca system to the Mediterranean area. During the year we have received contracts for eleven special purpose chains, which are now in course of manufacture and will be used for hydrographic and aerial survey, oil exploration, and other special projects in various parts of the world.

BEA Viscounts continue to get good service from the Decca Navigator, the flight log in many cases proving invaluable. Many experienced pilots have expressed the opinion that Decca can make a bigger contribution to the safety and reliability of air travel than any other known navigational aid. We have discovered a new technique which may well prove to be one of the most important advances during the last ten years in the science of electronic aids to navigation.

IMMENSE POTENTIALITIES IN USA

Perhaps the most significant commercial development during the current year has been the signing of a contract with the Bendix Aviation Corporation of Detroit, Michigan. Under this contract the American company has been granted a licence to manufacture and sell Decca navigational equipment in the USA. The initial interest of the Corporation was in the field of helicopter navigation for

which Decca is recognised as providing the best solution. Apart from this application, however, the co-operation with Bendix opens up immense potentialities in the USA.

More recently a company has been formed in Italy, jointly with French and Italian interests, with the object of actively developing the system in that country, and particularly furthering plans for the erection of an Italian transmitting chain.

From these remarks you will realise that the progress of this section of your company's business has been of quite an outstanding nature.

RADAR

With the considerable expansion that has taken place during the current year in Decca radar activities, orders for marine radar have increased substantially and now amount to equipment for over 3,700 ships operated by over 870 different ship owners, governments or authorities throughout the world. Since the last annual meeting 170 further ship owners have adopted the Decca radar, an indication of the confidence placed in our equipment by the shipping world.

The Decca Airfield Control Radar has found wide acceptance, sets having been ordered for the Royal Air Force, the South African, Royal Swedish and French Air Forces, the Royal Australian Navy, by civil airport and other authorities, and by leading aircraft manufacturers in the United Kingdom and overseas. The introduction of the "Q" band millimetric radar marks a big advance in radar techniques and we are the only company in the world offering this type of equipment on a commercial production basis. An order has been received from the Minister of Civil Aviation for this equipment to be installed on the new control tower at London Airport to assist in the control of surface movement on the airfield. The installation should be completed within the next two months.

Your company has taken the lead in the development of radar equipment for storm detection and installations have already been made in Entebbe, Calcutta and Khartoum. New techniques have also been developed for the use of radar in industries and government departments concerned with air pollution, hydro-electric schemes, and general long-range weather forecasting.

From these remarks you will appreciate that a large amount of effort has been given to our own research and development the benefits of which will be progressively felt in the future. Exports have been maintained at a high level accounting for almost two-thirds of our commercial radar turnover during the current year.

A large proportion of the company's research and development capacity is engaged in work of a most advanced character as a result of contracts received from government departments, and large orders are in hand for production of equipment of this nature.

From the above you will appreciate that we have continued to retain our position amongst the leaders in the electronic field.

Turnover for the year to date shows a substantial increase over that of the same period in the previous year. We are assured of another very successful year's trading and look forward to the future with every confidence.

The report was adopted.

F. W. WOOLWORTH & COMPANY LIMITED

A RECORD YEAR

The forty-sixth annual general meeting of F. W. Woolworth & Company, Limited, will be held on March 4th in London.

The following are extracts from the statement by the chairman, Mr S. V. Swash, circulated with the report and accounts for the year 1954:

I am pleased to present the report of the directors and the accounts for 1954. The figures show that it was a good trading year and marked a fresh record in the history of your company.

REVENUE RESERVES

It will be noted that the sum of £3,500,000 which we have been carrying as development reserve has been transferred to general reserve, and this with the proposed appropriation of £2 million brings the general reserve to £5,500,000 and marks a satisfactory start in rebuilding the reserves after the capitalisation.

The system of licence application before the undertaking of building work ended during the past year, so from now on alterations, improvements and rebuilding of premises will not be subject to this control limitation, but to the ordinary commercial limitations of desirability and availability of funds, men and materials. For these reasons your board decided to merge the development reserve into the general reserve.

There is a programme of alterations and extensions and building work of all kinds which has had to be deferred and which, together with such new sites as become available for stores, will keep the company's construction department very busy indeed for the next few years. It is the directors' intention to press this work forward vigorously, so as to make as many stores as possible modern and ideal for the convenience of our customers and staff.

DIVIDEND.—The proposed final dividend on ordinary stock is 1s. 10d. per unit compared with 2s. last year, but is of course payable on the capital as increased last October. I have had many letters from shareholders suggesting that they should use the stores for their own purchases as much as possible, and have no doubt that where practicable they do so.

TRADING PROFIT

The trading profit showed a very good expansion and marked a further satisfactory growth of turnover and a strengthening of the popularity of the company's stores. The past year was the first one since before the war when it was not possible to detect significant gaps in the availability of merchandise in one department or another, and at the present time it is fair to state that British manufacturers have reached a stage of production in the range of goods offered by your company where current needs can be met reasonably and promptly. After long years in the wilderness, the consumer is coming into his own. This is at once a satisfactory state of affairs and a challenge to retail trade.

I commented last year that my estimate was that a reduction of about one halfpenny in the selling price of every single item of merchandise we sold would about wipe out the trading profit, and your board is pursuing vigorously the well-trying policy of endeavouring to ensure rapid turnover by large volume of sales at small monetary profit margins.

A big production of goods for the home market provides the base from which manufacturers can sally forth to try to win export trade, and your company is always trying to find ways and means to satisfy customers' needs, so that ever bigger demands can be made on the manufacturers.

HIRE PURCHASE

Retail cash business is competing with the hire-purchase business for the consumers' spending money, and the lifting of the restrictions on hire-purchase trading undoubtedly made its impact on the weekly wage packet. This is all to the good and the availability of desirable merchandise in adequate quantities should encourage hard work to earn more to improve the standard of living. In conjunction with lower taxation, it should provide the incentive which is so necessary at all levels to induce people to put their best foot forward and increase productivity to the great benefit of their country and themselves.

Your company's manufacturers and suppliers have again been most helpful and co-operative in turning out goods to keep the stores well stocked. One of the most pleasant features of our operation is this close co-operation of the buyers with their manufacturers and it is a very essential element in the successful conduct of this business.

The variety, value and usefulness of the lines sold in the stores must be constantly improved to satisfy the exacting needs of the customer of 1955, and we can undoubtedly sell vast amounts of goods that measure up to the required standards.

I will just give one example which may be interesting—extruded brass curtain rail that in conjunction with roller runners is so extensively used in the homes of the people for hanging curtains. We sold over the counters of the stores enough mileage of this rail to extend a peaceful curtain from London to Berlin and back again.

This interesting work is never finished—this work of improving old lines and developing new ones; and both the manufacturer and the retailer have their full part to play.

EXPENSES

Expenses under many headings took big rises during 1954 in comparison with the previous year. Salaries, rates, rents as leases run out, repairs, lighting and wrapping all showed sharp increases, and it was essential to strive for, and attain much higher sales, in order to achieve the results set out in the report.

It does not appear to your directors that expenses have yet reached their peak and their stabilisation will depend on the general monetary and economic trends in the country's trade.

Finally, the present full employment situation and the apparently good economic prospects for this country in the immediate future, should provide conditions in which your company can endeavour to maintain and improve its position with quite good prospects of success. Your stores play an important and intimate part in the shopping lives of the community in nearly every town in the United Kingdom, and your board will use every endeavour to improve the service that is rendered to the public by good shop-keeping.

THE WEYBURN ENGINEERING COMPANY, LIMITED

RIISING COSTS AFFECT PROFITS

The nineteenth annual general meeting of this company was held on February 5th at Elstead, Mr Hamilton Gordon, chairman and managing director, presiding. The following is an extract from his circulated statement for the year to October 31, 1954. The profit is £173,199, a decrease of £8,296. Taxation absorbs £97,670, leaving £75,529 available for distribution as compared with £56,094 in 1953. The reason for the fall in profit is mainly an increase in costs. I would refer particularly to a wage increase granted to employees in April, 1954. Since we did not raise our prices then, the extra cost has had to be borne out of the year's revenue.

We have kept up the output of most of our products. We have also broadened the field of our customers.

As regards 1955, it may be that there will be a further decline in the trading profit. It seems possible that the tendency for the costs of materials and services to rise will continue. We shall not make any general price increase, however, unless there is a steep rise in costs, and therefore while we hope to maintain our sales at approximately the same value as this year, we may suffer a drop in profit margins.

It has been decided to propose the capitalisation of a further £45,000 of general reserve, and the distribution of three new ordinary shares for every seven held. Having regard to the higher net profit available, the directors have decided to recommend a dividend on the increased capital of 25 per cent.

The report was adopted and the board's capital proposals were approved.

NATIONAL MORTGAGE AND AGENCY COMPANY OF NEW ZEALAND

RECORD PROFIT

The seventy-ninth annual general meeting of this company was held on February 8th in London, The Right Honourable Lord Glenconner, the chairman, presiding.

The following are extracts from his circulated review for the year ended September 30, 1954:

The 1953-54 wool selling season was a most successful one. The future outlook is healthy, particularly for crossbred wool which forms the bulk of the New Zealand clip.

For the first time since 1939, New Zealand's meat trade is being handled by private traders.

New Zealand continues prosperous, due in large measure to the successful disposal of her primary products to overseas markets. It must, however, be remembered that it is the United Kingdom which continues to absorb the bulk of New Zealand's exportable surplus, and it follows that the prices she receives for her produce must be largely determined by the state of the United Kingdom's economy. United Kingdom prosperity is bound up with the general level of world trade, over which no one country can exercise more than a partial influence.

Our gross profit of £533,767 shows an increase of £118,806 compared with last year and is the highest ever achieved by the company. The net profit of £142,230 compares with £107,682 last year. Your directors recommend a final dividend of 8½ per cent, making 12 per cent free of tax for the year.

The report was adopted.

CLYDESDALE & NORTH OF SCOTLAND BANK LIMITED

A RECORD YEAR

ENCOURAGING PICTURE OF ECONOMIC BUOYANCY

SIR HAROLD E. YARROW'S SPEECH

The one hundred and seventeenth annual general meeting of the Clydesdale & North of Scotland Bank Limited was held on February 9th in Glasgow. Sir Harold E. Yarrow, Bt, CBE, LL.D., chairman of the bank, presided, and in the course of his speech, said:

The annual report and balance sheet are already in your hands, and you will see that the figures disclosed constitute fresh records in the history of the bank. Since last year, the balance sheet total has risen by some £16.6 million, and at £217,801,984 has reached its highest level to date. This gratifying expansion is largely accounted for by a substantial increase of over £13 million in current, deposit and other accounts. Our note circulation continued to follow the general upward trend of postwar years, and at £21,675,443 shows an advance of £1,455,719. A further rise of almost £2 million in the total of acceptances, confirmed credits and engagements on account of customers which now stands at £10,070,352 is evidence of the bank's continued support of the country's overseas trade, and of the increasing use made of the specialised services rendered by our overseas branches.

Turning to the assets side, you will observe that in the disposition of the additional resources available, we have maintained a

highly satisfactory level of liquidity. Cash, balances with other banks, and money at call and short notice in London amount to £67,154,033 and represent over 33 per cent of our liabilities to the public in respect of deposits and notes in circulation.

The bank continues to play its part in providing the working capital required by Scottish industry and agriculture, commerce and trade, and the greater activity which has prevailed in the economy during the past year is reflected in our advances to customers, which increased by £4.8 million to a total of £46,970,555. Our profit for the year at £476,134, is £46,639 higher than in 1953, largely as a result of the greater resources at our disposal and the wider scope for their employment in the more active industrial conditions prevailing. After making various allocations, the directors have decided to recommend payment of a dividend at the rate of 10 per cent actual, less income tax, for the half year ended December 31st, making 18 per cent for the year, an increase of 2 per cent. There remains a balance of £201,232 to be carried forward to 1955 with £199,257 brought in from the previous year.

STAFF TRAINING

A series of managers' conferences is being held, each attended by twelve managers who

are afforded an opportunity of discussing with the head office officials questions relating to their work in the branches. In October we undertook a further development of our staff training scheme when we inaugurated a junior training school in head office. It is frequently said that the banks are now finding it difficult to attract the right type of youth into their service. I am glad to say this is not our experience and in many districts we have at present a waiting list, a fact which would appear to indicate that service in the bank is not without its attractions. We are well satisfied with the quality and keenness of young entrants to our service.

FRUITS OF INVESTMENT

Business activity in Scotland was maintained at a high level in 1954 and many industries achieved further increases both in output and productivity as postwar capital investment schemes yielded more of their expected benefits.

All the achievements in 1954 have been made possible largely by the investment of substantial sums in Scottish industry within recent years. Over a wide field new capital expenditure has been undertaken with a view to reducing the cost and extending the range of production.

FUTURE PROSPECTS

The conditions which I have outlined, and which are obtaining over the British economy as a whole, present an encouraging picture. Industrial production has reached a new peak, employment is high, and in the field of overseas trade a record in exports has been set up as regards both value and volume. Against this background of general economic buoyancy several major problems stand out in bold relief, and the success attending their

solution will be an important factor in determining the longer-term prospects for prosperity. Our balance-of-payments position may have been improved, but it is far from strong enough to permit the necessary rebuilding of our reserves and the fulfilling of our investment obligations in undeveloped areas of the world. The strengthening of our position must, moreover, be achieved in conditions of increasing competition, conditions in which buyers naturally insist on guaranteed delivery dates and fixed prices. Fortunately, an improved flow of materials has brought some shortening of delivery dates in many industries, and further improvement is in prospect. But the problem of price remains, and this has become once more the major factor in the successful conduct of overseas trade.

Happily, the indications are that industrialists and the more responsible element in the trade unions are becoming increasingly aware of the realities of the situation and of the need, in the more flexible conditions now prevailing, for a stronger revival of enterprise in the national interest.

It needs to be emphasised that frequent demands for increases in wages render the achievement of fixed prices still more difficult and they do not add to the real value of the wages packet unless accompanied by greater output. The wise course is, without question, that of increasing earnings through higher production, a course which can contribute significantly to the stability so essential to a continuous flow of new business.

Conditions can, of course, be powerfully

influenced by the Government, and it will, I believe, be widely agreed that the official policy of the past three years has been wise and beneficial. Trade controls have been relaxed, income tax slightly reduced, and some incentive afforded to industrial development by the investment allowances granted in the last Finance Act. But still more requires to be done along these lines. What is clearly needed is a further sizeable reduction in the taxation burden on industry, so that the ploughing back of profits can be extended and the efficiency of the British productive machine maintained at the high level required in existing world conditions. Given this, and an end to restrictive practices on the part of trade unions, there would be justifiable cause for optimism about Britain's economic future. The report and accounts were adopted.

THE LANCASHIRE STEEL CORPORATION

PROSPECTUS ESTIMATE EXCEEDED

SIR JOHN JAMES ON BOARD'S DEVELOPMENT POLICY

The twenty-fifth annual general meeting of The Lancashire Steel Corporation Limited was held on February 8th in Warrington.

Sir John James (chairman and managing director), who presided, said:

Gentlemen,—This is the first occasion since 1950 that I have had the pleasure of giving my review of the past year's operations and my views on trade in general and in relation to the steel industry in particular to members directly holding shares in the company. As you know, in 1951 the company was nationalised under the provisions of the Iron and Steel Act, 1949, and since that date until January, 1954, operated under the control of the Iron and Steel Corporation of Great Britain or its successor, the Iron and Steel Holding and Realisation Agency. In January, 1954, however, the latter body offered the total capital of the company's preference and ordinary shares for sale to the public, and accordingly it gives me great pleasure to welcome you here today, representing as you do the shareholders.

The accounts and directors' report are before you and, with your permission, I shall take them as read.

TRADING RESULTS

The total profit for the 52 weeks ended October 2, 1954, after charging depreciation amounts to £2,170,150. It compares with the profit of £1,600,000 after depreciation which, for purposes of the prospectus in January, 1954, was estimated by your directors to be the trading profit for the year now under review. I think I should explain here that, at the time the prospectus was being framed, in the first quarter of our financial year—October-December, 1953—we had a remarkable falling off in demand for steel products in general. This quick change in the steel demand was no doubt due, in a great measure, to the increased steel output of Europe in general, in which this country shared, creating a feeling by both consumers and stockholders that with the prospect of a plentiful steel supply, stocks at works and warehouses which were higher than was generally expected, could be liquidated and I believe, in many cases, reduced to levels below normal. It was realised early in our next quarter that the steel demand was still strong and expanding, and as a result orders for immediate delivery became general and your company was again compelled to buy, when opportunity offered, steel in ingot form to help, together with our own production, to

service our rolling mills. This change in our favour had a welcome effect on the year's working, which finished with the satisfactory results now before you.

Returning to the accounts, you will notice that, after providing for taxation, the net income of the Group amounted to £1,050,150. After paying preference dividends the directors felt that the increase in the retained profit was sufficiently in excess of that estimated in the prospectus to raise the rate of dividend from the 8 per cent forecast to 9 per cent for the year, and it will be my pleasant duty later in this meeting to recommend for your approval the adoption of a final dividend of 6 per cent, making, with the interim dividend of 3 per cent paid on June 15, 1954, the total of 9 per cent for the year referred to.

From the remaining balance the directors have thought it advisable in view of the high cost of capital expenditure to transfer £275,000 to reserve for replacement of fixed assets and to transfer the sum of £350,532 to general reserve, bringing that reserve, together with other credits as explained in the notes to the accounts, to £3,400,000 in the case of the Group.

The consolidated balance sheet of the Corporation and its subsidiary companies discloses a strong financial position, current assets amounting to £11,369,919 compared with current liabilities and provisions of £4,102,091, a surplus of £7,267,828.

REVIEW OF ACTIVITIES

Turning to our development programme which is making satisfactory progress, I would remark that we are already feeling the benefit of our earlier capital expenditure. The satisfactory result of the year's working, which is largely due to keeping our plants on increasing production wherever possible, has shown to your directors more than ever before the necessity for maintaining our equipment in a high state of efficiency leading to the lowering of our costs of production.

Our nail factory had a record output year; our new rod and bar mill entered commercial production in May, 1954, and although not yet fully loaded, due to shortage of steel, and also of labour which has to be trained for this modern type of mill, it however made a useful contribution to our profit for the year. The same could be said of our new steam and electrical supply station now in full operation, reflecting satisfactory economy particularly in the use of fuel oil and coal.

That final picture is scheduled for the end of the year 1957, and your directors are keeping careful watch to enable our capital expenditure to be financed, as far as possible, from our own resources, and with our present strong financial position your directors are satisfied that we can accomplish the major part of our development in this way. The increasing output, they believe, would bring with it increasing resources, and I would draw your attention in support of this reasoning to the fact that, having spent on capital account £1,525,000 during the year, our liquid position shows itself to be within £75,000 of the amount obtaining a year ago.

ESSENTIALS FOR FUTURE SUCCESS

It is worthy of noting that, at the present time, it is estimated that the total ingot capacity of this country will rise to a figure of some 22 million tons by the end of the year 1958, and is calculated to make this country independent of imported steel. Such a figure is based upon the gradual rise in steel demand and capital expenditure required to keep our full employment and its resulting standard of living, which I believe can only be retained by increasing production per capita employed, which in turn demands the highest possible form of modern mechanism which I firmly believe we can employ to compete and compare with other countries and give to those who buy our goods value comparable to anything similar in kind and quality.

I would like, in conclusion, to offer to all our people your thanks for their efforts during a year of extreme difficulty due to abnormal weather conditions which affect such a large proportion of our productive work.

The report and accounts were adopted.

RADIO RENTALS LIMITED

STEADY GROWTH OF NEW BUSINESS

EXPANDING DEMAND FOR TELEVISION

MR P. PERRING-THOM'S STATEMENT

The eighteenth annual general meeting of Radio Rentals Limited was held on February 8th at Grosvenor House, Park Lane, London, W.1, Mr P. Perring-Thoms (chairman and joint managing director) presiding.

Mr J. L. Wilkie, CA (director and secretary) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

It gives me great pleasure to present to you the directors' report and the accounts of the group for the year to August 31, 1954, for the first time as chairman of the company. The steady growth and increasing success of the business which I started just on twenty-five years ago as a one-man concern have naturally been matters of great interest and satisfaction to me.

The profit of the group after providing for all charges other than taxation amounted to £562,834 an increase of £26,394 over that for the previous year. The net profit, attributable to the members of your company after providing for taxation totalled £241,431, an increase of £116,069 on the previous year.

GROWTH OF SALES WITH SERVICE SECTION

The volume of new business during the year under review remained at a high level and was in general on the same scale as that of the previous year which, of course, enjoyed the special stimulus of the Coronation. Demand for our television service, particularly, was very strong and a considerable amount of development work was undertaken in extending the areas in which our service is available. We continued our policy of obtaining better premises for some of our older branches and in addition we opened several new shops. The sales with service section of the business which caters for the public who prefer to own their sets, continued to grow and in the future I expect it to make a notable contribution to the earnings of the group.

In considering the net profit the most important factor contributing to the increase over the previous year is the large reduction in excess profits levy, which tax applied only to the first four months of the year under review. We are naturally glad to see the last of this very bad form of taxation which operated very inequitably against a developing business such as ours.

CONSERVATIVE DEPRECIATION POLICY

In the accounts there are only a few items to which I would draw your attention. The large amount of £990,118 is provided for depreciation of radio and television sets, and it may appear to be high in relation to the trading profits. Television accounts for a big proportion of that total, but this branch of the industry is developing very quickly with the popular screen size steadily becoming larger and the certainty of multiple wavelengths and programmes. In radio, within

the next four months the commencement of broadcasting on very high frequency marks the first major development on the "sound only" side of the industry for many years.

In these conditions your directors consider it essential to maintain a prudent and conservative policy in regard to depreciation, which also, of course, covers provision for obsolescence.

The charge in respect of staff bonus pension scheme and staff welfare fund has increased by £14,667 as compared with the previous year, an increase of some 36 per cent, and I am sure shareholders will welcome this indication of the staff's participation in the company's prosperity.

In June, 1954, as you may be aware, a scheme of capital reorganisation was carried out which considerably strengthened the capital structure of the group, and at the same time new articles of association were adopted so that "directors' commissions in terms of the articles of association" now appear in the accounts for the last time.

All the subsidiary companies, except Rentevision, Limited, which has not commenced to trade, operated at a profit for the year under review. The most important one, Mains Radio Gramophones, Limited, worked to capacity producing radio and television sets for the parent company. Burgot Rentals, Limited, the company renting burglar alarms, substantially increased its profit, made further progress in consolidating their rental business and further enhanced their fine reputation.

APPROPRIATIONS

Turning now to the matter of appropriations, your directors recommend the payment of a final dividend of 30 per cent. This dividend will be payable on the capital as increased by the bonus issue of June 1, 1954, and it follows an interim payment of 10 per cent on the capital before reorganisation. The directors also propose to transfer £125,000 to general reserve and to write off the sum of £24,837 from investments in subsidiary companies. That amount represents part of the premiums paid for the preference shares of subsidiary companies in the capital reorganisation scheme to which I have just referred.

Since the end of the year under review television business has still further increased, and although the number of sets being produced was materially increased, demand still outstrips our supply. On the other hand, which is due in my opinion to the current fashion for the small personal set which people prefer to purchase, especially since the cancellation of the restrictions on hire purchase.

DIRECTORATE

During the year Mr H. F. Hunt, who was associated with the business from its earliest days and who became your chairman

THE ECONOMIST, FEBRUARY 12, 1955

from the incorporation of the public company, decided to resign. His wise judgment in financial matters and devoted service to your company over many years we valued most highly, and I consider we are fortunate in that we still have the benefit of his experience in an advisory capacity. Mr F. W. Shelley, who was another of the first directors of your company, also retired during the year, and it gives me great pleasure to pay tribute to the profound interest which he took in your company and the benefits which accrued from his wide knowledge of men and affairs.

In February, 1954, Mr A. D. Smith, who for some time had been deputy managing director, was appointed joint managing director with myself. At the same time, Mr J. L. Wilkie, CA, who has for several years been secretary of the company, was co-opted to the board. His experience as an executive together with his accounting and financial training makes his contribution to the deliberations of your board of very considerable value.

Finally, it is my very pleasant duty to record the thanks of the board and the shareholders to the staff of the group for the sterling work which they have carried out most efficiently during the year. It is additionally agreeable for me to be able to do this, as it gives me the opportunity of saying how well I have always been supported from the commencement of the business to the present day.

The report and accounts were adopted, and the retiring directors, Mr J. L. Wilkie, CA, and Mr A. P. B. Renshaw, MBE, were re-elected.

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The annual general meeting for the year 1955 of the stockholders of Barclays Bank Limited was held on February 10th at the head office of the Bank, 54 Lombard Street, London, E.C.3.

Mr A. W. Tuke (the chairman) presided. Mr H. G. Tickle (the secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts were taken as read.

The chairman moved:

"That the report of the directors of the company now produced, together with the accounts annexed as at December 31, 1954, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent, making 10 per cent for the year, on the ordinary stock, and a final dividend of 10 per cent, making 20 per cent for the year, on the staff stock, and a special dividend of 2 per cent on the ordinary stock, less income tax at the standard rate in each case, be declared payable on February 21st to stockholders registered in the books of the company on January 14th last."

Sir F. Cecil Ellerton (deputy chairman) seconded the motion, which was carried.

The retiring directors were re-elected and other ordinary business was transacted.

A vote of thanks to the staff and a vote of thanks to the chairman for presiding at the meeting were unanimously accorded and the proceedings terminated.

B.Sc.(ECON.), woman, aged 30, seeks responsible post offering prospects. Four years' experience U.K. and overseas economic intelligence, collation of information, abstracting and preparation of reports. Qualified and experienced secretary (60/110).—Box 830.

OXFORD GRADUATE, 38, Rhodes Scholar, considerable experience administration/finance overseas, now in the City, would consider executive appointment, with attractive prospects, in organisation expanding at home and abroad.—Box 832.

THE ECONOMIST, FEBRUARY 12, 1955

AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

RESEARCH SCHOOL OF PACIFIC STUDIES

Applications are invited for appointment to the CHAIR OF INTERNATIONAL RELATIONS. Salary £3,000. Reasonable travel and removal expenses are payable. One year's study leave, with travel allowance, will be granted after each three years' service. The Professor of International Relations, as head of the Department, will be expected to engage in research and to supervise post-graduate research into the political, legal and economic relationships between nations, especially in the Asian and Pacific regions.

Notwithstanding this notification, the Council of the University retains the right to fill the Chair by invitation at any stage.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is April 30, 1955.

LEADING LONDON ADVERTISING AGENCY

DIRECTOR OF MARKET RESEARCH

A leading London advertising agency, which is expanding chiefly because it pays such great attention to the research and marketing side of its business, requires a Director for its market research department.

Candidates should possess a good degree in Economics and considerable practical commercial experience, particularly in consumer research.

There is no limit to salary. The right man will command at least his full market price and will qualify for the agency's bonus scheme. He will be given every opportunity of making this important job more important still.

Please write, in confidence, giving full details of age, education, career to date and salaries earned, to Box 827.

PREPARATION FOR EXAMINATIONS

UNIVERSITY CORRESPONDENCE COLLEGE

Provides home study courses for General Certificate of Education (all Examining Bodies), London University Entrance, and Inter. Degree exams for B.A., B.Sc., B.Sc.(Econ.), B.Sc.(Sociology), LL.B., Professional Prelim., Teachers' Diplomas, Law. The College, founded 1887, is an Educational Trust. Highly qualified Tutors. Low fees.—Prospectus free from Registrar, 60 Burlington House, Cambridge.

INDUSTRY AND HEALTH

Of special interest to industrial firms is the R.S.I. annual Health Congress, April 26-29, 1955. With up to 2,500 delegates the Congress is the largest in the Commonwealth.—Programme and full particulars from Secretary, Royal Sanitary Institute, 90 Buckingham Palace Road, London, S.W.1.

MARKETING RESEARCH.—The expanding activities of this Company have given rise to an extension of the marketing research organisation. There will be very good opportunities for graduate economists in work which will involve a stimulating variety of economic research; and as the new positions will carry varying degrees of responsibility, applications will be welcome from both new graduates and those with several years' experience in market and/or consumer research. The appointments are pensionable and carry good salaries and prospects. All applications will be acknowledged and the fullest information will be given to those invited for interview.—Apply to the Personnel Manager, British Nylon Spinners Limited, Pontypool, Mon.

MANUFACTURING COMPANY centred in North London is expanding its Market Research Department and requires a Statistical Assistant, age 25-29. Salary £500-£750 per annum, according to age and experience. Advanced level of education desirable, together with some experience of the analysis and collection of detailed statistics. Permanent and pensionable appointment.—Applicants are required to submit particulars of experience and qualifications to Box 826.

THOMAS HEDLEY & CO. LIMITED, Newcastle-upon-Tyne, is seeking a man for its advertising department who has had some years' experience in the planning, choice and use of all kinds of media and who is looking for a post of important responsibility. He is likely to be a man of about 30. He should be of good education, preferably with a University degree. He will be working closely with advertising agencies and their media departments and would very quickly become responsible for the planning and choice of printed word media over a wide field. He would be expected to initiate and interpret research in all forms of media and to contribute to the formulation of policy in media buying. The salary is a good one and will be subject to material increases as the man demonstrates his ability. The post is permanent and pensionable and there is a non-contributory life assurance scheme. Letters of application should contain details of age, education and career, including H.M. Forces, and will be treated in complete confidence.—Please write to Personnel Department, Thomas Hedley & Co. Limited, Gosforth, Newcastle-upon-Tyne 3, and mark envelope "M."

DEATH DUTIES can be drastically reduced if you plan and act now.—Write, in confidence, to Robert A. Thomson, 11 Duke Street, St. James's, S.W.1.

INSTITUTO DE ESPANA, 102 Eaton Square, S.W.1. Lecture in English by Dr. L. Pérez Pardo on "Spanish Economy: recent changes," on Thursday, February 17th, at 8 p.m.

STATISTICAL ASSISTANT (male) 25/30. Previous experience desirable but not essential. Salary £500/£550.—Details of qualifications and experience to Box 829.

UNIVERSITY OF CAMBRIDGE

UNIVERSITY ASSISTANT LECTURESHIP IN ECONOMICS: NOTICE

The Appointments Committee of the Faculty of Economics and Politics give notice that they hope to appoint a University Assistant Lecturer in Economics to take office from October 1, 1955. The appointment will be subject to the Statutes and Ordinances of the University. Further particulars can be obtained from the Secretary of the Appointments Committee, The Marshall Library, Downing Street, Cambridge, to whom applications should be sent to reach him not later than March 21, 1955.

Eight copies of each application should be sent and, if so desired, one or more copies of any published work or unpublished writings. Testimonials are not required, but a candidate should give the names of two persons to whom reference can be made.

BRITISH TRANSPORT COMMISSION

SUPPLIES AND PRODUCTION ADVISER

Applications are invited for the post of Supplies and Production Adviser to the British Transport Commission. The post will carry responsibility for the proper utilisation of the very large industrial facilities which the Commission operate, and for the general co-ordination of the Commission's purchasing programmes. Bearing on these responsibilities, the Commission has lately announced a programme for the re-equipment of their railways to cost more than £m.1200.

Candidates must be of the highest industrial standing and personal attainment. They must be engineer-trained and familiar with the economics and general technology of large-scale mechanical and electrical production. They must have experience of working at the top level in large organisations and of large-scale procurement problems. A sound knowledge of industrial costing and commercial law is also needed.

Only men of the highest calibre and standing should apply for this post, which will carry a salary according to qualifications, but with a minimum commencing at £4,000.

Applications, which will be treated in strict confidence, should be sent to the Chief Secretary, British Transport Commission, 222 Marylebone Road, London, N.W.1, to reach him not later than first post on Tuesday, March 1st next.

DOUGLAS GLASS

BRITAIN'S GREATEST PHOTOGRAPHER OF MEN

43 Black Lion Lane, W.6. RIV. 7522.

THE B.Sc.(ECON. DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretarialship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for the three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall students have passed London B.Sc.(Econ. (Final) exams since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P17, WOLSEY HALL, OXFORD.

A LARGE MANUFACTURING COMPANY in the Manchester area invites applications from suitably qualified candidates, aged between 32 and 37 years, to take charge of an existing clerical organisation and methods department. The person appointed will be expected to advise on the installation, development, and revision of clerical systems and procedures and office methods throughout the organisation. Candidates should have had at least six years' experience of office procedures, and have held a responsible position in connection with clerical administration, including some experience of office organisation and methods. Salary within the range £1,000 to £1,200. Pension scheme in operation.—Box 828.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

SENIOR ASSISTANT required in Sales Research Department of a North London Manufacturing Company. Applicants should have an Economics degree and experience of the application of statistical methods to distribution and market research problems. Permanent and pensionable appointment. Age 28-34. Commencing salary £800 per annum upwards, according to age and experience.—Applicants are requested to submit particulars of experience and qualifications to Box 825.

THOSE STERLING BALANCES—are they still a menace to the pound? Bank Earnings and Salaries—Is there an incongruity? These are two of the important questions discussed in the February issue of "The Banker." Other articles include Bankers on Inflation—and on their Critics; The Price of Rail Peace; and Brazil after Vargas. Price 2s. 6d. from 72 Coleman Street, E.C.2.

INDONESIAN and Dutch translations into English and from English; also from Italian, French and German into English.—A. Brotherton, 60 Portland Place, W.1.

FINANCIAL AND ECONOMIC CONSULTANT, lecturer in finance and economics, advises investors and companies.—Box 822.

EXPERT POSTAL TUITION

For Examinations—B.Sc.(Econ., LL.B. and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

10,000 words about the **BOOM**

What do people 'in the know' think about the current wave of prosperity in Great Britain? You will find the answers in 'The Anatomy of the Boom'—a penetrating study based on interviews by Manchester Guardian reporters with people in Industry all over Britain. The findings are set out with 'comments and conclusions', in the Manchester Guardian Survey of Industry, Trade and Finance, 1955. This is only one of many articles—equally candid and controversial—which have been written for this survey.

Life line of communication . . .

World wide radio-communication began with Marconi's Transatlantic messages in 1901. Since then Marconi research and development have been behind every major advance in technique. Marconi equipment today, operating at all frequencies, covers a very wide field of both long and short range radio/telegraph and radio/telephone requirements. Marconi VHF multi-channel equipment can provide for as many as 48 telephone channels and is largely superseding land line or cable routes on grounds of efficiency, economy, ease of installation and maintenance.

Eyes on the Mark

Every hour, every day, many pairs of eyes throughout your organisation are watching, questing, making sure. Those eyes command your production, for the machines in themselves are blind.

The leading question is this: Are you, in fact, providing the conditions under which those eyes will give of their best, and will make a reality of your estimates for increased production? Improvements in production by as much as 30% can be achieved under correct lighting.

You probably have a fluorescent installation, but this does not, in itself, guarantee a permanently high standard of lighting. Although many fluorescent tubes undoubtedly have a long life, in time some deterioration is inevitable.

There is no better insurance against indifferent lighting than that provided

by Osram tubes in a properly designed installation. For new schemes, and as replacements, their stamina will ensure a consistently high performance throughout a long life, while their superb quality offers freedom from the expense of sporadic failures. New improvements in efficiency add striking emphasis to these benefits.

A properly designed installation is a vital factor in achieving good lighting, and the G.E.C. maintains a highly qualified lighting service, with specialists at each of the Company's branches to advise on any lighting problem.

MERCERS OF WOOLLEN CLOTH TO THE LATE KING GEORGE VI

JOHN G. HARDY LTD.

The Big Six

The well-dressed man spends time as well as money on his clothes. For him, time spent in looking through the six John G. Hardy speciality cloths is a pleasure—as well as a sartorial duty. He wants to compare the rugged pure wool tweed of 'Hardithorn' and 'Hardilaine' with the silky luxury of 'Sheltie'. He wants also to feel for himself the resilient strength and toughness of the famous 'Alsport'. Perhaps he'll decide finally on the popular new 'Hardiwear' worsted, but almost certainly he'll have a second look at the Irish Homespuns.

Ask to see these fine cloths (they're known as the John G. Hardy 'Big Six') at our showrooms or on extra-large bunches at your own tailors.

Short Sea Routes to France

IN TEXTILES

The WHOLESALE helps the MANUFACTURER

By selling his goods through the Wholesaler, the Manufacturer gains many advantages. He receives bulk orders in advance of the seasons and thus ensures an even flow of work throughout the year.

He saves the expense and worries of a large sales and distribution organisation, of credit control and increased office work. He avoids the problem of finding storage space for mounting stocks awaiting delivery.

The Wholesaler orders early, takes delivery for stock and pays quickly, thus enabling the Manufacturer to buy further raw materials. In textiles, the distribution channel of Manufacturer—Wholesaler—Retailer has consistently proved economically sound.

This is the SECOND of a series of four announcements describing how the Textile Wholesaler helps the Manufacturer, the Retailer and the Nation.

What's the next move?

A recurring industrial problem—and one where THE FINANCIAL TIMES is of great help. Sound decisions demand the right background, and decisions are unquestionably easier for the executive who regularly reads this important newspaper. He is well-informed on facts and figures, and well-advised by authoritative writers on the possible future course of events. Recognised as the daily newspaper of industry and commerce, THE FINANCIAL TIMES supplies a wealth of vital information—carefully marshalled for quick reference—and absorbing articles and comments on many industrial subjects. What's your next move? Order a regular copy of THE FINANCIAL TIMES today, and make certain of getting wise counsel.

LIFT THE LOAD and LOWER THE COST.

WORKS SUGGESTION SCHEME
NAME *John Smith* NO 562 DEPT *Machin-shop*
GIVE A BRIEF DESCRIPTION OF YOUR IDEA:
I suggest that with a Fork Truck to do the lifting, carrying and stacking we could spend much more time on the machines and so catch up on our production schedule. A Fork like this would have a hundred uses and Lansing Bagnall experts in

The purpose of "Mechanised Muscle" is not the elimination of human effort but its release for more productive work, nevertheless each individual can only produce if the NATURE of his work is productive.

It's as simple as that... a man spending an hour carrying, lifting and moving materials contributes nothing to the value of the product but puts up its cost without improving it; whereas by spending that hour on productive work, leaving "Mechanised Muscle" to handle the materials, he not only ensures a cheaper end-product but earns with his effort the satisfaction of accomplishment.

Write to our Survey Dept. and we will prove conclusively how "MECHANISED MUSCLE" is already raising profits throughout your industry.

"Don't Burn Money"

says Private Btu (the British Thermal Unit)

"If the method of firing your boiler is wasteful you are as good as burning money and probably polluting the atmosphere too."

FUEL EFFICIENCY PAYS

For example... A large firm in the south of England installed two mechanical stokers at a cost of £2,050. This enabled the firm to use less fuel in spite of it being of a lower grade than previously. This has resulted in a monetary saving of £900 per annum. Hence the capital expenditure will be regained in less than three years.

Combustion Engineering Association 6 Duke Street St. James's London SW1 say that this is an outstanding example of how fuel efficiency pays. They have many others and will be pleased to pass on further information concerning the advantages of mechanical stokers together with names of manufacturers.

Government loans may be obtained for approved fuel saving schemes.

OSCAR HOBSON:

A Tribute

The Financial Times in its weekly column "Men and Matters" recently had this to say about the News Chronicle City Editor:

"No honour could have given greater pleasure to the City than the knighthood conferred upon Mr. Oscar Hobson in the New Year's List. This was an imaginative selection, and altogether appropriate."

"Mr. Hobson has always been a steady critic of the money-tamperers in Whitehall, and of the 'get-rich-quickly' people who have misused the machinery by which the City of London has become the most intelligent and far-seeing of world financial centres."

"Mr. Hobson is by far the ablest of City Editors of our time, and his shrewdness and capacity for judgment, tempered by high independence, have been of the greatest service to the City, the Treasury, and to British industry. Mr. Hobson does honour to the latest Honours List."

Sir Oscar Hobson is author of "How the City Works", a book that explains in plain non-technical language the financial machinery of the banks and the Stock Exchange and the hundred and one mysteries connected with the commercial life of the greatest City in the world.

PRICE 6/- from booksellers or 6/6 post paid from the News Chronicle Book Department, Bouverie Street, London, E.C.4.

A GUARANTEE has been given by Beecham Buildings Ltd. to complete a new factory of 200,000 sq. ft. and considerable intricate ancillary work for an Industrial organisation in the Midlands—within a year. This is the third advertisement telling the story.

Progress despite gales and floods!

Their new ways of building have enabled Beecham Buildings to make almost unimpeded progress during the recent appallingly bad weather. The structural frame of the main shop illustrated above, is now under way and rising rapidly; in the background to the right may be seen the North extension which is now complete. The daily production of reinforced concrete components has been kept up and many of these weighing 6 or 7 tons are being transported from the factory of Beecham Buildings to the site where expert erectors and builders complete the job. Further advertisements will continue to tell the story of this contract and to prove the value of our guarantee. May we advise you on the construction of permanent and competitive Industrial Buildings?

March into the future... **No 1**

Maybe one day...

Somewhere there lives a boy who will one day reach the highest position in his country: he will become Prime Minister. His sole aim then will be to safeguard the peace, progress and prosperity of his fellow-countrymen.

In all big national undertakings he will encounter the name of Philips. Philips radar equipment to guide his ships into harbour. Philips electron microscopes and X-ray apparatus to guard his people's health. His country's passenger planes will be fitted with Philips electronic tubes and communications equipment to ensure the utmost safety, thus strengthening national prestige abroad. Philips will help him, wherever they can, to make his country great.

When the big day comes for this boy - Philips will be there, ready to support his noble aims.

Trade Turning Traitor?

FOR a long time now Labour politicians have regarded the terms of trade as a reactionary mystery by which foreigners—except foreigners who plant tea—unfairly help the Tories. It is possible that they may soon be able to jettison this belief. Indeed the mood of the more economically minded of them can already be summed up in a topical metaphor: it is a mood reminiscent of that which swept round the Oval two summers ago—in that breathless moment when England, toiling with the craftier spin attack but on a cruel batsman's wicket, suddenly saw rise from a faster delivery a thin, significant spiral of dust. Today, in most of the indices of trade and inflation that matter, the dust seems to be rising again; and it is bringing with it a surge of emotion in Labour breasts that is not difficult to understand. It is possible—it is just possible—that the long batsman's wicket is breaking up.

This may be an exaggerated view, but it is certainly true that, despite the increase in Bank rate to 3½ per cent, there has been a visible deterioration in Britain's economic situation in the last few weeks. In part, the emphasis must be on the word "visible"; some of the adverse trends that were set in motion as long ago as last autumn are only now coming to light in published figures. But it does not really matter—least of all to politicians—exactly when the turn for the worse took place. The blunt fact is that some of the rosier assumptions with which the Government originally seemed able to approach its economic planning for this probable election year are assumptions that are no longer tenable.

Even at the beginning of the year, the assumptions were rather shaky. It seemed apparent then that the increase in production that could be expected during 1955 would be barely sufficient to satisfy the "natural" increases in investment and consumption that were deducible from published investment plans and the trend of money incomes. It followed from this that the Chancellor would have to rely on certain safeguards if he were to look forward, in honesty, to giving away part of his current budget surplus in tax reliefs—and thus to risk aggravating these "natural" increases in investment and consumption. At the time, he seemed to have two such safeguards. One was that the country had run a substantial balance-of-payments surplus in 1954—probably of the order of £200 million—and that only a purist would object if a little of this were to be eaten away by more investment or consumption at home in 1955. The other was the belief that, if budgetary policy were to be soft, monetary policy could be hardened to correct it.

The important news of the past few weeks is that, with a speed that will be only too familiar to all who have followed Britain's economic fortunes since the war, both these safeguards seem to have been whittled away. The cushion of the balance-of-payments surplus, indeed, is already flat; it was flat when Bank rate was raised three weeks ago, although nobody was then aware of it. The trade returns

for January, published last week, show that imports in that month were some £50 million higher, and exports only some £25 million higher, than the monthly average for 1954. It is not quite fair to multiply this excess by the number of months in a year, and to say that the visible balance of payments therefore looks like being £300 million worse in 1955 than in 1954; but, whatever corrections one makes to such crude arithmetic, it seems clear that Britain's external accounts are no longer in comfortable surplus. At best, they are in bare balance.

There have been several reasons for the disappearance of the surplus. The most important is that, since November, import prices have been rising, but the prices at which Britain can sell its exports in world markets have not. It is possible that this adverse movement in the "terms of trade" has cut down Britain's annual rate of real income by £100 million in the last three months—and that is very nearly the equivalent of sixpence off the income tax gone by the board. Another reason for the deterioration is that inflation has started to suck goods more voraciously out of export into domestic markets. The latest *Treasury Bulletin for Industry* suggests that it is only since October that wage rates have been rising faster than productivity; and the railway settlement will have given a new twist to that. Yet another reason is that industry is now buying more imported raw materials partly, in order to replenish the stocks that were run down during the autumn dock strike. Of these three causes of deterioration, only the third seems likely to be temporary; the others—especially the terms of trade—are more likely to grow worse as the year wears on.

★

The other major disappointment in the past three weeks has been the complete failure of the $\frac{1}{2}$ per cent increase in Bank rate to exert any disinflationary effect. This is not altogether surprising. It should be obvious, from observation on the roads, that, when an amber light is flashed, accelerator-happy motorists are apt to go right on through it; and this is precisely what has happened in the British economy in the last three weeks. One of the ways in which an increase in Bank rate is supposed to work is that business men and bankers may be induced to draw in their horns, because they read the increase as a signal that the authorities are going to use most of the many means in their power to try to drive interest rates up; the increase in January was read merely as a signal that the Government was using one of the few honest means in its power to try to bring tax rates down—and thus almost as a bull point for industrial shares and inflation.

Internally, this was made obvious by the reaction of the stock markets on the first day of the Bank rate change; the *Financial Times* index of equities was immediately pushed up to another new high. Externally, it has been made manifest by the continued weakness of

sterling, and by the eagerness of people in transferable account countries to turn their pounds into dollars—to Britain's detriment—at a depreciated rate. This last point raises two more familiar shadows. It has long been argued in some quarters that Britain would suffer if it were caught in its next terms of trade crisis with its exchange rate still fixed but its exchange controls half dismantled; and that foreigners might make more hurried use of their new and easier escape routes out of sterling as an election approached, for fear that a Labour Government might block those routes if it returned to power. Both developments may now be in train, and they could well gather pace in the next few months.

★

This is an awkward situation for the Conservatives, but it is not by any means a disastrous one. It is a situation that holds out to them one main economic, and one main political, message. The economic need is that they should recall in action, as Mr Butler did recall in words to a Liverpool audience last week, that the "Government's duty... [is] the maintenance of a due balance in our home economy so as to ensure that its demands do not conflict with the need to export... A hand must be kept on the reins—even a gentle tug given now and again to keep us on a straight path." The Government still has some room for manoeuvre in deciding how that tug should be exerted. The best course would clearly be another increase in Bank rate, accompanied—this time—by measures to make it effective. If that fails, the budget will have to be an unpopular one. Economically, this would be a pity, for an over-taxed economy will not be a rapidly expanding one; but it will be better to bear over-taxation than to have an economy that blows up and busts. In these dying months of the present Parliament, the Conservatives will need to be judged largely by their actions in defence against inflation.

The political lesson is that economic factors, as well as administrative ones, are making it more than ever desirable to hurry the election on. If the economy is now moving into rougher seas, the Government's task will be hard enough in all conscience; but it will become quite impossible if there is to be a quivering hand on the tiller for another twelve months, and if the look-out is looking out only for marginal seats. Between now and the next two possible election dates—which are May and October—the economy is not likely to deteriorate to the stage at which this Parliament came in; but the Tories should realise, on narrow party as well as broad national grounds, that it has already deteriorated to the stage where this Parliament should go out. Otherwise, with every month that passes, the Government will run a greater risk that it may go out too. The new forces of inflation already bid fair to have an important influence on either the timing or the result of the next election. The Government is fortunate that it may still have the opportunity to decide which.

Eden Goes East

SIR ANTHONY EDEN'S intended departure today for the Bangkok conference on Wednesday marks the start of a trip without precedent in the annals of British diplomacy. Never before has a Foreign Secretary set foot in eastern Asia while in office. It might be supposed that he is doing so now only because of the crisis in the Far East, a fireman, in fact, on his way to help put out the flames which are so obviously licking round Formosa. But much of the value of Sir Anthony's journey is in fact the precise opposite, that he is not going on a crisis mission and that the three-day conference of the Seato powers is specifically designed to prevent an emergency arising in South East Asia.

Naturally the question of Formosa will be very much in the minds of everyone present in Bangkok. For if the island fell to Communist China, whether by outright war or by decay from within, the chances of maintaining even the present degree of mental steadfastness against the Communist propaganda onslaught on South East Asia would be sharply reduced. Those people in Britain who simply argue about Formosa's legal status, declaim against America, and heap not undeserved calumnies on the Chiang Kai-shek regime, are dismissing two realities of prime importance to themselves. One is that, having spent years building up the Nationalists, no Administration in Washington can just drop them and walk away; and if America's allies insist that it do so, they may one day find that the same thing is done to them. Secondly, however nasty the taste of Chiang Kai-shek's own name today, the collapse of resistance to Communism in Formosa would have incalculable repercussions all the way from Tokyo to Cairo.

★

Formosa does not, however, appear on the agenda of the Bangkok conference itself. The problem will be discussed officially only in relation to general questions affecting the area as a whole. And while the opportunity for Sir Anthony Eden and Mr Dulles to meet informally at this moment is well timed, the conference has a clear role to play in its own right. To this there are three main aspects: the setting up of a permanent organisation under the South East Asian Collective Defence Treaty (SEACDT—though the name Seato is still used), which was signed at Manila last September; the planning of joint action by the signatories under Article 2, particularly against internal subversion in the South East Asian countries themselves; and some clarification of the economic side of Seato.

Nothing has yet been decided about a permanent organisation, except that there shall be one. The treaty speaks of a council, and lays down that this "shall

provide for consultation... from time to time"; the council is also "to be able to meet at any time." Clearly, it would be wrong to base plans on the analogy of the Nato structure in Paris, since the military and political resources of the powers concerned do not run to it. Nor, on the other hand, would it seem adequate that there should be only a yearly meeting of foreign ministers, as under the Anzus arrangement between Australia, New Zealand and the United States, with nothing in between and no continuing organisation in the area itself. If Seato is to become a name for Asian powers to conjure with, there must be a small intelligence secretariat to give the treaty punch and direction; but the exact nature, scope and location of this body must depend on the balance between political possibilities and needs within the area.

★

Already a clash of view has arisen, for instance, over the desirability of using Singapore as a headquarters. On practical grounds, Singapore is an obvious choice; it is central, secure and efficient—yet it carries the precise taint of colonialism which Seato needs to avoid. Looked at dispassionately, there is no satisfactory prospect of developing a political will to resist Communist encroachment in South East Asia, if there is no military power in the background capable of putting up a fight against aggression. On the other hand, the difficulty is that, while any such stiffening is at present available only from western sources, the very interest of America and other western powers creates the suspicion that they want the return of imperialism by the back door. The whole future of Seato therefore depends on its ability to dispel this illusion, to rally the waverers, and to grow by slowly attracting new members to its concept of genuinely collective defence. And that cause will not be helped by using Singapore as a pivot. Instead, the secretariat must be established in one of the two independent Asian states, in either Bangkok or Manila; and of the two Bangkok is patently the better. This need to develop Seato as a fundamentally Asian organisation is particularly important in view of the latest trends in the Chinese attitude. Disappointed with Sir Anthony Eden for going into Seato after the Geneva conference, the Chinese are now concentrating on the proposed Afro-Asian conference as a counterblast. At it, they see a chance of widening the area of so-called neutrality, created by their Indian and Burmese non-aggression pacts which Mr Chou En-lai concluded last year when he visited Delhi and Rangoon.

The novel feature of the Manila treaty, collective action not only against external aggression, but also

against revolt from within, has still to be developed into a practical plan. There are two obvious difficulties. One is that to interfere against, say, a *coup d'état* in Siam would itself savour of aggression and might involve a large outlay of force if the *coup* had been initially successful; it would also provide admirable fuel for Communist propaganda. The other difficulty is frankly that, while any plans for dealing with subversion would be useless without a tight hold on security, experience so far in South East Asia has been that all secrets have their price and that leakages are very hard to stop. There is, even so, scope for regular formal contact between members of Seato on such questions as intelligence and, in its best sense, police work. Already a start has been made in Malaya, for instance, by an interchange of information with surrounding countries on the techniques of criminal investigation and passport control.

When it came to the point, the economic side of Seato was never really developed at Manila. But the reasons which led to the shelving of these issues five months ago certainly still hold good today. There is little that Seato could effectively do which is not already being done under the Colombo Plan. And the Colombo Plan, which now includes every non-Communist country in southern and eastern Asia, is not tarred with the brush of anti-Communism as such. It represents in fact an ideal which Seato itself is still a very long way from attaining. Moreover, planning to channel aid through Seato is useless if the western powers are in no position to supply it, and if even the difficulties of using existing aid to the maximum effect have not been solved; much has been heard of a Stassen Plan for Asia, but the news from Washington about it is not encouraging.

The one live economic issue which may be raised behind the scenes at Bangkok has a serious political content, and in fact begs the whole question of what the western powers are trying to do in Asia. Logically enough, some of the political leaders in countries like the Philippines and Pakistan consider that their joining

Seato should put them several places up in the queue for foreign assistance. This, however, runs directly contrary to the principle which is in effect being generally adopted both by recipient nations and by enlightened administrators of American and other western aid, namely that no political strings shall be attached to such help. Obviously, military-economic aid must come under a somewhat different category; indeed it normally forms the basis of a specific and separate agreement, like Pakistan's recent arrangement with the United States. But, from the West's point of view, to channel purely economic aid into those countries that join Seato, at the expense of others, would be a mistake. It would defeat its own object and foment the accusations of western imperialism.

Meeting within less than half an hour's flight of Indo-China itself, the Seato powers will certainly discuss the new political difficulties which are emerging there. Not only have Laos, Cambodia and South Vietnam been designated as areas whose security concerns the Manila treaty, but the British and French committed themselves at Geneva to carrying out the terms of the Indo-Chinese cease-fire, and the Americans subsequently undertook not to work against it. Lately, however, the attitude and performance of the South Vietnamese government have been such that there is some danger of the Geneva agreement breaking down over the holding of elections next year. At a time when Communist claims to Formosa have thrown the western powers on to the defensive in some disarray, they can ill afford to run a new gauntlet of accusations of bad faith with Asian opinion. And while discussion of this question is admittedly not the main purpose of next week's assembly of ministers in Bangkok, it is characteristic of the dangerous realities which glower down on the conference table. Sir Anthony Eden may be going further afield than any Foreign Secretary has gone before. But he is going to discuss problems which could yet bring the world to the fringe of war.

France at a Loss

WHEN M. Mendès-France was at last brought down, just a fortnight ago, by an Assembly that has now worked its way through twenty governments in ten years, it was to a cry of "scuttle" that he fell. His fellow Radical, M. René Mayer, played skilfully upon the deputies' emotions with references to Indo-China, Pondicherry and Fezzan, and it was the spokesmen for the embattled settlers in North Africa who sealed the prime minister's doom. Thus, ironically enough, the most vigorous government that France has had in recent years was condemned on a charge of spinelessness. The Supreme Soviet was scarcely more irrelevant when it replaced Mr Malenkov, the "bad

manager," by a military commissar and ex-mayor in order to get a firmer grip on agricultural problems.

In sober fact, however, it was not lack of vigour but excess of it that made M. Mendès-France's ministry intolerable to the Assembly. His supporters have been fond of describing his main antagonists as *les féodaux*. The image is an apt one. M. Mendès-France has had to play in France much the same role as the Tudor monarchs played in an earlier England. Tough, determined, and sure of widespread popularity in the country at large, he has launched an open assault on local and sectional interests whose essentially feudal character is an obvious barrier to the brisk development that France

needs if it is to keep abreast of a changing world. The more baronial of the North African *colons* constitute the most visibly feudal of these groups; but in the ranks drawn up against M. Mendès-France two weeks ago were representatives of almost every special interest in France, ranging from M. Poujade's tax-dodging shopkeepers to M. Duclos's disciplined comrades, and taking in on the way both ultramontane clericals and owners of redundant vineyards. The prime minister brought a truly Tudor bluntness and impatience to the conflict, but he lacked the absolute monarch's ultimate argument; and in the end it was upon his neck that the parliamentary axe fell.

It was not the Right alone that brought him down, nor even the Right together with the Communists; among his unforgiving enemies were a number of genuine reformists, particularly in the MRP party. There was a symbolism here, although it was obscured by the unfinished vendetta that began with the EDC. M. Mendès-France was never a man of the classical Left—hence the Socialists' consistent refusal to take office in his government, although they gave him their votes time after time. Again, certain far-sighted elements in big business heartily supported his plans for economic "reconversion" and modernisation, despite the dogged resistance of the bulk of the *patronat*. Essentially, M. Mendès-France spoke for those Frenchmen who wanted urgent action, for men, drawn from all classes, who recognised and loathed the inertia in which France was bogged down both at home and abroad. His supporters were far from agreed among themselves, and some of them might have reacted sharply if he had been able to launch the economic plans for which, as things turned out, external problems left him little time. Moreover, some of his most sceptical opponents may have been right when they argued that he ought to be left in power long enough to apply his economic formulae, which, they maintained, would be exposed as inadequate. But for the moment these are academic issues. The central facts are that M. Mendès-France was brought down before he could turn his full attention to "reconversion," and that this left many Frenchmen in a mood of hope sharply frustrated.

The confused, parliamentary activity of the past fortnight has reflected this background of emotion. The swing of the pendulum from Pinay via Pflimlin towards Pineau—described by a correspondent on page 636—was in fact a swing back in the direction of the fallen prime minister; the trend was shown all the more clearly when M. Pineau not merely lavished praise on M. Mendès-France but actually sought to draw him into a new government. But there is still no such thing as an organised "*Mendèsiste*" movement. Each of the organised parties is divided over one or other of

his policies, his own party, the Radicals, showing perhaps the most bitter divisions of all, and there is over a year to go before the next elections. A vague emotional groundswell cannot, therefore, produce any immediate and constructive effect in French politics. As one of the newspapers that devotedly supported the fallen premier explained to its readers last week, it was now pure escapism merely to vent indignation on the men who defeated him; if his admirers' hopes were eventually to be fulfilled, each one of them should examine his conscience and decide whether he sincerely accepted all of M. Mendès-France's less popular arguments—for example, that small firms should be shut down and the big, efficient, but suspect concerns thereby encouraged, or that before reaching agreement with Russia on the German problem it was first necessary to grant Germany sovereignty and the right to rearm.

★

The groundswell is as yet quite inadequate to bring about any shattering of the rigid mould in which French party politics are cast. Gallic logic may suggest that this would be a good moment to slice each of the traditional parties into two parts and thus, setting the Communists aside, allow a properly organised Left to confront a similarly organised Right; but Gallic devotion to a whole range of familiar shibboleths, from laicism to *l'Europe*, forbids that. Thus, whether the first government that now takes office is maintained in power by its opponents' differences or brought down by its own supporters' differences, the outlook for the months to come is probably much the same: a quasi-caretaker government, or a series of such, forced to mark time on as many issues as possible while the parties arrange themselves with an eye to the 1956 elections. By the time those elections come, the present mood of confused frustration may have crystallised into a new political movement with a programme, an adequate team of leaders, and a national organisation; but what happens to France in the meantime? And what happens to its friends and allies?

If there were only internal problems to worry about, the country might get through a new period of *immobilisme* and uncertainty without anything more than discomfort. It is true that M. Mendès-France had fixed a "rendezvous" with the trade unions for April; but the recent upward swing of the economy has taken off a good deal of the pressure for immediate reforms and adjustments. Communist thunder has been stolen both by this economic improvement and by the alternative dynamism introduced into politics by M. Mendès-France, and it is no longer possible seriously to suppose that parliamentary democracy is threatened by the Gaullists. A France that existed in a vacuum might now relapse into almost complete inaction for several months, and feel little the worse for it.

But France does not live in a vacuum. North Africa calls urgently and insistently for decisions that only a solidly based government can take, and every hour of delay increases the already formidable difficulties that France faces across the Mediterranean. Europe's needs are scarcely any less immediate. The Council of the Republic, the upper house of the French parliament, would now be debating the Paris agreements on Western Union if the original timetable had not been interrupted by the fall of the government. Even if a new government can steer the agreements through the last twists and turns of the parliamentary maze during the next few weeks, it will not emerge on to a straight and easy path. Perplexing questions confront the whole western partnership, and would have confronted them if there had been no upheaval in Moscow last week. When and how (let alone with whom) can negotiations with the Soviet rulers be initiated with any prospect that they will be fruitful? M. Mendès-France had his own

Battle of the Docks

SINCE the London dock strike came to an end last October little has been heard of the issue on which it was fought—the claim that overtime is voluntary. But behind the scenes the argument has been going on between Mr Barrett's National Amalgamated Stevedores and Dockers Union and the port employers, and it may flare up again within a few weeks. Sooner or later the London employers will insist that men who refuse to work reasonable overtime should once more be reported to the local Dock Labour Board.

The situation is dangerous because there is no guarantee that the little stevedores' union will not again be able to sway the members of the Transport and General Workers' Union, to which nine out of ten dockers belong. The big union's officials have merely been observers at the discussions with the employers, since they themselves are perfectly satisfied with the formula, laid down in the Dock Labour Scheme, that "a man shall work such overtime as is reasonable in his particular case." So were their rank-and-file until they were induced, out of traditional solidarity, to walk out with Mr Barrett's stevedores. The NASD may again succeed in driving a wedge between leaders and rank-and-file—as, in a different way, it is still doing in the north. In Hull, Birkenhead, and Liverpool, unmoved by its suspension from the TUC, it continues to recruit the Transport Union's members.

The Transport Union is less perturbed about this than it probably should be. It says that its rival's claims are vastly exaggerated. It doubts if many of those who have applied for blue (NASD) cards have paid dues to their new union, and thinks that most of them are holding on to their red (TGWU) cards for safety. It trusts that the men will remember that the

very definite ideas on these matters. France's allies sometimes found him a difficult partner; but as they got to know him better, they discovered the virtues of a man who would promise only what he genuinely believed he could do, and who strained every nerve to reach the goals he had set himself.

The same allies are now wondering whether they will again find France a limp and limping partner, and whether they must try to carry it along with them, unwilling or at best undecided. Is there now to be a French version of the immortal phrase attributed to Mr Sam Goldwyn—"include me out"? If so, what becomes of the cherished principle "nothing without France"? The French nation, so far as its domestic affairs are concerned, may well be able to struggle along without an active and determined government for months to come; but can the free world as a whole afford such a Parisian luxury?

larger union offers much better friendly benefits; that it can keep the NASD off the negotiating machinery; and that Mr Deakin's voice carries more weight with the employers than ever Mr Barrett's could. A claim for a substantial wage increase presented this week by the union to the port employers may remind them of solid benefits received. Union officials are inclined to think that they have only to wait and all will be well.

If time, however, is on the Transport Union's side, some other things are not. One is the attitude of the British press, which consistently tends to present Mr Barrett as the brave little fighter against the big bureaucratic machine. In part, this attitude springs from the TGWU's poor sense of public relations—with its own members as well as with newspapermen; time and again impartial observers—such as those from Liverpool University in their survey of a Manchester dock strike published last month—have criticised its methods of communication. In part, it is due to the fact that newspaper correspondents, in the course of getting their stories, become friendly with the principal actors in industrial dramas, and present their side of the question in a favourable light. Mr Barrett is nothing if not a principal actor, with a developed audience sense.

The TGWU's second trouble is that it is under constant and clever attack from the Communist party. The party's objective—admitted quite frankly by a former TGWU official in a recent issue of the Communist *World News*—is to get control of the union itself. It has two methods, one direct, one indirect. The direct method is to get next year's Rules Conference of the union to rescind the rule introduced by Mr Deakin in 1950, requiring its officials to sign a declaration that they are not members of the party. This, the Com-

munists hope, may be easier after Mr Deakin retires on November 11th next. Nominations for his successor are being received this month at Transport House, and efforts will be made by the party to find a man who can successfully oppose the favourite, Mr Jock Tiffin, the present Assistant General Secretary and a firm anti-Communist.

The indirect method is to do everything possible to shake confidence in the present leadership. The London dock strike helped to do that, by setting a gulf between men and officials. From this point of view, the NASD's campaign of poaching its big rival's members is not really inconsistent with the Communist party's private aim of taking over the whole of the TGWU intact. It could help to stimulate dissatisfaction with existing officials and clear the way for more left wing successors. It is true that Mr Harry Pollitt has expressed loud disapproval of the NASD's poaching, but there may have been another reason for that. In the northern ports there are large numbers of Roman Catholics who would be put off by an obvious association between Communism and the NASD.

Is there a less obvious connection between the two? This is wide open to dispute. Mr Barrett is not a member of the Communist party; if he sometimes gets mixed up in odd ventures—like his recent statement that his members would not load any supplies destined for a Formosan war—he can justify them with a conventional left wing Socialist line. But, of his select union executive, one—Mr Dickens—is also a member of the Communist Party's executive, having been expelled from the TGWU on political grounds three years ago; another, Mr Timothy, was a member of the party until last year. Mr Barrett's opponents claim that time and again he appears ready to take a more reasonable direction only to have the reins snatched from his hands.

A third factor that weighs against the TGWU is that, through no fault of its own, it is not much good as a safety valve for the vague discontents in which the docks abound. The Liverpool survey made this point, and common sense supports it. This is not primarily because the Transport Union is "too big"—as is so often maintained. It is rather because it now stands for the observance of industrial agreements and for a policy of moderation. The docks are fertile ground for malcontents. The system of the call-stand means that the same men—the least efficient—are left until the last, to be allocated by the local Dock Labour Board's manager, or to have their books stamped so that they can draw the fall-back pay of 6s. a half day. If their homes are distant from the docks they loaf around all morning, for they must attend another call in the afternoon. Above all, relations between employers and men, and between men and men, are shifting and unstable. Some of the best dockers work

in gangs, following the same foreman whatever ship he works, and about a fifth of the total labour force is employed on a weekly basis. But others work for a different employer and with different workmates every day. Such discontents, reasonable and otherwise, used to find relief when all could get together and abuse the employers. But now that the employers provide less ground for abuse, and since the TGWU, as the largest union concerned, is more often associated with management than other unions, its meetings no longer provide a suitable safety valve.

A fourth trouble lies in the Ministry of Labour's excessive readiness to compromise, and the usual tendency of its courts of inquiry not to inquire into the most burning issues. For example, last autumn's dock strike sprang from an overtime ban, which in turn sprang from the disciplining of a few men at the end of 1953. That group was disciplined by a board on which Mr Barrett himself sat. One of the men, it turned out later, had refused to work overtime in order to attend a union meeting of the NASD; but neither he, nor Mr Barrett, if he knew, told the board at the time. This was one of the main reasons for the TGWU's bitterness in last year's struggle: the suspicion that the whole affair had been "planted." It is extraordinary that the subsequent court of inquiry did not inquire into this suspicion—either to refute or confirm it; it simply took no evidence on the subject.

★

If more trouble at the docks is to be avoided, everyone who wants to maintain order there will need to put aside complacency and go in for self-criticism. The employers—particularly at places like Hull—must press on with the modernisation of the ports, and with welfare amenities, particularly sanitary arrangements. They should engage men as far as possible on a weekly basis—as, indeed, more and more of them are doing. A trend towards fewer and larger firms would no doubt have a good effect. The union must try to produce officials who can cope with agitators, even if this means paying more in order to lure suitable men from more lucrative dock work. It should surely set up a public relations department both to keep its own members on the right lines and to inform the press. Steps should also be taken to improve the quality of new recruits to the docks; many are attracted by the relatively high earnings (averaging £11, and sometimes reaching as much as £20, a week) and the industry does not need to take the first-comers. A training scheme would raise efficiency. Finally, the Dock Labour Scheme should no longer be regarded as sacrosanct. In particular there is no reason why the unions should not extricate themselves from the machinery of discipline without any sacrifice of their powers elsewhere. It is time that all sides of this very conservative industry approached their problems with a more flexible mind.

Notes of the Week

Design for the Deterrent

THE publication of last year's Defence White Paper was almost immediately followed by the world's preview of the H-Bomb, so that there has been a full year for its implications—or fall-out—to take effect on the new White Paper which appears as *The Economist* goes to press. Perhaps the most notable effect is the virtual dropping of the idea that a period of broken-backed warfare would follow the initial exchange of atomic courtesies. The number of hydrogen bombers that need to get through to prostrate this country is small; and on the subject of "defence" the Defence White Paper admits what the Aircraft White Paper (discussed on page 649) obscures: now and for some years to come there will be no effective defence. Had there been no muddle over fighters there might have been some, and if there is no muddle over missiles there will be quite a lot in a few years—but not enough.

Thus after years of defence-spending, security depends on the deterrent—at present largely an American one, although Britain is to have the H-bomb as well as the bombers. But the new order of priorities is barely reflected in the 1955-56 estimates. The Air Force gets £540 million, or 35.4 per cent compared with 32.8 per cent of the estimates last year; the Army gets £484 million, or 31.5 per cent compared with 34.2 per cent; the Navy gets £347 million or 22.6 per cent—about the same as before. The Ministry of Supply's proportion has again risen—from 9.2 per cent to 9.6 per cent. The total estimate is £102.7 million lower than the original estimate for the current year.

This is only an instalment of the immense sum to be found to give Britain a measure of security that must seem slenderer than at any time in history. But though the failures and mistakes in all the Ministries involved are appalling, it is wrong to argue that the country has had no value for money. There has been no major war; the cold war has been fought—at times hotly—and not lost. And the speed with which scientific advance now makes strategic and tactical plans or weapons obsolete affects every country.

Mr Dulles Expounds

MR DULLES did more to clarify American policy towards Russia than towards China in his broadcast on Wednesday evening. Speaking of the recent changes in Moscow, he laid emphasis on a basic difference of attitude which may be emerging between Soviet leaders. One group would have the Soviet Union's power primarily employed

"as a tool of international Communism." The other is increasingly worried about Russia's own "welfare, security and greatness." This is to express in different words something of the rivalry between party and state, in which Mr Malenkov's overthrow has been widely interpreted during the past fortnight as representing a victory for the party. Mr Dulles has emphasised instead the role of those, in both the party and the army, who have shown how concerned they are about what is happening not only to the Russian economy but also to Russian relations with China. The Secretary of State draws two conclusions. There could be a basis for "practical agreement" with the new Russia. And, instead of trying to detach China from Russia, the West might be well advised to look at the problem the other way on, and try to draw Russia away from China.

For America to accept the idea of driving any kind of wedge between Moscow and Peking is welcome. What is less satisfactory from the British point of view is that Mr Dulles has still not given any clear evidence that the Administration really knows what it is going to do about the Chinese coastal islands, Quemoy and the Matsus. It is one thing to keep the Communists guessing, another to do the same to one's allies. His remark that the United States had "no commitment and no purpose to defend the coastal positions as such" was counterbalanced by his observation that it is doubtful whether their surrender "would serve either the cause of peace or the cause of freedom." This equivocation is reported to reflect some difference of view inside the Administration about the great difficulties it is encountering in its relations with the Chinese Nationalists. But, much as one may sympathise with Washington's predicament, two things cannot be emphasised too firmly. One is that public opinion outside the United States could not be expected to support American military action in the coastal islands. The other is that the chances of lowering tension will never be very good until the Straits of Formosa lie between the two opposing sides.

Mr Attlee Explains

MR ATTLEE has made a commendable attempt this week to reconcile his position as leader of a difficult political party and as alternative Prime Minister of Britain. First, he is reported to be ready to take back the expelled rebels into Labour's fold, although he is insisting that each case should be examined individually. Secondly, he has given a welcome interview to the *News Chronicle*, in which he has carefully redefined his recent pro-

nouncements on foreign affairs very much on the lines discussed by *The Economist* last week—and has thereby removed the left wing's excuse for misinterpreting them. But the nigger in his woodpile is still throwing the timber about. Mr Bevan, having failed to persuade the party to agree to a front bench motion calling for talks on German unity, has now put down such a motion himself, with a curiously timed proposal for top level talks on the H-bomb thrown in for good measure. Just over a hundred Labour members, rather more than a third of the party, have rallied to Mr Bevan's side; they include such former middle-of-the-roads as Mr Strachey. Mr Attlee is still a long way from getting his choir in harmony; it is a real gain, however, that the left wing should no longer be able to claim that it is merely recording his own voice.

United at Home

DESPITE—or perhaps because of—this internal squabble about foreign affairs, Labour is going to great pains to display belligerent party unity on the home front. This week it sounded a rather clumsy charge on the subjects of tea and requisitioned houses. The charge against British tea blenders flagged a little when it was discovered that the Prime Minister of Ceylon had got his figures wrong; as a table on page 654 shows, British blenders' present profits work out at about $\frac{1}{2}$ d. a lb—which provides unpromising electoral material. Labour has therefore had to fall back on castigating the Government for allowing Indian and Ceylonese tea producers to charge British traders the price that they can get on the world market. In pursuit of this campaign Labour has got hold of the profits announced by leading tea producers in 1954, but does not yet seem to have realised that these figures relate mainly to trading experience in 1953—before the boom really got under way. Conservatives, on their side, have not yet fully woken up to the fact that the relatively small figures of tea dividend increases quoted by Labour work out—when struck net of tax—to less than 1d. per lb of total Indian and Ceylonese tea exports in 1953.

Labour's second domestic tactic this week has been to object to the Bill which proposes that by 1960 the requisitioning of private houses should be wound up. The Bill contains various provisions for ensuring that the tenants do not suffer from this belated act of justice to their landlords; but Dr Dalton solemnly argued that it was "premature" to liquidate this wartime emergency measure fifteen years after the end of the war. This seems an unwise issue, even in the narrowest political terms; when Labour makes this sort of claim it only rekindles the suspicion that it still really hankers after a state of permanent emergency.

Hanging Reprieved Again

MOST people probably make up their minds about capital punishment instinctively and emotionally rather than rationally. But in last week's debate in the House of Commons most speakers relied on reason rather than on conscience, and in so far as this is a matter that can be decided on rational grounds there can be no doubt that

the abolitionists had the better of the argument—though not of the vote.

The debate was in theory concerned with the report of the Royal Commission on Capital Punishment, whose recommendations have, after sixteen months' consideration, been rejected by the Government—virtually *in toto*. But in practice the debate turned largely on the amendment proposing that capital punishment should be suspended for an experimental period. Suspension and outright abolition were outside the Royal Commission's terms of reference; yet whenever its report was quoted in the debate, it gave more support to the abolitionists than to their opponents. Thus, the Home Secretary rejected the alternative of a long term of imprisonment to hanging because of its supposed bad effects on the prisoner. A quite different view was given by his own department to the Royal Commission and expressed by that body itself. Moreover, a special institution for mentally abnormal prisoners who do not qualify for Broadmoor is now being built. Then there is the question of deterrence. Statistics of crimes of violence, the increase in which was used by the Government in support of the retention of hanging, are quite irrelevant to the argument. What is relevant is the evidence given to the commission that murder rates move the same way in both the abolition and death-penalty states of America, together with the commissioner's own view that penal policy in relation to murder should not be based "on exaggerated estimates of the uniquely deterrent effect of the death penalty."

But, in spite of evidence and argument, the death sentence, with all its anomalies, possible injustices and inherent barbarism, has been reprieved again. The abolitionists can, however, draw some encouragement from last week's vote. Tory opinion, it is true, appears to have shifted slightly against abolition compared with 1948; only 18 Conservative backbenchers voted against the Home Secretary's line. But this shift probably reflected some concealed pressure from the Government, which, though allowing its supporters a free vote, also left them in no doubt how embarrassed it would be if the abolitionists won. On the other hand, even if allowance is made for Labour members' greater freedom of action than they had in 1948, there was a distinct shift in Labour opinion. Only five Labour members voted against abolition last week compared with 74 in 1948, and the supporters of the amendment included nearly all the party's prospective leaders. There is at least a fair prospect that with the next Labour government hanging will be abolished—and this time decisively.

Malenkov's Mourners

THE Malenkov myth is well on its way. It was forecast in these columns last week that it would not be long before the deposed Soviet premier acquired a retrospective halo; and that forecast has been more than justified. The man who is now Soviet minister for power stations is already receiving glowing, if premature, obituary notices. He is praised as the great "conciliator," the man with the outstretched hand of friendship, the grossly misunderstood statesman whose repeated "overtures" were prevented only by western arrogance from bringing about a new age of

concord. In some eyes, the West has courted "ultimate catastrophe" by "refusing to respond" to Mr Malenkov's ardent wooing; and now, the mourners tell us, he has gone and it is too late.

It is hardly surprising that those who argue in this way do not bother to produce evidence of Mr Malenkov's sincere willingness to please, for the evidence is indeed scanty. Nor is it really surprising that the same voices that cried "too late" last week are now raised in calls for approaches to the very men who removed Mr Malenkov. There is quite as much logic in that as in the curious reasoning of those who, having preached for years that the free world's only hope is to outstrip the Communists in raising living standards, are now horrified at the revelation that Russia is well behind in the race and forced to move even slower owing to the burden of arms.

What is really odd is that Mr Malenkov's mourners did not wait to see whether his successors would imitate his tactics. In fact the Khrushchev-Bulganin regime has wasted no time in turning a conciliatory face to the outside world. Marshal Bulganin went so far as to reassure visiting American journalists that they should not take the more pugnacious sentiments uttered at the Supreme Soviet last week at their face value. Marshal Zhukov revealed that he dreams of visiting the United States, and Mr Khrushchev publicly chided the Chinese for keeping American airmen prisoner. What is a mere bunch of flowers picked for Dr Summerskill to this? Mr Malenkov's sympathisers in the West may retort that the new regime is merely indulging in disarming tactics. Just how did Mr Malenkov's foreign policy reflect anything different from that?

More Bidding for Germany

DR ADENAUER has reason to be pleased about the fall of Malenkov and the accompanying revelations of Soviet agricultural troubles. He has long been convinced that the key to Soviet policy lay in its rulers' efforts to get men back to the land. Now he forecasts that it may be easier to negotiate with the realistic Mr Khrushchev than with Mr Malenkov. More surprisingly, the Chancellor has indicated that there should be five-power negotiations, including Federal Germany, before the German army is set up. It is true that he did not say exactly how soon after ratification of the Paris agreements such talks might take place, and it may be recalled that three years will be needed to establish twelve German divisions. But he conveyed the impression that the right to rearm might be a useful counter in the bargaining with Moscow.

The struggle for German neutralisation is not likely to relax if the agreements are ratified, as Dr Adenauer confidently expects they will be, in the *Bundestag* next week. The public has undoubtedly been attracted by the campaign against rearmament that is being waged by the Socialists, nationalists, groups of Protestant clergymen and important sections of the trade union movement, helped by intense Communist activity. It is hard to see how government speakers can make headway against a barrage of arguments very potent in German ears. The independent German radio gives full publicity to the opposition, whose cause has been furthered this week by a horrifying broadcast from

Dr Otto Hahn, the famous nuclear physicist. Another broadcast, although on the purely peaceful uses of the atom, has been postponed at the direct request of Dr Adenauer, who is under fire on that account.

Propaganda for peace and German reunion tends to become anti-western in its effect. This was shown by the meetings that were held in Western as well as Eastern Germany in memory of the RAF's destruction of Dresden in February, 1945, when tens of thousands of refugees, in flight before the advancing Russian armies, were killed. The attack was indeed indefensible; but it is deplorable that the Germans should be whipped up to resent it now. Any such sentiment plays into Russian hands. And it may be expected that the new leaders will not be slow to meet it halfway. With Marshals Bulganin and Zhukov in power in Moscow, it is a wide open question what offers will be made in future to win Germany's neutralisation. There may well be a hint of surprising things to come in the proposal made at a Communist-sponsored conference last week in Warsaw. For the first time the suggestion was put forward that, in exchange for this prize, the Russian army would withdraw from Poland as well as from Eastern Germany. The Soviet bidding, it seems, may be raised again.

China's Conscripts

SOME press reports from Peking last week gave the impression that the Chinese government had just decided to introduce nation-wide conscription. In fact, universal military service was decreed at a meeting of the State Administrative Council in Peking on September 9th last year. Details appeared in the Chinese press five days later. It was announced that a first intake of 450,000 men would be called up between November, 1954, and the end of the present month. The term of service was given as three years for the army, four for the air force, and five for the navy. Youths who provided their families' sole manpower, or were only sons, could claim deferment.

PROGRESS IN ELECTRONICS

Despite its innumerable applications, the magnet is still popularly associated with its use as a navigational aid. This is perhaps not surprising when one considers that the earliest experiments in magnetism were connected with the compass and its use in navigation.

It is said that the Chinese were using a form of lodestone compass in B.C. 2637, but the experimental study of magnetic direction finding devices really began in A.D. 1000 and reached something of a milestone in the 16th century with the work of Dr. Gilbert, who was physician to Queen Elizabeth.

It is only within the last twenty years, however, that revolutionary advances have been made in navigational aids. Radar was, of course, the most important of these advances and it owed its successful development to the invention of an electronic tube known as a magnetron, and this device, in turn, depended for its efficiency upon the "Ticonal" permanent magnet—an alloy having great field strength, stability and uniformity.

Mullard's work in the field of magnetic materials has been particularly outstanding. In addition to "Ticonal" permanent magnets, two other materials now in quantity production are Magnadur, a non-metallic permanent magnet, and Ferroxcube, a non-metallic H.F. core material. These materials are contributing to important developments in other electronic applications such as television receivers and line communications equipment.

Progress in magnetic materials continues, and through this the future may well see developments of equal significance to those which have gone before.

Pile driving in Holland

Polishing in Sweden

Atlas-Copco puts compressed air to work for the world

Pushing back the sea is a full time job in Holland. Aiding the Dutch in their age-old battle are Atlas-Copco sheeting drivers now at work sinking piles and sheetings on the vast new Zuider Zee project. Doing a very different kind of job on the shores of the Baltic are Atlas-Copco pneumatic polishing machines. Installed on the production lines of an ultra-modern automobile plant, these and similar small hand tools are playing an important part in Sweden's

growing automobile industry. As in Holland and Sweden, so in almost every part of the world—Atlas-Copco is on the job wherever compressed air is working hardest. Atlas-Copco provides equipment for every conceivable application of compressed air. Add to this, the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

*Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to THE ATLAS DIESEL COMPANY LTD., Beresford Avenue, Wembley, Middlesex.

Ancient Chinese tradition was maintained by the Communist regime in the system of demanding from an area a fixed quota of conscripts.

In a huge country with poor communications, it is obviously not possible to set the full machinery of nationwide conscription in motion at one stroke, and last autumn the Chinese press was explaining to the public that universal service would have to be brought into operation by stages. The *People's Daily* of Peking made a point of warning those already in the army that the conscription decree did not mean that they could expect an immediate release. The press foresaw a good deal of "misunderstanding" and was at pains to insist that conscription was an "advanced system" essential to China's national defence, as to which "no relaxation could be allowed."

Last week's announcements in Peking concerned the future organisation of the army. The official armed forces gazette announced that in future there will be fourteen army corps, including a special political division which will presumably be based on the Soviet model. At the same time, new senior ranks, including marshals of the republic and a chief marshal, were introduced, and China finally abandoned the proletarian principle that officers should resemble their men in appearance.

The Political Screen

TELEVISION is so rapidly becoming the most important means of getting party propaganda across to the electorate that Labour's experimental programme last week deserves a critique of its effectiveness rather than of its content. The idea of concentrating on a single subject—the need for protection of the consumer against shoddy merchandise—was undoubtedly successful. By the end of the programme many viewers must have been ready to swallow the assumption that whenever they make a bad buy in the shops it is all Mr Thorneycroft's fault. Miss Elaine Burton also emerged as a definite television personality, despite her tendency to overact her astonishment as each tattered product was paraded before her. She triumphantly refuted the male political hypothesis that—apart perhaps from Lady Tweedsmuir and Mrs Barbara Castle—lady politicians should be heard but not seen.

Where the programme failed was in those parts that were obviously intended to fit into the tradition of TV. The worn-out shoes and carpets merely looked like old shoes and carpets, and it required a great effort of mind to remember that they were really relatively new ones. The idea of bringing in two members of the ordinary deluded public was also a failure. Utterly honest people both, they were quite unable to act their allotted roles of piteousness recollected in tranquillity; the only emotions they got across were, respectively, that they felt clever and hugely delighted to appear on the screen. The bluff manufacturer, who agreed with Miss Burton that manufacturers of shoddy goods should not be allowed to undercut him, was also a poor propaganda point. The lesson for politicians of both parties is that they would be wise to stick to their own political methods of presentation; when they try to imitate the panel game policy of professional television producers, odious comparisons will always be made.

Killing the Comics

THE Home Secretary has acted very promptly in trying to crush the horror comics, and everyone will sympathise with his aims. But the Bill that was published last week—with the pleasing title of the Children and Young Persons (Harmful Publications) Bill—has drawn a net whose mesh may yet be too wide. An attempt has very properly been made to confine its application to horror comics and nothing else by defining them as follows:

Any book, magazine or other like work which consists wholly or mainly of stories told in pictures (with or without the addition of written matter), being stories portraying

- (a) the commission of crimes; or
- (b) acts of violence or cruelty; or

- (c) incidents of a repulsive or horrible nature;

in such a way that the work as a whole would tend to corrupt a child or young person into whose hands it might fall (whether by inciting him to commit crimes or acts of violence or cruelty or in any other way whatsoever).

This is certainly specific enough to safeguard works of literary merit; and the emphasis on pictures is wise. But it could still catch an illustrated magazine that published pictures of modern warfare, from the laudable motive (more or less) that people ought to know about it. It is surprising that any reference to motive has been omitted from the Bill, just at a time when many people think that it ought to be included in the law against obscenity. It is true that it is very hard to determine a person's motives, but if a court had to try to do so, it would at least draw the net somewhat finer.

Another striking omission is that the penalties apply to "a person who prints, publishes, sells, or lets on hire" a horror comic, but not to those responsible for the pictures and captions. It is strange to punish the bookseller, who conceivably (although improbably) might not know what he was selling inside an apparently innocuous cover, and to take no action against author and artist, who must certainly know what they were doing. Parliament will have to scrutinise this Bill very closely—and it is to be hoped that it will not allow this particular measure to divert its attention from the wider—and at least as urgent—need for a revision of the whole law of obscenity as at present defined.

Dangerous Driving

THE House of Lords always offers a difficult course for any change in the motoring laws, and the new Road Traffic Bill came a cropper at the first hurdle. The peers rightly threw out a clause which proposed that the testing of old vehicles might be carried out not only at official centres but also by selected private garages, acting as Government agents. Their action may make it difficult to inspect as many vehicles as the Government would like, but only a particularly dim bureaucrat could have failed to see the danger of the original proposal. If there are four garages in a locality, and one became a Government inspecting centre, where would all the owners of old cars think it advisable to take their business? The lucky proprietor would probably not even need to drop a hint.

The results of the peers' second stricture may be less happy. The Government has agreed to consider a clause

that will make it possible to send to prison, for up to five years, any dangerous driver who causes a death on the roads; at present these drivers can only be imprisoned on a manslaughter charge, and the Lord Chief Justice believes that "juries hate the word manslaughter" and that their verdicts are apt to be over-generous and perverse. But the real trouble about the present law—as with the suggested new one—is that the punishment meted out to a dangerous driver depends on the sheer lottery of whether his victim is strong enough to survive. Justice is a monstrous thing when it varies according to the thickness of a particular pedestrian's skull.

Trek from Sophiatown

MERCIFULLY the first stages of the South African government's Western Areas resettlement scheme have gone off without incident. There was at one moment

a real danger of an explosion in which the sufferers would have been mainly innocent Africans. Responsibility for the tense atmosphere does not rest entirely with the government, whose arbitrary actions, however, did not inspire confidence. As it turned out the elaborate display of police strength and the theatrical banning of public gatherings (since lifted) were unnecessary.

The Western Areas plan envisages the transfer of some 60,000 Africans from the townships of Sophiatown, Martindale, and Newclare, which with the rapid growth of Johannesburg have become isolated pockets in a predominantly white residential area, to new houses built at government expense at Meadowlands some fifteen miles away on the outskirts of the city. The condemned townships are for the most part slums of indescribable squalor. Most of the inhabitants rented their houses and shacks; freehold ownership belonged to only a few and there were many complaints of rack-renting. In the new area freehold ownership is not allowed; instead the Africans are offered 30-year leases at rents adjusted to the income of the family. The scheme had been first devised and approved by the United Party-dominated city council, but later, when the

In spite of the vast perimeter of the Communist bloc, Soviet-Chinese power is at present contained just short of the Atlantic, of the Mediterranean and of the Indian Ocean. It nevertheless gives an appearance of menacing solidarity; and in world war the Communist system would benefit from internal lines of communication. Conversely, Soviet propaganda increasingly emphasises encirclement by America and its allies; and in world war the on the theme more than ever. As seen from Moscow, this is borne out by the map; even the former gap between Nato and Seato, between Turkey and Siam, has now been partly filled by Pakistan. From any of these territories the Russians believe that atom bombers could be directed against them.

Nationalist Minister of Native Affairs, Dr Verwoerd, began to take an interest, they dropped it. The government thereupon appointed a special board armed with the powers of a local authority to carry out the plan.

Some critics have attacked the scheme as a fraud because, they say, there are worse slums in other parts of Johannesburg which should have been tackled first. They object, moreover, to the destruction of property of a habitable standard at a time when the city is desperately short of African housing. But it is something gained that at least a part of Johannesburg's half-million African population is now to be decently housed. The real malice of the scheme is that it is naked *apartheid* in conception.

Building New Hospitals

THE health service has proved to be such an expensive part of the social services that any proposal to spend additional large sums on it is bound to be regarded askance, particularly as the Minister of Health's statement on new hospital building coincided with a supplementary estimate of £6 million for this year's health service bill. Nevertheless, replacement of old hospitals is in many cases long overdue, and expansion to meet new needs cannot be denied for ever. What is ominous for the taxpayer is that from Mr Macleod's statement it seems that there is to be more expansion than replacement. The public will have to face the fact that the new capital spending will be followed by a bigger bill for hospital maintenance.

Since 1948, hospital boards have been allowed certain sums for their capital expenditure each year, but they have not been sure enough of their financial future in this respect for them to carry out a planned and co-ordinated works programme. They have now been assured that, subject to Parliament's approval, their present capital allocations will be maintained and even increased over the next three years to enable them to carry out their ordinary capital works. They have also been promised, first, a sum of £2 million in 1956-57 and £4 million in 1957-58 for replacing inefficient boilers and obsolete laundry and kitchen equipment with a view to reducing their maintenance expenditure; and, second, £7½ million and £10 million in the same two years to enable them to start large new building projects, costing not less than £250,000 each.

This assurance of certain grants for large-scale building will undoubtedly be welcomed by the hospital boards. But it does not imply that the hospitals are to be given block grants for new schemes, similar to those given to the universities. Which projects put forward by the boards will be accepted by the Minister of Health and started in the two-year period cannot be foreseen; nor, to judge from the ones Mr Macleod mentioned last week as likely to be begun, are the principles guiding him in selection entirely clear. New hospitals for new centres of population or where present facilities are inadequate have a recognisable priority. But what determines which old hospitals should be lucky enough to secure their extensions, while others, equally hard pressed, have theirs turned down? Mr Macleod might well be asked to throw more light on this aspect of the new grants.

Higher Prices for Farmers

FARMERS have been awarded an all-round increase in guaranteed prices as the result of a special price review. Formally and logically, this result has no bearing on the more important annual review of farm prices which is also now taking place; the two reviews relate to different periods and are conducted along different lines. Livestock prices up to April 1st of this year and crop prices for this year's harvest were fixed a year ago; and these have now been adjusted in such a way as to recompense farmers in full for the increase in their wages bill during this period. This adjustment merely follows the established but unhappy convention that if costs rise suddenly during the period covered by an annual review, so shall prices.

Nevertheless, the prompt and full recoupment of the special review, coupled with the Chancellor's honeyed words at the farmers' banquet, is causing most farmers and politicians to assume that the annual price review will have an equally generous conclusion. The temptation to woo farmers in an election year is almost irresistible; possibly some Conservatives reflect that next year will be soon enough to inject a little realism into agricultural policy. But the consequences of this approach could be very dangerous—both for agriculture and the Conservatives. There can be no quick turn-round in agricultural policy, and the prices fixed now will have an important influence on both production and subsidies two years and more hence. If farmers are now given full compensation for their increased costs at the annual as well as at the special review, this will not only make a sizeable hole in this year's budget; it will make a hole in next year's as well.

Tito Comes Home

"It is really a long time to be away from the country, especially for a dictator." Thus spoke Marshal Tito to the crowd who greeted him at Belgrade railway station on his return last week from his ten weeks' tour to India and Burma. He spoke ironically, but the West will be

inclined to take him seriously and agree that a dictator who can travel so far and for so long, and yet return to find everything still "strong and monolithic" (in spite of Messrs Djilas and Dedijer) is indeed a rare bird who is entitled to crow a little over his achievement. It is unlikely that he would be able to see so much of the world if he had remained in the company of Rakosi, Chervenkov and Bierut.

Moreover, the tour was satisfactory, in an unspectacular way. Marshal Tito talked with important Asian leaders who feel very much as he does about the dangers of a world divided into two hostile blocs and are equally unwilling to throw in their lot with either; and he has returned with a reinforced conviction that he has hit on the right path for Yugoslavia. It is true that there are not many other safe paths open for the Yugoslavs; but there is no reason to doubt the sincerity of Marshal Tito's belief that his country's present course best serves the cause of peace. Nor is there yet any reason to cast doubt on his repeated and emphatic assertions that Yugoslavia's improved relations with the Soviet bloc do not imply any change in its policy of "friendship and co-operation" with the West.

Mr Molotov would evidently like to think otherwise. Whatever policies Moscow may now change or drop, the

Need for Reform

We called attention to the fact that the old constitutional practice of requiring every minister appointed by the Crown, or removed from one appointment to another, to vacate his seat, and present himself before his constituents for re-election, had ceased to be needed as a control upon the possible aggressions of the Crown, and had become purely and sometimes seriously mischievous; inasmuch as it gave, not to Parliament (which might have been proper enough), but to a cross-grained or malignant majority in any small borough, a veto upon the appointment of the Sovereign. . . . Lord John Russell saw the absurdity of carrying the antiquated custom as far as we now do; and in his new Reform Bill introduced a clause providing that the seat of the minister should not be vacated where merely a *change of office* was in question. That clause, however, shared the fate of the whole measure; and at this very moment, in the crisis of a war, and in the most anxious condition of the public mind, the House of Commons, after a fortnight's adjournment, in consequence of a ministerial break-up, has had to adjourn for ten days more, because one cabinet minister has moved from the Home Office to the Treasury, and another from the War Office to the Colonies, and both are, therefore . . . compelled to put themselves again upon their trial before the country, and solicit Tiverton and Wiltshire previously to ratify the decision of the Crown. This piece of pedantic red-tapism may be worthy of the slavist habits of routine, which in this sad war seem to have clogged the movements of every department of the state machine, but is surely unworthy of a free, sensible, and serious country. Why not at once proclaim openly what is the plain truth—that every man, by the mere fact of his election, is declared by the country to be competent for office. He is sent to Parliament to aid in governing the Empire; and if the Queen selects him to govern it in Downing Street as well as in St. Stephens, his constituents should regard this as a compliment to their choice, not as a sort of stigma which it requires a re-election to wipe away.

The Economist

February 17, 1955

wooing of Tito is not among them; on the contrary, it seems that it is to be intensified. In his review of world affairs before the Supreme Soviet last week the Russian Foreign Minister dropped a broad hint that the Yugoslavs had not been as forthcoming as they might have been; and he announced that the Russian leaders were striving for "a possible concerting of efforts (with Yugoslavia) in such a matter of decisive importance to all peoples as the safeguarding of peace and international security." In other words, every effort is to be made to induce Yugoslavia to become a cornerstone of Molotov's all-European security organisation. Nobody is better equipped than Marshal Tito to understand the drawbacks to this arrangement.

Revolt in Ashanti

DR KWAME NKRUMAH'S troubles are growing. Somewhat belatedly he decided that he must take the Ashanti National Liberation Movement seriously, and offered to parley—not on the Ashanti leaders' demand for a federation of Ashanti, the Colony and the Northern Territories, but on regional devolution. But now, with the backing of the Muslim party of the North, the Ashanti leaders have refused. Their movement's slogan has been altered from "No

federation—no independence" to "No federation—separation." Several of Dr Nkrumah's close friends have deserted his own party and joined the movement, notably Mr Joe Appiah. The influential Mr Mainoo is wavering. The Asantehene, the traditional ruler of Ashanti, has also emerged from behind the scenes and is now openly associated with the movement for Ashanti separatism. Though his autho-

rity is only moral (it fully compares with that of the Kabaka of Buganda), his emergence is significant; for he cannot afford to risk what remains of a symbolic kingship in a lost tribal cause.

So far, fortunately, the challenge has not become a challenge to law and order. But it clearly has great attractions for Ashanti minds. Although the grievances of the cocoa farmers about price policy have played a part, the basic causes of unrest are tribal rather than economic. The movement's terminology is clothed in constitutional jargon—federation and secession—but its real protest is against the transfer of power to Africans with a European outlook, whether politicians or officials. With this reaction the Colonial Office has clearly no sympathy, and it has refused

the movement's request for a Royal Commission, leaving Dr Nkrumah (and the Governor, Sir Charles Arden-Clarke) to settle matters internally. This is a crisis for the cause of African self-government. The Gold Coast—a compact, prosperous, viable African territory—is the key experiment in democratic African home rule; if tribal separatism triumphs there, it will be widely taken by critics of British colonial policy as a sign that Africans south of the Sahara are "not yet ready" for full responsibility to run their own affairs.

Help for Brazil

AFTER the death of President Vargas last summer, Brazil faced an extremely difficult economic situation brought on by inflation and a foolish attempt to hold out on coffee prices. Despite a series of cutbacks in the price of coffee and efforts by President Cafe Filho to put the country's books in order, the position is now more critical than ever. Loans of \$1 billion are outstanding against Brazil even if one does not take into account undisclosed internal dollar obligations. This year, Brazil is due to repay nearly \$200 million and the country's dollar shortage is getting continually more acute despite cutbacks in the allocation of foreign exchange for imports. Foreign exchange holdings, moreover, are dwindling under the pressures of an inflation which caused an increase of more than 35 per cent in wholesale prices in 1954.

Brazil's main source of strength is the fact that for strategic and commercial reasons the United States will continue to step in when matters threaten to collapse. Brazil is traditionally a major customer of the United States, which increasingly regards it as its stablest friend in Latin America. This attitude was expressed last week when the Export-Import Bank agreed to an emergency request for aid from Brazil and lent President Cafe Filho's government \$75 million. The money will be used, in large measure, to pay for imports of capital goods over the next six months. This new loan comes on top of \$200 million borrowed from a group of private banks last November.

Although Brazil's earnings in foreign exchange are usually larger in the second half of any given year, it is difficult to see how it can hope to pay off its many debts. Ultimately, the country will have to realise that, even in a vital election year such as this one, one cannot have both a vast social works programme and a sound balance of trade without increasing production. The Export-Import Bank's recent loan of \$730,440 to a Brazilian steel manufacturer in order to increase production at Monlevade is, in the long run, a sounder step than the pumping of further millions into the great inflationary balloon.

Clouds Over Nyasaland

IF the proposals for changes in the constitution of Nyasaland could be taken as evidence that the local administration were alive to the dangers building up in the

protectorate, and determined to deal with them, they would be doubly welcome. But, sensible as they are, they spring more from the previous Colonial Secretary's visit to the protectorate, and his evident anxiety about it, than to any drive and imagination on the spot. Though they make a concession to African demands for much more political influence, they are in no sense part of a wider plan to reduce the growing pressure of African discontent. They would give Africans two more seats in the Legislative Council—five out of a total of 23—and they lump Europeans and Asians together on a non-African common roll to elect six members; but the official side remains firmly in control. This may perhaps be suited to Nyasaland's limited political experience, lack of leaders, unpreparedness for elective methods and the state of Federal white public opinion; but being in control should not necessarily mean being inert.

The disturbances in the southern province are fresh in the mind; and among the reasons for the administration's inertia are its knowledge that discontent remains and its anxiety to do nothing that will start more trouble. But the land question becomes ever more urgent; there is exactly the same sense of grievance, based on misunderstanding, among Africans both in the Cholo district and in the districts round Limbe and Blantyre (which, it is now proposed, should become one municipality) as there is in Kikuyuland. There is still time to apply variants of the Swynnerton plan, and the other post-emergency proposals for relieving Kikuyu rural poverty, in Nyasaland before discontent is organised by troublemakers. The arrangements for winding up the "tangata" system (squatter rights on European companies' land) and the settlement of uncultivated land should be pushed forward, but they need to be supplemented by a far wider plan to improve African agricultural conditions. Most of the powers exist; the companies say they are eager to co-operate; it is widely known what is necessary; money could be found. What is lacking is forceful leadership of the kind to be found in territories next door to this key province of the Central African Federation.

Politics Down Under

AUSTRALIAN GOVERNMENT AND POLITICS.

By J. D. B. Miller.

Duckworth. 240 pages. 15s.

AMONG the "white Dominions" Australia is worthy of special study by the British people at the present time. It is the fastest expanding of the various British communities—expanding, moreover, with the aid of an annual immigration that is still 50 per cent British. But because it is so often represented as a sunnier home from home, and because Australian political nomenclature is borrowed extensively from the British, it is too readily assumed that in some way Australian federal government is a close copy of British parliamentary government. In fact, its differences are as striking as its resemblances. A better understanding of this has long been needed, and Mr Miller's book, cogent, lucid, up to date (1954) and highly readable, will admirably inculcate it. It is a fine study of a federal adaptation of British parliamentarianism that has been subtly woven into a wholly dissimilar environment, and it should be read not only by students or specialists in Australian or South Asian affairs (or by emigrants), but by political experts generally—for at a time when Britain is creating so many federal states, without any first-hand understanding of the problem, Australia's experiences are a suggestive case-history.

The circumstances that have given Australia, a country of 9 million people, thirteen Houses of Parliament and 680 MPs, is not simply an historical accident that calls for correction in the interests of cost and efficiency. Mr Miller distinguishes various types of federal situation, and finds that Australia's is based on distance and the separate local interests of a community of an otherwise remarkably homogeneous people. Indeed Australia is a great crescent of fertile islands between a sea of sand and a sea of water. What is significant in the fifty years since federation is not only the growth of the Federal government and its acquisition of certain functions from the States, but the simultaneous growth of the State governments in their own sphere, and in accordance with the needs of economic development, for which they are the agencies. It is true that the State governments do many of the things which local government does in Britain; but their main function is the administration of huge inhospitable development areas, so huge and so scattered that their

problems are entirely different from anything understood in Britain—problems, moreover, which could never be tidily centralised.

For the same reasons, Australia's party system is differently organised from the British, though it has a progressive and a conservative wing. But it is, and must remain, a three-party system, with the Country Party strongly entrenched in the rural interest. Mr Miller gives a most valuable analysis of the pressure groups or syndicates that arise in such an environment and the machinery through which they bring themselves to bear; the trade unions (with their Roman Catholic and Communist tugs-of-war) through the arbitration and wage-fixing systems; the manufacturers through the Tariff Board; the farmers through the marketing boards. He describes the circumstances that make it so difficult, for example, to nationalise an Australian industry; these have nothing to do with the provision of Senates, State or Federal, or the more obvious brakes on legislation, but everything to do with the splitting of sovereignty.

The checks and balances of the Australian constitution are intricate, like the American. The Australian politician's power is correspondingly circumscribed—and the public likes it so, as Mr Miller's examination of the history of referenda suggests. But the upshot is a system of government that enables the country to expand even if it puts a premium on inflation. Expansion in Australia is a hard fight with nature. This book usefully illuminates the political and administrative machinery of that struggle and leaves one with more respect than one expected to feel for the men who have to operate it in a society fiercely partisan, strongly political and tenaciously egalitarian. Mr Miller has made a notable contribution to the understanding, not only of Australian institutions, but of Australian political motivation.

A Classic of Detection

THE PILTDOWN FORGERY.

By J. S. Weiner.

Oxford University Press. 226 pages. 12s. 6d.

LET no one imagine that because this book concerns a palaeontological *cause célèbre* it is addressed solely or even mainly to connoisseurs of palaeontology. As well might one suppose Mr Freeman Wills Croft's "Death of a Train" written exclusively for railway-

THE ECONOMIST, FEBRUARY 19, 1955

men, or Miss Dorothy Sayers's "Nine Tailors" for campanologists. "The Piltdown Forgery" is detective story, pure and simple; a perfectly magnificent detective story, with the advantage of being true.

The first two chapters form a prologue, explaining the situation over which the author found himself fruitlessly mulling as he travelled home, one evening in 1953, from a palaeontological congress. Every advance in palaeontological knowledge through the last forty years had made Piltdown Man look odder and more anomalous; yet it was impossible to write him off. A human brainpan, a simian jawbone, even found in close proximity, would have been thankfully dismissed as unrelated fossils but for two facts: first, the typically human wear on the teeth; second, the subsequent discovery, at a nearby site, of a similar set of fossil fragments. The teeth alone might not clinch the matter; opinions had varied in 1912, when Mr Charles Dawson announced his discovery. The second set of fragments did clinch it; a double coincidence of fossil man and fossil ape was too much to swallow. Piltdown Man outraged all palaeontological knowledge; a fortuitous collection of fragments outraged the laws of probability; total impasse. . . . On the baffled Dr Weiner, brooding on this impasse, there breaks a flicker of luridly suggestive light. Those teeth. . . . That impossible jaw. . . . Those improbable coincidences. . . . They could all be explained if—if (despite all differences of style, one is irresistibly reminded of the sudden, hard-earned illumination of Inspector French) someone had been doctoring the evidence. Teeth can be artificially abraded, sites can be salted. . . .

The hypothesis is tested. It proves correct; jawbone and canine are not fossils at all but artificially stained frauds. Frauds by whom? Through succeeding chapters Dr Weiner follows the course of investigation: further tests on the Piltdown fragments, documentary studies, examination of the animal fossils and flint tools found (?) in the Piltdown gravel, interviews with surviving participants in the original dig, with relatives, acquaintances, colleagues. . . . A, B, C, D are progressively exonerated; little by little, there emerges a portrait of the hoaxer; inexorably his lineaments shape themselves on those of Mr Charles Dawson. Of Mr Dawson's exclusivity? Was he, at first, himself a victim? What were his motives? No answer. Possibly, just possibly, "he might have been implicated in a joke, perhaps not even his own, which went too far." (On his death-bed, one remembers, he was inarticulately trying to explain something about a skull.)

How pleasant that this detective story is not concerned with murder. Mr Dawson was undoubtedly very naughty. He wasted a great deal of other people's valuable efforts; he bedevilled palaeontology for a whole generation; he

brought aid and comfort, however illusory, to obscurantists. But one cannot cherish any really hard feelings against him. It was a wonderful leg-pull and it makes a wonderful story.

A Canvas too Broad

THE GREAT INFLATION 1939-1951. By A. J. Brown. Issued under the auspices of the Royal Institute of International Affairs.

Oxford University Press. 333 pages. 30s.

PROFESSOR BROWN is an erudite and conscientious economist; and from this spring both the virtues and the defects of his book. His task, under the auspices of the Royal Institute of International Affairs, was to examine the worldwide increase in prices between 1939 and 1951; and to explain to the general reader why it occurred. His theoretical—as distinct from his practical—approach is comprehensive, sometimes rather confusingly so. He rejects any attempt to analyse the process of inflation merely in terms of the pressure of demand upon inadequate supplies or stocks, and makes extensive use of such trusted (and rusted?) old tools as the quantity of money in different countries at different times. He says in his preface that he has accepted some suggestions from Professor R. G. Hawtrey "with very great profit." The general reader, for whom the book is supposed to be written, therefore finds himself looking at a very broad canvas from every possible angle at once.

In this mammoth task Mr Brown's basic raw material consists of the cost of living indices in nearly fifty countries between 1939 and 1951. These show that "the most frequent price increases in the years under survey were only some 50 per cent greater than the smallest recorded increase, while the largest increases were thousands or millions of times as great as those most frequently met with." Price inflation, he concludes, is therefore not simply an accident; it is "a disease which (beyond a certain point, at least) feeds upon itself." He then attempts to diagnose the disease in the large number of cases before him; and the reader is whirled away through a wide-ranging analysis of the effects of the multiplier, war expenditure, hyperinflation, price control, excessive liquidity and high interest rates.

Unfortunately, it soon emerges that the cases where price inflation really got out of hand cannot be made into very interesting economic studies. Their troubles usually lay in war or revolution or Latin American misgovernment or administrative breakdown—and these are not factors that are easily brought out by bare analysis of the (sometimes suspect) official statistics that flood across Mr Brown's desk. The most interesting parts of the book therefore deal with the maturer countries. Here Mr Brown moves steadily—although sometimes, especially in his treatment of price controls and interest rates, very controversially—towards a general conclusion about society's prospect of keeping price

inflation within tolerable bounds under conditions of full employment. He believes that "the United States might achieve it; for the United Kingdom the prospect is far more doubtful." This is a book into which it is profitable to dip, and with which it is sometimes easy to disagree. It has less value if it pretends to present a compact picture of twelve tumultuous years in the world's economic history.

Irish Inconvertibility

THE IRISH POUND.

By Frank Whitson Fetter.

Allen and Unwin. 136 pages. 16s.

EVERY student of monetary history is familiar with the report of the Bullion Committee of 1810. It has been reprinted and edited many times. The report of the committee which investigated the Irish currency in 1804 is far less well known, although it is in many respects more original and more interesting. In 1797 the Bank of Ireland had been compelled by the Government to suspend the redemption of its notes in gold. The period of Bank restriction continued in Ireland until June, 1821, whereas it terminated in England a month earlier. The twenty-four years of inconvertible paper in Ireland witnessed many interesting events in the monetary and banking spheres. Important questions of theory and policy arose. The Bank of Ireland unduly expanded its note issue and the Irish pound depreciated. Many of these problems were investigated by the Select Committee on Irish Currency in 1804.

Several of the members of this committee acted also on the Bullion Committee, and many of the same writers and politicians took part in the controversies that raged round these two inquiries. The proceedings of the Irish Committee are difficult to procure, except in public libraries. Professor Fetter has rendered a valuable service to students of economic history by reprinting the report with selections from the minutes of evidence. He has contributed an introduction that throws a flood of light on Irish monetary and banking questions at the beginning of the nineteenth century. This introduction traces the events that led to the appointment of the committee, the theoretical and practical issues it discussed, and the conclusions it reached. A full account is given of the developments that followed the publication of its report, ending with the amalgamation of the British and Irish currencies in 1826.

The most valuable part of Professor Fetter's introduction is his study of the theoretical questions investigated by the committee. He interprets old controversies in modern terminology and shows that many problems of monetary and banking policy have not changed very much with the passage of time. He makes the original suggestion that the recommendations of the committee for stabilising the exchange rate between London and Dublin contained the

nucleus of the sterling area and foreshadowed the present relation between the British and Irish monetary systems.

Translator's Skill

VERSE IN TRANSLATION.

By H. A. Siepmann.

Batchworth Press. 336 pages. 25s.

THE art of translation is little understood, and not enough has been written of its trials and pleasures. Fortunately for the reader, there have always been some who enjoy translation for its own sake, and Mr Siepmann is one of them. In this book he has set out a selection of his verse translations, mostly from French and German, but a few from Latin. With each translation he sets out the text of the original, and adds notes on his methods and on the difficulties he has encountered. A short introduction describes his aims: in it he says little that is new, but nothing off the point; the problems are posed clearly. He makes it clear that this is not an anthology of good or even favourite poems: good, indifferent, or sometimes downright bad, he has chosen them as tests and indications of the translator's skill.

Mr Siepmann's standard is high, and to read his versions and his notes adds greatly to one's understanding of the poems. He keeps to his own first principle: that a translation should not by its diction betray that it is not an original. He only fails in some modern French poems, written in colloquial style, where one feels not so much that he has clung to the French as that slang is a foreign tongue to him. As usually happens, German proves more untranslatable than French: the difference in feeling too often goes more than word-deep. The versions of Heine are not perfect, but they could not be. Those of Schiller are admirable; and in translating some minor poets Mr Siepmann improves on the original. The translations from French are mostly excellent. Obedient to the order of the alphabet (which he has followed so rigorously as to find a poet beginning with X in order to complete his muster) he starts with Aragon's *Les Yeux d'Elsa*, an immensely difficult task which he fulfils admirably. The few translations from the Latin are among the best in the book.

At the cross-roads between Mr Siepmann's two paths, as translator and as central banker, he presents a curiosity: some tart and entertaining epigrams by Dr Schacht.

The Malaysian World

MALAYA, INDONESIA, BORNEO AND THE PHILIPPINES.

By Charles Robequain. Translated by E. D. Laborde.

Longmans. 467 pages. 30s.

MR ROBEQUAIN'S own title for this impressive survey was "*Le Monde Malais*," and one wonders why it has been exchanged for the cumbersome collection of country names that heads

the English edition. There are purists, no doubt, who would quail at the use of the word "Malay" to cover the Philippines, but English has this advantage over French that the word "Malaysian" can be used in much the same way as the author uses *malais*, to cover an ethnic group which is to be found in varying numbers and proportions from the southern border of Siam across the vast crescent of scattered land that reaches to New Guinea and to the Philippine Islands.

It is a difficult task indeed to write a book about so vast and varied a region that will be both readable to the layman and useful to the specialist; the more difficult when the region is in full transition owing to the ferment of nationalism which prevails no less in Malaysia than elsewhere in Asia. A large proportion of the facts M. Robequain has gathered are basic and indestructible: history can be falsified, but not altered, and geography is immutable. But when he reaches the field of politics, M. Robequain finds himself outdistanced by events, and his breathless revisions and additions here and there are insufficient to enlighten the student of the contemporary scene. The same criticism, to a lesser degree, can be made of the economic aspects of this work. Too many of the statistics are out of date, in most cases no doubt because no more recent ones are available. It is of somewhat academic interest, for instance, to read the production figures for various minerals in 1939, without being given even an approximate idea of the corresponding figures in any year since the war.

This does not mean, however, that the value of M. Robequain's labours should be minimised. M. Robequain has, in fact, produced a survey of this vast area remarkable both for its breadth and its lucidity, which appears to be in no sense impaired by the translation. His years as professor of tropical geography at the Sorbonne and his travels to parts of Malaysia have well qualified him for his forbidding task, and the Institute of Pacific Relations, in co-operation with which the book has been published, deserves thanks for making it available to the wider public. The many photographs and the geological and economic maps greatly enhance the practical value of M. Robequain's study.

Books Received

AUTOMATIC MERCHANDISING.
By Martin V. Marshall. *Harvard Business School*. London: Bailey Bros. and Swinfen. 286 pages \$3.50. 28s.
Mr Marshall's book is the result of a doctoral dissertation devoted to the whole subject of using vending machines in the distribution of consumer goods.

MAN ON HIS NATURE: The Gifford Lectures, Edinburgh, 1937-38.
By Charles Sherrington. *A Pelican Book*. Penguin Books. 311 pages. 2s. 6d.

THE CLERICAL ORGANISATION OF THE HOUSE OF COMMONS 1661-1850.
By Orlo Cyprian Williams. *Oxford University Press*. 381 pages. 35s.

Letters to the Editor

Millions for Cinderella

SIR—Mr Grimond makes the good point that if the nationalised industries are to be accountable on commercial lines they should distinguish in their capitalisation between the elements of equity and prior charge. Unless grave maladjustment of the economy is to result it will be necessary that the claims of nationalised industries upon the available capital resources should be measured by competition in the capital market with the claims of commercial industry. Any such test is vitiated by a Treasury guarantee of the interest on their issues.

Unless nationalisation is advocated on ideological grounds there seem to be only two arguable grounds for nationalising a productive industry. (1) That it is, or is bound to become, monopolistic and had better, for that reason, be in public hands. This is presumably the case for railways, as it was for electricity. (2) That it provides an essential service which cannot be expected to yield a profit and therefore should not be left to competitive industry, as in the case of, for example, defence or education. Electricity is an example of an industry which the Treasury guarantee has assisted to achieve a disproportionately rapid rate of capital formation since the war. In consequence, resources which would have been better applied to the re-equipment of industry have been utilised to foster consumption—an unwise policy for an economy dependent on competitive world trade.

Diversion of investment by administrative action—by Treasury guarantees, control of capital issues, etc.—can only be justified if it is believed that governments are better informed than the market. The most advantageous distribution of available resources is best governed by the collective sense of all investors, which decides, through the free operation of the market, what should be the cost of money in one industry or another.—Yours faithfully,
London, EC3 ERIC MACFADYEN

Price Rings in the Corner

SIR—"The main arguments in favour of resale price maintenance," you say, "are that it enables small retailers to keep alive, to hold sufficient stocks and to provide additional services after sale." I had always supposed that this was the main argument against it.

Could you be a little more explicit? Why do you wish to retain in being any retailer of any size who is too inefficient to survive free competition? And why in this context do you agree with the

Lloyd Jacobs Committee's distinction between collective and individual resale price maintenance?—Yours faithfully,
P. J. D. WILES
New College, Oxford

[We did not say we agreed with these arguments about cossetting small retailers; but—as collective resale price maintenance should be fairly easy to attack, and individual resale price maintenance very hard—there would surely be some advantage in moving one step at a time.—EDITOR.]

India – Progress and Plan

SIR—In your supplement of January 22nd, after describing the recent increase in agricultural and industrial production, you go on to state (p. 17) that: "Expanded output has brought about a five per cent increase in consumption. The rate of investment may have risen by nearly double that figure. This is a much more encouraging outcome than the rise to seven per cent forecast by the Planning Commission for 1956."

Surely this is a *non sequitur*. The aim of the plan was to increase net investment from an estimated 5 per cent of national income to 7 per cent. If the rate of investment has increased by 10 per cent then its present share of national income is still no more than 5½ per cent. Am I not right in thinking that this is far from encouraging? Indeed, in so far as one can base any conclusions on estimates of this nature, it seems rather the contrary.—Yours faithfully,
M. W. TUCK
Imperial Chemical Industries

Economic Dividends

SIR—I have just noticed your underlining of Lord Kennet's remarks on the advantage to the national economy of the release of profits beyond the optimum by way of dividend. One cannot dispute the truth of such an observation, but there is a real danger in the interpretation of the qualifying term "optimum"; particularly in periods of rising prices, when reported profits are inflated by the financial gain derived merely from price changes.

To retain liquid working capital in a business, after proper allowance has been made for depreciation on current values of assets, over and above the needs of maintenance or planned expansion of the requisite amount of essential capital, is not good business for the country; but how many businesses are aware of how they stand in regard to the real "optimum" position?—Yours faithfully,
WILLIAM E. SPRUCE
Burgess Hill

harvests and health

The snake was an ancient symbol of Time and the turning year, with its earth-seasons

of spring planting, summer growth,

autumn harvest and winter sleep.

And the snake of Æsculapius has, since classical times, been a symbol of healing.

Agriculture to produce man's food,
and medicine to care for his health...

The improvement of crops
has been the main business of Fisons
for a hundred years and more,
almost since the science and production
of chemical fertilizers began.
and, in recent years, Fisons have struck roots
in the field of chemicals for medicine.
Fisons today contribute to the harvests
and health of the world.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Old Tariffs Fade Away

Washington, D.C.

THE House Ways and Means Committee, with fanfare and trumpeting, reported the President's Reciprocal Trade Bill to the House last week without important amendments. Meanwhile another committee was reminded of how really unimportant, by any but psychological tests, the Bill is. Though the State Department insists that it plans to use the modest tariff-cutting authority in the Bill for another round of multilateral negotiations, even with the new legislation the United States will have very little to give away. This was made clear by the testimony of a number of non-government experts before the Joint Congressional Committee on the Economic Report—including that of Mr Willard Thorpe, who in his State Department days was something of an architect of multilateralism.

Nevertheless, the sixteen days of intensive hearings before the Ways and Means Committee did reveal some genuine evidence of a trend in public opinion toward liberalism in trade—a trend which, in the end, may be more important than the actual Bill. Perhaps the most significant indicator came from the protectionist forces themselves. A number of their witnesses made the significant concession that the United States must, in fact, concern itself with the economies of its allies, asking only that it do so without sacrificing the witnesses' particular industries. This alone is a marked change from the old-style protectionism which had only to show that a domestic industry was being harmed in order to carry the day without further discussion. In addition, the protectionist forces concentrated more than ever before on the single, emotionally powerful, concept of "defence essentiality." The domestic watch makers, for example, even went so far as to approve the Bill—with the sweet reasonableness of the cat that has just swallowed the canary—adding only a righteous plea that skills vital to national security (such as their own) should be preserved from destructive foreign competition.

As usual the committee was confronted with a dazzling array of figures on imports, employment and relative shares of markets, and as usual the statistical battle left the uninitiated with the feeling of a draw. Yet, in the end, the assiduous work of the Committee for a National Trade Policy, whose researchers display the speed of light in producing figures to dispute the claims of any and every protectionist witness, managed almost by itself to persuade doubtful Congressmen that the world will not come to an end if tariffs are slightly liberalised. And it was a leading witness from this group of businessmen, formed last year to press for the President's programme, who most deeply

impressed the congressional committee. Mr Charles Percy, president of a camera-making firm, testified that imports were giving his business trouble, but he welcomed the competition and was confident that he could win the day by American ingenuity and imagination. Representative Noah Mason of Illinois, one of the few pre-Cambrians left in the House (he was one of only four members who voted against the extension of military conscription), told Mr Percy that "thou almost persuadest me to become a Christian."

★

The famous Bill, whose doubtful future so dominated the meetings of the International Monetary Fund last autumn and whose fate is being eyed even now at Geneva, has taken its first hurdle and will shortly be voted on in the House. This success is, perhaps, to be attributed less to the persuasiveness of the freer traders than to the firm hand of Mr Sam Rayburn, Speaker of the House, who made certain that the five new Democrats appointed to the Ways and Means Committee would have the proper views. The Senate is now the main hope of the protectionists. They confront a Finance Committee with a doubtful majority for the general principle of liberalism in trade; perhaps more important, they have in the persons of Mr Lyndon Johnson of Texas, the Democratic leader, and Mr Robert Kerr of Oklahoma, a senior member, Senators who will probably do all they can to burden the Bill with an amendment restricting oil imports. The President's announced opposition to oil quotas—together with the vital interest of New England and the eastern seaboard in obtaining cheap fuel oil—may turn the tide. Nevertheless, the protectionist forces profess to see in the powerful Finance Committee a ray of light at the end of their tunnel.

From their point of view, however, it remains a tunnel. The Bill's final prospects are good. This raises three related questions, the last two of which were explored in detail before the Joint Economic Committee. The first is: how much would passage of this Bill reveal a change in sentiment in the United States? Despite the protectionist forces' shift of ground before the Ways and Means Committee, and despite a definite swing in public opinion generally toward more liberal trade, a qualification is necessary. It centres on the old, and perhaps insoluble, problem of the relative persuasiveness of any specific protectionist plea as against the general liberal case. The reluctance with which a number of Congressmen voted or will vote for the Bill is apparent; they have no doubt

received campaign contributions from industries or workers in their districts which stand to lose, or believe they stand to lose, from import competition. Such reluctance will be overcome, no doubt, only by the modesty of the programme and the genuine wish to do the statesmanlike thing provided too much is not demanded. It is entirely possible, for example, that the Act ratifying the newly renegotiated General Agreement on Tariffs and Trade will prove more than timid lawmakers can stomach.

Second, there is the question of what is accomplished if the Bill does pass. In addition to extending for three years the power to negotiate reciprocal trade agreements with other countries, it grants three new types of tariff-cutting authority. Tariffs may be cut progressively by 15 per cent, but more important may turn out to be the right to reduce to 50 per cent *ad valorem* any tariff higher than that, and the right to cut by one-half of the 1945 rates the duty on any item not normally imported or imported in only negligible quantities. The authority to make these latter reductions unilaterally was denied the President by the Ways and Means Committee in its only substantial amendment. According to Mr Thorpe all of this "will mean relatively little effective reduction in tariff rates." Furthermore, the Bill preserves intact the notorious "escape clause"; under this an industry which considers itself damaged by foreign competition can appeal for a readjustment of rates. This clause is deemed the single most important deterrent to the development of American markets by foreigners.

★

The third, and most important question is: How much do American tariffs matter anyway? It is difficult to get round the quiet argument made to the Joint Economic Committee by Professor Arthur Upgren of Dartmouth College in which he stressed that the "limitations" of a liberal commercial policy as a means of assisting the rest of the world are "very great indeed." Though he is no protectionist, his points were driven home with telling effect. More than half of American imports enter duty-free and vary only with the prosperity of the domestic economy; if tariffs were abolished altogether—a patently ridiculous assumption—imports might increase by no more than \$2 billion a year. Under present conditions of profitability in American manufacturing, lower tariffs would simply lead the domestic producers to reduce prices in a probably successful effort to retain their markets.

Professor Jacob Viner, of Princeton, taking a somewhat different tack, pointed out that, despite the reduction of many tariffs by some 75 per cent under the reciprocal trade programme thus far, these cuts have "in large part been those that could be made without appreciably reducing the control of our protected industries over domestic markets." And yet imports have increased since before the war by more than 50 per cent a head by physical volume.

It seems entirely possible that during the three-year lull in tariff controversy which would result from passage of this Bill, the subject of American duties will diminish in importance both here and abroad. With the two sides at home as evenly balanced as they are, and with the emerging awareness that the importance of the subject may be over-rated anyway, tariffs might enter the limbo of issues on which basic policy is fixed and on which controversy hovers desultorily around the fringes.

Drawing the Line

THE Secretary of State's speech on Wednesday did something to meet the demand that a definite line should be drawn between Formosa and the mainland. But the line was not drawn in such a way as to satisfy those Senators and other influential Americans who have been making the demand. For they feel that Quemoy and Matsu, just off the mainland, should be excluded from the commitment to defend Formosa and the Pescadores. Mr Dulles, however, said that the United States cannot avoid defending Quemoy and Matsu so long as the Communists insist that their attacks on these islands are preliminaries to an attack on Formosa. Furthermore, he doubted whether it would serve "the cause of peace or the cause of freedom" for the Nationalists to evacuate them.

One of the chief uncertainties about the Mutual Defence Treaty with Formosa, which was approved by the Senate with unexpected speed last week, is that the United States might be drawn by it into war with Communist China through Matsu and Quemoy. Other fears are that the treaty might oblige the United States to support a Nationalist attack on the mainland and that it might reinforce the Nationalist claim to sovereignty over Formosa. Senator Morse attempted to have reservations on these points written into the treaty. But in the general mood of urgency which surrounds this question the Senate was ready to accept Senator George's authoritative assurance that the President was morally bound by the observations on these doubts in the Foreign Relations Committee's report on the treaty. In the end only six Senators went so far as to vote against the treaty, on the grounds that it would encourage rather than restrain General Chiang Kai-shek's belligerency.

But concern about this is more persistent than the votes showed. It was strengthened by the subsequent announcement from the Nationalists that the United States was in fact committed to defend Quemoy and Matsu, which led to the demand for clarification. According to Mr Joseph Alsop, the confusion arose because Mr Dulles, perhaps in order to facilitate the evacuation of the Tachen Islands, gave a pledge to the Nationalists which the President was not then prepared to make good. Mr Eisenhower is certainly more in touch than is his Secretary of State with the political realities of Washington and possibly also with the immediate military situation in the Far East.

Atomic Fallout

THIS week, on Yucca Flat in Nevada, members of the Atomic Energy Commission and guests from the Joint Congressional Committee on Atomic Energy were waiting to see the latest nuclear devices being tested. It would need the roar of an atomic explosion to silence not only Mr Molotov's most recent boast about Soviet supremacy in nuclear weapons, but also the angry bickering and recrimination that has characterised the AEC of late. Two of its commissioners, its chairman,

(Continued on page 629)

Deficit in the Schools

PRESIDENT EISENHOWER acknowledged the physical crisis facing American education in his Message on the State of the Union when he asked Congress to come to the aid of the schools this year instead of waiting until 1956 as had been intended. Now he has acknowledged the political crisis in education by rushing his detailed proposals to Congress sooner than expected in an attempt to get in before the mass of Bills with which the Democrats are seizing the initiative in the schools.

The President's recommendations, however, were not only rather too late but much too little—in the view of the Democrats at least. There is no argument about the general extent of the crisis, although detailed assessments vary somewhat. For the country as a whole there is an absolute shortage of over 300,000 schoolrooms for the 30 million children now in the state schools; over four million more go to private schools. According to the National Education Association, not a single state considers that it has a satisfactory number of schoolrooms. At present the shortage is greatest in the elementary schools, but the wartime crop of babies has begun to reach the secondary schools. Each year, until 1960 at least, 50,000 new classrooms will be needed for the 1½ million extra children entering the schools. By means of record capital outlays on school construction—now running at \$2 billion a year—educational authorities are keeping up with the flood but little more. Overcrowding is general, shift systems are frequent, and unsuitable and dilapidated buildings are being used. Capital expenditures need to be more than doubled to meet the deficit in classrooms.

President Eisenhower is concentrating on this emergency and leaving the needed "reassessment" of the whole school problem, and particularly of the shortage of teachers, for the educational conference he has called for this autumn. Mr Eisenhower is following his usual formula for federal aid, helping the states to help themselves and thus saving federal money. His threefold plan would cost the Treasury about

\$1.1 billion over a period of years. The federal government would buy school bonds in cases where local authorities cannot sell them at a reasonable rate; this would not, however, work everywhere, since many communities have reached the limit of their statutory borrowing authority. The President's alternative is federal help for the financing of special building agencies which lease schools to educational authorities. Finally, Mr Eisenhower suggests a limited amount of direct aid for those districts which are too poor to take advantage of his other recommendations.

Some communities would, however, hesitate to make the open declaration of poverty that would be needed to obtain the last form of federal help and in many places State Legislatures would have to act before use could be made of the other proposals. To many members of Congress the President's recommendations therefore seem entirely inadequate. They argue that local authorities are already struggling as hard as they can without outside help to meet the school crisis and that only direct grants from the federal government can do any real good. One suggestion is for \$500 million a year for two years for school building, to be matched by state contributions.

The President stressed the danger of over-centralisation in education, and the point carries weight with those Senators and Representatives who believe, as he does, that the states should be left to their own devices as far as possible. Moreover, there are members of Congress in both parties who feel even more urgently than does the President that the federal deficit must be ended and that any further strain on the federal budget must be avoided. For these reasons his school proposals may well have wider support when it comes to a vote than appeared in the initial reactions. Indeed, it now seems fairly certain that before long the federal government will, for the first time, and after many attempts, be playing a substantial and sustained part in the financing of education in America.

(Continued from page 626)

Mr Lewis Strauss, and Mr Thomas Murray, are at loggerheads, while its third member, Dr Thomas Libby, refuses to intervene. The nomination of Dr John von Neumann has not yet been considered by Congress and so far the President has nominated no one to fill the vacant fifth place on the commission.

Most of the trouble has arisen over the controversial Dixon-Yates contract, under which a private company is to furnish the publicly owned Tennessee Valley Authority with electric energy in order to replace power diverted to atomic plants. Mr Murray has testified that the staff of AEC has already spent 2,087 hours on work arising out of the politically inspired fight over the Dixon-Yates contract; he claims that, as a result, both the development of atomic weapons and the entry of industry into the new world of atomic fuel have been neglected. Mr Murray, moreover, agrees with the Democrats on the Joint Committee that the Dixon-Yates venture is ill-conceived. Mr Strauss, on the contrary, is an adamant supporter of the contract whose financing provisions were approved last week by the Securities and Exchange Commission. Supported by President Eisenhower, Mr Strauss maintains that this contract is in the best interests of the United States and that it has not interrupted the work of the AEC.

It is nearly impossible to tell whether or not the internal wranglings in the AEC have slowed down the development of atomic weapons. It is fairly clear, however, that the "share the atom with industry" programme, which the commission was to carry out, has fallen behind schedule. Despite Mr Strauss's assurances that private industry is being encouraged to co-operate with the commission in the search for cheaper and more efficient reactors, many Congressmen are convinced that information and help has been doled out slowly and on a suspiciously selective basis. In fairness to Mr Strauss, it should be said that firms wishing to enter the field of atomic energy are having difficulty in raising capital and obtaining public liability insurance. Nevertheless, the atmosphere surrounding the supposedly non-partisan AEC has deteriorated so badly and has become so intensely political, as to invite the suggestion from a member of Congress that the present commissioners should resign.

Wall Street's Watchdog

New York

IT was natural that Senator Fulbright, chairman of the Senate Banking Committee, should call on the assistance of two experts from the Securities and Exchange Commission in his "study" of the stock market. For the SEC resulted from a previous congressional inquiry into the market, after the 1929 disaster. If Senator Fulbright and his colleagues find anything wrong in Wall Street now, therefore, it will be the SEC that is on trial.

When comprehensive federal controls over the securities market were provided by the Securities Acts of 1933 and 1934, the SEC was set up to enforce them. The first of these two Acts is designed to protect the public against fraud by ensuring that sellers of a new security tell the truth and supply a potential buyer with sufficient informa-

tion regarding the risk he is taking. All new issues exceeding \$300,000 must, accordingly, be registered with the commission and the latter examines their prospectuses. The Act of 1934 gives the SEC broad powers over the operation of stock exchanges, brokers and dealers. In 1935, moreover, the Public Utility Holding Company Act was passed, giving the SEC the right to simplify the entire financial structure of public utility companies. To these major responsibilities have been added many others, and the commission's activities range from arbitration of colourful proxy fights between rival groups of stockholders, to the publication of valuable statistical surveys of capital markets.

In preventing fraud and ensuring that adequate information is provided for the public, the SEC has been highly successful. It has been criticised chiefly because of the costs and delays incurred in the process of registering a stock and drafting its prospectus. It is to this that aggrieved investment brokers attribute the rapid growth of the practice of placing securities privately with large institutional investors, where they are exempt from SEC control. For small borrowers, issuing securities up to \$300,000, there is a shortened form of registration. In contrast to last year, the SEC is no longer prepared to ask Congress to extend the limit to \$500,000. The reason is that small borrowers, particularly those who issue penny uranium shares, have flooded into the market and that they are the most prone to fraudulent practices.

Untouched by Human Hands

IT is increasingly clear that there will be a dual industrial revolution in the second half of the twentieth century; atomic energy will be added to conventional fuels and automation will transform technology. Automation is the operation, control and scrutiny of machines by other machines instead of by the human brain. At its simplest, automation controls a furnace by a thermostat; at a more advanced stage, an electronic computer installed by an insurance company does, by itself, the work of 100 punch-card machines served by 135 human operators. At the new Ford Motor Company plant in Cleveland, a series of electronic brains and "automated" machines, serviced by 250 skilled men, turn out in one day twice as much work as was formerly done by 2,500 employees. Complete assembly of an engine block used to require nine hours; with automation it takes less than fifteen minutes and electronic brains can be obscured neither by weariness nor boredom.

The human and social implications for a society whose labour force is increasing by about half a million a year are vast and disturbing. Already it is known that full automation in the automobile industry would mean that 200,000 men could produce more than the million United Automobile Workers now employed. Their head, Mr Walter Reuther, president of the Congress of Industrial Organizations, is preparing to meet the challenge: "We must accommodate ourselves to the implications of the new electronic-atomic solar revolution, rather than conduct a vain embittered fight against it."

The main problem, from the point of view of labour, is to maintain a steady increase in mass purchasing power and

A door with a difference

For modern interiors in offices, showrooms, shops, hospitals and restaurants; for doorways through which the traffic is brisk and businesslike, specify Pilkington's "ARMOURCAST" doors. They are made from $\frac{1}{2}$ " Toughened Rough Cast glass, 78" x 33" or 78" x 30", fitted with hinges and locks in Bronze Metal Antique finish. Non-standard sizes to order.

PILKINGTON'S

"ARMOURCAST" Glass Doors

For further information on the use of Glass in building, consult the Technical Sales and Service Department at Pilkington Brothers Limited, St. Helens, Lancs., or Selwyn House, Cleveland Row, St. James's S.W.1. Telephones: St. Helens 4001; Whitehall 5672-6. Supplies are available through the usual trade channels.

to ensure that companies do not dismiss large numbers of workers suddenly when introducing automation. Hence, 1955 will see a great drive for a guaranteed annual wage, for training programmes for semi-skilled workers and for increased participation by organised labour in the management and planning of industry. Trade union membership has never been greater, treasuries are full, and industrial competition is intense. For these reasons, labour leaders feel that they will obtain what they ask for and that booming industries will go a very long way to avoid a wave of strikes. Moreover, at a time when there are 3.3 million unemployed, which is, admittedly, some 400,000 less than at the worst point of the 1954 recession, the Administration cannot afford to appear hostile to labour.

Mercury Goes Up

FROM A CORRESPONDENT IN CALIFORNIA

THE mining of quicksilver, or mercury, is an industry where profits have often slipped through the fingers as easily as the product itself. But last year it suddenly became an attractively stable business, thanks to an upward surge in the price of the metal and an unprecedented purchase programme undertaken by the United States government. During 1954 the price of mercury on the New York market rose steadily to a record level of \$325 for a 76-pound flask; a year earlier it had been \$186 and the post-war low was \$70 in 1950. But because such price bubbles have usually collapsed in the past, American production of mercury, which had fallen to the lowest point in the country's history four years earlier, did not begin to mount significantly until the government announced its programme in July. It was prepared to buy 125,000 flasks of domestically produced mercury (nine times the entire output in 1953) within the next three years at a price of \$225 a flask; this was the first time substantial official encouragement had been offered to domestic producers.

Technically the programme establishes \$225 as the ceiling price for government purchases—and means that there have so far been no such purchases, since the market price is much higher. But it also built a reassuring floor under mercury prices: for, in addition to the domestic guarantees, the government undertook to buy 75,000 flasks from Mexico, which provides about 10 per cent of United States imports of mercury. The goals thus set seem almost impossible to meet.

This move "to broaden the mobilisation base of the metal and increase its supply for defence and industrial purposes" was obviously intended to minimise American dependence on overseas sources (largely Spain and Italy). Less obvious was the specific reason for the government's interest, since both the government procurement agency and the Atomic Energy Commission declined comment on rumours that the recent sharp price rises had been the result of plans for the increased use of mercury as a circulating medium in atomic reactors. Officials have denied that the huge surplus of supplies over industrial consumption—64,000 flasks in 1954—has been disappearing into the strategic stockpile, but disappear it apparently has.

This mystery did not cool the quicksilver fever which the announcement of the government's programme had

THE ECONOMIST, FEBRUARY 19, 1955

generated in the west, where 95 per cent of the domestically produced mercury comes from, mainly from California. Long-idle mines, most of them with a history of shutdowns and costly reopenings caused by rapid price fluctuations in the world mercury market, were suddenly in demand and the few still active mines made hasty plans for expansion. In San Francisco, the California Quicksilver Producers' Association, which purchases the output of small mines, reports that it is buying from forty different producers, ten times as many as a year earlier.

The largest domestic producer of mercury, the New Idria Mining and Chemical Company, stepped up production at its mines 200 miles south of San Francisco from an estimated rate of less than 300 flasks monthly in the autumn of 1953 to 500 flasks a month in September, 1954, and was reported to be aiming at an eventual output of 1,000 flasks a month. One of the few quicksilver companies whose shares are publicly traded, New Idria saw its 50 cent par stock rise from \$1 a share to \$4 in 1954, even though it had neither paid dividends nor shown profit for a number of years. New Idria and two other companies,

which mine in California and Nevada and have also been pushing up their output, had together been responsible for about 75 per cent of domestic output of mercury. The quicksilver boom has also stimulated colourful one- and two-man undertakings, reminiscent of the prospecting days of the California Gold Rush a century ago. Quicksilver had then an auxiliary importance as an ingredient in the gold-reduction process; in fact, two of these old mercury mines, New Almaden and New Idria (named after European mercury centres) are both said to have produced more wealth than any of the famous California gold mines. Today quicksilver prospectors at New Almaden live in aluminium trailers, complete with television sets, within sight of the abandoned nineteenth-century buildings of the old mining town. They are digging pits on the site of the old furnaces, to recover metal which leaked out of the retorts during the eighty years the mine was in operation.

Another team of two men expects to make a profit of \$20,000 to \$25,000 this year from the ore they are digging out of a small cave where, according to local legend, Indians once obtained the red quicksilver ore, cinnabar, to use as war paint. The two miners are extracting a remarkable yield of eight to ten flasks a month from a retort which handles only two tons of ore a week. It is not likely, however, that such undertakings can be continued profitably if the price of mercury actually drops to the \$225 a flask at which the government will purchase it. But no such drop is in prospect and so the small-scale producers are still as jubilant as the larger companies, who see their futures safe for at least three years.

The World Overseas

The Arabs and the West

FROM OUR CORRESPONDENT IN CAIRO

THE Arab League has always been able to withstand outside pressures better than internal stresses. That is one reason for the intense crisis caused by the announcement that Turkey and Iraq had agreed to agree. Former regimes in Egypt have always made use of Saudi Arabian antagonism towards the Hashemite Kingdom of Iraq in order to play up their predominance in the League, and this policy had put such a strain on the relations between the two countries that the efforts made in recent months to secure better understanding collapsed at the first serious dispute.

The proposed agreement between Turkey and Iraq hardly warrants all the fuss, either in Egypt or the western world. It provides simply for military staff consultations and for tax-free, unimpeded transit of military stores through either country to the other. It is difficult to say what exactly it contributes to western strategy or "perimeter defence," or why it was so urgently necessary. The psychological importance of Iraq's commitment to the western powers was already achieved by its undertaking to accept American military aid and by the severance of diplomatic relations with Russia.

Egypt's leaders have concluded that Iraq has jumped the queue for military aid before they have been able to prepare their own people for Egypt's acceptance of it. The significance of the agreement is that Iraq may now be able to co-ordinate and elaborate its defence system with that of Turkey. It is therefore unimportant to Egypt that the text of the agreement is a modest affair. Iraq has, as Egypt sees it, reduced the claims of Egypt and the other Arab states to western military aid by attaching itself to the well-established claim of Turkey and by appearing to separate itself from the needs of those Arab states bordering Israel. Iraq is accused of sacrificing the common interest for its own.

Lieutenant-Colonel Gamal Abdel Nasser, the Egyptian prime minister, contends that the Iraqi-Turkish agreement will be like the Turco-Pakistan agreement in its failure to strengthen the area. As he sees it, Turkey and Pakistan would, in the event of war, be so engaged themselves that they could add nothing to the security of Iraq. On the contrary, Turkey in particular requires the defence in depth which the Arab world could provide if it were given help to build up its defences. He believes that the very process of creating Arab bases would educate the people away from their nationalistic resistance to western policies and so

strengthen the West, whereas the Turkish-Iraqi agreement will not materially improve the strategic position and will strengthen the opponents of the West.

In short, before the crisis, the difference between Iraq and Egypt was largely a question of the speed of advance towards co-operation with the West. There was no irreconcilable conflict of policy to justify the violence of the Egyptian campaign against Iraq and its prime minister. Passionate polemics turned into a question of principle the Baghdad announcement that the agreement with Turkey would be signed whether the Arab League agreed or not, although there was no real reason why the evolution of the Arab Collective Security Pact should not have proceeded parallel to the Iraqi-Turkish agreement. There was little of the calm logic of Colonel Nasser's criticisms in the vituperation of the Egyptian broadcasts to the Arab world. Propaganda charged logic with emotion to an abnormal degree and to the detriment of Egypt's own aims.

For what the Egyptian propaganda did was to make it easy for Nuri es-Said to stick to the agreement. With the exception of the most extreme opponents of the prime minister, popular opinion united behind him. Even people who contended that the announcement of the agreement was badly worded and unnecessarily precipitate, who believed that it was dangerous and damaging to weaken the structure of the Arab League, came in the end to believe that they must stand behind Nuri es-Said and that Egypt was doing more than he to harm the League. The breach between Nuri and Saliah Jabr which has been almost complete since the oil debate in Parliament in 1952, was bridged, at least temporarily, by considerations of this sort. Even in other Arab countries there were many people who thought Egypt had gone too far.

The dispute between Egypt and Iraq was an embarrassment to all other Arab states except, perhaps, Saudi Arabia which promptly affirmed its complete agreement with Egypt in the belief that by so doing it would still further cement the Saudi-Egyptian combination which has been a feature of Arab politics ever since the formation of the Arab League. Neither Lebanon, which has for some time favoured better relations with Turkey, nor Syria, which still hopes for a friendly settlement of some of its northern frontier problems, saw any real harm in Iraq's action except the way in which it was done. As to Jordan, Saudi Arabia's influence combined with West Bank opposition to Turkey's friendship with Israel, brought it out more strongly in

"Daddy, what is earth made of?"

That's mostly powdered rock he's playing with, you tell him—mixed with mould. It's the top of the earth called soil; in it are mineral salts, which help to feed the plants which in turn feed us.

Earth—the basic raw material. Sometimes scratched, even to-day, with Bronze Age tools, yielding a pitiable crop. Yet fertile, brimming over, where it is channelled for irrigation, ploughed, reaped, husbanded by power: diesel and electrical power, supplied all over the world by THE BRUSH GROUP LIMITED.

Supplied to the Sudan Gezira Board, for example, by J. & H. McLaren Ltd., a member company. Here 108 McLaren diesel engines have been cable-ploughing the land since 1927, the soil being too light for tractors. Over 600,000 acres now yield their crop of cotton and linseed; soon this same number of engines will extend the limits of fertility further still, to a total area of one million acres.

DUKE'S COURT · DUKE STREET · ST. JAMES'S · LONDON · S.W.1 and throughout the world

favour of "Arab unity," which in effect meant opposition to Iraq. In the end, Egyptian opinion seems to have prevailed to the extent that Iraq will go to the signing alone and publicly unblest.

Nuri es-Said was not helped by Turkey's relations with Israel. He might have believed that he could better influence Turkey from a friendly position; the Turks went some way to meet his difficulty by nodding acquiescence as they listened to the familiar Arab case. But in this situation their position *vis-a-vis* Israel and the Arab states respectively is likely to be much the same as that of Britain and the many other countries that find it possible to have relations with both at once; thus within a few weeks of reaching agreement with Iraq, they are about to entertain an Israel economic mission at Istanbul.

The point about the inter-Arab quarrel that has been too little noted so far is the extent to which the Arab states are still subject to Egyptian influence. Although there was considerable irritation at the Cairo premiers' conference, although there were strong objections to some of Egypt's propaganda, although Egypt itself was offended by the indecisive nature of the talks and the Levantine delegates departed from Cairo in an ill humour, there was not one state which publicly defended Iraq. They sat on the fence with their legs dangling on the Egyptian side. It is clear that whoever wishes to influence the Arab bloc as a whole cannot yet afford to disregard the attitude of Egypt.

The position of Iraq was understandable. More than any other Arab state, it feels vulnerable and pressed for time. The years of abortive discussion about the Arab Collective Security Pact were hardly comforting. Egypt displayed neither sympathy nor understanding of its needs. Iraq, on the other hand, appeared careless of Egypt's opinion. In the end, all were losers, including the western powers.

The Arab League has been severely shaken and both Iraq and Egypt will find it difficult to restore the semblance of unity. Egypt has declared that it will denounce the Arab Collective Security Pact as soon as Iraq signs the agreement with Turkey. The policy of the western powers suffers because the pact, however ineffective it has been so far, has at least been the concept of an Arab defence system which was to be built with western aid. It is true that Egypt's behaviour has run counter to the westerly trend of its own policy and that the logic of its position dictates that it cannot abandon that policy; but, for the moment, the course which was set fair for the emergence of the Arab world from its relative isolation has been severely disturbed.

Mr Khrushchev's Animal Farms

MR KHRUSHCHEV, in his newly won position, seems very eager to rewrite his past, particularly as an agricultural policy maker. In his confession before the Supreme Soviet Mr Malenkov was, therefore, compelled to shoulder the blame for the unpopular agricultural measures taken during Stalin's life, while leaving the credit for the more recent tax reliefs and higher prices for farm produce with the party—that is, with Mr Khrushchev. In fact it was Mr Malenkov who first announced the post-Stalinist policy of incentives. But Mr Khrushchev's camouflage is

unlikely to succeed. In the Russian countryside he is still remembered as the champion of the abortive plan for "agro-towns" and as the man who tried to deprive the peasants of their small plots, those remnants of private property. This programme was so unpopular that it had to be shelved. Ironically, in fact, it was Mr Malenkov in person who disavowed it as a "reckless and untimely" scheme at the Party congress held towards the close of 1952.

But Mr Khrushchev remains in charge of agricultural policy, and he has just announced his plans for the future. The dramatic upheaval at the Supreme Soviet on February 8th overshadowed the preceding meeting of the Central Committee of the Party. It was there, however, that Mr Khrushchev not only proclaimed the supremacy of heavy industry but also outlined the next five-year plan for agriculture. Within the next five or six years the Soviet grain crop is to exceed 160 million tons, and the output of livestock products is to be roughly doubled. No targets were given for actual livestock breeding.

Mr Khrushchev omitted to say that the grain target now set for 1960 is actually lower than the original 1955 objective of 180 million tons. Soviet grain figures, however, are

very obscure. Up to 1952 they referred to the standing or "biological" crop and were therefore highly inflated in comparison with normal and realistic "barn crop" calculations. Then Mr Malenkov officially admitted this distortion, and no official figures have been given since. From the circumstantial evidence available it may be gathered that the present yield is somewhat below the record of 130 million tons. Mr Khrushchev's new objective may well be calculated in real terms. Even so, it seems strangely low when taken in conjunction with his other schemes.

His vast plan to "conquer virgin land" in Kazakhstan and Siberia apparently still stands; 100,000 new permanent settlers are to be sent there this year. The continuation of the process despite the general change in economic policy is not surprising, since the factories producing the chief tools needed for the "conquest"—tractors—can easily be switched to less peaceful uses. Now, on paper at least, some 30 million tons of additional grain are expected from the 70 million acres of new land to be reclaimed by next year. This is not all. Mr Khrushchev has just produced yet another gigantic scheme, his own version of the race "to equal and surpass America": large-scale maize cultivation is to provide the fodder for Soviet livestock.

In 1953 the total area under maize in the Soviet Union was less than 9 million acres and the maize crop amounted to 3.8 million tons. By 1960, according to Mr Khrushchev,

the area under cultivation is to be raised to over 70 million acres and the harvest is likewise to be increased eightfold, reaching nearly 30 million tons. Is Mr Khrushchev becoming "dizzy with success"? He appears bent on gigantic plans and the use of storm tactics, in comparison with which Stalin's "plan to change nature" seems the fruit of sober calculation. Indeed, to the sceptic with a long memory his plans recall the wild schemes in vogue during the early years of the Stalinist era—when it was, for example, suggested that the mass rearing of rabbits be undertaken to make up for the slaughter of cattle during collectivisation. Mr Khrushchev will surely endanger his political future if he chases after similar hares.

Three-fifths of the planned grain output is destined for human consumption. Two-fifths, or about 65 million tons, is earmarked for livestock feeding. This should provide a more plentiful supply of badly needed foodstuffs. By 1960 production of meat, fats and milk is planned to be double the 1954 level, that of eggs to be 120 per cent higher and that of raw wool 80 per cent higher. It is impossible to say how much of this is meant to be achieved by the improvement of stock and how much by increased numbers; no targets for livestock breeding are given. It appears that some progress has already been achieved in this field, though not at the pace foreshadowed by Mr Khrushchev.

SOVIET LIVESTOCK NUMBERS
(In millions)

	Cattle	Of which Cows	Pigs	Sheep and Goats
1928	66.8	33.2	27.7	146.5
1950	56.0	23.5	19.5	90.0
1953 January	56.6	24.0	28.5	109.9
1953 October	63.0	26.0	47.6	135.8
1954 October	64.9	27.5	51.0	138.4
1954 October (plan) ..	65.9	29.2	54.5	144.4

It may be seen from the table that, with the exception of pigs, the plan was not fulfilled last year. The failure in cow breeding must be a particularly painful disappointment since their milk yield has also fallen short of expectations. Besides, the low target for pigs is something of a puzzle; and Mr Khrushchev, instead of boasting about achievements, complained about the poor quality of pigs sent for slaughter. It is difficult to assess the real prospects for future livestock development, but the reckless plans for the expansion of the fodder basis tend to make one sceptical.

Some progress has been achieved in Soviet agriculture since 1940 despite the ravages of war. The share of wheat in the total grain harvest has risen at the expense of rye. The yield per acre is also slightly higher than before the war. Yet the lag in agriculture has always been officially admitted. Progress, it has been said repeatedly, has not corresponded to the growing needs of the economy nor even to past investments. More rapid expansion is thus indispensable, but are Mr Khrushchev's shock tactics the best way to achieve it? The growth of agricultural production was always an important part of the post-Stalin campaign to woo the consumer. Now that other pledges to the public are to be broken the role of food supplies becomes even more vital. Mr Khrushchev may learn again that shock tactics do not pay dividends in the countryside and the lesson may spell his political doom.

Siam Heads off Communism

THE £170,000 face-lift that Bangkok is undergoing in honour of next week's meeting of the South East Asia Collective Defence Treaty powers may or may not enhance its claim to become the permanent Seato headquarters. The Siamese might well argue that their capital has stronger claims than roads hastily widened or canals filled in for the occasion. For besides being an independent country—which gives Bangkok the edge over Singapore in Asian and American eyes—Siam can claim to be the least Communist-infiltrated country in South East Asia and the one in which, short of outright aggression, Communism is least likely to find a foothold.

Politically speaking, Siam is in a transitional state. The bloodless military coup of November, 1951, restored the one-chamber legislature of the 1932 constitution for a provisional period of ten years. Half the 246 members of parliament are nominated by the King, and half were elected in February,

1952. The elected members include about thirty members of small opposition parties. The cabinet itself mostly consists of military or naval leaders, under Field-Marshal Pibul Songgram, whose wartime collaboration with the Japanese is viewed with greater indulgence in retrospect than in the difficult days of 1942.

To a large extent, Siam's relative immunity from subversion is the work of the energetic and controversial chief of police and deputy minister of the interior, General Phao Sriyanond. Much has been written about General Phao's para-military police force, with its tanks and parachute corps; less than justice has been done to the progressive and often ingenious schemes by which the general seeks to arrest or prevent the growth of the kind of discontent that provides a breeding ground for Communism. The perennial problem of usury, for instance, is being dealt with by the simple expedient of not renewing the licences of pawnbrokers as they expire. The State then takes over the pawnshops and makes loans at minimal rates of interest.

To keep the youth of the country on a path reasonably straight and narrow, General Phao has inaugurated a corps of young detectives, open to boys aged twelve to twenty. Badges and books of rules are provided and the eager youngsters, with eyes open for pickpockets, are less likely

to be tempted into gangsterdom or the arms of Communist agents. The reproach that such methods are liable to develop a police state is less relevant than some Western commentators might accept. In any case, with 42,000 police in a nation of 18 million, Siam is far indeed from being the police state depicted by Communist propaganda.

With little real poverty—by Asian standards—and a well-established social welfare system, including free medical treatment in Bangkok and many towns, Siam is not a natural field for Communist infiltration. The government, however, with commendable scepticism and foresight, is making assurance doubly sure by land reform, housing and agricultural schemes, both with and without American or Colombo Plan aid. The new large-scale housing scheme, under the control of the ministry of the interior, is of special interest. The job is being tackled on a triple front: mortgages for land owners to build afresh or renovate old properties; land and new houses for hire purchase; and houses for rent. The rented houses are of three types: lower income houses at ten shillings (thirty baht) a month; middle income houses at £2 a month; and communal units, each with a small plot of land. The entire community is provided with its stores, school, post office and other facilities. Mortgages are spread over fifteen years and there is no interest. To prevent speculation, title deeds are not transferable until the fifteen years have elapsed.

The self-help settlement scheme is also interesting. The scheme has a dual purpose: to keep peasants on the land and away from the towns; and to put more of Siam's fertile but unowned and uncultivated land to productive use. Applicants for land are considered on a basis of need and vocational competence. The government undertakes the surveying, land improvement, the building of offices and staff housing, road construction and irrigation, and provides medical care, machinery and public utilities. Loans are provided for settlers' homes, farming implements, feed and livestock. Each settler gets ten acres of land, of which the first two acres are cleared for him; it is his responsibility to clear and cultivate the remainder. Title to the land is transferred if the loan is repaid within eight years and if at least three-fifths of the land is under cultivation. There are at present eight of these settlements and more are on the way. At some of the older ones settlers have built themselves, out of their profits, larger and more luxurious houses than those originally provided.

Across the Mekong

In the well-fed, prosperous north-west there are few problems now that the majority of the Chinese Nationalist troops in adjoining Burma have been sent to Formosa. The relatively poor north-eastern provinces, however, are uncomfortably close to Yunnan, headquarters of the "Free Thai" movement of the Siamese exile, Pridi Phanomyong, and to Laos, where the Communist-controlled Pathet Lao "state" remains a menace in the background. Although twenty thousand of General Phao's 42,000 police are stationed along the eastern border, it is clearly an impossible task to prevent infiltration. The Mekong, in any case, is a physical but not an ethnic barrier: the majority of Siamese in the north-eastern provinces are Laos, who speak the same language as the Laotians beyond the river, and frequently intermarry with them. There again, however, the government is pressing ahead with schemes designed eventually to raise living standards which, though higher than in neighbouring countries, are lower than elsewhere in Siam.

THE ECONOMIST, FEBRUARY 19, 1955

American aid is being used for railway building, agricultural experiments and training stations for the introduction of new crops, water tank installations to offset the unpredictable rainfall, and fish hatcheries. These are long-term schemes, but given freedom from direct aggression and the guarantees of the Manila Pact, the Siamese have grounds for believing that such schemes will ensure their continued freedom from Communism.

La Ronde.

FROM OUR SPECIAL CORRESPONDENT IN PARIS

AFTER two weeks of crisis it appears that logic has little hold on parliamentary activity in the country of Descartes. Two weeks ago the "leftist" government of M. Mendès-France was defeated, ostensibly over its North African policy. The Socialists were the only party not to desert his sinking ship. Proof was finally given, it seemed, that without the Communists there is no centre-left majority in the present Assembly. Yet two attempts to recreate the centre-right coalition—under the Conservative M. Pinay and the Christian Democrat M. Pflimlin—have failed. As this report is being written the Socialist M. Pineau has undertaken to try to form a government. On paper his programme differs little from his predecessor's; and as if to stress this paradoxical continuity, M. Mendès-France was offered a key post in the new team—an offer which he declined for obvious reasons.

It calls for a bold man to forecast the verdict of this unpredictable Assembly, but it would be strange if, with the wheel taken out of M. Mendès-France's hands, the ship were allowed to proceed on its former course. Did the only motive for getting rid of the captain lie in his stand on the EDC? True, there are substantial differences between the outgoing cabinet and the one now contemplated. For the first time since 1951 the Socialists would sit on the government benches and the Christian Democrats (MRP) would play their part in a reputedly leftist coalition. Yet even if M. Pineau manages to capture enough votes for the investiture, he is unlikely to keep them for long. He can stay in power only by stalling. If he follows in the footsteps of M. Mendès-France and tries to act, he will mobilise against himself the colonials, the beetroot growers and other conservative lobbies. North Africa, the wage increase or the question of Catholic schools will bring about another victory of arithmetic over improvisation and with it another crisis.

The mood of the deputies is unpredictable because the Assembly is worried about the popular reaction to its performance. Though the average Parisian shrugs his shoulders when the word crisis is mentioned, deputies in raised great hopes in the country and that a disappointment may have grave consequences for the parliamentary regime. The manner in which he was brought down and the ensuing scramble for portfolios did little to enhance its prestige. The "plot" was there for everyone to see.

The whole performance really flopped because of over-elaborate preparation. There were no less than five alternative casts ready to take over from M. Mendès-France, with MM. Pinay, Pflimlin, Pineau, Mayer and Faure as the leading actors. In a single government there is not enough

ECONOMIST, FEBRUARY 19, 1955

DOWN GOES THE PLUNGER and in the river distance a white, white plume goes up, sudden and silent. Seconds later comes the sound, the crack of the explosion, a thundering, a rumbling. The jam is cleared. The logs are free to jostle and leap and run with the current, glistening, wet, shining as they go, travelling with the river to the mills. It's all in the day's work in Scandinavia where, at Bowaters' groundwood mills, spruce is pulped and pressed, baled and loaded into ships to cross the North Sea, destined for the Bowater paper mills in the United Kingdom.

Every day of the year the Bowater Organisation is at work converting timber into woodpulp into paper. From its mills in Europe and North America comes newsprint in a never-ending stream for the newspapers and journals of the world; other printing papers for the magazines and reviews that carry colour and interest into countless lives; paper for the protection of food and for packages of almost infinite versatility.

Whether a trip round the lighthouse or a voyage across the world—nickel helps

A trip on a motor boat—traditional part of a seaside holiday—and a voyage to the new world require vessels of a very different type. For the motor boat a 12 h.p. engine may be adequate, but the Queen Elizabeth can call on 160,000 h.p. to drive her 83,673 tons through the water, not to mention additional power to provide for the comfort of her passengers and the safety of the ship.

Nickel plays a part in both of them. It strengthens and toughens the steels and alloys used in their engines, and, in the case of the big ship, goes also into decorative metal work, galley equipment and navigational aids. Throughout industry nickel helps equipment to perform better and last longer.

room to accommodate all the *ministrables*. The subsequent bargaining in the lobbies was so unashamed that even parliamentary old-timers, with few illusions left, commented bitterly that the only way to have a stable government is to appoint a hundred ministers and 426 under-secretaries (there are 627 deputies, of whom 99 are Communists).

Such a cynical comment, however, cannot explain the whole story. Although the elections are fifteen months ahead, electoral prospects have played an important role in the present crisis. The rightist label is now unpopular and the Christian Democrats want to get rid of it while there is still time; the Radicals want their electors to forget that their own internal division brought about the fall of their popular premier. Therein lies the explanation of the failure of the first two contenders. To serve once again under the Conservative Pinay would have branded the MRP as a right-wing party for ever and widened the gap separating them from the Socialists. To show a sense of unity the Radicals then asked M. Pinay's successor, the Christian Democrat M. Pflimlin, to include some Mendèsistes in his team. To make matters more farcical the demand was made by none other than M. René Mayer, the executioner of M. Mendès-France. Thus in the early hours of Monday morning the second abortive attempt to find a new French premier was abandoned.

Confusion in Palais Bourbon

And so to M. Pineau, the Socialist candidate whom many Christian Democrats prefer to their own. It is in their ranks that his candidature arouses the keenest enthusiasm. It enables them to argue that they were always right in pressing for a "progressive and European" majority. The Paris agreements did not rehabilitate M. Mendès-France in their eyes. M. Pineau has apparently all the virtues of the conciliators. He was in favour of EDC and he also voted for the Paris agreements. He is a Socialist, but also a "realist," friendly to M. Monnet.

Among other parties the feelings are more mixed. Many partisans of M. Mendès-France realise that a Socialist interlude will really blur the outline of the alliance and postpone a regrouping of the left. The Conservatives are suspicious of the man who wants to continue a policy of reform in North Africa and are generally hostile to a Socialist. In M. Pineau's own party the former opponents of EDC clamour that this unholy alliance with the MRP is a calamity. They would have to serve a Socialist candidate who advances a programme as bold as an electoral platform and therefore unacceptable to this Assembly. They fear that Socialist promises will benefit the Communists who will be able to resurrect the old axiom, "working class restaurant with bourgeois cuisine."

The Socialists, however, will have to back their candidate and many other deputies must argue that this Assembly has anyhow a perfect technique for preventing bold reforms. The hopes raised by M. Mendès-France may induce it to accept a Socialist interlude before coming back to one of the older formulae. Confusion reigns in the Palais Bourbon, where, after a constitutional reform, even the procedure of investiture is not quite clear. One must therefore wait for M. Pineau to form his government before assessing his prospects. But in the present atmosphere of crisis it is unlikely to prove more than an interlude.

Struggle Over German Prices

THE benefits of the large reserve of gold and foreign exchange in Federal Germany's central bank are growing more obvious. This week, the travel allowance, already very generous, has been increased to DM 600 (£50) each time for as many pleasure trips as the citizen wants to make in the area of the European Payments Union; and, for the first time, a travel allowance of DM 1500 has been granted for non-business visits to the dollar countries. Another sign of the German moves towards complete convertibility is the bonfire of over 400 foreign exchange regulations which the central bank made recently. Now the chief controversy in this field is over the question whether the freedom of transferable D-marks could be granted to the chronic debtor countries, such as Turkey, with whom Germany still has bilateral trading and payments agreements.

German exporters, particularly of consumer goods, are nervous lest they should lose their market if the under-developed lands are given the opportunity of spending the proceeds of their sales to Germany in the United States or in Germany's European competitor markets. Arguments on this matter inevitably lead to the conclusion that the chief exporters to the under-developed lands should come together in joint enterprises and selling agreements. Such ideas range from proposals for outright cartels to reasonable suggestions that British, German and French engineering firms should combine on big development projects.

But the advantage of a substantial reserve in the *Bank deutscher Länder*—now equal to six months imports—is emerging in another field. It is seen that it provides a safeguard if Dr Erhard takes steps to prevent prices from rising by fostering imports. These steps are now being taken. Duties on about 700 items were lowered by the *Bundestag* at the end of January, and Dr Erhard has now asked for permission to lower others at will without the changes having to be approved by parliament. His object is to counter any increase in the cost of goods bought on the world market, as well as of those internally produced.

Swollen Order Books

Dr Erhard must take some such action, as a matter of political urgency. He has asserted that rearmament will not halt Germany's rising standard of living, whereas there are already signs that even the prospect of defence contracts will raise prices. The steel industry is hard-pressed to cope with its swollen order books. Part of the boom is thought to be due to manufacturers ordering more than they currently need, in case of a shortage or the introduction—against official promises—of a system of allocations.

Steel imports from other members of the coal-steel community already enter Germany duty-free, and nothing further can be done by Dr Erhard in that direction. Moreover, the coalowners' demand for an increase in the internal price for coal has also been taken direct to the Luxemburg High Authority, much to the annoyance of the Bonn Ministry of Economics. This *démarche* on the part of the mining concerns was, however, probably a tactical move to prove to the High Authority that the Ruhr must be allowed to extend the powers of "Georg," the coal selling agency, in order to maintain collieries which are working at a loss.

There can be no doubt that a rise in coal prices would lead the mineworkers union to make still bigger demands for increased wages, over and above the 12 per cent rise which they are now claiming. In the meantime, the owners' proposal has already been seized upon by the Social-Democrat Party as evidence that rearmament will hit the workers. Every bullet is welcomed by the Socialists for their very effective campaign against the western alliance.

Sweden's Battle Over Wages

FROM OUR SCANDINAVIAN CORRESPONDENT

ONE of the most threatening industrial disputes in Swedish history came to a head this week. On Monday evening the industrial employers' association announced that unless a wages agreement had been reached for the paper and pulp industry by next Tuesday, it would declare a general lock-out which would affect half a million workers—five-sixths of those employed by members of the association and the largest number of Swedish workers ever to be involved in a labour dispute. The 37,000 workers in the pulp and paper industry, which accounts for 28 per cent of Swedish exports, have been demanding a 16-18 per cent rise; and it was their threat of resorting to strike action which led to the employers' ultimatum.

Most organised labour in Sweden has been putting its annual series of wage claims before the employers in the last few weeks. Negotiations are conducted piecemeal between individual unions and managements, according to an agreement reached in 1938 by the Confederation of Trade Unions (LO) and the Employers' Association (SAF). Although Swedish wages are already the highest in Europe, this year nearly the entire labour force is claiming increases ranging from 3 to 35 per cent, and averaging 10-15 per cent over the whole economy. Both the government coalition of Social Democrats and Agrarians, and the public at large have been anxiously following the negotiations; for it is generally accepted that widespread increases without a corresponding rise in production can only result in an inflationary wage-price spiral.

Hr. Sköld, the Social Democrat finance minister, has called repeatedly for restraint. His warning has been echoed, somewhat tepidly, by the LO, which counselled its 1,350,000 members to seek increases "on a limited scale." An overall 10 per cent increase in wages would represent 2,400 million kronor (£70 million) in additional spending power this year—equivalent to the total budgetary expenditure on social services. Since the government further liberalised trade with OEEC countries and the dollar area last autumn, imports have risen sharply. Wage increases will, it is feared, lead to a further rise in imports, endangering the already precarious equilibrium of Sweden's balance of payments. Higher production costs will jeopardise the competitiveness of Swedish goods in export markets, as well as the maintenance of full employment. If cheaper foreign products flood into Sweden, foreign currency reserves—at present sufficient to cover three months' imports—will dwindle.

Hr. Sköld's plea for restraint has not, apparently, fallen on completely deaf ears. For instance, 10,000 workers in the leather and shoe industry—which, like the textile industry, has been experiencing a recession—have accepted a 3 per cent rise; 140,000 forestry workers and lumberjacks, and 20,000 workers in the carpentry and furniture industry have agreed to a similar increase; 45,000 iron and steel workers are to receive 2.8 per cent and 122,000 building operatives 2 per cent more. The highest increase so far is 13 per cent for 5,000 stevedores, who had no rise last year. The Union of Salaried Employees (TCO), over 300,000 strong, has just presented its demand for a 10 per cent increase. This claim is a typical one for about one-third of the labour force, which receives fixed wages and salaries, and resents the fact that the remaining two-thirds, notably workers in the manufacturing industries, are on far more advantageous piece rates.

"Over-full" employment has led to competitive bidding amongst employers, so that real wages often considerably exceed the contractual rate. This, indeed, is one of the root causes of Sweden's economic difficulties. While the cost of living has remained reasonably stable—in the last two years it has increased less than 2 per cent—average wages have increased 7-8 per cent. Taking 1938 as 100, industrial wages had risen by 1953 to 339, the cost-of-living index to 203 and production only to 142. While production rose rapidly during and immediately after the war, since 1950 the pace has slackened. The 1954 increase of 4.5 per cent was only half the average for the other OEEC countries.

Last December the government, resolved to prevent a repetition of the 1951 inflationary boom, ordered public authorities and state-owned enterprises to place no further contracts without prior approval. Increases in the military stockpile were suspended. The 10,000 million kronor budget presented this January by Hr. Sköld was designed to check public and private spending. Last week the *Riksdag* approved a 12 per cent investment tax and a 10 per cent duty on motor cars. (In 1954 Sweden imported 90,000 cars.) These measures have been sharply criticised by Liberals and Conservatives, who advocate a more flexible interest rate policy, as well as by Hr. Strand, the spokesman of the Social Democrat trade union wing.

Until the last round in the present battle over wages has been fought, it is difficult to assess the extent of the inflationary danger to Sweden's economy, or to judge whether the government has taken defensive measures in time. Hr. Sköld, who has already shown considerable courage in preaching the unpopular doctrine of wage restraint, probably has several shots left in his locker.

COMMODITY REPORTS

Special and regular reports on the supply and demand position and on the price and market prospects for most commodities can be prepared for individual clients by our Commodities Department. Scope, length, frequency and cost are determined by clients' needs.

HOW MUCH MONEY ARE YOU WASTING ON FUEL?

The heat energy from at least 5 million tons
of coal evades British Industry every year!

Anglo American Productivity Report on Fuel Conservation

VERY few industrial firms are run as economically as they could be with better thermal insulation. Factories all over Great Britain are eating up fuel in a way that saps both their own profits and the nation's economy. Maximum fuel saving and the economical distribution of heat energy depend largely upon first-class insulation. Indeed, improved thermal insulation can save up to nine-tenths of present heat losses.

THE CHEMICAL AND INSULATING CO. LTD.—plays a major role in reclaiming heat energy previously dissipated through inefficient insulation. This leading organisation in the specialised field of thermal insulation maintains sales and contracting offices throughout Great Britain. It manufactures insulating materials, for sale in bulk or in prefabricated shapes, for temperatures as high as 2000° F. The head office or your nearest branch office will be pleased to answer any enquiries.

THE DARLINGTON INSULATION CO. LTD.—a subsidiary company of The Chemical & Insulating Co. Ltd., is a contracting organisation for the supply and installation of all types of heat, cold, or sound insulation. Power Stations, Oil Refineries, Shipping and Industrial Plants are all achieving higher efficiency per ton of fuel since consulting this company. Requirements are so diverse that each problem is individually studied, to ensure an efficient, economical and lasting installation.

IPSCOL LTD., another subsidiary company, makes automatic industrial process control equipment, and S. T. TAYLOR & SONS LTD. make sheet metal and light plate structures and casings for all types of insulation.

*What
shape is
an*

idea?

In the early stages of a new product, a number of things can happen between the birth of an idea and the appearance of the finished working drawings. And one of the first thoughts that often enters the mind of the designer is—does the idea lend itself to fabrication in plastics? B.I.P. is well qualified to answer this question. Within our organisation are specialist technicians and draughtsmen who have given the whole of their

working life to plastics, right from the early days. They develop and make many lines in the Plastics Industry, from moulding powders to tools and presses and the finished article. Together with our Product and Mould Design Service they constitute an organisation which is unique in the Plastics Industry. The benefit of their research is freely at your disposal. Use it! It costs you nothing and may save you a lot.

The most comprehensive service in plastics

THE BUSINESS WORLD

Reshaping the Coal Board

ON Monday next, a new coal board will be at work. There is a slight air of Muscovite drama in this, but it would be a disservice to make politics out of what has happened, just as it would be a great mistake to under-estimate the tasks that face the new board. The changes, which the Minister alone had power to make, are at the nub of a report on the National Coal Board that Dr Fleck, the chairman of Imperial Chemical Industries, and four colleagues, have presented to the board. For just over a year, they have been engaged in a searching examination of the board's structure and the way it works; they started this job at the invitation of the board, and their report is a model of clarity and good sense on most major issues of policy.

Their first recommendation is to the Minister of Fuel and Power: the board should have twelve members, including a chairman and deputy chairman, six full-time members and four part-time members. The Government have promptly accepted this recommendation, and the members of the former board (chairman, two deputies, and four each full- and part-time) put their resignations in the Minister's hands. He is retaining Sir Hubert Houldsworth's services as chairman (Sir Hubert's appointment has another eighteen months to run); his deputy is to be Mr James Bowman, who has been chairman of the Northern Division, and the previous deputies, Sir Eric Coates and Sir Walter Drummond, are retiring. So is Sir Charles Ellis, who has been a member of the NCB since it started in 1947, and two of the part-time members, Sir Geoffrey Heyworth and Mr J. H. Hambro. These two places remain to be filled, to bring the part-time complement up to four. The six full-time members will be in position on Monday: Mr J. Latham (Finance); Dr William Reid (production); Mr R. E. Thomas (marketing); Mr

A. H. A. Wynn (scientific); Sir Andrew Bryan (staff); and Mr W. H. Sales (industrial relations).

There are only three former full-time members in this list, and it is clear that major changes in the conception of the board's composition and functions have been at work. "However competent individuals may be in their own particular fields, it will be no use appointing them to the board if their personalities are such that they cannot work together as a team. In this respect, the experience of the board in the last eight years has not been happy." Secondly, the Fleck report urges that full-time members will have to be found mainly from within the industry in future; that is a matter of training good staff and paying them enough ("the salaries of the chairman and other full-time members should be substantially increased"); their appointments ought to overlap to give continuity, and they ought not to be appointed for fixed terms of years. If the full-time members must be found increasingly from the industry itself, the part-time members, declare the Fleck committee, may be of special assistance to the Minister in advising him on the appointment of the full-time members, and they should have right of access to him. It is an interesting proposition; some measure of outside independence is desirable, but is the selection of part-timers from panels provided by the FBI, the TUC and the British Employers' Confederation the inevitably right field of choice? In the last analysis, the proposal would give the part-timers the whip hand over the board's full-time members. It cannot be right.

Leadership is of the essence. "We are satisfied," say Dr Fleck and his colleagues, "that in the past the (eleven functional) departments at headquarters have not always or consistently received the support which is their due and without which their task cannot be

properly carried out." The open, unqualified support of the NCB has not always been accorded to them; and since the board started its life short of good staff, the need has been for more firmness and guidance from the top—"firmer than it is and has been since nationalisation." The chain of command must be kept taut and the quality of the links must be strengthened—better management at all levels, more people of ability, better techniques for them to use, and better discipline.

★

Here is the difficulty; there were not too many good men in colliery management, and many of them have gone since 1947. So, although the basic structure of the NCB is right, as the report holds, quick promotion has come to more people than is good for them or for the industry. Many of the people in key positions in the divisions and areas know little of modern methods of management. It is not that the number of staff is too large—40,000 out of 750,000 is not out of line, if their average quality were higher. The NCB needs a staff department to provide more training and impose a sterner standard of efficiency in filling staff posts. In summary, this may sound self-evident, but who can doubt that it is right? It is certainly argued in cogent detail in the report, and without any suggestion of turning over stones to see what scampers out. The report is certainly all the stronger for its level headed balance on the need for improving the quality of staff, and for leading them wisely and firmly.

In two respects, perhaps, it might be said to leave important matters in doubt. It plumps for keeping the eight divisions (with their 48 areas and 900 pits) as management units "doing for the areas everything that the board and their headquarters cannot do." In other words, the divisions should not be given autonomy; every major element of policy—wages, prices, marketing, investment—must be settled centrally. Coal as a public service and the industry as a single unit are the twin assumptions. When the report turns to the matter of "standards" as a yardstick of efficiency, it will have nothing to do with financial tests. Coal is as Nature left it; what it will bring is "not within the control of the management"; and, for a good measure of topsy-turvydom, the yardstick of financial results is "dangerous, particularly because it may easily lead to complacency where profits are being made, or to an unwillingness to spend money fruitfully when a loss is being incurred." Only an obsession with producing the biggest output of coal irrespective of unit costs could lead to this doctrine. Is not the right course to spend money even more fruitfully where profits are being made—that is, where costs are low? In the course of the next generation it may well be that the realities of marginal costs are going to play a bigger part in the efficient development of the coal industry than is at present realised. Then, the role of the

divisions may not be so merely mechanical as is thought to be proper today. It seems clear, for instance, that the prompt and liberal endorsement of capital schemes, totalling £131 million in 1953, which the report finds has been granted on too little, not too much, scrutiny, ought to be brought within some more rational economic discipline than now exists.

Down to the area—each of which is a large business in its own right with an average turnover of £10 million—the revision of the board's structure and chain of command has a convincing ring. The areas are the messiest features of the organisation; they differ, and so their administration should to some extent differ too. There ought, nevertheless, to be a standard framework, better management, less interference with production and smaller powers of capital investment. But in the end it is people who win coal, and the relations between the area manager, the pit manager and the men determine what will be produced. Here the Fleck report, understandably, is less illuminating than on other matters. The NCB should "clarify the organisation between the area and the pit." A thorough investigation of this complex stratum of the board's organisation is urged. There should be more training to help the pit manager to meet his heavy responsibilities, and more assistance for him by appointing administrative and personnel officers (the latter to be drawn less than in the past from the trade unions). These will be valuable improvements, especially in the large pits. But it is on the toning up of management from Hobart House down to the smallest pit that salvation ultimately depends. If there is sloppiness at the top (as there has been) why should the colliery manager bother to lead his men firmly? If one pit manager is allowed to rule his own roost without reference to his area leaders, how can good administration be expected in the rest of the area?

This is a significant week for the Fleck report to appear. Coal is short, and the railways and power industries are contemplating large new investment pro-

grammes designed to reduce its use within the next generation or two. But coal is not a dying industry. Demand will increase whatever happens in traction and power, and a resuscitated coal industry alone will enable the needs to be met. If the objective quality of this

Power from the Atom

IT is a bold and imaginative step to draw up plans for the large-scale generation of atomic electricity before the first experimental power stations anywhere in the west are more than part completed. Atomic science has shown in many ways that it can reward abundantly the kind of enterprise that goes all out for the highest stakes. Under the programme announced by the Government this week, the British Electricity Authority is making just such a bid.

In two years time, BEA will start building its first two atomic power stations; it will take until mid-1957 or thereabouts to make the necessary preparations.

In ten years time, there should be twelve completed atomic power plants, and a quarter of the new generating capacity annually installed will then be atomic-powered.

From the middle sixties it is conceivable that BEA will cease to build any more coal-fired stations and all its new plant will be atomic.

This programme is for commercial atomic power stations. They will be owned and operated by BEA; and built by contractors for them with all the technical assistance that the Atomic Energy Authority will be able to contribute. Thus the plan is something apart from the experimental atomic plants and power stations that will be built and designed during the same period by the Atomic Energy Authority itself in its programme of basic engineering research. Moreover, the new plants are intended to be base-load plants; they are not experimental stand-by capacity put in to handle peak loads. BEA expects to spend about £300 million on their construction during the ten years covered by the plan, and to trim its schemes for the construction of conventional power stations accordingly. It would be understandable if BEA, or public utility undertakings in other countries, were anxious to get early experience of atomic power generation and to make their own assessment of the new techniques. But to plan a ten-year atomic investment programme on this scale argues something more than a desire to acquire the know-how of a novel and technically important method of producing electricity; it points to strong confidence in the commercial future of atomic power. Electricity supply experts have sometimes been cautious about the economic aspects of atomic power; but the need for an alternative to coal-fired stations has begun to argue itself. It is well known that Sir Christopher Hinton, who has been responsible for all the atomic construction in this country, is no believer in pilot plants and has

report can be kept in the forefront of all the discussions and changes that are needed at the board, it will prove to be a monument of managerial reform—helpful, non-partisan, and designed to produce a more efficient coal industry.

so far been astonishingly successful in bringing plans of nightmare complexity from blue print to full production without the need for any intermediate trial and error. He will for many years be responsible for guiding and advising BEA's atomic enterprises and with the weight of his advice in favour of full-scale planning, has only been necessary for the scientists of the Atomic Energy Authority to produce their estimates that atomic power would cost no more, and might cost less, than power produced by a modern coal-fired station, to make atomic power attractive.

Their cost estimates must presumably be closer to reality than earlier exercises since the building of the Atomic Energy Authority's own power station at Calder Hall is well towards completion. This station is likely to be the first atomic power plant in the western world to operate and is the prototype for the first two power stations that BEA will start building in 1957. Its capital cost is estimated at £15 to £20 million, and its life working range between 10 to 20 years—another unknown about atomic reactors. In the roundest figures, the initial cost of uranium fuel for such a reactor might be £5 million and it will probably have to be completely replaced every 3 to 5 years.

The accompanying table shows a rough break-down of the costs of the 12 proposed atomic plants, as they are outlined in the programme. They will have a combined capacity of 1,500 to 2,000 megawatts and their total cost, including fuel and ancillary equipment, may reach £300 million—equivalent to between £150 and £200 per Kw capacity compared with £60 per Kw for a modern coal-fired station. These higher capital costs for the atomic powered station will presumably be offset by lower running costs—and there will be room for some nice economic argument about the price of uranium or the value of by-product plutonium; there will be considerable play here for the relative bargaining strengths of BEA and the Atomic Energy Authority which will design the plants, train the engineers, handle the fuel and for many years provide technical supervision of the programme. The early plants will be of the type that produces plutonium which is a valuable atomic fuel. BEA will buy outright its uranium fuel from the Atomic Energy Authority and will be the owner of whatever plutonium is produced in the plants. This it will sell back to the Atomic Energy Authority. The price of the plutonium will be a big factor in deciding the eventual cost of the electricity generated. The two sides seem to meet on common ground with a price of

"many thousands of pounds a kilogram" for the plutonium. With the assurance of this by-product revenue, BEA should be able to generate at "about" 0.6d. per unit—exactly the same as BEA's estimate of the generating cost in a modern high-efficiency coal-fired station.

But at this stage, any estimates about capital costs or generating costs can only be approximate, and BEA is proceeding with its initial investment of about £40 million for the first two stations on the broadest of assumptions that the cost of the atomic stations will not be higher than those of a new coal-fired station. The time for precise calculations will come after the Calder Hall reactors start to work.

More important to BEA than the actual generating costs of the plants, which are bound to come down as designs improve, is the prospect they offer of some release from BEA's dependence on coal supplies. Electricity consumption has been expanding steadily at the rate of about 7 per cent a year, and estimates suggest that this rate of expansion is likely to continue until the early sixties, when it might level off slightly to a rate of 6 per cent per annum and further to 5 per cent in the seventies. In 20 years, consumption might be three and a half times today's level. A different price policy might produce different results on the pattern of demand, but on the basis of its present structure, BEA

THE ATOMIC PLAN

	Building		Power	Total Cost
	Starting	Completed	Megawatts	£ mn.

Total cost of programme.....				300

might need almost to treble its existing installed capacity of 20,700 megawatts to 57,000 megawatts by 1975.

BEA has never yet managed to complete more than 1,500 megawatts of new capacity in any one year, but by the sixties it hopes to be bringing in up to 2,000 megawatts of capacity a year. BEA used 37 million tons of coal last year to feed its 20,700 megawatts capacity. Even assuming that the efficiency of all the stations can be raised to about 30 per cent, which is today's best standard, BEA would need the equivalent of 65 million tons

of coal a year for 1965 to meet the estimated demand for electricity, and possibly 100 million tons by 1975. Requirements could rise after that by between 4 and 5 million tons a year. It is difficult to see how this coal could be obtained, and alarming to contemplate what its cost might be. Oil provides an alternative fuel but on present standards an expensive one, and it is against this background that atomic power as suggested by the Atomic Energy Authority at a figure in the region of present coal generating costs at present coal prices becomes economically inviting.

Starting slowly and gaining momentum, the plan prepared for BEA by the Atomic Energy Authority provides for the installation of its first four atomic stations between 1957 and 1963, giving between 400 and 800 megawatts of atomic capacity out of a total capacity that will by that date be approaching 35-40,000 megawatts. But between 1960 and 1965, BEA will speed up atomic construction and put in hand 8 stations with a probable capacity of more than 1,000 megawatts. By the end of the first ten years BEA might therefore have 1,500 to 2,000 megawatts of atomic capacity and perhaps 35,000 to 38,000 megawatts of coal fired capacity. But by that time, assuming BEA is installing 2,000 megawatts of new plant every year, 25 per cent of the new plant would be atomic stations and they would all be base-load stations gradually building up to form the back-bone of the power supplies. The second decade, from 1965 to 1975, might see atomic capacity making up 10,000 to 15,000 megawatts, and coal fired stations, 42,000 to 47,000 megawatts of the 57,000 megawatts capacity that the country is estimated to need by that date. It is quite possible also that from the mid sixties or early seventies all the new power stations would be atomic. These figures suggest that the change to atomic power will be gradual, but since the atomic stations will all be base-load plants, they will in fact be supplying a higher proportion of the total power requirements than mere figures of capacity suggest.

Instead of rising steadily and insatiably, BEA's coal requirements might begin to level off to between 60 and 70 million tons a year during the sixties, and the 2,000 odd megawatts of atomic capacity installed would be producing roughly the same amount of electricity as 5 to 6 million tons of coal. These comparisons need not be regarded as too precise, in order to show that by the sixties and seventies BEA's difficulty may be, not to sell electricity or to build power stations, but to buy enough fuel to keep its turbines turning. The atomic fuels, uranium, plutonium and thorium, may well be more readily available at those dates than coal in Britain in the quantities required and may be no more costly to use. Other countries with a wider choice of fuels may want to look more closely at atomic costs. But to the Atomic Energy Authority in Britain must go the credit for drafting the world's first commercial atomic power project, and to BEA the credit for planning to put it through.

Judgment on the Comet

THE bid to put the Comet back in the air has begun. The government on the one hand and British Overseas Airways Corporation on the other have announced that the Comets will go back into service; modified and strengthened in accordance with the recommendations of the Court of Inquiry that investigated the disappearance of two Comets in succession over the Mediterranean early last year. The Minister of Transport and Civil Aviation, to whom the Court made its report, announced on Wednesday that the government fully accepted its recommendations and he gave some indication of what this decision would mean in practice. The first Comets, the only ones that went into service, cannot be modified and will be used for research. But the Comet IIs and IIIs can be brought up to the new standards suggested by the Court and BOAC is increasing its present combined order for the two types from 17 to 20.

It has taken just over a year to determine why the first jet airliner ever to go into passenger service, the Comet G-ALYP, ended its bright career in flames off the coast of Elba one Sunday morning in January, 1954. During that year not only the future of the Comet, but the future of all jet airliners has been *sub judice*. The Court of Inquiry that investigated this accident, and the subsequent disappearance of another Comet under closely similar circumstances in the following April, published its report last week-end. Until it did so, airlines and aircraft manufacturers could not tell whether, and under what limitations, civil jet flying might be resumed, nor whether the jet airliner was still a competitor for international air traffic.

★

The Court has accepted the evidence of Sir Arnold Hall, director of the Royal Aircraft Establishment, that the first crash, at least, was due to metal fatigue and in all probability, the second, too. On the future of the Comet, the Court has approved the steps that the de Havilland Aircraft Company, the manufacturers, and the Air Registration Board (which certified the Comet for passenger operation) have proposed to deal with fatigue risks. Evidence before the Court on measuring the strength of a pressure cabin and the stresses upon it led the chairman, Lord Justice Cohen, to say:

I may perhaps appropriately express the hope that this procedure will reassure the public as to the integrity of pressure cabins and will justify Sir Arnold Hall's confidence that the Comet aircraft will fly again.

The grounds for this confidence emerge from the body of the Court's report; the patient re-piecing of wreckage; the experiments, tests, measurements, and

deductions made by de Havillands during the construction of the Comet and by the Royal Aircraft Establishment during their post-mortem on it. The report crosses a virtually undefined scientific frontier, examining the behaviour of metals under stress, the nature of fatigue, and pressure differentials. The over-riding conclusion that emerges from this detailed analysis is that the Comet cabin was too highly stressed to have a long life. That is, the pressures exerted on the envelope were beyond the strength of the metal to carry them for long. At certain points, the metal skin was carrying loads as high as 70 per cent of its ultimate strength, and was thus especially vulnerable to fatigue. It was demonstrated in three ways:

(1) A Comet being fatigue tested in the water tank (to stimulate the effect of cycles of pressurising and de-pressurising) failed from fatigue after the equivalent of 9,000 hours flying.

(2) Experiments on other Comets showed that at the point where the failure first occurred (the corner of a cabin window) local stresses were very high. With such high stresses applied intermittently, fatigue failure would be rapid.

(3) Navy salvage vessels still in the Mediterranean when these inferences were being reached, were moved from areas where they had found most of the wreckage and given a course to trawl which, according to calculations, should yield the primary wreckage. The calculations proved to be right; the trawlers recovered a section from the top of the cabin. This had left scratches and traces over the other wreckage, demonstrating that it must have been the first to fail. It had split along two small windows—around which the structure was heavily stressed—and these splits showed signs of fatigue.

Any one of these demonstrations alone might not have proved conclusively that the failure of the Comet during flight was due to fatigue arising from local over-stressing. Taken together, they are difficult to disprove. There remains the second problem. How was this high stress concentration, with its invitation to early fatigue failure, allowed to occur? De Havillands were aware from the start that the danger points of the Comet cabin were its doors and windows. The Court's conclusion is that in the light of existing knowledge, when the aircraft were designed and built the de Havilland Aircraft Company had taken every precaution. They had tested and re-tested—and possibly over-tested—large sections of the Comet fuselage. The results of these tests suggested to them that the cabin would have a fatigue life of about ten years' flying. The Court offers explanations for the astonishing discrepancy between an estimated ten-year life and an actual failure after a year's flying. The Company's tests were not, as it turned out, truly representative of conditions in actual flight; but

the makers are not blamed for not making greater use of strain gauges, nor for believing that their static and fatigue tests gave a relevant assurance for actual flight.

Yet why did the fatal areas of heavy stress escape detection for so long, during the design and development of the aircraft and also during the detailed examination after the Comet crashed at Elba in January and before permission was given late in March to resume passenger services? The answer seems to be that the actual area under extreme stress was small, localised around rivet holes and similar points. Measurements taken by de Havilland in the window areas covered what the Court described as "a considerable distance" (it was a matter of 3 to 4 inches) and revealed a working stress of 28,000 lb per square inch. Strain gauge readings taken at one particular point by the Royal Aircraft Establishment gave a reading of 43,000 lb per square inch. It is perhaps difficult for any layman to appreciate just how much new knowledge of fatigue and stress problems has been brought to light only during the Comet investigations at Farnborough. The wide gap that has been opened up between what was known before about pressure cabins and the forces exerted on them, and what is known now leads the Court to clear the makers of any blame for the weakness of the Comet cabin.

★

What is the conclusion for the future? The loads carried by pressurised cabins will have to be kept relatively low—that is, low in relation to the ultimate strength of the structure—if early fatigue troubles are to be avoided. Additional strength can be provided only at the expense of extra weight. Since the Comet investigations have shown that a small area of stress can lead to catastrophic failure, parallel tests on two complete airframes will be made before an airliner is granted its certificate of airworthiness. One will be a fatigue test to destruction on the lines of the water tank tests carried out on the Comet. The other will be a static test with detailed strain gauge readings; taken together, these tests should give a reliable picture of the strength of the cabin. Even so, they will not reproduce all the stresses that occur in flight; some conservative assumptions will still have to be made about these. On the fatigue tests alone there would be doubts about whether a single cabin was representative; the fatigue life of nominally identical structures can differ widely. Hence the importance of ensuring that no high stress concentrations are allowed to build up in parts of the cabin. It is stress that invites fatigue, and low stress is the greatest safeguard against failure through fatigue.

These conclusions apply to all highly pressurised aircraft, whether jet or turbo-prop, whether built in this country, or in the United States or in France. Water tanks are being assembled in California as well as at Farnborough. For the Comet in particular, they mean that window shapes must be altered; the placing of

rivet holes and "local stress raisers" must be assessed in a new light; heavier, stronger materials must be used for the cabin structure. These are de Havilland's own suggestions, approved by the Court. But the Court has gone further and suggests that the whole Comet control system should be reconsidered. Loads sufficient to break up a pressure cabin could be created by the action of the controls. The failure of the Comets may have been due to fatigue under load, but could a disastrous build-up of that load be helped by the action of the controls? There is no evidence to show that any such thing happened, but the Court was told of differences of opinion among pilots about the present control system, and of criticisms of the "lack of feel" of the controls made by one of the Indian assessors who conducted the inquiry into the Comet that crashed near Calcutta in 1953. The Court therefore concludes that a change in the control system is desirable. This recommendation will give rise to considerable relief among experts who have not been satisfied beyond all doubt that metal fatigue *per se* presented the complete explanation for the Comet disasters.

It now rests with the airlines and with the flying public to weigh the known risks with the known advantages of jet flying. By using the more powerful engines now available, it will be hoped that de Havillands can put Comet IIs and Comet IIIs into the air strengthened and heavier, but with their economic performance unimpaired, and their safety assured within all reasonable limits. Those Comet IIs that are being modified for the RAF will be delivered towards the end of this year. The airlines however may not want the same kind of aircraft, with the same range and payload for delivery in two or three years' time that they would have accepted last year, when Comet II services were originally scheduled to start. During the next few weeks, de Havillands will hold talks with the customers for the Comets; after these talks it will become clearer what form future Comet production will take.

GOLD AND DOLLAR RESERVES
US DOLLARS [THOUSAND MILLION]

Business Notes

Whitewash for Fighters

IT is difficult to reconcile the sorry record of disappointment and delays over aircraft delivery that is given in the White Paper (Cmd. 9388) jointly presented by the Ministers of Defence and Supply on the supply of military aircraft with the bland assertions of that same white paper that the RAF is not equipped with obsolete aircraft and that the country's air defences, far from being inadequate, are the best in the world at the present time. Statements of this kind, of questionable accuracy and impossible to substantiate, can only seem deliberately designed to lull the public into a wholly unjustifiable state of complacency; they are likely to frighten this country's allies a great deal more than its potential enemies. This is not the way to inspire confidence in the government's determination to press forward with a realistic defence policy. Whitewash simply will not stick on aircraft.

The two that have given the most concern, the Swift and the Hunter fighters, are on the way to becoming classic examples of how aircraft development should not be handled. Their arrival in squadron service has been so long delayed that, except for reasons of prestige, no one much minds whether in fact they ever do arrive. Strenuous efforts have been made to salvage the Swift aircraft because it would have been a useful stepping-stone to the introduction of guided missiles. This hardly seems good enough. Why should men and resources still be diverted to testing and further developing aircraft for which—to give one example—11 different designs of tail have been proposed?

The Hunter, which is going into service, is an elegant and beautiful aircraft likely to earn high praise from its pilots, but, like Ferdinand, it has shown no disposition to fight. Apart from the succession of mechanical troubles that prevent the firing of its guns (what use are its four 30 mm cannons, even though they may deliver ten times the fire of the MIG?), the Hunter's performance is not up to the standard originally demanded by the RAF. The white paper admits that there is still room for development, but the Hunter is virtually obsolete. It is doubtful whether a day fighter of this class, without radar and without guided missiles, can do a useful job in intercepting high flying jet bombers of the kind that constitute the most serious threat to this country. The aircraft and the missiles that will do this are on order, and unless they, too, run into troubles as severe as those that have handicapped the Hunter and the Swift—which would mean that none of the lessons of the past ten years have been learned—then the front-line life of these aircraft is at the best about three years. This is the net product of five years of development and lavish sums of money.

New Methods for Supply?

IF the Swift and the Hunter were the only examples of misdirected energies it might be possible to accept the white paper's explanation that the deliberate dropping of research into high-speed and swept-wing aircraft was the basic cause of their troubles. But one aircraft after another has run into difficulties; the Navy's strike aircraft, the Wyvern, is still unfit for service 10 years after work first began on it. The anti-submarine Gannet has been lamentably delayed and both these are relatively slow, straight-wing aircraft. The Canberra bomber is one of the few wholly successful postwar military aircraft; the Valiant may prove to be another but is not yet clear of development.

These experiences seem at last to have made some dents in the armour of complacency that is encountered just as frequently in the design offices of the aircraft industry as it is among the government's technical advisors. The development policy of the past ten years has been based on the conviction that this country can do by inspiration what in other countries is reached by basic hard work. The Swift and the Hunter were each intended to be a "jump ahead" of competing design; so was the Javelin which, in spite of the optimistic statements made about it in the white paper, shows disconcerting behaviour in the air. Their delivery record points the obvious moral.

The white paper hints that at last this lesson has been learned; that for the future, development will proceed by smaller steps. If this policy is faithfully followed, it should mean that an aircraft is more likely from the start to have its designed performance and will spend less time in teething troubles. Other steps, the promise of more research and the ordering of more prototypes to speed up testing, are largely administrative measures that, without a basic change of outlook, can alone do little to improve deliveries. There is, however, little evidence yet that this new policy is being put into practice. There is no visible stepping stone between the Hunter and the massive supersonic P.1 fighter that will replace it; what new fighters will fly this year under government sponsorship are likely to be even more advanced in their way than the P.1.

There is, moreover, no evidence of an intention to overhaul the government machinery for aircraft development. The obvious lesson of the white paper is that the system is even more in need of attention than the individual projects. There is no incentive under present arrangements to meet delivery dates and design specifications because there are no sanctions against manufacturers who fail to do so. An overhaul of Ministry of Supply methods and their responsibilities to other government departments on the one hand and to

"FIBERITE" Packing Cases in solid and corrugated fibreboard.

Imperial Tobacco's income comes from three sources and, fortunately, these can be traced with some precision in the

materials outside the group as well as inside it. Such profits are added to those earned from cigarettes and tobacco in the consolidated accounts. The increase in the consolidated trading profit from £21,024,368 to £22,633,318 points directly to bigger earnings by these subsidiaries. Lastly, there is the income that Imperial Tobacco Company receives from its investments, notably from its holding in the British American Tobacco Company. The increase in BAT's dividend last year is reflected in the expansion in "dividends and interest" from £3,004,243 to £3,618,810. After tax the group's net income went up by about £1.3 million; of this increase just over £300,000 more was paid out to ordinary stockholders.

The society at December 31 still had a small depreciation (£69,097) on its gilt-edged portfolio of £6.7 million whereas at the end of 1953 there was a depreciation in terms of market prices of £340,865 on a portfolio of £8.7 million. The depreciation had thus been nearly cleared off. What

is more significant is that the society seems to have foreseen the present fall in the gilt-edged market and provided against it. The holding of British Government stocks has

been cut from £8.7 million to £6.7 million while the holding of loans to local authorities, which are immune from market fluctuation because they are unquoted, has been built up from £9.6 million to £19.3 million—a shrewd investment change, that must be paying good dividends now.

Skirmish in Tea

A FREE market is a sensitive thing, constantly expressing in price the mood of the moment among buyers and sellers. To the tea buyer's own efforts to bring prices down have recently been added the campaign waged in Parliament and the press and the resistance of consumers. Last Wed-

nesday that pressure was for an hour or so strong enough to topple a market that had been weakening for some time.

* Retail prices are still below replacement costs of tea in Ceylon.

If the London market settles down at about the present level and prices in Calcutta and Colombo fall into line, it should be possible to avoid another increase in retail prices. The testing time still lies ahead, however—from April to August, when shipments from India are seasonally low.

Building Society Growth

A GUESSING game has begun about the building societies' figures for last year. That they will show an outstanding increase over 1953 and all earlier years is not in doubt. The Building Societies Gazette suggests that a figure of £1,900 million for total assets (against £1,642 million in 1953) is not impossible. The Building Societies Associa-

Heat Pump in the Kitchen

ANY refrigerating mechanism works by taking in heat in a region of low temperature and giving it out in a region of higher temperature. A domestic refrigerator is concerned with the colder region, its storage compartment, not with the surrounding air that it makes slightly warmer. The essentially similar "heat pump" at the Royal Festival Hall is concerned in winter with the warmer region, the interior of the hall, not the River Thames that it makes slightly cooler (in such British summer months as require it, the system can be operated to cool the hall). A domestic heat pump that has now come on to the market makes use of both regions; it takes heat from the interior of the larder and from a refrigerated compartment within itself and delivers this heat into a 30-gallon storage water heater.

Most electric refrigerators work by compressing the "refrigerant," a volatile liquid, so that it condenses into a liquid and gives out heat in the warmer region, and then passing it through an expansion

valve into an evaporator that the compressor has been exhausting; the volatile liquid under very low pressure boils there, taking in latent heat from the cooler surrounding region within which this takes place; and then is sucked into the compressor to repeat the cycle. The

efficiency of the mechanism depends upon the amount of heat it can shift in this way and the amount of work—in this case electrical energy—that it expends in doing so.

Such heat pumps theoretically offer very high ratios of efficiency, depending upon the primary temperature at which

they are designed to operate; the domestic version now offered to British housewives, designed to operate at a comparatively low temperature, is still estimated to put into the water container twice the heat equivalent of the electrical energy that it consumes. Two British companies are known to have been experimenting with domestic apparatus based on the heat pump principle—Ferranti and a smaller London concern, Brentford Electric. The smaller company is now offering its own version through certain Electricity Boards; it is quoting an approximate price of £125 including purchase tax, and taking orders for three months' delivery. Ferranti's version is listed at about £141 including tax; this has been sold on a limited scale in the Manchester area.

This initial cost might roughly be compared with a small refrigerator, costing perhaps £60 with purchase tax, and a storage water heater, which costs £60-£70 including tax. The combined units in the heat pumps, according to their two makers, would have a running cost considerably lower than that of a normal storage heater alone.

Everybody notices a RILEY

You have arrived. . . And, as it glides into position, your Riley 1½ litre Saloon attracts approving eyes; draws eager comments. Today especially, this car with its classic low-swept lines . . . with the characterful grace that proclaims its essentially English design . . . stands out among others within, and far beyond, its price class. Nor does it ask to be judged alone by its obvious lines of distinction. Handling it, you realise all the worth of Riley craftsmanship behind that beautifully balanced steering; that masterly acceleration; those superb road-holding qualities. Here is a car that is looked up to in motoring circles because it lives up to a famous tradition . . .

★ The Brilliant RILEY PATHFINDER. Outstanding performance, luxurious accommodation for six and lavish equipment. Riley Models are fitted with Safety Glass all round

tion in its new bulletin has also produced figures from the returns of its own members so far available. The figures are not totals either for the movement as a whole or even for the membership of the association. But they tend in the same direction as the Gazette's estimate. If the total assets at the end of 1954 bear the same relationship to the association's figure of £1,654 million as did the final 1953 figure of £1,642 million to their 1953 estimate of £1,405 million, total assets at the end of 1954 would not be far from £1,900 million and the growth of the movement's resources during 1954 in the region of 17 per cent.

The true growth for the movement as a whole in 1954 may be a little—but only a little—less impressive. That is partly because the association has been making efforts to expedite figures from its members and the proportion available this year may have improved, and partly because the figures for the Halifax Society are not yet available: with

its lower rates the Halifax may have grown more slowly than the average. But though the finances of the movement are growing rapidly, they have nevertheless been fully employed; liquid assets have swelled only because bigger liquid assets were needed to support bigger mortgages. It is all the more surprising that there should currently be a move to extend the maximum length of mortgages. But current expectations are that one or two societies may follow the lead of the Co-operative in offering 35-year mortgages. Is that concession likely to be a good bargain for borrowers? Consider a mortgage of £1,000. On a 20-year basis with interest at 4½ per cent the monthly payment is £6 8s. 2d. If the 35-year option is taken the monthly cost drops to £4 15s. 5d. On the other hand the total repayment of interest and principal over 20 years is £1,537 and over 35 years £2,005. The borrower pays an extra £438 of interest on the longer loan.

A Lure to Savers

IT is recorded that in the early days of the productivity drive some Clydeside shipyards found it difficult to get apprentices to work overtime. The money was good, but the apprentices were reluctant. Then someone found the simple answer of separate pay packets for overtime. Mother did not see the second packet and the problem was resolved. A little of the same idea occurs in the present drive of the trustee savings banks. One of their plans for encouraging new savers is the "direct transfer" method. With the worker's consent a weekly deduction is made from his pay packet. It establishes a credit (usually once a

month) at the local Trustee bank and the pay packet says nothing about any deduction. In some parts of the country it is still the custom (which sounds peculiarly French) for pater familias to hand his pay packet unopened to his wife. Hence an undisclosed transfer to a bank would give him a nice little hidden reserve. How far does "direct transfer" build up real savings and how far secret spending money? At the Trustee savings banks conference this week it was reported that 25 per cent of these direct transfers is drawn out at once; another 25 per cent quickly, a third is short-term savings for holidays, and the last quarter looks like real long-term savings.

That intriguing exercise in the economics of family relations is not general nor necessarily laudable. And it is not the main source of the much better figures shown by the Trustee savings banks for the year ended November 11th last. Their total balances held for depositors rose by £55.7 million to £1,133.9 million at a time when deposits in the Post Office were still falling. Of the total increase only £2.2 million occurred in the ordinary department which pays 2½ per cent on deposits; £4.7 million occurred in the government stock department and £49.0 million occurred in the special investment department. In this department depositors are paid 2½/3 per cent, since here the Trustee savings banks are allowed a little more freedom of investment than in the ordinary department where the National Debt Office simply takes all the money and allows £2 17s. per cent on it—£2 10s. per cent for the depositor and 7s. for all the bank's expenses. Depositors who hold a respectable balance in the ordinary department move into the special investment department in fair numbers— attracted by the extra ½ per cent or ½ per cent.

Canadian Eagle Plans

CANADIAN EAGLE OIL COMPANY has announced a scheme for getting rid of its whole class of 854,770 participating preference shares by converting each of them into one and one-tenth ordinary shares. At the same time it is increasing its authorised capital to 40 million ordinary shares of no par value of which even after the scheme has gone through only 24,104,102 will be in issue. The market received the news without enthusiasm; it had hoped for a free scrip issue or a bid for this important oil shipping business from the Shell group which already holds 21 per cent of the equity, or at the least for an indication of an increased dividend. By Thursday Canadian Eagle bearer had dropped from Monday's price of 50s. 9d. to 44s. in a weak oil market.

Sellers in the market seem to have missed the main point of the company's plan. It precludes neither a scrip issue nor an increased dividend. Nor does it promise either of those happy events. But if the company had such ideas in mind the present scheme would be a necessary preliminary. The company's articles are old and doubts have arisen as to the true nature of the participating rights. Those doubts would have to be resolved either if there were a capitalisation of reserves or a substantial increase in the dividend. The present rate of ordinary dividend is 1s. 6d. per share; the fixed preferential dividend of 23.88 cents is roughly 1s. 9d. per share. Since the company announces that

earnings for 1954 will show an increase, it is clear that the meaning of the participating rights might soon have had to be tested.

Only two solutions were possible, long and costly processes in the Canadian courts or a scheme for getting rid of the participating preference rights. The second alternative is chosen and the only question is whether it is fair to both classes. The ordinary shareholders suffer a slight dilution of their equity that may well be cheap at the price. The preference shareholders gain a great deal. They get a 10 per cent increase in their shareholding. They have the right to opt to receive bearer stock, for this is the first postwar occasion on which fresh bearer stock has been permitted to British residents. They also gain an increase in net income even assuming no increase in dividend. This arises from the fact that Canadian Eagle controls Eagle Oil Shipping Company. Tax relief is obtained on that part of the parent's earnings that stems from the already taxed earnings of the shipping subsidiary. Last year's ordinary dividend was subject to tax on 66 hundredths of its total amount but the fixed preferential dividend is fully taxed.

Investment in Machine Tools

THE upsurge of orders for new machine tools in the last half of 1954 indicates that private industry is at last beginning to invest more rather than talking about it; but these figures are at best only a rough guide to the future plans of industrialists. Chairmen's speeches, the steady volume of industrial borrowing in the new issue market, and the Board of Trade's statistics of new factory construction licences, are other pointers that suggest a general expansion of orders for new plant. One may regret the absence of a fuller survey of investment intentions—such as the Department of

Commerce issues in the United States—but, as the Treasury Bulletin for Industry remarks this week, these signs are encouraging.

Last year the machine tool industry produced about £64 million worth of tools and received about £80 million worth of new orders. In 1953 deliveries exceeded fresh orders by about £15 million; this was not entirely unwelcome at the time as it enabled the industry to pare its delivery dates nearer to those of its overseas competitors. Most of the improvement last year seems to have occurred in the second half of the year, when home orders were nearly half as much again as current deliveries. The industry, as a whole, now has about 15 months' work in hand. Most makers of general purpose tools claim to have work for up to six months or

more, whereas last summer they were delivering from stock. The specialist tool makers always had more work in their books; apparently some are now fully booked for two or three years ahead.

These figures include the £6 million or so Russian orders the industry secured last autumn for delivery between 1955 and 1957 (licences for £12 million were originally granted); but they do not include the large number of tools that the automobile industry will be needing in the next few years. It is a little early, perhaps, to doubt whether the industry will be able to meet its growing commitments. But it is still plagued, to a greater extent than any other producer of capital goods, by fears and bitter memories of surplus capacity in the thirties. Its reluctance to expand capacity faster than it has been doing is at present re-inforced by an extreme shortage of skilled workmen. And the opportunity for parcelling out contracts amongst other machinery makers with capacity to spare—the expensive and unsatisfactory device used for years for some defence orders—has now disappeared.

Cinderella Steps Out—In Furs

FOR several years the fur trade has been the Cinderella of the commodity markets. Apart from the ever-desirable and costly mink, raw furs have been only a little dearer than before the war, whereas prices of most commodities are some three times higher. The feminine public has preferred to spend its money on an ever-widening range of other durable goods, and in the major consuming country, the United States, demand has also suffered from changes in social habits. But there are signs that Cinderella is now stepping out to a brighter future. Sales of finished furs are improving, stocks are low and furriers are buying eagerly in anticipation of a still better season next autumn. Prices have risen in the last few months, and the first sales of the new season's furs in London, the centre of the world trade, have been remarkably buoyant. Continental countries, particularly Germany and France, have dominated the bidding, and prices are up to 50 per cent higher than in the autumn.

That sharp recovery does not merely reflect the improvement in sales of fur coats, nor the gradual return to fashion of fur trimmings, which were a major outlet before the war. The revival has come when stocks of raw furs are low and supplies of wild furs are declining; by the middle of last year prices of many furs had dropped to a level that drove trappers to seek other employment. Supplies of American musquash, for example, a staple item of the trade, are only about one-third of the amount caught last season, and in the Siberian forests other preoccupations appear to have been responsible for a decline in supplies from Russia. The better demand for furs in this country cannot be attributed to the reduction in purchase tax from 75 to 50 per cent, for the rise in prices has wiped that out. The main reasons, as in other countries, are greater prosperity and the turn of fashion's fickle wheel. It is too early to say that the fur trade has left all its problems behind, but the prospect is certainly for a firm market for some time.

Courage and Barclay

THE merger of two large London and Home Counties brewers—Barclay Perkins and Courage—occurs in the very area where beer sales have been badly hit and receipts disappointing. Last summer the two breweries arranged to sell each other's bottled beers through their houses; now they have "agreed in principle to the desirability of a merger by the formation of a holding company to acquire the share capitals." The details of the scheme are still being worked out. Both are family businesses and both have had similar profit records since the war. After the dismal decline in profits just after the war, their earnings in the last three years have been going up—but only slowly.

Other London brewers have sought other ways out; some have absorbed smaller firms, usually in the provinces; others again—Watney Combe Reid and Mann Crossman and Paulin are examples—have tried to foster the sale of their bottled beers outside the London area. The merger of two close competitors may thus be a straightforward riposte to these efforts of their rivals to expand trade. Economies can arise from such a merger. The cost of transporting beer can be reduced and some of the smaller brewing plants could be closed down. Potential economies might go even further. Would it not be economical to close some public houses in areas where both companies are well represented? And might it not be tempting for such a large concern—as will emerge from the merger—to think over the possibilities of selling its bottled beers over a wider area?

Refuge for the Market

THE addition of a big and well-established insurance company to the list of quoted insurance shares is rare but welcome. The £1 "A" ordinary and 10s. "B" (non-voting) ordinary shares of Refuge Assurance company to be introduced on the Stock Exchange in April will be in that class. Few details of this marketing operation are yet available. It is clear that both classes of the Refuge capital will be "heavy" shares; the nominal capital, which will be £600,000 when the shares are introduced, is backed by assets that at the end of 1953 were already over £133 million. The company's business, particularly formidable in the North of England and in industrial life assurance, started in 1864 and is now deeply entrenched; its 500,000 ordinary life policies at the end of 1953 assured over £135 million; its eight million industrial policies assured over £175 million.

How will the market assess the Refuge shares amongst the other insurance equities? Industrial life assurance is not the most rapidly expanding branch of insurance, and it is the branch most open to political risk. But since 1953 the basis of the business has been broadened. The company then acquired the share capital of Federated Employers Insurance Association and its activities now include all branches of insurance except marine and aviation business. Much will depend at first on the detailed marketing arrangements. The families of the president, Mr J.

Wilcock Holgate, and the chairman, Mr William Proctor Smith, are believed to be large owners of the shares. If they agree to supply the market with sufficient shares to secure a free market, a good middle position in the insurance list—perhaps roughly equivalent to that occupied by Pearl Assurance, whose £1 shares offer a yield of about 4.7 per cent—seems justified.

More Accidents in Industry

IN 1953, for the first time since the war, there was a significant increase in the number of accidents in British industry; there were 181,637 during the year, an increase of just over 2 per cent. The trend, certainly, is still downward, and the 1953 figure was about 20 per cent lower than in 1938, though the total working population has grown very considerably. The accident rate per thousand workers in factories was only 22.7 for 1953, against about 30 in 1937. Broadly, therefore, work in British industry continues to grow safer; but some of the trends are disturbing. Since 1949, the accident rates for women and girls have shown little change, as against the steady reduction amongst men; in 1953, the number of accidents to girls went up by 6 per cent, almost entirely in the textile industries. Factories that employ large staffs of women and

girls, as the Chief Inspector of Factories, Sir George Barnet, says in his report on 1953, are often not among the industries conventionally considered dangerous; "possibly they feel that no great effort is called for (in accident prevention), or alternatively the psychological approach may be wrong." The Chief Inspector's point about psychological approach may indeed have a wider application. American managers visiting Britain often argue that here the emphasis is put upon preventing the worker from being injured, by guard rails or machine design: there the emphasis is on training the worker not to get hurt, and weeding out the accident-prone. How far this is true, and which approach is the better, are points on which opinions differ. But the sad recital in these yearly reports of cases where the expert

worker habitually takes risks (so that sometimes it is the apprentice trying to emulate him who has the accident), or judges a guard or shield more hindrance than help, does raise some doubt whether the British approach, deriving as it does from a historical tradition of prevention in factory legislation, does put enough emphasis on the human element.

Cocoa Feels Its Way

IF traders in commodities knew what production and consumption would be their lives would be placid and prices more stable. But markets are often working in the dark, as the raw cocoa market is now. In London last month Accra cocoa for March/May shipment rose by £30 to about £410 a ton. The advance reflected troubles in the Far East, worsening crop prospects in West Africa and changes in the Brazilian exchange rates, which stimulated local demand for raw cocoa among makers of cocoa butter. This month prices have fallen back to a little below the average of recent months, with Accra cocoa for March/May shipment at about £372 a ton. That may have been nothing more than a normal reaction, but no one knows whether small crops in West Africa will be offset in Brazil and by a further fall in world consumption of cocoa beans. Assuming that the Brazilian crop proves to be a little above average, Gill and Duffus estimate that world production in 1954-55 will be some 730,000 tons, a fall of 25,000 tons from the previous year. World consumption is estimated to have fallen by 60,000 tons last year to 740,000 tons. Hence production and consumption may be just balanced, but it would be a fine, sensitive balance.

Navigational Aids in Ships

RECENT collisions between ships, one or both fitted with radar, came in for some sharp comment in the annual report of the Liverpool Underwriters' Association last week. A short time ago a collier, less than a year old and equipped

with every modern aid to navigation, ran ashore on a clear night in the Firth of Clyde. Surprise is often expressed that the advent of radar and other electronic aids to navigation have not done more to reduce marine casualties, and it may be asked whether shipowners are getting value for the considerable sums of money they expend on such equipment. Shipowners are businessmen, and the rate at which these navigational aids are being installed shows that they themselves are convinced of their value. This value shows itself not so much in a reduction in the number of accidents as in savings of time—and therefore of money—on successful voyages. More accurate navigation means a shorter distance run, while the ability to maintain safely a reasonable speed in fog brings an obvious saving of time. Where casualties do occur, it is usually found that undue reliance has been placed in equipment, and well-proved principles of seamanship ignored. As the name indicates, navigational aids are at best aids to navigation; they supply information, on which the seaman must judge the situation and take the necessary action. But though such incidents have perhaps been more numerous than might have been expected, the actual numbers have not been large, and they are likely to diminish as experience and training facilities improve.

SHORTER NOTES

The £1 ordinary stock units of Leyland Motors closed 5s. higher at 126s. 3d., after touching a new peak of 131s. 3d., on Wednesday on the news of a bigger dividend and a scrip issue. Following an increase in the trading profit in the year to September 30th from £2,997,498 to £3,135,383 and a proportionately bigger increase in net profits (from £771,297 to £1,056,311), the ordinary dividend has been raised from 25 to 30 per cent. And the directors propose to make a 200 per cent free scrip issue.

At the opening of the February series of wool sales in London on Wednesday, New Zealand crossbred wools were between 2½ and 5 per cent dearer than at the close of the January sale and in line with prices in New Zealand.

with £3,131,795, and much of that profit has been retained to help to finance the capital developments still under way.

Company Notes

RICHARD THOMAS AND BALDWIN. The biggest operation still facing the Iron and Steel Realisation Agency is the sales of the shares of Richard Thomas and Baldwins and the Steel Company of Wales. The agency has not yet decided whether to sell the two concerns as separate entities or as one large unit. Richard Thomas and Baldwins, one of the founder companies of Steel of Wales, hived off its shares in the latter company to the agency at the end of 1953. There would, therefore, be few financial complications in arranging two separate offers. But there are some grounds for arguing that the two companies should be merged and sold as one concern. RTB did pass over some of its tinplate and blackplate mills and land and

house properties to Steel of Wales. More important than this historical link is the fact that both concerns operate in the same geographical area and both produce similar products, principally sheet steel and tinplate. But it would require a monster operation to sell off the shares in the group that would emerge from such an amalgamation.

Whatever form the ultimate offer to the public takes, its chances will be improved and its timing expedited by the results that the two companies have just published. The preliminary statement from Richard Thomas and Baldwins for the year to October 2nd reveals a growth in profits, after depreciation but before tax, from £6,844,958 to £8,171,987. The net profit is returned at £4,037,202, compared

STEEL COMPANY OF WALES. The preliminary results from the Steel Company of Wales, as might be expected from a company just getting the feel of a newly built plant, show a much more spectacular expansion in earnings than that reported by Richard Thomas and Baldwins. In the same accounting period the gross profits of Steel of Wales shot up from £2,082,208 to £8,285,625. The net balance, after making a provision of £4,100,000 for a postponed tax liability, is returned at £4,085,625, compared with £582,208 in 1952-53. The dividend paid to the agency has been left unchanged at 4 per cent (requiring £372,592) and the remaining profits have been ploughed back to help to support the heavy capital costs.

Such results as these make the task of the agency easier. So does the prospect that profits earned by Steel of Wales and RTB are likely to be even higher in the current financial year. In 1952-53 the results of both companies were adversely affected by the recession in the tinplate industry. That recession is past, leaving behind it in South Wales a number of closed hand mills. Until new plants are completed the home producers cannot meet the demand for tinplate in full. And current production in the motor industry and its future plans suggest that the prospect for the two companies' other main product, sheet steel, is rosy. This year the two companies will have to finance the cost of imported tinplate (which costs more than home-produced but which is sold to British consumers at the same price). But the decision to import tinplate was a deliberate one, enabling the two companies to continue to export tinplate (which still commands a premium on its home price). Those premiums and the demand for tinplate, with that for sheet steel, in Britain should enable the two companies to bear any losses on imported tinplate and still show a further advance in earnings.

ENGLISH ELECTRIC. The effective increase in English Electric's ordinary dividend from 9½ to 12½ per cent, announced last month when the company made its offer for the ordinary stock of Vulcan Foundry and Robert Stephenson and Hawthorns, is shown in the group's preliminary statement to be backed by yet another advance in profits. The gross profit of the group increased last year from £6,042,380 to £6,928,957. As the total provision for tax actually fell (thanks, presumably, to the demise of EPL, which absorbed £560,000 in 1953) from £3,226,023 to £3,041,462, the group's net earnings increased more than proportionately to the growth in trading profits. At £2,098,609, net profits cover

the higher dividend as comfortably as earnings in 1953 covered the previous dividend.

The £1 ordinary stock units of English Electric easily secure a place in the "blue-chip" range of industrial equities. Nor, to judge by the current yield of 3½ per

cent, do investors believe that the company has come to the end of its growth. The broad basis of the group, whose products range from the smaller electric capital goods through aircraft to the biggest generating plants, justifies the high standing of these stocks.

★

INVERESK PAPER. Higher profits and bigger dividends have been generally expected from the paper-making companies, and paper shares have been in the van of the Stock Exchange boom. To judge by the latest results of Inveresk Paper, those hopes have been more than fulfilled. Investors had looked for a tax-free dividend of 10 per cent, compared with the equivalent of 6½ per cent in 1952-53, and that is what they will receive for the year to September 30th last. At the current price of 16s. 9d. the 4s. shares yield 4½ per cent on the new dividend and there are already some who hope that the 100 free scrip issue made a year ago will be followed by another. Bigger profits from Inveresk were a certainty, but the size of the increase is staggering. Before depreciation and tax, the group's profit has rocketed from £2,103,443 to £4,127,190 and the net profit has risen from £621,260 to £1,319,905. The new ordinary dividend is covered about six times by net earnings.

LONDON STOCK EXCHANGE

Next Account begins: March 2nd
Next Contango Day: March 2nd
Next Settlement Day: February 22nd

RENEWED fears of dearer money and the Chancellor's warnings about overseas trade depressed the stock market this week. The sharp decline in gilt-edged prices set the fashion, and by the close on Wednesday the *Financial Times* Government Securities index was down to 99.63, compared with 101.14 just before the weekend. In the same period the *Financial Times* ordinary share index dropped from 196.5 to 192.1. Selling was not aggressive in the Funds, but there were some small sales and as buyers were holding off prices moved steadily downwards. That tendency persisted on Thursday after the announcement of an unchanged Bank rate. End-account sales lowered the price of Japanese and German issues in the foreign market but when the new account opened the German issues steadied and Japanese bonds, on a renewal of support from the Continent, rallied quite strongly.

Industrial equities, which had staged a rally just before the weekend, fell back in line with the Funds. No sector of the industrial market managed to withstand this fall in values. The biggest losses were reported in the store and motor groups. Selling was not substantial but there were few, if any, buyers in the market. The only equities to move against the trend were those, such as "Imps," Leyland and Inveresk Paper, that were cheered up by good preliminary reports.

Oil shares were weak along with the rest of the industrial market, and even Canadian Eagle, which had been marked up at first on the capitalisation proposals, could not stand out against this trend. Tea shares were dull and prices were more or less nominal on the fall in the price of the commodity. Rubber shares were generally dull though the actual losses were small. Diamond shares were unsettled and then moved rather erratically on reports of successful synthetic diamond experiments in the United States. Kaffirs were dull at first in the face of end-account selling but rallied strongly, led by Free State Geduld, when the new account opened.

(1) Annual figures are for June of each year.

(1) Annual figures are for June of each year. (2) Engineering, shipbuilding and electrical goods, vehicles, metal goods, precision instruments and as unemployed expressed as a percentage of the estimated number of employees. (3) United Kingdom. (4) Number registered in the industry. (5) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (6) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and wholesale prices in Western Germany on July-December, 1948=100. (7) Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (8) Notes only for France and Austria. (9) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (10) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced.

Financial Statistics

EXCHEQUER RETURNS

For the week ended February 12th there was an "above-line" surplus (after allowing for Sinking Funds) of £97,172,000 compared with a surplus of £168,176,000 in the previous week and a surplus of £58,957,000 in the corresponding period of last year. This brought the cumulative account to a surplus of £466,706,000 (compared with a surplus of £210,861,000 in 1953-54). Net expenditure "below-line" last week reached £17,139,000, bringing the total cumulative surplus to £481,765,000 (compared with a deficit of £139,973,000 in 1953-54).

THE MONEY MARKET

AFTER raising its bid price for Treasury bills at the previous week's tender, the market last week was content to maintain the bid at £99 8s. 5d. per cent. Outside competition for the increased offer of £230 million fell considerably—total applications were down from £387.4 million to £363.0 million—and the market's allotment rose from 39 to 50 per cent. The offer at yesterday's tender was raised further, to £250 million; and if these are fully allotted the apparent excess of maturities will drop next week from £30 million to £10 million.

Credit in Lombard Street was in keen demand at the end of last week, and on Monday conditions were so stringent that the authorities stepped up their purchases. But on Tuesday and Wednesday the repayment of the £84 million of 2½ per cent Exchequer stock—of which something under one half is believed to have been held outside official hands—produced an abundance of funds, in part mopped up by "reverse" sales of bills by the authorities. Considerable business took place in April maturities at 2½ per cent, compared with 2¼ per cent on previous days.

The price of gold in London has been sustained at around 251s. 11d. a fine ounce by the continued weakness of sterling, which fell to \$2.78½ despite official support.

The Bank return shows a further reflux of notes, of £2.9 million.

COMPANY MEETINGS

THE UNITED STEEL COMPANIES, LIMITED

PRODUCTION CONTINUING AT HIGH LEVEL

PROBLEM OF PLANT REPLACEMENT AT RISING COSTS

RAPID GROWTH OF WORLD OUTPUT

SIR WALTER BENTON JONES ON GREAT BRITAIN'S PROSPECTS

The annual general meeting of The United Steel Companies, Limited, was held on February 10th at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.4. Sir Walter Benton Jones, Bt, the chairman, presiding.

The secretary (Mr Ronald Peddie, CA) read the notice convening the meeting and the report of the auditors.

The following is the chairman's circulated statement on the accounts for the year ended September 30, 1954:

Our last annual meeting was held on March 29, 1954, when the report and accounts presented related to the year ended October 3, 1953. At that meeting I told you that the results for the then current year, which are now before you, were likely to be considerably better than we had expected, and you will see that actually they have been almost the same as they were in the previous year. Production remained at a high level and prices in the export markets fell less than was expected. Production continues at a high level and our order books indicate that this rate of production can be maintained for some months ahead.

The accounts tell you how we have fared financially. The directors' report records the output of primary products compared with the two previous years and the progress of the most important developments and comments on the balance sheet and profit and loss account.

WIDESPREAD SHARE OWNERSHIP

Our preference shares and debentures are still in the hands of the Realisation Agency, but it will interest you to know that the ownership of the ordinary shares is still spread over more than 30,000 shareholders. Of these the number owning 1,000 shares each or less is 27,000.

It is the desire of your directors, and I think of all who are connected with the company, that the shareholders should be acquainted not only with the financial results of the year's operations, but also with the character of the different works, of which there are many aspects. A year ago I attached to my statement a story to illustrate how many of our products appear in our everyday lives. As you may know, the works are widely spread, and this year my object is to introduce you to each one of them by means of a sketch which I call the geography of our company.

Apart from this sketch I confine my remarks to two subjects—viz., the replacement of plant and machinery and the future of steel, which includes iron, the parent of steel.

REPLACEMENT

I have chosen this subject because many who are not familiar with accountancy are

apt to compare the present earnings of industrial enterprises with those of long ago. Today, 20 years is long ago. In those years prices, and therefore costs, have climbed fast and without halt for what must be an unprecedented period, and they have reached a level which, compared with the year 1938, is three and a quarter times as high. And if the cost of everything else rises, so must the earnings and savings of industrial enterprises.

In this statement I use the words earnings and savings because the common expressions profits, gross profits, net profits and so on are often loosely used and give rise to misunderstandings. Throughout my statement the word "earnings" is used to mean income less expenditure before charging depreciation and taxation, and the word "savings" is used to mean what is left out of earnings after charging depreciation and taxation.

Earnings of industrial enterprises must follow the rise of everything else because they are the only source from which provision can be made for depreciation and taxation, and savings must also rise because they are the only source from which provision can be made for dividends, replacements and every other contingency including every expenditure required to ensure the maintenance of earning power.

CAPITAL EXPENDITURE

In their report the directors tell you that our capital expenditure during the year amounted to £8,609,000. This brings the total amount of capital expenditure since the termination of the late war, i.e. since 1945, up to £49 million, which sounds a very large figure and indeed it is, but more than half of it is a consequence of rising prices. If all the work which this money represents could have been carried out in a single year (which, of course, it could not), it would have cost £20 million in 1939 and even at the end of the war in 1945 it would not have cost more than £40 million.

Prices have continued to rise and today the cost would be £58 million. Although, therefore, what we have acquired since 1945 has cost us £29 million more than if we had acquired it in 1939 and £9 million more than in 1945, nevertheless it has cost us £9 million less than if we were acquiring it today. We had some good fortune in making an early start from which we shall derive benefits for some years to come, but I am putting these figures before you for a second reason, viz., so that we may bear in mind that all plant inevitably wears out and that the cost of replacement is always with us.

Obviously we shall never have to replace all our plant in a single year. In any one year some things may be near the end of their lives, others will be middle-aged, and others only just starting to work. But the rapid rise in prices in recent years and its effect on the replacement of manufacturing plant and machinery has become a matter

of great importance and much concern in industrial finance.

ORIGINAL VALUES AND DEPRECIATION

We see frequent references to this problem of replacement in general terms and we frequently talk about it among ourselves, also in general terms. But it will be interesting to look at it more nearly as it affects us.

In our consolidated balance sheet fixed assets appear at £64 million, which we may call their original value. Practically all these assets will have to be replaced sooner or later and probably all within 30 years. The yearly provisions which we make for depreciation in our accounts, are based on the original value divided by the probable life of every item. According to this formula the provision should amount to £64 million in rather less than 30 years. But the cost of replacement is much higher than the original value. At present prices replacement would cost £96 million, so that even if prices in the next 30 years do not rise above the present level, the replacement over that period will cost £32 million more than the original value, in other words £32 million more than we are providing by way of depreciation. The deficiency eventually must be made up out of savings and we have to earn enough and save enough to meet the deficiency.

But this is not the whole story. Although by providing depreciation in our accounts we spread the cost of replacements in our books over a number of years, we have to pay for them in cash when we buy them. Every replacement which we make today which is more than 20 years old costs three and a quarter times as much as the original and has to be paid for in cash.

RAPID INCREASE IN TAXATION

Of course the problem presented by the cost of replacement at rising prices is not new. Indeed it is not confined to industry. In private life household goods and clothing present a similar problem. What is new and what makes the problem look so much more formidable is the long and steep rise in prices in recent years and the very rapid increase in taxation. The rise in prices makes it more difficult to meet the cost of replacement; the rise in taxation adds to this difficulty because it reduces our savings. Nevertheless, the cost of replacement has to be met; in industry it is more than part of the cost of living, it is the cost of survival. That is why I have endeavoured to explain this problem and why I said in introducing it, if the costs of everything else rise so must the earnings and savings of industrial enterprises.

In this connection it is interesting to compare the expenditure and income of the state with what it was in 1938. In 1938 state expenditure was £1,000 million, in 1953 it was £4,500 million. That is to say, it had increased by £3,500 million or four and a half times. All this increase in state expendi-

ture comes directly or indirectly out of the earnings and savings of industry and of individuals.

FUTURE OF STEEL

My second subject concerns the future of the industry in which we are engaged, viz, the iron and steel industry. I have selected it because I suppose that only a few of you live with iron and steel and the remainder would hardly know where to find any kind of a picture of the past or of the possibilities of the future.

In my statement to you last year I said that in the long view the demand for steel must continue to grow and that steel must remain the most important material in the world. This I suggested was because iron ore from which it comes was one of the commonest and the most easily smelted of all the metallurgical ores.

I have prepared a picture which appears below to illustrate the rapid growth of steel

LIKELIHOOD OF FURTHER GROWTH

In this picture, we see how rapid the growth of the world's steel production has been and quite naturally we may ask ourselves how long will this rate of growth continue or even can the present level of demand be maintained. Of course no one can give the answer. Statistically it is said that the consumption of steel and the standard of living are very closely linked. If we accept this statistical deduction it follows that if the world succeeds in raising progressively its standard of living, the demand for steel will go on increasing.

But we are concerned with the United Kingdom. Mr Butler has said recently, "I see no reason why, in the next quarter of a century if we run our policy properly and soundly we should not double our standard of living in this country." If this hope should be realised we might be using in 1980 twice as much steel as now. But even if we do not aim so high we are justified in

† Includes Austria, Finland, Norway, Spain, Sweden.

‡ Includes USSR, Czechoslovakia, Hungary, Poland and Rumania.

production from 1918, the year in which the first world war ended, up to the last completed year, 1953, a period of 36 years. The significance of the intermediate critical dates is explained in the picture. You will see that in the period between the two wars world production had risen from 76 million tons to 133½ million tons and in 1953, that is in 36 years, it was 230½ million tons or three times as large as it was in 1918. In the same period of 36 years the production of the United Kingdom did not rise above the 1918 figure of 9½ million tons until 1935; from then to 1953 it rose by 7½ million tons.

The picture also shows the new entrants, the growth of the British Commonwealth, the enormous production in the United States of America, the large production of what is now called the European Coal and Steel Community and the startling growth of Russia and its satellites which is largely Russia.

Picture of the growth of world production of steel:

The critical dates:

1918, which was the end of World War I.

1929, the year preceding the depression of the early 30's.

1932, the lowest point in the depression.

1937, the highest United Kingdom year before World War II.

1943, the highest year reached in World War II.

1950, five years after World War II.

1953, the last completed year.

FACTORS IN EXPORT MARKET

In the export market there will be competition. In many parts of the world where the standard of living has been low, the standard of living and the demand for steel may grow faster than in the United Kingdom. If so, the world demand, which for us means export demand, will grow faster because in backward countries, even if they begin to make steel for themselves, it will be some years before they can make enough to keep up with their expanding demand.

But in looking at the export market there are two other factors to take into account. First, a large part of the steel sold in our home markets is exported in the form of finished steel goods—e.g., motor-cars, railway material, and many kinds of machinery. Other steel-making countries which like us sell steel and finished steel goods in export markets are increasing their production. Secondly, to this increase has to be added the production of countries which are beginning to make their own steel. Both these factors are a warning that competition for export markets will increase, and it is calculated that we exported to these markets in 1954, directly and indirectly, approximately 7 million ingot tons. We must, therefore, be

re-equipping ourselves to meet competition by searching for and adopting improved methods and modern plant and for this once again we depend upon our savings.

Perhaps we can hazard a guess and say that a growing demand at home and a share in expanding export demand will absorb all we can produce for an appreciable time.

IMPORTANCE OF MACHINERY MAINTENANCE

If you have had patience to follow the information I have given you and the arguments I have used you will see how important it is to maintain machinery and plant in an up-to-date condition, first to maintain a rising rate of production and secondly to meet competition from other steelmaking countries. And you will agree the ability to do these things depends on keeping earnings and savings in step with rising prices. Of course, this does not mean that we can do nothing about it ourselves. We can and must use every endeavour to reduce costs by greater productivity and greater economy. But we cannot control the prices of the things we have to buy.

I am afraid you will think I have over-laboured my two subjects, replacement and the future of steel. But I make no apology because you will see that they both lead to the same end, our ability to compete in the world's markets. My object has been to emphasise that like everything else replacement and modernisation have to be paid for, and since they are not regarded as costs of production they can only come out of what we can earn and what we can save out of our earnings, in other words, they can only come out of what are usually and loosely called profits, but what as a layman I call savings.

COMPANY'S GOOD PROSPECTS

Turning to the prospects of our own company I have already told you that our order books are full and that we are justified in looking forward to a continuance of production at a high level. Large modernisation and expansion schemes are already complete and in operation and are effecting economies in production, and we have a highly organised staff which at all levels is efficient and enthusiastic. So fortified we can expect to maintain our company in the strong position it has reached and to go forward.

The report and accounts were unanimously adopted and the retiring directors, Sir Walter Benton Jones, Bt, Mr J. Ivan Spens, OBE, CA, Mr K. G. Lampson, Lieutenant Commander G. W. Wells, RN (Retd), DL, Lieutenant Colonel P. F. Benton Jones, OBE, ACA, and Mr K. S. Peacock, were re-elected.

THE NATIONAL BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and twentieth annual general meeting of the proprietors of the National Bank Limited was held on February 10, 1955, at 34 College Green, Dublin.

The Right Honourable Lord Pakenham of Cowley, PC, the chairman, presided.

The joint secretary, Mr E. J. Moore, read the formal notice convening the meeting and the report of the auditors.

The directors' report for the year, which had been previously circulated, was taken as read, and the chairman reviewed the principal movements in the balance sheet figures as compared with those of a year ago. Refer-

ence was made to the transfer from profit and loss account of £30,000 to the reserve fund, contributions of £149,611 to the staff pensions and provident funds and the provision for a final dividend of 6 per cent, making a total of 11 per cent for the year, which left the sum of £56,331 to be carried forward.

The chairman moved: "That the profit and loss account for the year ended December 31, 1954, the balance sheet as at that date and the directors' report be adopted by the meeting and entered on the minutes."

Sir Cornelius J. Gregg, KCB, KBE, LLD, seconded the motion, which was carried unanimously.

The retiring directors, Sir Cornelius J. Gregg, KCB, KBE, LLD, the Right Honourable the Viscount FitzAlan of Derwent and John W. Dulanty, Esq., CB, CBE, LLD, were re-elected, and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company and Messrs Stokes Bros. and Pim, was fixed.

THE METROPOLITAN RAILWAY COUNTRY ESTATES LIMITED

SIR BERNARD DOCKER'S STATEMENT

The thirty-fifth annual general meeting of the Metropolitan Railway Country Estates Limited will be held on February 25th at Kensal House, 553/579 Harrow Road, W.10.

The following is an extract from the statement by the chairman, Sir Bernard Docker, KBE, circulated with the report and accounts for the year ended October 31, 1954:

The net consolidated profit for the year to October 31st last, before charging taxation,

was £59,802. This is about £7,000 higher than the comparable figure for the previous year, if, for purposes of comparison in normal trading results, the special net credit of £15,565 arising in 1953 be omitted. Taxation this year takes £30,868 after crediting £5,000 from tax provisions for prior years no longer required, leaving the net consolidated profit, after taxation, at £28,934. Thus, with the balance brought forward of £126,139 a total sum of £155,073 is available, out of which we recommend payment of a dividend of 12½ per cent, as against 10 per cent last year. The carry forward will be £131,010. I regard these results as satisfactory, particularly since our farming subsidiary has had a difficult year and made no contribution to our earnings, whereas in 1953 we had a substantial contribution from that source.

I am glad to say that our traditional business, namely estate development, has made the major contribution to this year's profits. We intend, now that conditions are more favourable, to extend this side of our activities.

After referring to the purchase during the year of the Chenies Estate, Buckinghamshire, and the Deepdene Estate, Surrey, and to other activities and the results of the subsidiary companies the statement continues:

The year ahead will, we hope, bring a final settlement of our claims for that part of the agreed value of our building land compulsorily acquired from us or voluntarily sold at restricted values since the coming into operation of the Town and Country Planning Act, 1947.

Since the closing of the accounts we have been very busy, and subject to no setback in our affairs or those of our subsidiaries, I can with some confidence express the view that this time next year we shall be able to put before you satisfactory results.

TEACHER (DISTILLERS) LIMITED

CONTINUED SALES EXPANSION

The Sixth Annual General Meeting of Teacher (Distillers) Limited was held on February 15th in Glasgow.

Mr R. M. Teacher (the chairman) presided and in the course of his speech said: The profit for the year ended September 30, 1954, is increased from £573,788 to £604,841, which, after deduction of charges, including increased liability for taxation of £314,769 as against £295,504, makes the net profit of the Group £264,011, as against £248,463. In the Balance Sheet the Fixed Assets reflect the programme of replacement and modernisation of plant and buildings which was forecast a year ago and which is so essential in an expanding business such as ours. There is a considerable amount yet to be done, but you can be assured that it is necessary and will be to the ultimate benefit of the business in the form of increased efficiency and earning power.

Our sales both at home and abroad continue to increase as the availability of stock improves. During the year, and since the agreed limitation of supplies to the home market ended, still larger quantities have been made available, but these are not yet enough to meet the demand.

GROWING POPULARITY IN U.S.A.

Export demand continues to increase, and our sales are well in excess of last year. The popularity of our Brand in the United States is greater than ever, as is the case in all markets, but of which the former is the largest. Canada, while we have maintained

our turnover, shows the effect of the considerable difference in the higher retail price of Scotch Whisky as against domestic whisky. In the important Southern and Central American markets almost partial prohibition of Scotch Whisky exists.

Local trade has been somewhat disappointing, showing a drop on last year. Rising costs and decreased spending power are the ruling factors, combined with the high cost of the article itself through the excessive duty. In the 125 years of our business, this duty has risen from 3s. 4d. to its present fantastic level of £10 10s. 10d. per proof gallon.

With the increased turnover, the improvements carried out in our bottling plant throughout the year have proved very satisfactory, and have made both for economy and smoother working. Further work is in progress and contemplated.

At Ardmore Distillery production is being maintained, and here again the improvements, though not yet completed, will be of great value.

Prospects for the Scotch Whisky industry appear to be good for the immediate future. Sales are on the increase and production is at a very high level, perhaps too high on its normal availability. We can, however, be content in assuming that, in the coming year, we will maintain the results which you have before you.

The report was adopted and a final dividend of 7½ per cent, making 12½ per cent for the year, was approved.

MILLS & ROCKLEYS

POSTER ADVERTISING

INCREASING DEMAND

The twenty-sixth annual general meeting of Mills & Rockleys Limited will be held on March 11th at Nottingham.

The following is an extract from the circulated statement by the chairman and managing director, Mr George T. Mills:

The accounts display the results of a full and successful year's work and the increase in the total profit before tax from £152,727 to £184,277 is a fair measure of this success. Once more the fruits of seven and a half months' work out of the year are swallowed by the Inland Revenue and of the increased profit of £31,500 some £18,500 is paid in additional tax. Your board recommend a dividend on the ordinary shares of 1s. 3d. per share less income tax, which compares with 1s. 2d. per share last year.

Capital expenditure has been on a somewhat similar scale to that of preceding years and the liquid position has been maintained.

Some years ago we sponsored and published some scientific research on the size and nature of the poster audience and we have recently sponsored some further research work. This we are about to publish. It will, we believe, considerably assist our customers in buying poster space and give them increased confidence in the medium. A poster campaign can reasonably be devised which can be seen by about 80 per cent of the population of a town during its first week and each member of that audience will have on average something over 20 opportunities per week to see a poster in such a campaign.

The poster is indeed a potent advertising medium for the sale of goods to the public and has an important place in the economical distribution of this country's industrial production. It sometimes seems to be forgotten these days that production and distribution of goods are but two aspects of the same problem, and if our cost of living is to be kept down and our standard of life improved the best advertising methods must be used. In this our poster advertising service is playing an increasing part.

POSTERS AND COMMERCIAL TELEVISION

The effect of commercial television on advertising allocations cannot yet be measured but this medium will, without doubt, be the subject of trials by many advertisers. It has to be remembered, however, that outdoor advertising reaches the public when they are out of doors—when they are shopping—when journeying to and from business—and it is the poster that provides the insistent reminder in the streets that clinches the sale of products which are advertised in the home by press, periodicals, direct mail or TV. In other words the poster is complementary to other media. Its advantages are obviously recognised by a large number of national and local advertisers who have been on the poster panels for many years.

To the future your board look forward with confidence. The business is soundly established and shows steady progress. Forward sales of space in the present financial year are satisfactory. The continued rehabilitation of the plant with the Hellberg poster panel has brought about a marked improvement in poster presentation which is obviously appreciated, not merely by our customers, but by the various town planning authorities, many of whom are now sufficiently enlightened to be aware of the essential need to provide facilities for outdoor advertising.

ELECTRIC AND MUSICAL INDUSTRIES, LIMITED

ACQUISITION OF CAPITOL RECORDS, INCORPORATED

US MARKETS FOR EMI ARTISTES

MR J. F. LOCKWOOD'S SPEECH

An extraordinary general meeting of Electric and Musical Industries, Limited, was held on February 11th in London.

Mr J. F. Lockwood, the chairman, said: Ladies and gentlemen, you have all received a copy of the notice convening the meeting. It is a long document and it has been in your hands for the required period of three weeks. I think you would prefer that we should not take up the time of the meeting by reading it now, and with your permission I should like to take the notice as read. (Agreed.)

INCREASE OF CAPITAL

Of the two resolutions in the notice to be dealt with today, the first is a special resolution to provide that

(1) the capital of the company be increased to £8,766,000 by the creation of 2,500,000 5½ per cent cumulative second preference shares of £1 each;

(2) each of the 500,000 unissued 4½ per cent cumulative redeemable preference shares of £1 numbered 460,001 to 960,000 inclusive be converted into one 5½ per cent cumulative second preference share of £1;

(3) the said 3 million 5½ per cent cumulative second preference shares shall carry the rights set forth in the articles of association of the company as altered by this resolution;

(4) when any of the said 3,000,000 5½ per cent cumulative second preference shares of £1 each are issued and become fully paid the same shall be converted into stock;

(5) the articles of association of the company shall be altered in the manner stated in the notice so as to amend the capital clause by stating the proposed new capital and the rights of the second preference shares, and to make consequential amendments elsewhere in the articles.

TERMS OF SHARE ISSUE

With the notice of this meeting each stockholder received a letter stating that your company has entered into an agreement to purchase a majority of the common stock of Capitol Records Inc. and is making an offer to acquire the remaining common stock of that company. The letter also stated that the cost of this investment would approximate to £3 million and that, to finance the purchase, the board proposed to issue 3 million of 5½ per cent cumulative second preference shares of £1 each, which would be offered to the preference and ordinary stockholders and noteholders of the company.

The issue has been underwritten and the 5½ per cent cumulative preference shares will be offered at 20s. 6d. per share. The closing date for acceptance of the offer will be February 22, 1955, and fuller details will be contained in the offer which will be posted this evening.

REASONS FOR BOARD'S PROPOSAL

Before I put the special resolution to the meeting, I will review the circumstances which resulted in the action your board has taken in acquiring for the company a controlling interest in Capitol Records Inc.

At the end of 1950 Columbia Records Incorporated of America, with whom—and its predecessors—your company had been associated for very many years, terminated the agreements for the reciprocal exchange

of matrices under which both parties had collaborated in the record business since the time when the Columbia Gramophone Company Limited of England owned its own subsidiary in the United States of America. As from January 1, 1953, therefore, it became necessary to provide other means whereby the recordings from artistes appearing on the English Columbia catalogue could reach the American markets, and whereby we could secure the recordings of American artistes for countries outside North America.

In order to secure an outlet for English Columbia recordings in the classical field in North America we formed our own subsidiary company—EMI (US) Limited in the early part of 1953. A few months later, the first catalogue of recordings was launched in America and in Canada under the trade mark "Angel." The Angel record was very well received by the American public, and we regard the development of this business in the United States of America as being satisfactory.

It was desirable, however, in order that your company should retain its leading position in the record markets of the world that adequate provision should also be made to support the company's vast business in the field of popular music. Some of the best music in this field originates in the United States.

ARRANGEMENTS WITH RADIO CORPORATION

We have had for many years arrangements with Radio Corporation of America, and its predecessors, for the use of their recordings in exchange for the recordings of The Gramophone Company Limited.

The acquisition of Capitol will not interfere with these arrangements which have provided both parties with some very valuable material, on the basis of mutual exchange. We need a large number of recordings of America's leading popular artistes (in addition to those already at our disposal) for manufacture, sale and export under our various trademarks, in the many countries where we operate. Our position in that we manufacture records in 18 overseas countries where we have our own factories or plants in addition to manufacturing arrangements in other countries where we have branches or agents.

Capitol Records Inc. have been conspicuously successful in attracting important "popular" artistes in the USA, and will provide for us the specialised American recordings which we need and which are so very popular in many parts of the world.

THE AMERICAN MARKET

The United States market for gramophone records is undoubtedly by far the largest in the world. It is therefore vitally important that we should be able to provide an adequate distribution outlet in the United States for the leading popular artistes of the world who record for us in countries outside the United States. Capitol Records Inc., which is now one of the largest firms in recording, manufacture and distribution of gramophone records in the United States, will provide this outlet.

The acquisition of a controlling interest in Capitol Records Inc. therefore meets two

objectives, i.e. (a) providing specialised American popular recordings for other countries, and (b) an outlet for distribution of British, European and other "popular" recordings in the United States. Your board are convinced that the best interests of the company have been served in making this arrangement. You will appreciate that the company is not making the purchase primarily as an investment, but because of the value of the Capitol business as an integral part of the EMI business.

HISTORY OF CAPITOL

Capitol was originally formed in April, 1942. In its first two years of operation the turnover amounted to £750,000 and \$2,250,000 respectively. In 1946 Capitol purchased all the assets of Scranton Record Company and Scranton Record Distributing Corporation, and since that time there has been almost continuous expansion in the business. A turnover of nearly \$17 million was achieved for the year to December, 1953.

Although Capitol has been in existence for a comparatively short time, its profits had risen for the year ended December 31, 1953, to \$1,424,000 (£508,000) before US Federal income taxes and \$690,154 (£246,000) after providing for US Federal income taxes. The profits for the year ended December 31, 1954, have not yet been ascertained, but the executive directors of Capitol estimate that for the year ended on that date the profits before providing for tax will be slightly lower than such profits for the previous year, but that the profits after US Federal income taxes will be not less than such profits for the year ended December 31, 1953. Since the beginning of this year a number of American record companies have made a reduction in the retail prices of microgroove records, particularly in the classical catalogues, with some slight increases in the prices of other types. Capitol has also adjusted its prices to conform with the competition, but it is too early yet to estimate the effect on sales or profits.

WIDESPREAD ACTIVITIES

The headquarters of the parent company, Capitol Records Inc., are located in Hollywood, but its wholly owned subsidiary, Capitol Records Distributing Corporation, has branches in 23 cities of the United States. There is also a Canadian subsidiary, Capitol Records of Canada Limited, through whom, since 1949, Canadian distribution has been effected. Capitol, whilst continuing the manufacture of 78 rpm standard records, is primarily concerned with the production of microgroove records to play at 33½ rpm and 45 rpm. It also publishes sheet music through its subsidiaries, Ardmore Music Corporation and Beechwood Music Corporation.

In addition to the 476,230 common shares of 25 cents each par value, all of which your company is prepared to buy at \$17.50 per share, there are outstanding at the present time 2,405 shares of preferred stock, \$50 par value each, which carry a cumulative preference dividend of \$2.60 per share.

During the course of the negotiations with the principal shareholders I had the opportunity not only of seeing for myself the premises and plant of Capitol Records Inc., but also to meet the men who will be running this vast business.

THE ECONOMIST, FEBRUARY 19, 1955

Mr Glenn E. Wallichs, the president of the company, is an outstanding personality in the American record business, and we are certain it is in the best interests of the group that he should continue to operate in the same capacity with his present executives. We have made a long-term agreement with Mr Wallichs, which ensures this continuity of management.

I now propose that the special resolution set out in the notice convening this meeting be and is hereby approved and adopted.

Mr L. J. Brown seconded the resolution and it was carried unanimously.

REDEMPTION OF NOTES

The chairman: You will also have read in the circular letter sent to you with the notice that the company has given notice to redeem its £2 million 4 per cent notes 1953-58. Apart from the restrictions which are the conditions of these notes impose, it is necessary for the company to provide finance on a longer term basis and you have been advised that it is intended to replace the present note issue by an issue of £2 million unsecured loan stock, maturing 1970-75.

The terms on which this loan stock is to be issued are at the price of £100 per cent with interest payable at the rate of 4½ per cent per annum, and again I must tell you that full details will be contained in the offer being posted today. In this case, a resolution approved by the members is not necessary because the issue will be made in accordance with the borrowing powers already held by the directors under the company's articles of association. Arrangements have also been made for the issue to be underwritten.

APPOINTMENT OF MR SHOENBERG

I now come to the ordinary resolution, No. 2 of the notice convening the meeting, i.e. the appointment of Mr Isaac Shoenberg as a director of the company.

Mr Isaac Shoenberg has been an eminent figure in research and development of radio for the past fifty years; he has been with EMI since our formation in 1931 as director of research, and lately as our chief consultant. Last year he was awarded the Faraday Medal of the Institution of Electrical Engineers for his outstanding contribution to the development of high definition television.

It was very largely the brilliant work of Mr Shoenberg, as head of EMI research, which gave Britain the world's first public television service years ahead of other countries. It should be remembered also that the high definition television circuitry evolved by his organisation formed the essential foundation of many important devices which contributed greatly to the successful conclusion of the war.

His unique experience is helping today to keep EMI in the forefront of peacetime electronic developments. There can be few such men, however, who have been so self-effacing, or who have succeeded so well in effacing the credit and publicity which usually attach to such accomplishments.

Today, as our chief consultant on development in the electronic field, Isaac Shoenberg attends at Hayes regularly to advise on many new commercial and industrial applications of the science he has done so much to advance.

I therefore propose: "That this meeting approves the appointment as a director of the company of Mr Isaac Shoenberg, who attained the age of 74 on March 1, 1954."

Sir Alexander Aikman, CIE, seconded the resolution and it was carried.

The proceedings terminated with a vote of thanks to the chairman.

P. P. PAYNE & SONS LIMITED

(Manufacturers of Specialised Printing and Packaging Products)

MR J. E. PAYNE'S REPORT

SATISFACTORY YEAR'S PROGRESS

The fourth annual general meeting of P. P. Payne & Sons Limited, Nottingham, was held in Nottingham on February 11th, Mr J. E. Payne, chairman and managing director, presiding. The following is an extract from the chairman's report:

VARIETY OF THE COMPANY'S PRODUCTS

Your company now manufactures a variety of different products and approximately 60 per cent of the turnover comprises specialised packaging materials for industrial and retail uses.

CAPITAL EXPENDITURE

The accounts now before you deal with the financial year ended September 30, 1954. The turnover shows an increase on the previous year and production is running at a satisfactory level. During the year we have built and equipped a new factory for the manufacture of our self-adhesive handles, and it will shortly be in full-time production. These developments have entailed heavy capital expenditure in buildings, plant and fixtures and fittings, but benefits from this outlay will not accrue until the next financial year.

In addition to the equipment of this new factory, we have installed various new types of machinery in our other sections which has achieved complete modernisation of the whole of our plant.

DEPRECIATION

In such a year of heavy capital expenditure, the depreciation allowances for new plant, including initial allowances, total practically one-third of the cost. When these are non-recurrent purchases, the deduction of these allowances in full in any one year's balance sheet would show marked fluctuations in our annual results and give an erroneous impression of the year's net profit. Your directors have, therefore, decided that all plant and machinery purchased from October 1, 1953, will be depreciated equally over a period of ten years in our balance sheets, although the full income tax allowances will, of course, be utilised in arriving at our taxation liabilities.

OVERSEAS TRADE

The company has over eighty full-time representatives and agents throughout the world, and sales offices and warehouses in Australia and Canada. The total export sales show an increase on the previous year.

ORDINARY DIVIDENDS

It is proposed, subject to your approval, to pay a final ordinary dividend of 15 per cent, which added to the interim dividend of 5 per cent makes a total of 20 per cent for the year, less income tax, on the increased capital, and as forecast in my previous report.

BALANCE SHEET AND ACCOUNTS

The trading profit of the group amounts to £180,882 against £162,376 last year.

Charged against this profit are:

Provision for depreciation	32,774
Bank interest	344
Directors' and auditors' remuneration	27,563
Directors' pension scheme employer's contribution	5,412
Staff and employees' profit-sharing scheme	11,546
	<u>£77,639</u>

*Nil last year.

With £258 profit left with a subsidiary, the group's net profit was £102,985 before providing for taxation, compared with £110,428 in the preceding year. It is necessary to provide the amount of £59,500 for profits tax and income tax on the year's results compared with £66,500 last year, which leaves a net available profit of £43,485 compared with £43,928 in the preceding year.

At September 30, 1953, the consolidated balance sheet showed an excess of net tangible assets over liabilities of £417,824 and this has increased to £434,628 in the present balance sheet.

The following analysis shows how each £1 of the gross trading income of the parent company was used during the year:

	s.	d.
Wages and salaries	5	8½
Materials and services	11	3½
Servicing of buildings, plant and equipment		10
Taxation	1	1½
Retained in the business		6½
Dividend (net)		5½
	<u>£1</u>	<u>0 0</u>

PROFIT SHARING SCHEME

During the year, your directors instigated a scheme with participation by all employees after one year's service, who were not in receipt of commission or other incentives. This scheme was welcomed by all concerned and in giving each employee a personal interest in the company's profits, it has already produced increased production and efficiency.

CURRENT TRADE AND PROSPECTS

The directors have intensified their efforts to produce a range of packaging products which are required by most types of industrial manufacturers and retailers. The variety of these products is now such that the company's prosperity is not dependent on any one section of industry, as was formerly the case.

The field of packaging is one where considerable expansion is taking place in protection, display and sales appeal of all manufactured products, and we shall continue our efforts to produce new specialised packaging lines suitable for modern and up to date requirements. With our main raw materials available at firm prices, but with some upward trend, the present level of trade is considered satisfactory. Our order book position is healthy and your directors have every confidence in the company's future expansion and prosperity.

Adoption of Audited Balance Sheet and Accounts. The resolution was formally moved and adopted together with the directors' and auditors' reports thereon.

WILLIAM TIMPSON LTD.

(Manufacturers and Retailers of Footwear)

The twenty-sixth annual general meeting was held in Manchester on February 18, 1955. The following are extracts from the chairman's circulated statement:

The profit for the year, £562,147, compares with £559,699 in the previous year, but 1953 included £72,150 arising on realisation of assets which has no equivalent in the year just ended. We have again increased the general reserve by £100,000 to £900,000, and carry forward £46,479.

The dividends of £124,472 net represent nearly 56 per cent of the profit after tax, and the remaining 44 per cent has been retained in the business to finance further extensions, so continuing the policy which has resulted in building up the assets from £838,222 in 1929, when shares were first issued to the public, to £2,916,389 today. In these years the turnover and the profits have both increased over 4½ times, so that the money retained in the business has been profitably employed.

Capital expenditure this year has amounted to £238,748 and the depreciation written off to £145,915.

Although it seemed impossible that we should have yet another bad summer, that is what happened in 1954, and as August approached the weather became so wet that the public had to buy protective footwear for their holidays. This meant that in general trade was satisfactory, and I am glad to report that the year ended successfully with a good run of retail trading. The directors assure the shareholders that the stock on hand is of good saleable value.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE (UNIVERSITY OF LONDON)

Applications are invited for the post of Junior Research Assistant in the Economics Research Division. The salary scale is £375 x £25—£450. Starting salary according to qualifications and experience. Applications should be received by the Secretary, Economics Research Division, London School of Economics and Political Science, Houghton Street, W.C.2, not later than March 1st.

STATISTICIAN, lady, to compile and interpret costing and other records. Graph experience essential. A new appointment in Central London with opportunity for intelligence and initiative. Salary to be agreed. Superannuated.—Write Box 680, c/o White's Ltd., 72/78 Fleet Street, E.C.4

A YOUNG CHARTERED ACCOUNTANT not over 28 years of age, is required by a leading industrial company. The successful applicant will be expected to undergo a period obtaining the experience necessary to undertake duties of a responsible nature. In addition to professional qualifications a University Degree would be considered an advantage although not essential. An adequate salary will be paid during the preliminary period, but the prospects of the appointment are outstanding, including remuneration of £2,000 per annum within five years of being confirmed in the appointment. Thereafter further advances may be expected as increased responsibility is assumed. Send details of qualifications and experience to Box 839.

LONDON COUNTY COUNCIL invites applications from women with suitable experience for appointment as Deputy Warden (resident) of Gisborne House Approved School, Watford. The school is being re-organised to provide for 40 girls of good intelligence, age 15-17 on admission a full programme of physical and mental activities, including home-making. The Children's Committee are seeking to appoint a woman capable of directing the home side of the school (a domestic management qualification would be an advantage, but is not essential) who will join with the Warden in creating a sympathetic approach to the problems of adolescent girls and who understands the advantage of a psychiatric approach to juvenile delinquency. Salary scale: £691 to £866 less a charge at the rate of £108 a year for emoluments. Six weeks' annual leave. Only single accommodation is available.—Further details and application form (s.a.e.) from the Children's Officer (CH/A2/152), L.C.C., County Hall, S.E.1.

PERSONAL ASSISTANT, 36, Chartered Secretary, at present regrettably geared to Academic Administration, would welcome opportunity to assist Business Administrator. Adaptable with sound knowledge of economics and negotiation. Above all anxious to join in a worthy team effort.—Box 845.

BARRISTER, just 40, single, athletically fit. Experienced Negotiator and Administrator. NOT IN THE LEAST "GROOVED," but 8 years' experience of "Fair Trading" and similar associations. Interested Foreign Affairs. Desires to move.—Box 843.

The company's factory at North Park, Kettering, has operated to full capacity throughout the year, and our well-known "Empire" and "Auric" brands for men and "Flexite" brand for women have been very popular and have sold freely.

We continue to retain our close connection with the dollar market of the United States, and are well represented on the other side of the Atlantic, where shoes of our own production find a ready market.

The company now operates 235 shops and 20 shoe repairing factories: branches have been opened during the year in Acocks Green, Ashton, Beeston, Corby and Shipley.

New shops are foreshadowed in Bangor, Coventry, Ilkeston, Gateshead, Mexborough, Norris Green and Speke (Liverpool), Sheffield and Whitehaven.

During the year we have refitted and enlarged several shops in the North of England and Scotland. These alterations are appreciated by customers, who welcome convenient and commodious premises in which to do their shopping.

The pension fund, founded in 1929, has an invested capital of nearly £590,000, and during the year £54,000 was paid in pension fund and other pension payments, which gives some indication of the benefits enjoyed by the company's retired servants. Employees with over one year's service share in the profits of the company, and £51,000 has been put on one side for this purpose.

Our best thanks are due to our executives, staff and workpeople for the enthusiastic way in which they have gone about their work. Nothing succeeds like success, and in terms of salaries, wages, pensions and other benefits, our employees are all better off for working in a progressive concern and doing adopted.

BRITISH TABULATING MACHINE A GOOD YEAR

The forty-eighth annual general meeting of the British Tabulating Machine Company Limited was held on February 11th in London, Sir Cecil M. Weir, KCMG, KBE, MC (the chairman), presiding.

The following is an extract from his circulated statement:

We have had a good year. Our trading has increased in volume; our orders have reached a new peak; our profits are higher; the progress of our research and development gives cause for satisfaction; our staff and operatives in all sections have given of their best; last, but not least, we have been able to implement our plan to replace, by a debenture stock issue, our short-term borrowing so that, assisted by the recent issue of ordinary shares, our finances continue to stand on a firm and satisfactory basis.

The year has seen the first production of our latest tabulator. This machine will emerge from the factory in increasing quantities during the present and subsequent years. We have also introduced equipment combining electronic with electro-mechanical means of operation.

We seek to preserve to the highest degree the speed and flexibility inherent in electronic principles, while causing the minimum disturbance in existing commercial and analogous routines.

Despite the introduction of new types of equipment, there is no falling-off in the demand for the well-established types of apparatus.

Our overseas companies continue to forge ahead. The report was adopted.

BUSINESS EXECUTIVE WANTED

Experienced Executive Administrator required by large Trade Finance Company (specialising in hire purchase) extending abroad with view to Management. Possible Directorship to the right applicant. Strict confidence observed.—Write Box 840.

WILLIAM MALLINSON & SONS, LTD., require a General Manager to take full responsibility of a very large modern Plywood Factory in the West Country. Applicants must be experienced production engineers conversant with the latest methods of controlling a mass production factory and with Management problems generally. How do you operate?

the office orator

Every office has one. Even we have one. The young lady with the loose larynx is proud of her ability to write and talk, type and talk, take shorthand and talk... even drink tea and talk. Yet she can be a figure expert, for no matter who operates a FACIT calculator, the answer will be right, first time and every time. FACIT, with only ten figure keys, is so simple to operate that any member of your staff can achieve machine-perfect multiplication and division after only a few minutes practice. No trained operator is required (nor any special knowledge of mathematics). We have some interesting leaflets on the subject—drop us a line and we'll send them along, without obligation;

THE BOOK THAT CHANGED 2,000,000 LIVES

THE POWER OF POSITIVE THINKING

is the title of the book that can change YOUR LIFE—just as it has changed the lives of millions in America.

For into 2,000,000 American homes in the last two years this remarkable book has penetrated with its simple, direct, homely and VITAL message.

In this age when all mankind is puzzled by the problems of the hydrogen bomb

THE POWER OF POSITIVE THINKING

by DR. NORMAN VINCENT PEALE

explains your doubts, your troubles, your difficulties and points the way to a happier life. Look, briefly, at some of the chapter headings that help to build up the message that Dr. Peale brings:—

HOW TO CREATE YOUR OWN HAPPINESS... HOW TO BREAK THE WORRY HABIT...
STOP FUMING AND FRETTING... HOW TO GET PEOPLE TO LIKE YOU...
EXPECT THE BEST AND GET IT... PRESCRIPTION FOR HEARTACHE...

And, always, like the thread of life, is the dominant message: Think POSITIVELY, and draw on a source of POWER you have never tapped before.

to a big
Friday problem.

What's inside? Full details of Smiths AUTOPRINT MARK II Time Recorder. A Smiths is economical. It takes an automatic check (so that there can be no overstamp or double printings). And the Accounts Dept. gets an accurate record of each employee's hours — normal time in blue; overtime and late time in red. It's simple — no levers or handles to waste time — it prints electrically by SOLENOID on insertion of the time card. And its constant efficiency means not only a saving in money — it promotes confidence amongst the staff, too. Worth looking into? A lot of big firms have done so already — for the name Smiths is itself well-known as a guarantee of good time-keeping. Smiths Time Recorders are available on sale or rental... details will gladly be sent you on request.

THE FAITH OF A NEWSPAPER

WE are tied to no political party; and we have
no set of dogmas to be used in interpreting
every situation. But we have some obligations.

The first of these is to the cause of human free-
dom and world peace. For the two go together.
Without freedom there can be no certainty of
peace.

To seek, in however small a way, to disperse
the threat of atomic war which hangs over all
mankind is a first duty to any responsible organ
of public opinion. For this threat is the most in-
sidious of all. It weakens religious faith, it under-
mines moral values and strikes at the very roots
of our Christian civilisation.

We believe that a newspaper should give the
news as it happens, honestly and accurately. We
consider that the worst crime in journalism is to
decide on some line of "policy" and then to
twist the presentation of events to justify that line.

But to be impartial is not to be indifferent or
indecisive. We exercise our right, in comment, to
take sides. Most of the time we shall do so in the
spirit of the man who said that it is the duty of a
great newspaper "to comfort the afflicted and
afflict the comfortable".

The "comfortable" and the "afflicted" are
not always the same as they were fifty or even
twenty years ago.

Among the comfortable today are some of the
families living in subsidised council houses with
two or three at work and £20 or £30 coming in
each week.

Among the afflicted we must count many of
the professional and "white-collared" workers,
harassed by rising prices and higher taxation, and
squeezed between the great pressure-groups of

organised capital and organised labour.

They have few champions. Yet it is upon them
—upon the teachers, scientists, parsons, doctors,
writers, artists, and many others — that the pros-
perity, and prestige, of Britain ultimately depend.

We shall always be ready to plead their cause,
and to fight against a tax system which allows a
football pool investor or a stock exchange specu-
lator to keep his winnings untouched, but con-
fiscates the fruits of energy and enterprise and
hard work.

We shall attack the monopolists who stifle com-
petition and enrich themselves at the expense of
the consumers.

We shall oppose the apostles of planning for
planning's sake. Bad planning and clumsy con-
trols only stifle initiative, restrict the rewards of
industry and — in the end — impoverish every-
one.

There is a fixed conviction in many a British
mind that an intelligent and responsible news-
paper must be dull and, conversely, that a lively
appearance is a sign of irresponsibility.

It is not so. The world we are living in is so full
of exciting events that any newspaper which
presents a true picture of what is going on must
bring some of that excitement into itself.

We live in a world of desperate perils and
boundless opportunities, a world where there are
great things to be done. The News Chronicle is a
paper which means to play its part in doing them.

*From a recent leading article

NEWS CHRONICLE

YOU PROBABLY READ IT ALREADY—IF NOT, GIVE IT A TRIAL

up to 15% FASTER MOULDING with LUSTREX HI-FLOW 55

LUSTREX*, Monsanto's popular polystyrene plastic, is now available in a faster flowing form. With Hi-Flow 55, you can mould at a lower temperature — and cut cycle time by up to 15%! Thus for normal mouldings, Hi-Flow 55 can save time, increase production and cut costs. And for intricate mouldings, particularly those needing a long flow, Hi-Flow 55 greatly reduces the risk of strain and instability in the finished product. Hi-Flow 55 is also specially suitable for very thin wall applications — and thick sections too! Lustrex Hi-Flow 55 needs no special moulding technique — it can be used in standard injection moulding equipment. Please note that it can be supplied only to commercial users in production quantities. Write now for full details.

What you can make with LUSTREX*

Many different products, cheaply and well. You can make tool handles, and packages for tools. You can make filing trays, and fittings for refrigerators and radios. In fact you can make almost anything — from instrument panels and picnic sets to camera spools and small cable drums — in Lustrex polystyrene plastic.

Negotiating from Sense

IN Europe, the free nations are approaching not one but two critical moments of decision; and they are nearing them in disturbing confusion. The first nettle that waits to be grasped is, of course, the final ratification of the Western Union agreements. The cumbrous democratic processes set in motion by the London and Paris conferences last autumn are now far advanced: German and Italian ratification appears imminent; and in France, where the prospects of a favourable verdict have been clouded by the parliamentary squabbling of the past fortnight, it is at least clear that final decisions cannot be delayed much longer. But ratification is no end in itself, and never was. The Paris agreements were devised as a means to several ends. Their purpose was not merely to add a West German contribution to the joint defences of the democratic half of Europe, but much more: to create a voluntary bond between Germany and its western neighbours; to draw the fangs of German militarism without arousing a German sense of frustration; and to enable the West to treat with the Soviet bloc on fair terms, neither under the pressure of vastly superior forces, nor beset by divisive fears, nor losing ground with every tick of the clock.

Yet at this moment, when all logic suggests that the West ought to be concentrating its attention on the last effort required to complete ratification and the steps that must be planned to follow it, Europe is, instead, deafened by a shrill clamour: an outcry against all that has been so slowly and painstakingly devised and agreed, a clamour to abandon it at this late stage, to drop it, somewhat in the manner of Aesop's dog, in hopes of being tossed some hypothetical Soviet bone the shape of which is not even clear. This half-hysterical mood has been intensified throughout the West, by the abrupt and furtive shifts of power in Moscow.

A fortnight has now gone by since the Supreme Soviet held its melodramatic session. There has been a slackening of the flood of words on which the new Russian government launched itself. There has been time for considered analysis of the lengthy interviews granted to American newspapermen by the new rulers, of their speeches before the Supreme Soviet, of this week's declarations on Red Army Day, and of the "line" which the Khrushchev-Bulganin regime is already putting out through its press and radio for domestic and foreign audiences. Already some of the first snap judgments pronounced in the West have been modified or even abandoned. Indeed, some of those who, a fortnight ago, were lamenting that Mr Malenkov had carried the free world's last chance with him into oblivion are now foremost in calling for instant and unconditional approaches to the men who deposed him.

What does really emerge from the torrent of words from Moscow, and what does it signify for a West that now stands on the threshold of a new form of unity? One must first accept the fact that no Communist will admit that any change in Soviet foreign policy has

occurred at all. Officially it is claimed, just as it was after Stalin's death, that Moscow's approach to world problems remains exactly as before; and the observer in the West has to adopt the technique, long used by the Russian public, of reading between the lines. He has also to relate what is being said in Moscow now to what has been said there over the past few years. Thus, it is meaningless to make deductions simply from the fact that the Soviet hydrogen bomb has been publicly brandished since Mr Malenkov fell; it was he who brandished it first, when he addressed the Supreme Soviet in the summer of 1953. Nor can the new rulers' threats about the fatal consequences of ratifying the Paris agreements be regarded as dramatically new; similar menaces were repeatedly uttered during the Malenkov era.

Two features of the present Soviet position, however, stand out with particular clarity. First, the new government has not the least intention of shutting the door to negotiation from the outset. It does not sound at all enthusiastic about personal contact with Sir Winston Churchill, who has been singled out for attack; but the new men have made more soothing noises in the general direction of the United States than have ever been heard yet. Admittedly, all the statements emitted from Moscow this month have judiciously blended the tart with the smooth, balancing words of welcome against assurances that the Soviet armed forces can and will take on all comers. But a striking feature of Russian broadcasts for foreign listeners in the week immediately after the Supreme Soviet meeting was the complaint that the western press had played up the marshals' sabre-rattling. Moscow is anxious not to cut too warlike a figure in the eyes of the outside world.

★

Secondly, although the immediate Russian objective in Europe is to frustrate Western Union, this falls into place as part of a broader pattern, a pattern that is repeated tirelessly in the various statements of recent weeks. The real objective on which Soviet eyes are focused is the removal of American bases from both Europe and Asia, from all points, in fact, where they represent any kind of threat to the Soviet bloc. The Communist campaign against Western Union, the denunciation of Nato, and the alternative plan for "European security" long canvassed by Mr Molotov are all parts of this whole. The Russians are not concerned merely to prevent the formation of twelve West German divisions, but to make it impossible for American forces to continue using Germany as a base—and thus to start a process which could quickly lead to their complete removal from Europe.

In the best traditions of Marx's original manifesto, the Soviet rulers—at least in this respect—"scorn to conceal their aims." The argument that the existence of American bases anywhere in the neighbourhood of the Soviet bloc is intolerable was hammered home, bluntly and without qualification, during this month's

newspaper interviews in Moscow, in the recent speeches, and in the Soviet press. If this to some extent reflects the soldierly thinking of the newly prominent marshals, it is also in line with Mr Khrushchev's well-known habit of outspokenness. Indeed, one of the characteristics of the new régime is the jettisoning of the suave manner of the Malenkov period. Last week a very clear example was provided by the new Soviet declaration on disarmament. Some observers interpreted this as an ominous retreat to the practice of stating impossible terms instead of negotiating seriously. But the obvious truth is that Vyshinsky was not negotiating seriously last year; on the contrary, he was making a well-timed effort to break up the London and Paris conferences. Patient cross-examination eventually revealed the hollowness behind his cloudy statements; and no more was heard of them. Now the Russians are back at the familiar task of making simple propaganda for simple minds out of the whole disarmament question; and in one way it is a relief. There was never any likelihood that they would come along with the West far enough to make watertight control over a balanced disarmament programme possible; and it is good that that should be made clear.

★

Yet, all that being said, it remains impossible merely to label every Soviet statement as pure propaganda or tactics. These elements are unquestionably present in all that the Soviet rulers say; but other, more genuine elements can sometimes be detected too. There is much reason to suppose that the repeated references to American bases reflect a quite genuine anxiety. The very inconsistency of the Russian leaders points to this. While Mr Khrushchev was denouncing the existence of bases in conversation with his western visitors, Marshal Bulganin was talking of "maintaining the present superiority of Soviet arms over those of the capitalist armies," and Mr Molotov was assuring all the Russians that in a hydrogen-bomb war only the wicked capitalist system would be destroyed. Behind such brashly confident statements, the Soviet rulers are plainly worried, and with some reason.

The West must, then, take seriously certain essential parts of the present Soviet "line"; without swallowing Moscow's whole propaganda output, it is both possible and necessary to accept the fact that at some points the propaganda coincides with bedrock policy. This is not to say that western policy must be tailored to suit Soviet requirements, that projects vital to the free nations must be abandoned merely because they cause in Moscow an alarm that is real and not simulated. But it does mean that western decisions should take full account of such real factors.

The Kremlin's new preference for plain spoken bluntness ought to make the task easier. The advent of the "tough" and talkative Khrushchev has torn apart some of the veils of illusion that Mr Malenkov affected.

It should now be clear for all to see that in Soviet eyes questions such as West German rearmament are secondary to the central aim of driving the Americans out of the whole Eurasian continent. (This gospel is not in the least new; but it emerges far more clearly from Mr Khrushchev's table talk than from the labyrinthine Notes that Mr Molotov has been despatching in recent years.) And when one comes down to this bedrock, it may be expected that the West will show a heartening degree of unity; few, even among the Bevanites, the German Social-Democrats and the French neutralists, really want to see the Americans retire to Kansas while the Russians retain their grip on Eastern Europe. Western leadership, then, faces a dual task. The point has to be patiently and consistently put across to the Russians that Nato and all other

Hire Purchase: A Test Case

THE Chancellor of the Exchequer deserves the warmest congratulations for the promptness and firmness with which he has moved to rein in the surging force of demand in the British economy. The more is the pity that the major move made on Thursday—the increase in Bank rate by a full one per cent—was accompanied by a minor measure—the reimposition of specific restrictions on hire purchase—which is much more questionable. In whatever form the new orders are drawn up, they will offend against what should be a cardinal principle of economic policy: namely, that industry and the markets, guided by the individual preferences of millions of customers, will do much better in deciding how any general cuts—whether they are initiated by Bank rate or by budgetary policy—should be distributed than will any gentleman in Whitehall.

The temptation to re-impose specific restrictions on these transactions was understandable. Hire purchase represents "consumption," which all postwar Chancellors have learned (and with justice) to regard as the first thing that should be cut. It is a form of consumption that has been increasing very rapidly since specific Government regulations about minimum down payments and maximum loan periods were removed last July. Total consumer debt financed in this way may now be more than £400 million, or as much as £30 per family (for some reason, it is possible to make this last figure sound both frightening and improper).

It must be conceded that there are some respectable economic arguments for looking askance at hire purchase at a time like this. For instance, it undeniably is to some extent an unstabilising element. This is not because hire purchase is capable of increasing or diminishing the total level of national consumption. If hire purchase were now to be banned altogether, the millions of people who now use part of their weekly

arrangements under which American forces provide a shield for smaller countries are vital to western defence (and to defence only) and can in no circumstances be discarded. The Russians may never publicly admit that these arrangements are strictly defensive; but they may be brought to a tacit understanding. Meanwhile the western people themselves have to be reminded that the Communist objective is, and was throughout the Malenkov era, nothing less than domination of a Eurasia uncluttered by American presence or American power. The European-American alliance is the main object of attack; by the same token, it should be the first thing to defend. If the deposition of Mr Malenkov contributes to an awareness of that cardinal fact, it may prove in the long run to have been one of the most helpful events in postwar history.

wage packets to make instalment or interest payments would be able to divert that money to chase after other goods instead. But an increase in hire purchase, though it does not alter the total of consumption expenditure, does bring forward in time the burden of that expenditure on production: the goods are sent from the shop to the home after the first payment, and the shop then replenishes its stocks from the factories. Economically the effect of an increase in hire purchase is the same as if traders carried larger stocks. And as hire purchase tends to go up and down with other forms of consumption expenditure, it does tend to exaggerate their inflationary or deflationary effect. This is therefore a system that works the wrong way in the trade cycle, and where the volume of hire purchase credit is as large as it is in America (where it is equal to some 8 per cent of annual personal incomes), it is a factor whose unstabilising effect has to be taken seriously. But the best available British guess suggests that hire purchase credit outstanding here may be equal to about 3 per cent of annual personal incomes. The Americans are dealing with a convulsive giant, the British with a promising babe.

But the qualitative effects of hire purchase may well be more disturbing than its total volume. It so happens that many of the goods that are bought on hire purchase—motor cars, household appliances and so on—are either goods that could be exported or else goods that are made by workers who could find other employment in similar export trades. Many of the goods and services to which demand might be diverted now that hire purchase is to be slowed down, on the other hand, are natural absorbents of inflation, which can suck in a flood of purchasing power with little transfer of real resources from other employment.

This is true of a surprising range of sumptuary expenditure in Britain today. It a man switches his

furniture money to beer and cigarettes, he adds to Exchequer revenue by far more than he diverts brewers from exporting or draws dollar tobacco from stock. If he transfers his erstwhile instalment payments into the football pools, he swells that extraordinary flood of money that weekly chases the work of a few hundred clerks in Liverpool, instead of chasing goods in the shops. If he goes more frequently to the cinema or the greyhound stadium, he makes more intensive use of these underfilled pieces of capital equipment; and the productivity of the film distribution and greyhound industries rises, in the national income accounts, by exactly the same amount as his admission money raises personal consumption. In all these cases, it would be foolish to deny that there is some disinflationary gain.

★

These are strong reasons for not exempting hire purchase from any general measures of restraint that may be in contemplation. Now that money is to be dearer, there should be no attempt to prevent the cost of hire purchase from going up. If credit is now to be tighter, it should be tighter for the hire purchase companies as for everybody else. If free availability of consumer credit is doing perceptible harm to export markets, that is a consideration that must enter into the Chancellor's decisions on such budgetary matters as purchase tax. But the good reasons for saying that hire purchase should not be exempted from general measures of restraint are hardly good reasons for saying that it should be specifically discriminated against. Indeed, there are two overwhelming arguments for deploring the Chancellor's decision, one that is particular to hire purchase, one that is more general.

The particular argument is that hire-purchase, and consumer credit more generally, shows signs of being precisely the sort of dynamic influence that the country so badly needs. By almost universal testimony, one of the reasons for the strange and striking sluggishness and leisure-mindedness of the British economy in these postwar years has been the lack of incentive to the individual worker. Even in the short period since hire purchase was set free, there has been some evidence that it has been providing just such an incentive. It is, of course, quite irrational that it should be so. In strict logic, it is just as easy to buy a television set by saving up before the purchase as after it—just as it should be just as easy to get up and go to bed an hour earlier in summer than in winter. But human nature is not logical, and hire purchase is effective just as summer time is. Moreover, though anything that tends to divert demand away from beer, tobacco and betting and towards durable goods may be a temporary inconvenience for the balance of payments, there surely cannot be any denying that in the long run it will strengthen both the moral and the economic fibre of the nation. Do the moralists who inveigh against the “never-never” really prefer the pubs and the pools?

The more general reason is that to reimpose, at the

first hint of difficulty, any specific controls that have once been successfully removed is an ignominious retreat. This is a matter of principle. The latter-day argument is not (though it is often misrepresented as being) an argument between the controlled or planned society and the licentious uncontrolled one. Virtually everybody today accepts the case for what Keynes called the “purposive direction” of the economy. The argument is whether that direction should be exercised by general “atmospheric” controls which, while they influence the decisions of the individual, leave him free to make up his own mind, or by specific regulation administered by bureaucratic agencies. There can be no doubt where, in a community which hopes to be both free and progressive, the balance of advantage lies. If there is complaint against the last three years, it is not that the principle has been wrong, but that it has not been ensued with sufficient audacity and resolution.

A retreat by the very people who profess this doctrine is a clear, and an unnecessary, defeat. A principle is not a principle (as distinct from a mere tendency of mind) unless it will be applied even to cases where there are some particular arguments in the contrary sense. That is why hire purchase has been worth defending at such length. Fate seems to have cast it as a test case.

The Crisis

The most determined optimist cannot conceal from himself that the position of public affairs at this moment is most grave and menacing. We are engaged in a war with the most colossal and inaccessible Power in the world. We have an army in one of the most vulnerable parts of his dominions, but that army is reduced to less than one-half of its original effective strength, and is threatened with an imminent and deadly struggle not only for victory but for existence. In the very crisis of the war we discover that our military system is defective, and either the machine or the personnel of our military administration inadequate to the pressure which has come upon it. The country is angry and alarmed; the House of Commons echoes instead of interpreting its feelings, and insists upon doing a necessary thing in an impracticable way; the Government is defeated and resigns; two political chiefs in succession endeavour to construct a new administration, and fail in the attempt; a third succeeds, but his Ministry has not been a week in office before three of its most important members resign [Mr Gladstone, Mr S. Herbert and Sir James Graham], and we are again thrown into confusion and uncertainty. All the difficulties, drawbacks and weaknesses of representative institutions are coming upon us in an aggravated form just at the critical instant when they are most damaging and most discreditable. The situation demands concentrated energy, and we have nothing but disunion and discontent. We need either the single will and the prompt action of despotism, or that patriotic self-abnegation that can, on occasion, imitate, supply, and surpass all the resources and advantages of aristocratic power;—and we have got neither.

Odd Slav Out

LIKE most people, the Yugoslavs enjoy finding themselves in the limelight only when certain that they are appearing to the best advantage. Marshal Tito's triumphant tour to India and Burma amply fulfilled this requirement. The Djilas-Dedijer affair, on the other hand, reflected little credit on the regime; consequently the great interest with which it was followed in the Western press provoked some very sour comments in Belgrade and some quite unjustified aspersions about western meddling in Yugoslav affairs. The Yugoslav Communists, however, must reconcile themselves to the disadvantages of being unique. As the first successful rebels from the Soviet bloc their domestic affairs are of much more than academic interest to the West. And, in the international sphere, their open search for a suitable niche for themselves is plainly of great importance to western defence planners who would like to know how far the Yugoslavs could be relied upon, to play their part in repelling any Soviet attack.

Marshal Tito's travels to the Far East provided his regime with plenty of the right kind of publicity; and his visit to the leading Asian statesman, who refuses to align himself with either power bloc, emphasised Tito's views on the place in the world that he believes his country ought to occupy. He has, in fact, little option but to stick to the middle of the road. Jugoslavia's relations with the Cominform bloc have now become reasonably civilised or “normalised,” and if Marshal Tito wished to return whence he came, within the Soviet camp, there is no doubt that the most diffident tap on the door would cause it to be flung wide open. Such a step, however, would have two major disadvantages for the Yugoslavs and these lend a ring of truth to Marshal Tito's constant assertions that he has no intention of abandoning his western friends. The first is that he knows better than any man that as soon as he walks into the Kremlin parlour his independence of action flies straight out of the window. And in the second place, he knows equally well that if he rejoins the Soviet camp, the western powers are hardly like to go on pumping economic aid into Jugoslavia in a spirit of pure philanthropy. Poor harvests, industrial growing-pains and the mistakes of the planners all combine to make it certain that for the next few years at least the Yugoslavs would be very hard put to it to manage without western aid; and it is unlikely that if it were to be stopped the Cominform countries could adequately fill the breach.

While Marshal Tito could rejoin the eastern bloc, he does not want to—at any rate for the time being—he neither would nor could join the western one. He would not because he would probably find it very hard to sell such a move to his more dyed-in-the-wool Communist followers. And he could not because most Nato members would not feel that he qualified for member-

ship of their club. The illogicalities of his indirect link with Nato through the Balkan Pact are, both for him and for the Greeks and Turks, outweighed by its defence value. But although the Yugoslavs are anxious to strengthen the non-military sides of the pact there is no reason to suppose that it represents for them any sort of a half-way house on a journey right into the western camp. They are clearly anxious to strengthen their friendly connections with the West, for instance, through the western socialist parties; but it is unlikely that the Yugoslav leopard will really change its spots even though it has grown considerably more benign.

★

The Yugoslav leaders must be given the credit for having removed the worst and most oppressive features of a Stalinist police state. The Djilas-Dedijer affair showed how far they have developed more liberal ideas about the treatment of those who disagree with them; but it also showed that there are definite limits to their liberal ideas and under the present system it is not easy to see how these limits can be much further extended. Marshal Tito and his associates would indeed be the first to agree that they have no intention of working towards a democracy of the western type. In their view, the “classical” forms of democracy which are suitable for economically advanced countries will not work in backward ones. They are engaged in working out a complicated experiment in “economic socialism” in which they maintain that each citizen will be able to participate directly in the government through producers' councils, communes, and other types of association; and they believe that the system will lead to a withering-away of the state.

It would be unfair to pass final judgment on an experiment which, in Mr Kardelj's grandiloquent phrase, is “still in the phase of fermentation and co-ordination of the form with the substance.” But it is already perfectly plain that it will never allow more than the most exiguous vestiges of genuine political liberty. If the present restrictions on political action are ever lifted, it clearly will not be until, in the leaders' view, there is no longer any possible danger that the system or the regime will be upset. In other words, Marshal Tito and his associates will never offer the Yugoslav peoples the choice of an alternative government; unlike Atatürk's successors, they never intend to put their record to the test of the ballot box.

Jugoslav ideas on economic socialism are clearly not for export. But Marshal Tito did not embark on his travels in order to try to sell them to his Asian hosts. He went in the much more likely and rewarding search of sympathetic understanding for his view that the

smaller countries should not align themselves with either of the great power blocs but should work together, whatever the differences in their internal political systems, to promote peace and international understanding. In developing these ideas he showed greater realism than his hosts have sometimes done. He does not cherish any illusions that if a major war were to break out, the Yugoslavs could bury their heads in the sand and let the storm sweep over their heads. On the contrary, he has said quite categorically that the world is an indivisible whole and that "any conflict would involve the small nations, and they would fare very badly in it." With some justification, he is irritated at the suggestion that he is nothing more than an "incorrigible neutral." He insists that there is all the difference in the world between a passive neutrality, and an "active co-existence" which strives constructively to promote peace, and which might, as he has more than once warned the Yugoslav people, involve them in danger and sacrifice. Equally firmly he has insisted that the smaller uncommitted nations have no intention of building up a "third force"; in their view, this would involve them in the very system of blocs of which they disapprove.

The West has no more cause to cavil at the role for which Marshal Tito has cast his country than it has at the part which Sweden has been playing for years at the other end of Europe. In fact, it has less; for while both countries are strongly armed and determined to defend their frontiers, Yugoslavia has gone further and pledged itself to go to the help of its two non-Cominform neighbours. But the West can legitimately feel aggrieved at the way in which Marshal Tito continually paints a smudged and distorted picture of the

setting in which Yugoslavia performs its role. He even once went so far as to tell his Burmese hosts that the big blocs would prevent the smaller powers from playing an independent part and that the interests of the two are bound to conflict. If he really believes that, then one can only conclude that he is completely blind to the evidence of his own dealings with the western bloc and that he has not outgrown his Stalinist upbringing as completely as he would like the world to suppose. Moreover, he habitually takes the line that all the tension in the world today springs mainly from the existence of the two big power blocs, that these form the chief obstacle to a lasting international settlement, and that the efforts of the smaller powers—like Yugoslavia—to keep the peace are the one redeeming feature of an otherwise naughty world.

The misrepresentation is obvious. The Marshal completely ignores the fact that the smaller powers can enjoy the luxury of walking by themselves and telling everyone else how to behave only because the West has built up its armed strength as a bulwark against Soviet expansionism. It is unlikely, to say the least, that he himself would have emerged so triumphantly from his long duel with Stalin if he had not been in effect protected by the Nato shield. As it is, he finds himself in a highly advantageous position. Both blocs treat him with consideration; and one supplies him with military and economic aid with no strings attached. But if he really wants to play an active and influential part on the international stage, he must show that he is fair-minded and his intentions honourable; and to give his people a quite distorted picture of the international scene is not the best way to dispel the suspicions that, in many circles in the West, still hover round his name.

Notes of the Week

Firm Hand

IT is unfair to job backwards and say that the increase in Bank rate, to 4½ per cent, should have been made four weeks ago. Most people had thought at the end of January that the increase to 3½ per cent might be sufficient; and few—including few in official circles themselves—had realised how rapidly the terms of trade were deteriorating. This realisation had only caught hold in the City within the last ten days, and had precipitated the fall in market prices that the first increase in Bank rate had failed to bring about by itself. It was essential that the authorities should rub

this realisation home; and to do this they had to increase the rate by the full 1 per cent. This was the only way in which they could hope to seize control of the situation; otherwise they would have appeared merely as unwilling followers in discomfort's wake.

Now that the step has been taken, it is right to say that there is more reason for satisfaction than alarm. Britain's own balance-of-payments prospect looks far less menacing than at the onset of the economic crisis of 1951; and the overseas sterling area's prospect, of course, is far less bleak than at the onset of the crises of 1947 and 1949. The real significance of these two dramatic *démarches* from the Bank is that there is a firmer hand upon the tiller in the face of a less frightening storm. The political implications

of this economic setback, so near to the election deadline, are bound to be disturbing for the Conservatives; the implications for that election's timing are a matter for them to work out for themselves. But they certainly deserve (and may even get) the credit for their courage in meeting trouble half way.

Parliament and Opinion

SIR WINSTON CHURCHILL has been in a delightfully vivacious mood this week; and, in his comments about political debates on television, he has been vivaciously wrong. The trouble arose after Mr Shinwell and certain other MPs had been prevented from discussing the Defence White Paper on television, because the BBC has an agreement with all political parties that no subject that is to be debated in Parliament within fourteen days shall be discussed on the air. Mr Shinwell said this was a silly agreement; most newspapers agreed with him; and questions were put down in the House suggesting that it should be reconsidered. To most people's surprise, but to the accompaniment of an approving nod from Mr Attlee, Sir Winston said that he would never reconsider it. It would be "a shocking thing," and contrary to the long-term interests of the House, to have debates forestalled time after time on this "vast new robot organisation of television and broadcasting."

There are two entirely separate issues here. The first is that so long as the BBC is a monopoly, and so long as its method of debating current affairs is to have a stage-set party battle about them, it inevitably begins to look like a rival forum to Parliament. It is a forum that attracts far more attention, but on which the debates are necessarily more informed and on which the reasons for particular Government policies cannot be prematurely disclosed. The proper remedy for this, however, is to stop the BBC being a monopoly, and to bring its methods of discussing current affairs more in line with those of the press.

The second issue, which Sir Winston appeared to ignore, is that all-party control of the discussions that may be held on the air can be desperately dangerous: almost as dangerous, in principle, as would be single-party control. This is of the arguments that are put forward in them. This is because there are certain issues—strikes are an example—in which it may be in the short-term interests of all professional politicians, but not in the long-term interests of the public, that deeply-probing debates should be forbidden. It is no answer to this criticism to say that these debates can still be held in a free press; broadcasting is a medium that now reaches far more people. This is a straight conflict between the convenience of Parliament and the rights of the people. For the sake of democracy itself, the organised party interests at Westminster must not be allowed to treat this most important means of public information—and largest means of public entertainment—as their inalienable private estate.

Labour and Defence

LABOUR seems to have taken the decision to make British H-bombs surprisingly calmly. There will inevitably be protests from the pacifists, and the far Left believes that

this is a great opportunity to woo the frightened; but the party as a whole is apparently ready to accept the logic of the case. Much of the credit for this realism belongs to Mr Attlee, and perhaps even a little to Sir Winston Churchill. A fortnight before the White Paper was published—in the private speech that shocked some of his colleagues into misinterpretation—Mr Attlee told his followers that Britain needed its own H-bombs, and explained why. He thus stole a march on the potential critics, and answered their arguments in advance. Presumably he would not have been able to do this if he had not been taken into Sir Winston's confidence. Certainly if he received any advance hint he made good use of it; and an announcement that might otherwise have touched off an emotional storm has been accepted with almost tame resignation.

The H-bomb has probably been made more palatable for Labour by the fact that there are still a number of grounds on which the Government can legitimately be attacked. Last week's deplorable White Paper on the supply of military aircraft, with its heavy-handed passing of the buck to the pre-1951 Labour Governments, ensured that the coming defence debates will take place in a sultry atmosphere; and the only problem facing Labour this week has been to agree on the exact form of the censure motion that it will table for next week's debate on the main Defence White Paper. On the broad issues the party seems agreed; the Government has been slack in promoting either international disarmament or national re-armament. Preferably Labour would like no arms; but, if these are still needed (as all except the pacifists admit), then the Tories have not been producing enough and what they have been producing have not been of the right type.

So much for the broad lines. On more detailed questions Labour is no more certain of itself than any other group of strategists, amateur or professional. It hopes it can think that National Service could be cut, but wants an inquiry first. It believes that more attention should be paid to nuclear weapons and less to conventional—chiefly because this sounds the progressive thing to believe; but it is not sure about bombers. It thinks that both the army and navy could be trimmed back more, but wonders what would happen if a third world war starts and if neither side dares to drop the first H-bomb. These are the doubts that assail all minds, including those on the Tory back benches.

Lack of Leadership Over Formosa

THIS week's resolution on Formosa by the National Executive Committee of the Labour Party might well have been worse. It calls on China and the United States to establish a cease-fire in the Straits of Formosa; to arrange the evacuation of Nationalist troops from the offshore islands; to see that Peking's representative is admitted to the United Nations; to neutralise Formosa and the Pescadores "by international guarantee," until their inhabitants can make a "free . . . choice without intimidation from either side"; and to ensure the "withdrawal of Chiang Kai-shek and his principal supporters." While this represents a toning down of some of Mr Attlee's more vote-winning statements in recent months, it appears nevertheless to have received general approval, including his own. It may be regarded as a compromise—possibly only temporary—which steers clear of Communist propaganda and yet, at

the same time, carries a warning to America that Britain would not in any circumstances go to war for Formosa.

If the resolution could be readily put into operation—which it cannot—few people in this country would contest it. But the Labour leadership has in reality fallen into a grave error. For, while it may be skilfully expressing a widespread emotional mood in Britain, to do so is extremely mischievous in two distinct respects. One is that it ignores several fundamental political realities in the Formosa situation. It ignores, above all, the fact that the Chinese Communists and not the Americans are making the running in the dispute; Peking's aggressive posture has created the present crisis, not Washington's attempt to damp it down. And although Labour spokesmen claim that they seek to strengthen the Administration's hand, no one in Washington could, in fact, have moved further on the China issue than President Eisenhower's government during the past few months. The other mischievous effect is that the resolution does nothing to remind people in Britain either of their responsibilities towards America as an ally, or of their own interest in not evading those responsibilities.

Blame rests, however, almost equally on the Government. Sir Anthony Eden has somewhat naturally hesitated to fly in the face of public opinion at this stage. But it is largely his and the Prime Minister's fault that the British public has not had the leadership it ought to have had on this question in the past. After discussing Formosa with Mr Dulles in Bangkok, the Foreign Secretary should speak frankly and boldly to the nation on his return.

Night Stop in Karachi

THERE was a touch of irony about the final schedule for Sir Anthony Eden's journey to and from Bangkok. On the way out he stopped in Cairo and Karachi. On the way home he is due to stop in Delhi and Baghdad. In both the Middle East and the Indian sub-continent he will thus have stepped delicately round local rivalries. And while the Foreign Secretary's conversations with Colonel Nasser have remained for the time being secret, he found Karachi in an altogether more expansive and confident mood. Acceptance of the necessity for Seato is characteristic of a new decisiveness about Pakistan's foreign policy. This spreads not only into South East Asia but into the Middle East as well. In regard to the first, Pakistan has this week proved the only major Afro-Asian power—apart from Japan—willing to extend, through detailed and specific defence talks, some of its commitments alongside the western powers. In regard to the second, Pakistan is at the moment playing host to President Bayar of Turkey, just as it has done during the past few months to the Kings of Iraq and Saudi Arabia and to the Shah of Persia.

In a West which has increasingly had to accept the tetchy and suspicious neutralism that appears to be inseparable from Asian and African nationalism, one may well ask: is all this too good to be true? Does Pakistan really mean to work for the genuine collective defence of the areas in which it has interests? In the search for an answer two factors are significant. General acceptance of Mr Nehru as the prophet of Asian neutralism has meant that Pakis-

THE ECONOMIST, FEBRUARY 26, 1955

tanis have taken another look at the bases of that attitude and found them wanting. This is a backlash from Kashmir. The other factor is that, for the moment at least, Pakistan has a firm and determined government, which is not bound to strike extreme Islamic attitudes. The pact with Turkey can be made the anchor of a realistic Middle East policy, with the result that, given time and backed by the American aid agreement, Pakistan might be found after all to fill some part of the gap left by the extinction of British power radiating from the old united India.

Signor Scelba's Unquiet Homecoming

NO expert reading between the lines is required to see that the visit to London of Signor Scelba and Professor Martino generated a genuine warmth of feeling. There is therefore ground for hoping that time may not after all prove it to have been "just one more visit," evanescent and superficial in its effects. Even the usual flaccid communiqué at the end of the London talks spoke of relations having "now happily returned to their old friendliness."

But, although the Italian prime minister's visit was a success, he has returned home to find a potentially disturbing political crisis threatening the stability of his government. Standing precariously between the tiny Liberal party on his right and the small number of Social Democrats and Republicans on his left, his government is virtually unable to sway in any direction without falling over. The latent crisis began with the opposition of Liberal landowners to the government's intention of bringing up again certain land reform proposals which have been shelved since 1948. This has precipitated a fresh clash on social and economic policy between the two wings of the big Christian Democrat party itself. And it undoubtedly raises questions on which there is no real unity of purpose within the government at all.

For Italy's allies it would be a disturbing affair if the present crisis led to a prolonged political deadlock. It is

SHREDS OF EVIDENCE...

But evidence of what? Some happening, back in geological time, left behind this strange material, with its long, thin, hairlike fibres; but, so far, the fibres have kept their secret. Their present usefulness, however—a usefulness which springs directly from this unique, fibrous composition—is no mystery at all. There is scarcely a branch of industry which does not make use of Asbestos in one form or another, either for its remarkable resistance to heat, or for its other highly distinctive properties. Asbestos, we suggest, is a material well worth looking into.

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

The Corporation is ready to consider applications for capital to purchase additional buildings, plant and machinery, or to provide increased working capital to further the expansion of business. Consideration will also be given to new ventures which are soundly conceived and adequately sponsored.

Please ask for our new booklet—"Capital for Business and Where to Find it".

Are you bored in the boardroom?

IS YOUR COMPANY'S BOARDROOM impressively but monumentally dull—a room still sacred to the memory of an august founder? Or is it a pleasant place in which to meet—a background for clear thinking, and brisk discussion?

This surely is what it should be—a room which reflects the Company's present day character and outlook.

Our design studio has many such board-rooms to its credit, as well as furnishing schemes for whole office blocks, hotels and ships—both in Britain and abroad. You will find us just as helpful if you are looking for a desk to suit an executive.

If you would like to see what we can do, tell your secretary to write for our booklet, *Furniture for Special Needs*. Better still, visit our new Contracts Showroom and look round for yourself.

GLENEAGLES HOTEL

Perthshire

The world-famous resort hotel and its unique sporting facilities. Guests pay reduced green fees on its championship golf courses and have free use of its superb tennis courts, putting and bowling greens, squash courts and indoor swimming pool. Dancing, private cinema.

Opens for the season 7th April

The Resident Manager will be happy to send full particulars.

TURNBERRY HOTEL

Ayrshire

The famous hotel and its championship Ailsa Golf Course on the warm and sheltered Ayrshire coast. Reduced green fees for hotel guests. Tennis courts, pitch and putt course, indoor swimming pool. Dancing, private cinema.

The Resident Manager will be happy to send full details.

often better to travel hopefully than to arrive. And while the present coalition is admittedly incapable of giving a dynamic lead on the home front, it undoubtedly represents the best compromise that is in fact available. Indeed, Signor Scelba's resignation at this stage would probably be followed by a more right-wing government. This would do even less at home and certainly could not improve on Signor Scelba's record abroad. A definite move towards a closer participation of the neo-Fascists in government might, in fact, undermine some of the new confidence which a democratic Italy has lately inspired among its neighbours.

Next Year's Civil Spending

THE publication of the Vote on Account and the Defence White Paper makes the accounting—as distinct from the anti-inflationary—outline of the coming Budget fairly clear; Mr Butler's prospect is discussed in a Note on page 742. In general, the estimate of total expenditure in the coming year is much the same as the original estimate for 1954-55, but within the total there are a few significant changes between the two years.

If all defence spending, in so far as it can be separated, is deducted from the total shown in the Vote on Account, the purely civil expenditure is estimated to be between £60 million and £70 million higher in the coming year. A large part of this increase is accounted for by the Ministry

EXPENDITURE ON THE SOCIAL SERVICES
(£ million)

	Estimated Expenditure		Increase or Decrease
	1954-55*	1955-56	
Education†	319	342	+23
Health Service	439	463	+24

National Assistance	80	73	-7
Housing			

* Including supplementary estimates.
† Including universities.

of Food's vote, which, apart from its purchase of strategic reserves, shows an ominous expansion of £41 million. Some of this presumably reflects the recent wage award to farm workers and the Government's subsequent underwriting of it; but until the detailed estimates for the Ministry appear, one cannot say to what extent the vote is merely speculative, based on a forecast of world market prices—and their relation to whatever is to be the final level of farmers' guaranteed prices—in the coming year. The remaining big increases in civil expenditure are accounted for, as might be expected, by three social service departments. The cost of education shows its usual steady rise; and the extra £24 million needed for the health service gives the impression that the brake put on the hospitals' expenditure in recent years has been released somewhat. The changes in the estimates for national insurance and

national assistance show the net effects of the new legislation for social security payments.

To offset these increases, there is a saving in the civil spending of the Ministry of Supply and in the cost of colonial services. But in the current year the latter has been swollen by grants and loans to Kenya, and from Mr Lennox-Boyd's statement on Wednesday, a supplementary estimate will evidently be required on this account some time in 1955-56. The fall in the housing vote presumably reflects the Government's determination that in future more houses should be built by private enterprise and fewer by local authorities.

Politics in Private Bills

THE results of the current batch of private members' bills are proving even worse than was feared. Last Friday pre-election expediency scored two more victories over principle and common sense. The first occurrence was when Mr Short introduced his Bill to allow local authorities to operate concessionary bus fares for old age pensioners and other arbitrarily chosen groups of citizens and voters. Mr Boyd-Carpenter rightly replied for the Government that local authorities wishing to use their ratepayers' money in this way should use the private Bill procedure that was designed for just such circumstances. But he hastened to say that he did not wish to put to this trouble those local authorities that have been operating such schemes illegally in the past. They will be indemnified and their paths cleared; only the others will have to introduce private Bills.

Mr Short's Bill took up so much time in the Commons that there was not enough left for a full debate on the Lotteries Bill, unless opponents of this minor change in the gambling laws were ready at least to let it pass into committee. This they were not, so the Bill was talked out and is now virtually dead for this session. There can be no serious pretence that the majority of the House or the country wants the private citizen's shilling raffle to remain subject to the present baffling and largely evaded restrictions, that it prefers the law to slither along in its present disrepute. But the Bill's prospects were politely dimmed by the Home Office spokesman, who seemed to be arguing that the Bill was immoral but practical. The Home Office would have given a firmer, and braver, lead on this issue under its previous tenant.

Red Light on the Disarmament Road

IN the five-power disarmament talks that have just opened in London the Russians made their attitude clear before they sat down; and it was not an encouraging attitude. Pravda's complaint that the membership of the United Nations sub-committee that is meeting at Lancaster House is weighted heavily against Russia, and the arrival of Mr Gromyko to play a role which, last summer, was left to the Soviet ambassador in London, Mr Malik, both suggest that the talks will be turned into a propaganda duel. This

suspicion is strengthened by the proposals on disarmament which were broadcast from Moscow last weekend. It is difficult to see how the Soviet government could have packed into three brief clauses a set of propositions more favourable to itself than these.

First, the Russians return to their old demand for an immediate and unconditional destruction of all stocks of atomic weapons. At the UN Assembly last autumn Vyshinsky appeared to have abruptly dropped this familiar formula, which was always an obvious attempt to clear the way for Soviet predominance in manpower and conventional arms. Its revival confirms the interpretation that Vyshinsky's move last year was merely a device for delaying and obstructing the Paris agreements on Western Union. Secondly, the Russians propose that the size of all armed forces be frozen at the level of last January 1st; this would not only perpetuate the Communists' numerical superiority but also prevent the West from adding any German contingent to its forces. Thirdly, in proposing a level above which defence expenditure should not be allowed to rise, the Russians have chosen to nominate the 1955 budget allocations. That would give them the benefit of the extra 12 per cent they have appropriated for their own armed forces this year.

Last May and June, when the same sub-committee held its previous session in London, its talks were conducted privately and without a propaganda fanfare. It seems that things will be different this time. Mr Gromyko has, in effect, brought to the table a placard inscribed: "No agreement here!" There is only one consoling aspect to this for the free nations. If the Russians are not ready for genuine disarmament anyway, it is better that they should be open about it.

Dear Food?

THE Minister of Food's written answer this week about relative food prices in Britain and three other carefully selected countries was, of course, slightly bogus; in particular, any translation of American into British prices straight across the official exchange rate is a trick that translators of wage rates could also play. Nevertheless, two conclusions can reasonably be drawn from his table, extracts from which are published below.

First, Britain is still a relatively cheap food country in an unduly dear food world. This is mainly because the support given to domestic agriculture here is usually wisely laid on the taxpayer rather than on the consumer (by import quotas or other means); but it is fair to say that British distributors of foods that are wholly imported—including tea—do not come out of this comparison too badly. Secondly, it is significant that the only one of Mr Heathcoat-Amory's fifteen commodities in which the British price was above those in both France and Switzerland was the only commodity that is wholly home produced—namely milk. This is also one of the commodities that is plainly in surplus supply. If the Opposition is going to make the cost of food its principal election issue, it would be wise to re-align its aim.

Return of Israel's Seer

WHEN Mr Ben-Gurion retired into Israel's southern desert fourteen months ago, everyone knew that he wanted to write the saga of its war effort before he died, but no one expected that he had quit the political scene for good. It was the moment of his return, and not the fact of it, that surprised even some of his intimates last week. He, the exponent of an "active" defence policy, has taken on the defence ministry in place of another "activist," Mr Pinhas Lavon. By doing so he has accepted service under Mr Sharett, the apostle of peaceful change.

Israel has been restless about its defences ever since Britain decided to quit Suez, and this restlessness increased at the news of the projected Turco-Iraqi pact. As against the few voices raised in argument that Turkey might succeed in knocking some realism into at least one Arab state, a multitude proclaimed that this newest of devices for arming Arabs would ultimately spell yet another threat to Israel. The news increased Israel's sense of isolation; Turkey is its only friendly neighbour and many Israelis instantly assumed, quite unnecessarily, that a Turkey in contact with Iraq must be an unfriendly Turkey. A people so cut off from normal give and take across frontiers tends to see every international situation in terms of stark black or white.

While nerves were thus on edge about defence, two aggravating factors arose. After four months of relative quiet, the frontier with Jordan once more became a scene of gunfire and incidents, while, inside the cabinet, serious differences arose between Mr Lavon and Mr Sharett as to the way defence was to be run. The first, explosive and unbureaucratic by temperament, had on at least one occasion in the Knesset implied that he condoned sponsored reprisals, and he sought changes in the field of defence that became, at his own request, the subject of a government inquiry. Its result led to his resignation.

Mr Ben-Gurion's decision to take his place may well have been taken from more than one motive. He reasoned that when frontier affrays are in the news and nerves on edge about defence a sensational appointment was needed to blanket the Lavon resignation. But he may also have reasoned that Israel's next elections are due on July 26th, and that if his party or coalition is to get a big enough majority to organise the end of proportional representation,

with its inevitable legacy of splinter parties, Mapai will need votes that only he can win. His ambition is, before he finally retires, to endow Israel with a party system of British, as opposed to French, pattern.

Satellites Falling into Line

THE announcement that the Hungarian prime minister, Mr Nagy, who has always been a strong advocate of the "new course" economic policy, is seriously ill, will inevitably be received with a large pinch of salt. But if he is indeed genuinely ill, he is probably consoling himself with the thought that in present circumstances his bed is the best place for him. With the open shift of policy in Moscow, Mr Rakosi is clearly coming towards the end of last year, having been fortified by a trip to Moscow. It is significant that the Hungarian régime reacted most swiftly of all the satellites to the change of government in the Kremlin, and that it did so with a stern warning that the people must expect sacrifices and privations, so that their armed forces could be strengthened and the war plans of the imperialists frustrated.

The Hungarians have been the recipients of louder and more lavish promises of better days than any other satellite peoples; a cry of *la patrie en danger*, an appeal to their patriotism, was no doubt considered the best means of consoling them for their frustrated hopes. Elsewhere in the Soviet bloc, where the movement towards a "new course" economic policy has in any case been much more cautious, the shift back to a tougher line is being more discreetly handled. The Poles, the Czechs and others are being let down fairly gently, partly for obvious reasons of political expediency, and partly because they have not, in fact, got very far to fall. All the same, a good many words are being eaten by those who have been expounding the wrong ideas about the relative importance of heavy and light industry; and no opportunity is let slip of stressing the overriding importance of the former. Mr Bierut, for instance, recently told the central committee of the party in Poland that the planned spurt in the production of consumer goods this year is "only an exceptional phenomenon" and that the conditions for the "further and more rapid expansion of the production of the means of production" must be created. In agriculture, too, the satellites are taking their cue from Mr Khrushchev; this will not come amiss to them, since everywhere the need to produce more food supplies is pressing. The Czechs have even decided to have their own version—by comparison a rather diminutive one—of the Soviet campaign to develop "virgin lands"; they have launched an appeal for volunteers to assist in the exploitation of the "vast land reserves" in the frontier areas formerly occupied by the Sudeten Germans.

Unions and Rebels

THREE news items in the past week provide an interesting contrast in union policy towards members who defy instructions. The Communist-dominated Electrical Trades Union is conducting a witch-hunt against those who, last

August, went back to work for Messrs. J. Lyons—in utter weariness of a four-month-long strike that had been called because a certain supervisor did not hold a union card. So far three leaders of the "back-to-work" movement have been charged, and fined the formidable sums of £20, £15 and £5 respectively. These fines have been treated as arrears of union dues. The appeal of the first man has been rejected. As a member may not be more than a pound or so in arrears without forfeiting union membership, and as the man concerned has been told that the arrears must be paid by March 4th, an expulsion seems likely; it remains to be seen whether the union will then try to get him out of his job. The rest of the 140 men who went back to work without permission are also to be charged by the prosecutor-judges of the ETU, but not until late in March. It is perhaps significant that the election of the general secretary and national officers also takes place in March.

If discipline is severe for those who contravene the instructions of their union in order to work, it amounts to only a little scolding for those who do so in order to strike. The National Union of Railwaymen is being called upon to do such scolding to guards on the Liverpool-Southport line. Some weeks ago these guards decided to refuse to do overtime, because some of them were asked to help collect tickets on Sundays, instead of sitting in the rest room. This week a porter was asked to act as guard to fill the temporary shortage thus created. He refused, was disciplined, and triggered off a strike. This fracas will be the first test of whether NUR's renewed promises to improve efficiency can be carried out.

The Transport and General Workers' Union also is faced with recalcitrance—by the busmen of West Bromwich, who are on strike against the employment of an Indian conductor. Neither union nor management was much helped by the decision of the transport committees of Wolverhampton, Walsall and Birmingham to stop their services at the boundaries of West Bromwich in order to avoid trouble with their own men. They have now resumed normal services, but only because the licensing authority has insisted. This affair is a direct violation by the busmen of human rights; it is the more unfortunate because India is the only country of the Commonwealth to allow unrestricted entry from Britain.

The Cost of Mau Mau

BRITAIN is to provide Kenya with a drawing-account of £14 million (£10 million in grants and £4 million as an interest-free loan) to meet the bills for the Emergency in 1955-56, as against £11½ million in the current year. Kenya will provide £2 million.

But the piper is objecting very bitterly to the tune that is being called. Both legitimately and highly illegitimately—in the Legislative Council and by means of pamphlets threatening surrendering terrorists with lynch law—the settlers are attacking the amnesty plan, which is now to run for three months. The European elected members in the Legislature must—like the settlers' newspapers—have the right to oppose the government outspokenly; but are their present tactics wise? Although the debate on the amnesty terms was not carried to a division, they are consciously or

unconsciously building up a picture of a completely irreconcilable, unreasonable and undisciplined community setting itself hard against the Government, the Colonial Office, the general trend of British opinion, and the other races in Kenya.

This is deplorable. Although there is much talk of settler opinion swinging behind those who oppose the amnesty, it is most improbable that the whole Kenya white community is taking up this attitude; but unless saner and more moderate people speak up soon, the impression that all settlers talk like Mr Slade will become a stereotype—and this is something that the other races can use to advantage, and that will tempt them to become anti-settler on principle. The settlers risk becoming isolated from everybody else; and with every repudiation of Mr Blundell's leadership, however hesitant it may sometimes be, they cut a worse figure.

Now that the amnesty offer is being tried, they have to make the best of it; and since it is being tried, it must be given a fair trial. Africans make up their minds slowly, and three months is not excessive. Military progress is slow, but there is progress. Settlers declare that the Kikuyu are still largely uncommitted. But to give them the impression that Europeans can never agree, are extremely rattled, and are more interested in terrorising than in observance of law, is no way to bring them over.

A False Economy

THE Government believes that productivity in the building industry has increased by about 10 per cent in the last four or five years; in consequence, Mr Bevin, the Parliamentary Secretary to the Ministry of Works, has told a questioner in the House of Commons, operational research by the Building Research Station, which was cut down as an economy measure in 1950 and 1951, is "not now so necessary." This is a curious complacency. Whatever the increase in productivity since 1950-51, there is still plenty of evidence that it has not been general throughout the industry; and that it is inadequate to make up the drop in efficiency since 1939, let alone to compare with the advances achieved in some other industries. In the last report that it was allowed to make, the Gridwood Committee on house building concluded that productivity in this section of the industry in 1951 was still 25 per cent below the 1939 level. In its study of productivity in a sample of about 150 housing contracts, the Building Research Station found that the number of man hours per house was almost three times as great in the worst contracts as in the best. Similar variations in performance are known in other types of building; indeed the building operations of the Ministry of Works itself are by no means a shining example.

With so much room for improvement, with new materials, new methods of construction and new types of mechanical equipment constantly coming into use, it is difficult to believe that a modest expenditure on objective research is unnecessary. Apart from occasional criticisms of slowness, it is also difficult to find anybody who denies that the Research Station has done its job fairly well. A much more common criticism—and it is to be hoped that this muddle does not account for the Government's decision

—has been levied against the distribution of responsibility for building research within Whitehall; at various times the Minister of Works, the Lord President, and the Treasury have seemed to be falling over each other's feet.

Communist Subversion in Germany

HERR GROTEWOHL'S appeal to the Federal German parliament for immediate joint talks on reunion was a blatant manoeuvre that has been made often before without any success. So far, the Social Democrat and trade union opponents of rearmament have consistently refused to accept the Russians' German puppets as allies. But the Communists have also been running an intensive underground campaign against the treaties, the effect of which will not be seen for some time. Money has been poured out by hundreds of camouflaged societies in Western Germany, which have been supporting the flood of appeals that have been sent from the Soviet Zone. Forged letters and leaflets have been circulated, which give the impression that they come from the *bona fide* antagonists of the Paris treaties. Signatures have been invited for alleged copies of the opposition's "German Manifesto" against rearmament. But the words "in freedom" were deleted from the original demand for German reunification—a significant omission if ever there was one.

A Communist trick which is practised on every possible occasion is to discredit the reliability of one western ally in the eyes of the others. The Americans, in particular, have to be made to believe that the British, French and Germans are not to be trusted with military secrets. Shortly before the *Bundestag* debate, the East German Communists played a trump in this game. They broadcast an alleged "leak" from the defence office of Herr Blank in Bonn, to the effect that General Gruenther had issued sealed orders instructing the office to move to the south of France in the event of war. If the report is a fake, Nato headquarters will, of course, be unimpressed. But, even so, the public will have been given more "evidence" to show that the Americans plan to use the German army as a shield behind which to retreat, leaving behind them a country destroyed by atomic warfare. The concept is one which Germans naturally dislike; and it has had to be countered by General Gruenther in an article in the Bonn government's daily bulletin, which shows that the Germans are not intended to do the shielding alone. This assurance is necessary. The current phase of cold war in Western Germany has made it abundantly clear that implementing the treaties will be as difficult as ratifying them.

Norway Trims its Sails

THE Norwegian government's action last week cutting back imports by 7 per cent came as no surprise. It had become obvious that, with a deficit in the foreign accounts equal to about £55 million in 1954, prompt action was essential. The real surprise is that after being dormant for the past nine years the Bank of Norway's discount rate has been raised from 2½ per cent to 3½ per cent. Norway

is almost the last country in Europe to revert to classical monetary techniques.

The return to dearer money is well advised, for the main problem of the Norwegian economy is a tendency towards over-investment. With nearly 30 per cent of gross national product going into investment, the rate of capital formation is the highest in Western Europe. Hitherto the Norwegian authorities have preferred to use direct controls on the banking and credit system; they may have better luck with traditional methods. The cuts in imports—quotas for cars from western countries are halved—are distributed widely. In addition, tighter controls on imports from Eastern Europe are promised, despite the fact that this may react on Norway's exports to these countries, since the trade is normally balanced on a bilateral basis. Another important proposal is the special tax of ten per cent on contracts placed for new ships.

Though Norway's difficulties obviously called for immediate action, it is discouraging that the first impulse is to slash imports. As it happens, the cuts do not affect Norway's liberalisation percentage. But would it not have been possible to tide Norway over its present temporary difficulties with some help from EPU?

Chinese Noughts and Crosses

CHINA'S currency," says the Peking People's Daily, "is one of the most stable in the world." From March 1st, a new currency will be issued at the rate of one new yuan to 10,000 old ones. This drastic currency reform is represented by Peking as little more than a convenient bookkeeping change—a matter of simply crossing out the last four noughts. This explanation is, to say the least, inadequate. What of the confusion, the suspicions, and the cost involved in the change over? The Chinese themselves have found it necessary to offer additional reasons. The central gold reserve, says the Bank of China, is now eleven times larger than in 1950. What of China, is now eleven times larger than in 1950. What it was then is anybody's guess, but surely this does not explain a currency reform of the order of five digits? Another argument put out by Peking is that the change is justified by the increase in the prices of gold and other precious metals. But the Chinese yuan is not defined in gold, nor even officially linked, like the satellite currencies, to the Russian "gold" rouble.

The change will have little external significance, since trade with China is usually conducted in terms of sterling or other western currencies. But it may nevertheless make its mark on China's foreign accounts by acting as yet another check to the already much diminished flow of remittances from Chinese overseas. The main significance of the currency reform is, however, obviously internal. The authorities claim that, since prices and wages will be deflated by the same proportion, real income distribution will not be affected, but it will be surprising if they really will not be affected, but it will be surprising if they really desire and are able to achieve this result. And evidently the change is intended, at least in part, as a blow to currency hoarders. Those who turn in any large number of old yuan will doubtless find themselves making further "voluntary" subscriptions to National Reconstruction Bonds; and many peasants will discover too late that the old notes they have hidden away in a sock have become worthless.

A Move in Guiana

BRITISH GUIANA is one of the colonies that pins down a British garrison; it is generally believed that the troops, sent when the constitution was suspended, could not be withdrawn without risk of disorder. The majority of the people are still under the spell of the near-communist People's Progressive Party, and the Commission of Enquiry, led by Sir James Robertson, reported last November that the hold of that party was as strong as ever. But there have been some slight signs that the Government's determination to rule without the constitution, and to prosecute leaders of the PPP who break the stringent regulations for ensuring law and order, is having an effect. Going to prison was an effective moral weapon against the British Government in India—but only over a very long period of years, under the guidance of a political moralist of genius, Mahatma Gandhi, and for a principle that the British approved in their hearts—parliamentary self-government. None of these conditions has held in British Guiana; and a people fond of excitement and action have become less enthusiastic for the PPP organisation and leadership in and out of prison.

It is by no means discredited; the strength of its appeal has been tacitly admitted by the strong anti-government statements of the leader of the rival "moderate" party, the United Democratic Party, who evidently feels this is the only way to compete. But the expulsion of Dr and Mrs Jagan from the chairmanship and secretaryship of the PPP, despite their bitter opposition and protest, suggests that the party executive wants to find more freedom for manoeuvre than is permitted by an uncompromising anti-government, anti-British, anti-white line. It has perhaps realised that it is completely out of step with developments in the rest of the Caribbean. But the way back from revolutionary organisation—especially after a putsch that failed—to a constitutional party is difficult; and it is far from certain that the new leader, the very wily Mr Burnham, even contemplates it. Guiana's interregnum will no doubt continue—but the chance of getting some more representative people into the nominated Legislative Council may occur later. As some of the present members of the council are not even remotely acceptable to the Guianese, that chance should not be missed.

Books & Publications

Making West Africa Pay

WEST AFRICAN TRADE.

By P. T. Bauer.
Cambridge University Press. 466 pages.
55s.

THE MARKETING OF COCOA IN WESTERN NIGERIA.

By K. D. S. Baldwin.
Oxford University Press. 52 pages. 5s.

FOR many years the system and the policies of the marketing boards set up as successors to the centralised wartime arrangements for disposing of West African produce were accepted not only without challenge but as an improvement over the "haphazard" system of middlemen and merchants which "exposed" the growers to "violent fluctuations" in prices before the war. The author of "West African Trade"—a most comprehensive and scholarly analysis—was (with Professor Paish) the first to challenge them on every ground—economic, social, political—and to worst their defenders in a series of pitched battles in the specialist press. In the second part of his book he rehearses the arguments in detail, showing, for example, not only that the boards have arrogated to themselves powers and functions which were never vested in them at the beginning, but that between 1948 and 1951 they totally failed to achieve the things they were supposed to do. They neither stabilised prices to the grower nor marketed the crops advantageously; and they rendered incomes far less stable than they had been. The burden of a meticulous argument sustained through some hundred pages is that the boards have, in fact, ruthlessly (if from a high sense of duty) squeezed the growers, failed even to reinvest the proceeds in the national interest, and have discouraged the private investment that would, in ordinary economic conditions, have expanded output and done something (perhaps much) to bring down prices from "windfall" levels.

It will not be easy to refute either the evidence or the reasoning, and it will be interesting to see if the boards' spokesmen or apologists attempt it; in point of fact some governments have laid hands on the money that the boards have been making and put it to general revenue, thus somewhat clipping their wings but in no way invalidating Mr Bauer's arguments. The way in which African governments have taken over the technique of making a levy of up to 50 per cent of producers' incomes bears out some of Mr Bauer's warnings of the political effects of such policies and it suits Britain's trade balance

extraordinarily well, if one neglects the good that might come of having more prosperous customers. There may be some technical limitations on expanding the cultivation of some crops (particularly cocoa) as much as Mr Bauer would look for if the full world price were passed to the grower; and in some areas in Africa it has certainly happened that high export crop prices have at times led to a shortage of subsistence crops (for example in Southern Sudan)—but there has been no famine, and the situation has rectified itself in a season or so; while the common argument about the inflation that would result from giving the local populations more than is good for them is certainly specious when any increased African demand for imported consumer goods, whether cloth or kerosene lamps, could be met in full; indeed, imports of food are possible. Mr Bauer's exploding of this fallacy should let a lot of light into the dark places of colonial treasuries.

Mr Bauer, however, has not written a deliberately controversial book, though he is unable to prevent himself from being provocative—and occasionally from making deductions from rather slender evidence: the alleged crushing of opposition by the big British importing houses, for example. The monopolistic pattern of importing favours such methods, but as Mr Bauer so effectively shows by economic analysis that the strangle grip of the half-dozen or so big firms gives the consumer a worse service, perhaps he could have given them more benefit of the doubt on sheer pertinence. But though "West African Trade" is self-consciously a treatise, a laboratory exercise, the fact is that the author feels—even indignantly—for the African underdog. And who will blame him? The book is all the better for it—all the better as a purge for officials and business magnates and for Socialist economists who are all for monopoly if it is official or government-owned.

One hopes that they will read it right through; but it is perhaps more important that African politicians and administrators, who now have the power, should read it. Mr Bauer argues unfalteringly that if monopolistic tendencies both in importing and exporting were reversed, and more competition allowed, Africans as a whole would be better off—but he realises that some Africans would immediately suffer, and it is these who are the best friends of a system that makes life easier, and more profitable, for a group of large British trading firms, banks, and shipping companies, as well as for the marketing

THE ECONOMIST, FEBRUARY 26, 1955

boards. Mr Bauer lists their virtues, but he would like to set a horde of competitors, especially Levantine, among them. His defence of the Levantine merchant is particularly skilful—since it is a defence of expatriate business in a nationalistic West Africa generally, and it is largely borne out by Mr Baldwin's study of the middleman in Nigeria. What is sauce for the Syrian is sauce for the panelled boardroom in the City of London. The boardroom will not enjoy it; but perhaps, as Mr Bauer acknowledges the generous help of some of these firms, they are prepared to be reasoned round.

Chamber of Horrors

SEDUCTION OF THE INNOCENT

By Frederic Wertham.
Museum Press. 407 pages. 21s.

WHATEVER the defects of the horror comics Bill, which was given a second reading in the House of Commons this week, the case for some legislative action is at least strengthened by the publication in this country of Dr Wertham's study of American horror comics. It is true that the horrible phenomenon has not reached anything like the proportions here that it has done in the United States. There, according to Dr Wertham, some sixty million comic books are printed each month, and many children spend two or three hours a day perusing them. In Britain, on the other hand, the circulation of the worst publications is relatively small, and the publicity given to them in recent months has already, according to the Home Secretary, considerably reduced the supply. Dr Wertham's book suggests, too, that the American brand of comic is rather more vicious (to judge by the specimens shown in the National Union of Teachers' recent exhibition) than those sold in Britain. Many of the British ones, it is true, were printed from American matrices, and certainly are horrible enough. But importers in this country, presumably because of the existing law against obscenity, have gone in for violence and cruelty, but not as a rule in a sexual context. The illustrations in this book show some very nasty examples of sexual sadism.

Dr Wertham is a psychiatrist specialising in the treatment of children. His assertion that young and impressionable minds are being moulded into those of hoodlums, criminals and perverts—or at best, into frightened little illiterates who cannot sleep at nights—is supported by examples from his case-book. No one could read this book and still give the glib answer, sometimes heard, that it does children no harm to have this outlet for their aggressive instincts, which otherwise might find more practical expression. Nor can anyone be complacent about the situation in Britain, where horror comics, in spite of recent frosts, may yet grow rankly if they are unchecked. And no one, to judge by American experience, can rely on

THE ECONOMIST, FEBRUARY 26, 1955

parents to protect their children from this kind of corruption. But it is clear that many people, inside the House of Commons and elsewhere, feel that a satisfactory way of setting the law on the comics has yet to be found.

Air Force Saga

THE MINT.

By T. E. Lawrence.
Cape. 206 pages. 17s. 6d.

WHEN imagination and perspicacity are combined as they were in T. E. Lawrence, they are apt to produce some good guesses about the future, and one of his prophecies about this book may well come true. In 1928, writing to Mr E. M. Forster about postponement of its publication until 1950 because of "the horror the fellows with me in the force would feel at my giving them away," he added:

It is quite safely preserved and if the next generation want to read our stuff then they'll have their chance. Usually it's the next but one that revives us, after much derision.

This may well happen, though largely for a reason that Lawrence could not foresee.

Part of his purpose in writing "The Mint" was to engage the attention of the founders of the Royal Air Force by describing how far the rigours of joining up were beneficial, and how far futile. In 1922, the dreary or sordid patches may have seemed unusual to the intellectual reader for whom he was writing, but by 1950 they are no longer so. In a postwar age when every other man under forty-five has done squarebashing and sanitary fatigues, when bishops black their boots and Fellows of All Souls know how to empty a bin and fill a hod, they are the lot of all of us, and "The Mint" no longer provides the peripety and discovery that it was meant to do.

Its interest now is quite other: first, in the quota it adds to knowledge of T. E. Lawrence's strange history; secondly, in its portrait of the infant RAF. Of course it shows Lawrence as the introspective and self-flagellating creature that the world knows from his letters, but it shows him as something more—a person with the will and reasoning power to conquer neurosis by deliberately seeking, and pursuing against great odds, a life of shoulder-rubbing with ordinary people. Self-consciously at first, but later with a growing satisfaction, he works at turning part of himself into someone "just like any other chap." Of course he never attains this target. Even when at Cranwell, where "months and months flowed silently away: I think I had become happy," he remains the wakeful and self-questioning member of the sleeping hut; but he is also one who takes pleasure in ordinary emotions such as gratification at the envy with which other units regard his superb motor-bicycle. As a personal record, "The Mint" is a tale of triumph over a diseased mind; as a piece of writing, it never reaches the heights of the "Seven

Pillars," but being virtually a diary, it is far less mannered and more direct. It will always be a second best, but, as he prophesied, is likely in due course to have a revival.

Its claim to the status of a classic will be enhanced because of the contribution it makes to early RAF history and folklore. This element will help posterity to discard its obscurities, and to retain its detail about sculleries, and to retain its account of the early technique of minting a "posh flight" out of much down-at-heel raw material. In a chapter called "School," a few sentences analyse the conflict between teaching servicemen the "passivity of puppets with something of their immediacy and automatism" and teaching them "to retain a fig of voluntariness." This combination, once resolved, produces a service that is "a vocation absolute and inevitable beyond any question under the sky, and so marvellous that I grow hot to make it perfect." From this point to September 15, 1940 there runs an unbroken thread.

Disbelieve It or Not

THE SPOOR OF SPOOKS.

By Bergen Evans.
Michael Joseph. 288 pages. 15s.

THE compilation of *sottisiers* serves two useful purposes. It does something towards popular enlightenment; a few hydra-heads of nonsense smashed are all to the good, and the spectacle encourages other club-wielders. It is also, from the author's point of view, a healthy outlet for the misanthropy generated by the spectacle of *Homo Stultus* in the mass. Both motives are at work in this robust, cheerful and exasperated onslaught on the forts of folly—myth and bugaboo, homely wisdom, Higher Hokum and *idées reçues*. From "extra-sensory perception" to Mr Whittaker Chambers's interview with the Devil, from Nostradamus and miraculous fasts to the doctrine of soul-mates and the belief in beer as a galactagogue, from the fear of impending matriarchy to the comforting conviction that crime does not pay, through the folklore of pregnancy and the legal learning of the amateur, Mr Bergen Evans ranges with iconoclastic glee, taking an occasional side-swipe at such embodiments of the American way of life as the automobile.

One misses, in this transatlantic compendium, some notable British folklore—has Mr Evans heard that hardy perennial of the teatables, about the girl bather who met an octopus and perished miserably in giving birth to an eight-armed baby? Or the various Poe-like legends of monsters immured in the secret chambers of this or that Stately Home? But one cannot have everything. It is all splendid fun, a sort of Ripley-in-reverse; a Voltairian performance on the strictly lowbrow, knockabout level. Mr Evans's intentions are, indeed, as serious as those of Voltaire. "We are committed to democracy, that 'formidable heresy,'" he says

German Search for Unity

THE EVOLUTION OF GERMANY.

By John A. Hawgood.
Home Study Books. Methuen. 220 pages. 8s. 6d.

THIS book justifies the claim of this series to "provide new interpretations of modern knowledge... in a language of general intelligibility..." and it should stimulate the intelligence of the reader. As the preface says, it is not just another conventional history of Germany; nor one more dissertation on "the German Problem"; nor is any of its limited space wasted on pseudo-psychological speculation about "the German character." The title is, perhaps, questionable—unless "Evolution" is interpreted as a process complicated by accidents and follies.

The book, which has a comprehensive reading list, is divided into four sections. The first describes the "German tribes" and their relations with one another and with their neighbours. The second reviews their "Resources," geographical and geological; the use made of them by nobles, peasants and townsmen; and those changes in population which have contributed to the instability of the course of German history.

In Section III Mr Hawgood, mindful of G. K. Chesterton's advice, walks backwards across the stage of history from Hitler to the early Hohenzollerns, assessing in turn the failures of the Weimar Republic, Bismarck, and the Frankfurt "Liberals" of 1848 to recover a unity lost centuries before—and rediscovered by Mr Hawgood in Section IV. This last section is arranged in the normal chronological order. Luther is acquitted, not altogether convincingly, of the charge of having widened the divisions and increased the tension of German political life; while the Renaissance, and the eighteenth century "Enlightenment," are shown to have had little influence on the political development of Germans, with the exception of those princes who took up enlightened despotism too late to save themselves or their subjects from the revolutionary wrath to come. But this, when it crossed the Rhine, was the Napoleonic Revolution, a strategic simplification, which gave the Germans a short experience of unity without political education.

The book concludes with an appreciation of the effects of the great emigrations of freedom-seeking Germans: these movements diminished not long before the urge of European colonial expansion started, a competition in which the Germans acquired few colonies and many jealous complexes. Some readers may feel that Mr Hawgood tends to blame fate rather than the Germans for their tale of woe; but his last pages contain a warning that the *furor teutonicus* may even now not have been exorcised.

Critical Roundup

THE ATTACK ON BIG BUSINESS.

By J. D. Glover.
Harvard University Graduate School of Business Administration. (London: Bailey Bros. and Swinfen). 391 pages. 48s.

THIS book," says Professor Learned in his foreword, "has been written primarily for use by thoughtful business leaders." "It is," says the author in his preface, "an endeavour to put together an accurate and understandable picture of the kinds of things that have been said and written against 'big business.'" This is a substantial assignment. At no time, even when the business man as such has been something of a folk hero, has big business been popular; and the "things said or written against big business" form a very large and varied class. They include highly technical attacks based on refinements of the theory of imperfect competition; screams of rage by artists; assaults in the name of extreme individualism and of all-embracing state socialism; criticisms of technical or administrative competence and of influence on the moral climate; much good sense or much twaddle.

Professor Glover does, on the whole, a very competent job of classifying, exemplifying, and sorting grain from chaff. The counts in the indictment are presented severally, with a wealth of quotations and references. There is the economists' attack: big business is inefficient; big business is monopolistic (or oligopolistic, which is as bad). There is the political and social attack: big business "runs the country"; it is incompatible with either the social or the economic bases of democracy. There is the ethical and moral attack: big business is crassly materialistic; it is irresponsible; it is the creator of "a baleful, inhuman civilisation." A fourth section mildly indicates the differences between the current American scene and that which might have been deduced from the foregoing analyses and jeremiads; emphasises, *per contra*, the positive value of criticism; and suggests to the "thoughtful business leader" some ways of enlightening and disarming the opposition.

To apply to "The Attack on Big Business" the sort of criticism called for by a profound and original analysis would be absurd. In all these fields it is sketchy enough to justify a pained raising of academic eyebrows. But the business leader sufficiently thoughtful to follow up the references given will find quite enough profundity to be going on with; the less thoughtful reader who has hitherto lumped all critics together as irresponsible or sinister un-Americans, "mere theorists" or cranks will—if he gets through the book at all—experience a most salutary opening of the eyes. One may even breathe a suspicion that some of the more intellectually exalted critics of big business, if they could overcome their irritation at the patball standards of controversy here exhibited, might gain a sense of proportion—and perhaps the ability to distinguish a genuine adversary from a man of straw.

THE ECONOMIST, FEBRUARY 26, 1955

Australasian Agriculture

WARTIME AGRICULTURE IN AUSTRALIA AND NEW ZEALAND 1939-50.

By J. G. Crawford and others.
Published for the Food Research Institute of Stanford University by Stanford University Press (London: Geoffrey Cumberlege). 367 pages. 60s.

IN some respects (including its more successful husbandry) New Zealand stands to Australia as Scotland does to England. The drily critical account of New Zealand wartime agricultural policy contrasts strongly with the lush documentation of the Australian section. But when you ask a prominent civil servant to write an account of wartime agricultural policy, you must expect to get a thoroughly competent analysis of the official records and documents—but with the most interesting parts of the story inevitably left out. We do not hear about the howling futility of both wartime and postwar "plans for agriculture" which are operated neither by the price incentive, nor by the compulsory allocation of labour and equipment, but which seem to rely on the force of ministerial oratory only. There is no answer to the permanent conundrum of how you can regulate prices in wartime, without compulsory purchase of supplies and control of distribution as well. It has in fact been Australian policy deliberately to discourage agriculture, and to pay to producers less than the world prices, for the sake of the supposed advantages of industrialisation (and to provide cheap food for an urban electorate).

Mr Ross's account of New Zealand agriculture only occupies a quarter of the book, into which he compresses a competent account of wartime problems, with only a few pages on postwar issues. The ironical threat of an unmanageable glut of meat in 1940, owing to the breakdown of sea transport, is graphically described, as is also the wholesale diversion of milk from butter to cheese. The sion of milk from butter to cheese. The author allows himself to be very critical during the war, and of transport in the postwar years. It is one of the most interesting episodes of recent history, which we tend to forget, that in New Zealand a general election has been fought, and won, on the issue of preventing restrictionist practices and irresponsible strikes in the waterside workers' (dockers') union.

Studies in Tradition

THE CONSERVATIVE MIND.

By Russell Kirk.
Faber. 480 pages. 30s.

GREAT BRITAIN and the United States are alone among the greater nations of the world in having escaped revolution during the last hundred and sixty years. Their conservatism, by this ultimate test, has been successful. What is the secret of its success? In what is the answer, Mr Russell Kirk quest of an answer, Mr Russell Kirk explores a large number of conservative writers of both countries, including for

good measure Tocqueville, who had considerable influence on them. The difficulty inherent in such a task is that conservative thought is usually meaningless save as the response to a reforming or revolutionary challenge; so that a satisfactory account of conservative arguments involves an almost equally thorough examination of radical arguments. Otherwise, it is like hearing one end of a telephone conversation.

Mr Kirk, in this series of intelligent and illuminating essays, overcomes this difficulty with skill. His concern is with those "who have stood by tradition and old establishments." But because, in Britain and the United States, liberty became itself a tradition, he permits himself to include in his list Whigs like Burke and Macaulay and Liberals like Tocqueville and John Stuart Mill. Likewise his American list includes John and Henry Adams, Irving Babbitt and George Santayana. He includes Disraeli and Newman but not Peel; Bagehot and Balfour but not Salisbury or Churchill.

Many who regard themselves as conservatives would think this selection very arbitrary. There is much point, if not complete conviction, in Mr Kirk's contention that "Often it requires a man who is not quite one of them to wake conservatives from their congenital lethargy." So it was with his hero, Edmund Burke, whose philosophy he regards as the source of most subsequent conservative thought. It is only by widening the scope of conservatism in this dubious way that Mr Kirk is able to conclude that

In both great English-speaking nations, conservatism has manifested a political and intellectual continuity for nearly one hundred and sixty-five years, while the radical parties that detested tradition have dissolved in succession.

Perhaps this somewhat fictitious continuity is small objection to a book which remains, in its essence, a collection of lively critical essays, worth reading for their own sake despite marked political prejudices and occasional errors of fact and interpretation. The initial study of Burke is the best in a book of many excellences.

Urban Anecdotes

THE CITY AND COUNTY OF BRISTOL.

By Bryan Little.
Werner Laurie. 418 pages. 25s.

MR LITTLE is a disciple of the pig-sticking school of urban history. Seated firmly in the saddle of his excellent bibliography, he gallops through the centuries of Bristol's history, spearing firmly the facts and anecdotes that spring up before him, and transferring a dozen or so of them, triumphantly, to each printed page. He performs the feat very well; but repeated at such length it becomes tiresome. Moreover, Bristol is peculiarly unsuited to this kind of treatment. Its history is too long and too varied; no English provincial city has been so continuously important as Bristol

has. A more selective approach was needed to indicate the patterns in the city's history.

In a book with the subtitle "A Study in Atlantic Civilisation," the history of Bristol before Cabot's voyage of 1497 might well have been treated more briefly, as preparation for the transatlantic connection. In fact, the well-marked pattern of that connection is not brought out at all clearly. The city's seventeenth and eighteenth century prosperity was based largely on its convenience—as compared with London—for transatlantic trades. But quite early in this period, the greater safety of Liverpool and of Glasgow in wartime became apparent, and in each war of the eighteenth century these ports advanced at Bristol's expense; in each peace they consolidated most of their new gains. The coming of machine industry to the north gave a new basis to their superiority; and the winding Avon appeared as a serious obstacle to the larger ships of the nineteenth century. Bristol was in real danger of becoming a backwater. It was saved, not by the Atlantic connection (though the new docks at Avonmouth preserved some part of this), but by industry and administration.

Mr Little does not clearly indicate this or any other pattern; and chronological anecdote, while it may still by courtesy be called history, cannot claim to be "A Study in Atlantic Civilisation." The last part of the book, in which the author leaves the Atlantic alone and turns to recent developments, is more interesting. The growth of public and private administrations centring in London, requiring branch headquarters in regional capitals, brought one kind of salvation. Another came with the development of electric power, shifting industry from the coalfields. And out of electric tramways came the Bristol aircraft industry, established to give the tramway workshops a little occupation in slack times.

Books Received

THE PARLIAMENTARY GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA. *Second Edition.*

By L. F. Crisp. *Longmans, Green, in association with The Wakefield Press, Adelaide.* 353 pages. 21s.

THE ECONOMIC STATE OF NEW ENGLAND. Editors: Arthur A. Bright, Jr., and George H. Ellis. *Yale University Press (London: Geoffrey Cumberlege).* 750 pages. 48s.

This monumental book is the report of the Committee of New England of the National Planning Association. It covers every aspect of economic life in the region ranging from forest lands to non-profit educational institutions. It will certainly be the standard reference work on a region where problems such as unemployment and obsolescence in industry have become critical.

TWO STUDIES IN AFRICAN NUTRITION: *An urban and rural community in Northern Rhodesia.*

By Betty Preston Thompson. *The Rhodes-Livingstone Institute, Manchester University Press.* 74 pages. 8s. 6d.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Eisenhower's Next Term

Washington, D.C.

PRESIDENT EISENHOWER is now coming under the impersonal pressure of one of the almost unchangeable laws of American politics, which compels a President, especially if he is politically successful, to try for a second term of office. While Mr Eisenhower hides his own intentions behind jest and subterfuge, and indeed may not have made up his mind, the political forces which genuinely want him and those which feel they cannot do without him are so arranging things that he can scarcely avoid being a candidate again in 1956.

Mr Eisenhower's own freedom of decision is greatly reduced, and he could only decide not to run at the cost of backing down on a multitude of obligations. The economic interests who feel that he is good for them are bringing their influence to bear through the Republican party structure; they must have a hearing in an era in which politics are becoming ever more expensive. As always, the men around the President have arrived at a sense of power, which translates easily into a belief that the nation cannot go on without the guidance of their chief. At all levels of the party, from the Cabinet and the Congress to the lowliest place-holder, the conviction grows that Republican survival demands a second Eisenhower term. The whole process gains force from every new indication that the President is the most popular political figure in the country today, with an appeal rivalling that of Franklin D. Roosevelt.

In these circumstances, the commanders of the party organisation, the Republican National Committee, have devised arrangements for the nominating convention in 1956 which can succeed only if Mr Eisenhower is again the presidential candidate. They have picked an unusually late date, August 20th, which would not leave enough time before the November election for any lesser nominee to make himself known to the voters. They have planned a brief session, four days, not long enough for a choice to be made from a wide-open field were the President to step aside. Feeling sure of what they are going to do and how they are going to do it, they have chosen San Francisco as the convention city, despite a three-hour time difference from the Atlantic coast; if, as is hoped, daily sessions can be limited to a genteel five hours in the afternoons they will fall during the peak evening television time in the east. Obviously, the party organisers expect no repetition of the all-night performances which left dark circles under the nation's eyes during the 1952 conventions. Finally, although the traditional function of the National Com-

mittee is to "elect, not select," the committee has adopted a resolution notifying the President, in effect, that he is expected to continue into a second term.

In a national history which has seen thirty-three men serve in the presidency, there is only one clear-cut case of a President's declining, once elected, to seek a second term. The example is Rutherford B. Hayes, 1877-81, who declared he would not accept renomination. The hard fact is that he could not have won it had he wanted it. Three other Presidents who were elected, as distinguished from Vice-Presidents who succeeded through death of their Presidents, failed to win renomination. All served in the stormy years just before the Civil War, when parties were still trying to evolve amid the debate over slavery. These experiences are not relevant today. The lesson of presidential history is that a man who has been elected once tries again, and usually wins.

★

The tendency of the men around the President to organise the pressure for a second term has been illustrated by recent changes in the White House staff. The men involved, and their offices, are not well known, but the three senior members of the group who advised Mr Eisenhower in his 1952 campaign are now under the White House roof and close to him. Mr Fred Seaton, who had been an Assistant Secretary of Defence, has left the Pentagon to become an administrative assistant to the President. Mr Bernard Shanley, who had been counsel to the President, has become his appointment secretary, sacrificing prestige for a more intimate relationship. Mr Sherman Adams continues as the Assistant to the President. These three will form a political headquarters hard by Mr Eisenhower. They will guide him toward renomination, set road blocks for challengers, and at the same time try to lighten his physical burdens so that he will be fit for a new race. In this, they are consulting their own desires, whatever the President's may be.

For justification, they can refer to many signs that the Republican party would be foolhardy to let go of the good thing it has in Mr Eisenhower. Dr George Gallup has reported on various soundings of the electorate which support that view, including a recent survey indicating that, in an election today, the President would score even more heavily than he did in 1952 over Mr Adlai Stevenson, were he the Democratic candidate. At the same time, Dr Gallup finds that the Vice-President, Mr Richard Nixon, who would

THE ECONOMIST, FEBRUARY 26, 1955

apparently top the Republican field if Mr Eisenhower stepped aside, would lose to Mr Stevenson three to two. The determinations of scientific poll-takers find confirmation in the cruder studies of all practical politicians.

Mr Eisenhower, for his part, is discovering that it is going to take more than four years to bring the Republican party forward into the second half of the twentieth century. The great difficulties he has had in Congress with his programme for the liberalisation of foreign trade policy drive the lesson for the liberalisation of foreign trade policy drive the lesson home. His efforts to disengage from the cherished Republican commitment to Nationalist China bring him up against a serious problem in his own party; and while the point is debatable, a respectable body of opinion holds that only the Republican party under Mr Eisenhower could carry off, without political disaster, a recognition of the Chinese Communist régime.

At home, the political philosophy which Mr Eisenhower calls "dynamic conservatism" generates anger on the Republican right. At a recent mass meeting in Chicago, the party's die-hards mourned the capture of the President by "people of questionable Republicanism," and took as their targets his highway and school construction programmes, his unbalanced budget, his foreign trade policy, and his opposition to the constitutional amendment still being pressed by Senator John W. Bricker to restrict the presidential treaty-making power. The President believes that a party dominated by views so narrow would find itself permanently in the minority and he wants to save the American political system from that fate. But weighing against the evidence that more than two more years are needed to do this, and that the country needs more Republican administration and cannot have it without an Eisenhower candidacy, are many personal considerations. There is still little evidence that the President really likes his office. He would be 70 at the end of another term. He is concerned by the exactions upon his wife's health. He is deeply eager to retire to his farm at Gettysburg.

When it comes to the final result of all this, the political realities are depressingly difficult for the Democrats. They find it hard to contest the President's programme in Congress, it is so much like their own. If Mr Adlai Stevenson runs again he has every reason to expect defeat, and the probable end of his political career. If he does not offer himself, few other Democrats of sufficient stature would be willing. Today it is hard to make the facts of 1956 predict anything but a second term for President Eisenhower.

Democrats Get In First

SINCE much of the President's legislative programme is what the Democrats themselves would have ordered, their best chance of making political capital out of their congressional majority is to get in first and go farther. This is why they opened hearings on Bills giving financial aid to the states for school and road building before the President sent Congress his less liberal proposals on these subjects. And this is why the House Ways and Means Committee last week suddenly offered every income tax payer a reduction of \$20 in liabilities for himself and for each of his

dependants. This would in practice exempt from taxation several million families with low incomes—and a substantial number of votes.

The Democrats decided in January to do something of this kind this year, after the President made it clear that he hoped to ask for a tax reduction in time for the 1956 election. But congressional enthusiasm for the idea waned with the growing prospect that increased military expenditure would be needed for Formosa. However, the committee's income tax reduction, which is likely to be approved by the House this week, would not come into force until next January and would thus only mean a loss of under \$1 billion in revenue during the 1955-56 fiscal year. The proposal is being pressed now because it can be tied in with the urgent extension of corporate income taxes and excise taxes on liquor, petrol, cars and cigarettes. These taxes are due to drop on April 1st and the President's budget calculations depend on their continuance at current rates. For this reason he would be reluctant to veto the Bill and for this reason too it may be possible to push the income tax reduction through the Senate in spite of the powerful opposition of the Democratic financial expert there—Senator Byrd, who is determined that the budget must be balanced with no more delay.

The Senate is also where the tariff reduction Bill, moderate as it is, will meet its strongest opposition, and anything stronger than it met last week in the House could kill it. For in spite of the successful attempt to limit debate on the Bill, and therefore a potential flood of crippling amendments, clever and complicated manoeuvres almost succeeded in attaching to the Bill the most crippling amendment of all, which would have undermined any tariff concessions. While it was Mr Rayburn, the Democratic Speaker, who saved the President's favourite legislation, Democratic votes as well as Republican contributed to the crisis. As industry has moved into the Democratic south, so has protectionism. For this and other reasons, trade policy has become as bipartisan as most other aspects of foreign policy—and more controversial.

Building Boom

SPENDING for new construction, one of the plumpest of the cushions which kept last year's readjustment from sinking into a recession, is doing as much or more to swell this winter's recovery. In January all records for that month, normally unfavourable for building, were broken, both by the value of structures put in place and by starts on new houses. The latest figures for new contracts awarded do not suggest that any falling off of construction is coming. But in these gains private residential building, generally responsible for roughly a third of construction outlays, is playing an even more important part than usual. In this some observers see the possibility that the building boom may burst before long and deflate hopes of sustained prosperity in 1955—or, maybe, 1956.

For several years it has been said that the gap in home building left by the depression and the war years must by now have been filled; but so far this has had little effect on the demand for new dwellings, perhaps because Americans

are always anxious to move to a better house. Now, however, the stunted birth rate of the nineteen-thirties is affecting the marriage rate and the number of couples wanting homes for the first time is falling off. Yet, if present levels of building continue, there will be more new residential units available this year than ever before. Already the first warning has appeared—a rise in the number of vacant flats in many places. More ominous, perhaps, are the increasingly easy terms on which new houses are being sold: frequently no down payments are asked and furniture is sometimes moved free; a refrigerator and even a television set is often standard equipment; the garage may be complete with car—a Cadillac for a \$60,000 house, a Ford for a \$10,000 one—to be paid for with the house by joint instalments. Such schemes entice buyers into the housing market who may

not be able to stand the long financial strain of a mortgage.

Behind the government's so far gentle efforts to make money a little less easy to obtain is a desire to check unsound housing credit. But it can be argued that the surest way to burst the construction boom is to raise interest rates, for the present house building activity depends almost entirely on mortgage loans. Indeed there are those who wonder whether all the funds needed this year can in fact be found at reasonable rates. Total mortgage debt outstanding is now about \$75 billion, an increase of \$9 billion in 1954, and another \$16 billion will have to be borrowed to finance the new houses planned for 1955. But once this year is over, housing may begin to play a less vital part in the building boom, for by then federal spending on school and highway construction should be going up.

Hoover's Report Cards

THE Commission on Organization of the Executive Branch of the Government was founded in 1947, under the chairmanship of Mr Herbert Hoover, to propose improved procedures and more efficient administrative practices for the federal government; it then made 273 recommendations, 193 of which were put into effect. The commission was re-established in 1953 with a new team of twelve men, still under Mr Hoover, and it was given the power to make recommendations not only on the methods of government but also on the "functions" and limitations of administrative action. The commission appoints "task forces" made up of prominent citizens, to investigate special

aspects of government and to report their findings to the commission. The latter, in turn, passes these on to Congress with its own evaluation.

The second batch of Hoover reports is now beginning to appear. The first in this new series was prepared by a task force headed by the President of Princeton University and deals with problems of personnel and civil service. Among its numerous recommendations was one for the creation of a "senior civil service group" (along British lines) in which administrators of exceptional skill could serve without partisan political interference. It was in the mixture of politics and permanent administrative service, even at the rural post-office level, that the task force saw the main threat to the efficiency and integrity of the civil service. The Hoover Commission itself had reservations about parts of its task force's findings but agreed that \$50 million a year could be saved if there was less turnover in government employment. It pointedly ignored, however, that part of the report that dealt with the need for a thorough overhauling of present security regulations.

The second report deals with possible reductions in government paper work and red tape. The government at present handles 25 billion pieces of paper a year and waste paper is the largest single item of export from Washington. Seven hundred and fifty thousand federal employees are needed to sort and file papers in millions of cabinets covering office space with a rental value of \$180 million a year. The cost of government forms comes to some \$867 million a year and directives run to one billion dollars annually. The commission urges that a "paper work management programme" be set up (no doubt with sufficient filing cabinets) to see whether some \$255 million a year can be sheared off red tape. Eighteen more reports from the Hoover Commission are due before its powers expire on May 31st, and there are those who say that Mr Hoover is doing more about government now than when he was in the White House.

City and State

MANY visitors to the United States are surprised to learn that Albany, and not New York City, is the capital of the State of New York. This surprise is often shared by Mayors of New York who think of their megapolis as a state in itself. When the Governor of the state happens to be a Republican and the Mayor of New York City is a Democrat, as was the case during Mr Thomas Dewey's administration, relations can get very strained, particularly over budget arguments. Today there is a Democratic Governor in Albany, Mr Averell Harriman, and a Democratic Mayor in New York City's Gracie Mansion, Mr Robert Wagner. But even so they are waging the traditional financial battle to the malicious amusement of the Republicans, who constitute a majority of the State Legislature.

The budgetary problems faced by a Mayor of New York are formidable. The 114 agencies which administer the city have asked for \$1,868,061,980 for the fiscal year beginning next July 1st. This is an increase of nearly \$225 million over the present year. The largest increases were

WILLIAM GRANT & SONS LTD. DISTILLERS. SCOTLAND

It must pay \$309,561,347 this year in interest.

To meet these obligations Mr Wagner asked the State Legislature for an increase of \$27,700,000 in grants from the state, and for permission to divert to the city \$11 million in betting taxes, now going to the state treasury. He has also asked for an emergency grant of \$18 million to meet the school problem and for the right to increase city taxes by raising business taxes and issuing bonds. All this does not fit into Governor Harriman's programme. He is compelled by law to balance the state budget and he was elected, by an extremely narrow margin, on the promise of cutting taxes. Consequently, he has recommended that New York City's share of state grants be increased by only \$5,600,000 and that it should receive only \$3,600,000 of betting revenue. He has ignored the emergency education grant altogether. Moreover, Governor Harriman has recommended increases in state aid to other localities proportionately higher than to New York. So far, Mr Harriman and Mr Wagner have been sparring gently, but with a Republican Legislature anxious to widen the breach and force an unpopular Democratic recourse to higher taxes, the battle may become violent.

WITH coyness and trepidation, the House of Representatives voted last week to raise the salaries of members of Congress and of the Judiciary. One hundred and eighteen Representatives voted against the Bill, even though the economic case for it is incontestable, rather than face the wrath of their constituents. The latter have no justification for indignation; since their last pay raise in 1946, Congressmen have found it increasingly difficult to make ends meet and several have been forced to quit public service. Nevertheless, the measure is political poison and on several previous occasions in American history it has haunted candidates at election time. That is why many Republicans are delighted that it is being brought forward by a Democratically-controlled Congress.

The new Bill provides for an additional \$10,000 a year for Congressmen, bringing their salaries and expense allowances to \$25,500. The Senate is expected to whittle this figure down to \$22,500. Members of the Judiciary will also benefit from the new wage scales: the Chief Justice will receive \$35,500 and Associate Justices will likewise be raised by \$10,000 to a salary of \$35,000. Circuit and lower court judges will also receive better pay. The need to attract more good men into the Judiciary is flagrant and it is hoped that the new salaries will help. A Republican Representative from North Dakota, on the other hand, was candid enough to admit that, if better men were attracted to run

It is likely that the Senate will indulge in considerable beating of breasts before approving the Bill. Already, Senator Williams of Delaware is proposing that the increases should be postponed until the budget is balanced—a remote prospect. But as the total additional cost to the American people is expected to be less than \$5 million a year, the Senate will almost certainly decide in the end that valour is the better part of bankruptcy.

New York.

Two other companies also appear to be on the verge of entering the atomic industry race. The Detroit Edison Company is preparing to submit to the AEC plans for a reactor plant with a capacity of 100,000 kilowatts to be built in Michigan. Detroit Edison is planning to spend \$3.8 million on nuclear research this year and will probably ask for AEC backing. In New England, the recently formed Yankee Atomic Electric Company is planning to build a "full-scale experimental plant" with a possible capacity of 200,000 kilowatts. The high cost of conventional fuels in New England justifies efforts to hasten the day of atomic energy.

Whether any of these plants will generate power at competitive prices is another matter. Even at the present high prices for electric current along the Atlantic seaboard,

Consolidated Edison can supply New York users at seven-tenths of a cent a kilowatt-hour by using conventional fuels. Only if it succeeds in generating atomic electricity at less than a cent an hour, will it have demonstrated that reactor plants can be competitive. Moreover, the problem of third party accident insurance remains unsolved. Consolidated Edison hopes to work out an arrangement with the insurance industry by the time its reactor "goes critical," but for smaller firms some form of government-sponsored "war risk insurance" seems inevitable.

Internationalists on Main Street

FROM A SPECIAL CORRESPONDENT

THE organisations which Americans form are infinitely various, ranging from the American Council of Learned Societies to the Elks, Moose, and Odd Fellows, not to mention a group known simply as "World" (Membership: 300). Some are, or are alleged to be, subversive. The Attorney General of the United States publishes a blacklist, largely composed of obscure groups with titles such as the Yugoslav Seamen's Club or the Chopin Cultural Center. At the other extreme are the ultra-nationalist organisations. These are supported by the kind of people who not long ago set out to become "Ten Million Americans for Mobilising for Justice" for Senator McCarthy, and ended up unable to fill Madison Square Garden in New York for a rally.

Much less is said about the plethora of organisations in the United States devoted to the spread of internationalism and enlightenment about world problems. One of the oldest of these is the Foreign Policy Association, before whose New York chapter Mr Dulles made an important speech last week. It publishes a book listing groups in the United States interested in international affairs; the book is nearly 400 pages long.

The FPA itself reflects the growth of internationalism since the last war. Founded in 1918, the association made a distinguished record as a non-partisan educational body. It reached a peak of membership in the agonised years from 1938 to 1941, then declined somewhat, and by the late nineteen-forties seemed to be suffering from organisational sclerosis. Prominent speakers still graced its banquet tables in New York; the useful pamphlets on current foreign problems still appeared. But in the branches and affiliated organisations around the country there grew up a feeling that the association was too tightly organised at the top, and lacked the flexibility and the dynamism needed to do an effective job at the local level.

Since then, a quiet revolution has taken place. A sizeable grant of money was forthcoming from the Fund for Adult Education, a creation of the Ford Foundation. New leadership has taken over at the top, in the person of Mr John W. Nason, a Rhodes Scholar. Under his guidance, the association has concentrated on helping with the formation of new citizens' groups in the field of foreign affairs, and on offering a variety of services to those already in existence. The FPA's membership has climbed again, but no one at headquarters cares whether it ever reaches the 1938-41 peak or not, as long as the association performs these functions with energy and imagination. There is

THE ECONOMIST, FEBRUARY 26, 1951

less exploitation of speakers with big names, and less belief that an occasional speech, to an audience of pre-convinced internationalists, is educating Americans about world affairs. The FPA is only too glad to turn the glory over to the local citizens who enlist its aid in forming a new World Affairs Council or Committee.

These councils are themselves often hybrid creatures. In St Louis, for instance, the local branch of the Foreign Policy Association, the St Louis Co-ordinating Committee for Unesco, the Inter-American Centre, and the Citizens' Committee for Atomic Energy Information grouped together in 1949 to form the St Louis Council on World Affairs and to make a common appeal for funds. Since then the local branch of the American Association for the United Nations and the Export Managers' Club of St Louis have come to be housed in the council's offices, although they raise their money separately. In Kansas, the state Council grew out of an annual Governor's Conference on World Affairs. Often the initial impetus comes from a committee set up to mark United Nations Day.

★

The approaches of these councils and committees are diverse. They offer documentary films for rent to schools, civic groups or clubs; they collaborate with businessmen's organisations such as Rotary, Kiwanis, or the Junior Chamber of Commerce. They distribute information on foreign affairs in every conceivable format and at every conceivable level of subtlety, from bright posters to reprints from learned journals; they help secondary school students to organise model United Nations sessions, where students play at orating with Mr Lodge or walking out with the late Mr Vishinsky. They burgeon with organisers' kits and with the organisers themselves. And over all, the FPA's regional representatives hover helpfully, ready to give the benefit of that wide practical experience without which local initiative is only too likely to fritter itself away in futility, leaving a community not only unorganised and uneducated, but disillusioned.

All this takes patient work, for Americans have become wary about joining organisations, especially those which smack of the foreign and the strange. A few words of suspicion have been known to hold up the organisation of a World Affairs Council for months, while the FPA wearily went about the business of proving its non-partisanship. In Texas, for instance, organisers go on the assumption that no internationalist organisation can survive unless it can claim to be 100 per cent Texan. The Dallas Council on World Affairs is healthy and effective, but it must maintain and assert its independence from New York influences, Manhattan being to many Texans quite as foreign as London or Djibouti. In many places the taunt, "un-American," must be exorcised in advance.

Nevertheless, thousands of Americans are enrolled, not only in non-partisan educational ventures, but in "action groups," such as the American Association for the United Nations, for which Mrs Eleanor Roosevelt has done so much, or the United World Federalists. More and more groups, whose primary purposes are not international, have become interested in promoting an understanding of foreign affairs and foreign peoples. In the United States, the great reserves of good will and friendliness for other nations have not been exhausted by the harsh realities of the postwar years, and they are being organised, informed, and put to work today on an unprecedented scale.

THE ECONOMIST, FEBRUARY 26, 1951

SHORTER NOTES

Senator Morse of Oregon, once a Republican and latterly the Senate's only Independent, has officially joined the Democratic party. He has thus formally given the Democrats the clear majority in the Senate which his support had already enabled them to enjoy in practice.

The Supreme Court has decided that both the theatre and professional boxing are subject to the same anti-trust laws as other interstate commercial enterprises and has thus cleared the way for the Justice Department to prosecute the Shubert theatre companies and the International Boxing Club for monopolistic practices. Although a previous Court ruling had exempted baseball from the provisions of federal monopoly legislation, this did not, according to a majority of the Justices, mean that all entertainments and sporting exhibitions are merely amusements and not businesses within the meaning of the anti-trust laws.

★

St Louis, in the border state of Missouri, has taken a significant step towards ending racial segregation in its public school system, in accordance with the recent Supreme Court ruling on the subject. The integration of Negro students in the secondary schools, in which they constitute thirty per cent of the enrolment, was achieved without incident, and is to be followed next September by the opening of all primary schools to Negro children.

★

In the refunding operation early this month, all but 5 per cent of the holders of the maturing securities took advantage of one of the exchanges offered by the Treasury. It was particularly satisfactory that the new long-term issue, for 40 years at 3 per cent, went better than had been expected; it was not available for cash but \$1.9 billion was reinvested in it.

★

The "lifetime" president of the International Longshoremen's Association, Mr Joseph P. Ryan, was indicted two years ago after the New York Crime Commission had accused him of appropriating union funds for his own use and accepting gratuities from employers in violation of the Taft-Hartley law. Mr Ryan, who resigned his ILA leadership last year, has been found guilty on the gratuities charge and sentenced to six months in prison and a \$2,500 fine.

★

In view of the serious depression and unemployment in the textile industry, the Textile Workers Union has decided not to press for a wage rise this year. The union took this decision in spite of the fact that there have been wage cuts but no wage increases in the industry since 1951.

Newsweek

Iraq has money to spend

How? . . . Why? . . . This is described in a most comprehensive article appearing in the February 28 issue of "NEWSWEEK".

Factual and analytical articles, such as this, or the one dealing with Scandinavia on March 21 next, fill the pages of each issue of "NEWSWEEK" and have earned the confidence of discerning readers the world over.

These readers, over 2,500,000 of them—consist of top Business Men, Government Officials, Professional Men, Engineers, Architects—in fact the men who make decisions. The case of *Pseudococcus kenyae*...

P. kenyae is a mealy bug which feeds on the sap of Kenya's coffee trees and spreads disease through the plantations. Given the chance, predatory insects soon clean up infestations—but between the mealy bug and the predators stands a species of ant. In return for a secretion of 'honeydew' the ants protect the mealy bugs from their natural enemies.

Direct control of the pest has always been difficult, because mealy bugs wear waxen coats which throw off insecticides. However, Kenya coffee growers have solved the problem by using the Shell insecticide dieldrin—against the ants.

Dieldrin is a powerful and persistent ant destroyer. One low-cost application to the stems of the trees acts as a lethal barrier to the ants for at least two months, by which time the predators have moved in and killed the mealy bugs.

dieldrin

dieldrin and aldrin are  insecticides for world-wide use

Japan's Confused Elections

FROM OUR TOKYO CORRESPONDENT

JAPAN goes to the polls tomorrow with the main parties as muddled and confused as the electors. Neither of the two conservative parties nor of the two socialist parties has made any attempt to suggest remedies for the nation's economic plight. All have dutifully pledged tax cuts, but only the Socialists have offered any suggestion on how this could be accomplished—in their case, of course, by cutting down the defence budget. The ousted Liberals (whose former doughty leader, Mr Yoshida, is mischievously running as a private member) have lost the initiative to their fellow-conservative opponents, Mr Hatoyama's Democrats, and are playing a desperate "double-up" game; the Democrats promised a 500-million-yen reduction promise; the Liberals countered with a 1,000-million-yen reduction promise; the Democrats triumphantly pulled out of thin air a six-year plan for "economic independence" (which even the party's able financial authority, Mr Tanzan Ishibashi, admits is "somewhat abstract and divorced from reality"); the Liberals countered doggedly with a three-year plan. In the circumstances, an apologetic warning from the Japanese Embassy in Washington that the government should not lean too heavily on expectations of continued American economic aid is regarded by all parties as being execrably timed and abominably embarrassing—the more so since all parties are pretending virtuously that their one aim is to be honourably rid of all American aid and influence.

For the West, the most important aspect of the election campaign has been the adroit timing of the Soviet overtures to Mr Hatoyama's caretaker government. Mr Molotov said to Mr Hatoyama's relations with Japan; he that he wanted to "normalise" relations with Japan; he has already succeeded admirably in "respectablising" conservative Japanese discussion of the Communist problem. The frustrated and unhappy left-wing Socialists, virtually indistinguishable from the Communist party, are drinking bitter green tea as they listen to Mr Hatoyama enthusiastically voicing the sentiments of which they felt they had a justifiable monopoly. Mr Hatoyama, as a professional politician if amateur diplomat, can afford to be exuberant over the Soviet gesture—to an extravagant degree which gives his Foreign Minister, Mr Shigemitsu, the professional diplomat, frantic—because the Moscow-Tokyo negotiations stress Japan's independence and the Democrats' "escape" from the Washington "colonialism" which imprisoned the weak Yoshida-san. True, both Mr Hatoyama and Mr Shigemitsu are earnestly professing—perhaps too much—Japan's unshaken

devotion to Washington and the West, but they know very well they will gain no votes by needless enthusiasm for that theme. As the campaign drew to its close, the advisers of the worried Mr Taketora Ogata, the new leader of the Liberals, strongly urged him to drop even his half-hearted warnings to Mr Hatoyama on the dangers of becoming friendly with Moscow.

None of this Japanese excitement over the Soviet Union's belated overtures should be interpreted as evidence of growing pro-Communism in Japan. The popular mood remains one of nationalism and neutralism. Mr Molotov has simply given Japan its first real postwar opportunity of demonstrating its independence. Britain, with great advantage to Japan and the West, could have aroused the same reaction by a more positive and sympathetic interest in Japan. Sir Anthony Eden's unfortunate refusal to visit Tokyo after his visit to Bangkok has been noted sensitively and regretfully. Conversely, Mr John Foster Dulles' decision to refrain from visiting Tokyo on his trip to Bangkok has—with equal sensitivity—been noted gratefully.

It was a natural corollary that Mr Hatoyama should also announce proudly that his government, if returned to power, intended to recognise Communist China. The manner of his announcement was also significant and consistent; he chose a distinguished visiting British pressman as his medium, thereby slighting the United States Ambassador, Mr Allison and again usurping the role of his harried Foreign Minister.

Some other points of interest have emerged from the campaign—which will probably result in a sullen and uneasy coalition between the two conservative parties. First, the Communist party is back in the field, strong and full of spirit and yen, after a curious lull of leaderless inactivity. With only one seat in the Diet, the party is running 99 candidates and may hope to elect three or four of them, including the redoubtable Yoshio Shiga, who has emerged from hiding after six years. Second, the ultranationalist rightists are also re-emerging, but not as confidently yet as the Communists, although their accredited membership is five times the official 100,000 membership of the Communist party. Eventually, they will probably again be a stronger threat to Japan's precarious democracy than the Communists.

Third, business interests are in the saddle—with Mitsui representatives saying openly that they would have preferred a Yoshida government to continue in office. Fourth, the

armed services are temporarily in the background; they are a liability now rather than an asset, even to the armament-dedicated Liberals and Democrats. Only two eminent representatives of the old Imperial forces are running as candidates. Fifth, there is no apparent evidence of any serious hostility against the Liberal members who were involved in the ship-building scandals. Finally, there is one certain prediction that can be made; the West will not benefit from the results of the Japanese election of 1955.

French Patchwork

FROM OUR SPECIAL CORRESPONDENT IN PARIS

AFTER eighteen days of interregnum the crisis is over. France has a new government. M. Mendès-France, brought down by his fellow-Radical, M. Mayer, is succeeded by another Radical, M. Edgar Faure. This is more than a farce; several lessons can be drawn from the paradoxical succession. Most French parties, and the Radical "club" in particular, manage to include conflicting groups under one label. Furthermore, with the Communists outside its orbit, the oscillations of the political pendulum have a limited range. Hence the key role of the Radical party. After the fall of Dien Bien Phu, popular pressure produced a leftward swing and brought M. Mendès-France to power. Now the pendulum is back to its more natural position. The Laniel majority is resurrected, but it now has a Radical at its head.

Before the crisis ran its full course other candidates had to be cleared out of the way. After the conservative, M. Pinay, and the Christian Democrat (MRP), M. Pflimlin, it was the turn of the Socialist, M. Pineau. But in spite of solid MRP backing he failed for several reasons. A tactical blunder cost him the votes of overseas deputies. Though himself a moderate "European" he packed his cabinet list, like M. Pinay before him, with former supporters of the EDC. ("Only Adenauer is missing," commented one Socialist "rebel.") This created unrest not only among the Gaullists, but in the divided Socialist ranks as well. The chief cause of M. Pineau's failure, however, was the deep suspicion of the conservatives. For the first time during this crisis the conservatives (Independents, Peasants and dissident Gaullists) acted together in a disciplined fashion. After eight months out of power they would not allow a Socialist to take over and initiate reform both in North Africa and at home. They would not accept this even in order to allow the MRP to recover its "leftist" label. Speaking on behalf of the conservatives, M. Reynaud evoked prospects of monetary instability and raised the spectre of inflation. M. Pineau was then doomed.

When he was defeated, however, in the early hours of last Saturday morning, the victorious conservatives did not wish to put forward one of their own men. To counteract the "Mendès myth" it was preferable to suggest a candidate with a left-wing reputation, but one who could be "trusted." When it was learnt that M. Edgar Faure had been approached, stock values rose on the Paris bourse. Still, some people wondered whether M. Faure would agree to lead a centre-right coalition. It was rumoured that in a

THE ECONOMIST, FEBRUARY 26, 1955

heated meeting, M. Mendès-France had advised his former colleague to agree only if he were sure of Socialist backing.

M. Faure went ahead without Socialist support. By Wednesday morning he had formed a prospective right-wing cabinet, and he then faced the Assembly. Since he had been Minister of Finance in the two preceding cabinets, he could claim some credit for the economic recovery of the last eighteen months. He promised to foster rapid industrial expansion and on its basis to increase real wages by 7 per cent before June, 1956.

When M. Faure replied to questions in the afternoon the mood was more relaxed. The problem was no longer whether he would muster a majority, but how big it would be. More confident, he could show the parliamentary skill which has kept him so long in the limelight and even produced the saying: "governments go, Faure remains." At first he answered soberly many questions of detail. Then, warming up, he blurred the outline of his North African policy with adroit rhetoric. He pledged himself to ratify the Paris agreements, but to keep their opponents satisfied he repeated in vague terms his predecessor's idea of "parallel negotiations." Finally, after scoring some clever debating points, M. Faure ended on an emotional note, referring to France's prestige, to the vital tasks facing it and to its leaders' duty of self-sacrifice.

No Future for Ostriches

The performance was brilliant, and some time elapsed before the critics began pulling it to pieces in the lobbies. Then some noted cynically that M. Faure has always shown a great propensity for "self-sacrifice." The partisans of M. Mendès-France accused the new premier of falsity, ingratitude and, above all, of preventing a clear division in the Assembly. It was also observed that all the applause came from the right side of the parliamentary semi-circle; that M. Mendès-France did not clap; that not only the Communists but the Socialists as well kept silent.

M. Faure was finally elected by 369 votes against 210. He "broadened" the majority by exchanging Socialist support for almost all the votes from the centre to the extreme right. The new government is more in the image of the present Assembly than its predecessor, which was born out of anger and frustration; the centre-right coalition is the natural ruler in this Chamber. But this does not necessarily mean that the new government will last. Comment. Besides, the right-wing itself stands divided. M. Laniel, who governed with a similar majority, has shown that it can be held together only by an ostrich-like policy. After the Mendès-France experiment it will be more difficult for a premier to keep his head in the sand.

The new government has a fair chance of getting the Paris agreements through the Council of the Republic. It will find it more awkward to act on the North African, and particularly on the economic, front. There it will also have to fight against a dangerous shadow. Since M. Mendès-France was brought down before producing his economic programme, the new team's acts will be matched by the public not against what he achieved but against what he might have done. For the first time since 1947 Christian Democrat ministers hold key economic portfolios (M. Pflimlin the Ministry of Finance, M. Bacon that of Labour); will they now prove their reforming zeal? Whatever their intentions or those of the premier, they are likely to be

THE ECONOMIST, FEBRUARY 26, 1955

the prisoners of their conservative majority. In a few weeks' time the new government will face an important test. If the April rendezvous is judged by the workers to be a new version of All Fools Day, M. Faure will lose the remnants of his left-wing reputation and the political regrouping begun last year will proceed on clearer lines. German rearmament, North Africa and M. Faure's economic policy will determine whether M. Mendès-France is brought back to power after next year's elections.

Aden's Hinterland

THE visitors' book at Aden carries some notable signatures for last month, beginning with Mr Henry Hopkinson's (the first British Minister-in-office ever to visit the territory) and ending with President Tito's. The latter, who was little more than a passer-by, no doubt retained only the impression Aden makes on every winter traveller—that of a busy oil and coal bunkering port below sharp bare hills and on a hot blue sea. Mr Hopkinson, who stayed longer, was able to see a very different scene; he spent nearly a week in the huge hinterland which is the Aden Protectorate, and which was till lately little known, except to intrepid Arabian travellers. As he learned, it is now opening up at a speed that confronts its rulers and advisers with some perplexities.

Aden itself, which is a Crown Colony, is only 80 square miles in area. The Protectorate, which stretches for 750 miles along the southern coast of Arabia, has an area of 112,000 square miles and consists of independent sheikhdoms and sultanates having treaty relations with Britain of much the same pattern as those now growing familiar along the oil-bearing coast of Arabia. These tribal territories, that is, are autonomous and highly individualistic, but some of them accept British advice about their internal affairs and all agree to British management of their external ones.

The western protectorate, which is divided between nineteen such rulers, shares a frontier with Yemen. The eastern one, divided between two main rulers, has no frontier troubles to speak of since it adjoins the Empty Quarter of Arabia. The greater part of both has been familiar only to people who like man as well as nature to be red in tooth and claw, for both were until quite recent years riven by tribal blood feuds. Some idea of the state of human relations that prevailed can be gleaned from the fact that good agricultural land, now bearing a heavy crop of long staple cotton, ran to waste until 1949; that many farmers could visit their fields only by way of trenches dug wherever they lived within gunshot of a neighbour; and that the so-called "Ingrams' Peace" signed in the eastern protectorate in 1937 required 3,000 "signatures" before it could be reckoned a valid document.

Today, several new influences are changing these mediaeval conditions, easily the most important being the prosperity of Aden Colony. This has reaped, since 1951, much of the profit discarded by Dr Mossadegh at Abadan; Aden oil refinery, designed for a throughput of 5 million tons of crude oil a year, came on stream last August after 21 months of tremendous building activity. The Colony's accounts for the year ending March, 1954, show

a revenue of £2.4 million, which is an excess of £788,000 over estimates and a surplus for the year of £344,000. Four years earlier, revenue was only £1.1 million.

Naturally, the news of so many new working and trading possibilities has penetrated to the Protectorates, and new ideas have been carried home by the returning worker. Another new influence on inland life and outlook is the sight of agricultural improvements, wrought by means of much patient preaching by a tiny Anglo-Arab staff and the demonstrations which this is able to stage, thanks to the Colonial Development and Welfare Fund. A third and more unsettling element is the anti-western and anti-British propaganda that is introduced by Cairo radio, by Yemeni visitors, and by travellers returning from Java, and is disseminated by means of gossip; as everywhere, this carries far even among people who are allegedly not on speaking terms.

In the light of all these developments, the British personnel based on Aden itself has rather naturally reckoned that if the Protectorate is to take on a new pattern it may as well adopt a model one. Last year, therefore, it devised a scheme of federation whereby the local rulers should get together at least in sufficient measure to promote social and economic progress. The scheme, which was presented to the rulers of the Western Protectorate in January, 1954, looked fine to anyone who could use a typewriter. It offered promise of much more rapid expansion of social and administrative services than any one ruler could compass on his own; by opening up communications it also offered the promise of more jobs for protectorate inhabitants. (Up till now, Yemenis living across the border have tended to hear of, and snap up, the work that is going at Aden before news of it percolates eastwards.) The scheme also ensured sheikhly unity against Yemeni encroachments. Easily the most demonstrable argument in its favour was the success of the Abyan irrigation scheme which was impossible of execution while an age-old feud prevailed between the Sultans of Yafa' and Fadhlī, but which, within a few years of a settlement between them, has this season produced first-class long staple cotton to the value of £2.5 million. In January, 1954, therefore, the rulers of the Western Protectorate were talked into accepting federation "in principle."

But they had many doubts about its details. They were worried about the restrictions it might impose on their main source of revenue, which is the levying of duty on goods in transit through their domains; they were concerned about compensation for this right, and they were worried about the amounts and distribution of such grants as might be coming their way for local improvements. They were also exercised about the novel idea of delegating the legislative and executive work of the proposed Council of Rulers

to bodies on which only two or three of them would sit. Nothing has therefore yet come of the proposal, and, happily, Mr Hopkinson felt constrained to say that he was not going to force it on them.

The great point about the Aden Protectorates is that they constitute, as at present run, a friendly hinterland for a port that is important both as a base and as an industrial centre. If they are to remain so, they had much best not be hurried. If they proceed at their own pace, the new ideas that are reaching them in such profusion may change their habits in a way that will not upset their present good relations with their British ally.

Radar in the Far North

FROM OUR OTTAWA CORRESPONDENT

THIS year a bigger share of Canada's defence budget will be spent on the air defence of the North rather than on strengthening Nato forces in Europe. The published figures hardly show the switch in emphasis, though they do show a decrease in the vote for "Mutual Aid" to other Nato countries from \$300 million to \$175 million. But expenditure on early warning devices, radar and suchlike, are concealed behind innocent generic headings like "construction." Somewhere in those figures lies a planned expenditure of something like \$50 million in the coming year on a warning chain which will stretch right across Canada from the northern part of British Columbia to the northern part of Labrador. It is called the Mid-Canada Line, and Canada is wholly responsible for it—even to paying for it all.

As a construction project the Mid-Canada Line is a tremendous challenge. The 55th parallel, which it roughly follows, crosses the northern part of all the provinces in almost uninhabited country. In some parts, as in the Ungava peninsula, it is a rocky, steep terrain where helicopters may provide the only access to selected sites. On the coasts of Hudson Bay some supply will be possible by water, and a few settlements of Eskimos will help to provide a suitable labour force. The Northern Affairs Department is sending in specialists to smooth the relations between contractors and natives. In the northern parts of the prairie provinces, swamps present one of the main problems. It is difficult to find sites where radio reception is good and yet the ground is suitable for construction. Apart from helicopters, the main transport of construction supplies and equipment is being done by "tractor trains"—huge tracked tractors hauling three or four wooden sleds. This exercise is possible only in the winter months, and it is going on now.

In building the Mid-Canada Line, Canada has taken an opposite course to that which the United States is following in building the yet more spectacular "D.E.W. Line" across the very far North. (D.E.W. stands for distant early warning). The Canadian authorities—primarily the Air Force, with the Department of Defence Production and Defence Construction Limited (a Crown company)—is planning everything to the last detail before letting contracts. A management contract has been let to the TransCanada Telephone System, which is working in very close co-operation with the government agencies. But sites are being

THE ECONOMIST, FEBRUARY 26, 1955

selected by the RCAF in co-operation with the management contractor; Defence Construction Limited is moving in supplies itself; and actual construction contracts will not be let until the authorities can provide nearly all the details about each installation.

The Distant Early Warning line, which is to cross "the most northerly practicable part of North America," has been made an American responsibility. The United States is paying for it, and it will be very much more costly than the Mid-Canada line. But Canada has stipulated that as much of the work as possible shall be done by Canadians. Newspaper reports here have been guessing its cost at \$200 million, and probably this guess is as good as another. The fact is that nobody can possibly know what it will cost, and the Americans are going at it (some critics say) as though they did not care.

They are making a mass assault on the Arctic the like of which the northern wilderness has never seen before. The general line to be followed by the chain of early warning

stations has been decided, though not without some argument—and some Canadians are still saying that they knew a better plan. Much of the country to be crossed is almost entirely unknown. The coastlines, on which heavy supplies should be landed during the short summer of 1955, are mainly uncharted and ice conditions present unforeseeable hazards. Before the few weeks of what the optimists may call "open water," supplies must go in by air. Canadian air-carriers are co-operating in a sort of pool air-lift which is intended to move thousands of tons before June.

A Canadian air-survey company has just started work along the projected route of the chain with a view to selecting sites on which later in the summer two Canadian contractors are supposed to start building. The whole operation is being planned by the Western Electric Company from a project office in New York on the basis of a management contract with the United States Air Force. The transportation by Canadian air-carriers and down the Mackenzie River by barge will be by sub-contract from the Canadian prime contractors. It will be supplemented, where necessary, by the United States Air Force. The Americans are also responsible for the carriage of supplies by sea, and it is presumed that only the Navy will be able to provide the vessels needed, including ice-breakers.

The world is now used to the American method of

CARBORUNDUM and a present for Sir Isaac Newton

IN 1949, BRITISH ASTRONOMY received from the MacGregor Trust of Michigan the gift of a piece of glass. It was special, low-expansion glass—a disc more than 8 feet in diameter, weighing 5 tons and worth more than £10,000. This was the MacGregor Trust's very generous contribution to the 98-inch astronomical telescope that is to be installed at the observatory at Hurstmonceux, in Sussex, as a memorial to Sir Isaac Newton.

Sir Howard Grubb, Parsons, and Company, of Newcastle on Tyne, undertook the work of converting the biggest piece of glass in Europe into a 98-inch telescope mirror whose concave surface would nowhere depart by more than 2 millionths of an inch from a perfect sphere with a radius of some 50 feet. Before they began the job, they consulted CARBORUNDUM—as many highly competent engineering firms do when they are faced with specially difficult or important work that involves the use of abrasives. And

the consultation was fruitful: for the job of shaping this big piece of glass, CARBORUNDUM were able to develop special diamond wheels which eliminated the danger of overheating and cut the glass more cleanly and rapidly than it could have been cut without them. When they were used for machining the edge of the disc the new wheels were able to take cuts up to a sixteenth of an inch deep.

Including the slow, meticulous work of finishing, the making of the mirror from the disc has taken almost 2 years' actual working time, and has involved the cutting away of 1800 lbs. of glass. We were interested enough in this great undertaking to send the CARBORUNDUM Film Unit to make a 16 mm. record of the work, in colour, with a spoken commentary. We shall be glad to lend this film, free of charge, to responsible organizations who may care to see it.

tackling a big project. The usual reaction, from the raised eyebrow to the flat declaration that "it can't be done," has been proved wrong so often that there is now a strong presumption of success. But it is doubtful if American methods have ever met a more formidable adversary than they face this time. This is the Arctic. They wrestle not against flesh and blood but against principalities and powers. The Arctic experts are inclined to be a little shocked at the irreverent mass attack on powers which they have always treated with more respect. One of the Canadian prime contractors has been wise enough to retain the services of Colonel Tom Manning, the outstanding Arctic explorer. It will be something new for him, whose last exploit was to circumnavigate Banks Island alone in a canoe, to watch the mechanised approach of the American method.

Development by Deficit in Asia

WHEN the seventh session of the Committee on Industry and Trade of the UN Economic Commission for Asia and the Far East (ECAFE) meets in Tokyo in the middle of March there will be before it a paper prepared by an expert working party on the financial aspects of economic development programmes in the area. This is an important subject, the practical implications of which deserve serious consideration by the governments taking part. The main point at issue concerns the wisdom of using the method of government budget deficits to finance economic development.

The working party's report, which balances the pros and cons of deficit financing, is unduly circumspect in expressing a definite conclusion one way or the other; but it is obvious from the remarks made by ECAFE's Executive Secretary that the method is, to say the least, not disapproved of in those quarters. It is frankly admitted that deficit finance is inflationary; but, it is argued, that, for a developing but backward country, which is unable to raise the financial resources by taxation, internal savings, or foreign assistance, it is justifiable. Moreover, a number of arguments are raised to show that the inflationary impact may be less in underdeveloped countries than in more mature countries. Finally, in the last resort, there are always controls to hold down and delay the effects of inflation. But the working party's report is at pains to distinguish between a moderate amount of inflation, which, it infers, will do little permanent harm, and uncontrolled inflation, which would be disastrous. This view, as well as other recommendations made in the report, have recently been challenged in an article in *Lloyds Bank Review* by Dr Frederic Benham, himself the British representative at ECAFE, and economic adviser to the UK Commissioner-General in South East Asia. Dr Benham is frankly apprehensive of the inflationary consequences and he writes "the scope for deficit finance is not very great; the limits beyond which the inflationary effects become harmful are soon reached." This is wise counsel.

Many Asian countries, notably India, have already embarked on deficit-financed development programmes, so far without disaster. But the insidious effects of inflation are seldom quick to appear. In the case of India, the

possession of substantial sterling assets is a protection against the effect of inflation on the balance of payments; other countries less well off for foreign reserves might, however, be misled by India's example to ignore this inevitable consequence. Moreover, the point should not be overlooked, though unfortunately it was not stressed in the working party's report, that a tendency towards inflation in an underdeveloped country might choke off the inflow of foreign development capital, because of doubts abroad about the country's economic stability.

Dr Benham was right, furthermore, in deprecating the working party's recommendation that, in order to minimise the inflationary effects, development plans should be revised to include mainly quick-yielding schemes rather than long-term projects. This surely is short-sighted advice. Finally, not enough attention has been paid by the advocates of deficit finance to the long-term social and economic effects of this policy. The working party, for instance, is relatively unconcerned at the transfer of income from the fixed income earners that is the inevitable consequence of inflationary finance; it will help, it says, to provide the government with the required real resources. But what of the social and political consequences of the erosion of this stable element in the society? Furthermore, is it reasonable for the democratic countries of South East Asia, nearly all of which have welfare state ambitions, to acquiesce in the deliberate impoverishment of the fixed income earners, many of whom will, one day, be either the employees or the wards of the State?

But the greatest danger in financing economic development by deficit finance is the probability that once started a mild dose of inflation tends to get out of control and becomes chronic. This is especially true of the countries in South East Asia whose shortcomings in the administrative field would make it difficult to hold the line effectively. Furthermore, as the post-Korean boom and slump of commodity prices showed, these countries are still largely at the mercy of world economic trends. For these reasons the temptations of deficit finance should be put aside; sound finance, even if it is unspectacular, will in the end serve the underdeveloped countries of Asia better.

Vanoni's Four Million

THE problem of surplus population in Italy, particularly in Southern Italy, has coloured the attitude of Italian representatives in all international economic organisations since the war. They have taken the leadership in manpower committees and migration conferences and have missed no opportunity to press for fresh outlets for their people. One of the most hopeful aspects of the new Italian ten-year development plan, generally known as the "Vanoni" plan after its sponsor, the Italian Minister of the Budget, is the fact that it treats the Italian surplus of manpower as a resource to be used, rather than as a drain on the economy to be exported as quickly as possible.

When the Vanoni plan was submitted to the OEEC council meeting last month it was warmly welcomed as an optimistic approach to a problem that has long been recognised as a dangerous source of weakness in the economic

base of the Atlantic community. As the Italians have rightly stressed, the responsibility for hard work and disciplined effort can only be theirs, but their chances of success will be improved if they receive from their OEEC partners both the moral support and the tangible help which they are entitled to expect.

The document submitted to the OEEC is not a detailed plan of action but a series of interlocking forecasts and assumptions about production, consumption, investment, trade, size of the labour force and related factors which, taken together, would bring about nearly full employment by 1964. The plan's best claim to realism is the fact that the annual rate of growth of the Italian economy which is necessary over the next ten years to achieve a satisfactory level of employment and a viable economy without external aid, is about 5 per cent, which is roughly the average rate of expansion attained during the past four years. The problem, therefore, is one of preserving, re-directing and, if possible, stepping-up a momentum which already exists, rather than the much more difficult task of moving the economy off dead centre. But simply to speak of maintaining the present rate of expansion for the next ten years gives a totally false impression of the difficulties that lie ahead. As the Italian plan fully recognises, a far greater investment effort will be required for a 5 per cent increase in national product, since there is no longer a large reserve of unused productive capacity. The gross investment effort needed is estimated at about 33,970,000 million lire (about £20,000 million), and assumes an increased rate of saving by stringent action to hold down consumption. This in a period when national income is to increase by 63 per cent, and gross investment is to be practically doubled, overall consumption will be held to a 50 per cent increase, most of it among the newly employed.

Houses as Counterweights

The plan starts from an analysis of the magnitude and character of the labour supply which must be absorbed by the end of the ten-year period. During this time the addition to the labour force from natural increase in the population is estimated at two million, from unemployment and underemployment in agriculture 1,300,000, and from industry 2,200,000. From these totals a rather high "frictional" unemployment figure of 700,000 and anticipated emigration of 800,000 are subtracted to give the "four million new jobs" goal of the plan. The abnormally high birth rate at the end of the war will be reflected in sharp increases in the labour force in 1960, 1961, and 1962, but will then be followed by a considerable drop in 1963 and a downward trend; from 1967 on the net increase in the labour force will be manageable at about 80,000 a year. This long term trend gives the Italians hope that if by an exceptional effort they can create four million jobs by 1964 they will then have brought about an "equilibrium of the economic and social system such as Italy has not known since the political unification of the country."

The government will play an important part in the ambitious investment programme which is the core of the plan. Approximately half of the total new investment will be channelled into three so-called "impulse sectors," agriculture, public utilities and communications, and public works, in which public investment will be dominant. This so-called "propulsive investment" is designed to create the economic and social conditions required for an expanding

THE ECONOMIST, FEBRUARY 26, 1955

economy, not to provide appreciable lasting new employment in the sectors affected. On the contrary, in agriculture the objective is a substantial reduction in the numbers employed so that at the end of the period 33 per cent of the total labour force, rather than 41 per cent as at present, will work on the land. The government will also invest heavily in new housing, which will not be looked to primarily as a source of new jobs but as a necessary social requisite for expansion; the basic target will be 10,200,000 new rooms by 1964. But the rate of investment in residential housing will deliberately be kept below the rate of increase in national income in order to channel investment into job-creating, income-producing industries. Housing is also to be used as a balancing factor and investment will be contracted or expanded to stimulate or siphon off demand for other consumption goods as required.

Investment in all the above sectors, as well as other government influenced investment, will be consciously directed to narrowing the economic and social gap between north and south, and the aggregate increase in income in the south over the ten-year period is estimated at 118 per cent as against 48 per cent in the north.

The prevailing optimism of the plan permeates the assumptions about foreign trade. It is assumed that by 1964 it will be possible for Italy to balance its international accounts without external aid. But instead of cutting down imports the Italian planners have set themselves a goal of increasing exports (including invisibles) to 60 per cent above the current level. This would allow a 43 per cent increase in imports, which they estimate would be adequate to satisfy the needs of the planned expansion. The greatest increase in imports is to be in iron and steel products, the greatest export hopes lie in mechanical and chemical products.

It is easy to wonder where Italy will find the markets, to question whether the internal discipline that is the *sine qua non* of the plan exists, and to feel that the implicit assumption of substantial foreign aid is optimistic. It is tempting to point out the vulnerability of any plan so patently "constructed" on so many bold, and interlocking, assumptions. And it is impossible to ignore the fact that the strength of the Communists in the trades unions and the parliament will be a formidable hurdle to the legislative action, hard work and self denial which the plan requires. But the Italians are undoubtedly on the right track; the optimism of their plan is, in a sense, its greatest strength, and if the government can persuade first itself and then the people of Italy that their problems are not intractable but manageable, the corner will have been turned.

MORE POWER AT LOWER COST

The Deltic is the smallest and lightest diesel made, in relation to its power. This means higher speeds for naval craft and more cargo space in freighters. The facilities for 'overhaul by replacement' which are available to users of the engine mean a shorter lay up and more sea-time for all Deltic-powered ships.

The Deltic is a working example of the Napier principle: more power at lower cost.

FROM DEFENCE TO DETERRENCE

A New Order of Priorities

THE 1955 Defence White Paper is the first official "appreciation" of Britain's strategic situation since the advent of nuclear weapons which inspires real confidence that Ministers are clear about what may happen and what ought to be done. They have taken the facts about the hydrogen bomb as their starting-point and reasoned from there. It is the only way: frankness and logic in this grim predicament will alone give the country faith in its leaders.

The previous White Paper was not only made obsolete by the American hydrogen bomb test, but its talk of a "period of broken-backed warfare" and "mobilisation of the reserves behind the shield of the active forces" strengthened uneasy feelings that British politicians and chiefs of staff were well behind the scientists and even the popular press. But in the past year the authorities have caught up a lot. The decisions to disband AA Command and to evacuate Suez have now been followed by the formulation of a new and much more convincing order of priorities. The trouble will be to live up to it. The most disquieting sections in the White Paper are those on research and manpower—though much in the other sections is vague but slightly complacent about aircraft and missiles.

Defence is now deterrence. Even with atomic bombs this was increasingly evident, though the experts never entirely abandoned hope that a system of interception might be devised which, given enough money, and the time to build and the power to sustain it long enough, would raise the proportion of raiding aircraft destroyed to so high a level that the damage sustained from bombers that got through would be short of prostrating. The decisive calculation is whether the cost to the attacker can be made greater than the damage done. But even if the rate of kills could be raised from 30 per cent (and this is optimistic) to 95 per cent, the surviving bombers, if they carried H-bombs, would be enough to devastate the country. That does not mean that no defence by fighters or missiles is required; to make things look easy, because of fatalism alone, is to

invite disaster; fighter defences are part of the deterrent.

The strategic revolution (for once the word is not an overstatement) that has occurred in little more than twelve months is this: so long as it was the original A-bombs that were in question, a small island might conceivably be defended, while it would take a massive bombing effort to provide an effective deterrent to a large and remote country. Defence and offence were still in some sort of balance. But with H-bombs, there is little or no defence, and the deterrent is overwhelming. Attack has become much the best part of defence, and by the same token the readiness to attack has become much more likely to succeed in its main objective of preventing the war from ever happening. The new doctrine is not easy to assimilate. But it is cast-iron in its logic.

THE PATTERN OF SPENDING

	Estimate, 1954-55		Estimate, 1955-56	
	£ million	Per cent	£ million	Per cent
Admiralty	367.0	22.4	347.0	22.6
War Office	561.0	34.2	484.0	31.5
Air Ministry	537.0	32.8	540.4	35.4
Ministry of Supply ...	151.0	9.2	147.5	9.6
Ministry of Defence ..	23.9	1.4	18.3	0.9
Total	1,639.9	100.0	1,537.2	100.0
Of which				
United States Aid	85.4	...	43.0	...

It is from the horrific facts about the H-bomb that the White Paper has distilled hope from despair. For the time being—perhaps until ballistic rockets offer to give complete surprise to the attacker—the certainty of retaliation on a mortal scale renders thermo-nuclear warfare useless as an instrument of national policy. It would almost certainly destroy the social structure of the belligerents and dissolve

their regimes, certainly any institutions not based on the people's will and needs; and after it the would-be "victor" would emerge far weaker than smaller powers that kept out of the fight—it might be forced to sue for their succour. To a country seeking world-mastery these facts are a deterrent indeed.

Circumstances may render this stable situation unstable again. But the relative security it offers must be a cardinal point of policy. The nuclear deterrent is related intimately to the whole strategic position of the Western powers. For the deterrent to be effective, the Communist powers must know that we are determined to retaliate; that we are in a posture to retaliate effectively; and they must also know what will produce retaliation. To be undefended on the ground in Western Europe would invite piecemeal advances none of which could easily be made a case for invoking the supreme sanction. It would dangerously weaken the air defences of the bomber bases in Britain, which start on the Elbe. It must be made evident that aggression in Europe will generate such heat as to make hot war inevitable. The 30 western divisions must be there to prevent any *faits accomplis* by the 100 Soviet divisions.

Nor will Britain's possession of the H-bomb change the facts about what the White Paper describes as "Communist imperialism in the cold war." The deterrent, if effective, leaves the cold war as the only remaining area of struggle in which a final decision can be reached by the Soviet. Any idea that little is needed in the way of forces between the nuclear-armed armies in Western Europe and policing units elsewhere is fallacious. The West, and its thermo-nuclear deterrent, could be outflanked and isolated by the gradual transfer of enormous territories, populations and resources from the western to the eastern orbit, either by infiltration, or by wars fought by conventional weapons—limited wars on the Korean pattern, perhaps in South East Asia, conceivably in the Middle East or elsewhere. In the political and psychological situation of the most critical area—South East Asia—it is not enough to show that the Western way of life is superior, but also that it is defensible.

This is a vast commitment; it has not decreased simply because Britain is stockpiling thermo-nuclear weapons. The small drop in the estimates for 1955-56 compared with a year earlier is no indication that defence costs can be pared down for technical reasons. In fact, on the outturn, the estimate for 1955-56 at £1,537.2 million, if it is fully spent, is likely to be in excess of actual spending this year. Yet much of the deterrence described in the White Paper is still in the planning or testing stage; the White Paper is largely written in the future tense. Such economies as can be discerned in defence spending—in production or manpower—are a matter for disquiet not satisfaction, for they reveal us to be less secure, not more.

The problem, in fact, is and will increasingly be, to get the deterrent forces we need out of the resources that we can spare. For that reason, strict adherence to the order of priorities will alone give the maximum of security. The first priority is the maintenance of the deterrent to hot war; the White Paper calls for "even higher priority for the primary deterrent." The second priority is the winning of the cold war; and only third comes the means of waging a hot war if it should ever get started—"the defence and continued functioning of the home base." The weapons to be chosen for the forces, the allocation of money between them, must reflect these priorities. The strategic bomber

qualifies for the highest priority; in the Navy, for example, the aircraft carrier, useful (or, as some would say, allegedly useful) both for the atomic deterrent and in the cold war, rates ahead of anti-submarine ships.

To relegate the defence and victualling of this island to the third priority is a difficult but necessary decision. To the present generation of Englishmen, who have twice had to endure year-long sieges, it is hard to swallow the doctrine that another long period during which a beleaguered island depends upon the shipping lanes for its life is really not very likely. Yet faith in the magnitude of the H-bomb deterrent implies the belief that the initial phase of an all-out hot war would, to all intents, end the war. The vision of broken-backed war has dissolved; if the H-bomb is ever used, civilisation's back would indeed be broken, but there could hardly be any organised war, either to wage or to ward off. The White Paper cannot altogether face this prospect. "We also need," it remarks, "defensive strength to take toll of the enemy's attacks. To this end the reserve army, apart from its overseas commitments to Nato and for other purposes will continue to play a vital role." It is far more likely

that the reserve army will be detained at home creating order; only a force capable of being flown to Europe would have much chance of getting there. This situation would change only if the hydrogen bomb (and perhaps the new big A-bombs) were somehow banned, but tactical nuclear weapons still employed.

But it does not follow that Civil Defence also must have a low priority. Civil defence—planning for survival—is, in fact, a part of the deterrent against hot war; for it shows that while Britain sees in the immense destructiveness of the opening phase the likelihood that organised warfare would soon cease, she is prepared "to face the threat of physical devastation, even on the immense scale that must now be foreseen" as "manifestly preferable to an attitude of subservience to militant Communism, with the national and individual humiliation that this would inevitably bring." Civil defence is the symbol of an attitude that means no flinching; no bluff. To bluff with the hydrogen bomb would be fatal.

The estimates show, so far, relatively little of this reshaping of forces; but the logic of events was already changing the allocation of money even before the H-bomb appeared. The Air Force share has risen to 35.4 per cent of the total,

THE ENGLISH WAY OF LIFE...

"The
Mermaids
are
late
this
year..."

Sitting quietly in his London Club, Colonel Russell is not a man whose demeanour suggests a martial past. His hobby is rose growing: Lady Hillingdon, de Meaux, Mermaids. . . Colonel Russell takes his coffee slowly, and before returning to Threadneedle Street, may stop for a moment to discuss his roses with Charles, the Hall Porter. "The Mermaids are late this year . . ." But don't let Colonel Russell's rather reticent manner deceive you for a moment. The slight stiffness in his right leg (which gets worse in the cold weather) dates from the first World War. In 1916, as Captain Russell, he was severely wounded when leading his company against six enemy machine gun posts.

Today, when we are all faced with the threat of a third, more terrible, World War—one thing is certain. Britain's friends and foes alike can count on there being enough 'Captain Russells' to spring

forward at the right moment. But courage and determination by themselves are not enough. They must be backed with up-to-date equipment.

This is why the Hawker Siddeley Group of companies is so important to Britain. Aircraft and aero engines designed and perfected by Group companies provide the essential equipment of security. The unquestioned excellence of Group aircraft like the Hawker Hunter, Gloster Javelin and Avro Vulcan proclaim our faith in freedom across the skies today. Over 65,000 skilled workers, technicians and aeronautical engineers man the immense production facilities of the Hawker Siddeley Group, forging the tools of national security. This combination of men, machines and aeronautical genius is a safeguard that, as long as there's an England, there will always be gardens, roses and men like Colonel Russell.

THE AVRO VULCAN
World's first 4-jet Delta bomber. Great range, fighter-like manoeuvrability and 'built-in' development potential are the striking features of this large bomber. No other high-flying bomber in the air today is so fast, safe and reliable.

the Army has slipped back to 31.5 per cent. The Navy is about the same as before—and the new emphasis on its offensive capacity may have stayed the axe. But it is no comfort that only £600 million was provided in the estimates for defence production for 1955-56 as compared with £650 million in the two previous years.

This, then, is the emerging pattern: deadly serious preparations for a fantastically destructive war of weeks or days, as the best means of ensuring that it will not happen; preparedness to fight peripheral limited wars and police wars that well may happen and prove costly in men, production and money over the next five or ten years until a new atomic situation emerges—as it may with the ballistic rocket, or when several powers have nuclear weapons. It is not a happy prospect, and the government inevitably—and no doubt in all seriousness—tried to soften it with their disarmament proposals. But it could be a worse prospect: a nuclear war that does not happen is still better than a conventional one

The Unconventional Armament

IT is still possible to draw a distinction between the weapons and tactics of nuclear warfare and those that are described as "conventional" armaments; but the distinction is already blurred and will in time disappear altogether. Two new technologies have wrought a revolution in the design of weapons that has not been equalled since the appearance of gunpowder. They have crammed as much technical progress into a decade as the world once took two and a half centuries to assimilate, and it is small wonder that the military planners are breathless from trying to keep their strategy abreast of the scientists. The two technologies are those of electronics and nuclear physics; the White Paper makes no attempt to minimise their impact on warfare. They mean the end of military strategy as the world has known it; the end of conventional air defence; of vast movements of armies; of battles at sea. But what they mean in positive terms is still far from clear.

The thermo-nuclear bomb, with its ability to pulverise areas of 30 square miles or more and to spread destruction over 200 miles with a single explosion has dwarfed all other concepts of warfare. An atom bomb is restricted in size by the need to keep the fissile material within critical margins; but there is no limit in theory to the size that a thermo-nuclear weapon can reach. It took Britain 2½ years to collect sufficient plutonium to set off the first atom explosion at Monte Bello in 1952, but if the scientists at Aldermaston decide to by-pass the difficulties involved in collecting enough tritium (a rare and heavy form of hydrogen) for hydrogen tests and use instead one of the light elements like lithium, which is relatively plentiful, it may not be so long before this country starts to build its own thermo-nuclear stockpile. There is no reason to believe that this will cost Britain anything like the huge sums spent in the United States. Lithium is not expensive to prepare, and the really heavy expense, the establishment of the atomic plants and research stations, has already been written off in the development of Britain's first atomic bombs. This assumes that the bombs will eventually be capable of being carried in and dropped from aircraft: it is worth remembering

that does. The fact must be faced that to keep it as favourable as it is, the very heavy insurance premiums must be paid. There is no guarantee that they will not grow heavier.

Britain, whether she likes it or not, is a world power. Her responsibilities are global, wherein she differs from, for example, France or China. The Colonial Empire abuts on some of the hottest spots in the cold war, and much of it is fertile ground for Communist subversion. The ability of Britain itself to take up a strongly deterrent role depends on a warning screen in Europe, which inexorably involves us in the maintenance of permanent forces on the continent—as does the probability that the Soviet has 400-mile range V-2 rockets. There is no avoiding this vast commitment, no question of leaving it to the Americans, or of haggling over fair shares. And because, in fact, it only can be met by collaboration with the nations of Nato and Seato it is vital that Britain's contribution of nuclear weapons to the deterrent umbrella over all should give her a full voice in policy.

that there is no evidence to show that this stage of development has yet been reached either in the United States or Russia.

The hydrogen bomb is essentially a weapon against large targets; against cities and perhaps against specific concentrations of troops or ships. While its great destructive power has the immense advantage of reducing the importance of accurate aim, many targets are not big enough to warrant the use of such pulverising explosive force. A whole range of nuclear weapons of varying size and power is being developed for use against targets such as these. This ability to produce not only weapons of increasing mass destruction, but atomic counterparts for almost all known forms of attack has been one of the surprises of atomic science. While the bomb and the heavy bomber were the only atomic weapon available, it seemed as if strategy in the field would remain much as it was, except for the prospect of total destruction of the rear communications. The arrival of tactical atomic weapons has destroyed this concept.

The White Paper makes two points about these weapons: first, that they give Western Europe its first real answer to the 400 land divisions of the Soviet bloc; and secondly, though less explicitly, that military strategy for this kind of atomic warfare is thrown into the melting pot. New methods of organisation, of supply and of equipment must be evolved and will be tried out in manoeuvres during the year. There will be little prospect in future of giving the infantry any support from conventional artillery, since the difficulties of moving it into position and of supplying it are too great, and the same holds for much of the equipment and the transport to which armies have become accustomed. There must be no "tail," and troops in the front line will have to attain a high degree of self-sufficiency as well as a high degree of dispersion. Some support can be given to them by ground attack aircraft, but there are not sufficient numbers of these in Europe to do the job adequately. The Army is placing more reliance on covering its troops with atomic fire-power. American atomic cannon are already in Europe; they are not regarded as particularly

effective weapons, but short-range atomic guided weapons are contemplated for the British Army. Easily launched, and easily concealed, missiles are tailored to the new strategy.

During the past three years, there has been a gradual change of emphasis in the RAF from air defence to air attack, with the growing realisation that no effective protection from atomic (and now thermo-nuclear) bombing was probable. Radar warning is limited by the physical properties of the beams to a distance of roughly 180 miles. This gives the defences roughly 10 minutes' notice. Modern bombers can fly at heights of 12 miles or so, and at those altitudes there is a real doubt about whether a defending fighter will be able to do a useful job of interception. It is significant that British bombers fly unarmed and rely on their height, speed and manoeuvrability at rarefied altitudes to outstrip the defences. Compared with the strength of the United States, Bomber Command is never likely to be more than a token force but, backed by a home-produced stockpile of atomic and thermo-nuclear weapons, it puts

THE ECONOMIST, FEBRUARY 26, 1955

under British command and direction the only real deterrent. Probably the only targets that can be adequately concealed from an attacking power are the bombers and their airstrips.

The Minister of Supply's confidence in the adequacy of Britain's present air defences may be based on knowledge that Russia cannot at present deliver such an atomic attack on Britain from Russian bases, but the date when it does become possible cannot be far off. It may also be true that Russia would not contemplate a nuclear war before Soviet aircraft were able to reach into the interior of the United States. Evidence suggests they may be in a position to do this some time in 1958. What defence will Britain then be able to muster? A fighter, even one armed with cannon as powerful as the 30 mm Aden, is no match for a modern bomber: if it can climb in the time available to the bomber's altitude, its own speed and that of its target are both so great that one shot is the most that can be expected. To give the fighter any real chance, it

Missile Mechanics

GUIDED missiles are taking longer to perfect than even the hydrogen bomb. Scientists have known in principle for many years how to build a weapon that will search out its own target, but the gap between theory and practice is wide and difficult to bridge. Ways of homing the missile are roughly classified as "active," where the missile does all its own hunting; and "passive" when it is directed from the ground or from the launching aircraft.

A moving object cannot fail to send out all kinds of electro-magnetic signals, so that while a missile can home on radar, it can also use the heat, or the noise, or the vibrations of an aircraft, or the infra-red radiation from its engine, or the static electricity, to find its target. The nearer the missile gets, the stronger these signals become and the more inexorably it locks on to its target. But if the missile is built to hunt alone, then it has to contain an additional link between homing systems and the servos that move its controls on to the collision course: this is a computing unit to calculate the course of the missile in relation to that of its

target so that its flight is continuously adjusted and corrected.

In the "passive" systems, this complicated process of computing takes place outside the missile. If it is launched from the ground, one radar set keeps continuous track of the target; another watches the missile. The collision course is worked out on the ground and radioed up to the missile. In other passive systems, the missile uses the radar beam on the target as a guiding line.

The same kind of "passive" homing can be used for air-to-air missiles, but an aircraft cannot send out such strong guiding signals to its weapon as a ground station can. Where the fighter gains is in its ability to come close enough to the target before launching to improve considerably the missile's chances of locking on to its victim.

It is much more difficult to set a missile on a mission against a target such as a city that does not move. The same kind of sensing devices can be used—heat is particularly effective—and a navigational course can be plotted for the missile. But here the designer runs up against three physical problems. First, it seems doubtful whether at present scientists can protect the atomic warhead from damage during flight at rocket speeds over long distances. Second, the vast weight of fuel needed to give a rocket the same kind of range as today's manned bombers makes a long-range rocket so huge that its introduction may have to wait for an improvement in the specific consumption of rocket motors. The third problem is one of navigation. The world's maps are not accurate enough and it may be difficult to set the course of a long-range missile with any hope of reasonable aim. It is only a matter of time before these physical

problems are overcome; ranges of up to 1,000 miles are expected within 20 years.

In the ultimate future, scientists believe it will be possible to use the same methods that missiles now employ to find their targets, to seek out and destroy the missile itself in flight. Until then, the only real defence against missile attack, either on raiding aircraft or on land targets, is to throw their sensing mechanisms off the scent. A missile homing on heat or infra-red radiation can be diverted from its target if a new, stronger source of heat is shot into the range of its scanners. Radio signals between ground station and missile can throw the weapon off its course, so can interference to the radar beam on which it is homing. Then the designer resorts to counter "counter-measures" and builds into his missile a system of rapidly changing codes and wavelengths so that the signals cannot be interrupted and the missile keeps to its destructive trajectory. Counter-measures, once a game, are one of the most important features of robot war.

Active homing

Passive homing

THE ECONOMIST, FEBRUARY 26, 1955

must be equipped with guided missiles, and no fighter is likely to be designed today with any other armament. Missiles are dependent on progress in electronics, and this has been somewhat slower than the progress made in nuclear weapons. Some experimental air-to-air guided weapons may come into service in Britain next year, just as a selection of experimental but not very effective missiles are in service in the United States, but the first really efficient designs will not be delivered to the RAF before 1957 at the earliest. Ground-to-air missiles are not likely much before the 1960s. While their effect on tactics is likely to be considerable, they can only partially offset the present overwhelming superiority of the bomber. And as the design of missiles improves, a new threat appears in the form of the ballistic rocket. At present its range is limited for reasons given below; atomic missiles seem restricted to about 20 miles, but other types with ranges of about 400 to 500 miles do exist and against them there is no known defence of any kind. Long-range atomic missiles of 1,000 miles or so are not expected to appear in numbers until the 1970s, but the White Paper plainly regards their introduction as inevitable.

The unconventional armaments, the nuclear weapons and the guided missiles, have developed faster than methods can be evolved for using them. The one clear line of theory that has been evolved in the new strategy is that of the deterrent, the overriding importance of maintaining a nuclear stockpile and the aircraft and other weapons capable of delivering it at points of maximum vulnerability. The clarity of this argument, and the uncertainty about so many other aspects of the "unconventional" strategy, tend to obscure one most important trend: that it is only a matter of time before today's unconventional weapons are tomorrow's conventional armaments. At some time, both from reasons of effectiveness and cost, all ground forces will have atomic artillery—and not only those in Western

The Conventional Armament

THE discharge of our many overseas commitments in cold war must continue to absorb a large share of the resources which we can make available for defence." All three services are involved—even in policing operations the RAF may be called in.

Lessening the Strain on the Army

In some respects, the thermo-nuclear bomb has simplified the problem of making the army into a dual purpose force, able to deal with hot and cold war. The tactical nuclear weapon means that armies must be dispersed, highly mobile, free of undue dependence on roads, able to operate in self-contained units of the minimum effective size—which is certainly less than that of the reduced size of a British division. This, however, is also approximately what is wanted in most of the cold-war terrain. It is certainly the requirement in Malaya and it was so in Indo-China. The army's tactical problem is to design a force large enough to be effective, and mobile enough to be able to concentrate rapidly for attack, and to disperse as rapidly if threatened with nuclear bombardment.

No less plainly, nuclear tactics require that dispersal must be the characteristic of the "infrastructure" in Europe.

Germany—while homing missiles of all kinds will be the basic equipment of the RAF. It may seem that the more effective the deterrent becomes in Europe, the greater the probability of the kind of local "hot" war that was fought in Korea. But, though atomic weapons were withheld in Korea, armies of the future may find it impossible to fight an engagement of this kind without using some of their atomic armoury and there are doubts about whether a nation in the face of defeat would hold back from using the largest and most terrible striking force at its disposal—the thermo-nuclear bombs. A dividing line can be drawn today between conventional and unconventional operations, but it is important to a clear understanding of the problems of Britain's defence to remember that this will not always be so, and to draw the grim deductions therefrom.

In about four years' time an "unconventional" Navy will take to sea; its outlines are those of a floating counterpart to Bomber Command. This new approach, explained in more detail in a later section, is the result of two technical advances in carrier design, the combined use of the angled deck with mirror landing aids. They have lifted the most severe of the limitations on the size and power of the aircraft that could be launched from carriers' decks, and greatly reduced the gap between the weight and range of attack that could be mounted from land-based airfields and from carriers. If the Navy can, in fact, strike as far and as hard into enemy territory as Bomber Command (and this depends on the performance of strike aircraft still undeveloped) then the carriers can exploit routes that take their bombers over the least defended territories. This is the plan that lies behind the new investment in high-powered fighters and missile ships. Both are needed to defend the attacking carriers; the fighters for distant interception, the missiles for those aircraft that break through the fighter ring.

Obvious targets must be avoided; everything must be stored in dispersed dumps. "Pipelines"—convoys on roads, build ups in railway yards—invite paralysing blows. The long tails of divisions as at present organised must be cut down or right off. The army, besides air support and communications needs its air supply lift. Independence of elaborate supply trains involves simpler and fewer weapons—certainly less artillery, other than anti-aircraft guns. (At present British formations in Europe are covered by US atomic cannon.) The White Paper, however, offers little promise of this streamlining. The list of new equipment is rather meagre.

The requirements of the army in the field are, on the broader canvas, the requirements of the army as a whole. The previous White Paper had to report that the army was fully stretched in meeting the commitments set by international and colonial demands. There was no strategic reserve at home; the portion of the army that was stationed in Britain was engaged in training national service men. Abroad, where the army was not engaged in operations it was tied down in garrison duties which were far from good for morale or the attractions of an army career. The rigidities of this situation have been lessened by the withdrawal from Suez and Trieste, and reduction of troops in Korea.

It will again be possible to reconstitute the strategic reserve in this country—which ought to be instantly ready for service and transport anywhere by air. But regular strength is expected to fall from 114,700 on April 1, 1955, to 108,400 on April 1, 1956—mostly of course as the result of men with three-year engagements becoming due for release.

Unfortunately, the White Paper is as reticent about plans for improving the inter-continental mobility of the army as it is about the plans to "streamline" it in the field. At present the army's airlift is based on Transport Command and long-term contracts with commercial charter companies. The encouragement to the companies to provide a reserve of trooping capacity is vital, but the time is approaching when the question of supply and control will have to be considered. Indeed, when missiles and ballistic rockets take over from Bomber Command, military aircraft will be entirely concerned with the army and should logically be unified with it. Meanwhile, a point of some importance is that it may well become necessary to equip an airborne army to land where there are no elaborate bases, and perhaps in the face of opposition. British bases throughout the world are dwindling. Streamlining on the ground and reinforcing in the air are twin keys to the better use of a smaller army.

But how small can the army be allowed to get? Thermo-nuclear warfare clearly reduces the need for huge trained

reserves. A large regular army would certainly reduce the need for national service men. But it is impossible to have a large regular army unless the country is prepared to pay the market rate for it. What that rate is, nobody knows; but indications are that the increases in pay introduced in April,

THE ECONOMIST, FEBRUARY 26, 1955

1954, have not reached it. Servicemen do not put forward organised demands for better pay, but they can elect to leave the army for occupations which do. An inquiry should be made to find out what are the true inducements to hold 180,000 men to the colours; and it is up to those who want national service cut not to cavil at the bill. Meanwhile, the White Paper is right to argue that any appreciable reduction in national service would reduce the army to a size at which it could not meet its commitments.

The length of the period of national service, however, is not simply a matter of the size of the army. It is a matter of trained men. If it takes a full year to train a man, then to cut the call-up by six months is to cut the size of the national service element in the army not by a quarter but by a half. Both hot- and cold-war deterrents will be weakened if the army is too obviously unable to meet a big new overseas commitment which might come any time.

What Sort of Tactical Air Force?

The great part of the RAF's resources have been diverted to meet the threat of all-out hot war, a thermo-nuclear conflagration. This, clearly, is according to priority, but it is fair to ask whether the build up of the RAF's striking and defensive power at home has not been allowed to drain away too much for its ability to play an effective part in conventional non-nuclear operations. Its atomic bombers can carry an effective load of ordinary high explosive and indeed a good deal of development work has been done on conventional bomb design since the war. They are, to that extent, dual purpose carriers but are never likely to be built in numbers large enough to provide much of a striking power in terms of high explosive, nor indeed would it be right if they were. But there is less justification for the policy of cutting down RAF fighter strength outside Western Europe to the status of token forces.

The White Paper draws a distinction between the RAF's role in the hot war and its contribution to the policing operations in Kenya and the Far East but carefully avoids any direct reference to the type of operations that were met in Korea, where the most modern marks of conventional equipment were brought into action. If this kind of operation were to start up again, the RAF could use its Hunter fighters to good effect but the evidence suggests that very few will be sent to the danger centres outside Europe, even though those are the points at which these conventional local wars are most likely to break out. This deliberate limitation on the numbers of modern fighters allotted to the RAF's overseas commands reduces the amount of air cover that can be offered to the ground troops in those areas, and shortage of aircraft suggests that little in the way of close support from ground-attack aircraft is likely either.

There is no question here of waiting for the development of suitable aircraft; the performances required are less exacting than they are for nuclear warfare. But since the aircraft themselves are costly—a Hunter costs about £70,000—and the priority given to this type of operation apparently low, the necessary funds appear to have been withheld. The fighting in Korea drove home the importance of full air cover; the RAF's state of unpreparedness in regions that many consider to be the storm centres of the next few years is almost an open invitation to aggression.

In operations of this kind, numbers count; in aircraft as well as men on the ground. It will soon be as "uneconomic" to use a hot-war fighter for conventional operations as it is

THE ECONOMIST, FEBRUARY 26, 1955

Oxygen brings new ideas to Life

For rocket propulsion, atomic power and nearly every other forward-looking project in the land, the British Oxygen Company supplies gases and helps to promote development.

**BRITISH OXYGEN
COMPANY LIMITED**

BRIDGEWATER HOUSE, ST. JAMES'S, LONDON, S.W.1

The constant problems of defence, the demands of industry and the immediate pleasures of life—all are served by the Cossor Group of Companies. Phenomenal progress was made during the Second World War in the development and manufacture of an infinite variety of radio communications and radiolocation equipment. Cossor's huge output during those dark days included air-navigation devices for the R.A.F. and U.S.A.A.F., electronic gunlaying units and a great range of receiving and transmitting equipment down to the tiny automatic S.O.S. transmitter carried by aircrews.

Today, in these years of watchful prosperity, the Cossor Group brings its exceptional experience and technical skill to the peaceful expansion of defence and civil radar, industrial electronics, domestic radio and television.

to use an atom bomber. This is, perhaps, the strongest practical case for the adoption of a "light" fighter by the RAF; a cheap, high performance of aircraft of the kind that Nato may be forced to adopt for reasons of economy.

Navy on the Offensive

If it were true, as the White Paper says, that "in a major war, the task of the Navy would be to secure the sea communications without which we cannot for long survive," it would be clear from the order of priorities that when more money is needed for the deterrent, it ought to come from the Navy's vote. But in fact the White Paper shows signs that the newer school of naval thought is gaining ground. For elsewhere a very different doctrine is set forth:

The Navy makes its contribution of heavy carriers to the allied striking fleet whose great mobility and offensive power, to be augmented by guided missiles and by other modern equipment which is under development, will add powerfully to our ability to hit the enemy either independently or in support of allied land forces and land-based forces.

In another place the White Paper observes that experiments have been successfully made to equip carriers to take aircraft carrying the atomic bomb. If it is possible for the Navy to get the RAF to commit the bombs along with the bombers to the fleet carriers, then the Navy will be what naval men think it should be—a first priority, because a part of the deterrent against hot war. For it will provide moving air bases which can retaliate against the enemy from an unforeseen direction through weak points in the defences.

In the cold war, the carrier has the greatest importance. Around the periphery of the Sino-Soviet land-mass, which is where limited wars may be started, the carrier can give to land forces support the RAF will be in no condition to provide. Control of these seas is, in fact, the main counter-balancing force to overwhelming Chinese manpower and growing technical resources. It thus is of great importance in influencing Japan and the East Indian archipelago. While cruisers may be useful along coasts, and for dealing with trouble on colonial seaboard in the traditional "send a cruiser" manner, only the carrier can reach inland with its aircraft. The De Havilland 110 and the Supermarine fighter (which now seems to be classified as the N.113) will have

a fire power equal to anything in the RAF. This is an asset unknown in battleship days, and one to be exploited and weighed against arguments that the high cost of carriers had better be put into the strategic air force.

Apart from the carriers the Navy's long "make-do and mend" with its ships continues. The new generation of ships, which has been promised, is not yet ready. The last three cruisers with guns are now being completed, but otherwise the Navy's modern ships are all small—ships built when the Navy's job was seen as essentially convoying and mine-clearing. It is not an easy decision to divert resources from the nation's traditional insurance against starvation when, as the White Paper says, "The vast conventional forces controlled by the Communist world include a large and growing Navy." But in any hot war it must be presumed that Soviet sea forces could be a nuisance only as long as their supplies held out for an initial sortie; Britain's possession of nuclear weapons would mean that they would have no depots to refit at. The task of dealing with them, and with cold-war naval problems, is one shared with the preponderant American Navy. For this reason, the decision to continue building so many small ships, announced in the Navy estimate this week, indicates the time-lag between strategic thinking and programme planning. The costly decision to refit the battleship *Vanguard* is inexplicable. Its place is in the reserve fleet.

Moreover, when the new generation of missile ships comes along, the situation will improve. It is evident, however, that the missiles are not going to be ready for a long time, and the first experimental ship will only be ready by 1956; in the meantime the Navy's answer to *Sverdlovs* must be carrier-based aircraft—some of which are missile carriers. Other sea-air counter-measures are being worked out to Soviet submarines, themselves designed for a sea situation which is changing out of recognition.

But, as in the other services, much is on paper still, and meanwhile keeping up a sea tradition in obsolete ships is hard. At least the Navy has been given a vital role, by implication if not outright. This should help recruiting; but the problem of making the Navy a career in a world in which there is an easier way of making a living than on shipboard will have to be seriously faced by the Chief of Naval Staff, Admiral Lord Mountbatten.

Total Civil Defence?

CIVIL Defence should be high on the order of priorities because, without a clear demonstration of plans to survive somehow despite thermo-nuclear devastation, the Soviet will never take really seriously the stated intention to use the H-bomb itself if defined limits are transgressed. For the deterrent to be effective, we must show that we are not unprepared to use it. But the history of Civil Defence has been unhappy—indeed to Soviet eyes it must have seemed a sign of infirmity of purpose, and an indication of a fear to face the facts, which might be turned to account at the right moment. That way lies danger.

There is thus much leeway to be made up. A complete air of unreality has hitherto pervaded the Home Office's efforts, because to the public they looked so absurdly inadequate to the problem. What has never been made brutally clear to the public at large is that the heavy casualties certain among

civilians and Civil Defence units does not obviate the need for the survivors to deal with the situation as they find it, stirrup pumps and all, and to be organised to do so; just as a regiment takes over the front of a decimated regiment in war, fighting with whatever it has got. The White Paper is rather more realistic in its forecasts and plans, but to say "public morale would be most severely tested" is a triumph of understatement. The trouble is that the public still have no real idea what lies behind a statement like "it would be a struggle for survival of the grimmest kind." There is no human precedent; but mix the Lisbon earthquake with the Black Death and the Bengal famine in equal parts and history, though no guide, may give some idea of the steadiness of nerve demanded.

The White Paper admits that it does not yet know the full danger to be expected from "fall-out"—information that

TRANSPORT FOR HEAVY INDUSTRY

THORNYCROFT 'BIG BEN'

Thornycroft "BIG BEN" heavy duty vehicles with the latest Thornycroft 11-33 litre 155 b.h.p. diesel engine are now in full production.

Range includes dump trucks and other types of load carriers, and tractor-trailer combinations for movement of machinery and heavy indivisible loads up to 56,000 lbs. in weight.

The Thornycroft range includes medium and heavy load chassis suitable for Service and Commercial applications up to gross laden weight of 224,000 lbs. or even greater under certain conditions.

JOHN I. THORNYCROFT & CO., LIMITED, THORNYCROFT HOUSE, LONDON, S.W.1, ENGLAND.

may come to hand when the British H-bomb is tested somewhere (where?). Until it does, "it would be unwise to embark on measures which may later prove to be misdirected." But some things are clear enough. It is clear that the whole country would be affected, and liable to damage, the farmer little less than the townsman; and therefore the central rule must be for those who are unfit to help the survivors of demolished areas—cities, towns or countryside. Therefore Civil Defence is everywhere, not just on the edge of towns. It is clear that the problem of law and order would be great, and that martial law would have to be the law of the land for a considerable time. It is clear that in view of the risk that central government might be wiped out (however dispersed) regional commands must be expected to run the country for as long as might be needed. And for that purpose, much more unification of command within regions will be necessary.

* Does not include population outside thirteen main towns.

The Government, in the White Paper, has made some sensible decisions—such as to give all regular, reserve and Territorial Army forces a training in Civil Defence. It seems certain that this will be the major role of the Territorials, though this is not stated—perhaps for fear of undermining morale. It is true that after hydrogen bomb attack a parachute landing cannot be ruled out. The modest expansion of mobile defence to 48 reserve battalions is a sound start—provided they are ready for instant action and trained to move without orders on the noise of an explosion. But there are different organisations for all the Civil Defence services—the Civil Defence Force, the Industrial Civil Defence Service, the Auxiliary Fire Service, the Women's Service and the Hospital Service—and the police. It is clear that these must be brought under some unified command: perhaps a territorial divisional commander with the commanders of each service under him. This would probably be unwelcome to many local government authorities, who are vitally concerned and will have to be driven, if not led, to play their part. The time may be coming for the appointment of a Commander in Chief, Home Defence.

It will not be enough to have a cadre of people trained in Civil Defence, however large. The prospect of bombs that will contaminate in varying degrees areas of 5,000 square miles makes it important that the whole population should have some basic understanding of what to do in emergency. The obvious instrument for such indoctrination is to hand in television. Great political courage would be needed, however, to meet the first opposition to its use.

Thinking about Civil Defence, moreover, seems to go

little beyond the first impact. The struggle for survival would follow, and would succeed in proportion as arrangements had been made beforehand. Heavy losses in stocks and capital equipment cannot be avoided. The problem of dispersed stocks of food, oil and other necessities has not yet been faced, because the cost of providing storage is intimidating. A heavy and successful attack would leave only a skeleton of industrial capacity standing—but even this would have to have stocks to draw on; and strategic stocks are not necessarily rightly located. Plainly Britain could not set up standby plant dispersed all over the country, but some provision for stocks of mobile power and lighting plant, simple machine tools and so forth cannot be waved aside as unthinkable. The White Paper rightly points out that communications must be kept going, and standby facilities are to be built by the Post Office. The major ports are highly vulnerable, and the small-port survey was a necessary task—but the vital capital improvements have yet to be made. These must include offloading into lighters by ships for which no berthing is left.

Hitherto, the allocation for Civil Defence has been heavily underspent, as the result of the apathy or illwill of local authorities. It may be easier to ensure that the civil departments spent the £70 million allotted to them (of which £23 million goes to the Ministry of Food and £13 million to the Post Office). But in terms of any realistic preparations for the aftermath of hydrogen bomb attack, these sums mean little. They leave the country vertibrate and smashable, whereas it must have the survival ability of a worm cut in sections. It is a pity the comparison has to be with lowly forms of life, but hydrogen war would quickly level down elaborate social and technical structures in any case. An H-bomb would not have smashed feudal Britain, whatever other results it produced. The question here is how far a democracy in pursuit of an ever higher, ever gaudier standard of living is prepared to think out the grim realities of a possible total reversal of its fortunes, to cost up the measures logically needed to improve the survivors' chances of rebuilding the nation, and to foot the bill—in hope that the far bigger bill will not have to be paid.

MUST WE BE HEROES?

And fight the Fire Fiend without NU-SWIFT? But why? Even the Royal Navy don't do that. Please send us details of your wonderfully rapid and reliable Fire Extinguishers—BEFORE IT IS TOO LATE!

LARGEST MANUFACTURERS OF V-BELT DRIVES IN THE COMMONWEALTH

1883-1955

'ENGLISH ELECTRIC' applies 72 years

of continuous traction experience to the design
and manufacture, *in its own works*, of both electric and
diesel-electric locomotives for the world

76 RAILWAY SYSTEMS SUPPLIED... NINE COMPLETE ELECTRIFICATIONS

The ENGLISH ELECTRIC Company is unique among British manufacturers of electric and diesel-electric locomotives and equipment for railway electrification. It is the only one with facilities for designing and building in its own works both types of locomotive, complete with their power equipment. Thus ENGLISH ELECTRIC is fully equipped to play an important part in implementing the Transport Commission's re-equipment plan.

Since the early days of electric and diesel-electric railway traction, ENGLISH ELECTRIC has been a pioneer. 72 years ago, when the Giant's Causeway Railway in Ireland became the first hydro-electrically powered railway in the world, the equipment was supplied by Siemens Bros., whose Stafford works have long been one of ENGLISH ELECTRIC's most important factories.

In 1899, the Preston works, then owned by Dick, Kerr & Co. and today one of the greatest traction factories in the world, made the electric coaches for the Waterloo & City Railway in London—re-equipped in 1940, after 41 years' service, with ENGLISH ELECTRIC coaches. The same works in 1904 electrified the Liverpool-Southport railway, and in 1912 carried out the world's first high-voltage (3,600 volt) direct current electrification. Since 1936 ENGLISH ELECTRIC has equipped over 1,000 of the electric driving coaches on British Railways' Southern Region—the most intensive electric suburban service in the world.

In diesel-electric traction, the pioneer work begun on diesel engines in 1904 by Willans & Robinson Ltd. at the Com-

pany's Rugby Works laid the foundation for ENGLISH ELECTRIC developments. The first main-line diesel-electric locomotives to enter service in Britain, Australia and New Zealand were all powered by ENGLISH ELECTRIC.

ENGLISH ELECTRIC has long appreciated the world trend towards the efficiency and economy of electric and diesel-electric traction, and has been a vigorous and competitive world-supplier of such equipment, often pioneering new applications.

In this way ENGLISH ELECTRIC has gained wide experience of varied design requirements, and has constantly expanded its production resources. Today, it has facilities for building complete diesel-electric locomotives, up to 2,000 h.p. Such powerful locomotives, as well as diesel-electric trains, railcars and shunting engines, are proving their value on railways in 18 countries.

ENGLISH ELECTRIC experience of electric traction at home and overseas includes the provision of locomotives up to 3,600 h.p. and of electric rolling stock, equipment for power stations and substations, switchgear, fusegear and rectifiers for complete railway electrification schemes.

With its roots in the earliest days of electric and diesel-electric railway traction, and with such wide experience and efficient production resources enabling the Company to carry out a complete job, ENGLISH ELECTRIC is finely placed to play a full part in the renaissance of Britain's railways that is now in sight.

'ENGLISH ELECTRIC'
bringing you better **TRANSPORT**

ENGLISH ELECTRIC HAS BUILT RAIL AND ROAD TRACTION EQUIPMENT FOR MOST OF THE PRINCIPAL COUNTRIES OF THE WORLD, INCLUDING: AMERICA, EGYPTIAN SUDAN, ARGENTINA, AUSTRALIA AND TASMANIA, BRAZIL, CANADA, CEYLON, DENMARK, EGYPT, FRANCE, GOLD COAST, GREAT BRITAIN, HOLLAND, INDIA, JAPAN, MALAYA, MOROCCO, NEW ZEALAND, NIGERIA, POLAND, RHODESIA, RUSSIA, SOUTH AFRICA, SPAIN, SWEDEN, URUGUAY, VENEZUELA.

Electric Traction...

... best meets the needs of systems where power is available at low cost and where the density of traffic justifies the capital investment in fixed installations. The areas and lines recommended by the Transport Commission for earliest electrification are those whose density of passenger traffic, as in the suburban areas, or of freight traffic, as in the main trunk lines, make it particularly desirable.

ENGLISH ELECTRIC has supplied
electric railway equipment to
53 railway systems in 16 countries

Diesel-electric Traction...

... represents the application of the most efficient practicable heat engine to a locomotive; transmission of power to the wheels by electrical means is accepted as the most generally successful. The diesel-electric locomotive has great advantages owing to its full-power output over a wide range of speeds. This makes it particularly suitable for freight and yard work and for many of the main-line passenger and goods services in this country.

ENGLISH ELECTRIC has supplied
diesel-electric railway equipment to
29 railway systems in 18 countries

The English Electric Company Limited

THE BUSINESS WORLD

The Bank's Big Stick

THE sixth sense of stock markets seems to have worked after all, if a little belatedly. In the seven business days to the close of dealings on Tuesday last, industrial equities took their worst tumble since the dark days of 1951-52, carrying the ordinary share index of the *Financial Times* down by over 17 points or 9 per cent. One of the major causes of this dramatic break in the boom was a growing conviction that, since the end-January increase in Bank rate had so obviously failed in its purpose, tougher measures would be needed and would in fact be applied. In the event, the new plan—made known by the Bank of England on Thursday morning and by the Chancellor in Parliament in the afternoon—proves to be even tougher and more far-reaching than the market had expected. Bank rate has been raised by a further 1 per cent, to 4½ per cent, its highest level since the crisis of 1931. The Exchange Equalisation Account is for the first time to take cognisance of the dealings in transferable sterling at unofficial rates, and has begun to intervene in the markets in support of those rates. And legal and financial controls are to be reimposed upon hire purchase.

It is easy to see why stronger corrective measures were needed and also why they took this particular form—though that is not to say that it is the best form. The extent of the pressures that led to the warning increase in Bank rate by ½ per cent at end-January has since become much more apparent. In these few weeks, as *The Economist* pointed out in its opening article last week, it has been realised that the surplus on the external balance of payments, which looked so substantial in the first half of last year, has now disappeared. Yet Britain faces this year a further external strain from the worsening of the terms of trade and from

the lag of exports behind rising imports that will continue unless the voracious demands of the domestic economy can be curbed. It had been hoped at first that the warning signal of four weeks ago might have been sufficient to induce a little restraint. But it did nothing to relieve the pressure upon sterling, nor was there any sign either in stock markets or in the economy in general that the mood of over-confidence had been shaken in the slightest degree. The boom in equities and in consumption spending, aided by hire purchase, went merrily on. Moreover, the strains upon the gold reserves were being aggravated by the fact that the rate for transferable sterling had been forced sharply below the quotation in the official London market, so that "shunting" operations had begun to take a serious toll.

There seemed to many people to be only two ways by which the problem in the exchange market could be tackled—by plucking up courage and making non-resident sterling formally convertible, so that the differential rate disappeared, or by lame attempts to make the paradoxical system work by new controls upon the exchanges and upon the newly-freed commodity markets. To its credit, the Government seems to have rejected this second course, and to have found instead a rather ingenious compromise that lies much nearer to the first alternative than to the second. Ever since the widening of the market for transferable sterling and the reopening of commodity markets, virtually all non-resident sterling had become convertible in practice—but at a discount and in the unofficial market. Now the authorities, by deciding to intervene in support of the

transferable rate, are in effect reinforcing this convertibility. They are evidently aiming at keeping the discount within such narrow limits as will ensure that it does little if any damage. By this means they may hope to squeeze the speculators in this market and thereby bring it more readily under control.

But if the transferable market was to be thus supported, the authorities dared not run the risk that it would become a larger and more direct drain upon the gold and dollar reserves. The basic prescription required for achieving a due equilibrium in the exchange market was, and must always be, precisely the same as that required for keeping the domestic economy from putting excessive pressure upon the balance of payments. The indispensable requirement is a check to over-confidence and due restraint upon the level of domestic demand. That is the task of domestic monetary policy, and the authorities seem determined at last to use their monetary weapons forthrightly.

★

The weakness of the Bank rate move of end-January was not simply that it was by $\frac{1}{2}$ per cent only, but that it was not supported in the orthodox way by intervention by the Bank of England in the market. Not until last Saturday did the Bank make any decisive move in this direction. Then, and for the following three business days, it kept the money market on so taut a rein that it was obliged to seek seven-day loans at Bank rate—for steadily increasing amounts. These firmer tactics would have enforced a sharp rise in Treasury bill rates at yesterday's tender even in the absence of a further increase in Bank rate, and they might in the end have had some effects upon the psychology of the markets and the banks.

Especially in view of these preliminary tactics, Thursday's rise in Bank rate by a full 1 per cent came as a severe jolt to a market already bewildered and yet already impressed by the fact that the Bank was no longer viewing Bank rate in isolation, but was prepared to intervene in support of it. Its effects should therefore be the more salutary—for $4\frac{1}{2}$ per cent is a strong

rate by any standards and if it is to be backed up by "open market" action it will undoubtedly be a very potent force. The clearing banks have duly responded by raising their maximum deposit allowances and their minimum charge for short loans to the money market by a full 1 per cent, so that on seven-day deposits they are now allowing $2\frac{1}{2}$ per cent, and the minimum rate for short loans to the money market is $2\frac{3}{4}$ per cent—with higher rates to be charged for a portion of the basic money supply and for overnight loans as market conditions dictate. Charges for bank advances will become higher than they have been for many years, ranging from 5 per cent for a select band of exceptionally strong borrowers to beyond 6 per cent. On the security markets, Bank rate has fallen with heavy weight. The *Financial Times* indices of fixed interest and government securities fell by about three points on Thursday. The ordinary share index dropped like a plummet by seven points, from 184.0 to 177.0.

In the circumstances it is the more regrettable that the authorities should have taken a backward step by deciding to reimpose controls over hire purchase, neglecting the argument that excessive demands generated by hire purchase (there is no tenable evidence that they have become excessive in relation to spending as a whole) correct themselves through the mechanism of the market. Instead they have imposed new controls on hire purchase terms for cars, radio and television, furniture and a wide range of other consumer goods. These are of the familiar kind discarded last year, and impose a 15 per cent down-payment on all goods covered by the order, with repayment in two years, except for washing machines, cookers and water heaters which can run for four years. These restrictions are more lenient than the old ones, but they include furniture which was not under control last summer. Moreover, the Government propose to take permanent powers for these purposes, and meanwhile the Capital Issues Committee and the banks are to adopt "a more restrictive attitude" towards hire purchase finance. It is a pity that in this field the Government is not prepared to let economic forces do their work, but has imposed a new list of restraints of the old type.

What Price Oil?

A GREAT deal of excitement has been worked up about the report that the Economic Commission for Europe has been preparing on the price of oil in Western Europe. There have been headlines about "suppression"; and, indeed, it seems to be true that one or two of the American oil companies that are concerned in the European market have put to the Secretary of the United Nations the kind of interlocutories that a report of this kind usually attracts. Perusal of the draft report does not suggest much ground for complaint and certainly no justification for seeking to gag a report that seems to be a workmanlike and not unsympathetic study of the problems and strains in oil pricing.

Some part of the ground of the ECE report had been covered more than two years before by a staff report of the Federal Trade Commission in Washington. That was frankly a pejorative report, intended as an indictment of what it described as "the International Petroleum Cartel," and it formed the ground work for criminal proceedings in Washington against the major international groups. But it did contain a chapter, of great complication but of rather lower temperature, on price determination in the international petroleum industry, which analysed in detail the use by the oil industry of basing-point systems for crude oil and refined petroleum products.

"The existing price structure," concluded this chapter, "is still highly profitable to the small number of major international oil companies that dominate world production. . . . American companies operating in the Middle East have made substantial net profits on their combined producing, refining and marketing operations . . . under a system of pricing that

(1) bases delivered prices throughout the world on the relatively high United States costs, notwithstanding the fact that this country had become a net importer of petroleum;

(2) uses schedules of uniform freight charges that may not have any real relationship to transportation costs actually incurred, especially by the major companies that own or control the bulk of the world's tanker facilities;

(3) is supported and maintained by effort on the part of the major international companies to adjust production to world demand. Joint ownership and private agreements in foreign countries and the conservation movement in the United States all facilitate these efforts."

None of these contentions necessarily damned the oil industry. The industry's critics fasten on several facts: high profits, though these are not necessarily a relevant test of wrong-doing; bigness and integrated operation from getting crude oil through the shipping, refining

and marketing of the final products, though these are inherent in the technology of the industry and the economic risks it shoulders; a certain care that the world should not be glutted with oil, though it is kept well provided. If this situation seems to some outsiders to be non-competitive, or to argue the existence of a cartel, or to exploit the consumer (who in Western Europe's markets does not fail to notice that when one of the major companies turns, they all turn), that is not exactly the picture as it presents itself to the companies themselves. They see themselves in a struggle for markets, partners perhaps in some operations in the Middle East, and almost bitter enemies in markets elsewhere. They see themselves, too, as carrying responsibilities towards their host governments in the Middle East, to whom a fifty per cent interest in "profits," however defined, bears the implication that "profits" are expected to rise.

This is the background to the study that ECE have been carrying out. No one has ever pretended that these are perfect competitive arrangements; there are few such arrangements in any of the industries serving Western Europe, and neither are they to be found everywhere in American industry. The oil industry would be relieved in many ways if some other pricing mechanism could be evolved that would spare them from the charge that the present system keeps the prices of Middle East oil higher than they should be in relation to the low cost at which it is produced. ECE's study is relevant largely because Western Europe has come to depend almost exclusively on imports of Middle East crude which it refines for itself. These countries imported 80½ million tons of crude in 1953, compared with 11 million tons in 1937; of those 11 million tons, less than 4½ million came from the Middle East, but by 1952, imports of Middle East crude into Western Europe had reached 65 million tons.

The essence of the argument, therefore, is whether prices have reflected such a major change in the structure of the industry and the sources of its supplies. If Europe is no longer tied physically to western hemisphere oil, where is the logic of maintaining a price mechanism that is bound to western hemisphere markets (which, within their limits, are genuine markets) rather than to the costs of getting, carrying and refining Middle East crude? Throughout its history, as the ECE report points out, the f.o.b. price of Middle East crude oil has been closely linked, though in a way which has changed with time, to that of crude oil in the United States. The doctrine has been that there is a homogeneous market for oil, and that a single structure of prices should conform to the conditions of demand and supply at any given time. But since transport costs are heavy, there will be a frontier or watershed of competition between two pro-

ducing centres, corresponding to the freight costs, and these freight differentials will determine the f.o.b. price (or "netback") that Middle East crude can fetch in individual markets. The given datum in this calculation is the delivered price of Texas Gulf crude; it is from that datum that Middle East prices are inferred, on the assumption of "a unified and normally competitive world market."

The result, as the ECE report makes clear, is that large and persistent disparities have come to exist between the costs and profit margins of the oil industries in the United States and in other crude oil producing centres. The report examines in some detail the trends of productivity and costs. Bahrain crude is said to have cost 10 cents a barrel in 1945, whereas average costs in the United States in 1941 were 76 cents a barrel. Or, taking Aramco's payments under its agreement with Saudi Arabia in 1952 at \$212 million, "net profits must have been in the neighbourhood of \$425 million, on a total production in that year of 300 million barrels. In other words, with crude oil selling at \$1.75 per barrel, a net profit in the neighbourhood of \$1.40 per barrel was being earned."

★

All this may be true, but ECE go on to recognise that, in conditions of effective competition, a small surplus of supplies would drive the price of oil to very low levels. "Crude oil is, in fact, an important example of the well-known theorem that industries enjoying increasing returns will, if composed of a large number of autonomous producers, operate at a loss." And hence the producers have been driven towards a pricing system and output programmes that are not determined exclusively by relative costs. In the United States, "conservation" and "pro-rating" have been developed, and the doctrine that imported oil should "supplement but not supplant" domestic oil is buttressed by the tariff of 10½ cents a barrel of crude, and much more on refined products. Hence the report's broad conclusion on the price of Middle East crude:

So long as the eastern hemisphere was dependent on the western for supplies of crude oil, consumers in the eastern hemisphere would expect to exercise little weight in determining the price which they paid, and this would depend on the price in the United States. . . . Now, the eastern hemisphere is self sufficient in crude oil and, indeed, is exporting to the United States. Given, moreover, the narrow limits assigned to this flow, it is clear that the continued dependence of Middle East prices on United States prices cannot be explained in terms of underlying conditions of supply and demand. . . . If this link were severed, the price charged on sales to European countries by the Middle East could be significantly lowered without adverse effects on the further development of its crude oil production.

Next, ECE turn their attention to the prices of refined products in Western Europe. They find that these prices tend to be equal to the price at which refined

products could be delivered from the Caribbean (except in the Eastern Mediterranean, which is linked to the Persian Gulf). There are no published ex-refinery prices, and there is always room for argument about the "right" cost of transport, but in bunker oil and gasoline, the ECE study finds, there has been a fair degree of correspondence with import parities. This means that prices depend on geography rather than domestic refinery costs, and also on a pattern of American refining practice (with its emphasis on gasoline) which is quite different from the European pattern (with its emphasis on fuel oils).

★

"It is evident," concludes the last section of the ECE report, "that the present structure of (refined) product prices in Western Europe is inherently weak because of the incentive which it gives to refiners to move towards a pattern of output sharply different from the pattern of demand." It is doubtful, perhaps, whether the oil industry in this country, faced with an extraordinary demand for fuel oil, would be conscious of any incentive other than the task and responsibility of meeting it. But be that as it may. ECE's conclusion is still a challenge to an industry that is trying to find right and respectable answers to its economic problems:

A more rational and tenable structure of product prices in Western Europe would need to be consistent with two objectives. One is to establish a pattern of relative prices for the different products which will make most attractive commercially their production in proportions appropriate to the pattern of demand in Western Europe. . . . The second is to ensure that the pricing practices adopted are such that efficient non-integrated refiners, who cannot subsidise refining out of profits made in crude oil production, transport or distribution, can compete on equal terms with the integrated companies.

A free opportunity in refining, and price arrangements that effectively represent the interests of consumers as well as producers—these are the conclusions. They are unexceptionable; the only question is whether, and how, they will make much difference. So much of a major oil group's operations must lie beyond any rational price calculus, for integration means that it must do most things for itself and can pre-determine, within a fairly wide range of decision, what its costs should be at each stage of its operations. "Alone and unaided," says the ECE report in its conclusion, "the oil industry may find it impossible to evolve a more rational price structure or pricing mechanism." The American anti-trust laws could easily get in the way of agreement between the companies, and without agreement the final results—in terms of depressed prices, dismay and anger in the Middle East, and delay to the progress and economic benefit that oil has conferred on Western Europe—could be deplorable. There is much that is not diabolical in the present price arrangements, and they are at least the Devil that everyone knows.

Business Notes

A Bombshell Not Unwelcome

THE market was, needless to say, taken completely by surprise. A Bank rate rise of ½ per cent had been if not foreseen at least provided against; the jobbers had price lists worked out for that contingency, but nothing had been prepared for a 1 per cent rise. Obviously, a heavy further reduction in gilt-edged prices was needed, and it took place. War Loan closed 4 points lower at 80½. Other gilt-edged stocks moved in proportion. A similar downward adjustment was made in industrials. Great Universal Stores "A," which opened at 51s. 3d. closed at 46s. Peninsular and Oriental started at 63s. and closed at 58s.; ICI opened at 41s. 3d. and closed at 39s. 9d. A few gold shares rose against the trend.

The markets closed with half the story—perhaps barely half—unfolded. The Chancellor had not then spoken, and dealers knew nothing either of the revival of the hire purchase controls or of the extension of the activities of the Exchange Equalisation Account. But City people know that their first reaction must be provisional. Since more had been done to tighten money policy than anyone expected, it was permissible to hope that more than the strict minimum had been done. Therefore Thursday's prices contained an element of bear closing. But in the gilt-edged market no one pretended that he had taken the measure of the new situation. The Government broker seemed unwilling to deal before Monday, which gives the dust time to settle. Prices closed uncertainly at about the lowest of the day.

New situation it certainly is, and there remain many parts of the picture still to be painted in. It seems certain that day-to-day money will be established at 2½ per cent, and that the bank deposit rate will be 2½ per cent. Three months' bills were nominally 3½ per cent after the announcement; and jobbers may have to pay at least 3½ per cent for loans against gilt-edged. Those rates may not be the last word, but even if they are approximately right, many other rates will have to fall into line. No one will suppose that the Public Works Loan Board can continue to hold its long-term lending rate at 3½. Can the building societies stay at 4½ per cent for mortgages and 2½ per cent net on shares? The Building Societies Association has issued a statement that no immediate change is expected, but it remains to be seen how far investors will continue to provide the wider funds. It now looks more than ever quixotic for the Halifax Building Society to stick to a 4 per cent lending rate. The short-dated gilt-edged market can perhaps now hope slowly to attract some of the money that has been going on deposit to hire purchase finance houses. But the immediate reaction of investors must obviously be to demand a higher return on the money. By the afternoon some institutions had already told their brokers to do so.

Trade on a Slippery Slope

THE provisional figures of overseas trade in January, which were summarised in *The Economist* of last week, confirmed that British trade has recently fallen back on to a familiar and slippery slope. The terms of trade are moving against this country, and imports are rising while exports are marking time. The details now available appear to add another touch of gloom. They show that the ratio of import to export prices deteriorated by a further point last month to 104 (1954=100), and that the visible trade deficit has grown most sharply with the dollar area. The increase in imports between October and January, compared with the same period a year ago, came entirely from the non-sterling—particularly the dollar—area. Thanks to larger arrivals of cereals, tobacco and raw materials, imports from the dollar area rose by 28 per cent to a monthly average of £63½ million, and the trade deficit with that area was nearly twice as high at £30 million a month, and nearly half the whole deficit of £63 million a month. Trade with the OEEC area moved from balance to a deficit of £7 million a month and the deficit with the rest of the non-sterling area, at £12 million a month, was a little higher than in October/January a year ago. The deficit with the sterling area rose too—by £3 million to £14 million a month.

Yet that picture of British trade conceals a few rays of

hope. The fall in exports to dollar and other non-sterling non-OEEC countries has been checked in the last four months; shipments to the dollar area in October/January, at £32.6 million a month, were higher than a year ago, and shipments to the other countries, at £23½ million a month, were about the same as a year ago. Exports to the OEEC countries continued to rise, and the monthly average of £61.2 million in October/January was £1½ million higher

than a year ago. The fall in exports to the sterling area, which at £111.4 million a month in October/January were £3 million a month lower than a year ago, may be attributable mainly to the dock strike. And it is worth remembering that while an adverse movement in the terms of trade places Britain's balance of payments under immediate strain, it bolsters the purchasing power of Britain's customers. Britain will not benefit by that if its prices become uncompetitive, however. The danger has been that the pressure of home demand will inflate British costs and suck resources of exports; it is this that explains Thursday's radical actions to correct the recent trend of trade and payments.

Clean Ticket for London Transport

LONDON has one of the best passenger transport systems in the world and it is served by a body of workers of all grades who have a fine tradition of loyalty and public service. It is a matter for serious regret and concern that the Transport and General Workers' Union, which represents a large proportion of the staff of London Transport, was unwilling to assist, either in writing or orally, the Chambers Committee which since July, 1953, has been conducting its inquiries into London Transport's efficiency. Any layman or London passenger would conclude that efficiency and economy are closely linked with attitudes and practices of labour. If it is a fine body of men that London Transport employ, it is a great pity that they were not as vocal on questions of efficiency as they are, with seasonal regularity, when their schedules change.

The report finds that London Transport is efficiently conducted, but that it would show a marked improvement in efficiency if the Committee's recommendations were followed. Some of these are external—staggering of working hours and the alleviation of traffic congestion—and it is from these, apparently, that the major advances are to be hoped for. Surprisingly little is necessary within London Transport itself, as it seems. There are some ambiguities in London Transport's policy about unremunerative services, but its decisions in practice are "reasonable." The fare system is basically right; any increase in the number of standing bus passengers in rush hours is "undesirable"; there might be an experiment in "standee" buses on certain special routes; there should be improvements in interchange points (Victoria is mentioned, but Euston and King's Cross are almost as hideous in their lack of convenience); maintenance costs are too high, though they are being improved.

The broad impression of the report is that London requires a large standardised system, run in a completely standardised way. It may be true, though the dangers that standardisation will inhibit technical and economic adventure are only too obvious. But the missing element throughout the report is the management's handling of staff. "These agreements (between London Transport and the unions) have a long history and we suggest that they should be re-examined in consultation with the trade unions with the object of eliminating or modifying those conditions which appear to militate against the efficient operation of the undertaking." It is not, one might guess, an inviting proposition to London Transport, whose attitude is more likely to favour leaving what is (whether well or ill) alone.

THE ECONOMIST, FEBRUARY 26, 1955 Size of the Budget

IT is now clear that the above-line expenditure that the Chancellor will have to provide for in his coming budget will be shown in the accounts at approximately the same amount as was originally estimated for the year now ending, but will in fact be about the same as the amount actually spent in 1954-55, or even a little more. Total "supply" expenditure by civil departments, including the requirements of the tax collecting departments, is estimated at £2,364 million for 1955-56, after excluding the £147.5 million of expenditure by the Ministry of Supply that is included in the defence budget. The corresponding estimate made at this time last year was £2,281 million, but the estimate then included for the Ministry of Food made no allowance for the effects of the 1954 review of farm prices, from which net savings of £27.3 million were later estimated. A proper comparison therefore shows an increase of £36.5 million in the estimates for the coming year. Defence expenditure, before taking credit for American aid, is estimated at £1,537 million, compared with £1,640 million twelve months ago, but this apparent saving is mainly, and perhaps fully, a reflection of the fact that in the current year defence spending has lagged heavily behind the estimates. After bringing in £43 million of estimated "counterpart" credits from American aid (compared with £85 million estimated for 1954-55), the net defence expenditure is estimated at £1,494 million compared with £1,555 million last year. Total "supply" expenditure as shown in the budget accounts will therefore be £3,858 million, compared with £3,882 million last year (or £3,855 million after the adjustment noted above).

ESTIMATED EXPENDITURE, 1954-56 Original Estimates (£ mn.)		
	1954-55	1955-56
Total Supply Services:—		
Admiralty	367.0	347.0
War Office	561.0	484.0
Air Ministry	537.0	540.4
Ministry of Supply	151.0	147.5
" " Defence	23.9	18.3
Gross Defence expenditure	1,639.9	1,537.2
Less Counterpart aid	85.4	43.0
Net defence expenditure	1,554.5	1,494.2
Civil expenditure	2,253.6*	2,315.3
Tax collection	46.9	49.0
Total Supply Expenditure.....	3,855.0	3,858.5
Consolidated Fund Services	667.0	667.0†
Total Ordinary Expenditure.....	4,522.0	4,525.5

* Original estimates adjusted for effects of 1954 farm prices review.
† Hypothetical; official estimates not revealed until Budget day.

The estimates for the remainder of the "above-line" expenditure, that on Consolidated Fund Services, will not be known until budget day, but on the arbitrary assumption that it will be approximately the same as last year (though the steep increase in Bank rate will increase the cost of the debt service), the "above-line" budget total will be roughly £4,525 million, compared with £4,549 million first estimated last year but adjusted to £4,522 million in the budget accounts.

Steel Raises its Sights

WITHOUT making any radical changes to the plan prepared by its predecessor, the Iron and Steel Board has raised the sights of the steel industry from the revised target of 21 million tons of crude steel in 1957-8 to 22 million tons in 1958. Assuming almost no imports in 1958 and some supplies of old steel for re-processing, this would allow exports of crude steel to remain at about three million tons and home consumption to rise from 16½ million tons achieved last year to 19½ million tons. It is always difficult for the steel industry to guess its future business; its customers' own estimates of their markets can and do change fairly rapidly. The Board now expects steel consumption to rise by 4½ per cent a year between 1953 and 1958; which implies an annual growth of 5 per cent in the output of the metal-using industries. That forecast may be ambitious. Last year steel consumption rose by 3½ per cent; since the war it has grown by about 3½ per cent a year, and before 1939 it averaged 2½ per cent. But as all previous postwar assumptions have had to be revised upwards, the Board is probably wise to err on the side of optimism.

Capital investment at home, which now absorbs about 10 million tons of steel a year, is expected to rise by 5 per cent a year; the consumption of the metal goods industries supplying the home consumer to rise by nearly 10 per cent a year; and exports of metal goods to rise by 4 or 5 per cent, despite increasing competition in world markets. If still more steel is needed in 1958, the Board believes it should be possible to squeeze more out of the plants that will then be working, and the cautious assumption about imports also gives some flexibility. But pig-iron and scrap supplies may become exceedingly tight by then. Nearly all the extra ore needed for the planned increase of 35 per cent in blast furnace output will be imported. This will press heavily upon the extraction rate in Scandinavia, North and West Africa and Labrador, as well as upon shipping and port facilities. It will also require another three million tons of coke, after allowing for a further improvement in furnace efficiency, and the ovens now being built will have to use more lower-grade coking coal. Indeed, the availability of coke and de-sulphurised fuel oil after 1958—little increase is seen in the use of fuel oil up to then—will soon need serious attention.

Finding the Brass

SO far the steel industry has spent a little over £100 million on the present development programme. Future expenditure is not expected to be less than £60-70 million a year, so that with the schemes still to be approved, rather

more than £250 million will be spent in the next four years, making a total of over £350 million during the six years ending in 1958. Steel companies will be familiar faces in the new issue market, though the Realisation Agency is an additional source of finance for the companies it still owns and for some others in which it retains an obligation. Much of the future financial needs of the industry, however, must once more be provided by the Finance Corporation for Industry—as that body has always recognised. The details of development published by the board, showing which companies are increasing their capacity and by roughly how much, are required reading for present and potential investors in the industry.

DELIVERIES FROM HOME OUTPUT
(‘000 tons)

	1953 Actual	1954 Estimated	1958 Potential
Plate	2,448	2,458	2,700
Sheet	1,790	2,029	2,650
Tinplate	775	868	1,450
Heavy Sections and Rails	2,848	2,991	3,500
Light Rolled Products	4,449	4,545	5,350
Wire Rod	828	1,033	1,200
Tubes	1,102	1,104	1,500
Other	1,179	1,147	1,300
Gross Deliveries	15,419	16,175	19,650
Less Conversion to other finished steel	2,134	2,145	2,550
Net Deliveries	13,285	14,030	17,100

Very little of the new money will be spent upon melting shops, which received priority in the first postwar programme. Emphasis is now placed upon primary processes and on finishing plant. By 1958 it should be possible to roll the equivalent of 2½ million ingot tons, a million tons more than the mills expect to handle. This will give some flexibility between different steel products, but it may still be questioned whether finishing capacity for wide flat products is being increased enough. Improvements or additions at Ebbw Vale, Margam, Shotton, and the new tinplate plant at Velindre, will raise sheet capacity by 50 per cent by 1958, and that of tinplate by 85 per cent, but to achieve this the Board now intend to keep the high-cost sheet and tinplate handmills in South Wales operating at their present levels. A decision whether to erect another continuous strip mill may not therefore be very far off. But first the industry will want to discover the real capacity of its present mills; these are still eating up all the steel that is fed into them and their appetite is still unsatisfied.

COMMODITY REPORTS

Special and regular reports on the supply and demand position and on the price and market prospects for most commodities can be prepared for individual clients by our Commodities Department. Scope, length, frequency and cost are determined by clients' needs.

A Giant Spreads Out

IMPERIAL TOBACCO £1 Ordinary stock units are nearly always good for the aged and the orphans. They are seldom of much interest to the young and active who like to see firework displays among their investments. The latest year ended October 31st, with its rise in profits and its one per cent increase to 21 per cent in the total dividend, was an exception. How should investors now view this unexpected stirring by the elderly giant whose annual turnover (including tobacco duty) exceeds £600 million at wholesale prices and £850 million at retail prices and whose share of the British cigarette and tobacco trade well exceeds three quarters? The full accounts and Sir Robert Sinclair's statement that accompanies them give some useful clues.

First the giant has been putting on some middle-age spread—spread into its neighbours' sitting space. All the company's brands came off allocation during last month; during the preceding year the company had been gradually approaching full satisfaction of its customers' requirements. In consequence Sir Robert is able to tell the shareholders that the increase in the parent company's turnover was slightly greater than the 2 per cent increase in trading profit. Since there is no reason for thinking that the tobacco trade's expansion was as a whole as good as that, it follows that Imperial Tobacco's share of the trade has certainly not shrunk and has probably gained a little. Secondly, though Sir Robert is a most cautious prophet, he is prepared to

On Oct. 31. (£'000)	Parent Company		Group	
	1953	1954	1953	1954
Net fixed assets.....	13,671	14,504	20,610	21,487
Investments	12,473	12,450	12,473	12,450
Stocks	117,429	125,946	123,027	131,255
Debtors	52,724	56,215	54,959	58,448
Cash	143	106	257	269
Bank overdrafts, etc.....	31,651	32,794	31,869	33,093
Loan Capital	40,000	45,928	40,000	45,928
Revenue Reserves	29,958	32,750	35,936	39,731
Ordinary capital.....	60,101	60,101	60,101	60,101

say that this year's trading results should not be less favourable than last. He bases that conclusion on the fact that the basis of the company's trade is being broadened and strengthened. He expects turnover for the current year to be higher, partly offsetting the rise in costs. He fears, however, price increases in some brands of pipe tobacco may be inevitable. This seems to suggest that the aggregate profit should be well maintained, though the profit per lb may be lower.

Many imponderables remain, not least of them the uncertainty about tobacco stocks. Stocks and debtors together (and debtors are only stocks held by the trade instead of by the manufacturer) are up by £11.7 million and Sir Robert implies that they have risen further since the end of the financial year. That increase in part reflects a better stock of leaf thanks to the more liberal buying policy allowed in the last American crop season. The extra buying was based on borrowed dollars; it is hoped that in the end

THE ECONOMIST, FEBRUARY 26, 1955

the tobacco may be paid for in sterling under the American Agricultural Trade development programme. If not, those dollars will have to come from this year's allocation. But as a whole the group seems to be gaining at least as much strength as its chairman publicly admits. The brands are popular and at last free from restriction; the subsidiaries representing the non-tobacco activities are gaining strength; among the trade investments much the most important is the holding of not less than a third of the capital of British American Tobacco Company, an investment that is now paying increasing dividends.

Verdict on the Swift

THERE are two disturbing features about this week's decision to write off the Supermarine Swift as a front-line fighter. The first is that it places the whole burden of the country's day defences on the Hawker Hunter, and it is never a satisfactory procedure to use only one type of aircraft for this purpose. The Swift and the Hunter should have complemented each other; the withdrawal of the Swifts leaves gaps in the air defence strategy. The existence of two roughly contemporary front-line fighters is an insurance also against one or other running into technical troubles during the evolution of later marks.

Too much time has now been lost to develop a new alternative, say the Folland Gnat, for in two years' time, when such a fighter would be coming into service, the process of replacing the cannon-armed fighter with one carrying missiles will already have begun. This does not mean that a missile-carrying Gnat is not possible, given some redesign. But there is a second point. The history of the Swift and the Hunter demonstrates how difficult it is to judge the capabilities of an aircraft during its early development. Up to 18 months ago, the Swift was considered far the better of the two aircraft. To-day, economy is bringing considerable pressure on the Chiefs of Staff to sponsor one aircraft only in each category; the hazards of an early choice are now plain—and the cost of a wrong decision. It may be necessary to plan for an "insurance" policy of development with one ambitious and one more conventional but less problematic design under construction at any one time.

Research into Speed

THE White Paper on aircraft production issued jointly by the Ministries of Supply and Defence last week, attributed many of the difficulties with British high-speed aircraft, the Swift among them, to lack of research. The big research plants planned during the war, wind tunnels where the equivalent of speeds of two and a half times that of sound could be reproduced on scale models, were so huge in area and staggering in cost that while building was allowed to start on them after the war, they were given no priority either for men or materials, of which they consume in large tonnages. In consequence, the major tunnel,

STOKELESS FUEL

Your gas account shows exactly how much you spend on fuel. There are no extra hands to pay because gas needs no special equipment for handling or storage. Gas burners give you years of life, with little servicing or replacement. That means uninterrupted, therefore greater, production. These are points to remember when assessing the true cost of your fuel. Gas is stored, examined and tested for you and delivered direct to the point of use. It burns clear and clean, is infinitely adaptable and easy to control. For your heat problem gas may well be the answer.

'Not knowing' can be costly.

YOU can call upon the resources of the Gas Industry to solve your fuel problem by consulting your Area Gas Board. The Boards' Industrial Gas Engineers are ready to give you free advice. They, in turn, can call upon the resources of the whole Gas Industry through the Gas Council's Industrial Gas Development Committee. Get your secretary to fill in these details (or pin this advertisement to your letter heading) and send to your Area Gas Board or to the Gas Council, 1 Grosvenor Place, London, S.W.1

Patch work

TORN TROUSERS are the same the whole world over. So are the needles that mend them. The needles, in all probability, were made in Britain. In 1954 about one thousand million assorted needles (weighing over 270 tons) went overseas. Along with them went nearly 1,100 tons of pins and over two and a quarter million gross of hair pins, slides, grips and curlers!

These export figures are remarkable: so are the figures for an enormous range of British steel products — from tins to tractors.

Wherever there is steel there is British steel.

British steel leads the world

THE BRITISH IRON AND STEEL FEDERATION

which has working area of 8 square feet (in which models of 6 foot span can be tested) and can reproduce conditions equivalent to speeds of 2,000 mph, will only be completed this year. The design of this tunnel has been modified and improved considerably during the past few years, but the delay in its building has meant that aircraft designers have had to learn what they can from the smaller wind tunnels at their own factories or at the Royal Aircraft Establishment at Farnborough.

Smaller tunnels are not necessarily slower in speed—some of those now working reach wind speeds higher than the big tunnel will do. But there are limits to how far a model can be scaled down and still give findings that will hold for the full-scale aircraft. As the wind speeds rise, a point is also reached when the small scale model cannot be made strong enough to resist them if it is still to retain its correct proportions. It is no longer possible to put wings on models being tested in small (1½ foot square) supersonic tunnels.

It has cost the Ministry of Supply about £5 million to complete the new 8 ft. tunnel, which stretches over a ¼-mile and consumes 80,000 horse power. In addition to this other lower-speed plants have to be built to complement its work; speeds as low as 200 mph to test take-off and landing behaviour of designs evolved in the high-speed tunnels are essential. The research that will be done in these plants, which are on a new research site near Bedford, cannot affect today's aircraft, but it will have a vital influence on those which are going on to the drawing boards now and may fly in four to eight years' time. It may be necessary to run the big tunnels on 24-hour shifts in order to fit in the work, and plans are already being drafted for tunnels that will give speeds of up to ten times that of sound. This represents the probable physical limit to which the present type can be built. For higher speeds, new and unconventional techniques must be evolved. The speed with which these plans are being pressed ahead suggest how heavily earlier delays must have cost the country.

Confusion on Speed Limits

THE speed limits imposed upon goods vehicles are anomalous and antiquated—and census returns show that over ninety per cent of the lorries on the road fail to observe them—but the regulations have not been made any simpler by the amendment inserted in the Road Traffic Bill last week by the House of Lords against the wishes of the government. This Bill, or part of it, is designed to remove the "anomaly" that has arisen from two recent Court decisions. The Courts found that a regulation introduced in 1950 to exempt utility or dual-purpose vehicles from the 30 mph speed limit (that applies to all goods vehicles with an unladen weight of less than 3 tons) when these utility vehicles were not being used for the transport of goods, could be interpreted to cover all commercial vehicles under 3 tons when they were travelling empty. Besides the speed limit, empty lorries were held to be free of all other "C" licence regulations, including the obligation to keep journey records and driving hours.

Before it was amended the Bill would have brought back the rules that applied before the 1950 regulation; that is

"C" licences and the statutory rules about records and speed limits would apply to all utility vehicles and goods vehicles under 3 tons in weight intended for the carriage of goods whether or not goods are actually being carried at any particular time. The amendment, however, permits utility vehicles to exceed the speed limit once more when goods are not being carried. A "C" licence will still be necessary but the licence rules will only apply when the vehicle is used as a goods vehicle. To avoid the difficulty that arose in the 1950 regulation the definition of a utility vehicle devised by the Customs authorities was inserted in the amendment. But this definition also does not appear to be precise enough; it would apparently be possible to make almost any van a dual purpose vehicle by adding two tip seats side by side behind the driver's seat. There are other difficulties. Police and traffic inspectors will be interested to hear how they are to differentiate between a rapidly moving vehicle that is carrying goods and one that is not. It also appears that, without a further amendment to the Bill, doctors, veterinary surgeons, and commercial travellers who carry their black bags or samples in utility vehicles will be subject to the speed limit whereas they would not if they used a private car. These difficulties can be ironed out at a later stage, for the bill has still to pass the Commons. But it seems unlikely that the government will remove or raise these speed limits; that would be the simplest way out.

Bigger Tea Auctions in Calcutta

IN the first seven years of Indian self-government the British investor in tea has not felt the heavy hand of nationalistic policies; pin-pricks there have been, but no more. Investors would be unrealistic to expect that good fortune to continue, and signs are now emerging of a change. Pressure from the left wing of the Congress Party may persuade the Indian government to shackle the managing agency system, and the proposed amendment of Article 31 of the Constitution would in several cases prevent a dispossessed property owner from challenging the state's terms of compensation in the courts. Another sign, less damaging to British tea interests, is the decision to restrict the quantity of tea consigned to the London auctions, as Ceylon already does. The committee appointed to examine that question has now submitted its report to the government. Three prominent British representatives served on that committee, and lest extremists raise the charge of "scuttle" it should be made clear that its terms of reference were not whether it was desirable that the bulk of India's tea should be auctioned locally, but how it could be done with the minimum dislocation of trade. At present roughly half of India's exportable crop of some 420 million lb is sold in Calcutta and Cochin and half in London.

The committee recommends that the proportion of the exportable crop sold locally should be raised to three-quarters within the next two years. Since the transfer of 100 million lb at once would be beyond the capacity of the Calcutta warehouses, the committee advises transfer in two stages—50 million lb at once and a further 50 million lb when new warehouses have been built. The question of

local auctions should be reviewed after two years, but it would be in India's interests to ship about one-quarter of the exportable crop to Mincing Lane. The committee evidently recognises the value of maintaining a spot market for Indian tea in Britain, the largest consuming country, where widespread competition will usually produce the best price for the grower. Moreover, the small British buyers, still an important element in the London market, would suffer if they had to rely on forward shipments from India. There seems little doubt that the Indian government will accept the report, though no one should expect that the present or succeeding governments will necessarily maintain an outlet in London. If the warehousing facilities in Calcutta are expanded sufficiently, the grower should receive a price comparable with that obtainable in London. In that event the tea investor would not suffer. The London broking houses would have to handle a larger volume of "second-hand" tea, and the business handled by the big Calcutta houses—several of which are associated with London firms—would increase. They will naturally fear, however, that an effort will eventually be made to steer more of the trade in Calcutta into Indian hands.

Egypt's Sterling

THE Egyptian government has made a formal request for a revision of the Anglo-Egyptian Sterling Releases Agreement of 1951 and in particular has asked for an acceleration of the releases from the blocked number 2 account. When the agreement was negotiated nearly four years ago the amount standing in that account was about £230 million. The agreement provided for the freeing of £150 million of this amount over a minimum period of ten years and a maximum of thirteen and a half years. A sum of £10 million was to be released in each year from 1951 to 1960 and an additional £5 million a year was to be released up to a maximum of £35 million when the balance in Egypt's number 1 account fell below £45 million. The balance in the number 1 account has been fairly consistently below that figure. In fact, therefore, the additional sum has been released on January 1st in each year and in most years the basic release of £10 million has also been made at the beginning of the calendar year. In the year 1951 a special additional release of £15 million was sanctioned.

In accordance with this schedule £90 million has been transferred from the number 2 to the number 1 account since the agreement was negotiated and the balance remaining in the number 2 account is now about £140 million. The 1951 agreement provided only for the release of £150 million out of the blocked balances of £230 million, leaving £80 million to be dealt with later. It may well be that a call on this residual may be needed to finance payments by Egypt for surplus stores, equipment and fixed assets in the Suez Canal base. If so, there can be little objection to a consequential revision of the 1951 agreement. If, however, it is a question of releasing more blocked sterling to the number 1 account, serious doubts will be entertained, for that would increase still further the already over-abundant supply of transferable sterling.

Rights the Right Way

LETTERS of rights are complicated documents. There are always shareholders who fail to understand their value, and who fail to consult their broker or bank manager and thus waste a valuable piece of their property, neither applying for the shares to which they are entitled nor selling the "rights" in the market. No "rights" issue is ever subscribed in full. Sometimes a fortunate underwriter obtains something he had not counted on; sometimes the other shareholders pick them up on their applications for surplus shares.

In happy contrast is the effort made recently by Consolidated Zinc Corporation to ensure that all its shareholders gained the benefits from the "rights" issue. The company offered 2,182,649 £1 ordinary shares at par in the ratio of one for three. When the offer closed on December 20th, the "rights" were worth about 15s. but about 40,000 shares had not been taken up. The first step that the company took was to announce that late applications would receive favourable consideration. A month later those shareholders who had still failed to apply received a letter pointing out to them the value of the "rights" and urging their acceptance. And where dividend mandates were held the help of bank managers was sought. Consolidated Zinc was able to leave the offer open because one of its subsidiaries acted as a depository for the unallotted shares. Any late applicant could thus receive the appropriate number of shares through a transfer without charge from this depository. These efforts to ensure fair treatment have not secured 100 per cent acceptance but they have borne fruit. Only about 0.3 per cent of the rights remain unclaimed.

Trouble About Top Qua'ity

IT has been illegal since the revised Merchandise Marks Act came into force last February to make claims about the quality of goods that were either false or misleading, but there has been widespread doubt about whether a clause of this kind could actually be enforced in the courts. The first prosecution against any trader for making wrong claims about the quality of goods on sale was not, in fact, brought until this month, when a Bournemouth trader was summoned by the Retail Trading Standards Association. The goods involved were flannelette sheets that were described as "top quality" and blankets described as "good quality wool." The sheets were demonstrably imperfect, they were stained and irregular, but they were wrapped in transparent paper so that they could not be examined. The blankets contained less than 30 per cent of wool and the rest, rayon.

To win its case the RTSA had the difficult task of showing that the descriptions used did not conform to definitions of quality as they were either (a) recognised, or (b) used, by the trade. On the face of it this was difficult to do, for who can give a precise description of "quality"? The RTSA considered that if advertisements for "top

UNDER 16 HRS

—Fastest Time Ever!

Business men! Here's a new, faster, more luxurious air service to the East—at no extra cost. By applying the latest advances in airline servicing and management technique to the most reliable commercial aircraft in the world, new Pakistan International Airlines bring to East-West air travel a trans-Atlantic standard of luxury aloft. Every Friday P.I.A.'s specially fitted Super-Constellations fly above the weather from London to Karachi via Cairo in just 15:50 hours flying time*—substantially less time than ever before. The return flight, leaving Karachi on Tuesday, takes only 17:50 hours in the air—still the fastest West. Moreover, P.I.A.'s domestic network serves both West and East Pakistan, India and Burma; its booking facilities cover all points East. P.I.A. flies faster—you fly more comfortably. For full details see your local Travel Agent.

FLY

PAKISTAN INTERNATIONAL
AIRLINES

CONTACT YOUR LOCAL TRAVEL AGENT
or P.I.A. 249 Brompton Road, S.W.3. Telephone: KNightsbridge 4371

SUPER-CONSTELLATIONS, specially fitted for P.I.A., bring a new standard of luxury to East-West air travel.

TOURIST AND FIRST CLASS FARES comply with normal competitive rates. It costs no more for P.I.A. speed and comfort.

P.I.A. BOOKING SERVICE can arrange your flight through P.I.A. international and domestic networks. It can use other airlines, to fly you to all points further East.

FOR NEW IDEAS* ON BUSINESS LIST-PRINTING

Stock, price and parts lists, mail-order and membership lists, inventories and internal telephone directories: how are they produced in your business? Is it a full time job for someone to

keep them up-to-date and accurate, to check proofs, to supervise printers and publication dates? Send for the Man from Remington Rand. He'll show you a way with business list production which is quicker, cheaper and more accurate altogether.

*THIS IS FLEXOPRINT Remington Rand's equipment for rapid, low-cost list-printing. Flexoprint turns your own typist into a compositor—does away with all typesetting charges. Flexoprint lists are maintained, amended, paged up in any format, and proof-read in your own office. They are always up-to-date, always ready for your printer or your own offset-litho department. Does Flexoprint sound like a solution to your listing problems? Let us prove that it is.

Send for the Man from

Remington Rand

COUPON: I would like to know more about Flexoprint.

Starch does surprising things

IN SUCH
SURPRISING
PLACES

Example:

STARCH IN PLASTER BOARD MANUFACTURE

Plaster board is an increasingly important material in modern building. It is made of crushed gypsum rock with a starch-based adhesive added to it. The process of production is continuous. Wet plaster is formed to the required thickness between two sheets of heavy paper, and sets into a rigid board in the course of a few minutes. As the moisture dries out, most of the starch adhesive is carried with it to the faces of the plaster 'core', where it helps to form a permanent bond between the core and the paper. The addition of the starch adhesive speeds production considerably. The Technical Liaison Department of

the Brown & Polson Group is usually asked to recommend the best starch adhesive for the purpose.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

CORN PRODUCTS COMPANY LIMITED

Brown & Polson

WELLINGTON HOUSE, 125/130 STRAND, LONDON, W.C.

quality" merchandise were produced it could be shown that the trade "used" the phrase in the meaning of the Act. This was not put to test, for the defendant changed to a plea of guilty and was fined £50 with 50 guineas costs. The importance of the prosecution lies in proving that this ambiguous section of the Act is enforceable. An earlier prosecution by the Board of Trade has already shown that, contrary to expectations, it can effectively be enforced against "misleading" descriptions too. The Merchandise Marks Act has suffered in the past from lack of any appreciable volume of case law; the prosecutions that have been brought since the beginning of 1954 have done a good deal to remedy this and this latest case is a most important addition. It suggests that the new Act may be providing greater protection for shoppers, in a quiet way, than more ambitious schemes.

Price Maintenance Defended

FROM all over the country representatives of the motor trade travelled to London last Friday—at their own expense, they insisted—to defend before the press the price maintenance policy of the British Motor Trade Association. The meeting received a statement explaining in its opening paragraphs that the association "does not support and does not permit itself to be used in support of price rings." The whole of the rest of the document was devoted to explaining how this particular price maintenance system is worked. Comparatively few motor accessories are price maintained but they include items most widely bought by motorists, tyres are an example. The manufacturer undertakes that he is not himself a member of a price ring before

the association will agree to maintain the price of his products. The association—a registered trade union consisting half of traders and half of manufacturers—"acts as a fair trade umpire," in the words of the chairman, "simply implementing the policy put forward by the manufacturers, only protecting the goods that the manufacturers ask us to protect."

It claims that its methods are fair; its tribunals to discipline the price deviationists are modelled on courts of law and presided over by an independent chairman of legal distinction. They operate against those who overcharge as much as against those who cut and it is claimed that they have saved the public money. Their sanctions are the reprimand, the fine and finally the stop list. These courts discipline non-members as much as members. Indeed some of those who have been in recent trouble about price cutting on tyres are not properly garages at all, but tyre and battery shops. The BMTA evidently feels that it has nothing to apologise for. Indeed it has no thoughts of retreat but intends to go further. There is at present no price maintenance of second-hand vehicles. Before the war there was a secret list of maximum prices that a trader could pay for second-hand cars traded in against new ones. If he paid more he was considered to be cutting his commission. That price list, it was disclosed, "will come back when the trade asks for it."

The Association's case is specious and the attitude of mind that supports it is woolly. No one has suggested that these traders are evil men, but they are stifling free competition in their own trade and allowing themselves to be used as the pawns of some manufacturers, accepting with little question that there is no manufacturers' price agreement on the articles of which they maintain the prices. Their courts, sitting in private and using quasi legal pro-

Prices of Manufactures

A NEW index prepared by the Board of Trade shows for the first time the average movement in wholesale prices (excluding purchase tax) of British manufactured goods since 1949. Thousands of individual prices go into the making of this index, which covers all sides of manufacturing except food, fuel, tobacco and the aircraft industry. The prices are combined into a single index according to producers' sales in 1948. Manufactures reached their post-Korean price peak about twelve months later than raw materials. It was a much

lower peak, not only because wages moved less, but also because sharp changes in materials prices tend to be ironed out; the actual volume of materials bought at peak prices is usually small. Since then manufacturing prices have changed little, wage increases having mostly absorbed cuts in the prices of raw materials and higher productivity. These movements are the average: the two smaller charts illustrate that the price relationship for individual industries may be widely different.

cedures, inspire public mistrust, not confidence. The ultimate penalty—the right to put a competitor—even a non-member—out of business has no economic or moral justification.

Road Haulage Rates

MANY hauliers may not immediately take up the recommendation of the Road Haulage Association that haulage charges be increased by $7\frac{1}{2}$ per cent on March 1st. Rates will probably move upwards in time, but the sharp competition in the haulage business at present will make a haulier hesitate to raise his own charges before he is sure that his competitors will raise theirs. Some increase is inevitable. The last general increase in rates took place in 1952. Since then the basic weekly wage for haulage workers has risen by 25s. and vehicle prices and running costs have been slowly rising.

In the long distance field, where all hauliers with a licence can now operate legally, and the railways may soon be offering competitive charges, rates have been cut rather than increased. The nationalised fleet has lost some traffic, but appreciably less than the lorry capacity that has been sold. Unless British Road Services raise their rates—and there is no indication that they intend to—the long distance private haulier will be disinclined to lose business by raising his. BRS rates for parcels and smalls, which the private haulier is much less willing to carry, are to be raised, however. Labour handling costs are heavy on these small items. But BRS will be able to absorb the higher costs of general haulage, including this week's 10s. wage increase, in the large operating surplus that it is still making—last year this surplus was only slightly smaller than the £9 million made in 1953 despite the loss of nearly a third of its fleet.

Short Lead in Cars

BRITISH motor exports are still maintaining their lead in the world markets, but it is not so long a lead as it was. During 1954, 366,000 cars were shipped abroad from Britain. This is a big improvement on the previous year when the total was little more than 302,000 yet it seems to lack the momentum of Western German exports. Two years before, when Britain's car exports were nearly 310,000, Western Germany's were a bare 100,000. They increased remarkably little in 1953 but last year they shot up nearly 70 per cent and the total, 231,000, was getting uncomfortably close to Britain's sales. American exports also show a substantial increase; having been at or below the 150,000 mark for the two previous years, they reached 207,000 last year. French and Italian exports did not behave as buoyantly, although they too improved. In short, 1954 was one of the best years for car sales in all countries. If German exports are any guide, there seems to be some merit in producing a solid, workmanlike design. Frequent changes of style do not appear to be necessary provided that per-

formance is above reproach. There are some British examples of this too.

It is only fair to the British industry to point out that if a comparison is made of total vehicle exports, cars and commercial vehicles together, then the German performance is less impressive. Britain exported nearly half a million vehicles (492,816) last year; Germany, with 298,000 vehicles, was a long way behind. The total for the United States was 401,000; the American truck still being supreme in world markets for commercial vehicles. British manufacturers have put in a strong challenge to American dominance in this field, and there is some reason to believe that they have been able to eat into some exclusively American markets.

Rubber and the Stockpile

PRICES of natural rubber have not recovered from the sharp fall of last week; a slight rally was checked on Thursday—partly by the rise in Bank rate—and spot rubber closed in London at 27d. a lb, compared with 31d. early last week. Last week's break was touched off by the news that the American government was revising its system of rotating natural rubber in the strategic stock, and it was accentuated as tension in the Far East lessened. Had speculation not made the market so vulnerable, it might have taken the news from America in its stride. By itself, the new policy is hardly significant. It applies only to "up-grading"—the sale of rubber that no longer meets strategic specifications and its replacement by rubber of a higher grade. Formerly the maximum quantity that could be so rotated was 5,000 tons a month; the limit has been raised to 7,500 tons, and sales of rubber for delivery in the current and succeeding month can now be replaced within two months, instead of one.

To that extent American consumers can avoid going to the market by "borrowing" an extra 7,500 tons of rubber from the stockpile, and that explains—though it hardly justifies—the criticism of the new policy. The GSA has some 100,000 tons of low-grade rubber to replace with higher grades before the summer of 1956. Under the former arrangements the GSA had found it impossible to up-grade 5,000 tons a month, because buyers were unable to obtain rubber for delivery within the period allowed without paying a premium. Had the delivery period not been extended it would have been pointless to raise the maximum quantity to 7,500 tons a month. The new maximum will enable the GSA to prolong the "life" of the strategic stock, which will eventually be composed almost entirely of the four highest grades of natural rubber. In the short term that will benefit Malayan and other producers of those grades, but in the longer term it will slow down the rate of rotation.

Russia in the Sugar Market

THERE have been several occasions recently when Russian buyers have unexpectedly stepped into an ailing market, and given it a much-needed shot in the arm. Their pur-

chases have usually been small, but marginally important nevertheless. The Russian purchase of raw sugar from Cuba does not quite fit into that category. The quantity is not small, yet the patient has not recovered. The contract is for 200,000 tons for shipment between February and June, but 50,000 tons will not be taken up if shipping is not available. The price—3.05 cents a lb f.a.s.—is low compared with the current market price of 3.17 cents a lb, but few sellers will blame the Cuban Sugar Institute for accepting it for a bulk sale, and thereby breaking its rule that the 1955 crop would not be sold at less than 3.25 cents a lb, the minimum in the International Sugar Agreement.

Cuba's problem is simple: it has a surplus and its quota for sales to the "free" world market exceeds the likely demand. As Russia, also a member of the agreement, is normally an exporter, the sale of 200,000 tons meets an unforeseen requirement on the free market. That gain may, however, be diminished if part of the sugar is sent to mainland China, for China imports some sugar from Russia and Poland, and its requirements from the free market this year were estimated by the Sugar Council at 100,000 tons. Moreover Cuba will have to find new customers for more than 200,000 tons if the present surplus is to be relieved. But the market has been so long in the

doldrums, with prices well below the minimum, that it would be churlish to look this particular gift horse too closely in the mouth.

SHORTER NOTES

As a result of falling markets substantial proportions of recent share issues have been left with the underwriters. Of the Truman Hanbury Buxton issue of £1½ million 4 per cent debenture stock 1980/85 at £98, underwriters had to take up 79 per cent. Of the £2,000,000 4½ per cent unsecured loan stock 1970/75 of Electric and Musical Industries underwriters took up 89 per cent and of that company's 3,000,000 5½ per cent second preference shares at 20s. 6d., 84½ per cent. The chairman of Debenhams announced this week that the intended new issue had been postponed.

Iron and Steel Holding and Realisation Agency announces that N. Hingley and Sons has bought back the entire share capital of John Bagnall and Sons for £200,000. John Bagnall and Sons therefore returns to its former ownership at the same price as that at which it was nationalised.

Company Notes

ENGLISH ELECTRIC. Across the world English Electric Company carries the flag of British competition, supplying electronic measuring instruments to the Russians, undercutting American competitors by 17 per cent on their home ground for the Chief Joseph Dam contract (the decision still waits on Washington's word), and failing on a St Lawrence Seaway contract only because American firms have seen an issue of prestige and cut their own prices ruthlessly. The profit and dividend already announced suggest that the 52 weeks ended December 25th made a glorious year; the trading profit was up from £6.5 million to £7.3 million; the 12½ per cent dividend for the year compares with an equivalent of 9½ per cent a year ago. But glory is seldom without price. Prices are on the way down and this roaring trade in electrical goods has been won in roaring competition. Stocks and work in progress are up by less than £1 million, from £51.9 million to £52.8 million, debtors by £3.7 million, from £25 million to £28.7 million. These increases contain no element of price inflation. They are wholly a volume increase, for the trend of prices is downwards.

All credit is due to English Electric, for it has been able to meet fierce price-cutting coupled with currency incentives and special taxation aids granted to its competitors in Germany, Switzerland and Sweden and still to expand. On the side of fixed investment a pause in that expansion seems now to be developing;

contracts for capital expenditure are down from £3.5 million to £2.7 million. But it can be no more than a pause caused partly by the completion of the joint venture with the Ministry of Supply at Liverpool and partly by a continued shortage of skilled labour. One of the reasons, incidentally, for the offer to shareholders of Vulcan Foundry has been to get access to additional labour. Expansion is still evident in the group's overdrafts outside Canada. These overdrafts are up from £7.2 million to £9.1 million. The group has never minded using a proportion of bank money in its working capital, but when expansion takes another stride it may wish to fund some of that growing home overdraft. For that reason, and with no intention of making an immediate issue, it is proposed to raise the authorised capital to £25 million by creating a further 10 million £1 ordinary shares.

BRITISH-AMERICAN TOBACCO. The label "growth stock" must be tagged on the 10s. ordinary stock units of British-American Tobacco. Massive earnings, backed up by an impressive balance sheet, cover the dividend, and gradually that dividend is being raised. The number of discarded cigarette butts along a main street is one of the empirical tests of a country's standard of living, and British-American Tobacco, trading in almost every free

country of the world, cannot fail to benefit from any improvement in those standards. The profits available for distribution have still to climb over the wall of restrictions on currency transfers, but recently profit remittances seem to have been flowing back to the parent company rather faster.

The latest results, for the year to September 30th, confirm the impression, which has been current for some time, that the group fared well last year, notably in the United States. The preliminary statement shows that the consolidated profit before tax has expanded from £42,497,372 to £48,500,560. That figure is struck after transferring £598,410 to replacement reserves, representing the balance of the devaluation surplus on stocks of dollar leaf tobacco.

After providing £23,656,463, compared with £19,194,358, for tax and £2,821,829 (against £2,955,717) for minority interests, net profits have risen from £20,147,297 to £22,022,268. The inevitable and long-expected corollary is an increase in ordinary dividends. The total tax-free payments for the year amount to 1s. 6d. (or 15 per cent) on each 10s. stock unit. In 1952-53, after allowing for the 50 per cent free scrip issue, the dividend amounted to 12½ per cent on the present capital. In addition, the directors have put the first interim dividend for the current year at 6d. on each unit, compared with 5d. a year ago. This announcement coincided with the rally in equities in Throgmorton Street and the 10s. units immediately gained 3s. 3d. to 52s. 6d. At the current price of 51s. the yield is 5.3 per cent. The yield on "Bats" is certainly not too low for an international trading group whose market is still expanding and which is meeting the threats of economic

autarchy by switching away from the export of British-made cigarettes to local manufacture.

HOOVER. This company, as a manufacturer of durable consumer goods, finds earnings swept upwards on the flood tide of hire purchase business. The group net profit before tax for the year 1954 was £4,581,961, compared with £3,095,793, and after tax £2,350,208, against £1,321,294. The final ordinary dividend is raised from rs. 9d. per 5s. unit to 3s., and since the interim payment was unchanged at 6d. per unit, the total distribution for the year is 3s. 6d. (70 per cent) compared with 2s. 3d. (45 per cent) for 1953. On the highly geared rs. "A" shares the dividend is 6s. 0.57883125d. per share compared with 3s. 8.7132d. The total distribution remains a small part of the available profit.

MONSANTO CHEMICALS. The high level of activity in the chemical industry in general, and an encouraging half-yearly report in particular, prepared investors for excellent trading results from Monsanto Chemicals for the whole of last year. Since the publication of the company's half-yearly progress report in September the 5s. ordinary stock units—about two-thirds of which are owned by an American parent of the same name—have gained about 6s. They stood at 31s. 6d. on the eve of the publication of the full year's preliminary statement. That report, showing an increase of 16 per cent in net sales from £10,852,854 to the record figure of £12,634,616, is just what might have been expected from a group that has spent great sums on capital developments since the war. The market for its products was particularly

buoyant at home. Export sales accounted for 38 per cent of total sales, compared with 40 per cent in 1953.

Trading profits have risen even more sharply than sales—by over 24 per cent from £2,354,084 to £2,940,407. Net earnings have also risen, from £715,724 to £845,984, and the ordinary dividend has been pushed up from 20 to 22½ per cent. The 1952 recession brought the dividend down to 18½ per cent, but within two years it has been restored to its 1951 level. A higher dividend than 22½ per cent was expected and the 5s. units fell after its announcement to 29s., to yield only 3½ per cent. The group's current financial year is still young, but so far there has been a "reasonably good demand" for the group's products. But Mr Edward A. O'Neal adds his customary warning about keener competition.

HANDLEY PAGE. The total ordinary dividend paid by Handley Page, the aircraft manufacturers, for 1954 has been confined to the increase made last November in the interim payment. That interim was raised from 3½ to 5 per cent. The final has been left unchanged at 10 per cent, so that the full year's dividend is 15 per cent, compared with 13½ per cent paid in the three previous years. Along with the rest of the industrial market the 5s. ordinary stock units of Handley Page came off their peak this week. At the current price of 12s. they yield 6½ per cent.

The group's gross profits have risen—but only slightly, from £647,405 to £673,870. Taxation has fallen—from £403,831 to £382,846—and, hence, there has been a more than proportionate increase in net earnings, from £243,574 to £291,024.

THE ECONOMIST, FEBRUARY 26, 1955

LONDON STOCK EXCHANGE

Next Account begins: March 2nd
Next Contango Day: March 2nd
Next Settlement Day: March 8th

THIS was the week of the slump in the stock market. Within five days of trading the *Financial Times* ordinary share index fell from 192.1 to stand at 178.9 on the close on Tuesday. Prices rallied on Wednesday and the index climbed back to 184.0. Gilt-edged prices staged their rally before then. Having fallen sharply before the week-end, they rallied when some institutional support was given on Monday. Small buying orders kept the prices of the long and medium dated stocks reasonably firm on Tuesday and Wednesday but the "shorts" were marked down on the tight credit conditions in Lombard Street. But when dealings began on Thursday, the prices of the long and undated stocks once again declined and then on the further increase in Bank rate they slumped.

Selling of industrial equities was heavy both before and just after the week-end. It came from individual investors and not from the institutions and the decline in prices was accentuated by the difficulties in which some speculators found themselves once the market had begun its slide. The weakest sectors of the market were those dealing with stores, radio, electrical equipment and paper issues. But no sector was completely immune from the collapse. Prices rallied on Wednesday and were again marked up on Thursday morning. But after the change in Bank rate prices tumbled down. By far the biggest falls were recorded in the low-yielding stocks that have been bought for capital appreciation. These stocks which had taken the hardest knocks responded most quickly in the rally. Elsewhere, buying of steel shares was renewed on the industry's plans for expanding capacity.

Oil shares followed the pattern established elsewhere in the equity market, also staging a rally on Wednesday before slumping again on Thursday. Rubber shares were weak at first in the fall in the price of the commodity, but then recovered when that price rallied. Tea shares were dull. Kaffirs were dull in the face of a dribble of selling orders, but this section was not involved in Thursday's collapse.

Financial Statistics

EXCHEQUER RETURNS

For the week ended February 19th there was an "above-line" deficit (after allowing for Sinking Funds) of £7,659,000 compared with a surplus of £97,172,000 in the previous week and a deficit of £37,898,000 in the corresponding period of last year. This brought the cumulative account to a surplus of £459,047,000 (compared with a surplus of £172,962,000). Net expenditure "below-line" last week reached £20,592,000, bringing the total cumulative surplus to £53,514,000 (compared with a deficit of £187,056,000 in 1953-54).

THE MONEY MARKET

BANK rate was raised from 3½ to 4½ per cent on Thursday. The consequential adjustments of money rates were uniformly of 1 per cent also, maintaining the new rate margins created after the increase in Bank rate from 3 to 3½ per cent four weeks before. The banks' deposit rate thus now stands at 2½ per cent and their basic rate for loans to the discount houses, against all classes of collateral, at 2½ per cent. Discount houses quoted rates of 3½ per cent on fine bank bills after the Bank rate change, but no dealings were reported.

The market had been prepared for the increase in Bank rate by the tactics of the authorities in the short loan market. It was "in the Bank" on Saturday last and through the first three days of this week. On Wednesday most houses were affected, despite large official purchases made indirectly through the banks; the size of the total week's borrowing at the Bank is reflected in the increase of £44.3 million in discounts and advances shown in the Bank return.

The market had maintained its bid unchanged at £99 8s. 5d. per cent at the Treasury bill tender on Friday last, following the easy credit conditions of preceding days. The average rate came out at 2½ per cent.

Sterling, which had already staged a slight recovery on Tuesday and Wednesday, rose by more than ½ per cent on the news of the increased Bank rate, to \$2.78½-2.78¼—the best rate since early January.

COUNTRY'S ECONOMIC PROGRESS—NO CAUSE FOR COMPLACENCY

THE DUKE OF BUCCLEUCH'S REVIEW

The annual general court of proprietors of The Royal Bank of Scotland was held on February 22nd in Edinburgh. His Grace The Duke of Buccleuch and Queensberry, KT, PC, GCVO, LLD, governor of the bank, presiding.

His Grace said:

Once again I have to refer to changes which have taken place and are about to take place in the court of directors.

Last May Mr Charles Augustus Carlow informed the chairman of his decision to retire, on medical grounds, from the ordinary court of which he had been a member since October, 1941. To our great regret, Mr Carlow died on August 13, 1954. He is missed as much by his colleagues at the bank as he will be by a host of friends and colleagues elsewhere, and particularly in his native county of Fife.

On the other hand, I am pleased to report the appointment, as an ordinary director of the bank, of Mr Donald Hamish Cameron of Lochiel, TD, DL, ACA, and I am sure you will welcome this appointment as much as we do on the court of directors. In accordance with our charters he retires at this meeting but is eligible for re-election.

Mr Kenneth Murray, who has given most valuable service to the bank as chairman of directors for almost ten years, and has been a member of the ordinary court since 1935, has asked to be relieved of the duties of chairman. To the regret of all his colleagues, Mr Murray will be retiring from the chair on April 1st, although I am glad to say he has agreed to continue as an ordinary director. Mr Murray will be succeeded by the deputy chairman, Mr David Fortune Landale, who, prior to his appointment as a member of the ordinary court in 1952, had considerable business and banking experience in the Far East.

I shall be referring later to important managerial changes, but I would mention at this stage that we are also losing, as from April 1st, the services of one of our general managers, Mr W. A. Watt, who attained the age of sixty-five this month and will have completed almost fifty years with the bank. I need not say how much Mr Watt's great experience will be missed, and I feel sure you will join with me in expressing our best wishes to him in his well-earned retirement.

I assume it will be your pleasure that the annual report of the bank and the accompanying accounts of our group, which have been circulated, shall be taken as read but, in compliance with statutory requirements, the auditors' report falls to be read at this meeting, and I now call upon the secretary to do so, after which it will be available for inspection by any proprietor.

DEPOSITS AND OTHER LIABILITIES

This year we are presenting to you, in addition to our own balance sheet and profit

and loss account, a consolidated balance sheet and a consolidated profit and loss account of our group. To make this possible, we have had to alter the date of our balance from the second Saturday of October to December 31st, and, therefore, on this occasion our accounts cover a period of approximately fourteen and two-third months. The figures given for comparative purposes are not those of exactly a year previous, but the figures appearing in the balance sheet of October 10, 1953, submitted to you at this time last year. The first point of interest to which I wish to direct your attention is that the balance sheet which you now have in front of you reflects the capital changes approved by you at the general court on September 28th last, when I gave you full details of the transactions involved and the reasons for them. The issued capital stock of the bank now amounts to £5,950,000, with a reserve fund of £5,050,000. When we add to this the balance of the profit and loss account carried forward, the capital resources of the bank are brought up to a total of £11,171,566, showing a position of strength which must be very gratifying both to you and to our customers.

Our deposits have increased by almost £7 million since October, 1953, and now amount to just over £147 million, a new record for us.

Our notes in circulation at December 31, 1954, were up by more than £1,200,000 over the October, 1953, circulation, and, although part of this increase can be accounted for by the extra demands for currency which are always experienced at Christmas, the general level of our note circulation has continued to rise throughout the period.

Our acceptances and other obligations outstanding at December 31st amounted to slightly more than £9,300,000, an increase of over £2 million as compared with the figure at October 10, 1953.

LIQUID ASSETS AND INVESTMENTS

Our total assets at just over £181 million show an increase of £10½ million over the October, 1953, figure and are the highest in the history of the bank. As usual, a strong liquid position is shown. Our holding of British Government Treasury Bills amounts to approximately the same figure as at October, 1953, but I am sure you will be pleased to see an increase of almost £2 million in our holding of commercial bills. This reflects additional facilities given to our customers to finance the movement of goods to and from this country, a substantial part being to the jute trade which, now that government control of the industry has terminated, has reverted to the prewar practice of making its own arrangements for obtaining its supplies of raw jute. Other evidence of the extent to which we have played our part in assisting industry and agriculture

during the year is shown by an increase of approximately £4,700,000 in our advances. This represents an increase of roughly 10 per cent on the October, 1953, figure.

The market value of our quoted investments at the prices ruling at December 31st exceeded the value of £63 million at which these investments stand in our balance sheet.

PROFIT AND LOSS ACCOUNT

This year the profit and loss account, as I have already mentioned, covers a period of approximately fourteen and two-third months, but, in order to give a clear guide as to our trading results over the period, we have given details in our announcements through the Press of the equivalent figures for a twelve-month period. The actual net profit for the period from October, 1953, to December 31, 1954, amounted to £733,735, which is equivalent to £600,329 for a period of twelve months. This represents an increase of just over 13 per cent, but you will appreciate that part of this increase includes the increased dividends received during the period from our subsidiary companies. Full provision has been made for all bad and doubtful debts and other contingencies and the net figure mentioned has been arrived at after making allocations on the usual scale to the property maintenance reserve fund and contributions to the staff pension fund and widows' fund.

Interim dividends were paid at midsummer and at Christmas. The midsummer dividend was at the rate of 9 per cent on £4,250,000 of capital stock and the Christmas dividend at the rate of 7½ per cent on the capital stock as increased by the £1,700,000 of new stock issued in September last. It is now recommended that a final dividend of 3½ per cent be paid on March 15th next, which will make the total distribution for the period from October 10, 1953, to December 31, 1954, approximate to an annual rate of 14 per cent on the present amount of the capital stock of the bank. It is proposed this year to carry forward the unallocated balance of profit amounting to £171,566.

GROUP ACCOUNTS

As you are aware, this is the first occasion on which we have published consolidated accounts of the group. I do not intend to dwell at length on the figures appearing in the consolidated balance sheet, but I would direct your attention to the fact that the combined resources of the group amount to over £414 million, with total deposits of £359 million and advances of nearly £115 million.

The total net profit of the group as shown in the consolidated profit and loss account is £961,833, which includes the trading profit of our bank for fourteen and two-third

For many years The Mercantile Bank of India has been intimately associated with the principal trading centres of the East and will be pleased to supply to all interested exporters and merchants on-the-spot information relative to the state of markets, agency representation, financial and currency exchange problems.

CAN THE INDUSTRIAL DEVELOPMENT BANK HELP YOU IN CANADA?

Businessmen who are considering establishing or expanding a manufacturing or processing business in Canada and have a project that meets practical requirements for success, but have not been able to finance it by standard methods, might find it worthwhile to know more about Industrial Development Bank (a subsidiary of Bank of Canada) and its wide experience with unusual problems. Industrial Development Bank's credit officers and technical specialists examine proposals before the Bank provides financing. If a term loan is granted, it may make for a more efficient and profitable operation. On the other hand, it may uncover factors which make regular commercial financing feasible. For further information we suggest you communicate with:

months and the net profits of our subsidiaries for the calendar year. I am sure that you will all view with satisfaction the progress which the group has made during the past year. The three banks fit into a nation-wide pattern providing a banking service of the highest quality throughout most areas of the United Kingdom. During 1954 new branches of Williams Deacon's Bank, Limited, were opened at Newbury, Newcastle-on-Tyne and Bournemouth. Arrangements are being made for the opening, in the early months of next year, of a branch of the Royal Bank in Mincing Lane, London, and we hope to follow this by establishing later in the same year a new branch in the busy area of Knightsbridge.

COUNTRY'S ECONOMIC POSITION

So much for our own affairs. Since I addressed you in March, 1954, it must be a source of satisfaction to us all that the improvement in the country's economic position, to which I then referred, has continued and gathered strength in the year which has since passed. The high level of our export trade, with the related rise in imports, and the considerable increase in our gold and dollar reserves, are matters which entitle us to feel a certain measure of satisfaction. But that must not be accompanied by any feeling of complacency. Ever-increasing efforts are required to maintain, let alone increase, our share of world trade and to keep our prices competitive in world markets. The further increase in productivity recorded during the year is satisfactory, but it cannot be too often emphasised that it is only by greater and more efficient production that real wages can be raised. A mere increase of money wages, followed inevitably by a rise in prices, can only result in a further fall in the purchasing power of the pound and, if pursued, in our pricing ourselves out of world markets. It should also be borne in mind that boom conditions, if continuing too long or carried too far, may result in demand outstripping production—a tendency which, no doubt, the recent rise in Bank rate was intended to curb.

NEED FOR TAXATION REDUCTION

Two important elements in considering the question of productivity are incentives and the improvement of our manufacturing position by large-scale increase in capital investment, particularly in the form of new plant and machinery. The best contribution towards both these objectives would be a reduction in the burden of taxation which, at present high levels, bears so heavily upon industry and all engaged in it, be they salary or wage earners. It is to be hoped that the Chancellor, in considering his next Budget, will be able to afford some relief both to the individual and to industry. A reduction in taxation and the correspondingly increased amount left in the hands of the taxpayer might, so far as it is used for spending, be more than offset by the stimulus to increased production and, so far as saved, add to the investment potential.

In this latter respect it is satisfactory to note the greatly improved figures for National Savings during the year, and we may hope that the present campaign for new savers will add many to those who are already in the movement.

The year which has passed has also seen the end of many controls which had long vexed the community, both producer and consumer alike, and this has, in the main, been achieved with benefit to all rather than the dire consequences which some people had forecast.

Great Britain would not seem to have made

much real progress towards convertibility during the year, but it is still an objective which we must keep well in view, cautious though our approach to it should be. The difficulty for us, and indeed for most of the world, is the probable unbalance of trade with the United States which might ensue, although, in this connection, it was interesting to read a few weeks ago that the President had again raised the question of reducing certain tariff rates on goods entering America.

SCOTTISH INDUSTRY AND COMMERCE

Turning now to Scottish affairs, I think we may pride ourselves on having had a good year. The level of employment continues to be satisfactory, although there are a few less fortunate "pockets" which are exceptions to the general rule. Let us hope that, in these cases, the affected industries will be revived or new ones attracted to the areas concerned. The Scottish Council (Development and Industry) continues its meritorious work, and the great success of its Exhibition in Glasgow last September reflects much credit on all those concerned in the conception and carrying through of the undertaking, the results of which must surely redound to the benefit of Scottish industry through the years.

Shipbuilding and the heavy industries have maintained a high level of output, British shipyards having achieved a record in tonnage of merchant ships completed during the year ended September, 1954. On the other hand, the state of order books for new shipbuilding continues to be a source of some anxiety.

Scotch whisky exports have again reached a new record, and this industry, and our Scottish woollen industry, have once more earned the nation's thanks for their outstanding contributions to the dollar position. Many of our Scottish industries, such as the Esparto Paper Trade, have also been operating at a high level of production during the year.

AGRICULTURE

The one industry for which 1954 has proved a year of exceptional difficulty is that which provides the life-blood of the country. I refer, of course, to agriculture, which in the past year, in addition to changes in Government policy and ever-increasing overheads, has had to compete with weather conditions which have made the gathering of the fruits of the industry extremely difficult.

All these added together have strained the farming economy, in some cases very severely, and it may well be that farmers need more than usual assistance just now. I am sure that any credit-worthy and efficient farmer will find he has both the sympathy and support of his banker in these difficult times. The same may be said of the owner of agricultural land and the owner-occupier, both of whom have to provide the fixed equipment, housing and amenities necessary to encourage a diminishing rural population to remain on the land.

MANAGEMENT AND STAFF

I have already referred to the loss the bank is suffering by the retirement of Mr Watt in a few weeks' time. His wisdom and experience will be missed by board and staff alike, and I feel sure this annual court would wish to place on record their appreciation of Mr Watt's long and distinguished services to the bank. On Mr Watt's retirement Mr Ballantyne becomes sole general manager, and we look forward with confidence to his occupation of that high office. We have

already appointed two assistant general managers, one of whom, Mr Ian B. White, will be resident in London, and the other, Mr John D. C. Dick, in Edinburgh.

Mr White has served the bank for thirty-six years, mainly spent in Bishopsgate office, where he became manager of our foreign department in 1936 and joint London manager in 1947. Our considerable foreign relations have been and will continue to be his special, but not exclusive, field of activity.

Mr Dick has now twenty-seven years' service, and has given valuable service to the bank as chief accountant since 1951.

In offering these three officers of the bank our best wishes for the future, may I also place on record the directors' appreciation not only of their services in the past but of the services of all the officials and staff, on both sides of the border, who continue to show undiminished zeal and efficiency in the interests of the bank. I should particularly like to express our appreciation for the manner in which the whole staff responded to the change in the date of our balance, involving as it did late work during a holiday season in Scotland. We are indeed grateful to them all.

APPROVAL OF ACCOUNTS

I now beg to propose that the report, containing a statement of the accounts and balance sheets, be approved and that a dividend of 3½ per cent, under deduction of income tax, be declared in conformity therewith.

The report was approved, and the governor, deputy governor, extraordinary directors and the retiring ordinary directors were re-elected.

SECOND BRITISH ASSETS TRUST LIMITED

CHAIRMAN'S REVIEW

The seventy-sixth annual general meeting of Second British Assets Trust Limited will be held on March 17th at 9, Charlotte Square, Edinburgh.

The following is the statement by the chairman, Mr Alastair C. Blair, CVO, WS, which has been circulated with the report and accounts for the year ended December 31, 1954:

Our income has continued to rise during the year and in spite of the fact that we have incurred profits tax for the first time the net income available for the ordinary capital has risen from £96,055 to £106,122. Income is still rising, but we look for this trend easing off as industrial companies come to face increasing costs, more competition and the need for money to keep equipment up to date. We are recommending the division of a rather higher proportion of our total net income than in the past when we still had profits tax ahead of us. We feel that when revenue is buoyant stockholders are entitled to benefit, but they will recognise that this may mean when there is a fall in income a reduction of dividend will come sooner.

The valuation at December 31st was the record figure of £6,322,716, an appreciation of 99.59 per cent over the book value, which is very satisfactory. During the year favourable opportunities were taken to invest in ordinary shares part of the funds which had previously been invested in Government Securities.

The directors have decided in future to publish quarterly income figures and also quarterly valuations as they think these will be of interest to stockholders.

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

ANNUAL REPORT AND ACCOUNTS

SIR ROBERT SINCLAIR'S REVIEW

The fifty-third annual general meeting of The Imperial Tobacco Company (of Great Britain and Ireland), Limited, will be held on March 22nd at Bristol.

The following is the statement by the chairman, Sir Robert Sinclair, KCB, KBE, which has been circulated to stockholders with the report and accounts for the year ended October 31, 1954:

The directors' report records the retirement of Mr G. A. Falk, and the appointment of Mr K. G. Y. Browne. Mr. Falk joined the company more than 50 years ago. He was appointed assistant solicitor in 1907, and secretary in 1911, and he became a member of the executive committee of the board in 1927. He retired from active work in October, 1945, and since then his great experience and knowledge of our business and his judgment have continued to be of very great value to the board, of which he was a member for over 30 years. The company has had no more loyal officer, no abler administrator or wiser counsellor, than Mr Falk. His qualities of mind and character gained for him the enduring admiration and affection of us all; and there are many in the company today who, like myself, have good cause to remember his kindness and his inspiring example. He carries with him in his retirement our warmest regard and best wishes.

Mr Browne has served the company's African organisation for 32 years. He joined our staff in Nyasaland in 1923, and, having been in turn manager of the Southern Rhodesia and Nyasaland branches, he became deputy general manager in 1949 and general manager in 1951. His election to the board is like a tribute to his ability and a recognition of the growth in the importance to the company of our leaf buying and handling organisation in the Federation of Rhodesia and Nyasaland.

SUMMARY OF THE YEAR'S RESULTS

The main features of the parent company's accounts are, I think, these: a slight increase in trading profit; a much-needed addition to our leaf stocks; an appreciable increase in dividends from trade investments; a strengthening of our financial position by the steps taken during the year for the funding of £20 million of short term borrowings and by further substantial transfers to reserve towards providing for replacement costs; and an increase in the ordinary dividend of 1 per cent—an increase which goes half-way to restoring the cut made a few years ago. There has also been an increase in turnover which is reflected in the increases in duty paid stocks and debtors.

The accounts for the group show that the subsidiary companies have had a satisfactory year's trading. Their profits, and the additions they have made to their reserves for capital needs, are included in the consolidated accounts, which show a further reinforcement of the group's position.

That is a review in very general terms of the year's results. You will, no doubt, expect me to comment in some detail on the more important items in the accounts.

THE ECONOMIST, FEBRUARY 26, 1955

TRADING PROFIT

To make a true comparison of this year's trading profit with that of last year, we must exclude the sum of £325,000 which represents a charge borne by the parent company last year but now considered more appropriately chargeable to some of the subsidiaries. This does not affect the total profit of the group. The effective increase in trading profit of the parent company is £415,000, or approximately 2 per cent. This percentage is slightly less than the percentage increase in our turnover, the reason being that rises in costs of leaf tobacco and in manufacturing wages and in salaries have exceeded the advantages we have had from improved efficiency. I will deal with the leaf supply position under stock-in-trade, but in connection with our trading results it is relevant to mention that the increase in turnover was only made possible by a greater availability of leaf tobacco which enabled us to increase the summer supplies to our customers and also to increase slightly the quotas of the brands which were in short supply. As you will have seen from the Press, the leaf supply position has improved to the point that a few weeks ago we were able to remove quotas entirely; and it is a great satisfaction to us to feel that we are at last free from the necessity of rationing supplies of our brands. I made some reference to the problems of rationing last year, but I would like to take this opportunity of saying how greatly we have appreciated the understanding attitude—and in most cases, I think, the sympathetic attitude—of our customers who were for so long unable to obtain all the goods they could sell and consequently had something of a rationing problem themselves. Our branches tried to be scrupulously fair in their rationing schemes, and I believe that our customers in general felt that they were given a square deal; but such restrictions cannot be popular, and we are glad to be quit of them.

STOCK-IN-TRADE

The value of the parent company's stock-in-trade shows an increase of £8,516,000. More than half of this is accounted for by an increase in value of our stocks of unmanufactured tobacco. This is due mainly to an increase in the quantity of leaf tobacco held, and, to a slight extent, to a higher average cost per lb. I am glad to be able to report that our purchases in North America and Rhodesia last year were more satisfactory, both in quantity and quality, than they have been for some years and we were able to buy more of the grades we need—which, of course, is one of the factors that involved an increase in the average cost per lb of our stocks.

Southern Rhodesia produced the largest and best crop in its history—a total of 120 million lb, of which nearly 60 per cent was bought for the United Kingdom. The quantity was up to expectations, and although there was still a larger amount of very low quality tobacco in the crop than we like to see, the quality of the rest showed a distinct improvement and reflected, I think, the value of the work of the research board and the care and attention which an increasing number of growers are giving to growing and curing problems. Tobacco is a delicate plant, very susceptible to variations of

climate, and nothing growers can do can fully insure against bad weather conditions, but there is no doubt that, with improved techniques, still better yields and better quality are possible. Unfortunately, the growing conditions in Southern Rhodesia recently have not been good, and the 1955 crop may turn out to be smaller than had been planned.

We were able to buy last year from the United States and Canada a quantity in excess of a year's using. I hope that the extra quantity purchased in the United States will be paid for ultimately in sterling, but to the extent that any part of these additional purchases has to be paid for in dollars we have to regard it, as at present advised, as a purchase on account of 1955. Our financial year ends in the middle of the buying season in the United States of America, and up to October 31st last we had been able to purchase about half the additional amount to which I have referred. The balance will, therefore, be taken into our stock in the current year.

The tobacco-growing districts of North America which produce flue-cured tobacco are more widely spread and cover a wider range of latitude than Southern Rhodesia. Therefore, they are not as a whole so vulnerable to local weather variations, and their total production (including Canada, which produces rather more than Southern Rhodesia) is more than ten times the Rhodesian crop. But even in North America, as we know from past experience, adverse weather conditions can drastically curtail the crop in any one year. We cannot afford, therefore, to lose any opportunity to raise our stocks to a level which will enable us to buy relatively sparingly from the less good crops and heavily from those that suit our needs.

I have referred on more than one occasion to the considerable increase in price of leaf tobacco since prewar days. It is, of course, natural for manufacturers to complain about the prices they have to pay for the materials they use; but it is as well to be realistic. While we certainly hope that improved methods and better yields will lead to some reduction in costs in the newer producing areas, in view of world conditions and the particular circumstances to which I have referred I do not myself think that, in the foreseeable future at any rate, we would be wise to count on a marked fall in the price of leaf tobacco generally.

CAPITAL AND RESERVES

I will now refer to our capital and reserve position, largely affected as it is by stocks and duty. A year ago we transferred to reserves in the parent company £2,796,000 out of the year's profits. With £464,000 provided from subsidiary companies the total addition to the group's reserves out of the year's profits amounted to £3,260,000. We were also able to add to our general reserves £733,000 previously provided but no longer needed for excess profits tax and £502,000 set free from income tax appropriations by reason of the reduction in the standard rate. This year we propose to transfer to reserves £2,750,000 from the parent company's profits, and £703,000 from subsidiary companies' profits—a total of £3,453,000 out of profits—together with £217,000 being the

THE ECONOMIST, FEBRUARY 26, 1955

surplus on realisation of certain fixed assets of a subsidiary company. In addition, out of the parent company's profits we have written off the expenses of issue of the 4 per cent unsecured loan stock 1975-80, and provided in full (£300,000) for the discount on that loan stock. The balance of profit to be carried forward is slightly greater than last year.

I have said more than once in recent years that unless we could be assured of a long period of lower prices, we should aim to transfer to reserves considerable sums each year to assist in meeting the replacement cost liability and our considerable needs of finance. This year we have certainly succeeded in so doing, but we have not, I think, done any more than is prudent in present circumstances. The increase in our leaf stocks is from one point of view highly satisfactory, but it is expensive; and our expenditure on manufacturing capacity, including modernisation and replacement of plant and machinery, must tend for a time to rise. Moreover, although one must admit that on the whole the general price level has been held remarkably well in conditions that might easily have become at least semi-inflationary, there is no sign of a reduction. There can, I think, be any invariable standard for the determination of the proportion of profits which a business should set aside in any one year towards meeting capital requirements maturing over a long period in the course of which many relevant circumstances may alter. Each industry and each company has its own problems. In the case of the tobacco industry, the financing of the duty at the present very high rates is a major problem, but I have never conceived it necessary—nor, I think, has anyone else—to provide the whole of that finance out of profits. Indeed, to provide any large part of it over a relatively short period would require substantial increases in price to the public, and it has been our consistent aim to keep prices, enormously inflated as they are by the duty element, as low as is reasonably possible. Moreover, we cannot expect to provide from profits the very large amount that may be required in any one year for an addition to leaf stocks; an addition that is small in terms of months' using is very large in value because of the size of our turnover. Circumstances, in fact, were such that our short term borrowings were rising during last year to a very high level, and, as you all know, we took advantage of favourable market conditions to fund £20 million by the issue of the 1975-80 4 per cent loan stock. We also arranged, subject to the permission of the Capital Issues Committee, for the replacement of £10 million 3 per cent Notes expiring next April by £15 million of a similar type of security with a life of 10 years, carrying interest at 3½ per cent per annum at a price of 99½. By these two transactions we will have effected a reduction of £25 million in our short term borrowings.

TAXATION

Comment on the transfers to reserve leads naturally to consideration of the effects of taxation. There can, I think, be no doubt that in practice taxation enters into costs and that the present level of taxation is higher than British industry can bear if it is to be truly competitive in world markets. The Government's declared policy of steady movement towards liberalisation of trade and payments—a policy which in theory must clearly be of particular advantage to this country as well as generally beneficial—could be frustrated and made to seem positively harmful if costs and prices cannot be kept down. It is to be hoped that increased revenue from the improvement in trade and productivity which has taken place in recent years may make possible some alleviation in tax burden. (I am here, of course,

speaking of the burden of direct taxation on industry—I will refer to the tobacco duty later.) Additions to reserves such as those to which I referred above have to be made out of taxed profits. They are mainly—in our case entirely—made as provision for capital purposes, and in so far as they are needed for a higher replacement cost of existing plant the tax upon them is in effect a tax on capital. I know only too well that there is no simple cure for this because a change in basis of tax has great complications, but there is no doubt that a reduction in the standard rate of income tax would be a material help in alleviating this particular burden on industry.

While on the subject of taxation, I would like to support most strongly the arguments that have been advanced recently from a number of quarters for alterations in the taxing of earned incomes so that there can be left, out of the higher earnings, some tangible reward for greater effort or skill or knowledge. I believe most people, whatever their circumstances, would agree with the fairness of this if the facts were properly understood. It certainly is a fact, under present conditions, that those who have the responsibility of controlling or directing an industrial concern constantly feel themselves frustrated in efforts to find ways of fairly rewarding special service on the part of the key men on whom so much of the success of the undertaking depends. This special service may take the form of the successful carrying of much greater responsibility or the development of a new and valuable technique—in short a service which adds materially to the prosperity of the undertaking. Under existing taxation it is impossible to give adequate financial recognition of special service on the part of anyone whose ability and industry have already carried him into the high income brackets. It would be absurd to say that loyalty or effort has thereby been sensibly reduced—the technological and managerial standards of British industry are as high as they have ever been—but the inescapable result of present taxation in this respect is injustice and the denial of material incentive.

GIFT TO EMPLOYEES

For many years this company has shown a practical sympathy with the ideals of profit-sharing about which some general public interest is being shown. We have tried very simply, by means of the gift, to give to all employees some financial reward over and above their ordinary earnings when the company's circumstances permit. This year the rate of the gift will be 13 per cent—the same rate as it was for the two preceding years—and as it is paid on actual earnings, and since salaries and wages have increased during each of these years, the amount which the great majority of employees will receive will again be slightly greater. This gift is made by way of special recognition of continuing loyal and efficient service. I believe that it has helped materially to strengthen the good relations which exist among all ranks in the company's service.

NET PROFIT AND DIVIDEND

The net profit for the parent company available for distribution after providing for taxation and all charges and for the appropriations to reserve to which I have already referred amounts to £7,452,000. It is proposed to pay a final dividend of 12½ per cent less income tax on the ordinary stock, which, with the interim dividend and the preference dividends, will take about £7,410,000 leaving £42,000 to be carried forward.

Included in the profit for the year before charging United Kingdom taxation is an amount of £3,612,000 from trade invest-

ments. This represents an increase of £652,000 in the income from that source as compared with the previous year, and that increase is mainly due to our holding in the British-American Tobacco Company which, as I have explained before handles *inter alia* the export trade in our brands. It is a fact, though I am not adducing this as an argument, that the increase on this score approximates very closely to the cost before tax of the increase of 1 per cent in the dividend. This increase goes half-way towards restoring cuts which circumstances forced upon us a few years ago. I would add only two things—firstly, that I am sorry that the increase cannot be more, but, from what I have said, you will appreciate there are good reasons for that, and secondly, that I do not think this increase would have been proposed if there had not been evidence that, for a time at least, the basis of our trade was being broadened and strengthened. I hope, therefore, you will consider the results of the year's operations as satisfactory.

THE OUTLOOK

In the present state of the trade it is even harder than usual to prophesy, but the phrase I have just used—"for a time at least"—requires some elaboration. Events during the past year and since its close have been seen to confirm the strength of our main brands in popular favour. On the information so far available, I would confidently expect our turnover in the current year to exceed that of last year. With still further improvements in efficiency we may succeed in offsetting some of the increases in cost that have already occurred. We may not, however, be able to avoid some small increases in prices of pipe tobaccos which are at a level where it is difficult for manufacturers—I am thinking, of course, particularly of those branches of ours whose business is mainly in the pipe tobacco trade—to make a profit. And, in many cases, this applies to distributors of pipe tobaccos as well. Cigars, too, are a special case where suitable leaf is in very short supply, and has risen in price enormously. On the bulk of our trade, however, I hope we may avoid any increases in price—we shall certainly do our best—and I think it is worthy of note that over the whole range of our pipe tobaccos and cigarettes the retail price to the public (excluding duty) has increased since 1939 by appreciably less than has the price of most other things. Taking everything into account, trading results this year should not so far as I can see be less favourable than last.

The more distant picture is, of course, clouded by the duty question. The Treasury and the Board of Customs and Excise are in no doubt of the views we hold as to the vital need in the interests both of the national revenue and of this industry for a start to be made soon in the process of reducing the rate of duty to a less penal level. There may be some who would say that a year in which the revenue from this duty is showing such buoyancy is a strange time to argue for a reduction. To that I would reply: firstly, that the apparent buoyancy is chiefly due to a long delayed availability of leaf tobacco in quantities sufficient to enable manufacturers to meet public demand (and partly, of course, to increased stocks in distributors' hands), and secondly, that some of the extra revenue from this "buoyancy" might wisely be regarded as a reserve towards meeting the first cost of a duty reduction that would help to strengthen the basis of future revenue. The demand itself has not grown, and great as, in my judgment, are the positive benefits which smoking can confer on mankind, the price of starting to smoke is made to look unduly high by the present rate of duty. In recent years, Canada has provided an admirable example of the ill-effect of an excessively high rate of duty and the benefits of a reduc-

tion. Coming nearer home, a comparison with Southern Ireland points the moral. There, since 1938, consumption per head has increased by 45 per cent, while the duty has gone up by 248 per cent. In the United Kingdom over the same period consumption per head has increased by 15 per cent, while duty has gone up by 512 per cent.

I recognise, of course, that such facts and arguments must be familiar to the powers that be, and, indeed, you would be entitled to be surprised if the industry had not taken steps to see that all concerned were fully informed of our strongly held views. Yet, if I am adequately and conscientiously to deal in this statement with the prospects of the company, I must re-emphasise the point and hope that what I say may not fall on deaf ears.

THE BAJOE KIDOEL RUBBER & PRODUCE COMPANY, LIMITED

SIR ERIC MILLER'S SPEECH

The forty-third annual general meeting of The Bajoe Kidoel Rubber & Produce Company, Limited, was held on February 23rd in London.

Sir Eric Miller, the chairman, in the course of his speech, said: The coffee crop at 1,009,648 kg was a postwar record. The rubber crop, however, fell short of the all-time record of the previous year by some 490,000 lb, mainly because of very dry weather. Export duties on rubber were lower and were suspended altogether towards the end of the year; yet production costs were higher and the world price, which in October, 1953, touched the low point of 16 pence per lb, averaged some 6½d. per lb less than during our previous year. On the other hand, our bumper crop of coffee met with a good market at rather higher prices.

The trading profit of our subsidiaries at Rp. 5,180,202 was only fractionally lower than for 1952-53.

Although no remittance of profits has been received from Indonesia for 1953-54, we recommend payment of a dividend of 10 per cent less income tax, which will absorb £13,693, leaving a credit balance on profit and loss account of £41,915, against £60,842 brought in. It is particularly cruel that in paying stockholders this modest dividend we have to provide £5,000 to cover the profits tax distribution charge demanded on it by the British Exchequer.

CONDITIONS IN INDONESIA

In East Java indiscipline is still rife, and a serious manifestation of it is the widespread and systematic theft of coffee berries from the bushes—we lost several tons of coffee in this way. Our valuable Celebes estates had a reasonably good year, although guerrillas still operate spasmodically in disregard of a military force on Balombissie. These estates were intermittently cut off from the outside world and ambushes were only one of the hazards the staff had to contend with.

Crops for the first ten months of the current year compared with the like period of the previous year are:

	East Java	Celebes
Rubber (lb)	1,614,091	1,299,812
953-54 (lb)	1,712,640	1,129,723
coffee (kg)	340,068	189,430
953-54 (kg)	717,000	256,615
apok (kg)	19,946	...
953-54 (kg)	...	26,800

There are six weeks of the current year still to go, but present indications are that our rupiah profits will substantially exceed those recorded in the accounts now before you.

The report and accounts were adopted and a dividend of 10 per cent, less tax, was approved.

CHELtenham AND GLOUCESTER BUILDING SOCIETY

ANNUAL GENERAL MEETING

CHAIRMAN'S SPEECH

The annual general meeting of the Cheltenham and Gloucester Building Society was held at the society's head office, Clarence Street, Cheltenham, on February 16, 1955.

Mr Leslie W. Bayley, CC, FAI, the president and chairman, presided, and in the course of his speech, said:

Throughout the year 1954 trade generally throughout the country was remarkably buoyant, and employment was maintained at a very high level, with the result that more people were able to save more money. Then, so far as housing is concerned, restrictions were removed, private building was getting into its swing, and the output of houses built for sale was 50 per cent greater than in the previous year.

In these circumstances it is not surprising that building societies in general have had a remarkably successful year, and this society in particular has done a record amount of business in all departments. For the first time in our history the amount of new money invested by shareholders and depositors has exceeded £5 million, and after allowing for withdrawals and interest the total remaining invested at the end of the year had increased by over £2½ million. The amount advanced on mortgage also exceeded £5 million for the first time in our history.

To deal with people for a moment, as opposed to money, our society now has 54,971 shareholders and depositors, and 26,925 borrowing members, giving a total of 81,896 separate accounts.

I would like to stress the point, however, that when a building society chairman announces a record year, as I am doing today, it does not mean that record profits have been made. A building society is not a trading concern, and is not out to make profits, and has in fact no reason for doing so. All we try to do is to hold the balance evenly between investors and borrowers, and after paying taxes and running expenses to put a modest sum to reserve. When a society announces a record year, therefore, it simply means that the society has been able to be of service to a greater number of people.

The accounts show that of the total of 5,438 new mortgages, no less than 5,015 were for advances not exceeding £2,000. You might be interested to know that 580 of our advances for a total of over £900,000 were in respect of newly built houses, this being an increase of some 50 per cent over last year's figure. Over 1,000 advances for a total of rather more than three-quarters of a million pounds were made to tenants who purchased the houses they were occupying, and this was more than double the 1953 figure.

During the year the Minister of Housing announced the guarantee scheme arranged between the representatives of the Ministry, the Local Authorities, and the Building Societies Association, under which building societies are enabled to advance 90 per cent of the value of houses costing not more than

£2,500, or 95 per cent of the value of modern houses costing not more than £2,000. Most building societies and many local authorities have agreed to operate the arrangement, but I must confess I have been disappointed at the attitude of some local authorities who prefer to advance the money themselves because they say they get a profit of ½ per cent. This ½ per cent is the difference between the rate the council pays the Public Works Loan Board and the rate at which it lends the money out on mortgage.

From an analysis of our management expenses, and after deleting items which would not apply to a local authority, and after deducting the proportion applicable to the investment side of our business, I find that it costs us 6s. 6d. per cent to administer our mortgages. I therefore doubt very much whether local authorities will make any profit out of their ½ per cent margin, and in fact it may not prove enough.

There is, however, a more important factor, and that is the risk of loss. The maximum advance which we consider it prudent to make on a newly built house without collateral security is 85 per cent, and our maximum term of years for repayment in such cases is 25. Many local authorities, however, are advancing 90 per cent on a 30-year term, and the risk is therefore appreciably greater. Such authorities are saddling themselves with the whole of the risk, whereas they need only take one-third of it by co-operating with building societies and the Government under the guarantee scheme. I hope I may look forward, however, during 1955 to increasing co-operation between building societies and local authorities in promoting house purchase under the guarantee scheme, because I feel confident this will be in the best interests of both.

In spite of the greatly increased mortgage business, we have been able to add to our holding in trustee securities during the year, and have maintained our liquid funds at just over 13 per cent of our assets. The market value of our quoted securities shows a surplus of £10,000 over book value.

After making full provision for increased income tax, and for profits tax and depreciation, we are able to transfer £75,000 to reserve (£70,000 last year), and our total reserves and unappropriated profit now amount to £1,546,000, representing 6.3 per cent on our assets. Total assets have now reached the record figure of £24,462,000.

The report and accounts were adopted.

The retiring directors were re-elected.

LLOYDS BANK LIMITED

ANNUAL GENERAL MEETING

CAPITAL PROPOSAL ADOPTED

The annual general meeting of Lloyds Bank Limited was held on February 18th at the head office, 71 Lombard Street, London, E.C.

The Right Honourable Sir Oliver Franks, GCMG, KCB, CBE, the chairman, presided.

With the concurrence of the members present the report and accounts and the statement by the chairman, all of which had been previously circulated, were taken as read.

The report and accounts were adopted and the other ordinary business transacted. A resolution approving the capitalisation of £3,593,239 from general reserve to pay up 5s. per share of the uncalled liability on the issued "A" shares was passed unanimously.

Votes of thanks were passed to the chairman and directors and to the staff.

JOHN SUMMERS AND SONS LIMITED

ACCOUNTS SHOW SUBSTANTIAL IMPROVEMENT

FUNDAMENTAL POSTWAR DEVELOPMENTS

PHENOMENAL INCREASE IN DEMAND

MR RICHARD F. SUMMERS ON FUTURE PLANS

The annual general meeting of John Summers and Sons Limited will be held on March 17th at St. Ermin's Hotel, Caxton Street, London, S.W.

The following is the statement by the chairman, Mr Richard F. Summers, circulated with the report and accounts for the fifty-two weeks ended October 2, 1954:

It affords me very great pleasure to be able once more to address members of the public as shareholders of John Summers and Sons Limited. The last occasion upon which I did this was in 1951; you will remember that on February 15th of that year all the shares in the company were taken over by the State. May I say how gratifying it is to know that a considerable number of our old shareholders have again taken an interest in the company, and how much I appreciate the confidence which they have once more placed in it. I am also very pleased that The United Steel Companies Limited once more have a holding in our company.

You will recollect that they took up 750,000 shares at the time the company was offered to the public. Our association with them goes back to 1939, and has been of considerable benefit to both companies. Also may I extend a very hearty welcome to the large number of new shareholders who for the first time have taken an interest in our affairs.

PREWAR DEVELOPMENTS

This business, which was founded by my grandfather just over one hundred years ago, has had a long history of expansion and progress. Many changes have taken place during the past century. Undoubtedly the most fundamental one was the decision taken in 1937 to abandon the old method of rolling sheets on hand mills and to change over to the continuous rolling method.

In 1938 we began the installation of hot and cold mills and a great deal of new finishing equipment. This change-over, which was fortunately virtually completed when war broke out, has ensured the maintenance by the company of a leading position in the sheet industry of this country.

MODERN DEVELOPMENT

The postwar development has also been of a fundamental character, consisting in the most part of the installation of two batteries of 88 coke ovens each, and two 27 ft. hearth blast furnaces. Prior to this we had to draw our supplies of pig iron from our subsidiary company, Shelton Iron, Steel and Coal Company, Limited, and other outside sources. This development was the logical consequence of the decision taken before the war, when we realised that in order to obtain the maximum tonnage from the hot and cold continuous strip mills we should have to increase our steel making capacity very substantially.

As our two melting shops were both many

years old, it was thought prudent to abandon them altogether, and put in an entirely new shop of the latest design. This also formed a part of our postwar development schemes. As a result of all this, when the installation of the plant is completed—which we hope will be some time in 1956—we feel confident that we shall reach our revised target figure of 1,250,000 tons of ingots.

Whilst we have naturally devoted a great deal of time and thought to the fundamental changes, we have not been unmindful of other possible developments. This company was the pioneer of a process which has been improved and expanded during the last few years of electrically deposited coatings on steel sheets. The new material has found a ready market, and has opened up new possibilities for the use of our product—in fact it has been so successful that we are now well on with plans for increasing our already sizeable production. We have also increased our capacity for continuous galvanising, in which I think I may also say we were the pioneers in this country, and now have three units in production.

Towards the end of 1955 we expect to have carried out modifications to the continuous cold mill, which will result in a substantial increase in its capacity. We hope that by then the second blast furnace will be in operation, and that the last few months of the year will show an increase in our tonnage. Unfortunately progress on this furnace has been severely handicapped by the strike of steel erectors employed by our main contractors. This is a matter over which we have no control, but it will undoubtedly delay the completion of the blast furnace by some months, and of course this will upsurge the other developments which are dependent upon the furnace coming into production.

INCREASE IN DEMAND

Since the war there has been a phenomenal increase in the demand for our products, and for a long time we have not been able entirely to satisfy our customers. Many of you, no doubt, will have read from time to time in the Press statements in connection with the expansion which is to take place in the motor industry. Not only the motor industry has plans for expansion; many other of our important and valued customers have also made it clear that their requirements are likely to rise. The higher standard of living brings with it a higher demand for household appliances and labour saving equipment, and the expansion of the oil and drum industries must also be borne in mind. All these markets are very large consumers of sheet steel.

In addition we are naturally under pressure from our many customers in the export market with whom we have had associations extending over a great number of years. Owing to the high home demand, steel sheets are still subject to export licences controlled by the Government. It has always been the

tradition of the steel industry to export a fairly large proportion of its products. This applies especially to our section of the trade, and I think it would be a mistake further to reduce the export quota of sheets, which is far below both the present demand and the amount we were exporting before the war.

INCREASE OF STEEL PRODUCTION

It must be remembered that in a basic industry such as steel the raising of production by a substantial amount entails the expenditure of vast sums of money, and the lapse of several years before the plan can be put into operation. Much has been said as to what should be the output of steel in this country, and widely varying totals have been mentioned, but the great progress in production that has been made since the war should not be overlooked. In 1946 the output was 12,700,000 tons; in 1954 it was 18,520,000 tons, and with the present plans in contemplation it is expected that by 1958 it may reach 22 million tons or thereabouts.

The whole question of the shortage of steel sheets is being earnestly considered by the industry, and an endeavour is being made to forecast on a realistic basis the likely requirements in the next few years. So far as we in this company are concerned we have, as I have already said, for many years occupied a very important place in the steel sheet industry, and I think it can be said that hitherto we have not failed to recognise our responsibilities as members of that industry.

CAPITAL COST OF PLANT

It has always been our desire to endeavour to meet to the best of our ability the demands of our customers, both from the point of view of quantity and quality. We had this very much in mind when we embarked upon the installation of the continuous strip mills in 1937. Subsequent events have proved how wise our policy was, for had we delayed the postwar supply position would have been very adversely affected. Furthermore, from the company's point of view it was a very fortunate decision, for the cost of these mills in 1938 and 1939 was only a fraction of what it would be today.

In spite of the high cost of postwar development schemes, as a result of our pre-war decisions the total cost of the complete Shotton works will be low by modern standards; it has been estimated, and stated in the Press, that the cost of a fully integrated plant of a similar character would today be in the region of £100 per annual ingot ton of steel produced. We had in mind the apparently ever increasing cost of plant when we decided to create the fixed assets replacement reserve referred to in the directors' report, to which sums will be allocated to augment the depreciation based on the actual or historical cost of our plant which is provided in the profit and loss account.

POSSIBLE FUTURE DEVELOPMENTS

When our present plans are complete our production of steel will be considerably more than doubled, but it may well be that investigations will show that further expansion of steel sheet production in this country is necessary. If this is the case I would hope and expect that as in the past your company will play its proper part. You may rest assured that we are fully alive to the position and are keeping in touch with the appropriate official bodies.

In the meantime detailed investigations are being undertaken regarding the possibility of still further expanding the production in our Shotton works beyond the present target of 1,250,000 ingot tons per annum. I am sure you will appreciate that it is too early at this stage for me to make any definite statement on this very important point. However, whatever may be the outcome I feel that we can look forward to the future with confidence.

FINANCIAL RESULTS

You will have noticed that the results for 1954 show a very substantial increase over those of the preceding year. This is mainly due to the fact that that year was one in which the new equipment was being brought progressively into production. It is inevitable when bringing such large units of plant into operation that there should be initial difficulties, more especially when, as in our case, it is necessary to train men in new processes of which they have had no previous experience.

Many of these men had been displaced, owing to the fact that our greatly increased steel output was to be made in eight large modern furnaces instead of the seventeen small old ones, and naturally we wished to find employment for them. We are now deriving the benefit of the economies of all this new plant, and we can therefore, I think, look forward to somewhat better results for the current year, although of course we shall not reach our maximum earning capacity until we have completed the whole of the developments now in hand. This, as I have previously said, we hope will be some time in 1956.

SHELTON IRON, STEEL AND COAL COMPANY, LIMITED

So far I have dealt entirely with the Shotton works, but I would not like to omit a reference to our main subsidiary, Shelton Iron, Steel and Coal Company, Limited, who have had a most successful year, and who have maintained their operations in a most efficient manner. I should also like to emphasise that to our ultimate ingot output of 1,250,000 tons must be added the production from Shelton, which last year was about 240,000 tons. This would give the group a total steel output of nearly 1,500,000 tons.

EMPLOYEES

With all the additional plant which has been installed at Shotton we have of course had to increase the number of our staff very considerably, and many of them have had to learn new methods and new techniques. I should like to take this opportunity of expressing our thanks and appreciation to all our employees for the services which they have given during the year, and the contribution which they have made to the rising prosperity of the company.

CONCLUSION.—I hope that when I address you next year I shall be in a position to report further progress, and to inform you that we are operating at a substantially higher level of production.

R. A. LISTER AND COMPANY, LIMITED
SIR PERCY LISTER'S STATEMENT

The annual general meeting of R. A. Lister and Company Limited was held on February 21st at Dursley. The following are extracts from the speech made by the chairman, Sir Percy Lister, who presided.

Turnover and profits before taxation have established yet another record, an accomplishment which is the more gratifying when it is realised that sterling shortages, licensing and quota controls still seriously interfere with the normal flow of trade in many markets.

During the past year, on the recommendation of your board, the members authorised the issue of 1,040,000 ordinary shares by capitalisation out of reserves, increasing the issued ordinary capital to £3,640,000 and thus bringing the capital of the company more into line with the capital employed in it.

In accordance with statements on our dividend policy made to the members when presenting the accounts at the last two annual meetings, your board have much pleasure in recommending that the final dividend for the year under review be 7½ per cent, representing a small increase over the final dividend paid on the smaller capital last year.

The increasing demand in the domestic market for the range of products of the group is encouraging and the ever-widening range of clients gives a valued measure of stability to your business in this market.

OVERSEAS ACTIVITIES

Your company's widespread export connections and goodwill have produced record demands for the products of the group, a trend which, I am happy to say, currently continues, and the steady expansion of your group's activities overseas should stand us in good stead if and when less favourable world trading conditions pertain.

Recently your company has placed on the market their first small air-cooled diesel engine, the result of many years of careful design, research and prolonged tests under laboratory and user conditions. The demand for this engine, for land and marine purposes in a wide field of applications, is most encouraging, and already this demand is considerably in excess of the current productive capacity which is being expanded as rapidly as circumstances will permit.

The improved financial and economic position of the country is reflected in the industrial expansion and the increased purchasing power, for which all credit should be given to the Chancellor of the Exchequer and his colleagues who so courageously, disregarding political repercussions, "cut our coat according to the cloth," and the currently improved trading conditions are a direct result—a fact which should not be forgotten by the beneficiaries, irrespective of their occupation.

With the improved financial conditions it is hoped that the taxpayers, who have contributed so much, should now receive a tangible measure of relief. Such relief must provide a greater incentive for productive effort and reduce the tendency for the type of skill and experience we so badly need being tempted to emigrate to countries where taxation is less "penal and frustrating."

In conclusion on your behalf, as well as on behalf of your board, I should like once more to extend to the directors, staff and employees in the service of the Lister group of companies, associated companies and branches in all parts of the world, our sincere thanks, for it is through their loyal co-operation and effort that the increased volume of turnover has been accomplished.

The report was adopted.

SOUTH ESSEX WATERWORKS
A SATISFACTORY YEAR

The annual general meeting of the South Essex Waterworks Company was held on February 18th in London, Mr G. Francis Stringer, OBE, chairman, presiding.

The following are extracts from his statement circulated with the report and accounts for the year 1954:

An increase of £46,712 in gross revenue is shown. A very appreciable additional demand for domestic, industrial and building purposes has occurred during the year and the above mentioned increase in gross revenue has enabled the company to meet further increases in the cost of coal, wages and other materials without recourse to an addition to water rates and charges. The erection and occupation of 5,965 dwelling houses during the year within the area of supply of your company has exceeded all postwar figures.

After the payment of dividends as recommended and the appropriation of £65,000 to contingency fund the carry forward is increased by £4,346 to £115,507.

Since the war, the population supplied by your company has increased by 170,000, while the demand for trade and industry has advanced by 70 per cent. Your board much regret that it has been necessary to prohibit until further notice within the limits of supply of the company, the use of any water supplied by them and drawn through a hosepipe or similar apparatus for the purpose of watering private gardens or washing private motor cars.

The report and accounts were adopted.

THE ATLAS STONE COMPANY

TURNOVER WELL MAINTAINED

The twenty-fourth ordinary general meeting of The Atlas Stone Company Limited was held on February 23rd in London, Mr Bernard Davis (chairman and managing director) presiding.

The following is an extract from his circulated statement:

Our trading profit for the year amounted to £73,097 and compares with £50,734 for the previous year. The profit this year, added to the amount of £64,201 brought forward, gives a total of £137,298. After charging depreciation, taxation and all other outgoings, there remains a net available balance of £82,172, out of which your directors recommend that a dividend of 10 per cent, less tax, should be paid, leaving £72,089 to be carried forward.

The result of the company's trading this year is satisfactory in spite of the fact that there has been a decline in the demand for certain precast concrete products which has resulted in keener competition than previously. Every effort has been made to maintain our turnover in this department in the face of reduced margins, and in this we have been successful.

On the paving and kerb side of our business, sales have exceeded those of last year. With regard to our asbestos cement products, I am also glad to report that our sales have been well maintained.

There has been a reduction in the volume of our export trade owing to keener competition from overseas, but we have in spite of this maintained a useful trade in many countries.

The report was adopted.

CO-OPERATIVE PERMANENT BUILDING SOCIETY
ALL-ROUND BUSINESS EXTENSION

35-YEAR REPAYMENT SCHEME INTRODUCED

MR HARRY L. SCORE REVIEWS EXCELLENT RESULTS

The seventy-first annual general meeting of the Co-operative Permanent Building Society was held on February 19th in London.

The president, Mr Harry L. Score, addressing the meeting, said:

Ladies and gentlemen,—I think I can claim that 1954 will long remain a notable and memorable year in the Society's history. I have not only to report an all round extension of the Society's business, including record mortgage advances of over £24 million and another large increase in membership, but, of course, we have attained total assets of £100 million. It is a source of much pride to the directors and the staff, and we have been gratified to receive the congratulations of many of our members and business connections.

ACCOUNTS FOR 1954

Our total share balances have increased during the year by some £16 million, and our deposit balances by some £3 million, and I can assure you that these increases represent a considerable achievement on the part of the organisation. It is only by the attraction of these increased funds that the society has been able to meet the heavy and sustained demand for mortgage advances which has flowed from the increasing number of houses being built for sale to owner-occupiers. In 1954 the loan applications actually approved exceeded £29 million, representing more than 22,000 separate advances. It may interest you to have the following analysis of that total lending:

Private dwelling houses:	£	£
New construction ...	11,003,000	
Existing houses ...	16,633,000	27,636,000
Shops with living accommodation ...		486,000
Farms and small holdings ...		164,000
Houses and flats purchased for investment ...		361,000
Offices, commercial and industrial securities ...		419,000
		<u>£29,066,000</u>

MORTGAGE ASSETS

At the end of the year the total amount outstanding on mortgage was £88,500,000, and I am very happy to report that the 110,000 accounts which made up this total were in excellent condition. The number of properties held in possession at December 31st was 33, compared with 42 12 months previously. When one considers that 75,000 of our accounts carry a debt of less than £1,000, and that the average debt on all our mortgage accounts is only £811, it will be realised what a wonderful security these assets represent for our investing members.

LIQUID POSITION

The society ended the year in a strong liquid position, having no less than

£16,400,000 in securities and cash. As you will see from the investments account, a surplus of £217,000 was realised during the year, and notwithstanding this the investments held at the end of the year had a market value substantially in excess of the book value.

PROFIT AND LOSS ACCOUNT

The total revenue for the year amounted to £4,315,000, £746,000 was absorbed by management expenses, £223,000 by deposit interest, and £1,098,000 by income tax and profits tax. After paying interest to shareholders, £250,000 has been credited to general reserve, £65,000 to investment reserve, and £109,000 to mortgage reserve account, leaving a balance to be carried forward of £189,000. The reserve funds have thus been considerably increased, and with the balance carried forward these amount to the substantial sum of £3,819,000.

STAFF AND AGENTS

These results should, I think, make us all proud of our efficient and still rapidly developing organisation. The volume of business transacted has meant that our staff at head office and at the branches have worked at full pressure throughout the year. I should like to pay the warmest tribute to their enthusiasm, and to the splendid work they have done. Few organisations enjoy the services of such a loyal and able team.

IMPROVED MORTGAGE TERMS

Last year I made reference to the need for low deposits and long repayment terms to encourage young people to embark upon home-ownership. The Government Guarantee Scheme, which was then under discussion, was brought into operation during 1954 and was welcomed by this Society and by building societies generally as an approach to the problem of low deposits. It provided for 95 per cent advances on properties costing not more than £2,000, but did not provide for a repayment term of more than 25 years. The scheme has been adopted by a majority of local authorities, and it will interest you to know, I am sure, that up to the end of January, 1955, the Society had agreed loans under the scheme amounting to £1,081,000.

To meet the needs of those who can find the 5 per cent deposit, but who want a lower repayment than is obtainable under the local authority scheme, the Society has recently introduced its own scheme, under which loans will be granted for a period of 35 years. Let me assure you that your board does not consider that the society is incurring any undue risks by making this extension. Some ten years ago we adopted and pioneered the thirty-year repayment term, a term of years which is widely used by local authorities under the Small Dwellings Acquisition Act, but considered by some building societies to be rather venturesome. I can only tell you that our experience of the thirty-year term since 1944—a period which includes several years of falling prices—has convinced us that

to extend the term a further five years involves very little hazard.

The other thing I would say about our new scheme is that it has been extremely well received, and I am sure that it is going to enable many families to buy their homes on terms which will ensure that the monthly payment to the society does not unduly strain the family budget. Jobs are plentiful and earnings are good. Nevertheless, young couples have many things to contend with—the cost of furnishing, legal costs, and stamp duties (and this latter is a point where the Chancellor could surely grant some relief)—and they do not want to be too heavily committed. Again, building costs are rising, not falling. They are about 3½ times what they were in 1939, and some four times what they were in the middle 1930s. This means that the house which could be bought at £500 in 1934 would cost something approaching £2,000 today. Is this not a good reason for an extended repayment term? We are trying to make house-purchase not a burden and a drain on the household income, but a venture which can be undertaken comfortably and with confidence as a further step towards independence. Tomorrow's prosperous families are those which are saving and buying their houses today.

INTEREST RATES

Building society interest rates occasioned much lively controversy during 1954. The primary factor was, of course, the reduction in Bank rate from 3½ per cent to 3 per cent in May, 1954—a factor which has disappeared from the scene within the last few weeks by the Bank of England's reversion to the 3½ per cent rate. I am not one of those who would argue that Bank rate and building society rates have no relation whatever. In so far as there must be some relationship between short and long term money rates, there must be occasions when Bank rate is a signal to building societies, and such it was in 1952 when it was raised to 4 per cent. But the relationship between building society rates and Bank rate can never be a close one.

A most important consideration we must always bear in mind is the rate which we must pay for funds, especially at a time when the demands on the Society's resources are running at high levels. If we were to reduce the rates paid to our investing members we should probably fail to attract adequate sums to fulfil our primary task of financing house-buyers. It is not always realised how essential the building society part in house finance has become. There is the day to day turnover in existing houses, which, as you will see from the figures I gave earlier, absorb even today practically two-thirds of our annual lending. On top of that, the number of houses built for sale is still rising, and should comfortably exceed 100,000 units in 1955. There are still greater opportunities awaiting building societies in financing private house-building in new towns and expanded towns, and in the rebuilding of the inner cores of our existing industrial towns. Building societies may also have the opportunity of participating in forms of redevelopment other than single family houses, and for my own part I see before us an expanding future of active and useful work.

The report and accounts were adopted.

HER MAJESTY'S OVERSEA CIVIL SERVICE

Statistician (BCD 63/7/93) in the Department of Agriculture, Kenya, to advise on the design of field and other experiments conducted by the Department including sampling, investigations and surveys, and to assist in the statistical analysis of results.

The appointment will be on two years' probation for permanent and pensionable employment. Salary in scale £816 to £1,629 (including pensionable allowance) plus a temporary variable non-pensionable allowance at present 10 per cent of salary (maximum £162 per annum). Government quarters provided when available at a moderate rental. Free passages for officer, wife and family up to cost of three adult passages. Income tax at local rates which are much lower than in United Kingdom. Generous home leave.

Qualifications required are a good degree in Mathematics or Statistics with some post-graduate training in statistics, and preferably a diploma in statistics; some experience of, or training in, statistics methods as applied to agricultural field experiments is essential. The required post-graduate training would if necessary be provided for by means of a Colonial Agricultural Probationship. Applications will therefore be accepted from persons who hope to obtain a degree this year.

Intending applicants, who should be between 21 and 40 years old should write to the Director of Recruitment (Her Majesty's Overseas Civil Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, stating briefly personal particulars and qualifications and quoting above reference.

THE STEEL COMPANY OF WALES, LIMITED

(STEEL DIVISION)
PORT TALBOT
INVITES

applications from suitably qualified young men, who have completed their National Service, for a number of posts in their Operational Research Department.

The Company operates the largest and most modern integrated Steel Plant in Europe and is still expanding. The plant is laid out on the South Wales seaboard in spacious and pleasant surroundings with ideal working conditions. Good residential areas are reasonably close to the Works.

The Operational Research Department engages in the investigation of a wide range of stimulating problems concerned with all aspects of the efficiency and development of a complex plant; there is ample scope for originality of approach and initiative.

An attractive pension scheme is in operation.

Removal expenses will be paid for a married man to a maximum of 5 per cent of annual salary.

Vacancies are available for:

(a) One PHYSICIST with a good honours degree and preferably some industrial experience. Starting salary in the range of £709-£900.

(b) One STATISTICIAN with an honours degree in Mathematics and a few years' experience. Salary in keeping with experience and qualifications.

(c) Three or Four GRADUATES in either Science or Engineering who seek to apply their training to industrial problems. Starting salary in the range of £550-£650.

Those wishing to apply should write for official Application Form to the:

Personnel Superintendent,
The Steel Company of Wales Limited,
P.O. Box No. 3,
PORT TALBOT, Glam.

MARKETING OFFICER required by NIGERIAN FEDERAL GOVERNMENT for Marketing and Exports Department for one tour of 15-24 months in first instance. Salary scale (including expatriation pay) either £750, rising to £1,480 a year with prospect of permanency, or £807, rising to £1,631, a year on temporary basis with gratuity of £100-£150 a year. Outfit allowance £30-£60. Free passages for Officer and wife. Assistance towards the cost of children's passages or up to £150 annually for maintenance in U.K. Liberal leave on full salary. Candidates, preferably under 45, must have had a sound general education with a University degree, preferably in Commerce or Economics, and must possess administrative ability. Write to the Crown Agents, 4 Millbank London, S.W.1 State age, name in block letters, full qualifications and experience, and quote M1B/34641/EN.

CHIEF ACCOUNTANT. A large British-owned manufacturing concern operating in Portugal requires the services of a Chief Accountant, not more than 45 years of age, who has held a similarly responsible position in the United Kingdom. This post calls for first-class knowledge and experience of all aspects of accounting, costing and financial control as well as for business acumen and the ability to control the whole of the work of the accounts department. A very substantial salary, virtually free of tax, is offered, with an initial contract for three years, the post thereafter becoming permanent, pensionable and holding exceptional prospects. Applications in confidence, to be addressed to Box FE/94, c/o 95 Bishopsgate, E.C.2.

PRODUCT AND CONSUMER RESEARCH ANALYST required by Export Market Analysis Department of Ford Motor Company, Ltd. Dagenham, Essex. Lively interest in motor vehicles and their overseas possibilities essential. Education to at least matriculation required, economics or engineering studies a strong advantage. A young, forward looking man is required. Good salary. Non-contributory pension. Reply to Salaried Personnel Department, quoting reference PCR/4.

ASSISTANT required for Publications Section of International Oil Company. Duties include editing of texts, styling, choice of illustrative material, and contact with typographers, blockmakers and writers. Subject matter ranges from technical to cultural and the highest standards of production are maintained. Applicants, who must have had previous experience of such work, should be between 24 and 32 years of age. Salary according to age, experience and qualifications. Pension Fund rights. Please apply to Box 847.

GRADUATE in Economics, "first" or good "second" degree (preferably with Statistics) required for research work in Department of Economics, International Wool Secretariat, starting salary £500-£600 according to qualifications, with superannuation benefits. Apply in writing, giving full details of qualifications and experience, to the Secretary, International Wool Secretariat, Dorland House, 18-20 Regent Street, London, S.W.1, marking cover: "EC Confidential."

YOUNG American woman, graduate of Geneva University, French and some German, now studying for D.Phil. (Oxon), desires part-time work in London: research, editing, coaching.—Mrs. Meynell, 16 Great James Street, London, W.C.1.

THE ECONOMIST, FEBRUARY 26, 1955

NATIONAL BANK OF INDIA

Notice is hereby given that the Transfer Books of the Bank will be closed from March 9th to March 22nd, both days inclusive.

By Order of the Board,
N. W. CHISHOLM, General Manager,
February 22, 1955.

MIDDLESEX COUNTY COUNCIL
EDUCATION COMMITTEE

ACTON TECHNICAL COLLEGE

HIGH STREET, ACTON, W.3

Applications are invited for the post of ASSISTANT LECTURER (Grade B) in the Department of Management and Production Engineering. Applicants should be prepared to work closely with the production engineering staff in developing with industry collaborative teaching demonstrating the interdependence of the technical and social factors affecting manufacture.

Desirable qualifications include a degree in one of the subjects of Social Science and some experience of industry, consultancy or existing social research team. There will be an opportunity of working with an Salary in accordance with the Burnham (Technical) Report, 1954.

Application forms (stamped addressed foolscap envelope) from the Principal to whom completed forms should be returned within fourteen days of the appearance of this advertisement.

C. E. GURR, Secretary to the Education Committee.

UNIVERSITY OF QUEENSLAND

AUSTRALIA

Applications are invited for a LECTURESHIP IN HISTORY (either Grade I or Grade II).

The salary ranges are:
Grade I £A1,275-£A1,450
Grade II £A1,100-£A1,250

Applicants should possess an Honours degree in History. Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is March 31, 1955.

THE TRAINING OF TECHNICAL TEACHERS

Applications are invited from men and women of approximately 25 years of age and over, for admission to a one-year course of training as full-time Teachers of General Commercial and Professional Subjects, and/or Office Arts (Shorthand, Typewriting and other Secretarial work), in technical colleges and similar institutions.

Applicants who wish to teach general commercial and professional subjects should have a University Degree, or professional qualification, or a Higher National Certificate in Commerce.

Applicants who wish to teach Office Arts should possess higher certificates of some recognised examining body in shorthand and typewriting, and should show evidence of a good general education.

In all cases applicants will be expected to show evidence of good business and other clerical experience.

The courses will begin in September, 1955. Recognised students will pay no fees, and they will be eligible for maintenance grants for the period of the course.

Further particulars and application forms may be obtained from the following Colleges on receipt of a stamped addressed foolscap envelope:

Bolton.—The Principal (S/1/4), Bolton Training College, Manchester Road, Bolton.

Huddersfield.—The Director (S/1/4), Huddersfield Training College, Queen Street South, Huddersfield, Yorks.

London.—The Principal (S/1/4), Garnett College, 83, New Kent Road, London, S.E.1.

QUALIFIED ACCOUNTANTS

A number of qualified Accountants—C.A., S.A.A., A.C.C.A.—are required for a rapidly expanding group of companies in the high-technology and electrical industry. Age 25-40. Salary range £600-£1,300, according to age and experience. Previous knowledge of budgetary control and standard costing preferable but not essential.

Successful applicants will be required to undertake an intensive course of training in factories in various parts of Great Britain for giving age and full details of qualifications, professional and industrial experience and salary required to Box 849.

A COMPANY of the highest standing converting flexible packaging materials invites applications from executives with thorough commercial experience in this field. The appointment will be that of Sales Manager in the first instance, but applicants should be of ability not less than 40-50 years of age. The salary would be £3,000 p.a. with contributory pension benefits.

Applications can be considered only from executives of the highest integrity and of proved management ability and record. Applications should be sent in the first place to Kennedy, Ponsonby and Pridemore, Solicitors, 117A, Chancery Lane, London, E.C.2.

Applicants who fear they may be replying to an advertisement forwarded to (name of their employers), in which case the application will be destroyed unopened.

MARKET RESEARCH.—Gillette Industries Limited are interested in receiving applications for appointments in their expanding Market Research Department. There is a vacancy for a senior man and also a vacancy for a younger man, preferably already with some experience, for training. All applications will be treated as strictly confidential and should be addressed to the Market Research Manager, Gillette Industries Limited, Isleworth, Middlesex.

A LARGE industrial organisation requires the services of a young, attractive Divisional, CHARTERED ACCOUNTANT in the Administration and Finance Department. The special qualities required are first-class personal service in H.M. Forces. This is an excellent opportunity for a young man with a considered determination to make a career in industry. Replies should state age and fullest details of Service experience. Box 846.

INDUSTRIAL DEVELOPMENT IN INDONESIA, by A. M. Neuman. Available from Students' Bookshops Ltd., Cambridge. The Book House Ltd., Whitehall, London, S.W.1. Price 4s. 6d.

THE UNIVERSITY OF MANCHESTER

HYDRO-ELECTRIC SCHEME
Comrie, Perthshire, Scotland

British & European
ROCK-TUNNELLING RECORD

During the week ending 19th December 1954,
The Mitchell Construction Company drove 428 feet on one heading
on a 10 feet 6 inches bed-width tunnel on one of the
Breadalbane contracts which Mitchell's are executing for the
North of Scotland Hydro-Electric Board.
This was part of a total of 1,300 feet driven on all headings
in the same week. No special arrangements were
made in connection with the record and the same
planning and resources which made it possible are
devoted to all contracts entrusted to us.

HOW YOU CAN HAVE VISIBLE RECORDS PLUS MULTIPLE ENTRIES for Ledgers, Wages, Stocks, Hire Purchase

Nobody questions the tremendous value of visible records, especially nowadays. For the rising cost of clerical labour has made any saving in cost (or increase in output) vitally important.

Take the basic factors of any visible record . . . First, you can SEE any one record instantly—without searching. That means instant reference and quicker entry.

Next, the edge of a visible record flashes to your eyes the facts you want to know—without check-up. You see who owes you money—what stocks are short—what credit limits are . . .

In short, visible records are not ONLY far more efficient. They save money as well as time. But now for an even greater step forward . . .

SAVE 66⅔% CLERICAL LABOUR

Now you can use visible records in such a way as to have three entries with one writing. Take, as an example, sales and purchase ledgers. Now, there is no need to find the account, type the statement, enter into the journal . . . and delay statements until the end of the month. For now you can have the statement WITH the ledger account WITH the Day Book sheet and enter all three with ONE WRITING. That means—surely?—66⅔% less margin of error, of checking and of posting figures.

The same economies can apply to Wages, Stocks, Hire Purchase, etc.

Just jot 'Multicopying Visible Records' on your letter heading and full details will be sent you by return.

A nice clean start, Mr. Percival?

Washing up the tea things at home is a very small headache compared with the huge task of washing millions of milk bottles—a problem that faces the milk industry every day. Calgon and other Albright & Wilson phosphates are being used more and more throughout many branches of the food industry to make washing solutions work more efficiently, and to ensure that bottles, jars, tins and equipment are left scrupulously clean and sterile.

Chemicals for Industry

ALBRIGHT & WILSON

ALBRIGHT & WILSON LTD • 49 PARK LANE • LONDON • W.1 • TELEPHONE: GROSVENOR 1311

Sounds, Shillings and Pence

IF SMELLS were the biggest curse of the nineteenth century, most certainly noises have taken their place as the greatest nuisance of the twentieth. In industry, noise nuisance is the unseen enemy employers have to face, contributing to inaccuracy, lack of concentration, careless mistakes and unwitting distraction from the job in hand.

Whilst the employees' need for adequate light, temperature and ventilation usually receive sufficient attention, is it not strange that so little regard is paid to the requirements of the ear? Heavy factory machinery is not the only source of noise in industry. The problem is becoming acute in offices where typewriters, adding and duplicating machines, and teleprinters are also making their own noisy contributions to unpleasant working conditions.

What can be done about this unwanted noise which so systematically lowers working efficiency? Nowadays the requirements of our hearing can be scientifically assessed so that the amount of noise reducing insulation can be accurately calculated. In many cases reduction of noise can be effected without structural alteration and without interruption to working arrangements of the factory or office.

It is worth a little thought to consider what contributions the elimination of undesired noise could make to the working efficiency of your factory and office. Newalls experience in this field as manufacturers and contractors is at your disposal on any aspect of sound insulation. *Preliminary investigation and consultation are gladly offered and will cost you nothing.*

NEWALLS INSULATION CO. LTD • Washington • Co. Durham

Offices and Depots at LONDON, GLASGOW, MANCHESTER, NEWCASTLE UPON TYNE, BIRMINGHAM, BELFAST, BRISTOL AND CARDIFF. AGENTS AND VENDORS IN MOST MARKETS ABROAD.

**Does your office
bear looking at?**

The effects of time on everyday faces and places are seldom seen clearly. Our children grow up, our friends grow old, our offices grow shabby and we hardly notice the difference.

Any business man who detects a need for improvement when he tries to see his own office as outsiders see it, is invited to get in touch with Catesbys Contracts.

Catesbys have a team of expert decorators, designers and furnishers who will co-operate intelligently with you to give your office a comfortable atmosphere that befits and inspires a good business man. You'll find that Catesbys Contracts are organised to get on with the job fast and efficiently and that they never seek to push you into more expense than you want.

They'll do the whole thing, from first plan to last fitting, then leave the place spick and span for you. *Ring Museum 7777 and have an executive round to see you.*

The Proportions of the Human Figure
Leonardo da Vinci

Man is the measure of all things—

PROTAGORAS (B.C. 481-411)

We live in an age of great organisations; can we also live in one of great individuals? To reconcile the technical achievement of modern society with the dignity of the men and women who compose it is the problem of our time. To reach a solution we must first be certain of the aim we set our mammoth communities and world-wide corporations; when the last superlative has been uttered, the test must be the same—how far they contribute to the happiness, understanding and liberty of the ordinary man.

The real measure of a modern industry is its power to preserve our human values while adding to our material heritage. Man is not just another factor in the productive chain—he is the reason for its existence.

“There are people whose business it is to know about these things”

You may never have seen a refractory. “The technical side!” you may say. “There are people whose business it is to know these things.” How right you are! Refractories are technically very complex, and financially very important. Their selection really is a specialists’ job. Morgans are such specialists. They are the manufacturers of some of the finest refractories in the world. They designed, and they operate, the most up-to-date refractories plant in Europe. They know, if anyone does, the care with which long-life refractories must be made. Morgans’ advice—which involves no obligation—is completely authoritative.

Refractories are the materials from which furnaces are built. They may well be in your balance sheet—unseen. Think of their effect on labour and fuel costs, overheads, furnace productivity; and their importance at once becomes clear. As well that there are people who know about these things!

Beauty that's good for business

WALLSPAN

The use of Wallspan for Outer Walls offers your architect greater scope and opportunity in the design of any new building you contemplate. Wallspan can give you an impressive, colourful building that will retain its beauty—and its value—through the smoke and grime of the years.

Why Wallspan gives you a Building you'll be proud of. Nowadays the weight of a building is borne by the structural frame. The outer walls, which provide the setting for windows and doors, are essentially protective and decorative, keeping the weather out and the warmth in and giving the building a suitable facade.

With Wallspan, the facade can be far more colourful and graceful, far more imaginative in design. For Wallspan outer walls consist of a grid of aluminium alloy which is bolted to the frame of the building. Into it are fixed windows and doors and the grid is completed with any of a wide variety of beautiful panelling materials, which can be faced in glass, stone, metal, wood and so on, each in a choice of colours. So the use of Wallspan gives your architect completely new opportunities to design not only a building you'll be proud of, but one that will keep its beautiful appearance and its value.

No maintenance. Wallspan walls need neither pointing nor painting. They can be kept clean by an occasional wash-down by the window cleaners.

More Floor Space and More Warmth. Wallspan grid members can be as little as 5 inches thick, carrying panelling about 2 inches thick, compared with the 11 inch thickness of traditional walls. Thus you get extra rentable floor space all round every floor. The walls, moreover, are not only weather-proof and durable, but can easily be constructed to offer 50 per cent more heat-retention than cavity brick.

Walls up in DAYS, too. Finally, Wallspan walls are so simple to erect, they can be put up in a matter of days. It will be worth your while to discuss with your architect the use of Wallspan in any new building you are planning—office, factory, shop, store, warehouse, school...

You'll be using your building sooner - much sooner - if it has Wallspan walls

OSCAR HOBSON:

A Tribute

The Financial Times in its weekly column "Men and Matters" recently had this to say about the News Chronicle City Editor:

"No honour could have given greater pleasure to the City than the knighthood conferred upon Mr. Oscar Hobson in the New Year's List. This was an imaginative selection, and one altogether appropriate.

"Mr. Hobson has always been a steady critic of the money-tamperers in Whitehall, and of the "get-rich-quickly" people who have misused the machinery by which the City of London has become the most intelligent and far-seeing of world financial centres.

"Mr. Hobson is by far the ablest of City Editors of our time, and his shrewdness and capacity for judgment, tempered by high independence, have been of the greatest service to the City, the Treasury, and to British industry. Mr. Hobson does honour to the latest Honours List."

Sir Oscar Hobson is author of "How the City Works", a book that explains in plain non-technical language the financial machinery of the banks and the Stock Exchange and the hundred and one mysteries connected with the commercial life of the greatest City in the world.

PRICE 6/- from booksellers or 6/6 post paid from the News Chronicle Book Department, Bouverie Street, London, E.C.4.

Nipped in the Bud?

THE important economic news of last week was not that Britain's balance of payments has been turning sour; that had been evident since the publication of the January trade returns. The important news was that the Government is taking prompt and commendable action to try to nip any crisis in the bud. This news—implying a realisation by the Conservatives that the time has come to go over from remarkably good luck to remarkably good management—is in many ways the most heartening development of the Government's whole period of office. Mr Butler deserves an unreserved apology from all who doubted whether he would really dare to do it.

So much for the Chancellor's bouquet. In present harsh circumstances, however, not much time can be wasted in fondling it. There are three questions that everybody—no doubt including Mr Butler himself—is now asking: Will Conservative restraint work? What further measures can the Government take if Bank rate fails? And what will be the political consequence of this new twist in fortune and management?

On the first question—whether the new policy will work—there seems to have been a rather facile surge of optimism during the past week. All that the 4½ per cent Bank rate has done so far, all that it could have done in ten short days, has been to arrest that part of the weakness of sterling that was due to fading confidence in the currency. This fading confidence was at once a symptom of, and a complication in, the country's economic sickness; if it had been allowed to develop it could have become a very serious complication, and it is excellent news that it has been temporarily checked. But nobody can cure a disease by arresting one of its complications and ameliorating one of its symptoms. Until somebody has been stopped from over-eating, the basic causes of indigestion will presumably remain. The doctor's diagnosis last week was that there is such indigestion. Import prices are expected to rise far enough this year to make it necessary to divert to export a large part of any increase in national production; but this increase in production—which is still in the bush—looks like being wholly absorbed by increases in domestic investment and consumption. It was to cut down investment and consumption that Bank rate was raised.

The most disturbing development of the past week is that the City of London does not seem to have realised this. After an initial setback the Stock Exchange has been recovering joyously; it has even been argued in the financial press that since the increase in Bank rate "removes uncertainty," it can almost be regarded as a "favourable market factor." Some of the big lending institutions have hastened to say that the change will have little or no effect upon their customers; the most shining exception—and this is another unexpected example of the Government's courage—is that the rise in the Public Works Loan Board's charges to local authorities is apparently not to be countered by an increase in housing subsidies. The peculiar notion

that over-consumption can be cured without actually reducing consumption is just as widespread in political as in financial circles. Mr Strachey pleaded last week that the British people's standard of living should not be "indiscriminately cut," but that its imports should be cut instead; there is no reason to suppose that he was trying to be funny.

Of course, the City may be right. The balance of payments may not be as weak as had been supposed. In this case the softness of sterling up to last week was wholly irrational; all that was needed was a faith-healer's nostrum, not a purgative medicine. (It is one of the great advantages of Bank rate that it can fulfil both these functions.) But this was not Mr Butler's assumption when he introduced his new measures; he can justly hope that he was being over-pessimistic, but he cannot be convinced that he was. The Government may yet have to take further restraining steps.

If so, there are three pleas that should be impressed upon it. The first is that it should continue to show the political courage that it evinced last week, for courage now will bring increasing returns. The second is that it should make any new restraints general—and impose them through next month's budget—rather than try to build up little discriminatory dams of controls in specific places in the economy (criticism of last week's specific restraints on hire purchase can now be tempered—although it is not vitiated—by the fact that this particular illegitimate baby has proved to be a very small one). The third need is to sound a note of warning about moving further towards sterling convertibility at the moment without the establishment of a floating exchange rate. Last week's action in sending the Bank of England to bid up rates in transferable sterling markets will produce a sort of *de facto* convertibility, and may be both defensible and effective in present circumstances. But it is as dangerous with currencies as it is with commodities to try to fix the price without being able to control the supply, and Mr Butler, who has been wisely cautious about entering into fixed-rate convertibility by the front door, should beware of finding that he has slipped into it by the back door.

(This subject is further discussed on a later page.)

★

But this is quite enough of admonition to Mr Butler. The message that needs to be addressed to the Government today is one of support for courageous action. Unfortunately the message that needs to be addressed to the Opposition is very much ruder. Labour's reaction to the latest economic developments may be psychologically comprehensible. The extraordinary noise that even moderate Labour MPs have been making at question time for the last few weeks, and the childish jubilation with which they greeted Mr Butler's statement about hire purchase, are symptoms of their deep desire to drown their internal party quarrels about foreign policy with a loud display of

unity at home. But it is not a very good excuse to say that the Gaitskellites are encouraging the party to be silly about one thing in an attempt to prevent it from being irresponsible about something else.

For they are being silly about economic affairs. They are muffing their political opportunity by presenting it to the public through a monstrous magnifying glass. This has been made very evident by their storm in the teacup. It is now probable that, as a result of recent import and wage trends, many retail prices are going to rise in the next twelve months. (Incidentally, for those who like to speculate about election dates, the main rise may well come after October rather than before it.) But it seems equally probable that tea prices themselves will come down. Labour has now done much to ensure that loud advertisement of the second movement would reduce the electoral consequences of the first. It is also running the political risk—a risk that damaged the prospects of some Democrat candidates in America last year—of appearing at the next polls as a confounded prophet of gloom and doom. If restraints that are much fiercer than the present mild curbs have to be imposed before October (or whatever the Government regards as the earliest possible date for the election), and if they have not succeeded in stemming the slide by the late summer of next year (or whatever the Government regards as the latest possible date), then the poll may indeed take place in conditions of gloom and doom. But, on any reasonable view, this double misfortune for the Tories seems unlikely. It has certainly been made the less likely by Mr Butler's prompt action last week.

★

On balance, therefore, the country has reason to feel very much more pleased with its Government than it did ten days ago. Thanks partly to Labour's reaction, the Government also has reason to feel more pleased with itself. This is not to deny, of course, that Conservative prospects must be more dubious than they were before the country's economic luck began to addle around the turn of the year. It is also not to deny that the economic situation may be much less settled than the City appears to think—although it is also certainly much less desperate than the Opposition pretends to believe. But Mr Butler's decision to move swiftly against inflation is economically right; and, over a period, what is economically right must be politically right as well. When economic restraints have to be imposed, there is always an initial period of unpopularity. The Opposition is comforting itself with the belief that it will last until the election has to be fought. The Conservatives, for their part, can comfort themselves with the knowledge that Mr Butler's firm action is calculated to shorten the period of hesitation—and that there are still eighteen months before this Parliament need be dissolved. The hand that lies on the economic steering wheel lies also on the mace.

Keeping Europe Going

IF spring has not yet arrived on the political scene in Western Europe, at least the ice is beginning to move. France has a government again—necessarily, one that is something of a patchwork, but it is better than a ministerial vacuum. The German *Bundestag* has approved the Paris agreements on Western Union, swallowing the unpalatable Saar pill more easily than had been expected. The Italian and German upper houses will both, it seems, have passed the agreements before the month is out; the parliaments of the Low Countries appear ready to do the same as soon as they get a green light from Paris. The French upper house, the *Conseil de la République*, remains the most uncertain factor. But M. Faure hopes to set it down to its task before March is out, and, as a correspondent points out on page 820, several factors ought to affect its decision favourably. Probably the more serious threat to the safe passage of the agreements is the insecure position of the Faure government itself. Despite the new prime minister's talent for conciliation, North Africa may prove the biggest obstacle in the path of his European policy, as it proved for M. Mendès-France.

Yet the augurs in Paris speak hopefully, and those in Bonn, although unwilling to prophesy a wholly untroubled debate in the *Bundesrat*, are even more optimistic. There is thus, once again, a natural tendency towards relaxation; more specifically, a feeling that there is nothing much that the West as a whole can do for the moment except await the decisions of Europe's various senates. And it is, as usual, a dangerous feeling. The arrival of a couple of thoroughly exhausted swallows is no guarantee that calm and sunshine are just ahead. Western leadership is certainly entitled to hope for the best; it ought at the same time to be preparing not only for the worst, but also for the varieties of the less bad that may confront it only a few weeks from now.

★

Indeed, "the best" does not imply an early end to the present struggle to draw together and fortify Western Europe. Even if the Paris agreements are brought safely to the end of their long parliamentary course before the summer, difficulties will still lie ahead. In Germany, Dr Adenauer will face a continued opposition to his western-orientated policies, and his parliamentary support, already severely strained in last week's debates, may not suffice to carry through the domestic legislation needed to authorise and organise the creation of West German defence forces. In France, the creation of West German defence forces could make it impossible for the West to present a united front in dealing with the Russians. Final ratification of the Western Union

agreements can be expected to evoke a whole series of menacing gestures from Moscow, including the formal conclusion of the tightly unified military alliance in Eastern Europe that has in fact been in existence for several years. It will take great skill and teamwork to protect the whole western plan from disruption even at that late stage; and the necessary political strategy ought surely to be in preparation already.

★

Moreover, in the western capitals minds still need to be much clearer on the subject of contact with the Soviet government after ratification. Readiness to talk to the Russians once Western Union is properly under way is common ground among the allied governments, although there are differences about timing. Among opponents of the Paris agreements in the West it is likewise common ground that Moscow will refuse to negotiate after ratification; it is, indeed, widely claimed that Mr Molotov has said just that. In fact, however, a careful reading of his recent statements suggests a different prospect: that the Russians will refuse, at least for a while, to discuss German reunification with the western allies, but that they will readily discuss it with the Germans (if Western Germany agrees that the Soviet zone regime can take part in the conference), and that they will just as readily meet the western governments to discuss Mr Molotov's familiar "European security" plan—which involves the abolition of Nato and the withdrawal of American forces.

Minds change even in Moscow, as last month's events revealed. But on present evidence it cannot simply be assumed that the Russians will sulk in their tents for a decent interval after ratification and then come to the conference table prepared to accept the new situation either as a basis for bargaining or as a final stalemate. The perspectives are far more complex—particularly in regard to the Germans, among whom the illusion has been encouraged that the reunification of their country already dangles at Mr Molotov's fingertips, to be tossed them the instant they break with the West. Clearly, this phantom can be exorcised only if, after ratification, the West challenges the Soviet government to give a really clear explanation of what it means by "free" all-German elections. So long as ratification is incomplete the western governments are compelled to seem hesitant and evasive on the subject of talks with Moscow—and therefore, by extension, on the subject of German reunification. Once ratification is complete, they can and should make themselves the urgent champions of German reunification in freedom and expose the Communists as the real obstacles.

But what if ratification is not completed before the

summer? At least as much thought should now be being devoted to the gloomy possibilities as to the brighter ones. What if M. Faure's government falls, or the French upper house appends to the Paris agreements clauses which necessitate a long wrangle between the two chambers? In either case, it might become clear that final French ratification was impossible before the autumn; and this would intensify the strains on western unity to a perilous degree. The Germans will soon have waited a full decade since the end of the war for the restoration of their sovereignty. If they find they must continue to wait, the siren voice of the Soviet Lorelei will ring in their ears with even more seductive charm. In France, the opposition to the Paris agreements might be so encouraged by a new delay as to make eventual ratification impossible; and in America, and elsewhere, impatience and disillusion will grow side by side and swiftly.

If momentum is not to be fatally lost, something at least must move, and must be seen to move, during the summer months. Yet what can in fact be done if France has not completed ratification? The occupation regime in Germany cannot be finally wound up except by common consent. If Britain and America were to press forward vigorously with the transfer to the Federal Republic of its rights to sovereignty and self-defence while a scandalised France sought to apply the brakes, it is obvious that frictions and tangles would develop at every point. Shape is impatient for its German divisions, and in strict military logic its arguments may be unassailable; but to the statesmen, and to Dr Adenauer at least as much as to any of them, the worst nightmare is the prospect of the western alliance having to make a naked choice between France and Germany.

Yet it would be unnecessarily defeatist to assume that,

THE ECONOMIST, MARCH 5, 1955

if the summer were to pass without French ratification, nothing whatever could be done to prevent the disintegration of the whole western plan. There would seem to be at least one road worth exploring; a difficult road and far from clear, but that increases the need to examine it carefully in advance. France's allies need not proceed on the assumption that France will never ratify, and that they must therefore turn their backs on it. On the contrary, they could start from the assumption that France would ratify in a matter of months, and that a fair amount of further work on the organising of German self-defence and statehood could be got through before French representatives were able to take their seats in the chairs awaiting them.

This would, admittedly, be an uncomfortable and a very delicate operation. It would be foolish to embark on it, or even to moot it publicly on official levels, as long as there is any prospect that the process of ratification can be completed by midsummer. Yet it would be preferable to total stagnation and decay, to a political void that would leave Mr Molotov's alluring proposals a clear field in Europe. It would mean that the Germans could see some visible evidences of continuing progress towards full sovereignty, of western confidence and goodwill, and of the approach of the point at which the Russians might at last have to take German desire for reunion in freedom seriously, instead of using it as a decoy. It would mean that the French would have a strong motive for completing ratification quickly in order to be in on everything that was done, instead of delaying, Micawber-like, in hopes that something better would turn up. It is, at the least, an avenue worth reconnoitring; and in the absence of any alternative escape routes from the quandary in which the West may very shortly find itself, it ought already to be undergoing the most careful examination.

Bull in a Picture Shop

TIRED bulls, who are getting nervous of Throgmorton Street, will be searching in new pastures for possible means of security—and of gain—for their capital. They might do worse than become collectors of Impressionist and post-Impressionist pictures. This idea may be rather startling to the average businessman. Old Masters, of course, have long been recognised as attractive and almost conservative investments—but only Masters who have been dead so long that their reputations are no longer subject to the whims of fashion. In view of the capriciousness and peculiar expertise of today's market, it may seem rash to suggest that businessmen should now invest in pictures by artists who died fairly recently, or who are still alive. Should they really switch from Decca to Degas, from Gussies to Gauguin?

For the purchaser in London it would be less of a gamble than it seemed a year or so ago. The market is now more international and seems more settled in its tastes. At the end of last November the Rees Jeffreys collection was sold at Christies, the most important sale of modern pictures in England since the war. This sale emphasised two important points. First, it showed that the prices obtained by modern pictures in London are now again irrevocably associated with the value of such pictures in Paris, New York and other centres. The unnatural isolation of the London art market, owing to the war and to exchange restrictions in the immediate postwar years, has come to an end. This suggests that the boom in modern pictures is reasonably broadly based; it is not merely a question of a few rich men in one country squandering their temporary capital gains

THE ECONOMIST, MARCH 5, 1955

or seeking a form of property that is often kindly treated for death duties.

The second important lesson from the Rees Jeffreys sale was the extent to which British demand for the work of the established French artists of the 19th and 20th centuries, and of the so-called *Ecole de Paris*, has increased in recent years. The effects of the encouragement given to British art by the isolation of the war years have largely worn off. Ever since 1945, despite the work of the Arts Council, the Institute of Contemporary Arts and the Contemporary Art Society, British collectors have been turning to Paris. One sign of this has been the steady rise in prices. As a very general rule, prices of pictures by the Impressionists and other artists working in a more or less impressionist style have at least doubled since the end of the war; and the prices of some later French painters have risen even more spectacularly. Another sign has been the increase during 1954 in the number of exhibitions held in London of the work of Parisian artists, many of whom are very young.

★

The unpractised investor in modern pictures soon comes across a rather frightening phenomenon: the market is a very artificial one. Anybody who makes even the most cursory study of it will find that the art dealers, particularly those in Paris, can to some extent—and for a short period—put prices almost where they want them. Not only have the dealers a virtual monopoly in deciding which living artists shall be presented to the public; they also—at first sight, rather surprisingly and alarmingly—determine the popularity of the work of the recently deceased. A case in point has been the marked rise in popularity in the last few years of the work of such minor French Impressionists and neo-Impressionists as Loiseau and Maximilien Luce, and of painters such as Pierre Dumont.

In this very artificiality, however, lies something of a safeguard for the unskilled collector, who is afraid that he might be caught by a sudden change in tastes. For self-interest has now come into play. To put it as directly as possible: if the price of Impressionist pictures were to suffer a sudden and marked decline, a great many art dealers would be out of business. There are therefore only two circumstances in which a collapse in prices would be at all likely. One would be if a sudden press of collectors, eager to turn their pictures into cash, overwhelmed the dealers and forced them to withdraw from the market; this happened, to some extent, in the market in etchings in the later 1920s, but there is no sign of anything of the sort happening now. The other would be if the dealers found something to take the Impressionists' place. This change in fashion has also happened before. Seventy-five years ago the work of several academic painters then called "great" was fetching from £2,000 to £3,000, and some commanded even more; today the work of the same artists can be bought for anywhere between £10 and £100, or

at most for as many hundreds of pounds as they once fetched thousands. But then Poynter and Alma-Tadema, to name only two of the best known of the artists of this kind, were working at the same time as Degas and Manet.

In the belief that similar disasters are not imminent today some shrewd—and singularly unexpected—people have started to invest quite keenly in this market. The most lucrative investments have been the pictures of a few artists who died either at the end of the last century or in the first half of this, and whose work is in such demand that it is virtually impossible to forecast what one of their pictures will fetch in a public sale. The most obvious examples are Cézanne, Toulouse-Lautrec, Van Gogh and the most famous of the Impressionists—Manet, Renoir, Degas, Monet and so forth. To give but three instances from the Cognacq sale held in Paris in 1952: a not outstanding Cézanne still-life fetched 23,000,000 francs; a pretty, but unimportant, Renoir commanded 22,500,000 francs; and a Degas pastel went for 10,000,000 francs (there are roughly a thousand francs to the pound). Even insignificant trifles by these artists command high prices.

★

The more speculative counters in the market are provided by the work of more modern painters—by no means all of them practising in an Impressionistic manner—who have enjoyed a spectacular vogue since the war. Three outstanding examples have been Chaim Soutine, Dufy and Matisse. Immediately after the war pictures by Soutine could be purchased in Paris for as little as 7,000 to 15,000 francs; by 1949 good things by him were commanding from 500,000 to 1,000,000 francs; then, at the Rees Jeffreys sale last November, one of his pictures, admittedly an important example of his work, fetched as much as 4,500 guineas. One of Dufy's popular racecourse scenes commanded 3,400,000 francs in the Docteur Girardin sale in Paris in December, 1953; and the price of similar works has continued to increase since then. Matisse, who was selling good examples of his work at around £100 in 1914, saw one of his important paintings fetch as much as 4,700,000 francs in 1953; and in November of last year the remarkable sum of 6,700 guineas was paid by the Tate Gallery for his small portrait of André Derain. This was admittedly a rather special transaction. Matisse had just died, and so had Derain; and because of outside contributions, and because death duties are not paid on pictures sold to a national collection, the Tate had to find only about £900 out of the 6,700 guineas paid over. Nevertheless the sale was only the first example of the very marked rise in the value of Matisse's work that is bound to follow his death.

These sales have raised another interesting point. Although prices of individual pictures still vary according to the interest in the subject (as with the Derain

portrait) or according to merit, there has been a general tendency since the war for the prices of works by a particular artist to level out. In other words, the cult of names has been gaining ground. For instance, feeble late works by Utrillo and Vlaminck have nearly approached in value examples of these artists' best periods. In much the same way, there has been an inartistic levelling-out between skilled and less skilled exponents of the same schools. This is at once the consequence of, and a temptation to, the entry of investors rather than collectors into the market.

The bull is still rampant. The general opinion among art dealers is that the prices of works by any artist who can loosely be classified as an "Impressionist" should continue to rise for some time to come, and even pictures by very minor followers of the movement should command considerable sums. If the

inflation continues, it should be shared by the work of the immediate post-Impressionists and of certain other modern artists. In this connection Picasso, Matisse and Derain should be remembered; and paintings and drawings by others—among whom Bonnard, Dufy, Gauguin, Klee, Modigliani, Rouault, Seurat, Signac, Soutine and Vuillard are particularly notable—may also continue to rise in price. From the standpoint of art, the present apparent lack of discrimination is rather sad; economically, there may be something a little frightening in this apparently continuing ability of dealers and investors to pull up prices with their own bootstraps. But the dealers, at any rate, do not seem unduly perturbed that a $4\frac{1}{2}$ per cent Bank rate has caused some lamentation—and may cause some realignment of investment habits—in the streets of Askalon and Gath.

Japan—Nationalist and Neutralist

THE Japanese are once again making their own way in the world, and the general election last week-end carried some useful indications of the direction they will take. Although the results caused no great surprise, that does not diminish their importance. For they mark a definite break with the long period of Liberal party rule, which had been tarred with the brush of the Occupation. The simplest verdict about the results is also the truest. The Japanese will become more Japanese. They will, that is to say, henceforward be at once more nationalist and more neutralist in their attitude to other nations. While remaining governed by an essentially conservative government, they will throw off the mantle of American influence and seek to make fresh terms with the Communist powers. And yet, in that their new policy will above all assert the national character of Japan, it will by no means be simply pro-Communist.

Mr Hatoyama, the leader of the Democrats, has been confirmed in office in so far as his party has captured the lead with 185 seats (last parliament, 124) to the 112 (180) of the Liberals, from whom he broke away at the time of Mr Yoshida's resignation. The next largest are the Left-wing Socialists with 89 seats (last time 74) and the Right-wing Socialists with 67 (61), making, if they combine, a bloc of 156. The Communists won only two seats, compared with one before; and there remain 10 seats among miscellaneous smaller parties, of both left and right. The interesting features of these results are that the Democrats have done about what was expected, the Liberals and Communists worse, and both groups of Socialists better.

The main deductions are, first, that Mr Hatoyama will probably form a minority government, consisting

of his own party alone and yet relying in the first instance on the support of the Liberals on major issues, though without their participation in the cabinet. Secondly, the Socialists are between them just strong enough, assuming other left-wing support and no defection to government ranks from their own right wing, to block the two-thirds majority that would be necessary to amend the constitution and introduce more outright rearmament; this can and will be regarded in Moscow as the achievement of a cardinal aim. Thirdly, although direct constitutional Communist influence on Japan's internal affairs is still negligible, the Left-wing Socialists are in a stronger position than they were. Moreover, Moscow's influence with them has never been greater, and it is a key element in present Soviet tactics to keep Communist parties in the background while building up broadly-based anti-American popular fronts.

Under these new colours, what will Japan do? And what should Britain's attitude be? All observers agree that Mr Hatoyama has won the elections largely on his avowed policy of seeking a fresh *modus vivendi* with the Communist rulers in Moscow and Peking. It is now clear that he favoured a more emphatic move in this direction than his foreign minister in the outgoing caretaker government, Mr Shigemitsu. And it must therefore be assumed that, if he is in fact the new prime minister, he will begin by concluding peace treaties with the Russians and with the Chinese Communists at the earliest practicable moment. There are, however, several snags. The most obvious is that Mr Hatoyama, engaging and effective in the brief spurt of the last few months, is nevertheless old and far from well, and he might not be able to sustain the burden

of premiership for long. If his health failed, the Democrat party could fall under less characterful leadership and it might well split. In that event, a new coalition based on the inclusion of the Liberals under Mr Ogata—who has stepped into Mr Yoshida's shoes—might be expected to pursue a somewhat more pro-American line.

Other question marks are raised by Japan's claims against Russia and its quasi-recognition of Formosa. It would be wrong, however, to expect either difficulty to do more than delay closer relations with Moscow and Peking. When Mr Hatoyama let it be known that he would welcome a fresh approach from the Russians, Mr Molotov had the head of the unofficial Soviet mission in Tokyo, Mr Domnitsky, write to and ring up the Japanese foreign ministry straightaway. So pressing, in fact, were Mr Domnitsky's messages and phone calls, that Tokyo sought and obtained independent confirmation from Moscow that he really represented the Kremlin's view. As things stand, the Russians have now accepted the Japanese demand that actual negotiations should take place on neutral ground at the United Nations in New York, and one of the first acts of a new government in Tokyo is bound to be to get these talks rolling. Japanese terms, despite demands which include the return both of the remaining prisoners of war and of the islands of Shikotan and Habomai, are not likely to be too stiff to make agreement possible. A major feature of the new Sino-Soviet policy, drawn up during the visit to Peking last October of Mr Khrushchev and Marshal Bulganin, has been to win the friendship of the Japanese at almost any cost, and it may be assumed that this will certainly be implemented.

Moscow is in fact batting on a good wicket in Japan. This was clearly visible during the electoral campaign, in spite of the relative failure of the Communists to produce any fireworks of their own. The Russians have two lines which they are at present plugging on a world-wide basis but which have a particular appeal to the Japanese. One is to abolish foreign bases and the other to ban atomic and thermo-nuclear weapons. Both are aimed exclusively and specifically at destroying American power, and both find a ready echo among many Japanese, who naturally resent the continued presence of foreign servicemen, while also associating them with a multiplicity of memories and fears about the A-bomb and the H-bomb. Nor should too much be read into the Communist electoral failure itself. Although the party put up 99 candidates and got only two elected, its policy was to avoid splitting the anti-conservative vote. It therefore withdrew candidates where Socialist prospects were good, and, with 100,000 members and 300,000 sympathisers, threw its weight into the Left-wing Socialist scale.

Even more important than Moscow to the Japanese

is Peking; and in regard to China Mr Hatoyama can be expected to have the added incentive of trade. While many Japanese feel that the time has come to regularise their political relations with the new giant who has appeared on their doorstep, still more believe that the precarious Japanese economy can never become less dependent on American goodwill until Japan rebuilds at least some of its prewar trade with the mainland. And, in those terms, Japanese trade with China is still very small, partly because of allied controls on strategic goods but mainly because China's own political line demands a greater concentration of trade within the Communist bloc. But at the end of last year Chinese-Japanese trade was picking up fast, and, given a Communist determination to make economic sacrifices for the political object of tightening ties with Japan, there is undoubtedly scope for a good deal more trade, even within the limits of the present strategic embargoes.

*

Signing a peace treaty with Communist China means recognising the Peking government. And it is here that Japan's new policy is bound to move into deeper water, since this implies both modifying the present relationship with Formosa and taking a line which would raise a good many eyebrows in Washington, particularly at the present moment; although Mr Dulles did not quite succeed in making it a condition of the peace treaty of 1951 that Japan should recognise the Chiang Kai-shek regime as the government of China, he did secure diplomatic relations between Tokyo and Taipei, with their precise status somewhat ill-defined. If Mr Hatoyama now wants to get on closer terms with Peking, he can hardly expect Mr Chou En-lai to accept his existing relationship with Formosa.

From Britain's point of view, there is no overriding reason why Japan should not take the course which Mr Hatoyama is charting. Indeed, until more normal relations are established between the powers of the area, there can be no prospect even of a makeshift settlement in the Far East. And there is certainly no greater possibility of keeping the Japanese indefinitely in a position of artificial inferiority than there is of keeping the Germans. But Japan has had the inestimable benefit, compared with Germany, of not being divided during the Occupation; of not suffering directly from purely cynical Communist tactics; and of receiving the maximum help that the United States has been able to give, economically, technically, and politically. It would be a disaster to the cause of the free world if the Japanese were not to understand in time the definite limits they should set on their rapprochement with the Communist powers. At the elections the Japanese people have rejected Communism as such. They should never forget that, in the eyes of the ruthless men in Moscow and Peking, their country represents the fattest prize in Asia.

Notes of the Week

Hideous Epoch

THE two-day defence debate was anything but a routine affair. Neither defence policy nor party politics nor the posture of foreign affairs stood on Wednesday evening exactly where they had been on Tuesday morning.

On the side of defence policy, the debate proved two things. The first was how widespread—almost complete—is the agreement in Westminster and Whitehall on the new basic strategy of relying on the deterrent effect of the H-bomb—even Mr Bevan appeared to want only a minor qualification of it. But it is only informed and expert opinion that has yet been compelled to bend its mind to the new logic. That logic is so strange—with its conclusion that the worse things get, the better the hope—that it takes more swallowing than public opinion at large has yet got around to; newspaper offices are still being flooded by letters of protest against the decision to make the H-bomb, written by perfectly responsible citizens who still hold the belief—which was respectable until yesterday—that to moderate the horrors of war is to serve mankind. Sir Winston Churchill's speech—one of his most impressive—will do more than anything else could do to make people think, and when they think they will reach the same conclusion as those who have already accepted the strategic revolution. But for the present it would be as well to assume that Parliament and the experts are ahead of the country.

The second thing that the debate made clear is purely negative—no one has yet more than a very vague idea of what else in addition to the H-bomb, should find a place in a realistic and economical defence programme. Is there still any risk of a full-scale war against Russia without the H-bomb? Or after it has done its worst? And if so what would be needed? And what other wars, with other enemies, are possible, and how would they be fought? On all these uncertainties there cannot yet be more than interim decisions. The plain fact is that nobody yet knows for sure what will be needed in the wholly new strategy into which we are moving.

Cuckoo Among Doves

MR BEVAN'S action in leading 57 Labour MPs in insurrectionist abstention from the official Labour amendment in the defence debate—ostensibly on the grounds that it did not make clear in what circumstances hydrogen bombs would be used—has set the cat (or is it the cuckoo?) back

among the Opposition doves. Some of the 57 were pacifists; there can be no question of Mr Attlee taking disciplinary action against them, since the party's rules allow for abstentions—though not for adverse votes—on grounds of conscience. Thanks to the protection of pacifist skirts, and to the protection of numbers, Mr Bevan feels confident—on balance, probably rightly confident—that disciplinary action also will not be taken against him.

But there can be no doubt that the party leaders are now very angry indeed. The suspicion has been gaining ground for some time that Mr Bevan's personal strategy is based upon the belief that Labour will not win the next election; he and his followers could then step in after electoral defeat as would-be salvagers. After Mr Butler's statement on the economic position last week, however, many Labour members swung round to the belief that they might be going to win the election after all; immediately after that statement, Mr Attlee won plaudits at a private party meeting with a little homily on the need for unity now that the Tories were "on the run." Some prominent Bevanite supporters may well have concluded from this speech that, if they continued to stand on the touch-lines jeering at Mr Attlee, he would be only too happy to leave them there when he handed out coveted jobs in his next Government. They had a temptation to edge out of the fold.

It was in these circumstances that Mr Bevan threw his studied challenge to Mr Attlee in the House; the occasion was dramatically reminiscent of his intervention about Seato last April, which—it will be remembered—took place immediately after the "no change Budget" and the East Edinburgh by-election had temporarily raised Labour's hopes. Does Mr Bevan really want a united Labour party to win the next general election? It is a potent factor in the present political situation that the Labour party leaders are not convinced that this is a purely rhetorical question; another five years of Opposition might serve his policies, and his personal prospects, best.

Delusions at the Highest Level

THE exchanges between the Prime Minister and Mr Bevan on Wednesday brought out even more fully than before the irresponsible and dangerous aspects of the whole project for "talks at the highest level." It was, not unexpectedly, Mr Bevan who restated the concept in the most misleading way. He pictured Britain as "unable to reach the potential enemy in time to arrive at an accommodation, because we are now at the mercy of the United States," thus combining two gross distortions in a single sentence. He

spoke, in fact, as if the prolonged and unencouraging contacts that Sir Anthony Eden has had with Mr Molotov at Berlin and Geneva in the past year had never been; as if Britain and the Soviet Union had no permanent diplomatic missions in each others' capitals, no opportunities for exhaustive exchange of views at the United Nations or, to take a current example, at the disarmament talks now being held at Lancaster House. But Mr Bevan does not bear sole responsibility for this caricature of reality. He has merely drawn a crude copy of the more deft original that Sir Winston Churchill produced before the last general elections.

The Prime Minister himself daubed in some glaring new patches of colour during Wednesday's debate. He had had hopes, he said, of an Anglo-Soviet meeting "at some neutral place like Stockholm," as "a sort of go-between prelude to a meeting of the three"; and he implied that only the Soviet campaign against the EDC (and, presumably, the subsequent campaign against Western Union) had prevented him from persevering with this idea. He thereby laid his flank wide open to Mr Bevan's assaults, and provided fresh material for not one but two malicious and false suggestions by those who seek to destroy the Anglo-American partnership. In Britain, they will now be able to claim that this country has been blocked by the Americans in its efforts to reach a settlement with the Soviet Union. In the United States, Sir Winston will be charged with seeking to deal with the Russians behind Mr Eisenhower's back. It is hard to think of anything more mischief-making. It is patent to all who know the Prime Minister that he is the last man to weaken the Atlantic bridge. It is equally patent that as long as Soviet policy remains as unyielding as it is now, no mere placing of top-level legs under a table is going to make the world's great problems vanish into thin air. Yet the myth which Sir Winston fathered and to which Mr Bevan now seeks to claim paternity will, it seems, long continue to mislead a world which needs to see its problems steadily and see them whole if it is to attain peace.

After Bangkok

CONSIDERING the background of feuds, fears and fence-sitting which Southern and Eastern Asia have known during the past few years, the Bangkok conference was a success. It inaugurated a permanent type of consultation between the members of Seato; it discussed both external and internal threats to the security of the area; and it showed the flag to those Asians who had been, and still are, sceptical about its viability. More could hardly have been expected.

But several cross-currents were visibly moving beneath the surface, and no one who has the combined Anglo-American interest at heart can afford to ignore them. Mr Dulles, for a start, appears to be leading American opinion in a direction in which it is by no means unwilling to go, but which bypasses the essential conception of Seato as a local defensive agreement locally arrived at. He is reported in the American press as wanting Seato to react offensively against China if Peking starts aggression outside its area. His aim, it appears, is what the Communists say it is, namely

to work for some kind of formal link-up between each of the American commitments in the West Pacific, those to Japan, Formosa, Korea, Seato and Anzus. But, however ideal this may look on paper, it is quite out of the question if other countries, like Burma and Ceylon, are to be encouraged to join Seato. And their encouragement is certainly the first priority.

Secondly, there appears to have been another wrangle about the word "Communist." In American eyes, even co-operation with so-called colonial powers has become generally acceptable if its object is the defeat of Communism. But in the view of many Asians it is now the Americans who are the prime exponents of a "colonial" mentality in their dealings with smaller countries. And Mr Dulles's apparent determination to line them up, not in collective self-defence, but against Communism as such, risks defeating its own object. It had been hoped after the Manila meeting last September that these things had been understood. It is regrettable that—even to placate Congress—reports of them should again have cropped up at Bangkok.

Liquidation by Instalments

THE really significant thing about this week's government reshuffles in Moscow is the further descent of Malenkov. It had evidently proved impossible, or at least risky, to try to hurl him to the ground with one blow. This could be done with the hated "policeman" Beria amid genuine applause from an uncomprehending public; but Malenkov both has allies and enjoys considerable popularity among the masses to whom he promised so much. His opponents must have decided to bring him down by stages, on the instalment plan, at the same time taking measures to prevent a counter-attack. Indeed, this week's upgrading of Mikoyan, who was "guilty," like Malenkov, of rash promises to the consumer and had to resign his post as minister of internal trade a few weeks earlier, looks like an attempt to divide the new opposition and to isolate the ex-premier.

In the ten-man presidium (the party's highest organ) appointed after Stalin's death just two years ago, Malenkov was *primus inter pares*. Now he has the lowest position of all. Beria was shot; Khrushchev is the party's first secretary, Voroshilov president, and Bulganin premier; Molotov and Kaganovich have now been joined as first vice-premiers not only by Mikoyan but by the two younger managers, Pervukhin and Saburov. Nominally still in the presidium, Malenkov is its only member to be merely an ordinary vice-premier. As if to underline his disgrace, four comparatively unimportant figures have now also been given the same title. This is the well-known process of devaluation by inflation. In fact, Marshal Zhukov, although only a simple minister, doubtless has more to say than some of his official superiors.

What is the next instalment planned for Malenkov? The new apparent leaders may not even be agreed on the next step. Even if they succeed in kicking Malenkov further down the ladder, they are most unlikely to remain at its top together for a long time. The tremor that shook Moscow on February 15th was clearly the first of a series.

The Anti-Monopoly Party

It is very rare for a speech in the House of Commons to have any effect on the voting in the subsequent division. Last week Mr Harold Wilson achieved this. When he rose to deplore the government's "slow progress" in dealing with monopolies, the Liberal party intended to vote with him; by the time he sat down, they had decided to vote against him. For Mr Wilson—mindful of his personal position as member for the marginal Lancashire seat of Huyton—had run away from the one monopoly case that might seriously embarrass him. Subject to certain safeguards (it was not very clear whether they were safeguards for the consumer or for Mr Wilson), he thought that the "Government would be justified in resisting the proposals of the Monopolies Commission" to break down the restrictive practices of the Calico Printers' Federation. This gave the President of the Board of Trade a chance to explain that he was now at last "absolutely clear" about

just what Socialist policy is. It is to strengthen the Commission but to act in advance of its recommendations, and if on any occasion it puts in a report which is unpopular or difficult, to ignore it.

Later Mr Thorneycroft improved his shining hour by saying that the Government accepted the principles of the report on the calico printers, and would discuss with the industry how to carry them into effect.

To judge from this bold statement the Tories will soon be able fairly to claim that they are the major anti-monopoly party; they have run away with another piece of the Opposition's clothes—admittedly some of their own backbenchers think it is a hairshirt—in one of the Opposition's own debates. They now await the Monopolies Commission's report on certain collective restrictive practices—quite rightly, they will not act before then—to judge whether new legislation will be necessary. After an outside inquiry, Mr Thorneycroft is satisfied with the procedure and progress of the Commission (as are most serious independent observers); he thinks that the Opposition's argument that it would be wise to compel all trade associations and cartels to publish their agreements is "perhaps . . . a little nearer the mark," but claims that there are difficulties about it. In only one section of his otherwise excellent speeches did Mr Thorneycroft strike a slightly disturbing note. He thought that "something can be said" for the suggestion of a Labour member—Mr Padley from the vested interest of the shop workers' union—that legislation should make the way smooth for individual resale price maintenance. It would be a pity to make this practice look more respectable than it is.

Forbidden Topic

BOTH the Labour majority on the London County Council and the members of the squirearchy on the Country Landowners' Association probably believe that they are at opposite ends of the political pole. They have shown this week that they are brothers under the skin. A spokesman of the LCC has said that if housing subsidies are not increased

THE ECONOMIST, MARCH 5, 1955

to cover the cost of rising interest charges (and the Minister of Housing has since announced that they are not to be), then the burden will have to be put on the rates. The Country Landowners' Association has submitted a memorandum* to the Government with three principal suggestions for securing the increase in capital investment that agriculture badly needs. First, more special subsidies (such as a grant for farm roads) should be provided by the Exchequer. Secondly, the special abatement of death duties on agricultural land (at present 45 per cent) should be enlarged. Thirdly, borrowing for long term agricultural purposes should be insulated from changes in the Bank rate.

The link between these two statements is not simply the glib assumption that particular interests should be shielded by the taxpayer from the economic forces that other people must learn to bear. The link is the common attitude of these two bodies to what should be regarded as the natural economic development: the possibility of a rise in rents. The LCC spokesman simply assumed that such a rise should be out of the question. The Country Landowners' Association seems to agree that the reason for the low level of agricultural investment is the low return on agricultural land; and it says that the machinery for adjusting rents is present prosperity, "are not prepared to pay even rents of income"; and it appears that the landlord is too good a fellow to make them do so. Why?

Famine in Tunisia

A DATE for resumption of the Franco-Tunisian negotiations should be fixed this weekend, when M. Edgar Faure is due to hold talks with his new Minister for Moroccan and Tunisian affairs and the Resident-General in Tunisia. Meanwhile, France is entitled to feel gratified at the measured way in which the Tunisian premier, M. Tahar Ben Ammar, has explained the reasons for delay to his countrymen. He has been helped to keep their impatience at bay by M. Faure's past record as an advocate of Tunisian self-government; it was a Faure cabinet which in February, 1952, offered the first ray of hope on this score after a dark interlude during which Paris stood out for co-sovereignty.

For the last few weeks Tunisian opinion has been distracted from the political issue by a more gruesome topic—slaughter of livestock, reduction of purchasing power, the unemployment. In central and southern Tunisia it has hardly rained at all this winter, and the harvest is already a dead loss; in the north, which is the granary, only heavy rains now can save the wilting crops. From mid-February the migration from south to north that is a feature of famine years became noticeable, and hungry roamers began to raid bakeries and grain stores. Tens of thousands of farmers French as well as Tunisian, face ruin unless it rains; in the south, they are already slaughtering flocks, and in the extreme south, locusts are adding to the toll of disaster. The French authorities have sprung into action with reli-

measures and palliatives such as employment on the construction of waterpoints and small dams, but the numbers they hope to absorb are a drop in the bucket; already in January there were 300,000 unemployed, for political uncertainty had restricted the inflow of capital and new work.

The risk is that M. Ben Ammar's cabinet, already under fire from the nationalists for its tendency to compromise, will be too weak to withstand criticism of failure to prepare for calamity. They are telling it that what Tunisia needs is not palliatives but a policy for developing unused lands. Since most of these are religious property such a policy would entail a reform of the Moslem system of land tenure, a change so drastic that only a Tunisian legislature could put it through. This sinister combination of famine and political upset may catch not only M. Faure, but M. Ben Ammar, in its vicious circle.

When is an MP Real?

THE Supreme Soviet's formal proposal that members of national parliaments should deliver speeches in each other's assemblies was at first sight a striking one. Direct, personal fraternisation between peoples has been consistently abhorred by all Soviet governments since the prewar "Intourist" period. It was pointed out by Sir Vincent Tewson last week that when the Russians claimed with pride that they had entertained 400 foreign delegations in five years, this meant in cold fact that they were admitting foreign visitors, mainly handpicked, at a rate of no more than 2,000 a year. Britain welcomed nearly 900,000 foreigners in 1954, and 1,200,000 Britons travelled abroad in the same one year.

At second glance, the Supreme Soviet's proposal, which Marshal Bulganin repeated in a newspaper interview, reveals more obvious motives. Herr Reimann, the West German Communist leader, claims that many members of the *Bundestag* welcome the proposal. It has long been Moscow's aim to get Western Germany to deal directly and on equal terms with the Ulbricht regime in the Soviet zone; and as Dr Adenauer enjoys wide support in his refusal to acknowledge Herr Ulbricht, it is an obvious gambit for the Communists to suggest inter-parliamentary exchanges that would give the East German *Volkskammer* a hearing at Bonn.

In other countries, the Supreme Soviet's proposal has had a cautious reception. Even the left-wing Socialists in Japan are apparently going to consult the British Labour Party and other democratic socialist parties before responding. They doubtless realise that Moscow would be delighted to welcome all-party delegations which would expose their internal differences before the Supreme Soviet; if, say, an Italian or Indian parliamentary team went to Russia, its Communist members would impress their audience with the fact that they, the only true representatives of the people of Italy or India, wholeheartedly supported Soviet policy. There would, in contrast, be no cracks in the monolithic solidarity of a Supreme Soviet delegation visiting Rome or Delhi. But how many of their hosts would recognise as genuine parliamentarians people

who come together only for a week or two each year, meekly rubber-stamp all that is laid before them, and, with equal meekness, form long queues at the Kremlin gates while their passes are checked by policemen?

Franco on Two Fronts

STRENGTHENED by a good harvest, General Franco is beginning what may be the last and most complex of his battles—the fight to make his own followers accept a return of the monarchy. In an interview given to *Arriba*, the organ of the Falange, he has emphasised that the Spanish monarchy should not be judged merely in the light of its decline. Spain's finest hours had been intimately connected with monarchical institutions and even Alfonso XIII had not been devoid of virtue. At the same time, General Franco allowed the publication in Madrid of the collected speeches of the last king, and hinted that Don Juan Carlos, whom he appears to have chosen as his successor, might soon take part in state functions.

It is unlikely that all elements in the Falangist movement will calmly accept their leader's analysis. Already, Falangists are saying openly that they did not fight the civil war and endure the lean years of Spain's quarantine only to have the old institutions restored. General Franco has been careful to say on several recent occasions that the new monarchy would have to adjust itself to the "new Spain" created by the revolution, but he has not reassured his party. He has sought to placate the Falange, moreover, by increasing its membership in the Cortes.

As if to distract attention from internal problems, the Caudillo has also launched a bolt against his most recent ally, the United States. Sr Jimenez, the director of Spanish-American economic co-operation, has threatened that the entire agreement about bases in Spain might be abrogated if Washington did not prove more generous. The trouble started over locomotives. The Foreign Operations Administration was preparing to buy fourteen perfectly good diesel locomotives for use in Spain. The Spaniards, however, discovered that a more expensive and glamorous model was also available, and they choose to feel insulted by this latest example of American parsimony. American contractors, on the other hand, are complaining bitterly that they cannot get on with their work as long as Spanish sub-contractors prefer sixteen mules to one bulldozer. Franco's problem, therefore, is a double one: he must persuade Spaniards to accept a régime anchored in the past and adopt a technology more suited to the future.

Plums for Teachers

A FIRST step was taken last weekend to alleviate the shortage of teachers of mathematics and science. The Burnham Committee, at the Minister of Education's request, has recommended a new scale of special allowances for

MARCH

NO STORYTELLER HE

When Snellius, on a March day in 1617, published his invention of triangulation, he did it in a way which caused, except among specialists, widespread apathy. Then and since. It was his own fault. Snellius omitted that *sine qua non* of early scientific discovery. He forgot to give the Press a good story. Every schoolboy knows about Archimedes, how he discovered the principle of something or other in his bath, and jumped out yelling "Eureka! I've got it!" Every schoolgirl knows about the apple that fell on the head of Isaac Newton. Gravity. Benjamin Franklin, the kite and the key. Electricity. Watt and the kettle in his mother's kitchen. Steam. All these deathless inventions are deathless because the inventors had the sense, or the luck, (a) to answer abstruse scientific problems at homely moments, (b) to give the story to the Press and history books. Snellius, poor chap, didn't invent triangulation in his bath, in an orchard, in a thunderstorm, or while waiting for a cup of his mother's tea. Any early seventeenth-century Public Relations Counsellor could have helped him put on a show. But Snellius, a lone wolf mathematician, preferred to go it alone. Which is why you don't know even now, who Snellius was and what triangulation is, and how they came together.

The Midland Bank confesses that its interest in triangulation is small. It has other things to think about—chief among them being the constant provision of a prompt and courteous banking service at more than 2,100 branches throughout England and Wales.

A E I

teachers taking advanced work—that is, above the “ordinary level” of the General Certificate of Education. These scales would be binding on local authorities in a way that the existing voluntary allowances are not. They would be regarded as minima, and teachers who considered that they were not getting their due would be able to bring the matter up before the Burnham Reference Committee. For the sake of peace in the common room they are to apply to teachers of all advanced work, although there is little shortage except in mathematics and science.

The question is whether these new scales—great improvement as they are—will attract scientists and mathematicians into the schools; whether they will outweigh the higher and quicker ladders of promotion in industry and Government service, and the glamour of postgraduate research. At the bottom of the new scale, a graduate teacher, over about 38 years of age and therefore at the maximum basic salary of £850 a year, could receive between £75 and £175 for taking five or more periods of advanced work a week; while for the head of a department, or a principal subject teacher in a large school, the recommended allowance would be between £200 and £350. In other words graduate assistant teachers could look forward to a maximum salary of £1,200; but no one knows what proportion of them would actually scale these modest heights.

In industry, according to a committee set up last year by the Federation of British Industries, the run-of-the-mill chemist or physicist earns over £1,200 by the time he is 40, and in later years considerably more. That committee thought a maximum of £1,500 for science teachers would be needed to enable the schools to compete. The new proposals, therefore, will not rob industry and Government service of their advantage—even if such employers decide to refrain from raising their bid for scientists. But the increases recommended are probably as much as can be expected at this stage. The whole structure of teachers' salaries may be reconsidered when the existing Burnham agreement comes to an end in 1957, when, perhaps, the principle of plums at the top may be incorporated into basic salary scales. Meanwhile Sir David Eccles should certainly accept these proposals—and look to industry, the public service and the universities for the next contribution to the problem.

No Plums for Nurses

THE £24 million increase in the estimated cost of the health services next year must have been budgeted for before the award of the industrial court on nurses' salaries was made—though in the knowledge that some rise would be forthcoming. If the nurses' claim had been upheld, an extra £7,900,000 would have been needed for the gross salary bill, less any increase decided on in the charges made to nurses for their board and lodging. In fact, the court has found in favour of the salary proposals of the management side of the Whitley council, and the gross bill will be raised by only £4,200,000 a year.

On board and lodging charges, however, the court has ruled against the management; this increase is now to absorb only one-third, instead of about one-half, of the rise in salaries. But this is poor consolation to the trained nurse.

Before the award, the salary of a ward sister, who has one of the most responsible and exacting posts in a hospital, ranged from £425 to £550 a year, from which she paid £145 residence charge. She is now to receive an extra £25 a year and will pay an extra £8 for her board and lodging. At the very top of the scale, the increase in the salary of the matron of a large hospital, formerly ranging from £970 to £1,170 with a residence charge of £245, is also limited to £25 (the staff side claimed £135).

Nursing is not now a profession which a recruit ordinarily enters with a view to climbing to the top of the tree; most nurses get married instead. But the award, which gives trained nurses of all grades a rise that is only £10 more than that to be given to student nurses, will tend to perpetuate the drawbacks of the profession as it is organised at present. Each year it demands large numbers of new students, many of whom leave nursing before or as soon as they have finished their training, whereas what the profession needs is more trained nurses and fewer students. This can certainly not be achieved by bigger salary differentials alone; a more important step should be the oft-suggested radical overhaul of nursing duties. But higher salaries for sisters and matrons and fewer student nurses is the objective to be aimed at. In this award the aim has been awry.

Tourists in North Korea

A PRETTY dilemma faces the five British Commonwealth citizens whose activities in the prisoner of war camps of North Korea are described in the Ministry of Defence's booklet on the treatment of British prisoners (discussed on page 819). A note attached to the booklet virtually challenges them to sue for libel by pointedly drawing attention to the fact that the document is not a Parliamentary publication and therefore does not enjoy absolute privilege. If the five ignore the gauntlet thus thrown down, many people will take this as a tacit admission of the accuracy

GOLD AND DOLLAR RESERVES

US DOLLARS [THOUSAND MILLION]

of the Ministry's account. If they decide to sue they face the possibility that the defendants will call upon former prisoners to describe their conduct. In neither case are the five likely to emerge with credit.

Their difficulty in justifying themselves is illustrated by the *Daily Worker's* claim on behalf of Mr Alan Winnington, who visited some of the camps as its correspondent. The Communist paper now says that the Ministry is forced to admit that relatives of British prisoners in Korea got news of their menfolk only as a result of the work of Mr Winnington. In fact the prisoners were dependent on this channel of communication because for 14 months after the Chinese entered the Korean war they refused to exchange lists of prisoners; and for almost as long they refused to allow prisoners to write home. Mr Winnington and the *Daily Worker* merely took advantage of their monopoly of information.

None of the five can be very happy about the part he or she played. Their sympathy for Communism may have been sincere, and they may even have persuaded themselves that their work was for the benefit of the prisoners (though in the case of Mr Shapiro, also of the *Daily Worker*, this hardly tallies with his reported threat to have one man shot). But the various accounts of their activities make it clear that they were used as tools by the Chinese. For the most part they saw only selected prisoners; a promise of Mr Shapiro's to get comforts for the men came to nothing; and if Mr Gaster believed what he wrote about the quality of the prisoners' food he must have been one of the most gullible visitors ever to glance at a cookhouse menu. Wittingly or not, the five became part of the Communist machine for indoctrinating prisoners—the machine which also employed the tortures described in the Ministry's booklet.

Recklessness at Gaza

WHOEVER fired the first shot near Gaza last Monday, the Israel army was either out of control or else obeying orders that its superiors had no business to give when it blew up one third of the Gaza water supply and mined a road inside the Gaza strip. These two incidents were only part of a frontier affray in which 39 Egyptians were killed, more than half of them in what look like prearranged ambushes.

Admittedly, tempers were running high in Israel—much higher than inside Egypt, where political attention has for the last few weeks been concentrated on inter-Arab affairs. Israeli anger with Egypt in particular has been piling up ever since the Egyptians seized the vessel *Bat Galim* in the Suez Canal in September; it was fed last month by the execution of two Jews in Cairo on charges of spying, and last week an element of fear entered into it at news that a band, said to come from the Gaza strip, had perpetrated raids as far north as Rehovoth and Richon le Zion, the latter only ten miles from Tel Aviv.

Retaliation of Monday's stamp undoubtedly has a cheering effect inside Israel; it makes people feel safe. But seen from outside, it minimises Israel's case against boycott and its protestations that what it wants is peace. As is well known, Israeli authorities are divided into the advo-

cates of diplomatic methods and the activists; the latter get the upper hand whenever security in frontier areas is shaky. But the price of their supremacy needs to be weighed; it is loss of western sympathy and, in the case of Gaza, the endangering of the lives of the 65,000 Jews who still live in Egypt.

The Egyptians have appealed to the Security Council, which is even more deeply concerned at Gaza than it was at last year's similar retaliatory acts on the Jordan border. For in the hills of Jordan, the refugee is defended by his cousins, and is in possession of arms. In Gaza, he—or rather 200,000 of him—lives unarmed in UN camps. On Tuesday and Wednesday, refugee rioters stormed UN offices there, clamouring for "arms, not bread"—an item which does not look pretty on the agenda of a peacemaking organisation.

High Flats and Tall Costs

THE recent conference on high flats at the Royal Institute of British Architects yielded some startling statistics. Dr J. C. Weston of the Building Research Station estimated, on the basis of recent tender prices, that the cost per square foot (exclusive of access space) rises from 32s. for a two-storey house to between 55s. and 80s. or even more for six to twelve storey buildings. In consequence, although the average two-bedroom flat is smaller than the equivalent house, its cost of construction is roughly twice as high; and the economic rent of the flat is higher still because maintenance and management charges are also considerably greater. Almost the entire extra cost of flat construction is borne by the central government, by means of a special subsidy.

In theory a policy of "mixed development" can combine the architectural attractions of large blocks of flats with the lower costs and greater popularity of maisonnettes and terrace housing. The London County Council is leading the way with such schemes. The snag with them is that they include much too low a proportion of ordinary housing (generally under 10 per cent) to satisfy tenants or to bring down average costs appreciably. According to another speaker at the conference, Miss Margaret Willis, two out of three of the tenants on the upper storeys of the tall LCC blocks—despite all the attractions of fresher air, greater quiet, and fine outlook—would still prefer a house and garden. There is certainly a place for a few tall flats in local authority schemes; but the suspicion remains that in some of the present mass development schemes—to the tenants' distaste and with the Minister of Housing's express encouragement—far too many authorities and architects are merely building exciting monuments to their own ingenuity.

Spare the Victors

THE Bill which will extend the benefits of the legal aid scheme from the High Court to the County Courts has passed its second reading in the Lords, to await handling in committee; and the Council of the Law Society has

chosen this occasion to release a new flood of statistics about the economy with which the scheme is run and the high proportion of assisted persons who succeed in winning or settling their cases. Since the scheme started in October, 1950, nearly 220,000 applications for legal aid have been received, and more than 130,000 certificates have been issued. The fact that about four-fifths of the certificates have related to matrimonial proceedings should not obscure the substantial number of assisted litigants in the Queen's Bench Division, particularly for industrial injuries and accidents; nearly nine-tenths of them have been successful.

As the scheme extends, however, so will the most potent cause of criticism of it. Like some, though not all, trade unions, the state does not pay the costs of successful unassisted litigants; since 1950 assisted persons have lost more than 1,000 cases in the Queen's Bench Division, and few of their opponents will have recovered more than a fraction, if any, of their costs. While many of the losers are insurance companies, which by now are philosophical on this subject, some of the successful parties may well have suffered great hardship; so may some of the people who have settled unfounded cases out of court, simply to spare themselves costs that they could not recover. It is not certain that a legal advice service—desirable as that might be on other grounds—would diminish the number of unfounded claims; an adviser would probably have less information than a certifying committee and no more capacity. More effective is the practice of granting limited certificates which endure only to the close of the pleadings, when the situation must be reviewed. A recent regulation has been made whereby area committees are required to discharge a certificate if, as a result of any information coming to their knowledge—for example from the other party to the case—they consider that the assisted person should proceed no further.

The Law Society is therefore doing its best. The next step seems to be up to the Government. Now that the County Courts Bill is to become law, it should surely consider the possibility of making some payment to the successful unassisted party, at least where hardship has been caused.

Alphabet Soup

REPORTS that Gatt is to vanish from the ken of newspaper readers and be replaced by a gallant body known as the OTC suggest that the tide may be turning against the mid-century fashion of shortening cumbrous titles not merely into groups of initials but into pronounceable words formed from those initials. If so, it will be a relief to some people and a pang to others. We have become accustomed to a language full of such exotic combinations of sounds as ecosoc, icaos, anzus and saclant. Some items in this fast-growing vocabulary strongly suggest packaged foods or beverages—we already have ecafé, ecla, cocom, sunfed, and benelux. Some have been suggestive of their purpose, like care, or picme, the committee concerned with would-be emigrants; others, such as unwrapne, which provides shelter for refugees from Palestine, have a misleading sound. There are those that possess pedigrees:

shape the son of shaef, seato the heir to seac; but one or two, such as uncurk and alfsea, have sounded decidedly illbred to many ears. International organisations and the armed services have been their most fertile breeding grounds, but not the only ones; Ishra, a hitherto unknown Old Testament prophet, may be found in financial columns.

Among those that remain obstinately capitalised, with each letter separately enunciated, are the unpronounceable, the sturdily conservative, and those, like WHO, that would lead straight into chaos if they were treated any other way. This resistance ought perhaps to be encouraged. There are already signs of a tendency to baptise new organisations more according to their vowel sounds than to their functions; and it will be a sad day when Englishmen begin to speak of the tuc, and Americans of the gop.

The King of Cambodia

THE abdication of King Norodom Sihanouk is an expected blow to western hopes of keeping Cambodia out of Communist hands. This is not the first time the unconventional young king has done things calculated to startle. But on previous occasions his objectives have been clear and commendable; this time, it is difficult to see what good can come of his action.

The king himself blames his decision on the actions of political opponents who have thwarted his attempts to introduce constitutional reforms. He named the Communist-supported ex-rebel leader Son Ngoc Thanh as being mainly responsible. This explanation, however, seems quite inadequate: King Norodom has apparently been riding high on the crest of a wave of acclaim in the past few months. He had seemed to make headway in his campaign against the persistently popular Thanh by claiming, in all fairness, that Cambodia owed its independence not to the rebel but to the king. He can certainly have had no cause to complain of the result of last month's referendum, in which 909,000 voters approved his policies, with only 1,700 voting against them.

General elections were due to be held in Cambodia later this month, not in fulfilment of the provisions of Geneva, but by ordinary constitutional processes. A number of demonstrations against the elections have taken place in the past few weeks, however, and on February 18th King Norodom outlined a programme of "national salvation" providing for the election of a National Assembly by village councils, as a substitute for general elections. Son Ngoc Thanh has now complained to the international commission that this plan would violate the Geneva agreements, and the commission's acceptance of his complaint is given as the reason for the abdication.

There is an element of the irrational in all this. When, in June, 1953, King Norodom went into voluntary exile in Siam, he did so with the aim of forcing France's hand in the independence negotiations; and he succeeded in his object. Now, however, the king seems to be handing over his country to Son Ngoc Thanh without a fight. One can only hope that his decision to abdicate is not final; it may be recalled that his exile two years ago lasted only a few days, and ended before the French had granted him all his wishes.

£530 a Year

BY last October average male earnings in industry were £10 4s. 5d. a week, compared with £9 17s. 8d. a week in the previous April and £3 9s. a week in October, 1938; it may be a little startling to some male salary earners to realise that, if they are getting less than £530 a year, they would usually do better in a factory. The latest increase in earnings, revealed in the Ministry of Labour's half yearly survey, published this week, was partly the result of working longer hours—48½ hours a week last October,

more than half-an-hour longer than a year before, and nearly one hour longer than in 1938. Men, in recent years, have done better than youths or women. Women earn on the average only about half as much but their hours are shorter, too, averaging nearly 42 hours last October—1½ hours less than before the war. As the chart shows, earnings still continue to rise faster than wage rates, and faster than retail prices.

Schleswig a Problem Still

DISCUSSIONS have opened in Copenhagen this week between German and Danish officials about the problem of the national minorities on either side of the frontier between the two countries. An attempt to settle the grievance of the Danes south of the border is welcome. They cast at least 40,000 votes in Schleswig-Holstein (their exact figures are vague because there is a considerable "floating" population which claims to be Danish or German according to the political circumstances of the moment); and they have been disgruntled since the *Land* elections of last autumn, when their party was deprived of its four seats in the provincial parliament by the operation of the "five per cent clause" in the electoral law. This is the clause which requires a party to gain one direct mandate, or five per cent of the aggregate vote, before it is entitled to a seat.

The Danes have hopes of winning back a place in the *Landtag* for their minority. Herr von Hassel, the Christian Democrat premier of Schleswig-Holstein, is reported not to

THE ECONOMIST, MARCH 5, 1955

oppose the idea of altering the election law in favour of the Danes. Herr von Hassel is a warm admirer and *protegé* of Dr Adenauer, who is sympathetic to the Danes' claim (the Federal election law, unlike the present *Land* law in Schleswig-Holstein, makes an exception in the "five per cent clause" for national minorities). But the two sides are said to have divergent approaches to the present talks. The Germans are talking in terms of a declaration on frontiers and a treaty between the two countries setting out the rights of the minorities. The Danes oppose both suggestions. They do not want the frontier "frozen" because they feel that in time, and with changing circumstances, they might have a case for suggesting changes; and they do not want a minorities treaty because they fear that it might give the Germans the right to interfere in their internal affairs. Instead they suggest that the two governments should exchange declarations about their policies towards the minorities.

Reforming the Civil Service

At a time when the general outcry against the ineffective condition of our administrative departments leads the public to look with favour upon any project for their improvement, we must be upon our guard against hasty or ill-considered changes. . . . The movement for the reform of our Civil Departments originated with the Crown . . . two gentlemen of high position in the service, Sir Charles Trevelyan and Sir Stafford Northcote, were directed to report upon the subject; . . . and the original documents, with the criticisms and rejoinders annexed, are now before the public. . . . The plan recommended by the original reporters is condemned by the names of greatest authority and the arguments of the greatest weight. Indeed it seems to us to carry its own condemnation on its face. . . . In the first place, a "competitive literary examination," even if science were superadded, would be a very imperfect mode of testing the possession by the candidate of the special qualities required. The qualifications needed in a "Permanent Civil Servant" and in a first-class man, the fellow or tutor of a college, are wholly different. What we need in the servants of public offices are sound sense, good judgment, good manners, an average education, diligence, and scrupulous honour and trustworthiness. . . . What you want are steady men, sensible men, wise men. And you propose a system which would give you, inevitably and by preference, learned men, clever men, and crammed men. . . . You want men of business, not men of genius. Not only would first-class men be out of place, but they would be thrown away there; they would be misplaced, uncomfortable, restless, troublesome, injured, and therefore discontented. There are a great number of men, conscientious, qualified, diligent, and steady, for whom the Civil Service is just the thing, and who are just the perfect trustiness; unenergetic but plodding; humble and contented; satisfied with a moderate salary, because they are aware they could not command a large one; . . . competent to moderate and regular work, but not able to undergo severe toil; quite content to obtain a place in the service of the State, because they know that they could not succeed in the open professions. The work that has to be done they will do as well as men of far superior talents and acquirements; and their powers, as well as good of the country, and employed where they can be employed with advantage. . . .

The Economist

March 3, 1855

THE ECONOMIST, MARCH 5, 1955

Letters to the Editor

Deficit Finance in Asia

SIR—You quote with obvious approval Dr Benham's strictures on the (rather timid) report of an ECAFE Working Party on the financial aspects of development. I do not wish to comment on the propriety of an attack by a high British official (and especially one in so exposed a position as the Economic Adviser to the UK Commissioner General in South East Asia) on a paper which is yet to be submitted to a Uno Committee. So far as the substance goes, Dr Benham's fears of deficit financing resulting in inflation would be more convincing if they were not expressed at a moment of a general fall in prices—despite the use of deficit finance—which threatens the stability of the non-Communist regimes in the area and at a moment when even India is unable to make use of such wholly insufficient foreign aid as she was granted.

A call for a substantial increase in foreign aid and stern warnings about the laggardness of investment programmes would be more in place. Even the Indian rate of investment is, at below 7 per cent, still under the critical rate at which a steady increase in output per head can be expected. China seems to have reached 8 per cent last year and is further increasing towards the eventual goal of 20 per cent in 1958 on the basis of substantial Russian help. Dr Benham's suggestion that higher taxation should be tried is, however laudable, hardly a practicable proposition. If the non-Communist areas waited until they managed to reform their fiscal systems, they might have to wait too long. His fears that a severe limitation of (luxury) imports would necessarily involve an increase in inflationary pressure is incorrect. It is more likely to decrease under-employment in handicraft and potential domestic service.

The vicious circle of poverty can only be broken in Asia by an increase in investment. The risks implicit in stagnation are far greater than that of inflation when the industrial and military strength of China visibly increases every day, though, no doubt, an adequate increase in foreign help would be preferable.—
Yours faithfully,
T. BALOGH
Balliol College, Oxford

Price Rings in the Corner

SIR—It seems to me that the tenor of your recent remarks is that you are opposed to both collective restrictive practices and individual resale price conditions. But is it not true to say

that *The Economist* applies restrictive practices? I believe I am right when I say that, if my newsagent supplies me with a current copy of *The Economist* at 11d., he runs the risk of having his supplies withdrawn. Alternatively, if a recognised advertising agent sold advertising space in *The Economist* at a price lower than that fixed on your official rate card, you would take action to prevent its recurrence.

As an advertising agent I am all for such restrictive practice on your part, but I do not think we should criticise other people for adopting similar methods.—Yours faithfully,
C. CARPENTER
London, W.1

[There is both a general and a specific answer to this issue, which we have no desire to dodge. The general answer is that it is perfectly consistent for one member of a community, or one firm in an industry, to advocate a change in the rules, without practising the new rules himself in advance of their being imposed on everybody else. One can sincerely advocate disarmament without unilaterally disarming. In advocating certain limits and restrictions on price maintenance practices, and more publicity for them, *The Economist* would have no desire to exempt the trades with which it is itself connected. As for the specific matters that Mr Carpenter raises, they are wholly hypothetical. We have never heard of any attempt to sell copies of *The Economist* or advertising space in it below the quoted prices. If either were to happen the pressure of prevailing practices of the distributing and advertising trades, in the present state of the law, might be too strong for a small business like this to resist. But at least we are not parties to any agreement.—EDITOR.]

★
SIR—I should like to support your condemnation of price maintenance. Just as the speed of a convoy is limited to that of the slowest ship, so the margins fixed by the system of price maintenance must cover the least efficient and highest cost traders, no allowances being tolerated for any divergences between these extremes. Apart from overcrowding in some fields, caused by the lure of high fixed profits, the absence of price competition leads to excessive expenditure on rendering premises more imposing, on overstaffing and on unnecessary advertising. That the economy would benefit by, and a large proportion of consumers prefer, simpler premises and services at lower prices are considerations for which the system makes no allowance.—Yours faithfully,
M. HARRIS
Dublin

Total Civil Defence

SIR—At the end of your article of February 27th you print a map headed "Contamination Effects from Fall-out" without specific comment in the letter-press. Some comment would seem to be required. First, the note at the bottom, "Percentages indicate casualty rate of people not under cover," needs the addition of "or taking protective measures." Suitable simple personal protective measures are possible and effective. Secondly, the indicated effects are those from a ground, or very low, burst. Such a burst would have considerably less fire and blast effects than a high one. Thirdly, the areas given are those estimated to be possible under ideal atmospheric conditions from the attacker's point of view. Such conditions will be very rare.

So far, these considerations are all to the good, but my fourth is not. That is that in the particularly uneven wind conditions in this country, the fall out would never come down in a neat predictable cigar shape. It would be scattered most irregularly with, probably, many isolated patches of severe contamination. However, with a really effective detection system and good public education in protective measures, fatal casualties from this cause should be reduced to a comparatively small figure.—Yours faithfully,
Stockbridge, Hants J. SPOTTISWOODE

Merger in Manhattan

SIR—On p. 278 of your issue of January 22, 1955, you state:

"In return for giving up the prestige of being a national institution, of which there are now only a handful in the banking field, the Chase Bank will gain practical advantages; . . ."

On June 30, 1954, there were 13,937 commercial banks in the United States, of which 4,835 were national banks. On that date the total assets of all commercial banks came to \$190,585 million, of which \$108,611 million belonged to national banks.—Yours faithfully,
W. A. L. COULBORN
Oglethorpe University, Georgia

[Professor Coulborn is quite right. Our statement should have referred only to New York City.—EDITOR.]

Prime Ministers Meet

SIR—As a faithful reader of *The Economist* I may perhaps regret an omission in your diagram about "Commonwealth Relations with Other Organisations and Groups," which appeared in your issue of January 29th.

The Seato members include France, whose representative at Manila on September 8, 1954, was M. Guy La Chambre, Minister of State, in charge of the Associated States in M. Mendès-France's government.—Yours faithfully,
Paris M. LE NAN

Books & Publications

In the Washington Jungle

THE SECRET DIARY OF HAROLD L. ICKES:

Volume I, *The First Thousand Days*, 1933-1936; and Volume II, *The Inside Struggle*, 1936-1939.

Weidenfeld and Nicolson. 749 and 759 pages, respectively. 31s. 6d. each.

IF the members of Franklin Roosevelt's administrations had truly been the Marxists their congressional critics said they were, they could have hardly been more intent on "getting themselves right with history." New Deal memoir-writing has been a major Washington industry, employing more shorthand-typists than the whole of Whitehall and more ghosts than Borley Rectory. But the memoirists, good as some of them (e.g., Frances Perkins) have been, are less valuable than the diarists. What the former recollect when put out to graze is less directly reliable than what their colleagues confided to their dictaphones while still in harness. Indeed, one of the minor mysteries of the New Deal is how these hard-driven administrators (Ickes, Roosevelt's Secretary of the Interior, claimed to have worked a twelve-hour day) found time and energy to record their secrets in such detail. "Every Saturday or Sunday," says Mrs. Ickes, "he dictated the full text of his diary for the week." Often, by his own admission, Ickes was worked to a frazzle. Yet rarely does the week's output fall below 1,500 words. The whole diary amounted to six million words, which, over a period of nineteen years, works out at an average of over 850 a day. Not all are printed here: "parts are too detailed to interest anyone but historians... other parts will have to wait until the death of many living persons." But enough is printed to make these volumes the most revealing inside picture of New Deal politics that has appeared or (saving, perhaps, the mysteriously suppressed Morgenthau diaries) that will ever appear.

At first sight these closely printed pages, dripping with the details of departmental skirmishes over issues that have lost most of their interest and all of their urgency, appear to be heavy and unrewarding reading. Yet even the most superficial reader can pull out a few plums, for Ickes, unlike many diarists, did not save up all his wisecracks for publication. Vice-President Garner can surely ask no better memorial than to be recorded as "navigating well in heavy alcoholic weather," and Cordell Hull remains pinned to the pages of history with the comment, "the only station on his one-track mind is 'trade agreements.'"

The Old Curmudgeon's caustic tongue is seldom silent in these pages; personalities abound and, whatever the editors' prudence may have excised, plenty of fascinating gossip remains.

The diary, however, is more than a sustained gossip column. Even at the purely personal level it acquires unity and depth from its revelation of the character of its two main figures, Ickes himself and the President he serves. Surprisingly to anyone whose first acquaintance with the diary is from the sharp-tongued notices in certain American journals, Ickes appears as a strangely pathetic figure. In the "First Thousand Days" in particular, everything seems to go wrong with him. When he goes out to dinner he always draws the wrong partners; when he plays poker he always loses; if he joins the presidential yacht he is generally sea-sick; at White House *soirées* the chairs stick into the small of his back; when he has his house decorated the ceiling has to be painted four times "and still isn't right"; whenever he tries to buttonhole the President, Fanny Perkins gets in front. And suddenly custard pie comedy turns to something very like tragedy when word is brought to him, in the midst of a crisis involving his own resignation, of the death of his wife in a motor accident.

Woven into every page of Ickes's personal, as well as ministerial, life is the figure of Franklin D. Roosevelt. It is a pathetic figure in every Freudian sense of the term. *Odi et amo* is the recurrent theme. The President has "sold me down the river"; he has "operated on me without even giving me an anaesthetic"; he has listened to the siren songs of Henry Wallace; he has betrayed the New Deal. There is a lovers' quarrel. Harold resigns, F. D. R. writes back, "Resignation not undoubted generosity and evident sincerity." Yet love is not wholly blind: "For a long time I have felt that the President isn't personal, and I don't think that he is in the sense that he particularly feels for or through another. But no one can be more friendly or interested than he or give so strong an impression of real concern." The pages of Roosevelt which no presidential biographer will be able to ignore.

But of course the greatest value of the diaries is the light they throw on the New Deal. They are superbly evocative—the excitement of the Hundred Days, the absurdities of the Liberty Leaguers, the glory and squalor

THE ECONOMIST, MARCH 5, 1955

of the Supreme Court battle, all this and more is here. Accurately, because unconsciously, they render the change in tone, from the competitive, isolationist idealism of the first term to the harder-boiled, slower-paced, often defensive compromises of the second, in which Hitler begins to count for as much as Mayor Kelly and Chamberlain is as monstrous a betrayer as Jack Nance Garner. However, all this for the English reader has one grave drawback. It is bound to make it harder for him to understand why American government works at all. A Cabinet in which every member fights (in public and private) with every other, a President who has neither a philosophy nor any sense of administrative order, a civil service which flouts its ministers and intrigues with the legislature—how, in heaven's name, did there emerge from this the staggering achievements of the New Deal? This is the question which future historians will have to answer. They will have to pierce the jungle depicted in Ickes's pages to the idealism, energy and revolutionary sense of purpose that lay somewhere beyond.

The Devil's Disciples

THE OLD CAUSE.

By John Carswell.

The Cresset Press. 425 pages. 30s.

DOCTOR JOHNSON said, "The first Whig was the Devil." But it was John Milton who in 1660 had said, "what I have spoken is the language of that which is not called amiss 'the Good Old Cause.'" But the cause for which Mr Carswell's three Whigs worked was ultimately the cause of the Hanoverian Electors, not of the Puritan "Elect" and he maintains that in their parliamentary careers they not only upheld the principles of 1688, but assisted in the evolution of the English constitution by developing the doctrine of the Opposition.

The three, whose political lives overlapped, save for a few months before Fox entered Parliament, are Thomas Wharton, George Bubb Doddington, and Charles James Fox. To their contemporary detractors, the first was a scheming, unscrupulous rake; the second a mediocre political toady; while Fox's lack of practical success seems to puzzle Mr Carswell as much as it baffled many of "the Black Boy's" friends. But though he is happier telling their stories than philosophising about their politics, Mr Carswell does not let the reader forget (indeed somewhat too frequently says "we shall see" or "this reminds us") that his purpose is to exhibit them as Whigs in action. To those who are familiar with Sir Lewis Namier's interpretation of eighteenth-century politics, the argument that the Whigs were not a party in the modern sense, and that the party system could not have developed without the formation of an Opposition may be superfluous but need not spoil their enjoyment; while those readers who know little about eighteenth-century

THE ECONOMIST, MARCH 5, 1955

measures will enjoy these eighteenth-century men who are so vividly revitalised by Mr Carswell.

Honest Tom Wharton, the puritan-bred aristocrat, who boasted that he had never issued a challenge, never refused one, and never killed a man; "zealous lover, hearty companion, uncompromising enemy"; endowed with stamina, courage, extraordinary power of recuperation, and "notable powers of dissimulation"; may possibly have drafted the invitation to William of Orange. "I own driving out King James and I would do it again," he said. He was the author of "Lilliburlero," and the most decisive speaker in the debate which followed James's flight; and he and his friends, with well-stocked country-house armouries, were ready to march in 1714 as they had marched in 1688.

The Whigs of Lord Wharton's generation established a monarchy controlled by an aristocracy—but not by a caste, as the career of George Bubb Doddington proves. The natural son of a minor landowner he was adopted by his uncle, who endowed him with his name and a fortune acquired by a typically eighteenth-century mixture of office-holding and commerce; and became eventually Baron Melcombe. Caricatured in Hogarth's "Chairing the Member," scornfully dismissed by Pope and Hervey as a clownish and unpopular political climber, he seems to walk on to the stage of history in the crowd of those who have their price. But he was not inspired by self-interest only: although he tried to keep in with Walpole and the Prince of Wales, he was not afraid to give unwelcome advice to "Poor Fred"; or to stand up to Walpole, who had interfered with his boroughs, and, when his protests were ignored, to organise an opposition that ended Robinocracy. And later he defended Byng, partly to weaken the Government, but also to oppose injustice. He was, in a mid-eighteenth-century way, the Old Cause in action: the "Country Member" whose independence was not to be bought—at any rate, not cheaply. Even his membership of the Medmenham Brotherhood sprang from social and political motives, not from an interest in black magic. His domestic life was almost regular; he secretly married his only mistress. When he managed to achieve office, he was industrious, and he made little out of the Paymastership. We should be grateful to Mr Carswell for a portrait that counterbalances Hogarth's caricature.

Fox's part in this trilogy is, however, less convincingly described. It may be that the author, like other recent biographers of Fox, while paying tribute to his popularity with contemporaries, finds him tiresome—as, indeed, even his friends sometimes did. And it must be hard to find anything new to say about "Fox, the Man." But it would be difficult to dispute the claim that this man of the people nourished the growth of parliamentary opposition, for he spent a large part of his political life out

of office—though it might be fairly maintained that this was due to defects of character and judgment as much as to the strength of his Whig convictions. However, in praising a warm humanity and courage that even super-egotism could not nullify, Mr Carswell is in the good company of Professor Alfred Cobban, who, in editing "The Debate on the French Revolution," says, "the traditional liberties of England had been preserved by the small aristocratic clique that found its inspiration in Charles James Fox."

The illustrations are well chosen and there is an ingeniously helpful chronological table. The Appendix contains the original version of Lilliburlero and (very fairly) a vigorous Tory song written a few years earlier.

Guide to the Economists

A HISTORY OF ECONOMIC THOUGHT.

By Eric Roll.

Faber. 540 pages. 30s.

IT is Mr Roll's bad luck that this third edition of his "History of Economic Thought"—first published in 1938, now heavily revised, enlarged, and brought up to date—should appear within a twelvemonth of the late Professor Schumpeter's formidable "History of Economic Analysis," in the wake of whose launching it bobs about as unfairly dwarfed as a light cruiser under the lee of the *Rodney*.

Light cruisers, however, can do jobs for which battleships are unsuited. Very few people will ever read (as distinct from consulting) Schumpeter's *magnum opus*; Mr Roll's history, while substantial, is eminently manageable. From the one author the reader will get all the refinements of a comprehensive scholarship, from the other an operational selection. "This book," says the author, "is concerned only with the main streams of thought which have gone to make up present-day academic theory." (This formula does not exclude a masterly account and assessment of Marx.) And Mr Roll's book is strongest just where Schumpeter's unfinished work is inevitably weakest—in its dealings with contemporary theory. His account of the process by which Keynes became the idol of New Deal economists and the bogymen of American business is beautifully perceptive; hardly less outstanding is the skill with which he traces the development of equilibrium theory from Cournot, Jevons, Walras, Marshall, Pareto, to such distinguished contemporaries as Messrs Sraffa, Hicks, Chamberlin, Samuelson, and Mrs Joan Robinson.

Books re-issued and revised—however thoroughly—after a long period are apt to have a patched-up look; only too often, they are ineradicably marked by the mental attitudes and the current preoccupations besetting the author when he first wrote them. Mr Roll's "History" is a refreshing exception.

Statistical Yearbook 1954

Sixth issue of a comprehensive collection of authoritative international statistics presented in 179 tables, most of which cover a twenty-year period ending 1953, and the first half of 1954. The Yearbook is of permanent value to economists, banks, statisticians and government departments. Prepared by the Statistical Office of the United Nations.

Clothbound: 45/- (46/8 incl. postage)

Paperbound: 40/- (41/6 incl. postage)

Yearbook of International Trade Statistics 1953

This publication is the fourth of an annual series, and shows detailed trade statistics for 90 countries, covering about 97% of world trade. In addition to trade statistics for each country, tables showing world trade according to regions are also shown. This Yearbook is of special value to all who are interested in world trade and economic development.

32/6 (33/9 incl. postage)

THOSE PERPLEXING ARGENTINES

by James Bruce

former U.S. Ambassador to Argentina

Birmingham Post

"An excellent picture of contemporary life in that fascinating country... just about the best account ever published on this most complex subject."

John Connell

"Lively, shrewd, wise and most informative... he describes in vivid, graphic and factual terms the way that the people of the Argentine live, work and play." (Evening News)

The Economist

"Mr. Bruce is certainly a stimulating guide... he writes engagingly about his personal reactions to Argentina and he has a good eye for colour and incident."

Chicago Tribune

"It is difficult to find any defects in this sound and fascinating volume." (30/- net)

EYRE & SPOTTISWOODE

Pro PR

VOTING IN DEMOCRACIES.

By Enid Lakeman and James D. Lambert. Faber. 303 pages. 25s.

CONTENT with the rough justice and the clear decisions of their electoral system, the British have never shown themselves very interested in the more elaborate formulae by which other countries choose their legislatures. Domestic advocates of proportional representation have often been goaded by the ignorance and the prejudice of their audience into a polemic tone and a degree of exaggeration which ill serves their cause. This book is therefore to be welcomed for its clarity and moderation as well as for its general utility as a work of reference. It provides a reasonably simple description of the principles involved in the various possible types of electoral system and it gives a valuable, though uneven, summary of the methods employed by most European democracies, duly recording the impact of changes in the mode of election upon the number and the strength of parties and upon the stability of governments.

It is hardly a book that makes exciting reading, and, although it will shake some established prejudices about the consequences of proportional representation, it will leave many readers unsatisfied. The authors are convinced that any form of PR is good and that the single transferable vote is best of all. They make almost no admissions of the defects that

have occurred in practice. Their marshalling of evidence is so selective that one hesitates to accept even their most plausible judgments as authoritative. The weakness of this book—as of all works advocating PR or any other institutional nostrum—is the assumption of universal applicability. But different electoral systems may be appropriate for different countries. PR, which in one country may be an essential safeguard of minority representation, may in another country prevent minorities from ever being assimilated in more national parties. PR, which in some settings has produced invaluable tranquillity, in others has produced dangerous stagnation. There are no universal laws about electoral systems. The authors of this book fail to realise that PR is a means not an end—and not even an indispensable means. Their book, although interesting and useful, is narrow and biased: it is certainly not a definitive examination of contemporary electoral systems.

Keats's Poetry

KEATS.

By J. Middleton Murry. Jonathan Cape. 322 pages. 21s.

THIS book resembles a house to which additions have been made at different periods. The original structure dates from 1930; it was much enlarged in 1939 and considerably altered in 1949; and now some extra rooms have been built on, which do not increase the architectural merits of the whole, although they possess intrinsic merit. The new material consists of two short essays, on "Keats and Friendship" and "Keats and Claret," and a much longer one, on "Keats and Mrs Isabella Jones," occasioned by Mr Robert Gittings's recent book, "John Keats: The Living Year."

The thesis that Keats had a fleeting but successful love affair with Mrs Jones, at a time when he was already in love with Fanny Brawne and she with him, and that Mrs Jones was the original inspiration of the sonnet "Bright Star," is clearly as repugnant to Mr Murry as the theory that Wordsworth felt an incestuous passion for Dorothy has lately been to a bevy of literary critics. It is, indeed, odd that nobody has rushed sooner to the defence of Keats, for the story runs counter to all that is known of him from his letters and his poetry.

Mr Murry has examined with scathing care the kind of literary evidence on which Mr Gittings based his datings and his deductions, and one is left reflecting on the dangers of trying to establish biographical facts on the necessarily flimsy and subjective basis of echoes and resemblances that a reader may perceive in the utterances of a poet.

The finest chapters of the book are not concerned with Keats's biography but with his inner, imaginative life. They are written with an intensity of sympathy that really does illuminate the way in which the creative spirit worked in and through this amazingly sensitive poet.

THE ECONOMIST, MARCH 5, 1955

Shorter Notice

GUIDE TO THE PLANETS.

By Patrick Moore.

Eyre & Spottiswoode. 222 pages. 21s.

Mr Moore's companion "Guide to the Moon" was a more interesting, deeper work. This, its sequel, is a venture between stools: it does not compass the immensities of the universe; nor does it go more deeply into as small an object in it as our moon. Oddly enough, Mr Moore does not give his readers—what he could profitably have given them, apart from the excellent diagrams and the 24 plates, seven of which are in colour—a real notion of an orrery. A three dimensional diagram could have done this fascinating trick for them, and would have made much of his text on orbits, inclinations, etc., more comprehensible.

Nevertheless he has written a useful handbook for those who find our own little system in space puzzling enough. There are chapters on all the planets and the asteroids; sound assessments of the possibilities of forms of life on them, their densities, composition, and so on; and some hair-raising, but reasonable, conjectures about inter-planetary travel and its conditions. It would be a dull dog indeed who failed to find this book interesting and to understand it. Will the author next, please, consider the heavens?

Books Received

BRITAIN AND THE TIDE OF WORLD AFFAIRS: BBC Reith Lectures 1954.

By Oliver S. Franks. Oxford University Press. 71 pages. 5s.

The publishers are to be congratulated on having reduced the delay between the delivery of the Reith Lectures and their subsequent publication. The lectures themselves were referred to briefly in an article in *The Economist* of January 29, 1955, page 348.

THE ATTACK OF BIG BUSINESS.

By J. D. Glover. Harvard Business School. This book, which was reviewed in our issue of February 26, 1955, can be obtained from Bailey Bros. and Swinfen for 32s. and not 48s.

INTERNATIONAL ECONOMIC INTEGRATION. Second, completely revised, edition of International Economic Co-operation.

By J. Tinbergen. Amsterdam and Brussels: Elsevier. Distributors for the British Commonwealth and USA: Cleaver-Hume Press. 191 pages. 21s.

YEAR BOOK OF THE TEXTILE INSTITUTE: Number 7, 1954-55.

The Textile Institute. 266 pages. 15s. (non-members).

THE BOUNDARIES OF CANADA, ITS PROVINCES AND TERRITORIES: Geographical Branch Memoir 2.

By Norman L. Nicholson. Department of Mines and Technical Surveys, Canada. Edmond Cloutier, Queen's Printer and Controller of Stationery, Ottawa. 151 pages. 75 cents.

SYSTEMS OF SOCIAL SECURITY: United States.

International Labour Office, Geneva. 11 pages. 4s. 6d.

YEARBOOK OF INTERNATIONAL TRADE STATISTICS.

Prepared by the Statistical Office of the United Nations, Department of Economic Affairs. Distribution: Her Majesty Stationery Office. 481 pages. 32s. 6d.

HARRODS LTD LONDON SW1

At last, nuclear knowledge brings to every building, office, and industrial enterprise a sure and certain means of fire prevention which is now available to all.

WHAT DOES IT DO?

Minerva instantly detects the first trace of smoke from any smouldering material.

HOW DOES IT WORK?

The activating source of the detector is a particle of radio-active material with a theoretical life of more than a thousand years. No current is consumed while the detector is on guard. The entry of smoke triggers the detector.

HOW IS IT INSTALLED?

Each detector is no larger than an electric light bulb and can be fitted as simply.

Only one is required in a room or for every 1,000 sq. ft. of floor area.

WHAT DOES IT COST?

Only the cost of the simple wiring—the detectors and signal equipment are hired to the user by the makers at a low annual fee which includes servicing and free replacements.

Manufactured by The Minerva Detector Company Ltd., Richmond, Surrey, England

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Fifty Little Mayors

Washington

IN Chicago, the classic home of syndicated crime and the kind of professional politics that gives it protection, the Democratic party machine appeared last week to have ground out a smooth electoral triumph. Strictly speaking, there were two kinds of election: the humorously named non-partisan contests to elect fifty aldermen to the city council, and the party primaries to choose the Democratic and Republican candidates for mayor, city clerk and city treasurer. These will be followed on April 5th by the election proper for the city offices and runoffs in the 14 wards in which no aspiring alderman obtained an absolute majority.

In no fewer than 31 of the 36 wards that were won outright, the successful candidate was "an organisation man," while in the Democratic primary the local party chairman, Mr Daley, eliminated the present mayor, Mr Kennelly, who had had the temerity to ignore hints to retire while the going was good. Altogether it is difficult to blame one of the victors, Alderman Bauler, for dancing a jig and concluding that "Chicago ain't ready for reform yet."

For the first time since 1939, however, the Republicans have found a mayoral candidate with a name to conjure with. This is Mr Robert Merriam, son of a famous political scientist at the University of Chicago and himself the author of a popular war history, who for the last eight years has sat in the city council for the "University Ward" fighting the professionals at every turn. As a result he is something of a hero to those who still believe in the possibility of civic reform.

Although Mr Merriam was considered until recently a liberal Democrat, the sweeping Democratic victory in Illinois last November put the Republican leaders in a frame of mind to accept him as their standard-bearer on his own terms, which include a completely free hand over patronage and an undertaking merely to be neutral in the national elections of 1956. From the Republican point of view, Mr Kennelly's defeat is probably a blessing. The issue is now a clearcut one. Mr Daley, who had an excellent record under Governor Adlai Stevenson and carries his blessing now, claims that the local Democratic machine can, under proper leadership, be turned into an instrument of reform. Mr Merriam argues that in Chicago the Democratic party is a hopeless case and must be turned out lock, stock and barrel if reform is to have any meaning.

Mr Kennelly, a dignified, independent-minded business man, was summoned in 1947 from the presidency of the

Chicago Red Cross to administer first aid to a Democratic party that seemed well on the road to electoral ruin. To save their own skins, the professionals allowed Mr Kennelly to run a semi-reform administration. It has to its credit the removal of political influence from the schools and the city's purchasing agency, some improvements in the police force and the widespread extension of what one of the party machine's statements calls "all this civil service where a guy sits down and needs glasses to take an examination." There are now 32,000 city jobs under the merit system, with only 3,500 still available to carry party henchmen on the public payroll. This is clearly the reform that hurts and accounts for the mounting resentment towards the mayor of a majority of the aldermen. On the other hand, Mr Kennelly was reproached, by Mr Daley as well as by Mr Merriam's faction, with being satisfied with putting to honourable use his present inadequate authority, without trying to wrest from the state legislature reasonable powers of self-government.

There is indeed much to be said for the argument that no reform can possibly be more than a palliative so long as Chicago's fragmented system of government remains unchanged. The structural problem is threefold. In the county of Cook there are some 350 separate and mostly overlapping units of local government; within Chicago itself there are six major tax-raising governments (and even two police forces, since the Park District, which is totally independent of the mayor's administration, employs its own force). In the Chicago city government the powers of the individual aldermen are such that they are virtually fifty "little mayors." The result is a hopeless diffusion of responsibility, with only the state legislature, dominated by rural and suburban interests and meeting only for six months in every second year, having the authority to articulate the different functions or even to allocate funds.

Mr Merriam's plea to the city is that it should purge itself by tossing out the Democratic machine. He promises that, if elected, he will go immediately to the state capitol in Springfield to demand that the Republican legislature should underpin his position and make possible the redemption of his pledges by strengthening the executive authority of the mayor. He wants to remove executive functions from the city council and reduce its size to thirty-five, of whom ten would be elected from the city as a whole, and

to give the city its necessary financial independence by allowing it to raise a tax on sales or earnings.

What are Mr Merriam's chances? His leadership of the Emergency Crime Committee and his radical proposals to overhaul the transport system, the police department and the housing programme have made his name well known. His main hope seems to be to rally an anti-machine coalition. Against him are the technical proficiency of the Democratic professionals and the dilemma of the liberals. Many of them worship Mr Adlai Stevenson, the national Democratic leader, and Mr Merriam, the local Republican, as twin heroes and they fear that for Mr Stevenson's party to lose its own home base once again, in however good a cause, would be a serious blow to his standing as a national leader.

The Big Cigar

IT has long been an open secret that civil defence was the weakest plate in America's armour. The Civil Defence Administration, directed by Mr Val Peterson, was given scant attention by the Pentagon and the Atomic Energy Commission. Last year, its headquarters were moved to Michigan in order to bolster Republican prestige in that state. Mr Peterson could well say: "I do not believe the Congress or anyone else in this country has realised the need for a strong civil defence." Last week, however, there were signs that the country was being shaken out of its apathy and the Senate Armed Services Subcommittee, under the chairmanship of Senator Estes Kefauver, began hearings on the problem of radioactive fallout. This change in mood was brought about by the publication, on February 15th, of the Atomic Energy Commission's report on the effects of the hydrogen bomb explosion in the Pacific last year.

This report, whose release appears to have been ordered by President Eisenhower, adds to the image of the mushroom cloud that of a vast cigar, measuring some twenty miles across and stretching 140 miles downwind from the point of thermo-nuclear detonation. Within its shadow, the fallout of radioactive particles would destroy nearly all life. In an area of about 7,000 square miles downwind, survival would depend on shelter or prompt evacuation and decontamination. The AEC report did not mention how long such an area—the state of Maryland, for example—would remain dangerously radioactive after an explosion. One independent scientist, however, has calculated that the region would need several months to "cool down."

In terms of civil defence, the implications of the AEC report are terrifying. Enemy planes will no longer have to brave the anti-aircraft guns and rockets which surround a city in order to render it untenable. The defence of New York might have to be centred far upwind, near Pittsburgh, and survival would depend on the possibility of the rapid evacuation of millions of people. As Mr Peterson puts it: "We have graduated from the 'duck and cover' age to the age of evacuation." The United States has the advantage over Britain of space. But on the other hand, its urban populations are more crowded and much more heterogeneous, and they have not had the experience of the dress rehearsal of 1939-45.

THE ECONOMIST, MARCH 5, 1955

The Senate subcommittee is studying the problem of industrial dispersal as well as that of civilian evacuation. Mr Arthur Flemming, director of the Office of Defence Mobilisation, has called for quick action on a programme whereby amortisation benefits would be awarded only to factories conforming to dispersal standards. New plants would be built on locations chosen by defence experts. Mr Peterson has announced that mayors of "target cities" will meet at the White House in May and that there will be nation-wide evacuation drills in June. The old novelty trick of the exploding cigar has taken on a grim significance.

Obstructing a Justice

ON November 9th of last year, President Eisenhower nominated Judge John Marshall Harlan to fill the vacancy on the Supreme Court caused by the death of Justice Robert Jackson. The President's nomination was resubmitted on January 10th, after the new Congress convened. Despite the pressure of public opinion, the Judiciary Committee of the Senate kept on postponing hearings on Judge Harlan until February 23rd. Behind this procrastination lay a tangle of political interests, regional prejudice and legislative inefficiency.

Pending before the Supreme Court are numerous cases designed to elicit what measures the federal government will be empowered to carry out in order to enforce the ruling against racial segregation in schools. This ruling, which the Court made unanimously last May, has been appealed against by several southern states. An examination of these appeals had been scheduled for December 6th, but on November 22nd the Supreme Court decided to postpone action until a full bench was present. If Judge Harlan's appointment can be delayed, therefore, further action on the Court in October. Six of the eight Democratic members of the Judiciary Committee are from states opposed to "desegregation" and although Judge Harlan has refused to express his views on the issue, his grandfather, who was a Justice on the Supreme Court, is remembered as saying "the Constitution is colour blind."

Other members of the committee have smaller axes to grind. Senator William Langer, who heads the Republican minority, is opposing all of President Eisenhower's nominations to the cabinet and the Supreme Court until some of the less prominent states—especially his own of North Dakota—get what he regards as their fair quota of these distinguished appointments; Judge Harlan comes from New York. Senator Eastland of Mississippi, on the other hand, is worried lest Judge Harlan turn out to be an "internationalist" and take the side of a foreign treaty against the Constitution. When questioned on this issue, Judge Harlan very properly refused to give any answers that could pre-hearing, moreover, Judge Harlan saw himself denounced by a number of crackpot witnesses for having been a Rhodes Scholar and a member of the board of directors of Atlantic Union.

THE ECONOMIST, MARCH 5, 1955

The Rolling Road

FROM A CORRESPONDENT IN OHIO

THE question whether or not to approve a belt conveyor line to transport coal and iron ore between the Ohio River and Lake Erie is now before the Ohio General Assembly, and is expected to produce the most heated debate since Prohibition days. The 103-mile-long "rubber railroad" would cut across the north-eastern corner of Ohio, from the coal barge terminus of East Liverpool on the Ohio to the lake port of Lorain near Cleveland, passing through the steel centre of Youngstown and through other industrial centres in "America's Ruhr." According to its sponsor, Riverlake Belt Conveyor Lines, Inc., the venture would save Ohio steel mills and power users from \$20 to \$45 million in transport costs annually on the basis of a maximum annual haulage of 20 million tons of coal and 32 million tons of iron ore.

Designed to run mostly on the ground, with elevations to clear highway and rail traffic, the twin belts would move at a speed of 600 feet per minute; the northbound belt would carry coal, loaded directly from river barges, the southbound ore loaded from lake steamers. The belts would be fully enclosed within a steel gallery, with outlets along the way and modern freight terminals at either end. The project would take three years to build and cost "more than \$300 million," but no financing difficulties are

anticipated as some of the country's largest corporations are involved.

Opposition to the scheme is vested mainly in the twelve railway companies serving Ohio, which successfully killed the measure when it was first introduced in the legislature (which meets biennially) in 1949 and again in 1951. The railways first claimed that the project was "an engineer's pipedream," and then argued that the competition would ruin them. More recently, rail operators have emphasised with justification the costly, and to some extent neglected, problem of how to segregate different grades of ore and coal at transfer points and terminals.

The obstacles to the passage of the scheme are points of law. In order to pass through farms, railway rights of way and villages, the promoters will have to obtain from the Ohio legislature the status of a common carrier, with power of eminent domain. The railways argue that the belt line would not be a true common carrier because it would not transport all kinds of goods—an argument that is weakened, however, by the fact that

way rights of way and villages, the promoters will have to obtain from the Ohio legislature the status of a common carrier, with power of eminent domain. First in world-wide banking

An extensive network of 57 overseas branches and of correspondents in every commercially important city throughout the free world has made The National City Bank of New York first in world-wide banking.

This great organization is staffed by men experienced in international trade and banking who can offer rapid, up-to-the-minute information on local conditions and developments. The London branches of The National City Bank are uniquely equipped to advise on trade with the dollar area.

Whatever your business and wherever your interests, The National City Bank of New York is able and happy to be of service.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK

London Offices—City: 117 OLD BROAD STREET, E.C.2. West End: 11 WATERLOO PLACE, S.W.1

Ohio already permits oil and coal pipelines, in addition to utility lines, to cross the state. But Ohio farmers, fearing that the railways would be forced to reduce their services or raise rates if deprived of coal and iron haulage, are opposing the grant. More than one hundred Ohio communities, fearing a loss of railway services or damage to the landscape, have passed resolutions against the project.

However, despite this powerful opposition, most political observers think the belt line will be approved this year. A new and important factor in its favour is the newly authorised St Lawrence Seaway project which has started a scramble among the states that skirt the Great Lakes for a dominant share in the anticipated traffic. To compete with its neighbours, Ohio needs cheaper transportation rates for coal and iron ore.

A Nation on Wheels

ON February 22nd, President Eisenhower sent to Congress his long-awaited Highway Message. It was founded on a report submitted by the Advisory Committee on a National Highway Programme which had been set up in September, 1954, under the chairmanship of General Clay. It was becoming increasingly clear that if America was to remain "a nation on wheels," it would have to re-plan and expand its road system, and national highways figured prominently among Republican campaign promises.

In his message to Congress, President Eisenhower cited four major reasons why this programme of expansion should be undertaken as soon as possible. Each year more than 36,000 people are killed and more than a million are injured on American highways, and the economic cost of the highway accident toll is nearly \$4½ billion. Second, the deteriorating physical condition of the present road network has increased the cost of operating the nation's automobiles by \$5 billion a year. Third, the President refers to the need for quick evacuation of large cities in the event of atomic war. The present system of roads in critical areas "would be the breeder of deadly congestion." Finally, Mr Eisenhower points out that by 1965 Americans will be driving some 81 million cars as compared with 58 million today. Unless new highways are built and old ones are widened, "existing traffic jams only faintly foreshadow those of ten years hence."

To meet this situation, the President has proposed a ten-year road building programme that would cost \$101 billion. It would concentrate on modernising the network of interstate highways, which at present covers some 40,000 miles. This system, although it accounts for only 1.2 per cent of total

THE ECONOMIST, MARCH 5, 1955

road mileage in the United States, links up the capitals of forty-two states and 90 per cent of all cities with a population exceeding 50,000. At current rates of development, however, this highway system would take more than half a century to reach "a reasonable level of extent and efficiency." State funds are not sufficient to do the job, and that is why the President is prepared to step in.

The federal government proposes to assume responsibility for the completion of a modern interstate network by 1964 at an annual average cost of \$2.5 billion. In addition, it would provide a further \$6 billion towards the development of secondary roads, roads in urban areas and forest highways. Over the same ten-year period, state and local governments would spend about \$70 billion on road construction and expansion. In order to finance its \$25 billion contribution, the federal government would issue 30-year 3 per cent bonds for \$20 billion. These bonds would be guaranteed by the Treasury, and annual payments would be appropriated by Congress out of revenue from federal taxes on petrol and lubricating oil. The remaining \$5 billion would come mainly from licences on petrol stations.

President Eisenhower's programme is facing stiff opposition in Congress. Senator Harry Byrd, the chairman of the Senate Finance Committee, sees in the administration's proposals a disguised evasion of the federal debt limit and a spur to inflation. Senator Byrd urges the government to cut present petrol taxes by three-quarters, enabling the individual states to make up the difference in higher taxes. They would then be in a position to expand their highways without special federal assistance. Senator Byrd argues that this would represent a net saving of \$11½ billion, the aggregated interest charges on the proposed federal bonds. Senator Albert Gore, chairman of the Senate Highway Subcommittee, is introducing a Bill embodying a rival road programme. It is less ambitious than the President's, and would be based on equal participation between state and federal authorities. There is mounting opposition, moreover, from certain trade union and farm leaders, who see in the projected bond issue a further example of governmental inflation.

Mr Eisenhower has made efforts to give his highway programme a non-partisan character. For the first time since their party took over control of Congress, ranking Democrats were invited to the White House to discuss a domestic issue. Their hostile attitude is due to two related factors. Increasingly, the Democrats are being out-maneuvred by an administration which is carrying out traditional Democratic ideas under Republican colours. A vast road programme financed by the federal government is precisely the kind of adventurous planning and central direction associated with the New Deal and the liberal elements in the Democratic party. To

THE ECONOMIST, MARCH 5, 1955

have it carried out by a Republican President makes the prospects for the 1956 elections look gloomy.

President Eisenhower, moreover, came to the White House after a campaign in which he denounced the alleged budgetary excesses of the previous administration and promised to introduce a policy of strict financial equilibrium. The bonds for the proposed highway programme would be sold by a Federal Highway Corporation instead of by the Treasury. Consequently, the administration could avoid asking Congress for an increase in the debt limit and could conceal a major item of expenditure. The Democrats contend, therefore, that the President's financing proposals are geared to a political effect. Nevertheless, observers feel that the highway programme will be accepted with more or less minor modifications.

Uncivil Aeronautics

PRESIDENT EISENHOWER has had in recent weeks some first-hand experience of the political complexities of civil aviation. Normally, the question of assigning routes between the different domestic companies to eliminate uneconomic competition is handled by the Civil Aeronautics Board—an independent agency composed of five members appointed by the President—and its decisions go to the White House for confirmation. Recently, the CAB unanimously decided to make the Seattle-Honolulu route the sole preserve of Northwest Airlines, which had offered to operate it without a subsidy; this cancelled the rights of Pan-American World Airways to fly a parallel run. This decision, however, was an unpopular one with the Department of Commerce—Pan-American Airways has always had its full share of government blessing—and the President was hastily persuaded to reverse it, without consulting the Board, thus excluding Northwest Airlines from this much cherished route. Immediate protests arose from the Congressional members from the four Northwest states. They pointed out that the revised decision would give Pan-American Airways a monopoly to Hawaii. The President agreed to re-examine the case himself, and finally to rescind his decision and allow both lines to fly the route for another three years.

With peace restored on the Pacific route, disputes are now brewing on runs to both Alaska and Mexico. A CAB decision of last December gave Pan-American Airways the most profitable Alaskan flights—from Seattle to Anchorage. But Alaskans were outraged at what they considered discrimination against their own Alaska Airlines which operates a network of short-distance, and therefore unprofitable, services within the territory. Pan-American Airways now seems prepared to step down in favour of Pacific Northern Airlines, with which it is on close terms, but the President will have to decide whether or not to weigh in on the side of the underprivileged Alaskan Airlines. The second dispute concerns the non-stop, New York-Mexico City route, on which three airlines—American Airlines, Eastern Airlines and Pan-American—are each anxious to break the present monopoly of Air France. Cold war has broken out between the domestic companies, and it is, in any case, uncertain how the Mexican government would react to a new United States flight.

In decisions such as these the Board, which wields enormous power over the fate of the domestic airlines, is subject to a battery of pressures from outside. Because of this, the method of recruitment to the Board has recently been open to criticism; the appointments are political in character rather than founded on consideration of the administrative ability or experience of candidates. This is especially regrettable at a time when the problems of crowded airlines and the commercial future of jet aviation need careful thought.

Helicopters Run High

New York.

PLANS for the first commercial heliport on Manhattan Island in New York City now await only the final approval of the city and port authorities. The American public, never slow to appreciate the virtues of a novel form of transport, has blind faith in the future of the helicopter, and airlines badly need a more economical short distance aircraft. But in spite of generous military research and development contracts, the day of the civilian transport helicopter has not yet arrived. In the context of military urgency, performance regardless of expense is the criterion of success. And in specialised uses, from spectacular rescue work to crop dusting, and from oil prospecting to whale hunting, the unique flight characteristics of the helicopter have amply justified its high operating costs. But as a common carrier, the helicopter is still a most expensive machine to operate.

Transport helicopters are flown commercially in the United States by specialised helicopter operators in Los Angeles, Chicago and New York. Their chief function so far has been the speeding up of airmail deliveries between post office and airport. Passengers are carried on a limited scale, especially between the three airports serving New York City—a service recently extended to a few suburban points. But all of these operations are heavily subsidised by the federal government. Two local service airlines have also begun experimental helicopter operations, without subsidy, but hope to offset part of their losses by attracting more customers to their profitable fixed-wing services to which the helicopter route connects.

The reasons for the high cost of these initial operations are clear: all the work is performed by small single-engined machines, the largest being capable of carrying only eight people. The Sikorsky S-55 and the Bell 47, the only machines released by the military in sufficient numbers for commercial transport operations, are too small to carry passengers economically, and their single engines preclude their safe utilisation over built-up areas. Direct flight costs for the Sikorsky S-55 operated by Los Angeles Airways and New York Airways, are in the region of 30 to 35 cents a "seat mile," and could not conceivably be reduced to below 10 cents a "seat mile"—or five times as high as the cost of a DC-3 or Convair operating under similar conditions. Only with larger helicopters is there any chance, therefore, of making operating costs competitive.

Under the spur of military transport demand, the two largest helicopter manufacturers, the Sikorsky Aircraft Division of the United Aircraft Corporation, and the Piasecki Helicopter Corporation, both have military versions of larger machines in production. Sikorsky is producing for the army and navy its S-58, a larger version of the S-55, which could be adapted to carry 15 or more passengers, and has contracts for its twin-engined S-56, capable of carrying 35. Piasecki is producing for both United States and Canadian military use its H-21 "Work Horse," a 20-place machine for which it will apply for commercial certification this year, and is flight testing its H-16, a 40-place machine comparable in size to a Convair airliner. All are twin-engined machines—an accepted safety factor which also permits and enables schedules to be more consistently maintained. Both of the largest machines are being adapted for the installation of gas turbine engines, which provide the same power for less weight and noise.

The strength of the helicopter lies in its ability to "land on a dime" at small heliports in the centre of cities. On the other hand it is a slow machine—150 miles an hour is considered its maximum realistic cruising speed—and it is noisy and costly to fly. Its most economic range is variously estimated by experts at between 200 and 350 miles, but three distinct types of operation are being explored. A limited market, for which the smaller helicopters are already catering and for which a 20-place machine may be best suited, is the provision of an "aerocab" shuttle service between airports, suburbs, and city centres.

A bigger market may lie in the extension of air travel to a virtually untouched field—the journey of between 20 and 100 miles. Proponents of this service point out that at distances below 100 miles the operating costs of fixed wing aircraft rise sharply, in comparison with a helicopter. But in this range the helicopter could save little time over a good rail or bus service, and would involve a much greater cost. Some airlines therefore hold that the only logical large-scale market for the helicopter is in direct competition with fixed-wing aircraft over distances of between 100 and 300 miles. Here the helicopter's obvious advantage is its ability to operate "from downtown heliport to downtown heliport."

Despite optimistic assumptions about the future of helicopter travel, no airline has at this stage sufficient confidence to underwrite civilian production on a large scale. Designs sponsored by the military have two drawbacks: they cannot be made available to civilian operators until military needs have been satisfied; and they are specifically tailored to military requirements and pay little attention to cost-reducing features. It is significant that, in spite of some government prompting, none of the big fixed-wing aircraft manufacturers has entered the specialised field of helicopter development.

If the Douglas Aircraft Company, which has been considering the production of a transport helicopter to replace the DC-3, decides to enter the lists, an economic transport helicopter will be one stage nearer. Perhaps the most fruitful suggestion, one now awaiting Defence Department approval, is that the larger military machine should be lent, free of charge, to a few "feeder" airlines for testing under the rigours of continuous commercial operation. But the uncertainty of the operators is compounded by the confusion reigning between helicopter and helicopter designers. Vertical take-off aircraft and the mongrel convertiplanes, which attempt to combine the landing and take-off characteristics of the helicopter with the speed of a fixed-wing aircraft, are already in experimental production. The airline operator can be forgiven, therefore, if he hovers warily on the brink.

SHORTER NOTES

After serving their five-year prison terms, four of the Communist Party leaders convicted in 1949 of conspiring as individuals to advocate the violent overthrow of the government have been arrested again and charged with the additional offence of membership in an organisation advocating that overthrow. The basis for the new charge was established by the Supreme Court decision in January that membership in the Communist Party constituted *prima facie* evidence of conspiracy.

"Pansize" bacon, a new packaged bacon with slices slightly thicker and half as long as the standard length, which has been determined by the size of the hog's waistline, is being sold by one meat packing company to make it easier for the cook to fit the bacon into the frying pan.

Those who have always admired the American system of standardised sizes for women's clothing may be surprised to hear that the Commerce Department is sponsoring an even more standard scheme, known as TS-5200A, which "fits the size to the body instead of the body to the size." Ten thousand women were measured by the Department of Agriculture and classified in nine different body types; in one size, whether she wants a coat or a slip, at \$100 or \$10.

The almost complete disappearance of the cart horse from American farms became official when Montgomery Ward and Company omitted harness for farm horses from its recent mail-order catalogue.

The Cheapest Food Money Can Buy!

What are the facts about fish? This favourite food is more popular than ever. Cod caught in Distant Waters has risen less in price than any other staple food since the war—it's the cheapest food

money can buy, even though it's non-subsidised! Most of our staple foods are subsidised—meat, butter, milk, eggs and cereals. Last year these subsidies cost the Government (you, the taxpayer and consumer) £334,000,000. Fish, caught by our own Distant Water Fleet is not subsidised! Despite increases in the cost of every single item in fishing, and with no help from subsidies, the British Distant Water Fleet has kept the price of fish down to very near its war-end price—a remarkable achievement!

One reason why the present price of fish is so low is that British trawling is a free, competitive industry. Anyone can own a boat. Anyone can buy and sell fish. Trawler captains and their mates have a real incentive to seek the best fishing grounds and land top-quality fish. Both captain and crew share the profits with their companies. Although trawling is a hard and dangerous job, it is one where enterprise is actively encouraged, skill and daring rewarded.

Let's see exactly what you're paying for when you buy a fresh cod fillet at your local fishmonger. A best quality cod will fetch on average 4½d. a lb. when it's sold at the dockside auction. Then this is what happens:—

1. More than half the fish—head, tail, fins and backbone—is cut away in filleting. This loss, plus the cost of labour to do the job, means that the wholesaler buys his cod fillets for 10d. a lb.
2. The dock wholesaler has to buy boxes and ice, employ packers and quickly transport the fish to Billingsgate or your local fishmonger.
3. The dock wholesaler and your fishmonger add a reasonable

profit in order to earn a living. Result—best cod fillet at 1/6d. to 1/9d. a lb.

Naturally, in the worst winter months when fishing is extremely difficult and catches are low, prices go up. But in summer, when fishing is easier and catches larger, they go down. However, fresh frozen cod fillets from peak catches are now available throughout the year at low prices.

Today Britain is no longer an island built on coal and surrounded by fish. The modern trawler, costs £200,000, is oil-fired and travels thousands of miles to find the fish. Last year the Distant Water trawlers brought in even more fish than in 1953 to keep pace with Britain's needs. It doesn't matter where you live in Britain, you can get fresh fish every day of the week. And thanks to the British Fishing Industry you enjoy a wider choice of fresh, good-quality fish at a lower price than anywhere else in the world.

HOW FOOD PRICES HAVE RISEN SINCE 1951.

Taking Counsel in Bangkok

FROM A CORRESPONDENT IN BANGKOK

NEWSPAPER correspondents who walked into Bangkok airport last week to confront a notice-board bearing the legend: "Please Check In Here for SEATO Confab" had the feeling that the general's daughter with the confident American accent who received them, the freshly painted weapon-carriers for their baggage and the policemen in brown denims and red-banded hats, who jumped to do their bidding, might soon evaporate into a Siamese fairytale. But it was not so. This first full-dress international conference in an Asian kingdom that has stayed, gaily and attractively, more or less in the 18th century was—apart from a wilting telephone system—well managed. Buses called regularly for correspondents at their hotels, which were separated by four or five miles of canals, dusty roads and noisy Chinese shopping streets from the white stone parliament building where the deliberations of the eight Seato members were held. The Siamese government enjoyed the chance of displaying to western, and some eastern, eyes the spectacle of a city being made grander and newer. Bangkok dripped with the cement of fresh sidewalks and was a cheerful but not over-political looking procession of young men which prattled its way through the town on the first day of the conference, bearing aloft placards which said: "Seato for ever" and "Down With The Reds."

But the first Council meeting of Seato was not all a "Siamese fantasy"; some interesting exchanges took place under the gold-painted cupolas of the Italian baroque throne-room where sparrows flew over the heads of delegates and occasionally perched on the nine white umbrellas under which only the king of Siam may sit. A working party in Washington had prepared the way for the conference; but on the second day American correspondents were exciting their colleagues with stories that Mr Dulles, in the first secret session, had proposed moving towards a grand extension of Seato to embrace Japan, Formosa and South Korea. There was consternation in British circles. What in fact Mr Dulles did say is not known, but that he at least floated a remarkable trial balloon is suggested by the closing sentences of the conference's communiqué, which calls in mild tones for the association of "other free nations of the region" with the South East Asia treaty organisation. This was a much watered-down dose of the mixture which Mr Dulles seems to have wanted to prescribe. In general the Bangkok declaration shows that the British

thesis on the direction in which Seato should now be steered on the whole prevailed. It probably runs something like this: There are few western ground forces to spare for stationing on the mainland of Asia; those that might be available would not be a decisive deterrent to aggression if Peking should contemplate it; there are political disadvantages in stationing western forces in independent Asian countries because of the propaganda fruit which this offers to local Communists and because antagonism in uncommitted Asian countries would be increased; the real deterrent to expansionist ambitions in Peking is bomber-power, which should be kept in the background ready to strike back but which requires fighter support further forward; therefore—according to the British view—the Seato problem boils down roughly to trying to ensure that South East Asia builds enough infrastructure for possible emergencies, and trains and equips armies of its own.

Thus British policy in South East Asia begins to approximate to that of the American Republican Administration. The Americans undoubtedly feel uneasy about the morale of non-Communist Asia and convinced that it is necessary to "do something" to counterbalance the effect of what is regarded as the "let-down" over Indo-China. But this feeling is not strong enough to cause the Administration to propose the dispatch of American ground forces to the Seato area. It does, however, partly explain Mr Dulles's posture of strength when, on the first day of the Bangkok conference, he enumerated the strong United States forces in the Pacific region and insisted that they should be regarded as a force in being towards which Seato ought to gravitate for defence.

At the Bangkok meeting it seems to have been the Australians who were the most vigorous advocates of the immediate commitment of military strength to the Seato organisation and of prompt additions to the local armed forces on the South East Asian mainland. Both Australia and New Zealand show increasing anxiety about their own position so close to unpredictable and overpopulated Asia; but in the absence of an American readiness to take the same line, Australian eagerness to give "immediate teeth" to Seato does not seem to have been pressed at Bangkok.

The results of this first Seato Council meeting can be defined as a postponement of decisions. The Permanent Council which is to be set up with a secretariat is to do preparatory work, but it has no directive as yet to create any fresh military organisation or alter any existing one. It will simply exist to explore military possibilities and

"Yes, he said I needn't take on extra staff after all..."

"YOU KNOW when our orders were going up and up? Our accountant told me we might have to take on more staff. So we decided to call in the Burroughs man. It couldn't do any harm and his advice was free... As it is, I'm more than glad. He went into the details with our accountant, then showed us how we could mechanize our accounting at low cost—and save a lot of overtime. He certainly knew his job..."

The Burroughs man is always at your disposal without cost. He is an experienced adviser on *all* accounting and

record-keeping systems, and well qualified to work with your accountant and auditor.

He has a complete knowledge of mechanized accounting. But he won't propose changing your accounting methods just to suit certain machines. Rather, after a full analysis of your problem, he will make proposals for a rapid, economical and *workable* solution.

If he does recommend a new system, he will prepare a detailed plan for it and help you get it working smoothly. He will make sure you continue to get *full* benefit from any Burroughs machine you install.

Whatever your business, large or small—if you have an accounting problem, the Burroughs man can help you solve it. Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment.

Call in the Burroughs man as soon as you like—you're committed to nothing and his advice is free. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford Street, London, W.1.

FOR EXPERT ADVICE ON BUSINESS SYSTEMS

CALL IN THE
Burroughs
MAN

One Burroughs man solved this problem. The Phonotas Co. Ltd. (weekly telephone cleaning and sterilizing service) have 80,000 separate accounts, and until recently, in London and in provincial offices, figures were copied by hand. As this led to errors and delays, they called in this Burroughs man, Mr. J. G. Winterbottom (left). He showed Phonotas how, with just two typewriter-accounting machines and two abbreviated-description accounting machines, they could halve their accounting time, and obtain up-to-date figures—all without extra staff.

political problems. Although much of this could have been done through ordinary channels, there is nevertheless a great deal to be said for bringing into being this permanent organisation within which soldiers and diplomats of the eight countries will acquire the habit of working together. Later action and decision—if they are necessary—will be made easier by the existence of the new machinery.

No Peace for Dr Adenauer

FROM OUR SPECIAL CORRESPONDENT IN BONN

GERMAN parliamentary disputes tend to look less chaotic from Bonn than they do from London, and from Paris they look positively monolithic. Dr. Adenauer has, when all is said and done, managed to secure a large majority for the final reading of the treaties ending the occupation and bringing Germany into Nato, and a substantial majority for the highly unpopular Saar agreement. Once again, his prophecies have come true. The tumult created by the powerful opposition outside parliament did not affect the vote inside the House. The trades unions and the Social Democrat leaders refrained from calling a political general strike, perhaps because the Communists from East Berlin were so urgently prodding them to stage what would have amounted to a *coup d'état*. Indeed, when the past weeks come to be looked at by historians, they may well remark that Germans took a fateful decision with extraordinary calm.

The televising and broadcasting of the whole four-day debate led to unprecedented public interest; it was something of a boost for parliamentary democracy in general, for many Germans were surprised and impressed to see their elected representatives getting down to their job so seriously. This public interest was particularly striking in view of the fact that the arguments were so familiar; moreover, a majority of Germans are basically inclined to indifference about reunification. This was, in fact, the main reason why a year ago the Ministry of All-German Affairs founded the "Indivisible Germany" organisation, with the object of rousing a popular movement for reunion and preventing Germans on either side of the zonal borders from growing estranged from one another. The public is also not so indignant about the Saar as speeches by nationalist politicians would indicate, and their fulminations are not echoed from the Saar itself.

The situation is the reverse of that in which Hitler came to power on patriotic and anti-semitic slogans. Then conditions were so bad that everyone wanted a change of any kind; now they are so good in comparison with war and postwar chaos that everyone is nervous lest there should be a change. The fulminations from Eastern Germany on Wednesday were, therefore, illjudged tactics. Herr Ollenhauer and the Social-Democrats in particular were embarrassed and angered by the Soviet zone leaders' claim that the "will of the people" was something quite separate from the operations of their parliament, and by their calls for a referendum and for nation-wide resistance to the application of the Paris agreements, with no holds barred. Some ironic comparisons have already been made between these menacing gestures and the genial attitude towards Western Germany that Mr Mikoyan has been displaying at the Leipzig fair.

THE ECONOMIST, MARCH 5, 1955

Nevertheless, there is no stability in the political situation. The Russians and their supporters will see to that. And, in Bonn, the course of rearmament does not go smoothly. Dr Adenauer faces a show-down with his coalition. The Free Democrats have proved the most recalcitrant of the government parties, but the large number of abstentions in this week's voting showed that the other parties in the government are divided among themselves, and even Dr Adenauer's own Christian Democrats have their rebels. In the topsy-turvy fashion of German politics, the Free Democratic Party executive allowed its parliamentary members to vote as they chose, but instructed the four party representatives in the cabinet to vote against the treaties. Two of them abstained, one voted against, and the fourth, the Federal Vice-Chancellor, Herr Blücher, voted with the government, of which he forms a part. Still more oddly, Herr Blücher, instead of resigning from his party, has resigned from the government.

Dr Adenauer now has the choice of either throwing the Free Democrats out of the cabinet or of bringing them into line. The most effective threat he can use is that the electoral law will be changed to something near the British system. If this move were made, the Free Democrats and other small parties might find that they were virtually eliminated. The threat may well make the Free Democrats think it best to placate the Chancellor now that they have made their protest. It is, however, unfortunate for Dr Adenauer that he is making his stand on a weak case. The Saar settlement is so patently favourable to the French that his arguments tended to sound unconvincing. The *Bundestag* has, indeed, registered its opposition to the agreement at the same time as voting for it. The resolutions which were carried at the conclusion of the debate affirmed that the Saar remained part of the Germany of 1937, and that political parties must have the right to campaign for its return to the fold. This is contrary to the agreement, which permits only two alternatives for the Saarlanders—the present status or the new statute. In view of this situation, Monday has "settled" the Saar.

Somalis with a Grievance

IN the House of Commons last week, the adjective "shabby" was freely applied to recent British policy towards loyal Somalis, and the Minister of State for the Colonies, though able to make a good case in law for the recent Anglo-Ethiopian agreement that was under discussion, could give only a lame explanation for the way in which the matter had been handled in British Somaliland. The question at issue was one of conflicting promises made by Britain at a time when the map of Africa was still full of blanks, and—as always with twice-promised lands—retribution has set in.

The complication is the greater because both the parties involved are good friends of Britain. One consists of Somali tribes which in 1884 and 1886 voluntarily placed themselves under British protection and undertook, in return, never to cede their lands to any other government. Their case is that they have kept this promise (except on occasions such as in 1940, when a British retreat left them

THE ECONOMIST, MARCH 5, 1955

for eight months in Italian hands) and that they still want the protection. The other party concerned is the Emperor of Ethiopia, neighbour to Kenya and the Sudan and proprietor of the sources of the Blue Nile, with whose fore-runner, the Emperor Menelik, the British Government reached in 1897 a frontier treaty that left some of the Somalis' seasonal grazing grounds in Ethiopia; by an exchange of letters, it provided that the British Somaliland tribes moving inland should have the right to use their traditional wells and grazing grounds across the frontier. Students of politics should note the date of the treaty; it is one year after Menelik had proved his strength by defeating the Italians at Adowa, and one year before the Fashoda incident and the final avenging of Gordon at Omdurman.

For almost the whole of the period between then and the Italian war of 1935, the Ethiopian Government never administered the desert lands in question, and British

officers followed and administered the tribes on their annual migrations over the border. But the Somalis never liked the 1897 treaty, more than once protested against it, and in 1931 showed their feelings by murdering a European member of a boundary commission that was delimiting the frontier line.

After the liberation of Ethiopia and Somalia from Italy, the British retained some controls that included management of a Reserved Area which was in effect the Somali grazing grounds—25,000 miles in area and inhabited by about 300,000 people. From 1946 onwards the British Government has been trying, abortively, to satisfy the Somalis' requirements either by exchanging this tract for a corridor at the north-west end of British Somaliland, and thereby giving Ethiopia the port of Zeila, or alternatively by leasing the area, or by extending the *status quo*. But the Ethiopian Government would have none of these things; admittedly, it would be difficult for a people just learning to use an atlas to swallow the reason for a sizeable frontier alteration. Therefore the 1897 treaty remains binding, and by a new Anglo-Ethiopian agreement which came into force last Monday, the area reverts to Ethiopian management.

The Somalis are aghast. Through the mouth of a dignified delegation that has been touring London, they have

made a case that suggests that the British Government did far too little to prepare them for the possibility that the 1897 treaty would prove unalterable. They are a protected people with only an advisory council to represent them, and they say that this has steadily been assured by its British Governor that all would come right in the end. They complain that only on January 5th were they told that this was not so. They object because they want to be British-protected persons, and because they claim that Somalis living in a part of Ethiopia that is remote from its highland capital do not enjoy political freedom; about 40 Ogaden tribal chiefs have, they say, fled to the Italian trust territory of Somalia as political exiles.

Their tale is not a pleasant one to hear from the lips of a decent people. But nor would it be pleasant to break the treaty of 1897, which, in law, is watertight. The core of the trouble is that the original promises to the Somalis never specified to what area they applied, but this defect of the 1880s does not reduce the "shabby" aspect of the story. It is one that the Somalis, who are a seagoing people, are bound to carry into awkward corners of Africa and Arabia.

1984 on the Yalu River

THE Chinese have shown themselves quick learners at the Marxist game of "persuading" opponents into a "conversion" to their creed. The Ministry of Defence's pamphlet, "Treatment of British Prisoners of War in Korea," shows that they have applied a characteristic resourcefulness to the battle for men's minds. It will probably be said that after an interval of more than 18 months since the release of the prisoners it would have been better to let this account rest in the archives. But the answer is that the experiences of nearly a thousand Britons who were subjected to Communist control for periods of up to three years are of unique interest to their compatriots.

Until the summer of 1953, when the prison camps along the Yalu River opened their gates, most people in this country had heard only second or third hand descriptions of the process of forcible re-education. Now we have our own reports from fellow citizens whose brains have been "washed." The Ministry of Defence pamphlet is a valuable and objective summing-up of all the men's accounts. It helps to explain some of the discrepancies in the first interviews with returning soldiers, and picks out the pattern from the mass of particulars. The unimpassioned precision of Civil Service English, even when dealing with methods of torture, comes into its own.

In dealing with their prisoners in Korea, the Chinese, and to a lesser extent the North Koreans, faced a difficult problem. To the Communist, the prisoner of war is raw material to be "converted"—conveniently corralled, and open to all kinds of direct and indirect pressure—and the prison camp is simply a continuation of the battle by other methods. The trouble in Korea was the shortage of time. As soon as the armistice negotiations began in July, 1951, the captors knew they were working to a shortening timetable. Hence, probably, some otherwise inexplicable

features—the decision to send later batches of prisoners to separate camps where they would not counteract the indoctrination of earlier arrivals, and the stupid cruelty of some of the methods of “persuasion.”

In novels like “Nineteen Eighty-four” and “Darkness at Noon,” the people who were to be convinced of the error of their ways had been conditioned from youth by totalitarian propaganda. In the non-fictional world of the Korean camps the Chinese had to deal with men accustomed to western freedoms who might at any time have to be returned to them. The techniques they used show that they were trying to take a short cut to 1984; and for every man temporarily won over by the barrage of propaganda or the favours extended to “progressives,” many more were alienated by the brutality which, through either haste or callousness, the Chinese made little attempt to disguise.

A perverse logic runs through the Communists' behaviour. They claimed that the prisoners were enjoying the benefits of a “lenient” policy—on the grounds that all United Nations prisoners were war criminals whom their captors had the right to kill. Both the Chinese and the North Koreans claimed to recognise the 1949 Geneva Convention on the treatment of prisoners of war (which they violated in half a dozen ways); but, as Mr Chou En-lai explained, “war criminals” did not count.

A Classic of Double-Talk

In this context the methods used fall into a logical pattern. When it was discovered in mid-1952 that compulsory study-groups were not working, “re-education” was changed to a voluntary basis. The Communists' use here of the word “voluntary” deserves to be enshrined in a dictionary of double-talk. Food, letters from home and medical treatment were some of the milder inducements for men to become “volunteers.” It was decided at an early stage to segregate officers and senior NCOs and to use young and pliable prisoners as squad leaders. Organisers of study groups and of “peace” committees could be found among those who for various reasons decided not to swim against the tide. Most of those who were tortured suffered because torture was clearly part of a plan to break down opposition quickly and at all costs, rather than because of the sadistic whims of individual guards. And the background to the whole process was the cant that the Communists were really working for the prisoners' own enlightenment and salvation.

Some of the things that happened fall outside this pattern. The camps nearest to Pyoktong, where General Wang Yang-kung, the commander of prisoner of war camps, had his headquarters, conformed most closely. In those that lay further away, particularly the transit camps and those controlled by the North Koreans, the brutality or humanity of individual guards played a more important part. Many of the prisoners who died in the winter and spring of 1951 were the victims of inefficiency and shortage of supplies rather than of deliberate policy. Later the prisoners seem to have been fed as well as their guards or the local population—but there were always variations according to the degree of “co-operation” shown.

Nearly 30 per cent of the prisoners were apparently affected to some degree by the intense indoctrination. They were almost all younger and junior men, and the effects on most of them are likely to have worn off after 18 months in a sane world. The methods used to influence them

evidently had a contrary effect on more resolute characters, of whom there were outstanding examples. Yet the figure of 30 per cent shows how continuous pressure can win men over even to a patently bad cause. The UN soldiers who were taken prisoner in Korea were unprepared for the treatment they received. They probably expected hardship, but some of them were not ready to face a three-year campaign to dig away the foundations of their beliefs. If another “Korean” war should break out somewhere along the Communist periphery the problem will have to be faced again. Fortunately the Ministry of Defence seems alive to the lessons of 1950-53. A soldier's equipment now includes more than his pack and rifle.

The Tasks of M. Faure

BY OUR CORRESPONDENT LATELY IN PARIS

M. EDGAR FAURE has been put into office by a seemingly comfortable majority, with only the Socialists and the Communists in open opposition. Yet he is too shrewd a parliamentarian to have many illusions about the coherence of his team or the stability of his coalition. Both can be kept together by inaction; both have a strong tendency to crumble in movement. M. Faure must be well aware how many pressing matters are crowded on to his agenda; the economic situation, North Africa, Europe—each in turn will reveal the frailty of the outwardly impressive majority. M. Faure's well-known gifts of conciliation will be taxed to the full.

On the face of it, his economic path should be the easiest. Here the Faure line has prevailed over the last 18 months, in two successive governments. The 1955 budget which must now be finally carried through the Assembly was in fact prepared by M. Faure himself. The total deficit, however (both below and above the line), is already estimated at over Frs. 600 billion, and M. Faure must be worried about the increased cost of the civil service if a wage increase is granted in April. He came to office partly as a defender of the franc, a guardian of financial stability. At the same time his need to placate the workers is even greater than was his predecessor's. Rightly or wrongly, France's workers and civil servants expected reforms from M. Mendès-France and were, therefore, inclined to show some patience. They have no such faith in the new right-wing government and will not exercise any restraint. M. Faure must certainly remember that when he was Minister of Finance in a “rich man's government” a single blunder—the projected raising of the retirement age—was enough to provoke a wave of strikes. The situation is now less critical but the government must reckon with Socialist suspicion and Communist hostility, while its conservative backers will not tolerate any “reformist monkeying with the economy.”

The government, on the other hand, may at first need Socialist support for its North African policy. Many of the conservative votes cast for M. Faure at his investiture will be missing if he tries to clinch the Tunisian deal initiated by M. Mendès-France. M. Faure's awareness of his dependence on the right was clearly shown in his choice of a minister for Moroccan and Tunisian affairs: the dissident

INDUSTRIAL POWER

INTERNATIONAL HARVESTER COMPANY OF GREAT BRITAIN LIMITED, HARVESTER HOUSE, 259 CITY ROAD, LONDON, E.C1

INTERNATIONAL BULLGRADER

This rugged hydraulic bullgrader maintains all the balance and manoeuvrability of the tractor and gives the operator a clear view of the work. The manganese-steel blade is scientifically curved to “roll” the dirt and so reduce load resistance. A single lever controls all blade movements. Blade angling and tilting can be quickly carried out without the use of special tools.

ANTHONY LOADER-DOZER MOD. (Made by Anthony Holts Ltd.)

With its front filling, rear dumping action, this hydraulically-operated unit saves turning and travelling time and simplifies loading in confined spaces. It has a powerful digging action and a bucket capacity of 1 cu. yd. One lever controls all bucket movements. In only 10 minutes the bucket can be removed and replaced by landsides and blade to convert the loader to a fully angling and tilting dozer.

BOUGHTON TYPE C EXTRA HEAVY DUTY WINCH

Fitting snugly into the rear of the tractor, this winch permits full use of the drawbar and the mounting of other allied equipment. It is of all-steel construction, with totally-enclosed all-gear drive. Both under- and over-winding are instantly available and a neutral gear position frees the drum for pay-out of rope by hand. The over-centre brake will hold any load the winch is capable of pulling.

STERLING B-695 4-WHEEL SCRAPER

For fast small-scale scraping, efficient work in tight quarters, the Sterling B-695 is pay-yards ahead. Its long wheelbase and wide wheel treads ensure good balance. Its “goose-neck” pillar permits a non-stop turn within a span of 16 ft. 6 ins. It cuts 6 ft. wide, 9 ins. deep; “rolls in” a load of 3.5 cu. yds.; spreads to a depth of 1 ft. 3 ins. Bowl, apron and ejector plate are hydraulically controlled by only two levers.

SPEND and SAVE

"Yes the two can go together" says Private Btu (the British Thermal Unit) "especially when you realise that there are about one and a quarter million of us in one hundredweight of coal and billions of us are just lost to air through walls and roofs."

FUEL EFFICIENCY PAYS

For example . . . To heat their factory a firm in Cheshire used to pay £645.15.3. for 14,417 gallons of oil and also used coke for sixteen heaters. Due to increased work they doubled their factory area. Now they heat twice the previous space at a cost of only £741.15.0. for 16,560 gallons of oil and have dispensed entirely with the coke heaters.

This improvement resulted from insulating the roof and part of the walls of the buildings at a cost of £2,151.

Structural Insulation Association 32 Queen Anne Street London W1 say other examples of the monetary benefits accruing from factory insulation are available and they will gladly send a useful booklet which includes a list of members on whose advice you can call without obligation.

A sherry that is sheer delight

A perfect gift to the most critical palate, Pintail is an exceptionally fine sherry, both pale and beautifully dry. Specially selected at Jerez, this proud product of Spain is available in a trial pack of two bottles at 42/7d; subsequent supplies at £12 per dozen bottles. Your orders will have prompt attention.

Pintail  **SHERRY**

Established 1800

MATTHEW GLOAG & SON LTD., PERTH, SCOTLAND

Gaullist, M. Pierre July, voted against M. Mendès-France in all the North African ballots. This was apparently due more to conservative discipline than to colonial extremism. In any case, since the new minister knows little about Tunisia, M. Faure himself will have to play an important role in the negotiations to be resumed soon. If he moves fast he has a fair chance of signing an agreement with the Tunisians and getting it ratified. The more intelligent colonialists now realise that something will have to be conceded on paper. They merely hope to sabotage the application of any agreement. Hence, if M. Faure intends to stick to the spirit as well as to the letter of the proposed reform, he will, in the long run, fall foul of his majority.

The discords within the present team, however, are best seen against the European background. This government is as deeply divided on German rearmament as any previous one. It includes staunch "Europeans" like M. Teitgen and determined opponents of EDC like M. Gaston Palewski. Eight of the Ministers voted for the Paris agreements; four voted against; and five, including the Foreign Minister, M. Pinay, abstained. Paradoxically, there may be some strength in this division. Neither M. Faure nor his team can be described as planning a "revenge for the EDC," and this renders the mobilisation of the "anti-European" forces difficult. M. Pinay commands strong support in the Council of the Republic, where the real battle is now to be waged. The Christian Democrats (MRP), too, wish the treaties to get through the Council without amendments, because their return to the Assembly would place the MRP deputies in an awkward position. They voted against the agreements in the lower chamber chiefly because they were presented by M. Mendès-France, whom they did not trust; they would find it awkward to reverse their vote.

A Trojan Horse?

M. Laniel's government avoided being disrupted by the problem of German rearmament because the file was carefully hidden away in a drawer. M. Mendès-France tried to face the issue and find a compromise; his collapse was partly the penalty of this action. Now, M. Faure is apparently determined to stage a debate in the upper chamber towards the end of this month and he is confident that he will be able to avoid a second reading in the Assembly. Profiting from the spade-work of M. Mendès-France, his efforts may well be crowned with success. Much will depend on the senators' fear of the forthcoming elections and on the attitude of General de Gaulle and his supporters. The general himself is expected to make a last effort to prevent outright ratification. His lieutenant, M. Palewski, apparently claims to have entered the government with the General's blessing, and in that case he must have been sent in as a Trojan horse. It is doubtful, however, whether at this stage the Gaullists can do much damage to the treaties from inside.

Thus M. Edgar Faure finds himself with plenty to do at the head of a coalition which can best be cemented by inaction. It has been said that there is no possible majority in the present French Assembly. This does not seem true. There is probably within it a conservative majority for stagnation, which is frightened from time to time by a public outcry. M. Faure's government may at first be carried forward by the momentum of his predecessor. Then he will have to make a choice: to stay in power as the leader, or the prisoner, of a negative, conservative majority, or to risk marching forward against its wishes.

Quiet Change in Uruguay

FROM A CORRESPONDENT

URUGUAY is unique among the republics of South America. It is the smallest of them (although larger than England); and although one party has controlled its governments for the past hundred years, it sets its neighbours an astonishing example of democracy and stability, and the voice of its political opposition has neither grown tired nor been smothered. A new government, still of the same party, took office this week in accordance with the decision that the electorate gave last November. Uruguay has no president, in the sense that other South American republics use that term; since 1952 its executive has been a council of nine, in which the opposition is represented. But the new chairman of this council, Señor Luis Batlle Berres, is a strong personality who may be expected to make his presence felt, and Uruguayans are wondering what his first actions will be.

The two main parties are both to some extent family clubs. The opposition *Blancos* (whites) can be distinguished only by a trace or two of traditionalism from the governing *Colorados* (reds). The main *Blanco* faction is also dubbed *Herrerista*, after the dominant personality of its recent years. The *Colorados* are even more strongly dominated by a family, that of the late José

Batlle y Ordoñez, whose ideas have shaped the country's development since 1880, and who introduced the project of collegiate government in 1911. From 1919 to 1933 Uruguay was governed by both a president and a council of nine. Then, however, President Terra decided that the party squabbling in the council was preventing the republic's recovery from severe economic depression. He carried out a *coup d'état* and instituted rule by decree. The council of nine was formally extinguished in the new constitution of 1942, and for a decade presidents again ruled alone. But in 1951 the *Batlistes*, still the principal *Colorado* faction, revived the collegiate idea in a more dramatic form and President Martínez Trueba voluntarily surrendered his powers.

But Sr Batlle Berres, who took office as chairman of the governing council on Tuesday, is not only a member of the great political family that has successfully destroyed presidential rule; he is also ambitious, and he has held the full powers of a president before. Elected as vice-president in 1946, he took over the executive power on the death of President Beretta in 1948. He is not particularly enthusiastic about the collegiate system and he may well feel frustrated in his new role. Yet, even if he is tempted to try to restore presidential government, nothing more drastic than a moderate "dictatorship" such as Terra imposed seems likely to threaten Uruguay.

One burning question that faces the new government concerns relations with Uruguay's large and sometimes

truculent neighbour, Argentina. Some 350,000 residents in Argentina are either Uruguayan or have family or business connections with the smaller republic, which also used to benefit from a large influx of Argentine tourists. In recent years, an "iron curtain" has fallen across the River Plate, with serious consequences for Uruguay. In General Perón's eyes, Montevideo is a nest of dangerous refugees from his régime; to Uruguayans, dictatorship is anathema, and the *Herreristas* have been fiercely attacked for pro-Perón tendencies. It is thus difficult for *Batllistas* to work for the better relations with Argentina which their country's economy requires without appearing to condone undemocratic methods. This accounts for the somewhat mysterious parleys that have taken place in recent weeks between Sr Batlle Berres and the Argentine Minister of the Interior, Sr Borlenghi, and between his son and the Argentine Foreign Minister, Dr Remorino. The Argentines first lifted restrictions on travel to Uruguay and then re-imposed them; this doubtless reflected their own internal divisions, but it is also reported that Sr Batlle Berres found the members of his council less ready than he was to concede points to General Perón.

To other countries, and particularly to those which, like Britain, have traditional commercial ties with Uruguay, the advent of the new government is unlikely to mean any great difference. Sr Batlle Berres is not expected to reduce the now high protection given to uneconomic local industries, but he may find that Uruguay's main export commodities can be better exploited if such artificial devices as subsidies and special exchange rates are discarded. One urgent task is to restore peace in the important meat-packing industry—peace both between management and labour and between the government and foreign-owned companies, some of them British. And the *Colorados* will certainly lose no votes at the next elections if the government succeeds, like its predecessors, in combining a sizeable welfare-state programme with the luxury of no personal income tax.

Riots in Sierra Leone

FROM A CORRESPONDENT

THE rioting which took place in Freetown, Sierra Leone, in the middle of February was surprising and unexpected. This British colony of some two and a half million people of very varied background and origins has always made quiet political advances following usually in the wake of its two larger neighbours, the Gold Coast and Nigeria. It now has a Chief Minister, Dr Margai, an African, at the head of the government, whose party, the Sierra Leone People's Party, consists mostly of members of the hinterland provincial tribes with a few Freetown Creole intellectuals. The opposition, the National Council of Sierra Leone, is almost completely composed of descendants of the liberated settlers in Freetown and the surrounding hill villages. Against this background, with an African government in power sympathetic to the tribal areas, and a high proportion of the labour in Freetown coming from the hinterland, it seemed improbable that unrest of this kind would occur.

Negotiations for a wage increase had been going on since last September. By the middle of January the workers had come down to an increase of 1s. 6d. a day whilst the employers offered fourpence a day for the Colony area and threepence for other areas. At this stage negotiations broke

THE ECONOMIST, MARCH 5, 1955

down, but were resumed a fortnight later. By then the workers had reduced their claim to an increase of tenpence a day, and after much persuasion, the employers agreed to increase their offer to sixpence a day for all areas. Neither would go any further, and the workers refused to go to arbitration.

A commission of enquiry was set up immediately, but the union—the Artisans and Allied Workers—issued a strike notice all the same. On February 9th, thousands of workers marched through the streets of Freetown. The railways and

other transport services as well as the Public Works Department were all immobilised but there were no serious incidents. Two days later, however, rioting started and followed the usual pattern. Railway lines were uprooted, the water supply and essential services damaged. A European police superintendent, ironically a champion revolver shot, was killed trying to repel a mob. The shops of the Syrian country's economy and are particularly vulnerable as they are largely concentrated in the shopping centres of the town. The troops were called out and helped the police to control the rioting. Five days later the union leaders called off the strike, allegedly in order to show that they had had no connection with the rioting. Last week a commission to inquire into both the riots and the strike was appointed.

Although Sierra Leone may be too small to afford many Ministers, it is clear that some of them are overburdened with difficult portfolios. In normal times, it would not be excessive to combine the portfolios of Mines and Labour. But since there is widespread illicit diamond mining, which is getting out of control, and difficult negotiations to carry out with the monopoly-holding Sierra Leone Selection Trust, it cannot be easy to pay full attention at the same time to labour problems. Inefficient and amateurish digging for diamonds by Africans, who then smuggle them out of the country, have had many bad effects, apart from the obvious danger to the world diamond market. A high proportion of the local population is behind the illicit miners, since it is felt that private bodies and individuals should be allowed to dig for diamonds and then sell to a central agency. This lack of co-operation from the public strains the resources of the police, as diamonds are now found over a large area. Moreover, agricultural labour has been attracted from the farms, so that, in spite of the excellent rice irrigation schemes instituted by the government, there is now a scarcity of this staple food with a consequent increase in its price. The fortunes made by illicit miners—in some villages in the mining areas, Humber Super-Snipes stand outside mud-huts—have also produced a tendency towards inflation. The cost-of-living index, which the employers and government have been using, is quite out-of-date, and the preparation of a more correct one is essential if the present labour difficulties are to be overcome.

THE ECONOMIST, MARCH 5, 1955

THE THINGS WE DO FOR YOU - I

We don't know

whether you yourself ever give us orders (we may not be in your line of country at all) but directly or indirectly we nevertheless do quite a lot for you.

what we do

is to design and build engineering equipment for many essential industries on which you depend for this and that. You would have less gas and smokeless fuel, for instance, without Simon-Carves coke ovens, and more dirt in your coal without Simon-Carves washeries. Some of the things you buy would cost a little more but for the economies derived from Simon mechanised materials-handling installations. If all the machinery driven through Turbine Gears were suddenly stopped, it would hurt you somewhere, somehow, some time. And Simon-Carves power station boilers help to generate the current that runs the electric railways and your television set.

coal washeries . coke ovens . power stations . heavy chemical and gasworks plants . metallurgical plants . materials handling plants . industrial gears . flour and provender mills and many other specialities.

FREEDOM OR LICENCE?

For more than a hundred years the bus has served the Londoner and his visitors. It was contrived by Shillibeer in 1829 as a vehicle for all and has become as much an amenity as street lighting; it is inextricably a part of the pattern of London Life.

We of London Transport inherit this tradition. We are responsible for public transport on the streets of London. But this responsibility can never be absolute because of the just and essential needs of other road users. Streets, after all, are not private property. There can be no bus system comparable to that of a railway on which all movement can be controlled. We must, however, see that public transport is run as efficiently as possible and that the buses on which the Londoner relies go through.

Today, traffic on the city streets is strangling itself. There is a disastrous confusion between freedom and licence—or is it between too little freedom and too many licences? Is it freedom if private car owners convert public streets into private garages? Half-cluttered streets are half efficient and this means bunching buses, crawling, irregularity, longer queues. The truth is that London is not having as good a bus service as it should.

London Transport will use this space from time to time not to air our grievances but to share our problem. Street congestion is an evil that affects all of us and we believe that public discussion may help to find a cure.

Australia from a business point of view

This booklet will assist anyone contemplating establishing a business in Australia whether it is a small retail business or a large manufacturing company.

Written with the authority of Australia's oldest and largest joint-stock bank, it offers those who wish to start a new enterprise in that young but growing country a short account of the framework of business organization throughout the Commonwealth of Australia. It also affords some knowledge of the problems and conditions which would be met.

If you are interested in establishing a business in Australia, obtain a free copy of this book from:

THE BUSINESS WORLD

Backdoor Convertibility

LAST week's decision to allow the Exchange Equalisation Account to intervene in the overseas markets for transferable sterling has been followed by appropriately vigorous action, which has been duly reflected in the exchange rate. The quotation for transferable sterling in terms of US dollars, which stood at \$2.71½ before the authorities intervened, has since risen to \$2.75¾. This response has not indeed been wholly due to official support. To some extent it has been simply a part of the general improvement in sterling exchange that has resulted from the higher Bank rate and its reinforcement of confidence in sterling. Since the beginning of last week sterling in the official market has risen from \$2.78½ to close on \$2.79, the rate for sterling notes in Zurich from Sw. frs. 11.34 to Sw. frs. 11.37, and that for security sterling from \$2.71 to \$2.75½, while the premium on dollar securities quoted in the London Stock Exchange has narrowed from 2½ to ½ per cent.

The improvement in the transferable rate is, however, much more than the reflection of the strengthening of confidence. It is also the result of active intervention by the authorities. Their supporting operations have been conducted mainly through agents in Zurich, but also through the less important markets in transferable sterling, including New York, Amsterdam, Brussels, Beirut and Kuwait. In most cases the agents have been chosen for the skill of their local dealers. The approach to those agents from the Exchange Equalisation Account is being made through the London correspondent of the overseas banks concerned. The first reports from the overseas centres confirm earlier impressions that the market in transferable sterling was substantial and active, and it would appear that the Exchange Account had to venture several million pounds' worth of dollars in the initial thrust which on Thursday

of last week brought the rate up from \$2.71½ to over \$2.74. The cost of the first four days' supporting operations is already reflected in the end-February statement, issued this week, of the gold and dollar reserves. This showed that in the four weeks the reserves dropped by \$82 million after crediting \$15 million from defence aid and \$6 million from the settlement of Britain's surplus with the European Payments Union for the month of January. The so-called residual deficit, which is a rough measure of the losses through the exchange markets, both in London and abroad, amounted to \$103 million.

The initial intervention in the transferable sterling market has been mopping up such sterling, and it has incidentally jolted the dealers in that market. It has even caught a few bears. The foreign banks dealing in transferable sterling will henceforth be a little less ready to provide the facilities and make the very close prices that have been the basis for the operations of the commodity shunters and other users of this market. In any case, now that the discount on transferable sterling has been narrowed to just over one per cent on the rate quoted in the official market, the scope for most types of commodity shunting must have largely disappeared—for the time being at least.

It would be wrong, however, to dismiss this official intervention in the transferable sterling market as mere technical legerdemain, as an ingenious trick intended to close the door to commodity shunting and to the consequential losses of gold and dollars or as a coup with which to hammer the "wicked" foreign merchant and exchange dealer. Far more important and enduring issues of principle are involved in this move.

For the first time the Exchange Equalisation Account stands behind the transferable sterling rate. Previously, the *de facto* convertibility of transferable sterling into

dollars, at whatever rate the free market dictated, was achieved by the willingness of certain foreign merchants to exchange dollars for transferable sterling. To give an example of the two-way trade in this market, the seller of transferable sterling might have been a Belgian exporter of steel to Australia who had been paid in sterling but wanted dollars; while the buyer might have been a Dutch merchant "shunting" sterling tin to the United States and converting the dollars obtained for the tin back into sterling in order to cover his initial expenditure on the tin (either directly, or by repaying a London credit with which the original purchase had been financed). So long as the market functioned merely in this way, it could be argued that this *de facto* convertibility was no reason for proceeding to the formal convertibility of non-resident sterling since the cost of informal convertibility was not falling directly on the reserves. But the circumstances have now changed. From Thursday last week, transferable sterling can confer upon its holders an undefined but nonetheless direct claim upon the Exchange Account's resources, if the authorities decide to buy it.

* E.P.U. settlements depend on balance with Union in previous month. † After payments totalling \$189 million on United States and Canadian loans. ‡ After payment of \$112 million to IMF for "repurchase" of sterling. § After payments totalling \$99 million to E.P.U. creditors in initial settlement of part of UK's overdraft with the Union.

Non-resident sterling used in current transactions can therefore now be regarded as falling into two categories—both of them convertible. First there is American account sterling, which is convertible within the range of the "gold points" of \$2.78 and \$2.82. Then there is transferable sterling which is convertible at rates that will fluctuate within a wider range, with a ceiling but no fixed floor. The rate for transferable sterling cannot rise above the rate for sterling quoted in the official market. On the other hand there is no precise lower limit to the range of its fluctuations.

If it is the intention of the authorities, in their determination to remove the opportunities for shunting, to

bring the transferable sterling rate close to or even within the range of permissible fluctuations of official sterling, then in fact a situation will have been created in which the goal of convertibility for all non-resident and currently acquired sterling will have been effectively reached. If, on the other hand, the transferable sterling rate continues to fluctuate widely and at times shows a substantial discount on the official rate, it seems likely that in due course it is transferable sterling that will oust official sterling as the currency most widely used in trade between the sterling and non-sterling worlds—providing another instance in which bad money drives out the good.

*

Britain is in fact to operate and control a multiple rate system—as contrasted with the previous state of affairs in which the rates for "cheap" sterling were made in markets outside Britain and free from the intervention of British operators, whether official or private. It will, however, be a unique system of differential rates, since it will involve most of the disadvantages yet will exclude most of the advantages that are normally conferred by such practices. Usually they are designed to encourage exports and discourage imports. If, however, substantial disparities between the official and the transferable rates remain, the British differential system will work in precisely the opposite direction. It will encourage imports from the dollar world, since these will naturally be financed with "cheap dollars" made available through the official market. For the same reason it will discourage direct exports from the sterling to the dollar area, since payments for these also pass through the official market. The multiple rate system will help sterling area exports only in so far as they are routed through foreign merchants who have the advantage of transferable sterling.

There can be no permanence about a system of this kind. In the first place, it is a moot point whether by dealing in dollars at the transferable sterling rate the British Government is not in conflict with its International Monetary Fund obligations. Secondly, and far more important, is the fact that this dual rate system lacks all logic or practical justification. Transferable sterling must therefore, either be brought within or very near the range of permissible fluctuations for official sterling, or the authorities must merge the two types of convertible non-resident sterling by letting official sterling fluctuate with the same measure of freedom as that commanded by transferable sterling. In either case the goal of convertibility for all non-resident sterling used in commercial transactions will have been reached. The first alternative is clearly preferable if it is also permanently attainable. But it is likely to be very expensive, in terms of dollar reserves, whenever sterling is under pressure.

The choice is therefore ultimately one of what can be afforded. The initial manoeuvre required to lift the transferable sterling rate was unquestionably costly.

What hope is there of holding this rate reasonably near the official market rate without incurring undue expense? The answer must naturally depend upon the extent of the supply of non-resident sterling that reaches the world markets. It is true that, if the support of transferable sterling proves too expensive, the rate can always be allowed to drop; but this would merely recreate the opportunities for commodity shunting and the resulting losses of dollar income and distortion of trading patterns that the intervention was intended to remove. The continuing intervention, whether in the official or transferable sterling markets, will be costly if sterling is inherently weak, if too much of the currency is being offered in the exchange markets as a result of deficits on the balance of payment whether of the United Kingdom or the overseas sterling area.

Measures are being taken in Britain to check the deterioration in the balance of payments. But there is good reason to believe that one of the main channels feeding the supply of transferable sterling has been the tendency to overspending by other sterling countries. The defence of sterling is a problem in which the responsibility of every member of the sterling area is involved. That may be the tritest truism; but the

truth of it is not always reflected in the reaction of individual members to common difficulties such as those that afflict sterling today. The need for a collective sterling area policy, though it has always existed, is rendered more urgent by reason of the decision taken last week to pledge the reserves of the sterling area not only behind official sterling but behind transferable sterling. Previously the market in cheap sterling could be allowed to fend for itself. Recent experience of its disturbing effect on the trade and the dollar income of the sterling area made it impossible, or at least unwise, to allow this market to flourish independently of the intervention and control of the authorities. Now the Exchange Equalisation Account stands behind all non-resident sterling used in current international trade. Technical convertibility of all such sterling has been introduced by the back door. It cannot possibly be maintained if the sterling area countries as a whole are feeding the supply of sterling by running heavy deficits on their external payments accounts and digging deeply into their currency reserves. If ever transferable sterling falls again to an appreciable discount on the official rate the world will draw its own damning conclusions.

War on the Terms of Trade

FOR the first time since the war the authorities are trying to correct a deterioration in Britain's balance of payments almost exclusively by means of dearer and tighter money. The prescription is to an extent novel, but the symptoms are to an extent familiar, though it is a long time since the British economy was in such rude health that it was threatened with blood pressure. The previous affliction of 1951 struck a still convalescing patient. The inflation of commodity prices set off by the Korean war was allowed to surge like a fever through the economy: the terms of trade moved sharply against this country and the visible trade deficit gaped wider month by month. Action on the monetary front had to be reinforced by swingeing restrictions on imports, and even those took months to become effective.

The danger today appears much less menacing. The terms of trade have swung adversely again, but they could not be expected to stick at the favourable point reached after the collapse of the Korean boom. World commodity prices began to recover towards the end of 1953, though that was not reflected in the official index of import prices until last April. That index, which includes a freight element, rose very gradually until December last year, when it jumped two points to 103 (1954=100), and it rose again in January to 104. A rise of 6 per cent in the index adds nearly £200 million a year to Britain's import bill. The prices at which Britain sells its exports, on the other hand, have remained unchanged at 100 since

November, 1953; hence the importing power of British exports has declined. The measure of that decline is shown in the index of the terms of trade—an upside-down affair in which a rise means a deterioration from the British standpoint—which has risen from 98 last March to 104 in January.

The effect of that deterioration on the visible balance of trade has recently been accentuated by the relapse in exports and by the slight rise in the volume of imports. The reasons for that rise in imports leave room for argument. Expansion of industrial production has certainly called for larger imports of some materials, such as steel and coal, and imports of certain items reflect increased consumption of foods, the using up of official stocks and—in grains—the poor domestic harvest. In some industries, stocks of raw materials had perhaps been allowed to fall too low, and demand generally may have been stimulated by fears that the troubles over Formosa might develop into another Korea.

Though the motives may be difficult to pinpoint, the result is not. The visible trade deficit rose sharply to £63 million for the average of the months October to

830

January, which was £24 million higher than the same average twelve months earlier, and the deficit with the dollar and other non-sterling countries leaped to nearly £50 million a month. Plainly that trend would leave a disastrous gap in Britain's balance of payments this year if it were allowed to continue. There is little concrete evidence as yet that industry is hoarding materials, or that domestic demand is plundering resources destined for export, but it cannot be wholly accidental that the recent boom in demand at home has been for manufactures that have been doing less well than they might in export markets.

By letting some of the steam out of domestic demand, tighter and dearer money should encourage exports and discourage imports. Now that all the major commodity markets in Britain are functioning again, monetary policy can exercise a more direct influence on world prices. Throughout the chain of manufacture and distribution, it has become more expensive to hold stock. That does not mean that everyone will hold less stock. Monetary policy works at the margin, the margin here being all merchanting and other firms who do not possess a firm order or a generous vision of profits to be earned. Such firms will have to pay more in future for accommodation, marginal profits will disappear, and the overdrafts of all firms may be scrutinised more closely.

The effect on world prices of a more cautious attitude by British buyers must be uneven as well as marginal. Britain's influence in commodity markets is usually strongest among sterling commodities such as raw wool, and weakest among "dollar" commodities, though some of these, such as copper, are also produced in the sterling area. Some relief in the prices that Britain pays for imports may be coming. The commodities that have been mainly accountable for the rising import bill have passed their peaks, though several months may pass before a decline is reflected in the indices, for these reflect market prices before the time of shipment. Rubber, which doubled in

peaks, though several months may pass before a decline is reflected in the indices, for these reflect market prices before the time of shipment. Rubber, which doubled in

THE ECONOMIST, MARCH 5, 1955

price between March last year and January this year, has since fallen by about 5d. to 26d. a lb., and copper,

which shot up by one-third to £360 a ton between August and February, is now a shade cheaper at about £340 a ton; provided that the end of the strike in Rhodesia is not followed by strikes elsewhere, copper should gradually become cheaper. Tea prices have dropped in the last month, and coffee and cocoa are far below their peaks. Wheat is a little dearer, but barley and maize are cheaper. Lead and zinc prices, which are supported by American strategic purchases, may change little, and the outlook for tin is obscure. Prices of many farm commodities, however, will depend partly on the coming harvests and, like the metals, partly on the level of industrial production in the world as a whole.

Last year the expansion in European demand took up the slack in markets left by the American recession. So far there is nothing to suggest that the recovery in the American economy may be offset by any falling off in European demand. Hence there is no reason to expect drastic breaks in prices, though the action of the British authorities can hardly fail to be bearish in time.

The new monetary policy should bring about a modest correction in British trade, and that is needed

COMMODITY PRICES		
	Percentage Change	
	End 1954 compared with End 1953	End Feb., 1955 compared with End 1954
Copper...	+20	+22

Wool...	-9	+6
Wheat...	-8	+1

As the Chancellor has emphasised, the changes in trade have not been violent, and the economy is fundamentally sound. The improvement in the terms of trade two years ago brought substantial gains to the balance of payments, and some part of this must now be surrendered. The important needs are not to surrender too much and to ensure that prices of British exports do not become uncompetitive. If these dangers are avoided the recent improvement in the purchasing power of Britain's customers will help to maintain exports.

Steel Three-fifths Unscrambled

THE marketing of the shares of the nationalised steel companies is an epic of untried techniques in the markets, of the mobilisation of vast investment potential, and of successes snatched from the jaws of defeat. This impressive story is smothered by the bleak language of the first report of the Iron and Steel Holding Realisation Agency* for the period July 13, 1953, to September 30, 1954. To the general public to whom it should be addressed it makes impossible reading. The story stops just before the sale to the public of the ordinary capital of John Summers, Dorman Long, Colvilles and Whitehead. At that point of time about one-third of the nationalised steel industry had ceased to be subsidiary companies of the agency; today the unscrambled portion reaches nearly three-fifths of the total, measured either by steel production or by numbers employed.

The ordinary man will wish to know whether the operations of the agency's first period have produced a capital profit compared with the sums paid for the companies when they were nationalised in 1951 and how that profit or loss has impinged on the nation's accounts. The answer is most complicated, partly because the agency has first concentrated on selling ordinary shares only. Of the thirteen leading companies (with their 126 subsidiaries) that had been handled by September 30, 1954, only seven had been entirely sold. Of the other, and on the whole the bigger, six, the equities only had been sold and the agency retained the prior charges. The value of those prior charges in a fluctuating security market has yet to be established.

★

The agency also has two other functions besides being a seller of securities. It is a big shareholder drawing substantial dividend income from the companies not yet sold. Moreover it provides capital for the development of the retained companies and to a limited extent (through the medium of partly paid capital) for the companies that have been partly sold. In its function as a holding agency the agency drew interest and dividends of £10.3 million; after deducting £1.3 million for loans written off and £1.4 million for the agency's expenses, there remained an income of £7.6 million, of which the government took the whole—£4.6 million in tax and £3.0 million as net revenue paid over to the Treasury and used presumably to offset the interest cost on the £240 million of Treasury 3½ per cent stock (1979-81)—the old British Iron and Steel stock.

The interest on that stock costs around £8.4 million a year. It is no longer fully covered by the revenue

* H of C, 70, 2s.

of the agency. But it is probably fair and certainly necessary to disregard the revenue account. The corpus of the nationalised steel industry is shrinking, and the service of the Treasury 1978-81 stock is no longer the concern of the nationalised steel industry.

It is on the capital side of the accounts that attention will be focused—on the capital receipts from the sale of steel undertakings and on the investment of public funds in further capital for the industry. The provision of the industry's capital needs has placed no burden on the national finances. From sales to the date of the accounts nearly £78 million had been realised—a mere £17 million of it in government securities (automatically taken out of issue), £51½ million in cash from the public and £9½ million from the companies by way of special distributions before sale. Of this £78 million, £63 million net has been paid into the government's Iron and Steel Realisation Account and just under £15 million has been retained by the agency and used for investment in the companies it still owns. No use at all has been made of the agency's power to borrow £150 million on the security of the Consolidated Fund of the United Kingdom. Instead a substantial repayment of capital has been made. Save to the small extent that that repayment has consisted of Government stock, this is a funding operation just as much as an issue of Government stock in the market. The public has the steel shares; the Government has the money, and the public debt is reduced.

If no exact answer emerges as to the extent of the agency's capital profit, it remains certain that there has been a profit and that it is substantial but not enormous. The seven companies that were wholly sold realised £15 million, including a capital profit of £1.6 million. The six companies that were partly sold stood in the books at £96.1 million after making allowance for the agency's additional investment in them. Sale of the ordinary shares has realised £63 million. The agency keeps £33.1 million on its books and holds against it good prior charges (like the 5½ per cent preferences and 4½ per cent (1964) loan stock of Stewarts and Lloyds) to the nominal amount of £51.8 million. These stocks often changed in form in the process of preparing the steel companies for the market and were evidently intended to realise an average of about par. The institutions are ready to buy them, and many of the dates appear tailored for that market.

If Britain is headed for a longish period of dearer money it is no longer certain that this list will indeed command an average of par after allowing for the costs of selling (a 4½ per cent preference stock of United Steel companies, for example, might be worth a shade below its face value). But it seems certain that nothing so drastic can happen as would induce the price for all

this portfolio from £51.8 million to £33.1 million. A profit can be counted from the sales made up to last September, and doubtless from the sales that have been made between September and now.

The agency took over from its predecessor—the nationalised Corporation—with steel assets at a book value of £246.1 million—not a very different total from the compensation of £245.8 million paid for the nationalised companies. It has worked that down to £183.0 million, and if the retained investments in the

THE ECONOMIST, MARCH 5, 1955

partly sold companies realised no better than their book value there was still £151.7 million invested in companies that on September 30th were waiting to be sold. It is necessary that the first accounts of the agency should show a substantial profit. For the residual list contains some companies that will be more difficult to sell and the job may have to be tackled in an atmosphere of dearer money. But a good start has been made and the agency and the City consortium deserve full credit.

Business Notes

Is Bank Rate Working?

A CASUAL observer of events in the markets during the week since Bank rate went up from 3½ per cent to 4½ per cent could be pardoned for jumping to the conclusion that the momentum behind the market was still much too strong for the forces trying to control it, that the 1 per cent rise of February 24th was proving little more effective than the ½ per cent rise of January 27th. Some part of the inevitable fall in security prices had admittedly taken place before the event. But a stormy Stock Exchange account in the early stages of which nasty losses on the more speculative groups had been uncovered ended on Tuesday with gilt-edged securities only a little below the level at which they had stood immediately before the increase and industrials actually higher than they then were. So far from signs of distress selling still being in evidence, there was in the earlier days of this week a fair amount of renewed buying. It was mostly small, though in the gilt-edged market some of the institutions that had been holding off as long as they dared felt obliged to resume buying, and on Monday the market had to go to the Government broker for a little stock. That buying died down again on Wednesday when the February gold loss was shown to be bigger than wishful investors had cared to foresee.

To most dealers in the gilt-edged market, and to some in the industrial market, prices seemed more optimistic than realistic, for they make little allowance for the really sharp tightening of short term money rates, for the fact that at that end of the money machine the reins are firmly held and had driven the discount market persistently into the Bank. Moreover new borrowers in both fixed interest and equity fields have still to test the rate at which they can borrow. But the market does not dictate the prices; the buyers and the sellers do that. And far beyond the strict confines of the security markets—in the fields of building society finance and hire purchase finance—there is also a disposition to feel and behave as though the dearer money policy is transient, as though a firm financial policy has dealt with inflation so that the business of "inflation as usual" can be quietly resumed.

The New Bill Rates

IN Lombard Street the response to the shock of the 1 per cent increase in Bank rate proved to be even sharper than was first expected. At last week's Treasury bill tender the discount houses' bid was equivalent to a discount rate of only a fraction below 3 per cent, or almost exactly 1½ per cent above the rate for their tenders in the previous week. Other applicants for the bills paid rather more than did the discount houses, so that the average discount rate for the whole allotment did not rise quite so sharply—it was £3 15s. 5.32d. per cent, compared with £2 6s. 3.97d. per cent. The market was naturally influenced in its tenders by the desire to try to recoup some of the loss that it has sustained on the financing of its existing portfolios by reason of the steep rise in rates, and its determination to make the attempt was certainly stiffened by the tight policy that the authorities had been pursuing in the short loan market on the eve of the 1 per cent rise in Bank rate. The reins have been kept taut in this past week, but not so tight as to prevent most discount houses from repaying the sums they had borrowed from the Bank in the previous week. Only on one day—last Monday—was there any need to take new money or to re-borrow at the Bank, and only two or three houses were thus affected. At the date of the Bank return, however, some of the original lendings were still outstanding because most of the sums lent on the day before the increase in Bank rate had to be taken for eight days.

THE ECONOMIST, MARCH 5, 1955

At the new level of bill rates a wide margin is opened up for profitable switches of mobile foreign funds to London, even after allowing for the cost of obtaining forward exchange cover now that forward sterling, as expected, has gone to a discount. The overseas interest in bills appears to have been considerable, and business has been done with Canadian and Dutch buyers at rates down to 3½-½ per cent.

Bank Lending Unrestrained

IN the four weeks to February 16, a period that began eight days before the increase in Bank rate by ½ per cent and ended eight days before the jump to 4½ per cent, bank advances rocketed up by £107 million. This expansion is without parallel in Britain; and even the previous record increase of £89 million shown in the return for June, 1951, related to a period of six weeks.

Private industry and trade has admittedly secured virtually no new finance in recent weeks from new market issues, but its borrowing from the banks has been rising fast ever since the early autumn—when activity in the new issue market was exceptionally large. The rise in bank advances, which has carried the total outstanding beyond the previous peak of April, 1952, to close on £2,000 million, clearly reflects for the most part the drying up of business liquidity that has resulted from many months of high and often strained levels of activity. It is the clearest domestic indicator yet of inflation.

The question now is whether credit inflation will be checked by the restraints of the 4½ per cent Bank rate. The reaction of borrowers to the increase of up to 1 per cent in advances rates is difficult to predict; but it does seem

possible that the banks themselves may be forced to impose tighter standards of lending than have been applied in recent months — by the classic restraint of a squeeze on their liquidity. The government's repayments to the banks in the February banking period from seasonally buoyant tax revenue made a big inroad into the banks' liquid assets—

† Ratio of assets to published deposits.

holdings of cash, call money and Treasury bills fell by £274.3 million. The simultaneous upsurge in advances thus reduced the liquidity of most banks quite sharply; and three banks whose liquidity was already strained appear to have been forced to reduce their investment portfolios in consequence. Total investment holdings fell by £52 million; the Westminster alone shows a decline of £25½ million and the District and Martins account for most of the remaining fall. Despite this corrective action, the average liquidity ratio dropped from 34.4 to 31.3 per cent, its lowest since the war. Only the National Provincial had

How Yields Have Moved

Gilt-edged prices have been falling and yields rising since last November. In industrials the move towards dearer money did not come until well after the January Bank rate increase. Even now it is mainly in short-dated stocks that the rise in yields is most marked.

Lord Luke of Pavenham, T.D., D.L., J.P. As Chairman of Bovril Ltd. and also of the National Playing Fields Association, his time is at a premium. So, on his desk, always ready, you will notice his Dictaphone Time-Master dictating machine.

Dictaphone goes to work for Lord Luke

TO MEN of Lord Luke's calibre, *time* is perhaps the most valuable commodity of all. And it is for men whose time is precious that the Dictaphone Time-Master is made. This high-quality precision dictating machine is the most efficient office time-saver ever devised. By cutting routine in half, it makes possible astonishing increases in executive accomplishment. The executive—and his secretary—gets far more done, in far less time, with far less effort. The Dictaphone Time-Master dictating machine can save time in *your* office, too. For a demonstration and a free trial, write to Dictaphone Company Ltd., 17-19 Stratford Place, London, W.1.

Revolutionary plastic Dictabelt records give permanent, visible recording; are the "inside secret" of the Time-Master.

Some features of the Time-Master

- ★ Only 4½" high, and scarcely larger than a sheet of typing paper.
- ★ Completely portable—and you can mail Dictabelt recordings in an ordinary envelope.
- ★ Amazingly simple—just pick up the microphone and talk.
- ★ Quick play back by simply pressing a button on the microphone.
- ★ Secretary can see corrections, letter lengths.

The watch in his life...

He's frantically busy. Only by the strictest deployment of his time is he able to get through everything. A man like this *has* to have a good watch. If he bought the Baume watch illustrated here he could forget about it. He wouldn't even have to wind it... seldom have to re-set it... probably never, throughout its long life, have to take it to a watchmaker for anything more than a yearly oiling. It's very robust and pleasant to look at.

Ref. 423. 17 jewels. Shock absorbent. Anti-magnetic. Waterproof. Automatic wind.

• In stainless steel case from £19.

BAUME *the good watch*

BAUME & CO. LTD. (ESTABLISHED 1834) LONDON AND LA CHAUX-DE-FONDS

SANDILANDS BUTTERY AND COMPANY LIMITED

Established over 100 years, Sandilands Buttery & Co. Ltd., with branches throughout Malaya, will be pleased to help in any problems concerning trade with:— **MALAYA**

most reputable stores have been advertising 10 per cent initial payments; they will have to change to 15 per cent, but few have been offering contracts much longer than two years. Reputable traders are not sorry that competition will no longer force them towards offering easier terms. The Board of Trade's new shoe will pinch in particular places. The radio and television trades will feel it. A fraction—but only a small fraction—of the furniture trade will have to modify its terms; so will the part of the new car market that has been offering three-year contracts. But private industry sheds no tears because the nationalised area boards, both gas and electricity, have been forced to accept a quick change in policy.

On the purely financial controls hire traders have no cause for jubilation, but none yet for fear. Much remains obscure; in so far as the finance houses use bank money they will have to pay more for it—possibly about 5½ per cent, though some finance houses still hope to get overdrafts at 5½ per cent. Nor is it yet clear how the banks will interpret the new request for rigour towards HP advances. Traders and finance houses have seen nothing yet that alarms them, nor have they yet altered their scales of charges. The electricity boards using government guaranteed money have made no change, and those companies that advertise for public deposits are still offering the same rates. There is no incentive in market rates yet to cause depositors in the finance houses to take their money elsewhere.

Traders concerned with hire purchase are quietly confident, making two assumptions: first that the redrafted Board of Trade regulations will not be widely evaded for some months. In particular that trick of cutting a loophole in the regulations by making a hire purchase agreement into a hiring agreement with an option to purchase has been closed. Secondly, it is being widely assumed that the present phase of dearer money is also transient. Difficulties there are; the mixed contract comprising some controlled and some non-controlled articles is no longer permissible. It may also be more difficult—though it should not be impossible—to help out the customer caught by strikes or unemployment. And there is a tinge of regret that the nationalised industries are allowed four-year contracts for most of their products while broadly private industry is limited to two years. Figures for February just issued by HP Information show the strong momentum still behind hire purchase. Total contracts reported for February numbered 53,322 compared with 31,215 in February last year. Motor contracts numbered 34,261 compared with 24,095 in January and 17,180 in February last year.

Lancashire's Bitter Pills

THE cotton industry has found little pleasure in two announcements from London and Delhi. Last week the President of the Board of Trade announced that the government had accepted the report of the Monopolies Commission on restrictive practices in the calico printing industry. The report concluded that those practices operated against the public interest, and the government will now discuss with the industry how the Commission's recommendations are to be carried out. The restrictive

practices of other sections of the cotton industry have not yet been referred to the Commission, but their progenitors will no doubt feel that their turn must come.

This week the Indian Finance Minister announced that he proposed to reduce the export duty on coarse cloth from 10 to 6½ per cent *ad valorem*, and to raise the domestic tax on cloth. This reduction may have little effect on exports of cloth to Britain, for the bulk of that trade lies in the medium grade, on which the export duty was abolished in 1953. But it will strengthen Indian competition in world markets, and if the higher internal tax on cloth discourages domestic demand, the Indian mills will have another incentive to increase their exports.

It was always a pious hope that the Indian government would restrict exports to the British market, but there was some hope, on grounds of equity, that it might be persuaded to reduce the preferential yet penal import duty on British cotton textiles. That hope has also gone, and the import duty on wool textiles and other goods may be increased by an amount corresponding to the internal tax that is proposed for similar Indian-made goods. Lancashire can now look only to the British Government for protection against imports of Indian cloth. It has been given no immediate encouragement, but the President of the Board of Trade has recently asked the Cotton Board to submit recommendations on the action that would be most appropriate, if the government should decide that action was necessary.

Halifax Hauls the Flag Down

THE Halifax Building Society has stepped into line with other building societies in paying 2½ per cent net on shares and charging 4½ per cent on new mortgages. Those who have mortgages with the society at lower rates—and there is a lot of 4 per cent money outstanding—are also being brought into line, but with a generous delay. The 4½ per cent rate on existing owner occupier mortgages will not operate until October 1. The decision is necessary both because of the change in money rates generally, and for the good health of the Halifax Society itself.

Halifax remains the biggest building society in the world with record total assets of £237.8 million at January 31 showing a record increase of £23.5 million in the year. But records are two a penny in the building society movement. The rate of increase is only around 10 per cent compared with a larger general increase, in particular with one of 17½ per cent to £213.5 million in the Society's next competitor, the Abbey National, and since it restored the 4 per cent mortgage rate last year, the Halifax society has been overburdened with applications and has had to ration money. A long term lending rate for mortgages of up to 25 years ½ per cent below the Bank of England's lending rate for 7-day money had become anomalous.

The issue was not whether the Halifax Society should come into line, but whether the line itself should be held at the general level of 2½ per cent net paid on shares and 4½ per cent net charged on mortgages. For the moment, evidently, building societies think that it can. That is the burden of the Association's recent statement, and Sir Harold Bellman's remarks at last week's meeting of the Abbey

National Society support the view that the societies should more than ever seek to maintain reasonable stability on interest rates over considerable periods.

That worked well in 1954, when housebuilding was booming. The 1954 estimates of the Building Societies' Gazette are now issued. They show a formidable achievement. Total assets of the movement are thought to have risen by £228 million to the record level of £1,870 million; mortgage advances to have risen by £71 million to £370 million during the year, and balances due to shareholders and depositors by £219 million to £1,760 million. Those figures spring from a period predominantly of cheap money and the societies have ended up liquid, some of them with funds to spare. Trial, and it is to be hoped not too much error, will show whether the same rate structure will hold against a background of dearer money. Building society interest paid and charged may not move with the Bank rate, it has to conform to the major trends. A movement which stands out from conforming to incidental changes in the Bank rate must not fail to spot changes in the main trend.

BOAC's Seven Seas

AFTER a good deal of uncertainty, the Government decided last week to permit the British Overseas Airways Corporation to buy ten Douglas Seven Seas airliners out of the 19 originally requested. The cost is put at £13 million with spares and the ten aircraft will be just adequate to operate a non-stop service between London and New York. On routes to Canada and to South America, where the other nine aircraft would have flown, BOAC will make do with Stratocruisers. The government has recognised that BOAC would lose traffic and repute if the corporation were unable to offer non-stop trans-Atlantic services when its competitors do. The Seven Seas is the first airliner to promise this range, and the first of them is due for delivery to Pan-American in the spring of 1956 while BOAC will wait until the autumn. It is a condition of the arrangement that BOAC will sell these American airliners as soon as a trans-Atlantic version of the Bristol Britannia becomes available; in this way the Seven Seas can be presented as a stop-gap until British aircraft of similar performance become available.

The Douglas company can claim a remarkable technical achievement in designing the Seven Seas. It has given the piston-engined airliner a new lease of life and upset the plans for its British and its American competitors. In America, Lockheed has had to press forward with an interim turbo-prop version of the super-Constellation in order to compete with speed and range of the Seven Seas. This may be ready to go into service with the first buyer, TWA, in a year to 18 months after BOAC take delivery of the ten Douglas airliners.

Britannia on the Move

THE Bristol Aeroplane Company has come out of the recent negotiations with considerable advantage. BOAC has confirmed its order for eight of the long-range Britannias for non-stop trans-Atlantic services, and two of

THE ECONOMIST, MARCH 5, 1955

the 25 shorter-range Britannias already on order are being converted to this more advanced mark. Further, 60 of the new BE 25 engines are being ordered and, when they become available, they will replace the Britannia's Proteus engines. Finally, a contract for three trooping Britannias is being placed in Belfast with Short Brothers and Harland, in which Bristol has an interest and for which it will build the main components.
